... or you might want to be lazy (Virtues of a programmer) and use the assembler we have provided. :-)

Simply cut and paste the translation below into a file I'll call "barbosa.wp34s".

```
// George W. Barbosa's mystery program
// http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=187663#187663
//
// $ wp34s_asm.pl barbosa.wp34s -o wp34s-0.dat
//
// Emulator will now just read it in directly (provided you are in the right directory).
// Or you can load it into the calculator as well.
//
001 LBL'MYS' // Changed label so it could be more easily found via "h CAT".
002 DEC X

in response to message #2 by Neil Hamilton (Ottawa)

Nice utility! I've downloaded wp34s_asm.exe and wp34s_asm.pl to the wp34s emulator folder. What should I do next? (I don't know Perl). Thanks!

in response to message #3 by Gerson W. Barbosa

Hi Gerson,

There is a manual in the SVN's "./doc" directory: WP34s_Assembler_Disassembler.pdf.

Basically, you don't need to know any Perl -- even if you use the Perl version. The EXE is the same thing (just SLOWER -- due to its requirement to dynamically decompress [at least the first time], and BIGGER -- same reason). Again, see the document.

To assemble an ASCII source file into a binary image (I'll show the EXE version but the Perl script is the same, just a different extension):

```
$ wp34s_asm.exe YOUR_ASCII_SOURCE.wp34s -o BINARY_IMAGE.dat
```

To disassemble a binary image back into an ASCII source file:

```
$ wp34s_asm.exe -dis BINARY_IMAGE.dat > RECOVERED_SOURCE.wp34s
```

You don't need to use the suggested file extensions but I would encourage these ones to aid in standardization. The ".dat" are eaten directly by the emulator if called "wp34s-0.dat", "wp34s-1.dat", or "wp34s-2.dat". (As of a few days ago, -3 disappeared due to flash space limitations. Can't recall the exact SVN version of this change.)

There are a bunch of options that you can use as documented in the manual.

Paul had a few cool ideas that we are trying to capture this week (or maybe the next) so it should gain some interesting new functionality soon. Most are dealing with symbolic branch targets -- you won't have to count backwards or forwards N-steps, and if you later insert a few new steps in between, you won't have to "fix up" the BACK/SKIP instructions -- these will be automatically handled. A simple example:

```
Loop::      RCL+ 00
            STO/ 01
            x[<->] Y
            BACK Loop
            STO 02
```

If you can afford the disk space, having a proper Perl package installed will result in higher performance (no decompression wait) and the doc explains about where you can get these.

I hope you find it useful! Let us know how you make out.

BTW: All the programs in the SVN "./library" directory have a ".wp34s" counterpart that can be directly assembled by this tool (assuming I haven't made any transcription errors :-). These can be used as examples for writing your own compatible code. We know the syntax is a bit weird and unforgiving. To help, the tool can write an opcode syntax guide using the "-syntax FILENAME" switch. This should help a bit.

Cheers...

Re: wp34s program

*Message #5 Posted by **Gerson W. Barbosa** on 14 July 2011, 5:52 p.m.,*
in response to message #4 by Neil Hamilton (Ottawa)

Hello Neil,

Thanks! I've installed the latest version of Strawberry Perl:

```
>wp34s_asm.pl mpgm.wp34s -o wp34s-0.dat

// CRC16: 5ACD
// Total words: 79
// Total steps: 78

>wp34s_asm.pl -dis wp34s-0.dat > test.wp34s
```

This reverses to the original listing, as expected, but I don't know how to properly load the .dat file into the emulator. I tried the LOAD command, but this is what I got:

```
001 LBL'MYS'
002 DEC X
003 3
004 ENTER[^]
005 ???
006 ???
007 ???
...
```

Most likely I've done something wrong. I'll read through the manual later. For the time being I am not interesting in transferring programs to the real calculator, as I don't have a suitable USB-to-RS232 converter yet.

Regards,

Gerson.

*Message #9 Posted by **Neil Hamilton (Ottawa)** on 14 July 2011, 9:25 p.m.,*
in response to message #5 by Gerson W. Barbosa

Hi Gerson,

No, your commands are correct. The fact that you got the same CRC16 as I did means that the assembly did work. Mail me your DAT file and I'll see if I can figure out what might have occurred. You can mail it to the account attached to this message.

As Paul pointed out, firmware versions are VERY important as the op-code numbers sometimes migrate with the ever-improving state of the development. The assembler can handle this IFF you have the correct op-code tables. (There is info in the manual about this but it can be tricky to create the alternate tables.) However, looking at your message, the first op-code that is wacky is the square root (step 005) and it hasn't changed in a while (0x020a). The version numbers we need to track this are the ones reported by "h X.FCN|3|ENTER" (in other words, the VERS command) from the calculator and the SVN number of the assembler. Tack the -svn switch onto the command line and tell me what number it reports. It is likely:

```
$ wp34s_asm.pl  library/gerson.wp34s -o wp34s-0.dat -svn
// Opcode SVN version: 1210
// CRC16: 5ACD
// Total words: 79
// Total steps: 78
```

Just for interest, if you have an MD-5 or SHA1 tool (look on Wiki), the hashes for the DAT file should be:

```
$ sha1sum wp34s-0.dat
7b5213cf6e9176c282cc1933f578891a89b4bbf6  wp34s-0.dat
$ md5sum wp34s-0.dat
9f875de2bc41422e3c1a639c84103cfc  wp34s-0.dat
```

If you have such a hash tool, let me know what value(s) you got. Either one will do -- no need for both.

If you make sure that the "wp34s-0.dat" file is present in the same directory you started the emulator from, the emulator will automatically read that specific file into emulated flash page 0 (wp34s-1.dat would be read into flash page 1, and -2 into page 2).

Though the current Assembler documentation mentions flash page 3, the latest SVN versions of the calculator have run out flash space -- so only 0-2 for now. :-(

What directory the emulator is starting in depends on how you start it. In Windows, you can create links to programs so you can start them from a shortcut. I am pretty sure you can edit the properties of that shortcut to tell it what directory to start in. (I am running Linux and don't recall the exact sequence off the top of my head.) Make sure that the DAT file is in that directory. (Going from memory here so YMMV.)

Once you start the emulator, because I switched your label from A to 'MYS', the program will

be visible with the calculator's "h CAT" function. Using "h CAT", search for MYS (since you have used the flash page 0 file name, wp34s-0.dat, the CAT function should show it as being in "PG 00") and hit XEQ to run your program directly from emulated flash. There are other ways to do this but this is probably the easiest.

I see Bruce Bergman has kindly built a web front end for the tool here. You could give this a try as well.

I am still working kinks out but I have also run a fair bit of code through on both Windows and Linux with few issues (other than SVN bumps *evolving* the internal opcode numbers!! :-). For example, I had a Great Circle program that, as a last step, converted nautical miles to km but after one SVN bump of the calculator, it was converting astronomical units to km! It changed the distance from Boston to Vancouver to something out of this world -- literally!

This is why the assembler can read in opcode definitions from virtually any SVN revision after 1133 (or some such number).

Re: wp34s program

*Message #10 Posted by **Gerson W. Barbosa** on 14 July 2011, 10:03 p.m.,*
in response to message #9 by Neil Hamilton (Ottawa)

Hello Neil,

Here are what I have:

```
>wp34s_asm.pl mpgm.wp34s -o wp34s-0.dat -svn

// Opcode SVN version: 1199
// CRC16: 5ACD
// Total words: 79
// Total steps: 78
```

VERS on the emulator returns only

```
34S 2.0
PAULI, WALTEr
```

no build date (like my hardware wp34s which was flashed two or three weeks ago). It is Marcus's stack lift fix as of this afternoon. I replaced only the files wp34s.exe and wp34sgui.exe inside the emulator folder.

Thanks for your concern.

Gerson.

*Message #11 Posted by **Neil Hamilton (Ottawa)** on 14 July 2011, 10:31 p.m.,*
in response to message #10 by Gerson W. Barbosa

Hi Gerson,

It looks like your emulator might be broken as Paul suggested. Mine is the latest on the tree and VERS is showing "34s 2.0 1220" (meaning SVN 1220). The actual complete SVN file set is now at 1222.

The (lack of) SVN number your emulator is showing is mighty peculiar! I would be leery of just updating a few files since this thing is typically built as a set and there may be things in other files that need to be there as well (DLLs, etc.)

My emulator reads in the flash image of your program just fine and if I execute a "PRCL 0", to swap the flash into RAM, I can scroll through your program with no trouble. (I don't know how to *run* the program -- do I seed it with something in X? -- but I can see it. :-)

If I were you I would do a clean SVN checkout to a new directory and try it all again. (I am *not* an SVN expert so there may be cleaner ways of getting a clean checkout but I don't know how to do that. I just use "svn up".)

Let me know what happens.

Cheers...

in response to message #11 by Neil Hamilton (Ottawa)

Hello Neil,

I am not familiarized with SVN. Previously I'd dowload the whole build when is was available. I'll try to fix things tomorrow. I realize the assembler is a great tool, so it's worth to learn how to use it. Thanks again!

Regarding the program, it takes two arguments from the stack (see Jim Horn's post just below). The equivalent C++ program is 33 lines long (I'll post it later).

Cheers,

Gerson.

Ahh! I think the root of the problem is becoming clear!

Many of us obsessive ones are running on the bleeding edge of the techo-trinity's every twitch and whim with this project. When I look in the latest ZIP bundle, I see that the newest file puts it at about SVN 1136. We are currently on SVN 1223. The emulator in the bundle is hopelessly out-of-date with the current

assembler. Unfortunately, you will likely have to be up near the latest to make use of the assembler (recall that opcodes "evolve") -- at least for now. These targets are moving fairly rapidly. The assembler was not reliable until about SVN 1161 -- and that one was set up to use that vintage of op-code map.

[WARNING: Using the bundled version will also be a problem with the assembler that Bruce Bergman is hosting as well. His CGI script is simply running the very same assembler from SVN and it is still assuming you are at or near the latest SVN build!]

Not to worry! If you want to pursue the assembler route (and get a more modern version of the calculator!), the best thing you can do is get an SVN client. If you are on Windows, check out TortoiseSVN -- it is quite easy to use and hooks right into Explorer. Use the download address from here. TortoiseSVN needs the https address and a clean directory (and an optional build number -- this is where you want to go).

There are some very stable builds that should get you going and I am sure we can give you some "landing points" for those builds. Normally you would right click on TortoiseSVN to tell it to get the latest -- but in your case you want to tell to get revision XYZ (TBD).

Basically everything was incredibly stable just before the latest series of serial functions went in. If you are still game to try this, I will find a good SVN number and let you know. SVN is not that daunting, and has the wonderful advantage that, if you don't like the version you are running, you just tell it to get another specific version. You can easily backward or forward.

Note that you do get quite a few files with the SVN build but I am assuming that a 140MB and a slightly more involved set of paths won't deter you! :-)

We had some issues with stack lift and y^ lately which have nothing to do with the serial I/O stuff. The problem is flash space. Fixing bugs and adding features at the same time may lead to some inconsistencies. This will definitely be fixed!

There are sometimes SVN updates which simply don't work but are necessary for Pauli and me to exchange the source files. We are working on the same files sometimes and need to exchange them often. That's what SVN is all about.

Sorry, Marcus. You said it better than I. It was not a criticism at all. I was just pointing out that there are "islands of stability" if Gerson wanted to give it another try. The last stable island was just before the serial effort began... not that it was necessarily related.

We understand that you have to break a few eggs to make an omelette. :-)

Quite exactly!

> Quote:

> I have to note that RPN programming with all the WP-34S features is remarkably powerful and remarkably write-only.

I haven't read all through the manual yet, so it is possible the program can be shrunk even more. Minor improvements can always be made. Before posting, for instance, I managed to make it one step shorter so that the three columns were the same height. The following is much easier to read and will compile in Dev-C++ :

```
#include <stdio.h>
#include <stdlib.h>
#include <math.h>

int main(int argc, char *argv[])
{
  int i, j, mi, mj, n = 3;
  double a, c, p, h, g, s, x;
  scanf("%d %d", &mi,&mj);
  h = 3*sqrt(3);
  g = h/4;
  x = 1/4.;
  for (i = 1; i <= mi; i++)
  {
    p = x;
    a = 2/3.;
    c = -a;
    for (j = 1; j < mj;)
    {
      c *= 1-1/(2.*j)-4/(2.*j++ +3);
      a -= c*p;
      p *= x;
    }
    s = g+8*n*x*sqrt(x)*a;
    g = sqrt(g*h);
    printf("%12d  %.16f  %.16f  %.16f\n",n,g,h,s);
    h *= 2*g/(g+h);
    x = (1-sqrt(1-x))/2;
    n += n;
  }
  printf("\n");
  system("pause");
  return 0;
}
```

I think this is more a function of RPN programming than the WP 34S feature set :-)

- Pauli

Re: wp34s program

*Message #20 Posted by **Gerson W. Barbosa** on 15 July 2011, 10:04 p.m.,*
in response to message #19 by Paul Dale

> Quote:
>
> I'd figured out the PI but not the followup portion of the program...

```
1 ENTER 20 A  ->  3.141592653589793
```

That's Newton's approximation of pi. In 1666 he obtained 3.1415926535897928 carrying out his calculations to 17 significant digits and evaluating the first 20 terms of his series.

```
6 ENTER 2 A     ->  3.14903810568          Same as above, with only the first two
terms of the series
          R/S   ->  2.59807621135          perimeter of the inscribed triangle
(diameter of the circumference = 1)
                    5.19615242271          perimeter of the circumscribed triangle
          R/S   ->  3.14172962149          sum of the area of he inscribed hexagon
and the area of the sectors comprised between, the latter
                                           ones approximated with the first two
terms of Newton's series
          R/S   ->  3                      perimeter of the inscribed hexagon
                    3.46410161514          perimeter of circumscribed hexagon
          .
          .                                and so on, until the 96-gon (3*2^6)
          .

          R/S   ->  3.14159265360          area of the 96-gon and the approximated
area of the inner sectors
          R/S   ->  3.14103195089          Archimedes' lower bound
          R/S   ->  3.14271459965          Archimedes' upper bound
          R/S   ->  2                      end of iterations
```

The number of correct digits yielded by the approximation of the inner sectors through the Newton's series appear to be

```
d = (n + 1)*lg(4^a) + 1.5
```

where

```
n = number of terms of the Newton's series
a = number of duplications of the sides of the polygons, starting with triangles
lg: base-10 logarithm
```

Thus, if the calculations are carried out with 1000+ digits, we should expect 1001 correct digits when n = 82 and a = 20 (83*lgt(4^20) + 1.5). The drawback is the extraction of 40 square roots which might take some time.

I've come up with a variation of Archimedes' method that will produce about 1.8 digits per iteration. Unlike Newton's method, no Calculus needed, but it will require a cube root extraction in the last iteration (van Ceulen could have used it to compute pi to 70 digits in the 15th century :-). Here are some results obtained on Free42 Decimal:

```
   6  3.14146091177349897863 3978
  12  3.14159094796311999296 6256
  24  3.14159262812349623867 1042
  48  3.14159265319634301272 3174
  96  3.14159265358366284751 6782
 192  3.14159265358969751840 9744
 384  3.14159265358979174309 9584
 768  3.14159265358979321509 8622
```

Regards,

Gerson.

> I've come up with a variation of Archimedes' method that will produce about 1.8 digits per iteration.

It is essentially the Archimedes' method, only an attempt has been made to improve the approximations. (He did it this way).

Using trigonometry, the Archimedes' lower and upper bounds for pi are, respectively:

```
a = x*sin(pi/x)

b = x*tan(pi/x)

where x=3*2^k,   k=1, 2,...
```

Let's consider the following limit:

```
        x*tan(pi/x) - pi
  lim   ---------------- = 2
x->inf  pi - x*sin(pi/x)
```

then the following weighted arithmetic mean of the bounds gives successively better approximations to pi at each iteration:

```
            2*a + b
   wam   =  ---------       ~   pi
               3
```

Likewise, the following weighted geometric mean appears to hold:

```
   wgm   =  (a^2*b)^(1/3)   ~   pi
```

also

```
         wam(x) - pi      9
  lim   ------------- = ---
x->inf   wgm(x) - pi      4
```

this leads to

```
         9*wgm(x) - 4*wam(x)
   pi = ---------------------,  when x equals infinity
                  5
```

or

```
         27*(a^2*b)^(1/3) - 4*(2*a + b)
   pi ~ ------------------------------
                      15
```

The demonstration may not be rigorously correct, nevertheless we can use the result to write the following wp34s program:

```
001 LBL 77
```

```
002 STO 00
003 3
004 SQRT
005 STO+ X
006 FILL

030 RCL+ X
031 RCL+ Z
032 4
033 *
034 -
035 1
036 5
037 /
038 RTN

1 XEQ 77   ->   3.141460911773500
2 XEQ 77   ->   3.141590947963119
3 XEQ 77   ->   3.141592628123497
4 XEQ 77   ->   3.141592653196343
5 XEQ 77   ->   3.141592653583662
6 XEQ 77   ->   3.141592653589791
```

An equivalent C++ program is:

```
#include <stdio.h>
#include <stdlib.h>
#include <math.h>

int main(int argc, char *argv[])
{
  char i, m;
  int n = 6;
  double gm, hm, wam, wgm;
// start with inscribed and circumscribed
  scanf("%d", &m);
// hexagons (diameter of the circumference = 1)
  system("cls");
// hm: harmonic mean
  hm = 2*sqrt(3);
// gm: geometric mean
  gm = 3*hm/4;
// 2*sqrt(3): perimeter of the circumscribed
  printf("\       n-gon\t      wgm\t          wam\t\t(9*wgm-4*wam)/5 \n\n");
// hexagon
  for (i = 1; i <= m; i++)
// gm(3/4*2*sqrt(3),2*sqrt(3)) = 3, this is the
  {
// perimeter of the inscribed hexagon
    gm = sqrt(gm*hm);
// wam: weighted arithmetic mean of hm and gm
    wam = (2*gm+hm)/3;
// wgm: weighted geometric mean of hm and gm
```

```
    wgm = pow(gm*gm*hm,1/3.);
// weights of gm and hm: 2 and 1, respectively
    printf("%12d  %.16f  %.16f  %.16f\n",n,wgm,wam,(9*wgm-4*wam)/5);             //
the weighted arithmetic mean of wgm and wam
    hm *= 2*gm/(gm+hm);
// (weights 9 and -4, respectively) will approximate
    n += n;
// pi at a rate of 1.8 correct digits per iteration.
  }
  printf("\n");
  system("pause");
  return 0;
}
```

Output for nine iterations:

```
       n-gon          wgm                  wam           (9*wgm-4*wam)/5

           6  3.1473451902649443  3.1547005383792515  3.1414609117734984

          96  3.1415927336837215  3.1415928338087955  3.1415926535836625
         192  3.1415926585943867  3.1415926648502488  3.1415926535896972
         384  3.1415926539025598  3.1415926542935209  3.1415926535897909
         768  3.1415926536093401  3.1415926536337748  3.1415926535897922
        1536  3.1415926535910144  3.1415926535925416  3.1415926535897927

========================================
```

Update:

$$10\pi \sim \frac{9ac}{4a - c} - \frac{7(a - 4c)}{3}$$

where

a = lower bound
c = next lower bound

avoids the cube root exraction and gives out the same accuracy (1.8 decimal places per iteration).

==

Update:

Found a relationship between the previous formulas and had W|A solve the equation (solve (p-(27*(a^2*b)^(1/3)-4*(2*a+b))/15)/((9*a*c/(4*a-c)-7/3*(a-4*c))/10-p)==128/19 for p) and simplify the result:

```
p ~ (513*(a^2*b)^(1/3) + 24*a*(-(288*a)/(c - 4*a) - 97) - 76*b + 1792*c)/2205
```

where

```
a = lower bound
b = upper bound
c = the next lower bound
```

This gives 2.4 decimal digits per iteration.

Archimedes' 96-gon is enough for 15 correct digits:

```
3.14159265358979259
```

The following procedure can be used to check the formula without running all the iterations:

```
n:=50;
a:=3*2^n*sin(pi/(3*2^n));
b:=3*2^n*tan(pi/(3*2^n));
c:=3*2^(n+1)*sin(pi/(3*2^(n+1)));
p:=(513*(a^2*b)^(1/3)+24*a*(-(288*a)/(c-4*a)-97)-76*b+1792*c)/2205;
```

More details here.

Re: wp34s program

*Message #22 Posted by **Gerson W. Barbosa** on 20 July 2011, 1:47 a.m.,*
in response to message #21 by Gerson W. Barbosa

FWIW, the TurboBCD program below is equivalent to the 38-step wp34s program above, except for the computation of p inside the loop. Sqrt(x) and Cbrt(x) are necessary because Turbo Pascal BCD lacks these functions. Notice that only eight iterations suffice for an approximation of pi to 17 digits (as the number of iterations grows, the algorithm yields 1.8 digits per iteration).

```
Program Quick_Archimedes;

var a, b, p: real;
       i, m: byte;
          n: integer;

function Sqrt(x: Real): real;

var s, t: Real;

begin
  if x<>0 then
    begin
      s:=x/2;
      repeat
        t:=s;
        s:=(s+x/s)/2
      until s=t;
      Sqrt:=s
    end
    else
      Sqrt:=0
end;

function Cbrt(x: Real): real;

var c, t: Real;

begin
  if x<>0 then
    begin
      c:=x/2;
      repeat
        t:=c;
        c:=(2*c+x/(c*c))/3
      until Abs(c-t)<1e-16;
      Cbrt:=c
    end
    else
      Cbrt:=0
end;
```

```
begin
  ReadLn(m);
  n:=6;
  b:=2*Sqrt(3);
  a:=3*b/4;
  ClrScr;
  Writeln(' n-gon',' ':11,'a',' ':21,'b',' ':21,'p',#10);
  for i:=1 to m-1 do
    begin
      a:=Sqrt(a*b);
      p:=(27*Cbrt(a*a*b)-4*(2*a+b))/15;
      WriteLn(n:5,a:22:17,b:22:17,p:22:17);
      b:=2*a*b/(a+b);
      n:=2*n
    end;
  a:=Sqrt(a*b);
  p:=(27*Cbrt(a*a*b)-4*(2*a+b))/15;
  WriteLn(n:5,a:22:17,b:22:17,p:22:17)
end.
```

Output for eight iterations:

```
 n-gon           a                     b                     p

    6   3.00000000000000001   3.46410161513775460   3.14146091177349899

  768   3.14158389214831843   3.14161017660468956   3.14159265358979324
```

==========

Update:

TurboBCD program using the new formula above, which avoids the cube root extraction whilst keeping the same accuracy (1.8 places per iteration).

```
Program Quick_Archimedes;

var a, b, c, p: real;
          i, m: byte;
             n: integer;

function Sqrt(x: Real): real;

var s, t: Real;

begin
  if x<>0 then
    begin
      s:=x/2;
      repeat
        t:=s;
        s:=(s+x/s)/2
      until s=t;
      Sqrt:=s
    end
    else
      Sqrt:=0
end;

begin
  ReadLn(m);
  n:=6;
```

```
  b:=2*Sqrt(3);
  a:=3*b/4;
  ClrScr;
  Writeln(' n-gon',' ':11,'a',' ':21,'b',' ':21,'p',#10);
  for i:=1 to m-1 do
    begin
      a:=Sqrt(a*b);
      WriteLn(n:5,a:22:17,b:22:17);
      b:=2*a*b/(a+b);
      n:=2*n
    end;
  c:=Sqrt(a*b);
  p:=((9*a*c/(4*a-c)-7/3*(a-4*c))/10);
  WriteLn(n:5,c:22:17,b:22:17,p:22:17)
end.
```

Output for nine iterations

```
 n-gon            a                      b                      p

    6   3.00000000000000001   3.46410161513775460
   12   3.10582854123024916   3.21539030917347249

Fair Interview Question?

*Message #1 Posted by **Norman Dziedzic** on 14 July 2011, 9:54 a.m.*

I'm interviewing someone today for a job that could eventually lead to position in my engineering department.

Do you think it is fair to ask them what type of calculator they use?

Re: Fair Interview Question?

*Message #2 Posted by **Alex Mark (Greece)** on 14 July 2011, 10:02 a.m.,*
in response to message #1 by Norman Dziedzic

When I was being interviewed for my current job, the Chief Engineer gave me an old and heavily used HP 15C (that is still working) and asked me to calculate 2+2... He was so amazed when I did it, that I got hired almost instantly...

Thanks, 32Sii...

Alex (Civil Engineer) - Greece

Re: Fair Interview Question?

*Message #3 Posted by **Jeff Kearns** on 14 July 2011, 10:02 a.m.,*
in response to message #1 by Norman Dziedzic

Sure. Then, if the candidate doesn't give you the answer you want and you hire him/her anyway, buy them a nice HP calculator out of your departmental budget and encourage its use.

Jeff

Re: Fair Interview Question?

*Message #4 Posted by **Tim Wessman** on 14 July 2011, 10:07 a.m.,*
in response to message #1 by Norman Dziedzic

I always do. :-)

That can be a good lead in type question to really get at the heart of what the candidate thinks about math, problem solving, and the way they approach things. Even if they don't really use a calculator, it is a good way to then have them reason out what might be the advantages of using one vs other options.

Re: Fair Interview Question?

*Message #5 Posted by **George Bailey (Bedford Falls)** on 14 July 2011, 10:25 a.m.,*
in response to message #1 by Norman Dziedzic

It doesn't matter what brand of calculator he uses, if he uses one at all or a spreadsheet, a piece of paper, a slide rule or what have you, as long as he solves the problem.

This is too much a politics/religion-type of question that raises too many emotions (at least with you) that divert from the important questions of a job interview. As soon as you anticipate good and not-so-good answers, don't go there at all. If you are completely neutral about his answers you could ask it - but then: why should you in the first place!?!

The fact alone that you ask this here shows me you shouldn't ask it there! ;)

Edited: 14 July 2011, 10:28 a.m.

Re: Fair Interview Question?

*Message #6 Posted by **John Pierce** on 14 July 2011, 11:41 a.m.,*
in response to message #5 by George Bailey (Bedford Falls)

I don't agree with your premise. One could not ask any question during an interview.

Re: Fair Interview Question?

*Message #7 Posted by **M. Joury** on 14 July 2011, 11:58 a.m.,*
in response to message #6 by John Pierce

I think that the point of George's statement is that the type of calculator (if any) chosen by the candidate does not affect his/her ability to do the work. The corollary that George offers is religion / politics. Is it correct to ask the candidate's opinion of either in an interview? Neither are related to the job at hand and neither help determine the candidate's ability to do said job. The type of calculator chosen falls into the same category in my opinion. Interview questions should be related to the ability of the candidate to perform the duties expected of him/her and questions unrelated to the job that might engender an emotional response should not be asked.

My 2 cents worth...

Re: Fair Interview Question?

*Message #8 Posted by **Mike T.** on 14 July 2011, 5:11 p.m.,*
in response to message #5 by George Bailey (Bedford Falls)

I don't agree as I would want to be sure they could solve the problem in an approprite way.

Even if they got the right answer I'd be concerned abount a candidate that had to break out a spreadsheet or use Wolfram Alpha to find the proability of throwing (a fair) coin and getting three heads, or finding the resistance of two resistors in parallel...

Mike T.

Re: Fair Interview Question?

*Message #9 Posted by **M. Joury** on 14 July 2011, 7:10 p.m.,*
in response to message #8 by Mike T.

And how does the BRAND of calculator they choose to use matter to their ability to solve a problem the appropriate way? Any question related to being able to do the job is fine. No one is suggesting that such questions should not be asked. But asking if you use a HP vs. TI vs. any other brand does not

judge your ability to solve a problem appropriately.

I'd be concerned even more if anyone had to get out his pocket calculator for these answers, when a piece of paper or just his or her head alone would do.

If help is needed, the best candidate will use whatever is available, no matter what specifically it is. This could be the own fingers, a calculator, a super computer, wikipedia, a book, a coworker, his aunt Eleonore...I wouldn't care how the problem was solved, if the answer was correct and delivered in time.

Re: Fair Interview Question?

*Message #13 Posted by **Ren** on 14 July 2011, 12:53 p.m.,*
in response to message #1 by Norman Dziedzic

Once my cow-orkers proposed that during a job interview, they gave the interviewee a Stardate. The interviewee would then have to correctly identify the episode Title and guest star.

A correct answer assured them the candidate would fit in with the team.

*Message #14 Posted by **Maximilian Hohmann** on 14 July 2011, 1:24 p.m.,*
in response to message #1 by Norman Dziedzic

Hi!

Don't you have anti-discrimination laws in the US? Here in Germany you would probably not be allowed to ask that question and base your decision on the answer...

And how would I qualify for your position? Although I own almost 1000 calculators I haven't used one at work (engineer and aviator) for 15 years or more. No need at all.

Regards, max

And ideology ("Weltanschauung"). The preference for certain types of calculators is certainly an ideological issue, because professionally, an engineer must be flexible enough to adapt to every kind of technology :-)

in response to message #1 by Norman Dziedzic

I didn't ask.

This is a recent graduate and he was nervous enough without wondering why I'm asking him about what calculator he uses.

Re: Fair Interview Question?

*Message #20 Posted by **db (martinez, ca.)** on 14 July 2011, 9:42 p.m.,*
in response to message #1 by Norman Dziedzic

Norman; I think it's fair, as long as you include the Corvus 500, Privileg SR 54 NC and the Electronica RPNs on the correct answer list.

Alex; Every surveyor i know has met at least one (civil) engineer who needs a calculator to do 2+2.

Ren; I remember reading that stardates vary by not only time but position; so if that's true, depending where you are, it's always 4523.3

Tim; Extra points given to applicants whipping out a DC50?

BTW: There was a bean counter at our field office today. He brought the 17bii he bought in college, and uses it in RPN. For the very little that it is worth; he gets extra points from me.

34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #1 Posted by **gene wright** on 14 July 2011, 9:52 a.m.*

Try this:

4 ENTER 3 ENTER 2 ENTER PI

On the 15c, you can press Roll Down and see 2, 3, 4, then PI again.

On the 34s, when I press roll down at this point, I see 2, 2, 3, then PI.

Should this keystroke sequence load the stack in the same way?

Or, what have I missed here? :-)

Edited: 14 July 2011, 11:22 a.m. after one or more responses were posted

Re: 34s - stack lift with PI compared to 15c - difference

*Message #2 Posted by **M. Joury** on 14 July 2011, 10:38 a.m.,*
in response to message #1 by gene wright

I don't have a machine handy at the moment (or the emulator) but if it is acting as described I personally think that this is a bug. ENTER should disable stack lift. This should act the same as entering: 4 E^ 3 E^ 2 E^ 3.14159...

Cheers

Re: 34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #3 Posted by **M. Joury** on 14 July 2011, 11:36 a.m.,*
in response to message #1 by gene wright

I just loaded the emulator on my laptop and was able to reproduce this. I see exactly the same thing as Gene.

Cheers.

in response to message #3 by M. Joury

Pauli has to look into this.

Re: 34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #5 Posted by **Hubert Weikert** on 14 July 2011, 1:38 p.m.,*
in response to message #1 by gene wright

It is the same when you insert constants from the constants menu instead of PI.

A short test with on the 35S works like the 15C, even with constants.

Hubert

Re: 34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #6 Posted by **Marcus von Cube, Germany** on 14 July 2011, 1:56 p.m.,*
in response to message #5 by Hubert Weikert

I agree that it's a bug. We have to wait until Pauli is back. He's in the middle of the night at the moment.

EDIT: It should be fixed now.

And not only with constants - also recalling a value from any register with RCL xx behaves the same way.

Franz

Re: 34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #8 Posted by **Walter B** on 14 July 2011, 2:39 p.m.,*
in response to message #1 by gene wright

Entering the same as you, Gene, on my 30b I get 2, 2, 3, 4, 0, 0, 0, pi ;-) Same story with constants. It's definitively a bug. Thanks for reporting d:-)

Walter

Re: 34s - stack lift with PI compared to 15c - fixed !

Nun, war sowieso "zu früh gefreut" as we say in German. :-(
Constants (from the menu with [h][CONST]) are still making a stack lift - I've overlooked to test this because I've not needed any constants so far (except PI, but this one works).

Re: 34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #15 Posted by **Paul Dale** on 14 July 2011, 6:06 p.m.,*
in response to message #1 by gene wright

I think I've fixed this one but due to the pervasiveness of the stack lift, it is going to need a lot of testing.

PS: nobody mentioned that complex RCL and complex constants caused problems as well. Do folks even know these commands exist?

- Pauli

Re: 34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #19 Posted by **Ángel Martin** on 15 July 2011, 2:33 a.m.,*
in response to message #15 by Paul Dale

The stack lift again - it's amazing how we take certain things for granted, and how detailed our code must be to play along them. I also had a few glitches with the 41Z in this department, so I can understand this dilemma.

Re: 34s - stack lift with PI compared to 15c - difference - anyone else able to repeat this?

*Message #20 Posted by **Paul Dale** on 15 July 2011, 2:43 a.m.,*
in response to message #19 by Ángel Martin

Things would be simplier without being able to disable stack lift. We've got a separate command line so it ought to be possible to do without it. That wouldn't be old calculator friendly however.

- Pauli

Re: 34s - Domain Error on multiply plus SST change

*Message #21 Posted by **Jake Schwartz** on 15 July 2011, 8:47 a.m.,*
in response to message #20 by Paul Dale

Hi, I know we're up to version 1228 now, but last night I loaded version 1220 and now every time I press the multiply key, I get a "Domain Error". Also, I may have missed something a couple of weeks ago, but single-stepping a program seems to have changed. In the past, I would press down arrow and see the step just executed along with the result in X; and now I see the step about to be executed but in X is the result of the last step. This is very misleading to me and was much more intuitive before (and I would say the original way was much more like our other HP machines).

Thanks, Jake

Re: 34s - Domain Error on multiply plus SST change

Yes, the 4 basic operations +-*/ have been removed, because they can easily be done in the head! ;-)

But seriously again, duadic ops were broken for a few SVN versions, but are now working again.

The SVN is currently changing faster than you can download: today suddenly Zeta and Bernoulli were removed, then I went outdoor smoking 2 cigarettes and when I returned they have come back again. But now STOM/RCLM suddenly disappeared (2 quite useful function IMHO).

Franz

I think if the trinity are willing to let us peek in at the SVN development stage, we should be patient when things go adrift for a day or two.

Doing engieering for a living, I certainly wouldn't want my customer to have the kind of access that these guys have granted us!

You can always look at the SVN logs and back off a few revisions if you want. That is what this tool is designed for.

How about we report problems and then give them a wee bit of space to crack them. The thinnly veiled sniping is not a positive feedback for anyone.

Then again, maybe I have misiunderstood you. If so, I apologize.

> Doing engieering for a living,...

Yeah, I do engineering for a living, too (since 1976). But when there is a posting that something has been addressed, that usually means we should take a crack at it to see how it is (which is what I did).

I am still puzzled about the single-stepping programs issue. Does anyone remember whether this change was supposedly a "feature"? It is counter-intuitive for me.

Jake

> But when there is a posting that something has been addressed, that usually means we should take a crack at it to see how it is (which is what I did).

I didn't actually think I was quote you. I saw nothing untoward in your entry. Others however....

But I was not whining about the feedback -- far from it. The feedback is essential to assisting in the verification effort. These guys are overloaded as it is.

I am asking that the unhelpful, negative comments be toned back. We can point out issues without tearing at them -- I am thinking of "death by a thousand paper cuts"...

I guess I have said my piece (or is the "peace" pun more approprite in this case :-).

Re: 34s - Domain Error on multiply plus SST change

in response to message #22 by fhub

You are very good at detecting what we are currently discussing internally. The main issue is flash space. Both STOM/RCLM and Zeta/Bernoulli are large functions in terms of code space. I just need some headroom to debug the serial I/O stuff. If that's done, we'll be putting back what will fit.

STOM/RCLM are useful, I agree, but the implementation is not at a level we want it to be. They will probably reappear in new clothes soon.

Re: 34s - Domain Error on multiply plus SST change

Well, from earlier experience(s) I know that MY ideas have never been very welcome here, but nevertheless I dare to suggest one further idea:

I'm really curious who would ever need (or use) this 'strange' STATUS display (of flags and labels)!? Maybe I just don't get it, but I see no useful purpose for flags at all in manual calculator mode. For programming flags are of course very useful, but what would I need them for when I do manual calculations?
And so I'm wondering what this "flags display" with STATUS is in fact good for (it's a nice 'Gimmick' but not more).

Now I'm sure this 'feature' need a lot of programming bytes too, so maybe you should think about removing THIS feature instead of storing and recalling a complete calculator

status (or mode). And furthermore this would also free one key which could be used for any other purpose.

Just my 2 (Euro) cents, ;-)
Franz

Re: 34s - Domain Error on multiply plus SST change

*Message #28 Posted by **Paul Dale** on 15 July 2011, 7:22 p.m.,*
in response to message #26 by Marcus von Cube, Germany

STOM/RCLM use about 600 bytes which is way too large for what they do. In addition, they only returned a fraction of the calculator's user settable state so they weren't fulfilling their defined purpose. Things that aren't included (in no particular order and I've likely missed some):

- Fraction maximum denominator
- Fraction denominator mode
- Proper or improper fractions?
- Fractions mode
- Integer or real mode?
- Integer base
- Leading zeros in integer mode
- Integer word size
- Thousands separator?
- Julian to Gregorian calendar change over date

There are about as many settings that weren't included as were. The choice as to what was included seems rather odd to me. We included the radix mark but not the thousands separator. Integer sign mode but not word size or base. Basically, this is a mess.

Some history: these two commands were originally introduced to allow the trig mode to be saved, changed and restored from a program. We no longer need this functionality with the suite of conversions based on the current trig mode. Want a right angle in the current mode "90 DEG->". Want to display your result in radians "->RAD". There is no pressing need for a program to change the trig mode now.

The extras sort of crept in. We are thinking about these two and how to implement them using a lot less space and more fully. As usual suggestions are welcome. However, any suggestion to go back to what was there is a waste of everyone's time...what was there is broken and needs to be fixed.

A question, has anybody actually used these commands in a program? I tried a couple of times and they were more pain than they were worth. I do admit that I was coding for XROM which has special requirements and limitations. Has anyone else used them or tried to use them for something serious? Trying them to see the result doesn't count :-)

- Pauli

Re: 34s - Domain Error on multiply plus SST change

*Message #29 Posted by **Marcus von Cube, Germany** on 16 July 2011, 3:12 a.m.,*
in response to message #28 by Paul Dale

I can imagine it's quite useful to be able to format a number for display or Alpha

append without overwriting the users preferences for the main numeric display. So saving and restoring the display settings seems worthwhile.

Re: 34s - Domain Error on multiply plus SST change

*Message #30 Posted by **Paul Dale** on 16 July 2011, 4:26 a.m.,*
in response to message #29 by Marcus von Cube, Germany

And nowhere have I said that these two commands aren't coming back. Just that they are too big for what they do and they don't actually do what they ought.

I can't win. I was given a hard time over the "dubious" SST behaviour of showing the step just executed. I changed to what was asked for which was to show the next step to execute. Now I'm getting a hard time over the new behaviour.

Either way is easy to implement, neither takes noticeably more space than the other. What should we do here? I prefer the old.

- Pauli

SST - old way - should show step just executed and the result

*Message #32 Posted by **gene wright** on 15 July 2011, 10:35 p.m.,*
in response to message #31 by Paul Dale

Showing the next step that will be executed AND the result of the step just finished but not shown seems to be a recipe for all sorts of confusion, IMO. :-)

Re: SST - old way - should show step just executed and the result

*Message #33 Posted by **Marcus von Cube, Germany** on 16 July 2011, 3:14 a.m.,*
in response to message #32 by gene wright

SST is a key where "show what will happen" and "NULL" makes perfect sense but then I'll have to implement key up detection.

Edit: This will break the autorepeat feature. :-(

Edited: 16 July 2011, 3:16 a.m.

Re: SST - old way - should show step just executed and the result

*Message #34 Posted by **Paul Dale** on 16 July 2011, 4:30 a.m.,*
in response to message #33 by Marcus von Cube, Germany

I wouldn't bother NULLing out SST. If you don't have a clue what your program is going to do next then you should switch to program mode and look and if you are too lazy to do that you probably shouldn't be programming.

Like I said, I'm happy to implement this either way. So far 100% of the votes are to show what was executed rather than what will be. Where have those vocal few who wanted the change I wonder?

- Pauli

SST change

*Message #35 Posted by **Jake Schwartz** on 16 July 2011, 1:44 p.m.,*
in response to message #31 by Paul Dale

> Quote:
>
> I can't win. I was given a hard time over the "dubious" SST behaviour of showing the step just executed.

Hi Pauli,

First, let me say that you have been doing a fantastic job with this completely voluntary endeavor....your commitment to the project has been amazing.

Secondly, the SST function showing the step just executed in conjunction with the resulting X register shouldn't be considered "dubious", since that is how every HP RPN calculator works up to this point. Please hear me out as to why it should be this way.

First off, it has been made clear that the flash space is just about exhausted and adding things in at this point means possibly sacrificing existing things in return, which is probably a bad thing. The way it is now (with it showing the step not-yet-executed) has a serious problem when the step (call it step "n") just executed has been either GTO, XEQ or a test function (like "x=y?"). In these cases, the machine displays program step "n+1", which in the case of GTO or XEQ is the incorrect program step shown - it should be the destination label of the branch. In the case of a test instruction, the display always shows step n+1, which is only executed if the test evaluates to true. If the test fails, the step displayed is skipped.....again, very misleading. If it was returned back to the original way of displaying the step just executed, you would see the GTO, XEQ or test correctly, followed by the correct next step, whatever that is. I would bet that changing the logic with the existing situation so it showed the correct next step on GTO or XEQ would be fairly complex and would require eating up more precious flash space which isn't available. Plus, I don't think there is a logical solution at all for test instructions, in that the machine might not yet know what the next step will be, especially if the user moved the program counter (via GTO while out of program mode) to the test instruction and pressed the down-arrow in order to do an "SST" from there.

I hope this all makes sense and will justify returning to the "HP way".

Thanks for reading, Jake

Re: SST change

*Message #36 Posted by **Marcus von Cube, Germany** on 16 July 2011, 4:45 p.m.,*
in response to message #35 by Jake Schwartz

Very well pointed out. Even if Pauli has taken account of some of the points you mention, chances are high he has missed some so it's much better to return to the way it was before the change.

Re: SST change

*Message #37 Posted by **gene wright** on 16 July 2011, 5:30 p.m.,*
in response to message #36 by Marcus von Cube, Germany

I hope so. The behavior desired would probably be best to be the same as previous HP calculators.

Press SST, see the step about to be executed, and then see the result.

On the 34s, it will be:

Press SST, top line shows the step just executed, and the result is shown on the bottom line.

Re: SST change

*Message #38 Posted by **Paul Dale** on 16 July 2011, 9:11 p.m.,*
in response to message #36 by Marcus von Cube, Germany

I hadn't considered these cases, they would be easy to handle -- display to step after it executes when the program counter is updated.

It looks like we'll be heading back to the old way since nobody has voiced any support for the current method even though some people requested the change!

- Pauli

WP 34s lockup with [y-hat]

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 14 July 2011, 5:49 a.m.*

I have managed to create a hard lockup in both the emulator and calculator.

Steps to reproduce:

```
- Reset the calculator (back switch on calculator [thanks for pointing that out!], or "h X.FCN
RESET" on either)
- "f [y-hat]"
```

I suspect that it happens when no [SIGMA]+ operations have been previously performed.

Emulator crashes. Calculator never advances beyond the "f" display -- requires reset switch to regain control.

Versions: emulator SVN 1209, calculator SVN 1196.

Re: WP 34s lockup with [y-hat]

*Message #2 Posted by **Paul Dale** on 14 July 2011, 7:06 a.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

Hmmmm, there is a bug there but I'm not sure what or where yet.

I've reproduced this a couple of times now but haven't done it reliably :-(The code looks like it should be generating an error here.

- Pauli

Re: WP 34s lockup with [y-hat] - Fixed?

*Message #3 Posted by **Marcus von Cube, Germany** on 14 July 2011, 8:21 a.m.,*
in response to message #2 by Paul Dale

I debugged it in the emulator and have given Pauli a hint what might be wrong. ((I'm afraid it's his part to fix it.))

Edit: I may have fixed it but tests need to be done. It was a general problem with functions not returning a proper result in some cases.

Be aware that the flash image may be grossly unstable because I've added the serial stuff which is totally untested at this point.

Edited: 14 July 2011, 9:15 a.m.

Re: WP 34s lockup with [y-hat] - Fixed?

*Message #4 Posted by **Paul Dale** on 14 July 2011, 5:24 p.m.,*
in response to message #3 by Marcus von Cube, Germany

This is fixed now. A bad return from the x-hat and y-hat functions could cause a lock up (but not always).

- Pauli

The WP 34s - Where to get it and how to do it?!?

*Message #1 Posted by **George Bailey (Bedford Falls)** on 14 July 2011, 1:40 a.m.*

Given the popularity of the WP 34s project, wouldn't it be nice to have some kind of 'sticky thread' that always would remain visible or maybe a link on the main page, that gathers all the needed information to get started? Especially for newcomers who happen to stumble in or people like me who just don't follow every thread and are too dumb to find all the necessary information. ;)

- a download link for the software (sdk, firmware, desktop)

- where to get the cable or how to build one

- where to get the overlay

- How-to-tutorial

Or even better: one source who would be willing to pack everything needed in one package! Or sell a readily flashed and overlayed WP 34s...

Re: The WP 34s - Where to get it and how to do it?!?

*Message #2 Posted by **Paul Dale** on 14 July 2011, 1:50 a.m.,*
in response to message #1 by George Bailey (Bedford Falls)

You could try the WP 34S wiki.

The WP 34S is available at at least one store.

:(Maybe someday the wiki will be the place to go...right now however it leaves me as dumb as I was before. The how-to is somewhat empty... I thought of something that would take me by the hand and lead me step-by-step.

Still, a 'sticky' thread or a dedicated link on the museum's front page would be something!

Re: The WP 34s - Where to get it and how to do it?!?

in response to message #3 by George Bailey (Bedford Falls)

The problem with this approach (and the wiki as well) is that someone has to maintain it. It's just a

matter of time devoted to the project by one of the volunteers.

WP-34s works exactly the same on a 30b. The 30b has a much nicer keyboard (in my and most people's opinion, I guess there might be someone who prefers the 20b's squishy keys) and a better display. The only downside to the 30b is that the overlay does not look quite as nice as it does on a 20b, since the 30b keyboard is silver and the overlay is black.

in response to message #1 by George Bailey (Bedford Falls)

Hi George --

Yes, the wiki can only be as good as people who contribute to it. I do think it will gain momentum as time goes on. Right now, I'm trying to update at least one article per day to see if I can get some of that momentum going.

Anyhow, here's my take at the Getting Started page:

WP 34S Getting Started

Comments and suggestions welcome!

Thanks,

Bruce

George,

The museum is a museum is a museum. But it features a very vivid cafeteria, a.k.a. THE FORUM, with a lot of people dropping in frequently for getting their piece of blueberry cake and the latest news. IMHO, any request for a special table there must go to Dave in his role as museum director.

in response to message #16 by George Bailey (Bedford Falls)

Bruce meant that it's on the first page of the WP34s section in the HP calculator wiki (wiki4hp.com), not the museum.

Bruce, I like your guide. I was thinking about writing something similar after doing a fair

amount of research to figure out where the cable and ARM software came from. A few additions/suggestions:

After I flashed my 30b, the first thing I wanted to do was adjust the contrast down. You do that by holding ON/CE (on a bare 30b) and using the '-' and '+' keys. The second thing I wanted to do was display the version (the Pauli, Walter) screen that you see in everyone's photos. On a bare 30b, you do RCL-blue shift-3-Input. You might add these instructions to section 6.

There appears to be a typo in section 5. The board should be "at91sam7l128-ek", not "at91sam71128-ek". Note that it's a lowercase "L" after the seven, not the number "one".

You might make a note that Eric's overlays are not yet available again, and update the wiki if/when he starts a new run. There is a paper-printable overlay provided in the WP34s zip file that can work in the meantime though.

Well, yeah, that's - like - my whole point! ;)

Someone who already knows about WP 34s has no problem finding the wiki, using the search in this very forum to find every single thread about it. But wouldn't it be nice to have all those calc nerds who happen to stumble into the museum pointed to this great project? Why keeping it a secret to those 'in the know'?

I opened this thread for everybody to read, even the curator, to get an impression what's wanted and what not.

I thereby got the impression the WP 34s-group is fairly happy with its rather secretive existence. ;)

Re: The WP 34s - Where to get it and how to do it?!?

*Message #22 Posted by **Gerry Schultz** on 15 July 2011, 1:40 p.m.,*
in response to message #21 by George Bailey (Bedford Falls)

Perhaps they are a secretive bunch but I don't agree. With the project being such a fast moving target, newbies could become frustrated with features coming and going along with bugs biting them unexpectedly and documentation catching up. When the firmware stabilizes and this small group wrings out and fixes the majority of bugs, then it can be opened more to the public.

I'm thinking less about the 34s and more about carmageddon. I'm looking at the 405 outside my window wondering how well work will go this weekend. I've got staff here both Saturday and Sunday from 4 AM to 11 PM. I'm of the opinion it will be less of an issue than the media makes it but I could be wrong. How would you calculate the probabilities on this?

in response to message #25 by Walter B

Walter,

I appreciate what you've done for the WP 34s project, but I don't have your sense of humor.

Yes, I found it neat to have a link installed, but thought it best to ask for like-mindedness amongst others before bothering the curator to get to work.

In the meantime I was convinced by others, that it's too early in the process (software stabilitywise) to frighten newbies off with a permanent link. Besides, it's a museum for **antique** calculators - the still sold 50G as well has no link of his own yet.

That's what people call "den Spieß umdrehen" here, George: first not understanding a friendly hint, then introducing an unpleasant undertone instead of plainly responding "I want to ask if it's wanted here before I ask Dave if it's possible" - you did this only after I insisted on getting an answer. But then you had to add a sentence stressing a well known fact as if it wasn't said in the very same thread before. And - when pointed to this - reacted like a "beleidigte Leberwurst" claiming the other one had a problem. Sorry, this looks pretty irrational IMHO.

I'm slowly getting tired of taking care for hypersensible takers. "Wer austeilt, muss auch einstecken können." For symmetry reasons, I leave a few translations for you.

Walter

Gene did put it to a wider audience on an official HP forum, HP community calculator forum, but there was not much response.

So one may ask, is the wider public ready for such a project? :-)

Re: The WP 34s - Where to get it and how to do it?!?

*Message #32 Posted by **JustinM** on 15 July 2011, 2:46 p.m.,*
in response to message #19 by George Bailey (Bedford Falls)

I didn't mean that there shouldn't be a link from the museum front page, you just appeared to be confused by Bruce's earlier statement.

I agree that there should be a more obvious introduction to the project. I came here looking for news or rumors of the HP 15c re-release. I kept seeing WP34s posts and initially ignored them. I think I saw some post titles that said "emulator" and assumed the project was another Nonpareil or an iPhone app, neither of which I have any particular use for.

Once I saw a picture of a 30b with the overlay applied, I was hooked. A real, physical calculator with the look of a classic HP got my attention. It took some research on my part to dig up the right threads and get up to speed on what it can do and how to make one. I got the sense that only forum regulars knew anything about the project.

Board Stacking Connector HP-9815

*Message #1 Posted by **aj04062** on 13 July 2011, 11:31 p.m.*

Anyone know a source for new PCA stacking connectors?

Original is a Teledyne Interconnect 40 pin connector with .100" spacing. The part number is B415U040.

Anyone fixed busted contacts on these before?

Re: Board Stacking Connector HP-9815

*Message #2 Posted by **Joel Setton (France)** on 14 July 2011, 4:26 p.m.,*
in response to message #1 by aj04062

I haven't seen them anyplace but in a 9815. Must have been one of these special, non-standard things that were typical HP fashion.

I did kludge one by splitting a standard PC-edge connector along its length, then gluing the two halves back-to-back with epoxy. After that, a little dose of point-to-point soldering to bridge the contacts did the trick. It didn't look good but it got the calculator to work!

Joel

WP34S - possible to correct RTC in SW?

*Message #1 Posted by **BobVA** on 12 July 2011, 10:41 p.m.*

Hi:

I've noticed the (crystal equipped) clock on my WP-34 has an annoying drift - probably due to some mismatch in the crystal/capacitor/chip combination. Is there any way to correct this in the WP-34 software (e.g. like in the HP41c Time Module)? Perhaps by adding/subtracting a correction factor of "x" seconds at some reasonably easy to detect epoch (e.g. date/time roll-over at midnight, etc.)?

What I'm thinking of is a routine that, when the calculator is turned on, will look to see if the date rolled over and, if so, read and correct the clock, then reset it. Possible? If it would slow the calculator could it be made dependent on a flag (e.g. the stored correction value being non-zero)?

While trying to figure this out, I also noticed that the WP-34S doesn't seem to have an "auto execute" flag for user programs? Or did I miss it somewhere?

(I went through the processor data sheets hoping for a clock correction at the hardware level, but no such luck.)

I've got no good reason for worrying about this, other than it just bugs me :-)

Thanks, Bob

Re: WP34S - possible to correct RTC in SW?

*Message #2 Posted by **Allen** on 12 July 2011, 10:58 p.m.,*
in response to message #1 by BobVA

At some velocity near the speed of light this would be relatively unnecessary :)

In reality, not as easy as the suggestion above due to crystal aging, supply voltage, temperature gradient, and a host of other factors.

Re: WP34S - possible to correct RTC in SW?

*Message #3 Posted by **Paul Dale** on 12 July 2011, 11:10 p.m.,*
in response to message #1 by BobVA

> Quote:
>
> I've noticed the (crystal equipped) clock on my WP-34 has an annoying drift - probably due to some mismatch in the crystal/capacitor/chip combination.

I'd suspect the crystal being wrong. When you buy a X ppm crystal, you can pretty much guarantee that it will fall in the range X to X - small ppm. Better crystals get sold as smaller ppm for more $.

> Quote:

> Is there any way to correct this in the WP-34 software (e.g. like in the HP41c Time Module)?

Not in the firmware as it currently stands and there isn't any spare RAM to add the necessary calibration constants. However, it should be possible to write a user program that, when run, fixes the clock based on the time since the last run.

> Quote:
>
> While trying to figure this out, I also noticed that the WP-34S doesn't seem to have an "auto execute" flag for user programs? Or did I miss it somewhere?

There isn't one. It didn't seem all that worthwhile given the complete absence of I/O and peripherals. Likewise, we don't have the 41's ON function since we couldn't see a use for it, why wouldn't you want to save your batteries?

Now it wouldn't be all that hard to add either or both of these, so give us a compelling reason or three as to why they are vital.

- Pauli

Edited: 12 July 2011, 11:15 p.m.

Re: WP34S - possible to correct RTC in SW?

*Message #4 Posted by **BobVA** on 12 July 2011, 11:41 p.m.,*
in response to message #3 by Paul Dale

Thanks Pauli.

The lowest crystal spec I've seen for 32 KHz crystals is around 20 ppm and I'm seeing significantly greater errors. I suspect it's more likely the caps aren't exactly the correct values consequently pulling the frequency off.

I was tinkering with exactly the program you suggested as a fix when I discovered the lack of auto execute. But running it manually as you suggest may make more sense now that I think about it - why fix it until you need it?

Actually that suggests another approach. Could the correction routine be added to the "TIME" function (i.e. the correction gets run when TIME is called)? I was thinking of writing a user program replacement for TIME to do this, but perhaps it's worth including in the firmware?

I see two ways to do it - either reset the clock with the corrected time on every call, or just compute and store a bias value in EEPROM, and add it to the RTC value when TIME is called (saving the time/effort of actually resetting the clock).

Re: Autorun flag. Well, you can't play all those fabulous tricks on your friends that we used to do back in the 41c/42c days using it :-)

Allen: Well, it IS running fast. If my math is correct all I need to do is to store in a drawer that's moving at 3.5E6 m/s and that would fix it right up....

Cheers, Bob

As I mentioned, there is no RAM left to store the calibration information so this is very unlikely to end up in flash. Putting a hook into the TIME routine to call some user code if it exists would be possible but it hardly seems worthwhile introducing such support for one lone function.

- Pauli

Re: WP34S - possible to correct RTC in SW?

*Message #6 Posted by **BobVA** on 13 July 2011, 12:09 a.m.,*
in response to message #5 by Paul Dale

But the correction factor would be stored in flash, no? For instance, if my clock is running 6 sec/day fast, I was thinking that a value of -6 would be stored in flash, along with a date/time string of when RTC was last set ("TIMESet").

Then when TIME was called it would read the RTC and compute the correct time as

Correct time = RTC + (RTC - TIMESet)*correction factor

Then return "Correct time" to the user?

Sorry if I'm being a bit thick here...

Or is the issue there's no way for the user to store the correction factor to flash (i.e that would require writing another function)? If so, perhaps the user could patch the binary with an appropriate value before flashing the calculator?

Bob

Edited: 13 July 2011, 12:26 a.m.

Re: WP34S - possible to correct RTC in SW?

*Message #7 Posted by **Paul Dale** on 13 July 2011, 1:49 a.m.,*
in response to message #6 by BobVA

Writing a value to flash requires writing an entire 256 byte page. Seems a lot to dedicate for one little value. We could possibly squeeze it onto one of the program pages which have a few bytes free at the end but managing this wouldn't be a lot of fun.

So yes it would be possible but we're unlikely to I suspect. Of course, feel free to code the changes and submit them :-) If they are small enough they'd likely go in.

A user program could dedicate a register or two for the purpose and the user would then know not to use that register or registers. Seems like a workable solution to me.

- Pauli

Re: WP34S - possible to correct RTC in SW?

*Message #8 Posted by **BobVA** on 13 July 2011, 8:15 p.m.,*
in response to message #7 by Paul Dale

Yep - 256 bytes would be overkill. I'm thinking it only needs 9: one signed byte for the correction factor and 8 for the time/date that the RTC was last set. But if you wind up with a few extra bytes when you're doing something else, perhaps you can keep this in mind?

A user program seems like a good solution and an excellent opportunity for me to figure out how to use PSTO. By using the offset computation approach neither of the constants will have to be rewritten, so it should work well with a program stored in flash.

Thanks very much for the explanations!

Cheers, Bob

Re: WP34S - possible to correct RTC in SW?

*Message #10 Posted by **BobVA** on 13 July 2011, 10:45 p.m.,*
in response to message #9 by Paul Dale

Well...we could drop the seconds (one byte) and the century (one byte) from the standard RTC format, leaving six bytes for the starting time/date, plus one more byte for the correction factor (limiting it to +/-128 sec/day), for a total of seven bytes.

The century can be ignored (there I go, creating a Y3K problem); I don't think the error caused by rounding to the nearest whole minute is enough to worry about, either. Any higher accuracy would probably require keeping a periodic watch on the temperature and calculating a thermal compensation in addition to the fixed drift rate.

I'm using RTC data descriptions in sections 14.5.3 & 14.5.4 of the "AT91SAM7L128/64 Preliminary" data sheet for this, btw.

Re: WP34S - possible to correct RTC in SW?

32Khz crystals vary in their required load capacitance. Many crystals have a 6pf load spec, if you're using 18pf capacitors you'll be way off in frequency. Make sure that the crystal and caps match, but even then you'll only be within the manufacturing tolerance of the crystal.

Alternatively, you can try to fit a tiny trimmer cap in place of one of the fixed capacitors, this will allow you to adjust the clock rate. If you have a good frequency counter you can get it near perfect at least for a given ambient temperature.

Re: WP34S - possible to correct RTC in SW?

*Message #12 Posted by **BobVA** on 13 July 2011, 8:29 p.m.,*
in response to message #11 by Katie Wasserman

You're probably right about the mismatch, or it may be due to not getting the crystal, leads or caps exactly lined up right on the board. It's running about 4 sec/day fast - not sure if that's horrible or within specs for the layout.

I do have a frequency counter, but I'm not sure how much luck I'd have installing a trimmer on the tiny pads they put on the board. Have to poke around on Digikey and see what the options are.

Thanks!

Bob

WP 34S overlay feedback

*Message #1 Posted by **Eric Rechlin** on 12 July 2011, 3:48 p.m.*

I think I may make another batch of overlays for the WP 34S. However, I haven't received a lot of feedback from the first batch, so I am hoping to hear a little more first.

The biggest concern I have heard is that it is extremely hard to apply without causing keys to stick. I have already decided that I will make the holes for the buttons a little bigger, and possibly tweak their alignment a bit, in an attempt to resolve this.

Are there any other concerns? How has durability been? One thing I can do is spray a protective glossy spray on the overlay. This will add glare but it may make it a little more durable. Might this be worth doing?

Anything else anyone wants to add?

Eric

Re: WP 34S overlay feedback

*Message #2 Posted by **M. Joury** on 12 July 2011, 3:53 p.m.,*
in response to message #1 by Eric Rechlin

Hi Eric,

I have not had the pleasure of seeing the overlays yet, but your concern about glare with a gloss overcoat seems valid. How about using a clear matt instead? Would something like this work: Testors Dullcoat

Cheers

Re: WP 34S overlay feedback

*Message #3 Posted by **Cristian Arezzini** on 12 July 2011, 3:54 p.m.,*
in response to message #1 by Eric Rechlin

As for durability, I've only had it for a few weeks, but it's still like new - no sign of peeling whatsoever, anywhere. I agree with making the holes just a little taller - for me, the whole ENTER row became sticky, though easily fixed by passing a very sharp knife tip in the gap above the keys. The biggest problem I had with mine, as I told you, is that any hard object (including a fingernail) that "scrapes" the overlay, even if just lightly, leaves a permanent, "shiny" mark. I'm not so sure I would like a glossy finish; wouldn't it be possible to find a matte protective varnish?

I would also like, as I said before, if the corners were rounded, especially because with the 30b the colour contrast isn't that nice.

Cristian

Re: WP 34S overlay feedback

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 12 July 2011, 4:03 p.m.,*
in response to message #1 by Eric Rechlin

Hi Eric,

In general I found them much easier to apply than I thought they would be given the commentary I had read. Perhaps the the documented experiences (upside down, middle outwards, etc.) helped in that regard. A little bit of VERY SHARP razor blade work fixed the "squishy" keys (and that only happened on my 30b -- the first one I applied -- not my 20b, though I doubt the chassis that is different). If you make the holes bigger, don't make them much bigger.

I find that a few of my keys are lifting a bit. Probably I did not clean my sweaty/oily finger prints well enough before I applied the overlays. I just push them back down and hope for the best...

I agree with the comment that you could easily add a few extra key labels for those that want a different division and/or radix point. Given that the calculator title sticker is either alongside or above (below?) the main template, and has extra room at its end, this would seem a reasonable use of that space. Only a bit more ink and cutting tool life.

In general, mine are working out very well. It is certainly better than the paper overlay I was using! :-)

I did have one issue separating the a couple of key labels from the backing. I thought I had delaminated the label when all it was was the fact that carving tool had penetrated the layer below the glossy backing and that was the layer than had delaminated and stuck to the stick layer. It just gave me pause for a moment -- no biggie.

All in all, I don't think I would change too much. Grand job and thanks for doing this!

Best regards...

> I have already decided that I will make the holes for the buttons a little bigger, and possibly tweak their alignment a bit, in an attempt to resolve this.

I'd vote for increasing the keyholes by 0,5 mm maximum. OTOH, the key stickers / covers may grow 1 mm in either dimension, since much of the "old key surface" is still visible so far.

Since you printed and stamped the first batch, some changes were made in the layout. Please refer to the e-mail you got from me some 10 days ago.

Walter

P.S.: Please print f, g, h white.

Edited: 12 July 2011, 5:54 p.m.

Re: WP 34S overlay feedback

*Message #7 Posted by **Marcus von Cube, Germany** on 12 July 2011, 4:42 p.m.,*
in response to message #1 by Eric Rechlin

Eric, your overlays are very usable. Thanks for your efforts. I would suggest to add another layer of protective film or varnish. The surface is a bit unpleasant on the finger tips and I fear I will wear down the ink some time.

Re: WP 34S overlay feedback

*Message #8 Posted by **Jose Gonzalez Divasson** on 12 July 2011, 5:21 p.m.,*
in response to message #1 by Eric Rechlin

Eric,

The overlays worked well - I second your 2 comments (while all it takes is a little more care when putting the overlay)

While the "holes" might be increased in size, the key covers might as well be made bigger - don't the other users thinks so?

The varnish - good idea as well.

Re: WP 34S overlay feedback

*Message #9 Posted by **Paul Dale** on 12 July 2011, 5:38 p.m.,*
in response to message #1 by Eric Rechlin

I've no problem with the overlays. I like the finish and there is no sign of wear on my most used 34S. I do have a few sticky keys which I'll fix when they get annoying enough.

I've a sad 34S first -- my main test unit's screen broke during reassembly after installing a crystal :-(

It is possible to get satin or matt clear varnishes. They aren't anything like as protective as gloss but they are still better than nothing.

Re: WP 34S overlay feedback

*Message #10 Posted by **BobVA** on 12 July 2011, 9:35 p.m.,*
in response to message #1 by Eric Rechlin

Increasing the hole size a tad is the only "must have" I've noticed. Since you're experimenting though, I'd be interested in a "beta 2" run with a matte coating to see how that works. (Sounds like the layout changed, so I'll need to change the overlay anyway...)

Also, is it possible to set the cut depth just a bit deeper? I had a couple of keys that were difficult to separate from main sticker. If that's not possible, it's not a big deal - very minor issue.

Bob

in response to message #11 by Paul Dale

Hey Pauli.

Then what did Walter mean above with:

"Since you printed and stamped the first batch, some changes were made in the layout."

I got my overlay from Eric about a month ago and if the layout had not changed since then, then what is the worry with mentioning a layout change now?

Re: WP 34S overlay feedback

*Message #13 Posted by **Walter B** on 13 July 2011, 1:01 a.m.,*
in response to message #12 by gene wright

What I meant were changes in font sizes, adjustments in positioning and some fine tuning for sake of better readability. I summed up all that as "layout change" since it obviously changed the layout and I don't know a better word in your language. If you know, please tell me. TIA

Walter

Re: WP 34S overlay feedback

*Message #14 Posted by **JimHorn** on 13 July 2011, 1:19 a.m.,*
in response to message #13 by Walter B

The overlay works spectacularly well on my HHC2008 HP-20b. No need to change any dimensions at all. No sticky keys. I'm guarding my second overlay with care in anticipation of

using it on a '30b should I get one (my '20 is a delight and will only disappoint me if I ever try a '30 I suspect).

The one minor item I've noticed is that if a key label is snagged at the edge, the underlying white substrate can show. A moment with a black Sharpie permanent pen fixes that and I suspect we need the white substrate for the white lettering (higher contrast than white ink on a black substrate). A clear top coat may add to the ruggedness - but also may detract from the wearability as pointed out.

So I'm pleased with it as it is. Kudos and many thanks to you, Eric!

Re: WP 34S overlay feedback

*Message #15 Posted by **Paul Dale** on 13 July 2011, 1:43 a.m.,*

That's great. I've been using mine with no overlay and I am quite used to it now. I would not suggest any change at this stage, however I would ask you whether a shortcut for [g] [OFF], like [ON][v] or [ON][0], might be possible.

Regards,

Gerson.

Re: WP 34S overlay feedback

*Message #20 Posted by **Marcus von Cube, Germany** on 13 July 2011, 9:28 a.m.,*
in response to message #19 by Gerson W. Barbosa

Gerson, just let it sit on your desk and wait until it turns off automatically. ;-)

ON+0 is certainly possible but is it really necessary? We've a flash space problem again. (I'm implementing the serial I/O stuff at the moment.)

*Message #21 Posted by **Walter B** on 13 July 2011, 12:00 p.m.,*
in response to message #19 by Gerson W. Barbosa

Olá Gerson,

Why do you call this a shortcut? ;-)

Walter

Re: WP 34S overlay feedback

*Message #22 Posted by **Gerson W. Barbosa** on 13 July 2011, 12:46 p.m.,*
in response to message #21 by Walter B

Hallo Walter,

Considering the long eight centimeter finger travel from distant [g] shift key to the [ON/CE] key, the [ON][0] sequence would be literally a shortcut :-) Yes, I usually do as Marcus has suggested, I just count on automatic shut-off. In just about every HP calculator I have the shift key required to turn them off is close to the [ON] key. The [g] key being far away from the [ON] key and buried amid other keys is somewhat inconvenient to me. Of course, if there is only one user complaining about this, then other more important issues should be addressed.

Regards,

Gerson.

Re: WP 34S overlay feedback

*Message #23 Posted by **Walter B** on 13 July 2011, 1:46 p.m.,*
in response to message #22 by Gerson W. Barbosa

Bem, Gerson,

I'd like to offer swapping OFF and SHOW. So you won't have to find g "buried amid other keys" but can reach h at the edge easily. I don't see a chance to move the prefixes closer to EXIT, OTOH.

Walter

Re: WP 34S overlay feedback

*Message #24 Posted by **Neil Hamilton (Ottawa)** on 13 July 2011, 2:13 p.m.,*
in response to message #23 by Walter B

I am willing to bet that the majority of the current adopters (ie: those that have one -- or more -- of Eric's overlays) would be somewhat unwilling to swap anything on the keyboard at this stage unless it has a significant advantage.

Turning off the calculator doesn't seem to me to be that significant to justify a change. You get used to the unconventional "g OFF" pretty quickly. (Unconventional only in the sense that it is not "h OFF" instead. There was a thread awhile ago about variations on this very topic and if I knew how to link to threads, I'd link to that thread right <here>... Boy I wish I knew how to link to threads.)

There are several key sequences I do very automatically now; like "h X.FCN|3|ENTER". I seem to do that one in my sleep! :-)

Re: WP 34S overlay feedback

*Message #27 Posted by **Gerson W. Barbosa** on 13 July 2011, 2:17 p.m.,*
in response to message #23 by Walter B

Walter.

Yes, using the prefix key at the edge would be more ergonomic. However, the current overlay has become a standard now that many of them have been produced. Also, 'SHOW' would have to be compressed to fit below EXIT together with ON and the yellow arrow. That's why I have suggested a shortcut. But if the latter takes up valuable flash space, then it's better to leave things unchanged.

Regards,

Gerson.

in response to message #29 by Walter B

> Quote:
>
> So a very limited number of overlays out there will not prevent me from improving the WP 34S layout if possible with our limited ressources.

I agree with you Walter -- it is a moving target and will continue to evolve/improve. I just think that if the "techo-trinity" could limit the changes to something significant, that would find more support.

For example, when you guys locate an undocumented MB of flash and a big wad of RAM that Atmel forgot to mention allowing matrix operations to be added... :-)

For now, if you do put the change in the bottom left corner, many are going to have to get an overlay for the overlay and a new button label. :-D (Oh no! Back to the paper overlay taped over the calculator!)

BTW: Thanks for the hint on the linking.

Cheers...

in response to message #1 by Eric Rechlin

Eric,

I am very happy with the overlays, except that the key holes are quite tight, and require very precise assembly. But that is already known...

For durability I have seen up to now no wear. But my fingers are quite dry, so I may not count as a reference.

Thank you for the work and effort to make this possible,

Hubert

Re: WP 34S overlay feedback

*Message #33 Posted by **db (martinez, ca.)** on 14 July 2011, 12:42 a.m.,*
in response to message #1 by Eric Rechlin

Eric;
Mine went on centered and square but might not the next time, so the larger holes may be a good idea.
That spray-on coat may flake in the act of bending the overlay to put it on, and then it would look - well-flaky. Test before mass production.
Hopefully any change that the trinity needs to make will only necessitate a new key or two and not the whole

overlay. That's the kind of thing you can hand out at the conference and not have to mail.
Thanks for making them. They are literally the icing on the cake.

Re: WP 34S overlay feedback

*Message #34 Posted by **JustinM** on 14 July 2011, 11:59 p.m.,*
in response to message #1 by Eric Rechlin

Hi all. I'm new on the forum but have been reading for about a month. I came looking for info on the re-released HP-15C and stuck around after learning about the WP-34s project. After getting a cable from Gene a couple of weeks ago I've now got a flashed 30b. I flashed it again with the 1196 build last weekend. I missed getting one of Eric's first overlays so I can't comment on the initial run. I would like to comment on some of the topics discussed here and earlier about the overlay.

I like the idea of an h-shifted OFF button. Walter's diagram in message #29 is exactly what I had in mind. The ON label looks good on a lower row of text like the 'a b/c' label. I realize that swapping the g and h functions of the EXIT key would require all the original overlays to be replaced, so that should be a consideration.

I prefer the colored shift keys to Walter's preference for white text. The shift keys are some of the most important keys on the keyboard and should have an easy way to visually differentiate them from the other keys. I would even suggest making the entire key cover gold, blue, or green and put the f, g, and h in black font. That would be consistent with the 34C and 67 (except for the green vs. black h-shift key, of course) and the f and g keys of the Voyagers. I would also prefer a 'g' that's like the Arial 'g' instead of the Calibri. The Arial 'g' is more consistent with historical HPs. I realize that the rest of the overlay uses Calibri and changing fonts for one key may not look right though.

On the black ink issue, I have a few suggestions that may or may not work. Eric, have you considered or tested black or transparent vinyl as a base layer? I don't know if the colors will print properly on black vinyl, but that might give the black areas a more durable finish without requiring any overcoat or spray.

With the transparent vinyl, I was picturing placing a black field above each key to print the f and g-shifted functions. The alpha characters and the functions above the A, B, C, and D keys would have to be reworked. My thought with using transparent vinyl is to let the natural black or silver of the 20b or 30b show through. The key hole sizing wouldn't be as critical and could be larger to avoid the sticky key problem. If the overlay's key holes let a bit of a "ring" of the underlying keyboard show through, it wouldn't look bad on the 30b. Putting a black field of ink above each key would cover up "Black S" also. It would cut down on the ink requirement for each printed overlay too.

Finally, on the topic of keys, I'd prefer an EEX exponent key, I like the obelus division key, and I'd like an Enter key without the up arrow on it. In general, I'd like the keyboard to approximate some of the classic styling cues of HP calculators - colored shift keys, EEX, Enter, and an obelus division key. I don't care for the CHS as +/- makes more sense to me.

Thanks to all who have made this project possible. It's been fun to tinker with so far. I haven't been able to put it into more use without an overlay yet, so I'm looking forward to another print run.

We are not planning on changing the layout for this "trivial" change. If, however, a more significant change becomes necessary then this one will be incorporated as well.

Re: WP 34S overlay feedback

*Message #36 Posted by **JustinM** on 15 July 2011, 12:21 a.m.,*
in response to message #35 by Paul Dale

Fair enough. I agree with not making key changes this late in the project. If you do decide to do it, the design layout that Walter provided works well.

Re: WP 34S overlay feedback

*Message #37 Posted by **Marcus von Cube, Germany** on 15 July 2011, 3:13 a.m.,*
in response to message #36 by JustinM

I'm struggling with flash space at the moment but if we find some more by compressing the code in certain areas, I may introduce a "hold down ON for a second to turn it off" method in addition to g+ON.

Re: WP 34S overlay feedback

*Message #38 Posted by **Andrés C. Rodríguez (Argentina)** on 15 July 2011, 8:22 a.m.,*
in response to message #37 by Marcus von Cube, Germany

That's a very good option! And it brings to the table the possibility of doing things when keys are pressed and hold down... Maybe a case for NULL? :-))

I don't mean to insist. I swear I wasn't thinking about NULL when I started this post, I really like the idea of "timeouted" OFF by itself. But other ideas came as I was writing...

Re: WP 34S overlay feedback

*Message #39 Posted by **Marcus von Cube, Germany** on 15 July 2011, 12:31 p.m.,*
in response to message #38 by Andrés C. Rodríguez (Argentina)

The NULL problem has been discussed here. It's not as easy as it might sound as I have to react on key down and key up, not only on key down. Since we don't have user definable keys except A to D it's much less important to show the key function and let the user decide if he wants it or not.

We had to remove functionality due to space constraints in the last iterations. If I find the room in flash I'll put these back with higher priority then adding new features.

Re: WP 34S overlay feedback

*Message #40 Posted by **Andrés C. Rodríguez (Argentina)** on 15 July 2011, 3:01 p.m.,*
in response to message #39 by Marcus von Cube, Germany

Marcus,

I agree, we already discussed NULL in depth, and the issue against it is clear enough for me; I was just joking at myself with the previous post.

On the other hand, the "keep ON pressed to turn OFF" seems a good idea to me.

Best regards,

> Eric, have you considered or tested black or transparent vinyl as a base layer?

For black, find me a consumer inkjet printer that can print white ink and maybe we'll have something.

I do have a few options for transparent overlays that may look nice on the 30b, but realize I would still need the white vinyl for the keys themselves.

One possibility are "waterslide" decals, like you use when making model cars or model airplanes. The best way to do this would require disassembling the calculator, applying the waterslide decals, and then putting a clear spray over the whole calculator face. It would probably look very nice but would take a lot of work.

The other, of course, is transparent vinyl, but in both of these cases, I suspect the colors would not look very good due to the inability to print white.

Eric

Re: WP 34S overlay feedback

*Message #43 Posted by **JustinM** on 16 July 2011, 11:19 a.m.,*
in response to message #42 by Eric Rechlin

Ah, I was thinking you had some kind of specialized vinyl printer. Maybe you just mentioned you had a vinyl cutter before and I was thinking you had a printer too. I've had T-shirts screenprinted before and they could do white ink on dark fabrics. I was picturing a similar setup. If you're just using a consumer inkjet then that would limit you to white vinyl.

> Never mind. Carry on.

Re: WP 34S overlay feedback

*Message #44 Posted by **Etienne Victoria** on 16 July 2011, 5:47 a.m.,*
in response to message #1 by Eric Rechlin

The overlay is great:

§ Tools needed: tweezers (actually 2 of them), your finger.

§ Adjusting on the calculator faceplate: Used Eric's method starting from the middle of the keyboard and moving towards the ends. Row by row, adjust the overlay around the key openings with your finger. Another tool might damage the very nice matt finish.

§ Both tweezers are used to put the stickers on the keys. Prior to this I had erased the Hp key labels.

It's been one month now since I put the overlay in place. The stress-tester is my 14th year old daughter which has one of my Wp§34s in absolute daily use and abuse.

In the schoolbag rubbing against books, at her desk... the key stickers did not move and the overlay is still perfectly in place.

...and my daughter thinks the calculator is "cool".

I never thought I would bring kids to RPN with a non-Hp calculator (sorry Den, I don't have one of your gems :-)

Nice work, Paul, Marcus, Walter, Eric and now Neil.

Thanks to all of you.

Etienne

wp34S TICKS Command: How Much Time?

*Message #1 Posted by **Jake Schwartz** on 12 July 2011, 3:44 p.m.*

Hi,

What is the granularity of the wp34S TICKS command? I could not find this info in the manual, nor in a search of the HP Museum Forum. It appears that a time "TICK" is around 0.1 second, but I wanted to be sure.

Thanks, Jake

Re: wp34S TICKS Command: How Much Time?

*Message #2 Posted by **Marcus von Cube, Germany** on 12 July 2011, 4:31 p.m.,*
in response to message #1 by Jake Schwartz

You got it. TICKS should be accurate to .1 seconds. This depends of course on the accuracy of the oscillator.

I'm pretty sure, Walter will answer with a page in the manual.

Re: wp34S TICKS Command: How Much Time?

*Message #3 Posted by **Paul Dale** on 12 July 2011, 5:34 p.m.,*
in response to message #1 by Jake Schwartz

The granularity is 0.1 seconds give or take the oscillator.

In float mode, a value in seconds is returned.

In integer mode, ten times this value is returned.

- Pauli

Edited: 12 July 2011, 5:34 p.m.

Re: wp34S TICKS Command: How Much Time?

*Message #4 Posted by **Walter B** on 12 July 2011, 6:06 p.m.,*
in response to message #3 by Paul Dale

Hmmmh, I hate to tell you, but that contradicts the documentation. The command is called TICKS after all, not SECONDS [;-)

Walter

Re: wp34S TICKS Command: How Much Time?

*Message #5 Posted by **Paul Dale** on 12 July 2011, 6:40 p.m.,*
in response to message #4 by Walter B

The documentation is wrong then :-) We discussed this and the consensus was what is implemented....

HP-48G IR connectivity

*Message #1 Posted by **Thomas Radtke** on 12 July 2011, 1:34 p.m.*

I'd like to transfer files between my 48G and my PC.

Here's what I did:

Installing USB-serial converter on Win7 (FTDI/FT232RL)
Connect Jeteye IR device
Setup Windows NT 4.0sp6 in VirtualBox
Connect host port to guest port
Start WinNT
Install Quickbeam

Now, Jeteye works basically. The IR detector scans for devices every three seconds and you see the red LED lighten up at this interval. However, no IR device is detected, allthough the 48G has flag 33 set and is in server mode (and of course just in front of Jeteye).

I'm lost.

Thanks,

Thomas

Re: HP-48G IR connectivity

*Message #2 Posted by **Marcus von Cube, Germany** on 12 July 2011, 1:41 p.m.,*
in response to message #1 by Thomas Radtke

Are you sure the 48G is an IRDA device? I assume it's just serial over IR. You should try without the driver installed. Just use the comport provided by the FTDI driver.

Re: HP-48G IR connectivity

*Message #3 Posted by **Thomas Radtke** on 12 July 2011, 2:18 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thank you Marcus,

I didn't noticed the Quickbeam software conforms to IrDA :-/. Ok, deinstalled the package, rebooted NT4. Now not even the LED lights up when I fire up the connectivity software. Of course, I changed the COM port from the no longer available number 4 to number 1, even specified base address and IRQ after that failed, but still to no avail.

Any further ideas?

Re: HP-48G IR connectivity

*Message #4 Posted by **Christoph Giesselink** on 12 July 2011, 2:01 p.m.,*
in response to message #1 by Thomas Radtke

Many year ago I wrote an article about this topic. The article is available at http://www.hpcalc.org/details.php?id=4856.

WP34S files - dumb question

*Message #1 Posted by **fhub** on 12 July 2011, 11:35 a.m.*

In todays SVN 1209 I see an updated file emulator_d.dll (among others).

What's the purpose of those emulator_**d**.* files? **D**ebug versions?

Franz

Re: WP34S files - dumb question

> What's the purpose of those emulator_d.* files? Debug versions?

You got it. The problem I'm tackling with this approach is that the emulator kernel written by HP uses the MFC development headers and libraries which are not available with the free Express edition of Visual C++. I've split the package in a dll and an exe. The exe can be compiled with VC++ Express and you can even debug in this environment. It's necessary to provide compiled debug versions of the dlls complete with the symbol tables to make this possible.

Yes, that would indeed be a very nice feature!

OTOH it's a pity that Emu42/48 doesn't support this HP20/30b calculator. I guess the hardware differences are not so big, so that an emulation of this calc (i.e. using calc.bin as ROM) shouldn't be too much work - at least not for an expert like Christoph Giesselink.

CHRISTOPH, DO YOU READ THIS? ;-)

> Doesn't the HP20b also have a ARM(7?) CPU?

It's an Atmel AT91SAM7L128 with an ARM 7 core and a bunch of peripherals. But why go the hardware emulator way when the source code is freely available? If you want more brains in the GUI, feel free to improve it! It's just not my interest to do Windows GUI coding beyond what I've done so far. I still have to patch in some more functionality with respect to my current work on the project (I/O) which I'm not looking forward to.

Re: WP34S files - dumb question

*Message #15 Posted by **fhub** on 13 July 2011, 9:52 a.m.,*
in response to message #14 by Marcus von Cube, Germany

> Quote:
>
> If you want more brains in the GUI, feel free to improve it!

Well, I would probably do it if the emulator were written in 'Delphi', but 'C' is not my world.

I even had still another idea: maybe I could write some kind of 'shell' for the WP34S emulator, which just calls WP34S as subprocess, but the only problem is: how to communicate with the emulator?
If there were any external interface in WP34S with which it could be controlled, things would be quite easy, but so the only method I can imagine is to 'send mouseclicks' to this WP34S subprocess - and so far I'm not even sure if this would work at all in Windows.

Re: WP34S files - dumb question

*Message #16 Posted by **Marcus von Cube, Germany** on 13 July 2011, 10:18 a.m.,*
in response to message #15 by fhub

Franz, you can. You just need to write a DLL which replaces the emulator.dll from the project. The interface is relatively thin, most calls go from the dll to wp34s. The main program registers some callbacks which are called by the dll. The main loop is in the dll.

Re: WP34S files - dumb question

*Message #17 Posted by **fhub** on 14 July 2011, 5:20 a.m.,*
in response to message #16 by Marcus von Cube, Germany

Another question, Marcus:

I know you're compiling WP34S with VisualStudio 2008 (or even 2010/11?), but this system is much to big for me to download.
Now I would have the possibility to get the old MSVC6 compiler, which would also have the advantage that it produces compiles that are Win98 compatible.

Now my question: do you know if the WP34S system can be compiled with MSVC6, or is this impossible?

Edited: 14 July 2011, 5:21 a.m.

Re: WP34S files - dumb question

It's Visual Studio 2010, the only version available for purchase and download when I started. The minimum system requirement for this environment (and the code produced by it) is XP. I bought the professional version in order to be able to handle the MFC GUI parts.

> Quote:
>
> Now my question: do you know if the WP34S system can be compiled with MSVC6, or is this impossible?

That's how I started and gave up early. MSVC6 does not understand the "long long" data type, at least not under this name. I started modifying the code of the SDK (before tackling the WP 34S sources) to comply to the old compiler but that wasn't fun.

The main problem was that MSVC6 supports an older version of the MFC library lacking an important API that is used in the emulator. Without this API I was unable to populate the Skins menu. It seemed to be easier to switch to a more recent compiler then.

If you do not want to touch the GUI components you can compile the project with the freely available VC++ Express 2010 edition, but if I understand your intentions right, the GUI is just what you want to do.

It shouldn't be too hard to rewrite the GUI with Delphi if you are able to create a DLL with this environment. You need to understand what HP has done in its emulator, though.

Re: WP34S files - dumb question

*Message #19 Posted by **Walter B** on 12 July 2011, 5:00 p.m.,*
in response to message #9 by Neil Hamilton (Ottawa)

Keep your fingers crossed that Michael succeeds with his 15C update. Then chances will be elevated you may see two stack levels at a time like 33 years ago. Else no way unless HP rethink their display policy (don't hold your breath) :-/

Unresponsive HP-42s

*Message #1 Posted by **aj04062** on 11 July 2011, 10:11 p.m.*

I've "taken in" 4 42s in need of aide.

They are all disassembled at this point. Two were delivered to me apart. One of these is hopeless with a destroyed processor. The second one is very dirty.

The last two have hope, I think, but need the forums help.

Unit 3 was taken apart and cleaned. I re-assembled and got it to turn on after batteries are installed. However it seems to be bogged down with something and will either be very slow to respond to keystrokes or not at all.

Unit 4 starts up after putting batteries in, but will not respond to any keystrokes.

They both seem to have similar ailments. Is it dirty/bad keyboards?

Re: Unresponsive HP-42s

*Message #2 Posted by **Geoff Quickfall** on 12 July 2011, 12:00 a.m.,*
in response to message #1 by aj04062

Have you checked the foam insert residing under the keyboard pca to logic pca flex pcb.

These have a tendency to compress over time resulting in a lost connection causing unresponsive keys or whole keyboard.

Assemble one and then press gently on the frame between the lower LCD panel and the top of the keys. While pressing at that location also test the keyboards unresponsive keys. If they work it is definitely the foam which must be replaced.

I use an older foam mouse pad as a donor.

Geoff

Re: Unresponsive HP-42s

*Message #3 Posted by **aj04062** on 12 July 2011, 10:26 a.m.,*
in response to message #2 by Geoff Quickfall

I've tried that. Cleaned the contact with alcohol and "erased" the gold contact. No matter how hard I push, it does not change.

I think I need to go through the keyboards and test using Randy's Diagram

HP50g emulator package

*Message #1 Posted by **fhub** on 11 July 2011, 8:00 a.m.*

Hi,

here's a quite interesting complete HP50g emulator package:
http://www.spaadyshare.net/54rvhm6a68s8/HP50g.zip

Two things are especially remarkable:
1) all shifted functions can be accessed directly by clicking on their label (the most comfortable KML script I've ever seen)
2) a very nice skin for 800x600 resolution (but also bigger skins are included)

Franz

Re: HP50g emulator package

*Message #2 Posted by **Lode** on 11 July 2011, 5:26 p.m.,*
in response to message #1 by fhub

Thanks a lot, this one works in Linux under Wine!

Re: HP50g emulator package

*Message #3 Posted by **fhub** on 13 July 2011, 7:17 a.m.,*
in response to message #1 by fhub

Here's a small update for the HP50g package above:
http://www.spaadyshare.net/549ko26re3md/HP50g_upd.zip

I've improved the BMPs a bit (making some shifted-function labels better readable), and I've included 3 additional KML-scripts ('3D') which give a '3D-effect' (i.e. moving keys) when you click on any calculator key - maybe you'll like it. :-)

It's only an update which contains the KML and BMP files, so the full package above is still needed.

Franz

PS: I'm sure that most members here would know where to find it, but for newbies here's the original HP documentation for the HP-50g:

User's Manual: http://www.hpcalc.org/hp49/docs/misc/hp50gum.zip
User's Guide: http://www.hpcalc.org/hp49/docs/misc/hp50gug.zip
Advanced User's Reference Manual: http://www.hpcalc.org/hp49/docs/misc/hp50gaur.zip

34C display problem

*Message #1 Posted by **Daniel CLEMENT** on 11 July 2011, 4:27 a.m.*

Hello,

I'd like to fix a display problem on a (otherwise fine) HP-34C.

Here are the symptoms: 1) the rightmost digit doesn't light up; 2) on each other digit, the top segment and top left segment are weakly lit when they should be off on 2's, 3's and 4's.

Here is what I believe (I do my best to translate the technical terms from French...): 1) there is a transistor which toggles the right digit, and it is dead; 2) there are transistors which address the defective segments, and they leak. (But then, why would the 1's appear correctly?)

I'd appreciate someone confirms (or not!) these guesses. Can these faulty components be changed separately? A link to a diagram of the 34C electric circuit would also help much.

Thanks a lot in advance - regards, Daniel

Re: 34C display problem

*Message #2 Posted by **Dieter** on 11 July 2011, 2:01 p.m.,*
in response to message #1 by Daniel CLEMENT

Daniel, you probably know that HP used a special manufacturing technique in their Spice series (34C, 32E etc.). In those days they used a solderless construction, i.e. the various chips and other components were fixed / clamped to the PCB by simple pressure.

This way, the contact may become insufficient over time. This also happened with my own 34C: Here and there one ore more segments or even complete digits may drop out. In these cases some careful (!) bending of the case makes the missing segments appear again.

In you happen to own one of the last 34Cs this might be one of the few that have been manufactured in the good old soldered way. If you are not sure, simply weigh it: with the batteries inside the solderless version is about 220-230 g, the soldered version close to 170-180 g.

Dieter

Re: 34C display problem

*Message #3 Posted by **Michael de Estrada** on 11 July 2011, 3:01 p.m.,*
in response to message #2 by Dieter

It doesn't sound like a contact pressure problem, since some of the LED segments exhibit ghosting. I've fixed the pressure problem on mine with a thin strip of electrical tape on the plastic back plate to act as a shim on the LED array fingers. In this particular case, the LED array probably needs to be replaced.

Re: 34C display problem

*Message #4 Posted by **Daniel CLEMENT** on 12 July 2011, 3:19 a.m.,*
in response to message #3 by Michael de Estrada

Thank you for your valuable input.

@Dieter: weight is 220+ g, hence not soldered (is it good news?) I did not know that the display itself was clamped. This sure can account for the last digit missing completely, but could it explain the ghosting on the others? I _carefully_ bent the case, but no luck.

@Michael: I'll try improving the contacts. The end of your answer is what I feared. I don't have a spare LED array --only on working calculators... Perhaps on a Woodstock, but I guess it's not the same. However, a temporary exchange might help.

Yet, don't you like my transistor story? I thought it was pretty consistent with the technology... I have found the hpcc site which has some diagrams, but not the 34C, only the 33C: do you think I could use it instead? I'd like to find out if the display driving is performed by a single chip, or by separate components.

Daniel

Re: 34C display problem

*Message #5 Posted by **Tony Duell** on 12 July 2011, 4:37 a.m.,*
in response to message #4 by Daniel CLEMENT

Electrically there are only really 2 versions of the Spice series -- the -E models and the -C models. The various machines in each group differ in exact processor and memory chips fitted, but they are connected together in the same way. Keyboard, display, PSU module, etc are the same.

Therefore. the HPCC HP33C diagram _is_ of use in repairing a 34C. Just be warned that the IC part numbers will be different.

Re: 34C display problem

*Message #6 Posted by **Daniel CLEMENT** on 13 July 2011, 4:33 a.m.,*
in response to message #5 by Tony Duell

Thank you, I'll get myself a copy of the hpcc diagrams CD.

Tomorrow I'll leave for 2 weeks so I won't be able to try anything on my 34C until August. Then I'll get back to the forum to report progresses (hopefully).

Re: 34C display problem

*Message #7 Posted by **Mike Morrow** on 11 July 2011, 8:04 p.m.,*
in response to message #2 by Dieter

> Quote:
>
> In you happen to own one of the last 34Cs this might be one of the few that have been manufactured in the good old soldered way.

I don't believe that "few" accurately characterizes the population of soldered vs. press-fit Spice models. All

my Spice machines are of the soldered variety, made two or more years before these models were discontinued. I wouldn't be surprised if the press-fit models were the less common of the two, but that's just a guess.

Randy of FTC would be the best authority on the relative percentages.

Re: 34C display problem

*Message #8 Posted by **Randy** on 11 July 2011, 8:30 p.m.,*
in response to message #7 by Mike Morrow

I would agree many soldered models where manufactured and many solderless where created during repair but at this point I think it is more a case of how many have not made the one way trip to the bin.

My very un-scientifically estimate would at least ten to one, solderless to soldered, based on a sample of about 70 units that I have either purchased on ebay or repaired over about an eight year period. FWIW, the 34C and 38C lead the numbers of soldered machines, I don't remember ever seeing a single soldered 31/32E low end machine.

Re: 34C display problem

*Message #9 Posted by **Michael de Estrada** on 11 July 2011, 9:45 p.m.,*
in response to message #8 by Randy

I guess we all have different experiences in this regard. I currently have 12 Spices, all fully functional, and only 3 of them are of the soldered variety. However, one of the soldered units is an HP-32E and the others are an HP-33C and HP-37E. I have one HP-34C and two HP-38Cs, all of which are press-fit. Of course, many of the press-fit units were cobbled together from parts in several units, and I've had 4 or so other units that acted as donors to create the 9 good units. There was recently an HP-34C on TAS that I bid on but did not win, which I believe was most likely a soldered unit, based on the serial number.

(Almost) amusing WP34s bug(?)

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 10 July 2011, 4:20 p.m.*

Either interesting or (maybe) a battery killer...

The rate that the 'WHO' program zips through the messages is dependent on what base you are operating in.

All of the main bases (octal, decimal, and hex) run very fast -- can't quite make out the messages.

Binary stalls at the very first message -- I had to remove the batteries to get it back again. :-)

I haven't tried the all other bases but something tells me that a similar pattern will emerge.

Does this mean that PSE is base/mode dependent? I'll investigate some more.

Cheers...

Re: (Almost) amusing WP34s bug

*Message #2 Posted by **Walter B** on 10 July 2011, 4:42 p.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

Neil,

Thanks for your observation. I could reproduce and extend your findings. Bases 7 and 4 work as fast as bases 8, 10, and 16. Base 3 leads to the same stall you observed with base 2. I consider this being a bug. We will look into that.

Walter

P.S.: A paper clip reset does it - no need to remove the batteries 8-)

Re: (Almost) amusing WP34s bug

*Message #3 Posted by **Marcus von Cube, Germany** on 10 July 2011, 5:40 p.m.,*
in response to message #2 by Walter B

I'm wondering why a reset is necessary. Shouldn't any keyboard entry end a PSE? Might have to do with XROM.

Edit: I found it. Pauli's "Verschlimmbesserung":

```
#ifdef REALBUILD
DIG(5)
EEX
DIG(3)
```

```
DSZ(st(X))
BACK(1)
#else
PAUSE(8)
#endif
```

Re: (Almost) amusing WP34s bug

*Message #4 Posted by **Paul Dale** on 10 July 2011, 5:55 p.m.,*
in response to message #3 by Marcus von Cube, Germany

That conditional is the problem but removing it will introduce a different bug.

Now to figure out how to make this work in integer mode as well as real. Or do we just switch to real on entry like some of the other xrom routines...

Doh! I can always claim I didn't have a paper clip :-)

Anyway, it stopped what I assumed was large battery consumption...

WP34s - Verifying Flashing

*Message #1 Posted by **Thomas Chrapkiewicz** on 10 July 2011, 12:41 p.m.*

Hello:

I have flashed a HP30b with the latest code from sourceforge.

How do I verify validity of the flashing?

I have concerns as the response from the reflashed machine does not match the .pdf file flashing instructions. The On/PMT sequence seems to toggle Debug mode.

I have used X.fncs/Vers and get:

34s 2.0 1133

I presume this is correct.

Thanks, TomC

Re: WP34s - Verifying Flashing

*Message #2 Posted by **Walter B** on 10 July 2011, 1:10 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

Thomas,

ON + D is observed correctly as documented :-)

I didn't experience *any* incomplete flash so far, though I can't tell you about any verification procedure.

Walter

*Message #3 Posted by **Thomas Chrapkiewicz** on 10 July 2011, 1:30 p.m.,*
in response to message #2 by Walter B

Walter:

Thank you for the prompt response!

TomC ps: Nice Job!!!! Thank you!!!

Re: WP34s - Verifying Flashing

*Message #4 Posted by **Marcus von Cube, Germany** on 10 July 2011, 2:36 p.m.,*
in response to message #2 by Walter B

Thomas,

the HP procedures assume that you're flashing a firmware from them. If you reflash the 20b/30b with another 20b/30b image you get a 20b/30b which responds to ON+D as documented by HP.

If you reflash the 20b/30b with a WP 34S image you get a WP 34S which responds to ON+D as documented by Walter. :-) There is not a single bit of HP code left after reflashing and therefore HP's documentation about the behavior of you calculator no longer holds.

One of the differences concerns the reflashing process itself: There is no longer the need to clear all of flash memory in order to get the device into SAM-BA boot mode. ON+D followed by a double ON+S (ON+6) does the trick. The documentation tells you more about the details. The main benefit is that this will preserve a previously created backup of the RAM in your calculator and all installed libraries.

If the calculator boots you can be pretty sure that the flashing has completed. If you are in doubt, SAM-BA provides a verify mechanism.

Edited: 10 July 2011, 2:37 p.m.

Re: WP34s - Verifying Flashing

*Message #5 Posted by **Tim Wessman** on 10 July 2011, 6:00 p.m.,*
in response to message #2 by Walter B

As a note, niether Cyrille nor myself have ever seen a failed flash either in the thousands of times we've flashed things. If it connects and sends, it is good.

Re: WP34s - Verifying Flashing

*Message #6 Posted by **Mike T.** on 11 July 2011, 5:03 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

Perhaps a 'ROM' checksum check (self test) could be added using a few of the spare bytes? Posibly using STO ENTER like the old SPICE series? I would not be suprised if it was already there as the guys producing the WP34 firmware seem to have done an excellent job.

Mike T.

Re: WP34s - Verifying Flashing

*Message #7 Posted by **Paul Dale** on 11 July 2011, 5:32 p.m.,*
in response to message #6 by Mike T.

There isn't a ROM checksum. Wouldn't be difficult to add one. Adding one that checked for the correct value would be a little harder but not much. Honestly, this hasn't come up -- I've not had a bad flash and it seems HP hasn't either.

STO ENTER can't be used for this purpose.

Adding a crystal to the wp34s - how?

*Message #1 Posted by **Cristian Arezzini** on 10 July 2011, 6:22 a.m.*

I just received the components to add a crystal to the repurposed 30b (thanks Eric). I opened the calculator, and it's quite obvious where I should put the crystal; but I have no idea where to put the capacitors (there are many empty pads), and I couldn't find any info around. So... Where do the capacitors go? :)

Thanks, Cristian

Re: Adding a crystal to the wp34s - how?

*Message #2 Posted by **Paul Dale** on 10 July 2011, 6:29 a.m.,*
in response to message #1 by Cristian Arezzini

They go immediately to either side of the crystal.

They are labelled C3 and C4 on the 20b's PCB.

- Pauli

*Message #5 Posted by **Etienne Victoria** on 10 July 2011, 8:51 a.m.,*
in response to message #4 by Cristian Arezzini

For my 47 years old eyes, a magnifier was mandatory.

Also, no ristretto or Red Bull for 12 hours prior to the modification and you should be set.

Steroids necessary to open the 30B case.

I succeeded by pressing hard on the side with thumb and inserting a FINE PLASTIC spudge in the opening whilst keeping the central part flat with the palm.

And yes, you need 3 hands for this: my daughter helped on this one :-)

Etienne

Edited: Didn't notice that Cristian had already opened the case. Sorry

Stand-alone version of WP34s assembler available

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 9 July 2011, 1:04 p.m.*

All,

Though the executable is big (5.6MB) and clunky slow (if has to decompress itself -- each time -- before it runs), it is available for any Windows environment without an installed Perl package. Other than that, it has none of the drawbacks of the TinyPerl build attempted a few weeks ago, and behaves identically to the main Perl script.

The Assembler documentation in SVN has been updated and includes some commentary about this addition as well. (A 'red-lined' difference of the document is also available at: WP34s_Assembler_Disassembler_diff_30Jun2011_to_9Jul2011.pdf)

The main Perl script is still, and will continue to be, the main development but the executable will be topped-up from time to time (its an ugly, multi-computer chore to create, ugh!!).

On another note, after a month wandering in the wilderness of Canada Post, my overlays have arrived (thanks Eric!) so I can finally retire my paper overlay. My photography doesn't hold a candle to others I have seen, but here is the comparison (I haven't flashed in a bit):

I too have had the mushy keys on <-, and to a lesser extent EEX and +/-. I am going to try a sharp razor blade to release the keys. You can just make out a bit of hacking I tried on the <- key with a less than sharp xacto blade.

Other than that minor issue, the new overlays are great.

Cheers...

*Message #7 Posted by **Hubert Weikert** on 9 July 2011, 3:06 p.m.,*

in response to message #1 by Neil Hamilton (Ottawa)

Hello Neil,

Congratulations! Have you used pp or have you found something better?

Hubert

Re: Stand-alone version of WP34s assembler available

*Message #8 Posted by **Neil Hamilton (Ottawa)** on 9 July 2011, 5:02 p.m.,*
in response to message #7 by Hubert Weikert

Hi Hubert,

Yes, this was done using "pp". Once I got it all together it worked quite well. There were some problems with which Perl package was used and I'd have to go back and find out which one I eventually used.(I think I mentioned more details in an email to you last week.)

There is about 14MB (compressed to ~5MB) of unicode that I am still trying to figure out if I can remove. I have tried several tricks -- including just deleting the darn stuff -- but, as yet no luck. I am still looking for a solution that will make it smaller. Making it smaller will also make it faster since the majority of the time is taken decompressing the image.

The Assembler documentation gives a bit more detail.

BTW: It may *not* work with VERY old versions of Windows (ie: Windows 98). I have no way to test this but I do recall seeing something in some "pp" documentation that may indicate this.

Cheers...

Re: Stand-alone version of WP34s assembler available

Hi again,

I've now looked into your EXE and I saw that the biggest part in it is for Unicode support (in the subfolder lib\unicore).
Maybe you could try to compile it without Unicode support?
I don't know if this is possible, but it would dramatically reduce the size of the EXE and also its decompression time, and Unicode is certainly not necessary for your assembler.

Franz

Can't quite indentify this calculator

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 9 July 2011, 11:07 a.m.*

My local engineering society rag came wrapped in an advertisement for life insurance that had a couple of pictures on it -- one of which I cannot quite figure out. The first is obviously an HP41C of some type:

The second is something I can't quite fathom:

.

It has a blue ENTER key. There is a yellow ISG label above the key below the ENTER. The key below the ENTER appears to be CHS.

Anyone know what this is? Is it a Frankenstein? Photoshop (if so, why??)?

Re: Can't quite indentify this calculator

*Message #2 Posted by **Raymond Del Tondo** on 9 July 2011, 11:30 a.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

Hi,

it seems that the people who made the ad actually like ThinkPads;-)

From early 200x on, ThinkPad computers and IBM/Lenovo keyboards have a blue ENTER/Return/Endline key.

Apart from that, the photos in the brochure were surely meant to support the ad text in some way, and maybe they simply thought it looks best this way.

As you can see from the ISG/CHS key in the 2nd pic, they placed elements with PS, and maybe they also thought that a key legend like CHS/ISG looked better than "-"/x=y?

50G has stopped plotting?

*Message #1 Posted by **Glenn Becker** on 9 July 2011, 6:36 a.m.*

Good morning all -

I am being driven nuts by this and don't have my manuals handy ... but my 50G seems to no longer be drawing plots, even of simple functions. I get coordinate axes ... if I ask the calc for things like slope, etc. I get the correct values, but no plot is drawn.

I have tried setting/unsetting a few flags, but nothing has helped.

I have tried resetting the unit by pressing ON F3 (and alternatively by pushing a paper clip into the small hole in the back) but I am not sure the unit is resetting properly, either: I get a brief flash of the "powered by <something> kernel" and then the display is immediately back -- with, apparently, the same settings.

I'm sure I'm doing something silly, but I can't figure out what it is.

Glenn

Re: 50G has stopped plotting?

*Message #2 Posted by **Glenn Becker** on 10 July 2011, 6:21 p.m.,*
in response to message #1 by Glenn Becker

I wound up doing a complete reset by removing all the batteries. I think I just had the calc at some extreme zoom level or something. All better now, and learning more about this unit every day. :^)

Re: 50G has stopped plotting?

*Message #3 Posted by **Chris Randle (UK)** on 11 July 2011, 6:01 p.m.,*
in response to message #2 by Glenn Becker

Hi Glenn,

If it was a case of an extreme zoom level, then you can reset it by purging the PPAR variable in the current directory. You can change the zoom level with LS+WIN (press and *hold* the white left-shift key and press F2). Edit the min and max H-View values to something better. -6.5 to 6.5 is the default. The Auto key (F4) will adjust the V-View for the current H-view range.

An alternative way to do a machine reset is ON+A+F and answer "NO" to "Try To Recover Memory?"

9810 works, briefly

*Message #1 Posted by **David Ramsey** on 8 July 2011, 9:22 p.m.*

Well, my TAS 9810 arrived today. Did you know that the rubber printer roller can disintegrate into goo so liquid that it actually soaks into the paper roll? Well, it can.

The card reader rollers had turned into something like brittle cork. Messy, but easier to deal with than goo.

Took it apart, removed PCVs, cleaned connectors, plugged everything back in and...it works! Came up, and aside from two bad segments in one digit of the "keyboard" register display, everything seemed functional. Bolted it back together and....nothing. Won't turn on, no power fan, no horrible smoking components, just as though it was receiving no power at all.

Fuses OK, power switch OK. No voltages on the nicely labeled measuring points on the power supply.

Any suggestions?

Re: 9810 works, briefly

*Message #2 Posted by **David Ramsey** on 9 July 2011, 12:59 a.m.,*
in response to message #1 by David Ramsey

Never mind...there's a short somewhere near the power switch. If I apply pressure to the lower right end of the keyboard, it works fine. Just a matter of tracking it down...

Re: 9810 works, briefly

*Message #3 Posted by **BobVA** on 9 July 2011, 7:53 a.m.,*
in response to message #2 by David Ramsey

Post a couple of pictures one you get it sorted - that's just a cool looking machine. Glad you got it working.

Re: 9810 works, briefly

*Message #4 Posted by **David Ramsey** on 9 July 2011, 12:27 p.m.,*
in response to message #3 by BobVA

Well, I probably won't get time to work on the short issue for a week or so, but here are some photos anyway. First, the 2011 quail chicks:

I catch and release quail chicks in my yard every year. The little buggers can run like lighting and make inertialess 90-degree turns. Considering I'm 55, I'm kinda proud I can still catch 'em.

What? Oh, the 9810! Well, the first thing I noticed was when I removed the printer paper:

Yeah, that's going to be a LOT of fun to clean up internally. The card reader, on the other hand, will be easier:

As you can see from this slightly blurry photo, the drive rollers have turned to some crumbly brown material.

The edges of the circuit boards, on the other hand, are pristine. Is this gold plating?

The keyboard/X register has one digit with two dead segments. I don't suppose these LEDs are still made...?

Here's another shot of the display...

Here it is in program mode. I have a simple little program I use to do basic functional testing; it calculates how long it would take to fly a ship from here to Pluto (using 3.7e9 miles as the distance) assuming it could accelerate at 1g halfway then decelerate the remainder. On an HP-67, this program takes several seconds to run. On an HP-41, it takes just under 2 seconds. On the 9810, it's instantaneous.

The primitive version of RPN is confusing: having the result of an operation end up in the Y register is weird; you have to roll the result down to X to perform a subsequent unary operation.

Here are the options the calculator came with.

The exterior of the machine is quite battered: stains, chips in paint and plastic, and so forth. I won't try any cosmetic restoration, though: it has earned its stripes, as it were.

I would like to get a math module, because it feels weird to have an HP calculator without transcendentals. I will also eventually repair the printer and card reader, and although I have Katie's writeup on the latter, I have nothing on the former.

Also, I have no mag cards. Maybe Katie will sell me one or two.

Edited: 15 July 2011, 4:20 p.m. after one or more responses were posted

Re: 9810 works, briefly

*Message #5 Posted by **BobVA** on 9 July 2011, 1:19 p.m.,*
in response to message #4 by David Ramsey

Looks cool! Thanks for putting those up.

It is indeed gold. Fortunately for us, HP was generous with it back in the day. I doubt all our old treasures would work so well today if they hadn't. I was restoring an old HP DVM a couple of weeks ago and the internal construction was very reminiscent of HP calculators. Lots of gold plating and, interestingly enough, one of those weird gold "comb" connectors like the ones between boards on the older calculators. In the DVM it was used to connect a PCB with a large hybrid circuit (A2D, signal buffers, etc.) to the main board.

Is the LED display a monolithic unit? Or can you swap, say, the "X" and perhaps "Z" displays? That would at least move the problem to a less noticed location and also confirm the problem is the LED, vs. a connector or something like that.

If you score a math module, perhaps you can start doing some curve fits on quail population trends. Always good to have a dissertation topic in your back pocket :-)

Thanks again, Bob

> Is the LED display a monolithic unit? Or can you swap, say, the "X" and perhaps "Z" displays? That would at least move the problem to a less noticed location and also confirm the problem is the LED, vs. a connector or something like that.

The display is a single, easily removed, plug-in circuit board that contains the drivers and all three registers (I believe there's a photo on the Museum's 9810 page). Each LED digit is individually soldered on.

I think it would be relatively simple to unsolder and swap the problematic digit with another one; I've done similar things on Classic series calculators (where the LEDs were in 5-digit segments). I'm not going to risk it here, though, because the best possible outcome it still a digit with missing segments, just in another part of the display, and the worst possible outcome is a display with more problems (if not completely dead).

It's still pretty easy to find an old Classic for spare parts; not so another 9820! Frankly I would be reluctant to try it even if I had several new LED digits for this display!

Re: 9810 works, briefly

*Message #7 Posted by **Tony Duell** on 10 July 2011, 4:02 a.m.,*
in response to message #6 by David Ramsey

There are 2 versions of the display board. They are totally interchangable, and differ only in the displays themselves. The rest of the electronics works in the same way.

The older one has 45 individual 7 segment modules fitted to it. The later one has 9 off 5-digit modules. These appear to be electrically the same as the displays used in the classic series handhelds (HP35, etc), but with the pins bent differently. But of course I don't recomend raiding an HP35 to fix an HP9810.

It sounds like you have the older display board anyway. In the absence of any spares, I'd do what others suggest and move the dud displays to a less-used position. Individual segments missing is almost always a problem with the displays themselves, of course.

Re: 9810 works, briefly

*Message #8 Posted by **Katie Wasserman** on 9 July 2011, 2:23 p.m.,*
in response to message #4 by David Ramsey

David,

Take a look at this thread for suggestions on how to remake the printer platen.

There are two different length cards made for the 9810: one about 6 inches the other about 10.5 inches. I have a few extras of the 6 inch cards if you need a couple of test with. I found some large 3M magnetic cards somewhere that I was able to cut down to around 8 inches and use successfully as well. (I'm not sure if I have any of those left or not. PM me on this.)

I need to do some repair work on my 9810 too, it's not booting up. But was 100% functional not too long ago....

-Katie

Re: 9810 works, briefly

*Message #9 Posted by **David Ramsey** on 10 July 2011, 12:15 a.m.,*
in response to message #8 by Katie Wasserman

Katie, thanks for the card offer, but Etienne Victoria is already sending me a couple (from France!), which should be all I ever need.

Hopefully your 9810's problem is as simple as mine was.

Re: 9810 works, briefly

*Message #10 Posted by **Tony Duell** on 11 July 2011, 4:31 a.m.,*
in response to message #8 by Katie Wasserman

It will actually record on any length of card (within reason). I think you can even get 9100 cards to hold a few program steps. There are optical sensors in the card reader that detect when the leading edge of the card has got past the head (start recording) and when the trailing edge is getting near the head (stop recording).

Another common card reader problems is that the bulbs for these sensors burn out. That's easy to cure and the bulbs are still available.

As for the machine that's not starting up, my procedure is basically to check all the PSU outputs, then check if the clock circuitry is running properly. You can power up the clock PCB on its own (either from a 5V bench supply or by plugging it into the machine with the other logic boards removed) and check the muClk and Bitclk signals. You should get 16 of the latter then 1 of the former, 16 of the latter and so on.

After that, I connect a logic analyser to the test connector on the CPU control board, trace the microcode, and sit down with the listing.

Re: 9810 works, briefly

*Message #11 Posted by **Katie Wasserman** on 11 July 2011, 11:14 a.m.,*
in response to message #10 by Tony Duell

Tony,

Thank you for the tips! Isn't there also a POP(not) indication from the 5 volt supply that might be the issue with a machine that doesn't boot up?

-Katie

in response to message #11 by Katie Wasserman

Yes there is a POP signal (Power On Preset, what is more commonly called a 'rst' signal now). It clears the microcode program counter, basically, to get the microcode starting at location 1717 (split octal).

But if it's stuck you'll find the problem when you try to trace the microcode with a logic analyser and find that it's totally stuck. I suppose it could fail to operate at all, and thus cause the processor not to start cleanly, but I think you'll find that when you try to trace the microcode too.

Hey Dave/Katie,

I have the Mathematics Module. Is there any way to transfer some of the functions you want to a card? This would imply that I GET MY CARD READER GOING!

Just a thought.

Although at this point I know very little about the 9810, I suspect the various plug-in modules contain machine code, not keystroke sequences that could be recorded to a card, sigh.

*Message #15 Posted by **Eric v d Wateren** on 10 July 2011, 2:36 p.m.,*
in response to message #14 by David Ramsey

David,

Thanks for sharing your pictures, they (apart from the wonderful quail picture) look very familiar. I had a similar experience with my unit that required a major clean up due to a liquified printer roller... Thanks to Tony Duell's help it is now again in great condition, including new card reader rollers.

By the way, I should have a spare Math module. If you are interested you're welcome to have it. Just drop me a line at 'vdwateren at netscape.net'.

Congratulations with your aqcuisition and enjoy it!

Best regards, Eric

*Message #16 Posted by **Tony Duell** on 10 July 2011, 4:51 a.m.,*
in response to message #2 by David Ramsey

Much more likely to be an open-circuit than a short. The power switch directly controls the mains input, and if yuo get a short there you'll blow fuses.

The power switch itself can fail. I've never never had any success with taking them apart and cleaning them, nearly always there are broken plastic parts. Finding a mechanically-similar switch is a problem if you need to replace it.

Getting the swtich out is not totally trivial either. It goes like this:

Remove the complete keyboard assembly and turn it over so that it's resting on the keys. Have the the display window section overhanging the edge of the bench.

Unplug the interconnection PCB between the keyboard and the encoder PCB, then unplug the cable from the other end of the encoder PCB, undo the screws and remove said PCB.

Undo the 6 screws holding the keyboard to tbe bezel. 4 are easy to see at the sides, the other 2 are reached through holes in the keyboard PCB. Remove the keyboard from the bezel.

Undo the 6 screws holding the front strip to the keybaord. Remove the strip. Now you can see the 2 screws holding the switch in place.

The switch can be tested in the obvious way (look at the schematics...)

You may find that the screws were originally anchored with threadlock or similar. I find it best to clean up the threads using taps and dies (4-40 and 6-32 UNC) before refitting them. And don't bother with any threadlock, unless you are shipping the unit in an army tank it's not going to come apart by itself.

When you come to ressemble it, the only difficult part is refitting the bezel. I do it like this :

Put the keybaord into the bezel and fit the 4 side screws (the easy ones to get to) loosly. The bezel should be just lifted off the bench.

With long-nose pliers, fit the rear center screw, fiddling it between the 'switches'. Put a screwdriver

through the hole in the PCB, locate the screw and start it into the bezel thread.

Put the remaining screw on the screwdriver tip and 'ram' it into the front hole in the PCB. If it doesn't locate, shake it out and try again. With all screws located, tighten them up evenly.

Yeah, looking at the switch carefully I don't see any obvious problems with the solder connections, so it may well be a mechanical issue inside the switch. The switch doesn't *feel* broken when you operate it, though, so I'll want to look at this very carefully.

Given the generally horrible cosmetics of this example, I have no problem with replacing it with a functionally identical switch mounted in a hole drilled in the right lower side of the case. I don't have the machine apart now but as I recall the switch has 6 contacts, 4 of which are in use, and a resistor bridges each pare of contacts. Normally I'd call this a "triple pole single throw" type switch, but hopefully you can tell me what it REALLY is...

(Yes, I've ordered the CD with the schematics, but I assume it'll be a couple of weeks to get here...)

Re: 9810 works, briefly

*Message #18 Posted by **Tony Duell** on 11 July 2011, 4:23 a.m.,*
in response to message #17 by David Ramsey

In England we'd call it a 'Double Pole Double Throw' switch. Or 'DPDT', 'Double Pole Form C', 'Double Pole Changeover'. Electrically, it has to be rated to switch mains voltage (250V) at about 2A.

Mains comes in on the middle pin of each side of the switch (which is the 'moving contact'. The contacts that are made when the switch is in the 'on' position feed the mains to the voltage selector and transformer. The contacts that are made in the 'off' position connect a 1M resistor across the output of the mains filter to discharge the capacitors in said filter when the machine is unplugged. I believe this was a prodution modification, early machines don't have this resistor (and you could, if unlucky, get a small shock from the pins of the mains plug after unplugging the machine).

For testing you can bridge the switch by soldering a wire link between the middle pin and the 'end pin' carrying a wire on each side of the switch. That is one link between the grey wire and the white/brown/black wire and a second link between white/grey and the white/brown/red wires. Remember you are dealing with the mains so be careful nothing can sort to things it shouldn't.

I'm on the road now but will check this out when I return, and make sure that I'm not about to smoke the PS.

Re: 9810 works, briefly

*Message #20 Posted by **Mike Morrow** on 10 July 2011, 11:42 a.m.,*
in response to message #16 by Tony Duell

Lacking an exact switch replacement, one would likely do better bypassing the existing switch electrically. A power cord with in-line switch would replace the function. This would also preserve the possibility of restoring all back to original status, should an exact replacement be found later.

True: since the switch connects to the rest of the machine via a 4-pin Molex connector, it's easy to wire around. All I need to know is which of the four pins on the mating connector I need to short to turn it "on", and then I can build a shorting plug to keep in on internally, and use the switched power cord as per your suggestion...

Re: 9810 works, briefly

*Message #22 Posted by **Tony Duell** on 11 July 2011, 4:25 a.m.,*
in response to message #21 by David Ramsey

It's actually a 5 pin Molex (I think it's Molex and not AMP) connector, the middle pin is not used. It's non-trivial to find this housing now too.

But numbering the pins from either end, the switch connects 1 to 4 and 2 to 5 when it's turned on.

Re: 9810 works, briefly

*Message #23 Posted by **David Ramsey** on 11 July 2011, 11:35 a.m.,*
in response to message #22 by Tony Duell

Hm. Well, it *would* be trivial to replace the 5 pin Molex with a 4 pin version...in fact I could probably just push the pins out of the existing connector and into a 4 pin shell, allowing future restoration of the Historically Correct Part.

Re: 9810 works, briefly

*Message #24 Posted by **David Ramsey** on 12 July 2011, 8:20 p.m.,*
in response to message #16 by Tony Duell

When I see stuff like this, I rejoice, because it means that even someone of my *extremely limited hardware skills* can deal with it:

One wire had corroded and come lose from the middle connector. I will note that the quality of the hand soldering on this switch was not the best: note the "solder ball" appearance which means that the connections weren't heated well when the solder was applied. Still, it works and it was easy to strip a few mm of insulation from the broken wire, clean off the existing solder, and re-solder it.

My power switch now works perfectly.

BTW, getting that last keyboard retaining screw in initially frustrated me: the screws are non-magnetic, so that trick doesn't work. Then I had an inspiration: dip the tip of the screwdriver in platen goo, touch to screw, insert! Works a champ.

Re: 9810 works, briefly

*Message #25 Posted by **Katie Wasserman** on 13 July 2011, 10:56 a.m.,*
in response to message #24 by David Ramsey

My power switch fell apart completely. I salvaged the metal frame that was holding the switch together and mounted a sub-mini toggle switch in that frame. In this way the two screws that were holding the switch in place still are holding it in place.

My problem now is that the machine needs a while to warm up before it starts working. This can take a few minutes if it's cold or about 2 seconds if it's warm. I don't know what's wrong but once it's on it stays and and works 100%.

What the normal delay from when the power switch is turned on to when you see all zeros on the display?

Thanks, -Katie

That's probably more elegant than anything I would have done. Hopefully the submini toggle can handle the current.

Do you just have to wait, or do you have to turn it on, let it warm up, then turn it off and on again? I can only suspect this is a power supply problem (low voltage?) since none of the electronics should be temp sensitive, unless maybe it's a case of "heat expansion making a contact that should be made". But considering my minimal hardware knowledge, someone else should chime in.

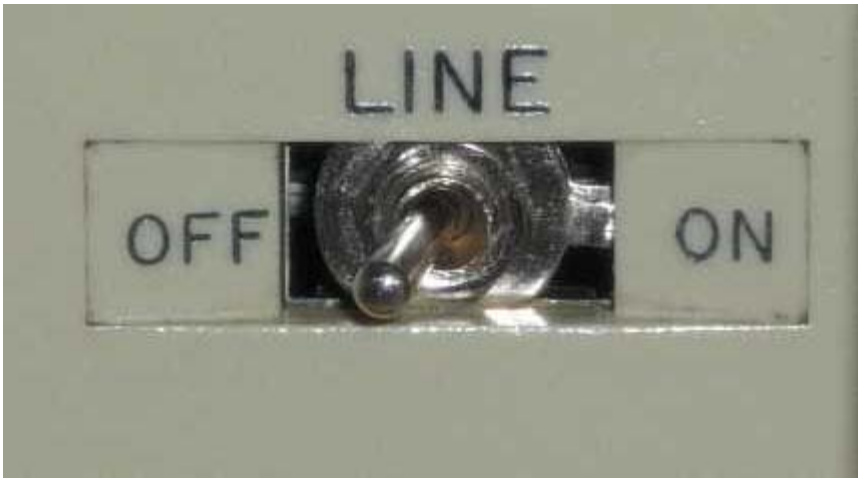
> Quote:
>
> What the normal delay from when the power switch is turned on to when you see all zeros on the display?

3 seconds or a fraction under. All the status LEDs on the keyboard light up immediately, and the display follows shortly thereafter.

Re: 9810 works, briefly

*Message #27 Posted by **Katie Wasserman** on 13 July 2011, 10:03 p.m.,*
in response to message #26 by David Ramsey

Thanks for that. The sub-mini toggle switch is rated for 3A 125V, it should be fine.



I let the machine stay on for a long time and now it's working perfectly, even when it's cooled down to room temperature. I suspect that the issue is/was with one or more electrolytic capacitors. Without use, over time they loose their ability to store charge and need to be "reformed". If they're not too far gone reforming can be done at their normal operating voltage -- i.e., "the calculator fixed itself".

Well, replacing the electrolytics on the PS boards should be pretty simple...

Re: 9810 works, briefly

*Message #29 Posted by **Katie Wasserman** on 13 July 2011, 10:22 p.m.,*
in response to message #28 by David Ramsey

I agree, replacing the caps is simple, but I'm not so sure it's the power supply ones because the voltages were all very steady with very low ripple. Anyway, if it acts up again I work on doing just that.

Re: 9810 works, briefly

*Message #30 Posted by **David Ramsey** on 14 July 2011, 10:37 p.m.,*
in response to message #29 by Katie Wasserman

In other news, I received my O rings from smallparts.com today. Now I have a bag of 100, if anyone needs any spares. Using your instructions I'm hoping repairing the card reader will be relatively simple. SR-60 cards physically fit in the slot with only a mm or so of clearance on each side, so perhaps they will work.

Re: 9810 works, briefly

*Message #31 Posted by **Katie Wasserman** on 14 July 2011, 10:55 p.m.,*
in response to message #30 by David Ramsey

The card reader in the 9810/20 is remarkably robust, the SR-60 cards should work. BTW the o-ring fix to the reader in my calculator has never failed to work in the past 10 years. Not that I was using it much but there's no deterioration or slippage over time.

Re: 9810 works, briefly

*Message #32 Posted by **David Ramsey** on 15 July 2011, 1:41 p.m.,*
in response to message #31 by Katie Wasserman

A question on card reader repair (yeah, I know it's been 10 years):

Access to the drive wheels are blocked by the black plastic card guide:

The bottom end of said card guide is secured by a snap ring:

I have snap ring pliers but that sucker's on pretty tight and I'm worried about damaging it. Your instructions don't mention this, but it would seem a necessary step to getting to the drive wheels...unless I'm doing something wrong.

Hints?

Update: Never mind! The solution is to unscrew the shaft securing the bottom part of the card guide from the drive belt side of the reader. Duh.

Edited: 15 July 2011, 2:09 p.m.

Re: 9810 works, briefly

*Message #33 Posted by **David Ramsey** on 15 July 2011, 4:03 p.m.,*
in response to message #32 by David Ramsey

And...success! Wrestling the O rings on was tedious, but patience and many, many tries won out.

I tested the reader feed mechanism by manually running an SR-60 card through it, turning the motor by hand. OK, that works.

Reassembled everything, wrote a small program, stuck the SR-60 card in and pressed RECORD. The card's entire length fed through and stopped.

Turned the calculator off, waited 30 seconds, turned it back on and verified program memory was clear. Inserted the card and pressed LOAD.

Success! The 20 or so program steps read in and executed perfectly.

The SR-60 cards are long, but otherwise fit as though they were made for the machine. Makes me wonder...

Re: 9810 works, briefly

*Message #34 Posted by **Katie Wasserman** on 15 July 2011, 7:09 p.m.,*
in response to message #33 by David Ramsey

> Quote:
>
> The solution is to unscrew the shaft securing the bottom part of the card guide from the drive belt side of the reader

That sounds about right. Ten years is a long time for my memory cells to retain something, I'm glad you figured it out!

It's a fast calculator and good to write programs for. It's easier if you have the alhpa/printer ROM to see nemonics for your listings and fun to use the FMT key to print alphabetics from programs. The fan noise is loud though, which detracts from long-term use. I suppose I could slow it down or replace it with a quieter one, but I don't want to take a chance on it overheating and shortening the IC's lifetimes.

Re: 9810 works, briefly

*Message #35 Posted by **David Ramsey** on 15 July 2011, 8:08 p.m.,*
in response to message #34 by Katie Wasserman

It is startlingly fast, much faster than, say, an HP-41 or 42 and

about a zillion times faster than the SR-60.

It's amazing how well the card reader works. I haven't had a bad read or write yet. Just need to remember to end programs with END instead of STOP or RTN, because otherwise the card reader will keep on running...

*Message #36 Posted by **Tony Duell** on 10 July 2011, 3:58 a.m.,*
in response to message #1 by David Ramsey

Yes, I had a paper platen roller turn to goo (in an HP9820, which is mechanically identical). Based on some advice in this forum, I used 3M Cold Shrink to replace it. You want the smallest size cold shrink kit, which contains 2 rubber tubes (which you have to force onto the spindle) and the cold shink itself. Put that over the sleeves, pull out about half the support (this will make sense if you are doing it), then put the remaining cold shrink on top as a second layer. Finally trim to length.

Cleaning off this goo is the big problem though. You hae to completely strip the printer. It gets on the printhead, the driver PCB (at the bottom), and even onto the main backplane and keyboard connector. I found propan-2-ol helps in cleaning it up, but it still takes a lot of elbow grease.

For the card reader roller, I use a rather different technique to the one normally suggested here. I remove the old hubs with a puller and then fit a new, machined brass hub with grooves to take a pair of 1" outside-diameter O-rings.

Sometimes I can't get the hubs off without damaging the spindle, so I have to replace that too (1/8" diameter, I use stainless steel).

The only downside to this method is that you need a small lathe.

My datafile articles on the HP9800s do cover repairing the printer and card reader, but in part 8, which will (hopefully) be published at the end of next year. I don't suppose you want to wait that long :-). But I will be happy to talk you trhough any repairs.

There are some pictures in my flickr account of repairing the printer and card reader. Actually listed as for an HP9820, but it's the same.

Re: Calculator Business, back then

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 8 July 2011, 10:39 p.m.,*
in response to message #1 by Frank Boehm (Germany)

The complete text was:

> Quote:
>
> There were no calculators in 19th century Russia. Arithmetic was done with the help of an abacus; so of course, this provided a niche for the peasantry -- wood carvers, in particular.

I noted from the picture that most of the wires had ten beads, but some wires had only four. I didn't understand what that was about until I found the following discussion in Wikipedia:

> Quote:
>
> The Russian abacus, the schoty (ñ÷¸òû), usually has a single slanted deck, with ten beads on each wire (except one wire which has four beads, for quarter-ruble fractions. This wire is usually near the user). (Older models have another 4-bead wire for quarter-kopeks, which were minted until 1916.)

If you go to the next picture in the series on Russian peasantry you will find the following text:

> Quote:
>
> Knife grinders were much needed in Russia. Among the lower classes there was no money to just buy a new knife when one went blunt, and even the wealthy would send out their knives for resharpening.

One can only wonder what world the author of the texts in the Russian peasantry series was in. Maybe I'm just sensitive on the sharpening of knives subject. Even in this 21st century I still sharpen my knives rather than buy new ones when my old ones become dull. I suppose that Ms. Michelle Collet would identify me as "of the lower classes."

HP 50G - ROM upgrade under Linux

*Message #1 Posted by **Glenn Becker** on 7 July 2011, 11:44 a.m.*

Hi all -

Has anyone upgraded the ROM on a 50G under Linux? I maintain a Windows-free computing environment at my house, and as I am looking forward to tackling a multivariable calculus course in the fall, I'm using the 50G a lot more. I'd like to know if there is a way to do this.

At worst, I guess I could try running the Win connectivity software under Wine, but I'd prefer a native solution.

Thanks,

Glenn

Re: HP 50G - ROM upgrade under Linux

*Message #2 Posted by **Gerson W. Barbosa** on 7 July 2011, 11:58 a.m.,*
in response to message #1 by Glenn Becker

Just download the HP-50g ROM update file to an SD card and follow the instructions at Educalc.net:

http://www.educalc.net/284489.page

Regards,

Gerson.

in response to message #4 by Bill Zimmerly

> Quote:
>
> ...Wine extensively...

Christoph Giesselink's emulators (http://hp.giesselink.com/emu48.htm) work well with WINE. So if x49gp is too much hassle, then emu48 (the debug4x build) works great with WINE.

Re: HP 50G - ROM upgrade under Linux

*Message #6 Posted by **Egan Ford** on 8 July 2011, 2:17 p.m.,*
in response to message #1 by Glenn Becker

You do not need Windows at all to enjoy the 50g. The 50g without Windows:

1. Can flash with SD card.
2. Can be truly emulated (i.e. true ARM 50g emulation). http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART. Screen shot here: http://sense.net/~egan/hpgcc3/pics/x49gp-osx.png. NOTE: Please do not ask me to port to Windows.
3. With DOSBox/DOSEMU you can emulate a printer and print to it: http://sense.net/~egan/virtual82240b/. More information here: http://groups.google.com/group/comp.sys.hp48/tree/browse_frm/thread/c694a8c429f4c623/8204b04a11a19d27?rnum=1&_done=%2Fgroup%2Fcomp.sys.hp48%2Fbrowse_frm%2Fthread%2Fc694a8c429f4c623%3F#doc_8204b04a11a19d27, Or natively in Unix/Linux: http://www.hpcalc.org/details.php?id=7081
4. Write HPGCC2 programs (http://sense.net/~egan/hpgcc/) or HPGCC3 programs (http://hpgcc3.org/).

You do not need Windows to get the most out of your 50g. I cannot think of a single thing that you'd ever need Windows for. However, if it comes to that, VirtualBox (mentioned above) is a great solution for the emulation of legacy operating systems. :-)

Project Euler Problem 11 on the HP 48GX?

*Message #1 Posted by **Peter Murphy (Livermore)** on 6 July 2011, 10:17 p.m.*

I have a 48GX, bought Not Working and revived by Randy Sloyer. I am using Project Euler to help me learn to use it, purely for fun; I have no practical application in mind.

Project Euler Problem 11 seeks the largest product of four adjacent integers in a 20 x 20 matrix. I solved it by compiling a list of the maximum such products for each row, column, and diagonal and then using RNRM to extract the greatest of those.

Can anyone suggest smarter ways to solve the problem, and/or applicable commands more sophisticated than those required to extract rows, columns, and diagonals?

Re: Project Euler Problem 11 on the HP 48GX?

*Message #2 Posted by **Gilles Carpentier** on 7 July 2011, 1:48 a.m.,*
in response to message #1 by Peter Murphy (Livermore)

Hi,

I solved it like this (with the 50G). My solution is quick & dirty and not very smart. I am not sure it's pefect but it gave the good answer. I remember now i was lucky to find the solution without testing others diagonals (just few lines to add). The first try was the good one so i stopped here.

How do you do with RNRM ?

EDIT : "I solved it by compiling a list of the maximum such products for each row, column, and diagonal and then using RNRM to extract the greatest of those."

To find the greatest value (num, alpha ...) in a list , you can also do :

<< MAX >> STREAM

«

```
{
{ 08 02 22 97 38 15 00 40 00 75 04 05 07 78 52 12 50 77 91 08 }
{ etc...}
}

0 0

  -> t t2 m
  «
    t AXL 't2' STO

    @ Diag 1
```

```
    « n '61+(n-4)*20' EVAL 2 ->LIST » 'n' 4 20 1 SEQ

    1
     «
       « 't2' n GET » 'n' ROT LIST-> DROP 19 SEQ
     »
    DOSUBS

    t + t AXL TRAN AXL +

    1
      «
        4 « * * * DUP m < « DROP » « 'm' STO » IFTE » DOSUBS
      »
    DOSUBS
    m
  »
»
```

Re: Project Euler Problem 11 on the HP 48GX?

*Message #3 Posted by **Peter Murphy (Livermore)** on 7 July 2011, 9:33 a.m.,*
in response to message #2 by Gilles Carpentier

Hello Gilles,

And thanks for the helpful reply.

You say,

"To find the greatest value (num, alpha ...) in a list , you can also do :

<< MAX >> STREAM"

That's clearly the best way; thanks for pointing out the MAX/STREAM combination and for showing me the format that makes it work. They're both valuable lessons, and just what I hoped for when I posted this.

To use RNRM I had to turn the list into an array with OBJ-> ->ARRY, a waste of time.

I used ->DIAG to extract the diagonals, successively paring away rows or columns of the matrix to expose successive diagonals. I thought that that was efficient; is there a better way?

To extract the oppositely directed diagonals, I extracted all the columns, made them a list, used REVLIST to reverse them, and reconstituted the matrix. Then I could use ->DIAG as before. Is there a better way to do that? Would a loop to swap symmetrically located pairs of matrix columns be better, for example?

Unfortunately, I am a very poor reader of RPL, so I can't appreciate any additional lessons contained in your code.

All the best,

Peter

G

in response to message #3 by Peter Murphy (Livermore)

Hello !

You wrote :

"I had to turn the list into an array with OBJ-> ->ARRY, a waste of time."

AXL do the job and toggle list <-> matrice :

{ 1 2 3 } AXL -> [1 2 3]

[1 2 3] AXL -> { 1 2 3 }

It's very quick (but i've a doubt. perhaps it's a new 49/50 command)

About ->DIAG, as I understand it returns only the larger diagonal...

"Would a loop to swap symmetrically located pairs of matrix columns be better, for example?"

Have you try the TRAN command ?

TRAN Type: Command Description: Transpose Matrix Command: Returns the transpose of a matrix.

(not sure it works on a 48...)

Generaly, you can avoid using loops for list processing with DOLIST and DOSUBS commands

Edited: 7 July 2011, 6:44 p.m.

Re: G

*Message #5 Posted by **Oliver Unter Ecker** on 7 July 2011, 6:49 p.m.,*
in response to message #4 by Gilles Carpentier

If TRAN doesn't exist, TRN will (this one's been around since the 28C), which does the same for real matrices.

DOSUBS is so worth learning... it's the swiss army knife of list processing.

Re: G

*Message #6 Posted by **Peter Murphy (Livermore)** on 8 July 2011, 9:47 a.m.,*
in response to message #4 by Gilles Carpentier

Bonjour Gilles,

->DIAG indeed returns a vector that contains the major diagonal elements of a matrix. But the input matrix does not have to be square.

So if I lop off the leftmost column (or the topmost row) of a 20 x 20 matrix, ->DIAG will return a vector containing 19 elements; lop off another column (or another row) and get a vector containing 18 elements. etc. COL- or ROW- do the surgery.

Thus I get all 33 diagonals of the principal orientation.

I had hoped that taking the transpose of the matrix would allow me to get the oppositely oriented diagonals, but it does not; TRN swaps column 1 with row 1, column 2 with row 2, ..., column 20

with row 20, but it leaves those diagonals in the same orientation.

Swapping columns 1 and 20, columns 2 and 19, ..., and columns10 and 11 does the trick, however. That's where I chose to extract the columns as a list, reverse the list, and reconstitute the matrix; a loop seemed to be the only other way to do the swapping.

Thanks very much for suggesting DOLIST and DOSUBS as a better alternative.

Add those to MAX and STREAM, you've enlarged my vocabulary by four comands. Now I must learn how to use them!

All the best,

Peter

Re: Project Euler Problem 11 on the HP 48GX?

*Message #7 Posted by **Oliver Unter Ecker** on 7 July 2011, 6:23 p.m.,*
in response to message #2 by Gilles Carpentier

Nice code, Gilles! (As always...)

I skipped this problem when I worked through the first PE problems because it just seemed tedious and unrewarding...

Peter's mention of \->DIAG instilled some curiosity and glimpse of a possible elegant solution. The command was missing in ND1, so I went ahead and implemented it, along with a couple more.

Here's the RPL+ result:

```
<< #11_data =m
   0 @ max product kept on stack
   m
   m transpose concat
   m diagonals concat
   m flip diagonals concat
   1
   << 4 [ * * * MAX ] DOSUBS >>
   DOSUBS
>>
```

The new command "diagonals" returns a matrix of the diagonals of a given matrix, and "flip" mirrors a matrix horizontally.
(MorphEngine commands outside the 50g command set are in small letters, for easier typing on a mobile device.)

The running max product is maintained on the stack, and I believe that should also be applicable to your solution, and maybe speed things up somewhat. (It does make the code smaller.)

The solution thread to this problem reveals there were no clever solutions. Everyone brute-forced it and many guessed the right numbers. The solutions in "J" are concise but (to me) not exactly readable.

Oh, in RPL+, lists and vectors are unified. Hence no need for conversions back and fro.
(Peter: Gilles AXL command does conversion, too. Your OBJ\-> \->ARRAY conversion isn't redundant. AXL is just the nicer 50g syntax to accomplish the same.)

Very fine ! It works ;) For better comprehension, here a version without diagonal :

```
«
0
{
{ 08 02 22 97 etc ..........
}

DUP AXL TRAN AXL +

 1
  «
   4 « * * * MAX » DOSUBS
  »
 DOSUBS
»
```

I don't like at all my diagonals solution ;) But i've a new idea to test ....

Here is new idea to tests the 2 diagonals:

```
«
 0               @ Initialise maximun
 {
  { 08 02 22 97 38 15 00 40 00 75 04 05 07 78 52 12 50 77 91 08 }
  { 49 49 99 40 17 etc ..... 20x20 list
 }
 DUP             @ Horizontal
 AXL TRAN AXL    @ Vertical
 OVER            @ For Diagonales 1 & 2

 1
  «
    « 0 » 'n' 1.  NSUB 1. SEQ
    « 0 » 'n' 1. 21. NSUB - 1. SEQ
    2. PICK 4. PICK + OVER +          @ Diag 1
    2. ROLL 4. ROLL + ROT +           @ Diag 2
    +
  »
 DOSUBS

 AXL TRAN AXL

 + +              @ Add horiz. + vert. + diago.

 1
  « 4 « * * * MAX » DOSUBS »
 DOSUBS
»
```

Edited: 10 July 2011, 3:01 p.m.

Re: Project Euler Problem 11 on the HP 28C/S ?

*Message #10 Posted by **C.Ret** on 11 July 2011, 4:31 a.m.,*
in response to message #9 by Gilles Carpentier

Hi,

The uses of AXL and TRAN to manipulate the list of data are interresinting. But I am in difficulty to clearly understand how much computation are made by the calculator, especially in DOSUB sequences.

In comparison, here is the way I resolve Euler11 on my HP 28S.

First step is to enter the array of 20x20 datas. This is really a lot of typing (and double check), HP28C/S have no i/o facility.

```
[[ 08 02 22 97 38 15 00 40 00 75 04 05 07 78 52 12 50 77 91 08 ]
 [ 49 49 99 40 17 ...
                          20x20 arry
 [                                        ...             ]]
'DATA11' STO
```

Second step, computing the product of 4 consecutive elements in any directions.

Thericaly, we have 8 directions to consider: left, right, up, down, up-left, up-right, down-right, down-left. By luck, multiplication is commutative; we don't have to seek in all the 8 directions, only half of it since right is equivalent to left, up to down etc.

The reduce set of scan we have to perform are only horizontal, vertical, direct diagonal (down-right '\') and indirect diagonal (up-right or '/') of the matrix. This is dividing the number of scans by two.

Now, considering the organization of the data matrix, one may notice a regular disposition of the element position (or indexes):

```
[[ 1  2  3 ...  18 19 20 ]
 [ 21 22 23 ...  38 39 40 ]
 [ 41 42 43 ...  58 59 60 ]
 [ 61 62 63 ...  78 79 80 ]
 [ ...
                   ..400 ]]
```

This mean that horizontal scanning can be performed by increasing indexes by one, vertical scanning by increasing index by 20, direct diagonal scanning by increasing index of 21 or 19 for inderct diagobal.

```
Horizontal indexing    vertical indexing       diagonal \ indexing     diagonal
/ indexing
[* 1* 2* 3* 4* 5 ...    [* 1* 2  3  4  5 ...    [* 1* 2  3  4  5 ...    [  1
2  3 *4* 5 ...
[ 21 22 23 24 25 ...    [*21*22 23 24 25 ...    [ 21*22*23 24 25 ...    [ 21
22*23*24 25 ...
[ 41 42 43 44 45 ...    [*41*42 43 44 45 ...    [ 41 42*43*44 45 ...    [
41*42*43 44 45 ...
[ 61 62 63 64 65 ...    [*61*62 63 64 65 ...    [ 61 62 63*64*65 ...
[*61*62 63 64 65 ...

  0 +1 +1 +1              0 +20 +20 +20             0 +21 +21 +21           4 +
```

```
19 + 19 + 19
```

To minimize computation time, I paln to scan the entire data matrice only one time, from element 1 up to 400. At each step, the HP28S have to compute product of consecutive element in the four directions by playing with index increases from this INDEX table :

```
[[ 0  1  2  3 ]                @ horizontal
[  0 20 40 60 ]                @ vertical
[  0 21 42 63 ]                @ diagonal   \
[  3 22 41 60 ]]               @ diagonal   /
'IND' STO
```

Please note that we don't have to scan the full matrix since the last 3 lines and the 3 last columns are already involved in previous steps of the run. This reduce again the among of computation, only 72.25% of the matrix positions have to be consider.

This lead to the 'quite' brute force scan algorithm :

```
«
  0                                @ initialize max
  0 16 FOR l                       @ scan line
     1 17 FOR c                    @ scan column
        1 4 FOR d                  @ scan directions
           1 4 FOR j               @ scan element in each direction
               'DATA11'
                 20 l * c +        @ index i of (l,c) position
                'IND'              @ index Table : (direction x j-th element of
four-product)
             { d j }
                      GET +        @ get index offset and add it to index i of
(l,c) position
                            GET    @ get element from DATA11
           NEXT
           * * *                   @ product of the 4 extracted elements
           MAX
        NEXT
     NEXT
   NEXT
»
```

This code is a bit "crude". It uses no elaborated strategy or sophisticate instruction, since HP28C/S have few appropriate commands for matrix manipulations. By the less, any of you who have any idea or comment or any other strategy to optimize this problem on aged RPL is welcome.

Re: Project Euler Problem 11 on the HP 28C/S ?

*Message #11 Posted by **Gilles Carpentier** on 11 July 2011, 6:56 a.m.,*
in response to message #10 by C.Ret

Bonjour C.Ret !

I like your sense of bytes economy and optimisation :D I like the idea of a index table.

But is there a problem here ? : it seems to me your algo don't test horizontal & vertical products for the lines 18 to 20 ?

Edited: 11 July 2011, 7:01 a.m.

Re: Project Euler Problem 11 on the HP 28C/S ?

*Message #12 Posted by **C.Ret** on 11 July 2011, 8:13 a.m.,*
in response to message #11 by Gilles Carpentier

Bonjour Gilles

You are right! My code miss to check any horizontal products from line 18 to 20 as well as any vertical products from column 17 to 20 ! This makes two gross errors! Lucky I am than the greatest four elements product was not in the edge of the data matrix!

I have to correct my code by using a more 'complex' approach! In fact, my second attempt seems not to be so complex, it's only using a complex INDex matrix instead of the too loosely mono-dimensional indexing of first attempt.

As testing if line, row (l,c) element are in the correct interval is too much code and tests, I propose to short-cut all these tests by using the IFERR THEN END structure. Any attempt to get an element out of the matrix bound will be detected and trapped.

```
[[
      ... 20 x 20 ...
 [                        ]]
'DATA11' STO

[[ (0,0) (1,0) (2,0) (3,0) ]
 [ (0,0) (0,1) (0,2) (0,3) ]
 [ (0,0) (1,1) (2,2) (3,3) ]
 [ (0,3) (1,2) (2,1) (3,0) ]]
'IND'

As in previous version IND is the table of offsets, but using complex
(x,y) coordinate for line/column offset values.

«
  0                                @ initialize max
  1 20 FOR l                       @ scan ALL lines
     1 20 FOR c                    @ scan ALL columns
        1 4 FOR d                  @ scan ALL directions
           1 4 FOR j               @ scan 4 elements in each direction
               'DATA11'
                l c R->C           @ (l,c) position  into complex number
               'IND'               @ complex index Table
             { d j }
                       GET +       @ get index offset (x,y) and add it to
index i of (l,c) position
             C->R 2 ->LIST         @ convert (l+x,c+y) complex position
index into list index { l+x c+y }
               IFERR
                           GET     @ try getting (l+x,c+y) element from
DATA11
               THEN
                        DROP2 0    @ if error (out of matrix bound, return
0 )
               END
           NEXT
           * * *                   @ product of the 4 extracted elements
           MAX
        NEXT
     NEXT
   NEXT
»
```

Thank you for your attentive readings !

Hi,

another way would be to add 3 lines and columns fill with 0 and use your first version just changing the loop values

Re: Project Euler Problem 11 on the HP 28C/S ?

*Message #14 Posted by **C.Ret** on 12 July 2011, 2:43 p.m.,*
in response to message #13 by Gilles Carpentier

Yes, you are right again.

Extending the matrix and padding the matrix with 0 makes it !

But, why padding with 0, why not with 1 ? Supposing we have en matrix full of low numbers (i.e. less than 20), and suppose that the greatest products appears to be at one borders with only 2 or 3 elements (supposing that only border's element are great numbers!

Perhaps, I may change my last version by returning 1 instead of 0 ?

Another question is whenever or not is it needed to take this border effect into consideration? I have notice that may first version don't scan the end-border regions (last three columns or rows) of the data matrix only after your notice it ! Fortunately, the greatest four element product is not in one of these regions, so even the erroneous first version of my code is able to found the expected result.

That's the problem with Euler, of few of us may get the expected answer by using an erroneous algorithm or a buggy code!

HP 15C Clone

*Message #1 Posted by **Bunuel66** on 6 July 2011, 4:20 a.m.*

Hi everybody.

I'm new on the forum even if a old HP fan ;-) I found that recently: http://www.rpn-calc.ch/ What did you think of it? Wouldn't it be also an option for a 34s case?

Regards from southern France

Re: HP 15C Clone

*Message #2 Posted by **Daniel CLEMENT** on 6 July 2011, 5:54 a.m.,*
in response to message #1 by Bunuel66

Hello (from France too--but more to the North!)

For one thing I can't access the video of the prototype in action. Have you seen it? Is it conclusive?

I do think it is interesting, but from the rendered pictures I would say that the matrix display is dud. The indicators appear to overlap with the commas (see pic. 16).

Does the video confirm this, or is it a side effect of the rendering?

Regards, Daniel

Re: HP 15C Clone

*Message #3 Posted by **bunuel66** on 6 July 2011, 6:27 a.m.,*
in response to message #2 by Daniel CLEMENT

I have not had any trouble to see the video. Maybe your brower is missing some plugin. That said, the display is clearly a dot display not the quality of the original but let say it is good enough. Yes the rendered pictures show some overlap but it doesn't look that bad. May be fixed later on. From a quality standpoint I'm expecting something like the old TI Galaxy 67 which was one of the greatest TI product. I'm a bit dubious about legal aspects. I'm not sure the HP15C are open source and free neither the saturn emulation. I'm sure they pick all that in the 'free world' of the web but it's still questionable. The price is not that bad, but I expect to see the actual product, not just some drawings and a breadboard. BTW I had a similar idea using an arduino kit. Justthe idea, not any time to start ;-(

Regards

The video works here as well.

With respect to the item itself, a dot matrix display is a welcome step towards more flexibility. The "running" display looks like with a 7-segment LCD, however. 132 x 16 pixels would allow for alphanumeric output of two lines of text or digits like on the 42S - that's what we always wanted to get from HP. I'll contact this guy and ask a few questions in German.

Walter

Hello all.

I watched the video as you did. Where are the molded parts ? I just see a printed plastic film instead of an actual keyboard with molded keys. The website says :"the 3D models necessary for the moulds were also used to render the pictures." Good to know, but you sure have an idea of the HUGE cost of moulds for plastic injected parts, so could someone explain to me how a single person could make this incredible investment ? Or am I missing something ?

Kind regards from France. JM.

Re: HP 15C Clone

*Message #12 Posted by **Raymond Del Tondo** on 6 July 2011, 3:39 p.m.,*
in response to message #11 by Jean-Michel

Maybe he used kinda "3D printer" , and the model is made of ... soap ?

Re: HP 15C Clone

*Message #13 Posted by **Jeff Kearns** on 7 July 2011, 2:27 p.m.,*
in response to message #12 by Raymond Del Tondo

Gents,

The models to which he refers are almost certainly 3-D models generated in a 3-D CAD package

like SolidWorks. Not 'soap' models from the 1970's. I can't imagine how he could fund the actual mold injection process but I like the effort he has put into this so far.

This is a very interesting project as far as I am concerned. I hesitate to criticize what this fellow (or anyone) is doing until I know more - BUT - I did fill out the form for a pre-order!! I would buy one for sure if it is as advertized. Reminds me of the 41CL project. I want one of those too!

Jeff Kearns

Re: HP 15C Clone

*Message #14 Posted by **Walter B** on 7 July 2011, 3:45 p.m.,*
in response to message #13 by Jeff Kearns

FYI, I did file a pre-order as well for the same reason as Jeff did. If it will be as advertized, the LCD alone in such a package will be worth the $$ IMHO - maybe (!) we can even do some repurposing then ;-)

The video posted by Cody below answers that.

Re: HP 15C Clone

*Message #18 Posted by **Katie Wasserman** on 8 July 2011, 12:45 a.m.,*
in response to message #17 by Egan Ford

Egan,

I'm feeling pretty stupid, I don't see how that video answers my question. Is there some function demonstrated that results in a different result than a real 15C would? If not, how can I tell if it's an Voyager processor emulator running the 15C ROM image or a really good emulation of a 15C from scratch?

-Katie

edit....

I found this on the developer's site:

> Quote:
>
> runs on a battery saving LPC1114 ARM processor emulating the NUT processor

Now that DOES answer my question. Since it would just be plain silly to emulate that processor without running the original ROM image.

*Message #19 Posted by **Lode** on 8 July 2011, 4:21 a.m.,*
in response to message #18 by Katie Wasserman

I thought I had read somewhere that the original ROM image was lost even to HP themselves. Is it not lost after all then?

Re: HP 15C Clone

*Message #20 Posted by **Ángel Martin** on 8 July 2011, 5:31 a.m.,*
in response to message #19 by Lode

I believe that applies to the 42S code, not the 15C.

The urban legend grows...

Re: HP 15C Clone

*Message #21 Posted by **Didier Lachieze** on 8 July 2011, 6:33 a.m.,*
in response to message #20 by Ángel Martin

Well I think that the 15C code is also lost, unless I'm wrong, only the 41, 71 and 75 source code were published by HP and are still available (not including RPL units here). However 15C rom image is present in every 15C unit and can be extracted with the right tools and cleverness. Same apply to 42S.

One thing is to extract the code and another ro understand its intricacies and HW dependencies. Those would have to be touched up to make it compatible with the new CPU, or the design chganges. This is close to mission impossible without the SOURCE code, IMHO.

There isn't near enough code to be anywhere close to "mission impossible" if someone is familiar with the processor.

A man-day or two per k-byte of instructions will usually suffice if you have some idea of what the code does. It goes quicker if you have interactive debugging (trace, breakpoints, etc.) or slower if there was intentional obfuscation or extreme byte-saving tricks.

In some ways it's easier if it was written as assembly (or machine) code originally. At least then you have the same structure as existed in the original. On the other hand, well written high-level language usually compiles to an obvious and easily understood structure so you can get lucky that way. Unfortunately most code isn't well written, and a high-level language tends to multiply the resulting executable size by an order of magnitude or more, so usually it is easier if it was originally assembly code.

The 15c is more code than the other Voyagers, but it still isn't very big. Of course, an emulator might be easier than reworking the old code... That's what HP did.

(I used to take apart a lot of code (mostly Z80, some 8080, 6502 and 8086) and could read and write hex 8080 and Z80 code as if it were the assembler mnemonics. Spending a few weeks taking something apart, patching and putting it together will do that for you.)

Re: HP 15C Clone

*Message #24 Posted by **Mike Morrow** on 8 July 2011, 11:23 a.m.,*
in response to message #20 by Ángel Martin

Were one really really motivated, or if one had the appropriate secretarial resources, the HP 42S firmware could always be non-invasively **slowly*** extracted *manually* using the built-in RAM/ROM scanner, 16 hexadecimal nybbles at a time. The 64K-byte ROM would likely require one person less than ten 8-hour days to display and transcribe approximately 8000 segments of the firmware in this manner, and then double check. It would be much faster if some voice recognition process was used. I wouldn't want to do it...mind-numbing no matter what way it was done.

I've valued that memory scanner facility and appreciated HP designing easy access to it. I've only used it to check the firmware version on 17BII or 42S units I've come across or to alter the RAM location that temporarily doubles 42S speed. This scanner is a feature that is rare on HP products. It is non-existent on most calculators, including the Voyagers and the HP-41. A big disappointment found after I bought an HP 48GX was that, unlike my old HP48SX, HP had eliminated such easy owner access to machine internals.

I do not recall the procedure in detail, or how automated it was, but there was a way to extract the 42S rom by sending it to a 48G via the infra-red output of the 42S. A special program, called "BINPRINT" if I recall correctly, was used on the 48G to capture the characters. I could try to find details if you are interested.

Re: HP 15C Clone

*Message #26 Posted by **Marcus von Cube, Germany** on 9 July 2011, 7:11 a.m.,*
in response to message #25 by Jeff O.

It's INPRT or INPRINT if I'm not mistaken and you need a well equipped 48G, memory wise. You can then "IR print" from the monitor in the 42S and capture the output with the

48G. This does not work with a 49G or 50G. It's described in the docs for emu42 (hardware emulator for the high end pioneers).

Re: HP 15C Clone

*Message #27 Posted by **Jeff O.** on 9 July 2011, 1:25 p.m.,*

What a joke - HP gladly pay lawyers big bucks to "squash" projects rather than paying a few to produce it themselves... HP actually have shown how much they care about calculators given the fact they have lost the documentation as indicated by some. I also pre-ordered one and hope it gets produced.

Re: HP 15C Clone

*Message #37 Posted by **Eric Smith** on 8 July 2011, 2:50 p.m.,*
in response to message #36 by Gerry Schultz

The Voyager calculators, including the 15C, use the 1LF5-0301 or 1LM2-0001 Nut processors, or in later models, versions of the 1LQ9, 1RR2, or 2AF1.

The HP-41 uses the 1LA5-0001, 1LF5-0002, or 1LF5-0003 Nut processors.

The 1LF5-0301 used in some Voyager calculators is a variant of the 1LF5-0002/0003 used in some HP-41 calculators. The differences are primarily in the power supply and electrical specifications.

Re: HP 15C Clone

*Message #41 Posted by **Cody** on 10 July 2011, 9:14 p.m.,*
in response to message #10 by robert rozee

With so much demand for a new 15c, I have to think it would be quicker and easier to repurpose the new 12c in the same way the 30b has become the WP 34s.

I understand why the 20b/30b project was chosen first to provide the most returns and functionality, but perhaps the new 12c can get the same treatment now to satisfy everyone.

It seems like with the new 12c platform, the biggest concerns of key feel and quality casing have already been solved. A new ROM and quality overlay seem simple compared so building a new calculator from scratch.

Re: HP 15C Clone

*Message #42 Posted by **Walter B** on 11 July 2011, 1:35 a.m.,*
in response to message #41 by Cody

Cody,

All you wrote is true. Remember, however, the very limited display of the 12C. IMHO, the display in Michael's clone is the decisive point as mentioned above. Personally, I won't repurpose a 12C with only a 7-segment display.

Walter

Re: HP 15C Clone

*Message #43 Posted by **Paul Dale** on 11 July 2011, 2:01 a.m.,*
in response to message #42 by Walter B

I'm with Walter on this one. The seven segment display really inhibits what can be done. You'd be flat out doing better than the 15c and if you want that port an older version of non-pareil and you're

done.

- Pauli

Re: HP 15C Clone

*Message #44 Posted by **Paul Dale** on 11 July 2011, 2:58 a.m.,*

```
Some idea and comments:
```

1.) If it have 132x16 pixel LCD why don't use normal (e.g. 5x7 pixel) alphabet? This right-angled dummy seven segment things seems so ugly, I think...

2.) 15C shape is very good, but, why we need to copy the original? Faceplate arrangement, labels, colors, etc is OK, but the left and right handed gray ends of case made to thinner will be looks so better than the original!

3.) Why don't made it thinner than original?

4.) I don't want to take off battery cover to use RS232. After the 5th use of this function the users will be lost the cover. RS232 port without cover / or plugged with rubber cap the good solution, I think.

5.) Changeable faceplate OR "snap-on" faceplate for USER functions or for program LBLs?

6.) LCD and keyboard backlight?

7.) And my old desire: 1:50 and/or 1:20, 1:100 scales on backplate or on the top side of calculator (for measuring drawings, maps, to made sketches on site...!)

Thanx for reading!
Csaba

10bii+ Trig Bug

*Message #1 Posted by **Katie Wasserman** on 5 July 2011, 10:50 p.m.*

I was just thinking about what the 10bii+ would be like as a re-purposed RPN calculator and playing around with it when I found a trig bug. Try this in degrees mode:

```
270
SIN
(you'll correctly get -1.00)
270
TAN
(you'll see OFLO flash and get correctly get -1.00E500)
270
COS
(you'll correctly get 0.00)
270
TAN
(you'll see OFLO flash and get 1.00E500 -- the bug)
```

This is in version 7-13-2010. I hope that this is the only bug, I use the 10bii+ a bunch and find it to be a really nice (if non-RPN) machine.

-Katie

p.s. There's still a yet-to-be-found Easter Egg in there.

Edited: 5 July 2011, 10:51 p.m.

Re: 10bii+ Trig Bug

*Message #2 Posted by **Tim Wessman** on 5 July 2011, 11:51 p.m.,*
in response to message #1 by Katie Wasserman

I have not been able to reproduce the sign change thing. Is that what you are referring to? Or the fact that it does the overflow and then returns a number?

270 is undefined as it is an infinity sign change. Could you please explain more?

TW

Edited: 5 July 2011, 11:52 p.m.

Re: 10bii+ Trig Bug

*Message #3 Posted by **Katie Wasserman** on 6 July 2011, 1:24 a.m.,*
in response to message #2 by Tim Wessman

Correct, I am referring to the sign change.

In the first case the TAN of 270 returns -1.00E500 in the second it returns +1.00E500. You need to do these steps in the order I wrote starting with a ALL CLEAR. I can reproduce this on both 10bii+

calculators that I have.

I realize that TAN 270 is infinite but in one case it's negative infinity and the other it's positive infinity. Apparently the sign of the last result obtained before the TAN function is the determining factor.

More....

Actually, it turns out that an overflow condition always carries over the sign from the previous calculation. This happens even for something like factorial, for example:

```
1
-
2
=
300
!
```

results in -1.00e500

The 10bii (not +) results in +1.00e500

Re: 10bii+ Trig Bug

*Message #5 Posted by **Katie Wasserman** on 6 July 2011, 11:42 a.m.,*
in response to message #4 by Thomas Radtke

I agree and I believe that the 20b/30b takes this approach. However the 10bii+ was intended to replace the 10bii and needs to be upwardly compatible with it in all respects. One of which is just flashing OFLO and returning 1e500 when an overflow occurs.

Re: 10bii+ Trig Bug

*Message #6 Posted by **Thomas Radtke** on 6 July 2011, 5:01 p.m.,*
in response to message #5 by Katie Wasserman

Yes, the 20b at least omits it.

Just noticed the german error message on overflow (300!): "Keine Amortisation". Strange.

HP-48G IR Test Failure

*Message #1 Posted by **aj04062** on 5 July 2011, 9:08 p.m.*

Can anyone say what the typical root cause might be? Would it be the LEDs?

If so, are the pair from the HP-38s the same?

I can't get a unit I bought to send or receive.

Thanks!

Re: HP-48G IR Test Failure

*Message #2 Posted by **BobVA** on 6 July 2011, 5:51 a.m.,*
in response to message #1 by aj04062

It's been awhile since I've done this, but as I recall you need to place a piece of white paper (or similar reflective surface) in front of the IR port (about an inch or so away) for this to work properly. Did you try that? (Or am I thinking of another calculator?)

Regards, Bob

Re: HP-48G IR Test Failure

*Message #3 Posted by **aj04062** on 6 July 2011, 6:48 a.m.,*
in response to message #2 by BobVA

I did try that and it didn't work.

I swapped both LEDs with ones from a 38g parts machine I had. No luck. I then tried to print with the unit and it did print, so I know the send is working. When I try to send an object to another hp-48, no luck. This doesn't make sense to me.

Re: HP-48G IR Test Failure

*Message #4 Posted by **Thomas Chrapkiewicz** on 6 July 2011, 8:41 a.m.,*
in response to message #3 by aj04062

A simple check to see if the transmitting LED is working is by viewing it (on the LCD display) with a pocket camera (or smartphone camera), as the image sensor in the camera is IR sensitive and you can 'see' the LED illuminating with IR when it is transmitting.

TomC

Re: HP-48G IR Test Failure

*Message #5 Posted by **Paul Berger (Canada)** on 6 July 2011, 9:01 a.m.,*
in response to message #3 by aj04062

I tried the test on my 48G and 48GX and the test passes even if the IR is pointing off into space, on the GX it will fail if the card cover is not in place, as warned in the manual. You are likely able to print as the print communication would be one way, however when you are trying to transfer to another calculator there would likely be some handshaking between then which would fail if the receive circuit is bad. My 48S has this problem it prints but the IR test fails and it will not communicate with other calculators.

Re: HP-48G IR Test Failure

*Message #6 Posted by **aj04062** on 6 July 2011, 6:25 p.m.,*
in response to message #5 by Paul Berger (Canada)

Do you think this is a failure in the LED or in the rest of the circuitry?

Re: HP-48G IR Test Failure

*Message #7 Posted by **Paul Berger (Canada)** on 6 July 2011, 8:57 p.m.,*
in response to message #6 by aj04062

I have not looked into it too much, the 48S is kind of a junker so I was not too concerned, however with what little looking I did it seems that the photo-transistor does detect IR pulses which would lead me to believe it is OK and the problem is somewhere beyond that. Schematics for the 48 can be found at http://www.hpcalc.org/hp48/docs/misc/.

Re: HP-48G IR Test Failure

*Message #8 Posted by **Paul Berger (Canada)** on 10 July 2011, 9:22 p.m.,*
in response to message #6 by aj04062

Well I fixed the IR on my 48S it appears that there was an intermittent connection between the second transistor and the input pin on the processor, it started working while I as probing around so I replaced that connection with a piece of wire wrap wire.

While inside the 48S I noticed that the processor is not a Clarke as most documentation lists as the saturn version used in the 48S/SX but is in fact a Yorke with the speed pin tied low so that it runs at 2MHz. I did see an article that claimed that early production runs of Yorke did not yield a lot of chips that would run reliably at 4MHZ perhaps these found there way into late production 48S/SX. The serial number of my S suggests it was built week 46 of 1992.

June's over - No new calcs :) - Interesting TI product

*Message #1 Posted by **John Stark** on 5 July 2011, 6:30 p.m.*

To all:

June is over and no rumours or announcements from HP of new (or reintroduced) calculators.

Whaddya' think ??

John Stark

PS:

Saw and used for a bit the new Texas Instruments Nspire CX colour-screen calculator.

Stunning packaging,display, and battery life; build quality not bad.

Would be a dream machine if somehow merged with HP-50 series or similar operating system; however TI places this unit as an "educational", rather than a "workaday" calc.

Are you listening, HP ?? Some great display and design ideas here for a high-end calculator.

Nonetheless, can't give up RPN and LED's for now.

Hope all (in USA) had a great 4th ; Canadian friends a fine Canada Day.

John

Re: June's over - No new calcs :) - Interesting TI product

*Message #2 Posted by **Thomas Radtke** on 6 July 2011, 5:30 a.m.,*
in response to message #1 by John Stark

A workhorse doesn't really need the ability to play doom on it, imo. I'm sure b/w displays still offer the best readability, and an operating system stripped down to the absolute minimum reduces the number of bugs contained. Both features characterize a good calculator.

Re: June's over - No new calcs :) - Interesting TI product

*Message #3 Posted by **David Ramsey** on 6 July 2011, 11:45 a.m.,*
in response to message #1 by John Stark

The nSpire is a teaching tool, not a calculator in the sense we think of it. As a teaching tool, it seems to be very nice, though.

Re: June's over - No new calcs :) - Interesting TI product

*Message #4 Posted by **Lode** on 7 July 2011, 7:46 a.m.,*
in response to message #1 by John Stark

I'm personally not very interested in it because:

-it's for schools, not for engineers

-it does not have a battery life of multiple years, but of multiple hours

-it is more like a smartphone, PDA or computer than like a calculator, I mean, I can just put an app on my phone that does math and I've also got a color screen calculator, it's not very magical (admittedly this is the same as the second point)

-it is not something that makes maximum use of its hardware, but sort of locked down

Edited: 7 July 2011, 8:32 a.m.

Re: June's over - No new calcs :) - Interesting TI product

*Message #5 Posted by **Cody** on 7 July 2011, 11:47 a.m.,*
in response to message #1 by John Stark

The sad difference between the Nspire series and say, the TI-89, is that the calculator is incredibly crippled in terms of usability. I've never been more frustrated with any calculator than the Nspire CAS. Much like the iPad makes a good media consumption device, the Nspire seems like its purpose is also simply to consume electronic lesson plans distributed by a teacher.

Actually using the Nspire is maddening how many button presses it takes to accomplish simple calculations. The trig functions are hidden behind a single button, which takes multiple presses or using the navigation pad to navigate to the correct function. Trying to access the solve function is also several menu levels deep with no easy shortcut.

I haven't seen the Nspire CX screen, but the black and white screen of the current models is an abomination completely unreadable under normal indoor lighting conditions. The backlit LCD on the CX series would correct this problem, but then the power consumption jumps, necessitating the use of a rechargeable lithium ion battery, which of course has a limited lifespan before replacement is needed.

TI spent more time locking down the calculator than addressing usability. With just a couple buttons, you can accidentally put the Nspire series in press to test mode, which activates a flashing red led and restricts access to any 3rd party programs along with removing access to built in functions. To get out of press to test requires connecting to a computer or another calculator.

It's true than the Nspire CX is a stunning looking calculator, but all joy ends there sadly. With TI playing a cat and mouse game with developers, they have also alienated an entire enthusiast community.

Aside from the improved hardware, the Nspire series is a significant step down when compared to the HP50g or even the TI-89. If the Nspire series encourages HP to release a new product, at least there will be some benefit to us. Hopefully HP can see beyond the glitz that TI has included just for show and provide a legitimate tool that enables one to quickly and efficiently get the answer for which he is looking.

Re: June's over - No new calcs :) - Interesting TI product

*Message #6 Posted by **John Stark** on 7 July 2011, 7:09 p.m.,*
in response to message #5 by Cody

Dear Cody:

You have articulated my feelings completely.

The Nspire IS a locked-down teaching machine, NOT a tool for everyday calculating.

My opinion is that from a styling and physical user experience ("OOB Experience") viewpoint alone, the Nspire is a possible (starting) point for HP to use in a new generation of "RPL" or 49-50G based calculators.

Agreed that battery life and use of rechargeable cells breaks with (recent) HP tradition, but I would LOVE an HP.45 with 80-100 hours between charges.

Li-ion batteries and colour displays, I'm afraid, are the trend of today and tomorrow.

BTW, I believe the future of display technology is somehow linked to E-readers such as the "NOOK", and the "KINDLE"; they have high resolution displays that are easy on the batteries and the eyes.

Just some food for thought. You guys are a lot more hard-headed and experienced in engineering and product design than I am. I operate primarily by feeling, and some elements of the Nspire's design appealed to me, although its functionality STANK.

John

Question about random number generators

*Message #1 Posted by **Namir** on 5 July 2011, 4:01 a.m.*

Using the linear congruential generator method to calculate a sequence of pseudo-random numbers:

```
S(n+1) = (A * S(n) + C) mod M
```

The S() is the integer seed values. The random number between 0 and 1 is calculated using:

```
X(n) = S(n) / M
```

What do you think if one uses the following algorithm instead:

```
S(n+1) = (A * S(n) + C) mod M
if S(n+1) < S(n) then
  X(n) = S(n+1) / S(n)
Else
  X(n) = S(n) / S(n+1)
End If
```

Namir

Re: Question about random number generators

*Message #2 Posted by **Paul Dale** on 5 July 2011, 4:29 a.m.,*
in response to message #1 by Namir

I'd be very surprised if this wasn't biased. It is also more computation.

Re: Question about random number generators

*Message #3 Posted by **Garth Wilson** on 5 July 2011, 4:36 a.m.,*
in response to message #2 by Paul Dale

What do you want to run it on? If there's a timer/counter and its value might be anything when you need the random number, you could bring that into the derivation.

Re: Question about random number generators

*Message #4 Posted by **Namir** on 5 July 2011, 5:19 a.m.,*
in response to message #3 by Garth Wilson

Just a general random number generator. My very basic tests show that the new algorithm generates a good spread. BUT ... MORE testing is needed.

Another more complex algorithm I had developed last year uses a VIRTUAL CLOCK. The clock ticks each time you call it's random number generator. This way, it is independent of the real CPU clock. That algorithm seems to do well.

Of course when you use RNG for Monte Carlo methods, you need very good ones (based on this book I am reading).

Cheers from southern France!

Namir

Re: Question about random number generators

*Message #5 Posted by **Paul Dale** on 5 July 2011, 5:52 a.m.,*
in response to message #4 by Namir

A very good rule of thumb regarding random number generators is to not try to invert your own. It is **very** easy to stuff it up in a way you won't recognise. I.e. it is easy to produce what you think is randomness when in reality, you've produced nothing of the sort.

So, find a reputable pseudo random number generator and stick with that. Linear congruential is quite popular. Mersenne twister is gaining popularity. The 34s uses the Taus generator from the GNU scientific library.

But use a reputable, known, tried and tested algorithm. If you're planning cryptographic applications, choose one specialised for that, the ones I've mentioned here are not suitable.

- Pauli

Re: Question about random number generators

*Message #6 Posted by **Bart (UK)** on 5 July 2011, 8:39 a.m.,*
in response to message #5 by Paul Dale

I have used Mersenne Twister with good results on Monte Carlo type simulations with iterations around 1E7. How would the 34s Taus generator compare?

-Bart

Edited: 5 July 2011, 9:06 a.m.

Re: Question about random number generators

*Message #7 Posted by **marais** on 5 July 2011, 3:46 p.m.,*
in response to message #6 by Bart (UK)

So have I, but its implementation goes far beyond of what's achievable on pocket calculators.

Re: Question about random number generators

*Message #8 Posted by **Paul Dale** on 5 July 2011, 5:47 p.m.,*
in response to message #6 by Bart (UK)

The primary problem with the MT algorithm is the amount of state it requires. It requires more data in its state vector than the 34s has persistent RAM :-) Tau on the other hand requires twelve bytes of state.

The Tau generator has a much smaller period than MT, only about 10^28 instead of

something like 10^6000 but either of these is more than large enough for a calculator. They are more than large enough for a super computer. Tau is also supposed to be faster which is relevant on a low speed computing device.

Both are reputable and pass the usual battery of tests to which these things are subjected (the spectral test is only the beginning). They are not suitable for cryptographic applications however. That is a completely different story with much more stringent requirements.

The GSL documents their random number generators quite well.

- Pauli

Re: Question about random number generators

*Message #9 Posted by **Bart (UK)** on 7 July 2011, 5:03 a.m.,*
in response to message #8 by Paul Dale

Thanks Pauli,

The period sure seems long enough. I am still learning to use my recently "acquired" 34s, and I'm curios to try and run some of my simulations on it :-). Having so many useful functions already built into the calculator really helps to keep programs short! (as I discovered many years ago when I went from a 28C to an fx-850p - the fx had more than double the memory but I used it all up rewriting functions that were built into the 28).

Thank you for the link, it is an interesting read.

Regards
Bart

Re: Question about random number generators

*Message #10 Posted by **Paul Dale** on 7 July 2011, 5:26 a.m.,*
in response to message #9 by Bart (UK)

> Quote:
>
> The period sure seems long enough.

I'd hope so. By my rough calculations, assuming that one FLOP is sufficient to generate the next number in sequence (which it isn't even close), it would take the current world's fastest super-computer approximately 3.8e19 years to get the RNG to repeat. I don't think you'll be running out :-)

> Quote:
>
> Having so many useful functions already built into the calculator really helps to keep programs short!

It is definitely a programmers' calculator.

Thank you for this discussion!

It helped me decide that ND1 will support the Mersenne twister with the next update.
(I was just working on adding ARC4, which will also be available, for crypto-applications.)

Re: Question about random number generators

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 5 July 2011, 8:46 a.m.,*
in response to message #1 by Namir

There is a specific chapter in "The Art of Computer Programming", vol 2- Seminumerical Algorithms, by Donald Knuth. It includes a memorable example of a random number generator that seems to be very random, but it fails badly, prompting for a clear statement "Never use a randomly chosen method to create random numbers".

AFAIK, the critical test for randomness is the "spectral test", which sort of measures the "white noise" quality of a pseudo-random sequence. The congruential one used for HP-41C applications, where S(n+1)=FRAC(S(n) * 9821 + 0.211327) is reported as passing the "spectral test".

As all these bits of data are just from memory, I apologize for possible inaccuracies and idiomatic mistakes. HTH.

Re: Question about random number generators

*Message #13 Posted by **Thomas Radtke** on 5 July 2011, 9:51 a.m.,*
in response to message #12 by Andrés C. Rodríguez (Argentina)

> Quote:

An interesting test is to calculate 'how much' a series is a cyclic difference set. Years ago, I implemented this in a simple Java spreadsheet program to quickly check the 'randomness' of a given series. By definition of this method, a series is at maximum random if self-similarity is minimal.

Re: Question about random number generators

*Message #14 Posted by **Marcus von Cube, Germany** on 5 July 2011, 9:59 a.m.,*
in response to message #13 by Thomas Radtke

I think one of the problems you can run into are sequences that repeat themselves and are short compared to the number of possible values given the machine accuracy. If you have such cycles you split the random numbers into distinct sets which do not overlap.

Another possible outcome is that the sequence converges or bounces around only a few values. This

may happen only after a million cycles. But it may happen.

Re: Question about random number generators

*Message #15 Posted by **Thomas Radtke** on 5 July 2011, 10:16 a.m.,*
in response to message #14 by Marcus von Cube, Germany

> Quote:
>
> I think one of the problems you can run into are sequences that repeat themselves [...]

That would be a very predictable sequence, and so not really random. The CDS method perfectly identifies this. When using a ranom number generator, you should use it inside a unique series only anyway.

> Quote:
>
> [...] and are short compared to the number of possible values given the machine accuracy.

I'm not sure I understand. I calculate the algebraic difference, *not* doing boolean algebra (i.e. test on equalty). That's a little different from the usual CDS thing, I admit.

> Quote:
>
> Another possible outcome is that the sequence converges or bounces around only a few values. This may happen only after a million cycles. But it may happen.

And here I'm sure I don't understand what you mean ;-).

Re: Question about random number generators

*Message #16 Posted by **Marcus von Cube, Germany** on 5 July 2011, 10:42 a.m.,*
in response to message #15 by Thomas Radtke

Thomas, I was not replying to you directly but to the complete thread. But I try to answer you questions anyway. ;)

Given you have a sequence S(n+1) := F(S(n)). The numeric precision of your device is limited. So you have only a limited set V of values, the set having N elements. Depending on F you split this set in subsets. The simplest function F is identity (not random at all). S(n+1) := S(n) for every S in V. You split V in N subsets.

If your function F cycles through just the half of the possible values and there are starting seeds S and S' which create distinct subsets, you split V in two subsets, one containing S and the other containing S'. This may still be a good random sequence but it limits the possible number of random numbers in a single sequence to a subset of the possible values. If the split is asymmetric (one set much larger than the other) you can either get a good sequence or a very bad one, depending on the seed.

F might have another unwanted behavior. Even if F can produce all numbers in V in a single run, there may be values in the sequence which lead to more or less short cycles. You can enter the cycle from anywhere in V but once in the loop, F never produces values outside the loop.

Re: Question about random number generators

*Message #19 Posted by **C.Ret** on 5 July 2011, 2:24 p.m.,*
in response to message #18 by Katie Wasserman

By luck, I am living in North-East of France and I am only involve with pseudo-random numbers set and ions spectrometric generators.

This perhaps explain why I usely make differencies between : - a set of random data, - a random set of data, - a set of random data, - data of a random set, - to set data from a random, and so on !

Re: Question about random number generators

*Message #20 Posted by **hugh steers** on 6 July 2011, 9:15 a.m.,*
in response to message #1 by Namir

you would need to, in addition to the usual constraints on A, C and M, ensure low correlation between S(n) and S(n+1).

This is to say, S(n) would have to pass the serial correlation test, achieved by having low partial quotients of A/M. The partial quotients are the numbers that come out from the euclidian algorithm for GCD(A,M).

See knuth V2, 3.3.3, theorem D and K.

Re: Question about random number generators

*Message #21 Posted by **David Hayden** on 8 July 2011, 11:05 a.m.,*
in response to message #1 by Namir

The X86 processors have a random number generator built into the hardware (RDRAND instruction). It uses a combination of truly random numbers, generated by an entropy source on the chip, and a pseudo-random number generator that is periodically seeded from the entropy source.

Dave

HP-41CL

*Message #1 Posted by **robertoataulfo** on 4 July 2011, 4:07 p.m.*

```
How can I have a HP-41CL?
The possibility of having new production?
I entered the site and the author made &amp;#8203;&amp;#8203;it clear that one of 41CL stayed with
him.
This indicates that not going to produce?
I appreciate any information
```

Edited: 4 July 2011, 4:10 p.m.

Re: HP-41CL

*Message #2 Posted by **exschr** on 4 July 2011, 4:35 p.m.,*
in response to message #1 by robertoataulfo

The first batch is out (approx. 20 units) and are beeing thoroughly tested
These beta units are absolutely great and as soon as the testing has finished there might start a production of the next batch (Alpha units?!)

To get more informations check:
http://www.systemyde.com/hp41/
or send an email to:
Monte Dalrymple
monted@systemyde.com

Hope this helps Roger

Re: HP-41CL

*Message #3 Posted by **Geoff Quickfall** on 5 July 2011, 2:48 p.m.,*
in response to message #1 by robertoataulfo

Have to concur with Roger,

The HP 41CL is much more then advertised. Unbelievable power at your finger tips.

Just for example, faster, I mean fast. Recoverable state in case of MEMORY LOSS or loss of power. Recoverable in the sense that you can copy your entire calculator to USER FLASH RAM which is writable; 'YFRM' to FLASH and copy-able; 'YMCPY' from FLASH.

No need for card reader, cassette, disc drive back up. In fact I now have two calculator states resident in flash. A suite of programs taking up 250 program registers and 200 x-memory registers stored in a FLASH RAM address belonging to my Palynology studies. And a suite of programs with aviation related programs and x-memory.

The following information relates to the creation of the FLASH RAM files and the copy back. No need to understand the commands as you will learn them and they are part of the CL functions which get plugged into

PORT 1 Lower (PLUG1L).

Sequence of steps to create the write from 800 to OC9 and 804 to OCF:

```
1.      TURBO50
2.      "062>812"
3.      YMCPY
4.      “812-RAM”       YFNS in RAM so YFWR can be used.
5.      PLUG1L
6.      “800>0C9
7.      YFWR
8.      “804>OCF
9.      YFWR
10.     “YFNS”
11.     PLUG1l
```

The above inputs can be automated in the form of a program!

Now at a complete “MEMORY LOSS” state:

```
1.      MMUCLR          basic reboot steps to enable MMU etc.
2.      “YFNS”
3.      PLUG1L
4       MMUEN
5.      TURBO50
6.      “0C9>800”       copy calc state from FLASH back to 800
7.      YMCPY           and 804.
8.      “0CF>804”
9.      YMCPY
10.     XEQ “PG”        see below
11.     XEQ “SGMT”      see below
```

```
1.      LBL PG          my suite of standard modules
2.      “YFNS”
3.      PLUG1L
4.      “CCDX”
5.      PLUG1U
6.      “PPCM”
7.      PLUG2
8.      RTN
```

```
1.      LBL SGMT        my clock is set to GMT (+7) hours for
2.      TURBO50         labelling.  Programs with date and for
3.      DATE            the world time program with city airport
4.      PROMPT          identifiers.
5.      SETDATE         The need for this routine is during a power
6.      TIME?           loss or MEMORY LOSS the time module has a
7.      PROMPT          power interupt and as such needs a reset.
8.      SETIME
9.      "+-GMT"         The CL in TURBO50 is so fast that the
10.     PROMPT          SETIME function occurs when you hit R/S
11.     T+X
12.     CLA
13.     TIME
14.     ATIME
15.     AVIEW
16.     END
```

To switch to another state:

ON+CLR and follow the MEMORY LOSS state example but substitute the calculator state memory address that you now require. As you can see it is no leap to run some programs, collect the data, store the data in FLASH and then switch calculator states and run programs for other reasons, switch back and continue with the previous state.

Well you get the picture, everything creates more ideas and the emails between the Beta testers includes creating ROMS, which would substitute the need for a backup state, unless you have data involved to serial communications with import and export functions to, well check out the link Roger posted.

I think with WP34S and HP 41CL this is an extremely interesting year. I forsee, with the availability of the CL the prices for used 41C, CV and CXs going up!

Cheers, Geoff

I have barely scratched the surface of the CL capabilities!

Do be careful with Geoff's material... and about those 21 units ... Re: HP-41CL

*Message #5 Posted by **gene wright** on 5 July 2011, 3:48 p.m.,*
in response to message #4 by robertoataulfo

The beta testers are still working out the best ways to copy things to ram and flash ram, as well as loading new .rom images into the 41CL.

The procedures to write to flash are very dangerous is you do not know what you are doing OR if you make a mistake. Think how things were with the early synthetic programmers investigating register c and then increase the risks. :-)

that said, Monte had people sign up to buy HP 41CL units but when the time came, quite a few of the original 20 never responded to his email about wanting a 41CL.

That may lead Monte to the (hopefully wrong) conclusion that people **say** they want a 41CL board but when the time comes, who will pay for it?

Monte may be forced to have a pay-in-advance model with the next batch (which I think won't happen until the beta testing process winds down a bit).

CAVEAT

*Message #6 Posted by **geoff quickfall** on 5 July 2011, 4:26 p.m.,*
in response to message #5 by gene wright

As Gene says, have to be careful with copying to FLASH RAM. The locations chosen have involved a LOT of reading, EMAILING and confirmations.

I posted them to show you what the CL can do and its potential. After all this is Beta testing. So those of you without a CL board don't do this ;-)

Those of you with a beta CL board, READ the MANUAL!

Enough of the serious stuff now.

Gene is correct, for Monte not to show a deficit, those that want one must follow through!

Cheers, Geoff

My four phases of 41C life:

```
my first 41C                1980
my foray into synthetics    1982
my first 41CX               1984
my first 41CL               2011
```

31 years later and the 41 (CL) is a 21st century machine!

Geoff

Yes, we're all heads-down trying to absorb the new machine's capabilities and (literally) studying its marvels. It's a wondrous accomplishment, way better than the most optimistic expectations... and yet best.

Back to study!

Re: HP-41CL automation

*Message #13 Posted by **Geoff Quickfall** on 6 July 2011, 3:15 p.m.,*

in response to message #12 by Ángel Martin

Angel is correct, emails flying, never so much fun since sythetics came about for the C.

Just to show how easy a full copy of the entire calculator state can be I converted the manually input sequence of keys in the first post to a program. The program copies the key assignments, memory registers, program registers, extended memory, flag status... well you get the idea. Similar to a WRTA or WALL command but with the added bonus of carrying all extended memory along with it!

Calculator to Flash "YCTOF"

```
001 LBL "YCTOF"
002 TURBO50
003 "062>812"
004 YMCPY
005 "812-RAM"
006 PLUG1L
007 "0C9000"
008 YFERASE
009 "800>0C9"
010 YFWR
011 "804>0CF"
012 YFWR
013 "YFNS"
014 PLUG1L
015 END
```

I have run the above program and it functions correctly. It takes 44 seconds to run in TURBO50 mode. You can see at that there is a copy command to RAM (YMCPY) and two copy commands to FLASH (YFWR)which explains the time lag.

When a MEMORY LOSS ocurrs for various reasons like 0 STO C ;-) for you synthetic nuts or power interupt or conflict between the ROMS (all things which afflicted the 41C for a novice or pro). You have a safe image which can be restored in about 25 seconds with the following manual key inputs.

```
1  MMUCLR
2  "YFNS"
3  PLUG1L
4  TURBO50
5  "0C9>800"
6  YMCPY
7  "OCF>804"
8  YMCPY
9  MMUEN
```

Of course, READ the manual if you are lucky enough to get one of these! Genes caveat is absolute, messing with FLASH can be dangerous and relies on explicit knowledge of memory addresses, all supplied in Montes great CL manual:

HP 41CL manual

That's a really, really cool (and two decade overdue) capability.

The restore listing should get added to the to the "41CL" label sticker sheet, in a size that would fit the indent in the battery pack.

Cheers, Bob

Difference in design for 25 and 25c

*Message #1 Posted by **exschr** on 4 July 2011, 3:12 p.m.*

I'm not interested in the user feature "continuous", I know it's the non-volatile memory, but the design difference in HW behind this: is it achieved through exchange of some parts (different parts) or just through adding of additional components?

thanks for hints/pointers/ideas!

Roger

Re: Difference in design for 25 and 25c

*Message #2 Posted by **Marcus von Cube, Germany** on 4 July 2011, 3:37 p.m.,*
in response to message #1 by exschr

The major step was the technology switch from PMOS to CMOS. The latter allows low power memory save as required by continuous memory.

A few simple HP 35s programs

*Message #1 Posted by **Lode** on 3 July 2011, 5:14 p.m.*

Hi,

I made a few simple programs for the HP 35s which make it a little bit better imho :)

I tried to let each one keep as much of the original stack as possible intact, this didn't succeed for every function however.

There are: extract im/re, ->R, ->P, lambertw, complex loggamma, complex conjugate, complex asin/acos/atan and complex sqrt.

They're almost all located on or near a key where either a function is similar, or the letter is a good mnemonic.

The polar/rect and lambertw ones were inspired by posts from here but made simpler.

What do you think of the programs?

Got any tips to improve them?

Are there any HP-35s related resources for other useful programs or programming tips and techniques? I found the Matrix Multitool which is very nice, but for the rest I only find surveying related programs...

Any ideas for *games* that can be programmed on a device like this?

Thanks!

```
//Get re in x and im in y. Located on the imaginary number key.
lbl g
eqn: abs(regx-sq(abs(regx))/regx)/2
x<>y
1/x
clx
eqn: abs(lastx+sq(abs(lastx))/lastx)/2
rtn

//Complex conjugate, on the +/- key
lbl n
1/x
clx
sq(abs(lastx))/lastx
rtn

//LambertW, on the W key. Makes a mess of the stack.
lbl w
sto j
fn= v
solve i
rollup
x<>y
rtn
```

```
//LambertW helper function (too bad this costs a whole label, why can't you give line numbers
to SOLVE??)
lbl v
rcl i
e^x
lastx
*
rcl j
-
rtn

//Polar to rect, on the R key representing ->R
lbl r
eqn: regy*sin(regx)
enter
eqn: regx*cos(regy)
rtn

//Rect to polar, on the S key because it's next to the R. Unfortunately lets the oldest stack
value get lost.
lbl s
i
*
+
arg
lastx
abs
rtn

//Complex loggamma, on the z key which is above '!'.
lbl z
1/x
clx
eqn: 0.918938533205+(lastx-0.5)*ln(lastx)-lastx+1/(12*lastx)-1/(360*lastx^3)+1/(1260*lastx^5)
rtn

//Square root of complex numbers, on the square root key
lbl k
1/x
clx
eqn: lastx^0.5i0
rtn

//Complex asin, on the sin key (why doesn't it support this by default anyway?)
lbl h
1/x
clx
eqn: -i*ln(i*lastx+(1-lastx*lastx)^0.5i0)
rtn

//Complex acos, on the cos key
lbl i
1/x
clx
eqn: -i*ln(lastx+((lastx*lastx-1)^035i0))
rtn

//Complex atan, on the tan key
lbl j
1/x
clx
eqn: 0.5*i*ln((1-i*lastx)/(1+i*lastx))
rtn
```

Re: A few simple HP 35s programs

*Message #2 Posted by **Paul Dale** on 4 July 2011, 1:28 a.m.,*
in response to message #1 by Lode

I wrote a game for the 35s which still hasn't made it into the software library but is available as an article and buried in the archives.

Also, we did a group effort on R->P and P->R functions, again available as an article. These behave the same as internal commands with respects to stack operations, LastX etc.

Re: A few simple HP 35s programs

*Message #3 Posted by **Lode** on 4 July 2011, 3:36 p.m.,*
in response to message #2 by Paul Dale

Why is there so much flag 10 logic in these R/P examples? If it's to clear it for the equation, isn't just a single "CF 10" enough? If it's to keep the original state of flag 10: is that really so important to be worth so much extra lines (not to me)? If a program wants to display a message it will set the flag anyway...

The game looks cool! It's going to be a LOT of work to type it over though! I wish there existed a way to automate this inputting. When typing over the "Matrix Multitool", there was one big problem I had: since the calculator updates line numbers automatically when inserting lines, it sometimes messes with line numbers if you need to correct a mistake on an earlier line. It was hell. When I typed that matrix program, I had already added the "RTN" at the end while still typing all previous lines. It had changed almost all GTO's and XEQ's that pointed to the future, into line number 442. When going back to correct each of those, due to deleting and readding the GTO line, some others got messed up as well, etc... Any tips on efficiently entering a long program and not letting it mess up line numbers?

Re: A few simple HP 35s programs

in response to message #3 by Lode

> Quote:
>
> Why is there so much flag 10 logic in these R/P examples?

The logic is there so they act exactly like internal commands -- don't care about the state of the device on entry and don't change the state of the device on exit. Equations don't work if flag 10 is set so that has to be cleared and restored.

> Quote:
>
> If it's to clear it for the equation, isn't just a single "CF 10" enough? If it's to keep the original state of flag 10: is that really so important to be worth so much extra lines (not to me)?

A nice simple solution is to remove the bits you don't want. The 35s isn't even remotely short of program memory so the extra lines are kind of moot.

> Quote:

> If a program wants to display a message it will set the flag anyway...

And if the program neglects to clear this flag afterwards? What about a program that sets it to display messages and then does a rectangular polar conversion. These commands are designed to work regardless. Still, take out the bits you don't want or do your own.

> Quote:
>
> Any tips on efficiently entering a long program and not letting it mess up line numbers?

Nope, it is just painful. When developing the game, I retyped it when substantial changes were made to avoid these issues.

SpeedUI 11.06 released!

*Message #1 Posted by **Raymond Del Tondo** on 3 July 2011, 4:48 p.m.*

Hello all,

here's an important update for SpeedUI.

SpeedUI 11.06 fixes a menu key bug when in the Units menu,
and replaces the normal soft keys display with a faster one based on UFL.

Several components have been slightly optimized.

Prior to installation of the new SpeedUI,
please remove ALL older SpeedUI components,
since CF.LIB and other components have changed internally,
and all components have been adjusted to the new CF.LIB layout.

For installation/uninstallation, please take a look into
StartHere.pdf supplied with the SpeedUI 11.06 archive.

The new version is available here:
SpeedUI Walkthrough PDF
SpeedUI zip archive

but _not_ on www.hpcalc.org (since the site has not been updated for a long time)

Have fun:-)

Raymond

BTW: This could be considered as my birthday edition, since today's my **48**. birthday:-)

Unfortunately, no.

> Quote:

> Btw I'm still searching for ROM based language memory dump (basic, hpl, ...)

Don't exactly understand what you mean with this. I have a 9816, so probably I can help ...

Re: SpeedUI 11.06 released!

*Message #7 Posted by **Olivier De Smet** on 9 July 2011, 6:21 a.m.,*
in response to message #6 by Juergen Keller

For the rom dump you need :

hp series 200 unit

9121 or 9122 disk unit, pc with win XP or win98, teledisk utility (best to have a 9122 to use 600K disk)

language in rom : 98603A BASIC 4.0 ROM, ROM HPL 2.0 for 200 Series, ROM BASIC 2.0 for 200 Series (see hpmuseum site)

if so I can make a basic or pascal program to dump the rom on a file (I need to know the release of your basic or pascal)

Then you can use teledisk to make an image of the 3"1/2 disc

Olivier

Is there an easy way to determine how many factors a number has?

*Message #1 Posted by **Don Shepherd** on 2 July 2011, 8:09 p.m.*

My student wanted to know. The classic way is to do the prime factorization for the number, take the exponent of each prime factor and add 1 to it and multiply these together, and the result is the number of factors that the original number has.

The 17b can do it easily in a solver equation:

```
nf=0xL(a:√(n))+2+Σ(i:2:g(a):1:if(mod(n:i)=0:if(i=a:1:2):0))
```

It works on the 17b, 17bii, and 17bii+, although it's much slower on the plus.

Edited: 2 July 2011, 9:45 p.m.

Re: Is there an easy way to determine how many factors a number has?

*Message #2 Posted by **Paul Dale** on 2 July 2011, 9:46 p.m.,*
in response to message #1 by Don Shepherd

I'm not aware of any and I believe that finding this is equivalent in difficult to factorising. I looked at adding this to the 34s firmware but didn't dig too deeply.

Once you have the prime factorisation, determining the factors is straightforward as you've pointed out.

- Pauli

No, there is not!

*Message #3 Posted by **Gerson W. Barbosa** on 3 July 2011, 10:58 a.m.,*
in response to message #1 by Don Shepherd

Otherwise there would be a an easy way to tell whether a number is prime or not. There are a number of interesting properties related to this, however. One of them states that perfect squares, and only them, have an odd number of divisors (more at OEIS). This is the basis for the optimized solution to the 100 doors problem (the following wp34s program will display the doors that will be open after the last pass).

```
001 LBL D
002 2
003 10^x
004 SQRT
005 FP?
006 SKIP 02
007 RCL L
008 PSE 10
009 DEC L
010 x<> L
011 x>1?
012 BACK 08
013 RTN
```

Re: No, there is not!

*Message #4 Posted by **Marcus von Cube, Germany** on 3 July 2011, 2:13 p.m.,*
in response to message #3 by Gerson W. Barbosa

Gerson, wouldn't it be much easier to just compute the squares from 1^2 to 10^2 instead of testing each integer if it is a square?

Re: No, there is not!

*Message #5 Posted by **Gerson W. Barbosa** on 3 July 2011, 2:30 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Yes, it would :-) And it would make for an extremely short wp34s program.

BTW at least a couple of optimized C solutions there follow that approach:

```
#include <stdio.h>

int main()
{
        int i;
        for (i = 1; i * i <= 100; i++)
                printf("door %d open\n", i * i);

        return 0;
}

#include <iostream> //compiled with "Dev-C++" , from RaptorOne

int main()
{
    for(int i=1; i*i<=100; i++)
            std::cout<<"Door "<<i*i<<" is open!"<<std::endl;
}
```

A mathematical explanation, in Spanish:

http://gaussianos.com/el-problema-de-las-100-puertas-y-los-divisores-de-un-numero-natural/

Edited: 3 July 2011, 2:36 p.m.

Changing the ROM of a HP-35s?

*Message #1 Posted by **Lode** on 2 July 2011, 2:00 p.m.*

Hello,

Do you think it would be technically possible to change the ROM of a HP-35s?

The hardware of this machine rocks! Nice keys, low battery consumption, alphanumeric LCD, beautiful looks. The software on it is OK but is a bit disappointing imho. I think there should be more potential with this CPU and 30k memory. Like, for example, outputting '-1' instead of 'error' when pressing x^2 button if 'i' is on screen.

Is this ROM located under the same epoxy blob as the CPU? Is such a type of ROM typically modifiable somehow, and if it's truly hardwired read only, to replace it with something else somehow? I have much more software than electronics experience. It would be awesome to learn programming assembly for this CPU (or if there's a compiler for it it's even better) and applying this to the actual device to use it.

It would be fantastic to come up with something that uses roughly the same key layout but is better, and to have the ability to upload ROMs to it with USB from any OS including Linux.

Thanks.

Edited: 2 July 2011, 2:57 p.m.

This was the basic idea we started our WP 34S project with 8-) after ranting many months about HP unwilling to come out with a scientific successor of the 42S. AFAIK, the 20b, 30b, and 12C are the only HP calcs

allowing to be repurposed in any way by educated users. *And the 10bii and 50g are as well. Developer's tool kits are available for the 20b, 30b, 12C.* That's it, but that's far better than nothing :-)

Of those three, the 20b and 30b sport the most versatile display (and they share the same processor), and the 12C and 30b feature the best keyboards. The intersection is the 30b suiting best to be repurposed for the time being.

Walter

Added the italic text above taking care of Tim's and Pauli's remarks posted below.

in response to message #3 by Walter B

I don't know any reason why one couldn't do the same kinds of things with a 50g. Like the 12C, 20b, 30b, and 10bii, its firmware is in flash memory. It uses a Samsung S3C2410 SoC with an ARM 9 core.

Re: Changing the ROM of a HP-35s?

*Message #7 Posted by **Paul Dale** on 3 July 2011, 12:18 a.m.,*
in response to message #6 by Eric Smith

This is definitely possible. Without erasing the existing calculator functionality too. My 49g+ died so it won't be me.

Re: Changing the ROM of a HP-35s?

*Message #8 Posted by **Walter B** on 3 July 2011, 2:55 a.m.,*
in response to message #7 by Paul Dale

OK, for those needing a really big stick for hunting, the 50g might be appropriate. Personally, I prefer smaller weapons ;-) But a REASONABLE DISPLAY will be nice, of course d:-)

Walter

P.S.: Strange, but it seems to me we had this discussion more than once before. Presumably getting old d;-)

Re: Changing the ROM of a HP-35s?

*Message #10 Posted by **Paul Dale** on 3 July 2011, 12:21 a.m.,*
in response to message #1 by Lode

I'd love for the 35s to be reprogrammable. Lots of RAM, nice keyboard, heaps of flash and a good display. The 34s functionality would pale in comparison to what could be done with this platform.

Sadly, not to be.

As it is the 34s pretty much does everything the 35s does except algebraic support and lots of RAM.

Emu48 problem with BEEP patches

*Message #1 Posted by **fhub** on 2 July 2011, 10:29 a.m.*

Hi,

I have a problem with the emulations of 38G and 39G/40G in Emu48:
no matter what I do/try, I just can't get these emulated calcs to beep (e.g. on errors)! :-(

Everything works fine for all other emulations (48SX/GX, 49G and 50g), but all BEEP-patches I've found and I've tried just don't work.

Here's a list of different patch addresses that I've tried, some of them I found in KML-scripts and others in ROM entry list:

For the 38G:
017D0:81B1; =makebeep (internal, undocumented)
8114F:81B1; =makebeep

And for the 39G/40G:
017BC:81B1; =makebeep (internal, undocumented)
017D0:81B1; =makebeep (internal, undocumented)
0F360:81B1; =makebeep

As already said: none of them works! :-(

So has anyone here correct BEEP patch addresses for these 2 emulator ROMs for the 38G and 39G/40G, or does anyone know how maybe I could find out such correct addresses for my ROMs myself?

Franz

Edited: 2 July 2011, 10:30 a.m.

Re: Emu48 problem with BEEP patches

*Message #2 Posted by **Raymond Del Tondo** on 2 July 2011, 11:50 a.m.,*
in response to message #1 by fhub

Hi,

at least for the HP-38G I can't remember ever hearing a tone signal on a real unit at all. On errors there only was an exclamation mark in the display.

These calcs were meant to be used in classrooms, and therefore unwanted tone signals had to be suppressed.

I guess it similar with the 39g/40g.

Re: Emu48 problem with BEEP patches

*Message #3 Posted by **fhub** on 2 July 2011, 12:08 p.m.,*
in response to message #2 by Raymond Del Tondo

Well, maybe you're in fact right - I don't own a real unit of them.

But then I wonder why almost every KML script for these calcs contains a patching line like e.g. this: Patch "BEEP.39G"

Re: Emu48 problem with BEEP patches

> 017BC:81B1; =makebeep (internal, undocumented)

The above entries are good for me.

The command for beeping on the 38G/39G/40G is

BEEP frequency;duration

BEEP 1000;5 are 1000Hz for 5s.

Short message beeps generated over the =RCKBp (ROM Check Beep) entry aren't simulated.

Christoph

Re: Emu48 problem with BEEP patches

*Message #5 Posted by **fhub** on 3 July 2011, 4:53 p.m.,*
in response to message #4 by Christoph Giesselink

> Quote:
>
> The above entries are good for me.

Yep, it's indeed working - many thanks Christoph! :-)

The problem was that I got no beep after the bootup or for any error messages (as it happens for all other HP emulators), so I didn't even try it with the BEEP command because I was sure it won't work.

So the 38G and 39/40G are using different internal commands for such short error/message-beeps than e.g. the 48/49/50G, because for the latter also these beeps work?

HP-48GX SpeedUI problem

*Message #1 Posted by **Tom Sauntry** on 30 June 2011, 9:44 p.m.*

I have tried to install SpeedUI several times now and I can't get it to work except for one quick attempt that later froze. I download the libraries, store them on Port 0 or on my Port 2 RAM card as required. Then I attach them and restart the calculator. It comes up on the stack display okay but the processing icon stays on and the calculator does not respond to any keys. I have tried ON/C/F to clear memory and tried again several times, with and without attaching the libraries. It seems like the CF module starts up and then keeps running, no UI stack displays. Any ideas?

This was the latest V11.05

The last couple of times, I tried to attach the libraries, but nothing shows up as attached when I do RS LIBRARY to see what is attached to the HOME directory.

Re: HP-48GX SpeedUI problem

*Message #2 Posted by **Raymond Del Tondo** on 1 July 2011, 4:08 a.m.,*
in response to message #1 by Tom Sauntry

Hello,

which libraries did you store in which port, and which third-party libraries are installed, and in which ports?

Some of the libraries of the SpeedUI package must be stored in port 0 or 1, like the CF.LIB . For more details please take a look at the MoreInfo.pdf .

Most components should also work from port higher than 1, but it's recommended to store all SpeedUI components in port 0 or 1 for performance reasons, since all higher ports are bank-switched, and thus lead to slower program execution.

Did you install the special UFL library supplied with SpeedUI?

You mention that the library menu doesn't show the SpeedUI components, which indicates that CF.LIB is not stored in port 0 or 1.

As most libraries, the SpeedUI core component is auto-attaching after a turn of-turn on sequence. During warmstart, the CF config code also "attaches" (or better activates) the other installed SpeedUI components.

HTH

Raymond

Curious Sticker on the Back of an HP-35

*Message #1 Posted by **Katie Wasserman** on 29 June 2011, 10:14 a.m.*

Ignoring the fact that this is mis-advertised as a programmable calculator, take a look a the trig function sticker on the back of this HP-35..

Was this sticker offered by HP or possibly one of the companies that made aftermarket products?

Re: Curious Sticker on the Back of an HP-35

*Message #2 Posted by **Michael de Estrada** on 29 June 2011, 10:31 a.m.,*
in response to message #1 by Katie Wasserman

I doubt it came from HP. Also interesting, the S/N says Version 3, but the front label says Version 2.

Re: Curious Sticker on the Back of an HP-35

*Message #3 Posted by **Walter B** on 29 June 2011, 11:22 a.m.,*
in response to message #1 by Katie Wasserman

Since it's far from being coherent, I bet that label was made by somebody else, maybe even DIY.

Walter

*Message #10 Posted by **aj04062** on 29 June 2011, 8:55 p.m.,*
in response to message #9 by Joerg Woerner

NICE!

I think this last one is ENTIRELY APPROPRIATE for a calculator of this vintage.

However, I don't think the hippies were carrying the HP-35s at Woodstock. (I know my dates are off but it made me laugh to think a tripping hippie would need to remember trigonometry)

Re: Curious Sticker on the Back of an HP-35

*Message #11 Posted by **Palmer O. Hanson, Jr.** on 4 July 2011, 8:24 p.m.,*
in response to message #1 by Katie Wasserman

I didn't know what this was all about until I looked up the Wikapedia reference. I don't think that I have known anyone who used any of these memory aids for trigonometric relationships. So, I am curious. Did the participants in this forum use this sort of stuff?

In seventh grade geography I was introduced to the memory aid HOMES as a way to remember the names of the Great Lakes. But the teacher commented that it was far better to work from a visualization of the lakes.

Re: Curious Sticker on the Back of an HP-35

*Message #12 Posted by **Forrest Switzer** on 4 July 2011, 11:13 p.m.,*
in response to message #11 by Palmer O. Hanson, Jr.

Nope.

Opposite over hypotenuse. Adjacent over hypotenuse. Opposite over adjacent.

Re: Curious Sticker on the Back of an HP-35

*Message #13 Posted by **Dave Shaffer (Arizona)** on 4 July 2011, 11:46 p.m.,*
in response to message #12 by Forrest Switzer

I'm with Forrest.

I had never heard of SOCATOA (or whatever) until I started teaching Phsyics I in 2000 (some 32 years after I learned trig).

Re: Curious Sticker on the Back of an HP-35

*Message #14 Posted by **Walter B** on 5 July 2011, 2:01 a.m.,*
in response to message #13 by Dave Shaffer (Arizona)

Same on this side of the pond. No memory aids (Eselsbrücken) in use for such stuff.

Walter

Re: Curious Sticker on the Back of an HP-35

*Message #15 Posted by **Katie Wasserman** on 5 July 2011, 2:16 a.m.,*
in response to message #14 by Walter B

I remember being told to remember SOHCAHTOA by my high school trig teacher as a help in talking the NY State Regents Exam. But I found that learning how to spell such a word took the same effort as just learning the definitions of the functions.

Re: Curious Sticker on the Back of an HP-35

*Message #16 Posted by **Paul Dale** on 5 July 2011, 3:57 a.m.,*
in response to message #13 by Dave Shaffer (Arizona)

I never heard of it before this forum. Not at school, not at university doing mathematics nor doing postgraduate mathematics.

- Pauli

Re: Curious Sticker on the Back of an HP-35

*Message #17 Posted by **Neil Hamilton (Ottawa)** on 5 July 2011, 6:17 a.m.,*
in response to message #13 by Dave Shaffer (Arizona)

Yah, yah, yah. I hear that everyone here "just gets" the trigonometric relationships -- and considering some of the spelling capability, it might be just as well :-) For the rest of us slightly dyslexic fools (some with several university degrees, including "physics"!), we sometimes could use a crutch or two. But do we all need it? Naw, but it sure is more fun to know!

I am wondering what you used to remember the resistor colour codes? Mine was a bit racy and probably not entirely appropriate in this day and age (suitably modified for a public audience):

"Bad boys [relish] our young girls but Violet goes willingly."

Oh, but surely y'all just got those as well! :-D

Or how about: "Many velvet elephants met jolly Santa under North Pole." Ooops! I guess that doesn't work anymore...

"30 days has September, April, June, and November, all the rest have 31 save February." Or the knuckles trick.

For me, I am lucky if I remember where my car keys are (or even, "where did I park that darn car? ")...

Re: Curious Sticker on the Back of an HP-35

*Message #18 Posted by **Walter B** on 5 July 2011, 1:16 p.m.,*
in response to message #17 by Neil Hamilton (Ottawa)

Neil,

> Quote:
>
> I hear that everyone here "just gets" the trigonometric relationships

At the bottom line, you have to remember just one, e.g. sin = opposite / hypotenuse. Then you know cosine being "the other leg". And everything else follows. Feasible, isn't it? Even many engineers know it ;-)

Walter

Re: Curious Sticker on the Back of an HP-35

*Message #19 Posted by **Dave Shaffer (Arizona)** on 5 July 2011, 1:24 p.m.,*
in response to message #17 by Neil Hamilton (Ottawa)

Have to admit I use (a slightly racier version of) Neil's resistor code!

Depends, perhaps, on your field: I never needed a mnemonic for the planets, but I'm an astronomer (although not a planetary one).

On the other hand, if you want to know "what star is that" when looking up at the sky, DON'T ask a professional. You are much better off with a good amateur for that! We tend to look at much (!) fainter stuff, and just type coordinates in to the computer which controls whatever telescope we are using.

Re: Curious Sticker on the Back of an HP-35

*Message #20 Posted by **Palmer O. Hanson, Jr.** on 5 July 2011, 10:55 p.m.,*
in response to message #1 by Katie Wasserman

Back in the 1940s and 1950s most trigonometry tests were closed book. Students were expected to know the

basic trigonometric relationships. No one would have objected to the use of one of the mnemonic tricks as a memory aid. But if a student had written the mnemonic in the palm of his hand or somewhere on his slide rule it would have been considered cheating. So, wasn't the sticker on the back of an HP-35 a case of cheating?

wp34S Flag Table via STATUS

*Message #1 Posted by **Jake Schwartz** on 29 June 2011, 9:36 a.m.*

Hi Guys,

I was playing with the wp34S STATUS command the other day to look at flag status and noticed something. In the 34S, presses of down arrow when at the end of the flag list (and up arrow when at the beginning) act as a NOP. On the 50g, when the system flag table is displayed (via MODE > FLAGS), when the end of the list as flag 128 is reached, a further press of the down-arrow key conveniently returns the list back to the beginning. Likewise, when at the top of the list, pressing up-arrow rolls around to the end of the list. This seems to be a nice feature. Would there be any way this could be adopted for the 34S?

Thanks, Jake

Re: wp34S Flag Table via STATUS

*Message #2 Posted by **Marcus von Cube, Germany** on 29 June 2011, 10:33 a.m.,*
in response to message #1 by Jake Schwartz

Anything can be done. If Pauli does it and Walter approves it. :-)

Your suggestion sounds very reasonable and I don't think it's too much work to implement so your chances are high.

I'm working on I/O routines for the next release so that data and programs may be exchanged via a link cable between devices or device and (emulator running on) PC. Stay tuned!

Re: wp34S Flag Table via STATUS

*Message #3 Posted by **Walter B** on 29 June 2011, 11:04 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Jake,

> Quote:
>
> Anything can be done. If Pauli does it and Walter approves it. :-)

:-) In this very case it was the other way round: I had the cyclic flag browsing in the documentation already some months ago - but then it turned out it wasn't implemented. So Pauli must say if it's possible within the limits set - and he will tell you tomorrow at earliest. TIA for your patience.

Walter

Re: wp34S Flag Table via STATUS

9810 on TAS

*Message #1 Posted by **David Ramsey** on 28 June 2011, 10:58 p.m.*

Hm. HP 9810A calc, $599 Buy It Now, but seller hasn't plugged it in "for fear of blowing something".

Expensive bet. Still, tempting. Would have jumped already if not for the $ spent on the SR-60.

Re: 9810 on TAS

*Message #2 Posted by **Michael de Estrada** on 29 June 2011, 6:09 a.m.,*
in response to message #1 by David Ramsey

Well, it's Buy it Now or Best Offer, so why not just make an offer ? Also, they have a 7 day return policy, so you don't need to be stuck with a lemon.

Re: 9810 on TAS

*Message #3 Posted by **David Ramsey** on 29 June 2011, 11:07 a.m.,*
in response to message #2 by Michael de Estrada

Mmm...good points. I'll make an offer...

After having my collecting bug re-ignited recently, I've added an HP-85, HP-87, several HPIB disk drives, and the SR-60 to my existing desktop collection of an HP-46, a 9815, and a 9825 (which I just had Larry Atherton refurb the tape drive and printer on).

I am running out of space for these large machines. Perhaps I'll sell the 9815; it works perfectly, but the printer sounds like a machine gun and I've always been annoyed that you can't see your program on the display.

Re: 9810 on TAS

*Message #4 Posted by **Michael de Estrada** on 29 June 2011, 12:05 p.m.,*
in response to message #3 by David Ramsey

> Quote:
>
> I am running out of space for these large machines.

The only large machine I have is an HP 46, which completes the scientific trilogy of HP 45, 46 and 91, and that's all I can handle spacewise. It would be nice to also have an HP 81 to complete the financial trilogy of HP 80, 81 and 92, but unless I move to a larger home it's not in the cards. The only calcs I buy nowadays are handhelds.

Re: 9810 on TAS

*Message #5 Posted by **David Ramsey** on 29 June 2011, 12:13 p.m.,*
in response to message #4 by Michael de Estrada

Yeah, my original collection was "handheld scientifics", but I have all of those, collected over about 30 years.

They accepted my "best offer", so the 9810's mine. Any suggestions anyone might have about what I should do before putting power to it would be appreciated. I believe the standard is to open it up, remove all the plug-in cards, and clean the contacts thereof...but I'm sure there's more.

Re: 9810 on TAS

*Message #6 Posted by **Dave Shaffer (Arizona)** on 29 June 2011, 12:50 p.m.,*
in response to message #5 by David Ramsey

Depends a bit on what test equipment you have.

If it was mine, I would:

open it up, disconnect everything from the power supply (if possible)

Clean out any dead bugs, spider webs, mice droppings, etc. Check for corrosion and any obvious scorch marks

Check the continuity of the power supply INPUT (check across the power plug with an ohm meter), with power switch in both ON and OFF position - checks for shorts and blown fuses or power supply transformer

Plug it in (hold your breath)

If nothing blows up, check the power supply output(s) for the expected voltages. If you have a 'scope, check the DC voltages for AC ripple (or use your multimeter in AC mode on the DC lines). A likely problem, if has been sitting for a long time, is that the electrolytic filter capacitors for the DC output have gone south. They should be relatively easy to replace if necessary.

At that point, it ought to be safe to plug various things back into their slots with power connected

Good luck!

Re: 9810 on TAS

*Message #7 Posted by **David Ramsey** on 29 June 2011, 2:14 p.m.,*
in response to message #6 by Dave Shaffer (Arizona)

Thanks for the tips, Dave. I do have a multimeter so I can perform the basic checks you mentioned. I'll post my results here.

Re: 9810 on TAS

in response to message #7 by David Ramsey

Congratulations! You may want to have a look at my 9810 ownership experience. It's a gorgeous machine, but it might require some work.

My 9810 repair job

Regards Andreas

Re: 9810 on TAS

*Message #9 Posted by **David Ramsey** on 29 June 2011, 7:59 p.m.,*
in response to message #8 by marais

Interesting information. Using a soldering iron and a multimeter are pretty much the limit of my hardware abilities, so if the machine's dead, I'll have to decide whether to return it or appeal to the community for (paid) help.

Re: 9810 on TAS

*Message #10 Posted by **aj04062** on 29 June 2011, 9:04 p.m.,*
in response to message #9 by David Ramsey

Hey Dave,

I have a recently picked up a 9810 from a Hospital near Philly. I have to debug a keyboard problem, then rebuilt & repair the printer and card reader.

If you're interested, we can embark on the troubleshooting together. Tony Duell in the UK has already helped me A LOT.

BTW, I was "wicked brave" as they say in Maine (or stupid) and plugged this on in and turned it right on. After some funcky behavior it seems to work okay except for the keyboard.

Re: 9810 on TAS

*Message #11 Posted by **Dave Shaffer (Arizona)** on 29 June 2011, 9:44 p.m.,*
in response to message #10 by aj04062

I appreciate the vote of confidence, but I think any help you can get from Tony will be several orders of magnitude more useful than I can offer!

My comments are pretty generic for starting up any old piece of electronics, whereas Tony has been all over the insides of these.

Re: 9810 on TAS

*Message #12 Posted by **Tony Duell** on 30 June 2011, 4:25 a.m.,*
in response to message #11 by Dave Shaffer (Arizona)

I'll be happy to help anyone get one of these machines running again (ditto for the 9820 and 9830, I can't comment as much on the 9821).

I have to be honest, they are not trivial machines to get going in some cases. On the other hand if you do have a nasty logic fault, you will learn a lot tracking it down.

Then there are mechanical repairs. The card reader roller will certainly need replacing, the printer platen may be decayed too. There are various

ways to repair these, I can tell you what I do (and there are some pictures in my flickr account, tony_duell, listed as for the 9820 printer and card reader, the 9810 is the same), but as you'll see from there I have a reasonable workshop.

I hate to blow my own trumpet even more, but I've submitted 8 articles on repairing these machines to HPCC (to go in Datafile). At the moment I am not willing to share said articles (to et them you have to join HPCC), I may well do so in a couple of years time after they are all published. FWIW, the first 5 articles are simply on how the machine should work, understand that and IMHO finding the fault is easy!

Were I to join HPCC (which I must admit I was unaware of until now), are all of your articles available, or are some still pending?

It seems virtually none of the *Datafile* content is available online, which strikes me as odd and counterproductive in 2011. Even HP makes all of their *HP Journal* content available online.

I have no problem buying a membership, though. God knows it will be less than I paid the Computer History Museum to scan those SR-60 manuals.

Re: 9810 on TAS

in response to message #13 by David Ramsey

How many people would subscribe to Datafile if all its content was available free online? HP didn't have to worry about that sort of thing when they put HP Journal online (and gave out paper copies for free back in the day).

Re: 9810 on TAS

*Message #15 Posted by **David Ramsey** on 30 June 2011, 11:12 p.m.,*
in response to message #14 by Eric Smith

I wasn't suggesting that the content be free, merely that it be available online. It's not as if write the code to implement name and password authorization-- like, say, we do here on this forum-- is particularly difficult.

Re: 9810 on TAS

*Message #16 Posted by **Tony Duell** on 1 July 2011, 4:20 a.m.,*
in response to message #15 by David Ramsey

This has been discussed at HPCC many times. I think it comes down to several issues

-- What is to stop people sharing their password, or distributing the downloaded documents? In other words, a group of people get together, one joins HPCC, and the on-line issue of Datafile gets to all of them. Yes, I realise you can pass round a paper copy too, but it's a lot harder to duplicate it, there's a big difference IMHO between showing a magazine to a friend and giving him a duplicate of it

-- There is no requirement for members to have internet access, ability to view or print files, etc. And I happen to know that a number of members do not in fact have such facilites. We would have to keep the printed version or risk losing some active members.

-- This would then lead to multiple classes of membership which would be more work for the club.

-- It would proasbly have an impact of the sale of Jake's CD-ROMs, which are also a source of income to the club.

But I am not really the person to talk about this. Feel free to pester the other committee members (details on the hpcc web site).

Re: 9810 on TAS

*Message #17 Posted by **Tony Duell** on 1 July 2011, 4:08 a.m.,*
in response to message #13 by David Ramsey

Most are still pending...

Part 1 : CPU Theory was published in the last issue of Datafile (HPCC journal). Part 2 : HP9810/HP9820 memory theory should appear in the next issue, when it gets produced (It's currently about 2 months late!).

The remaining parts from memory are : Part 3 : HP9830 memroy theory; Part 4 : Display, Keyboard and Printer theory; Part 5 : Storage and PSU theory; Part 6 : Dismantling and initial checks;

Part 7 : Electronic troubleshooting; Part 8 : Mechanical repairs.

I am not really the person to comment as to why Datafile is not available on-line. I guess the main reason is that HPCC is a club, not a big company, and we rely on income from membership fees for club expenses. Of course none of the people involved in the club are paid in any way for their work.

Authors of articles do not transfer the copyright to HPCC, they do however grant that HPCC may publish the articles and normally that they may be included in other HPCC and related publications (such as Jake's CD-ROMs of datafile). Authors are therefore welcome to publish their articles online (or on paper) if they so wish. My moral view is that I will not do this during the year that HPCC publishes them in Datafile (and maybe not for at least one more year), after that I would be prepared to make my stuff available.

I hate to say this, but as it's a bit-serial machine, I know that _I_ would have a lot of difficulty fixing logic faults with just a multimeter.

I find I need 3 things to do serious troubleshooting on these machines :

The schematics (available from the Australian museum site) A logic analyser CPU Microcode source listing (ask me nicely...)

> The schematics (available from the Australian museum site) A logic analyser CPU Microcode source listing (ask me nicely...)

Actually, I'd have a lot of difficulty tracking logic errors in a 9810 even with an entire lab full of professional equipment, since I don't have the knowledge to use it.

Purely mechanical repairs like card reader rollers are one thing (although this may largely be academic since I don't have any 9810 cards. Perhaps I can cut

an SR-60 card down to fit); programming, which I am actually quite good at, is another; but hardware work at this level...well...

I will do the obvious stuff already mentioned, and perhaps it will *Just Work*. It's not unprecedented. If it doesn't, I'll comfort myself with the fact that there are knowledgeable folks here willing to help.

Re: 9810 on TAS

*Message #20 Posted by **Tony Duell** on 1 July 2011, 4:14 a.m.,*
in response to message #19 by David Ramsey

Yes, you are absolutely correct. I have said many times that the most important piece of test gear is your brain :-)

More seriously, all the multimeter, logic analyser, 'scope, etc do is enable you to gather evidence as to what the machine is doing. You can't directly see electrical signals, and you can't directly interpret any signal at 8MHz, so you need test gear to be able to follow what the signals are doing.

However, IMHO the _only_ way to find a fault goes like this : Understand what the machine should be doing, make measurements to find out what it is doing, then work out why the 2 are different.

This may be straightforward (for example if you're missing some segments in one row of the display, I'd home in on the driver chips for that row), it may be complicated (a totally blank display can be caused by a fault in the CPU, memory, PSU, display driver, etc). But only by goinging logically through the machine will you find the fault and cure it.

Making random changes, boardswapping and the like, will get you nowhere fast.

I'd like to add that the 74LS688-based address comparator we used to track down the current uCode address on my 9810 might be a worth a try, if you do not have a logic analyzer. I don't have one either, although it's on my wishlist for quite some time.

Re: 9810 on TAS

*Message #22 Posted by **David Ramsey** on 1 July 2011, 1:09 p.m.,*
in response to message #20 by Tony Duell

Well, if it were a modern machine, it'd be easy: I have more motherboards, processors, memory, video cards, cases, and power supplies than I know what to do with (I test hardware for a reviews web site). I can (and have) swapped stuff out to isolate problems, and I've been in the computer industry since the late 70s and so can generally zero in on a problem quickly.

At least many of the 74-series ICs in the 9810 are still available, unlike, say, the special TI chips in an SR-60.

Re: 9810 on TAS

*Message #23 Posted by **marais** on 2 July 2011, 4:53 a.m.,*
in response to message #22 by David Ramsey

It's true that most of the chips are still available. I recall that one owner had problems with a triple or quadruple logic gate, and had to build an equivalent circuit with two smaller gates. When I did my repair job, I bought most of the 74 circuits required, to be ready for futur service needs. I think the most difficult tasks on this type of machine concern mechanical parts; unlike Tony, I do not have a lathe, but I am considering getting one.

*Message #24 Posted by **Joel Setton (France)** on 2 July 2011, 5:22 a.m.,*
in response to message #23 by marais

I quite agree, that's one of the nice things in these early machines.

The 9815 is also built from standard linear and 74LSxx chips. The only exception is the masked ROMS, but in later units (and in the 9815S), these can be replaced with standard EPROMs which are pin-for-pin compatible with the original chips.

Of course, as sales volumes increased, it made economic sense for HP to produce custom chips, which also resulted in pocket-sized calculators!

> Of course, as sales volumes increased, it made economic sense for HP to produce custom chips, which also resulted in pocket-sized calculators!

The HP-9800 series is contemporary with the HP-35 (1972), so I doubt there was any linear progression from HP's desktops to HP's handhelds.

At Georgia Tech so long ago (1972, 73), an HP-9820A was used to control a digital circuit simulator. It connected to a panel that accepted special jumper-plug boards that were similar to the 1940s/50s-era programming boards used in some early computers. On this board various types and number of logic gates were represented which students would connect appropriately with jumpers to configure and test their solution to assigned digital design problems. I really liked the 9820A, which could be also be diverted to normal calculator use. I still have a couple of its magnetic program cards. I don't recall what I had programmed on them, because the associated thermal paper listings faded a few years after printout.

In the mid-1990s, I was given an excellent condition but (of course) non-working HP-9820A that powers up but does little else. I've not tried any troubleshooting due to higher priority projects. Still, it has nostalgic value as an example of the first HP that I ever used. (The HP-35 and -45 were in the college bookstore at the time, but I could never have afforded one.)

(Edited to correct my 9200A typo in the last paragraph to 9820A.)

*Message #26 Posted by **Tony Duell** on 30 June 2011, 4:16 a.m.,*
in response to message #6 by Dave Shaffer (Arizona)

You can easily 'disconnect everything from the power supply' The power supply regulators are on the 3 PCBs under the metal plate at the right side of the machine. The mains transformer is on the rear panel, and the secondary (output) windings are wired to edge connectors on the base of the machine. The PSU boards plug both into those and into edge connectors on the main backplane.

So if you remove the PSU boards you can apply mains and test the mains trasformer. If you remove all the other parts from the backplane (memory box, CPU boards, display, printer, card reader controller, keyboard signal cable) you can fit the PSU boards, power up and check that the power supply outputs are all correct.

Most of them are avaialable on testpoints on the PSU boards (labelled on the metal cover plate). The 5V line isn't, but you can easily fidn that on one of the edge conenctors. The chassis is connected to the machine's 0V rail and you can connect the -ve multimeter probe there.

The mains on/off switch is, of course, on the keyboard assembly. It's connected by the 5 pin in-line connector. Unless that is connected, you can't power anything up. Be careful not to touch the connections on the back of this switch, it's live mains!

The cooling fan is connected to the primary (mains) side of the transformer. If that's running, you know that power is getting that far, but nothing more.

Don't forget to check (and if necessary reset) the voltage selector switches on the back before appling mains. Burning out the power transformer will ruin your day.

Update of ILPer, the HP-IL peripheral simulator

*Message #1 Posted by **Christoph Giesselink** on 28 June 2011, 3:51 p.m.*

I just updated ILPer, the HP-IL peripheral simulator program created by Jean-Francois Garnier. ILPer was developed as printer and mass storage simulation in connection with the PIL-Box hardware and real calculators like the HP-41 and the HP-71B with the HP-IL interface module. The disadvantage of this solution was, that you only could connect one ILPer instance on the PC side of the PIL-Box. The new version of ILPer now has also an interface to link more than one peripheral simulation together. I called the new connection method "Virtual HP-IL". The programs and a description of the used technique for the transport layer can be found on my HP page at http://hp.giesselink.com under "Virtual HP-IL".

Of course the new version 1.4 of ILPer is fully backwards compatible to his latest version 1.35.3. So it still could be connected with the PIL-Box as standalone system. In this case you only have the advantage of the minor improvements like the new *.lif file filter, remembering the display position, the possibility of the automatic activation of the "Start" button after program start, new settings saving method, ...

I especially want to thank Mike for his suggestions and his assistance by reading the additional manuals of the published material.

Regards

Christoph

Thanks Christoph, that's great !!. Is the source still Visual Basic, or has it migrated now ?

Also, where will future updates come from ? Jean-Francois Garnier or yourself ??

Thanks John

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #3 Posted by **Christoph Giesselink** on 29 June 2011, 2:58 p.m.,*
in response to message #2 by John Robinson

All programs are written in Visual C++ (sources included). The latest Visual Basic version of ILPer was v1.35. I migrated the ILPer sources in fall/winter 2009-2010 to Visual C++ to fix some issues I recognized during my work with the PIL-Box. The versions 1.35.1 to 1.35.3 published over JFG web page were already versions which base on the migrated Visual C++ sources. Because I done the migration before, it was no problem for me to add the new TCP/IP (IPv4) interface.

For those who already had a closer look to the sources, you will recognized that they are already prepared for the IPv4/IPv6 (dual stack) protocol. To activate the IPv6 stack I need to use a newer compiler version,

which has the disadvantage of installing an additional runtime package by the user and the build EXE file will not run on older Win OS revisions like Win98 or Win2K depending on the used compiler.

I'm in contact with Jean-Francois and he told me that he's very busy a the moment. So I decided to publish the update and the additions by my own for some reasons. But be sure that further updates of ILPer will base on now published v1.4 version, either published by JFG or by me.

Regards

Christoph

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #4 Posted by **Mike (Stgt)** on 30 June 2011, 7:07 a.m.,*
in response to message #3 by Christoph Giesselink

Well, I am a 'big iron' dinosaur (VM/CMS) and as such a big devotee of everything virtual. So my daydream would be an emulated HP-41 as controller. By virtual HP-IL I could use the Hercules System/370, ESA/390, and z/Architecture Emulator with extend NutEm to do so (yes, I have an simulation of the Nut CPU (HP41 and Voyagers) written in FORTRAN). Alas there are several hurdles to overcome - it will stay a daydream.

Using Open Object Rexx (an extension of REXX I know from the host - and preventing to use C) I wrote a sniffer for the virtual HP-IL. From this starting point I try to do a simulation of a device. Hopefully ready some day.

A big thank you to Christoph for bringing virutal HP-IL to life.

Ciao.....Mike

*Message #7 Posted by **Marcus von Cube, Germany** on 4 July 2011, 10:13 a.m.,*
in response to message #6 by Mike (Stgt)

The problem with DOS and networking is that:

1/ DOS has a severe memory limit
, 2/ There is no standard TCP/IP stack available
, 3/ Finding a DOS network driver might be tricky.

Each stack (FTP software, IBM, Microsoft) comes with its own set of libraries which must be linked into the program. I don't know the memory requirements of EMU41 or EMU71 but TCP/IP is taking its share, too, so that 1/ might be a real constraint.

Marcus

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #9 Posted by **Marcus von Cube, Germany** on 4 July 2011, 10:51 a.m.,*
in response to message #8 by Mike (Stgt)

I'm not a DOS on Windows specialist but it's not unlikely that the emulated DOS environment also emulates the MS TCP/IP stack for 16 bit programs.

Are you sure that ooRexx is a DOS program and not a Windows command line (CLI) application? There is a huge difference between the two environments! Coming from OS/2, I know (and like) Rexx pretty well. I cannot imagine that it can be run on top of plain DOS. Long filename support and the presence of DLLs in the installation directory of ooRexx would speak for a native Windows CLI application.

> Coming from OS/2, I know (and like) Rexx pretty well. I cannot imagine that it can be run on top of plain DOS.

I used Rexx on MS and PC-DOS well before OS/2: it could be done.
I should still have the floppies somewhere...

Greetings,
Massimo

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #11 Posted by **Mike (Stgt)** on 5 July 2011, 5:30 a.m.,*
in response to message #9 by Marcus von Cube, Germany

You are right, ooREXX is not a DOS program, there are AIX, Linux, and Windows installations. I once had two REXX for DOS, one came with PC-DOS V7 (IIRC), the other was BRexx from Vasilis Vlachoudis of the Cern Laboratory.

And TCP/IP on DOS? Well, I mentioned before that I am _not_ the connoisseur of TCP/IP, but I used an eMail system on a HP200LX connected to a modem or via IRda to a mobile phone. It based on WWW/LX what is freeware today. I assume that this program installed some TCP/IP capability to this 2nd to none DOS machine. So for sure you do not need Windows or similar to access the Internet.

Ciao.....Mike

*Message #12 Posted by **Marcus von Cube, Germany** on 5 July 2011, 9:50 a.m.,*
in response to message #11 by Mike (Stgt)

My first TCP/IP experiences were on DOS, too: "FTP Software" with a NE2000 network card (with packet driver) and coax cabling. We were juggling with all the possible high memory tricks available at the time to cram everything we needed into the machines.

With virtual DOS environments (e. g. on Windows or OS/2) things become easier because the network software interface can be reduced to a thin compatibility layer which maps the calls to the host operating system. You still need the proper libraries because there is no standard API. DOS lacks dynamic libraries to hide the implementation and DOS itself has no network API either.

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #13 Posted by **Christoph Giesselink** on 4 July 2011, 4:05 p.m.,*
in response to message #7 by Marcus von Cube, Germany

Hello,

the DOS operating system has no TCP/IP support. There have been (quite expensive) 3rd party products implementing a TCP/IP stack for pure DOS programs years ago.

AFAIK Windows 3.x was the first MS OS containing an API for the Win integrated TCP/IP stack. So you have to write a "Windows" program to use the TCP/IP stack.

Furthermore on modern servers the NetBIOS and WINS services are more and more disabled, without them you loose the connection to other PC's over the network.

I fully agree with Marcus that the available DOS memory is also an important aspect. On a real DOS machine the network card drivers need alone ~100KB-150KB, not counted the additional memory inside the application (emu41).

IMHO one possible solution for Windows would be using a Null-Modem emulator (like com0com) and a special bridge software (similar to ILPilbox) translating the serial data from the emu41 COM port to the virtual HP-IL loop.

Of course it also should be possible to use two PIL-Boxes. With Emu41 and one PIL-Box you have the emulated 41 in real HP-IL world and then connected with a 2nd PIL-Box and the program ILPilbox you have connection to the virtual HP-IL interface. ;-)

Christoph

in response to message #6 by Mike (Stgt)

> Quote:
>
> I'd like a 'virtual only' set up.

There are patches for nonpareil for exactly that. E.g., I have virtual mass storage, 80 and 40 column video, and printer.

It's been two years since I played with this, but it should still work.

Patch: http://kdntl.pagesperso-orange.fr/hp41/nonpareil-patch-doc.html

My 2009 PPT with a few screen shots: http://sense.net/~egan/HHC%202009%20HPIL.pdf

I tested this primarily with OS/X and Linux, however I was able to get it to build and work with Windows/Cygwin.

I should have added that EMU41 already emulates HP-IL with devices without a PIL-Box. I guess I may not really understand exactly what you want to accomplish.

Sorry I don't understand the "tcp" option in the modified Nonpareil version. From my reading understanding you can't create a loop?

It seem for me that one Nonpareil instance can work as server, another instance as client and so they can exchange data.

The "Virtual HP-IL" is a real loop, so the server port must always be different to the client port.

Christoph

Re: Update of ILPer, the HP-IL peripheral simulator

in response to message #16 by Christoph Giesselink

> Quote:
>
> From my reading understanding you can't create a loop?

Sure you can. You can start nonpareil with a virtual printer, serial port and storage all on a virtual loop. You can print, save/restore, etc... All communication is HP-IL.

The tcp option allows you to create other virtual devices without having to patch them into nonpareil. HP-IL frames are wrapped with TCP frames. At this time no virtual HP-IL devices have been created.

Khanh-Dang had planned on creating a dedicated virtual loop for use with standalone virtual devices, but he never got around to it.

All the code is there, someone just needs to run with it.

> ...someone just needs to run with it

Christoph's 'virtual HP-IL' is available. And works so far.

Ciao.....Mike

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #19 Posted by **Egan Ford** on 5 July 2011, 11:12 a.m.,*
in response to message #18 by Mike (Stgt)

I think there is a bit of confusion here. The nonpareil patch creates a virtual HP-IL loop in RAM and has built into it various virtual HP-IL devices, e.g. printer, disk, tape, serial, etc...

All communication between the various devices is via HP-IL. This is no different than EMU41 emulating HP-IL. Both nonpareil and EMU41 support the PIL-Box as a bridge from the virtual to the physical.

The nonpareil patch has another virtual device, 'tcp'. I.e. a way to tunnel HP-IL through TCP/IP. The intended purpose of this was to support other virtual devices without having to link them into the nonpareil executable. At this time none have been created, or released I should say. I have a version with just the virtual loop and the devices but without the controller. The intended purpose was to provide virtual devices to the PIL-Box, however the tcp interface should usable as well.

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #21 Posted by **Christoph Giesselink** on 5 July 2011, 1:10 p.m.,*
in response to message #19 by Egan Ford

I just checked the sources in the diff file especially the file hpil_io_tcp.c which seem to be the implementation for the tcp option in the expanded Nonpareil version.

In function hpil_io_peripheral_tcp_main() is the implementation for the server, line 255 is reading a frame and in line 287 the modified frame is writing back. Both functions read() and write() use the same socket so both communications use the same port (in this case by default 4141).

IMHO that's a big and important difference to the design of "Virtual HP-IL". A "Virtual HP-IL" device has different ports for receiving and transmitting frames (like you have two cables in reality).

Example for "Virtual HP-IL" with three devices

```
HP41/71 ---port60001--> Device1 ---port60002--> Device2
   ^                                                |
   +--- <--port60000--- Device3 <--port60003--- <--+
```

Example for "Nonpareil with tcp extension"

```
HP41 ---port4141--> Device
 ^                    |
 +-- <--port4141--- <--+
```

So you see, the tcp implementation in the modified Nonpareil version don't create a loop because send and receive share the same port and so you can create only a connection between the emulated HP41 and one device.

Christoph

You can create multiple connections by defining multiple ports.

E.g. in hpil.conf:

```
#HP82182A
#set printer_switch 1
#printer mode=manual

#HP82163
#video 32 zoomx=2 zoomy=2

#HP92198 (two displays)
video 80 zoomx=1 zoomy=1
video 80 zoomx=1 zoomy=1

#HP9114B
#disc file=/Users/egan/.nonpareil/foo.lif

#HP82161A
tape file=/Users/egan/.nonpareil/foo.lif

#PIL-Box
pilbox tty=/dev/cu.usbserial-FTE03NXR debug init=con
speed=115200

#New HP-IL devices
tcp listen port=1111
tcp host=127.0.0.1 port=1112
tcp listen port=1113

E.g.:
emulated device

^
```

```
|
V
np/hp41 -> np/hp-il-display -> np/hp-il-storage ->
np/tcp-port-1111
   ^
|
   '------ np/tcp-port-1112 <- np/tcp-port 1113 <--------
-'
                  ^                   ^
                  |                   |
                  V                   V
             emulated device     emulated device
```

It is not exactly the way you do it, but it is still a virtual loop with multiple devices.

Re: Update of ILPer, the HP-IL peripheral simulator

*Message #23 Posted by **Marcus von Cube, Germany** on 5 July 2011, 2:21 p.m.,*
in response to message #22 by Egan Ford

Can the two methods be mixed and matched?

1/ Is the protocol the same (TCP vs. UDP)?
2/ Are the frames formatted the same?
3/ If (1) or (2) are not both true, can an intermediate server be created to translate between the two?

Since there doesn't seem to exist a device implementation for NP, it might be a good idea to replace the NP protocol by the ILPer one to solve the compatibility issue. Both IP address(es) and ports need to be configurable because the device(s) might reside on different (virtual) machines.

> Can the two methods be mixed and matched?

Not directly.

> Quote:
>
> 1/ Is the protocol the same (TCP vs. UDP)?

Yes, it is, TCP.

> Quote:
>
> 2/ Are the frames formatted the same?

Yes, they are. Each frame has 16 bit in network byte order.

> Quote:
>
> 3/ If (1) or (2) are not both true, can an intermediate server be created to translate between the two?

To use ILPer in combination with Nonpareil Emu41 you need a bridge software (ILTCP?) like the ILPilbox software.

```
+-------+              +--------+
| Emu41 |---port4141-->| Bridge |---port60001--
>Device1---port60002-->Device2
|       |<--port4141---| ILTCP? |
|
+-------+              +--------+
|
                           ^
|
                           +---- <--port60000---
Device3<--port60003-- <--+
```

> Quote:
>
> Since there doesn't seem to exist a device implementation for NP, it might be a good idea to replace the NP protocol by the ILPer one to solve the compatibility issue. Both IP address(es) and ports need to be configurable because the device(s) might reside on different (virtual) machines.

The TCP/IP server inside ILPer, ILScope and ILPilbox accept frames from any IP address, so the configuration dialogs want to have the IP address of the next device only, but of course the two port numbers.

I will publish a software which will use the "Virtual HP-IL" in the next weeks.

Christoph

How do you handle the loop setup? Is it temporary in the sense that each connection is established just for a single packet and then closed, or is permanent? Then how do you setup the complete loop? You can't start all servers at the same time?

I think its much easier to use UDP instead because its connectionless. A server just listens for packets, checks if it is meant, acts upon the data if necessary and sends a response or the unmodified packet to its next partner. There is no error if the partner cannot be reached but the controller will monitor the arrival of the packet it had sent and will either raise an error or try again, just as it would if the physical loop were broken. I have the feeling that the handling will be much easier for a device and the logic in the controller is already there. With this scheme, its no problem to stop a device and replace it with some other, just acting on the same ports or interfaces. If you want to add or remove a device, you need to stop and reconfigure its neighbors but the rest of the loop is not affected.

>
> How do you handle the loop setup? Is it temporary in the sense that each connection is established just for a single packet and then closed, or is permanent?

When the client get his first frame to send, the client setup the connection and stay permanent. If sending failed to an established connection, the client automatically reopens the connection and then send the frame again.

> Quote:
>
> Then how do you setup the complete loop? You can't start all servers at the same

> time?

Yes, I can start all servers at the same time, because the clients establish their connection at the first frame and not at program startup.

> Quote:

If you want to add or remove a device, you need to stop and reconfigure its neighbors but the rest of the loop is not affected.

I made a proof of concept program with configurable settings of using IPv4, IPv6, TCP/IP and UDP in September/October last year. The main reason for choosing TCP/IP was, when I tried to establish a IPv6 connection, but the gateway was only IPv4, the UDP package get lost. With TCP/IP I get an error when I try to "connect" a IPv6 connection over a IPv4 only gateway. Because I implemented a dual stack (after recompiling the sources with a IPv6 capable C++ compiler) I switch back to IPv4 and establish the connection over IPv4. Furthermore TCP/IP helps to find a broken link. The program which find no server under the given IP address can pop up an error message box. Before, I preferred UDP like you, because the behavior is closer to the original hardware.

With the retry of an established connection I described above it's no problem to stop a device, replace it and start again. The problem is on the HP-IL loop controller side, because the new device has only his default HP-IL address, you have to readdress the loop, on the HP71B with "RESTORE IO".

Hope this make the interface more clear. The programs

are licensed under the GPL, so you may have a look at the sources.

Christoph

Yes, an RFC for HP-IL over IP is in order. :-)

Nobody is developing nonpareil's HP-IL support. Khanh-Dang halted development nearly two years ago. I thought that I would have had time to contribute to it myself, but I have been swamped with work and other personal projects. It's open source; any can take over.

Thank you for clarification. But I still have 2 questions:

i) The sequence of TCP ports in your diagram is 1111-1113-1112 but in the conf file they are sorted acending. How do you fix the position of a device within the loop?

ii) the loop is built within Nonpareil's add-on, so the TCP devices get only frames that are addressed to them? Or do they get all

traffic and must filter out what is realy of interest?

Ciao.....Mike

The order of the HP-IL devices is based on the order listed in hpil.conf. My diagram didn't match my hpil.conf file. Error on my part.

> Quote:
>
> ii) the loop is built within Nonpareil's add-on, so the TCP devices get only frames that are addressed to them? Or do they get all traffic and must filter out what is realy of interest?

The TCP devices only get what is destined for each of them since they each connect or listen to distinct ports.

Yes, JFG's EMU41 is a gem, and it covers most of the needs. What I'd like to try is programming 'my own' HPIL device and set it into the virtual HP-IL. With Christoph's innovation it is now feasible for me - but I miss badly a virtual HP41 as controller.

Ciao.....Mike

*Message #32 Posted by **Egan Ford** on 5 July 2011, 10:49 a.m.,*
in response to message #31 by Mike (Stgt)

If you want to use Christoph's, then you should be able to hack up the nonpareil patch so that it's tcp support complies with Christoph's interface. This way you get a controller.

BTW, now that EMU41 is open source, it should be possible to port it to win32 or Unix and add IP support. Or keep it DOS and use a packet driver.

Obscure 41 Custom Modules: SNEAP

*Message #1 Posted by **Ángel Martin** on 28 June 2011, 5:24 a.m.*

Out of curiosity, anybody has some ideas about the SNEAP activities? These three 8k-modules contain FOCAL programs in French, and appear to be dedicated to science/engineering subjects.

Could it be related to the "SYMPOSIUM OF NORTHEASTERN ACCELERATOR PERSONNEL - S.N.E.A.P."?

Isn't interesting to see the far-reached presence our beloved 41 had in its peak times...

Re: Obscure 41 Custom Modules: SNEAP

*Message #2 Posted by **Philippe Lasnier** on 28 June 2011, 9:07 a.m.,*
in response to message #1 by Ángel Martin

Hi Ángel,

SNEAP would most probably stand for Société Nationale Elf-Aquitaine Production, a major petrol company in France. I thought the name was familiar - that's because I spent a 6 month placement in one of their research centre (the only one? I can't recall) during my engineering degree in the 1980's.

The place was Boussens, in the foothills of the Pyrenées, not far from Toulouse. Lovely.

Anyway, SNEAP as a name doesn't exist anymore, although the research centre may still be there in one form or another (the SNEA of SNEAP is now ELF Aquitaine as part of TotalFinaElf).

I couldn't possibly speculate on what would be inside the 41 module, but the fact that it would be full of engineering (including petroleum) programs sounds exactly right.

All the best,

Philippe

Re: HP 15C

*Message #7 Posted by **db (martinez, ca.)** on 28 June 2011, 11:51 p.m.,*
in response to message #6 by jonny brice

Jonny;

No one really knows for sure. Local and in person means more to the buyer because it is a for sure deal, high price and ease of money transfer are important to you. The saying goes that it's worth what it sells for, and that changes daily. It's too bad you just can't do it openly on this forum with the guy or girl offering the most getting it. All that said: Dave Hicks who runs the Forum has listed three Mint In Box 15C transactions for between $306 and $455. No telling when those sales were and what the inflation vs. economic downturn factor would be. Calculators are going for a bit lower today than they were 3 years ago (fewer/lower bidders) but what do i know.

The 15 is one of the Holy Trinity of HP calculators that working people still really use fairly commonly. The sealed one may get put in a glass case but the last on your list might get used by someone crunching numbers on a daily basis.

You mentioned not being a numbers guy. You might consider keeping one of these or buying a cheaper RPN programmable with your "ill-gotten-gains" anyway. A 15c, 41 or 42 will effectively raise your IQ about 20 points, unless you work in finance. Then of course; there's no hope. The 34s that folks here invented and that you make from 3 different sources is very impressive. They are all dam nice tools.

Thanks for recognizing these jewels and not just throwing them away.

WP 34S - SAM-BA boot gone?

*Message #1 Posted by **Marcus von Cube, Germany** on 26 June 2011, 11:44 a.m.*

A reader of this forum and WP 34S tester (thanks Hubert) was missing the SAM-BA boot function in the latest WP 34S firmware release (only in SVN). He is right, ON+S seems to be gone. Why?

ON+S pressed accidentally by a user without the cable and working SAM-BA software can easily turn his calculator into a battery eating brick without any visible functionality. To make this harder, I decided to hide the ON+S key combo behind another one, ON+D. The latter is primarily used as a debugging aid, disabling all power saving and thus allowing the hardware debugger to work. I just decided to give this mode a double meaning in the sense of allowing some dangerous functions to be selected by the user.

In short: To reflash your calc press ON+D once and then ON+S twice to go into SAM-BA boot mode.

Going to the ASEE conference this week

*Message #1 Posted by **Eric Rechlin** on 26 June 2011, 12:38 a.m.*

Hi all.

I am going to the ASEE (American Society for Engineering Education) conference in Vancouver, BC this week. It's a trade show, mostly attended by engineering professors, and HP has a booth again.

I went last year (in Louisville, KY) and worked HP's booth, talking about calculators, and I will be doing the same thing this year.

Last year I had quite a few attendees come up to me to talk about how much they loved their 15C or 41, and a few raved about their 16C as well. Of course, I had to show off the 50g and 35s. I think I'll sneak a 34S in this time. :)

Not sure if any of you will be there, but if you are, make sure to stop by and say hello. I'll be at ASEE on Monday and Tuesday, and then will have most of Wednesday and Thursday to myself to explore Vancouver on my own, before I head back on Friday.

Eric

Ode to the calculators I have used...and the 41C

*Message #1 Posted by **Geoff Quickfall** on 25 June 2011, 7:58 p.m.*

Well hello,

I was looking through the two large 4 foot by 2 feet by 1 foot tubs in storage full of calculators (oops, way to many, time to sell them off).

These are the non HP calculators, HP is up to 50 but the book is the reason for them. Once the book is done then a core group, say one of example of each will be saved. But that is for the future.

Looking through the tub brought to mind my HP calculator history. It didn't start with an HP though. Back in 1975 I started community college (sounds like community service) and required a calculator, in sciences so it had to include transcendental functions. New nothing about HP at the time and the office store had the neatest looking calc I had seen. This was no ordinary calc as it had STYLE. So I purchased it; a LLOYDS 333 scientific calculator with exponential display. I could finally retire the Post 1460 Slide rule!

Yep, it looked like something out of 2001, A Space Odyssey.

Well onto University (of British Columbia) for a Science degree. Started learning ALGOL W in computer science along with Fortran on the typewriter and cards. YUCKKKKK. But along with that course was the Statistics 2nd year course and they demanded and HP 25 with statistical registers:

Well not being someone that can throw out a perfectly functional calculator I removed the batteries and retired the 333. Now endless hours of Lunar Lander plus programming and etc.

After leaving university I took the HP 25 into the northern bush of Canada while flying. Weight and balance, log book times and Lunar Lander for fun...

Got back to reality in 1982 and decided to finish my remaining 2 years of a BSc but this time with money in the bank. Off to the university book store and WHOA, wait a minute, ALPHANUMERIC display with all that programming space and continuous memory and ...

The HP 41C! I purchased it second hand (2033Axxx tall keys)

Plus, after awhile I could upgrade it with x-functions, x-memory, quad memory, HPIL, card reader, laser wand, printer, plotter. So I did!. Back to work in the summers up north flying and school in the winter and fall.

Suddenly time for graduation and an offer of a Masters program. Well I jumped at the masters of Science (Climatology/Palynology) and soon realized that a more powerful version of the 41C had come out freeing up ports and it included a clock, so I removed the 41C batteries and stored it, purchased the 41CX in 1984 and wrote programs to back up the info the IBM AT 8086 had on its stacked 5mb hard drives.

In fact my 41CX did all the math and stats for the thesis, couldn't stand the desk top.

Graduate and got hired at the airline the next day. The 41CX stays with me for until 2008. In the meantime I discover the world of HPMUSEUM and start collecting and restoring.

At HCC2009 I was given an HP42S and purchased a manual for it on the drive home from Corvallis. Powells book store in Portland supplied the manual. Wlodek supplied the incentive and soon I had the HP42S with expanded memory in the cockpit:

This replaced the 41CX only because it was thinner, had sufficient stable memory for all my programs, wasn't static sensitive and still printed. It did not have a clock. I don't know why all business machines get a clock but science calcs don't. The 41CX ran multiple timers for lab processing and was fantastic that way.

Along comes 5 HP71Bs in various states of repair, the language is easy and the wow factor in cockpit is high. Of course it runs all the required programs, but size and printer requirement makes it less portable. Still it is a beauty and it has a clock! But no IR printer ;-(

So back to the 42S with the 71B as something to learn and fill in the time at hotel layovers.

Then along comes the MONTE DARYMPLE "41CL". My favorite machine is back, so out come all the HPIL and the calc is loaded with all relevant programs. A new overlay and back to work.

Thanks MONTE!!!!

Actually thanks to EVERYONE who has brought the 41 into the 21st century!!

Names like Diego, Monte, Meindert, Jeff and etc, to you I owe a thanks.

in response to message #1 by Geoff Quickfall

My personal computing history was:

1969 Dietzgen 1725L Slide Rule ($35, $215 in 2011)
1972 Bomar 901B ($140, $757 in 2011)
1974 SR-50 ($120, $550 in 2011)
1977 HP-67 ($450, $1678 in 2011)

I still own these, and I could probably be tempted to sell any of them (at the inflation-adjusted price, of course). :-)

The only one that I regret buying is the Bomar.

in response to message #3 by Mike Morrow

For sheer coolness in todays LCD backlit society, the HP 67 takes the cake in the cockpit!

I do take mine with me occasionally but the 41CX/CL is the cats ass for speed and functionality!

Geoff

you can just make out the 67 in the lower right corner beneath the hp 01.

Nah. The pilots can use whatever they want; the "possible interference with flight systems" was always bullshit.

With most airlines now allowing the use of iPads in place of the old Jeppson flight maps, expect this to become more common.

Re: Ode to the calculators I have used...and the 41C

*Message #7 Posted by **Geoff Quickfall** on 27 June 2011, 12:52 p.m.,*
in response to message #5 by Joerg Woerner

A few points on these.

```
- Shielding is wonderful until you drop your item.
- RF is not a problem unless you are sitting by the antenna.
- Aircraft navigation can be affected depending on the phase of
  flight, stength of electronic, lack of sheilding and position
  relative to the aircraft antenna.
- Some electronic use prohibition was probably revenue generated
  later in time but originally was prohibited for reason.
- Ipad use not approved yet!
```

Point 1

Sheilding on older equipment was lacking or shifted or just plain useless. Note, the FAA and IATA/ICAO are reactionary, they respond to problems, develop strategies and implement them. They are slow to remove archaic rules. Lawyers and liability and laziness and all that. It is easier to ban all electronics during phase of flight then to make a list of approved electronics. The reason are money and time.

Point 2

That LLOYDS 333 will completely jam a SW and AM radio when within 2 feet of a radio antenna. Fortunately for the cockpit, the F/O and Capt radio nav equipment antennas are located over and under the passenger cabin. Also all equipment on the flight deck is sheilded for obvious reasons. Conversely, antennas are not sheilded for obvious reasons!

Point 3

Phase of flight usually depends on radio navigation and hence the antennas. That is why there is a prohibition in the cabin of transmitting devices today during takeoff and landing. High use of VHF and LW radio navigation systems of both ground and aircraft systems are used during takeoff and landing. In cruise GPS is used (different frequencies less liable to interference by RF and different attenna location).

Point 4

When phones were installed at the seats (ten years ago) they generated revenue. So the ban on cell phones for all phases of flight became a revenue thing, in part. They also had a dedicated antenna which was directional, located away from aircraft navigation antennas and again, a different frequency to aircraft navigation and communication systems.

Point 5

The FAA has not approved the battery system on the IPads and as it is new tech they have not yet tested it for use in the cockpit. They are in the process now so technically the IPad is ok but the battery is not (oxymoron?). Of course it can be stated that the public has been testing this battery for years. And guess what! Computers have caught fire in the cabin. Computers placed on pillows on the lap, plugging venting cooling fans and boom! Bad lithium ion battery batch and boom! Some rechargeable lithium based flashlights are banned from the cockpit. Happened to a fight I was on to Beijing from Vancouver. Got to tell you, at 39000 feet over the Pacific 5 hours from anywhere and the smell of smoke in the cockpit! NOT FUN. Think Swissair.

Back to the IPAD, it can be used at your discretion. This implies a liability aspect that has not been investigated by the FAA (USA). Some airlines are using it for manuals such as the Flight Operations manual, Aircraft Operating manuals and etc. The exception are Jeps which are not approved for the IPad at the at the tier one Airline level (Alaska Airlines being one but not for Jeps). They are also only used

for specific phases of flight.

IPads are certainly the future for Jeps, the current problem is the only update available is manually loading the system. The FOM must be updated to include a revision provision for IPads as approved for the airline by the FAA. That has yet to be done. It is co-ordinated between individual airlines creating procedures that insure the Jeps are updated in a timely manner and that the procedure is then examined and approved by the FAA.

Annecdotal (me)

I have seen my radio nav go nuts, autopilot was not on at the time. I was climbing out of LAX to YVR (1992) going through 20,000 feet when the radio nav (VOR) started wildley fluctuating. If the auto pilot had been on the aircraft would have started a series of rapid banking (25'). After running an experiment in business class; asking everyone to turn off their computers and games. I had them turn them on one at a time. We got to a kid who had a portable nintendo hand held. He happened to be sitting right below the physical location of the #1VOR antenna. Everything went wonky (technical term) again. Business class electronic equipment was suspect as the antenna for the #1VOR is located on the ceiling right above the second row of seats.

Conclusion:

Like any rule, law or etc the precept is based on a combination of known evidence, actual affect, probable affect, worst case scenario and etc. The rules usually apply to worst case scenarios; every one switches on the cell phone at the same time...

I still think, electronics near antennas should have a phase of flight restriction. The cost and time required to test ALL electronics on the market today is prohibitive.

As far as electronics go, during takeoff, climb, descent and landing (the so called critical phases of flight) electronics in the cockpit: NO WAY! In the cabin also NO WAY! There are still to many older electronics, older aircraft and still a reliance on radio navigation and therefore antennas.

Of course an argument can be made to retrofit all older aircraft and redesign new aircraft to allow hand held nintendos and etc. But that is a cost OR how about a phase of flight prohibition.

Another anecdote:

My airline allows cell phones on ground and during taxi. They do not in the air, of course, being me, I have tested them in the air. My analog worked perfectly as it did not due to software, limit the transmit to one tower at a time. My blackberry does lock on to one tower at a time. Because of this and at 450 KTS it has about 5 seconds of useful broadcast, just enough to tell you it has disconnected.

We were testing phones as means of communication in the event of a loss of all radios, electrics. Call ATC directly and collect the pax cell phones. Worked in the analog days and early digital (2002) but not any more.

Enough said!

HP 71B sitting on the lap Joerg, not the flight computer! And no where near an antenna. Also the wiring is shielded in the cockpit for radio aids similar to the cable tv cable and all equipment in the cockpit is sheilded. It is the passenger cabin antenna locations that are the problem.

Cheers, Geoff

OR it is all a conspiracy along with chem trails ;-)

and even then, since the antenna is *outside* the metal skin of the aircraft, Gameboys and other electronics of the passengers should not be a problem, except that I've seen too many situations where the connectors were not correctly mounted on the ends of the coax cable going to the antenna. If the shield of the cable doesn't make good connection, the cable itself can become an antenna too, and that's *inside* the plane, not outside.

Our equipment mostly goes into bug smashers and not passenger jets, but I've had quite a few times over the years when I'd get a call from an avionics shop telling me of a particular problem, and I could tell they didn't have the antenna cable connectors mounted right. They'd call back later saying they re-mounted the connectors and it took care of the problem.

thread drift! technology, bureaucracy, procedures and lawyers!

*Message #9 Posted by **Geoff Quickfall** on 27 June 2011, 2:52 p.m.,*
in response to message #8 by Garth Wilson

Bingo Garth!

and until maintenance and etc. are perfect, this will be a problem. Until no leakage at antenna or gameboy can be guaranteed we will have restrictions.

This subject can go on forever and has only been breifly touched upon here.

Some of the problems are:

```
- technology takes time to be tested.
- bureaucracy takes time to react.
- procedures take time to be written.
- lawyers are involved in each step.
```

the last point says it all. Just look at the checklists required in the event of an emergency. Talk about gray areas!

Aviation safety is driven by the worst case scenario. Similar to bridge construction. The worst case scenario is rush hour on a bridge with bumper to bumper fully loaded semis. So after you cut the ribbon load it up with nothing but semis. Would it happen in the real world, probably not. Same with aviation, but when it happens the legal ramifications are stupendous let alone writing off a 380 with 6oo pasengers. So write a procedure that seems rediculous as it is the safer (read cheapest safest method) method.

I like to tell people that any fool can build a bridge that will stand up. The trick is building one that won't fall down....

It's true that some problems are unforeseen by the engineers, but I think more often trouble occurs when a combination of problems happen at once. It's really hard to figure out how to deal with those cases. I suspect that the airline industry in particular has reached this point. More airline accidents today are probably the result of multiple simultaneous failures, not a single problem.

But, the skin is full of holes (windows!), all of which act like slot antennas (just as good as a dipole: a slot in a sheet of metal is the inverse of a dipole in free space and works just as well to re-radiate any electronic racket generated inside the passenger cabin).

If you want good shielding, you can't have any breaks in the surrounding metal (holes less than 1/20 wavelength or so might be ok) - just ask NSA, who shield some of their entire buildings to keep external prying eyes (ears!) from listening to what goes on inside.

While the likelihood of interference is low, I'd rather be on the safe side.

Yeah, then you can get into fresnel zones and all that-- but due to the curvature of the fuselage, there's nowhere near a line-of-sight path from the windows to the antenna. When I have the techs in the avionics shops fix the connector terminations, the problems are totally gone-- and this is on small aircraft whose windows are very large proportional to the size of the roof or belly. (For the record, I've worked in VHF & UHF power transistor applications engineering, but not antennas. I have some feel for antennas from being a radio amateur and also high-speed digital design.)

WP34s feature question

*Message #1 Posted by **fhub** on 25 June 2011, 6:06 p.m.*

Hi,

I can remember that the HP-41 had a special flag (22) which was set when the user had just input anything. This was quite useful in programs: entering a number and then pressing one of the upper-row label keys could e.g. just store this value, but pressing such a label without having entered anything before could calculate this value (almost all TVM calculators behave exactly like this for the usual 5 function keys N I PV PMT FV).

Is there something like this in the WP34s? I've read through the manual but couldn't find anything.
This could also be useful when a running program stops/prompts for an user input, so that it could decide after a R/S whether anything had in fact been entered or not.

Franz

Edited: 25 June 2011, 6:09 p.m.

Yes there is. Look in the test catalogue for ENTRY?

- Pauli

Re: WP34s feature question

*Message #3 Posted by **fhub** on 26 June 2011, 7:05 a.m.,*
in response to message #2 by Paul Dale

Yep, that's exactly what I meant, many thanks! :-)
There are soooo many functions that you almost overlook everything you're searching for ... ;-)

Maybe it would be nice if this ENTRY? condition could be manually reset via the EXIT key (e.g. if you enter something but then exit this input again), but it's not very important.

[Edit:] Ok, I've just tried it again and EXIT works except directly when entering a number - here you have to press EXIT twice to reset the ENTRY? condition. Not optimal but ok (if you know it). ;-)

Franz

Edited: 26 June 2011, 8:09 a.m.

Re: WP34s feature question

*Message #4 Posted by **Paul Dale** on 27 June 2011, 1:55 a.m.,*
in response to message #3 by fhub

There are plenty of ramifications with the entry flag. For example, what if I'm entering two numbers and exit out of the second?

In fact, I might change it so that EXIT doesn't clear this flag. I'm not sure what is correct or desirable here. This one was added late and hasn't really been thought through completely.

- Pauli

Re: WP34s feature question

*Message #5 Posted by **fhub** on 27 June 2011, 5:29 a.m.,*
in response to message #4 by Paul Dale

> Quote:
>

Well, that would even be worse than it is now! :-(
How could you then reset this ENTRY? condition at all?

I guess it will be better to not report any found problem(s) anymore, if after this report you think about changing it in a way that would even worsen the situation ...

Franz

Edited: 27 June 2011, 5:30 a.m.

Re: WP34s feature question

*Message #6 Posted by **Paul Dale** on 27 June 2011, 5:59 a.m.,*
in response to message #5 by fhub

The entry flag is reset when a program stops running. It is set by numeric or alpha entry. I'm happy with this part of its operation. I'm not sure about how it should behave on EXIT and this hasn't been thought through properly yet.

Please explain how & when you think it should be reset.

You will need to take into account all usage scenarios not just the one you've raised thus far. Things like multiple number entries and cancellations of some and possibly all of those entries. Also consider what happens if I enter a number, press enter to commit it to the stack and then press EXIT. What about entering stuff and performing some arithmetic and functions and then pressing exit and continuing the program. Currently these last two will not register as digit entry although they clearly are. This seems very wrong to me hence my suggestion to change exit to not clear the flag.

Now complicate everything with catalogues and exit.

Finally, we've only a small number of bits of RAM left, so we cannot add lots of state variables.

Anyway, I'm very much looking forward to suggestions here.

- Pauli

Re: WP34s feature question

*Message #7 Posted by **fhub** on 27 June 2011, 6:21 a.m.,*
in response to message #6 by Paul Dale

Well, at the moment I'm not on the computer where WP43s is running, but IIRC from my yesterdays trials this ENTRY? flag is also reset by almost any other operations (e.g. +, -, *, etc....).
And I have no problem with that at all - the only thing I was wondering is that EXIT during a number input did NOT reset this flag and that I had to press EXIT twice!

I'm quite satisfied with this ENTRY? flag behaviour as it is now (except this need for a double press of EXIT when cancelling a number entry), so there's no need to completely change anything.
But I think there MUST be ANY way to reset this flag, and as long as there's no explicit flag number that can be used with CF, pressing EXIT is probably the best method!

Franz

Re: WP34s feature question

*Message #8 Posted by **Paul Dale** on 27 June 2011, 6:28 a.m.,*
in response to message #7 by fhub

> Quote:
>
> Well, at the moment I'm not on the computer where WP43s is running, but IIRC from my yesterdays trials this ENTRY? flag is also reset by almost any other operations (e.g. +, -, *, etc....).

No it isn't. Almost all operations don't touch this flag. So if the program stops and you press + R/S the flag will be clear. If, however, you press 3 + R/S the flag will be set because you entered a digit.

Another way to clear the flag is to press the up arrow then R/S although this is less obvious.

Like I've said a couple of times now this flag hasn't been thought through properly. What we've got is mostly right most of the time.

- Pauli

Re: WP34s feature question

*Message #9 Posted by **fhub** on 27 June 2011, 6:59 a.m.,*
in response to message #8 by Paul Dale

Yes, you're right with +, - and so on, I've tried it again now.

All I've tried yesterday was not with a program which prompted for an input (and was continued with R/S), but just with a program with LBL A, and the program should check if there has been an entry immediately before pressing the A button. It

should then just store this entry and otherwise calculate something.

And as I already said it's quite ok as it is now: I know that I have to press EXIT twice to reset this ENTRY? flag again when I'm cancelling an input to make the program behave correctly, so there's no need to change anything.
I'm just wondering why e.g. after an input has been finished with ENTER a single EXIT is enough to reset this flag, but during the input you need 2 EXITs for that.

Franz

Edited: 27 June 2011, 7:01 a.m.

Does anyone else have suggestions as to how the entry flag should behave?

> Quote:
>
> ...but just with a program with LBL A, and the program should check if there has been an entry immediately before pressing the A button. It should then just store this entry and otherwise calculate something.

I don't think it will ever operate like this. When you do something it is impossible to tell that your next operation will be to execute a label. If I could tell this, I'd prefer use such accurate precognition to make a fortune on the stock market or lottery :-) Finish the LBL A subroutine with a R/S instead of a RTN to reset the flag. Pressing A again will have the flag set if the user entered something and cleared if not.

> Quote:
>
> I'm just wondering why e.g. after an input has been finished with ENTER a single EXIT is enough to reset this flag, but during the input you need 2 EXITs for that.

File keys.c lines 2077 - 2086. The first EXIT cancels the command line. The second does a warm start. It is the latter that resets this flag.

This is all documented on page 56 of the manual BTW. The 'does nothing' at the end should be 'does a soft reset'. Most of the time there is no noticeable difference however.

- Pauli

in response to message #10 by Paul Dale

> Quote:

> I don't think it will ever operate like this.

Well, but it DOES operate exactly like this on all financial keys (N,I,PV,PMT,FV) of HP calcs! ;-)

Re: WP34s feature question

*Message #12 Posted by **Paul Dale** on 27 June 2011, 8:02 a.m.,*
in response to message #11 by fhub

No calculator financial or otherwise works the way you are suggesting. Case in point, my 12c treats any keystroke except one of the TVM keys as a data entry regardless of what it is. e.g. f PREFIX to look at all the digits of the result followed by one of the TVM keys enters a new value rather than calculating. Likewise, g MEM does the same. Neither of these are data entry operations and neither changes the stack nor any other registers. Also worthy of note is that there is no simple way to clear the data entry setting -- which is something you've been asking quite vocally for.

We could operate exactly this way on the 34s, but I'd need input from other people before committing to such a change. One opinion does not a change make (unless it's mine of course ;-)

Since there seems to be a fixation on financial calculators, I'll reiterate: this isn't a financial calculator and never will be. Leave your 20b/30b alone if you want a financial calculator. Better yet buy a spare and leave that alone so you've got both and HP has two sales :-)

> One opinion does not a change make (unless it's mine of course ;-)

Yes, that's something I've already got! ;-)

I doubt you'll get much input because this is a rather special 'feature' almost nobody else would ever need. So I would say leave it as it is - I can clear this flag with a double-EXIT from any pending operation or with a single-EXIT when the calculator is in its 'normal' state and that's ok for me.

Since you say that such a (2nd) EXIT does a 'warm start' (???), I hope this won't do any other 'dangerous' (unexpected) things (like e.g.

clear all my registers or delete my program) ... ;-)

As you (should) know, we're in *beta test* phase now. So feel free to check what's going to happen under whatever conditions you can think of - we did only check the conditions we could think of ;-) And we're pretty patient usually ...

Walter

Re: WP34s feature question

*Message #15 Posted by **Marcus von Cube, Germany** on 27 June 2011, 11:03 a.m.,*
in response to message #14 by Walter B

I've an idea how it should work: Any action that potentially changes the contents of X or Alpha sets the flag. EXIT, be it on digit entry (cancel the command line) or on its own while X is shown, resets the flag. So does CLP.

Re: WP34s feature question

Yes, that's exactly as I would have expected it!
(and of course every STOP or RTN in a program)

Now we have already 2 opinions, so maybe that would make a change now ... ;-)

Re: WP34s feature question

*Message #17 Posted by **Paul Dale** on 27 June 2011, 5:51 p.m.,*
in response to message #15 by Marcus von Cube, Germany

I thought about this a fair bit last night while not sleeping.

EXIT to clear this flag is just asking for user error and confusion which we're trying to avoid. E.g. I input a number, go to the conversions catalogue, decide I don't need to change it, pressed EXIT and continue. Result is the flag is set. Change the last bit to press EXIT twice by accident and continue and the result is totally different and unexpected. This flies in the face of extra EXITs doing nothing as documented in the manual.

I'm going to change the behaviour to detect any digit entry as per the 41 series (which is what this flag setting is modeled off, not the financial calculators overloading of the TVM keys) and to only clear this flag on program stop. I think this is the only consistent option. This is far gentler than the financial calculators any key press kills the flag and it captures the meaning of the setting: did you the user press a digit key? Yes you did.

We can argue about whether it should be digit entry or any change in X. We can also argue is a clear entry flag command is required but this should be a manual step and never done automatically & this remains available via up-arrow then R/S.

Ok, do whatever you want! :-(

So this is definitely my last report wrt. the WP34s, if mentioning a little problem leads to a 'solution' (?) that

is even worse than it has been before.

Franz

Re: WP34s feature question

*Message #19 Posted by **Paul Dale** on 27 June 2011, 6:33 p.m.,*
in response to message #18 by fhub

As I asked last night and you pretty much completely ignored, make a consistent and intuitive suggestion as to how this should behave and we'll consider it. Make sure you cover at least the use cases I mentioned -- I know there are plenty more I missed in my haste that will become apparent as you do your analysis.

The current behaviour has major potential for confusion, I do not believe this is acceptable as it stands. Your only suggestion so far has been to make things worse from the confusing point of view.

After my recent change it is consistent and not confusing. Any digit entry sets the flag, program stop clears it. No exceptions and no avoiding it. You press a digit, the flag gets set. Using your baseline of financial calculators, we're already a lot softer in raising this than they are. Show me a financial model that lets you reset the "user pressed a key flag"? How about one that lets you unpress a shift key and not impact this flag? My latest suggestion is more in line with this behaviour, you should be overjoyed by it not condemning it.

Now, if somebody sits down and thinks this through and comes up with a better solution, I'm all ears. We've made quite a few changes based on the input here and I'm sure we will make some more in the future.

- Pauli

PS: It is possible to do the TVM functions without an entry flag, there is a 15c program that does just this by defining the hot key labels twice.

*Message #20 Posted by **Marcus von Cube, Germany** on 28 June 2011, 2:34 a.m.,*
in response to message #17 by Paul Dale

I vote for a slight modification to your scheme. It

shouldn't be the typing of a digit entry key but the commit of the input line to X that sets the flag. So you have the option to cancel the command line with EXIT or backspace which will return you to the unmodified stack. If this situation would set the entry flag you are asking for confusion.

Re: WP34s feature question

> If this situation would set the entry flag you are asking for confusion.

You typed a digit didn't you? No confusion :-)

You suggestion sounds good however. What should happen if the command line processing produces an error -- set the entry flag or do nothing?

Pauli

ENTER vs. DUP - stack lift or not?

*Message #22 Posted by **Marcus von Cube, Germany** on 28 June 2011, 6:27 a.m.,*
in response to message #21 by Paul Dale

The discussion about the command line rises another question that is not only interesting to WP 34S but to all newer RPN calculators that handle an input line.

In the good old days, there was no distinction between the input line and the X register. ENTER is always a DUP which disables stack lift. If you type 1 ENTER 2 + you get 3 because the 2 after ENTER replaces the 1 in X. Typing 1 ENTER + returns 2. We all know this behavior well.

Now to the newer generation. Let's talk about RPL first. There is no concept of disabled stack lift at all. ENTER isn't a DUP anymore, at least not after entry of some data on the input line. It just commits what is there. If it is a number or if it generates one through evaluation, this goes to the stack. ENTER duplicates as DUP if no command line entry is present. This is just a shortcut. Our examples from above now work

slightly differently then before. If you type 1 ENTER 2 + you get 3 because + does an implicit evaluation of the input line before it executes. The result is the same as before. Typing 1 ENTER + returns the sum of 1 and whatever is on the next higher stack level. Here things behave differently.

What about more recent RPN (not RPL) calcs? Some testing revealed that most of them (27bii+, 32S, 33S, 35S, 42S) behave the old way. On the last three you have a visible feedback so the behavior is obvious to the user.

The 20b and 30b change the game. Here 1 INPUT + returns 1 if the stack has been cleared before and not 2 as one could expect from an RPN machine. INPUT just commits the input line to X but leaves stack lift enabled. 1 INPUT 1 + behaves as expected. It occurs to me that there is not concept of a disabled stack lift in these calculators at all. 1 INPUT INPUT 2 INPUT leaves 1 in Y, 1 in Z and 2 in X. This is exactly what RPL would do here.

What is your preferred behavior? I start liking the way the 20b and 30b work.

Re: ENTER vs. DUP - stack lift or not?

*Message #23 Posted by **Walter B** on 28 June 2011, 6:39 a.m.,*
in response to message #22 by Marcus von Cube, Germany

I'm a conservative in this matter: 1 ENTER + equals 2. Period d:-)

Re: ENTER vs. DUP - stack lift or not?

*Message #24 Posted by **Andrés C. Rodríguez (Argentina)** on 28 June 2011, 8:02 a.m.,*
in response to message #23 by Walter B

FWIW, I agree about keeping it the old way. People who like RPL style have had the choice of buying a 48 / 49 / 50 or so; but people who stood by years in a yet-unanswered prayer for an HP43S

only has the WP34S as choice.

(Please disregard any idiomatic mistake)

Re: ENTER vs. DUP - stack lift or not?

*Message #25 Posted by **Paul Dale** on 28 June 2011, 6:55 a.m.,*
in response to message #22 by Marcus von Cube, Germany

Marcus,

If only life were so simple ...

ENTER isn't the only command that plays games with stack lift. Sigma+ is another e.g.

Also, we've got backwards compatibility issues with existing programs, we've tried pretty hard to be able to run many old solution book programs and user library programs as is.

Anyway, I've not really used the 20b and 30b for computations so I don't really know if it is better or not.

Re: ENTER vs. DUP - stack lift or not?

*Message #26 Posted by **Cristian Arezzini** on 28 June 2011, 9:36 a.m.,*
in response to message #22 by Marcus von Cube, Germany

Marcus, having grown with the 48 and 50 calculators, I would have loved SO MUCH if the 34s worked the way you describe! Of course I didn't dare suggest it. In my opinion, this whole "stack lift disabling" thing is confusing. It took me a long time to get used to it, and I think people are comfortable with that system only because they've used it for so long...! :)

Cristian

Re: WP34s feature question

*Message #27 Posted by **Paul Dale** on 28 June 2011, 4:49 a.m.,*

in response to message #20 by Marcus von Cube, Germany

This has been implemented and will be coming soon the build.

Entering a command line and having it accepted onto the stack sets the entry flag. The flag is only cleared when program execution stops.

The flag is also set if you enter any alpha character even if you backspace over it again or press exit. Can't easily change this one. So I guess we've a small inconsistency :-(

> They both test for an entry, but the 2nd test also clears the flag. Similar to the FS? 22 and FS?C 22 flags on the HP 41.

We could make ?C the default behavior, i. e. clear the flag after it has been tested. If you need the status more than once, use a

user flag: CF 1; ENTRY?; SF 1. This would offer a possibility to clear the flag manually by just executing ENTRY?. ENTRY?C will not happen because we have only six characters for the command name.

Re: Pauli... ? Re: WP34s feature question

*Message #30 Posted by **gene wright** on 28 June 2011, 10:41 a.m.,*
in response to message #29 by Marcus von Cube, Germany

That would probably work, as I believe a majority of times it will be used to detect input and then branch. Once you have branched, input has of course occurred.

I do think the FS?C behavior was the most common type in HP 41 style programs.

Thoughts from anyone else?

Re: Pauli... ? Re: WP34s feature question

*Message #31 Posted by **Paul Dale** on 28 June 2011, 5:48 p.m.,*
in response to message #28 by gene wright

There is no point having ENTRY?C as a command. First up the command name is too long but ignoring that for a moment...

The internal entry flag is cleared when a program stops execution (for whatever reason). The flag is set when a command line is accepted and processed successfully. Typically the user will continue with R/S and the program runs again.

Unless someone can find a use case where a second user entry is made without a program stopping execution a second time, I don't see a need for ENTRY? to clear the internal flag. Two entries at once doesn't count -- the flag doesn't count them only indicates that at least one has been made.

I believe getting a second command line entered is impossible without a program

stopping execution a second time.

Does having ENTRY? clearing the flag hurt any use cases? One that I can think of:

```
ENTRY?
XEQ ..
ENTRY?
GTO ..
```

Could be worked around easily enough of course so this doesn't really count in the grand scheme.

- Pauli

PS: and now I see Marcus said half of what I did already...

in response to message #31 by Paul Dale

Hi Pauli:

I don't completely follow this thread but it appears to me that you're saying ENTRY? sets the internal entry flag when the command line is processed successfully and clears when the program halts. Does that mean if a user writes a program with multiple data input requests (each on a separate line) that each time the program halts for data entry the internal entry flag is reset?

A little confused, Gerry

Re: Pauli... ? Re: WP34s feature question

Re: Pauli... ? Re: WP34s feature question

*Message #35 Posted by **Marcus von Cube, Germany** on 29 June 2011, 8:55 a.m.,*
in response to message #33 by Gerry Schultz

ENTRY? doesn't set a flag, it just checks for it. The flag is set during number entry, that is while the calculator is not executing a program (which is not totally correct if Pauli didn't build in a check for it. We can safely ignore the case because the next program halt will reset the flag.)

The intended logic is as follows:

Running program comes to a STOP -> flag is reset.
User **does not** enter any numbers or text.
User presses R/S, A~D or XEQ <label>.
ENTRY? will **skip** the next command because the flag is still reset.

Running program comes to a STOP -> flag is reset.
User **does** enter some numbers or text.
User presses R/S, A~D or XEQ <label>.
ENTRY? will **execute** the next command because the flag is set.

The only way to reset the flag is doing a BST and R/S to re-execute the instruction that made the program stop.

In a real world application one might code the following (given the stack is set to 4 levels):

```
LBL A
ENTRY?
GTO 01
```

```
<compute A>
LBL 01
STO A
RTN
```

This will allow the following use cases:

<number> A or <number> STO A ==> Store parameter A
RCL A ==> control or use the value of A
A ==> compute a new value for A

Re: Pauli... ? Re: WP34s feature question

*Message #36 Posted by **Andrés C. Rodríguez (Argentina)** on 29 June 2011, 12:38 p.m.,*
in response to message #35 by Marcus von Cube, Germany

I think it's fine the way it is, but just for the sake of curiosity... (these are cases of little practical value):

a) What happens if a program enters numeric data and then ENTRY? is tested before a R/S resets the flag?

b) It's clear that the "STOP" operation from a running program (or an interrupting R/S by the user) clears the flag, before the user can ever enter data. Is it the same when debugging a program using SST to run it step-by step?

Possibly in the weekend... I need to get the "last" version before. I'm some hundreds of revisions (10 days) late... As Walter once said, 34S is a moving target indeed! :-)

Re: Pauli... ? Re: WP34s feature question

*Message #39 Posted by **Paul Dale** on 30 June 2011, 5:43 p.m.,*
in response to message #38 by Andrés C. Rodríguez (Argentina)

I'll spill the beans then, both your queries work properly.

i.e. in a the flag is set by numeric entry inside a running program and in b the flag operates properly even though you are single stepping the code.

Anyway, the point of my response was more to highlight that it would be most helpful if folks checked these kind of "what if" or "waht about" questions out themselves rather than asking. While I don't mind checking these, I'd prefer a bug report. Even better I'd get no report when things already worked :-)

ENTRY?

*Message #41 Posted by **gene wright** on 27 June 2011, 11:03 a.m.,*
in response to message #14 by Walter B

How about a comparison to Flag 22 of the HP 41? The description below comes from A. Thimet's great HP-41CV Quick Reference found here:

HP 41 quick reference

Flag 22 Data Entry Flag. This flag detect keyboard input. The calculator sets flag 22 when numeric data is entered from the keyboard. The flag is cleared each time calculator is turned on.

Flag 22 is not automatically cleared, which is why you see many HP 41 programs that right after a PAUSE have a "FS?C 22" instruction.

The ENTRY? right now is more like a FS? 22 instruction, is that correct?

If so, perhaps an ENTRY?C instruction might be a useful addition?

Thanks...

HP-67 AC Charger

*Message #1 Posted by **Ángel Martin** on 25 June 2011, 4:31 a.m.*

Recently I got a nice HP-67 but it's missing the AC charger - was wondering whether the same charger used for the 41/Printer/TapeDrive/ would also be suitable? The 67 has three male conectors, whilst the charger in question only has two female connectors - but physically they match two of the 67 prongs. Does anyonw know if they're compatible?

Thanks.

Re: HP-67 AC Charger

*Message #2 Posted by **Marcus von Cube, Germany** on 25 June 2011, 4:38 a.m.,*
in response to message #1 by Ángel Martin

You need one of the classic chargers that work for the 35 or the 45. You will likely ruin the card reader electronics if you don't have a working battery pack in place and connect the charger. Some posts down is a discussion were to find these cheap.

Re: HP-67 AC Charger

*Message #3 Posted by **Hans Brueggemann** on 25 June 2011, 6:45 a.m.,*
in response to message #1 by Ángel Martin

ángel,
these chargers are not cpmpatible with each other.
the 41 charger has (simply spoken) an AC constant voltage output, meaning that the charged device has its own rectifier and battery charging electronics on board.
the 67 charger has a DC constant current output, so, battery charging is completely managed by the electronics inside the charger itself.

best regards,
hans

Re: HP-67 AC Charger

WP 34s and USB

*Message #1 Posted by **Marcus von Cube, Germany** on 24 June 2011, 1:18 p.m.*

Here is a short success story. :-)

I've bought a cable from FTDI, the FT232R 3.3V version. I cut the plug and soldered a 2.5 mm stereo jack on the cable. It looks a bit ugly because I sacrificed a TI cable for it and soldered the wires together.

Now to the calculator. The serial interface used for programming (and hopefully for program exchange in the near future) has connections on the board which are easy to identify. I did not want to solder directly to the tabs of the programming plug because the plug should work as before after modification. The solder points are on the jumpers J5 and J6 just below the big blob. Ground is on one of the battery terminals.

The plug comes from an old "black" TI serial cable (which only works under Windows with a real serial port. I've enough "silver" cables so this one became a donor.) I found a place for the plug under the HP logo. Gluing did not work but it's mechanically a tight fit so I have hopes that it will not break.

I was able to connect to the modified calculator through the cable with SAM-BA which shows that the cable works.

Some pictures follow:

Re: WP 34s and USB - more I/O possible?

*Message #3 Posted by **Marcus von Cube, Germany** on 25 June 2011, 4:32 a.m.,*
in response to message #1 by Marcus von Cube, Germany

The connector not only allows the direct connection to a PC via USB (see above) but also the communication between two devices, if they are wired identically. I decided to connect the tip of the plug (calculator side) to RXD and the ring to TXD. If all WP 34S were equipped the same way, a connection cable from Casio will do nicely to make two calculators talk to each other, given I create the software for this. Casio's cable is a cross over connection (tip to ring and vice versa) while the TI cable is wired tip to tip and ring to ring. On the USB jack, the tip is TX and the ring is RX.

With the right software in place, data exchange between the PC and the calculator will be possible with the USB cable. I plan to implement a symmetric protocol that works identically on the PC and on the calculator.

Another thought: HP has wisely decided to bring a bunch of free I/O pins to solder pads on the board. I have the feeling that it wouldn't be too hard to connect an IR transmitter to these pins. This could be used to drive the HP printer. Geoff, we're coming !

Re: WP 34s and USB - more I/O possible?

*Message #4 Posted by **Paul Dale** on 25 June 2011, 4:34 a.m.,*
in response to message #3 by Marcus von Cube, Germany

Any chance of bit bashing an SD card via the I/O solder pads? I think this would be more useful than serial -- programs in SD executing from SD...

Pauli

Re: WP 34s and USB - more I/O possible?

*Message #7 Posted by **Gerry Schultz** on 27 June 2011, 3:31 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Marcus, it's great you were able to identify the proper points in the 30b to connect in a USB port. How did you figure it out? Let's see, USB needs ground, 5VDC, transmit and receive lines. Isn't there a data format for the transfer of valid data using USB? I would think so but I don't know what it is. Did HP included that in their design of the 30b? If so that implies HP has plans to expand their hardware calculator platform. May we all live in interesting times.

Also, I thought USB was designed with a smart computer at one end, as a controller or 'master' and the peripheral or 'slave' that does as it is told. Firewire or IEEE 1394 was designed with smart devices at both ends so they could all work peer-to-peer. Is there enough memory space in a WP-34s to make it smart enough to share data with another 34s?

In my opinion it makes the most sense to have a 34s share info with a PC via USB and use the PC application to move user programs between 34ses. I know it's an extra step to move 'stuff' but it might simplify the initial software implementation.

Just some thoughts, Gerry

in response to message #7 by Gerry Schultz

All the smart things are integrated into the "cable" made by FTDI. This cable is, in effect, a tiny controller chip built into the USB plug. So you need the "proper" cable which will cost you around $20. A standard USB cable will not do!

I just made a 1:1 connection of the 3V serial I/O pins inside the calculator to the stereo jack. No magic involved on my side.

Both will be possible. I plan to just make the protocols totally symmetric so that it doesn't matter if one of the devices is the emulator running on the PC, making use of the USB or HP's cable, or if it is another 34S.

You will be able to connect:

A/ two 34Ses with a cross over cable,
B/ two 34Ses with two HP cables and a null modem,
C/ a 34S to the emulator via the USB cable as outlined above,
D/ a 34S to the emulator via HP's cable.

Option B works because the HP cable draws its power for the level converter from the calculator, not from the PC serial plug. It's a bad idea to leave the cable connected to the 34S or 20b/30b while not in use because it will drain the battery at a rate of 4mA even with the calculator apparently turned off.

Hi Gerry,

As far as I can tell, Marcus has "issues" with the mechanical cable connection that HP built into these things. I am pretty sure I have read of his sad, heavy sighs at the nature/position of the pogo connector out the back. :-)

From my quick look at the datasheet, I don't think that the Atmel AT91SAM7L128-EK has a USB port built in. I think Marcus has "just**" connected the existing serial port to a small 3-pin jack out the side of the calculator to make it more convenient. Hence the need for the USB-to-serial cable made by FTDI and the discussion of RXD and TXD in post #3.

BTW, as far as I recall, there actually is a USB-USB specification called On-The-Go (OTG) which will work peer-to-peer. I don't recall much about it but did quickly review the specs a few years ago. I am sure someone here knows a fair bit more about it than I.

Cheers...

** When I say "just" here, I am still somewhat in awe of someone taking their Dremel tool and carving up the case to put this in! :-) Way to go Marcus!!

Nothing less and nothing more.

> Quote:
>
> BTW, as far as I recall, there actually is a USB-USB specification called On-The-Go (OTG) which will work peer-to-peer.

The TI graphing calculators make use of this specification. You can tell the difference by closely looking at the mini USB connector. The mini USB to mini USB cross over cable furnished by TI has a slightly different connector on one end.

> Quote:
>
> ** When I say "just" here, I am still somewhat in awe of someone taking their Dremel tool

> > and carving up the case to put this in! :-) Way to go Marcus!!
>
> I vote for HP doing the modification. ;-)
>
> The plug has the added benefit of missing the dangerous Erase and Reset buttons. With WP 34S once installed, Erase is no longer necessary because you can go to SAM-BA boot from within the firmware. Reset is possible with a paper clip.

48GX + Meta Kernel + Erable + ALG48 all at once?

*Message #1 Posted by **mr-scorpio** on 23 June 2011, 6:01 p.m.*

Being new to HP calculators & now the proud owner of a pristine (2003 HP 48GX), I've been researching what software exists out there, as well as what software will 'enhance' the machine.

Whilst the 48GX has a respectable 128K built in. How much MORE 'beefing up' will it need to be able to cope with: Meta Kernel + Erable + ALG48 ALL installed at the same time.

It seems that a 128K card in slot 1 'still' won't be enough to have installed all three progs? - As as user, you'd also want space left over as well surely for other things?

Therefore, just how much beefing up via cards is it necessary to get all 3 programs installed?

How can one go about getting a 128K card (or larger) without being ripped off?

Alternatively ... I've found some 32k cards for sale at a 'reasonable' price. Could one of these cards be used as the basis for a 128K upgrade, if one were to obtain the correct 128k chip & 'swap' it with some crafty soldering?

Hope you can advice & help Many thanks

Re: 48GX + Meta Kernel + Erable + ALG48 all at once?

*Message #2 Posted by **Allen** on 23 June 2011, 10:06 p.m.,*
in response to message #1 by mr-scorpio

First, congrats on your HP48GX machine! That's my favorite graphing calculator of all time.

My recommendation: Go buy a HP50g. It has many of the CAS and display features you're souped up HP48GX will aspire to, and will be fully capable at a fraction of the cost compared to upgrading the 48gx.

If you're set on the ol' stalwart 48gx Charlemagne, buy a real MetaKernel Card. That will set you back between $200 and $300.

Sadly MK cards are so rare at any price, it's not entirely realistic. There are alternatives: the HP/TDS 128K ram cards typically sell for around $100- a good deal compared to the much dearer MetaKernel card. You'll need all 128K for the MetaKernel alone, and an empty calculator when you boot-load it. An HP 32K ram card should cost $50 or less, but these are not very useful.

When discussing prices of used equipment in a capitalist market the terms 'ripped off' and 'reasonable' mean little. Don't forget you're competing against a small minority of survey companies who still use HP48GX ram cards to store data and way-points, collectors willing to pay top-dollar and against a world currency that is strong relative to the US dollar. Either you want one worse than the next guy or you don't- there is no 'expensive' or 'cheap'.

IMHO, Don't try the upgrade the 32K ram card unless you just want to waste time and money. The narrow clearances involved with the card case, the delicacy of the operation, along with the difficulty in finding those

SRAM chips make it not worth the trouble. Others may disagree, but I'd rather pay the extra $60 and be done with it.

I've done memory upgrades of the HP48G\GX motherboard using the Hitachi HM628128BLFP-8 SRAM chip it works like a dream, and still arguably not worth the time- if you can even find the chips for sale.

Wish I had better news for you- consider the 50G as an alternative before you spend $200 juicing up your 48G rig.

*Message #3 Posted by **Arnaud Amiel** on 24 June 2011, 3:24 a.m.,*
in response to message #1 by mr-scorpio

To install the metakernel (available for free from hpcalc.org), you do need a 128k RAM card in port1. Other programs could be loaded in an other card occupying the 2nd slot.

At the time there was some relatively affordable non hp (cynox, klotz) memory cards (this is what I use). I don't know where to find them now but they should not be that expensive.

Really you can have Meta Kernel + Erable + ALG48 and much more and still most of your 128k memory free.

in response to message #3 by Arnaud Amiel

Hi there, Many thanks for your replies so far. I was contemplating the 50g, but ... i dunno.. there's just something about the 48GX - LOVE the keyboard, the whole 'mature' outlook & feel of the machine etc.

One thing I've read about Meta Kernel is how much 'faster' it apparently is compared to the native 'built in' features, like 'Equation Writer' stating in some cases to be 100 times faster!!

Which begs the question, If optimized code could be written to perform like MK does, the potential was there all along. This being the case, why is HP's OWN software 'Equation Writer' for example, so slow, when a 3rd party has proved it could have been done better in the first place? Cheers

This is understandable. It's a piece of hardware. You can't spend too much time writing the code before going to market with it.

But software? If McAfee, Symantec, etc. can hire programmers to defeat viruses, why can't Microsoft? Why is Windows written in a way that allows attacks anyway?

Remember Windows 95? You had to buy a separate 3rd party program just to keep it from fatally crashing and losing your data. Same concept.

*Message #6 Posted by **Raymond Del Tondo** on 24 June 2011, 11:39 a.m.,*
in response to message #4 by mr-scorpio

Hello,

If you want a really fast user Interface on your HP-48GX, I suggest trying SpeedUI, the real Software Turbo for the HP-48G series.

SpeedUI accelerates every aspect of the user interface, including choose boxes, Input forms, the MatrixWriter, MemoryBrowser, and the stack interface, of course, and adds features not available on an HP-48 before, while being very modular.

And SpeedUI is still supported, and Features are still added, while the old MK beta Software is outdated since at least fifteen years.

The next SpeedUI release, version 11.06 , will be on the 3rd of July, 2011.

HTH

*Message #7 Posted by **mr-scorpio** on 24 June 2011, 7:04 p.m.,*
in response to message #6 by Raymond Del Tondo

Hi Raymond, Many thanks for the SpeedUI suggestion. How does it compare to MK as a UI replacement? Does it speed up everything, including Equation Writing & symbolics?

I've also wondered about the 3d graphing? does either SpeedUI or MK offer realtime rotation?

Cheers Al

Re: 48GX + Meta Kernel + Erable + ALG48 all at once?

*Message #8 Posted by **Raymond Del Tondo** on 24 June 2011, 7:47 p.m.,*
in response to message #7 by mr-scorpio

Hi Al,

hmmm, somewhat difficult to compare SpeedUI and MK directly.

SpeedUI is targeted to users who simply want to use their calc as before, but with a much more performant user interface.

For a SpeedUI feature overview, please take a look at the SpeedUI walkthrough

and give it a try: SpeedUI 11.05 archive

SpeedUI speeds up everything _except_ the built-in EquationWriter. Actually one of the few things not available as a SpeedUI component so far is the EquationWriter, because there are equation editor replacements on www.hpcalc.org . But maybe later this year, I'll make an EquationWriter version which is more performant than the built-in one.

Displaying the expressions on the stack will be done with SpeedUI .

Neither SpeedUI nor MK offer real-time 3D rotation from stock. However a few years ago, I backported the 49g DRAW3DMATRIX functionality to the HP-48. DRAW3DMATRIX actually is the 3D real-time rotation tool. My backport is available on www.hpcalc.org , too.

Cheers

Ray

Hi,

>Hi there, Many thanks for your replies so far. I was contemplating the 50g, but ... i dunno.. there's just something about the 48GX - LOVE the keyboard, the whole 'mature' outlook & feel of the machine etc.

Imho i prefer the 50g for the keyboard agencement , and the look and feel of the 50.

>One thing I've read about Meta Kernel is how much 'faster' it apparently is compared to the native 'built in' features, like 'Equation Writer' stating in some cases to be 100 times faster!!

And 200 times faster on the 49G... and perhaps 400 times faster on 50G ;)

>Which begs the question, If optimized code could be written to perform like MK does, the potential was there all along. This being the case, why is HP's OWN software 'Equation Writer' for example, so slow, when a 3rd party has proved it could have been done better in the first place?

Perhaps i'm wrong,but i think that the 49G/49G+ and 50G have all of this integrated. Equation writer, matrix editor (and list editor), CAS, speed, RAM, USB connection, SD card you can use like mass storage, larger screen, better font etc etc.

I think that if you use a 50G few hours, you will never want to downgrade on a 48GX. A point for the 48 could be the small enter key of the 50 (i like this small enter key), and the keyboard feeling wich is good but less than on the 48GX

HP7470A Plotter calibration with an HP-IL interface

*Message #1 Posted by **Richard L. Taylor** on 23 June 2011, 2:58 p.m.*

Hi,

Does any one know how to calibrate the HP7470A plotter that has an HP-IL interface?

Thanks in advance

Rich

Re: HP7470A Plotter calibration with an HP-IL interface

*Message #2 Posted by **Garth Wilson** on 23 June 2011, 4:58 p.m.,*
in response to message #1 by Richard L. Taylor

Are you missing the manual? I have the manual here for the 7475 which is almost the same thing but for bigger paper, with HPIB which should work the same way, and I don't find anything about calibration. If it were an analog machine, there would be trimmers inside for that; but it's not. It's all stepper-motor controlled, with gears and a toothed belt, so it cannot come out of calibration. We used one continuously for months at my last place of work around 1990, and I wondered about the rough wheels that control the paper movement wearing down, but I guess their carbide surface was so hard that it wasn't a problem. Otherwise, I suppose you could plot something, measure it, and crank calibration constants into your software to multiply the X and Y values by.

What we were using it for was plotting PC boards (2x or 4x actual size) on very tough, stable-based material, before the days of being able to just send your files to a board house via the internet, and the boards always came out perfect and screw holes and connectors lined up perfectly with what they were supposed to mate with. There was no discernable error. Ever.

Re: HP7470A Plotter calibration with an HP-IL interface

*Message #3 Posted by **Richard L. Taylor** on 23 June 2011, 9:10 p.m.,*
in response to message #2 by Garth Wilson

Thank you for that info. I had no idea. I did buy a service manual on CD at EBAY for $10.00. One of the strange things on my HP7470a is I wrote a program to draw the Nevada county boundries and part of the joining boundries come out as double lines about 0.4 mm apart when I use pen 1. When I switch to pen 2 and draw the map again, the double lines are not in the same place. What do you think?

Thanks

Rich

I was able to do it only after following the first requirement (Windows XP computer with hardware serial port). I had tried a patched SAMBA v6 both on Vista on Seven but it did not work, probably because of the USB-to-RS232 I used.

Note that SAM-BA 2.10 (the current version on the Atmel site) only provides support for serial port on Windows XP, on Vista and Seven it only provides USB support (and even though the

USB to serial converter is plugged into a USB port, it still simulates a serial port).

Unfortunately currently there is only a serial cable available - does anyone know of a USB equivalent?

I don't know how well older versions of SAM-BA will work on Vista and Seven, as they will have to run in compatability mode or be modified, which creates its own problems - anyone have success on Vista or Seven with a USB-serial converter that can share their exact setup? Thanks

Re: Is there a ref doc/place for 34S how-to?

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 7 July 2011, 8:36 p.m.,*
in response to message #10 by Bart (UK)

I used a USB to serial converter. It's a small printed circuit board, but is not a commercial product. It uses an FTDI chip.

It worked fine under Windows 7, but with SAM-BA 2.6. The newer SAM-BA 2.10 doesn't work with this configuration.

Re: Is there a ref doc/place for 34S how-to?

in response to message #11 by Andrés C. Rodríguez (Argentina)

I have Windows 7 Pro 64-bit, since my old XP box died shortly before I decided to take on the WP 34s project.

Microsoft offers a legacy support if you have Win7 Pro or better in the form of the Windows Virtual PC and Windows XP Mode. I was able to get SAM-BA 2.10 to work with the built in serial port in my machine by installing it in the virtual machine. Took a little tweeking, but it wasn't too hard.

If you have Win7 Home, you would need a copy of XP to install, but it may be possible.

Re: Is there a ref doc/place for 34S how-to?

*Message #13 Posted by **Marcus von Cube, Germany** on 15 July 2011, 12:33 p.m.,*
in response to message #12 by John Gustaf Stebbins

Virtual PC is still free but you need something to install within it. Any XP copy will do.

That would have been my suggestion.

Another way to figure it out: Try to download the appropriate drivers and/or manuals for the device in question before you buy it. You can normally tell from the driver names if it's an FTDI device.

Re: FTDI chip USB-RS232 - Marcus do you know a brand that contains it?

Name brand cables are not trustworthy. Too often they change their oem supplier without public notice and no longer have the expected components.

Simplified Arduino boards often use FTDI chips/cables. I'm not familiar with European suppliers (I've stumbled across many in the past but don't keep the links).

U.S. examples:
3.3v I/O cable
5v I/O cable
3.3v or 5v board
3.3v or 5v breakout board

SparkFun does quote Euro and Pound prices, so I imagine they'll ship. No idea if it is a good deal or not. They are pretty good in the U.S.

Re: FTDI chip USB-RS232 - Marcus do you know a brand that contains it?

*Message #19 Posted by **Marcus von Cube, Germany** on 10 July 2011, 2:11 a.m.,*
in response to message #18 by sylvandb

For these cables to work, you need to modify your 20b or 30b.

The first (3.3V) can be directly connected to the serial I/O pins of the calculator if you find the plug. None of the cables can be used with HP's cable. Someone should produce modified cables where the voltage converter is replaced by the 3.3V FTDI cable. For initial programming of an unmodified 20b or 30b you'll need the "Erase" button.

> "Mini Adapter has one Status LED and uses FTDI Chip for up to 230K Speed."FTDI adapter

Notice anything different about that compared to the ones I listed?

Unfortunately that one and many others I've seen on Amazon all are specified to do a conversion to RS-232 voltage levels (-5v to -12v and +5v to +12v) which may or may not work and may or may not fry the 3.3v (0v and 3v) signaling used by the calculators. It seems like it would be cheaper to not do the conversion but quantities of scale...

Adding "header" to the search does turn up: USB to 3.3v TTL Header like FTDI TTL-232R-3V3 with a description that claims "Utilizes newest FTDI FT232QR chip"

With that said, sometimes the cheap ones don't actually do a conversion to RS-232 voltages... (Which violates the RS-232 specification, but much RS-232 hardware does work and recognize the signals never the less.) I just cannot recommend anything like that, because you are relying on not only unspecified feature, but a feature contrary to the specification.

Re: FTDI chip USB-RS232 - Marcus do you know a brand that contains it?

*Message #22 Posted by **Walter B** on 12 July 2011, 1:24 a.m.,*
in response to message #21 by sylvandb

We are *guessing* there's a correlation between "FTDI" and "USB 2.0". Holds for a few samples I googled. I leave this to the experts to confirm or deny, however.

Walter

*Message #23 Posted by **Marcus von Cube, Germany** on 12 July 2011, 2:49 a.m.,*
in response to message #21 by sylvandb

Sylvandb, you're mixing things up a little.

HP furnishes a cable with the special plug to match the connector of their latest calculators. This cable has a plastic housing with two buttons ("Reset" and "Erase") in the middle and a standard 9 pin header on the computer end. This plugs into a standard RS232 port or a serial/USB converter. Using the latter works only with an

FTDI equipped converter, who knows why.

FTDI makes cables which operate directly on the lower (and inverted) levels available on the calculator socket but you cannot use these with the cable made by HP. You have to make your own connection directly to the board, e. g. with a stereo jack like I did. The 3.3V cable is the one use in this case.

Message #24 Posted by ***Reth*** *on 12 July 2011, 1:40 a.m.,*
in response to message #15 by Bart (UK)

Following Marcus' advise I got this one and I can confirm it works perfectly on all our computers Win XP, Win 7 etc.

What's the deal with expensive battery packs ?

*Message #1 Posted by **Michael de Estrada** on 23 June 2011, 9:10 a.m.*

Lately I've seen a lot of expensive rebuilt battery packs for HP Classics being sold on TAS. I really don't see the point of this, given that there are much cheaper HP Classic battery packs available, that use the same 1000 mAh capacity AA NiCd cells and work just as well. Sure, the lower priced packs don't look like the originals, but they are hidden under the battery door, so who cares? Anyways, just another issue to ponder.

in response to message #3 by Michael de Estrada

Which I Personally would not call "a lot"

But that is just me

Re: What's the deal with expensive battery packs ?

*Message #5 Posted by **Michael de Estrada** on 23 June 2011, 12:11 p.m.,*
in response to message #4 by Gene wright

A lot, a few, whatever. The point I was trying to make is that the more expensive battery packs do not make economic sense to me, since it's an expendable item that does not affect the exterior appearance of the calculator.

*Message #6 Posted by **Namir** on 23 June 2011, 11:55 a.m.,*
in response to message #1 by Michael de Estrada

One of the sellers is Scott R. from the L.A. area. Seems he is including the plastic housing for the batteries that the less expensive sellers do not. This might explain why these sellers are asking for more. Scott is a nice

person and I have invited him to attend HHC2011. He plans to.

in response to message #6 by Namir

For sure the expensive batteries use the OEM plastic housing, which the less expensive Waterhosko (Mark Hoskins) battery does not. Still, except for cosmetics or some dogged adherance to authenticity, for me it doesn't justify the 3 X cost. The cheap batteries work just as well.

Re: What's the deal with expensive battery packs ?

*Message #8 Posted by **Namir** on 23 June 2011, 12:54 p.m.,*
in response to message #7 by Michael de Estrada

I have the Waterhosko batteries too and they work just fine in my calculators. I have more than enough of these batteries that I don't need to buy any more and don't worry bout their cost.

Does any one know where to find batteries for the HPIL cassette drive or the HPIL printer?

Re: What's the deal with expensive battery packs ?

*Message #10 Posted by **Geoff Quickfall** on 23 June 2011, 3:00 p.m.,*
in response to message #9 by Tim

Local batteries plus store in Canada supplied me with tabbed NiMh C cells which I used to replace the dead ones.

Conversely you could diassemble the packs and have your electronics store build you a new set. I say, disassemle your self to prevent harsh hands working on your pristine battery cases.

The Thinkjet printer HPIL battery pack is held together by clips AND double sided INDUSTRIAL strength tape. I used a hair dryer to heat the top of the case to soften the tape adhesive. Then gently pry appart after releasing the snaps. As DB said, you need the hads of Shiva, or a few fine knife blades and a pry tool. The Cassette pack is easy to fix. The 9114a and B is a sealed lead acid and is also found inside an easy to open plastic case.

*Message #11 Posted by **Richard L. Taylor** on 23 June 2011, 3:05 p.m.,*
in response to message #9 by Tim

There is a place called the Nicad Lady that will rebuild them for $47.00 each. I had four of mine done. They work great. You have to send in your old battery packs.

Rich

Re: What's the deal with expensive battery packs ?

*Message #12 Posted by **Ernst Fueloep** on 24 June 2011, 5:33 a.m.,*
in response to message #9 by Tim

Look at the battery packs from seller waterhosko. The battery pack for a HP 97 should fit perfectly in a HPIL cassette drive or HPIL thermal printer.

Re: What's the deal with expensive battery packs ?

*Message #13 Posted by **Martin Pinckney** on 24 June 2011, 11:08 a.m.,*
in response to message #1 by Michael de Estrada

I looked at the Waterhosko batteries, and the cost certainly is reasonable. But I had two OEM packs that had dead NiCads, so I went to Batteries+ for a quote. It was $14.99, same as Waterhosko, so I said, why not?

Then things started to go wrong. I decided to cut the plastic apart and later glue it back together myself, so I could control the final result. Problem was, apparently in the original packs the plastic parts space the cells, but Batteries+ just re-soldered the tabs with the (insulated) cells touching. So now the cells won't allow the plastic halves to fully close, and the pack won't allow the door to close.

I am sure I will be able to remedy this problem, but I offer this as a word to the wise for any other unsuspecting Classic owners out there.

Re: What's the deal with expensive battery packs ?

*Message #14 Posted by **Michael de Estrada** on 24 June 2011, 11:59 a.m.,*
in response to message #13 by Martin Pinckney

This has always been a problem with rebuilding Classic battery packs, which is why I don't bother and just buy the very affordable Waterhosko ones. It's especially bad in the card reader HP 65/67 models, where even the OEM battery packs are a very tight fit. Years ago I bought a number of rebuilt Classic battery packs on TAS that were all bad fits and had to be discarded. That particular seller has since departed. There's a new seller that I have not tried that sells Classic battery packs for more than Waterhosko, but still about 1/2 the price of the others. Perhaps someone here has bought them and would care to provide feedback.

Re: What's the deal with expensive battery packs ?

*Message #15 Posted by **Gerry Schultz** on 24 June 2011, 1:00 p.m.,*
in response to message #13 by Martin Pinckney

Thanks for the info Martin. I have three or four classic battery packs for the 97 calc, 143A printer, 161A tape drive and the 162A printer that I want to rebuild. I've got the batteries but haven't had the time to replace them yet. I'm thinking of using a dremel tool or a razor blade to split the packs. What did you use?

Thanks, Gerry

Re: What's the deal with expensive battery packs ?

*Message #16 Posted by **Martin Pinckney** on 24 June 2011, 10:41 p.m.,*
in response to message #15 by Gerry Schultz

Hi, Gerry.

At first I thought I would cut them with a razor knife, but the plastic proved to be a little thick to do this easily. So I got out my trusty Dremel. I happen to have an older Dremel saw blade that I use for just such jobs*. It has a very thin kerf, and I use it with one of my Dremels that allow reduced speed for better control. I was able to make a very neat cut this way. My intention, after I rectify the thickness problem, is to glue the halves back together with the epoxy just filling in the cut, so it can be opened up again by cutting out the epoxy.

I'm sure you realize it, but just in case, you cut the sides at the ends of the cells.

*Dremel doesn't make it any more, so I take real good care of it. It is 3/4" in diameter, and has its own arbor. Nowadays they make an expensive saw attachment that takes a 1-1/4" blade, with blade guard, etc. Lawyers. But all is not lost, because they also sell an abrasive-type blade that's made for use on plastics; it goes on the EZ Lock arbor.

Re: What's the deal with expensive battery packs ?

*Message #17 Posted by **Paul Dale** on 24 June 2011, 10:58 p.m.,*
in response to message #16 by Martin Pinckney

Try Widget Supply for these blades. Their prices are very cheap compared to just about everywhere else I've ever seen.

Pick up a key-less chuck where you're there, you won't regret it.

- Pauli

Unreleased models

*Message #1 Posted by **Johnny Bjoern Rasmussen** on 23 June 2011, 7:10 a.m.*

Hi
I have just re-read the "Where are they now" article by Dennis York in HPCC Datafile V27N6 to look for information regarding unreleased HP's for my website. The article is very exciting especially the part where Dennis describes (unfortunatly very brief) the unreleased projects "Eagle" and "Eagle Beagle".
Also I remember reading (maybe in Wlodek Mier-Jedrzejowicz's "Guide to HP Handheld Calculators and Computers") about HP-calc family names like "Earthquake" and "Pogo".

Is there anyone here who have any information or pictures about the these prototypes?

Thank you in advance!
Johnny Bjoern Rasmussen
Denmark

> Is there anyone here who have any information or pictures about the these prototypes?

...and there are others which I have only heard about, such as "Firefly" - the cancelled "HP02" LCD watch; and "Zipper", which I believe was to be a vertical-format machine with some sort of alternate mass storage built in (beyond the 41, if I remember correctly). Eric Vogel once mentioned a cancelled clamshell financial/PIM machine from the timeframe prior to the 18C called "Singha" and Richard Nelson has the top case from a cancelled Classic-series machine whose focus was statistical functions. Also, check out HPCC's Datafile issue Volume 21 Number 2 with a cover drawing (and story inside) of the cancelled HP-12R Pioneer-series real-estate machine.

The Prime Factors Kata

*Message #1 Posted by **Thomas Klemm** on 23 June 2011, 3:52 a.m.*

> Quote:
>
> The model of computation of Java bytecode is that of a stack-oriented programming language.

Let's see how we can use that with the following Java program for the Prime Factors problem:

```
package primeFactors;

import java.util.*;

public class PrimeFactors {
  public static List<Integer> generate(int n) {
    List<Integer> primes = new ArrayList<Integer>();

    for (int candidate = 2; n > 1; candidate++)
      for (; n%candidate == 0; n/=candidate)
        primes.add(candidate);

    return primes;
  }
}
```

I used the Java compiler to create a class file and *javap* to disassemble the code:

```
javac PrimeFactors.java
javap -c PrimeFactors
```

That's the result:

```
Compiled from "PrimeFactors.java"
public class primeFactors.PrimeFactors extends java.lang.Object{
public primeFactors.PrimeFactors();
  Code:
   0:   aload_0
   1:   invokespecial   #1; //Method java/lang/Object."<init>":()V
   4:   return

public static java.util.List generate(int);
  Code:
   0:   new #2; //class java/util/ArrayList
   3:   dup
   4:   invokespecial   #3; //Method java/util/ArrayList."<init>":()V
   7:   astore_1
   8:   iconst_2
   9:   istore_2
   10:  iload_0
   11:  iconst_1
   12:  if_icmple   45
   15:  iload_0
   16:  iload_2
   17:  irem
   18:  ifne    39
   21:  aload_1
```

```
   22:  iload_2
   23:  invokestatic    #4; //Method java/lang/Integer.valueOf:(I)Ljava/lang/Integer;
   26:  invokeinterface #5,  2; //InterfaceMethod java/util/List.add:(Ljava/lang/Object;)Z
   31:  pop
   32:  iload_0
   33:  iload_2
   34:  idiv
   35:  istore_0
   36:  goto    15
   39:  iinc    2, 1
   42:  goto    10
   45:  aload_1
   46:  areturn

}
```

Now it's straightforward to translate that to RPN:

```
STO 00              ; int n
2                   ; 8:   iconst_2
STO 02              ; 9:   istore_2
LBL 10
RCL 00              ; 10:  iload_0
1                   ; 11:  iconst_1
X>=Y?               ; 12:  if_icmple   45
GTO 45
LBL 15
RCL 00              ; 15:  iload_0
RCL 02              ; 16:  iload_2
MOD                 ; 17:  irem
X#0?                ; 18:  ifne    39
GTO 39
VIEW 02             ; 22:  iload_2
RCL 00              ; 32:  iload_0
RCL 02              ; 33:  iload_2
/                   ; 34:  idiv
STO 00              ; 35:  istore_0
GTO 15              ; 36:  goto    15
LBL 39
1
STO+ 02             ; 39:  iinc    2, 1
GTO 10              ; 42:  goto    10
LBL 45
RTN                 ; 46:  areturn
```

We can't return a list and so I decided to just view the factors.

Cheers
Thomas

Re: The Prime Factors Kata

*Message #2 Posted by **Eddie W. Shore** on 26 June 2011, 11:30 a.m.,*

Really cool. When I was checking out the link I thought you managed to work a prime factors program in PowerPoint. LOL

Re: The Prime Factors Kata

*Message #3 Posted by **Thomas Klemm** on 27 June 2011, 3:32 p.m.,*
in response to message #2 by Eddie W. Shore

When you run the disassembly through this script a lot of the translation is done:

```
#!/usr/bin/perl -w

while (<>) {
```

```
    printf "%-22s; $_%s",

    /[adfil]?return/        ? 'RTN' :
    /dup/                   ? 'ENTER' :
    /swap/                  ? 'X<>Y' :
    /[dfil]const_(\d)/      ? $1 :
    /iconst_m1/             ? -1 :
    /[dfil]load_(\d)/       ? "RCL 0$1" :
    /[dfil]load\s+(\d+)/    ? sprintf("RCL %02d", $1) :
    /[dfil]store_(\d)/      ? "STO 0$1" :
    /[dfil]store\s+(\d+)/   ? sprintf("STO %02d", $1) :
    /goto\s+(\d+)/          ? sprintf("GTO %02d", $1) :
    /iinc\s+(\d+),\s+(\d+)/ ? ($2, sprintf "STO+ %02d\n", $1) :
    /[dfil]add/             ? '+' :
    /[dfil]sub/             ? '-' :
    /[dfil]mul/             ? '*' :
    /[dfil]div/             ? '/' :
    /[dfil]rem/             ? 'MOD' :
    /ifeq\s+(\d+)/          ? ('X=0?',  sprintf "GTO %02d\n", $1) :
    /ifne\s+(\d+)/          ? ('X#0?',  sprintf "GTO %02d\n", $1) :
    /iflt\s+(\d+)/          ? ('X<0?',  sprintf "GTO %02d\n", $1) :
    /ifge\s+(\d+)/          ? ('X>=0?', sprintf "GTO %02d\n", $1) :
    /ifgt\s+(\d+)/          ? ('X>0?',  sprintf "GTO %02d\n", $1) :
    /ifle\s+(\d+)/          ? ('X<=0?', sprintf "GTO %02d\n", $1) :
    /if_icmpeq\s+(\d+)/     ? ('X=Y?',  sprintf "GTO %02d\n", $1) :
    /if_icmpne\s+(\d+)/     ? ('X#Y?',  sprintf "GTO %02d\n", $1) :
    /if_icmplt\s+(\d+)/     ? ('X>Y?',  sprintf "GTO %02d\n", $1) :
    /if_icmpge\s+(\d+)/     ? ('X<=Y?', sprintf "GTO %02d\n", $1) :
    /if_icmpgt\s+(\d+)/     ? ('X<Y?',  sprintf "GTO %02d\n", $1) :
    /if_icmple\s+(\d+)/     ? ('X>=Y?', sprintf "GTO %02d\n", $1) :
    '', ''

}
```

Labels are missing though. That's the output of the previous example:

```
                        ; Compiled from "PrimeFactors.java"
                        ; public class primeFactors.PrimeFactors extends java.lang.Object{
                        ; public primeFactors.PrimeFactors();
                        ;   Code:
                        ;     0:   aload_0
                        ;     1:   invokespecial   #1; //Method
java/lang/Object."<init>":()V
RTN                     ;     4:   return
                        ;
                        ; public static java.util.List generate(int);
                        ;   Code:
                        ;     0:   new     #2; //class java/util/ArrayList
ENTER                   ;     3:   dup
                        ;     4:   invokespecial   #3; //Method
java/util/ArrayList."<init>":()V
                        ;     7:   astore_1

MOD                     ;     17:  irem
X#0?                    ;     18:  ifne    39
GTO 39
                        ;     21:  aload_1
RCL 02                  ;     22:  iload_2
                        ;     23:  invokestatic    #4; //Method
java/lang/Integer.valueOf:(I)Ljava/lang/Integer;
                        ;     26:  invokeinterface #5,  2; //InterfaceMethod
java/util/List.add:(Ljava/lang/Object;)Z
                        ;     31:  pop
RCL 00                  ;     32:  iload_0
RCL 02                  ;     33:  iload_2
/                       ;     34:  idiv
STO 00                  ;     35:  istore_0
GTO 15                  ;     36:  goto    15
1                       ;     39:  iinc    2, 1
```

```
STO+ 02
GTO 10                  ;    42:  goto    10
                        ;    45:  aload_1
RTN                     ;    46:  areturn
                        ;
                        ; }
                        ;
```

Far from perfect but maybe a good starting point.

Kind regards
Thomas

Shocker! Nice HP-70 sells for only $260

*Message #1 Posted by **Michael de Estrada** on 22 June 2011, 1:43 p.m.*

It's commonplace to see threads on this forum discussing outrageouly high TAS auction sale prices for vintage calcs and accessories, but how about amazingly low sale prices? Something to this effect happened earlier today, as a very nice HP-70 sold for a mere $260. In the past, an HP-70 in good condition would easily fetch over $500, and in one case nearly $1000.

There were several factors that probably affected the final price.

First, it was domestic only with no shipping beyond the USA.

Second, the auction ended at an odd time, middle of the week at a time of the morning when many potential bidders were probably somewhere between home and work.

Third, this auction comes after a period in the last 1 1/2 years in which more than a dozen HP-70s have sold, and perhaps all the high roller buyers have been exhausted, leaving only budget buyers.

Anyways, there is one very lucky collector out there today.

Re: Shocker! Nice HP-70 sells for only $260

*Message #2 Posted by **bill platt** on 22 June 2011, 3:39 p.m.,*
in response to message #1 by Michael de Estrada

The Euro is strong, the Greeks are going bankrupt, Helicopter Ben is printing money, and everyone is out of work.

What's shocking? ;-)

Re: Shocker! Nice HP-70 sells for only $260

*Message #3 Posted by **Joerg Woerner** on 22 June 2011, 4:48 p.m.,*
in response to message #2 by bill platt

Or collectors spent their money on TI calculators?

I saw three SR-60(A)in the past three weeks going for $2,000+, $1,600, and $760. And a TI-59 in Europe for more than EUR 300 (more than USD 450...).

Or was it Casio? That fx-98 recently for $485, you remember.

Or collectors knew already that I listed today a fx-98 Plus a.k.a. Radio Shack EC-4009?

If you do a lot of auctions on eBay as a seller, you'll learn:

It's all about bidding war! I had calculators not selling for my usual $9 minimum, re-listed them in the

same week and selling for $30+. You can't predict the maximum bid, this is why you see more and more "Buy-It-Now OR Make-Offer" auctions.

Or in case of the EC-4009 a very high minimum bid...

Regards, Joerg

Re: Shocker! Nice HP-70 sells for only $260

*Message #4 Posted by **Mike Morrow** on 22 June 2011, 7:05 p.m.,*
in response to message #3 by Joerg Woerner

That EC-4009 is, IMHO, the best credit-card scientific ever made. They were inexpensive...I bought more than five when they were on the US market in 1985 and gave most away as cheap gifts...except for the one I still have.

The HP-70, on the other hand, was never the nicest or the best in any category.

Re: Shocker! Nice HP-70 sells for only $260

*Message #5 Posted by **bill platt** on 22 June 2011, 8:29 p.m.,*
in response to message #3 by Joerg Woerner

I will not bid on any calculator auction with a minimum, or a reserve price. Waste of Time.

Hm. Guess I shouldn't have contributed my HP 70 as a raffle prize at HHC 2006.

But it was so *ugly*. And I really only am interested in the scientific calks.

Re: Shocker! Nice HP-70 sells for only $260

*Message #8 Posted by **Mark Hardman** on 22 June 2011, 8:44 p.m.,*
in response to message #1 by Michael de Estrada

In January of this year I purchased an HP-70 from a seller in the UK that disclosed that there were a few bad LED segments. I won the auction for what I then thought was an incomprehensibly low $312! There must have just been a little corrosion on the LED's finger connections. Because, when it arrived from the UK, all display segments were working like new.

I guess it’s just a good time to be a buyer on TAS. In the last month, I also picked up an HP Xpander for

$48.77! The seller disclosed that the digitizer was not working. But again, lady luck was with me. The NIB Xpander arrived, I popped in two pre-charged NiMH batteries and the unit booted right up to the digitizer calibration screen and I was able to align the touch screen without problem.

Possible bug in WP34s with big integers

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 22 June 2011, 12:30 p.m.*

I was working at generating toy RSA keys for algorithm exploration and created 2 32-bit primes (P and Q). I decremented each one in 2c64 mode and multiplied them together to get N = (P-1)(Q-1).

However, the number I get is missing the MSbit.

On VERS 1145:

With R77 = 0xF138552D (a prime) and R78 = 0xAAC9B7A5 (a prime)

```
001 LBL A
002 WSIZE 64
003 2COMPL
004 BASE 16
005 RCL 77
006 DEC X
007 RCL 78
008 DEC X
009 [times]
010 RTN
```

The answer WP34s gives is: 0x20ED7AD3E4850430.

In BC:

```
ibase=2^4
obase=2^4
p=F138552D
q=AAC9B7A5
n=(p-1)*(q-1)
n
A0ED7AD3E4850430 (This is correct. The MSbit should be set.)
```

I also repeated this in 1c64 mode with the same result. Any ideas? Have I overflowed something? I think this value should have been within range of [1-2]c64.

Best regards...

Re: Possible bug in WP34s with big integers

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 22 June 2011, 2:26 p.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

Oops! That's obviously phi(n) not n but still likely a bug. :-)

Re: Possible bug in WP34s with big integers

*Message #3 Posted by **Jake Schwartz** on 22 June 2011, 4:08 p.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

Quote:

> The answer WP34s gives is: 0x20ED7AD3E4850430.

....and leaving the overflow flag set. Since the MSB is the sign, the value would not be able to be represented in only 63 bits and if the MSB was able to be set, the value would erroneously go negative. If you run the program in the 34S and receive 20ED 7AD3 E485 0430 as a result, then get the leading hex digit to become an A by the following: 100000000000 ENTER 10000 * + 100000000000 ENTER 70000 * +, switching to decimal generates -6,850,684,407,670,045,648. Also, doing the problem in unsigned mode results in a decimal value of 11,596,059,666,039,505,968. The log(base 2) of this value is 63.33..., so since more than 63 bits would be needed to represent it, the signed 64-bit modes could not hold it. I think the 34S is okay.

Input wanted

*Message #1 Posted by **Paul Dale** on 22 June 2011, 4:17 a.m.*

The 34s is pretty much finalised now. The F distribution still needs some work and no doubt there are other bugs which will eat into the available space. I'd like some serial IO which might or might not be possible even with a hardware modification.

Anyways, if we've some space left after the above, I'd like to ask for suggestions for extra conversions and constants to include. Straight multiplicative conversions (both ways) take 20 bytes and constants take 12 so we can squeeze them in pretty well.

I've added the WGS84 constants recently and the rest are documented in the manual. So any others we should include???

The WGS constants are: a, b, e^2, e'^2, 1/f, gm and omega. The constants b, e^2 and e'^2 are derived from the other four but are more commonly used. If you don't know what I'm talking about then don't worry, if you do I'm sure you'll appreciate having them.

- Pauli

Re: Input wanted

*Message #2 Posted by **Cristian Arezzini** on 22 June 2011, 10:45 a.m.,*
in response to message #1 by Paul Dale

I personally wouldn't mind some astronomical constants... you know, Earth/Sun/Moon mass, peri- and apo-distances (sorry, I don't recall the English name now) of some important orbits - again, Earth, Moon for example... I've often had to do some orbital calculations and these constants would be useful.

Cristian

Re: Input wanted

*Message #3 Posted by **Paul Dale** on 23 June 2011, 7:57 a.m.,*
in response to message #2 by Cristian Arezzini

Apogee and perigee.

Will see what we can do. No promises yet, I've got some more work to do on the statistical functions and the possibility of another page of user programs remains open.

- Pauli

Re: Input wanted

*Message #4 Posted by **Cristian Arezzini** on 23 June 2011, 9:18 a.m.,*
in response to message #3 by Paul Dale

Thanks! :) If apogee and perigee (are they called apohelios and perihelios in case of orbits around the sun? :) can't make it in the library, then Earth/sun/moon masses are more important... in my direct, personal experience of course! :)

Re: Input wanted

*Message #5 Posted by **Ren** on 23 June 2011, 10:49 a.m.,*
in response to message #4 by Cristian Arezzini

apohelion, perihelion (helios) are the terms I recall, apolune and perilune, (lunar) IIRC from Walter Cronkite and CBS's coverage of the Apollo missions. so maybe apogee and perigee only relate to Earth (geo).

So what would they be for Kronos B^)

Re: Input wanted

*Message #7 Posted by **fhub** on 23 June 2011, 7:33 a.m.,*
in response to message #1 by Paul Dale

It has certainly been mentioned a few times here that the missing matrix math is probably the biggest disadvantage of this (otherwise outstanding) WP34s calculator.

Now I've read in the manual that this missing matrix math is "due to display restrictions!!?
What's this??? Sorry, but I don't understand this at all, what special display capabilities would be needed for matrix input and output?
Ok, there's of course no way for a 2-dimensional display, but the matrix could still be entered, displayed and edited by single elements (e.g. showing the row and column at the upper dot matrix display).

I could have understood if the reason would have been explained by "not enough memory for coding all those matrix routines", but not those "display" reasons.

So can someone please enlighten me about the 'true' reason for NOT implementing matrix math - or about what I'm mis- or not understanding in this "display restrictions"?

Franz

Re: Input wanted

*Message #8 Posted by **Paul Dale** on 23 June 2011, 7:46 a.m.,*
in response to message #7 by fhub

Walter wrote the manual so he'll have to explain that phrase (and he's away from the Internet for a while).

The display on the 34s is pretty poor. Not being able to display two numbers properly was part of our reason to support the 32s's complex mode rather than the 42s's. Memory was of course the other major reason. Matrix support was omitted for basically the same two reasons: it is impossible to nicely display a matrix on the display and there isn't memory to do the job properly. I'm also of the opinion that if you want matrix operations, you should be using a real maths package like matlab or equivalent :-) I'd never be able to fit robust and fast routines for many of the desirable operations in -- numeric stability of matrix operations has many very heavy books written about it.

That said, there is easily space for a reasonable selection of user code matrix operations. I've thought about porting JMB's matrix code a couple of times. One or two pages of flash should be sufficient to hold the important routines and the conversion should be fairly straightforward. The biggest change I'd make would be to reformat the the matrix descriptors into something more user friendly e.g. bb.ccrr where bb is the base register, cc is the number of columns and rr the number of rows.

- Pauli

Re: Input wanted

*Message #9 Posted by **fhub** on 23 June 2011, 8:03 a.m.,*
in response to message #8 by Paul Dale

> Quote:
>
> it is impossible to nicely display a matrix on the display and there isn't memory to do the job properly.

Displaying the row and column numbers in the upper line, and scrolling through the single elements with the 4 cursor keys would be a quite comfortable method IMO.
But of course you're right with the limited code space.

> Quote:
>
> I'm also of the opinion that if you want matrix operations, you should be using a real maths package like matlab or equivalent :-)

Well, this would be true for doing ANY kind of maths, so for what should a pocket calculator be needed at all? For portability!

If I'm at home sitting on my computer then I'm of course using one of those powerful math/CAS programs but not any pocket calc ... ;-)

Re: Input wanted

*Message #10 Posted by **Paul Dale** on 23 June 2011, 7:04 p.m.,*
in response to message #9 by fhub

If somebody donates user code for matrix operations, we'd be quite happy to include it as a library. There is no way we're squeezing matrix support into the base firmware so it will have to be keystroke programming that saves the day here. Fortunately, this device is *very* capable on this front.

- Pauli

Re: Input wanted

*Message #11 Posted by **db (martinez, ca.)** on 23 June 2011, 11:21 p.m.,*
in response to message #10 by Paul Dale

Pauli; A question only, not a request. I'm happy with my 34 as is, and it's stability. However; some people might want to do matrices but not need (lets say) hyperbolic trig and constants. Did you guys think of having a couple of packages or the capability of assembling a semi custom 34 from some building blocks? This would of course complicate youall's and Eric's lives something fierce. Maybe we should forget i asked that.

Re: Input wanted

*Message #12 Posted by **Paul Dale** on 24 June 2011, 12:19 a.m.,*
in response to message #11 by db (martinez, ca.)

No way am I going to do several different releases. One is quite enough :-)

If somebody else wants to put the effort into conditionally including some of the features already present and also into implementing other functionality again conditionally included, I'd be happy include that.

We've got conditional inclusion for a few features already (bessel, digamma, subfactorial, double factorial, Jacobi elliptic functions, factorisation and a few others). Adding more is straightforward.

The difficult part will be locating substantial pieces of functionality and cleanly removing them. The constants e.g. are relatively small at 12 bytes each. So removing them won't save much space but it will cause some big internal changes to the keyboard handling, the catalogue display, command display etc.

- Pauli

Re: Input wanted

*Message #13 Posted by **db (martinez, ca.)** on 24 June 2011, 10:09 a.m.,*
in response to message #12 by Paul Dale

RE: "One is quite enough :-)"

One is simply amazing. Who would have thought it possible? You guys are the Gods of the programmable calculator, along with Katie, who is the Goddess because of the HP 94 RPN.

When Gene finishes that matrix program we will have a close approximation of the fabled "hp43", albeit with no more memory.

Re: Input wanted

*Message #14 Posted by **Katie Wasserman** on 24 June 2011, 2:53 p.m.,*
in response to message #13 by db (martinez, ca.)

Thanks for the plug, but the HP94 RPN thing I wrote is just a dumb BASIC program to almost simulate an HP35. It was an attempt to justify having the HP94's in a calculator collection. The real challenge was to figure out how to use the

development tools for the HP94 and rebuild the battery packs.

Re: Input wanted

*Message #15 Posted by **gene wright** on 25 June 2011, 1:51 a.m.,*
in response to message #13 by db (martinez, ca.)

Oh, it really will not take huge programming skills to translate the M1 through M5 and RRM programs for the 34s.

Anyone *could* do it. I may end up being the one who does it only because no one else gets around to it.

I'll be back in the country tomorrow from an international trip and will be able to spend time getting it done.

Re: Input wanted

*Message #16 Posted by **Marcus von Cube, Germany** on 23 June 2011, 8:04 a.m.,*
in response to message #8 by Paul Dale

Add an easy to read row/column display in the matrix display and we have a reasonably capable matrix package as an optional feature.

To load the package I'm still thinking of serial I/O. I've ordered the 3.3V FTDI cable and I plan to mod one of my calculators with an additional connector. I don't like the way HP's cable is connected to the back, there must be smarter ways.

Re: Input wanted

*Message #17 Posted by **Gene wright** on 23 June 2011, 12:53 p.m.,*
in response to message #16 by Marcus von Cube, Germany

I have been doin some early work to convert the ppc rom m1 thru m5 routines to the 34s and then the matrix, determinant and inverse and systems of equations program.

Should work and not take that much room

If someone writes something better ... Good :-)

Re: Input wanted

*Message #18 Posted by **Neil Hamilton (Ottawa)** on 23 June 2011, 1:37 p.m.,*
in response to message #17 by Gene wright

Gene,

You might want to give the WP-34s assembler/disassembler a try for this. There will be a bunch of examples go online tonight in the 'library' directory and I hope to see a manual by the weekend. The mnemonic syntax is the hardest thing but you can generate a reference table by using the following (undocumented) command:

```
$ ./trunk/tools/wp34s_asmp.pl -syntax syntax.lst
$ more syntax.lst
```

You might find the tool useful in 2 ways:

1) If you have already loaded the programs into the calculator, you can download the images from memory (emulator or actual calculator) and convert them to an ASCII source listing (which I am calling *.wp34s) for archive, distribution, or program merging:

```
$ ./trunk/tools/wp34s_asm.pl -dis wp34s-0.dat > myProgs.wp34s
```

These source listings should also be immune to "opcode creep" as I am starting to call it. :-) Once your programs are in this form, if the opcodes evolve, you just reassemble with the current assembler. The assembler will be continually updated as part of the development process to use the latest opcode map by default. The tool can also read in historical opcode maps to convert between opcode revisions by specifying an older map (which you must have on hand -- usually just a SVN effort). Thus you can bring an old flash image "forward" by disassembling it using the old opcode map it was written under (you need the calculator's current 'VERS' number for this) and then reassembling it using the new map.

2) You can also assemble one or more ASCII source files into a single concatenated flash image (subject to the flash 506 word limit, of course) which can then be uploaded to either the emulator or calculator. This will allow you to have a library of programs that you load on a case-by-case basis.

```
$ ./trunk/tools/wp34s_asm.pl myProg1.wp34s [myProg2.wp34s [myProg3.wp34s ...]]
-o wp34s-1.dat
```

If you can't wait for the weekend to try it :-), let me know and I'll give you a boost.

The help screen combined with the stuff that will go up tonight in the 'library' directory should get you a fair distance down the road.

```
$ ./trunk/tools/wp34s_asm.pl -h
```

You do need Perl on your system to run it but that is not such a big stretch. Info will be forthcoming if that presents some problems.

Cheers...

Re: Input wanted

*Message #19 Posted by **gene wright** on 24 June 2011, 12:18 a.m.,*
in response to message #18 by Neil Hamilton (Ottawa)

Oh, I just want to get it working first on the real machine. Haven't been able to devote enough time to it yet.

I believe all the pieces should fit in the 506 steps. Limiting factor here is the 100 registers. That limits the size of the matrix / system you can solve here...but it would STILL be much larger than any I would ever need to solve.

Re: Input wanted

*Message #20 Posted by **Paul Dale** on 24 June 2011, 12:21 a.m.,*
in response to message #19 by gene wright

There is a second set of 112 registers in flash :-) You don't want to write to them often but they are usable and directly addressable via the RCF instructions and R-COPY.

But yes, the 100 registers is a big limit. That leaves a few over for the matrix code to use internally.

- Pauli

Re: Input wanted

*Message #21 Posted by **Paul Dale** on 24 June 2011, 12:23 a.m.,*
in response to message #20 by Paul Dale

You could also go well beyond the 506 steps. There are several flash banks and more than one could be used at a pinch. It would also be possible to fake things and get four extra steps but it probably isn't worth the effort and would make the program not able to be entered via the keyboard.

- Pauli

Re: Input wanted

*Message #22 Posted by **Paul Dale** on 24 June 2011, 9:39 p.m.,*
in response to message #17 by Gene wright

I've been looking at Jean-Marc Baillard's matrix code and the programs looks like they will convert over pretty much as is. This is certainly true for the basic matrix operations. Some of the more advanced routines use the block register operations from the extended functions module & the 34s has a slightly different syntax here.

Of course, this won't produce optimal code for the 34s but it would do as a start.

- Pauli

Re: Input wanted

*Message #23 Posted by **Gerson W. Barbosa** on 24 June 2011, 2:12 a.m.,*
in response to message #1 by Paul Dale

Paul,

I cannot think of any new constant right now, but having just keyed in a 100-step program I realized it doesn't make much sense the soft keys A through D keep assigned to existing user programs when in program mode. 1/x, y^x and SQRT are way more frequent than XEQ B, XEQ C and XED D in programs. Would this be easy to change?

Regards,

Gerson.

Re: Input wanted

*Message #24 Posted by **Marcus von Cube, Germany** on 24 June 2011, 2:18 a.m.,*
in response to message #23 by Gerson W. Barbosa

This would be another "bad patch" in the not very cleanly designed keyboard state machine. I doubt Pauli will be implementing this change.

Re: Input wanted

*Message #25 Posted by **Paul Dale** on 24 June 2011, 2:22 a.m.,*

in response to message #24 by Marcus von Cube, Germany

This one wouldn't be too difficult I think. It would probably simplify this part of the keyboard state machine -- not having the keys change function based on the presence of labels means a tiny bit less code. Those keys would still change their primary meaning in integer mode with bases > 10.

We'd also free up four other keyboard position and make sigma-'s location awful.

So it is a large change from an interface viewpoint even though the underlying code changes wouldn't be too awful.

I'll also agree that the keyboard state engine is big and ugly. Too much organic growth and stuffing additional functionality onto the keyboard.

- Pauli

Edited: 24 June 2011, 2:23 a.m.

Re: Input wanted

*Message #26 Posted by **Marcus von Cube, Germany** on 24 June 2011, 2:26 a.m.,*
in response to message #25 by Paul Dale

I think this was only meant in program entry mode, not generally.

For a general change, we need a USER mode then.

Re: Input wanted

*Message #27 Posted by **Paul Dale** on 24 June 2011, 2:36 a.m.,*
in response to message #26 by Marcus von Cube, Germany

> Quote:
>

Insufficient RAM to keep keyboard definition. At the moment at least.

- Pauli

Re: Input wanted

*Message #28 Posted by **Marcus von Cube, Germany** on 24 June 2011, 3:22 a.m.,*
in response to message #27 by Paul Dale

What about a simple mode setting for those who prefer the simple functions. If the mode is set, you need XEQ A to run program A and get Sigma+ by just hitting A. Without the mode, the behavior is the same as it is now. This would be similar to the USER mode of the 15C.

Re: Input wanted

*Message #29 Posted by **Paul Dale** on 24 June 2011, 3:24 a.m.,*
in response to message #28 by Marcus von Cube, Germany

That would complicate the keyboard engine :-(

I'll leave these questions to Walter....

- Pauli

Re: Input wanted

*Message #30 Posted by **Paul Dale** on 24 June 2011, 2:19 a.m.,*
in response to message #23 by Gerson W. Barbosa

Of course it can be changed but to what? Those functions are elsewhere on the keyboard of course.

Walter is the custodian of the keyboard and he's off the Internet for a while longer.

- Pauli

Re: Input wanted

*Message #31 Posted by **David Hayden** on 24 June 2011, 1:59 p.m.,*
in response to message #1 by Paul Dale

I would leave the space empty for now in case more bugs show up. If/when there is another release, you might add some constants then.

It would really be a shame if bug fixes took up so much space that you had to remove functionality or constants. It's better to leave the extra room for now and add more later.

At least that's my opinion :)

in response to message #1 by Geoff Quickfall

As i remember; having more hands than Shiva and some thin prying/scraping thingers helped. Just too much double sided tape in there. If i didn't break mine; you'll do fine.

Re: What is the trick to...

*Message #3 Posted by **Geoff Quickfall** on 22 June 2011, 12:18 p.m.,*
in response to message #2 by db (martinez, ca.)

Thanks DB,

Applying heat in the form of a hair dryer really loosened the adhesive on the double sided tape.

I understand the need to secure the batteries but industrial strength adhesive tape? Does overkill come to mind. Granted it did fullfill its purpose.

Cheers, Geoff

HP41CL physical ports -or- how many physical ports do you require with the HP41CL?

*Message #1 Posted by **Geoff Quickfall** on 21 June 2011, 6:18 p.m.*

More 41CL stuff!

When looking at the physical use of ports on the CL many users have questioned whether installing the time module internally and/or moving the RS232 jack to another location (side) would make more sense.

My short answer would be yes IF the free physical ports are required. Remember, all the existing ROMs are available on the CL board and can be invoked by the CL plug commands. There are a few exceptions such as the timer module and others listed in the manual:

HP 41CL home page

With this in mind do you NEED to internalize the time module or move the rs232 jack?

Again from the manual, the time module is physically installed in any PORT, although PORT two is the most convenient for me. It leaves PORT three for the IR or HPIL modules. Physical PORT four is for the card reader (PORT 4 LOWER must remain free as the card reader functions install in PORT 4 LOWER).

The following is the basic physical configuration:

table 1: Free ports with time module and RS232 jack in place:

```
PORT 1 UPPER  FREE
PORT 1 LOWER  YNFS (CL functions required, see manual)
PORT 2 UPPER  FREE
PORT 3 LOWER  FREE
PORT 4 UPPER  FREE
PORT 4 LOWER  FREE
```

figure 1: Basic configuration.

As you can see from table 1 the RS232 jack and the time module take no PORTs away from ROM image use. PORT 1 LOWER is taken over by the CL board

for functions as does any physical module which takes over specific addresses. This still leaves PORT 1 UPPER free for STAT or any other ROM image occupying less then half a page.

The timer module behaves the same. Although the physical port is taken up, it does not occupy PORT 2 therefore leaving it free for a ROM image such as the full page ADVANTAGE module.

So you are left with two physical ports for physical module use. In figure 2 the IR module has been removed for the HPIL module. If using the HPIL to drive an HPIL printer then the IR module should be removed. If you are using the IR module with the HPIL then the HPIL module should have the printer switch set to disabled. (edited to reflect Montes' reminder that the HPIL module HAS a printer enable, disable switch.)

Note: If a plug-in HP 82143A Printer is connected to the calculator system, the Print Function Switch on the interface module must be set to DISABLE. Otherwise, the operation of the calculator could be disrupted. With this setting, printer operations will be executed by the plug-in printer only. If you want to print using the HP-IL print functions and an HP-IL printer, the Print Function Switch on the interface module must be set to ENABLE and a plug-in HP 82143A Printer must *not* be connected.

Figure 2. IR removed and HPIL installed with Disc drive:

In figure 3 the HP 41CL now has the HPIL and the Card Reader installed and linked to the HPIL cassette:

So now two free physical ports contain the HPIL and the card reader.

The calculator is currently configured with the following physical modules and ROM images:

Table 2: VIRTUAL STATUS (non phyical ROM images):

```
PORT 1 UPPER  STAT
PORT 1 LOWER  YNFS
PORT 2 UPPER  FREE
PORT 2 LOWER  FREE
PORT 3 UPPER  PPC
PORT 3 LOWER  CCD OS\X
PORT 4 UPPER  FREE
PORT 4 LOWER  CARD READER functions
```

Table 3: PHYSICAL STATUS (physically inserted modules)

```
PORT 1  RS232 JACK  technically not a ROM at all as it just
        occupies the space.
PORT 2  TIME MODULE
PORT 3  IR MODULE   swappable with HPIL or others
PORT 4  CARD READER requires PORT 4 LOWER be free of virtual ROM
```

I cannot foresee any need to free up physically the two upper PORTs; 1 and 2. Esthetically I like the RS232 jack in place as it keeps the calculator case free of modification. But that is my opinion.

Of course there may be a reason or use by some one else that requires more then 2 open ports be available. So unless someone comes up with a valid reason to open up the two upper ports I say leave well enough alone ;-)

Just some ramblings (due in part between the CL users to internalize the timer module and move the RS232 Jack).

Cheers, Geoff

long live the CL (boy is it fast in turbo50!!!!)

Figure 4: overlay and modules, early photo, move the IR to PORT 3 in your mind please!

Re: HP41CL physical ports -or- how many physical ports do you require with the HP41CL?

*Message #2 Posted by **Gerry Schultz** on 21 June 2011, 9:11 p.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff:

Why are you still using the card reader? The only reason I can think of is the card reader is very portable compared to the 9114B and if your 41C loses it mind via static discharge, you can more easily reload your programs during a flight. Do you bring multiple 41Cs with you when you're in the air? I remember you mentioning that one time you had your 41C with you and it locked up pretty tight during a flight. If your 42 lost it's mind while up there, the only way to recover is a lot of keyboard typing.

I wonder if the 41CL is more or less sensitive to static electricity than a 41C?

Thanks, Gerry

Re: HP41CL physical ports -or- how many physical ports do you require with the HP41CL?

*Message #3 Posted by **Geoff Quickfall** on 21 June 2011, 9:40 p.m.,*
in response to message #2 by Gerry Schultz

Hi Gerry

The 41C locked up tight when the Clonix module started to melt. The thinking at the time was that the Clonix had suffered a latch out and allowed 6 volts to course through it!

At the moment, I have the 41CL, 42S for backup and the 71B as something to play with all in my bag along with the IR printer and card reader.

The CL has performed admirably (only one flight thus far without static repercussions.) One flight is not statistical enough though ;-)

The card reader is for back up away from home (you were correct, portable) as it fits in the flight bag with the cards. I did use it this flight but that was in London at the hotel as I crashed it with some non creative conflicts while experimenting with the roms. At home the cassette or the disc drive are the

prefered methods of reloading!

The 41's really hate the HPIL and IR modules in ports simutaneously and on the 41CX this creates an alarm sequence that only MEMORY LOST will correct. On the CL it creates a nasty ALPHA display when you try to XEQ an alpha command. The only way out is to reboot.

So yes the card reader is still the best back up. At least until I create a rom image with clonix or the pil box. Both I have to dig out and start playing with. Once my HP is backed up to a ROM image then EVERYTHING I need is in the CL board!

Another reason to use the CL now that it is as fast as the 42S is because during a calculator crash it can be recovered WITHOUT all that typing...

;-)

Just dug up my University cards for the 41. 15 cards with a quite a few dedicated routines for data analysis and collecting. They all work perfectly, even after 26 years!

That is great and solves the problem of having to retype. You will notice that the three calcs I carry all print and two have easy backups.

I need the print capability for the cockpit! I need the 34S to have fun with and will program when the Postal service up here resumes work. (currently on strike so no USPS stuff makes it here!).

34s and printing
*Message #8 Posted by **Marcus von Cube, Germany** on 22 June 2011, 4:01 a.m.,*
in response to message #7 by Geoff Quickfall

If we only had some more capable hardware...

What's missing:

Memory for code and data, Better display, Better I/O (e.g. an IR eye and/or USB port).

I still have the feeling that we've done a pretty good job, given what the 20b/30b provide as a hardware basis. But we can't beat the 41CL or 42s in many respects.

>
> The one last thing I'd like to add is some serial IO but it will require hardware modifications like the time and date stuff.

I'm thinking of it. The idea is to add a 2.5 mm jack like the TIs or Casios have. There are USB cables available for Casio calculators which are made of an FTDI chip. The problem: They work on 5 V. A better idea would be to use the 3V variant of the FTDI USB to serial cable and tell people how to add the proper plug to it. Here is the data sheet: DS_TTL-232R_CABLES.pdf.

Are the special plugs used by HP for the programming interface publicly available? I don't like how the plug and cable protrudes from the back of the device so that you cannot put it flat on your desk while connected but this would prevent modifying the case.

Re: HP41CL physical ports -or- how many physical ports do you require with the HP41CL?

*Message #11 Posted by **Monte Dalrymple** on 22 June 2011, 12:51 a.m.,*
in response to message #3 by Geoff Quickfall

The IR Printer module should only be in the calculator at the same time as the HP-IL module if the HP-IL module Print Function switch is set to Disable. Otherwise both modules will be trying to drive the ISA bus whenever the operating system is trying to find a function. This isn't good for either module. What you are probably seeing is the result of bad levels on the ISA bus during this time. Who knows how the logic in the CPU (either in a 41C or a 41CL) are going to respond to this.

Re: HP41CL physical ports -or- how many physical ports do you require with the HP41CL?

*Message #12 Posted by **Geoff Quickfall** on 22 June 2011, 2:24 a.m.,*
in response to message #11 by Monte Dalrymple

Somewhere in the last 35 years I knew this! After 35 years using this calc and HPIL I still feel like a novice! Of course it would make sense that there is a conflict, they both support printers. How basic is that logic!

So still learning or being reminded! Of course I could have re-read my HPIL module manual and seen this:

Note: If a plug-in HP 82143A Printer is connected to the calculator system, the Print Function Switch on the interface module must be set to DISABLE. Otherwise, the operation of the calculator could be disrupted. With this setting, printer operations will be executed by the plug-in printer only. If you want to print using the HP-IL print functions and an HP-IL printer, the Print Function Switch on the interface module must be set to ENABLE and a plug-in HP 82143A Printer must *not* be connected.

Geoff

top post now edited to reflect Montes' reminder ;-)

*Message #13 Posted by **Gerry Schultz** on 22 June 2011, 1:08 p.m.,*
in response to message #12 by Geoff Quickfall

Geoff, you're right about that. I knew that too and it didn't connect until Monte mentioned what is obvious and logical. It makes me feel old.

I wanted to mention that the link to 41CL manual in your first post doesn't work for me. I'm also starting to put together some questions I have about the 41CL just to understand how it works. For instance, is it possible to place the 41CL into a state whereby to recover, the static RAM would have to be cleared; in essence doing a 'first-birthday' on it? Is it possible to dump the entire contents of a fully configured 41CL to a PC via the serial port or using HP-IL to a tape drive of floppy (like a WALL command), to make recovery easier if the answer to my first question is yes. I am fascinated by the 41CL and how it will fit with my other 41 equipment. Geoff, your postings are very helpful in figuring that out so thank you. I just wish I was out there on the bleeding edge with you. I have a knack for instinctively finding bugs and

'issues' with new gear. Just ask my boss!

Re: HP41CL physical ports -or- how many physical ports do you require with the HP41CL?
*Message #17 Posted by **Gerry Schultz** on 22 June 2011, 8:52 p.m.,*
in response to message #16 by Geoff Quickfall

I've been reading the 41CL manual to figure out which of my 41s I can use to upgrade. I have a 41CV with rounded display corners, which makes it a half-nut. It's serial number starts with 2641S which, as I remember, means it was built in 1986 in Singapore. In the 41CL manual, it says:

"If the light part of the display has square corners, like those shown below, the calculator is a candidate for replacing the CPU circuit board".

Also,

"If your 41CV/CX has a serial number starting with “2003” or larger it uses the correct display driver".

So, it appears that this 41CV is NOT a candidate for the 41CL board. Am I correct?

Thanks, Gerry

Re: HP41CL physical ports -or- how many physical ports do you require with the HP41CL?
*Message #18 Posted by **Monte Dalrymple** on 22 June 2011, 11:32 p.m.,*
in response to message #17 by Gerry Schultz

Correct. Half-nuts cannot be upgraded.

Fullnut versus Halfnut
*Message #19 Posted by **Geoff Quickfall** on 23 June 2011, 1:49 a.m.,*
in response to message #17 by Gerry Schultz

Here for those that are interested are shots elaborating the difference between the fullnut (older) and the halfnut versions of the HP 41C, CV, CX

```
-There are fullnut 41C's, 41CV's and 41CX's
-There are halfnut 41CV's and 41CX's (if you have a 41C halfnut
 then you have a fullnut that was repaired under warranty and
 a very rare nut indeed, infact it should be called a rarenut)
```

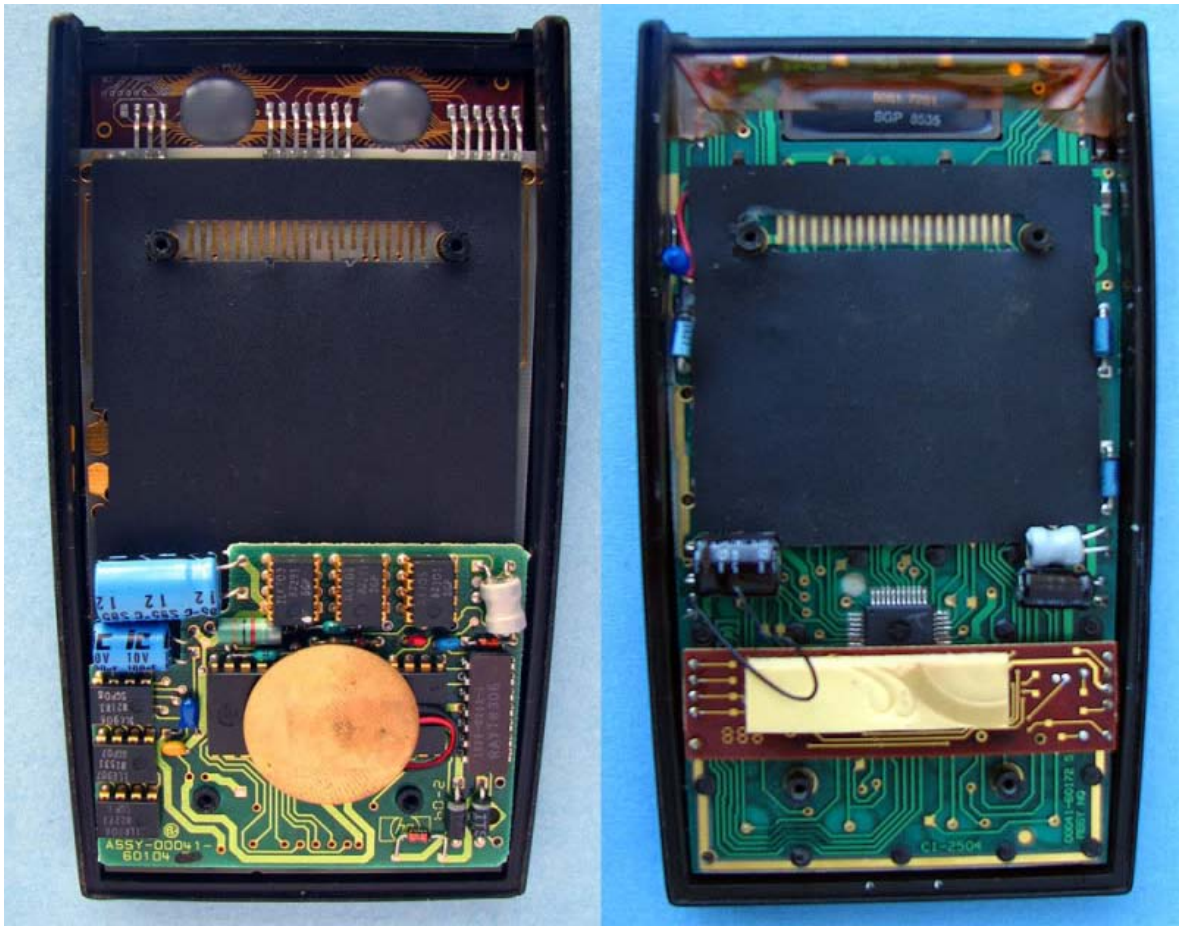
EXTERNAL VIEWS

Fullnut with squared LCD corners:

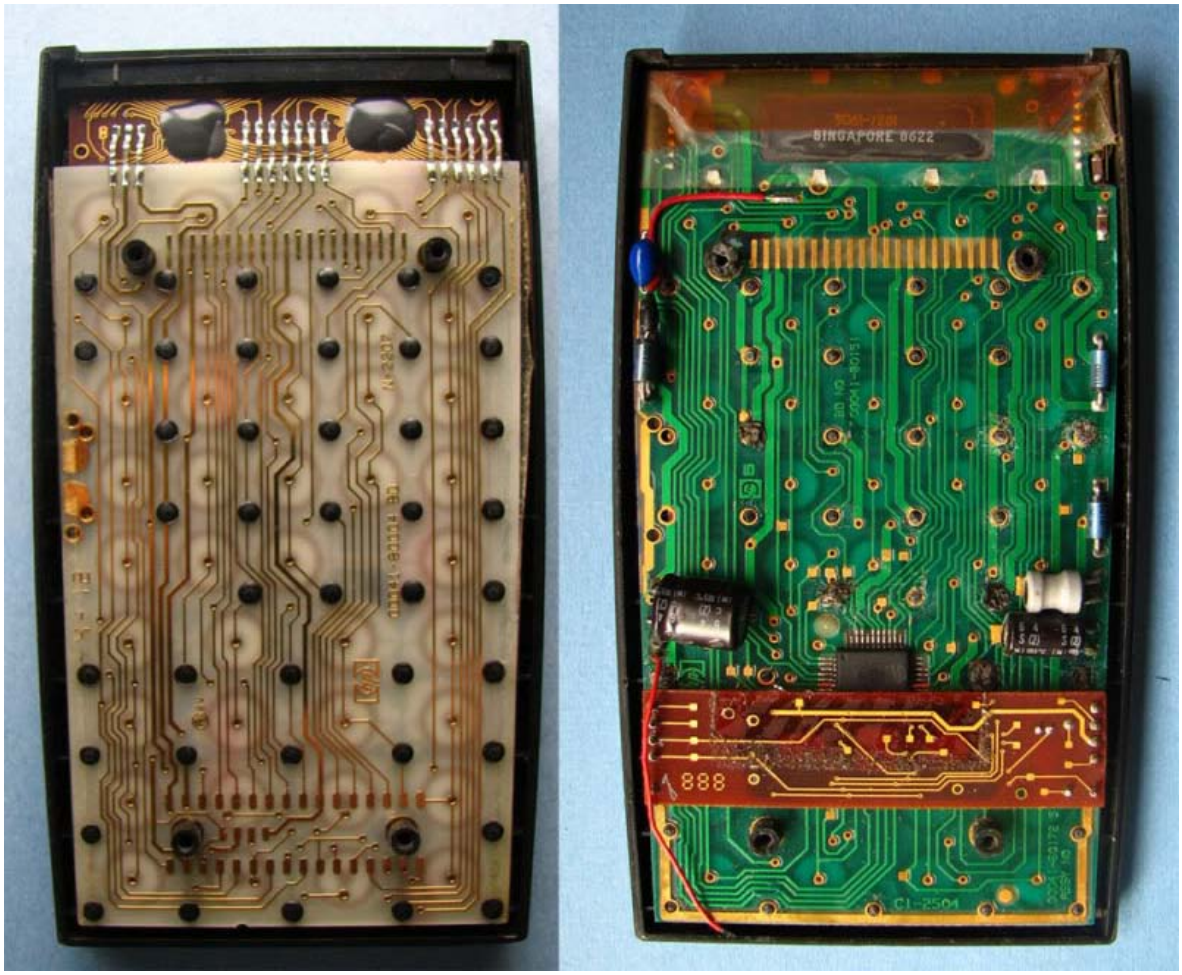
Halfnut with rounded LCD corners:

INTERNAL VIEWS

Open the case and you see on the left a full nut removable board and on the right a half nut soldered board.



As above but with the film removed:



You can see the removable fullnut logic pca on the left and the smaller soldered pca on the right. Of course it cannot be a swap as the physical boards are completely different. Montes' HP41CL will function in place on the left board style only. Also note that the half nut has the IC imbedded on the keyboard pca precluding any swap and has a completely redesigned keyboard and logic pca.

Hope the visual helps

EMU41

*Message #1 Posted by **Richard L. Taylor** on 21 June 2011, 5:32 p.m.*

Hi

Has any one ever got the HP7470A plotter with the HP-IL interface to work with the EMU41 program, using the PL-Box in the USB port of the MAC G4, running Virtual PC 4.0? I have got to the point where the EMU41 can see all of the 82184 PLOTTER MODULE commands in my program from the plotter.bin file, but they won't execute. All of the other commands in my program will execute, for example: SEEKR, READRX, ... I tried the AUTOIO mode and the MANIO mode and I get the error message "NO PLOTTER" in AUTOIO mode and TRANSMISSION ERROR in MANIO mode. I would like some help please. Thanks in advance.

Re: EMU41

*Message #2 Posted by **Egan Ford** on 21 June 2011, 6:43 p.m.,*
in response to message #1 by Richard L. Taylor

I have, using DOSBox on OS/X, however I cannot test it/doc it since my PIL-Box is dead. I just have not had the time to examine it and get it working again.

The plotter plots much faster with EMU41 running in turbo mode. I also tested EMU41 in DOSEMU on Linux with an ISA HP-IL board.

Re: EMU41

*Message #3 Posted by **Mike (Stgt)** on 22 June 2011, 5:37 a.m.,*
in response to message #1 by Richard L. Taylor

Two questions: your HP7074A (or HP7470A??) worked fine without PIL-Box but a real controller (HP41 or HP71) in the HPIL loop? With EMU41 and PIL-Box, had you been able to address other real HW in the loop?

BTW, the .bin file is for EMU41 what a plug-in module for the real HP41. So with the plotter module plugged in you will have access to the plotter commands even the plotter is not in the HPIL loop.

Ciao.....Mike

Advantage Pac Curve Fitting

*Message #1 Posted by **mbrethen** on 21 June 2011, 5:28 p.m.*

After the regression coefficients have been calculated, projections may be made based on the curve fit. I'm disappointed that you may only key in an x value to see an estimated y value. How about keying in a known y value? I thought about adding this feature to the CFIT program, similar to the Curve Fitting program originally published in the HP-67 Standard Pac. Are there any issues with running a tweaked program from main memory, with the advantage pac still installed?

Re: Advantage Pac Curve Fitting

*Message #2 Posted by **Namir** on 21 June 2011, 8:06 p.m.,*
in response to message #1 by mbrethen

Projecting Y onto X may seem harmless from a mathematical point of view. However, some statistician may frown upon that, because (the way I understand it) the measurement in variable X have no error in its measurement while those of variable Y has normally distributed errors. For some reason statisticians frown on calculating X^ ... and the really get into a hissy fit (pun intended) if you calculate the confidence interval of X^.

Namir

Edited: 21 June 2011, 8:17 p.m.

Re: Advantage Pac Curve Fitting

*Message #3 Posted by **mbrethen** on 21 June 2011, 10:30 p.m.,*
in response to message #2 by Namir

Well, suppose you measure the gross weight of a UPS truck (y) with various numbers of packages (x) in it, and you get the regression equation ˆy = 2.17x+2463. The slope, 2.17, is the average weight per package, and the y intercept, 2463, is the weight of the empty truck. The value of ˆy when x is 0 isn't always meaningful, but in this case, it has physical meaning!

Edited: 21 June 2011, 10:36 p.m.

Re: Advantage Pac Curve Fitting

*Message #4 Posted by **Marcus von Cube, Germany** on 22 June 2011, 2:10 a.m.,*
in response to message #3 by mbrethen

From what I've read it's not the same if you just invert the resulting regression equation as opposed to swapping x and y in the data set and do a new regression to predict x from y. So in order to do it correctly, you need to accumulate the reverse statistic in parallel for this kind of calculation.

Re: Advantage Pac Curve Fitting

*Message #5 Posted by **Namir** on 22 June 2011, 5:40 a.m.,*
in response to message #3 by mbrethen

You were asking about supplying a value for Y and calculating X. Some statisticians will cry foul because the relation of the regression line is to correlated Y with X and not X with Y.

Re: Advantage Pac Curve Fitting

*Message #6 Posted by **mbrethen** on 22 June 2011, 7:32 a.m.,*
in response to message #5 by Namir

The point I was trying to make is that a least squares fit has applications other than statistics. For instance, I use it to iterate between finite element analyses results, when determining the starting point for the next iteration. The relation between X and Y is not statistical, but is based on geometry and material properties used in the model. If the material(s) have a linear stress-strain relationship, then the straight line fit would represent the combined spring rate (for complex models this would be difficult to calculate directly). And geometry can introduce non-linear behavior (e.g. belleville spring). For such uses, it would be nice to have the option to calculate estimates in either direction, where Y=load and X=deflection.

Adding a Crystal to a WP34s

*Message #1 Posted by **Gerry Schultz** on 21 June 2011, 12:58 p.m.*

Okay, I've now got a 34s with a new overlay and it works great. As I understand it, to make the time functions accurate, it requires adding a crystal to my 30b. Has anyone compiled a parts list and where to put them in a 30b? Is the same for a 20b? I can get the parts and do the install as I assume it will be all surface mount components.

Thanks for any information you have.

Gerry

Re: Adding a Crystal to a WP34s

*Message #2 Posted by **Marcus von Cube, Germany** on 21 June 2011, 2:21 p.m.,*
in response to message #1 by Gerry Schultz

The 20b and the 30b are identical in this respect. You need some SMD soldering skills as the capacitors look more like grain of sand then like electronic components.

Eric Rechlin has the values on his pages: 20b Hacker's Kit. You won't need the whole kit just the two 18pf 0603 caps and the 32768 kHz crystal. Once installed, the key sequence to activate the oscillator is ON+C (twice in a row). If the answer is OK, you've made it. Otherwise the calculator hangs.

Re: Adding a Crystal to a WP34s - speed

*Message #3 Posted by **Marcus von Cube, Germany** on 23 June 2011, 8:30 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Just an interesting observation: The crystal seems to make the calculator faster, at least my 30b takes advantage of it. I tested it with the simple addition benchmark. The result was around 340.000 without the crystal and around 415.000 with the crystal enabled.

For the records: Both tests were made in decimal mode with the following code:

INC X
BACK 01

The program was started with 0 in the display and ran for about a minute. Integer mode is a bit faster.

> Want to try the eight queens benchmark with a crystal to improve the timings a bit :-)

Strange, I just get 2.1 and 2.4 seconds. Same result as yours.

Thinking twice it's not so strange any more: If you did use TICKS to time the benchmark, you will have got the same results as the ticker runs slower at the very same rate as the rest of the machine. To do real world timing, you need to run the benchmark 10 times and time it with a stop watch.

CLRREG is a bad command. It spoils automatic timing. I had to modify the benchmark to store TICKS in A just after the CLRREG so that LBL A; XEQ '8QN'; RCL- A; RTN could do the timing.

A command to just clear a range of registers would be useful. If it takes its limits from X it will be hard to make it work in integer mode. You need to introduce some scaling there.

Yes, I used TICKS for the timing. I half suspected it wouldn't alter the perceived timing.

> Quote:
>
> A command to just clear a range of registers would be useful. If it takes its limits from X it will be hard to make it work in integer mode. You need to introduce some scaling there.

I really shouldn't have to say this but, "read the manual" :-) R-CLR does what you want already.

Idea for WP34s emulator

*Message #1 Posted by **fhub** on 21 June 2011, 8:05 a.m.*

Hi,

I've made a very useful KML-script for the HP50g emulator (Emu48), where I can access the shifted-key functions by directly clicking on their labels above the key (so no need to click one of the 'Shift' keys anymore).

Now I'm asking if this could also be done for the WP34s emulator?
I would do (or at least try) it myself, but unfortunately C/C++ is not my programming language (I'm programming in Borland Delphi).

My idea consist of 2 parts:
1) a right-click with the mouse on any emulator button should automatically invoke the h-shifted function (i.e. simulate a press of [h] and then the usual key)
2) besides the already defined rectangle for each key where a mouseclick is possible, there should also be an additional (smaller) rectangle area below the keys (where the f- and g-shifted function labels are positioned), and a mouseclick on THIS area should now call these shifted functions automatically (left-click for [f] and right-click for [g]).

So what's your opinion about these ideas?
Of course the most important opinion is the one of Marcus, because I guess it would be his turn to implement this feature(s) ... ;-)

Franz

Re: Idea for WP34s emulator

*Message #2 Posted by **Marcus von Cube, Germany** on 21 June 2011, 8:57 a.m.,*
in response to message #1 by fhub

Franz, go ahead! ;-)

Just kidding. I'm not a Windows programmer and the structure of the skin files isn't very well suited for hand made editing. I assume that HP has some generator software for this. The corresponding code isn't easy to understand either. It's "densely written" C++.

In short: Good idea but I will not implement it. It's too much tedious work.

"fake" 12C

*Message #1 Posted by **robert rozee** on 20 June 2011, 5:10 a.m.*

for your amusement, spotted this on our local online auction site here in nz :

http://www.trademe.co.nz/Electronics-photography/Other-electronics/Calculators/auction-385788764.htm

shop display versions of th 12C, missing the internals.

Re: "fake" 12C

*Message #2 Posted by **bill platt** on 20 June 2011, 9:09 a.m.,*
in response to message #1 by robert rozee

Why the heck wold anyone pay $25 for a 12c shell?

Re: "fake" 12C

*Message #3 Posted by **Michael de Estrada** on 20 June 2011, 9:43 a.m.,*
in response to message #2 by bill platt

Probably the same reason someone would pay $15.50 for this. And it still needs to be rebuilt, and it's international shipping, which is substantial. At least the 12C housing makes some sense to replace one that is damaged, but I've never heard of a damaged card reader drive wheel.

Re: "fake" 12C

*Message #4 Posted by **bill platt** on 20 June 2011, 9:51 p.m.,*
in response to message #3 by Michael de Estrada

Maybe I should consider selling off my calculator collection.

SpeedUI Bug with Unit Conversion?

*Message #1 Posted by **Timo** on 20 June 2011, 2:42 a.m.*

Hi all,

I'm not sure if I've come across a bug in SpeedUi which is associated to the unit conversion. Here's what I do:

- Enter a number then R-Shift "Units", then slect a unit submenu, e.g. "LENG".

- Assign a unit to the number, e.g. "m".

- Then convert it into another unit, e.g. "ft", using L-Shift "FT".

- Try to convert it into "yd" using L-Shift "YD" and nothing will happen, only an error beep can be heard.

On the standard HP-48GX, one can switch back and forth bewteen different units using the key combination (L-Shift then Unit), but not so when SpeedUI is installed. With SpeedUI, this conversion sequence only works once. Then I have to exit the unit submenu, then re-enter it again to make it work.

I've observed this behaviour in SpeedUI 11.04 and 11.05 and could also verify it using Emu48.

Raymond, are you familiar with this behaviour?

I'd appreciate any feedback, best regards, Timo

Re: SpeedUI Bug with Unit Conversion?

*Message #2 Posted by **Raymond Del Tondo** on 20 June 2011, 6:13 p.m.,*
in response to message #1 by Timo

Hi Timo,

many thanks for the bug report:-)

The bug has already been fixed, actually it was changing one single opcode.

The new SpeedUI version 11.06 , which will be released in a few days, and which includes some other bug fixes and performance optimisations, will include the fixed LS units menu code, of course.

Best Regards

Raymond

Evolution of the 30B

*Message #1 Posted by **Keith Midson** on 19 June 2011, 8:34 p.m.*

Hello all, with all this talk of the WP34S, I thought i'd post a pic of the evolution of the 30B, which many use to drive the 34.

http://www.flickr.com/photos/60529780@N02/5850241487/in/photostream
This appears in my prototype and rarities set:
http://www.flickr.com/photos/60529780@N02/sets/72157626354800664/with/5850241487/

and HP collection set:
http://www.flickr.com/photos/60529780@N02/sets/72157626354812528/

I've posted these links before, but there are a few new pics in there now.
Enjoy! Keith

Re: Evolution of the 30B

*Message #2 Posted by **Eric Rechlin** on 19 June 2011, 8:48 p.m.,*
in response to message #1 by Keith Midson

The one labeled as a "later prototype" was actually the initial production version. It was mixed in with the later production version for quite a while, so there's no serial number cutoff for it (I came across quite a few examples of sequential serial numbers where one had the old labels and one had the new labels).

Re: Evolution of the 30B

*Message #3 Posted by **Keith Midson** on 19 June 2011, 9:13 p.m.,*
in response to message #2 by Eric Rechlin

Hi Eric,
The clear case has the following label on the back:
Ver 8 18 2009
The other version has:
Ver 10 13 2009
So i'd say the silver version is slightly newer. This is also what I was told when I received them.
Cheers, Keith

Re: Evolution of the 30B

*Message #4 Posted by **Eric Rechlin** on 19 June 2011, 9:51 p.m.,*
in response to message #3 by Keith Midson

Yes, and that doesn't contradict anything I said. The clear one is a prototype; the other appear to be production models.

Eric

Re: Evolution of the 30B

*Message #5 Posted by **Keith Midson** on 19 June 2011, 11:58 p.m.,*
in response to message #4 by Eric Rechlin

This might clear it up:
http://www.flickr.com/photos/60529780@N02/5851164945/in/photostream
These units were used in the beta testing of the firmware. Cheers, Keith

Edited: 20 June 2011, 12:00 a.m.

Re: Evolution of the 30B

*Message #6 Posted by **Keith Midson** on 20 June 2011, 12:02 a.m.,*
in response to message #4 by Eric Rechlin

Also - the 'PGRM' button differs between the final production version and the middle prototype (PGRM vs Pgrm). It is labelled "keypad" in the clear cased version.

Edited: 20 June 2011, 12:18 a.m.

Re: Evolution of the 30B

*Message #7 Posted by **Eric Rechlin** on 20 June 2011, 12:26 a.m.,*
in response to message #6 by Keith Midson

I think production ones showed both PRGM and Prgm also. I believe it was changed the same time the % Calc, BEG, END, 1/x, xP/YR, nPr, and nCr keys changed. I can't verify because I don't have both in front of me now, but I do know that I have both examples.

Eric

Re: Evolution of the 30B

*Message #8 Posted by **Marcus von Cube, Germany** on 20 June 2011, 2:27 a.m.,*
in response to message #1 by Keith Midson

If you open a 30b (I did it to add the crystal oscillator) you can "clearly" see that the front shell is always made of clear plastic. The silver is just a coating. The window for the LCD is simply an uncoated area of the shell. That's a nice production trick :-).

Re: Evolution of the 30B

*Message #9 Posted by **Keith Midson** on 20 June 2011, 2:59 a.m.,*
in response to message #8 by Marcus von Cube, Germany

I'm not sure how much clearer I can make this - both versions were not production models. These were used in testing of the firmware between August and November 2009 well before they were available to consumers. I don't know how much technical difference there is between the second prototype and the final production version, but the prototype was not a production version that could be purchased anywhere - it was used in the fine tuning of the firmware for the final model.
Maybe I am misunderstanding the comments, but the only production model is the third calculator, which I purchased only a few weeks ago for comparison purposes (to complement the prototypes in the collection).

Re: Evolution of the 30B

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 20 June 2011, 9:35 a.m.,*
in response to message #8 by Marcus von Cube, Germany

That opens another possible way for 34S "keypanel" labeling... At least, it would be protected from scratches, wear, finger oils...

Do you think it's possible to remove the silver coating in a reasonable way? Or to ask HP to sell uncoated topcases as spare parts? I know they won't take small orders, but...

Keys would still be a challenge.

(edited just to remove a couple of typos)

Edited: 20 June 2011, 2:56 p.m. after one or more responses were posted

Re: Evolution of the 30B

*Message #11 Posted by **Tim Wessman** on 20 June 2011, 1:07 p.m.,*
in response to message #10 by Andrés C. Rodríguez (Argentina)

No, the silver coating is sandwiched between plastic. It isn't on the surface.

TW

Re: Evolution of the 30B

*Message #12 Posted by **Marcus von Cube, Germany** on 20 June 2011, 2:45 p.m.,*
in response to message #11 by Tim Wessman

Tim, if I understand you correctly, the silver layer is a thin foil which is put into the mold before the clear plastic is shot in. It should be possible to replace this foil by a different design during the production process without too much effort.

HP-41CL Calculator Benchmark

*Message #1 Posted by **Juergen Keller** on 19 June 2011, 2:11 p.m.*

I did some benchmarks for the HP-41CL as described in the Calculator Benchmark article. You'll find the results in PDF format here. As expected the MCODE benchmark shows a linear speed-up because there is no display output (the 41CL has to switch back to original speed for some I/O operations). With keystroke programming in TURBO50 mode the 41CL is as fast as a Commodore 64, programmed in BASIC. With MCODE in TURBO50 mode, the 8-Queen problem is solved in 1/4 sec!

Re: HP-41CL Calculator Benchmark

*Message #2 Posted by **Xerxes** on 19 June 2011, 6:15 p.m.,*
in response to message #1 by Juergen Keller

I was curious to see the difference of the speed modes since discovering the 41CL some times ago. Thank you for your effort and the nice contribution.

Re: HP-41CL Calculator Benchmark

*Message #3 Posted by **Juergen Keller** on 20 June 2011, 3:15 a.m.,*
in response to message #2 by Xerxes

I have to thank you for updating the article.

Re: HP-41CL Calculator Benchmark

*Message #4 Posted by **exschr** on 20 June 2011, 3:46 a.m.,*
in response to message #3 by Juergen Keller

Even though "TurboX" means "normal speed", TurboX could be misleading to the unaware!
My propose instead of:
17:58 HP-41CL Keystroke / RPN / TurboX Mode

to change to:
17:58 HP-41CL Keystroke / RPN / Turbo off

Re: HP-41CL Calculator Benchmark

*Message #5 Posted by **Xerxes** on 20 June 2011, 2:07 p.m.,*
in response to message #4 by exschr

I think you are right, but in the list "Turbo" usually stands for speed up by hardware modification, so I changed it to "TurboX Mode x1.0" to make it more clear what TurboX means.

Re: HP-41CL Calculator Benchmark

*Message #6 Posted by **Oliver Unter Ecker** on 21 June 2011, 6:33 a.m.,*
in response to message #2 by Xerxes

Hi Xerxes,

Here's a couple of additions to your nice benchmark doc, in, I hope, ready-to-paste format:

```
 -       4.36      ND1 (v1.4)       RPL (UserRPL from HP-50g)
 -
 -       2.78      ND1 (v1.4)       RPL+
 -
 -       0.00338   ND1 (v1.3.9)     JavaScript
 -
```

```
==========================================================================================
```

```
 RPL+:
-------

<< 8 =r
   0 =:s =:x =y
   [] =a
   DO
      r =a[++x]
      DO
         ++s
         x =y
         WHILE y 1 > REPEAT
            a[x] a[--y] - =:t
            IF 0 == t ABS x y - == OR THEN
              0 =y
              WHILE a[x] -- =:a[x] 0 ==
              REPEAT
                 --x
              END
            END
         END
      UNTIL y 1 == END
   UNTIL x r == END
   s
>>
```

```
==========================================================================================
```

```
 JavaScript:
 [taken almost verbatim from C code]
--------------------------------------

function() { /*as is*/
   var r=8, s=0, x=0, a = [];
     do{
       a[++x]=r;
       do{
         ++s;
         var t, y=x;
         while(y>1)
           if (!(t=a[x]-a[--y]) || x-y==Math.abs(t)){
             y=0;
             while(!--a[x])
               --x;
           }
       } while(y!=1);
     } while(x!=r);
   return s;
}
```

Edited: 21 June 2011, 7:54 a.m.

Re: HP-41CL Calculator Benchmark

*Message #7 Posted by **Xerxes** on 21 June 2011, 5:16 p.m.,*
in response to message #6 by Oliver Unter Ecker

Hi Oliver,

thank you for this interesting comparison, but if I'm right the ND1 is an App and the speed depends on the used device. Please consider that the benchmark is especially for physical calculators and calculator like pocket computers of the past. I think comparing software or emulated calculators needs an own benchmark list with tests on different hardware. Thank you for your understanding.

Re: HP-41CL Calculator Benchmark

*Message #8 Posted by **Oliver Unter Ecker** on 21 June 2011, 5:46 p.m.,*
in response to message #7 by Xerxes

Hi Xerxes,

Yes, ND1 is an app. I understand what you're saying and did notice that almost all results were for HW calcs. I saw a C64 result in there, which encouraged me to suggest this addition anyway.

But that's ok, I understand.

(I'll reapply after I figure out how to get a JavaScript VM running on an HP-30b. Ok, that's a joke. I think.)

Cheers.

Re: HP-41CL Calculator Benchmark

*Message #9 Posted by **Xerxes** on 21 June 2011, 6:50 p.m.,*
in response to message #8 by Oliver Unter Ecker

:)

The C64 stands for the missing Panasonic HHC with the Microsoft Basic ROM, because I suspect an equivalent speed. AFAIK there was also Snap Basic and Snap Forth available for the HHC.

Re: HP-41CL Calculator Benchmark

*Message #10 Posted by **exschr** on 20 June 2011, 3:41 a.m.,*
in response to message #1 by Juergen Keller

very nice contribution, Thank you both!

Re: HP-41CL Calculator Benchmark

*Message #11 Posted by **Paul Dale** on 20 June 2011, 4:24 a.m.,*
in response to message #1 by Juergen Keller

Since we're revisiting this benchmark. The WP 34S runs it in 2.3 seconds in real mode and 2.1 in integer.

The program is the same either way:

```
001: LBL B
```

```
002: CLREG
003: 8
004: STO 11
005: RCL 11
006: x=? 00
007: SKIP 22
008: INC 00
009: STO ->00
010: INC 10
011: RCL 00
012: STO 09
013: DEC 09
014: RCL 09
015: x=0?
016: BACK 11
017: RCL ->00
018: RCL- ->09
019: x=0?
020: SKIP 05
021: ABS
022: RCL 00
023: RCL- 09
024: x<>? Y
025: BACK 12
026: DSZ ->00
027: BACK 17
028: DSZ 00
029: BACK 03
030: RCL 10
031: RTN
```

- Pauli

The fastest keystroke programmable! Thank you for testing.

Re: HP-41CL Calculator Benchmark

*Message #13 Posted by **Oliver Unter Ecker** on 20 June 2011, 3:09 p.m.,*
in response to message #11 by Paul Dale

10x faster than a HP-12C ARM in RPN and 40x (!) faster than a 50G in UserRPL? Wow!

I guess RPL's poor showing comes from this code being more about interpreting control structures, than computing.

Re: HP-41CL Calculator Benchmark

*Message #14 Posted by **Marcus von Cube, Germany** on 20 June 2011, 3:53 p.m.,*
in response to message #13 by Oliver Unter Ecker

> Quote:
>
> 10x faster than a HP-12C ARM in RPN

I was thinking that using SKIP and BACK would be responsible for the speed advantage of WP 34S over other designs but the 12C ARM is using the same hardware and direct addressing, no labels. Pauli must have done something right, I guess.

EDIT: Thinking twice, isn't the 12C ARM based on an emulation layer that mimics the old voyager

processor and runs the original firmware almost untouched? This would explain why it's slower than a native implementation.

Edited: 20 June 2011, 4:07 p.m.

Re: HP-41CL Calculator Benchmark

*Message #15 Posted by **Paul Dale** on 20 June 2011, 5:54 p.m.,*
in response to message #14 by Marcus von Cube, Germany

> Quote:
>
> I was thinking that using SKIP and BACK would be responsible for the speed advantage of WP 34S over other designs but the 12C ARM is using the same hardware and direct addressing, no labels.

I haven't tested but the long backward jumps might be faster using a GTO/LBL pair. I suspect that it is the distance of search that is important since both BACK/SKIP and GTO load every instruction from program memory. The LBL instruction executes very rapidly since it doesn't even call a worker routine.

If I could think of a better way to handle errors we'd get a fairly nice speed up. The current method saves the stack and volatile state before executing every instruction and restores it if an error occurred. This is quite expensive time wise but it allows a complete restoration with a minimum of code. The memory copy routine is optimised for space not speed which will also hurt a bit here.

Likewise, I've got lots of checks for illegal op-codes in the instruction dispatch & execution paths. Take these out and we'd get a small speed up. However, I'm not going to since the chance of an error causing havoc would increase too much.

The 12c is emulating the old (NUT?) processor.

> Quote:
>
> Pauli must have done something right, I guess.

I hope I've done more than one thing right in the firmware :-) Minimising the instruction decode/execute overhead was deemed desirable from the start.

- Pauli

Re: HP-41CL Calculator Benchmark

*Message #16 Posted by **Oliver Unter Ecker** on 21 June 2011, 6:45 a.m.,*
in response to message #13 by Oliver Unter Ecker

I've collected a few benchmarks by now, and compared UserRPL speed to JavaScript. With this benchmark, the speed difference is 800x, when it normally is ~20x.

The ratio from ND1 to 50g is ~20x for UserRPL, and ~30x for RPL+ vs. UserRPL, in line with usual results.

I conclude that this benchmark, so far, is an outlier / worst case for UserRPL.

An internal build runs the RPL+ code in 0.008 seconds (that is, a whopping 300x faster than current ND1, and ~10,000x faster than HP-50g), employing code-morphing to JavaScript. I don't have implemented this yet fully, but this nice result provides some motivation to push ahead with this work.

So, thank you for this worst-case-for-RPL benchmark... ;-)

34s - I am IMPRESSED ... Re: HP-41CL Calculator Benchmark

*Message #17 Posted by **gene wright** on 21 June 2011, 4:31 p.m.,*
in response to message #11 by Paul Dale

I must admit yet again. 2.1 seconds. Wow.

Mismatches in opcode tables from WP34s "calc a a"

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 19 June 2011, 8:51 a.m.*

Hi Paul,

I am getting some mismatches when I re-expand the compressed table (SVN 1133) and compare it to the "calc a a" version. Some of the issues seem to be in the "a a" table and some in the compressed table:

1) There seems to be significant mismatch in 0500-0624 range. Some are just that (I think) the compressed table is missing [cmplx] but "a a" is missing 0501-0503, 0519-051e, 052f-0534, 0537-0576, and 0613-0624.
2) The "a a" table is showing an a100 opcode but there is no corresponding one in the compressed table.
3) I cannot easily retain whitespace so the space in the compressed table at 0x1a20 may be difficult to deal with. (That is likely my problem and I'll think up some solution.)
4) There is new(?) CONJ opcode at 0236 in the compressed table that is missing from the "a a" table.
5) The "arg iC max=30,indirect" should be "arg iC max=0,indirect" since the 30 opcodes are already accounted for in the explicit "cmd iC" versions.
6) There is a second CONJ at 0536 in "a a" but I suspect that it should also be a [cmplx] as per #1.

Cheers...

Re: Mismatches in opcode tables from WP34s "calc a a"

*Message #2 Posted by **Marcus von Cube, Germany** on 19 June 2011, 1:33 p.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

The discussion has been moved to private mail as I assume it's not of enough public interest here. The result will be a working wp34s assembler. :-)

I don't understand why anyone would need this

*Message #1 Posted by **Michael de Estrada** on 18 June 2011, 9:49 a.m.*

There are many spare / repair parts for vintage calculators being sold on TAS, such as battery doors / latches, logic boards, rubber feet, printer idler gears, etc. But I can't understand why anyone would ever need one of these. I've never seen one of these break or be missing from a card reader. Perhaps if the seller had replaced the rubber / plastic it might have some value, but not as it is being sold. Anyways, just an idle observation.

Note: Normally at this time of day on a weekend I'd be out and about instead of posting unimportant items on this forum, however, I had hernia surgery just a week ago, and am condemned to sitting bored at home for weeks while I heal. Thank God for the internet and cable TV.

Re: I don't understand why anyone would need this

Post script. It sold for $15.50 to a buyer who has also bid on items on the French TAS. Maybe I should sell the spare keyboard buttons for an HP 38E than I broke down for parts.

Re: I don't understand why anyone would need this

*Message #3 Posted by **TIm** on 21 June 2011, 2:07 p.m.,*

The wheels usually become gummy and have to be replaced. There are other sites to get them cheaper.

Re: I don't understand why anyone would need this

*Message #4 Posted by **Michael de Estrada** on 21 June 2011, 2:59 p.m.,*
in response to message #3 by TIm

Yes, but you don't have to replace the entire wheel. You can very easily rebuild them with either model airplane fuel line tubing or Viton O-rings. Besides, that wheel in the auction needed to be rebuilt anyway.

WP 34s manual pointer incorrect

*Message #1 Posted by **Jim Yohe** on 18 June 2011, 3:04 a.m.*

When selecting the Help > Manual up pops an error message saying that the path is incorrect to:

...wp34s\emulator\wp34s_Manual.pdf

when it should be pointing to:

...wp34s\doc\Manual_wp_34s_2_0.pdf

Re: WP 34s manual pointer incorrect

*Message #2 Posted by **Marcus von Cube, Germany** on 18 June 2011, 5:39 a.m.,*
in response to message #1 by Jim Yohe

Jim, that's intentional. The help file is always in the directory the emulator is started from and carries the same name independent of version number. That's the reason for the small copy_manual.cmd script in the distribution.

Re: WP 34s manual pointer incorrect

*Message #3 Posted by **Jim Yohe** on 18 June 2011, 1:11 p.m.,*
in response to message #2 by Marcus von Cube, Germany

So, apparently, before Help > Manual works we need to manually run the copy_manual.cmd program so it will copy the Manual_wp_34s_{x}_{y}.pdf file from the doc directory into the emulator directory and name it wp34s_Manual.pdf.

I ran the program just now and it put the "missing" copy of the manual into the emulator director. Works fine now.

If selecting Help > Manual is supposed to first "check" for the existence of wp34s_Manual.pdf in the emulator directory and if not found then runs the copy_manual.cmd program before attempting to open the manual, then perhaps the routine needs adjusting because it wasn't doing this automatically.

Re: WP 34s manual pointer incorrect

*Message #4 Posted by **Marcus von Cube, Germany** on 18 June 2011, 1:15 p.m.,*
in response to message #3 by Jim Yohe

The emulator knows nothing about the directory layout of the distribution zip file which in turn is different from the directory structure of the development environment. It simply assumes everything to be in one directory. I've no plans to change that.

Re: WP 34s manual pointer incorrect

*Message #5 Posted by **Joel Setton (France)** on 19 June 2011, 2:08 a.m.,*
in response to message #4 by Marcus von Cube, Germany

I'm still seeing this problem. The directory from which the emulator is started also contains the file wp34s_Manual.pdf, but when I try to access the manual I get an error pop-up which says Windows can't access the file C:\Program. TIA for any help on this. Apart from this minor inconvenience, WP34s is an amazing calculator!

Re: WP 34s manual pointer incorrect - fixed an issue with spaces in path name

*Message #6 Posted by **Marcus von Cube, Germany** on 19 June 2011, 3:27 a.m.,*
in response to message #5 by Joel Setton (France)

> Quote:
>
> Windows can't access the file C:\Program

Sigh, Windows...

It's looking somewhere down "C:\Program Files\". I'll check if the help command depends on the fact that there are (no) spaces in the directory path to its location. Otherwise, the behavior will not be touched.

EDIT: The issue with the pathname containing spaces should be fixed now.

Edited: 19 June 2011, 4:26 a.m.

Re: WP 34s manual typo

*Message #8 Posted by **fhub** on 24 June 2011, 6:35 p.m.,*
in response to message #1 by Jim Yohe

There's a small typo in the manual for the TVM formula:

PMT - I/k * [.....] = 0

should be

PMT + I/k * [.....] = 0

Edited: 24 June 2011, 6:47 p.m.

Re: WP 34s manual error

*Message #9 Posted by **fhub** on 25 June 2011, 6:30 a.m.,*
in response to message #8 by fhub

Next error in the manual: the description of the stack arithmetic with RCL-nn and RCL/nn is wrong (doesn't matter for RCL+nn or RCL*nn)!

In the given example RCL-12 it subtracts r12 from x (not x from r12!), so the x<>y in the following "corresponding steps" is wrong.

Edited: 25 June 2011, 6:30 a.m.

Re: WP 34s manual error

*Message #11 Posted by **fhub** on 25 June 2011, 6:59 a.m.,*
in response to message #10 by Paul Dale

> Quote:
>
> Just to clarify: this isn't a firmware bug, the manual is wrong.

Yes, and there are still a few other things not clear (or wrong?) in the manual:

I'm just starting to experiment with the WP34s emulator, and if I understand it correctly then the SLV command needs 2 initial guesses (in x and y).
But now in the manual I see a routine to calculate 'PMT' with the TVM and the SLV command, and it says "routine is entered with a first guess in X"!?

So what's now correct? 2 initial guesses (in which case the manual routine would be wrong) or is just 1 enough?

Re: WP 34s manual error

*Message #12 Posted by **Paul Dale** on 25 June 2011, 7:02 a.m.,*
in response to message #11 by fhub

Solve wants two guesses but they can be the same & if so it tries to work out a second itself. It will use whatever is in X and Y as the two guesses.

- Pauli

Re: WP 34s manual error

*Message #13 Posted by **fhub** on 25 June 2011, 7:22 a.m.,*
in response to message #12 by Paul Dale

Ok, then the manual is not very exact about using this 'PMT' routine.

But what's confusing me even more in this routine is the NOP after SLV 01 with the comment "this step must be included since SLV acts as test".
What does this mean? What purpose has this NOP? I also can't find any more detailled description for SLV in the command list.

Re: WP 34s manual error

*Message #14 Posted by **Paul Dale** on 25 June 2011, 7:26 a.m.,*
in response to message #13 by fhub

Solve acts as a conditional test. If it fails to find a root, it skips the next step. This is documented in the 34c and 15c manuals, the latter is pointed to in the description of solve in the command table.

- Pauli

Re: WP 34s manual error

*Message #15 Posted by **fhub** on 25 June 2011, 7:47 a.m.,*
in response to message #14 by Paul Dale

Thanks, now I understand!
But IMO this could have been mentioned in the command list for SLV (and maybe SLV? would have been a better choice then).

And I see now that it would be a good idea to find manuals for the 34c, 15c (and maybe also for 41c, 32s, 16c etc....) and learn so how to use the WP34s. ;-)

BTW, for a calculator which has been a financial calc in its original state, this TVM handling is quite complicated and also very 'primitive'.
You could have implemented 2 additional 'variables' (NP=payments per year and NI=interest(compounds) per year), and so with a few additional program steps to convert the annual effective interest rate I to an internal periodical interest rate (e.g. IC) you could also solve problems where the compounding period (which is usually one year) differs from the payment periods (which are often one month).
This extension of the TVM calculations is exactly what I'm trying at the moment, thus all my remarks about these functions and the unexact manual descriptions ...

Franz

Re: WP 34s manual error

*Message #16 Posted by **Paul Dale** on 25 June 2011, 8:02 a.m.,*

in response to message #15 by fhub

If you want a financial calculator, don't re-flash the 30b. I am never going to do as good a job on the financial functions as HP has done. I don't want to and I've little interest in doing so as a hobby.

The TVM program has been included because Walter thought it would be worthwhile even in this primitive state. I tend to agree and occasionally have to estimate loan repayments and durations. The command as implemented occupies a total of forty bytes of flash. I can live with that much to provide this service. I wouldn't want to dedicate too much more to what is not and never will be a core function for a scientific calculator.

If you're reworking this, then the best solution would be to use the explicit formulas for the unknowns whenever possible and to resort to the solver only when absolutely required. Also there are some numeric stability and accuracy concerns -- there was an article by Willam Kahan discussing the 12C (?) financial functions in some depth. These are difficult to get accurate everywhere.

In case it helps, the xrom code for this one is:

```
81fe: 1054 4d56  LBL'TVM'
8200: 8b50       RCL 80
8201: 8b51       RCL 81
8202: 8c52       RCL+ 82
8203: 0006       1
8204: 8c53       RCL+ 83
8205: 8b54       RCL 84
8206: 0300       y[^x]
8207: b964       DEC X
8208: 0304       /
8209: 8c51       RCL+ 81
820a: 8e53       RCL[times] 83
820b: ce50       FC? 80
820c: b303       SKIP 03
820d: 8b53       RCL 83
820e: ba64       INC X
820f: 0304       /
8210: 0301       +
8211: 013a       RTN
```

Anyway, I doubt we'd include any augmented functions in the flash image, however adding them to the growing software library would be worthwhile.

Re: WP 34s manual error

*Message #17 Posted by **fhub** on 25 June 2011, 8:15 a.m.,*
in response to message #16 by Paul Dale

Yes, I've already extracted this XROM routine for TVM with the wp34s commandline version. :-)

Just one last short question:
Why has y^x those brackets in its token, ie. y[^x]?
And why is the token RCL[times] used instead of just RCL* (as for +,- and /) ?

Re: WP 34s manual error

*Message #18 Posted by **Paul Dale** on 25 June 2011, 8:18 a.m.,*
in response to message #17 by fhub

They are the console version converting internal characters into printable versions. [times] is not '*' they are different characters. Likewise, [^x] is a superscript x not the two characters '^' and 'x'.

The printouts are exactly what is inside the calculator, not the usual short cuts people use.

written by better authors before.

Well, I'm not sure whether I should agree or not.

Think about the following:
HP makes a new calculator and the manual has only 10 pages (describing just the few new features), but they include 5 manuals of 5 older calculators on which the new one is based.
Would you really like this? ;-)

BTW, my main reason were the errors in the manual that I've reported above, not the general quality of the manual.

Franz

Re: WP 34s manual error

*Message #22 Posted by **Paul Dale** on 27 June 2011, 6:10 a.m.,*
in response to message #21 by fhub

Is this an offer to write the missing material for the project? This would be very welcome and greatly appreciated.

Walter and I are just two people who have been doing this in our *spare time* for a couple of years. Unlike HP and other commercial ventures, neither Walter nor I are planning on making any money from this exercise so we cannot realistically pay for the kind of professional writing you seem to believe is required. Our available time is finite and not great so we have to take short cuts. Referring to old and readily available manuals makes perfect sense to both Walter and myself and it saves a lot of writing and proofreading effort.

So if you or someone else is offering to write the missing manual sections, we'll provide all the assistance we can and be overjoyed someone else cares about the project to a similar level that we do. Otherwise, purchase the MoHPC DVD collection and you'll have the required reference material. As I've said before these DVDs are great value and worthwhile for any HP calculator fan.

Re: WP 34s manual error

*Message #23 Posted by **gene wright** on 27 June 2011, 11:00 a.m.,*
in response to message #22 by Paul Dale

Jake and I had offered to do just this, only requesting to get a word version of the current full manual.

However, all I was given was the word copy of a much older previous version.

The manual as it is now is a very complex reference document full of references to previous sections of the manual and is not easy to read, even by experienced users.

Well, it is what it is.

However, Jake and I were willing to write chapters in the style of previous manuals making as few assumptions as possible. Chapters on complex numbers, integration with examples, etc.

But, I have not understood the seeming reluctance to help and encourage this effort. Because of this apparent resistance or a NIH reaction, we have done little in this regard.

I think that is a real shame, as a much better manual with very few assumptions would do wonders for the spread of the fantastic 34s.

IMO.

Re: WP 34s manual error

*Message #24 Posted by **Marcus von Cube, Germany** on 27 June 2011, 11:07 a.m.,*
in response to message #23 by gene wright

Gene, I would not mix the reference manual with the user's guide i a single document because there is the danger of diverging versions of the same material. So the "much older version", together with its fonts and other support files, should be fine as a start. Just take the formatting to have a consistent style and start from scratch otherwise.

Re: WP 34s manual error

Yes, I agree!
I'm a mathematician, using and programming computers since about 30 years and so I would say I'm quite experienced, but when reading some parts of this manual (e.g. the tables of addressing modes) I have to put myself into a state of 'deep meditation' to understand anything ... ;-)

Eric's overlay - my experience and suggestions

*Message #1 Posted by **Cristian Arezzini** on 18 June 2011, 12:53 a.m.*

I received the WP34s overlays today, and I immediately went to install one. It's a great product and it has improved the looks and usability of my calc a lot. But being a "first run", I suppose constructive criticism is expected, so here are the (tiny) things I'd change. I'll describe them in the order I noticed them.

When I first touched the overlay, I had a feeling of "roughness" of texture. I was expecting something much more "smooth" at the touch, I don't know how to describe it better. I'm not saying I wanted something shiny... matte is ok. But passing a fingernail over the black areas encountered some resistance, as if the surface wasn't perfectly smooth; and it left a visible mark.

Then I proceeded to apply the top small sticker, the one saying "WP-34S RPN scientific". I peeled the sticker from the backing with tweezers, and it is much "softer", more flexible, than I thought. I thought it would be more "plastic-like". Being so flexible is better in a way because you can "stretch" it a little if needed; but on the other side, it could go on a little "deformed" if one is not precise (by the way: tweezers really are a MUST with this product).

Anyway, I went on with the main piece. One thing I already noticed from others' photos, is that I would really like if the corners could be rounded a little, especially the two corners on the bottom. On a 30b, where the contrast with silver is bigger, I think it would look better. Anyway, I followed Eric's suggestion of first sticking the middle part, and then proceeding towards the top and the bottom. It worked great, at the first try, no need to reposition it. All the keys "feel" OK, except the ENTER which seems a little more "murky". There's not much I can do to fix it, I suppose... I might try "filing" with a modeling knife around the key, but I fear it might look bad then. Maybe making the holes just a tad wider (just 1/10th of a millimeter maybe) could help...

Then, to help the adhesive stick better, I put a soft cloth over the calc and passed my fingernail all over the overlay, pushing down a little between the keys. And here is where the worst problem showed up... the whole overlay now shows "blemishes" where my fingernail passed. In those places it is shinier, less matte, than the rest of the black ink. So: don't even *try* passing a hard (or semi-hard) object over the overlay, if you want to keep it pristine. Even if you protect it with a soft cloth.

Then I proceeded with the keys. They went on without problems, I could place them all in their correct position and very neatly - many years of building small airplane models definitely helped here! :) But one thing I noticed is that the cut is deeper than the vinyl; and so sometimes, the tweezers "caught" on a layer of the substrate too, and it was difficult to separate the sticker from the backing. Eric commented that he could make the cut less deep, but that in this case it's better a little too deep than too shallow. Which of course makes sense. If it seems difficult to lift a key from the backing, just try at another side of the key.

I also noticed that the key stickers leave quite a large surface of the key uncovered - which is intentional, because if they were larger, then if a key went on not perfectly centered, a "lip" would remain out of the key, possibly sticking to something and making the whole sticker peel away.

In a couple of places (the ENTER key and the original SHIFT key) a little blue shows below the sticker. Eric says these two keys might be slightly enlarged to fix this.

So, to recap:

1. - The ink's "texture" could be made a little smoother, "slicker" without having to be shiny, I don't know what

exact words to use...
2. - The vinyl is thin but that's just a "psychological" feeling, once it's on it's perfect. It seems really durable and "elastic".
3. - It would be really nice if a way could be found to make the black ink more resistant to scratches/damages by fingernails or other semi-hard objects. I'd like to keep it matte though.
4. - The corners (especially the bottom ones) could be rounded.
5. - The key holes could be a tiny bit larger.

I still don't know about durability of course. I'm wondering if it will catch dirt/finger oil, and in case it does, if it's cleanable without damage.

If you want I can post a picture, which shows the marks left by my fingernail and the small blue parts showing below two keys.

There's something I'm wondering: does anyone have an idea of how many WP34s (I mean real, hardware ones) exist in the world? And how many have an overlay?

Cristian

Re: Eric's overlay - my experience and suggestions

*Message #2 Posted by **Eric Rechlin** on 18 June 2011, 9:58 a.m.,*
in response to message #1 by Cristian Arezzini

It's not the black ink that isn't resistant to pressure smoothing it out making it shiny, it's the vinyl itself. The only solution I can think of is for me to spray the whole overlay with a glossy protective spray before cutting. Of course, it would then all be shiny, which would mean more glare. Not sure what you guys would prefer. I just don't rub my fingernail on my 34s and that way it stays matte.

The overlay is surprisingly safe from cleaning solvents. Water is no problem at all, and I even was able to wipe it with both isopropanol and brake cleaner with no damage, so you can use some fairly strong solvents. The only concern is abrasion, which would cause the ink to flake off, but I see this as being more of a problem on the edges of the labels rather than anywhere else.

I shipped about 60 overlays over a one-week period.

Eric

Re: Eric's overlay - my experience and suggestions

*Message #3 Posted by **Jim Yohe** on 18 June 2011, 1:15 p.m.,*
in response to message #2 by Eric Rechlin

Brake cleaner? There must be an interesting story for the reason you happened to try that out over the overlay. Perhaps there's a high percentage of auto mechanics who'd be using a WP 34s? ;-)

Re: Eric's overlay - my experience and suggestions

*Message #4 Posted by **Eric Rechlin** on 18 June 2011, 1:54 p.m.,*
in response to message #3 by Jim Yohe

I was just trying random chemicals that I had in my closet. :)

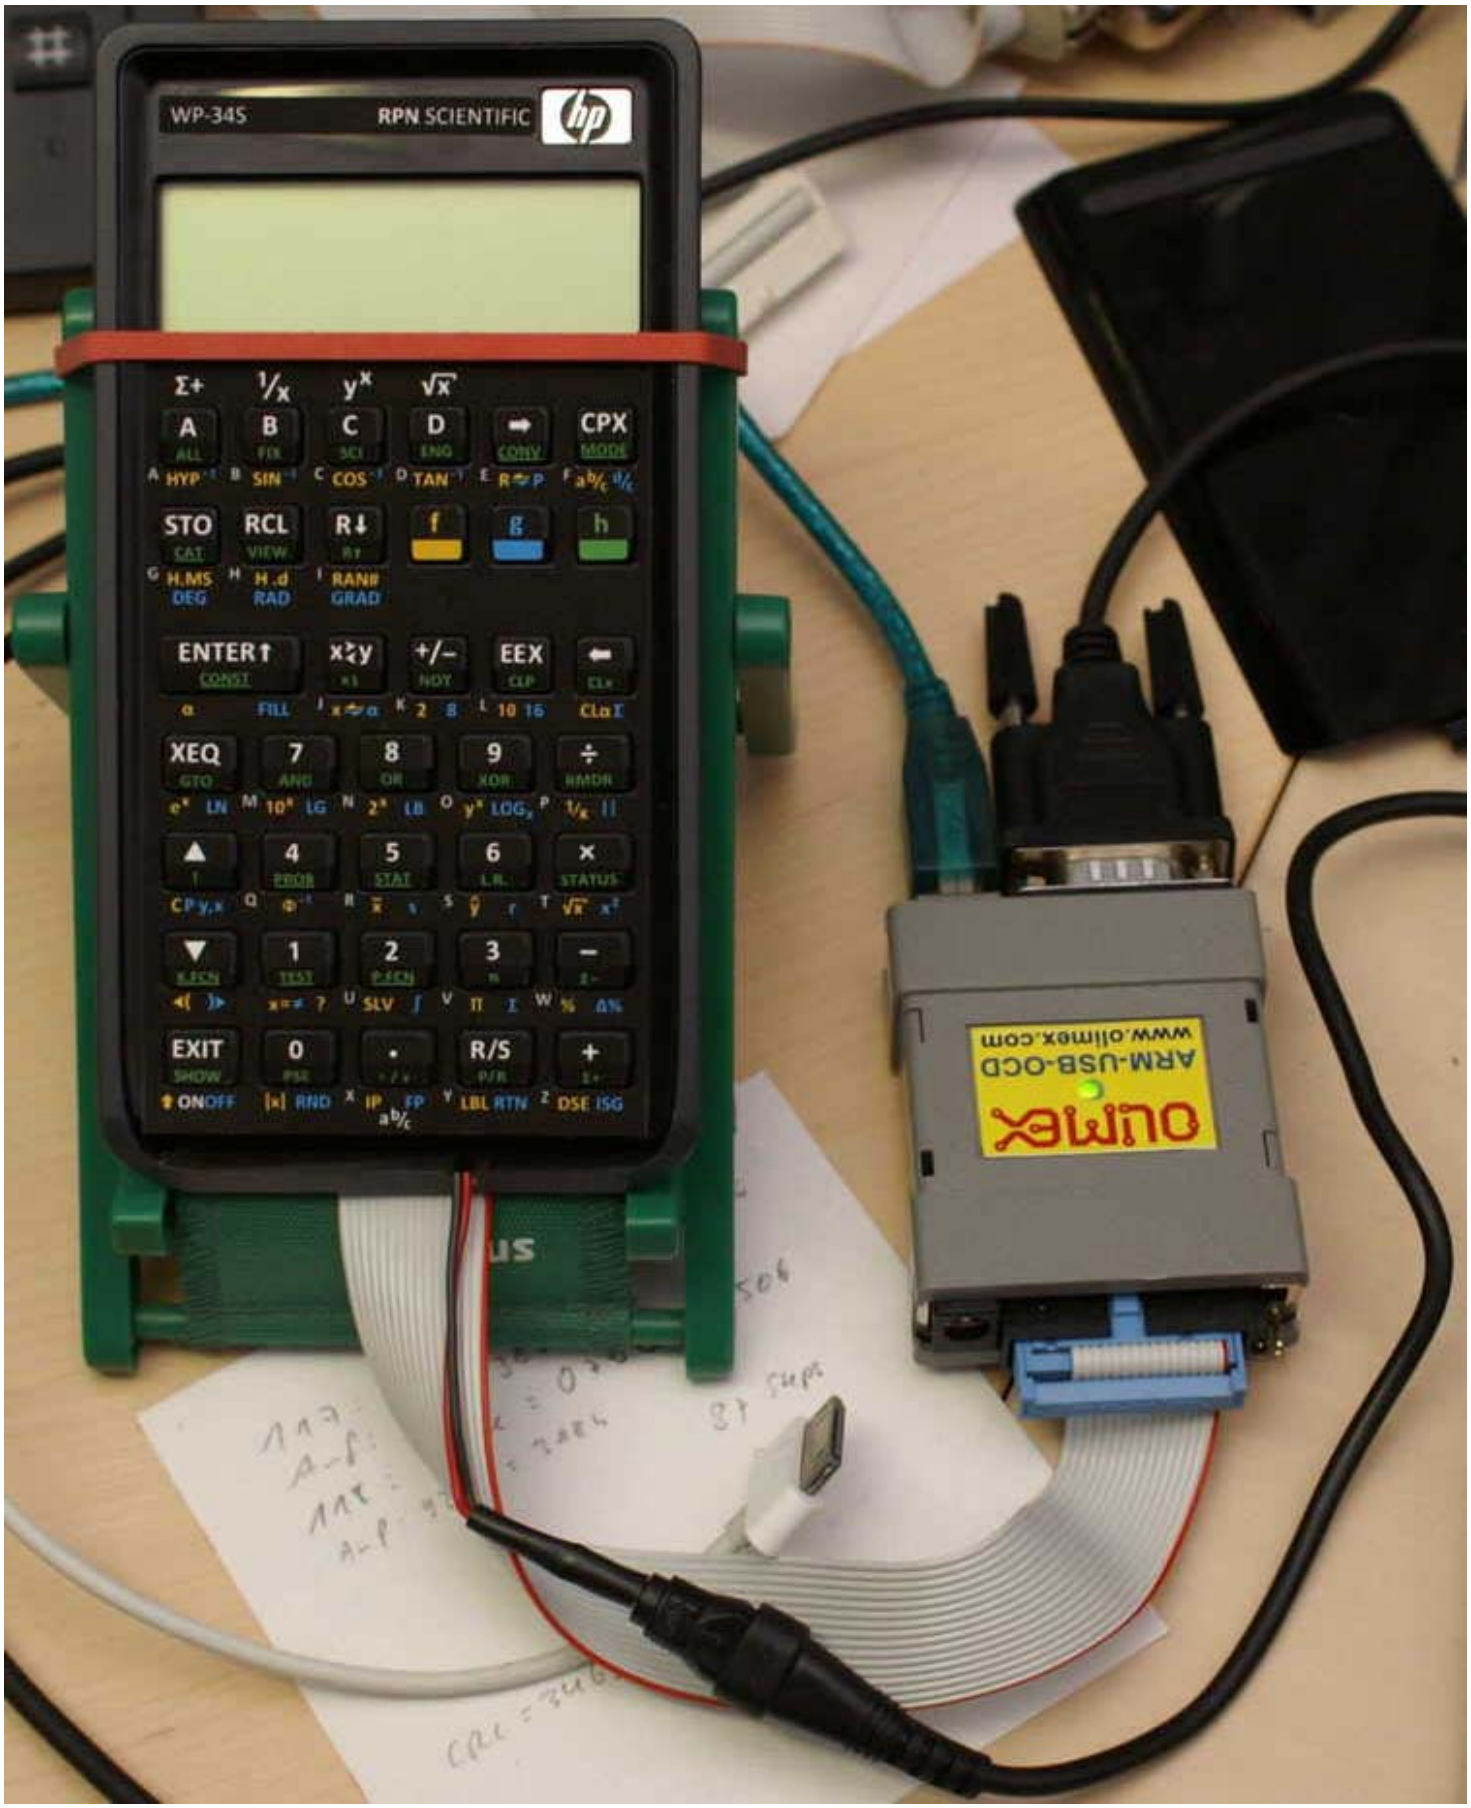
MAF cleaner didn't hurt it either.

Eric

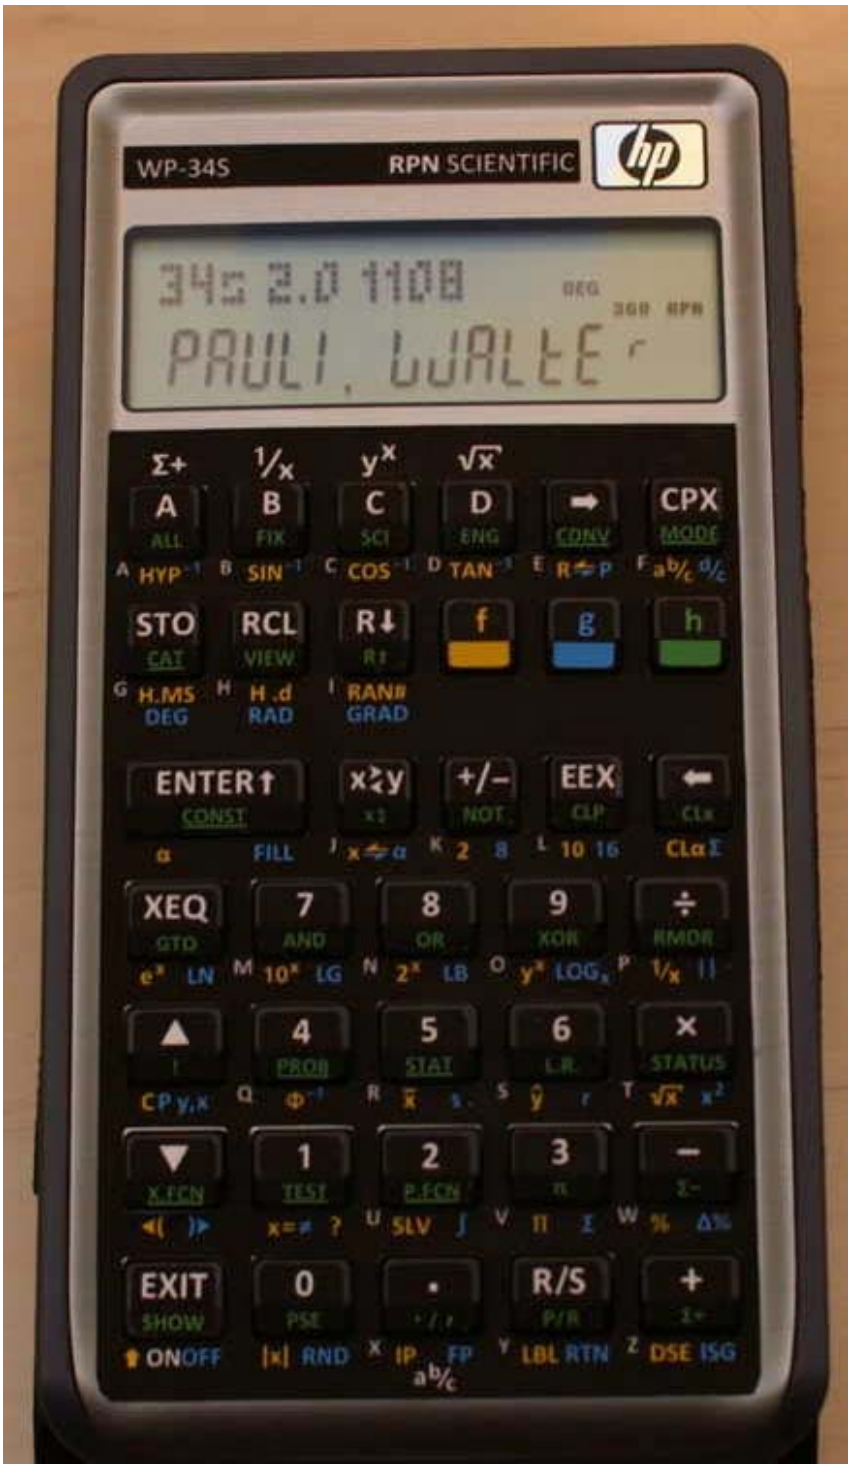
Re: Eric's overlay - my experience and suggestions

*Message #5 Posted by **Marcus von Cube, Germany** on 20 June 2011, 5:18 p.m.,*
in response to message #1 by Cristian Arezzini

Mine have arrived, too. Thanks Eric!



My poor development unit in its new clothes.



This is my carry around 30b.

As you can see, the overlay is pitch black. I had some trouble with the f, g, and h prefix keys on my 30b which had lost the click. I must have glued the overlay too close to the upper edge of the keys. I solved it by introducing a sharp knife (the small blade of my Victor Inox pocket knife) in the gap above the keys. This seems to have widened the gap enough for a good key click. Over the second row from below you can see the bright background shine through. It might be worthwhile to paint around the keys with a permanent marker before applying the overlay.

Now let's see how long it will last.

Re: Eric's overlay - my experience and suggestions

*Message #6 Posted by **Gerry Schultz** on 20 June 2011, 5:37 p.m.,*
in response to message #5 by Marcus von Cube, Germany

I put my overlay on this weekend and it worked out much better than expected. One thing I found is that when I was putting on the key cap covers, if I put them on lightly, there was play in the adhesive and I could do final positioning by pushing and twisting on the cover to get them all aligned in rows and columns.

Overall it came out great and I'm very satisfied. Now I feel like I got a new calculator. That overlay sure make a big difference.

Thanks a million, Eric.

Gerry

SR-60a manuals available

*Message #1 Posted by **David Ramsey** on 18 June 2011, 12:36 a.m.*

I recently obtained a functional (well, except for the card reader, but I'm working on that) SR-60a calculator. The only English manuals I could find were those held by the Computer History Museum in Mountain View, CA.

No, you can't borrow them to scan, or even bring a battery powered scanner in and do it yourself. You can, however, give them money to do it for you.

So I did. You can download the manuals here.

Re: SR-60a manuals available

*Message #2 Posted by **Katie Wasserman** on 18 June 2011, 2:04 a.m.,*
in response to message #1 by David Ramsey

Contragulations on your find! Thank you for your contribution to get these manuals scanned, I hope to need them them some day. This is the only TI calculator I ever wanted, still looking for one....

Re: SR-60a manuals available

*Message #3 Posted by **Joerg Woerner** on 18 June 2011, 8:24 a.m.,*
in response to message #2 by Katie Wasserman

Katie,

You never asked!

There was one on eBay ending yesterday evening for $760 including the memory expansion 2 (310 register, a few thousand program steps) and I placed a bid on it on behalf of a friend in Norway. Other than that I sold this year my three units off.

One of the units - a non-working one - is on its way as a parts donor to David.

Anything else from TI you are missing?

You can even ask for a TI-88 (but have your credit card loaded with two-and-a-half grands and one cent).

Regards, Joerg

Re: SR-60a manuals available

*Message #4 Posted by **Eric Smith** on 18 June 2011, 4:27 p.m.,*
in response to message #3 by Joerg Woerner

Darn! I've been wanting one of those also, to dump the ROMs and reverse-engineer for simulation.

Re: SR-60a manuals available

*Message #5 Posted by **Katie Wasserman** on 18 June 2011, 11:57 p.m.,*
in response to message #4 by Eric Smith

Now I'll know who I'm bidding against! :)

Re: SR-60a manuals available

*Message #6 Posted by **Eric Smith** on 19 June 2011, 1:47 a.m.,*
in response to message #5 by Katie Wasserman

Not me! I don't have time to follow TAS, nor the money to bid competitively there.

Re: SR-60a manuals available

*Message #7 Posted by **Paul Dale** on 19 June 2011, 1:52 a.m.,*
in response to message #6 by Eric Smith

Somebody load a unit to Eric so we get a nice emulator.....

I've no TI's so I can't.

- Pauli

Re: SR-60a manuals available

*Message #8 Posted by **Eric Smith** on 19 June 2011, 4:01 a.m.,*
in response to message #7 by Paul Dale

I wouldn't want to borrow one right away, as I'm too busy currently. But it would be nice to borrow one eventually.

I've started work on reverse-engineering the TI-58/59, and much of that work will be applicable to the SR-60. (As well as the SR-50, SR-51, SR-52, and SR-56.)

One of the key things that needs to be investigated is how the TMC0501E (used in the TI-58/59 and SR-60) differs from the TMC0501.

Re: SR-60a manuals available

*Message #9 Posted by **David Ramsey** on 19 June 2011, 2:03 p.m.,*
in response to message #7 by Paul Dale

I'll be happy to arrange this with Eric, especially after I receive the nonworking unit for Joerg. I could bring it to the conference...

in response to message #1 by David Ramsey

They did a nice job of it. I wasn't familiar with the SR-60a - it was interesting leafing through the manual. Thanks for making that available to the community.

Did you get any of those unusual magnetic cards with your find?

Bob

No, but Joerg's been kind enough to include a few with his donor SR-60. My machine has the same gummy wheel problem we've all experienced with our HP card readers, except that the gummy wheel is about 1" in diameter. The card reader seems to run, but I don't want to try any cards until I do something about the reader's wheel, and I'll probably practice on the donor machine first...

Re: SR-60a manuals available

That's good news - nice to know there will be more fully functional units in the wild. Good luck with the restoration.

Regards, Bob

Re: SR-60a manuals available

*Message #14 Posted by **Michael Coyle** on 19 June 2011, 8:01 p.m.,*
in response to message #1 by David Ramsey

Thanks for the manual. It was a blast looking through it. My second programming job involved the SR-60.

Bear with me a few moments here.

For a few months in 1976 I worked for an office equipment dealer here on Long Island. They sold (among other things) TI calculators. I was 18, between high school and college and very naive, meaning that I worked cheap but didn't realize *how* cheap. (I think I was making about $150/week part time.)

I lusted after HP calculators, but I had a brand-new SR-52, still not too shabby. So I had a head start on the SR-60.

I worked on three programs during my time there. Two were payroll programs, one for the small-memory SR-60, one for the large memory version.

The third program waas the most interesting. It was done for a swimming pool store. The idea was that the customer would test his pool, come into the store, and the calculator would tell him what chemicals to use to fix his problems. The program would ask things like: What is the pH of the pool? What is the chlorine reading? Is there algae in the pool? (I suppose the volume of the pool also had to be entered.) The program would then figure out how much of what chemicals were needed. This would be printed out on the little 20-column printer, complete with brand names, so as to leave nothing to doubt. Of course, all of the named chemicals were what the dealer was stocking.

The interesting part of the calculation was that using one chemical might change the amount of the others, so the interactions had to be taken into account. All of the formulas were supplied by the dealer. I wish I had a listing of the program, but unfortunately thermal paper isn't an archival medium :(All my SR-60 printouts faded to nothing in a couple of years.

The one thing I remember about working with the SR-60 was how sensitive to static it was. Just walking across the carpeted room and touching the calculator could generate a spark that could blow out circuitry. In particular, the $700 memory expansion boards were very susceptable to static damage! We soon learned to "de-zap" ourselves by touching the metal desk leg before touching the calculator.

This is a bit long but I hope you enjoyed hearing about using the SR-60.

Re: SR-60a manuals available

*Message #15 Posted by **David Ramsey** on 21 June 2011, 9:23 p.m.,*
in response to message #14 by Michael Coyle

The static sensitivity thing makes me very nervous. Dare I drag this monster to HHC?

Re: SR-60a manuals available

*Message #16 Posted by **Michael Coyle** on 26 June 2011, 10:30 p.m.,*
in response to message #15 by David Ramsey

Well, I'd wrap it in antistatic material (foil or black foam or big pink envelope or whatever, and de-zap yourself before use, just in case.

But it's your call.

BTW, does anyone know what the difference is between the SR-60 and SR-60A? Is it just the memory size or are there other functional differences? Thanks.

in response to message #1 by Jose Gonzalez Divasson

Being late on the wp34s scene and not following the developments, I have the 101 questions; How can I make my 20b into a wp34s - i.e. where do I buy all the needed stuff; cable? overlay? And where do I download and how do I do it?

How to get started with a 34s...

*Message #4 Posted by **gene wright** on 17 June 2011, 8:15 p.m.,*
in response to message #3 by Geir Isene

1) Go here:

http://sourceforge.net/projects/wp34s/

Download the wp34s.zip file at the green button location.

2) Cable? You can get one from me but you will have to wait a week. I ask for $5 if overseas and $3 in the USA to cover the padded envelope I buy, postage and my gas to the post office. Email me at my forum email. :-)

3) Overlay? comes from Eric Rechlin.

4) How to do it? Download this PDF.

How to flash a 20b

I had no problems at all under Linux, using a (good quality) USB-to-Serial converter. I seem to recall people having success with more recent versions of Windows, too.

If you can't access Eric's site (though it works for me) you can contact him by clicking on his name on one of his posts here.

Re: How to get started with a 34s...

*Message #7 Posted by **Jose Gonzalez Divasson** on 18 June 2011, 5:11 a.m.,*
in response to message #5 by David Ramsey

I have been able to succeed with XP and a USB to serail converter, running SAM-BA version 2.10

For Europe, I can supply "flashed" 20b of 30b calculators.

Re: How to get started with a 34s...

*Message #8 Posted by **Marcus von Cube, Germany** on 18 June 2011, 5:40 a.m.,*
in response to message #7 by Jose Gonzalez Divasson

The trick is NOT to use converters with Prolific chips. FTDI equipped converters are fine.

Re: How to get started, etc

*Message #9 Posted by **db (martinez, ca.)** on 18 June 2011, 11:10 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Thank you Marcus. I'll get one and try again. I thought it was my Ubuntu Linux at fault.

It might be a good thing for you guys to collect this info in one place and put it up as some kind of simple document file on your site. That could save you from answering the same question multiple times.

David; XP was a good choice for them. I think that globally it is still the most common OS. I use Linux now but if XP Pro would work like it did before Vista came out; i would happily use it.

Re: How to get started with a 34s...

*Message #10 Posted by **Eduardo Duenez** on 18 June 2011, 11:46 a.m.,*
in response to message #4 by gene wright

Perhaps Gene will read this...

I have made two separate attempts to reach Gene using the forums "contact..." form, and the messages have been apparently sent, but they either haven't been delivered, or his reply hasn't reached me. I'd like to get a cable to flash my 20b.

I can be reached at eduenezATmathDOTutsaDOTedu. (I teach at the Univ. of Texas at San Antonio, aka UTSA.)

I apologize for posting this request to the forum, but I don't know what I've done wrong before...

ED

JavaScript calculator

*Message #1 Posted by **Lode** on 17 June 2011, 3:38 p.m.*

Hello,

I created a scientific programmable button operated calculator in JavaScript. It's somewhat inspired by HP calculators. What do you guys think of it?

It's got many functions, but one issue to note is that secondary (2nd, inv and hyp) functions aren't labeled on buttons, they're only shown in a mouseover tooltip.

Its programming ability is really easy, e.g. to calculate the integral of x^2 from 0 to 100, in RPN mode (first set the Alg dropdown to RPN), press PRGM, x^2, PRGM, 0, ENTER, 100, ENTER, 100, ENTER, INTEGRATE, and it should show 333333. (the second 100 is the number of steps for precision)

Please provide feedback.

It's here: http://lodev.org/jscalc/jscalc.html

Thanks!

Edited: 17 June 2011, 4:52 p.m. after one or more responses were posted

Re: JavaScript calculator

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 17 June 2011, 4:08 p.m.,*
in response to message #1 by Lode

My first reaction, having missed the note about the "Alg dropdown", was to paraphrase the general populace when confronted with an RPN calculator in saying: "Where's the ENTER key?" :-)

I like the "hover help". If only more "real calculators" had this feature (taking into account the HP-42, etc.).

Nice job!

Re: JavaScript calculator

*Message #3 Posted by **Jim Yohe** on 18 June 2011, 1:35 p.m.,*
in response to message #1 by Lode

It would be useful to open a new tab or window for the manual instead of replacing the calculator with the manual in the same tab/window.

Why I like the blank overlay option for the 41C, CV, CX & CL and my 41CL final configuration

*Message #1 Posted by **Geoff Quickfall** on 17 June 2011, 2:22 p.m.*

With the blank cards and clear adhesive media, any overlay can be created.

If I had (and soon will with the pil box) the 41Z, I can create a template which then requires slicing.

Here is a blank overlay for the cockpit but now incorporating HP 41CL functions as well as extended memory and program routines. This labelling is easy to produce and can be replaced without ruining the overlay. It is reasonably durable, but easily replaced. This project took 30 minutes this morning. Note the synthetic T in the display!

These are the functions and routines currentlly placed at shifted key assingments:

```
WPA     GREAT CIRCLE DISTANCE TRACK BETWEEN LOADED DATA WAYPOINTS
WPC     GREAT CIRCLE DISTANCE TRACK BETWEEN INPUT LAT AND LON
TC      ALTIMETER CORRECTIONS DUE TO LOW TEMPERATURES
WT      WORLD TIME PROGRAM, INPUT AIRPORT, GET TIME\DATE\DAY
BRK     BREAK SCHEDULES FOR 3 AND 4 PILOT CREWS
SAL     SET ALARM ROUTINE
CLRA    CLEAR ALARM FUNCTION
TURBO   HP 41CL FUNCTION "TURBO50" SPEEDS UP CALC
SSW     SET STOPWATCH WITH DEFINED TIME
SW      GO TO STOPWATCH MODE
HMS+
HMS-
ZULU    GMT TIME
DATE    GMT DATE
PON     PRINTER ON
POFF    PRINTER OFF
MC      MASTER CLEAR, CLEARS AND RESETS FLAGS, REGISTERS TO DESIRED STATE
CODE    DOOR CODES FOR AIRPORT ACCESS
IN-MB   INCHES TO MILLIBARS (HECTOPASCALS)
MB-IN   MILLIBARS TO INCHES
SAVE    EXTENDED MEMORY "SAVEP" FUNCTION
PHONE   PHONE NUMBERS, INPUT TITLE GET PHONE NUMBER
FT-MT   FEET TO METERS
MT-FT   METERS TO FEET
GET     EXTENDED MEMORY "GETP" FUNCTION
PLUG    HP 41CL ROUTINE, PROMPTS FOR ROMS AND INPUTS THEM WHERE DESIRED
SG      SPECIFIC GRAVITY 'FUEL IN TANK' PROGRAM
L-K-U   LITRES TO KILOGRAMS TO US GALLONS USING AVERAGE SPECIFIC GRAVITY
PURF    EXTENDED MEMORY "PURFL" PURGE FILE FUNCTION
UPLUG   HP 41CL ROUTINE TO UNPLUG ALL PORTS *EXCEPT* PORT1L
F-C     FARENHEIT TO CELSIUS
C-F     CELSIUS TO FARENHEIT
LO      LOCK OFF, PREVENTS INADVERTANT TURN ON (DRAIN BATTERIES)
```

As well, the following roms are loaded using the 41CL functions:

```
PORT 1 LOWER  YFNS (cl functions in PORT1L)
PORT 1 UPPER  TREK
PORT 2 ADVANTAGE
PORT 3 PPC
PORT 4 UPPER CCD (leaving lower free allows the card reader
                  to swap without conflict).
```

Cheers, Geoff

Edited: 18 June 2011, 2:34 p.m. after one or more responses were posted

Final configuration and the whys, whats and wherefores as explained to me ;-)

*Message #2 Posted by **Geoff Quickfall** on 18 June 2011, 3:18 a.m.,*
in response to message #1 by Geoff Quickfall

Hello Gene and others. I posted this below and it is imbedded well down the postings. I thought it worth posting higher up as it contains explanations about the CL and CLONIX which appeared to function correctly at first. So ...

Okay, there is a rub in all this. The experts, of which I am NOT one are looking or going to look at the addresses CLONIX uses when ROMS are loaded. These are NOT bugs with either the CL or the CLONIX. Both these work perfectly but at the moment there are conflicts on addressing and priortizing the access with CLONIX installed and the CL wins all the time.

My example looked like it worked with a couple of bugs. Probably the way I installed and then loaded created what appeared to be a perfectly function CLONIX CL CLONE ;-)

So here is what I did with a MEMORY LOST condition on the CL board (naturally occuring when you recieve the logic pca and install it.)

```
1 follow Montes' instructions to the letter while installing YFNS
  to PORT 1 Lower.
2 now HPIL is available so cassette deck to calculator to fill
  program memory with a suite of routines.
3 insert card reader to, of course, PORT 4 which is empty.
4 use RFL synthetic program to load DATA files into Extended
  memory with the card reader.
5 use YFNS (CL) functions PLUG to load ROMs into PORTS.
6 LEARN FROM THE EXPERTS!!!
7 see 6
8 Realize through explanation that the card reader when installed
  takes over PORT 4 lower thus disabling any full page ROM residing
  there.
9 Read the manual again and realize that the ADVANTAGE module is
  a full PORT!  I loaded the ROM half page version of routines
  based mistaking it to be the ADVANTAGE rom.

So it is a must to:

1 READ THE MANUAL
2 UNDERSTAND THE ADDRESSING OF THE PHYSICAL MODULES
3 LOAD THE CORRECT ROMS ACCORDINGLY
4 IN THE CASE OF THE CARD READER, YOU CAN LOAD A FULL ROM AND
  UNPLUG IT WHEN THE CARD READER IS INSTALLED or LOAD THE PORT 4
  upper WITH A HALF PAGE ROM.
```

The treat here is you could write a routine called PCR and assign it to a key. Invoke it when you want to use the card reader and when done invoke UPCR.

```
01  LBL PCR (plug in card reader)
02  UPLUG4
03  RTN
04  LBL UPCR?
05  AON
06  "ROM?"
07  PROMPT
08  AOFF
09  PLUG4
END
```

If it is always the same rom then replace lines 5 - 8 with the name of the rom in alpha. For example in PORT4 you want the full page ROM PPC. The program would look like:

```
01  LBL PCR (plug in card reader)
02  UPLUG4
03  RTN
04  LBL UPCR
05  'PPCM'
06  PLUG4
END
```

It looked like the clonix would add two more full page ROMs to the calculator. In fact the reason it worked for me is the portion of the CCD and PPC that were required did not conflict. Cat II on closer inspection reveiled that only a third of CCD in clonix was available and the NAV1B never showed up at all.

In my defence I assumed that if a conflict occured I would see a complete failure of the CLONIX ROMS (not the CLONIX). They worked enough to sucker me in! That combined with the inability to find my CLONIX PIC program files to determine address loading and a lack of understanding of the intracacies of the 41CL/CLONIX addressing fooled me into thinking the combination worked.

So back to the PIC programmer to copy the CLONIX to the computer and determine the page addressing. Diego will also be looking into this along with Monte (emails).

Back to the machine:

I have the short routines loaded so that PORT4 can be swapped between the Card Reader and the CCD. I have PPC in PORT 3 and the full ADVANTAGE in PORT2. PORT1 lower has the CL YFNS functions while PORT1 upper has TREK.

Of course the beauty is that it so easy to swap ROMS in and out with the XEQ PLUG and UPLUG functions.

Well still playing and without ROM manuals that is a treat! The Museum DVD is a must!

Cheers, Geoff

Just so you don't get bored a gratuitous calculator picture

Trying to understand Spice ROM/RAM Layout

*Message #1 Posted by **Michael de Estrada** on 17 June 2011, 9:55 a.m.*

I have been restoring the HP Spice series calcs for some time now, and have come to the realization that I do not understand how the RAM/ROM is arranged. All Spice series calcs have one large IC chip and 1 or 2 or 3 small ICs. Yesterday, I was working on my HP-34C with non-soldered keyboard and accidentally knocked 2 of the 3 small ICs out of their holder. I took a 50-50 guess as to which one went where. When I reassembled the calc, it seemed to work perfectly in both run and program mode, and passed the self-test, so I assumed that I had guessed correctly. However, when I switched it off and then on, I got a Pr Error and memory had been erased. At first I thought is was a bad connection problem, but when that did not work, I switched the two ICs, and to my amazement the calc worked properly and the Pr Error problem disappeared. In the past when I got the small ICs out of order the calc did not work properly and gave the self-test Error 9, indicating a self-test failure. So, what exacly are the ICs? Is the large IC a ROM and the small IC(s) just RAM? If so, how are the small ICs arranged? I'm sure someone out there knows all this.

TIA - Michael

Re: Trying to understand Spice ROM/RAM Layout

*Message #2 Posted by **Eric Smith** on 17 June 2011, 7:37 p.m.,*
in response to message #1 by Michael de Estrada

In the E series, all three eight-pin DIP locations are interchangeable.

In the C series, the eight-pin DIP location nearest the display is wired for battery backup, so if you get the wrong chip in that location, the calculator won't have continuous memory, and may also have reduced battery life.

Re: Trying to understand Spice ROM/RAM Layout

*Message #3 Posted by **Michael de Estrada** on 17 June 2011, 7:56 p.m.,*
in response to message #2 by Eric Smith

Thanks, Eric. So, if I understand correctly, the small 8-pin DIP ICs are all simply RAM, and in the case of the C suffix models, only the top IC is CMOS. Also, since I've found that the keyboards are interchangeable among the E and C series models, then the wiring of the top 8-pin DIP location only for battery power when the calc is switched off must be a function of the power circuit board, which I know are different between the E and C series. I am still perplexed with an earlier experience with an HP 38E, which did not work when the order of the 3 8-pin DIPs was changed.

Re: Trying to understand Spice ROM/RAM Layout

*Message #4 Posted by **Eric Smith** on 17 June 2011, 7:59 p.m.,*
in response to message #3 by Michael de Estrada

The 8-pin chips contain varying mixes of ROM and RAM. I don't think any of them are RAM-only, but some are ROM-only and some are combined.

I don't have any idea why reordering the chips in a 38E wouuldn't work, unless one was backwards (rotated 180 degrees), which is obviously a no-no. All three 8-bit positions are wired entirely in parallel in the E series.

Edited: 17 June 2011, 8:00 p.m.

Re: Trying to understand Spice ROM/RAM Layout

*Message #5 Posted by **Michael de Estrada** on 17 June 2011, 8:43 p.m.,*
in response to message #4 by Eric Smith

The chips were definitely not rotated, but I cannot replicate the situation since the calc has long since been parted out for use in the repair of other calcs. Anyways, it's just an academic question now, based on your explanation. Thanks, again.

- Michael

WP34S assembler/disassembler in the wild

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 17 June 2011, 9:09 a.m.*

Thanks to the good graces of the 3 amigos, an assembler/disassembler is now available for alpha testing.

It is written in Perl (5.8+) so that is a minimum requirement, and currently it is only a command line version.

It is available in the ./trunk/tools directory and is called "wp34s_asm.pl". You can get it through the "svn update".

Personally, I envisaged this tool as primarily an archiving and program concatenation tool but you can also write programs on a standard editor using the opcode format described in the output of one one Paul's programs (more on that later when I have had a chance to write documentation.)

It runs in both disassembly and assembly modes. In disassembler mode (triggered by the -dis switch) it writes its output to STDOUT so you will have to redirect the resulting listing to a file if you want to keep it. For example, to see what you had stored in flash-0, use the following:

```
$ ./trunk/tools/wp34s_asm.pl -dis wp34s-0.dat > myProg.wp34s
```

In assembly mode, you need to specify the output file because the output is a binary image (-o switch and *no* -dis switch):

```
$ ./trunk/tools/wp34s_asm.pl myProg.wp34s -o wp34s-0a.dat
```

These complimentary commands "should" result in the recreated flash image (wp34s-0a.dat) being identical to the original (wp34s-0.dat):

```
$ diff wp34s-0a.dat wp34s-0.dat
```

[Note that a few things could go "wrong" resulting in files that don't match but are otherwise functionally identical. More in the TBD documentation.]

I have tested it with the very small suite of WP34S programs I have at my disposal but it could really use some extra eyes and more sophisticated WP34S programs than my simple coding attempts.

There is a reasonable help screen that you can get by using the '-h' switch:

```
$ wp34s_asm.pl -h
```

As I said, it is very early in its development so it will undoubtedly have issues. Hopefully I'll find them before you do. :-) It will not currently eat the output from Paul's disassembler but that should be trivial to include in a day or two.

One really nice feature is that, once you have the programs in source form (what I am calling "*.wp34s"), the assembler can concatenate more than one program into a single flash image -- limited by the 506 word flash size limit. These source files may or may not have line numbers but they are ignored by the assembler in any case. For example:

```
$ wp34s_asm.pl gc.wp34s fp.wp34s moonlander.wp34s -o wp34s-3.dat
```

It was written to be platform independent but I have not been able to test it on an Apple yet.

I hope you find it useful! Let me know what dumb errors I have made (but be gentle!).

Best regards...

in response to message #1 by Neil Hamilton (Ottawa)

> Quote:
>
> It was written to be platform independent but I have not been able to test it on an Apple yet.

Is there no compiler in PERL so that you could make a Win32 executable for us?

Re: WP34S assembler/disassembler in the wild

*Message #3 Posted by **Neil Hamilton (Ottawa)** on 17 June 2011, 12:33 p.m.,*
in response to message #2 by fhub

Perl is an interpreted scripting language and thus has no compiler itself (that I am aware of). Someone else may know more about a Perl compiler than I.

There are many good Perl packages available to choose from. On Windows I tend to use cygwin but the equally free Active State package has very good reviews and is available on most platforms that would matter to this community. Strawberry Perl is another one that is widely used with very good reviews -- and available as a Portable installation (ie: on a USB drive).

While cygwin is very attractive package for Windows people wishing to run Unix-like commands, it can be a challenge to install for novices. Not so with Active State or Strawberry (to the best of my recollection).

I have yet to see a Linux distribution without a Perl package as part of the installation.

I hope that helps.

Well, I've had a look at these programs but I really don't want to install a 200MB Perl package just for running one single script.
So I continued my search and in fact found a very small (minimal) Perl system (TinyPerl, only 600kB) here:
http://tinyperl.sourceforge.net/

Unfortunately when I try to run your script with "tinyperl wp34s_asm.pl" I always get the following error message:
"Global symbol "@base_mnemonic" requires explicit package name at (eval 24) line 781."

Any idea what might cause this error and how to solve this problem?
(I have not clue at all about Perl ...)

Franz

Re: WP34S assembler/disassembler in the wild

*Message #6 Posted by **Neil Hamilton (Ottawa)** on 30 June 2011, 9:04 a.m.,*
in response to message #5 by fhub

Hi Franz,

I suspect that it is a "tinyperl" bug and its parser is likely mistakenly interpreting "${base_mnemonic}[->]" as "${base_mnemonic[->]}". The first means "access the scalar value called $base_mnemonic and append the string '[->]'" (the intended action) while the second means "access the '->'-th element of the @base_mnemonic array" (a wee bit of nonsense since '->' does not resolve into anything meaningful in this case). There is no array called @base_mnemonic so their interpreter pukes telling you that the global array doesn't exist.

None the less, I can probably work around their issue with a small patch. Stay tuned!

(I suspect that you are looking at revision 1183 of the wp34s_asm.pl script. In future, can you do an "svn log wp34s_asm.pl" and mention the revision number you are looking at when you report an issue? Thanks...)

BTW: I have tried to find a Perl compiler as per your previous comment. Active Perl has such a compiler but you need a paid-up license to use it (there are many good, free Perl interpreters so I have no intension of paying for it!). I have successfully generated a portable Windows executable using an evaluation license of the Active Perl PDK and it works fine. Unfortunately, the terms of the eval license mean that I am prohibited from uploading the executable and it ceases to function after 21 days. However, I am still (semi-actively) looking for a solution for you.

That being said, with the size of disks these days, 200MB is a "fart in a hurricane". If you are really concerned about space, you might be able to install a much smaller subset of the Perl libraries -- though I have never tried. Someone else might know better than I.

Incidentally, I spent a day testing the script against various downloads of Perl on a "clean" Windows box. Strawberry Perl has a "portable" version that can work directly from a USB stick and it works just fine.

Re: WP34S assembler/disassembler in the wild

*Message #7 Posted by **fhub** on 30 June 2011, 10:56 a.m.,*
in response to message #6 by Neil Hamilton (Ottawa)

Hi Neil,

thanks for your answer and that you'll try to solve this problem! :-)

And yes, it was the latest SVN 1183, I'll report the number whenever I post any issue again.

As for the compiler: well, such a trial-limit won't be a big problem for me, I'm quite experienced in 'prolonging' such restrictions. ;-)
But even this TinyPerl is able to produce an executable from the Perl script (with the option -bin), so maybe I could do it this way when the script works again in TinyPerl.
Unfortunately I've read (and also confirmed already) that these TinyPerl executables can't handle any additional commandline options of the script, because TinyPerl itself uses these options itself. So I guess a batchfile will rather be my solution.

A "fart in a hurricane"? LOL, I've never seen this expression before, but I can imagine what you mean.
Well, since we have no hurricane(s) here, even a "fart" alone isn't really a nice thing, is it? ;-)

Franz

Re: WP34S assembler/disassembler in the wild

*Message #8 Posted by **Neil Hamilton (Ottawa)** on 30 June 2011, 7:25 p.m.,*
in response to message #7 by fhub

Hi Franz,

I have put in a workaround to get past the faulty parser in tinyperl but you will have to do a few other things as well to get it working with the assembler/disassembler script.

Background: Perl has the ability to have a __DATA__ segment attached (usually?) at the bottom of a script. This can be read just like any normally opened file using the file handle "DATA". This is standard Perl! However, tinyperl does not seem to recognize the __DATA__ segment. Therefore, you are going to have to manually copy from lines 1197 to the end (ie: the compressed opcode table) to a separate file which you can ask my script to read in using a pre-existing facility (the '-op' switch). This pre-existing facility was planned to be used to update or "down-date" :-) to newer or older SVN opcode maps but it can also be used for this workaround as well.

So here is what you need to do in detail:

1) Search for the text "__DATA__" in the wp34s_asm.pl script (currently line 1196) and copy all the lines *below* that to a file we will call "svn_1186.op".

2) To assemble a source file, use the following (I am assuming you are in the library directory for now):

```
$ c:\tinyperl\tinyperl.exe ..\trunk\tools\wp34s_asm.pl -op svn_1186.op
8queens.wp34s -o wp34s-0.dat
```

This will assemble the 8-Queens program into a flash image for slot 0. By using the '-op' switch, the assembler will use the explicitly referenced opcode map (svn_1186.op) instead of the internal one located after __DATA__. After the assembley has completed, make sure that the CRC16 matches the one I have put in the listing (shown below)! [I *really* don't trust tinyperl!!]

```
// CRC16: 520A
// Total words: 32
// Total steps: 31
```

3) To disassemble a flash image, use the following:

```
$ c:\tinyperl\tinyperl.exe ..\trunk\tools\wp34s_asm.pl -op svn_1186.op -dis
wp34s-0.dat > mysrc.wp34s
```

This will disassemble the flash image (wp34s-0.dat) into a source file called "mysrc.wp34s".

I must warn you that, based on what I have seen, I have little faith in this tinyperl interpreter. The above workarounds are solely because tinyperl itself has bugs. I will reiterate that these are *not* faults in the original script! If I were you I would stick with the mainstream Perl bundles like Active State Perl -- which is 85MB not 200! The mainstream downloads work as expected!

Best of luck!

Re: WP34S assembler/disassembler in the wild

*Message #9 Posted by **fhub** on 1 July 2011, 8:49 a.m.,*
in response to message #8 by Neil Hamilton (Ottawa)

Hi Neil!

WOW, that was indeed a more than detailled description, many thanks! :-)
(sorry that you had so much troubles just because of me ...)

But now everything is working fine, I've made 2 batchfiles (asm.bat, conv.bat) for your 2 Perl scripts, so that I don't have to type so much. And besides these problems with your previous script TinyPerl seems to work correctly now.

I don't remember which of the 2 Perl distributions (which you've recommended last time) I have downloaded, but when I wanted to install it I just saw "Disk space used: 200 MB", and so I immediately cancelled the installation.
Even if it's in fact only 85 MB this would definitely be too much for me, because your script is the only Perl program that I have (and probably the only one I'll ever need). Before installing 85 MB for that one single script I would rather write such a (Dis)Assembler myself in any other programming language that I know (probably in Delphi). ;-)
But I think this will not be necessary because now your scripts are working fine with TinyPerl, and I hope this will stay so for future versions, too.

Thanks again for your 'extra' work, :-)
Franz

Re: WP34S assembler/disassembler in the wild

*Message #10 Posted by **Neil Hamilton (Ottawa)** on 1 July 2011, 9:55 a.m.,*
in response to message #9 by fhub

Hi Franz,

I have just done a little more work with TinyPerl (you can see I am now even capitalizing it correctly!) and I may have been a little harsh on my first impression. Once you work around its eccentricities, it seems to be OK. There have certainly quite a few complimentary statements made online about it (mostly "Perl on a floppy" type thing...). But it could use some work...

I have come up with a workaround for its broken __DATA__ segment -- it is a bit ugly but it is functional. So I have a version that does not require you to extract the compressed opcode table to a separate file.

I have also worked around the compiled version not having access to command line parameters (by injecting the command line via an environment variable).

I am not really keen to let this one loose into the general public because it is a hack to fit a broken tool, but I would be willing to let you have it if you wish. You can compile it down to an executable using the TinyPerl compiler.

Let me know if you want these mods and let me know how I can send them to you.

All I ask is that you try out the tool and report back to the site how you get on. Comments and suggestions are (usually) welcome! :-)

Best regards...

Re: WP34S assembler/disassembler in the wild

Hey, that would even be my main wish - such a single EXE is definitely the most comfortable method!

You can send me your files to my email-address:
fhub@gmx.at

Of course I'll immediately test it and report back if it works! :-)

Franz

Re: WP34S assembler/disassembler in the wild

*Message #12 Posted by **fhub** on 1 July 2011, 2:20 p.m.,*
in response to message #11 by fhub

Ok Neil, I've now received your file and tested it, but my first impression is not very good!

First I found that this compiled EXE still needs the 2 files perl58.dll and lib.zip for running (I thought those would be 'included' in the EXE when compiling the script!), they must be in the current folder and so this is no advantage at all.

And also with this enviroment variable I would have expected an other behaviour: I thought that the EXE would get its commandline parameters _automatically_ via the environment variable (there's a variable CMDLINE in Windows for this purpose), but as you wrote one has to set all wanted parameters _manually_ via "set WP34S_CMD=..." and then run the EXE. Well, I would say that's even more complicated than running the EXE via a batchfile where I can enter all parameters directly.

The only advantage I see so far is that this external opcode-file (and the -op parameter) isn't necessary anymore. But I think this won't justify all those modifications (and extra troubles with future updates), because using my current method with a batchfile (which already includes this "-op opcode.lst") is neither more nor less 'work' than this compiled EXE - it's rather the opposite, because with this batchfile I don't need to set this environment variable separately.

So my conclusion is: let's forget this compiled script. ;-)
Whether you prefer to use your new 'TinyPerl method' for the opcode table or stay with your last method of the official version that's your decision - for me it's absolutely no problem to create a new external opcode file whenever your script changes in the future.
The most important thing for me was that your Perl script is working at all with this TinyPerl, and this has already been achieved with your last changes in todays SVN release.

Thanks again for all your efforts, :-)
Franz

Re: WP34S assembler/disassembler in the wild

*Message #13 Posted by **Neil Hamilton (Ottawa)** on 1 July 2011, 3:01 p.m.,*
in response to message #12 by fhub

Ok, Franz. Sounds good. You have basically identified the limitations of TinyPerl and my suspicion about the paths that I alluded to in my email.

The environment variable technique was an UGLY workaround at best -- I understand this and I too think it is an awful solution. However, I suspect that if you wanted to, you could construct a batch file that decomposes a Windows 'cmd' command line, sets the the environment variable to the batch command line and launches the EXE from a suitable directory.

Personally, I am still *not* in love with TP and will stick with a pure Perl

script until I find a good compiler solution.

However, I think you'll agree that it was worth the shot to see what would happen. :-)

Best regards...

Well, the Windows batch file 'features' are so limited that I won't know how to do this (i.e. split an enviroment variable into its parts).

> Quote:
>
> Personally, I am still *not* in love with TP and will stick with a pure Perl script until I find a good compiler solution.

Yes, I agree that this will be the best solution - as long as you still keep those changes in the current SVN version, i.e. as long at your script runs at all in TinyPerl! ;-)

BTW, what about this: couldn't you combine your 2 scripts to one, so that your wp34s_conv can be simple be used from your wp34s_asm script e.g. via the option "-conv"? Not important, just an idea ...

Franz

Yes. The convert script was written for the sole reason that I needed "live" test code for the main script. I did not have enough real source of my own to use as test data so I converted the XROM programs. I had not really intended to release that script into the open since it would be so little use for most people. At some point, I do intend to fold its functionality (and more) into the main script but it is not a priority just yet. Since the convert script works just fine as it is at the moment, I am in no great rush. I have a few other things closer to the radar. :-)

BTW: What are you using the convert script for? Are you "harvesting" XROM programs for other uses?

Cheers...

Re: WP34S assembler/disassembler in the wild

Oh no, I was just curious to see what it is good for. ;-)

So far I've not written any program for the WP34s, because there are so many limitations of this calc (compared to my HP-48GX or TI-92Plus), so that I don't really know WHAT programs I should write ...

82161A Tape Drive - O-Ring Question

*Message #1 Posted by **Ángel Martin** on 17 June 2011, 8:37 a.m.*

I'm in the process of re-aconditioning a few HI-IL peripherals, prepping them for the "big event" once my CL is up & running...

Unfortunately my tape drive has lost one of the plastic o-rings that hold the spring-loaded spindle in place. Does anybody have any suggestions as for a suitable replacement for it?

Thanks, ÁM

Re: 82161A Tape Drive - O-Ring Question

*Message #2 Posted by **Paul Berger (Canada)** on 17 June 2011, 2:18 p.m.,*
in response to message #1 by Ángel Martin

I just looked at one of my tape drives and there seems to be on the very top a white disk that has a hole slightly smaller that the diameter of the post, this disk is the retainer. Under that there are two grey plastic? washers. I made a substitute retainer from a piece of plastic cut from a plastic blister pack, I think almost any thin but stiff plastic would work, the hole in the retainer I took off is about 1.5mm in diameter so I drill a small hole in a piece of plastic and then cut it down to roughly the size of the original retainer and pushed it on and it seems to work, I hooked the drive up to my 75 and initialized a tape a couple time and it is holding.

Re: 82161A Tape Drive - O-Ring Question

*Message #3 Posted by **Ángel Martin** on 17 June 2011, 3:02 p.m.,*
in response to message #2 by Paul Berger (Canada)

Thanks Paul, that's exactly the part - badly described in my post, you did it much better. I'll do the DIY during the weekend as per your posting.

Thanks again, 'AM

Re: 82161A Tape Drive - O-Ring Question

*Message #4 Posted by **Eric Smith** on 18 June 2011, 4:33 a.m.,*
in response to message #1 by Ángel Martin

I doubt that replacement parts are available, but just FYI:

The retainer washer is HP P/N 3050-1042, made of mylar.

The thrust washers that are paired below the retainer washer are HP P/N 3050-1065, claimed to be made of "nyletron". I suspect that it is actually Nylatron GS, which is nylon filled with molybdenum disulfide (MoS2), typically used for strength, rigidity, wear resistance, and low coefficient of thermal expansion.

Presumably any other plastic washer of approximately the same dimensions should work, though perhaps not

as well or for as long a lifetime. Normal nylon has poor dimensional stability due to water absorption.

"WP 34S", "WP 34s", "WP-34S", or "WP-34s"?

*Message #1 Posted by **Eric Rechlin** on 16 June 2011, 11:27 p.m.*

The subject says it all. What is the official name of this amazing creation? The documentation and web page (and calculator itself) are inconsistent in this, and I want to know what the official name is. Is it "WP 34S", "WP 34s", "WP-34S", or "WP-34s"?

HP has been inconsistent over the years with this, but at least they have always been consistent within the same model (though they did introduce confusion by having the "HP 10BII" and "HP 10bII" being different calculators).

Eric

Re: "WP 34S", "WP 34s", "WP-34S", or "WP-34s"?

*Message #2 Posted by **Paul Dale** on 17 June 2011, 12:27 a.m.,*
in response to message #1 by Eric Rechlin

I don't know :-)

- Pauli

WP 34S for obvious reasons????

*Message #3 Posted by **Geoff Quickfall** on 17 June 2011, 1:22 a.m.,*
in response to message #2 by Paul Dale

Well until the pioneer the HP calcs had a space between the HP and the number. In the pioneers and later the space was removed.

ex. HP 35, HP 55 and later the HP32SII or 17BII+

So I propose the

"WP 34S"

since this is a (or am I mistaken) homage to the HP 34C (the first calculator to incorporate the Solve function).

Cheers, Geoff

just my 34 cents worth!

Edited: 17 June 2011, 1:33 a.m.

Re: WP 34S for obvious reasons????

*Message #6 Posted by **Didier Lachieze** on 17 June 2011, 3:09 a.m.,*
in response to message #3 by Geoff Quickfall

If we want to be consistent with HP conventions prior to the pioneer, I vote for WP-34S :-)

It seems that the dash between the HP and the number appeared well before the pioneer, at least it's the case in the Hewlett-Packard Pocket Calculator Buyers Guide - Fall 1975 and in HP-65 Key Note issues starting Summer 1974 as well as in the following HP Key Notes.

Regarding the 34C the dash is also present in the HP manuals and in these sample ads: HP-33C,34C,& 38C with Continuous memory. They're ready when you are and A touch of brilliant simplicity.

Re: WP 34S for obvious reasons????

*Message #7 Posted by **Geoff Quickfall** on 17 June 2011, 10:11 a.m.,*
in response to message #6 by Didier Lachieze

Didier is correct, both with the reference and the book labelling.

All the books and reference materials state HP-34C, HP-35, HP-41C and etc. However the calculators are all branded:

"Hewlett Packard 34C, Hewlett Packard 35, Hewlett Packard 41C and etc." without the hyphen.

I was refering to the calculator not the books ;-)

Cheers, Geoff

Edited: 17 June 2011, 10:14 a.m.

Re: WP 34S for obvious reasons????

*Message #8 Posted by **Oliver Unter Ecker** on 17 June 2011, 5:31 a.m.,*
in response to message #3 by Geoff Quickfall

Just a remark: new HP calcs use small letters vs. capitals in the model name. "WP 34S" looks "old" to me, whereas "WP 34s" looks "new". Is this intended?

Re: "WP 34S", "WP 34s", "WP-34S", or "WP-34s"?

*Message #9 Posted by **Eddie W. Shore** on 17 June 2011, 10:58 a.m.,*
in response to message #1 by Eric Rechlin

The newer calculators use smaller letters - however I think capital letters look better. I vote for WP 34S.

The work on the calculator is nothing short of amazing.

in response to message #1 by Prabhu Bhooplapur

Get a copy of Tony Duell's hand drawn schematics for this, it's got what you need. It's available here.

Re: HP41c Printer 82143A connector details

*Message #3 Posted by **Eric Smith** on 16 June 2011, 10:11 p.m.,*
in response to message #1 by Prabhu Bhooplapur

Do you mean the contacts on the module end that plugs into the HP-41? Those are described briefly in the HP-41 service manual, available on the MoHPC DVD set, or on TOS. See also "Inside the HP-41C" by Kelly McClellan, PPC Journal V6 N6 P4, September 1979, and "HP-41C Bus Interfacing" by Jim De Arras, PPC Journal V7 N3 P20, April 1980.

It's a 56-bit serial bus at 6.0-6.5V CMOS levels. Level shifters are needed interface to any normal logic, whether at 3.3V or 5.0V levels.

1. Vbat - battery positive
2. B4 - tied high or left open by port block in calculator, along with B3, to tell module which port it is plugged into, for port addressing
3. Vcc -regulated power (6.0-6.5V)
4. B3
5. GND - ground reference
6. PWO - power on reset
7. DATA - 56-bit serial data word - 14 BCD or hexadecimal digits, little-endian (LSB first, LSD first)
8. FI - flag input, used by peripheral to indicate that service is requested, during one digit time
9. ISA (or IS/IA_ - instruction and address - serial 16-bit address (bit times 14 to 29), 10-bit ROM data (bit times 44 to 53)
10. SYNC - high for bit times 44 to 53 (when instruction should be presented on ISA line), except during second cycle of two-cycle instructions
11. Phi2 - bit clock - active-high - a bit time is generally between the falling edge of Phi2 and the next leading edge of Phi2
12. Phi1 - bit clock - active-high - occurs near end of a bit time for use to strobe inputs (such as DATA, ISA, and SYNC)

If you mean the signals on the captive cable between the module and the printer, that's also a serial bus, but entirely different than the 41C bus. There's a description in the "Peripheral Interface Chip" (NPIC) internal HP

documentation. The signals are:

- GND
- Vcc
- DD0 - bidirectional data
- DD1 - strobe provided by printer
- DD2 - direction select, printer to NPIC when low, NPIC to printer when high
- DD3 - printer power on, from printer to NPIC

WP-34S "PRIME?"

*Message #1 Posted by **Jim Horn** on 16 June 2011, 6:44 p.m.*

With build #1108 I noticed that 9999999967 "PRIME?" returns false. Is there a limit to the values for which PRIME? works correctly?

Many thanks to the team for this *remarkable* calculator - I'm really enjoying it!

Re: WP-34S "PRIME?"

*Message #2 Posted by **Jim Horn** on 16 June 2011, 6:49 p.m.,*
in response to message #1 by Jim Horn

Apparently the maximum value for "PRIME?" is 2^31, i.e. a signed 32 bit integer. Larger primes are evaluated as composite.

Re: WP-34S "PRIME?"

*Message #3 Posted by **Paul Dale** on 16 June 2011, 6:59 p.m.,*
in response to message #2 by Jim Horn

Hmmm, seems like you found a bug....

My goal is for PRIME? to work for all values with a high degree of confidence. I.e. the conjectured accuracy rather than the proven level.

- Pauli

Re: WP-34S "PRIME?"

*Message #4 Posted by **Paul Dale** on 16 June 2011, 6:58 p.m.,*
in response to message #1 by Jim Horn

We honestly don't know for sure what the smallest value the primality test fails for. We believe that no composite number should ever be declared a prime by this function.

The test is Miller-Rabin's using the first fifteen prime numbers as a base. There is a proof that 7 or 8 are sufficient for a fairly large number (who exact value escapes me) which is less than the largest integer we allow (2^64-1 in integer mode, quite a bit less for reals). For more bases like we use, there are conjectures that no composite number will be declared prime for values well in excess of the largest exact integer we can handle.

I didn't think the converse could occur (declaring a prime composite) so I'll have a look & try to see what's going on.

- Pauli

Re: WP-34S "PRIME?"

*Message #5 Posted by **gene wright** on 16 June 2011, 10:17 p.m.,*
in response to message #1 by Jim Horn

Hey Jim.

Still using that 10 digit prime? I bet the 34s will prove it prime a lot faster than the HP 65, HP 25, and HP 67 prime factor programs from the PPC Journal, dont' you think? :-)

Re: WP-34S "PRIME?"

*Message #6 Posted by **Jim Horn** on 16 June 2011, 10:29 p.m.,*
in response to message #5 by gene wright

Hi, Gene,

V4N4? It's been a while(!!). The largest prime the '67 could evaluate was 10^10-33, i.e. 9999999967. The first eight digits are obvious; the last two are strangely easy to remember considering how many hours I spent diving into mine!

I used Wolfram Alpha to try values above and below expected powers of two to find what I reported above. NextPrime[2^31,-1] there evaluates as prime on the '34S; NextPrime[2^31,1] does not.

Of course, the newer algorithms are *so* much more powerful than MOD30 trial division.

Again, my sincere thanks and admiriation to the '34S team!

Re: WP-34S "PRIME?"

*Message #7 Posted by **Paul Dale** on 16 June 2011, 10:43 p.m.,*
in response to message #1 by Jim Horn

And fixed in build 1125.

Integer truncation problem.

Fantastic Bug Fix Department!

Re: WP-34S "PRIME?"

*Message #9 Posted by **Jim Horn** on 16 June 2011, 11:33 p.m.,*
in response to message #7 by Paul Dale

Fantastic indeed! I ran a test of the last 10 primes below 2^31 on the errant version; all showed as "true". The first 10 above it gave three "true" and seven "false" outputs.

All of which is moot. I'll flog it some tomorrow when I get to work (where the programming cable is - thanks Gene!) but my hat is off again to Pauli's incredibly quick and fine corrections.

Meanwhile, thank you for the chance to study your code and learn from it - it's marvelous!

Re: WP-34S "PRIME?"

*Message #10 Posted by **Paul Dale** on 17 June 2011, 3:53 a.m.,*
in response to message #1 by Jim Horn

Seems to be working for number up to 2^63 e.g. the largest prime less than this is 9223372036854775783 which tests as prime. The largest prime less than 2^64 is testing as composite :-(

I'm not sure there is much I can easily do about this since we are likely hitting integer size limits. I'll have a quick look tomorrow if I remember.

This is much larger than the largest integer that can be represented exactly in real mode...

- Pauli

Re: WP-34S "PRIME?"

*Message #11 Posted by **Marcus von Cube, Germany** on 17 June 2011, 4:01 a.m.,*
in response to message #10 by Paul Dale

Pauli, just throw a domain error if the number gets too large. Walter has to document the limits.

Re: WP-34S "PRIME?"

*Message #12 Posted by **Paul Dale** on 17 June 2011, 5:55 a.m.,*
in response to message #11 by Marcus von Cube, Germany

I'd prefer the function to work for the entire numeric range....

Pauli

Re: WP-34S "PRIME?"

*Message #13 Posted by **Paul Dale** on 17 June 2011, 6:06 a.m.,*
in response to message #10 by Paul Dale

2^{63}-1 is the limit here :-(So prime numbers equal to or greater than 9,223,372,036,854,775,837 will not necessarily return true from PRIME? Likewise composite numbers greater than 9,223,372,036,854,775,808 may return false (although this is less likely I suspect). Below these values the results should be accurate.

This limit only applies in integer mode with unsigned 64 bit word size. For all other modes and word sizes, it isn't a limitation.

The code relies on one bit beyond the largest value being available during the calculation and I'm not bothered to work around this (mostly because it will be fairly involved and partly because we're handling pretty large numbers already).

Walter, can you please document this limitation :-)

- Pauli

black HP17bII

*Message #1 Posted by **Jose Gonzalez Divasson** on 16 June 2011, 5:37 p.m.*

I have finally received the black 17bII that I have been looking for.

HP 17bII black

Does anybody know why HP turned to the admittedly uglier brown scheme?

Also the pouch is black - and seems better quality as well.

Both machines pictired were made in Indonesia.

Re: black HP17bII

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 16 June 2011, 7:14 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

IIRC, I think that in a HP Digest magazine around 1980 it was mentioned that the HP41 was dark brown (and not black) because brown was "warm", avoiding the "coldness" of black. If this approach was still valid many years after is just a possibility...

Re: black HP17bII

*Message #3 Posted by **Nacho** on 17 June 2011, 4:38 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

hello,

first units were brown then arrived the black one.

keyboard is better in the brown unit.

regards

Re: black HP17bII

*Message #4 Posted by **Jose Gonzalez Divasson** on 17 June 2011, 6:20 p.m.,*
in response to message #3 by Nacho

Thanks for the information!

Serial number info is not as clear as with old models.

Regarding keyboard quality, both are equal in my humble opinion. I am not able to wring out any difference!!

Re: black HP17bII

*Message #5 Posted by **Nacho** on 17 June 2011, 6:58 p.m.,*
in response to message #4 by Jose Gonzalez Divasson

dears,

i have some 17bii, the brown ones are singapore units with molded keys and the black units are from indonesia and painted keys.

the lcd is a bit better in the black units.

regards

Re: black HP17bII

*Message #6 Posted by **Don Shepherd** on 17 June 2011, 5:20 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Ugly, like beauty, is in the eye of the beholder.

I think the brown unit is better looking.

Emu48+ for HP-39gs/40gs?

*Message #1 Posted by **fhub** on 16 June 2011, 4:25 p.m.*

Hi,

does any Emu48 expert know if it's possible to emulate the HP-39gs/40gs with this emulator?

I've read that Emu48+ supports HP-39G+, and since the 39gs has similar (or even identical) hardware, I guess it should be possible.

Unfortunately I've found no way so far to convert the 39gs/40gs ROM updates (which can be found at hpcalc.org) to the usual Emu48 emulator ROM format - all conversion programs I've tried are failing with this *.bin file (has something like KINPOUPDATE in the file header).

So my 2nd question: does such a conversion program for this 39gs/40gs.bin format exist, which gives a usual ROM file for Emu48?

Franz

HP 28S - Better than You Thought

*Message #1 Posted by **Howard Owen** on 16 June 2011, 3:24 p.m.*

"People could cheat on a math test with it and that is what it is known for. "

http://cgi.ebay.com/HP-28s-Calculator-/260801635492#ht_540wt_1141

Re: HP 28S - Better than You Thought

*Message #2 Posted by **Geoff Quickfall** on 16 June 2011, 3:53 p.m.,*
in response to message #1 by Howard Owen

Wasn't the 34C the first with a solver?

As for cheating, any continuous memory calc was good for that as long as you could get it by the TA's guarding the door!

The 41C was great cause you could create a program to display "MEMORY LOST". That usually convinced a no-nothing TA that the calc was clear of programs.

Of course, I really wouldn't know if that worked or not ;-)

Then again, if you could write an RPN program to cover the formulae required for the exam, you usually ended up with them memorized in any case, (now that did happen to me so I really did memory loss the calc at the door, guilt and all that).

Cheers, Geoff

p.s. did I mention that I love my 41CL

Just some Classics eye candy

*Message #1 Posted by **Geoff Quickfall** on 16 June 2011, 2:53 p.m.*

Some photo experiments with background and lighting etc. Just HP portraits.

Except for the prototype case all these have been restored using techniques developed at this forum, by others (and myself). Just a few classics (note the HP 70 is missing, donations excepted!).

An HP 35 prototype case, note the red dot hole, clear led lens and colour:

An HP 35, one of many keyboard designs:

An HP 45, this one with the quartz crystal inplant:

An HP 55, note the faded keyboard silkscreening, UV damage combined with a very CAREFUL wash with an artists brush.

An HP 65 fully functional:

The ultimate (IMHO) LED portable programmable:

The HP 80 (where's the 70, donations welcome!)

Cheers, Geoff

*Message #2 Posted by **bill platt** on 16 June 2011, 3:08 p.m.,*
in response to message #1 by Geoff Quickfall

I am pretty sure the 67 is the first HP I saw and marveled at. My father's old friend, and engineer in Connecticut, showed us how to play "moon lander" in the late 70s.

Re: Just some Classics eye candy

*Message #3 Posted by **Mike Morrow** on 16 June 2011, 11:37 p.m.,*
in response to message #2 by bill platt

I was a Junior at Georgia Tech when the HP-35 showed up in 1972. I wasn't able to afford an HP until four years later. That was the beautiful HP-67, my first HP, purchased at the MIT ["Georgia Tech of the North"] Coop. It may be Woodstock inside, but it's the best Classic beauty outside.

That HP-67 with some accessories and application pacs and Massachusetts sales tax cost me eight percent of my before-taxes **annual** salary as a US Navy lieutentant junior grade. My perpetually weak bank account balance was cleaned out and didn't recover for more than a year.

Re: Just some Classics eye candy

*Message #4 Posted by **Geoff Quickfall** on 17 June 2011, 1:31 a.m.,*
in response to message #2 by bill platt

Mine was the 25 purchased in 1976 and sold in 1981 to help support my habit, my HP habit that is! Yep I sold it to purchase a 1981 HP 41C.

The HP 25 took me through 2 years of college, then 4 years flying in the bush. The HP 41C took over that duty accompanying me for two more years of university and flying and into my MSc.

The flying jobs allowed me to save the HP 41C for backup, it now had xfunctions and xmemory added as well as laser wand, 9114B and a plotter in the lab. It was superceded by the HP 41CX which I still have today.

The 41CX, 71B and 42S are swapped in and out of the flight bag with the 67 showing up for showiness. Now the 41CL will be taking over the primary flight bag roll.

I liked the IR of the 41CX along with the dynamic time function. The 71B has the dynamic time but requires HPIL and an HPIL printer making the 41CX more portable but slower. The 42S has the IR and the speed but no clock.

The 41CL has the IR, the clock and the speed in turbo! And it now has the memory capabilities (just have to learn how to use them) along with serial RS 232 ability.

WOW to the 41CL

Re: Just some Classics eye candy

*Message #5 Posted by **Hal Bitton in Boise** on 17 June 2011, 12:46 a.m.,*
in response to message #1 by Geoff Quickfall

I was in college in 1978...the kid who sat 3 chairs behind me in math had an HP 67 (he must have been from a rich family!). If ever there were a "sexy" calculator, the 67 must be it.
Whenever I heard the card reader, the only thing keeping me from being totally lost to envy was the fact that my new 29C had continuous memory... :)

41Z Overlay For 41CL

*Message #1 Posted by **Mark Hardman** on 16 June 2011, 1:46 p.m.*

Eric, if Ángel provides the artwork--which I know he will as the 41Z is his chef-d'œuvre, then I'm in for two. With that and 41CL, I can do on-the-fly impedance matching on a real machine (as opposed to i41CX+). My heart be still!

I'm would also be interested in several Sandmath overlays.

Mark Hardman
Houston, TX

*Message #2 Posted by **Ben Moss** on 16 June 2011, 2:49 p.m.,*
in response to message #1 by Mark Hardman

I'm also interested in this! I'm willing to help make the SVG file, or otherwise provide manpower if additional effort is necessary.

Re: 41Z Overlay For 41CL

*Message #3 Posted by **Monte Dalrymple** on 16 June 2011, 3:43 p.m.,*
in response to message #1 by Mark Hardman

I know it would be a ton of work, but wouldn't be nice to have
a package of overlays available that covered all of the images
loaded into the 41CL? Something for the user community to think
about.

Edited: 16 June 2011, 3:44 p.m.

Re: 41Z Overlay For 41CL

*Message #4 Posted by **Ben Moss** on 16 June 2011, 4:28 p.m.,*
in response to message #3 by Monte Dalrymple

The idea is certainly worth exploring, Monte!

Your 41CL has over 100 ROMs and I agree that an organized community effort would be necessary to even generate all of the overlay files. We could use spb's fantastic 41C overlay generator (mentioned in this previous discussion from April) to make our lives easier.

Unfortunately, it looks like printing and selling a bundle of 100 overlays would be impractical. Using Eric's $5 WP34s overlay as a price point, that would be around $500 USD... twice the cost of the 41CL (and I suspect Eric has priced his overlay generously low). Maybe 41 overlays can be produced cheaper because they do not need adhesive backing, but we probably need some way for a user to select a subset of the overlays that they would like to purchase.

Eric - if you are reading this, I certainly don't want to imply that you should shoulder this project, but maybe you have input from your experience on the feasibility of doing this?

Re: 41Z Overlay For 41CL

*Message #5 Posted by **Geoff Quickfall** on 16 June 2011, 4:58 p.m.,*
in response to message #4 by Ben Moss

Overlays are great,

how about a set of plastic overlays similar to the original blanks. In plastic or heavy construction. Something that can fit into a paper printer. Mass produced the price would surely come down. Especially if they are blanks.

The other option is blank overlays with clear adhesive media printed on a laser or ink jet. These overlays are a blank original and ink jet media sliced and fitted. Doesn't take long to do.

Edited: 16 June 2011, 4:59 p.m.

Re: 41Z Overlay For 41CL

*Message #6 Posted by **Geoff Quickfall** on 16 June 2011, 6:13 p.m.,*
in response to message #5 by Geoff Quickfall

I guess my point is, how much for 100 blank overlays in similar to original plastic? That way I can pick and choose the ROMS that I will bother with.

I have a CCD as well as the standard overlays, CCD might be rare so providing a hi res tiff, jpg or etc would be easy.

Geoff

Re: 41Z Overlay For 41CL

*Message #7 Posted by **Monte Dalrymple** on 16 June 2011, 6:24 p.m.,*
in response to message #4 by Ben Moss

I think that only about a fourth of them actually use an overlay, and not every person would want every overlay. But it was just an idea.

Re: 41Z Overlay For 41CL

*Message #8 Posted by **Geoff Quickfall** on 16 June 2011, 6:42 p.m.,*
in response to message #7 by Monte Dalrymple

Thats why I think the blanks are perfect. In the old days I overlayed them with rub on lettering. Now I use the ink jet.

With some roms, you only use some programs but with the CL the world has opened up.

I also created other overlays for specific application. I would convert the entire calculator into a Palynology calc, with stat functions, dedicated synthetic memories which contained over 40 tree pollen counts derived from slide data.

they would automatically be converted to % and concentration data for plotting.

Lots of fun in the past, now just mundane systems checks in the cockpit.

So producing blanks would be great. I will see what can be done in Hong Kong or Beijing and the cost. Would people be intereste in a set of 20 blank overlays?

Cheers, Geoff

Re: 41Z Overlay For 41CL

*Message #9 Posted by **Paul Dale** on 16 June 2011, 6:45 p.m.,*

in response to message #8 by Geoff Quickfall

Now that I have this huge set of rom images at hand inside the CL I'd be interested too!
CL = worth a fortune :-)

...and I agree with Geoff: I love my CL!

Re: 41Z Overlay For 41CL

*Message #12 Posted by **Eric Rechlin** on 16 June 2011, 7:12 p.m.,*
in response to message #1 by Mark Hardman

Angel emailed me to let me know he'd be sending me the artwork, so I can take care of it.

I have already made new blank overlays for the 48 and 41. I have also made replacement printed overlays for the 48 (I just made new Survey Pro overlays a couple weeks ago for someone who requested them). The vinyl overlays are actually better looking than the original Mylar ones, but they may not be as durable. Also, due to difficulty in getting the registration right, I could only make them one-sided rather than printing on both sides.

For the printed overlays, they are actually slightly more expensive for materials than the 34s overlays. This is because, after investing several hundred dollars in different materials from all sorts of stores, the best material I have found so far is taking card stock, sticking the adhesive vinyl on it, and printing and cutting that. This only adds about $0.10 to the cost.

However, the difficulty comes in the way my cutter works. To cut these all the way through, I have to use a cutting mat. I have since found I can get away without a cutting mat for the 34s overlays, so this is an added consumable cost. Also, with a cutting mat, after removing the overlay, I have to clean it of all the keys before I can reuse it, and this is time consuming.

Next month when I get back into this, I will see how it goes, but for now the biggest factor is the labor involved in cleaning the keys from the cutting mat.

I'd love to sell blank overlays for cheap, but then I'd be afraid of getting an order for 100 of them and then having to spend hours and hours cleaning cutting mats.

I will have to do some more testing to find a solution to the cutting mat problem. I bet someone has already run into this before and I just haven't found the answer yet.

Also, I would ideally like to use plastic, but there are several problems there. First, I haven't found plastic that I can print on, and second, plastic is too thick for my cutter unless I buy a heavier-duty one.

Eric

Eric, does this video help? This sounds like the problem you are describing.

For a 41 or 48 overlay I imagine you don't care about salvaging the key-shaped bits as you would for a WP-34 overlay, so this may help you.

Re: 41Z Overlay For 41CL

*Message #14 Posted by **Eric Rechlin** on 16 June 2011, 11:19 p.m.,*
in response to message #13 by Ben Moss

> Quote:
>
> Eric, does this video help? This sounds like the problem you are describing.

That's awesome. I bought a little scraper that was designed specifically for this, but it didn't work very well, so I can't wait to try this trick. Also I may consider switching to the Cricut mats if those work better; the mats I have are losing some stickiness after scraping them. They appear to be a little big for my cutter but I can trim them to fit.

Thanks for the tip.

Eric

Re: 41Z Overlay For 41CL

*Message #15 Posted by **Ángel Martin** on 17 June 2011, 2:03 a.m.,*
in response to message #12 by Eric Rechlin

I sent the files to Eric already so he can start "practicing" when he's got time.

The blank overlays is a good plan-B idea and sure Geoff's ones look very good - but some modules are too complex for that workaround (like CCD, 41Z, SandMath...).

The 41Z has just one sticker over the Sigma+ Key, and the SandMath has two, on the Sigma+ key and on the RCL key. That at least should compensate for the extra work compared to the 34S.

Cheers, 'AM.

Unabashed HP 41CL promotion (with pictures)!

*Message #1 Posted by **Geoff Quickfall** on 15 June 2011, 6:12 p.m.*

What a facinating project Monte has undertaken. The board is working flawlessly for me.

Currently it is configured with my resident programs for work complete with key assignments.

Also I have physically inserted the following:

```
- port 1 serial connector which leaves port 1
- port 2 Diego Diaz's Clonix
- port 3 time module
- port 4 reserved for IR printer, HPIL, laser wand, card reader.
```

Virtually installed are the following:

```
- port one lower the HP41CL suite of commands including plug and
  uplug, turbo and etc
- port two Clonix with CCD, PPC, NAVB1 (all removable and
  interchangeable with the pic programmer and Diego's instructions.
- port three with MATH and ADVANTAGE roms
- port four with STAT and TREK roms
```

The turbo mode* runs my WPA (way point data) routine in 7 seconds including prompted key inputs giving Great Circle and true track. This is fast as the program relies on a data base of airport codes attached to Lat and Lon co-ordinates. So not only calculating the GC distance and track but scanning the extended memory for the prompted for airport three letter code (Vancouver YVR) and converting lat and lon alpha into numeric.

Contrast with 30 seconds without turbo50 mode!

Well enough said, with the addition of a couple of small programs in memory to assist in plugging and unplugging the roms this is one of the most incredible scientific calculators today.

The calculator I chose is a tall keys (actually steeper front) with an early serial number (yep, Gene, not as early as Richards!) but still. It had a defunct board which I have yet to trouble shoot. The case and keys were perfect. No cracked screw posts or shell. All keys with an incredible HP snap. Crisp clear LCD panel. The presence of power supply contact balls.

So the completed project, with a capacitor modification due to the LCD driver revision.

The pristine OLD NEW **HP 41CL**

The early serial number 1933A...

The port configuration with the serial connector beside clonix:

The external contact balls/springs/clip (see The CL conversion of an early HP 41C)

*There is a note in Monte's manual that the turbo mode does affect power drain and shortens battery life. That is another reason I selected this calculator as it has the power supply ball contacts. With a modified TV cord which I will put together soon I can attach this to an external power supply if required. This is mentioned in the annals of history 'HPNotes'. So having the external power supply ball contacts makes life easier if you are in an office. In fact, wiring the cord to a large lantern alkaline 6 volt battery would suffice.

Also, you will need a time module for the calculator as the 41CL board does not have a quartz crystal. Of course this is required on the C and CV version but also on a converted CX to CL as the CL board contains the timing functions but not the running clock.

Enjoy and if you are an HP 41C, CV, CX you must have one of these CL's. This is now back in the cockpit as it is as fast as the 42S in turbo50 mode!

Geoff

It would be great if someone would use my wiki (www.wiki4hp.com) to put it there! ;-) The more we can share this kind of information, the better. I totally agree!

Thanks,

Bruce

in response to message #3 by Bruce Bergman

Hello Bruce,

I will clean up the previous post and add it to this one. Then post at your wiki site.

This is also included in the HP 41C chapter of the book.

Cheers, Geoff

HPnut, I didn't know a thing about the 41CL board until HCC2010 and Genes presentation on behalf of Monte.

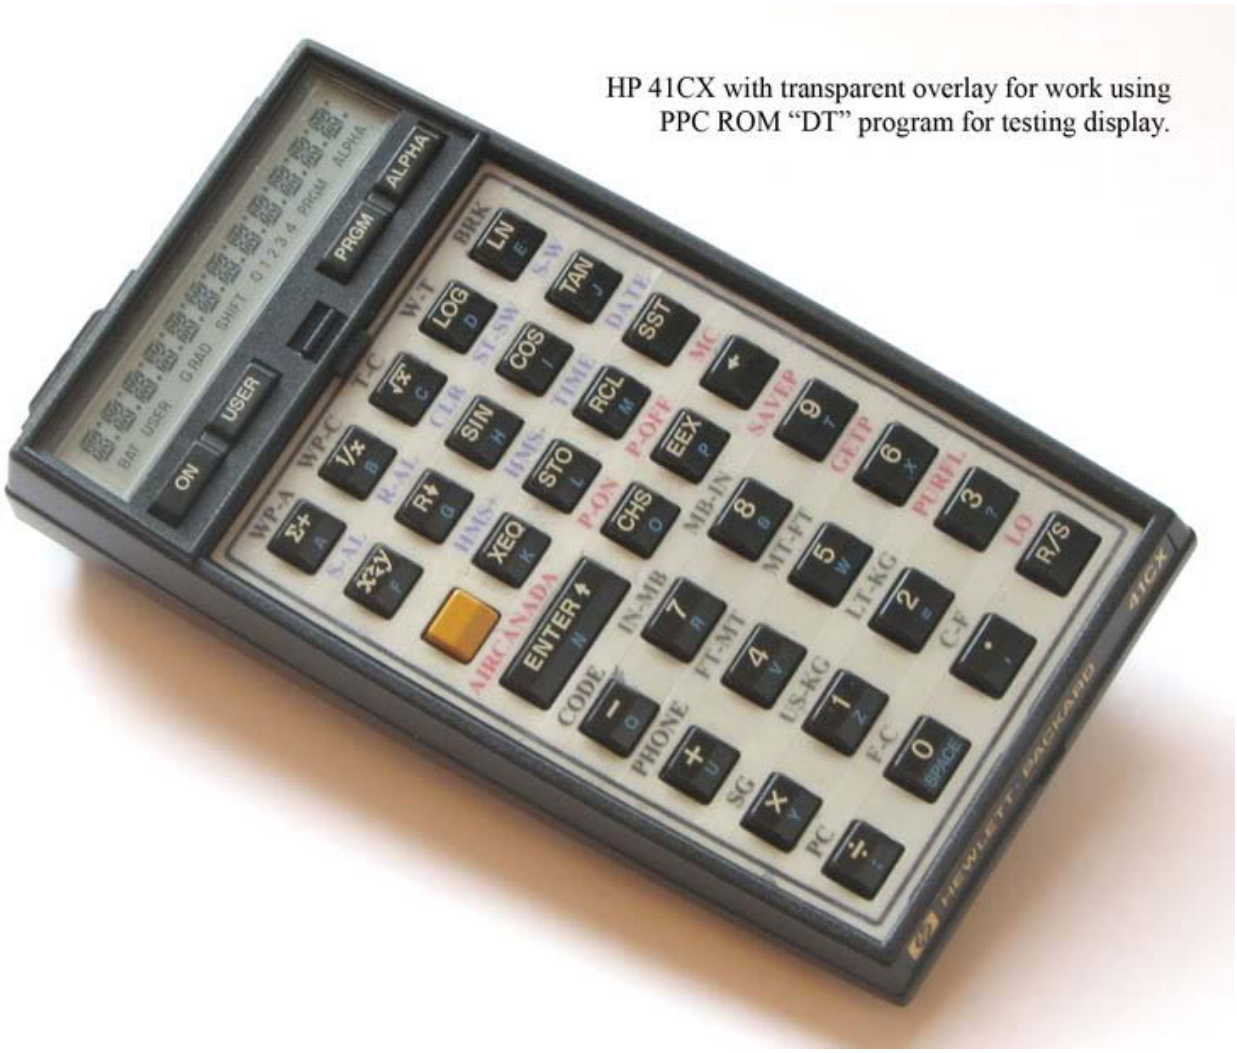
HP 41CL HCC2010 link

This is ALL Monte Dalrymples baby. Go to the site Gene lists and look at the above video. All I did was install it in the shell of a 41C per Montes instructions.

By the way there are now 9 ROM images installed in that puppy. With 450 of the 600 extended memory registers loaded with data and programs while a full list of programs are residing in program memory.

I will be using this overlay on the calculator as it has replaced my 41CX. I needed the realtime function for my program so the time module is required.

I wonder, can the time module be hardwired into an area inside the calc HHHMMMMMM!



Geoff

I'd be looking REAL hard at the port that the RS-232 shell covers. Some thoughts:

- Hardwire the internals of the TM to the port occupied by the RS-232 shell and mount the TM board inside the calculator?

- Move the RS-232 connector to another edge of the calculator, perhaps using a more compact connector (e.g. mini USB, ribbon ZIF, etc)? A stroll through Akihabara next time you're there might be spark some ideas.

- Bluetooth<->serial module mounted internally. (Perhaps Monte might add this to the NEWT board?)

Cheers, Bob

> Blue tooth

The problem with Bluetooth is that it is defifintely not hacker/hobbyist/workbench friendly. I've tried with a couple of companies who offered development kits where everything is supposedly done for you, yet I ended up giving up, telling my employer I wasn't going to try any longer, at the risk of losing my job. (I didn't lose it.) Then I found out that he gave me the job because another engineer had tried and told him the same thing, and he didn't believe him, and didn't want to tell me. The data sheet for the module was a couple hundred pages, and after getting through it, you have more questions than answers, and no idea of how to get to certain requirements. RS-232 is extremely easy by comparison.

Re: Unabashed HP 41CL promotion (with pictures)!

*Message #15 Posted by **Monte Dalrymple** on 17 June 2011, 8:51 p.m.,*
in response to message #12 by BobVA

I looked into the Bluetooth option. There should be room inside the calculator body (but not on the 41CL board itself). But after spending a day going through the specs, I realized that it was going to take a LOT more time to write the necessary software than I wanted to invest. Call me a Luddite, but RS-232 works and doesn't take a lot of power. For me personally, I will very rarely actually be uploading or dowloading anything, so RS-232 is sufficient. But other users might be different.

Re: Unabashed HP 41CL promotion (with pictures)!

*Message #16 Posted by **BobVA** on 17 June 2011, 11:13 p.m.,*
in response to message #15 by Monte Dalrymple

I was actually thinking of using one of the dedicated RS-232<>Bluetooth modules, vs. a more generic BT chip dev kit and all the associated headaches that come with that. These generally have a dedicated microcontroller (or core) running the BT chip and your application talks to that.

The ones Sparkfun sells accept simple "AT" commands on the serial port to set up the link, etc.

Drawbacks are these modules are pretty spendy (40-60 USD) and are a bit bulky. Upside is they are available with TTL serial interfaces and work from 6v.

Completely agree with the wired approach if that answers the mail for a given application. No extra power required and one less thing to go wrong.

But it's fun to think about!

Bob

Re: Unabashed HP 41CL promotion (with pictures)!

*Message #19 Posted by **Jim Horn** on 17 June 2011, 5:10 p.m.,*
in response to message #11 by Geoff Quickfall

Hard-wiring modules wasn't uncommon in the '80s during the '41s heyday. They'd be stripped of their enclosures and contacts then the bare circuit boards mounted vertically between the ports and the side case of the '41 where two per side could be squeezed in. Wire-wrap wire (i.e. 30AWG / 0.25mm) was connected point-to-point between the modules and the keyboard circuit board to make the connections.

This was all written up in the PPC Journal or one of its worthy successors but I don't recall the issue. In my case, I just updated my '41C by replacing the RAM chips with those for the '41CV but that's another story (in this Forum's archives).

Re: Unabashed HP 41CL promotion (with pictures)!

*Message #20 Posted by **Geoff Quickfall** on 17 June 2011, 6:49 p.m.,*
in response to message #19 by Jim Horn

Jims absolutely correct, how many did you do Jim?

I have to clean up my solder skills. Interestingly enough, the time module does NOT take over the ROM assigned PORTS on the CL.

So physically having the timer in port 3 (my configuration) still allows without conflict the MATH and ADV rom to reside there also.

When I cat 2 the calc I get the following:

```
-EXT FCN 2D
-CX EXT FCN
-TIME 2C
-CX TIME
-PRINTER 3B
--
YFNS 1A
-I/O FNS
-ADV FNS
C PPC 1981
SR
-NAV 1B
-MATH 1D
-ADV ELECTR
-ADV STATIC
-ADV COMPUT
--
STAT 1B
-STAR TREK
-4 TREK
-WARP 2
-ULTRA TRK
```

Not bad EH?

Edited: 17 June 2011, 6:53 p.m.

Re: Unabashed HP 41CL promotion (with pictures)!

*Message #21 Posted by **Monte Dalrymple** on 17 June 2011, 8:46 p.m.,*
in response to message #20 by Geoff Quickfall

The Time Module can reside in any Port, without conflict. This is because the Time ROM uses Page 5, which isn't physically addressed via a Port. In the CL the Time ROM is internal, in the Flash on the CL board, and the ROM in the physical Time module is never accessed. This is accomplished by preventing any address in Page 5 from appearing on the 41 address bus.

You could put the timer portion of the Time Module inside the calculator body, but what's the point? The Ports are now only really needed for things like the card reader, printer or Wand, so three open Ports should be sufficient.

As far as the Clonix, you still need to be careful to make sure that you don't virtually plug a module into the addresses being used by the Clonix, because a bus conflict will result. Remember that the Clonix uses addresses programmed into the module, (AFAIK) as opposed to physically decoding the Port address where it resides. This is probably why certain configurations weren't working for you, Geoff. You should just as easily be able to virtually load those images into Ports without using the Clonix, unless it is doing some kind of bank switching that I don't know about.

Re: Unabashed HP 41CL promotion (with pictures)!

*Message #22 Posted by **Geoff Quickfall** on 17 June 2011, 10:18 p.m.,*
in response to message #21 by Monte Dalrymple

Hello Monte

Yeh, had to remove clonix as it did conflict. While testing last night and today, I realized only parts of the CCD and PPC were loading. That occured no matter which physical port was used. Also it dropped the third full page rom image completely whenever a port after the physical port it occupied was used for a rom image. And, whenever plug or unplug was used the Clonix was dropped completely and had to be removed and reinstalled.

The convenience if it worked is that it contained three full page rom images in one physical port. Now I understand more of how it maps to the logic pca.

So everything functions as perfect using the cl rom images for CCD and PPC. That leaves 3 other free ports available for one full page rom or 3 half page roms.

Well it is really easy to right a routine which can be dedicated to plugging and unplugging images in the three remaining free ports. Problem is most of my programs use CCD and PPC subroutines so they must stay resident.

As I said above, it is easy to automate the swapping of images with a dedicated key assigned routines.

Thanks again Monte!

Geoff

Problem with Interest entry

*Message #1 Posted by **Don Griffith** on 15 June 2011, 11:33 a.m.*

HP-12C Viewing the manual shows the following when entering interest in a financial calculation.

```
Assume the problem has a interest rate of 13%
Enter 13 on the numeric keys.
Enter control key "g"
Press the interest key which enters "13%" divided by 12
   or 1.08333 which is correct as far as it goes.
I have always been taught that 13% is = .13 decimal.
```

Nowhere can I see that the 12C automatically converts the % decimal. Am I missing something? Thanks for your answers

Re: Problem with Interest entry

*Message #2 Posted by **gene wright** on 15 June 2011, 4:46 p.m.,*
in response to message #1 by Don Griffith

Hi. The interest rates on the 12c (and most financial calculators) are expressed as you see in the manual, i.e., 13% is 13; 10% is 10.

When you divide by 12, you will see 10/12 or 0.8333, etc.

The calculator always does the "divide by 100" when it uses the interest rate.

Re: Problem with Interest entry

*Message #3 Posted by **Allen** on 15 June 2011, 7:52 p.m.,*
in response to message #1 by Don Griffith

Gene is right. To put it a different way, the 12C only uses **periodic interest rate** (no assumption is made about how many payments are made per annum)

In contrast, most of the other HP financial calculators accept only an **annual interest rate**, and a separate entry must be made for how many annual payments occur.

Most (like the 10B) will default to 12 P/Y when reset.

Re: Problem with Interest entry

*Message #4 Posted by **gene wright** on 16 June 2011, 8:24 a.m.,*
in response to message #3 by Allen

True, but even those where you specify the interest rate take interest input as 10 and not 0.10.

:-)

Until there is an official (or semi-official) announcement, anybody who knows can't say, and anybody else doesn't know. Anything here is pure speculation and doesn't necessarily have any grounding in reality.

Eric

Re: Any 15c news?

*Message #8 Posted by **rav walia** on 15 June 2011, 1:53 p.m.,*
in response to message #7 by Eric Rechlin

I believe that the calls for a 15c have been around for a long while.

Has HP ever responded in anyway to the calls? For example, saying why it might not happen, not for the for seeable future, etc, etc?

As lowly user, it just seems that HP is a closed shop and to me there's nothing to ever indicate that there will be another scientific RPN, let alone a 15c reissue.

I've tried to use non rpn calculators and find it tough. So my only option is to hope that my HP32sii doesn't flake out on me and HP comes out with something better than the HP35s.

I applaud the repurposing efforts the community is doing and programs written in the past to add a little scientific functionality to some financial rpn calcs from HP. Is this the new way forward, make financial rpn calcs and leave options for repurposing to the rpn community?

I understand that no company would give there roadmap away, but I'd think you'd at least want to let the market know that you're still actively in the market.

Maybe this is all some great marketing strategy from HP that I just don't understand, but surely some teasers would be required to slowly build up the excitment.

Deep down I don't believe that HP will release anything new in the rpn scientific calculator field, but I want/hope they do.

Re: Any 15c news?

*Message #9 Posted by **Tim Wessman** on 15 June 2011, 4:47 p.m.,*
in response to message #8 by rav walia

HHC is a big part of that outreach and communication. It has been receiving a lot more support from the HP calc group these past few years and managers have seen the value and benefit of hosting such an event.

Just the fact that we can communicate so much information to people there is very, very unusual in the world of large companies. I can say with absolute certainty that we will not be announcing a 15c re-release at the HHC 2011 conference in September.

There will *hopefully* (depending on when planes have to leave) be about 10 people from the HP calc group at the conference this year. They timed the marketing/business summit to coincide so that many people would be able to go and interact with users.

I will say that if you ever have thought about going to a conference - this should be the one. I will be quiet now.

Sufficient amount?

That brings to mind the time a former supervisor hosted a couple of weather scientists visiting from Germany at his home for an evening. Just to help "make them feel at home" he bought a variety of imported beers prior to their visit.

The two visitors drank over $200 worth of beer that evening!

in response to message #9 by Tim Wessman

Tim,

The folks that usually attend the HHC conferences, like myself, enjoy the camaraderie first and foremost. My wife calls it geek fest and geek fest paloosa! This year's topics regarding the 41CL and the wp34s alone are worth attending. If HP can show or talk about interesting concepts or projects then we are even happier. It's meeting the people to celebrate their skills (like Geoff Quickfall's uncanny gift to repair vintage calculators) and personalities. I have know many attendees for over 30 years and that is something special!

I think the main achievement of the HP calculator R&D department, namely Cyrille & Tim, lies only a few years back when they chose a platform that is variable enough to

- spit out one new calculator after the other with reasonable effort,
- is documented so that it can be repurposed,
- is fast end versatile enough for serious work.

Thanks HP! If you will not announce what is hoped by the community, we will be able to do the job ourselves. ;-)

*Message #26 Posted by **Tim Wessman** on 16 June 2011, 8:22 p.m.,*
in response to message #25 by Walter B

Well, the 20/30b was essentially exclusively Cyrille. The thanks for that go exclusively there (and to Sam Kim for helping push through the cable port).

When someone repurposes the 10bII+, I'll happily take the thanks for that! ;-)

I imagine it would be straightforward to repurpose.

The display looks to be very difficult to work with (no/limited alpha) and there is no wide enter key.

in response to message #33 by fhub

Oh you "Pie in the Sky" guys...

HPC will take a slower, more cautious approach than what you've been speculating...

HP is going to re-release the HP-10C+ first and then the 11C+, then quietly release the ill-fated 13C, which, because of negative publicity, force them to abandon the introduction of the 14C, and further delay (for 2-3 years) the eventual re-release of the HP-1[56]C which will maintain the same form factor as the 12C (which should be in its HP-12C Rhodium +SIII variant by then) but have "electronic paper" key tops which will display each keys function as determined by operating mode selected by the user. Well, "user" will be mostly a redundant term as that calculator will not need human interaction and more likely "use" the person handling it to accomplish its (the calculator's) goals via SkyNet.

HP is very tight lipped about any future calculators. The only way I know of to find out anything about their future thinking and plans is to attend the HHC conference (in San Diego this year). At the conference you will be required to sign a non-disclosure agreement and in exchange, you *may* learn something about HP's future plans. Both HP and the attendees that the non-disclosure agreement very seriously.

At the very least, you will be treated to one of Tim's thrilling talks about Desiduous trees of North America.

HHC2011 and wp34s

*Message #1 Posted by **Marcus von Cube, Germany** on 14 June 2011, 4:59 a.m.*

Hello friends and participants of the upcoming HHC 2011 in San Diego!

I'm making up my mind going there and hold a presentation about our project. I will most probably tell you about my part which I know best but in the meantime I know quite a few things about Walter's and Pauli's work over the years.

There is on obstacle: cost. The flight alone will be in the 800 Euro league. I'm certainly able to cover my expenses on my own but I'd appreciate any donations made on the project's SoureForge pages to buy me a beer or one or more nights in the hotel. I plan for at least a week in San Diego. You will not want to see a sleeping developer on the conference suffering from jet lag, don't you?

Edited: 14 June 2011, 5:01 a.m.

This is great news. Hopefully, we can pitch in and at least pick up a portion of your costs. This project is important enough (IMHO) that HP should be able to have an opportunity to speak to (at least) one of the primary developers in person. The wp34s might not mean much in HP's grand scheme of things, but to me, it's a 21st century version of the PPC ROM - where the community gets to extend a machine (in this case the 20b/30b platform) far beyond its originally-planned scope. In my fantasy, they'd take enough notice to think that they should be doing something like this on their own :-)

Thanks, Jake

Re: HHC2011 and wp34s

*Message #3 Posted by **gene wright** on 14 June 2011, 4:35 p.m.,*
in response to message #1 by Marcus von Cube, Germany

I agree with Jake.

I think it will be humorous to me for some HP attendees to perhaps begin to realize that the WP 34s is in many ways a much more capable scientific calculator than the 35s.

In fact, a comparison document between the two would be something good to put together.

Re: HHC2011 and wp34s

*Message #4 Posted by **Namir** on 14 June 2011, 4:55 p.m.,*
in response to message #3 by gene wright

Gene,

Maybe the HHC organizers can ask for some contributions for Marcus' expenses during the registration process. I would be willing to do that.

Can HP also help with some of Marcus' expenses, such as lodging? After all he and his team represent a success story for repurposing the 20b/30b machines, which in turn is a feather in HP's cap (Cyril to be more exact).

Namir

Edited: 14 June 2011, 5:01 p.m.

Re: HHC2011 and wp34s

in response to message #4 by Namir

".....he and his team represent a success story for repurposing the 20b/30b machines....."

Exactly true Namir. When Sam Kim first showed me the the 20b he said that he hoped others would pick up the platform and use it as the basis for controllers, keypads, data entry devices and faceplates. The 34s may be the first such use and would be a great example to show prospective 3rd parties. HP and Cyril should buy Marcus some very good beer.

Re: HHC2011 and wp34s

*Message #6 Posted by **Namir** on 14 June 2011, 10:39 p.m.,*

Well put, especially that HP can show the wp34s as an example for other third parties.

Re: HHC2011 and wp34s

*Message #7 Posted by **Marcus von Cube, Germany** on 15 June 2011, 2:30 a.m.,*
in response to message #6 by Namir

I'm looking forward to "some very good beer". :-)

To be honest, I'm less then one third of the team. My main achievement was bringing what had already been done by Pauli, Walter, and to some extend Hugh, in more than two years before I joined them, to a greater audience in form of the emulator (originally furnished by HP in the SDK) and later to the real hardware. I had earned my living with micro controller programming more then 20 years ago which still proved beneficial for my part of the project. I'll tell you about the story in person. :-)

WP 34S experience (cable, flashing, overlay, etc)

*Message #1 Posted by **JayV** on 13 June 2011, 9:46 p.m.*

http://www.flickr.com/photos/jay_vavra/5830509555/

The photo above is my 30b flashed with the 34S firmware. I purchased the 30b with the intent of making the conversion, so I didn't do much with the calculator prior to flashing. I requested and received the cable very quickly (thanks Gene!). I followed the instructions and the flashing process worked as expected with no surprises.

Immediately after flashing, the the display seemed to be at the highest contrast it was capable of. The first thing I needed to do was adjust the contrast. I searched the 34S Owner's Manual but didn't find anything regarding adjustment of the display. Holding "On" while pressing "+" and "-" made the adjustments, as it does on every other HP calculator I have and it was documented in the Quick Start Guide that come with the 30b. The WP 34S Owner's Manual seems to cover the software extremely well, but the addition of this basic hardware adjustment would be helpful to someone who wasn't familiar with the method from previous experience.

A few days after flashing the calculator (and frustrating myself with my inability to coordinate between the keyboard on screen and the physical calculator) my overlay arrived (thanks Eric!). I had read a few other descriptions and suggestions on this forum for applying the overlay and decided to give it a shot. The overlay proved more durable than it felt as I had to peel back and make a few slight adjustments. Three keys, "h" "<-" and "divide" seem a bit mushy after applying the overlay. After pressing a couple times though they regain their original feel and only feel mushy again after a few hours of no use. I hope they eventually permanently adjust to the normal feel. I believe I had read someone else making the suggestion of slightly larger key openings and I'd second that suggestion, but only slightly larger. The current fit seems almost perfect, but achieving that fit isn't easy and takes a lot of patience. Slightly larger openings would make installation a bit easier. Applying the overlay took a total of about an hour, but I wasn't giving it 100% of my attention at the time. I did use tweezers for holding and aligning the key labels and I'm pretty happy with how they turned out. Aesthetics wise, I think I'd prefer rounded corners on the main overlay to mirror the factory corners on the hp logo, metallic bezel, and lcd opening. So far the material and printing seems pretty durable.

Everything I've attempted regarding the software has worked as expected. I haven't had a chance to really stress it, but I've done a bit and between my previous experience, reading this forum, and reading the Owner's Manual I have been able to figure things out so far. I'll certainly ask questions when they arise.

Finally, congratulations to Paul, Walter, Marcus and everyone involved with the WP 34S. This is an extremely impressive project and the results are tremendous. I look forward to using the calculator, showing it to friends and coworkers, and watching the project continue to improve and gain users and popularity.

Re: WP 34S experience (cable, flashing, overlay, etc)

*Message #3 Posted by **Marcus von Cube, Germany** on 14 June 2011, 2:44 a.m.,*
in response to message #1 by JayV

You must have downloaded your flash file through the web interface as it does not show the internal revision number but blanks instead. It's better to use either a regular SVN client or wait for another "official" release. The SVN version is always "the leading edge" but at times will be totally broken. Such is progress...

I need to update the zip file soon because we surely do not want people to install and work with a version that is no longer binary compatible with what we have now in the current build.

HP 41CL, thoughts...pics...part 1 (new pinout cap picture)

*Message #1 Posted by **Geoff Quickfall** on 13 June 2011, 8:11 p.m.*

Thoughts:

in one word "incredible".

Pics:

well some more thoughts first. My donor is serial numbered 1933Axxxx (thanks Gene) making it a very early example with the "tall keys" keyboard. I used this donor because the case is pristine as is the battery module block and battery posts. The logic pca is dead, and I still haven't trouble shot it as yet. I also wanted to use the 'oldest version of 41C' that I had, just to contrast with the newest technology supplied by Monte.

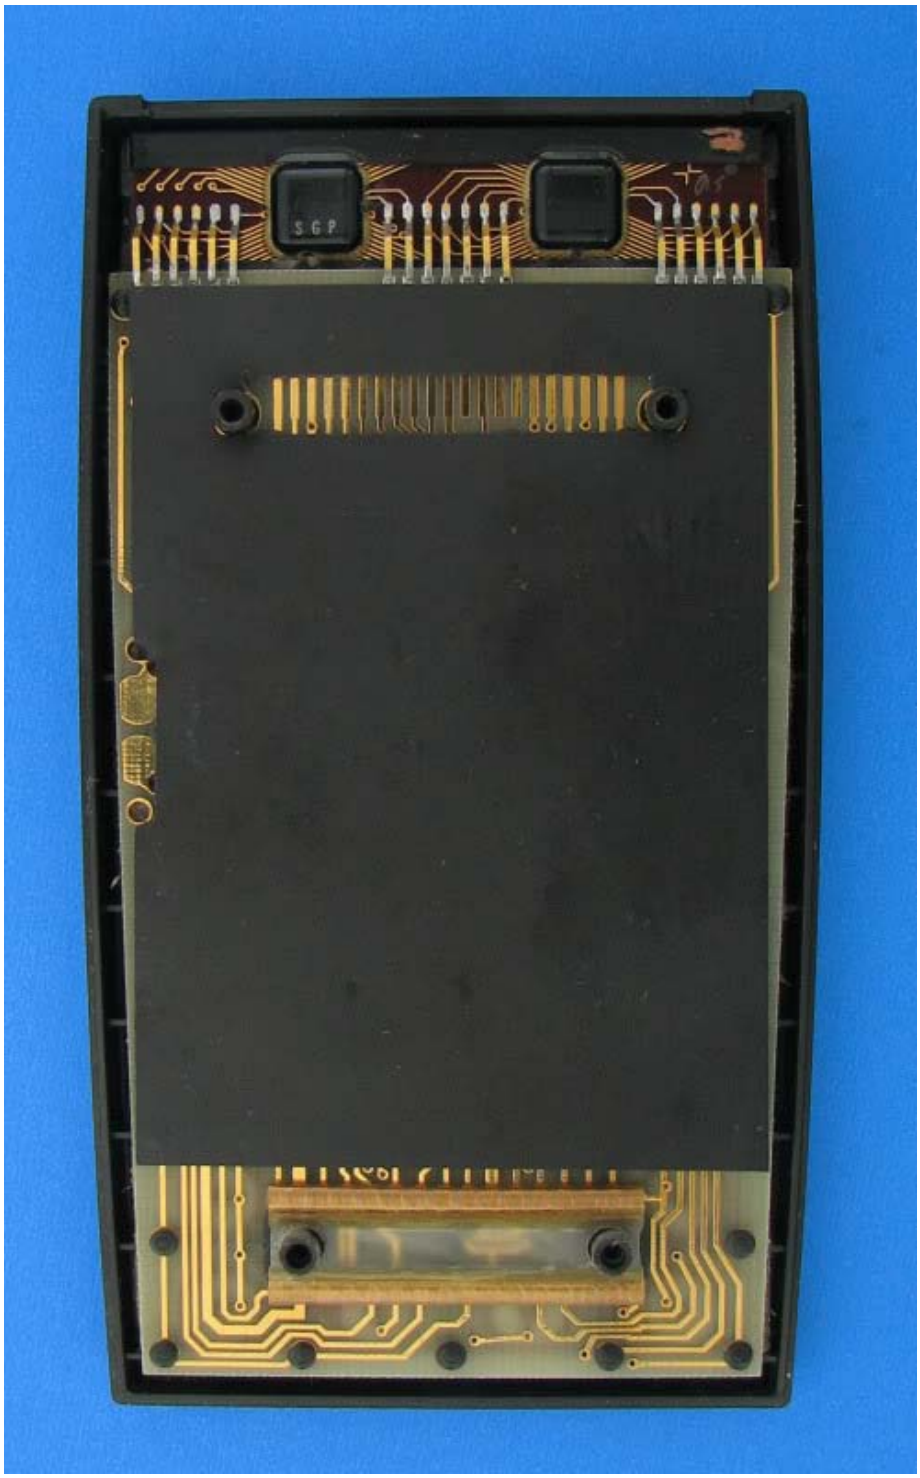
After a thorough cleaning I was preparing to install when I read Monte's warning to READ the installation manual. Usually I don't! This time I did!!

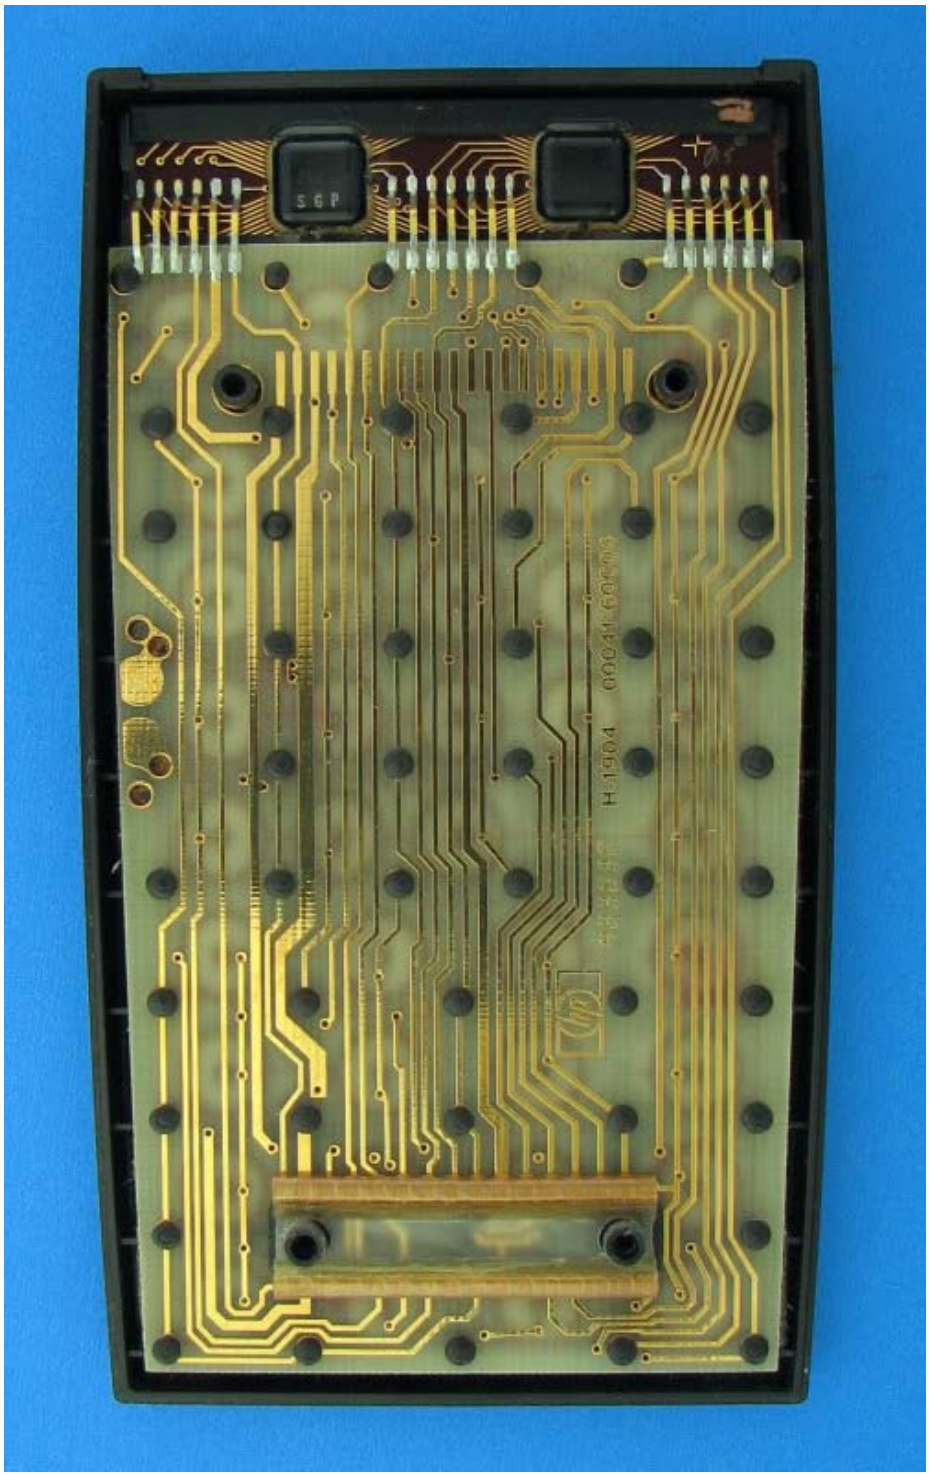
According to Monte's installation instructions there is a warning about differing revisions on the LCD display. Revision F LCD panels need an installation of a .01uF from the OS1 pin out on the keyboard pca pinout. The ground is pin two of the keyboard logic pca. These two pins can be found at the LCD pinouts at the top of the keyboard pca also (see the pinout diagram at bottom of posting). This LCD pinout would be the easiest area to attach the 0.01uF capacitor. I will do that tomorrow.

Some shots:

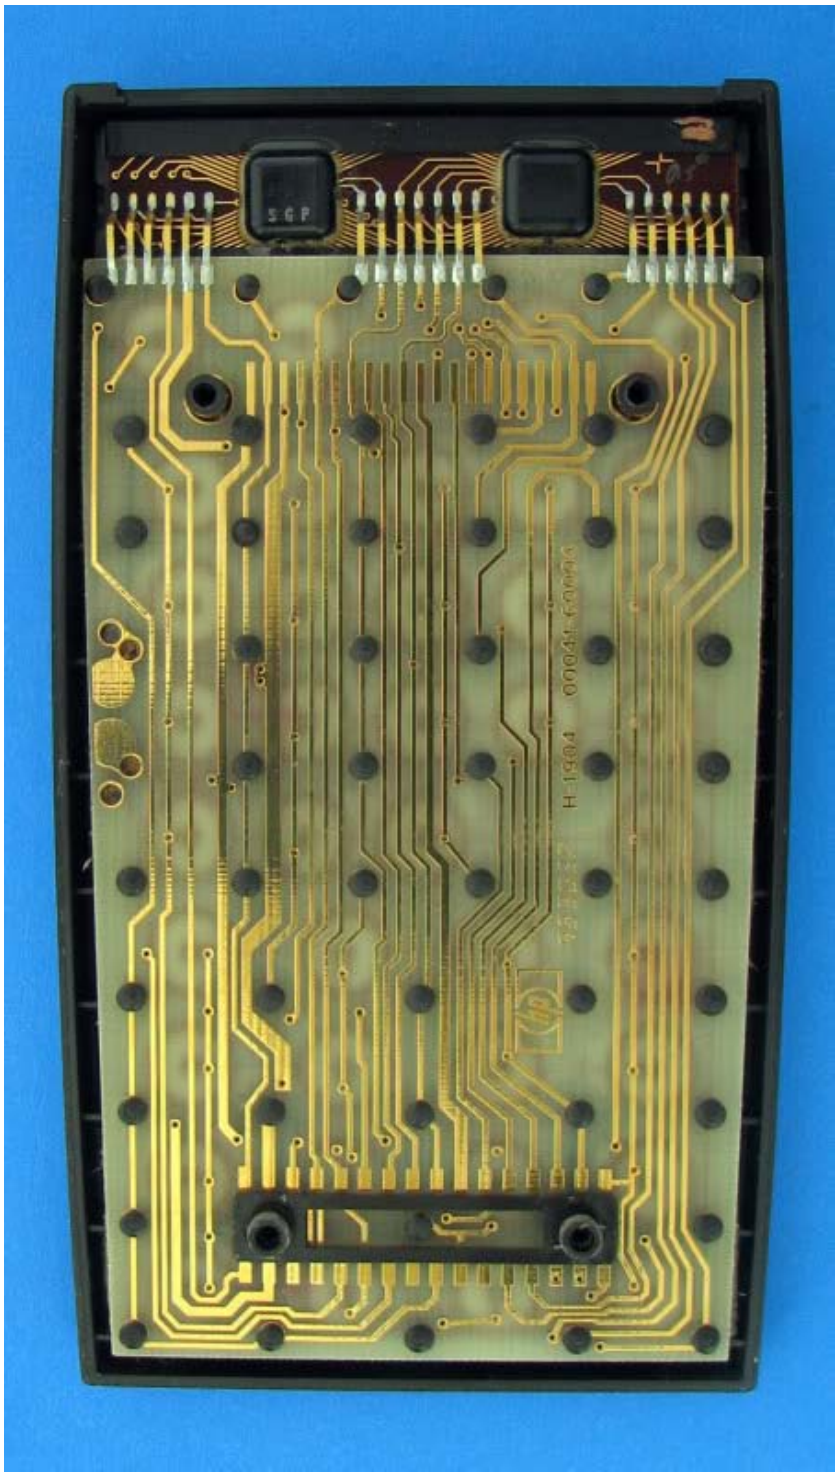
the HP 41C serial numbered 1933A which is below the cutoff of 1954A. This means that I need to add the 0.01uF cap. Note the shinier keyboard bezel. Missing is the textured matte surface of later 41Cs.

Opening the case and placing the back aside, here are the sequential shots after removing the 41C original logic PCA:

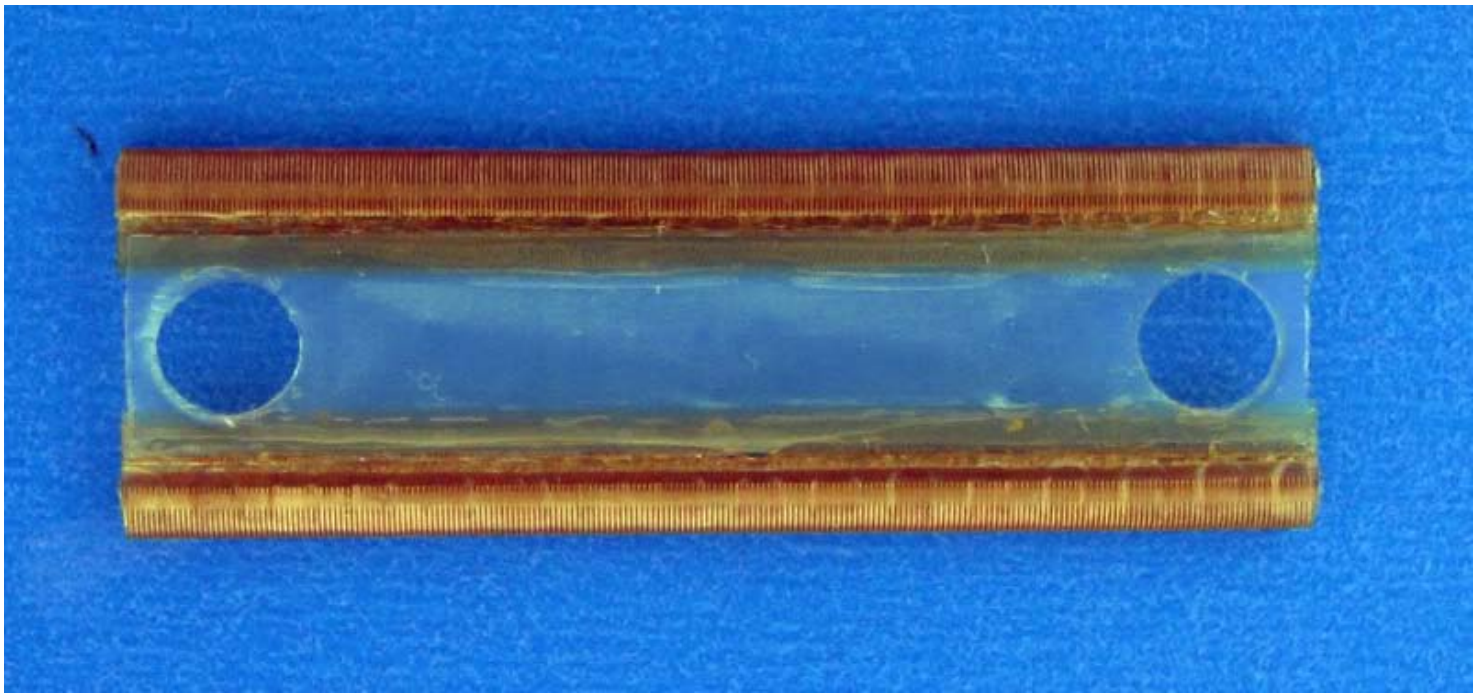




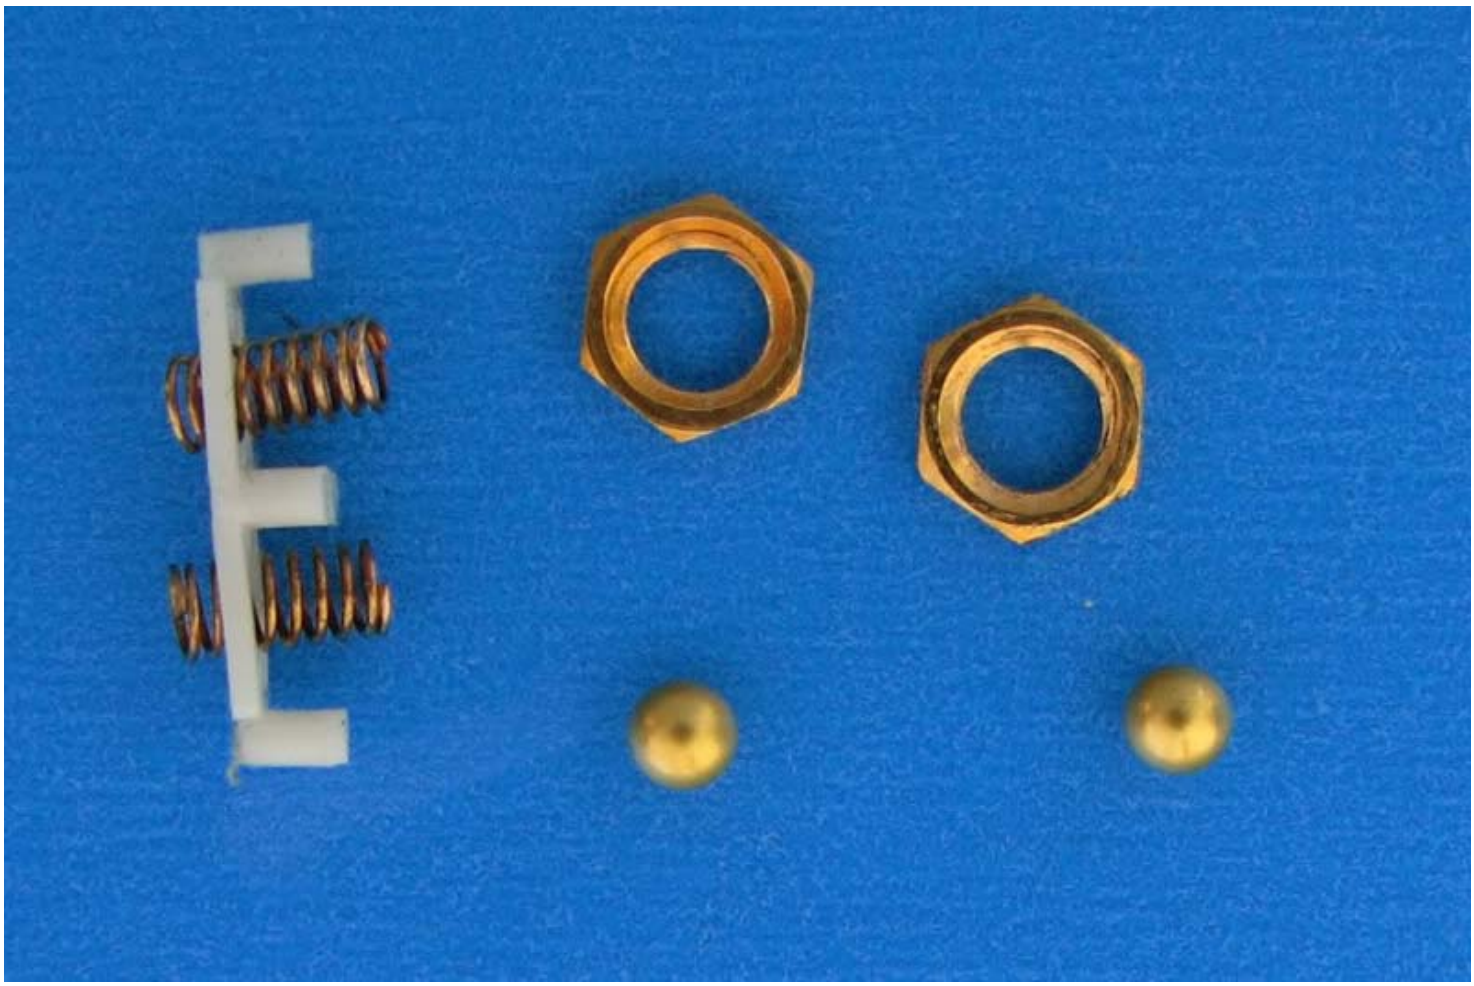
SGP
H 1904



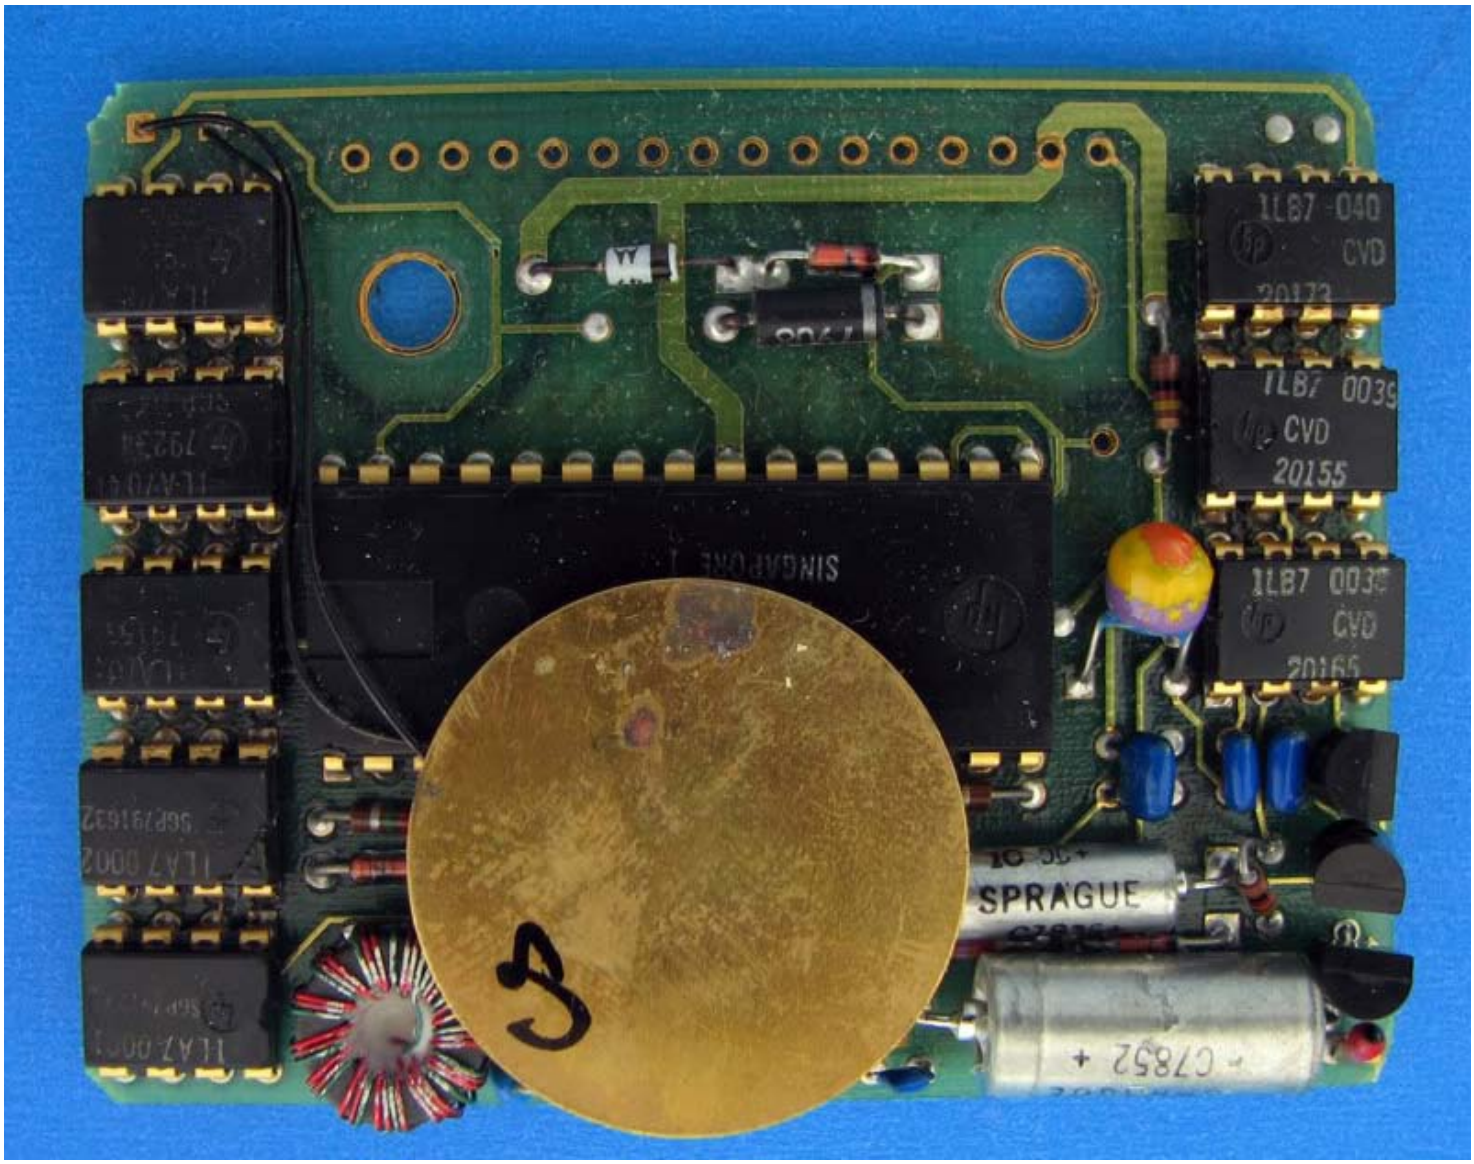
Close up of the wired connector recommended by Monte and others:



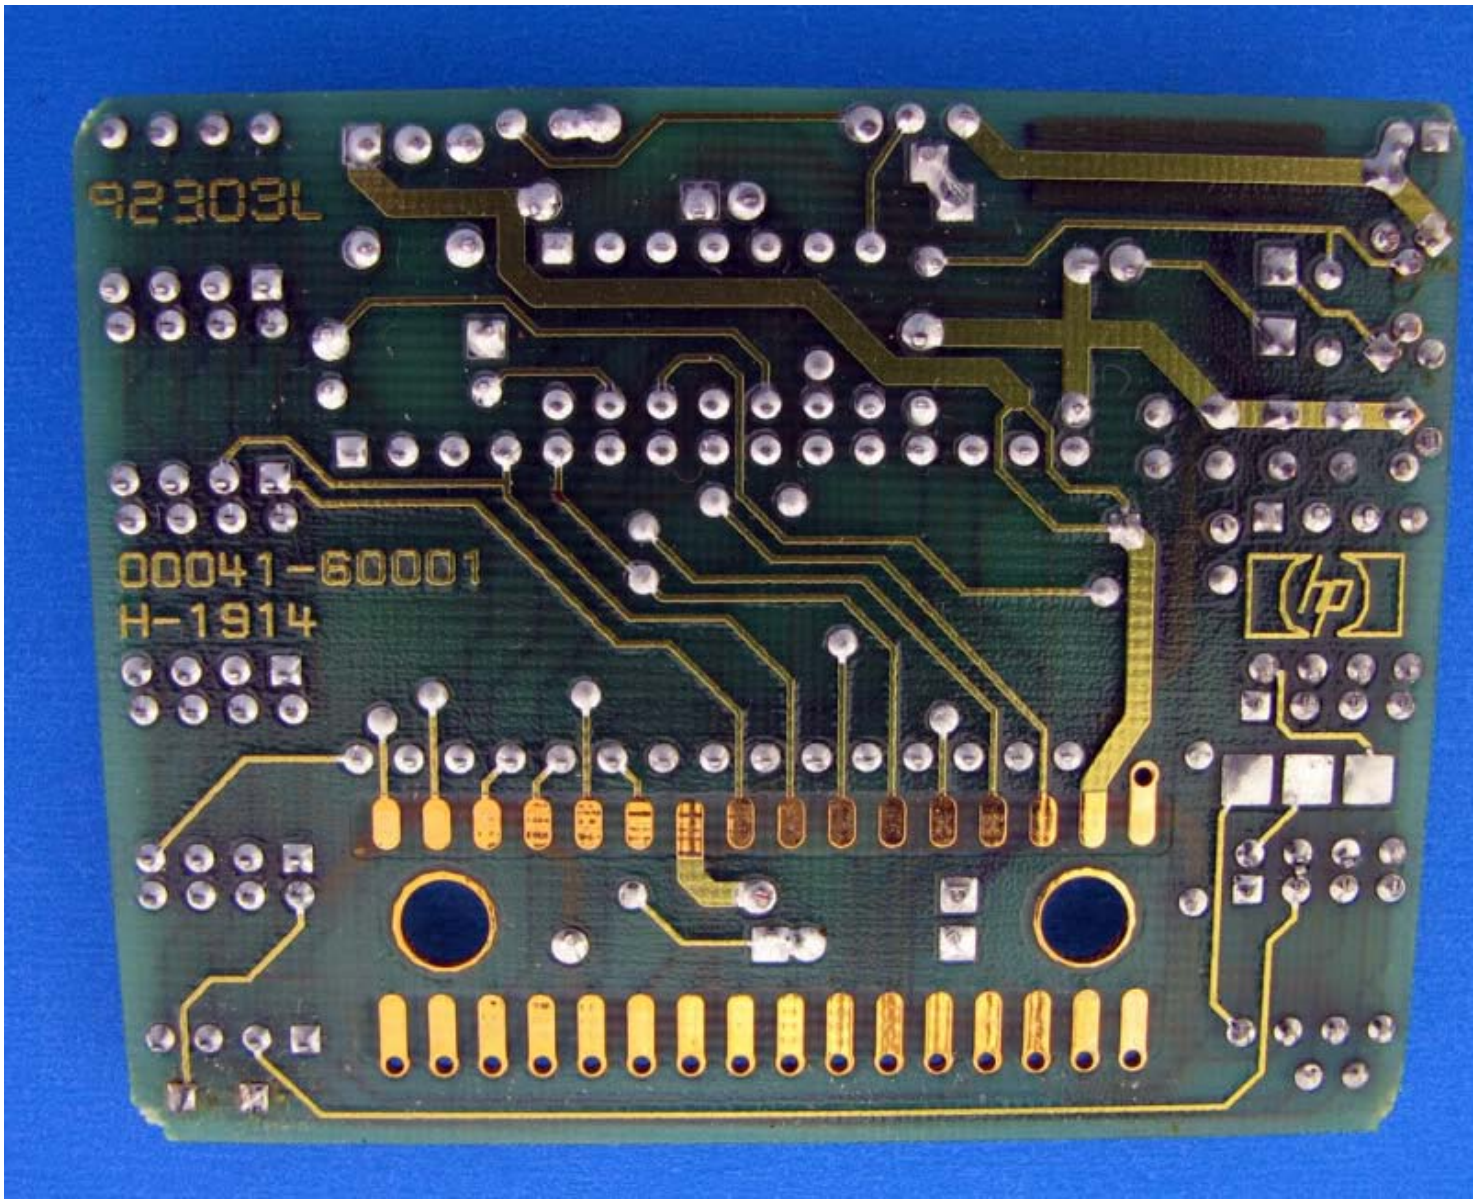
The AC ball and springs connector as well as the original nuts that hold the oldest HP 41C logic pcas:



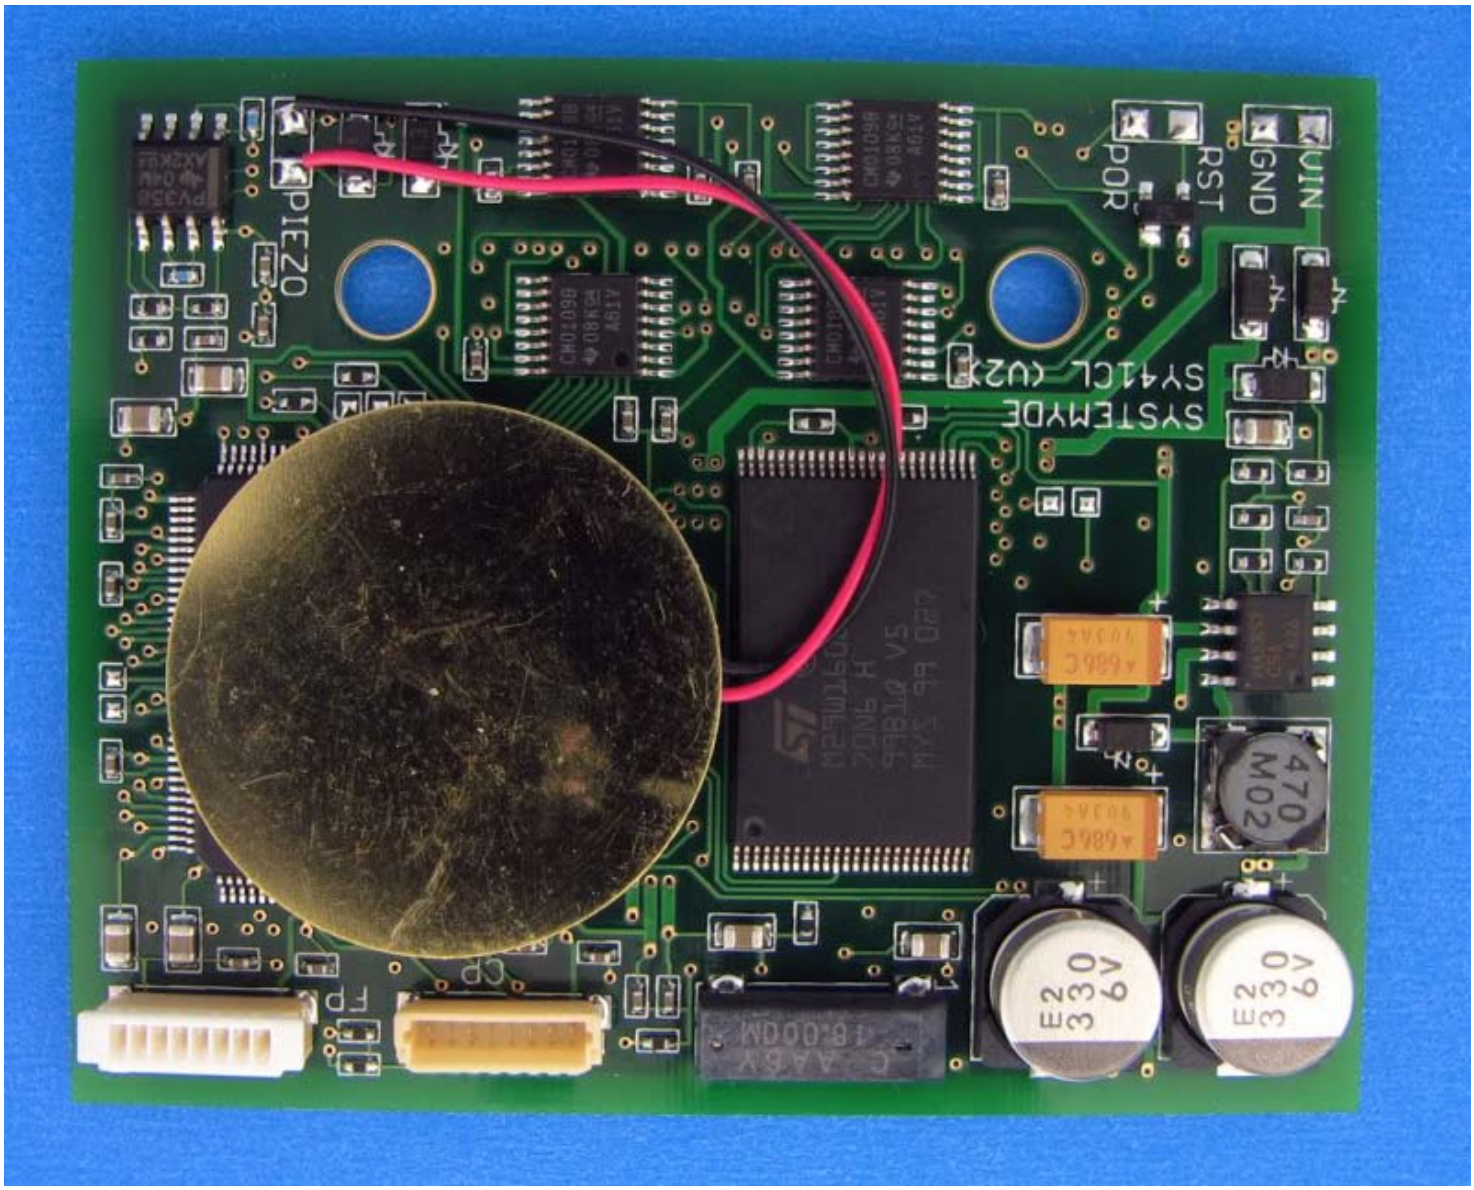
Close up of the original PCA obverse and reverse followed by Montes new 41CL:



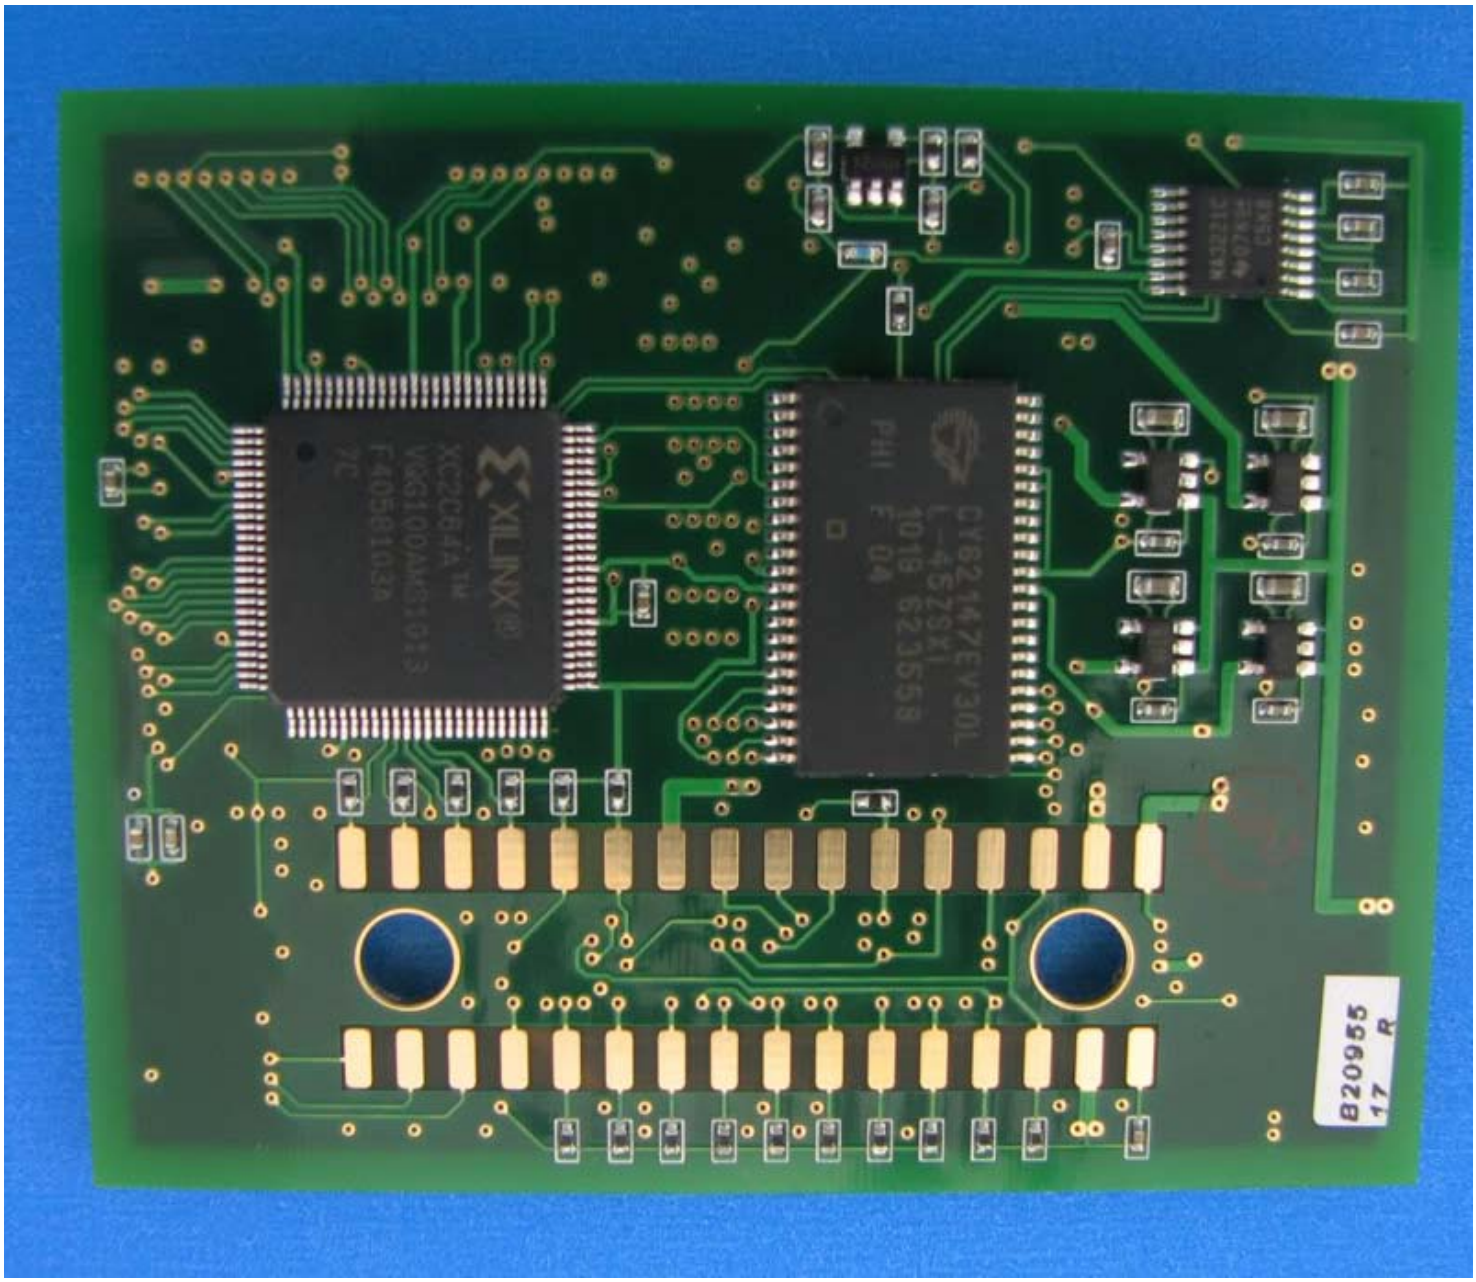
1LB7 040
CVD
1LB7 0039
CVD
20155
1LB7 0039
CVD
SINGAPORE
SPRAGUE
C7852 +



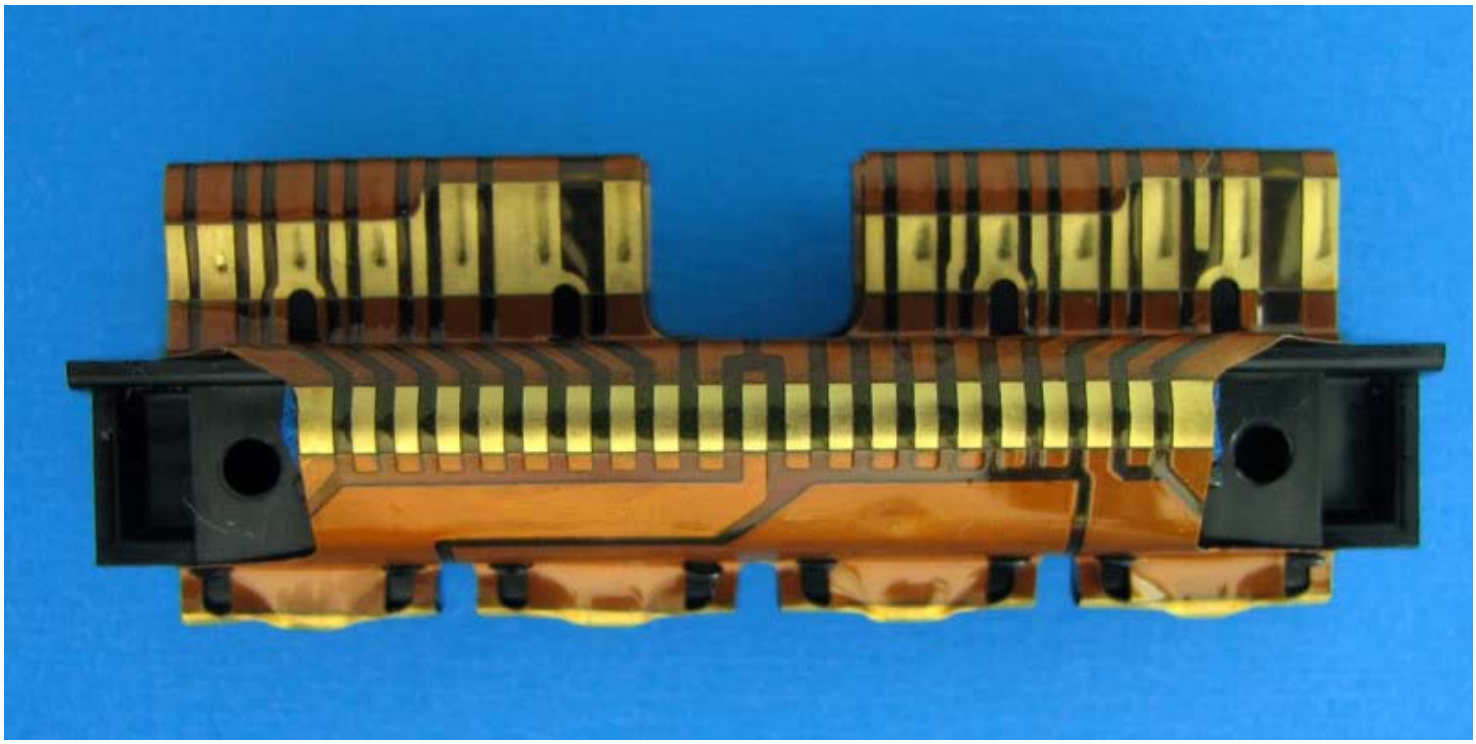
You can see the quality in Montes 41CL, wonderful:

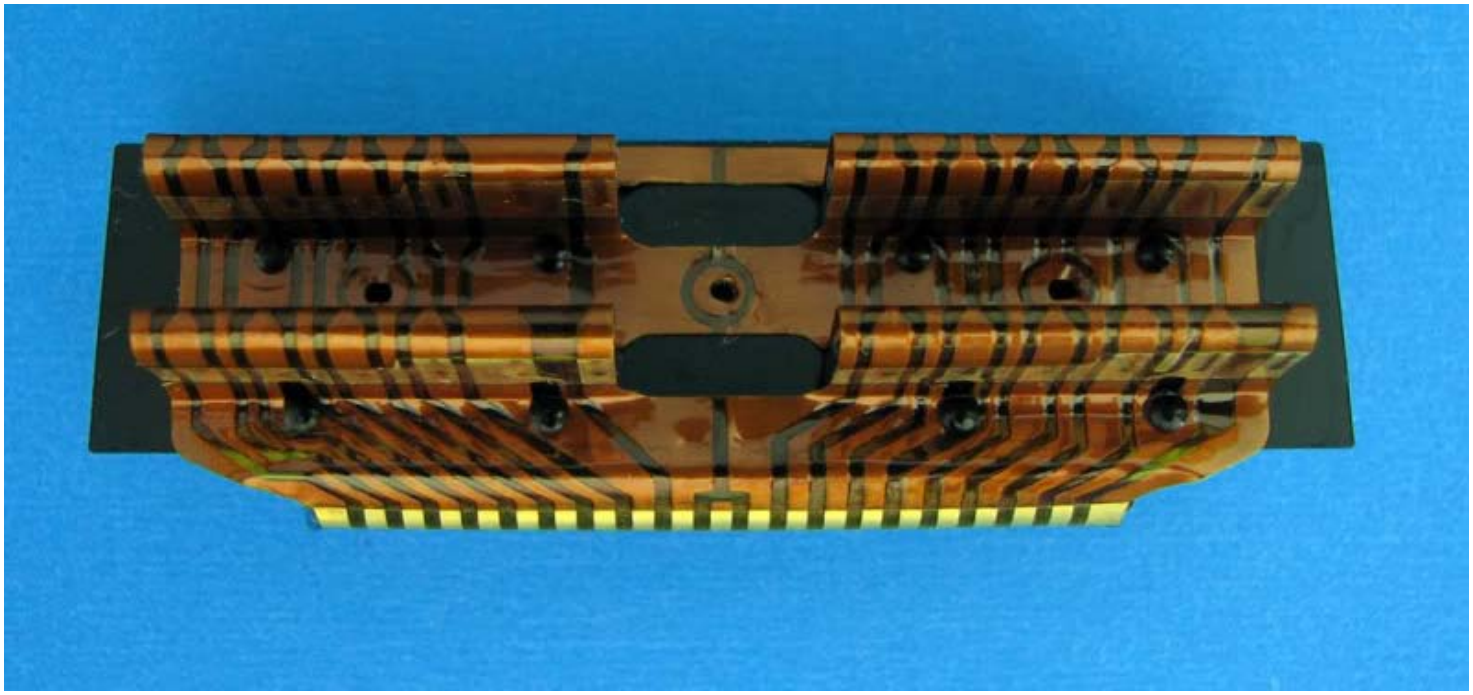


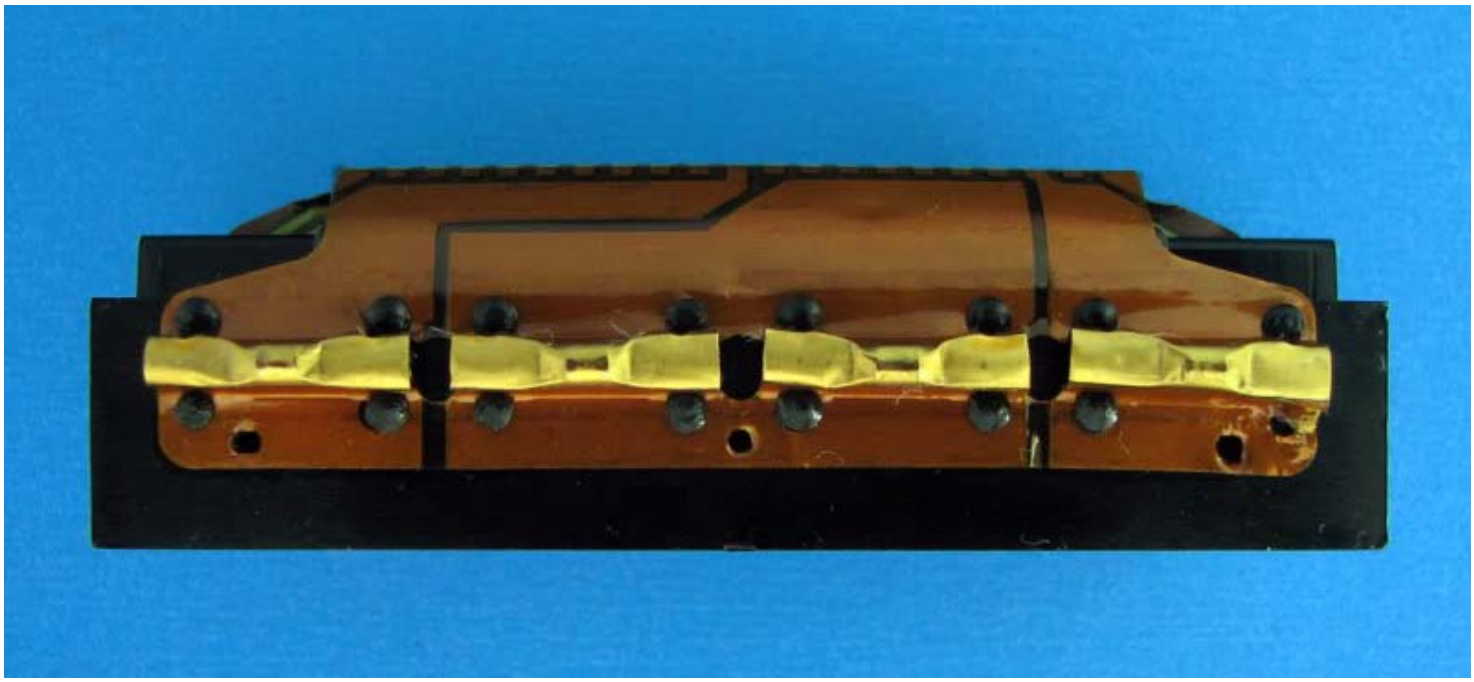
PIEZO
POR
RST
GND
VIN
SYSTEMYDE
SY41CL (U2)
470
M02
E2
330
6V
E2
330
6V



While you are here, clean the wire wrap connector with a soft natural brush stroking it the parallel to the wrapped wire. Also clean the battery-module block on all three sides. Insure continuity and that the pressure foam is still expanded. Clean contact surfaces of the keyboard pca. Dry and blow off dust when reassembling:



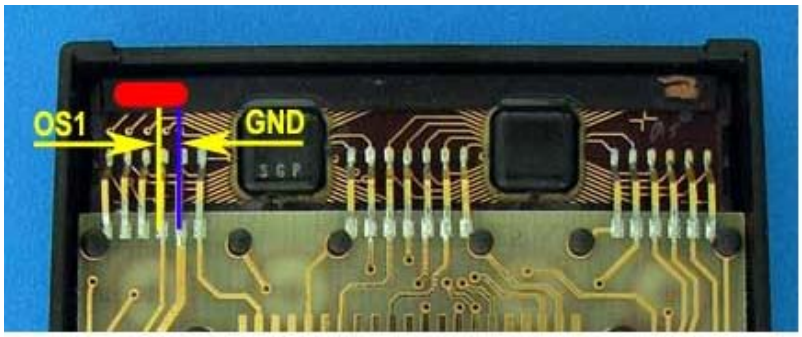




Now adding the serial bus port and double sided tape to hold the wire in place:

And now the CL in position:

Tomorrow, using Monte's emailed instructions and this excerpt from the HP41C manual illustrating the rev 7 LCD drivers attachment point and pinouts for the LCD:



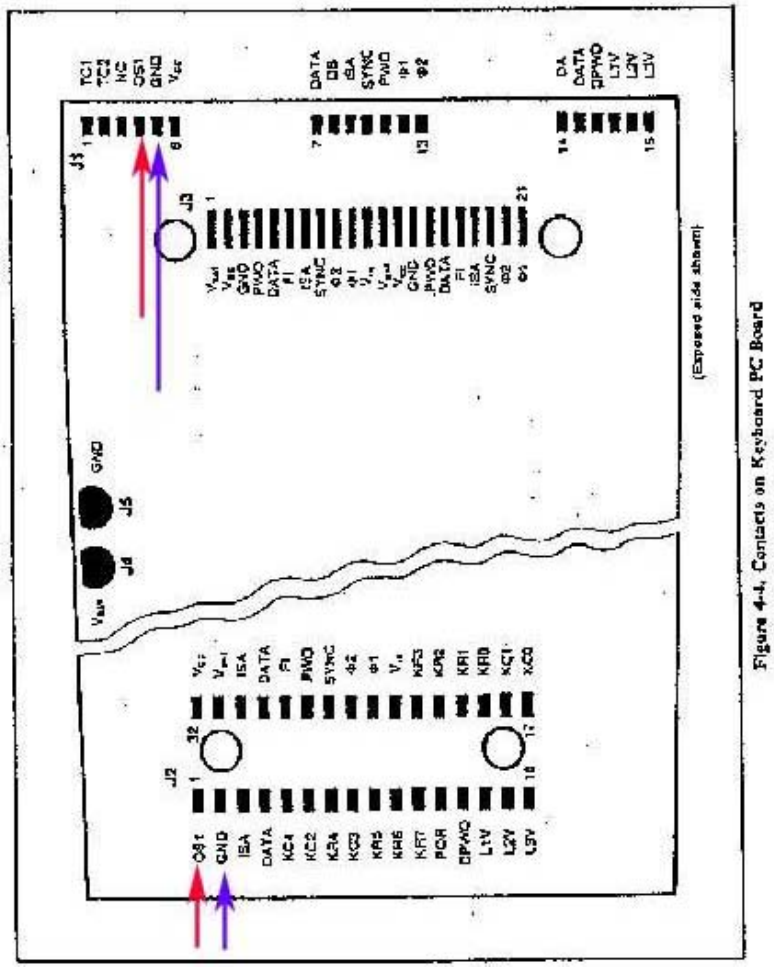


Figure 4-4. Contacts on Keyboard PC Board

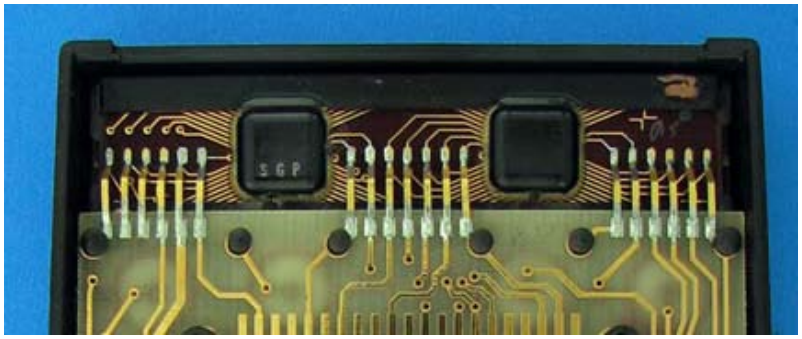
Here is a close up on the revision 7 LCD drivers, as evidenced by the plastic caps as opposed to epoxy blobs:



As I said, standby for further!

Geoff

edited as per typo indicated by Gene and other stuff.

in response to message #1 by Geoff Quickfall

In a 2009 issue of DATAFILE there was a short article entitled "Why the HP-41 can't be upgraded". I hope that this disproves that assertion.

And they said ....

*Message #3 Posted by **Geoff Quickfall** on 14 June 2011, 1:56 p.m.,*
in response to message #2 by Monte Dalrymple

it couldn't be done.

Thanks Monte for the 41CL. It feels the same as when I picked up my first 41C in 1981!

Geoff

stepping out to get the phone to computer cable and the capacitor!

*Message #4 Posted by **Ángel Martin** on 14 June 2011, 2:55 p.m.,*
in response to message #2 by Monte Dalrymple

How´s that for an exaggeration then, although it´s taken 30 years and a clever design to break that myth.

The only thing that betters a 41 is... a faster 41!

Add to that the mass memory capacity of the 41CL and you´ll have the best there is...

Can´t wait to get mine installed, the anticipation is so good, I agree it´s like when I got my first 41C so many moons ago.

*Message #6 Posted by **Tony Duell** on 17 June 2011, 4:10 a.m.,*
in response to message #2 by Monte Dalrymple

Actually, the statement I made in Datafile was that the HP41 could not be upgraded _and maintain compatibility with all HP41 add-ons_.

I don't think the 41CL changes that. From what I understand, it can't run machine code from plug-in modules (only from the built-in flash memory on the 41CL board). I don't think it can access RAM on plug-in modules either. Yes, all the memory is built in to the HP41CL board, so there are very few times when you'd want to do either of these, but I can think of some.

The issue with periperhals is more complex. The 41CL claims to be compatible with all HP41 peripherals. I am quite sure it's compatible with all the standard ones, printer, HPIL, wand, card reader, etc. But the way HP41 peripherals work is to decode machine language instructions from the ROM (or ROM emualtor ;-)) on the ISA line. Unless the 41CL sends all ROM instructions over that line at the normal speed (which IMHO means it's not running any faster than a normal HP41), I claim I can design a peripheral that will work on an unmodifed HP41 but will fail on a 41CL, even if the ROM to control said peripheral is loaded into the 41CL flash memory.

Re: HP 41CL, thoughts...pics...part 1 (new pinout cap picture)

*Message #7 Posted by **Eric Smith** on 17 June 2011, 4:53 a.m.,*
in response to message #6 by Tony Duell

The 41CL will run machine code from plug-in modules just fine, at normal 41 speed. This occurs when the MMU has a page set as "disabled", meaning that it uses external memory (normal 41 bus ROMs and such) rather than the 41CL flash. Your hypothetical peripheral should work just fine as long as its ROM is external.

If for some reason you do want to run your peripheral with its ROM code executing from 41CL flash, if you've followed the 41 bus protocol for peripheral instructions correctly, and not depended on instruction timing of non-I/O instructions, it should still work correctly, because the peripheral instructions always access the 41 bus. I would claim that a good design for a peripheral isn't dependent on the speed at which non-I/O instructions execute. However, it's certainly possible that you could design a peripheral for which that is not the case.

Re: HP 41CL, thoughts...pics...part 1 (new pinout cap picture)

*Message #8 Posted by **Ángel Martin** on 17 June 2011, 9:00 a.m.,*
in response to message #6 by Tony Duell

Considering that there hasn't been any new HP-IL peripheral designed in the last 20+ years (not counting the fantastic PIL-Box of course), it's interesting to see this hypothetical reason - just to prove or disprove the claim that it wouldn't be compatible with the CL. To me it's a moot point: as far as it counts, the CL is perfectly compatible with (what's left, used and known today) of the 41C system.

Speaking of which, the Pil-Box is also queued on the testing bench, will see how things fare..

*Message #9 Posted by **gene wright** on 17 June 2011, 9:02 a.m.,*
in response to message #8 by Ángel Martin

The basic fact exists that for certainly all practical concerns, the HP 41 HAS been upgraded.

Clonix modules plugged in work fine. Hepax works fine. The Forth ROM works fine. HP IL peripherals work fine. The card reader works. The list so far goes on and on.

Monte's achievement is monumental.

Hello Gene

Okay, there is a rub in all this. The experts, of which I am NOT one are looking or going to look at the addresses CLONIX uses when ROMS are loaded. These are NOT bugs with either the CL or the CLONIX. Both these work perfectly but at the moment there are conflicts on addressing and priortizing the access with CLONIX installed and the CL wins all the time.

My example looked like it worked with a couple of bugs. Probably the way I installed and then loaded created what appeared to be a perfectly function CLONIX CL CLONE ;-)

So here is what I did with a MEMORY LOST condition on the CL board (naturally occuring when you recieve the logic pca and install it.)

```
1 follow Montes' instructions to the letter while installing YFNS
  to PORT 1 Lower.
2 now HPIL is available so cassette deck to calculator to fill
  program memory with a suite of routines.
3 insert card reader to, of course, PORT 4 which is empty.
4 use RFL synthetic program to load DATA files into Extended
  memory with the card reader.
5 use YFNS (CL) functions PLUG to load ROMs into PORTS.
6 LEARN FROM THE EXPERTS!!!
7 see 6
8 Realize through explanation that the card reader when installed
  takes over PORT 4 lower thus disabling any full page ROM residing
  there.
9 Read the manual again and realize that the ADVANTAGE module is
  a full PORT!  I loaded the ROM half page version of routines
  based mistaking it to be the ADVANTAGE rom.

So it is a must to:

1 READ THE MANUAL
2 UNDERSTAND THE ADDRESSING OF THE PHYSICAL MODULES
3 LOAD THE CORRECT ROMS ACCORDINGLY
4 IN THE CASE OF THE CARD READER, YOU CAN LOAD A FULL ROM AND
  UNPLUG IT WHEN THE CARD READER IS INSTALLED or LOAD THE PORT 4
  upper WITH A HALF PAGE ROM.
```

The treat here is you could write a routine called PCR and assign it to a key. Invoke it when you want to use the card reader and when done invoke UPCR.

```
01  LBL PCR (plug in card reader)
02  UPLUG4
03  RTN
04  LBL UPCR?
05  AON
06  "ROM?"
07  PROMPT
08  AOFF
09  PLUG4
END
```

If it is always the same rom then replace lines 5 - 8 with the name of the rom in alpha. For example in PORT4 you want the full page ROM PPC. The program would look like:

```
01  LBL PCR (plug in card reader)
02  UPLUG4
03  RTN
04  LBL UPCR
05  'PPCM'
06  PLUG4
END
```

It looked like the clonix would add two more full page ROMs to the calculator. In fact the reason it worked for me is the portion of the CCD and PPC that were required did not conflict. Cat II on closer inspection reveiled that only a third of CCD in clonix was available and the NAV1B never showed up at all.

In my defence I assumed that if a conflict occured I would see a complete failure of the CLONIX ROMS (not the CLONIX). They worked enough to sucker me in! That combined with the inability to find my CLONIX PIC program files to determine address loading and a lack of understanding of the intracacies of the 41CL/CLONIX addressing fooled me into thinking the combination worked.

So back to the PIC programmer to copy the CLONIX to the computer and determine the page addressing. Diego will also be looking into this along with Monte (emails).

Back to the machine:

I have the short routines loaded so that PORT4 can be swapped between the Card Reader and the CCD. I have PPC in PORT 3 and the full ADVANTAGE in PORT2. PORT1 lower has the CL YFNS functions while PORT1 upper has TREK.

Of course the beauty is that it so easy to swap ROMS in and out with the XEQ PLUG and UPLUG functions.

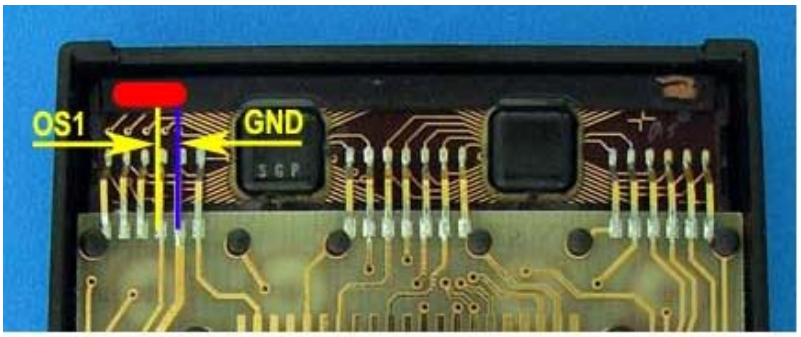
Well still playing and without ROM manuals that is a treat! The Museum DVD is a must!

Cheers, Geoff

Part 2; capacitor soldered in place...

*Message #12 Posted by **Geoff Quickfall** on 14 June 2011, 5:50 p.m.,*
in response to message #1 by Geoff Quickfall

Well it was an easy job to add the capacitor as explained in the following diagram:



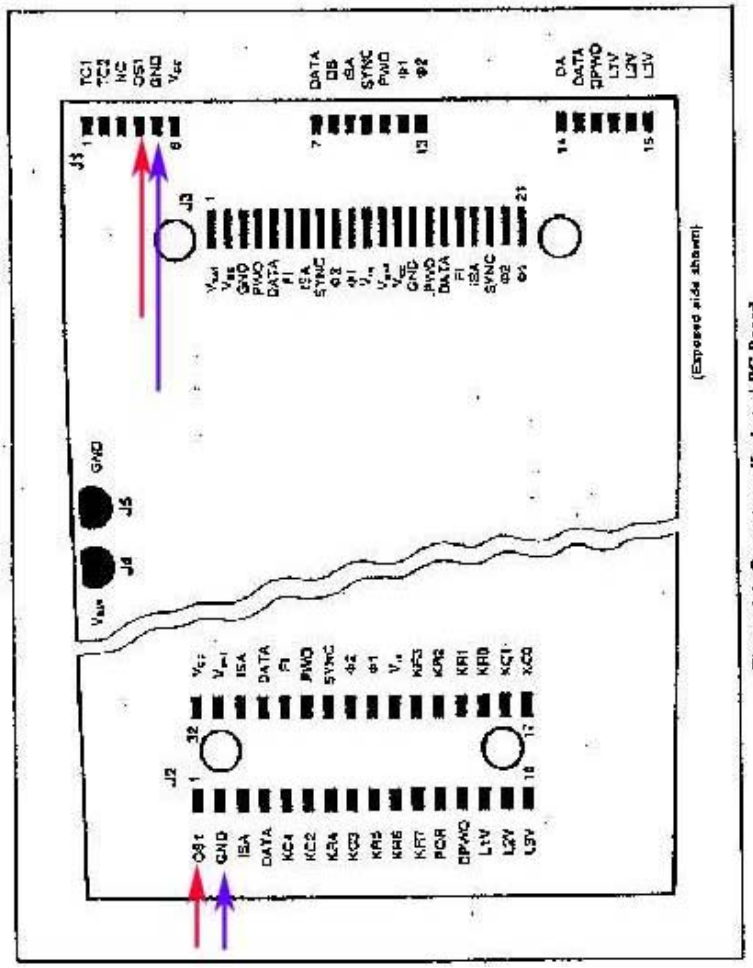


Figure 4-4. Contacts on Keyboard PC Board

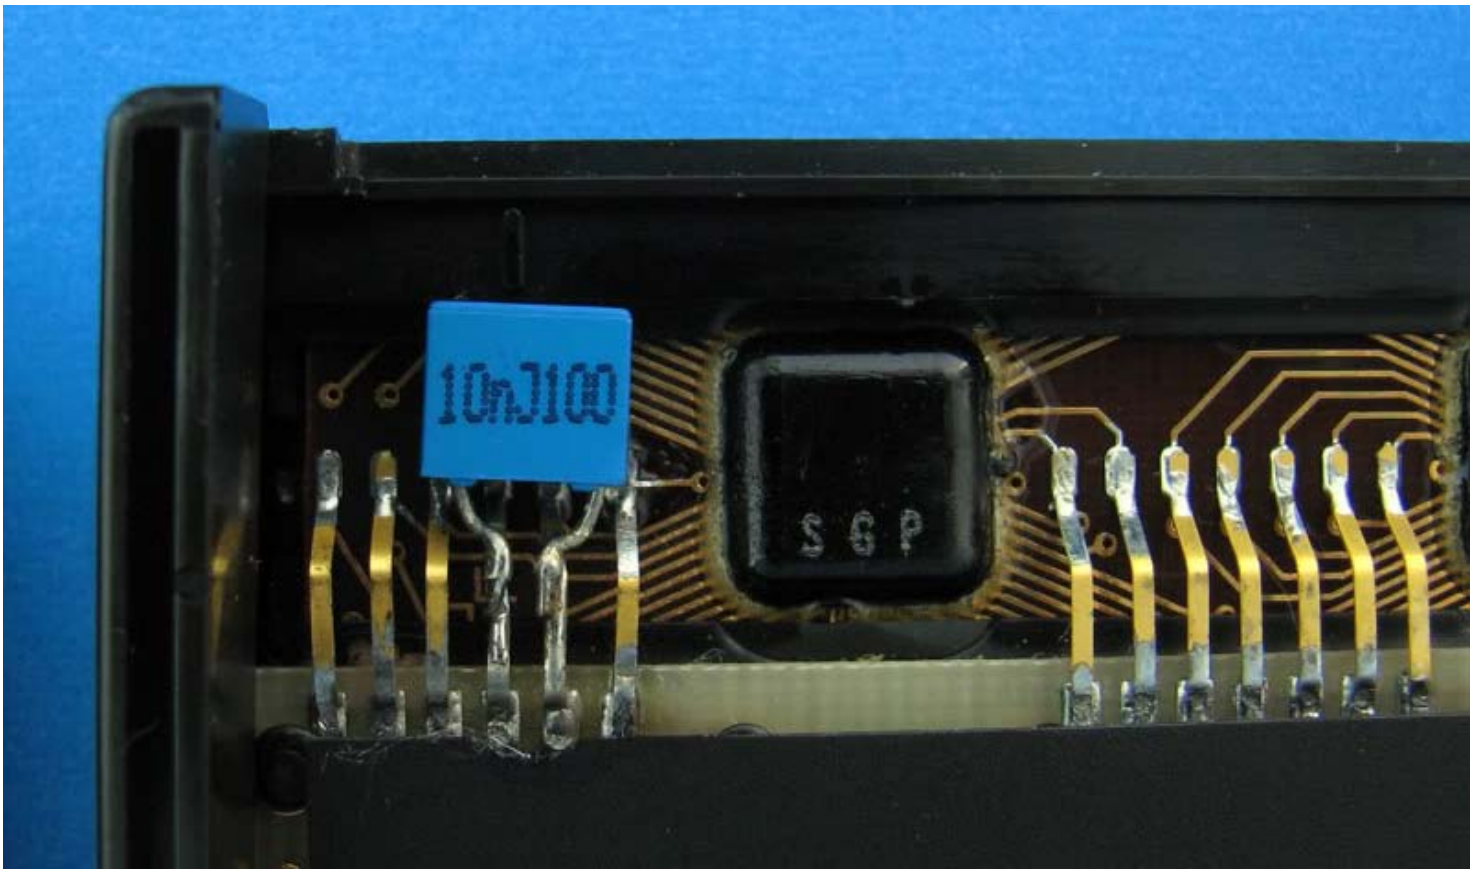
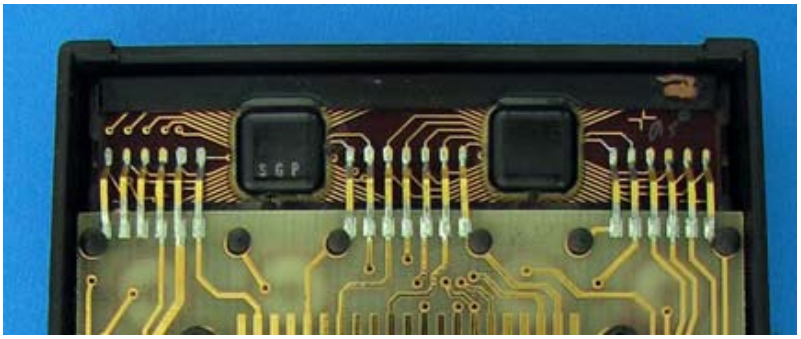
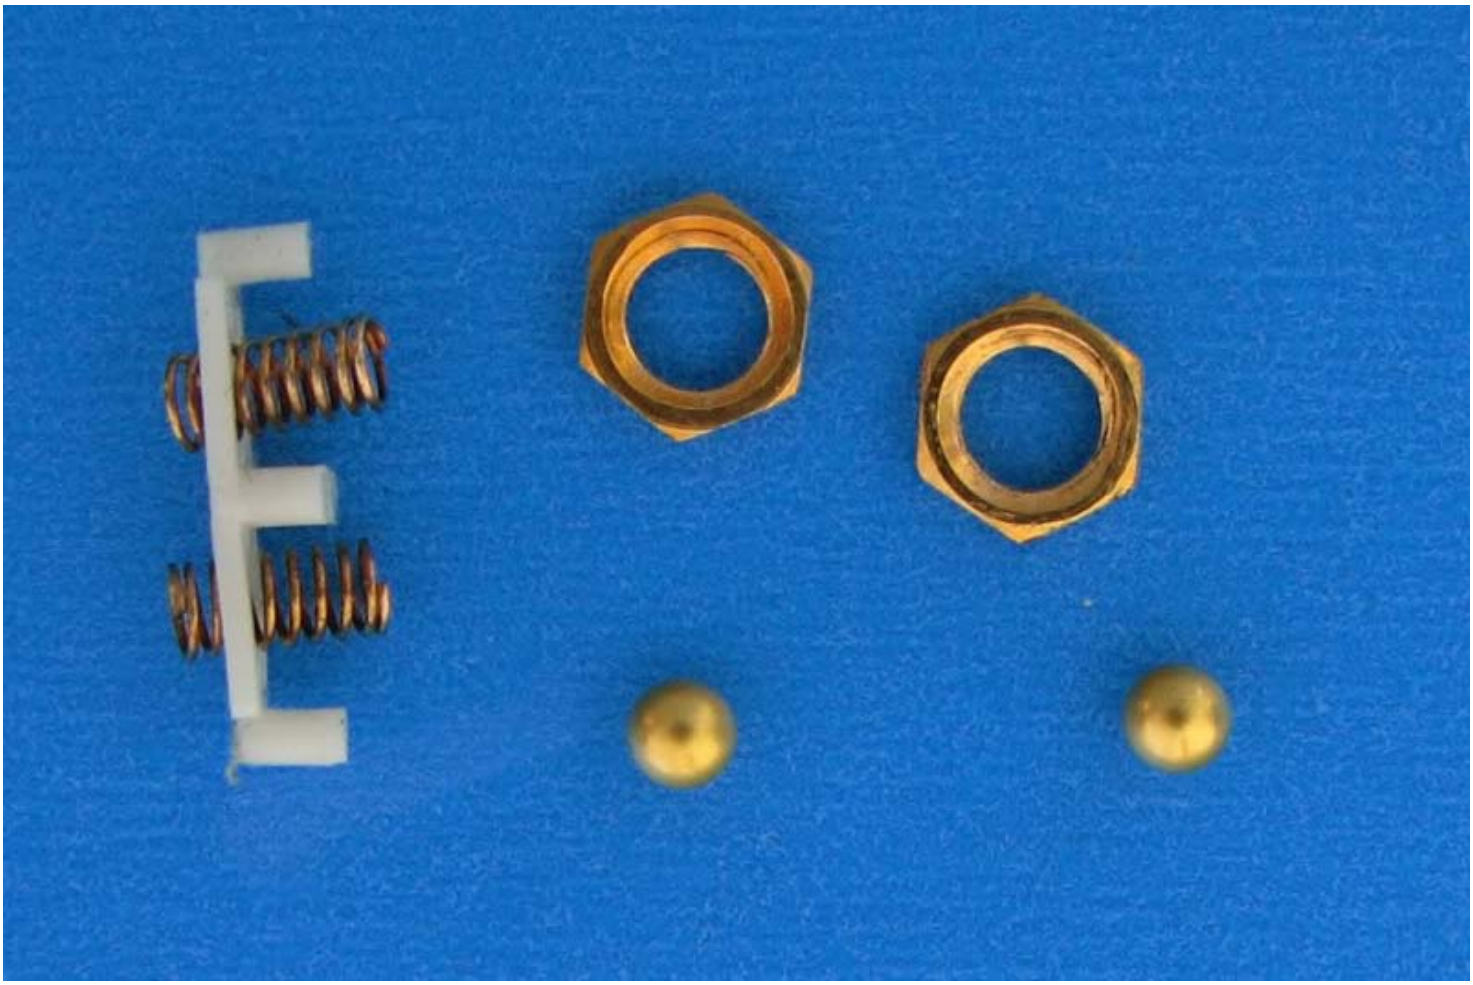
Here is the capacitor in place, excuse my poor solder job:



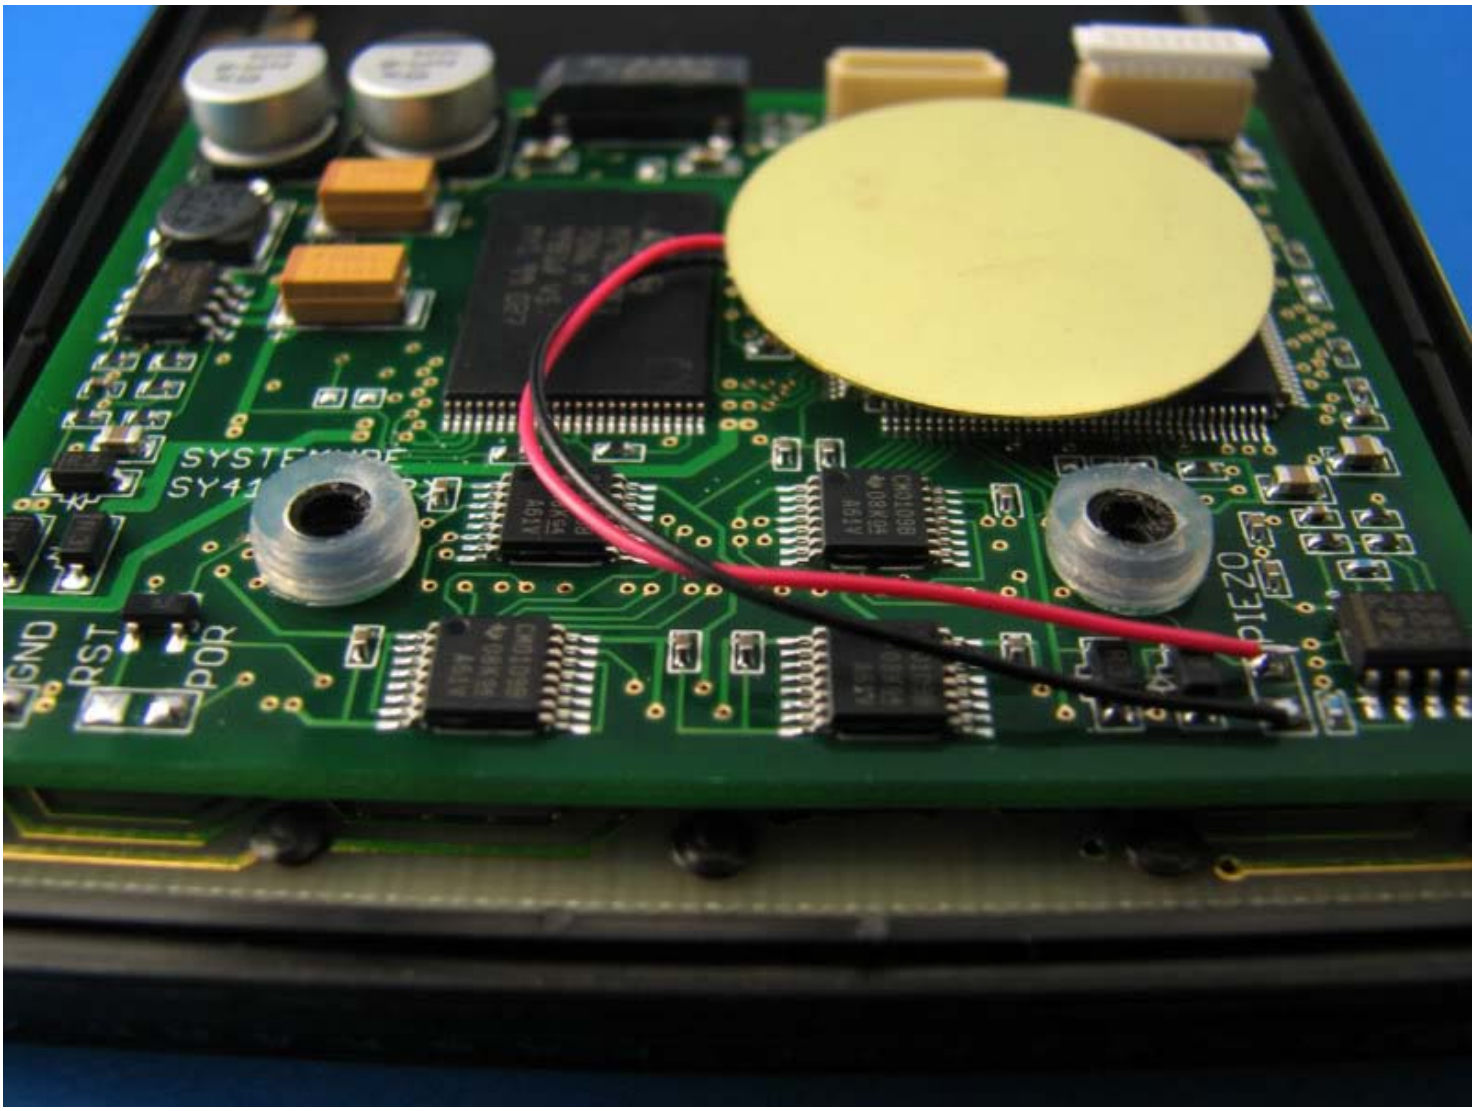
Remember this is for the HP 41C Rev 7 LCD drivers with serial numbers less then 1954Axxxxx. Again these are recognizable by the plastic capped display drivers:



Also the early HP 41C may include the AC connector ball, springs and have the Logic pca attached by nuts:



Be careful removing the nuts as the posts tend to strip preventing the reuse of the nuts. If this happens a smaller diameter nut may be used or the following procedure can be followed. The tubing is the same tubing used on the card readers. It should be cut slightly longer then the screw post. It should sit proud of the top of the post as depicted below. This allows the bottom case via the case screws to push the new HP 41CL logic pca into the wire wrapped connector.



I have a couple of early 41C's modified this way and they work perfectly.

Conclusion:

In order to avoid the 0.01uF (10nF) capacitor installation pick a donor with a serial number greater then 1954Axxxxx. If you do use an early one like I did then you need the cap.

Also, I had to add the 'time' module to take advantage of the timing functions of the CL board. My calc is now configured as follows:

```
PHYSICAL PORTS
1.  serial port communications in port one
2.  time module port two
3.  IR printer module port 3 or HPIL
4.  open for card reader if required and when I get more into
    swapping the virtual ports then the card reader won't be
    needed.

So far the Virtual Ports:

1.  Port 2 CCD module full port
2.  Port 3 PPC module full port
3.  Port 4L (lower) TREK!
```

Thats all I have had time to do since I installed the cap. Well it will give me something to do at work! So I have HPIL from the tape drive my suite of programs, uploaded the data base to the extended memory, tried out turbo50 mode (as fast as the 42S) for some programs. Later, learn how to create my own module and load it into the board memory as a module and recall it via programming when required.

Lets put it this way, there is a LOT to learn AGAIN!!!!

Geoff

Cheers. Geoff

in response to message #12 by Geoff Quickfall

Geoff, you might be able to get along with only the CCD/OSX 4K rom instead of the entire 8K CCD module.

That would give you a 4K spot for some games or one of the game roms.

Re: Part 2; capacitor soldered in place...

*Message #14 Posted by **Geoff Quickfall** on 14 June 2011, 10:50 p.m.,*
in response to message #13 by gene wright

Thanks for the suggestion, I will try it although I realized that I have a clonix with the CCD, PPC and Nav1B modules in it.

Plugged it in and it runs with the CL perfectly. This opened up port 4 and 3.

So now the physical config is:

```
1. serial port connection
2. clonix (CCD, PPC, NAV1B)
3. Time
4. IRprinter, card reader, laser wand, hpil and its accessories
   (swapping physically)
```

A small program is used to plug and unplug other roms in number 4 when the physical connections are removed. Alpha prompt along with the plug and unplug commands makes of the short program. Assigned to a key and the process is quick and easy.

LOVE THIS MACHINE (deja vu all over again)!

Geoff

*Message #15 Posted by **Monte Dalrymple** on 14 June 2011, 11:25 p.m.,*
in response to message #14 by Geoff Quickfall

I'm sure that you have realized this, but I'll reiterate that the Port that is used for the serial connector is still open for a module image. The same thing is true for the Port that holds the time module, because the time module code uses page 5 rather than the Port address where it resides.

Re: Part 2; capacitor soldered in place...

*Message #16 Posted by **Geoff Quickfall** on 14 June 2011, 11:37 p.m.,*
in response to message #15 by Monte Dalrymple

Thanks Monte;

Still have a lot of reading to do.

Some where I read that, but it dropped out in my excitement about the project. The serial port makes sense since it attached to the board and just uses the physical port one for wiring convenience. The time chip I did read but forgot.

Still playing with it, I sure hope my wife doesn't mind the key clicking while she is reading tonight.

Cheers, Geoff

Edited: 14 June 2011, 11:39 p.m.

Slightly OOT...

*Message #17 Posted by **Ángel Martin** on 15 June 2011, 1:18 a.m.,*
in response to message #13 by gene wright

If Retro-Gaming is the theme then you may also try the FunStuff module - I particularly enjoy doing a round of Fruit Machine or BattleShip while, say waiting at the doctor´s office, or even some turns of Roulette, Goufers, High Rollers, Pinball Machine, and Gene's own Yathzee's..

But pls. don't do that at the cockpit :-)

*Message #18 Posted by **Ángel Martin** on 15 June 2011, 1:24 a.m.,*
in response to message #13 by gene wright

Speaking of which (the CCD/OSX that is), a new release is just available - see (buried under dozens of 34S threads):

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=185880#185880

It all comes together now, nice...

Re: Part 2; capacitor soldered in place...

*Message #19 Posted by **Geoff Quickfall** on 15 June 2011, 1:54 a.m.,*
in response to message #18 by Ángel Martin

Answer to both postings:

we have a separate room above the first class galley that contains two bunks and two recliner seats each hooked into the video system. On the way to Sydney Australia from Vancouver with two complete crews (4) each group of 2 gets two breaks of 3 hours each.

That gives me lots of typing time on the book although now it looks like some of that will be exploring Monte's CL board!!!

I use quite alot of the CCD commands, especially the alpha display synthetics in my programs so it is a must. And of course a few PPC routines.

Trek is fun and I will give the others a try also!

Geoff

I may have to push the release date on the book back another year (JUST KIDDING) ;-)

Re: Part 2; capacitor soldered in place...

in response to message #13 by gene wright

Hello Gene,

Haven't forgotten your 41C with bad ram, or the 67.

The short form of the ccd does not contain the synthetic alpha instructions I am calling upon. Not a problem as Deigos Clonic contains three full page roms in one physical port!

Cheers, Geoff

Re: Part 2; capacitor soldered in place...

> Quote:
>
> The short form of the ccd does not contain the synthetic alpha instructions I am calling upon. Not a problem as Deigos Clonic contains three full page roms in one physical port!

Hi Geoff, this intrigues me:- I thought the only "shortcoming" of the short form of the CCD (a.k.a. the CCD-OS/X) was the lack of displaying the file types during a CAT'4 execution, and this only for the extended ones (Matrix, Keys, Buffers)- it shows a blank for the file type.

Wouldn't it be because your machine has disabled the "synthetic alpha input", perhaps using function TOGLC (toggle Lower Case)?

Cheers, ÁM.

Re: Part 2; capacitor soldered in place...

*Message #22 Posted by **Geoff Quickfall** on 18 June 2011, 1:04 p.m.,*
in response to message #21 by Ángel Martin

Hello Angel,

yes it has something to do with alpha input. I created this program 5 years ago. It does a synthetic trick that used to take about 4 synthetic lines.

An alpha prompt occurs and the display arises in alpha mode. While typing the alpha response the original prompt remains. The CCDX version probably has a different rom number location for the command.

So I will determine the command (no manual) and then load CCDX and retype the command in place. If the command exists then it will have the new rom location attached to it.

In all it is just my ignorance with CCDX and the command I used.

N Size Cell Charger

*Message #1 Posted by **Gerry Schultz** on 13 June 2011, 7:27 p.m.*

I got Lenmar's BCUNI3 NiMH charger along with N Size flattop cells today. The BCUNI2/3 specs are:

Power Source: 12VDC, 100-240V AC and DC car cord plus EU & USA plugs included.

Input current: 1000mA

Output charging Current: 1000mA max. (3.6V Li-ion Battery) 1000mA max. (7.2V Li-ion Battery) 1000mA max. (Ni-CD/Ni-MH battery)

USB output: 5v/1000mA max.

Charge Termination: 130mA max. (Li-ion Battery)

Negative Delta V detection (Ni-CD/Ni-MH battery)

Timing protection: Max. 7 hours (Li-ion battery) Max. 6 hours (NiCD/Ni-MH Battery)

The unit comes with the upper battery terminals being adjustable in width and height. The door slides down and is adjustable for battery length. I charged two N Size flattop cells in about 10 minutes (they we probably shipped almost fully charged). The batteries got a little warm but not too hard to handle.

The BCUNI3 also has a USB port for charging external devices and an LCD screen to show battery chemistry, battery voltage (1.2, 2.4, 3.6, 4.8, 6.0 or 7.2V), Fault, Capacity/Charging Status, USB Active and Power. The BCUNI2 doesn't have the USB charger port or LCD display.

I'm presently trying to charge a couple of Panasonic AA Ni-MH batteries rated at 2600mAh and they seem to charge quickly with the batteries getting a little warm. I like the battery charger because it can charge battery packs for Camcorders, Digital cameras and Mobile phones (that's why the upper terminals are adjustable) as well as external devices like iPods and iTouches with USB. One downside is that it will only do two N Size cells at a time. It also says it will charge one battery at a time in the right channel but the 'Charging Status' display just blinks. I'm not sure what to make of that. Note: Later the charger display took some time to update but it will support a single cell battery in the right channel at 1.2V.

Anyway, it does charge N Size cells quickly but I have to see how they'll work in my 41C, especially driving a card reader. I also remember that a 143 printer will power a 41c through its cable if the 41 has no batteries in it. I wonder if how NiMH batteries will affect an attached printer. I'm also wondering how these flattop N Size cells will work in a 41. They are a little shorter than the alkaline primary N Size cells, which I think is good as some of the springs in the 41 battery compartment are pretty stiff.

Stuff to play with. Let me know what you think,

Gerry

Re: N Size Cell Charger

*Message #2 Posted by **Katie Wasserman** on 13 June 2011, 11:28 p.m.,*
in response to message #1 by Gerry Schultz

Gerry,

Thanks for the nice review!

I may need to get one of these myself. I've got all sorts of ways to charge up batteries with external power supplies but this sounds really easy to use and very versatile. My only concern is that the the nicad/ni-mh charging rates seems excessively high for small capacity cells. But as long as it doens't cook them by seriously overcharging they should be fine.

-Katie

Re: N Size Cell Charger

*Message #3 Posted by **Gerry Schultz** on 14 June 2011, 2:46 p.m.,*
in response to message #2 by Katie Wasserman

Thanks Katie.

I tried the flattop N Size cells in one of my 41Cs last night and they are too short. Crap! Okay, time to modify the cells. I'm going to add beads of solder to each end and see if that works. I will probably go over to Newark and order some button top N Size cells.

In response to your concern about excessive charge current, the specs seem to specify a maximum current of 1A but I don't know if that's used throughout the charge cycle. I assume there is some algorithm in the uProc that tailors the current based upon the cell chemistry. Also, as the cell voltage increases that will reduce the charge current to help control the temperature of the cell. My initial impression so far is that the N Size cells don't get too hot. I believe the "Negative Delta V Detection" for Ni-CD/Ni-MH batteries means that it will stop charging a cell if the battery voltage drops over a period of time as charging current is applied. That's how the charger determines when the cell is fully charged.

Here, at work, we use Anton Bauer rechargeable battery packs (specifically the HyTRON 140 and Dionic 90) for our Panasonic P2 ENG HD field cameras. The associated chargers are amazing in how they can test, diagnose and try to repair problem batteries. The batteries recharge very quickly with the chargers monitoring the internal temperature sensors. There use to be white papers on their website explaining how their patented chargers worked but I didn't see them this morning. If you're curious take a look at http://www.antonbauer.com.

Thanks,

Gerry

Re: N Size Cell Charger

*Message #4 Posted by **Gerry Schultz** on 17 June 2011, 12:14 p.m.,*
in response to message #3 by Gerry Schultz

I wanted to update anyone interested in Lenmar's BCUNI3 NiMH charger that can be used to charge N Size cells. I received some button style N Size cells from Newark yesterday and ran them through the

chargers last night. These cells must have been sitting for a while as the chargers reported a low initial charge but quickly charged them up. TOO quickly as when they were done, the N Size cells were almost too hot to handle. I one case, a cell making a sizzling noise and leaked a little during charging but none of the other 13 cells did that.

These freshly charged cells worked great in my 41cs and ran my new card reader just fine. I bought the reader from TOS really cheap (from a Canadian, Hey!) thinking I could do a rebuild based upon Geoff Quickfall's HHC presentation from 2 years ago (was it two years ago already?). But the card reader works as well as my original rebuilt card reader. And the new one is a version G so I'm happy.

Anyway, I would think twice about using this charger for N Size NiMH cells. It appears it uses too much charging current causing the cells to get hot. Bummer.

Numeric integration on 34s

*Message #1 Posted by **Gene Wright** on 13 June 2011, 4:49 p.m.*

Ok, so I started trying the examples from the IG routine in the PPC rom manual using the built-in integration function on the 34s.

Less than nice results. :-) Of course, this was expected.

So, I then decided...why not just adapt the PPC ROM IG routine and key it into the 34s.

Everything keyed properly with a couple of exceptions. The HP 41 puts numbers on one program line while the 34s puts each digit on a separate line. Not usually a problem even though not as readable as the HP 41 way.

However, it did cause a problem until I spotted it in the IG listing.

Lines 17 and 18 in IG are E and then 2, which enters a 1 and then a 2 into Y and X, respectively.

My first attempt was to key a 1 then ENTER and a 2 and go back and delete the ENTER. Oops. That made the 1 2 a 12. So, if you have things like 1 and 2 to be entered as two numbers, the ENTER is needed. No hidden "null" like on the HP 41 series.

That said, IG runs like a charm with one change (Ok, some other changes too like RCL L for LastX, but those are not real changes):

IG looked for alpha labels for the function to be integrated. I found that XEQ ind 10 with a 3 letter alpha label inside errored out...so I changed the program to simply XEQ 99 and used label 99 for the function.

It is very fast, but even the 34s is taking its time right now solving the integral from 0 to 1 of x^(-1/2). The "Answer" is 2. So far, after about 4-5 minutes, the 34s has 1.9999678... and it is still going. Of course, I put it in SCI 9, so I am being a real pain to the poor 34s.

The program IG on the 34s takes 93 program steps/lines. If you want to do numerical integration, that is probably worth it.

I plan to show the results from the IG program and the built-in integration command when I can.

Hey 34s team... those "internal" constants in the manual for the 34s integration... do they take up more/less space than a 93 step program? Or is it that the constants are not in a similar memory location than an IG program-like function would be?

We cannot distinguish alpha data from numbers at the moment. There are two commands [alpha]XEQ and XEQ[alpha] that do what you want and more. The internal command has a special call user routine function available that can call alpha or numeric labels.

> Hey 34s team... those "internal" constants in the manual for the 34s integration... do they take up more/less space than a 93 step program? Or is it that the constants are not in a similar memory location than an IG program-like function would be?

93 steps is 186 bytes. The constants take eight bytes each so 208 bytes for the magic constants. The integration program isn't small either -- see xrom.c. I doubt 93 steps is enough once you have to start dealing with the user's code returning NaN's and infinite results and such but it wouldn't be a huge amount more.

However, the big limitation is the internal integration command is capped at five persistent registers (i.e. there are only five registers that will survive execution of the user's routine). It don't have any more scratch registers beyond the four level stack but more could be made available at a pinch -- they wouldn't survive the user's code being executed however.

If you code meets the register requirement, please send it to me and I'll replace the internal integration routine. Actually, send it anyway and it can go into the library :-)

Re: Numeric integration on 34s

*Message #3 Posted by **Gene Wright** on 13 June 2011, 6:37 p.m.,*
in response to message #2 by Paul Dale

Hey Pauli.

It is simply the IG routine from the PPC ROM manual. Surely you have that? :-)

Actually, check ur mail since I am sending you the PPC ROM program listing.

And, note that this program as written WILL use user memory registers. Quite a few of them.

So, to have this "in rom" will mean that it will use memory registers.

Re: Numeric integration on 34s

*Message #4 Posted by **Paul Dale** on 13 June 2011, 8:13 p.m.,*
in response to message #3 by Gene Wright

Thanks, file received. I don't have a PPC manual although I do have a module. I think it is on the DVDs though.

I really don't want internal commands touching user's registers unless there is a specific and well defined purpose that cannot be abused. This isn't the case here unfortunately.

Re: Numeric integration on 34s

*Message #5 Posted by **Marcus von Cube, Germany** on 14 June 2011, 2:56 a.m.,*
in response to message #4 by Paul Dale

How many registers are used? Any of them just constants stored for convenience in registers? Any of them only used internally between executions of user code and can be lost if the user code program contains a STOP (which will kill RAM)?

If it really will not fit nicely within the internal (X)ROM constraints, we can still create a "default library" which gets it. The default library can then be made available with the flash download so that it is automatically included when flashing the calc. It will occupy one of the PSTO slots, of course.

Pauli, Walter, what do you think?

Re: Numeric integration on 34s

*Message #6 Posted by **Paul Dale** on 14 June 2011, 3:12 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Not a chance of it fitting in XROM space. Way too many registers used.

A default library is a decent idea.

Re: Numeric integration on 34s

*Message #7 Posted by **Marcus von Cube, Germany** on 14 June 2011, 3:19 a.m.,*
in response to message #6 by Paul Dale

Pauli,

I've high hopes of your typing skills. If you provide a library file (either salvaged from the calculator via SAM-BA or created on the emulator) I'll take care of its inclusion in the default build. We can put all the stuff in the "library" folder in it.

Anybody else willing to provide useful programs for a default library?

Re: Numeric integration on 34s

*Message #8 Posted by **Paul Dale** on 14 June 2011, 3:21 a.m.,*
in response to message #7 by Marcus von Cube, Germany

Most of the stuff in the library folder shouldn't be included. Much of it is a copy of the xrom code of the same function. I.e. useful for explaining how the internals work and how some of the special commands are used but that is all.

- Pauli

Re: Numeric integration on 34s

*Message #9 Posted by **Marcus von Cube, Germany** on 14 June 2011, 4:43 a.m.,*

in response to message #10 by Jeff O.

Thanks Jeff! I leave it to Pauli to integrate it into the package.

Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #12 Posted by **gene wright** on 14 June 2011, 1:59 p.m.,*
in response to message #2 by Paul Dale

Below are the results from comparing the WP 34s built-in integration function vs. the PPC ROM converted IG routine.

PPC ROM IG Routine Example Function	WP 34s Built-in	WP 34s IG Program value
1 0 to 1: 4/(x^2+1)	3.141593	3.141593
2 0 to 1: x^(1/2)	0.666671	0.666667
3 0 to 1: Sin(PI*X)	0.636620	0.636620
4 0 to 1: LN(x)	-0.999147	-1.000000
6 0 to 2: (x(4-x))^(1/2)	3.141620	3.151593
8 0 to 1: COS(LN(x))	0.501097	0.500000
9 0 to 1: x^(-1/2)	1.967500	2.000000
10 0 to 1: (1 - x^2)^(1/2)	0.785405	0.785398
12 -1 to 1: ((1-x^2)(2-x))^(1/2)	2.203398	2.203346

The tests were fairly maddening. The 34s integrator gets its results very quickly, but sometimes is just off enough to irritate you. :-) The IG program takes longer most of the time but gets more "accurate" values.

Re: Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #13 Posted by **Marcus von Cube, Germany** on 14 June 2011, 4:29 p.m.,*
in response to message #12 by gene wright

The wp34s integrator uses a fixed number of points and does not iterate. It should be fairly easy to create a subinterval algorithm that divides the integration interval in two halves and integrates each part with the built in command. This can be redone several times until the combined results do not change

any more.

Re: Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #14 Posted by **gene wright** on 14 June 2011, 4:32 p.m.,*
in response to message #13 by Marcus von Cube, Germany

Well, the 34s integrator did a good job in many circumstances, but things like the quick result of 0.501097 to the COS(LN(X)) integral were disappointing as was the 1.9675 result to the SQRT(X) integral.

the next task I plan to try is a matrix series modeled after the M1 - M5 routines from the PPC ROM and the RRM application program from the PPC ROM.

Now THAT would make a good standard library program, IMO.

Re: Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #15 Posted by **Paul Dale** on 14 June 2011, 5:32 p.m.,*
in response to message #14 by gene wright

I was thinking JMB's matrix library would be well suited for this.

- Pauli

Re: Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #16 Posted by **gene wright** on 14 June 2011, 5:39 p.m.,*
in response to message #15 by Paul Dale

Ah, but given my slim programming skills :-) it is much more likely that I can re-write the PPC ROM routines to the 34s. Now if JMB or someone else can rewrite the Matrix library... Ha!

Seriously, matrix functions are "the" missing piece to the 34s, as it is now...as the developers know well. A library that can do systems of equations, determinants (of course to do the systems) and inverses would be a great thing to fill that gap.

Re: Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #17 Posted by **Paul Dale** on 14 June 2011, 5:33 p.m.,*
in response to message #12 by gene wright

Any idea what the error estimates returned by the 34s's integrator are?

- Pauli

Re: Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #18 Posted by **gene wright** on 14 June 2011, 5:42 p.m.,*
in response to message #17 by Paul Dale

Well, for the COS(LN(X)) integral, the Y stack level contains 0.002169.

Should have written down the others. :-)

Re: Test Results: 34s built-in integration vs. PPC ROM IG routine

*Message #19 Posted by **Paul Dale** on 14 June 2011, 6:21 p.m.,*
in response to message #18 by gene wright

The answer + or - the error estimate brackets the true integral nicely in this case at least.

What's needing is a wrapper that uses the built in integrator and subdivides the interval until the sum of the error estimates is small enough.

- Pauli

Hi,

I'm wondering how the WP34S (and also the PPC-ROM) can calculate this numeric integral at all, when the integrand x^(-1/2) is not defined at the left endpoint x=0?

Is there any code in the integration routine which checks for such 'undefined' function values, or is this integration algorithm just using function values at some midpoints of the sub-intervals?
Can these algorithms for numeric integration (used in the WP34S and PPC-ROM) be found anywhere?

Franz

Re: Numeric integration on 34s

*Message #21 Posted by **Paul Dale** on 14 June 2011, 7:03 a.m.,*
in response to message #20 by fhub

The 34s's integration code doesn't evaluate at the end points.

It uses a 10/21 point Gauss-Kronrod quadrature.

The freely available source code (in xrom.c) implements the algorithm.

More information can be found on the Internet by visiting your friendly search engine.

- Pauli

Well, that's good for such improper integrals! ;-)

Thanks for the info, I know a few integration methods but Gauss-Kronrod was new to me.

Franz

Re: Numeric integration on 34s

*Message #23 Posted by **Paul Dale** on 14 June 2011, 7:31 a.m.,*
in response to message #22 by fhub

Gauss-Kronrod quadratures are pretty much the standard these days. Their main benefit is that the function is evaluated for the Kronrod quadrature and the Gauss points are a subset. Thus you get two different order estimates of the integral which gives you an idea of the error.

Generally they are used with a fairly adaptive wrapper that increases the number of quadrature points -- this can be done while reusing the existing function evaluations if the points are carefully chosen. The 34s isn't this sophicated however.

Quite an interesting lump of theory :-)

- Pauli

Thanks, very interesting and detailled article! :-)
Of course Romberg is one of the standard methods, but so far I didn't know that it could also be used for improper integrals.

> I don't like the ominous Led glowing on picture 3.

Yes, but notice that it is not connected to the charger, and the batteries are dead, so it may just be a reflection from a camera flash. Still, I wouldn't want to trust that it is working properly. Note that the seller only states that it will "power up." Sounds like another infamous TAS seller we all know.

Re: Would you take a chance on this auction?

*Message #4 Posted by **Juergen Keller** on 13 June 2011, 4:36 p.m.,*
in response to message #3 by Michael de Estrada

I think you are right, it is a reflection from the flash. Aside from the engraving (luckily on the backside) it looks quite nice. Regarding the working condition: ask the seller to clarify this point.

I refuse to buy a calculator off ebay if it has a reserve price. I did it once and I will forever regret it.

The reserve is ridiculous.

Re: Would you take a chance on this auction?

*Message #7 Posted by **Michael de Estrada** on 13 June 2011, 2:32 p.m.,*
in response to message #6 by bill platt

The reserve just adds insult to injury. I don't bid on reserve auctions either, but this one is just plain silly.

Re: Would you take a chance on this auction?

*Message #8 Posted by **Steve Simpkin** on 13 June 2011, 3:25 p.m.,*
in response to message #1 by Michael de Estrada

The statements "This is a working vintage HP 29C calculator." and "The calculator will power up by connecting the leads of the charger to the prongs on the calculator." do not add up. The Woodstock charger puts out 10+ Volts of AC power. The AC voltage is half-wave rectified to convert it to DC, passed through a current limiting resistor and placed across the battery pack which acts as a regulator keeping the voltage below 3 Volts DC. Removing the battery pack and connecting the charger would supply over 10 Volts of AC power to the internal calculator circuity. This would likely damage the calculator circuitry not only by over-voltage stresses but by reverse polarity stresses as well (at minimum to the continuous memory IC). My conclusion is that this seller is lying.

Re: Would you take a chance on this auction?

*Message #9 Posted by **Ren** on 14 June 2011, 12:57 p.m.,*
in response to message #8 by Steve Simpkin

Just playing Devil's advocate...

But the pictures don't show the charger connected WITHOUT the battery pack installed, so maybe it hasn't been fried (like I clumsily did once).

Ren

dona nobis pacem

Re: Would you take a chance on this auction?

*Message #10 Posted by **Michael de Estrada** on 14 June 2011, 1:06 p.m.,*
in response to message #9 by Ren

You can damage the calculator by powering it up with the ac charger, even if there is a battery pack installed. If the battery pack is spent, as the seller readily admits, then its resistance can increase significantly to the point that it effectively acts like an open circuit. This is no different than powering

the calc from the charger with the battery pack removed, which is the condition that results in damage to the calc electronics. Also, corrosion on the contacts can result in high resistance as well.

Edited: 14 June 2011, 1:07 p.m.

HP9815A SOFTWARE

*Message #1 Posted by **Mary Santoro** on 13 June 2011, 10:50 a.m.*

I am looking to buy software for an older model 9815A in a cassette form. The program title is General Utility Routines and the program part number is 09815-10000 Rev E. Thank you. Mary

Re: HP9815A SOFTWARE

*Message #2 Posted by **Joel Setton (France)** on 14 June 2011, 3:21 p.m.,*
in response to message #1 by Mary Santoro

Hi Mary,

Greetings from a 9815 fan!

Unfortunately, this tape is very rare... and although similar requests have been posted on this forum before, I don't remember anyone responding positively.

The good news is that many of the programs from this tape are listed in the General Utility and Test Routines manual which is available on CD/DVD from this Museum. With a little bit of luck, the particular program you need is listed and all it takes is a little typing.

I hope this helps!

Joel Setton

Wp 34s awaiting overlay.

*Message #1 Posted by **Etienne Victoria** on 13 June 2011, 10:27 a.m.*

Just for the record,

Prior to Eric producing his overlays, I have tried a couple of tools to produce a Blanknut 30b.

Some findings:

- Avoid aceton (or similar solvent) as it will soften the key plastic and leave an ugly uneven surface.

- Dremel: avoid steel brushes (too harsh) and speeds beyond 6k rpm: this will heat the plastic and you get the above final result.

--> I have used a brass brush at 5k rpm and a LOT of patience.

--> Avoid ugly white decals like the ones I used because I was in a hurry.

As said above, this is just for the record because I expect Eric's overlay to look way better.

Anyway a couple of pics:

and all of them: here.

Best

Etienne

Re: Wp 34s awaiting overlay.

*Message #2 Posted by **Walter B** on 13 June 2011, 10:52 a.m.,*
in response to message #1 by Etienne Victoria

Bonjour Etienne,

très interessante. I expect the overlay staying excellently between the keys. Let's see how good it will perform on them. Maybe we'll return to your (and Pauli's) experience working on the keys directly. Thanks for sharing.

Walter

It's the right division symbol in my opinion, so I am keeping it.

It's hard to judge color from a photo. Do realize that it is likely that Gene's photo does not contain

specific colorspace information, his camera probably is not color calibrated, and your monitor may not be color calibrated, and unless all three match it won't do you any good to judge colors. You'll get some sample overlays in the mail soon.

However, I will say that due to limitations of printers, you're not going to get the same colors out of the printer that you see on the screen. In particular, the colors won't be as bright.

Eric

Re: Wp 34s awaiting overlay.

*Message #7 Posted by **db (martinez, ca.)** on 15 June 2011, 3:55 p.m.,*
in response to message #6 by Eric Rechlin

Yes Eric; the current division sign is correct because that's the one that's on my 41.
and
My computer shows each color a bit more pastel, the black less black and the white a bit less white - than the colors on your real overlay.

41CL's awaiting overlay.

*Message #8 Posted by **Mark Hardman** on 15 June 2011, 11:30 p.m.,*
in response to message #6 by Eric Rechlin

Eric,

I don't understand why you continue to tolerate Walter's attitude. If I were you, I'd change projects and try recouping the cost of my die cutter by producing 41CL overlays.

I for one would pay handsomely for, say, a 41Z overlay.

Mark Hardman

Re: 41CL's awaiting overlay.

*Message #9 Posted by **Paul Dale** on 16 June 2011, 12:08 a.m.,*
in response to message #8 by Mark Hardman

Bad attitude or almost maniacal attention to detail? Without the latter the 34s wouldn't have come out half the calculator it has.

Wouldn't it be possible to please everyone by including one extra key sticker with the other division symbol?

Two extra key stickers would include that and a comma for a decimal to really make everyone happy.

- Pauli

Re: 41CL's awaiting overlay.

Quote:

> I for one would pay handsomely for, say, a 41Z overlay.

Both HP 41 and HP 48 overlays are in the works. They will be slightly more expensive than the 20b/30b overlays, though, for various reasons, mainly due to the significantly increased labor cost and slightly increased consumable cost in producing them. Basically what I do is I use the adhesive vinyl of the 20b/30b overlays, but then I stick it on card stock to make it stiff (so it doesn't pop out of the slots), and cut the keys out entirely rather than just going through the top surface

But yes, I can make any overlay you want. Send me a scan/picture/drawing/whatever of the 41Z overlay and I will make you a replica in July. $8 shipped. Is this it? If so, it looks like it just consists of a regular 41 overlay plus a sticker for the Z key.

Eric

41Z Overlay

*Message #11 Posted by **Ángel Martin** on 16 June 2011, 3:21 a.m.,*
in response to message #10 by Eric Rechlin

Hi Eric, I should send you the latest / greatest 41Z overlay BMP, as it has some little changes from the one posted. Pls. send me your email address to nowake92atgmaildotcom and I´ll proceed.

Needless to say I´m also interested in having a couple of those ' and another for the SandMath, BTW.

Cheers, ÁM

in response to message #8 by Mark Hardman

Come on, Mark, the wp34s isn't your baby, is it? And we do - as other parents do - want our baby looking cute. Anyway, an obelus on the division key is a logical inconsistency as explained before.

Walter

*Message #13 Posted by **Paul Dale** on 16 June 2011, 8:01 a.m.,*
in response to message #1 by Etienne Victoria

Overlays arrived.

One applied so far and it is much better than the one I made (which was a right pain to get off & I suspect these will be too). Went on quite easily and looks great.

Re: Wp 34s installing overlay.

*Message #14 Posted by **Gerry Schultz** on 16 June 2011, 12:33 p.m.,*

in response to message #13 by Paul Dale

Hi Eric:

I got my overlays but haven't installed them yet. I've been thinking what's the easiest way to put the overlay on once and not have to reapply it to get it centered on my 30b buttons. I'm thinking of cutting out all the button overlays and remove the bottom row of backing to expose the adhesive and put a slight bow in the overlay. Then, turning the calculator upside down, place the upper half of the overlay on the 30b and center it over the keys. When I'm satisfied, smooth down the bottom of the overlay using a pencil eraser to anchor it to the calculator. Then peel off the rest of the backing and finish sticking it down. The remove the backing on the individual buttons and stick them down separately.

Now that I have the overlays, it will take some time to cut out the button labels. If you think this installation procedure will work, would you consider punching the button overlays through the backing cover for easier removal and putting a seam in the backing so part of it can be removed easily for aligning and setting the overlay? I will try to install mine this weekend to see how it works. I'm glad I bought four of them in case I screw up.

Gerry

Re: Wp 34s installing overlay.

*Message #15 Posted by **Eric Rechlin** on 16 June 2011, 1:30 p.m.,*
in response to message #14 by Gerry Schultz

No need to punch out the buttons separately. Just peel the main part of the overlay off the backing. It's relatively stiff but still will bow a bit. Let it sag down in the middle and stick that part down first. Slowly lower it onto the area around the 7-8-9 keys or the row above and make sure it's perfectly centered around the keys. Let it fall once it is. Then work your way up and down the rows, pushing the overlay down one row at a time. If it seems a little misaligned, if you are very careful you might be able to pull it up and try again, but instead you could maybe very carefully stretch the overlay (if it's coming short) to better fit around the keys. You have no more than about a half millimeter of clearance, so you have to get it just right.

Once you've done the overlay, the keys will be simple. I used a tweezers so I could better see what I was doing (to make sure they weren't crooked) and so I wouldn't reduce the effectiveness of the adhesive with oil from my fingers, but some have reported success with their fingers as well.

Wp34s STAT and PRG doubts

*Message #1 Posted by **Cristian Arezzini** on 13 June 2011, 2:47 a.m.*

Here are two more things that might be bugs or intended behavior... I didn't find informations on the manual telling me either way.

1) I have entered several data points with Sigma+. Then I chose, from the STAT catalog, x^ (the ^ goes above the x of course), and the calc showed a numerical value, and "Linear" on top. If then I press the up/down arrows, on the top line, I see the contents of the program memory, and the numerical value changes according to the step that is displayed above. I know next to nothing about statistics, but this looks like a strange behavior...

2) If I want to write a program that as the first thing, it duplicates what is in x to y (like the DUP command of RPL), I have to put two ENTER steps. I thought just one should do. Why does the first ENTER do nothing?

Thanks, Cristian

What did you expect the up and down arrows to do here?

They are in fact single stepping whatever program you have in memory & even if you don't have a program, they'll show step 000. The x^ operation has finished.

You are probably getting caught by ENTER duplicating x into y and disabling stack lift. If you enter a number after ENTER, whatever in x is destroyed. As a fix RCL X should do what you want.

You're right. I was fooled by the fact that the top row said "linear" - other functions I usually use don't say anything on the top row - so I thought there was some choice to do, or something like that. The fact that I posted that around 5am didn't help! :) Sorry!

> Quote:

I see. I don't actually enter a number after, but execute RAN# (I want to multiply X by a random number, but keeping a copy on y). I didn't think about the stack lifting being disabled. I tried RCL X and it works. It works exactly like a DUP, right?

Thanks again, Cristian

Yes, RCL X is equivalent to DUP.

RAN# will replace the X register if stack lift is disabled. Plenty of other commands will as well.

Another sequence that should work and which is shorter is:

```
RAN#
RCL* Y
```

Single-stepping through WP34s programs

*Message #5 Posted by **Dieter** on 13 June 2011, 4:09 p.m.,*
in response to message #2 by Paul Dale

While we're on this topic: debugging 34s programs with the single-step key (down-arrow) always felt a bit ...strange for me. Now I think I know why:

While stepping through a program the 34s displays the *previous* step that *has* already been executed. So the numeric display shows the *result after* the step that is displayed in the upper line. In all other HPs I know of the display shows the *next* step that *will be* executed as soon as the SST-key is pressed. Makes more sense to me: on the 34s you never know what comes next. What do you think?

Dieter

A simple wp34s mini-challenge

*Message #1 Posted by **Gerson W. Barbosa** on 12 June 2011, 7:43 p.m.*

Quoting from the Wikipedia article on Ramanujan:

"Imagine that you are on a street with houses marked 1 through n. There is a house in between (x) such that the sum of the house numbers to left of it equals the sum of the house numbers to its right. If n is between 50 and 500, what are n and x?"

Other HP RPN calculators can be used, but only on the wp34s this can be done in 18 steps or less (LBL and RTN included) using the method I have used. It is possible Ramanujan's method based on continued fractions allows for an even smaller program, but I am not aware of it. A solution based on his method is much welcome, no matter the program size, in case anyone knows it.

Re: A simple wp34s mini-challenge

*Message #2 Posted by **Paul Dale** on 12 June 2011, 8:55 p.m.,*
in response to message #1 by Gerson W. Barbosa

Interesting challenge. I've no idea about the continued fraction solution.

I suspect the 16c can do this in 18 steps too although I might be wrong here. Anyway the 34s can do a bit better than that:

```
001: LBL A
002: 5
003: 0
004: 0
005: STO I
006: RCL I
007: x^2
008: RCL+ I
009: SR 01
010: SQRT
011: FC? C
012: RTN
013: DSZ I
014: BACK 08
```

This requires the device to be in integer mode with a sufficient word size (19 or 20 minimum I think -- I used 64) and decimal base. Press A and *x* is returned in the display. *n* is in register I.

If you don't allow an integer mode start, change steps 2, 3 & 4 to:

```
002: 5
003: S.L 02
004: BASE 10
```

Actually, the base doesn't matter here. We just need to be in integer mode. I love the S.L and S.R commands :-)

How did I arrive at this? A little algebra. The sum of the numbers to the left of x is *x (x-1) / 2*. The sum of the numbers to the right is *(n + x + 1) (n - x) / 2*. From this you get that *n (n+1) / 2 = x^2* at the solution both

sides must be integral. The divide by two is safe since *n^2 - n* is always even. So we need to check the square root for being integer. Fortunately integer mode square root sets carry if there is a remainder.

- Pauli

Edit: return *n* in register I instead of *n+1*.

Edited: 12 June 2011, 9:22 p.m.

Re: A simple wp34s mini-challenge

*Message #3 Posted by **Paul Dale** on 12 June 2011, 9:26 p.m.,*
in response to message #2 by Paul Dale

And an improvement. Replace lines 2 through 4 with MASKR 09 giving a 12 step solution:

```
001: LBL A       entry label
002: MASKR 09    511
003: STO I       save in the n register
004: RCL I       beginning of loop: get n
005: x^2         n^2
006: RCL+ I      n^2 + n
007: SR 01       (n^2 + n) / 2 no chance of carry here
008: SQRT
009: FC? C       integer answer for the square root?
010: RTN         yes then we've finished
011: DSZ I       decrement the loop counter
012: BACK 08     back to the top of the loop
```

- Pauli

Re: A simple wp34s mini-challenge

*Message #4 Posted by **Gerson W. Barbosa** on 12 June 2011, 9:41 p.m.,*
in response to message #2 by Paul Dale

Very quick solution! I wonder if Ramanujan was as fast :-)

I have not used a good method, it would have taken too long if done by hand (too many quadratic equations to solve). Anyway, it works:

```
 sum of the house numbers to left: x*(x-1)/2

sum of the house numbers to right: n*(n+1)/2 - x*(x+1)/2

x*(x-1)/2 = n*(n+1)/2 - x*(x+1)/2

x*(x-1)/2 - (n*(n+1)/2 - x*(x+1)/2) = 0

which simplifies to

2*x^2 - n^2 - n = 0

Now, all is left to do is solving the quadratic equations for n = 50 and above and
checking for positive roots.

001 LBL A
002 FILL
003 2
004 ENTER^
```

```
005 0
006 R^
007 x^2
008 RCL+ L
009 +/-
010 SLVQ
011 FP
012 x=0?
013 SKIP 03
014 R^
015 INC X
016 GTO A
017 Rv
018 RTN

50 A   -->   x
x<>y   -->   n
```

Regards,

Gerson.

Re: A simple wp34s mini-challenge

*Message #5 Posted by **Paul Dale** on 12 June 2011, 10:03 p.m.,*
in response to message #4 by Gerson W. Barbosa

If we can input the loop starting value before running the program...

```
001: LBL A
002: STO I
003: RCL I
004: x^2
005: RCL+ I
006: SR 01
007: SQRT
008: FC? C
009: RTN
010: INC I
011: BACK 08
```

50 A to execute. x is in the display. RCL I for n.

- Pauli

Re: A simple wp34s mini-challenge

*Message #6 Posted by **Paul Dale** on 12 June 2011, 10:21 p.m.,*
in response to message #5 by Paul Dale

And a version that doesn't use a register:

```
001: LBL A
002: FILL
003: *
004: +
005: SR 01
006: SQRT
007: FC? C
008: RTN
009: Rv
010: INC X
011: GTO A
```

As above, 50 A to run. x in in the display. X<>Y to get n.

And if we had included the fused multiply add instruction steps 3 and 4 could be merged. Sadly it

isn't in the firmware.

Here is a HP-16c program in 17 steps that works like the above albeit glacially slowly:

```
001-43,22, A  LBL A
002-       36  ENTER
003-       36  ENTER
004-       36  ENTER
005-       20  *
006-       40  +
007-        2  2
008-       10  /
009-  43   25  SQRT
010-43, 6, 4  F? 4
011-   22  1  GTO 1
012-  43   21  RTN
013-43,22, 1  LBL 1
014-       33  Rv
015-        1  1
016-       40  +
017-   22   A  GTO A
```

I thought it could be done.

- Pauli

I'll leave a program to calculate this as an exercise :-)

- Pauli

Re: A simple wp34s mini-challenge

*Message #12 Posted by **Gerson W. Barbosa** on 13 June 2011, 2:37 a.m.,*
in response to message #11 by Paul Dale

For solving, I'll choose Dario Alpern's solver. A program based on continued fractions would be a bit larger but would run significantly faster. The general solution for $2*x^2 - y^2 - y = 0$ is

$$x_{n+1} = 3*x_n + 2*y_n + 1$$
$$y_{n+1} = 4*x_n + 4*y_n + 1$$

Here is a 42S program to display the solutions:

```
00 { 44-Byte Prgm }
01>LBL "R"
02 0
03 STO 00
04 STO 01
05>LBL 00
06 3
07 RCL* 00
08 2
09 RCL* 01
10 +
11 1
12 +
13 4
14 RCL* 00
15 3
16 RCL* 01
17 +
18 1
19 +
20 STO 01
21 X<>Y
22 STO 00
23 STOP
24 GTO 00
25.END.
```

Notice the solutions are successive approximants to sqrt(2), when divided by each other.

They used to solve this kind of problem centuries ago, only it took a little longer :-)

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv018.cgi?read=145904

(I knew I'd seen this before...)

Gerson.

Re: A simple wp34s mini-challenge

*Message #13 Posted by **Gerson W. Barbosa** on 13 June 2011, 5:37 p.m.,*
in response to message #11 by Paul Dale

Thanks for the link!

The trick is to transform the equation we'd already found

$m^2 + m - 2n^2 = 0$

into an easier to solve Pell's equation:

$$m^2 + m = 2n^2$$
$$m^2 + m + 3m^2 + 3m + 1 = 2n^2 + 3m^2 + 3m + 1$$
$$4m^2 + 4m + 1 = 2n^2 + 3(m^2 + m) + 1$$
$$(2m + 1)^2 = 2n^2 + 6n^2 + 1$$
$$(2m + 1)^2 - 8n^2 = 1$$
$$(2m + 1)^2 - 2(2n)^2 = 1$$

Let $m + 1 = x$ and $2n = y$:

$x^2 - 2*y^2 = 1$

Now the problem is ready to be quickly solved by the following HP-42S program:

```
00 { 70-Byte Prgm }             27 1/X
01>LBL "R"                      28 FP
02 2                            29 STO 03
03 SQRT                         30 1/X
04 STO 01                       31 IP
05 IP                           32 STO 04
06 STO 02                       33 RCL 07
07 LAST X                       34 STO 05
08 FP                           35 RCL 02
09 STO 03                       36 X^2
10 1/X                          37 RCL 06
11 IP                           38 X^2
12 STO 04                       39 STO+ X
13 1                            40 -
14 STO 05                       41 1
15 STO 06                       42 X=Y?
16>LBL 00                       43 XEQ 01
17 RCL 02                       44 GTO 00

                        80782
```

I'll leave optimization and porting to wp34s as an exercise :-)

Gerson.

P.S.: Be warned this is my own algorithm for generating the approximants to sqrt(N), which means there is quite room for improvement.

```
TurboBDC code
Program Pell;
var b, c, d, k, n, n0, r, s, t, x: Real;
function Sqrt(x: Real): real;
var s, t: Real;
begin
  if x<>0 then
    begin
      s:=x/2;
      repeat
        t:=s;
        s:=(s+x/s)/2
      until s=t;
      Sqrt:=s
    end
    else
      Sqrt:=0
end;
begin
  ClrScr;
  ReadLn(k);
  ClrScr;
  r:=Sqrt(k);
  n0:=1;
  d:=1;
  n:=Int(r);
  b:=Frac(r);
  c:=Int(1/b);
  repeat
    t:=n;
    n:=c*n+n0;
    d:=Int(n/r+0.5);
    b:=Frac(1/b);
    c:=Int(1/b);
    n0:=t;
    if (n*n-k*d*d)=1
      then
        WriteLn(n:10:0,'  /',d:9:0,'   = ',n/d:19:16);
  until Abs((n/d)-Sqrt(k))<1e-16;
  Writeln;
  Writeln(' ':14,'Sqrt(',k:3:0,' ) = ',r:19:16)
end.
```

Re: A simple wp34s mini-challenge

*Message #14 Posted by **Günter Schink** on 14 June 2011, 2:26 p.m.,*

in response to message #13 by Gerson W. Barbosa

Hi Gerson,

if you want it really fast, then try this one on your 42S(or on the WS34). This program will stop and show matching "n" and "x" in Stack y and x. Continue with R/S to see the next pair. I've left out the "50" and "500" condition. You'll see why :-)

```
00 { 44-Byte Prgm }
01>LBL "S"
02 0
03 1
04>LBL 00
05 RCL ST Y
06 RCL+ ST Y
07 X<>Y
08 RCL+ ST Z
09 RCL+ ST Z
10 RCL ST Y
11 X^2
12 2
13 ×
14 RCL ST Y
15 X^2
16 X<Y?
17 X<>Y
18 Rv
19 RCL ST Y
20 RCL× ST T
21 STOP
22 Rv
23 Rv
24 GTO 00
25 .END.
```

Re: A simple wp34s mini-challenge

*Message #15 Posted by **Gerson W. Barbosa** on 14 June 2011, 4:03 p.m.,*
in response to message #14 by Günter Schink

Wow! Really fast and optimized!

And you can optimize it even further if you replace lines 12 and 13 with

```
12 STO+ ST X
```

This will save one byte and one step.

Thank you for your valuable contribution!

Gerson.

Re: A simple wp34s mini-challenge

*Message #16 Posted by **gene wright** on 14 June 2011, 4:37 p.m.,*
in response to message #14 by Günter Schink

I believe the 34s will require the first few steps to be 0 ENTER 1. The 34s stores numbers one digit per line and so 0 1 is just 1.

That will be something to watch out for if converting programs from the 42s / 41c to the 34s.

FYI.

*Message #17 Posted by **Günter Schink** on 14 June 2011, 5:31 p.m.,*
in response to message #16 by gene wright

Hi Gerson and Gene,

your comments made me delete some lines. But now the values 0 and 1 must be on the stack. I have also added some comments, because I think the code is rather kryptisch :-)

A and B are auxiliarey "vars". Instead of using the complicated continuos fraction algorithm the following rules apply:

A_new = A_old + B_old ; B_new = B_old + 2*A_old

x=A*B n= MIN(2A^2;B^2)

put 0 and 1 on the stack and then XEQ "S"

```
00 { 39-Byte Prgm }
01>LBL "S"
02 RCL ST Y                     #RCL A_old
03 RCL+ ST Y            #add B_old giving A_new
04 X<>Y                         #get B_old in front
05 RCL+ ST Z            #add A_old twice
06 RCL+ ST Z            #giving B_new
07 RCL ST Y                     #get A_new to calculate 2*A_new^2
08 X^2
09 STO+ ST X
10 RCL ST Y                     #get B_new to calculate B_new^2
11 X^2
12 X<Y?                         #we need the smaller one
13 X<>Y                         #put the larger one in front if necessary
14 Rv                           #and drop it, leaving "n" on stack
15 RCL ST Y                     #get B_new
16 RCL× ST T            #multiply with A_new giving "x"
17 STOP                         #show "n" and "x" on stack Y and X
18 Rv                           #do away with "n" and "x"
19 Rv                           #leave A_new and B_new an stack Y and X
20 GTO "S"                      #calculate the next pair, A_new and B_new now
becoming A_old and B_old
21 .END.
```

Re: A simple wp34s mini-challenge

*Message #18 Posted by **Gerson W. Barbosa** on 14 June 2011, 8:07 p.m.,*
in response to message #17 by Günter Schink

Günter,

I'd rather keep the values 0 and 1 inside the program. It is possible to achieve this on the wp34s using two steps. That's a good reason to define 0^0 = 1 :-)

```
001 LBL B
002 CLSTK
003 y^x
004 RCL Y
005 RCL+ Y
006 X<>Y
007 RCL+ Z
008 RCL+ Z
```

```
009 RCL Y
010 X^2
011 STO+ X
012 RCL Y
013 X^2
014 X<? Y
015 X<>Y
016 Rv
017 RCL Y
018 RCL× T
019 STOP
020 Rv
021 Rv
022 BACK 18
```

Regards,

Gerson.

*Message #19 Posted by **Paul Dale** on 14 June 2011, 8:12 p.m.,*
in response to message #18 by Gerson W. Barbosa

There is another way, in fact lots of ways.

```
iC 00
iC 01
```

or

```
CLSTK
NOT
```

Might make for an interesting challenge all on its on.

Pity I didn't define complex versions of the internal constants -- then it would be possible in a single step :-)

in response to message #19 by Paul Dale

Quote:

```
CLSTK
NOT
```

Missed that one. It has the advantage to save yet one more byte in the HP-42S program.

Gerson.

Re: A simple wp34s mini-challenge

*Message #21 Posted by **Günter Schink** on 15 June 2011, 11:25 a.m.,*
in response to message #18 by Gerson W. Barbosa

As I'm aiming more for the 42S and here for the Free42, I'd like to leave the input outside of the program, not only would the inclusion add 2 superficial lines it also required an additional local label.

When playing around to get this piece done I didn't really squeeze the last byte out of it, because my main problem was to recall something I dealt with 25 years ago, when I ran into a similar mini-challenge. "Scrooge" didn't remember how rich he was, but knew he had something between 500.000 and a million Golddollars, and they could be layed down either as a square or a triangle. Like in this mini-challenge there was a lot discussion how to optimize the necessary loops. Then I came with my 1 line BASIC program and the discussion was over.

okay, here is my next optimization, with a slightly different approach, and some lines less :-)

put 0 and 1 on the stack, then XEQ "S"

```
00 { 33-Byte Prgm }
01>LBL "S"
02 RCL+ ST Y
03 STO+ ST Y
04 X<>Y
05 RCL ST Y
06 X^2
07 STO+ ST X
08 RCL ST Y
09 X^2
10 X<Y?
11 X<>Y
12 Rv
13 RCL ST Y
14 RCL× ST T
15 STOP
16 Rv
17 Rv
18 GTO "S"
19 .END.
```

BTW, I'm not at all an expert in math. The solution is based on simply analyzing the figures found with brute force that time 25 years ago. The hint to the continoues fraction approach now sheds some light on my findings.

Günter

Yes, that's essentially the same problem as it can be described by the same equation, $m^2 + m = 2n^2$. Are you sure the specified range is correct? Here is a brute-force one-liner:

```
1 FOR I%=1 TO 1000: R=SQR(I%*(I%+1)/2): IF (R-INT(R))<>0 THEN NEXT
ELSE PRINT I%*I%: NEXT
run
```

```
 1
 64
 2401
 82944
Ok
```

> Quote:
>
> BTW, I'm not at all an expert in math.

Neither am I.

> Quote:
>
> The solution is based on simply analyzing the figures found with brute force that time 25 years ago.

Very insightful analysis, I would say. Congrats!

Gerson.

>  64
>  2401
>  82944
> Ok
> ```

You would need R to be squared. I% is the base of the triangle, thus the results are wrong.

concerning the boundaries, I now believe the upper limit of "Scrooge's" dollars was two millions.

Günter

Re: A simple wp34s mini-challenge

*Message #25 Posted by **Guenter Schink** on 23 June 2011, 3:50 p.m.,*
in response to message #24 by Gerson W. Barbosa

Hi Gerson

squeezing is fun :-)

so here is the next condensed Free42 approach, that's really short.

clear the stack and then XEQ "T"

R/S will show the next pair of m and n

```
00 { 30-Byte Prgm }
01>LBL "T"
02 RCL ST X
03 RCL+ ST Z
04 STO+ ST X
05 RCL+ ST Z
06 1
07 +
08 RCL ST X
09 RCL+ ST T
10 RCL+ ST Z
11 STOP
12 GTO "T"
13 .END.
```

Günter

*Message #26 Posted by **Gerson W. Barbosa** on 26 June 2011, 9:35 a.m.,*
in response to message #25 by Guenter Schink

Really impressive! On the 34s you would need only 11 steps, or 13 if you wanted to press A and R/S for each pair:

```
001 LBL A
002 CLSTK
003 RCL X
004 RCL+ Z
005 STO+ X
006 RCL+ Z
007 INC X
008 RCL X
009 PSE 10
010 RCL+ T
011 RCL+ Z
012 STOP
013 BACK 10
```

Gerson.

Re: A simple wp34s mini-challenge

*Message #27 Posted by **Gerson W. Barbosa** on 27 June 2011, 7:25 p.m.,*
in response to message #26 by Gerson W. Barbosa

```
001 LBL A
002 CLx
003 2
004 SQRT
005 INC X
006 x^2
007 *
008 INC X
009 IP
010 STO
011 BACK 08
```

This will generate the sequence

```
1, 6, 35, 204, 1189, 6930, 40931,...
```

Hi,

as the 42S doesn't have the INC nor the BACK commands, I think there's little room, if at all, to make that code shorter.

I think I leave this how it is now.

Have fun, Günter

HP-41 Advanced Matrix Pac Question

*Message #1 Posted by **mbrethen** on 12 June 2011, 4:46 p.m.*

Angel,

Would you please explain how the New Matrix Input mode works?

Also, are the dimensioning, storing and recalling functions on the advantage module compatible with this module?

Re: HP-41 Advanced Matrix Pac Question

*Message #2 Posted by **Ángel Martin** on 13 June 2011, 2:41 a.m.,*
in response to message #1 by mbrethen

The first thing to say is that with just a couple of exceptions, every matix function from the Advantage pac is kept untouched, same functionality, same XROM id#, etc. The "Advanced Matrix Pac" builds upon the Matrix set of the advantage, leaving that one unmodified.

So you'll start by using MATDIM to create your matrix, same as always. Then it comes your choices to enter/input the matrix elements. You can used MEDIT as always, or you can use IMR (Input Matrix by Rows) or IMC (input Matrix by Columns). Either one of these three will prompt sequentially for each element, in the corresponding order until the matrix is completed.

Or you can use PMTM (Prompt Matrix), which will prompt for all row elements together as a single entry. To enter them just press ENTER^ after each element (which will write a blank space to separate the string into different numeric values), and terminate the sequence with R/S. The prompt will then ask for the next row, and so until all rows are completed.

The only input parameter is the matrix name in ALPHA. The advantage of this method is ithat it's much quicker and convenient than asking for each element individually. The limitation is that it doesn't support exponents. i.e. 1,23 E-02 - so you need to use the traditional methods if your matrix includes these.

Example: with "TEST" in ALPHA, type 3,004, MATDIM to create the matrix in X-MEM. Them execute PMTM to see:

"R1: _" -> type: 11 ENTER^ 12 ENTER 13 ENTER^ 14 R/S
"R2: _" -> type: 21 ENTER^ 22 ENTER^ 23 ENTER^ 24 R/S
"R3: _" -> type: 31 ENTER^ 32 ENTER^ 33 ENTER^ 34 R/S

Done. You can review the matrix using OMR or OMC to check.

The keyboard is redefined during data entry to accept only nummeric values plus control characters, so you're writing in Alpha and the display simultaneously even if no ALPHA indicator is on.

As you type in do you'll see the "strings" being filled with your entries, each separated by a blank space when you press ENTER^. You can use the back arrow to cancel wrong digits, and also the CHS key for negative numbers, as well as the radix key for decimal parts of course. The logic won't let you input wrong

combinations of these.

If you input more elements per row than the number of matrix columns, the exceeding ones will just be ignored - so you need to remember your matrix dimension during the process. Also you can't exceed 24 characters in total, or the ALPHA register will overflow. If you do, only the rightmost 24 will be taken of course.

However inputing fewer elements that the number of columns on any of the ROW sequences will simply abort the data entry process after pressing R/S.

That's how it works, hopefully intuitive and sensible enough to be useful and practical - of course it ain't perfect and sure enough you can trick it if you really mean to.

Cheers, "AM

in response to message #2 by Ángel Martin

The PMTM entry works very well, however the eigenvalue functions (CHRPOL, EIGEN, VP3X3) don't take advantage of this? I did see that flag 06 is used to determine if a matrix exists. Maybe I'm not putting the matrix in the proper registers?

Edited: 14 June 2011, 5:26 p.m.

Re: HP-41 Advanced Matrix Pac Question

*Message #4 Posted by **Ángel Martin** on 15 June 2011, 1:37 a.m.,*
in response to message #3 by mbrethen

The only program using PMTM is "MATP", the driver for the matrix product. Remember that PMTM does not allow number entry in SCI or ENG modes, thus it'll be frustrating if it was the default mode. Therefore I used IMR as default.

Yes flag 6 controls whether the matrix is already entered, so you can skip the data entry process (when F6 is set). Those programs don't use registers, but X-MEM files instead, all you need is to name the matrix (which you can enter using PMTM if you wish) as it's expected by the program, as follows:

for EV3X3: "E3"
for EIGEN: "AA"

This doesn't apply to CHRPOL or JACOBI though, can't skip the data entry for those.

Lastly, CHARPOL will return the coefficients of the characteristic polynomial but to obtain its roots you'll need to plug in the ALGEBRA module, as there's a call to the RTSN program from that ROM.

TOS = "The Other Site"

euphemisn we need to resort to to avoid using the URL or any descriptive reference to the other dedicated 41 site, as it seems to be some kind of "trapping mechanism" in the museum forum preventing messages with those contents from being posted.

Oh my god, I didn't know that such animosities also exist between science/math/calculator sites (I know such nonsense only from computer chess sites and fora ;-)).

So I guess I know what you mean by TOS: a site with a big HP-41CX on the intro

page, and W.F. as author!?
Well, I'm visiting it almost daily, so it seems I've not missed anything ... :-)

Franz

Re: HP-41 Advanced Matrix Pac Question

*Message #10 Posted by **mbrethen** on 16 June 2011, 5:10 p.m.,*
in response to message #6 by Angel Martin

Angel,

I found a user program on TOS forum that uses routines from the MATHSTAT (or MATH I) module. It computes the characteristic equation and eigenvalues of matrices of order 2, 3, 4, and 5. The coefficients of the characteristic polynomial are computed directly, then the roots of the polynomial are solved. MATRIX is run first to enter the matrix elements, then both DET (XROM 01,06) and ROOTS (XROM 01,12) are called.

Any reason why I couldn't do the same with the IMR (or PMTM), MDET and POLYN functions from the Advanced Matrix Pac?

Edited: 16 June 2011, 7:06 p.m.

Re: HP-41 Advanced Matrix Pac Question

*Message #11 Posted by **Ángel Martin** on 17 June 2011, 2:21 a.m.,*
in response to message #10 by mbrethen

You can use any combination / variation to solve the type of problem you describe. I'd certainly not use the MATH Pac anymore, as the CCD Matrix implementation is light-year's ahead.

Just be aware that the register usage is not compatible between programs, so whatever you found at TOS will certainly need some modification if you want to exchange the MathPac programs with the Advanced Matrix functions.

CHRPOL is for me the way to go, even if it "requires" RTSN to obtain the roots.
JACOBI is for symmetrical matrices (calculates the roots BTW), and of course EV3X3 is a particulat case for n=3.

*Message #12 Posted by **Ángel Martin** on 17 June 2011, 7:11 a.m.,*
in response to message #11 by Ángel Martin

Lest to forget EIGEN, using SOLVE to iteratively obtain ONE eigen-value within a specific interval.

I'm not familiar with the CCD Module. What is it used for?

Re: HP-41 Advanced Matrix Pac Question

*Message #14 Posted by **Ángel Martin** on 17 June 2011, 3:07 p.m.,*
in response to message #13 by mbrethen

The CCD Array functions are the basis of the Advantage Pac Matrix Functions. Same conceptual design, same approach. Believe it or not, HP bought the rights from W&W (the company that did the CCD).

34s conversions

*Message #1 Posted by **gene wright** on 12 June 2011, 2:36 p.m.*

When I started typing this, it was to say that "Looks like the km -> miles conversion is wrong" because I had input 1 and the km->mile conversion was showing 0.9 something, which of course is not right. However, strangely enough, in the time it took me to get ready to type this, I stepped through the entire CONV catalog with a 1 as an input and checked against the values shown in the catalog (or the formulae shown) to see whether it matched. Very odd, because now 1 km->miles shows the 0.62... value it should. Could anything be off in the code of this section that might cause what I observed? I truly :-) don't think it was user error.

However, stepping through the catalog and the manual...

bar->Pa and Pa->bar are not in the manual on the table starting on page 66 but are in the machine.

mbar->Pa and Pa->mbar are in the table but not in the CONV catalog in the machine.

I would suggest checking the table on pages 68ff against the contents of the CONV catalog on the 2.0 machine.

Re: 34s conversions

in response to message #1 by gene wright

> Quote:
>
> I would suggest checking the table on pages 68ff against the contents of the CONV catalog on the 2.0 machine.

I would suggest checking said table in the current manual against the contents of the CONV catalog on the 2.0 machine ;-) We exchanged two pressure conversions recently (exactly those you found).

When testing, please make sure you start with the wp34s in a defined state. I've experienced strange results on the emulator sometimes, too, but only in the first operation. Especially if starting the emulator after loading a new build a RESET helps.

Hope that explains what you've seen.

Walter

Re: 34s conversions

*Message #3 Posted by **Gene wright** on 12 June 2011, 4:08 p.m.,*
in response to message #2 by Walter B

Ah, but I was looking at the 2.0 documentation and the flash version is the 2.0 one, revision 1085 from yesterday.

Check commands for 2.0: RCFRG and RCFST are present in X.FCN catalog on my flashed physical 34s. That's 2.0 only, isn't it? These commands are present in my machine and my CONV catalog does not have the mbar conversion that the 2.0 documentation suggests is present.

So, the issue existed at least with the 1085 flash version.

Were you checking with an emulator or a physical flashed unit?

Re: 34s conversions

*Message #4 Posted by **Walter B** on 12 June 2011, 6:01 p.m.,*
in response to message #3 by Gene wright

Hmmh, I don't know where you were looking at. Take the manual with #1085 on the title (committed under #1086), and you'll find on page 68 the conversion bar->Pa and on page 70 Pa->bar, perfectly matching the SW. So, what's your issue?

This holds for the flash as well as for the emulator.

Warning (though repeated some times already): The build numbers of SW and manual shall match, though not every build will result in a new manual revision. Moving targets, you know.

Walter

Re: 34s conversions

*Message #5 Posted by **gene wright** on 12 June 2011, 6:24 p.m.,*
in response to message #4 by Walter B

My "issue" as you so helpfully framed the discussion was that the 2.0 manual which has no identifier in it has a table of conversions different from the build from a few days ago. The Emulator presently downloadable does not seem to have a "build" number associated with it, that I can find.

You have now successfully solved my "issue" by pointing out that the 2.0 manual in the emulator does not have a build number associated with it, hence the discrepancy.

Re: 34s conversions

*Message #6 Posted by **Walter B** on 12 June 2011, 7:06 p.m.,*
in response to message #5 by gene wright

Gene,

Calm down. The only point is you publicly claim a discrepancy which - based on the information you kindly gave us - cannot be reproduced. If stating that is what you call an insult then I'm sorry - I wasn't aware insulting is so easy. But, master - for sure you know already, then I apologize three times in advance, but nevertheless - VERS will tell you the build number. And:

> Quote:
>
> You have now successfully solved my "issue" by pointing out that the 2.0 manual

> in the emulator does not have a build number associated with it, hence the discrepancy.

I wonder where you saw me "pointing out" that? Since it's plain wrong: When you open said "manual in the emulator" you will immediately see the title picture telling you "34s 2.0 1089" right now. The last four digits are the "build number associated with it". So each and every manual we publish for months has an identifier in it. Your luck I'm not as insult-prone ... [;-)

Sorry, if anybody claims our work being faulty, then this person shall prove it. If (s)he can - fine - we've shown many times we listen and improve. If (s)he can't - well - "wer austeilt, muss auch einstecken können" as people say here. FWIW.

Walter

Re: 34s conversions

*Message #7 Posted by **gene wright** on 12 June 2011, 10:24 p.m.,*
in response to message #6 by Walter B

Thank you, Walter. VERS returns no # when executed on this physical machine for reasons of which I am aware.

Perhaps you assume too much from those with whom you communicate. That was my original reason why I suggested creating a much more user-friendly manual and why I had requested the Word version of your manual as a starting point.

I would still like to have a Word version of your document to save me (and others) a great deal of time to create a manual with much less "assumed".

Thanks...

Re: 34s conversions

*Message #8 Posted by **Walter B** on 13 June 2011, 3:31 a.m.,*
in response to message #7 by gene wright

Thanks, Gene, for the explanations. I googled the phrase that you are "not particularly upset" about - BTW then I don't want to hear you upset [[;-) - and found nothing justifying any upset IMHO. But "issue" turns out having a lot of meanings, so maybe I missed one using English as a foreign language. I used that expression thinking of "Was ist jetzt eigentlich dein Problem?" being a very common phrase in such context here. Since "translates poorly" isn't a real explanation IMHO, I'd appreciate an enlightenment what was wrong with this sentence - just for sake of curiosity and continuous improvement.

OTOH I read texts here claiming plain wrong stuff more than once (well, they look plain wrong to me at least, like e.g. "there's no identification number in the manual"). So I try rectifying this but it seems the author didn't even notice the error :-? Very confusing!

Maybe I got it fundamentally wrong: I thought this being an international forum here. But it seems knowledge of all sorts of slang, local TV shows and movies is required from participants coming from beyond the English speaking world (yes, there is one, and it will survive), while the requirements on the other side are a bit lower ... :-(

(I'll never forget my family and me ROFL reading a "professional" multilingual ad in a San Diego hotel some years ago: it was "translated" into German - well, into what the translator meant (thought??) being German ... And we had good reasons to assume it happened in more languages there.)

So I sign off modestly wishing the educated people of this planet would learn one (!) second language at least, just to get a broader view (and maybe for symmetry reasons as well). But I know Xmas is still some months to come. My apologies for any wrong words, terms, contextual meanings, spellings etc. I may have picked.

Walter

Addendum: Though your sentence sounds different, you got a Word version of our manual many weeks ago already. No - I won't ask "what's your issue" again [[[;-)

Addendum 2: Just read this thread once again from the beginning and found the term "issue" was introduced by *you*. Confusion rising :-?

It was on the 12th of April. Now, I just did forward the file to you once more at genewright143AThotmailDOTcom. HTH

Re: 34s conversions

*Message #12 Posted by **Marcus von Cube, Germany** on 13 June 2011, 4:31 a.m.,*
in response to message #5 by gene wright

Quote:

You have now successfully solved my "issue" by pointing out that the 2.0 manual in the emulator does not have a build number associated with it, hence the discrepancy.

All versions have a build number embedded in the code that is automatically updated by SVN. The problem you may have encountered is the web download from the subversion tree which returns this field blanked out. A regular SVN client returns the files with the build number

intact.

BTW, I'm not very pleased with the discussion as it surfaces from time to time that deals with style and personal matters. Would you be so kind and move the discussion out of the public forum, please?

Re: 34s conversions

*Message #13 Posted by **Paul Dale** on 12 June 2011, 7:25 p.m.,*

Weird. I've not seen any problems with this catalogue for a while now and it is one I always go through and test. We've had a few hiccups but none recently that I'm aware of. If you do manage to replicate this please let us know.

There was a (recently fixed) bug with stack lift and turning the device off (stack lift got itself disabled always over a power off and on) which was very confusing but is fixed now. Still, I don't see how this would have caused what you saw.

The VERS command in the emulator should include the subversion build number.

Re: 34s conversions - Table Order

*Message #14 Posted by **Norman Dziedzic** on 12 June 2011, 11:52 p.m.,*
in response to message #1 by gene wright

While we are on conversions (hopefully this is not too much of a thread hijack) I have had a thought about how I work with conversions and noticed that I generally need to go back and forth a few times with complimentary conversions. I.e. hp->W and then W->hp.

For me, I would prefer the table of conversions to be organized with complementary conversions right next to each other. I know this would probably kill the ability to search for a conversion alphabetically but with the position within the table saved between uses, it means the complementary conversion is just an arrow away.

Any other thoughts on this?

Re: 34s conversions - Table Order

*Message #15 Posted by **Paul Dale** on 13 June 2011, 12:17 a.m.,*
in response to message #14 by Norman Dziedzic

Sure it would be possible, not even terribly difficult.

However, I'm not keen because, as you point out, it would destroy the type alpha characters to get to the command functionality which is very useful. That code relies on the catalogue being sorted correctly.

As things stand, the catalogues are automatically sorted as part of the build process so we'd have to modify

that as well which would mean going back to manual ordering which was a right pain in the a**.

If there is a conversion you require a lot, write small wrapper programs and use the hotkeys. Not as good as an assignable keyboard but workable nonetheless.

- Pauli

Re: 34s conversions - Table Order

*Message #16 Posted by **Marcus von Cube, Germany** on 13 June 2011, 4:41 a.m.,*
in response to message #15 by Paul Dale

Pauli, we might use a key in the conversion catalogue which just jumps to the reverse operation. It would need some code and rely on the spelling of the conversion commands (slow) instead of a special table (too demanding on flash space) but that seems possible.

Re: 34s conversions - Table Order

*Message #17 Posted by **Walter B** on 13 June 2011, 4:58 a.m.,*
in response to message #16 by Marcus von Cube, Germany

Marcus, good idea. Browsing a catalogue, however, alpha mode is set so finding an unused *and* comprehensive key will be challenging. Right now, f-shifted B is the only one I find.

Walter

Edited: 13 June 2011, 5:07 a.m.

Re: 34s conversions - Table Order

*Message #18 Posted by **Paul Dale** on 13 June 2011, 5:15 a.m.,*
in response to message #16 by Marcus von Cube, Germany

The opcodes are closely related for most of the conversions but there are enough exceptions to be annoying.

Rather than a key to jump to the opposite command, why not a key to do the conversion in reverse & exit the catalogue?

f-shift B -> Backwards perhaps?

- Pauli

Re: 34s conversions - Table Order

*Message #19 Posted by **Paul Dale** on 13 June 2011, 5:52 a.m.,*
in response to message #18 by Paul Dale

Coded, committed and built. The subversion binaries include f-shift B which performs the inverse of the currently displayed conversion. Note it doesn't go to the inverse of the currently display conversion, it does it.

I've also done some work on the hyperbolic functions and inverses to improve numeric stability and performance.

Programming tools for HP49g, HP50g

*Message #1 Posted by **Jose Gonzalez Divasson** on 12 June 2011, 12:49 p.m.*

Hi,

I fell some days ago onto a tool called HPUserEdit. Despite being in Spanish at first install, it can be put in most common languages, and it is a very useful tool for UserRPL programming. It allows even to create libraries, embeds the latest emulator (to which you can send the libraries just written), and is freeware.

I imagine that the lack of comments is due to some other tool being even better. In that case, which one?

Here is the link to the programmer website (you can find it as well on HPcalc.org website - an endorsement in itself

HPUserEdit

Re: Programming tools for HP49g, HP50g

*Message #2 Posted by **Tim Wessman** on 12 June 2011, 5:07 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Debug4x (www.debug4x.com)

Most of that, at least the initial parts, were developed by HP for creating the 49g.

TW

HPUserEdit

*Message #3 Posted by **Gilles Carpentier** on 12 June 2011, 5:41 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

I use HPUserEdit v5 very often and I think it's a marvelous tool for User RPL programming. I don't know better tools for User RPL. Note that the programming wizards for CHOOSE / INPUT / INFORM commands are fine.

The french translation is OK even if the help file is not translate

It's a mystery to me why this soft is so unknow (perhaps because it is in spanish for the first install but others languages are available)

I dont have a perfect usage of it perhaps because of the lack of manuel in english or french . For exemple I don't understand why there is two stacks display in the software.

Re: HPUserEdit

*Message #4 Posted by **Namir** on 12 June 2011, 7:02 p.m.,*
in response to message #3 by Gilles Carpentier

Gilles,

You are so right! The utility is a little Gem. I was able to set the IDE language to English. As you commented it is not as popular, probably because it initially installs in Spanish.

Namir

Re: HPUserEdit

*Message #5 Posted by **Stuart Sprott** on 13 June 2011, 6:59 a.m.,*
in response to message #4 by Namir

Just one question, how do you set the language to English?

Re: HPUserEdit

*Message #6 Posted by **Namir** on 13 June 2011, 8:42 a.m.,*
in response to message #5 by Stuart Sprott

1) Select Opdones from the menu bar.

2)Select the Idiomas menu. This menu shows another popup menu.

3) Select English (1) or English (2), or any other language that appears in the popup menu.

Namir

Edited: 13 June 2011, 8:42 a.m.

Re: HPUserEdit

*Message #7 Posted by **Stuart Sprott** on 14 June 2011, 7:02 a.m.,*
in response to message #6 by Namir

Sorry to be a pest, but I cannot find opdones in the menu bar.

My menu bar reads "archivo, edicion, Busequeda, ver, emulador, herranientas, opciones, ayuda". I have tried all of the menu options without any success.

Thanks for your help so far.

Re: HPUserEdit

*Message #8 Posted by **Ronald Williams** on 14 June 2011, 7:23 a.m.,*
in response to message #7 by Stuart Sprott

On the menu bar click the next to last tab on right (Opciones) then click / point mouse on 'Odiomas' then select 'English (1)'. That should do it.

Enjoy!!

Re: HPUserEdit

*Message #9 Posted by **Alex Mark (Greece)** on 13 June 2011, 4:41 a.m.,*
in response to message #3 by Gilles Carpentier

Allow me also to thank the creator of this programme. It has helped me so much for the creation of User RPL programmes for my calcs.

It's a pity that not many people know about its existence.

Alex

Re: HPUserEdit

*Message #10 Posted by **Dave** on 14 June 2011, 10:32 a.m.,*
in response to message #9 by Alex Mark (Greece)

I made English language files for it for several versions. It changed so often I couldn't keep up and eventually quit. I may give it another try. The included English file is usually incomplete. I think the author relies on others for the non-Spanish language files. Great program though.

Interesting European market HP-32E

*Message #1 Posted by **Michael de Estrada** on 12 June 2011, 12:05 p.m.*

I found this interesting German market HP-32E with periods for 1000s delimiters and a comma for the decimal point. The seller is in Belgium and it was manufactured in Singapore. Note that the serial number has an asterisk (*) preceding it. I have seen this previously with a Brazilian made Spice, and a "normal" calc with commas for 1000s separators and a period for the decimal point can be coverted to reverse them by cutting a jumper on the power circuit board inside the calc.

And thanks to you, I obtained my first LED HP calculator. (I have since obtained a HP-45, these are now the only 2 LED HP's I currently have).

Cheers, Bart

Newest Wp34s ROM and backwards compatibility

*Message #1 Posted by **Cristian Arezzini** on 12 June 2011, 3:09 a.m.*

I tried a few minutes ago to update my wp34s. I had read that it breaks binary compatibility, but I wasn't sure exactly what that meant so I wrote down my programs, just in case. I flashed the machine the usual way, but it wouldn't work. It would turn on but lock as soon as I tried to press a key (except EXIT or one of the shift keys). After a moment of panic I tried re-flashing it, and this time it worked (this was my first failed flashing ever... weird that it did turn on and drive the display etc - so the flash wasn't totally dead - but it couldn't perform any operations). Anyway, now after the second flashing, it appears to work, but the programs I had entered no longer work. Looking at the listings I see some commands have changed. Is this what "breaks binary compatibility" means? I suppose so, but I thought I'd ask to be sure it wasn't another failed flashing! :) Is there a list of what commands might have changed, and to what?

Cristian

*Message #2 Posted by **Walter B** on 12 June 2011, 3:18 a.m.,*
in response to message #1 by Cristian Arezzini

Please look at the release notes on the last page of the manual. The change causing the break was in ALL.

Walter

Re: Newest Wp34s ROM and backwards compatibility

*Message #3 Posted by **Cristian Arezzini** on 12 June 2011, 3:39 a.m.,*
in response to message #2 by Walter B

Walter, I know that the "offending" command was ALL (and I thank you all for changing it, as it behaves now exactly as I wished). My question though, was if anyone could tell me what commands in my old programs would have changed due to this "broken compatibility". I noticed that many commands changed, including RTN, aVIEW, PSE and others. A list of affected commands would have made easier for me to scroll through my installed programs, and change back the wrong steps. And this information isn't in the release notes.

EDIT: @ Pauli: I see you have replied while I was typing the above message... Thank you! :)

Thanks again, Cristian

Re: Newest Wp34s ROM and backwards compatibility

*Message #4 Posted by **Paul Dale** on 12 June 2011, 3:52 a.m.,*
in response to message #3 by Cristian Arezzini

Not that it will help but 57 commands from ALL and down in the commands with arguments table will have moved. The 92 commands from RTN down in the commands without argument table have changed. Also the last 60 commands in the commands that take one argument table have changed.

Look at the sources (commands.c) to find the full list.

Thanks Pauli, that did actually help! With that information I could build that list myself.

Re: Newest Wp34s ROM and backwards compatibility

*Message #6 Posted by **Paul Dale** on 12 June 2011, 4:55 a.m.,*
in response to message #5 by Cristian Arezzini

Great. I could have reduced the number of changed commands, but since some where changing it seemed sensible to rationalise some of the more recent additions.

- Pauli

Re: Newest Wp34s ROM and backwards compatibility

*Message #7 Posted by **Neil Hamilton (Ottawa)** on 12 June 2011, 9:15 a.m.,*
in response to message #5 by Cristian Arezzini

Hi Cristian,

I am looking at building an assembler/disassembler that might help in a situation like yours. I am amazed at how productive Paul, Walter and Marcus are ALL THE TIME (when do they get a chance to do their pay-for-the-bread-on-the-table work??) and I will certainly not be rolling this out in a day or two but I hope it may help.

To answer your specific question about the changes, I discovered today that if I capture the screen output of the console version I can gather the opcode table. I have done this for both SVN 1077 and 1089 (identical to 1095). Indeed, the changes mentioned above show up quite clearly if you diff the outputs.

```
$ wp34s.exe calc xrom > opcode_dump.txt
```

I may have more in the command line than I need (I can find little information on how to work the console version) but at least this barfs out what you are looking for.

(Interesting, I normally use Ubuntu and redirecting the console does not seem to work under wine. I reverted to a Windows box to get the output. I would love to make the console for a native linux shell but I can't seem to figure out how to get stuff working that way.)

I would post the tables here but they are 477K each!

Cheers...

> I am amazed at how productive Paul, Walter and Marcus are ALL THE TIME (when do they get a chance to do their pay-for-the-bread-on-the-table work??) ...

First of all we benefit from being a intercontinental team. So you ask questions in the morning - we can answer them from Europe. You ask in the evening, we can answer them from Australia. Taking into account we have an opportunity in the morning and in the evening at least, this alone allows a reasonable service level already. Additionally, not everyone in our team has had an 8-to-5 job all the time since December 2008. Things they are a'changing and keep doing so.

Walter

Re: Newest Wp34s ROM and backwards compatibility

*Message #11 Posted by **Paul Dale** on 12 June 2011, 7:17 p.m.,*
in response to message #7 by Neil Hamilton (Ottawa)

To answer the responsiveness question first, I feel like I've been working a second full time job these past couple of months :-) It isn't quite that bad but it feels like it. I be needing a break soon.

The console mode has a few special commands buried that were helpful for me to debug with.

calc xrom produces a formatted listing of the XROM contents. This is what provides solve, integrate, sum, product, the two derivatives, TVM, the quadratic solver, etc.

calc a prints out the catalogues and a summary of the defined op-codes. The *a* can be anything except *xrom*. Currently the summary looks like:

```
total number of opcodes 25627
        niladic commands 150
        monadic commands 119 with 178 functions
        dyadic commands 37 with 65 functions
        triadic commands 5 with 5 functions
        argument commands 126
        multiword commands 10
        special commands 43
```

calc a a prints out all the legal opcodes and this is what you discovered. Again the *a*'s can be anything. The only op-codes that aren't listed in full are the multi-character alpha ones (which includes LBL, XEQ, GTO, SOLVE, integrate, ...) They only get a single entry in the big list.

calc wake does a warm start. Not all that useful really.

Since you are running Ubuntu, I'd strongly suggest grabbing the source from subversion and compiling it locally. There isn't anything special required to build the console version (ncurses is the only thing that comes to mind beyond the basic development tools). Ubuntu is one of the platforms I developed this on.

Finally, there is no point reverse engineering this stuff, it is open source. Use the sources to build a disassembler which will be quite straightforward, then do the assembler. xeq.h defines the opcodes, commands.c is the canonical place for the command names. keys.c has a weird character to real character mapping function (but not the reverse). prt.c converts op-codes to printable commands. xeq.c has code to step forward and backward instructions and to grab op-codes from memory (multi character alpha ones being double length but this is all handled automatically). console.c has the main routine and the xrom disassembler in it. Make this task easy for yourself :-)

It would even be possible to build the assembler/disassembler into the console version to keep everything self contained.

- Pauli

PS: I really really don't want to renumber op-codes again.

Edited: 12 June 2011, 8:07 p.m.

Re: Newest Wp34s ROM and backwards compatibility

*Message #12 Posted by **Neil Hamilton (Ottawa)** on 13 June 2011, 6:27 a.m.,*
in response to message #11 by Paul Dale

Thanks, Paul.

I have been using SVN since my second download (not much of stretch from my CVS experience). However, my skills at "making" C programs are not in your league unfortunately. I tried a few attempts at building the console version but gave up. I am afraid that I need a bit more "block A goes into slot B" type instructions. :-) I also have an aversion to modifying the wonderful code base you guys have put together as well. Seems somewhat sacrilegious to me...

However, I have been trolling through the source looking at how you did various things as an instructive process. I must admit that I do get lost a fair bit.

Actually, as you say, disassembling is pretty simple. My Perl script achieved that in short order. I parsed the output table from the console version and it is a fairly simple lookup to exchange the op-code for the mnemonic in the flash images.

The assembler is a bit trickier. It is not too difficult if one uses the mnemonic format listed alongside the opcode in the console-generated table -- but that is a bit of a clumsy format. I had hoped to build an assembler that parsed a few different formats.

That you have 1) whipped off a disassembler in remarkably short order, and 2) are considering extending it to an assembler, pretty much renders my poor script somewhat less than useful. :-) I absolutely agree that building off the existing code base makes more sense. Mine required a big, bulky opcode translation table (477K!) and thus a 2-step process if the opcodes ever changed. Sigh...

PS: Any extended hints for my poor brain on how to compile the console version would be highly appreciated! Otherwise I am stuck reverting to a Windows box to do this step.

Best regards...

Re: Newest Wp34s ROM and backwards compatibility

*Message #13 Posted by **Paul Dale** on 13 June 2011, 6:36 a.m.,*
in response to message #12 by Neil Hamilton (Ottawa)

Building the code should be as simple as:

```
cd trunk
make
```

It is possible that things will be missing, you obviously need make and a tool chain installed as well as ncurses-dev. But that should be about it -- the code is almost completely self contained. I avoided standard library calls in favour of rolling my own (smaller & probably slower) versions. Speed generally isn't an issue for this platform, space is.

The code isn't as well structured as I'd have liked, it started out pretty good but we've been through a few iterations of space saving and feature adding.

I've no firm plans to build an assembler at this stage. Just maintaining the existing

code base and fixing bugs is keeping me more than busy enough.

- Pauli

Re: Newest Wp34s ROM and backwards compatibility

*Message #14 Posted by **Neil Hamilton (Ottawa)** on 15 June 2011, 7:33 p.m.,*
in response to message #13 by Paul Dale

OK, I was feeling pretty stupid about this. When I ran make on Ubuntu I got an error making keys.c -- it can't find curses.h. (Like the name of the header file, I know how it feels :-)

```
$ make
gcc -c -Wall -Werror -g -fno-common -fno-inline-functions -fno-
defer-pop -fno-exceptions -O0 -DUSECURSES -DDEBUG -o
Linux/obj/keys.o keys.c
In file included from keys.c:20:
lcd.h:58:20: error: curses.h: No such file or directory
make: *** [Linux/obj/keys.o] Error 1
```

A bit of Google searching showed me I had to install the ncurses libraries:

```
sudo apt-get install zlib1g-dev libncurses5-dev
```

Then make would finish and in the ./trunk/Linux/ directory there is now an executable called "calc". So now I finally understand what you meant by "calc xrom" and "calc opcodes" when talking about the console. I hadn't connected the "calc" phrase with the executable because I was expecting the executable to be similar to wp34s.exe. I had thought they were command line parameters to the other console. Ahah! The penny finally drops... :-)

I am on 1115 and now I see a new more attractive format for the opcode table. A big thanks from me!! (You can ignore my post -- probably a bit *below* this one -- about suppressing certain fields.)

I'll give this one a whirl and see what I can come up with.

Cheers...

*Message #16 Posted by **Paul Dale** on 12 June 2011, 8:05 p.m.,*
in response to message #7 by Neil Hamilton (Ottawa)

I just added a disassembler to the console version, I knew it would be straightforward :-)

calc ram to disassemble RAM contents.

calc prog0 to disassemble the backup flash program region.

calc prog1 to disassemble the first user flash program region.

calc prog2 to disassemble the second user flash program region.

calc prog3 to disassemble the third user flash program region.

calc xrom to disassemble the internal user code program.

Will be in the next build.

Which just leaves an assembler :-)

I can fully understand your position on the assembler. I think you guys have definitely been burning the midnight oil. Don't think that we all don't appreciate it!

Given that you are not looking to do the assembler any time soon, I think I may just "keep on keeping on" with my Perl project. Last night I flashed 1099 using the slick "ON+STO" trick and, as noted elsewhere, my existing programs don't work anymore (I get a cool "undefined OP-COdE" message when running the program and "???" when I list it via single step in program mode). I fully understand why this happened but my little ditty should help anyone else in this boat. One feature of the tool is that, since it reads and parses the legal opcode table when it does its thing, it will be able to translate between opcode "bumps" via a common mnemonic listing.

As an aside, I much prefer typing out programs using a full editor and keyboard rather than on the calculator keyboard so I have an additional motive for doing this.

I am now on 1104 but when I tried your changes with the disassembler, it didn't seem to matter what I added to the command line, I always got a full dump of the legal opcodes. When I asked the console application for its version, it reported "34s 2.0 621"(!?). In spite of what I try, I can't seem to dump a test disassembly of "calc xrom", "calc ram", "calc prog0", etc. Is it possible I am I just too early on the SVN and you haven't committed it yet? (Maybe I am a bit too keen to use it. :^)

BTW: When I parse the legal opcode table, either from before the great schism (1077), or after (1095), my disassembler reports 2 duplicates: "CLx" at both 0001 and 0140, and "+/-" at 0003 and 0235. I am not sure if this is intentional or not. Just noting it.

Cheers...

> Those duplicates are intentional.

That is fine. I am presuming that the calculator doesn't care which version of the opcode it sees then. Once the binary is converted to a mnemonic form, it loses connection to the original opcode. (Is there a reason you can share/recall as to why just these 2 are repeated?)

I have a first crack of the assembler/disassembler up and running. In disassembler mode it reads the flash image and converts it to a text form very similar to the right hand side of the legal opcode table. There are a very few differences (such as the conversion factors being embedded in the opcode table) that have to be dealt with as exceptions but generally it is pretty faithful.

In assembler mode it is capable of taking in multiple mnemonic sources and seamlessly stitching them together into a single binary image. It recalculates and injects the CRC16 so no MAGIC_MARKER's are required.

I am not exactly sure how to load a single flash (ie: wp34s-0.dat) into the emulator so I did a seocnd little stop-gap script to overlay it on top of the emulator 'wp34s.dat' file which loads automatically. This works for now but I will experiment more with the actual H/W when I have some time. I am sure it is easy to do.

(Most) Everything seems to have worked beautifully except my program for calculating Great Circle routes now converts from nmi->AU instead of nmi->km! My legal opcode table came from 1104 and I am now running on emulator 1109 so I am thinking something may have changed between them -- something to do with stones and kg perhaps? (I haven't rebuilt a table as yet since that means moving back over to Windows -- ugh!).

Currently the script is parsing the legal opcode table to generate that hash table so I either need an external file (ugly solution) or I embed the table in the Perl script (cleaner solution but HUGE). Typically, I have split the difference and have both modes in the script. That has the advantage of allowing older flash images to be translated to the new opcodes by giving it an optional older legal opcode table.

Since there is a lot of repetition in the table (ie: SL 01, SL 02, ... SL 09, etc), I am thinking I can compress it with a bit of cleverness to get the script to a much smaller state.

I have tested it with a few programs I have written and a transcription of a program Jake Schwartz wrote: "wp34S IEEE Floating-Point Conversions". I have concatenated these with the tool in various orders and all seems well (except for astronomical units, of course :-)

I am not sure if anyone would be interested in trying an alpha of this Perl script or not. If so let me know and I will get it to you. There are certainly still things I need to test that will undoubtedly break (I have never done much with the alpha stuff as yet, for example).

Below is a fragment of the Jake's Floating Point program as I transcribed it from his note (mistakes are mine! hard to copy from 3 JPG images). I have added a few comments to help me keep things straight. These are ignored by the assembler. Also, the line numbers are ignored so you can easily concatenate several sources together into a single image (see below).

```
# From Jake Schwartz 7-June-2011 (near:
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?
read=185649#185649)
#
# Hand entered from 3 JPG's(!?) and converted to the opcode style
shown in the legal opcode
# dump from the console app so there may be a mistyping or two.
#
# Keep the leading asterisk in front of the LBL's since that is a
an easy marker to see and
# is easy to "clean up" in the assembler.

00003f0 8303 8303 8303 8303 0000 0000 0000 0000
0000400
```

To close the loop, a fragment of disassembly of this resultant flash-compatible image:

```
$ wp34s_asm.pl -dis fp.dat | head -20
001 LBL B
002 BASE 16
003 2COMPL
004 WSIZE 32
005 SL 01
006 ENTER[^]
007 ENTER[^]
008 x=0?
009 GTO 02
010 MASKR 24
011 AND
012 XOR
013 RCL L
014 x[<->]y
015 MASKL 08
016 x=? Y
017 GTO 04
018 R[v]
019 x=0?
020 GTO 03
```

To stitch multiple source together is simply a matter of giving it more than one source. I haven't tested the 506 opcode limit yet but it should correctly crap out if this is exceeded.

```
$ wp34s_asm.pl fp.wp34s gc.wp34s -o fp_gc.dat
```

I still have a few things I want to do (detect duplicate labels, maybe allow an alternate [more friendly] mnemonic format, etc.) but I hope someone might find this useful. [Warning until I can compress the opcode table, the script is *BIG* at 465K!]

If people are interested, and I can be coached on how to do it, maybe it can be uploaded to a public site in due course.

Cheers...

Actually it does -- they go to different pieces of code.

> Quote:
>
> Is there a reason you can share/recall as to why just these 2 are repeated?

For CLx one code is generated one entering the command line and the other when not. This catches backspace to edit the command line which isn't legal in a program. I forget the difference between the two CHS commands but I think it is something similar.

You are correct the conversions got an entry added early in the table which I'd forgotten about. Most of these will have changed too.

> Quote:
>
> I still have a few things I want to do (detect duplicate labels, ...)

Duplicate numeric labels are legal and useful -- XROM is full of them e.g. Duplicate alpha labels also have a use but it is more esoteric -- again XROM defines [delta]X which is meant to be overridden by a user version on occasion.

Re: Newest Wp34s ROM and backwards compatibility

*Message #21 Posted by **Marcus von Cube, Germany** on 15 June 2011, 2:59 a.m.,*
in response to message #19 by Neil Hamilton (Ottawa)

Neil, your tool should definitely be part of wp34s. Get in contact with Pauli how this can be achieved. SF is our home and so should be yours. We might even create a step in the build process that ensures a valid command table is present.

The wp34s-n.dat file (n being a number from zero to 3, maybe more later) is automatically read in by the emulator on startup. Just create a program with an alpha label and use CAT to find and execute it. With PRCL n or P<-> n you can load this into RAM where it is modifiable.

How to get this into the real machine is described in the manual and in a small text file "flash.txt" in the doc directory. In short: Use SAM-BA and load the file to a location 0x11EC00 or above.

For ROM images I prefer 0xFFFF as the dummy opcode to fill the image because this reduces the number of bits flipped with flash programming.

I'm confident we can modify the build process or add a utility to output the command table in a better format. As mentioned, there is a lot of repeated entries. I might add something to output the base op-codes only with a tag if they take an argument.

Does the assembler deal with multi-character labels properly? Only the first such op-code (& even then only two of the four bytes) is listed in the op-code dump.

One thing I would love to see is automatically converting branches into SKIP & BACK instructions where possible.

Try "calc opcodes" in the latest console build :-)

Fields are tab separated.

The first field is the numeric op-code in hex.

The second field is the type of op-code. *cmd* is a standard command. *mult* is a multi-character alpha command (double length). *arg* is a command that takes an argument.

The third field is the op-code itself.

For argument commands there is a fourth field that can contain up to four pieces of information comma separated:

max=nnn nnn is the maximum value + 1 permitted as an argument. I.e. legal arguments are 0 through nnn-1 inclusive.

indirect is present if the command is permitted an indirect argument. If it is, the argument can of course be any register including the stack (0 - 111 inclusive).

stack is present if a stack register is allowed as an argument.

complex is present if the argument specifies a complex pair of registers. This basically restricts numeric registers to be 0 - 98 instead of 0 - 99 and it restricts lettered registers to be X, Z, A, C, L and J.

Re: Newest Wp34s ROM and backwards compatibility

*Message #24 Posted by **Neil Hamilton (Ottawa)** on 16 June 2011, 7:51 p.m.,*
in response to message #23 by Paul Dale

This is great! The script has imploded from 477K to ~47k with this simple table change. So far I am having the script expand this new table -- on the fly -- back into something akin to the original format so I don't have to change many other sections of the code.

A couple of observations:

1) Is "stack" actually required? I can see no case where "stack" is indicated that "max=112" is not. Therefore I am presuming that any value of max=112 already includes the stack registers. I may have missed something...

2) Similarly, is "complex" required? In all cases, the prefix "[cmplx]" appears in the mnemonic for these as well.

3) I am not really sure how to deal with the very 1st "arg" line: "0x8200\targ\tiC\tmax=30,indirect". The indirect portion is easy, but how to encode the others (opcodes 8200 -- 821d, inclusive)? Is it your intention that these should be expanded to be "iC 'some-bunch-of-digits'" in a listing, and conversely, that "iC 'some-bunch-of-digits'" in an assembler source file be translated back to 80xx, where 0 <= xx <= 1d? If so, then this new format is missing some information and it will have to be entered through other means. As an alternative, maybe you could split out these 30 'direct' opcodes as "cmd" type and the others as "arg" types something like this:

```
0x8200  cmd  iC 0
0x8201  cmd  iC 1
0x8202  cmd  iC 5.01402
...
0x821d  cmd  iC iC 0.14773910
0x8280  arg  iC  max=0,indirect
```

Note that I have used spaces in the above section where you are using tab delimiters. I can't seem to represent tabs in this editor.

4) I am wondering why there is the inconsistency in the letter-named offsets. For the max=112 set, the letters are XYZTABCDLIJK (indicating opcode offsets of 100-112) and for the max=104 set they are ABDC (indicating opcode offsets of 100-103). Have you considered normalizing these to ABCDXYZTLIJK? Then there is a commonality between the two sets. No biggie but it means fewer exceptions. FAIK it may break

huge swaths of other code in the calculator. If this doesn't make sense, obviously don't worry about it.

I am still coding but these are some of my thoughts thus far.

Best regards...

(BTW: Vancouver lost 4-0! Ouch!!)

Re: Newest Wp34s ROM and backwards compatibility

*Message #25 Posted by **Paul Dale** on 16 June 2011, 8:06 p.m.,*
in response to message #24 by Neil Hamilton (Ottawa)

1. Stack is the internal flag indicating that the stack can be used. I'd honor this rather than relying on 112. E.g. the complex operations that accept a stack argument could have their max reduced to 111 (& probably should do since 112 is completely meaningless for them and would walk memory if it was encountered).

2. Complex likewise, although I don't see a case for this (yet).

3. I can expand these to cmd status easily enough.

4. The funny numbering is the result of changes over time :-(I don't want to "fix" this now.

Re: Newest Wp34s ROM and backwards compatibility

*Message #26 Posted by **Neil Hamilton (Ottawa)** on 16 June 2011, 10:17 p.m.,*
in response to message #25 by Paul Dale

1. Fine.

2. Likewise.

3. Actually, for consistency, can you make the base hex number for the "arg" component 0x8200 instead of 0x8280 like I originally suggested? This allows the indirect flag bit (0x80) to work transparently with these ones as well. I realize that this will "look funny" since both the first "cmd" element and the "arg" element will have the same hex value but it keeps things the same.

I suppose that, according to (1), the "arg" element should now have ",stack" as well?

(I have hand edited a copy to work on for now -- shown without the ",stack" until I hear back.)

```
0x8200  cmd     iC 0
...
0x821d  cmd     iC 0.14773910
0x8200  arg     iC      max=0,indirect
```

4. Don't blame you one little bit! :-) Just thought I'd ask.

If you are considering barfing out a table, can you removing (or containing) the extraneous information to the right of some of the mnemonic areas (eg: in the constants such as "# a\s+365.2425" and the conversions such as "kg[->]lb\s+/ 0.4535924")?

If you need to keep this data for some other process, could you put the right hand stuff into some kind of comment field (I'd suggest the C comment marker of "//" for now), then this table would be easier to parse without resorting to exceptions?

Best regards...

Early days yet but I think it handles the 3-character ones (eg: LBL'FTH). The alpha texts are exception-handled to inject a second word with the 2nd and 3rd characters. I haven't tried alpha stuff so that might not work so great as yet. (Not sure I fully understand alpha mode at all :-) -- I am a pretty rank beginner with this level of calculator. I am afraid I am going to need Gene's "WP34S for Dummies" when it comes out!!)

> Quote:
>
> For ROM images I prefer 0xFFFF as the dummy opcode to fill the image because this reduces the number of bits flipped with flash programming.

As you can see from the alpha labels example below, a custom fill is a trivial change. I was just following what I observed in the existing images I have to work with -- which injects "ERR 03". (BTW: What is the purpose of the 4 trailing words of 0 at the end of each image?) A spec for the image would be lovely. :-)

```
$ cat multichar.wp34s
LBL'ABC
INT'12K
RTN

$ wp34s_asm.pl multichar.wp34s -o multichar.dat -f FFFF;
hexdump multichar.dat
0000000 3fde 0006 1041 4342 1931 4b32 013a ffff
0000010 ffff ffff ffff ffff ffff ffff ffff ffff
*
00003f0 ffff ffff ffff ffff 0000 0000 0000 0000
0000400

$ wp34s_asm.pl -dis multichar.dat
001 LBL'ABC
```

```
003 INT'12K
005 RTN
```

> Quote:
>

This could be possible. Might require a 2-pass assembly where this is currently only a direct translation, single pass version (very dumb coding at the moment, I'm afraid).

Can you explain a bit more about duplicate labels and how the calculator handles these? I can't seem to understand how they can be "local" to a function. Makes my brain hurt.

That the emulator just reads in the wp34s-[0-3].dat file is so cool! That they are available to execute directly from flash via the CAT is brilliant! I never would have expected that. I probably didn't notice this since I tended to use the A-D labels more as opposed to the alpha ones. As was mentioned, the alpha ones in flash programs show up in CAT. (Goodbye my script to temporarily overlay the wps34.dat file!)

Cheers...

*Message #31 Posted by **Marcus von Cube, Germany** on 15 June 2011, 10:18 a.m.,*
in response to message #30 by Neil Hamilton (Ottawa)

Neil, go to the file data.h where the formats of all data structures in RAM and the flash regions are defined. The maximum number of program steps is 4 less then would fit in one K because we need this space for other purposes in RAM. The flash regions have the same structure as the start of RAM has. Thus, 8 bytes are wasted in each region. It is totally fine to fill this space with 0xff.

Re: Newest Wp34s ROM and backwards compatibility

*Message #32 Posted by **Neil Hamilton (Ottawa)** on 17 June 2011, 8:43 a.m.,*

Would it be possible, when executing the "SAVE" command (or equivalent) that the calculator inject the SVN version number into some of these unused fields? This would certainly help with archiving flash images and could facilitate an automatic assembler

feature to either correctly deal with the revision, or at least issue a warning of some possible impending dome due to opcode revision mismatch.

Cheers...

Re: Newest Wp34s ROM and backwards compatibility

*Message #33 Posted by **Marcus von Cube, Germany** on 17 June 2011, 11:04 a.m.,*
in response to message #32 by Neil Hamilton (Ottawa)

Neil, this is not possible for image 0 because here, the complete RAM image is saved and I cannot modify single fields which have a different meaning on restore (this is the program return stack to be precise).

I don't think it's worth the hassle. Pauli has promised to leave the op-codes untouched.

Re: Newest Wp34s ROM and backwards compatibility

*Message #34 Posted by **Neil Hamilton (Ottawa)** on 17 June 2011, 12:12 p.m.,*
in response to message #33 by Marcus von Cube, Germany

OK. It was just a thought. Would have been a nice archival tool. :-)

It was under the assumption that these last 4 words are actually DONT_CARE in the flash images (they always appear as 0000 0000 0000 0000 in flash images generated by SAVE -- IIRC).

Q: Does my DONT_CARE assumption still hold for 0 through 3 based on what you have said? Or is this DONT_CARE only valid for 1 through 3?

I think Marcus had mentioned that a flash-efficient FFFF was a possibility for these last 4 words, but I don't recall if he mentioned a limitation on which images ([0-3]) would allow this.

I'm always learning... :-)

Best regards...

Re: Newest Wp34s ROM and backwards compatibility

*Message #35 Posted by **Marcus von Cube, Germany** on 17 June 2011, 12:20 p.m.,*

in response to message #34 by Neil Hamilton (Ottawa)

To make a long story short:

If you use PSTO and PRCL the trailing data isn't used at all. So FFFF is totally fine.

If you replace the program part of image 0 (the backup) in the calculator or emulator and restore the backup with LOAD (or ON+RCL on the hardware) you will have some inconsistency in the return stack. This is normally of no importance but may cause some irritation if you execute a RTN statement directly after the restore. I think this can be safely ignored but Pauli may explain it in more detail (the return stack is his.)

Re: Newest Wp34s ROM and backwards compatibility

*Message #36 Posted by **Paul Dale** on 17 June 2011, 6:44 p.m.,*
in response to message #35 by Marcus von Cube, Germany

The bottom two banks (register and PSTO 0) are special. They really contain the 2kb of RAM in the device and there is no free space. The other program banks have a small amount free. Which is the space for the user program return stack in bank 0.

- Pauli

Try page 12 of the manual for a description of the label searching.

In a nutshell, numeric labels (and hotkeys) are local to the program region. The search runs from the current location forward until the end of the segment and then from the start of the segment forward until the initial location is reached. For forward jumps it is generally fine to duplicate a labels. For backward jumps it isn't. A lot of HP-41 programs re-use the low numbered labels quite heavily because they are shorter. In the 34s, the XROM code uses this feature quite a bit to save on the number of labels defined.

Alpha labels are searched for in a specific order and only the first match is used. Thus, these can be duplicated but there is no point duplicating them within a program region (RAM or flash bank) as only the first will ever be used. This allows e.g. a user to override a library routine. The example I gave was the deltaX label in XROM which specifies the step size for the numeric differentiation code. The label in XROM returns a 0.1 value. You, as a user, can define a deltaX routine in RAM of one of the flash banks and this will be used in preference.

*Message #38 Posted by **Paul Dale** on 12 June 2011, 3:36 a.m.,*
in response to message #1 by Cristian Arezzini

Yes, some of the commands in your existing program changing their name is an indication of the command restructure.

The new ALL command takes a parameter which meant it went into a different table than the old command. This upset the command numbering so commands after its old location in that table will have moved up one position.

Since existing programs likely wouldn't work I took the opportunity to relocate a couple of other commands that had been put out of place.

I'm going to try very hard not to have to do this again.

Pauli

WP34s STATs Prediction Question

*Message #1 Posted by **Norman Dziedzic** on 11 June 2011, 9:14 p.m.*

I either don't understand how this function works or there is a bug with it...

I enter the following X & y values with Sigma+

```
Y,X
36,6
25,5
81,9
100,10
```

With each entry the wp34s shows the number of entries as expected.

I do a STAT BestF then I key h-6(L.R.) and the top area says Power. X register is -6.09818323034e-14 and y register is 2. So far so good.

Now I key in 4 and press f-6 for a predicted y but instead of 16 I get 8.

Edited: 11 June 2011, 9:15 p.m.

CCD OS/X Revisited

*Message #1 Posted by **Ángel Martin** on 11 June 2011, 2:46 p.m.*

I don't know you fellow MCODER's but every time I start thinking that I'm getting the knack of MCODE I turn to the CCD Module to get humbled again - and this time hasn't been the exception either...

Nevertheless I managed to squeeze another twist to the wondrous CCD OS/X module - in case you aren't familiar it's a 4k subset of the CCD-Module containing the OS extensions, put together by Raymond Del Tondo many moons ago. (That was a feat worth admiring, I always wonder: did he have access to the source code from W&W??)

This enhancement consists of adding the "Prompt Lengthener" from the MLROM to the same bag of tricks. It's a very nice addition to the OS/X tool kit - so you can extend the length of the prompting functions to three fields just by pressing the "ON" key while the prompt is up. Further pressing "EEX" adds a one to the left, for the thousand's parameter... way to go!

Obviously there's a price to pay, in this case space:- I removed the function INPT to make for the required room, not a big loss to my standards (I've never used it) but if you need it then stick to the original instead. Trades, choices... such is life.

Available at a TOS near you in a few days.

Cheers, 'AM

A new 6-problem challenge (free42 or 42s)

*Message #1 Posted by **Allen** on 10 June 2011, 5:18 p.m.*

Thanks to Gerson for introducing the Project Euler a few weeks back on the msg board. There are so many fun programming nuggets in there.

I've been reading through several of the problems, and many are quite conducive to programming on the HP 42S or similar machine. How about a challenge?

```
Guidelines:
1. Goal is to program euler.net problems: 1,2,3,4,5,and 6 using a HP 42s (free42 or similar).
   If you use a 32S(II) that's OK too, but harder.
2. All programs must start with a LBL, but do not have to contain a RTN statement.
   (e.g. byte counts can be done with only one program at a time in memory)
3. Brute force is allowed, but boring.
4. Number entry: Programs may accept no more than 1 integer value from the user. Any further
   data entry must be built in to the program. For example in problem 2 if you are looping to
   4e6, you can enter 4e6 and press R/S, but you can't enter two or three stack values as
inputs.
   e.g. the first three terms of Fibonacci series 1,2,3,...)
5. Initial Scoring is the sum of the byte count for the problems 1-6.
   > 240   : Beginner
   230-220 : Advanced
   220-210 : Very Good!
   210-200 : Black Belt!!
   < 200   : Grand Master
6. Bonus round is problem 28
   subtract 1 byte from the total above for every byte under 25 bytes used for problem 28.
   For example a 23 byte solution to p.28 gets a 2 byte subtraction from the total above)
7. Optimize first for byte size then for lines of code. (if two programs of the same size,
   the one with fewest lines of code is supreme).
8. No googling solutions. I'm sure there are some posted outside the Euler.net portal, but
   copying others' work takes the fun out.
```

Any one interested?

Edited: 10 June 2011, 5:58 p.m.

Re: A new 6-problem challenge (free42 or 42s)

*Message #2 Posted by **Jim Horn** on 10 June 2011, 6:53 p.m.,*
in response to message #1 by Allen

The optional problem is easy in closed form - 21 bytes, counting the label. An input of pi gives about 28.294 if that means anything. I'm curious how this approach can be tweaked to be smaller.

Re: A new 6-problem challenge (free42 or 42s)

*Message #3 Posted by **Allen** on 10 June 2011, 8:37 p.m.,*
in response to message #2 by Jim Horn

Jim, Fast work coming up with the closed form! Mine is 20 bytes of the form: (x(x(ax+b)+c)+d)/e (numbers omitted to avoid spoilers), same result as you when PI is entered. I'll bet I'm saving that extra byte by filling up the stack and using a series of a * b + * c + *.. etc. I have a loop version at 21 bytes, 20 bytes closed form but can't get either any smaller.

Tip: If you already have a closed-form equation type it into Wolfram Alpha.. One of the "alternate forms" should be calculator friendly. Example: http://www.wolframalpha.com/input/?i=x^2%2B6*x%2B6

Edited: 10 June 2011, 8:38 p.m.

Re: A new 6-problem challenge (free42 or 42s)

*Message #4 Posted by **Gerson W. Barbosa** on 11 June 2011, 1:16 a.m.,*
in response to message #3 by Allen

No spoiler as this will require at least 40 bytes. You're right, Horner should be the next step.

```
n(n+1)+(n-1){2(n-1)[(n-1)/3+1]+(1-n)/2+4/3}-1

-------
```

25 bytes, one-letter label

28.2944435257 when n=pi

Edited: 11 June 2011, 1:31 a.m.

Re: A new 6-problem challenge (free42 or 42s)

*Message #5 Posted by **Gerson W. Barbosa** on 11 June 2011, 3:22 a.m.,*
in response to message #4 by Gerson W. Barbosa

Some explanation:

```
43 44 45 46 47 48 49
42 21 22 23 24 25 26
41 20  7  8  9 10 27
40 19  6  1  2 11 28
39 18  5  4  3 12 29
38 17 16 15 14 13 30
37 36 35 34 33 32 31

Pattern of half-diagonals, clock-wise:

3^2, 5^2, 7^2, ...

2^2-1, 4^2-3, 6^2-5, ...

2^2+1, 4^2+1, 6^2+1, ...

3^2-2, 5^2-4, 7^2-6, ...

These add up to

2(2^2 + 3^2 + 4^2 + ... + n^2) - (1 + 2 + 3 + ... + n-1 ) + (n - 1)/2 + 1    or

2(1^2 + 2^2 + 3^2 + 4^2 + ... + n^2) - (1 + 2 + 3 + ... + n-1 ) + (n - 1)/2 - 1

= 2*Sum(n=1,n,n^2) - Sum(n=1,n-1,n) + (n - 1)/2

= 2*Sum(n=1,n,n^2) - T(n-1) + (n -1)/2 where T(n-1) is the n_th number,
```

Since T(n) = n/2*(n+1) then T(n-1) = n*(n-1)/2

Now we need only compute the sum of the squares. Let's do it for n up to 5 first, as an example:

1^2 + 2^2 + 3^2 + 4^2 + 5^2, which we can rewrite as

```
                    1   3   6  10    15
                  ──────────────────┐
              1 + 1 + 1 + 1 + 1 +   │  10
              2 + 2 + 2 + 2 + 1 +   │   6
              3 + 3 + 3 + 2 + 1 +   │   3
              4 + 4 + 3 + 2 + 1 +   │   1
              5 + 4 + 3 + 2 + 1     │
                                    │
```

When summing the elements diagonally, as indicated, we get

1^2 + 2^2 + 3^2 + 4^2 + 5^2 = 15 + 2*(1 + 3 + 6 + 10) = 5, that is T(5) + 2*Sum(n=1,4,T(n))

Generalizing,

Sum(1,n,n^2) = T(n) + 2*Sum(n=1,n-1,T(n))

T(n) = n/2*(n+1), as we know, but an expression for the sum T(n), for n=1 up to n, is still lacking. I won't derive it here (done it once long ago, don't remember the details), but I'll try to find an expression empirically, given that 1/6 is one factor in the expression (all I remember). Let's write a small table to help us:

n	1	2	3	4	5	6	
T(n)	1	3	6	10	15	21	
Sum(T(n))	1	4	10	20	35	56	
6*S(Tn)/T(n)	6	8	10	12	14	16	, that is, 2*n+4

Then we can write

Sum(n=1,n-1,T(n)) = 1/6*(2n + 4)*n/2*(n+1) = 1/6*((n-1)^3 + 3(n-1)^2 + 2(n-1))

Now we the expression we are looking for can be completed:

S = 2*Sum(n=1,n,n^2) - Sum(n=11,n-1,n) + (n - 1)/2 - 1

S = 2*(T(n) + 2*Sum(n=1,n-1,T(n))) - Sum(n=1,n-1,n) + (n - 1)/2 - 1

S = 2*(n/2*(n+1) + 2*1/6*((n-1)^3 + 3(n-1)^2 + 2(n-1))) - n*(n-1)/2 + (n - 1)/2 - 1

A little algebra yields

```
S = n*(n + 1) + (n - 1)*(2*(n - 1)*((n - 1)/3 + 1) + (1 - n)/2 + 4/3) - 1
```

Further optimization is required, like applying a Horner scheme to take advantage of the RPN stack.

Bonus problem and horner method

*Message #6 Posted by **Allen** on 11 June 2011, 8:43 a.m.,*
in response to message #5 by Gerson W. Barbosa

Gerson, Nice work! A quick check in W|A shows the horner methods match. I like your explanation..

```
http://www.wolframalpha.com/input/?i=n*%28n+%2B+1%29+%2B+%28n+-
+1%29*%282*%28n+-+1%29*%28%28n+-+1%29%2F3+%2B+1%29+%2B+%281+-
+n%29%2F2+%2B+4%2F3%29+-+1
```

While the end is the same I approached the problem more like a cinnamon roll. Unroll each ring individually and you can see the pattern:

```
Ring                                                    Sum
-------------------------------------------------------------------
Core:                      1                             1    = 4(1) -3

                         *-> <-*                <--     5 + 7  = 2(6)
Row 1:             3  4  5  6  7  8  9
                   *-------> <--------*                3 + 5  = 2(6)

                     *-----> <----*                  17 + 21 = 2(19)
Row 2: 13 14 15 16 17 18 19 20 21 22 23 24 25
       *-----------------> <-----------------*       13 + 25 = 2(19)
```

* indicates a corner

So one must sum over a a closed-form formula F(n) for 1,6,19,40... Multiply by 4 and subtract 3 for the core:

```
43 44 45 46 47 48 49
42 21 22 23 24 25 26
41 20  7  8  9 10 27
40 19  6  1  2 11 28
39 18  5  4  3 12 29
38 17 16 15 14 13 30
37 36 35 34 33 32 31
```

Re: Bonus problem and horner method

```
43 44 45 46 47 48 49
42 21 22 23 24 25 26
41 20  7  8  9 10 27
40 19  6  1  2 11 28
39 18  5  4  3 12 29
38 17 16 15 14 13 30
37 36 35 34 33 32 31
```

Nice approach! A closed-form formula for F(n) is

```
F(n) = 4*(n\2+1)^2 - 7*(n\2 + 1) + 4    or

F(n) = (2*n^2 - 3*n + 3)/2
```

Regards,

Gerson.

Re: Bonus problem and horner method

*Message #8 Posted by **Thomas Klemm** on 13 June 2011, 3:18 p.m.,*
in response to message #7 by Gerson W. Barbosa

When in need of a closed-form formula for a polynomial sequence consider the following approach using the difference-operator *D f(n) := f(n+1) - f(n)*:

```
      n:    0    1    2    3    4  ...

   f(n):    1   25  101  261  537  ...
D  f(n):   24   76  160  276  ...
D^2 f(n):  52   84  116  ...
D^3 f(n):  32   32  ...
```

With

$$C(n,k) = \binom{n}{k}$$

you can write down the result immediately:

*f(n) = **1** C(n,0) + **24** C(n,1) + **52** C(n,2) + **32** C(n,3)* or

$$f(n) = 1 + 24n + 52\frac{n(n-1)}{1 \cdot 2} + 32\frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3}$$

Using the Horner-like schema the expression can be rewritten to:

$$f(n) = ((32\frac{n-2}{3} + 52)\frac{n-1}{2} + 24)n + 1$$

Plug that expression into WolframAlpha to get:

$$\frac{16n^3}{3} + 10n^2 + \frac{26n}{3} + 1$$

This is in accordance with what you find at the on-line encyclopedia of integer sequences.

Cheers
Thomas

Explanation:

$$f(n) = \sum_{k=0}^{m} a_k \cdot C(n,k)$$

D C(n,k) = C(n+1,k) - C(n,k) = C(n,k-1)

D^i C(n,k) = C(n,k-i)

$$D^i f(n) = \sum_{k=0}^{m} a_k \cdot C(n,k-i)$$

C(n,0) = 1 for all n => C(0,0) = 1

C(0,k) = 0 for all k > 0

$$D^i f(n) \mid_{n=0} = a_i$$

Re: Bonus problem and horner method

*Message #9 Posted by **Allen** on 13 June 2011, 8:46 p.m.,*
in response to message #8 by Thomas Klemm

Thank you! I never thought about using the Difference function to reverse out the polynomial coefficients. Very clever. I agree with you assessments on the byte count above- very impressive.

I did not know what the minimum goal should be as I had only myself finished the rough draft of each code before posting the challenge. I later achieved some economy of 5-10 bytes, but mine would require significant rewrites and change of approach to get below your solution to puzzle 1 and 3. Very well done indeed!

FWIW, I had also considered an 18- byte version of puzzle 18 which pre-loaded 2N into the Stat registers and the summed over N with 4N on the X and Y stack. My adding RCL11 and RCL14 one could get sum(16N^2+4N)+4N+1. At 22+ bytes that's easy, much harder once you get below 18.

> I never thought about using the Difference function to reverse out the polynomial coefficients.

It's similar to the Maclaurin Series replacing $x^k/k!$ by $C(n,k)$.

Once in this form the sequence is also easy to "integrate" (i.e. calculate partial sums) as this is only a shift of index.

Here's the example for n^3:

```
      n:    0    1    2    3    4  ...

   f(n):    0    1    8   27   64  ...
D  f(n):    1    7   19   37  ...
D2 f(n):    6   12   18  ...
D3 f(n):    6    6  ...
```

$f(n) = n^3 = 6\,C(n,3) + 6\,C(n,2) + C(n,1)$

$F(n) = \Sigma n^3 = 6\,C(n,4) + 6\,C(n,3) + C(n,2)$

$F(n) = ((6(n-3)/4 + 6)(n-2)/3 + 1)\,(n-1)n/2$

$F(n) = n^4/4 - n^3/2 + n^2/4$

Question about the matrix mapping

*Message #11 Posted by **Namir** on 11 June 2011, 7:59 p.m.,*
in response to message #5 by Gerson W. Barbosa

The matrices shown in theses threads seem to have two indexing schemes:

1. The sequence index where the index is also equal to the value of the element. The first element in the "spiral" matrix is 1, the second is 2, and so on. 2. the row/column index of the matrix as seen as a more traditional matrix.

My question is this, given a "spiral" matrix with N rows and N columns, when is the relationship between the above two indexing schemes?

So for N rows and N columns, the row/column indices (i,j) correspond to what spiral index/value??

Namir

Re: Question about the matrix mapping

*Message #12 Posted by **Gerson W. Barbosa** on 11 June 2011, 10:28 p.m.,*
in response to message #11 by Namir

Namir,

This has not to do with your question, but I think I should mention a minor omission:

Instead of

"= 2*Sum(n=1,n,n^2) - T(n-1) + (n -1)/2 where T(n-1) is the n_{th} number,"

It should have read

"= 2*Sum(n=1,n,n^2) - T(n-1) + (n -1)/2 where T(n-1) is the n_{th} triangular number,"

I hope this hasn't caused any confusion.

Best regards,

Gerson.

Re: Question about the matrix mapping

*Message #13 Posted by **Namir** on 12 June 2011, 5:42 a.m.,*
in response to message #12 by Gerson W. Barbosa

Gerson,

As I slept last night, my unconscious mind went to work to answer my question. I present pseudo-code for two procedures that map between the serial index of the matrix elements and the row/column indices:

```
Given dimension of matrix BigN and index IdxVal.
Find row and column index of matrix element containing IdxVal

If N is odd then
  M = (BigN+1) / 2
Else
  M = BigN / 2
End If

row = M
col = M
Idx = 1

N=1

do
  # extend the spiral to the next level
  col = col + 1
  Idx = Idx + 1
  LastN = N
  N = N + 2
  if Idx > BigN^2 then exit
  if Idx = IdxVal then return (row,col)

  # move downward
  for i = 1 to LastN
    row = row + 1
    Idx = Idx + 1
    if Idx = IdxVal then return (row,col)
  end

  # move to the left
  for j = 1 to N - 1
    col = col - 1
    Idx = Idx + 1
    if Idx = IdxVal then return (row,col)
  end
```

```
  # move up
  for i = 1 to N - 1
    row = row - 1
    Idx = Idx + 1
    if Idx = IdxVal then return (row,col)
  end

  # move to the right
  for j = 1 to N - 1
    col = col + 1
    Idx = Idx + 1
    if Idx = IdxVal then return (row,col)
  end

loop

end procedure

Given dimension of matrix BigN and row,col) indices.
Find index IdVal of matrix element at (rowVal,colVal)

If N is odd then
  M = (BigN+1) / 2
Else
  M = BigN / 2
End If

row = M
col = M
Idx = 1

N=1

do
  # extend the spiral to the next level
  col = col + 1
  Idx = Idx + 1
  LastN = N
  N = N + 2
  if Idx > BigN^2 then exit
  if row = rowVal And col = colVal then return Idx

  # move downward
  for i = 1 to LastN
    row = row + 1
    Idx = Idx + 1
    if row = rowVal And col = colVal then return Idx
  end

  # move to the left
  for j = 1 to N - 1
    col = col - 1
    Idx = Idx + 1
    if row = rowVal And col = colVal then return Idx
  end

  # move up
  for i = 1 to N - 1
    row = row - 1
    Idx = Idx + 1
    if row = rowVal And col = colVal then return Idx
  end

  # move to the right
  for j = 1 to N - 1
    col = col + 1
    Idx = Idx + 1
```

```
    if row = rowVal And col = colVal then return Idx
  end

loop

end procedure
```

The two pseudo-code procedures basically perform a brute-force sequential search starting with the first element of the sequence (located in the center of the matrix) and then searching clockwise in a spiral manner.

If the matrix elements increment by values greater than one, then you need to track the index and the search value separately. The code would require some minor modification.

in response to message #13 by Namir

Namir, If you are interested in "navigating" Ulam's spiral, I strongly suggest this posting from Feb 2011 I spent dozens of hours finding a closed-form solution (and a 32-byte 42S program) to do exactly that.

Re: A new 6-problem challenge (free42 or 42s)

*Message #15 Posted by **Gerson W. Barbosa** on 11 June 2011, 2:37 p.m.,*
in response to message #3 by Allen

Allen,

If the labels A through J are allowed and the stack is filled with n then a 19-byte solution is possible. This first execution could be a bit cumbersome. For instance, for n=5 and n=, assuming LBL A has been used:

```
5 ENTER ENTER ENTER XEQ ENTER SIGMA+ SIGMA+ ENTER     -->   101

7 ENTER ENTER ENTER R/S                               -->   261
```

If the stack should not be previously filled and the label A is used, then the program size is 22 bytes and it is 16-step long, final END included. *

Regards,

Gerson.

---

* Never mind. Found the answer in you PDF file (I should have used a numeric label). BTW, there's a line numbering mistake in your third solution to #28.

*Message #16 Posted by **Allen** on 10 June 2011, 11:22 p.m.,*
in response to message #1 by Allen

I don't know how good this metric is:

```
> 240   : Beginner
230-220 : Advanced
220-210 : Very Good!
210-200 : Black Belt!!
< 200   : Grand Master
```

I have reason to believe a Grand Master could get below 190 based on the grading and bonus above.

Thanks for the interesting challenge. My favorite was problem 1. It was fun trying to find yet another solution.

Now I'm going to have a look at the other contributions.

Kind regards
Thomas

Re: A new 6-problem challenge (free42 or 42s)

*Message #19 Posted by **Gerson W. Barbosa** on 11 June 2011, 10:00 p.m.,*
in response to message #18 by Thomas Klemm

Excellent work as always, Thomas!

Please allow me a small suggestion to save one step in your "E28":

Replace

```
04 ENTER
05 4
06 *
```

with

```
04 STO+ ST X
05 STO+ ST X
```

Best regards,

Gerson.

Re: A new 6-problem challenge (free42 or 42s)

*Message #20 Posted by **Thomas Klemm** on 12 June 2011, 12:29 a.m.,*
in response to message #19 by Gerson W. Barbosa

Thank you, for pointing that out. I forgot about rule 7.

Thomas

Re: A new 6-problem challenge (free42 or 42s)

*Message #21 Posted by **Gerson W. Barbosa** on 12 June 2011, 3:29 p.m.,*
in response to message #20 by Thomas Klemm

Well, that's not exactly a rule that had to be followed. As I did only #28, I tried at least to make it as short as possible. How does your 21-byte version look like? 22 bytes was my best, by using LBL A in the first line. (*)

Here is an interesting fact about this problem: when n is 1, 3, 11, 35 and 147 the sums are perfect squares. I would bet there are no others, but I may be wrong.

Best regards,

Gerson.

Re: A new 6-problem challenge (free42 or 42s)

*Message #22 Posted by **Allen** on 12 June 2011, 1:27 a.m.,*
in response to message #18 by Thomas Klemm

Thomas, very nice! I'm still studying some of your solutions!

I'll post my own solutions later today .... Here's a quick table:

```
               42S results
Prob.   Bytes    Steps     O(?)          Desc
============================================================
 1       39       22       1            sum 3,5 multiples
 2       27       19      ~LN(N)        sum even F(n) nums
 3       34       23       ?            factor odd 12-digit
 4       60       35       N^2          abccba palindrome
 5       24       18      ~N LOG(N)     LCM (1..20)
 6       14       12       N            sum sq. - sq. sum

28       19       14       N            sum ulam corners
Bonus   -25        0       n/a          n/a
============================================================
         192      129 (143 w/ bonus)
Note:All my byte/step counts assume 1 byte local label at the beginning.

We have basically the same size/solution/algorithm for Problem 2
Your method is MUCH smaller (>5 bytes difference) for 1,3,4 and
mine is SLIGHTLY smaller (<5 bytes difference) for 5 and 6, 28. Fantastic work!!

My looping solution for BONUS problem:

Input: 500 R/S
00 { 19-Byte Prgm }
01>LBL 01
02 STO 01           leave counter on stack and initialize 01 for DSE
03>LBL 02
04 RCL 01
05 ENTER            Save a copy for step 08
```

```
06 STO+ ST X        double it
07 X^2              = 4N^2
08 +                = 4N^2+N
09 +                accumulate prev. sums together in X register
10 DSE 01           Main loop back for counter
11 GTO 02
12 4
13 ×                X: 4 (sum(4N^2+N)+N)
14 ISG ST X         X: 4 (sum(4N^2+N)+N)+1
15 .END.
```

Uses the same eq as the horner solution, but rewritten to save space:

$$4\left[\sum_{n=0}^{\frac{s-1}{2}}\left((2n)^2+n\right)+\frac{s-1}{2}\right]+1$$

Wp34s beta 2: possible serious bug in integer mode

*Message #1 Posted by **Cristian Arezzini** on 10 June 2011, 2:16 p.m.*

I just noticed this now because I usually enter values in hex and not in binary, but this seems serious. I have the calc set to 16 bit unsigned. If I try to enter a 16 digits long binary integer, only the first 12 digits are "understood", and become the lowest bits of the number. The rest of the bits (the most significant ones) are filled with zeroes.

Example: if I try to enter 1234h in binary, which should be 0001 0010 0011 0100, on the display I see 0001 0010 0011b. If I switch one page to the left, I see 0000b. I should have seen 0010 0011 0100b, and 0001 on the left page.

Same thing on the emulator, updated to latest version.

Bug or mess-up on my part? :)

Cristian

in response to message #1 by Cristian Arezzini

Just to add to my previous post, this happens also in other bases and in other word sizes - all the bases and word sizes that produce a number with more than 12 digits. Only 12 digits are entered, the others are ignored.

Other modes as 1c, 2c don't fix the issue; and even turning off leading zeros doesn't fix it.

Re: Wp34s beta 2: possible serious bug in integer mode

*Message #3 Posted by **Walter B** on 10 June 2011, 3:47 p.m.,*
in response to message #2 by Cristian Arezzini

Ciao Cristian,

That's no bug - it's a feature. You can't enter more than 12 digits in any base. No blind typing ;-) But you may of course enter 76543 octal and change the base to binary thereafter.

Walter

Re: Wp34s beta 2: possible serious bug in integer mode

*Message #4 Posted by **Cristian Arezzini** on 10 June 2011, 6:01 p.m.,*
in response to message #3 by Walter B

Ah... Ok. I thought the intended behaviour could have been, for example, a scrolling screen - i.e. when entering "extra" digits, the whole display scrolls to the left and the leftmost digit disappears, going to the other page - exactly as it happens on the 16c. It's lucky then that I don't enter binary numbers directly very often! :)

Suggestions for WP-34s overlay installation

*Message #1 Posted by **BobVA** on 9 June 2011, 10:25 p.m.*

Just got my "beta" WP-34s overlay from Eric. A couple of observations if you haven't installed yours:

Keys: Use tweezers, or the tip of an X-acto knife, to install the key stickers. Holding the sticker by the bottom right corner worked best for me. It was easier to align and place the top part, then smooth down the bottom/face section.

Overlay: What worked for me was flipping the calculator so the LCD was at the bottom, then applying the label "bottom-to-top" (i.e. starting at the top key row and working towards the bottom). Carefully monitor the space between the overlay and the top of the keys - test each row of keys as stick down the label above the row (i.e. before you completely surround the key). If any don't "click" reset the overlay until it does.

I did the key stickers first, but it might have been better to do the overlay. I flexed the overlay a lot picking off the key labels, so perhaps peeling that off would save a little wear on it, and a make the key labels easier to pick up. Downside may be accidentally picking up some of the key stickers, though. Please post if you try this and it works better.

The overlay is a HUGE improvement - thank you Eric. Looks and works great. (And I'm no longer hitting the wrong arrow key when going through the function catalog!)

Bob

:-) An overlay really does make a huge difference and it puts to rest the calls to move the arrows up one position to match.

Have fun.

- Pauli

*Message #6 Posted by **BobVA** on 10 June 2011, 5:45 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Here's how mine came out. Note that I removed and re-applied the overlay a couple of times until I was happy with the key action, so it got a little wear on it.

The photo shows a lot of scuffing I don't see in "real life" The color is a very deep black in person.

Hey Bob,

that's the very first photographically documented sighting of a wp34s 2.0, isn't it? Congratulations! Now we're waiting for pictures showing it in it's natural habitat :-)

Walter

Re: Suggestions for WP-34s overlay installation

*Message #8 Posted by **Eric Rechlin** on 10 June 2011, 10:45 a.m.,*
in response to message #1 by BobVA

Definitely use a tweezers for the key stickers.

When I mount the overlay (I have done this a bunch of times already) I always put on the overlay first, before the keys. It peels right up without removing the keys, so you won't have the problem with worrying about damaging the overlay when pulling up the keys. Also, it makes it so that if you don't align it right you don't damage the key labels with the adhesive from the overlay.

You can easily remove the key stickers from the backing by bending the overlay sheet, which makes them start to peel up on their own, giving you something to grip with the tweezers.

Also, I start applying it in the middle and gradually work my way to the top and bottom. I sometimes stretch it a bit when installing it to make sure it aligns with the keys properly, because if you don't do it just right (which is very hard to do) some of the keys will bind as Bob noted.

I will probably make the holes for the keys slightly larger, at Bob's suggestion.

Right now, other than fitment, my biggest unknown is durability. I've been keeping my 34s loose in my backpack, and I've been playing with it every day, in order to see how durable the overlay is. I have had zero problems with the key labels coming off (at least not with the stronger adhesive I have been using in my latest test prints), but I do worry about the ink wearing off the vinyl. If that is a problem I can spray a clearcoat over it, but that makes it shinier (I prefer the dull appearance of it without the clearcoat) and it is not yet known how much that will help durability.

Thanks to all those who are the first to test this.

Eric

Re: Suggestions for WP-34s overlay installation

*Message #9 Posted by **Cristian Arezzini** on 10 June 2011, 11:08 a.m.,*
in response to message #1 by BobVA

Bob, could you tell me if the overlay is "re-positionable"? I mean, if I start placing it and it goes on not perfectly straight - can I "peel it off" without damaging it and try again? Or will it "rip" like a paper sticker?

Thanks, Cristian

Re: Suggestions for WP-34s overlay installation

*Message #10 Posted by **Eric Rechlin** on 10 June 2011, 2:44 p.m.,*
in response to message #9 by Cristian Arezzini

If it's only partially adhered you can remove it if you pull very very very slowly, but unless you are careful it will rip. Also, once it's been on there a few days it's pretty much impossible to remove without destroying it.

Eric

Re: Suggestions for WP-34s overlay installation

*Message #11 Posted by **BobVA** on 10 June 2011, 5:32 p.m.,*
in response to message #9 by Cristian Arezzini

I re-did mine three times because I wasn't happy with the key action until I hit on applying it with the calculator upside down so I could stretch/fit it as I installed it. But I hadn't really pressed it down hard, and it did this immediately.

As Eric noted you have to be careful (and if you look at the photo above you can see it got a little scuffed up), but it came off in one piece. It's pretty durable considering how little actual material there is in the lower keyboard section.

HP 19C horror show!

*Message #1 Posted by **Geoff Quickfall** on 9 June 2011, 7:49 p.m.*

Hello all

I knew I was getting an defunct HP 19C but one can only hope. This is a resale of a resale but I needed an example, working or not for the book, so out went the expense and in came the 19C.

Filthy dirty filthy mess! Keys soiled, case soiled and some one attacked the battery compartment with a cattle branding iron instead of a soldering iron!

Melted grooves and plastic in the battery compartment with spare melted solder globs imbedded in the plastic. Both battery contacts loaded with excess solder to a quarter inch in thickness. So much so that I had to remove the excess before extracting the pca from the calculator.

Of course, it took a good hour to get into the calculator due to a rounded philips head screw. Ended up drilling the head off without damaging the screw post or case.

Corrosion was minor, however the print head was imbedded in the smooth platten as it had melted in place!!!

So I disassembled the calculator, cleaned up the pca's. Removed the corrosion (all traces were intact and tested so). All contacts cleaned and SOOT removed from some of the components. Maybe the paper caught fire ;-)

Well as I said, it was for photodocumenting the dissection. Did I mention that two large headed brass screws were missing leaving only one holding the printer in place. Also as tiny screw jack was floating in the wreakage.

Well, desoldering, removing the corrosion and cleaning contacts and etc. have resulted in random LEDS lighting up depending on the off/on cycling of the calculator. It would seem that an attempt was made to repair it by that guy with all thumbs. Probably attached the charger to it with no batteries in it also. The motor works and moves the print to and fro as tested from a 1.5 volt battery attached to the motor leads. Well there are some good parts and the keyboard side looks good so it will display well, or until a working one can be secured.

Does this calc suffer the same demise as the 29C and other woodstocks vis-a-vis, chargers and bad/missing batteries? The new symptoms (at least it lights up ;-) would attest that it does.

some shots of the dismantelling:

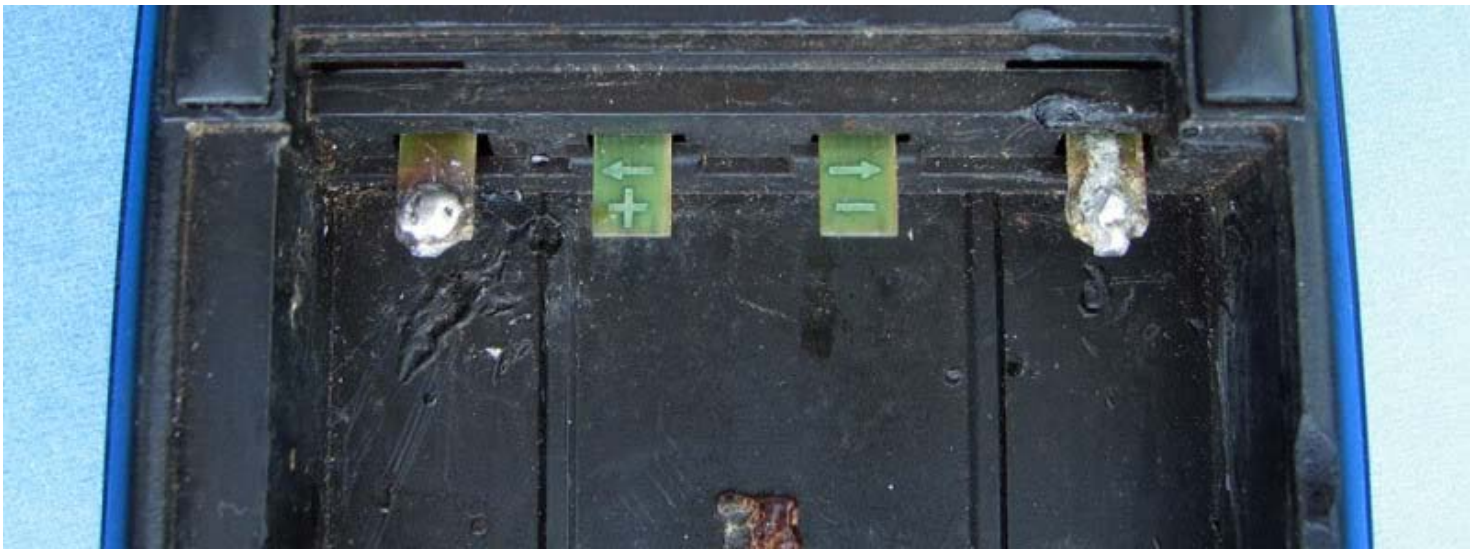
(Mike Morrow; this is not yours!!!!!! It is safe and sound and with what I gleam from this will help with yours, hopefully!)

As it arrived, not bad looking:

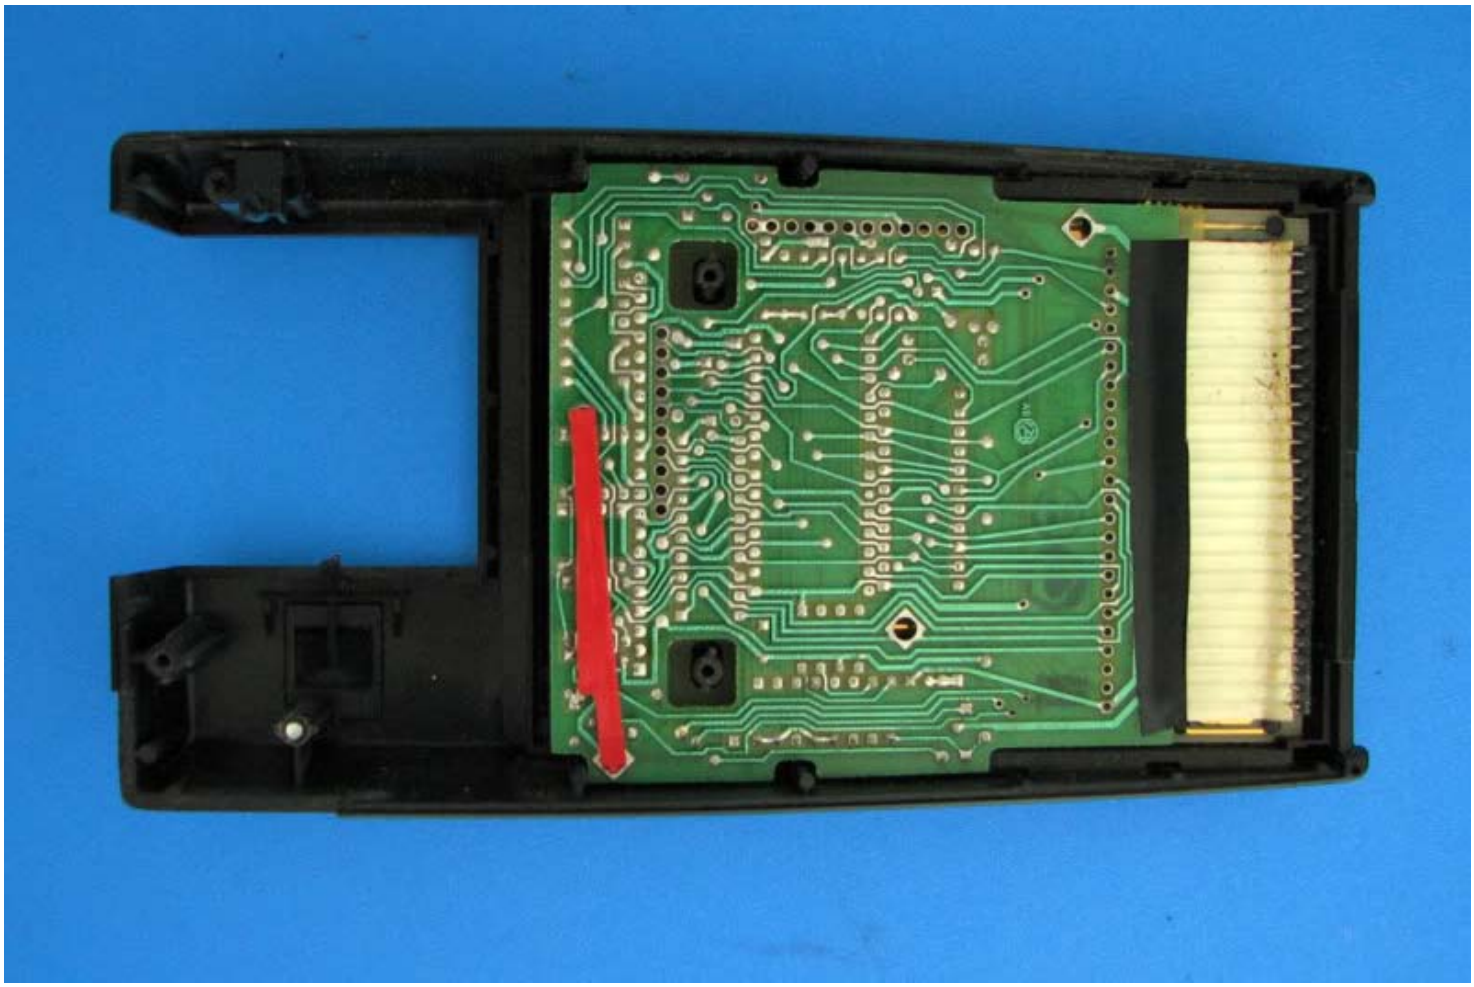
Back cover a little chewed up with pry marks, not a good sign:

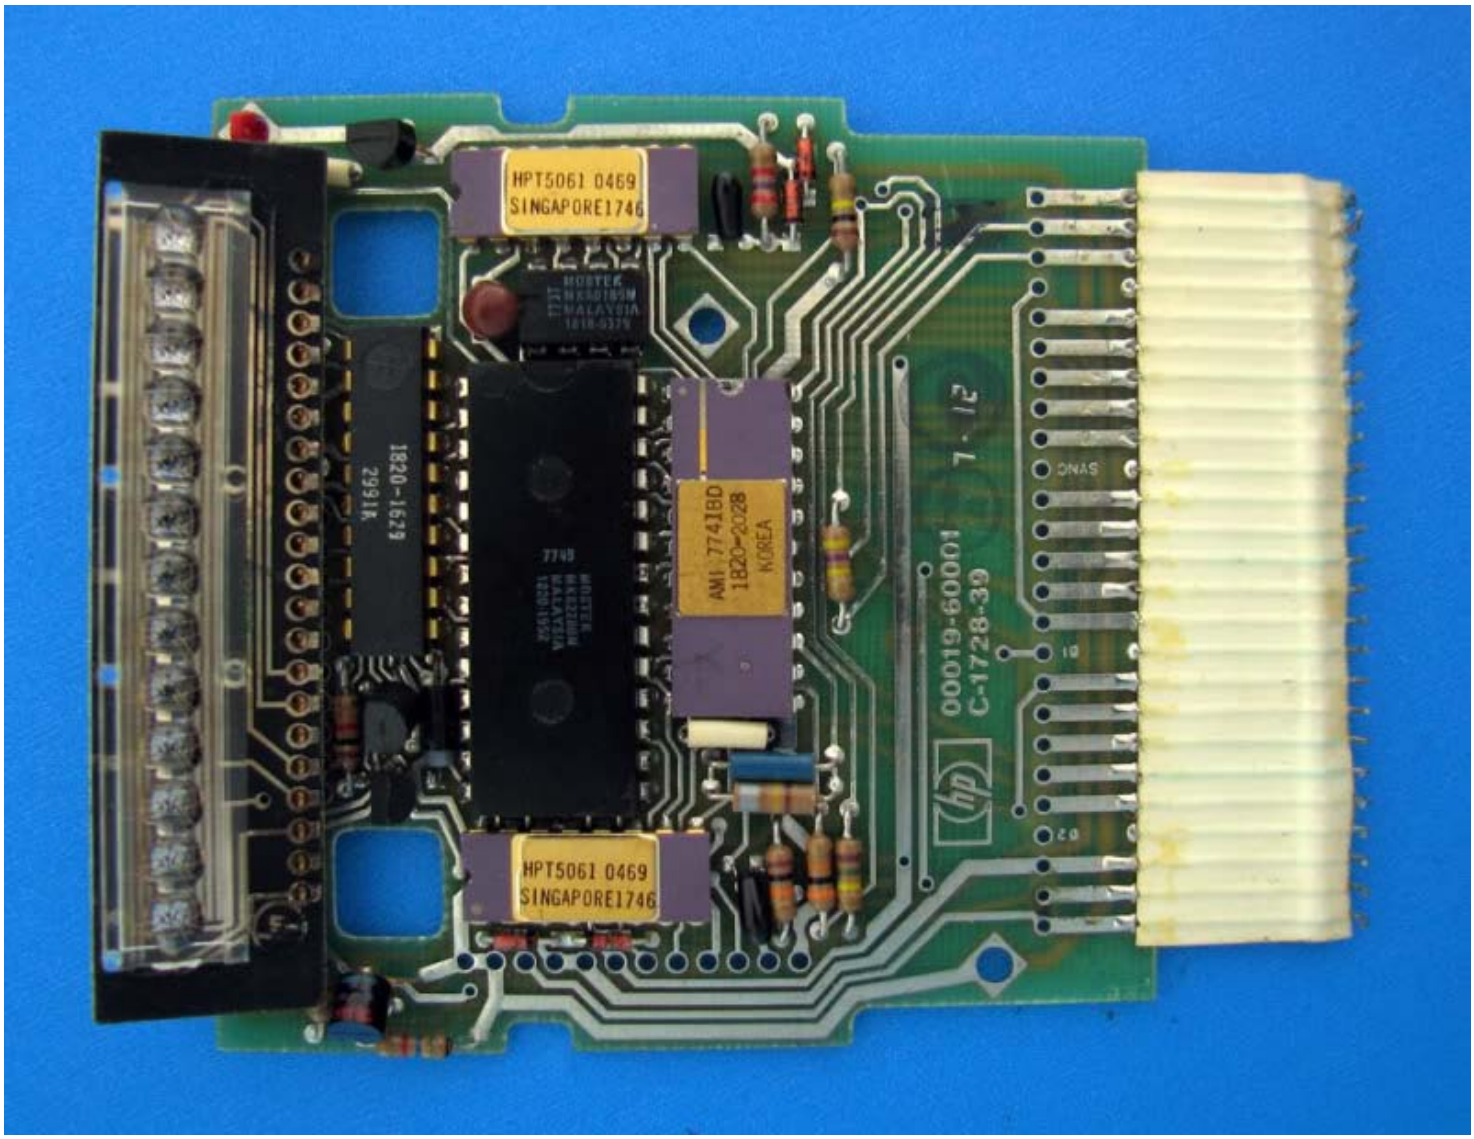
Evidence of a branding iron and bucket of solder:

The contacts, had to desolder prior to removal to get to exit the back of the case:

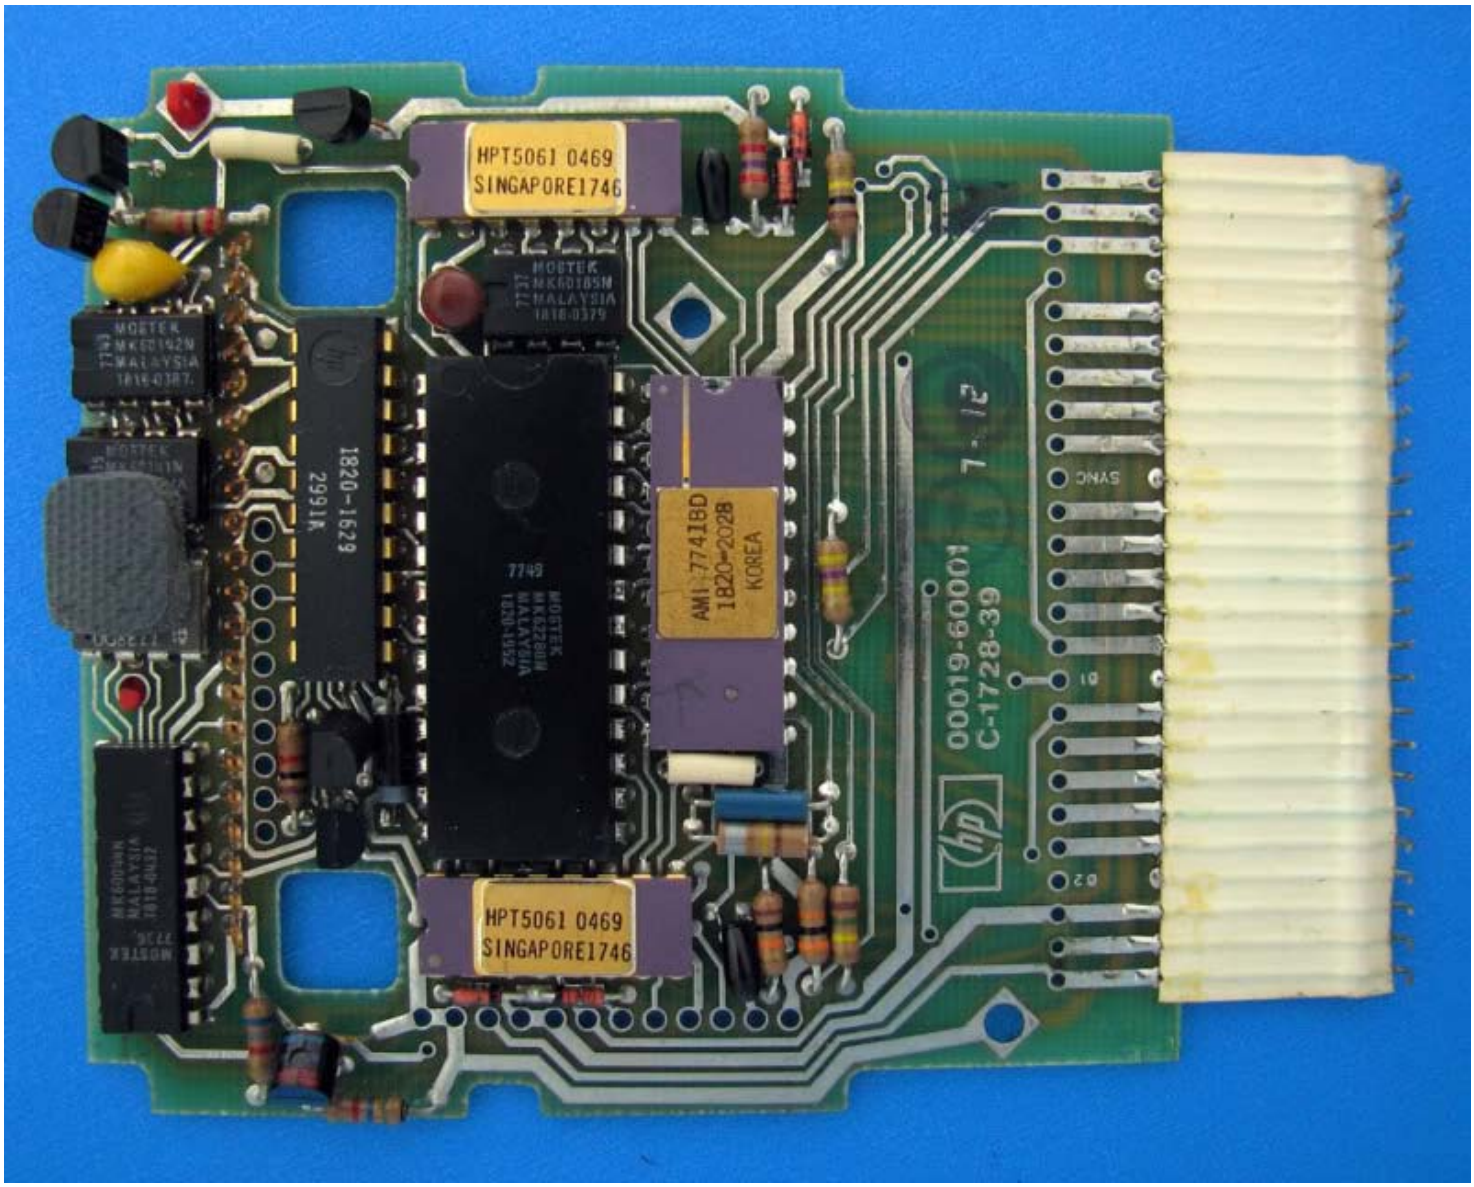


Keyboard PCA:

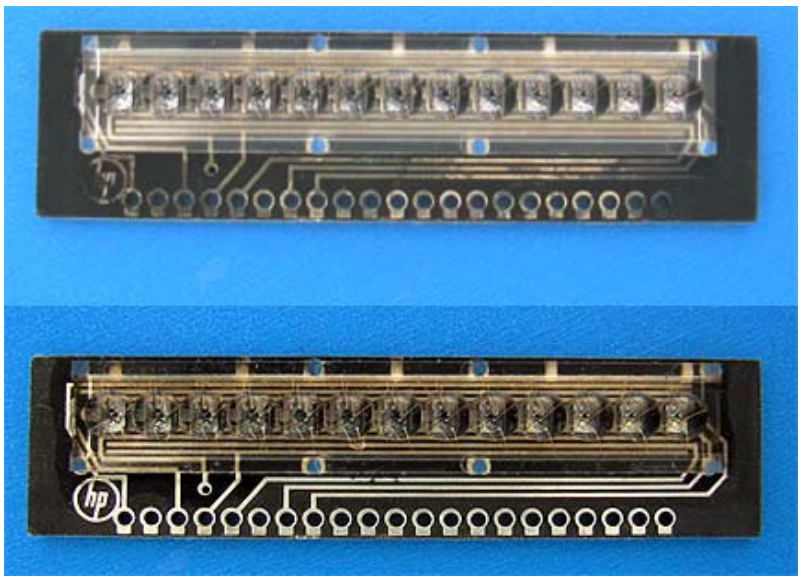


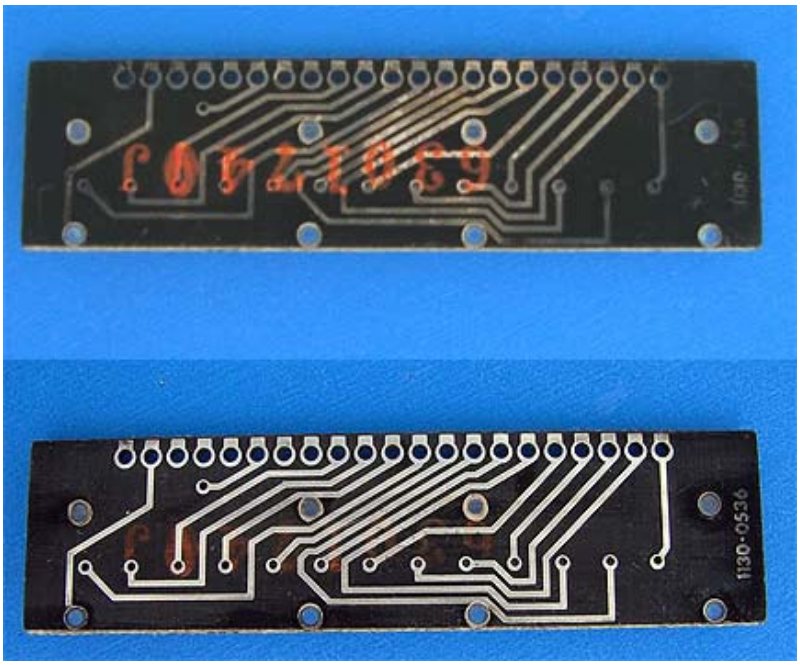


HPT5061 0469
SINGAPORE1746
1820-1629
2931A
AMI 7741BD
1820-2028
KOREA
HPT5061 0469
SINGAPORE1746
00019-60001
C-1728-39

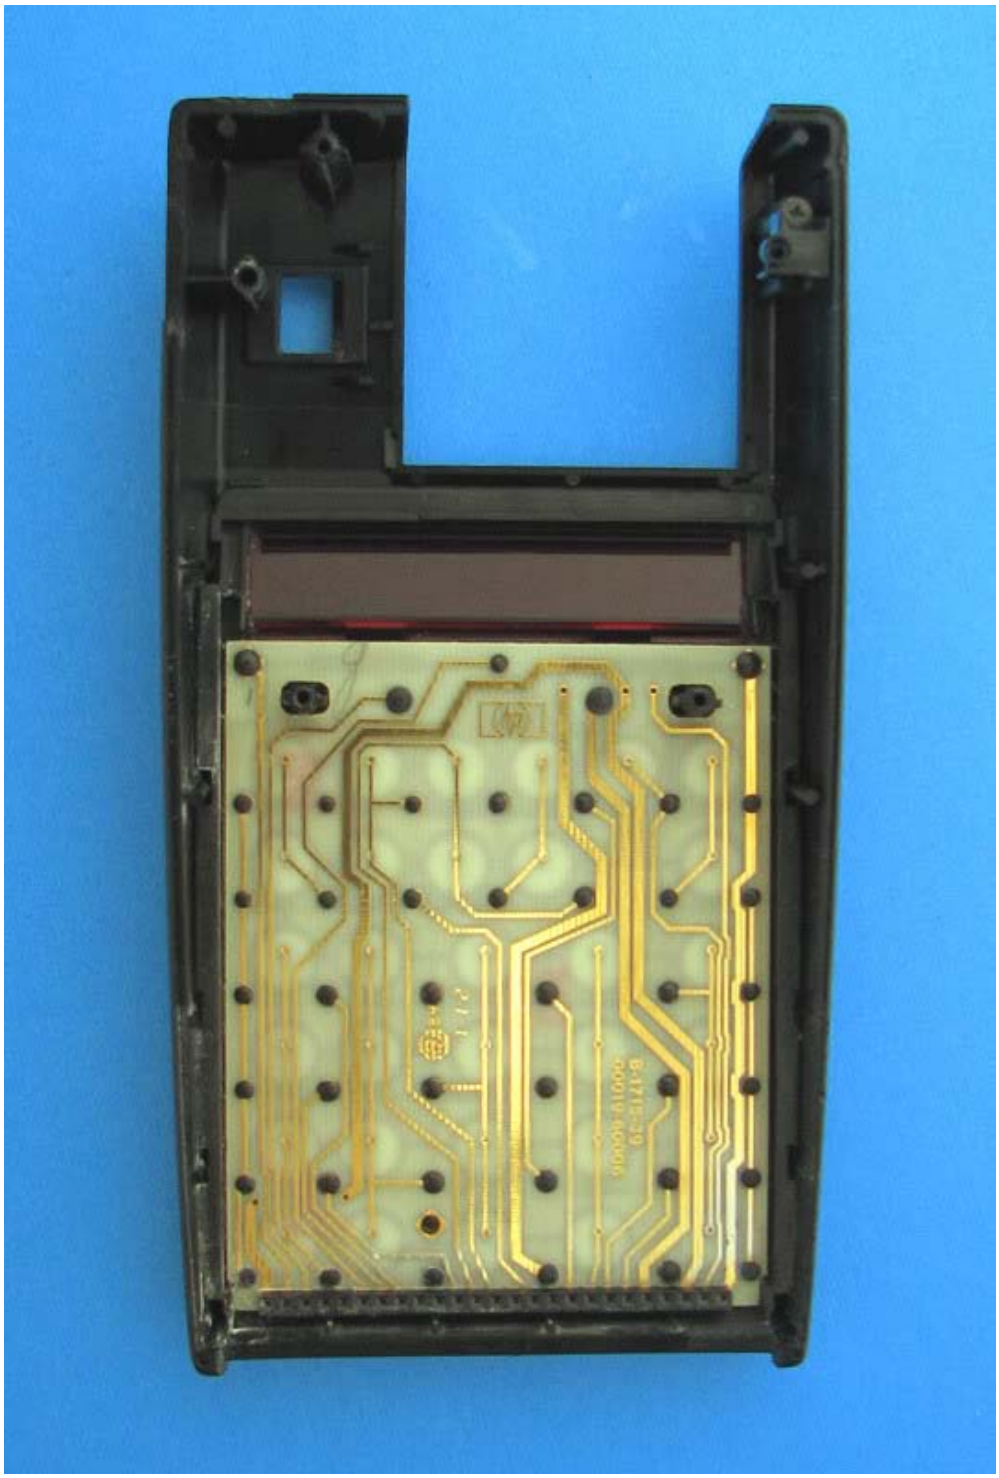


LED before and after cleaning soot:

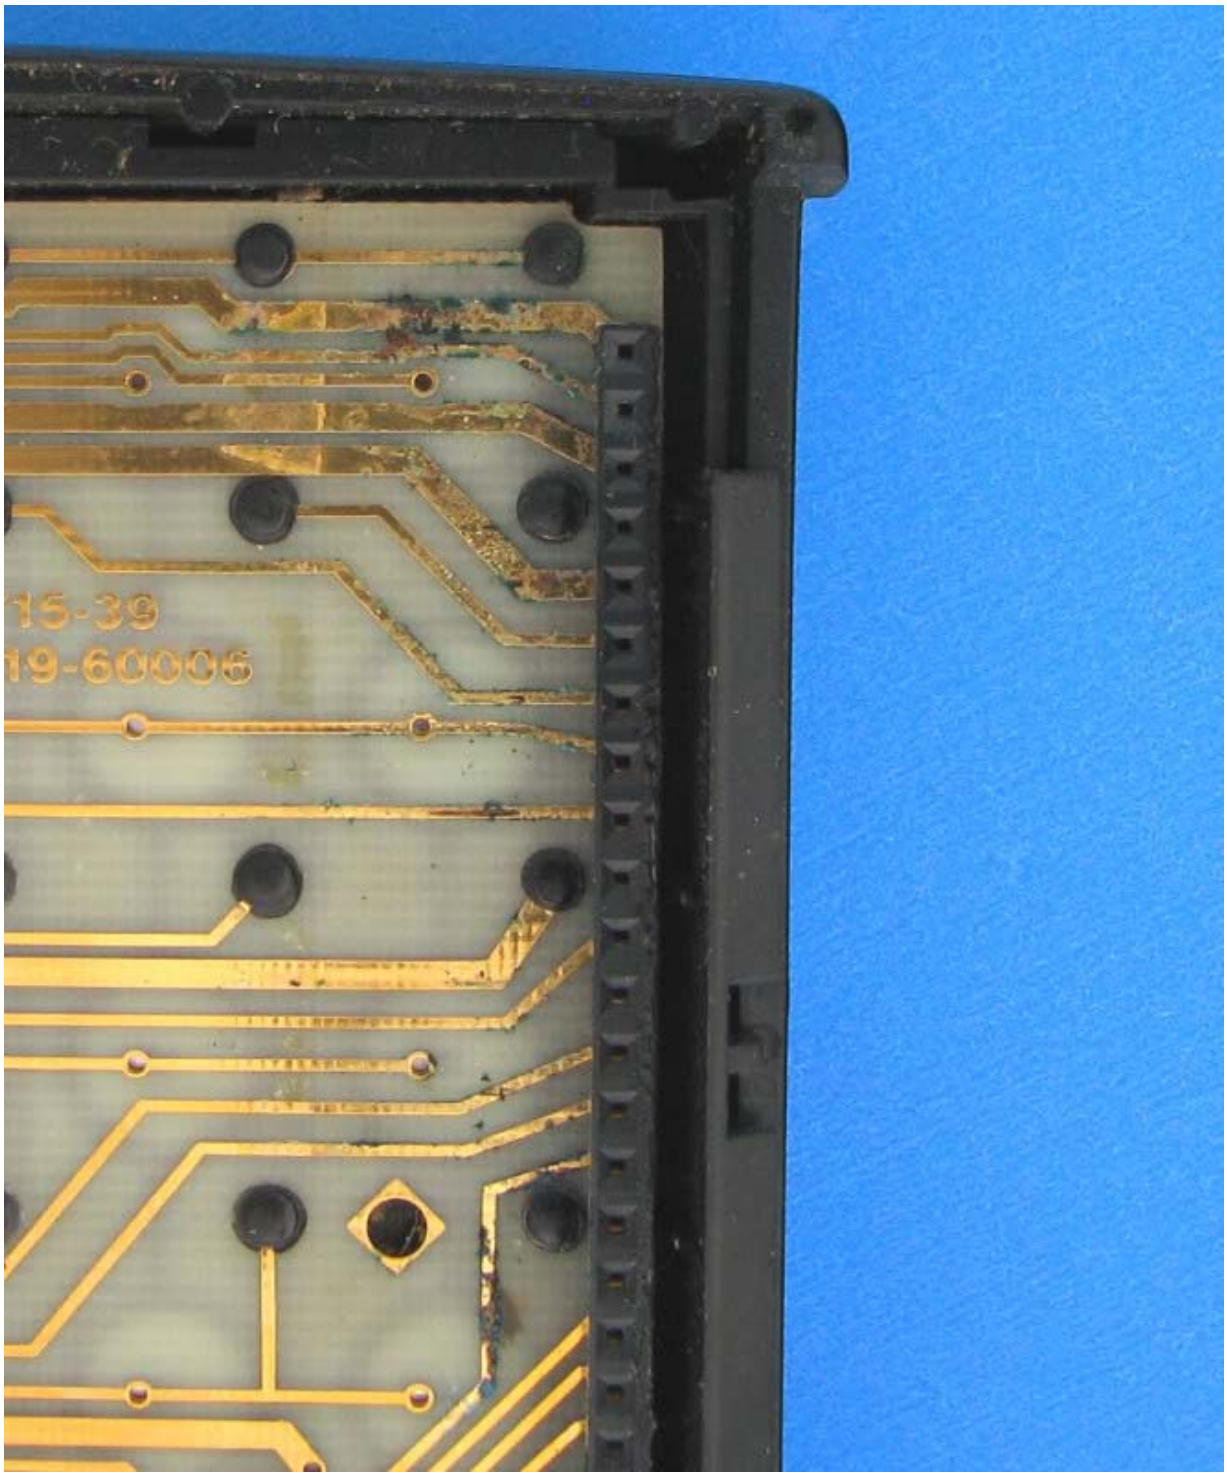




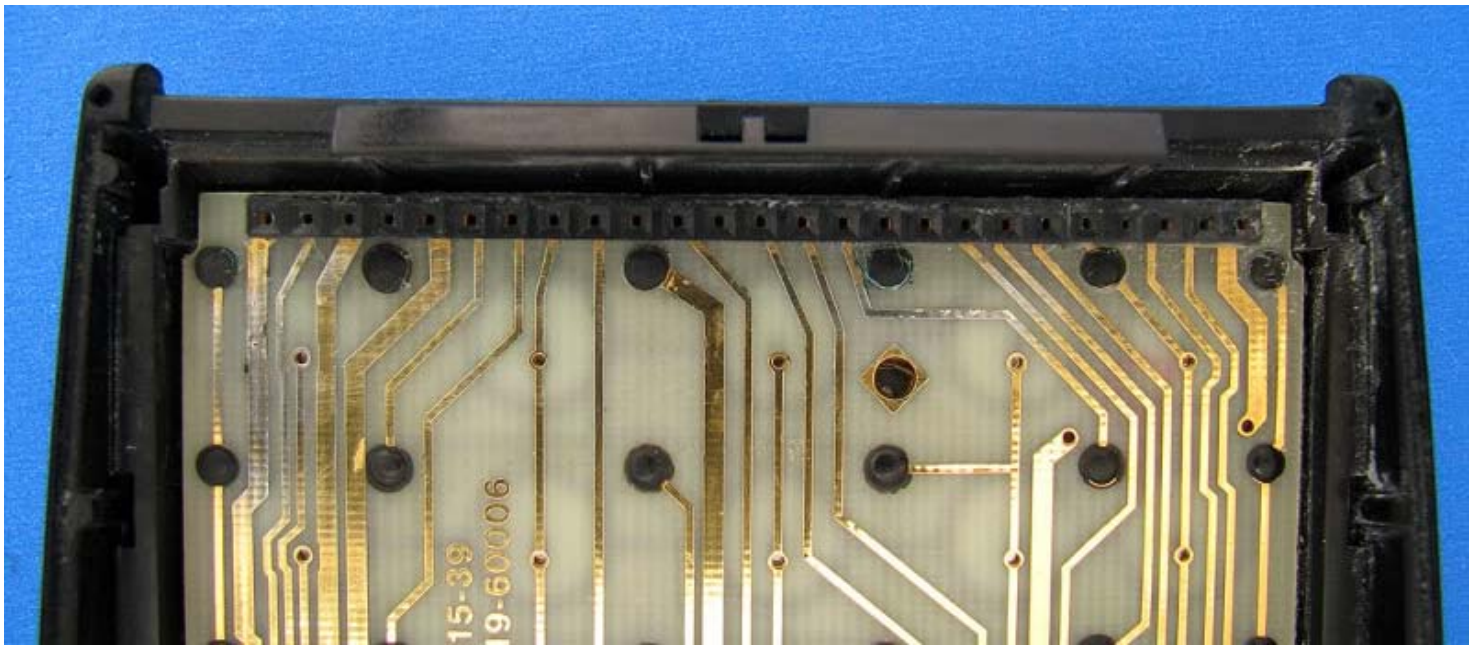
Keyboard trace:



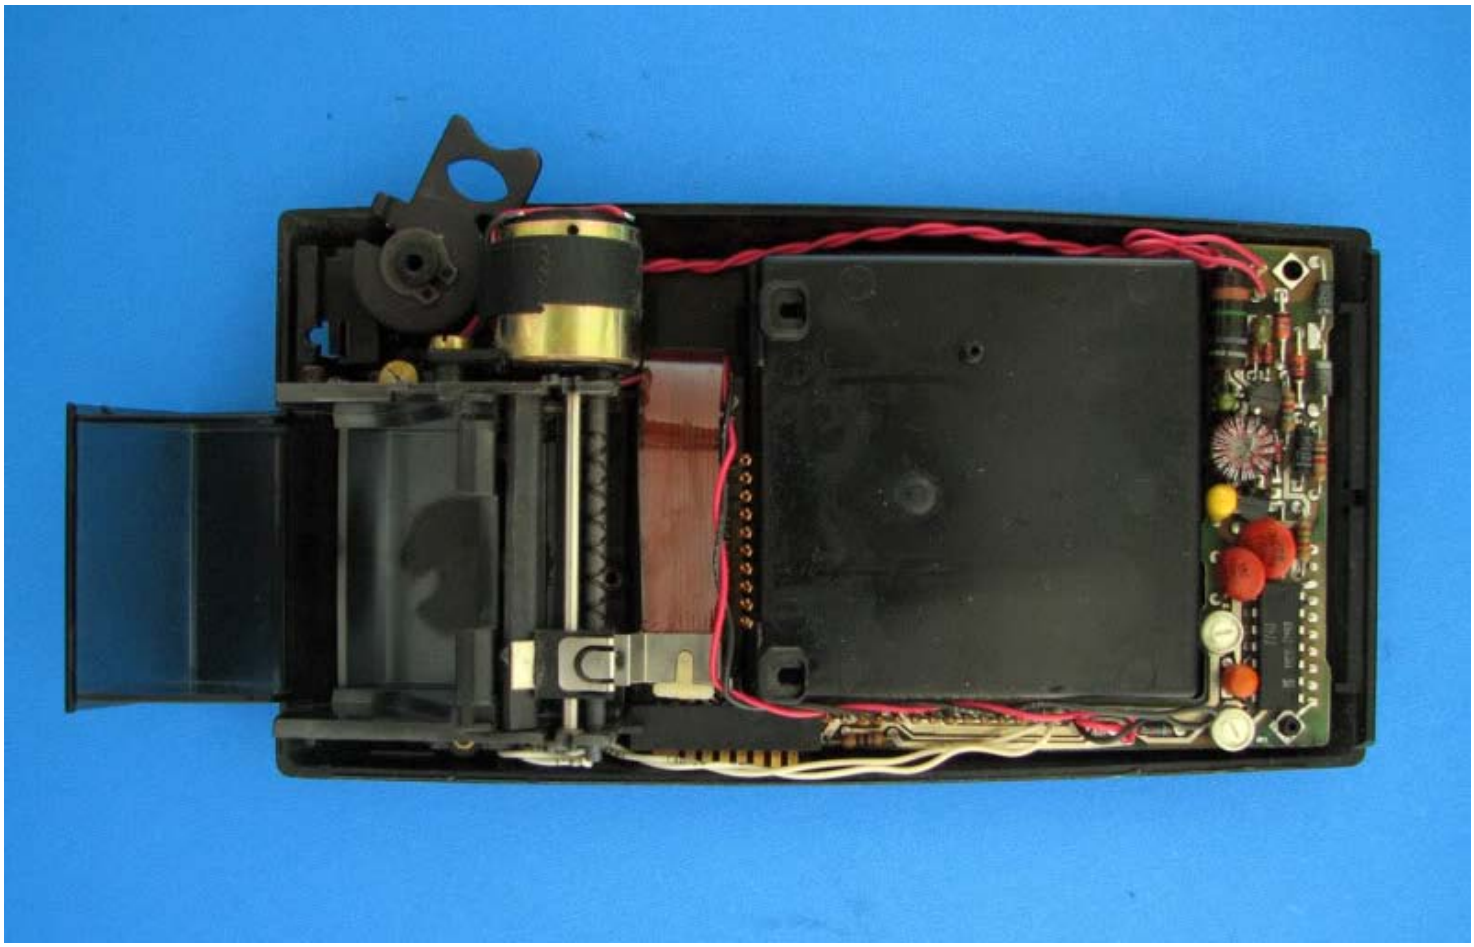
Trace corrosion at base of calculator keyboard pca:



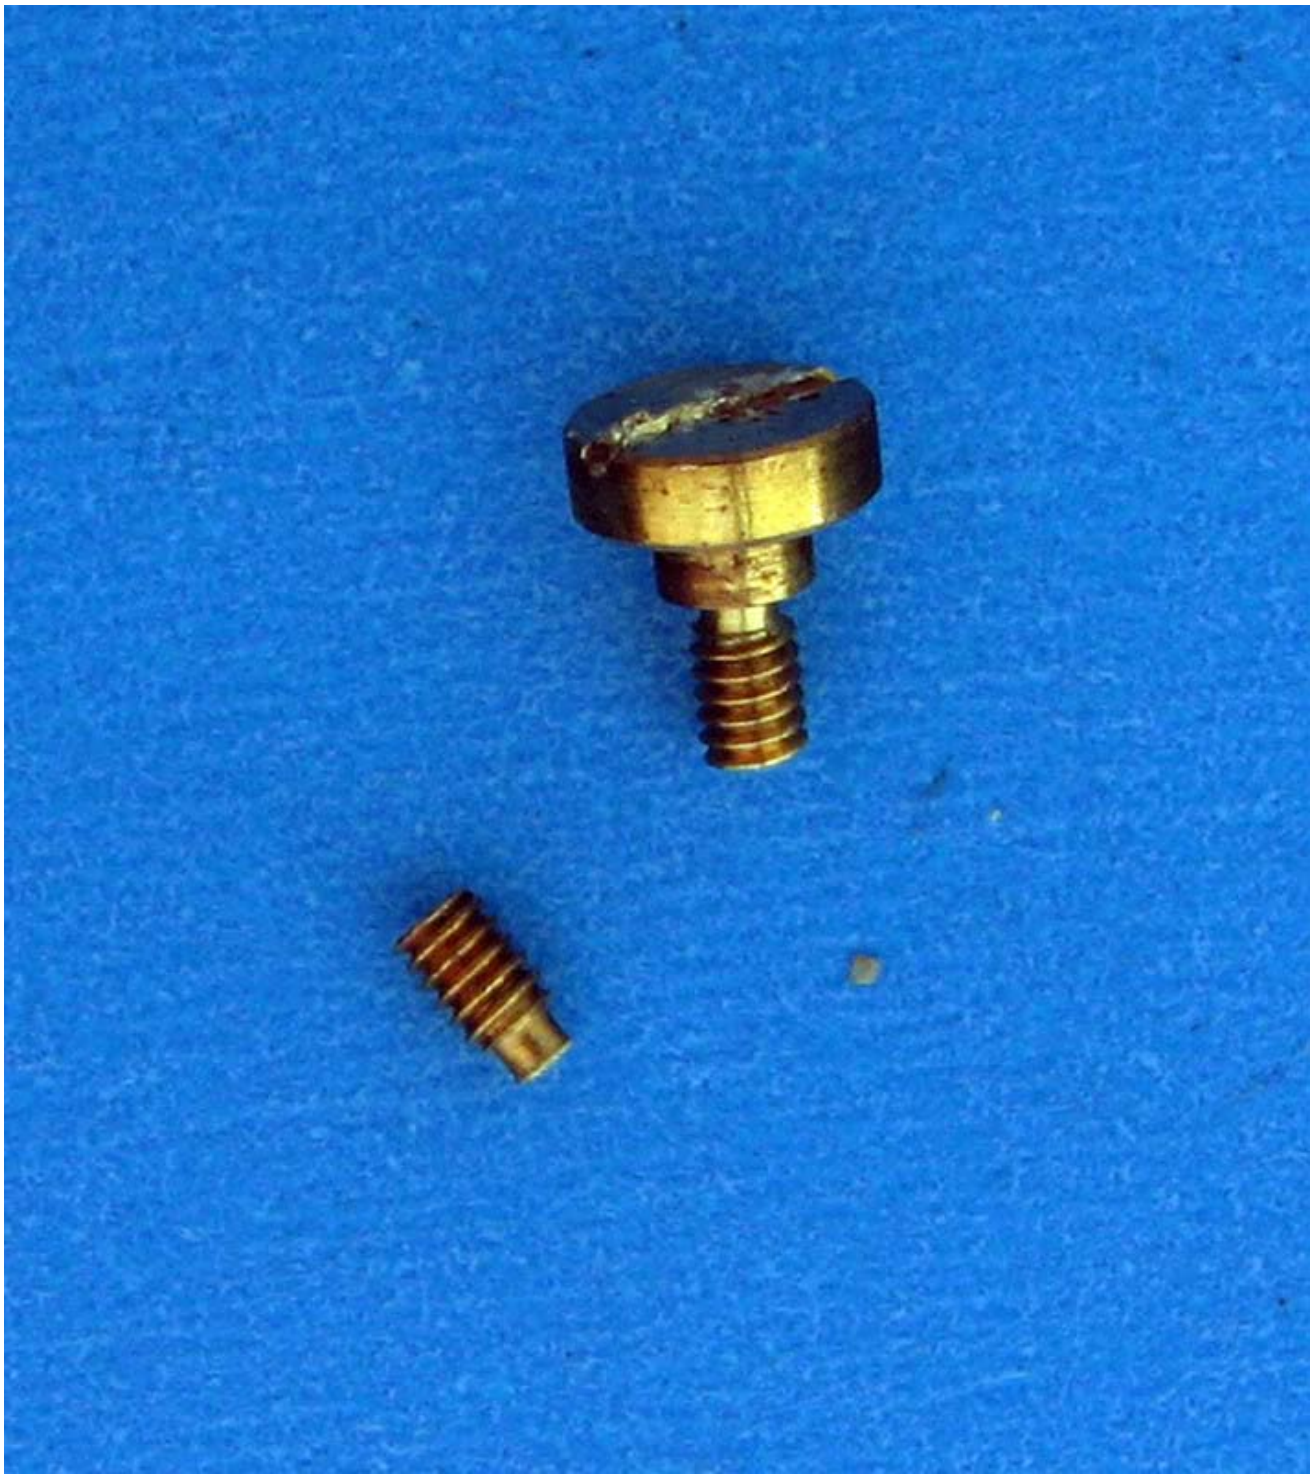
And again after corrosion removed and continuity checked:



And now the printer assembly:

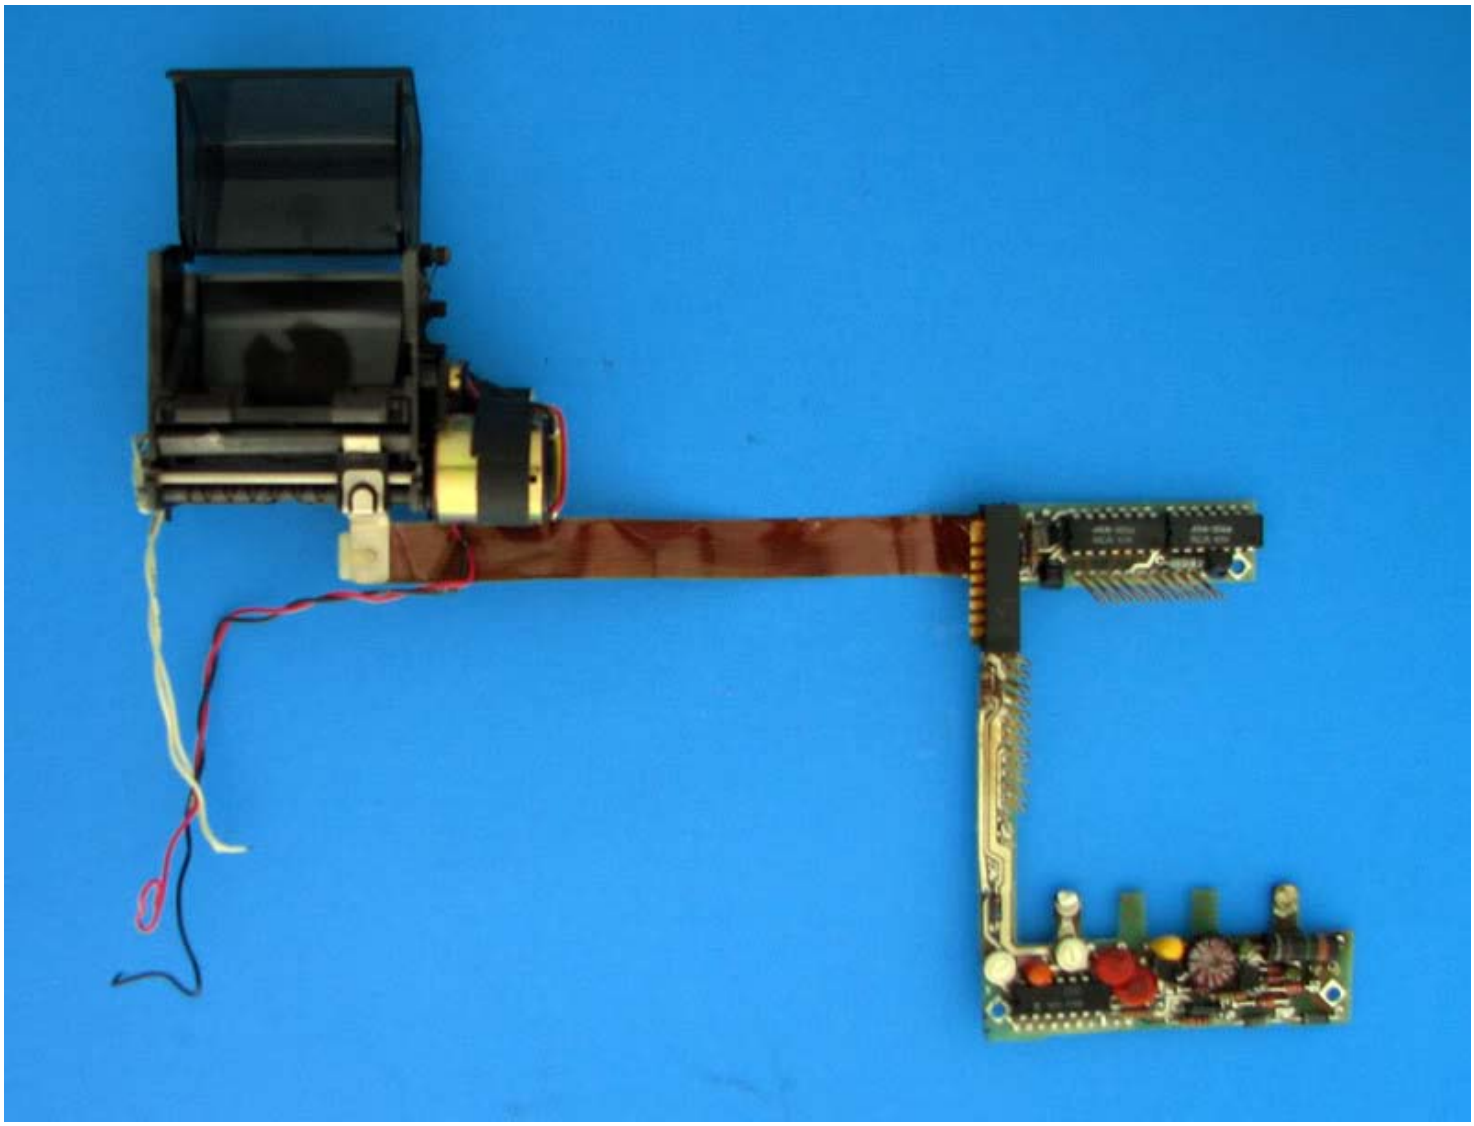


One of three large screws for securing printer assembly to case (the other two are missing). Also a small slotted threaded screw found floating inside, any suggestions?

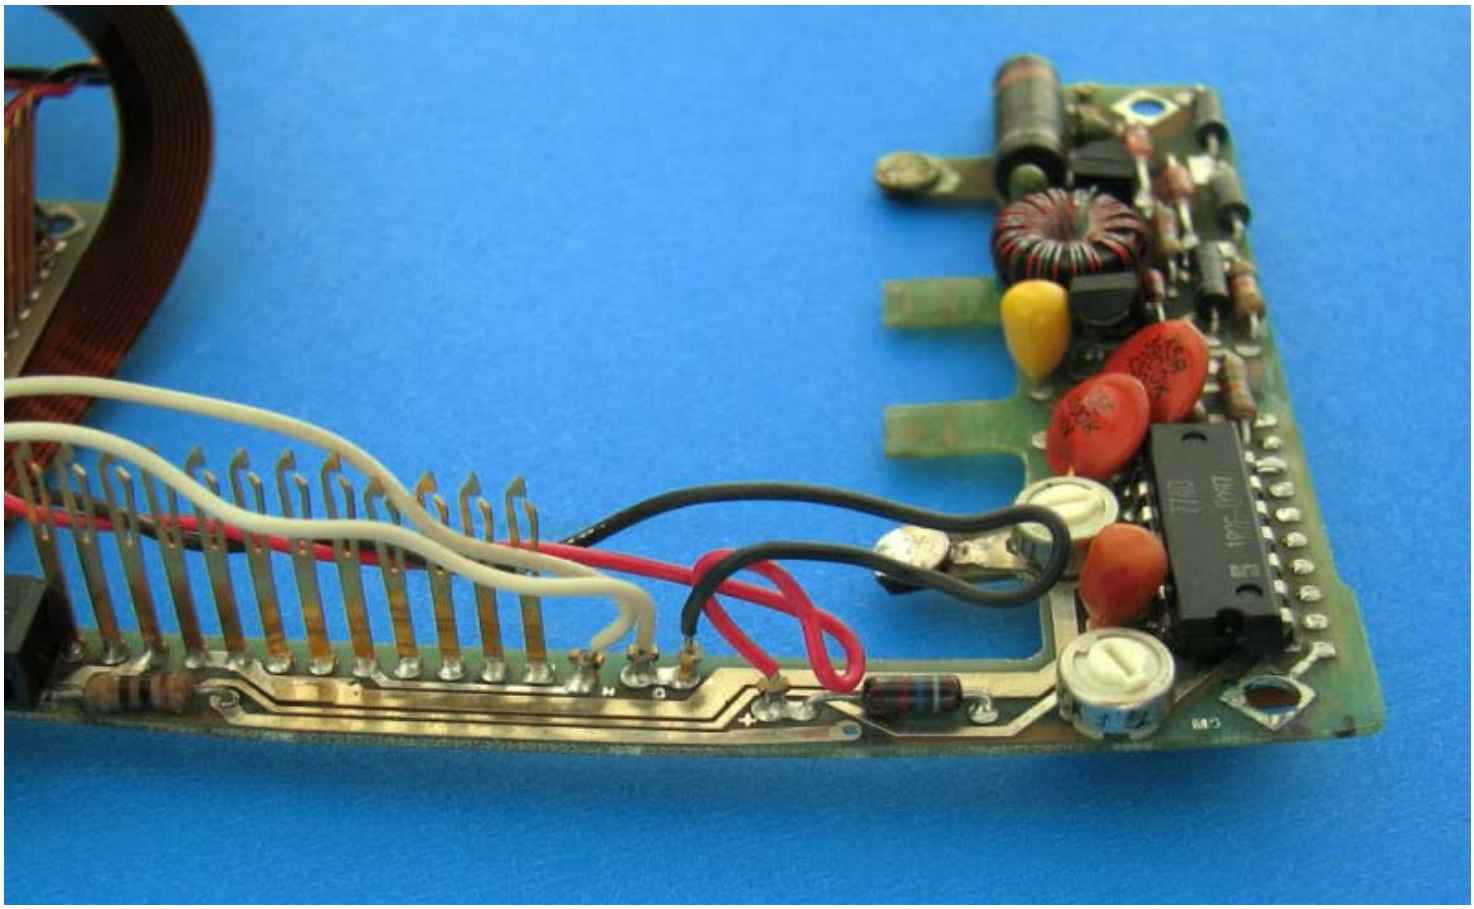


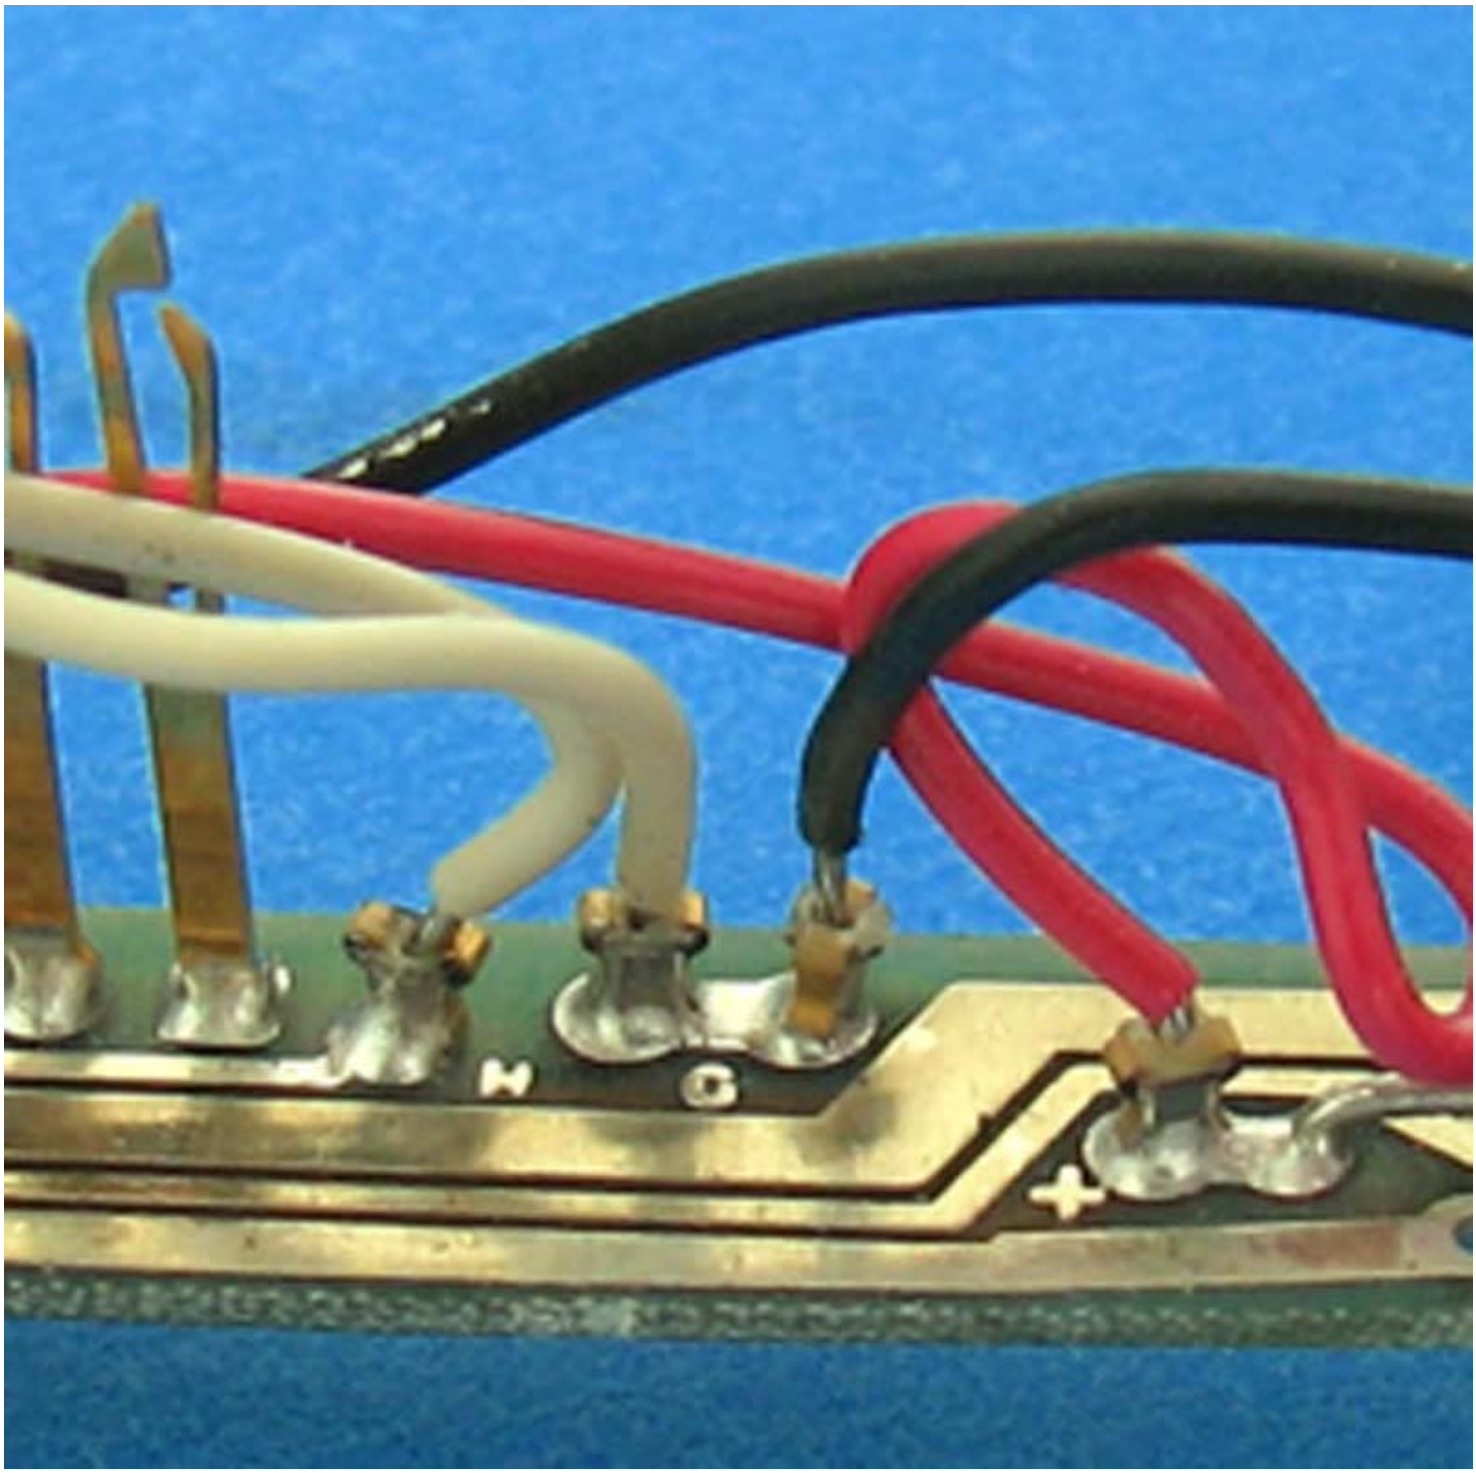
Melted platten:

Printer PCA, printer and ribbon:

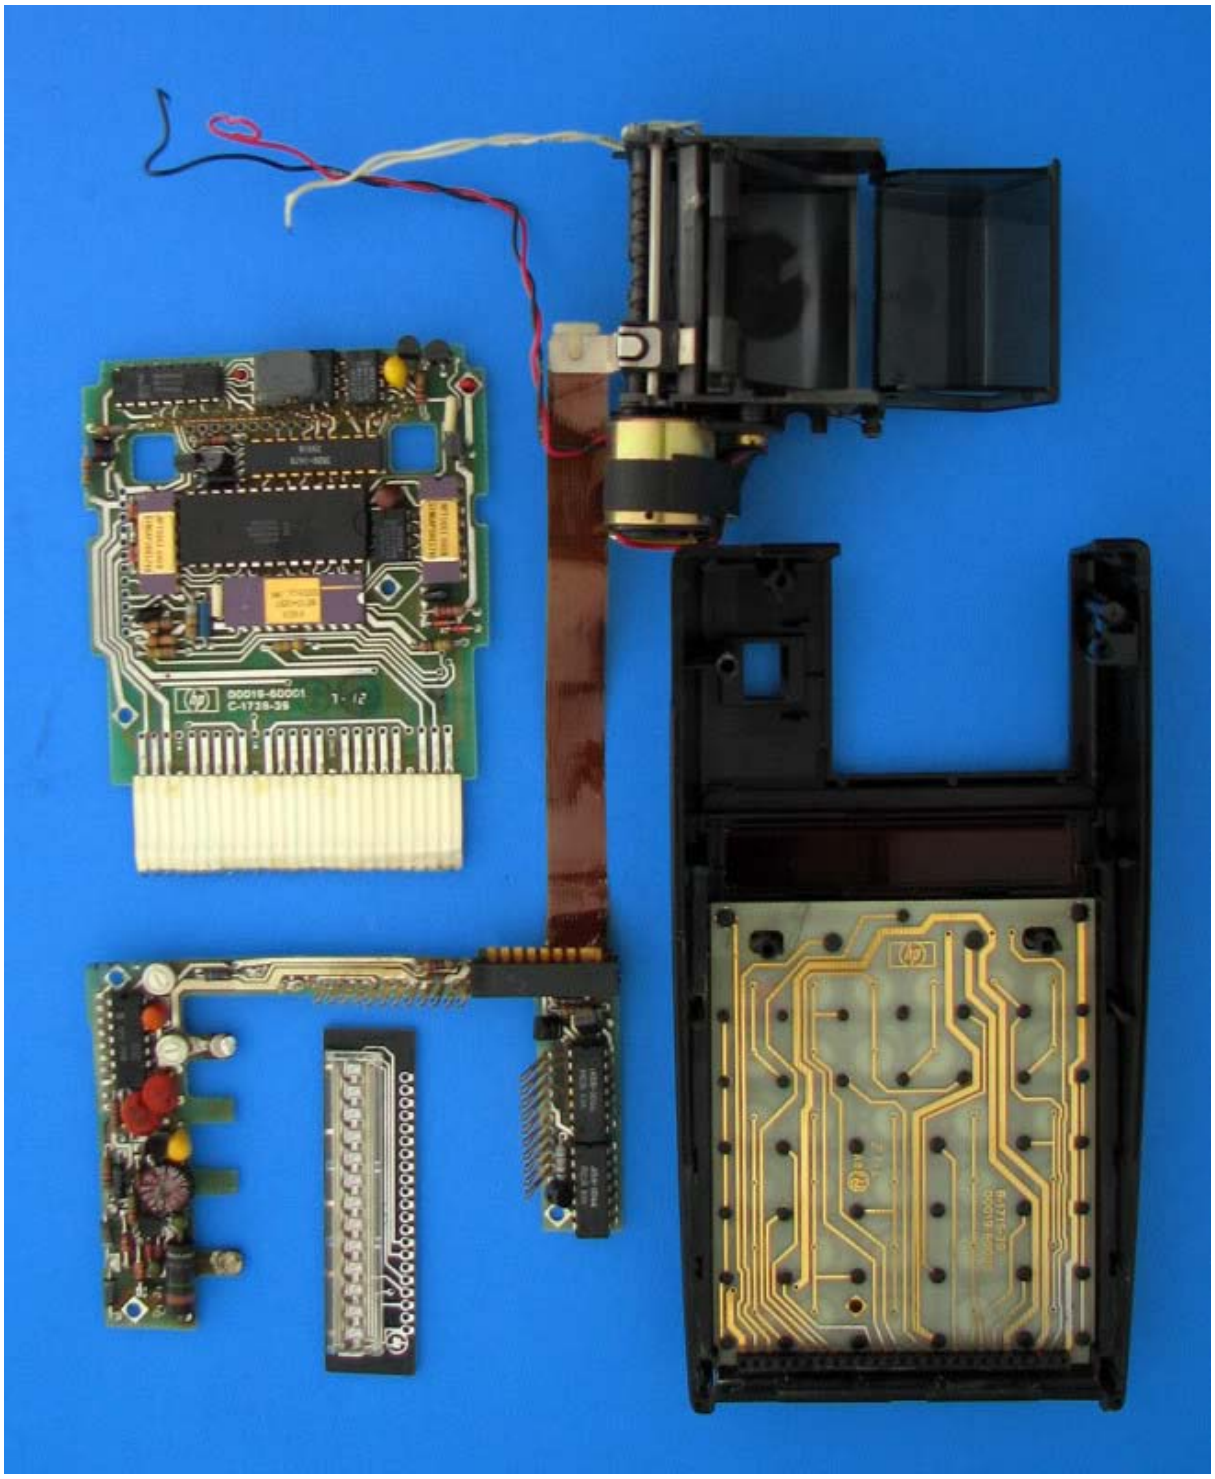


Printer motor and printer power connections:





An overview of the pca's:



Now to clean up the photos, label them and insert them in the text. Still to do with this is a diassembly of the printer system with photos and explanation.

Just one more chapter to photograph then onto the text for three chapters, some appendices and then proofing. Still hoping for a release in San Diego.

Enjoy the photos.

Geoff

in response to message #10 by Rainer Wiedemann (Germany)

:-) Nice idea but too early for Carly ... although, hmmmh, you're right: it's her fault in any case ;-)

Re: HP 19C horror show!

*Message #12 Posted by **Hal Bitton in Boise** on 10 June 2011, 10:10 a.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff,
My 19C doesn't have the security cable tab either.
It's serial no. is 1803S11159, (supposedly built in the 3rd week of 1978).

When was your unit built?
Best regards, Hal

Ta da! sort of.....

*Message #13 Posted by **Geoff Quickfall** on 10 June 2011, 2:42 p.m.,*
in response to message #1 by Geoff Quickfall

Hello responders and others:

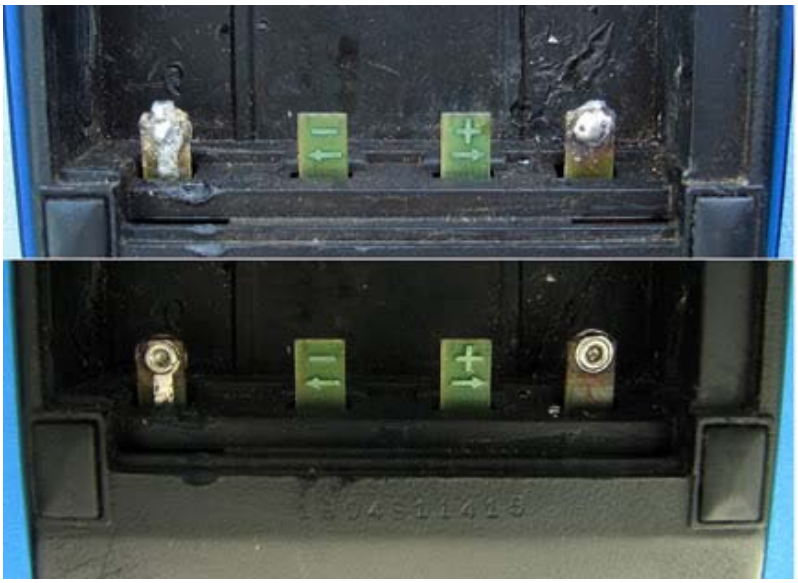
Exschr: thanks for the lament and the kudos!

Walter B: you have!!! and soon (San Deigo).

BobVA and Hal: serial number 1804sxxxxx with the security cradle option.

Ignazio: spot on and thanks, didn't really look at it, but, yes a sheared threaded section of the original brass screw.

And now a before and after on the contacts:



The desoldering and cleaning combined with the work on the keyboard and logic pcas resulted in the following:

Interestingly the display is random and dependent on the cycling of the off/on switch. Also the display of the lit LED's cycles itself, as though the timing logic is still there. This is unlike my HP 21 with the power and logic destroyed by the

application of the charger without batteries (a no no). In the 21 the display is locked on one LED and static, does not vary.

Now for the spoof:

E**Y sale:

HP 19C, powers up and displays. Calculator clean with no corrosion evident. Includes rare security cable attachment. Will not perform calculations but probably just needs new batteries. No charger so no way to test it further. Instruction manual not included but is readilly available on the web. Should be an easy fix. Any gullible buyers, contact me at.....

Just to be accurate, it is not forsale, that is a joke, but haven't we seen it before with respect to Woodstocks and others.

Cheers, Geoff

it will make for a nice display when I am done.

Edited: 10 June 2011, 2:43 p.m.

Re: Ta da! sort of.....

*Message #14 Posted by **Joel Setton (France)** on 10 June 2011, 2:58 p.m.,*
in response to message #13 by Geoff Quickfall

Geoff, if the display "wants" to cycle, this may be a sign of a defective clock oscillator. Look for broken traces or faulty components on the LC1 and LC2 pins of the ACT. Just my $2E-2's worth... Joel

Re: Ta da! sort of.....

*Message #15 Posted by **Geoff Quickfall** on 10 June 2011, 3:00 p.m.,*
in response to message #14 by Joel Setton (France)

Joel,

I was thinking along the same lines, but not as technical. I will certainly check as I have not given up yet!

Thanks again!

Re: Ta da! sort of.....

*Message #16 Posted by **Eric Smith** on 10 June 2011, 7:16 p.m.,*
in response to message #14 by Joel Setton (France)

If the oscillator isn't running, you shouldn't have more than one digit illuminated in the display at a time, unless cathode lines are shorted together, the cathode driver chip is bad, or possibly if the cathode driver chip isn't getting a reset signal. (I'm not sure of how the internal logic of the cathode driver works; if it is a shift register, then without a reset more than one output can be driven.)

Re: Ta da! sort of.....

*Message #17 Posted by **Randy** on 11 June 2011, 10:47 a.m.,*
in response to message #16 by Eric Smith

Yes, the 19C is just as fragile as all woodstocks to over-voltage damage.

If the clock is not running:

1) LC components bad, traces to same open (rare). 2) Bad VSS/VGG (rare) 3) Bad ACT. (most common failure)

The other common over-voltage damage in addition to the ACT is the combo RAM/ROM (1818-0379).

Re: Ta da! sort of.....

*Message #18 Posted by **Ernst Fueloep** on 14 June 2011, 3:59 p.m.,*
in response to message #13 by Geoff Quickfall

Geoff,

How have you cleaned the contacts? And removed the solder?

wp34s 2.0 Beta Release

*Message #1 Posted by **Marcus von Cube, Germany** on 9 June 2011, 4:32 a.m.*

We've finally released what we believe is very close to the final wp34s firmware. Go to SourceForge.net and get the file wp34s.zip!

We do not plan to add any more features as we only have a few hundred bytes of flash space left. Feel free to provide useful user programs for the system that can be neatly packed in the available user flash pages if you want more functions. It's a programmable machine in the end, isn't it?

We expect that the community will still find some bugs and inaccuracies and kindly ask you to play around with either the emulator or a reflashed HP calculator and report back your findings.

Looking forward to your comments.

Marcus, Pauli & Walter

P.S.: I've had trouble uploading the file. If you've downloaded a corrupted archive, just try again.

Edited: 9 June 2011, 6:20 a.m. after one or more responses were posted

Re: wp34s 2.0 Beta Release

*Message #2 Posted by **Cristian Arezzini** on 9 June 2011, 6:15 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Hmmm... The file there appears to be broken? I downloaded it (it's 1931337 bytes), but when I try to extract the zip, I get an error. I tried to download it twice, with the same results.

A question: if I just update with svn, do I get the same version?

Cristian

Re: wp34s 2.0 Beta Release

*Message #3 Posted by **Marcus von Cube, Germany** on 9 June 2011, 6:22 a.m.,*
in response to message #2 by Cristian Arezzini

I've just fixed the file. SF is giving some grief from time to time. SVN should generally be the same or a newer version. It's just not so neatly packaged.

Edited: 9 June 2011, 6:22 a.m.

in response to message #8 by Marcus von Cube, Germany

For those that do use the console version and want to run under Wine, I discovered that you need to use "wineconsole wp34s.exe" to run this rather than "wine wp34s.exe".

Since I am most definitely not a Wine expert, I can't tell you why or what the difference is.

Enjoy...

Why???? The native console version builds easily for Mac and Linux.

I am actually a bit surprised by the interest in the console version. I thought I was the only person doing anything with it (and that is for ease of debugging).

Pauli

Re: wp34s 2.0 1037 Alpha H mia

*Message #12 Posted by **Neil Hamilton (Ottawa)** on 10 June 2011, 8:39 a.m.,*
in response to message #11 by Paul Dale

Actually, I was looking back for anything about an assembler and you made a point on 12 May about "Build the console version and run 'calc xrom'". I thought I would see if I could get something out of that but could not really figure out what "run calc xrom" meant in that context.

Before I saw anything of this I was thinking of trying to cobble together an assembler/disassembler in Perl (my poison of choice) to work with the wp34s.dat file. I have since trolled through some of the C and found mnemonic-type listings (ie: xrom.c) that obviously correspond to what you were talking about. I would love to be able to work with something like this to write and edit programs -- presumably loaded/unloaded through the wp34s.dat facility.

I spent a few hours seeing if I could figure out the format of the dat file but got a bit swamped in all the details.

Anyway, that is the only reason I mentioned it. I had to figure out how to get the executable going in my environment (Ubuntu 10.04) before I decided I didn't really want to work with it if I had a choice. I had no real wish to build it from scratch when you had already done all the work to get it to an exe for me!! FWIW I *MUCH* prefer to use the emulator -- but no real surprise there I am sure. :-)

Cheers...

Re: wp34s 2.0 1037 Alpha H mia

*Message #13 Posted by **Marcus von Cube, Germany** on 10 June 2011, 9:24 a.m.,*
in response to message #12 by Neil Hamilton (Ottawa)

Neil, the flash files are much easier to understand. They start with a CRC followed by the number of program steps + 1 (two shorts). The rest is program steps. The CRC can be replaced by the wildcard value A53C which is considered valid in any circumstance. All values are little endian.

Re: wp34s 2.0 1037 Alpha H mia

in response to message #13 by Marcus von Cube, Germany

> Quote:
>
> The CRC can be replaced by the wildcard value A53C which is considered valid in any circumstance.

Now forgive me but I have to ask... when I see apparently random numbers being chosen as "special", I get curious... How did you choose just that value as a wildcard? Why not a "less random" number like 0000 or FFFF? :P

Re: wp34s 2.0 1037 Alpha H mia

*Message #15 Posted by **Marcus von Cube, Germany** on 10 June 2011, 1:35 p.m.,*

> Quote:
>
> How did you choose just that value as a wildcard? Why not a "less random" number like 0000 or FFFF? :P

I wanted to make sure that the magic number has some magic in it. So the

two bytes should not be identical nor should one byte be the complement of the other. Since FFFF is the default contents of free flash memory and 0000 is the default value for blanked out RAM, neither value is a good candidate for a magic number. I chose a funny bit pattern as "my" value: 1010.0101.0011.1100.

Re: wp34s 2.0 1037 Alpha H mia

*Message #16 Posted by **Cristian Arezzini** on 10 June 2011, 2:08 p.m.,*

I just noticed a difference in aVIEW. Now when I show the Alpha register, the numeric display shows "---", while before, the normal X register was shown. I see it's not a bug because it's documented in the manual, but I was just wondering why it was changed. In case I needed the old behavior, should I just put VWa+?

Re: wp34s 2.0 Beta Release

*Message #18 Posted by **Marcus von Cube, Germany** on 9 June 2011, 1:10 p.m.,*
in response to message #17 by Cristian Arezzini

Yes, VWa+ X does it. The added benefit is that you can view any register together with Alpha.

Re: wp34s 2.0 Beta Release

*Message #19 Posted by **Paul Dale** on 9 June 2011, 5:25 p.m.,*
in response to message #17 by Cristian Arezzini

It was changed after a fairly lengthy and lively discussion about what we wanted to achieve with the view commands.

The initial problem being that you couldn't both view alpha (alphaVIEW) and a register (VIEW) at the same time as the second command canceled the first. VWalpha+ was introduced to achieve this.

Once the new command was present, there really wasn't any need for alphaVIEW to display the X register as well as alpha (that being available with VMalpha+ X) so the bottom line was effectively erased. Thus providing an alpha prompt without a numeric value which is something I've missed while programming e.g. the 35s.

Also, even though these are in the catalogues, there is a short cut: h-shift VIEW ENTER always gives alphaVIEW.

*Message #20 Posted by **Eric Rechlin** on 9 June 2011, 11:54 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Looks great. I'll load it onto my calculator tonight.

I'm glad to see that nothing of consequence in the layout has changed (though the layout in the manual doesn't agree with the emulator, with alpha and FILL swapped), so the overlays everyone should be receiving will still be accurate. Speaking of which, I have mailed 30 of the overlays so far, and I have 15 more that are printed and ready to mail, but I ran out of stamps so I'll mail those tomorrow after I stop by the post office. The remainder I will mail on Saturday or Monday.

Eric

Pauli, just as an idea for an eventual future "adjusting" of the layout... I remember my very first

frustration, when trying out the emulator, was finding out how to switch back from integer to floating point. Now I know I have to push H.d, but I remember scanning the keyboard without finding anything that sounded useful. After all, how to switch to integer is rather obvious - just push 2,8,10 or 16 - so wouldn't it be nice if the reverse was as obvious?

I guess relabeling that key to make it a little more evident (i.e. "float" or "decimal") is out of the question?

Cristian

Re: wp34s 2.0 Beta Release

*Message #24 Posted by **Walter B** on 10 June 2011, 4:15 p.m.,*
in response to message #23 by Cristian Arezzini

Cristian,

Many months ago, we featured two labels: one named ".d" for decimal mode (the opposite of integer) and one named "HR" or "H" for decimal hours (the opposite of H.MS). It took some time until I realized these two are actually doing the same: converting something to decimal. So they were merged into one label "H .d" for that reason. This way we gained one more label :-)

Re: wp34s 2.0 Beta Release

*Message #25 Posted by **Cristian Arezzini** on 9 June 2011, 2:53 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Another small issue I noticed (this is really minor and doesn't involve any new feature or anything! :) If you press On+C, to use a hardware crystal, the message displayed is: "Crystal? Installed" This might be misleading in that it could be read as a confirmation that the crystal is indeed installed. As I see that some alphabetical characters can be generated even in the 7-segment display, could it be possible to move the question mark to the lower line, so that the message reads "Crystal installed?" or even "Is crystal installed" if the 7-segment question mark looks too ugly?

What do you think?

Cristian

Re: wp34s 2.0 Beta Release

*Message #30 Posted by **Dieter** on 10 June 2011, 10:24 a.m.,*
in response to message #1 by Marcus von Cube, Germany

The first thing I noticed was a permanent decimal point/comma even for integers in ALL and FIX 0. This always annoyed me on other calculators. On the 41-series this can be solved by clearing Flag 29 (thousands separator off), while on the 34s even after E3OFF the decimal marker remains visible.

While we are on this topic: some time ago we had a discussion concerning an improved standard display format that switches to scientific notation only if the value is below 0,01 or 0,001. If memory serves well, this was generally considered a good idea. So, how about that?

I also wonder if there is a way that makes SHOW display all 16 digits. Yes, I know the display only has 12 digits. I also would prefer the classic MANT/SHOW style that also displays trailing zeroes. But the 16-digit issue is something I really would appreciate.

The second thing I tried was - once again ;-) - the precision of the statistical distributions and their inverses. The Chi-square quantile still returns values that are completely off. Try 10 d.o.f. and p = 1E-9 and you will get something like 2,01256 (which also looks like it required substantial execution time on a physical 20s/30s), while the correct result is 0,083152. In the meantime I have found a method that gives a nice initial estimate for the Chi-square quantile, which is within -10...+6% of the true value (or even +/-3% after some tweaks). In most cases a 16-digit result is obtained after 4 - 6 iterations. Also, an estimate for the F-quantile should be no big problem. Let me know if there's sufficient space left and the better estimate can be implemented.

Dieter

*Message #31 Posted by **Marcus von Cube, Germany** on 10 June 2011, 1:30 p.m.,*
in response to message #30 by Dieter

We can always reclaim another K from the user library area in flash. I was hoping these issues were long sorted out. You should send your findings to Pauli via the forum mail system.

A remark on the decimal marker at the end of a number. That was my request to Pauli. I'm used to this

since the early beginnings of calculator use (an SR-51A at the time). I was missing it and Pauli did me the favor.

We have some additions to scientific and engineering notation, related to what happens when a number over or underflows. I'm not deep enough into this matter but the manual should tell you.

AFAIK, the 0.001 to sci transition is not implemented. It might be worthwhile to do so but we need enough space for it.

Showing more than 12 digits would involve scrolling or repeated key presses. Suggest an implementation!

Re: wp34s 2.0 Beta Release

*Message #32 Posted by **Dieter** on 10 June 2011, 4:27 p.m.,*
in response to message #31 by Marcus von Cube, Germany

Among the statistical distributions the Normal and Student case have been discussed here earlier, and in both cases good and (I hope) sufficiently fast solutions are implemented now. I still wait for a 20s/30s user with 34s firmware to report actual execution times for the Normal and student quantile.

For some other distributions there are exact direct solutions that do not require an iterative approach, but there were and are still two cases left that require some improvements in the quantile algorithm: these are the Chi-square and F-distribution.

I think I found a fine solution for the Chi-square case, and I just tried it on the new 34s emulator v2. The estimate is fine, but using the solver, the quantile sometimes does not converge well. On the other hand a simple Newton approach usually finds a 16-digit solution with just a few iterations. Which sounds like it may be better not to use the solver here, just as in the Normal case which returns fast and accurate results now with a dedicated algorithm.

Anyway, I will post my results as soon as the final formula for the estimate is fixed. Most of the work has been done 80 resp. 35 years ago now. ;-)

I did some work on Chi-square but not on F. Clearly neither is good enough yet.

There are two others left. Both Poisson and Binomial are also suspect.

E3ON and E3OFF deal with the thousands separator. The decimal marker is another animal.

Walter

Re: wp34s 2.0 Beta Release

*Message #35 Posted by **Dieter** on 10 June 2011, 5:01 p.m.,*
in response to message #34 by Walter B

ENGOVR now does what in the heydays of the '41 a synthetic command already could do: use FIX/ENG instead of FIX/SCI. ;-) However, it does not affect the ALL format in the proposed way. Some time ago, many users found it useful if the 34s would not display 1/30 as 3,33333333333 E-2 but simply 0,03333333333 - even if this means that one less digit is visible. It's simply more ..."natural". I still think this is a good idea.

The (IMHO annoying) decimal point/comma even for integer values actually could be controlled on the 41 by the setting of the thousands separator. If the separator was on, 1234 was displayed as "1.234," resp. "1,234.". With the separator off it was simply "1234" - no trailing point or comma. So the user could have it the way he wanted.

I think the combination of thousands separator and trailing decimal marker (as on the 41) is a quite clever idea. This way there will be no display like "1.300" or "1,300" that might be mistaken for 13/10 while it actually is "one thousand three hundred". The 41 would display either the larger value as "1300" or "1.300," resp. "1,300.", and the smaller value as "1,300" resp. "1.300".

Dieter

> Quote:
>
> ENGOVR ... does not affect the ALL format in the proposed way. Some time ago, many users [2] found it useful if the 34s would not display 1/30 as 3,33333333333 E-2 but simply 0,03333333333 - even if this means that one less digit is visible [1]. It's simply more ..."natural".

[1] Two digits - after all, counting is the basis of mathemetics ;-)

[2] Two, three, four, many? I learned "many" has often a very archaic meaning in this forum when counting people :-)

BTW, I think this is a pretty academic request. IMHO everybody capable to use a scientific calc knows what 3,3E-2 or even 33E-3 means.

Re: wp34s 2.0 Beta Release

*Message #39 Posted by **Paul Dale** on 11 June 2011, 9:15 p.m.,*
in response to message #37 by Cristian Arezzini

The next firmware release will have an ALL command which takes an argument. The argument specifies the number of zeros to the right of the decimal when which ALL mode changes to scientific notation even if this causes loss of digits or rounding at the extreme right.

ALL 00 is the same as the ALL command we used to have. ALL 02 matches Dieter's and Cristian's desires. ALL 11 is supported but a bit silly :-)

The biggest downside here is that binary compatibility with existing save files isn't maintained. You'll have to at least manually check all programs loaded from these.

If you mean physically opening them, you'll generally need to use a sharp knife to cut them open, as they are ultrasonically welded. They are not intended to be opened. As they say, "no user serviceable parts inside." Of course, some of us aren't normal users.

HP 31E buttons not responding

*Message #1 Posted by **Adam Vaughn** on 8 June 2011, 5:43 p.m.*

Hello everyone. I recently picked up a HP 31E calculator. At first, everything seemed fine. However, it seems to have developed an issue with the 8, 5, and 2 keys. They seem to have become highly intermittent, taking many button presses to work. When they do work, there seems to be a far higher amount of 'key bounce' than with any of the other keys, causing lots of repeating. At first, I thought the keys might just be in need of cleaning, but the fact that they're in the same vertical row makes me wonder (though the decimal key seems unaffected). Any ideas on how I might be able to solve this issue? Thanks in advance!

Re: HP 31E buttons not responding

*Message #2 Posted by **Michael de Estrada** on 8 June 2011, 6:02 p.m.,*
in response to message #1 by Adam Vaughn

Unfortunately, the circuit trace may be cracked on that keyboard button set, and is not repairable. If it were a normal pcb, you could repair the circuit with solder, but the Spice board will be ruined if you do this. I had several go bad on me and had to use donor boards from other Spices. The good thing is that the circuit board is interchangeable among all the Spice models.

Re: HP 31E buttons not responding

*Message #3 Posted by **Eric Smith** on 8 June 2011, 6:29 p.m.,*
in response to message #2 by Michael de Estrada

You could try a silver conductive ink pen, such as a Circuitworks CW2200MTP. There are also nickel conductive ink pens, which are less expensive, but I think the silver ones would be more likely to provide a satisfactory repair.

I've also used conductive silver-filled epoxy for some repair jobs. It's more expensive yet, and less well-suited for PCB repair.

Re: HP 31E buttons not responding

*Message #4 Posted by **Michael de Estrada** on 8 June 2011, 7:27 p.m.,*
in response to message #3 by Eric Smith

Have you repaired Spice keyboards this way. The problem sometimes is on the snap dome side, and unless the ink pen material is very flexible, the repair is not likely to last.

Re: HP 31E buttons not responding

*Message #5 Posted by **Adam Vaughn** on 11 June 2011, 2:47 a.m.,*
in response to message #4 by Michael de Estrada

What would I be looking for with regards to breaks? I'm hoping to not have this lovely calculator rendered as a fancy-looking paperweight...

Re: HP 31E buttons not responding

*Message #6 Posted by **Michael de Estrada** on 12 June 2011, 10:58 a.m.,*
in response to message #5 by Adam Vaughn

It's very hard to see. You need to simply check for continuity with an ohmmeter. Sometimes the film with the snap domes separates from the circuit board where it is connected, losing continuity at that point. Perhaps it could be riveted together to fix it. I tried solder, which just ruined it. You could ask a pro like fixthatcalc if it can be repaired.

wp34S Spelling Out Function Names?

*Message #1 Posted by **Jake Schwartz** on 8 June 2011, 10:59 a.m.*

Hi Guys,

Frequently when I'm accessing a wp34S function, I can't remember whether it is in the "X.FCN" or "P.FCN" catalogs and have to exit the current catalog and enter the correct one. Was any consideration ever given to additionally allowing the user to spell out the function name, similar to the HP41? Pressing [XEQ] [ENTER] (for ALPHA) and spelling out the name currently searches for labels in program memory, but couldn't it search through the built-in function names first?

Thanks, Jake

I agree Jake,

an excellent idea - or should I better say eXEQellent idea. ;-)

Maybe this should work for ALL implemented functions, even for those already on the keyboard like SIN, ACOS, ATANH, etc. ...

Re: wp34S Spelling Out Function Names?

implement it. Enjoy!

Walter

Well, I didn't mean that you should completely reorganize your program structure or your list(s) of functions - it should only be possible to execute any implemented function by directly entering the name instead of navigating through the menus.

But I finally get it: any improvement suggestions are not welcome here, and the usual answer to such feature requests is something like your sentence above.

So this is my last posting here, I wish you much success in improving your WP34S project.

Cheers, Franz

Re: wp34S Spelling Out Function Names?

in response to message #4 by fhub

Hallo Franz,

> Quote:
>
> ... any improvement suggestions are not welcome here ...

There are many participants who can tell you that the opposite is true. It's more a matter of timing - you joined pretty late and fired a lot of ideas which would have been appreciated much much more if they would have been sent significantly earlier.

Right now we're happy we made it so far. After all it was not only fun, but also a lot of labor. After some rest, we will be more open for new suggestions for sure - but remember it's easier making suggestions than bringing the whole thing up and running.

I'd wish you'll continue enjoying this forum.

Walter

I hope you're kidding. Read my answer explaining the reasons why this function simply will not fit in the current software. We've done a lot to add features requested in this forum and we're still adding more. Your proposal is especially useful and I had already discussed it with my fellow developers some time ago. The conclusion was that it does not fit easily due to flash space constraints.

Re: wp34S Spelling Out Function Names?

*Message #8 Posted by **Paul Dale** on 8 June 2011, 5:36 p.m.,*
in response to message #4 by fhub

I think you've misunderstood. We have a limited amount of time to devote to the project & believe me we've devoted a *lot* already. We're very willing to listen to suggestions and in many cases in the past we have implemented them. We can't do this for everything, there are way too many changes people want.

There are some good reasons why implementing commands via their alpha labels isn't going to be a quick and easy task (I can go into this in more detail if people want to be bored by it all). So rather than spend my time implementing a feature which strictly isn't necessary (since every function -- except one -- is already available from the keyboard), I'd prefer to spend my time doing other things like fixing bugs and getting the beta release out.

So where does this leave you as the person making the suggestion? Well, if you think the feature is sufficiently important go ahead and code it. We will definitely consider its inclusion and in this case I'm almost certain we would include it if the space requirements weren't large. That is, I don't for a minute think it isn't a useful addition. I do, however, feel that it isn't a useful enough addition to spend the effort to implement especially this late in the process.

Talk is cheap. Actions aren't.

Pauli

WP-34s 2.0 Manual correction?

*Message #11 Posted by **gene wright** on 8 June 2011, 7:24 p.m.,*
in response to message #10 by Paul Dale

Page 58 of 81: In the h CAT catalog description, it specifies 0 - 2 as the flash segments. Isn't this 0-3 now?

At least, 0-2 on page 58 seems inconsistent with the description on page 12 of 81. I'm thinking I'm either confused (possibly) or that page 58 should say 0-3.

:-)

Also on page 12 of 81, it references segments 2, 1 and 0 in that order. Should that be 3, 2, 1, and 0? Paragraph on page 12 is below.

"Else, i.e. if xy is an alpha label of up to three characters of arbitrary case, searching will start at program step 000 and cover the entire memory in the sequence RAM, flash segment 2, flash 1, flash 0, and XROM, independent of the position of the program pointer."

And, again, for the record, I consider the flash "pages" 1, 2, and 3 and their ability to be called as subroutines or executed in place as perhaps one of the most substantial features of the entire WP 34s!

Re: wp34S Spelling Out Function Names?

*Message #16 Posted by **Marcus von Cube, Germany** on 8 June 2011, 4:05 p.m.,*
in response to message #3 by Walter B

It's not as easy as it sounds. In order to make the search possible we have to sort the commands by name and create a catalogue from them. This is done by an external program during the compile process and included as a table in the resulting object. In theory that is no problem, but in fact it is... We're just running out of possible code space. We would need about 2 KB for the catalogue table alone. Gone are the library regions...

Re: wp34S Spelling Out Function Names?

*Message #17 Posted by **Walter B** on 8 June 2011, 11:27 a.m.,*
in response to message #1 by Jake Schwartz

Hi Jake,

Probably you've expected the following: yes, also our catalogs have a long history. Especially it took many (!) months until the alpha search function was tackled and implemented for more than one character. Until then scrolling was the dominant browsing method, and we split the ever growing set of extra functions into several separate catalogs for easier practical handling. With a convenient search method as we feature it now, we won't have to do it again to this extent, but now we've done it.

But life is quite easy: Commands containing a '?' are in TEST, all mode setting is in MODE, distributions are in PROB, statistics beyond distributions is in STAT. And CONV as well as CONST are self-explanatory. The

separation of P.FCN and X.FCN is not as evident and contains some arbitrary decisions for sure - we may merge at least those two and regain one label, but that won't be a big gain and we are a bit tired/lazy now after all.

Within X.FCN in particular, you may benefit from fast typing on an alphabetic keyboard (3 s timeout, good luck!). So this comes pretty near to what you want, AFAIK.

Walter

> But life is quite easy: Commands containing....

Another situation I find myself facing is when I am entering program steps and go to a catalog, searching for an integer-mode function, but the appropriate catalog does not currently show that function because the machine is currently in DECM mode. As a result, I must exit the catalog, exit program mode, enter integer mode, re-enter program mode and then re-enter the catalog in order to be able to enter the function as a program step. Being able to spell the function under these circumstances would be another big time-saving benefit, for what it is worth.

Jake

Re: wp34S Spelling Out Function Names?

*Message #19 Posted by **Walter B** on 8 June 2011, 2:34 p.m.,*
in response to message #18 by Jake Schwartz

One solution for this problem is merging the different flavors of X.FCN and adding P.FCN, so you'll get one big catalog for the "standard stuff". It's contents would be independent of the mode (integer, DECM, PRG) you are in. Sounds like this is what you want, don't you?

This looks like a "minor change" besides the label P.FCN becoming obsolete.

Walter

in response to message #19 by Walter B

Jake, you're facing some of the problems I've struggled with when I joined the project. The problem is that we still have the flash space problem which prevents us from adding lengthy catalogues. Before we can add these features, be assured we want to do this, we need to squeeze out the software to a much higher extent than we've already done. It's hard work, no more low hanging fruit, I'm afraid.

Re: wp34S Spelling Out Function Names?

*Message #21 Posted by **Paul Dale** on 8 June 2011, 5:40 p.m.,*
in response to message #19 by Walter B

This would be a simple enough change. It would also save some flash space (a very small amount but still some).

I've hit the integer mode functions problem a couple of times & it is annoying. Still, programs that change between real and integer mode aren't all that common -- you got lucky with the IEEE floating point conversion ones :-)

Walter, I myself have encountered this problem in the past, and the merging of the two catalogs would be really welcome to me, especially if it would be independent on the mode. I don't know if you're being ironic when you say that it's a "minor change", but I wanted to tell you that if you should ever implement this change (in the near or distant future) I'd be happy indeed! :)

Re: wp34S Spelling Out Function Names?

*Message #23 Posted by **Paul Dale** on 9 June 2011, 6:36 a.m.,*
in response to message #22 by Cristian Arezzini

We didn't implement a full merge.

We have provided a new X.FCN catalogue in program mode that includes all the commands from the other three X.FCN catalogues.

We also merged the two MODE catalogues together again.

So mixed mode integer/real programming will be less painful.

P.FCN is unchanged.

wp34S IEEE Floating-Point Conversions

*Message #1 Posted by **Jake Schwartz** on 7 June 2011, 9:49 p.m.*

Hi,

I am happy to report that with wp34s version 1019, I was able to successfully work through the HP16C manual without finding any more anomalies. After that, it seemed logical to attempt to translate the IEEE floating-point-format conversion routines in Appendix D to programs for the wp34s. Here is my first crack at those programs:

Entering a floating-point number and pressing `XEQ A` will create the IEEE HEX equivalent. In 2's compliment, 32-bit word size and HEX, entering a hexadecimal value and pressing `XEQ B` will convert to the floating-point value. The range of values is roughly between positive or negative 3*10^-38 and 3*10^+38 (or2^-128 to 2^+128). Within this range, one should be able to convert back and forth with little or no change to the original value. An example would be in "DECM" mode, entering 3.5 E -25 and pressing XEQ A to yield HEX 16D8A367. Then, pressing XEQ B returns 3.50000006840 E-25.These conversions on the 16C require around 5 seconds in each direction, where on the 34S they run in an instant.

Some notes: Note usage of flags B and C for overflow and carry, respectively. Register R99 was arbitrarily used in place of the HP16C index register (I) and no other storage registers were used. Flags 00 and 01 are also used. When the hexadecimal value7F800000, representing "infinity", is converted to floating point, the program returns "9.999... E99" as the 16C does, in order to maintain consistency. The most "interesting" part of the conversion from the 16C versions was emulating [f] [FLOAT] [.] (converting from integer to float mode) and [HEX] (converting back from floating point to integer mode), whereby the integer value is represented in the lowest two stack levels as (y * 2^x) while attempting to maintain the highest possible accuracy. See pages 56 and 59 in the HP16C manual for the pertinent passages.

Thanks,

Jake

Jake,

Very nice effort and thanks for the large amount of testing you've undertaken.

Leaving out the somwhat weird mode change behaviour of the 16c doesn't seem to have hurt which is good :-) It saved us a deal of code space.

Was the conversion otherwise straightforward? The extra capability of our integer operations might have made porting 16c code more difficult -- at least there aren't many 16c programs in the wild so we were willing to live with this.

A few quick things I noticed:

- We have a register I if you are not using complex operations so you didn't need to grab register 99 instead.
- The 1 + and 1 - sequences are INC X and DEC X.
- R^ R^ is of course [CPX] R^ (or CPX Rv or CPX x<>y with a four level stack).

- Pauli

> Quote:
>
> R^ R^ is of course [CPX] R^ (or CPX Rv or CPX x<>y with a four level stack).

Talking about complex operations, I'm really wondering why you have implemented it the way you did?

Usually when I do complex operations I don't need only 1 or 2 but even a bunch of them. As it is now I have to precede EVERY function or operation with this [CPX] key.

In my opinion it would be more convenient (and logical) to make this 'complex' a separate mode (as for the integer mode), which can be switched on/off in the modes menu (real, complex, integer, ...).
So you won't have to use this CPX prefix anymore for every calculation, and furthermore this would make the CPX key free for any other useful purpose.

Franz

Re: wp34S Complex operations

*Message #6 Posted by **Paul Dale** on 8 June 2011, 8:00 a.m.,*
in response to message #5 by fhub

We followed the implementation path of the 32sii for complex numbers. We knew we weren't going to be able to do what the 42s does due to memory and display constraints. I guess we could have gone the path of the 15c but that decision is long past and the move to an eight value stack was late in the piece.

Of course, the complete source code is freely available so you are welcome to add a complex mode and submit a patch :-)

- Pauli

Re: wp34S Complex operations

*Message #7 Posted by **fhub** on 8 June 2011, 8:18 a.m.,*
in response to message #6 by Paul Dale

> Quote:
>
> Of course, the complete source code is freely available so you are welcome to add a complex mode and submit a patch :-)

Well, I see you completely misunderstood me. :-(
I didn't suggest to change anything in entering/displaying or the internal representation of complex numbers (although it could be made much better, but because of the limitations of this small calc certainly not possible).

All I would like to be different for complex operations is, that pressing this [CPX] key (or better changing to a 'complex mode' in the settings menu) should set the calculator into a complex mode, where every new function or operation is done as if you had pressed again this [CPX] key, i.e. for every operation (for which it makes sense) there should be used the 'complex' counterpart - until you switch this complex mode off again.

This would definitely NOT require any BIG changes in the WP34S program structure.

Franz

Re: wp34S Complex operations

*Message #8 Posted by **Paul Dale** on 8 June 2011, 8:29 a.m.,*
in response to message #7 by fhub

I understood, I just was clear enough in my response. It is getting late here and I'm getting tired and we've been very busy trying to get final bits and pieces sorted out for the beta.

You asked why we went the way we did and I answered that. This might have been a poor decision in hindsight but at the time it was probably the correct one.

Then I suggested you could add the complex mode and submit a patch. I had assumed but didn't make explicit that this was a not pressing the prefix lots of times :-) I suspect it isn't completely straightforward but I agree it won't require major deep surgery into the code base.

- Pauli

Re: wp34S Complex operations

*Message #9 Posted by **Marcus von Cube, Germany** on 8 June 2011, 9:40 a.m.,*
in response to message #8 by Paul Dale

We might add a user settable mode which makes the CPX prefix sticky. Press it once to turn it on and once to turn it off. The user decides what he wants by setting the stickiness mode in his preferences.

Re: wp34S Complex operations

*Message #10 Posted by **Paul Dale** on 8 June 2011, 5:48 p.m.,*
in response to message #9 by Marcus von Cube, Germany

This path is fraught with problems. That's why I didn't think it was just a "set a bit and all will be happy" patch.

The keyboard state machine separates real and complex early on and most keys will cease functioning with the complex bit set (digits e.g.). Okay fix this but don't use any more flash space doing so.

Now, what about operations that don't take a complex prefix? What to do here? Exit complex mode? Ignore the command? Do the command anyway? Raise an error? It will change depending on the function naturally.

Entering new numbers and looking at the complex portion of numbers on the stack is also problematic now, x<>y and ENTER take a complex prefix so they won't do what you want all the time.

So all in all, it cannot be a set a bit and life will be happy task. It will require significant effort defining how operations work in the two modes and then making lots of small changes to bring everything into line.

And then a lot of code shrinking due to the bloat just introduced.

- Pauli

Re: wp34S Complex operations

*Message #11 Posted by **gene wright** on 8 June 2011, 7:03 p.m.,*
in response to message #10 by Paul Dale

Personally, my 2 cents would be to stay with the CPX prefix being required. I have done a good bit of complex number math with the 34s so far and it isn't *that* cumbersome. Sure, a sticky mode would be nice, but I would be afraid that a) things might break if it were changed :-) and b) the code squeezing required might also break something.

Hi Pauli,

> Quote:
>
> We have a register I if you are not using complex operations so you didn't need to grab register 99 instead.

I totally forgot about register I (109) ...that would have been much better. As you can see, I'm still learning :-) And using INC X and DEC X would be better as well.

The conversion was otherwise straightforward, and the merging of keystrokes in the 34S for functions which required the x-register value as their argument in the 16C (like SB, RL, MASKR, etc) was a step saver. I had to remember though, that in these cases, the 34S argument was always in decimal (such as MASKL 24) versus in the 16C, when the argument was loaded into X in the current base as program steps, so in the 16C assuming HEX, the steps were "1" and "8". Otherwise, it was not too bad at all. Having virtually all the 16C functionality available is a really great thing.

Ok, the hunt is on... Nimh charger solution for N-cell batteries in the USA

*Message #1 Posted by **gene wright** on 7 June 2011, 8:50 p.m.*

Found a nice source for Nimh batteries in the US, but now need to either find some AA to N cell adapters or a dedicated N-cell recharger.

Hoping someone has some links. :-)

Re: Ok, the hunt is on... Nimh charger solution for N-cell batteries in the USA

*Message #2 Posted by **aj04062** on 7 June 2011, 9:28 p.m.,*
in response to message #1 by gene wright

I've been looking too. Couldn't find a thing. Charged some old nicad N's with an AA charger with a bolt as a spacer.

I was thinking of making a nice set, but figured there HAS to be some out there somewhere.

Re: Ok, the hunt is on... Nimh charger solution for N-cell batteries in the USA

*Message #3 Posted by **M. Joury** on 7 June 2011, 10:23 p.m.,*
in response to message #2 by aj04062

This unit come with an adapter for N cell batteries: Mimio

However, it only comes with ONE adapter for 2 N cell batteries. At least that is how mine came.

Cheers.

Re: Ok, the hunt is on... Nimh charger solution for N-cell batteries in the USA

*Message #4 Posted by **Dieter** on 8 June 2011, 3:19 p.m.,*
in response to message #1 by gene wright

I must say, I prefer the AA-N-adapter idea. Here is a picture of a homebrew adapter, made of a piece of aluminium tube:

Please note: the shown (disposable) Duracell batteries are *not* rechargeable and are only there to demonstrate the different sizes. ;-)

However, if N-batteries are charged in AA-chargers, there are a few precautions that have to be considered:

- The key issue is the so called relative charging current. In numbers, that's simply the actual charging current divided by the battery's capacity. For instance, 100 mA for a 500 mAh N-size battery are 0,2 C. Regular NiMH batteries usually are charged with rates between 0,1 and 0,5 C. For a 500-mAh-battery this translates to a charging current of 50...250 mA.
- The charging time is roughly 1.2 divided by the relative charging current. For instance, 100 mA and a 500 mAh battery give 0,2 C, so the charging time for a completely empty battery is about 1,2 / 0,2 = six hours.
- Faster charging means more stress for the NiMH-battery, unless it is not specifically built for it, and definitely requires some kind of charge control. In other words: a special charger that is able to detect when the battery has been completely charged and then turns the charger off.
- The essential point here is the much, much higher capacity of AA-sized batteries compared to the N-versions we use here. Their capacity is roughly five times as high as in the N case, which means that the relative charging current is five times as high as well. In other words: if an AA-N-adapter is used to charge an N-battery in an AA-charger with, say, 700 mA current, this would mean a rate of 1,4 C or less than 1 hour. Which is more than a battery like the GP50NH will take without the risk of damage.
- So, the solution is simple: yes, use an AA-N-adapter to charge our N-batteries in a regular AA-charger, but be sure to use one with sufficiently low charging current. One may think of a good old simple-charger from the Eighties when regular NiCd AA-cells had the same capacity as N-NiMH-cells today. For instance, I got this old Panasonic charger for 4x AA with 50 mA charging current, which is perfectly fine for this case, giving a relaxed charging time of 12 hours. Some of today's higher end chargers may be set to currents as low as 100..200 mA while providing exact charge control (current, voltage, temperature, battery-full-detection). This would be perfect.

Dieter

in response to message #7 by exschr

If you buy this charger, measure the current and figure out the charging time yourself. However, this charger seems to be smart enough to deal with lithium cells so it might "know" when to turn off charging for ni-cads as well and you won't have to worry about it. Modern nicads can be charged at much fast rates than older ones without damage.

> Yes, but over here in Europe we don't get NiCd anymore. I bought 8 NiMh and what I understood they should be charged with lower current.

Actually you can often charge NiMH with even higher (absolute) currents than NiCds. The point here is that NiMH N-cells (500 mAh) have 2 - 3 times the capacity of the latest NiCds (200 mAh). Now, if your charger provides 200 mA charging current, that's a whopping 1 C for the NiCd, but only moderate 0.4 C for the NiMH version. Which is very nicely balanced between speed (3 hours) and safety.

So, 150 or 200 mA seems to be just right for current N-size 500 mAh NiMHs. But where is a decent, sufficiently sophisticated charger that can handle low charging currents for N cells as well as higher currents for more common AA and AAA sizes? Here's a suggestion:

At least in Germany the Conrad IPC-series chargers have quite a good reputation. There are various models, even sold under various brand names. For our purposes the IPC-1L is just fine. It is a full-featured AA/AAA charger that can be set to different charging currents. It offers four independently controlled battery slots with four displays to inform about voltage, charging current, charged capacity, elapsed time, discharge current and much more. Of course the whole charging process is monitored and processor-controlled. Yes, it can even make a geek happy. ;-) So, first it is a really fine charger for regular AA and AAA cells.

The IPC-1L now can be set to three different charging currents: 200, 500 and 700 mA. The lowest is the default setting - perfect for our N-cells, charging an empty cell within 3 hours. Get a set of four AA-N-adapters, and you're done.

I assume similar other chargers are available in other countries around the world. The key combination is a decent processor controlled charger that can be set to a low charging current.

Dieter

in response to message #12 by M. Joury

You can use these from DX. N and AAA cells are the about the same diameter so all you need is a small compression spring to take up the extra space. Any hardware store will have a selection of them.

Although I haven't tried these adpaters I have tried these adapters and the N cells fit perfectly. N cells measure about 1mm greater in diameter then AAA cells.

(BTW, I highly recommend the Next Generation RF remote control system. It's not only nifty in the way they replace a cell with combination cell/RF transmitter, but it works extremely well.)

If AA-N-adapters are really absolutely unobtainable, there are several solutions:

In the early Eighties a German supplier offered a set with N-batteries and a dedicated charger for the HP-41. The device essentially looked like a modified AA- or AAA-charger. As far as I can remember, the gap between charger contacts and battery was filled by something like a spring-loaded metal strip.

Generally, one can think of all possible kinds of spacers. A friend of mine simply used four screws in his charger. This kind of solution also has another advantage: the charger's contacts for AAA-cells may be used, which means that many, if not most chargers can be used because charging currents like 150 or 200 mA are quite common for AAA batteries.

And finally: make your own adapter - it's not rocket science. Get some aluminium tube with 12 mm inner diameter, maybe 1/2" (GP states 11,65 mm for their GP50NH) and press in another short (solid) piece with 12 mm outer diameter. Maybe you want to add a small spring (usually not required).

And finally, if everything else fails - maybe you have a friend or relative in good old Europe. 8-)

Or try a different approach: get a simple battery holder for four N-cells and connect it to a simple constant current charger. If you don't have one, make your own.

Dieter

The BCUNI3 data sheet states a current of 1000 mA and mentions no lower currents. Don't you think this is quite a bit ..."too much" for a tiny 500 mA N-cell? Let alone a 200 mA NiCd - in that case the battery is toasted with no less than 5 C.

The data sheet also says that -dU detection is used here. Well, at least 5C will give a significant voltage drop that should be easy to detect. #-)

More like 2C on a 500mAH NiMh cell. Still high but maybe tolerable with newer cells. After all there are a number of manufacturers that are putting out cells designed to be charged at 4C (Admittedly larger capacity to begin with).

I have a very nice Maha AA/AAA charger that is completely configurable as to charge rate. I think that the best solution for me, when I find the time, may be to assemble some kind of adapter.

Cheers

A look at the data sheet gives the relevant facts: GP batteries allow fast charge rates of 0,5 to 1 C (or 250 to 500 mA) if the charging process is controlled and terminated as the voltage has dropped by at most 5 mV.

> Quote:
>
> After all there are a number of manufacturers that are putting out cells designed to be charged at 4C (Admittedly larger capacity to begin with).

Yes, especially Sub-C or similar sizes for high-drain applications like RC models or power tools. That's a completely different story. I don't think you run your model railway on 25000 Volts just because British Rail does so. ;-)

> Quote:
>
> I have a very nice Maha AA/AAA charger that is completely configurable as to charge rate.

Sounds quite similar to the proposed IPC-1L / BC700 charger. I see the charging current can also be set to 200 mA, which in my humble opinion is just right for the tiny 500 mAh N-cells we use.

Actually I was referring to AA batteries for general use. Rayovac had a 2000mAH version that would rapid charge in 15 minutes and I believe that Energizer has something equivalent.

The Rayovac cells are some of the best I have ever used and are very interesting in that they have internal circuitry to cut off the charge. They are designed to be used in a special Rayovac charger but can be charged by regular AA chargers as well. When charged with regular chargers you will often get an error at the end of the charge when the charger reports an open circuit because the cell itself has opened the circuit internally to stop charging.

All we need is the same sort of capability in an N-Cell...

Cheers.

*Message #28 Posted by **Dieter** on 10 June 2011, 3:29 p.m.,*
in response to message #27 by M. Joury

These special "15-minutes-batteries" have been available for a few years now, over here a similar solution was offered by Varta. The point is that this 4C charge required a special combination of charger and batteries, that - as you mentioned - were equipped with some kind of internal electronics that prevents possible damage. In the meantime they offer a special new charger which is claimed to charge regular (!) NiMH AA-cells in 15-20 minutes - with 7500 mA.

There is something these 15-minute-batteries and special rapid-charge batteries have in common: apart from their different chemistry it's their sheer size resp. volume, or the ratio surface : volume. In a tiny N-cell there simply is no room for electronics (unless you do want to significantly cut down the useable capacity), and high charge rates will heat up the cell much more than a bigger AA or Sub-C size battery. That's why we probably will never see rapid-charge N-cells. And, honestly, who would buy them except nerds like us ?-)

Dieter

Re: Ok, the hunt is on... Nimh charger solution for N-cell batteries in the USA

*Message #29 Posted by **M. Joury** on 10 June 2011, 5:22 p.m.,*
in response to message #28 by Dieter

Yes. You are correct on all counts. I did note in my original post that the 4C cells are of a larger size and capacity than the N cells that we are discussing but as chemistries get better so do charge rates. We are seeing this across the board with different technologies. For example (and much more recently than the

4C AA's I was referring to) LiPo batteries are now being produced that can accept a 5C charge rate, an accomplishment unheard of just 2 years ago. This is purely a chemistry change as the same chargers are being utilized to charge these newer packs.

And yes, the 4C AA technology has been around for quite some time. I have been using those Rayovac cells for 10 years and am very disappointed that they were recently taken off the market (at least by Rayovac).

The charger that you mention that uses a charge current of 7.5A is interesting. It would seem to me that the batteries would heat up very quickly and without internal protection might be at risk of damage. After all those Rayovac's were EXTREMELY hot when they came off the charger after a 15 minute charge cycle.

Cheers.

I have an old Buddy-L Supercharger (circa 1993). The Salvation Army store sold it to me for $0.25 USD about 11 years ago. It recharges disposable alkaline cells as well as NiCd's and adjusts to various lengths.

It fell out of the market because it would stop before complete recharging, so users need to run a cell through several cycles.

(I just wish it also recharged 9 volt batteries)

Hi Ren,

> Quote:
>
> (I just wish it also recharged 9 volt batteries)

In the mid-60's, my transistor radio would eat 9v batteries very quick. So I came up with a very quick charger - remember these were standard carbon based 9v batteries. I took a transformer out of an old TV, used a rectifier tube, and had a very high voltage (unknown amperage) charger. I found that about 9 seconds would shove enough power into the battery to run the radio for a few more hours. The battery would be too hot to touch after charging.

Once I miss-timed it and the heat caused the metal covering on the battery to shoot off the end and it ended up embedded in the wall of my room. Thank goodness my parents never figured out what I was doing with all that 'old' electrical junk I had. Forturnately, I only receive a few shocks with my expermenting and survived the experiences. Great fun at the time.

Bill

Hey Bill,

You reminded me of when I was a kid and at Christmas time my Dad would hang the lights around the house. He would cut off the male and female plugs and hardwire all the strands together so there were a lot of AC plug pigtails floating around the garage. I got curious about what would happen if I stripped the wires of a male plug, twisted them together and plugged it in.

Well, in my room there was a big flash of light, then it was dark and my father was cussing up a storm somewhere outside. I pulled what was left of the plug out of the socket (it felt really cool in the dark), wiped all the soot off of the wall and hid the evidence. He never knew about that one.

Or I could tell you about the time I was up early in the morning, bored, so I took the bulb out of a lamp and turned it off and on an bunch of times (rotary switch) and didn't know if the lamp was on or off. So I stuck my finger in the socket to find out. Oh man did that hurt. It was fun though in a brain-damaged sort of way.

Gerry

It's a wonder we all survived our youth! I suspect nearly all of us here did something like Bill or Gerry did, at some point in the formative stages of our lives.

I remember me and my chemistry being banned to the basement after a couple of odiferous Sunday morning "experiments." And, the cherry red glow of the rectifier tube in my first 300 V DC power supply (the filter capacitor got hooked up in reverse polarity - my Dad actually gets credit for that one!). Also, try loading your squirt gun with salt water and squirting the wall sockets to see what happens!

having fun with the HP-17b

*Message #1 Posted by **Don Shepherd** on 7 June 2011, 4:25 p.m.*

How about a "guess the number 0-99" program for the 17b (and 17bii) solver.

At first glance, you would think it might not be possible due to: lack of a random number function, lack of alpha messages to tell you if you are too high or too low, and lack of a "beep" instruction when you correctly guess the number. Plus, the 17b is not programmable, right?

Lack of random number function is overcome by using current time (minutes, seconds) and the MOD function. Lack of alpha capability is overcome by returning -1 if your guess is too low and 1 if it is too high (yes, it's not ideal, but it works). A "beep" is generated by doing a Log(0) which generates an error message and halts evalution of the equation (AFTER saving the number of guesses in variable GUESS so it can be recalled).

The equation works on the 17b and 17bii. It mostly works on the 17bii+ except the number of guesses is wrong due to the way the solver in the 17bii+ works (or doesn't work, actually).

```
IF(S(INIT):
            L(G:0)X
            L(N:MOD(10000XFP(CTIME)X111:100))
            -INIT
           :
            0XL(G:G(G)+1)+
            IF(GUESS=G(N):
                          L(GUESS:G(G))+
                          LOG(0)
                         :
                          IF(GUESS>G(N):1:-1)
              )
               -EVAL
  )
```

Press INIT a couple of times (not sure why that is necessary) then enter your guess and press GUESS. Then press EVAL to evaluate your guess: -1 means you are too low, 1 means you are too high, and a beep means you guessed the number so do a RCL GUESS to see the number of guesses it took.

What is the maximum number of guesses it should take to identify the number from 0 to 99?

Implementing the TI 58/59 game described below on an RPN HP calculator is trivial. Now doing it on the HP-17B is not. Congratulations!

From the TI Programmable 58/59 Master Library Manual, page 77:

```
HI-LO GAME
ML-21

In addition to recreational diversion, this program serves as a nontechnical demonstration
of the library
module. The game is easy to play, permitting almost immediate hands-on experience for any
user.

The object of the game is to guess a secret number (whole numbers only) from 1 to 1023
that has been
generated in the calculator. The calculator responds with a "too high," "too low," or
"correct" indica-
tion to each of your guesses. Your score (number of guesses) is tallied by the calculator.

Also, you may select a number in the range 1 to 1023 and the calculator will attempt to
guess this
number as you supply proper responses to each of its guesses. When the calculator has
found the num-
ber you selected, its score will be displayed.

An exercise which often cast doubt on the "man over machine" axiom is to have the
calculator guess
the same number that it generated for you to guess. Now, follow the User Instructions and
seed if you
can uphold the superiority of man.

USER INSTRUCTIONS

STEP            PROCEDURE                                          ENTER            PRESS

Hi-Lo Game with an interesting twist

*Message #5 Posted by **Namir** on 7 June 2011, 7:46 p.m.,*
in response to message #4 by Gerson W. Barbosa

I have used the hi-low guessing games in many programmings books that I wrote way back. I would present various versions, each a bit more sophisticated than the previous one.

One interesting (and cunning) variation of the hi-low game is the percent of reliability for the feedback. Normally, the program would reliably tell you if your guess is higher or lower than the secret number. This special variant would introduce a level of doubt (say 10%) in that kind of answer, making thinks a bit more interesting.

Namir

Edited: 7 June 2011, 7:49 p.m.

Runs nicely! Thank you!

Re: having fun with the HP-17b

*Message #10 Posted by **Don Shepherd** on 7 June 2011, 7:46 p.m.,*
in response to message #4 by Gerson W. Barbosa

The 17b solver is not the best platform for this particular game, I just wanted to see if it could be done in a way that wasn't too horrible. It is more intuitive on a regular RPN calculator; for example, you enter your guess and press R/S and it immediately tells you "too high" or "too low" (on models like the 30b that have alpha messages). The 17b requires another keypress to get that feedback.

I like to discuss this problem with my students. They are always kind of amazed that a maximum of only 7 guesses can identify a selected number from 0 to 99 when I show them the advantages of splitting the groups in half each time, thus narrowing down the potential set of numbers. It kind of makes math interesting, if only for a moment!

In the example at the next page in the TI manual the program is asked to find a secret number, 848. The program's guesses, following the user's correct clues, are 512, 768, 896, 832, 864 and 848, that is, 512, 512+256, 512+256+128, 512+256+128-64, 512+256+128-64+32 and 512+256+128-64-16. That's the principle behind the binary search algorithm. Once I used this technique to find a fault in an 800-meter long circuit in four or five steps. The idea occurred to me from having played this little game. Thanks for bringing it back :-)

*Message #13 Posted by **Don Shepherd** on 8 June 2011, 10:08 p.m.,*
in response to message #1 by Don Shepherd

Well, a little testing with VBScript has determined that the method I used to generate a random number between 0 and 99 is totally unacceptable. Whole series of numbers, such as 1-4, 12-15, 23-26, etc., are never generated by that method. So I came up with a new method using the first 2 digits of the fractional part of the

square root of mmss returned by the CTIME function, and that method does generate every number from 0 to 99 in a more or less random method, good enough for an entertainment program.

This is the new program:

```
IF(S(INIT):
           L(G:0)X
           L(N:IP(100XFP(SQRT(10000XFP(CTIME)))))
           -INIT
          :
           0XL(G:G(G)+1)+
           IF(GUESS=G(N):
                         L(GUESS:G(G))+
                         LOG(0)
                        :
                         IF(GUESS>G(N):1:-1)
             )
              -EVAL
  )
```

re-release of the voyager with matrix, solve, integrate & complex numbers

*Message #1 Posted by **exschr** on 7 June 2011, 11:48 a.m.*

I don't use the known name for this voyager, because everything in this forum will be found in cleartext on TSS !

I was just poking around to find a source to buy the above mentioned HP-calc that should be out in mid of june. Interestingly, someone from the same company that the first rumor originated (BC) responded to me with this:

> Quote:
>
> The **-15* will be released in early 2012. Drop me another email in December of this year so that I can update you with more information.
> ...

If this is true, I can relax again and do other things in the meantime!

Are there other sources (confidential/informal/official) that point into the same timeslot?

Thanks Roger

30th anniversary of introduction of original.

Re: re-release of the voyager with matrix, solve, integrate & complex numbers

*Message #3 Posted by **M. Joury** on 7 June 2011, 1:02 p.m.,*
in response to message #1 by exschr

Well, since the 15 (if real) won't be around until next year (we can continue to hope that it eventually materializes), what is the story on the rumors about a special edition 12? I know, not quite as interesting, but at least a new HP RPN calc to play with. What would be really nice is a 12 with a little more programming capability--just delete/insert would be a great addition. I do realize that even if the rumors of a special edition 12 are true the likelihood is that it will be exactly the same calc with a "special" edition case.

Cheers

This puzzled me, because I always thought Diamond was 75th. I thought, maybe diamond is traditionally 30th in UK. But no, (30th is pearl in both US and UK), I find that "traditional" isn't good enough any more (surprise, surprise). Now there's "modern" US, where indeed 30th is diamond. Bah!

Me wantsss!!! :D As much as I love the 34s (and the 35s and other scientifics) I really, really love the graphic RPL calcs... Color screen and native OS (not emulated Saturn code) please? :)

Cristian

Re: HP50g replacement...

*Message #11 Posted by **M. Joury** on 7 June 2011, 4:42 p.m.,*
in response to message #10 by Cristian Arezzini

<Grin> Don't get too excited. I am just repeating a (relatively weak IMHO) rumor. Does that make it a rumor of a rumor?

The only thing that makes me think that this might actually happen is that the 50 is relatively old and several companies (two?) have delivered color screen calcs recently. Maybe HP will try to catch up.

Also there was that thread a while back where Tim Wessman was asking for info on current draw for the competitions' color screen units. Does this presage something new on the horizon? Maybe this is just wishful thinking on my part but one can always hope!

In addition to the features you mention give me a full width ENTER^ key where it is

supposed to be!

Cheers.

*Message #12 Posted by **Gilles Carpentier** on 7 June 2011, 5:37 p.m.,*
in response to message #10 by Cristian Arezzini

I'm also Hp50 addict ;)

Color screen and native OS would be marvelous. I no longer need the CAS which I think would be the most difficult to implement.

Even with no color, just a better display resolution would be fine

It would be marvelous but i'm not very optimistic about a HP51G or a new RPL calculator

Please help! HP-55 odd behavior

*Message #1 Posted by **Martin Pinckney** on 6 June 2011, 8:48 p.m.*

Thanks to Eric for responding, but I need more input from the Classics experts in the group.

Testing a newly-acquired HP-55. Timer mode seems to work fine. In program mode, I can enter keystrokes fine. But in run mode, no numeric input registers, and trying to run a simple program results in a flashing display.

Other keyboard functions (at least what I can try) seem to work. For example, although I cannot enter any numbers (the number keys just don't register on the display), I can, for instance press Sigma+ a few times, which leaves an integer in the display, then act on that integer. Correct results.

Any ideas?

Edited: 7 June 2011, 1:30 p.m. after one or more responses were posted

Re: HP-55 odd behavior

*Message #2 Posted by **Eric Smith** on 6 June 2011, 9:20 p.m.,*
in response to message #1 by Martin Pinckney

Sounds to me like one of the ROMs has gone bad, though there are probably other possible causes.

Re: HP-55 odd behavior

*Message #3 Posted by **Martin Pinckney** on 8 June 2011, 9:25 a.m.,*
in response to message #2 by Eric Smith

Eric,

Is the calculator architecture such that different ROMs control registering numeric input and functions assigned to the same keys? And if one ROM were bad, everything else would work fine? Thanks.

Re: HP-55 odd behavior

*Message #4 Posted by **Eric Smith** on 9 June 2011, 1:15 a.m.,*
in response to message #3 by Martin Pinckney

The stuff is distributed somewhat haphazardly between the two ROM chips. However, usually when a ROM fails, it isn't the whole ROM that fails, just some locations.

Re: HP-55 odd behavior

*Message #5 Posted by **Martin Pinckney** on 6 June 2011, 11:08 p.m.,*
in response to message #1 by Martin Pinckney

More observations:

1. Start in run mode. Press either STO or RCL X (where X is an integer 0-9), get 1X.000000 in display. Press CLX, get all zeros flashing.

2. In spite of the above, in timer mode the lap times are faithfully recorded in registers 0-9, and can be recalled without error.

Re: HP-55 odd behavior

*Message #6 Posted by **BobVA** on 7 June 2011, 5:43 p.m.,*
in response to message #5 by Martin Pinckney

It couldn't hurt to check the mode switch - make sure that the "RUN" position is actually doing what it's supposed to (i.e. that the proper connections are being made in this position).

Re: HP-55 odd behavior

*Message #7 Posted by **Martin Pinckney** on 8 June 2011, 8:57 a.m.,*
in response to message #6 by BobVA

Bob, it does do keyboard functions correctly if I can get a number in the X-register, by a slight of hand, such as using Sigma+ as described above, or by letting the timer run, then switching to run mode, which puts the timer result in the X-register.

For example, the trig functions and unit conversions return correct results after the trick above. So my question to you is, could these things happen if the mode switch wasn't working correctly? I don't want to open the calc unless I have to.

Thanks.

Re: HP-55 odd behavior

*Message #8 Posted by **Jeff O.** on 8 June 2011, 2:56 p.m.,*
in response to message #7 by Martin Pinckney

> Quote:
>
> I don't want to open the calc unless I have to.

Martin,
May I ask why you hesitate to open it? Unless you are worried about the decision to try to remove and re-apply the back label vs. poking holes in it to get at the screws, opening and working on any classic is very easy. Enables a thorough cleaning of keys, keyboard, key contacts, and switch contacts.

Sorry if you are well aware of the above, just wondering.

Jeff

Re: HP-55 odd behavior

*Message #9 Posted by **Martin Pinckney** on 8 June 2011, 5:12 p.m.,*
in response to message #8 by Jeff O.

Thanks, Jeff.

I am reluctant because I may not then be able to return it to the seller if it is non-functional.

Anyway, the calculator is immaculate on the outside; seems it should not need any cleaning on the inside!

Edited: 8 June 2011, 5:15 p.m.

Re: HP-55 odd behavior

*Message #10 Posted by **BobVA** on 8 June 2011, 6:35 p.m.,*
in response to message #9 by Martin Pinckney

Hi Martin:

Unless someone has seen exactly the problem you've got (ideally a couple of times) it's going to be pretty hard for you to place a bet on whether it's going to be fixable.

If you got it for a good price, it's probably worth keeping for parts. If you paid a lot, that may be another matter.

Hopefully somebody will chip in with "oh yeah, seen that" and help you sort this out.

Regards, Bob

Re: HP-55 odd behavior

*Message #11 Posted by **Michael de Estrada** on 8 June 2011, 7:37 p.m.,*
in response to message #10 by BobVA

There are only three possibilities that occur to me:

1) A rom such as the keyboard controller is bad on the logic board

2) A connection between the logic board and keyboard is bad

3) A circuit trace on the keyboard is broken (open circuit)

If the calc has never been opened and there is no evidence of corrosion, then I'm inclined to believe case 1 is most likely.

I agree that if the purchase price was high and the seller advertised it as fully functional, then I'd return it.

Edited: 8 June 2011, 7:38 p.m.

HP 9127A with 85/87

*Message #1 Posted by **David Ramsey** on 6 June 2011, 4:04 p.m.*

Can the HP 9127A HP-IB 5.25" floppy drive be used with the HP-85/87 computers? Empirical evidence would suggest not...perhaps it uses a different command set. But if anyone knows for sure...

Re: HP 9127A with 85/87

*Message #2 Posted by **Juergen Keller** on 6 June 2011, 5:11 p.m.,*
in response to message #1 by David Ramsey

You can find the manual here. I quickly browsed through it but I didn't found a reference to Series 80 computers. The 9127A uses the SS/80 protocol so my guess is that it might work. However, I would recommend a 3.5" floppy drive, they are much more convenient.

Re: HP 9127A with 85/87

*Message #3 Posted by **David Ramsey** on 6 June 2011, 8:21 p.m.,*
in response to message #2 by Juergen Keller

I have a 9121 3.5" diskette drive, this one was just for...I dunno...completeness. Can't seem to get the 85/87 to "see" it, though. I have the manual for the drive and will check some more. With the drive address set to "4" and the computers at "7", I thought:

MASS STORAGE IS ":D704"

would let me use it. Nope...

Re: HP 9127A with 85/87

*Message #4 Posted by **Juergen Keller** on 7 June 2011, 2:44 a.m.,*
in response to message #3 by David Ramsey

According to Series 80 Tips, drives using the Amigo protocol (like the 9121) should work with an HP-85. If you have an HP-85A you need the Mass Storage and I/O ROM. For drives using the SS/80 protocol (like the 9127A) you need the EMS ROM.

The device address 704 seems to be correct. Do you know if the drive and the HP-IB interface are working (i.e., did you use them successfully with other devices and other computers, respectively)?

Re: HP 9127A with 85/87

*Message #5 Posted by **David Ramsey** on 7 June 2011, 11:37 a.m.,*
in response to message #4 by Juergen Keller

The 9121 works perfectly with both computers. In fact they can both be connected at the same time since the 87's "controller" switch is turned off.

I don't have the Extended Mass Storage ROM for the 87, though. (And there's no way to get the drive to work with an 85A, dang.)

If anyone out there has an EMS ROM for the 87, I have numerous other 87 ROMs, ROM drawers, BCD and serial interfaces, etc. that I'd be happy to trade.

WP34S: Power consumption

*Message #1 Posted by **exschr** on 6 June 2011, 2:59 a.m.*

Reading about this great repurposing project makes me eager
to go buy a 30B and explore a world of nicely put together
alltime-best-of functionality in ONE calc!
great job done!
But I wonder if the 20B/30B hardware is as hard on batteries
as is the new HP35S?

I'm getting sick of replacing again and again a set of batteries
in the HP-35S!
This is just not user-friendly! (HP, do you read me?!)
I rather have a bigger case with space for fat batteries that
last at least two years than having a flat thin calc that eats
through three sets of batteries per year
I feel like selling this hungry HP-35S-monster and stick
to the 15C/16C/41C and enjoy (battery-)life with them.

What are your experiences? How long last a set of batteries in
the new 20B/30B?

Thanks for input,
Roger

Re: WP34S: Power consumption

*Message #2 Posted by **Paul Dale** on 6 June 2011, 4:56 a.m.,*
in response to message #1 by exschr

I'm still on my first set of batteries in the prototypical 34s test unit (okay, Marcus probably has this but mine will be second in line I suspect). I've done lots of coding and testing and it is still fine.

Will the batteries last as long as a voyager? No chance -- my 15c is on its second set now. Will they last longer than any LED calculator -- by a huge margin.

So, go out and buy a dozen 30b's and repurpose them immediately. The only way HP will take up own design is if people buy lots and lots and lots and lots and even they they won't :-(

- Pauli

Re: WP34S: Power consumption

*Message #3 Posted by **Marcus von Cube, Germany** on 6 June 2011, 7:17 a.m.,*
in response to message #2 by Paul Dale

Pauli, what does BATT tell you on your device?

One of my reflashing attempts of my 30b wasn't too smart on my side. I let it sit in SAM-BA mode for an hour or so. When I came back, the batteries were down to 2.7V :-(. Power saving is essential on this type of machine. What I've learned: Two batteries should last much longer than an hour while the machine is busy (or idling in SAM-BA mode with the cable connected.) The cable itself is powered by the calculator, so don't leave it plugged in when it is not in use!

There are essentially four modes of operation in the firmware:

1) Full power, while a function is executing or a program is running.
2) Active idle, e. g. during a programmed pause or for about half a second after a key stroke. Interrupts are running in this mode for house keeping tasks.
3) Deep sleep with display on and keyboard active.
4) Off with continuous memory.

A fifth mode is possible: Make a backup with ON+STO and then pull the batteries.

Approximate power draw from the top of my head:

1) 30 mA (10 mA if battery power is low and speed reduced)
2) 0.4 mA
3) 0.15 mA
4) ? (I couldn't measure it with my equipment)
5) 0 :-)

I'd be glad to see measurements by other people more knowledgeable than me.

Re: WP34S: Power consumption

*Message #4 Posted by **Paul Dale** on 6 June 2011, 9:10 p.m.,*
in response to message #3 by Marcus von Cube, Germany

BATT says 2.9 currently.

I don't leave the device plugged into the cable for any length of time.

What? The 35s is hard on batteries? You have to replace them over and over, even three times per year?!?
You must be using a different calculator!

I got my 35s in August 2007, just as it was available in Europe. The first set of batteries that came with the calculator had to take heavy testing and playing around with the new toy. It lasted for about a year. Both the second and the third battery set powered the 35s for almost one and a half year each (!) while the calculator was still used every day. All in all it was three years and ten months on 3 battery sets, or on average 1 1/4 year per set. I am using regular quality batteries from electronics and photo stores and cannot see that the 35s should be a battery-eating monster.

Dieter

Re: WP34S: Power consumption

*Message #6 Posted by **Raymond Del Tondo** on 6 June 2011, 7:34 p.m.,*
in response to message #5 by Dieter

There was a related thread a while ago.
The 35s seems to drain more energy when the unit is off.
Also happened with my 35s, whose batts were empty after a year of non-usage.

Interesting thing is that the batts of my 17bII+ silver edition are still intact after months of non-usage, so the hardware or software of that model seems to be somewhat more efficient than that of the 35s.

Ray

Wp34s Flash backup/restore

*Message #1 Posted by **Cristian Arezzini** on 6 June 2011, 1:34 a.m.*

Hello, I'm trying to understand how to backup/restore program data so that I don't loose my programs when I upgrade the firmware. Here's what I'm doing:

1. On+B+B to backup to Flash;
2. On+S+S to enter Samba;
3. In Samba, save from 0x11F800, 0x800 bytes, to a file on the PC;
4. Update the firmware as usual;
5. send the saved backup file to the calc, from address 0x11F800.

This worked partially, in that I had two programs on my calculator, and now I only have one. Could it be because in memory, the program labeled "A" came after the program labeled "B"? Or did I do something wrong?

Also, I have a suggestion... When you press On+S, it writes "SAM-BA? Boot" on the display, showing what you're going to do if you press S again. This is great. Instead, when you press On+B to backup (or On+R to restore), you get no message at all; the only message you get is "Cancelled" if you don't press B (or R) again. It would be really nice if it could show, after the first press, i.e. "Backup?" or "Restore?" and then, if the operation is carried on, "Backup OK" or "Restore OK", or "Cancelled" otherwise. Does this make sense? :)

Cristian

Re: Wp34s Flash backup/restore

*Message #2 Posted by **Marcus von Cube, Germany** on 6 June 2011, 2:52 a.m.,*
in response to message #1 by Cristian Arezzini

Cristian, the docs aren't up to date. Go to the FLASH.TXT file for the correct commands. Here is the contents again:

```
Commands to handle the flash memory on the real calculator
==========================================================

Hold down ON (EXIT) and press one of the following keys:

STO - Backup:  This creates a copy of the RAM in flash memory.

RCL - Restore: This restores a previously created backup.

S - SAM-BA:    Clears the GPNVM1 bit and turns the calculator off.
               S is on the '6' key.
               ATTENTION: You can now only boot into SAM-BA mode!
               Without the SAM-BA software and the cable, you're lost!

These ON key combinations have to be pressed twice in a row without
releasing the ON key to be executed.
```

Do an ON+STO before you want to flash a new release! After flashing, your backup should still be in place if you didn't accidentally press the ERASE button on the cable but used ON+S instead to get into SAM-BA boot mode.

There are additional commands in the I/O catalogue (f+STO):

PSTO n Store program in region n. n is 0 to 3. A region is a block of flash memory that can hold a copy of the user program area. Alphanumeric labels in flash can be called with XEQ. This allows creation of libraries. Use the new label browser (f+RCL) to see the labels. Region 0 is the same region that is stored with the backup.

PRCL n Restore region n to the program area where data can be edited.

P<> n Swap the current program with the contents of region n.

LOAD Executes ON+RCL. This is available on the emulator, too.

SAVE Executes ON+STO. See above.

RRCL Recall the register data only from a previously created backup.

SRCL Recall the setup data only from a previously created backup.

You can recall a group of registers from the backup with the command R-COPY from the program catalogue. Just give it a negative value in X and the source block will be fetched from flash instead of RAM.

Single registers in flash can be read with RCF and its arithmetic variants (RCF+, etc.)

Mapping from memory regions to emulator state files

Region	Flash address	state file	Remark
unnamed	0x11fc00	wp34s-R.dat	Registers and state of the backup
0	0x11f800	wp34s-0.dat	User program of the backup
1	0x11f400	wp34s-1.dat	Generic user Program region
2	0x11f000	wp34s-2.dat	ditto
3	0x11ec00	wp34s-3.dat	ditto
RAM		wp34s.dat	Emulator image of the RAM area

wp34s.dat is only written on exit of the emulator software.
wp34s-?.dat is written each time a flash command is executed.
All files are only read into memory on emulator startup.
If we find enough free space in flash we may increase the number of regions.

How to transfer data between the calculator and your PC

The whole RAM is saved to address 0x11f800 (relative address 0x1f800) with ON+STO. This can be copied to your PC or loaded from it.

1. From calculator to PC

   a) Do an ON+STO, then ON+S, then RESET with the cable connected.
   b) Press ON once and start SAM-BA on the PC. It should connect.
   c) Set the start address to 0x11F800 and the size to 0x800

```
   d) Enter a file name in the receive field.
   e) You can now receive the file with SAM-BA.
   f) Move it under the name wp34s.dat into your emulator directory.
   g) The emulator should accept the file. Your registers and programs
      will than be in place.
   h) To get your calculator back in business, start the "Boot from flash"
      script in SAM-BA, the same procedure you should know from flashing
      the firmware.
   i) Reset and power the calculator up and perform a restore with ON+RCL.
      The latest version does the restore automatically when RAM is lost.

2. From PC to calculator

   a) Perform steps (a) to (c) from above. No need to set the size.
   b) Point SAM-BA to your wp34s.dat file from the emulator.
   c) You can now send the short file with SAM-BA.
   d) Perform steps (h) and (i) from above.

The program regions accessible with the commands PSTO, PRCL and P<> are
stored at addresses 0x11f000 and above (see table above) and have a length
of 0x400 (1 KB) each. The emulator creates files 'wp32s-?.dat', '?' being
the region number. You can handle these files the same way as the complete
state file from the emulator. The regions have identical formatting and
can be swapped by copying their data to the "wrong" place. The register
and state portion of the backup area at 0x11fc00 is formatted differently.

If you want to get your emulator data into the calculator in one go,
do the following in Windows:

copy /b calc.bin+wp34s-2.dat+wp34s-1.dat+wp34s.dat calc-full.bin

As an alternative the following will copy the backup data instead of the
RAM state file:

copy /b calc.bin+wp34s-2.dat+wp34s-1.dat+wp34s-0.dat+wp34s-R.dat calc-full.bin

The resulting file can be programmed into flash and all data is readily
available.
```

Edited to reflect latest updates.

wp34S - 16C Compatibility #7 - MASKL, MASKR

*Message #1 Posted by **Jake Schwartz** on 5 June 2011, 11:34 p.m.*

Hi,

I am getting to the end of trying everything from the 16C manual and found that in the 34S, the MASKL and MASKR functions clear the carry flag, when in the 16C these do not affect the carry or out-of-range flags at all (as explained in the table on the manual's page 98 in Appendix A). Any chance of making these leave the carry flag alone? (I am using version 1008.)

Thanks, Jake

Re: wp34S - 16C Compatibility #7 - MASKL, MASKR

WP-34S

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 5 June 2011, 8:58 p.m.*

Hardly a "new topic" these days, but a nice topic for experimenting and posting on a Sunday afternoon.

I just downloaded 1.18, flashed my 30B with SAM-BA 2.6 (USB, Win7), and printed the so-far latest keyboard layout. Then I covered it with a transparent self-adhesive film and...

WOW!! While previous versions were nice to try, the current one *AND* the workable layout created a more full experience, including my first, very simple, WP-34S programs; just trying to get familiar with it.

A couple of suggestions and ballots for the last polls, FWIW:

+/- preferred against CHS; but CHS acceptable after all

EEX preferred against E; but E acceptable after all

The "usual division sign" preferred against slash

All prefix keys together against edge-based "h"

OFF in green (h-prefixed) against blue (g-prefixed)

Sorry for these late replies, I used my iPod to read the MoHPC Forum for the last days and it's difficult to post replies from it (possible cookie issue).

Before my recurring admiration and congratulations for the design and implementation team, just a mention of a possible bug (I don't remember this one mentioned before, excuse me if it's old news, or if it is just "the intended behavior").

Press CLX, EEX, CHS, ENTER. Answer is "Domain Error".

And... I'm no expert about SVN, etc.; and just read that a 2.0 full release is coming, so this may not be important at all; but a short document about how to find the latest version and the latest layout may help us to avoid losing some time navigating the last versions committed, looking for the last layout and the last calc.bin (they are not necessarily together).

Now, again, CONGRATULATIONS!!!!

Re: WP-34S

*Message #3 Posted by **Walter B** on 6 June 2011, 2:39 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Buenas dias y muchas grazias, Andrés!

With respect to your "suggestions and ballots", please find 60% of them implemented in the current version already 8-)

About h-shifted OFF, please read my response in another thread.

Well, and the "usual division signs" vary a bit on this planet. Personally, I think the "colon bar" being graphically suboptimal since it looks similar to +. I know lots of people taught using a plain colon for division which is very well established for many decades, but presumably wasn't invented on the right side of the Atlantic :-? And the slash may be an alternative. Both : and / differentiate very well from the other symbols.

Walter

But it's in fact used in probably 95% (if not more) of all calculators!

And if making this "colon bar" to a more computer-like "/", then I wonder why not do the same with the multiplication, i.e. making "x" to a "*" ('since it looks similar to the letter x')

Franz

In the glorious land of OZ, which is really the only place that matters in the universe -- the yellow brick road and all -- betting odds are represented using a colon and division using an obelus.

So, we should represent division using an obelus with huge dots and a thin line. Making no-one happy but that's beside the point of compromise.

WP 34S 2.0 is going to come

*Message #1 Posted by **Walter B** on 5 June 2011, 12:49 p.m.*

Hi all,

Unless something very bad will happen, we will be making a feature and layout freeze shortly based on what's in now. This means we think what's documented works (and vice versa). We are content with what our baby does now, will build a zipped package again including the manual and an overlay file, and release it for beta testing. Then we'll lay back d;-) and switch to maintaining the functionality, if any bugs shall be found by you (for sure there will :-/).

For sake of clarity: The new package is not built yet. It will be soon.

Walter

Re: WP 34S 2.0 is going to come

*Message #2 Posted by **Cristian Arezzini** on 5 June 2011, 11:45 p.m.,*
in response to message #1 by Walter B

Hi Walter, While I'm happy to see the stable package taking a leap, this news has put me in a state of "panic", as there is a "deadline" now to ask for new features! :) Speaking of which... The key "MEM" on the HP35s opens a nice "Memory catalog" where it shows how many free bytes you have for programs, and it also shows a catalog of all the installed programs and their lengths. And it shows the defined variables, too. I think it's very useful, and used it all the time. I couldn't find anything like that in the 34s - I searched through the manual and couldn't find anything (which doesn't mean it isn't there, just that I didn't find it...) So, is such a functionality present on the 34s? If not, could it be added? :)

Cristian

Re: WP 34S 2.0 is going to come

*Message #3 Posted by **Walter B** on 6 June 2011, 2:17 a.m.,*
in response to message #2 by Cristian Arezzini

Ciao Cristian,

Don't panic :-) The number of free program steps is displayed in programming mode all the time. We don't feature variables, only registers - they may be checked individually using VIEW. A list of all the programs in memory is the only information missing :-/ We'll think about it.

Walter

Re: WP 34S 2.0 is going to come

*Message #4 Posted by **Marcus von Cube, Germany** on 6 June 2011, 2:36 a.m.,*
in response to message #3 by Walter B

If you label your programs 'correctly' with an alpha label, the label browser will do nicely four you. Here is a small guideline how a program could be designed:

```
LBL 'WOW'
alpha 'WOW prog'
alphaVIEW
LBL 00
RTN
LBL A
<hotkey A function goes here>
GTO 00
LBL B
...
GTO 00
```

This can be put into flash or user memory and run via the CAT function. The program stops after a short message. The PC is pointing before the hotkey labels. Pressing such a key will find its next occurrence in the current program space, making sure that the function matching the selected program is executed. The GTO 00 ensures that this is true for the next keypress after the piece of code has executed. Keep the local labels (00 to 99) apart between programs or use BACK and SKIP instead to make sure all GTO or XEQ commands find their target and you can put several programs with complete hotkey support in a flash bank or user memory.

Re: WP 34S 2.0 is going to come

*Message #5 Posted by **Cristian Arezzini** on 6 June 2011, 9:03 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Marcus, thank you for your reply, but I can't really follow it. Maybe I should study the manual more, but I really can't understand your example. Is it supposed to be a way to organize programs? So that A, B and so on are my programs, and WOW is a sort of "container" for them all?

Cristian

Re: WP 34S 2.0 is going to come

*Message #6 Posted by **Marcus von Cube, Germany** on 6 June 2011, 10:53 a.m.,*
in response to message #5 by Cristian Arezzini

My outline describes a somewhat evolved application which makes use of the hot keys for various sub functions. If you have more of these in RAM or flash, you need to make sure that hitting one of the A to D keys executes the subroutine in the correct application.

Re: WP 34S 2.0 is going to come

*Message #7 Posted by **Paul Dale** on 6 June 2011, 4:44 a.m.,*
in response to message #2 by Cristian Arezzini

As Walter said, registers are fixed -- no variables. Free program steps are show in program mode always -- everything that doesn't reference an alpha label takes one step with no exceptions. Alpha labels take two. Much better than bytes free :-)

Marcus wants a register (& flash backup browser) which *might* get added and might be left as a user program. We're undecided at this point.

Alpha labels have their own browser. So you can see defined "programs" but not their lengths.

Oh and, new features delay/prevent a solid release.

There will almost certainly be a 34s successor -- 34sx, 43s, ???.

Pauli

Re: WP 34S 2.0 is going to come

I gladly accept a delay (I always update with svn anyway) if that means extra capability! :) But I understand that you want to "slow down" a little after all this frantic coding!

> Quote:
>
> There will almost certainly be a 34s successor -- 34sx, 43s, ???.

Hear, hear - should I buy some more HP30b's while they last? :) And what about the possibility of repurposing other atmel machines (i.e. the newest 12c)? :)

Cristian

Re: WP 34S 2.0 is going to come

*Message #9 Posted by **Walter B** on 6 June 2011, 9:20 a.m.,*
in response to message #8 by Cristian Arezzini

Ancora una volta: Unless something very bad will happen (like somebody appearing with a groundbreaking idea changing life, the universe, and everything) we will release 2.0 very soon. With a probability of 99.73% it will not feature a MEM command for the reasons mentioned above already.

Ooh, and any 34s successors are "ungelegte Hühnereier" so far, which translates to "vaporware" pretty well IMHO.

Walter

HP-41CL & Battery

*Message #1 Posted by **Geir Isene** on 5 June 2011, 10:40 a.m.*

Given that the battery drain from the new 41CL by Monty is some ten times greater than a normal 41 while OFF, I am looking for a better battery solution than the normal N size batteries (or the even less capacity rechargeable counterparts).

How about building a new battery pack using cell phone batteries, like stacking two of these or some such. Any suggestion for a rechargeable replacement for the new line of 41s?

Re: HP-41CL & Battery

*Message #2 Posted by **exschr** on 5 June 2011, 2:04 p.m.,*
in response to message #1 by Geir Isene

I might plug in the modified module with a USB connector to sustain power to the 41CL while at my desk. But that's no solution for beeing "on the road" with the 41CL. The stacking of cell phone batteries sound like a good idea!

The hint with the USB in a modified module came from Diego Diaz, see this thread!

Re: HP-41CL & Battery

*Message #3 Posted by **Dieter** on 5 June 2011, 2:11 p.m.,*
in response to message #1 by Geir Isene

We had a discussion on HP-41 battery options just a few weeks ago (cf this thread). While current LiIon and LiPo batteries for cell phones are not an option due to their voltage (3,6 V is too low and 7,2 V too high), the solution you suggest is a NiMH battery with 6 V nominal voltage, i.e. it probably is made of five cells instead of four in the original HP NiCd battery pack. Since freshly charged NiCd and NiMH cells may have voltages like 1,4 V and higher, the 5-cell pack may provide 7 Volts and more. That's why I would prefer a solution with the usual four cells.

Anyway, the essential point here is the higher power consumption of the 41CL. Let's take a look at what we can expect from different power sources:

- 70 - 80 mAh: former 1/2-N-size NiCd cells in 82120A battery pack
- 140 - 170 mAh: current 1/3-AAA-size NiMH cells for refurbished battery packs
- 500 mAh: current N-size NiMH cells
- 700 - 800 mAh: single-use N-size Alkaline cells
- 2000 - 3000 mAh: current AA-size Alkaline cells (external battery packs)
- 2000 - 3000 mAh: current AA-size NiMH cells (external battery packs)

So, what do we need for the 41CL? Without the card reader or wand, single-use N-Alkalines were a good option for the 41-series. In case of rechargeable batteries, even the original 82120A pack with less than 100 mAh capacity was fine. If you look at the figures again, there is an elegant solution with more than sufficient capacity: use simple rechargeable N-cells in the regular battery holder and charge them externally. Some more

thoughts and ideas can be found in the thread I mentioned, including an external battery pack with four AA batteries (NiMH or alkaline).

Dieter

Any easy way to ensure that the voltage doesn't exceed 6V?

Re: HP-41CL & Battery

*Message #5 Posted by **designnut** on 6 June 2011, 10:29 a.m.,*
in response to message #4 by Geir Isene

Lithium cells have a higher voltage inherently, so 2 Li cells might suffice. I know they are available in AA size. Caution against overcharge, they may explode. Some are equipped with vharge limiters. Sam

Re: HP-41CL & Battery

*Message #6 Posted by **Dieter** on 6 June 2011, 3:23 p.m.,*
in response to message #5 by designnut

Before we talk about "lithium batteries" we should define what this term refers to: Take a look at wikipedia to get an overview over the variety of various lithium-based battery designs.

In our case there are three major relevant groups:

- Single-use Li-Mn batteries. Their cell voltage is 3 V or slightly higher. One of these may replace two regular 1.5 V alkaline batteries. There are 6-V-Versions like the 2CR5 used in many conventional photo cameras. As far as I know this technique is not used for standard-size AA or AAA batteries, simply because twice the voltage in the same package is not a good idea for usual consumer devices. ;-)
- Single-use Li-FeS2 batteries with voltages roughly comparable to those of regular alkaline batteries (1,5 up to 1,8 V). In many cases these batteries can replace standard alkaline batteries while offering a significantly higger capacity.
- Rechargeable Li-Ion or Li-Po batteries like they are used in most cell phones and digital cameras. Their nominal cell voltage is 3,6 or 3,7 V and can exceed 4 V when fully charged. Since the only options here are 3,6 or 7,2 V they are not particulary useful for applications that require 5 or 6 V nominal voltage.

Dieter

Re: HP-41CL & Battery

*Message #7 Posted by **Garth Wilson** on 6 June 2011, 3:18 p.m.,*
in response to message #4 by Geir Isene

> Quote:
>
> Any easy way to ensure that the voltage doesn't exceed 6V?

It should be ok to exceed it a little. A brand-new alkaline is really more like 1.6V per cell, meaning

6.4V for four.

Re: HP-41CL & Battery

*Message #8 Posted by **Geir Isene** on 6 June 2011, 1:40 p.m.,*

How about using two 4LR44 (6V) in parallel?

Re: HP-41CL & Battery

*Message #9 Posted by **Dieter** on 6 June 2011, 3:05 p.m.,*
in response to message #8 by Geir Isene

Using regular batteries in parallel without additional electronics generally is not a good idea. The 4LR44 in particular does not fit our needs very well either. As the name suggests, this battery is made of four LR44 button cells, the usual capacity is something like 100 mAh. There are more powerful versions like the 4SR44 (silver oxide) and 2CR1/3N (lithium), well known as power sources for photo cameras of the Seventies and Eighties, which can provide 150...200 mAh, but that's still rather low compared to other solutions (OK, twice that with two batteries in parallel, if you really want to do that) and last, not least: they are quite expensive.

Dieter

Re: HP-41CL & Battery

*Message #10 Posted by **gene wright** on 6 June 2011, 3:43 p.m.,*
in response to message #9 by Dieter

Button-top Nicad N cells can be found for less than $3 each in 200 mah capacity. A set of 8 of these (to have one recharged set always ready) doesn't seem too expensive.

Flat top Nimh N cells with 40 mah are about $4-5 each, but then you have to deal with the flat top issue.

I will probably just use nicads...unless an easier, higher capacity solution can be found.

Re: HP-41CL & Battery

*Message #11 Posted by **Dieter** on 6 June 2011, 4:24 p.m.,*
in response to message #10 by gene wright

Well, NiCd batteries have been banned in many countries of the western world, so they are hard to get and most major manufacturers simply do not make them any longer. Over here in Europe, regular button-top N-size NiMH cells by GP (type GP50NH) are readily available for 3,49 Euros each from a source that is not exactly know for its lowest prices. Or for just 1,85 Euros from a well-reputed source on the internet, including VAT and other possible taxes. ;-) Their capacity is 500 mAh, more than twice that of the good old NiCd versions.

I always thought that "pay less, get more" is quite a good idea. ;-)

in response to message #12 by gene wright

Here in Germany the two usual sources for electronic parts (and toys ;-)) are Conrad and Reichelt.

At Reichelt, the GP50NH can be found here.

The same battery (and a cheaper flat-top alternative at Conrad is listed here. There are additional discounts if you need more than one.

Yes, both webpages only speak German and I do not think that either of them will ship to the US, but I am sure you will find similar offers in your area as well.

*Message #15 Posted by **Geir Isene** on 7 June 2011, 8:25 a.m.,*
in response to message #3 by Dieter

So, if I went ahead and made a new battery pack by stacking two of those I linked to - what *could* happen if they were freshly recharged and gave 7V output.

It would be interesting to order a couple, recharge them fully and see the output. If it is in the area of 5.5 - 6.5, it would be fine, right?

And then I would have my high capacity battery pack for the CL...

Re: HP-41CL & Battery

*Message #16 Posted by **Monte Dalrymple** on 10 June 2011, 12:34 p.m.,*
in response to message #15 by Geir Isene

The board is designed to accept 6V. Applying a higher voltage will reduce the lifetime.

Re: HP-41CL & Battery

*Message #17 Posted by **robert rozee** on 10 June 2011, 11:40 a.m.,*
in response to message #1 by Geir Isene

perhaps a silly question... why not have the final design of the 41CL board run off 2.4 volts derived from 2x AA cells, fitted horizontally in the existing 41 battery compartment? it would likely be easy enough to add the necessary step-up converter to the board design.

Re: HP-41CL & Battery

*Message #18 Posted by **Monte Dalrymple** on 10 June 2011, 12:32 p.m.,*
in response to message #17 by robert rozee

Compatibility. The 6V is on the Port connector for external peripherals to use. This would mean keeping a step-up converter running all of the time, meaning higher off-state current drain.

I believe that the board will run reliably at slightly less than 4V, although the battery warn annunciator will always be on in this case, which kind of defeats its purpose.

Monte

i'm not a 41 expert (never owned or even used one much really), but what is the point of powering external peripherals when the calculator is turned off?! any such peripheral, if it drew more than negligible power, would flatten the N-cell batteries quite rapidly anyway, denying itself ongoing power in short order.

and if this was an issue for a few odd devices under exceptional usage conditions, it would be easy enough to bring out the 6v feed line to a 2-pin header somewhere on the board that was accessible (such as in a spare corner of the battery compartment).

Robert, think of memory peripherals which rely on the 6V to buffer their contents or devices which may wake up the calculator.

Re: HP-41CL & Battery

*Message #21 Posted by **Monte Dalrymple** on 10 June 2011, 2:20 p.m.,*
in response to message #19 by robert rozee

Pressing the button on the Wand wakes up the calculator. I think that the printer can wake up the calculator that way also.

Re: HP-41CL & Battery

*Message #22 Posted by **Garth Wilson** on 10 June 2011, 2:23 p.m.,*
in response to message #18 by Monte Dalrymple

Would the non-stepped-up voltage be enough to preserve the memory and keep the clock going (these typically go on a lot less than normal operating voltage), and would a step-up converter come up fast enough for when an alarm or other stimulus tries to turn the 41 on? If so, you might still be able to go that route, use the step-up converter, and shut it down when the calc is asleep. I've designed step-up converters into products many times, but I don't know what the requirements for the 41 might be to retain memory and keep the clock going, and turn-on time.

Re: HP-41CL & Battery

*Message #23 Posted by **robert rozee** on 11 June 2011, 3:16 a.m.,*
in response to message #22 by Garth Wilson

there's a number of neat tricks that could be done - most obvious, have a capacitor that holds up the 6v rail when required and briefly start the converter every 10 seconds or so (when the calculator is off) to keep it topped up.

my reasoning is simply that it would be 'nicer' if the calculator could be run on more standard and obtainable AA batteries rather than N cells, while still fitting everything inside the existing body of the calculator (as opposed to people having to look at attaching an extended battery pack on the back).

and to answer the obvious question, Li-Ion cells with a service life of only a couple or three years aren't really a good match for a calculator who's lifespan thus far has been a quarter of a century :-)

I don't remember if we ever seriously entertained this notion or not. Things are more than cluttered enough already I suspect. We didn't delve far into the press and hold a shift key while pressing another key like the 30b -- we'd need new colours and more space on the overlay for this to be workable.

The clutter level is already very high -- every key has four functions and some go well beyond this: STO e.g. has seven (STO, f H.MS, g DEG, h CAT, CPX STO, -> f H.MS, -> g DEG) and that isn't counting the six arithmetic suffixes available (+, -, *, /, MIN and MAX) for STO itself. Roll down and RCL also have seven. EEX and +/- have six.

I think the worst offenders are C and D, which have nine separate functions if you consider their undefined default action a separate use (XEQ C, y^x, CPX y^x, COS, ACOS, CPX COS, CPX ACOS, SCI & SCIOVR). Phew!

Needless to say, the keyboard state engine is a rather large portion of the whole firmware :-)

Re: Another poll

*Message #6 Posted by **Walter B** on 5 June 2011, 8:35 a.m.,*
in response to message #4 by Ángel Martin

Buenas dias Ángel,

I concur with Pauli in leaving f/g/h without further functionality. After all, they are self-inverting (e.g. f f = NOP) and overwrite each other (e.g. f g = g), that's sufficient IMHO. The keyboard is full enough.

Walter

I never really understood why HP split them up on the 65 and 67.

My vote is to retain the "a".

Re: b

*Message #10 Posted by **Paul Dale** on 5 June 2011, 8:24 a.m.,*
in response to message #9 by Neil Hamilton (Ottawa)

The only reason I can think of is that it is might be a little easier to press a key on the edge of the keyboard than one in the middle.

The 34C used the top corner well for the shift keys and for a very long time the 34s did exactly this but it made integer mode entry irksome having E and F on the second row. I think putting them on the top row was a positive step.

- Pauli

Re: b

*Message #11 Posted by **Neil Hamilton (Ottawa)** on 5 June 2011, 9:10 a.m.,*
in response to message #10 by Paul Dale

Oops! I missed that the 34C did this as well. I guess I should have looked at the WP34S' namesake.

Personally, I will use hex mode a great deal with this calculator and having A-F all on the top row is a great boon for this mode of operation. I find the necessity to enter an extra menu to get at the A-F on the 42S rather clumsy. I really like the way this one allows unshifted access to them.

I thankfully agree with your decision to not split the shift keys onto different rows or put (any of) them on the top row. The assignable label keys should occupy that space (as they do). On my 11C, I often put a strip of Scotch tape between the display and the keyboard and pencil in what programs I have attached to

these labels (a la the cards of the 65/67 and TI-59). So I would morn the movement of the A-D keys as well (not that it is being discussed -- just a pre-emptive plea to not change that area).

WRT to the prefix keys having secondary roles, my experience is that HP calculators have canceled the previous prefix in favour of the latest prefix. This is shown very nicely in bullet 3 on page 21 of the WP34S manual. This cancellation behaviour has frequently saved my bacon -- having more thumbs (or toes) than fingers!

*Message #12 Posted by **Cristian Arezzini** on 5 June 2011, 9:01 a.m.,*
in response to message #1 by Walter B

For me either one is OK, but, as we're talking about layout... I would like it better if 'OFF' was a 'h-shifted' function... I am used to turning calcs on/off as needed, so quite often... and 'g' being in the middle of the keyboard is a little inconvenient to me. For me the 35s/48/50g way is best (shift right above "on" + "on") but I know it's impossible here, so 'h-shifting' it would be next best.

Cristian

Re: Another poll

Some answers:

1. Battery life is determined mainly by the time the wp 34s runs at full speed. The time sitting on your desk snoozing and waiting for you keying in the next challenge doesn't really matter. And there's still an auto-turn-off after some minutes. So there's no need hitting OFF every minute - we don't have LEDs built in ;-)
2. SHOW is a pretty long command name, fitting nicely on the h-shifted position. Swapping this with g-shifted OFF will make a second row necessary for the f- and g-shifted functions plus ON. Nothing dramatic, just not good looking :-(
3. And - hmmmh - the middle of the keyboard's still 1.5 keys away, isn't it? ;-)

So I'd like to stay with g-shifted OFF.

Walter

> don't have LEDs built in ;-)

OK, I get it... it's just that I've always been uset to turning things off, and seeing a calc sitting there displaying something but doing nothing is sort of against my nature! :)

> Quote:
>
> SHOW is a pretty long command name, fitting nicely on the h-shifted position. Swapping this with g-shifted OFF will make a second row necessary for the f- and g-shifted functions plus ON. Nothing dramatic, just not good looking :-(

I see your point. And I see that just "swapping the colors" on the keyboard would be even worse. :) But then... I haven't really understood what SHOW does outside of program mode; when I press it in normal decimal mode, nothing obvious happens. So, would it be possible that - leaving g-OFF untouched - when SHOW does nothing obvious, then it turns off the calculator? Kind of like "EXIT" which has different functions depending on the calculator state?

> Quote:
>
> And - hmmmh - the middle of the keyboard's still 1.5 keys away, isn't it? ;-)

Well... I'd say that the "center" of the keyboard is 1.5 keys away... I tend to consider "middle" anything that's not on the edge! :) But then, English is not my language... :P

Anyway, this was just a minor thing... I see your points, and the layout is perfectly usable as it is, and surely much better than any other calc I have!

Depends on your "normal mode" ;-) I bet you're using ALL. Try e.g. FIX 2 and use SHOW again.

Background: many users (me too) don't need 10 decimals all the time. The most significant ones are sufficient in many problems in science and engineering (that's why slide rules were useful instruments for long). So I may set e.g. SCI 3. But sometimes I want to see all the digits - then SHOW shows them d8-)

You're right, I use ALL. Not because I need 10 decimals, it's just what I'm used to. And now I see why SHOW is needed, and why my suggestion makes little sense. Unless you want to implement it for when ALL is being used! :)

Thanks for voting! Looks like a pretty unambiguous result. Honestly, I didn't expect it in this extent, since the better accessibility of a second prefix may carry some practical benefits, and the three HPs using three prefixes (65, 67, 34C) did place them one key away from the edge maximum. Anyway, we make the wp 34s with the people for the people, so we'll leave the prefixes in row adjacent to each other.

WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 4 June 2011, 8:32 p.m.*

I haven't done an exhaustive search as yet but I can't seem to locate a bunch of the HP-16C-like functions such as rotate (RL, RLC, RR, RRC), shift (ASR), the DBL's, [RL] Justify, etc. in the X.FCN menu (emulator commit 993, calc.bin commit 994, and "ENTER_20b_1_18.pdf" commit 983 -- all from 999).

Are they yet to go in or have they been removed (sacrificed to the flash-size limitation gods)?

My apologies if this has been asked before but why are there 2 PDF manuals in the SVN tree ("ENTER_20b_1_18.pdf" -- strange name!, and "wp34s_Manual.pdf")? The former seems to be the more up-to-date, showing more details of the stack mechanics, for example, and showing a rev number of 1.18 vs. 1.17. Should one be removed from the repository to avoid confusion?

Thanks...

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #2 Posted by **Paul Dale** on 4 June 2011, 8:37 p.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

These functions are in the X.FCN catalogue when you are in integer mode only. I.e. this catalogue is context sensitive. Don't worry, they are all there and implemented and won't be removed. A lot of the real functions disappear when in integer mode and there is yet another version of the catalogue for when you are in alpha mode.

The ENTER_20b_1_18.pdf is the more recent documentation somewhat matching the subversion build. It won't necessarily match the release build however wp34s_Manual.pdf will.

So get the release, and the correct manual is included.

If you're going directly to subversion get the ENTER... version. If you are going to subversion, you are living on the leading edge and can cope with some degree of confusion :-)

Pauli

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #3 Posted by **Neil Hamilton (Ottawa)** on 5 June 2011, 8:35 a.m.,*
in response to message #2 by Paul Dale

Ah! You are so right! I guess I have to pay more attention to the "in modes" column. My mistake.

I thought we all liked living on the (b)leading edge and that is why we so much like this project! Thanks for the explanation on the 2 documents. I fully understand. I also understand that the doc, by its very nature, will usually be a step or two behind the wavefront.

I have to say that I am still amazed by how much you guys have packed into this little beast.

BTW: RCF is still showing "xxx" in commit 1004. Reminds me of my days working with BSD! I am wondering what this X-rate function is all about.

Best regards...

> BTW: RCF is still showing "xxx" in commit 1004. Reminds me of my days working with BSD! I am wondering what this X-rate function is all about.

It shouldn't be. The file name got changed to *Manual_wp_34s_2_0.pdf* for the soon to be released beta firmware. Subversion should have deleted the older manual file when you updated.

To answer your question, RCF is just like RCL except that it uses the backup flash register region as the register source. Thus, effectively doubling the number of registers available although half are basically read only.

It accepts a complex prefix and all the arithmetic suffixes of course. Indirection is supported as well and it gets the flash register number from a normal register which seems like the more useful option.

- Pauli

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #5 Posted by **Paul Dale** on 5 June 2011, 8:50 a.m.,*

And vice-versa on occasions too.

Then are the times when the two are just plain different.

- Pauli

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #6 Posted by **Neil Hamilton (Ottawa)** on 5 June 2011, 9:28 a.m.,*
in response to message #5 by Paul Dale

Yes, SVN did delete the ENTER... and add Manual...

```
D    doc/ENTER_20b_1_18.pdf
A    doc/Manual_wp_34s_2_0.pdf
...
Updated to revision 1004.
```

Another question about the bit manipulation functions. My reading of the manual and the operation of the 34S is that these functions (eg: BC?, CB, etc.) operate on a *fixed* bit (ie: BC? 14) in the X register. It does not look like you can have the bit in question be a variable.

My reading of the HP16C manual shows that the 16C version of these operations has the bit to be operated upon as a variable (defined in X) with the value to be tested and/or modified being in Y.

Page 50 of the HP16C manual:

```
• The word containing the specific bit must be in the Y-register.
• The magnitude of the number in the X-register specifies the
  number of the bit to be set, cleared, or tested.
```

The 11C allows the operation to be used more effectively in a program where you want to scan through a word.

Is there a way to tell the op-code to use the 16C-like mode rather than a fixed bit position? Maybe something like the "x =" function requiring you to switch to alpha mode to enter "x=y"?

Thanks...

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #7 Posted by **Walter B** on 5 June 2011, 10:09 a.m.,*
in response to message #6 by Neil Hamilton (Ottawa)

That's a special topic. We had repeated discussions about parameter transfer to integer functions in the course of this project. In this very case, I advocated the 16C-way, while Pauli preferred the way it's implemented now with indirection and all bells and whistles. After all, he uses such operations more than I do, so I gave in to the expert :-)

Walter

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #8 Posted by **Neil Hamilton (Ottawa)** on 5 June 2011, 10:55 a.m.,*
in response to message #7 by Walter B

Indirection you say?? Is there a thread you can point me to that would explain how that is done? That would be very useful.

Is there something in the manual that I missed? If not, perhaps a paragraph or two might help since this differs from the baseline 16C behaviour. :-)

BTW: The several of the blue underlined links in the manual are not working. Specific examples from the manual (most from the function description table): "above" in c..., "above" in BASE, "catalog of conversion table" in D->R, "below" in ERR, "above" in H.MS, "indicators" in RCLM, "catalog of conversion table" in R->D, "indicators" in STOM, first "addressing table above" in x < ...?, "tables" in 0...9, "addressing tables" in A...Z, "above" in h STATUS, "above" in XEQ, "tables" and "indicators" in the paragraphs immediately above the the function description table.

I am making heavy use of this table while learning the beast and like the hot-link capability (when it works :-).

It might be overkill but in the "Catalog contents in detail" tables, it would be really useful if this was hot linked to the more descriptive table entires (though I can fully understand if you don't want to do this!!!).

Thanks...

>
> I'd recommend page 14 :-) Page 26 explains how you recognice a command allowing indirect addressing. And then the index entry for the command(s) you are interested in ...

Page 16 turns out to be the critical table (go figure: "Addressing Labels" -- just like the broken link in the function table was trying to tell me!). The crucial piece of information I had missed was the "->" key being used for indirection.

Now I have to explore how it works.

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #11 Posted by **Paul Dale** on 5 June 2011, 5:29 p.m.,*
in response to message #7 by Walter B

As Walter mentioned we discussed this long and hard. We started off having the bit commands operating as the 16c (BS, BC, ...). For a while these got extended like the flag commands were but that got lost later for reasons I don't remember. Then we added the current versions which are actually more flexible and more compact versions with arguments (BS#, BC#, ...). I've a suspicion that there was a third complete suite as well but I'm probably misremembering. Anyway, the result was a big mess of bit operations mostly alike.

After much back and forth, the decision was finally made to lose direct 16c compatibility here (helped along by the almost complete lack of published 16c programs) and stick with the single set that provided the more complete & useful range of functionality. I.e. the BS#, BC#, ... new commands.

The bottom line is that the current bit commands are considerably more flexible than the 16c's. The 16c's bit operations are available by swapping x and y before the operation and going indirect on y for the bit number. So were very nearly compatible and more flexible.

For similar reasons the shifts and rotates got count arguments. In this case we definitely had three flavours: SR, SRn, SRB. The first two being the 16c commands and the last being a byte shift as per the RPL machines. Giving the command an argument completely replaced all three (times five for the five shifts and rotates) with a single more powerful command with the proviso that direct 16c compatibility was lost for the SRn command. I think this loss of direct compatibility is worth the gain in usefulness.

If you really want the direct 16c commands, define them using alpha labels and XEQ them from a flash program region. We've got enough capability to exactly emulate the 16c here. From memory this is the kind of framework you'll require:

```
LBL'BS'
x<>y
BS->Y
x<>y
STO L
DROP
RTN
```

Have fun with the indirection. Almost every command that takes an argument can take an indirect argument as well. Also, remember that all registers including the stack can be used for the indirect register.

- Pauli

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #12 Posted by **Neil Hamilton (Ottawa)** on 5 June 2011, 6:43 p.m.,*

in response to message #11 by Paul Dale

Hi Paul,

After I got the hang of it (ie: once I had figured out the required swap-aroo -- no geographical pun intended!), I realized that this was indeed a more flexible option than the 16C version. I have never used a 16C myself and thus feel no great allegiance an exact replica of its functions. As I mentioned, it was my oversight of the "->" giving you indirect address mode.

I still suspect that a (short) paragraph (or two) in the document might help grease the wheel to usage of these beauties! I agree that most of the information is buried in there but the information density is quite high in places. :-)

BTW: I have noticed in the latest calc.bin binaries that the flashed calculators are showing "34s 2.0 ?100" rather than the "34s 2.0 ?1001" that shows up in the emulator. Does the emulator have an extra character in the dot matrix line or is something else happening?

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #13 Posted by **Walter B** on 5 June 2011, 7:08 p.m.,*
in response to message #12 by Neil Hamilton (Ottawa)

Neil,

Since you keep asking for some more paragraphs: Looking at the examples given on pp. 14-16, what do you want added or explained in more depth? As I don't know what you don't know, some idea(s) will be helpful to meet your needs. TIA

Walter

Re: WP34S functions missing in action? (LJ, RJ, RL, RLC, RR, RRC, etc.)

*Message #14 Posted by **Neil Hamilton (Ottawa)** on 5 June 2011, 7:33 p.m.,*
in response to message #13 by Walter B

Hi Walter,

Honestly, I am not trying to be a pest.

Some of the content Paul put in his post might find its way into the manual. I did figure most of it out myself through a bit of trial and error (mostly error!) but without some seeding from you two, I doubt I would have gotten there.

I will see if I can boil down the information into a very few sentences and post it back to you. Would that be OK?

Cheers...

WP 34S Version 1.18

*Message #1 Posted by **Gerry Schultz** on 4 June 2011, 4:48 p.m.*

Hey guys:

A little clarification please. In Eric's posting below about ordering overlays (which I did too) he mentions updating the overlay to the 1.18 layout. I downloaded the latest version from sourceforge.net/projects/wp34s/files/ but it shows the zip file to be dated 2011-05-11. When I flash my 30b with last night's download and check the version, it says I have 1.17 874. It has said that for the last 3 downloads which I do weekly on Friday night.

So, has 1.18 been out or is it in some pre-alpha evaluation and not released to SourceForge yet?

Thanks, Gerry

Re: WP 34S Version 1.18

> So, has 1.18 been out or is it in some pre-alpha evaluation and not released to SourceForge yet?

If you always want the latest version you have to look at the develop site:
http://sourceforge.net/projects/wp34s/develop

There you can click on the link 'SVN browse code' to get any up-to-date file you want, the files for flashing your real calc are in the subfolder 'trunc/realbuild'.

Edited: 4 June 2011, 5:28 p.m.

Re: WP 34S Version 1.18

*Message #3 Posted by **Marcus von Cube, Germany** on 4 June 2011, 6:46 p.m.,*
in response to message #2 by fhub

I'm out of the house in the moment. We're planing some "final" release in due course.

Re: WP 34S Version 1.18

*Message #4 Posted by **Walter B** on 4 June 2011, 7:02 p.m.,*
in response to message #3 by Marcus von Cube, Germany

... and, watch out, the layout will change.

BTW, the zipped package is updated seldom. As Franz wrote, please look to other branches of the project tree. Then you'll be closer to the edge of development - with all advantages and disadvantages

...

Walter

In a week I am going out of town for a month, and right now I have 47 overlays that have been ordered that I need to ship out before I leave. I would ideally start making them on Monday to give myself enough time to get them done, and I certainly can't wait past Wednesday. What do you think is the timeline for the revisions? Or should I not even bother to get those in place for this production run?

I suppose I could take my equipment with me on my trip but I would really rather not do that.

Eric

Re: WP 34S Version 1.18

*Message #7 Posted by **Neil Hamilton (Ottawa)** on 5 June 2011, 9:39 a.m.,*
in response to message #6 by Eric Rechlin

I, for one, could certainly wait another month to allow the dust to settle. I am in no panic to get a hold of the overlays.

I ordered a couple right away because you mentioned you were going to "accept a small number of orders" and didn't want to get caught out on the wrong side of the "small number".

I suspect if you delayed doing your print run until you are back it would not hurt anyone unduly.

Re: WP 34S Version 1.18

*Message #8 Posted by **Cristian Arezzini** on 5 June 2011, 11:02 a.m.,*
in response to message #7 by Neil Hamilton (Ottawa)

Neil, I think he *wants* to ship some now, to be used as a test and to get user feedback. I think he was just asking if there is going to be a layout update very soon, so that even the "beta test" overlays could include it, so that they would be already actual, without being obsoleted after a few days. Either way, I'll be glad to test it when it arrives, if feedback might be important; even if this

means having to buy another set when the layout is finalized.

Cristian

What is the celestial cycle for Red Dots on TAS?

*Message #1 Posted by **Michael de Estrada** on 4 June 2011, 2:06 p.m.*

The HP-35 Red Dot is clearly one of the rarest and most coveted calculator collectables, and only very infrequently does an authentic one appear on TAS. Even rarer is one that is totally original, in good working order and complete with all its original accessories. I'm the fortunate owner of one of these complete sets, which is the only one I've noticed, since I started monitoring TAS about 6 years ago. There was a fake one about a year ago, and another that may have sold privately, but that's all I've seen. It seems like there are very few in existence anymore, and most of those are the hands of collectors like myself who have no interest in selling them. Anyways, I'm just wondering if anyone has any ideas or would want to speculate as to if and when another one might appear for auction. Right now TAS browsing is pretty boring as there are few if any interesting and rare items being listed.

Re: What is the celestial cycle for Red Dots on TAS?

*Message #2 Posted by **DavidShenk** on 4 June 2011, 3:12 p.m.,*
in response to message #1 by Michael de Estrada

It's very irritating that TAS does not have a way to research things like this that sell much more infrequently.

*Message #5 Posted by **aj04062** on 5 June 2011, 10:05 a.m.,*
in response to message #1 by Michael de Estrada

Would a 9810A be interesting and unique? I was thinking of putting one I just got up on TAS.

However, I can't help tinker with it before I would consider doing it.

Re: What is the celestial cycle for Red Dots on TAS?

*Message #6 Posted by **Michael de Estrada** on 5 June 2011, 4:46 p.m.,*
in response to message #5 by aj04062

I'd say that the HP 9810A is interesting, however, it is not nearly as rare as an HP 35 Red Dot. I'd put it in the same class as an HP 92 or HP 81, which show up infrequently and command a high price, but are certainly attainable and are not milestone machines. If you had an HP 9800A, I'd be more impressed. If you had an HP 95C, then I'd prostrate myself at your feet.

Re: What is the celestial cycle for Red Dots on TAS?

*Message #8 Posted by **David Ramsey** on 5 June 2011, 8:20 p.m.,*
in response to message #5 by aj04062

Hm. I have a Red Dot, but I don't have a 9810A. You should definitely sell it to me, knowing it will go to a loving home. I finally found an SR-60 recently and am feeling peckish, especially since the only English manuals that exist for this machine are those at the Computer History Museum, and I'm having to pay them to scan 'em for me.

Do you have manuals or anything other than just the calculator?

Re: What is the celestial cycle for Red Dots on TAS?

*Message #9 Posted by **aj04062** on 5 June 2011, 8:35 p.m.,*
in response to message #8 by David Ramsey

It seems like a "loaded version".

Has the following options: Standard 51 Total Storage Registers 003 2036 total program steps 004 Printer

Has Statistics (with overlay & QRG), Peripheral Control and Mathamatics Module

I need to debug a keyboard issue. Tony Duell is helping me debug. The printer and card reader need to be rebuilt/repaired.

Supposedly it came from the cardiology dept at a Philadelphia hospital.

Re: What is the celestial cycle for Red Dots on TAS?

*Message #10 Posted by **David Ramsey** on 5 June 2011, 9:02 p.m.,*
in response to message #9 by aj04062

I've rebuilt a lot of the small HP card readers. Next I get to practice on the SR-60, but it looks as if

its giant card reader will be pretty simple comparatively. No tiny nylon balls! Hopefully the 9810 card reader's large size will make it easy to deal with.

Let me know if you decide you want to part with it!

Re: What is the celestial cycle for Red Dots on TAS?

*Message #11 Posted by **aj04062** on 5 June 2011, 9:15 p.m.,*
in response to message #10 by David Ramsey

will do Dave.

I'll send you some pictures (not that I have decided yet) for you to look at.

Speaking of CAS: CAS48 or Erable?

*Message #1 Posted by **mr-scorpio** on 4 June 2011, 10:32 a.m.*

Hi, Firstly apologies, I'm new to HP calcs on the whole. So a bit of a 'noob' (Hate that term).

However it seems for the 48GX it IS possible to install a comprehensive Computer Algebra System (CAS) on it.

So far i have discovered Erable & CAS48

Is there a direct comparison table that compares the features of these two applications? Which is the best & most complete? Which is the most stable? Which is the fastest?

Are these the only two CAS systems available for the 48GX? - Are there others?

I would have asked this on the hpcalc.org website, but unless someone can point it out, it doesn't seem to have a Forum?

Many thanks for your wisdom! Al

Re: Speaking of CAS: CAS48 or Erable?

*Message #2 Posted by **Marcus von Cube, Germany** on 6 June 2011, 7:23 a.m.,*
in response to message #1 by mr-scorpio

I don't know CAS48 and have only marginally played around with Erable on my 48G but the latter must be good enough for having been adopted by HP for their CAS machines, most notably the 49G and 50G series. The function set you find in these calcs is provided in large parts by Erable if I remember correctly.

HP 28S - Partial CAS?

*Message #1 Posted by **mr-scorpio** on 4 June 2011, 9:23 a.m.*

I've recently become the proud owner of a mint HP 48GX (Black Screen, 2003 build)

However this has gotten me into researching other HP calcs etc. One thing that has struck me is that whilst the 48GX can be 'expanded' by loading a CAS app like Erable onto it (& eating up 80% of its storage), the 28S seems to have had some sort of simpler 'CAS' built into it already? - Meaning that is could symbolically Simplify and Expand epressions for example. In fact the user manual has a whole section on 'Simplification'.

My question is, the 48 series came out shortly after the 28S & dominated the 90's, but WHY did HP 'Drop' the seemingly Useful 'CAS' features that the older/simpler 28S had? - With HP calcs not getting CAS again until the more current models. Seems like a backward step by HP? OR 'CAN' the 48GX for example expand & simplify Algebraic equations (WITHOUT installing a prog), but calls it something else? Look forward to your insights.

Al

*Message #3 Posted by **mr-scorpio** on 4 June 2011, 10:24 a.m.,*
in response to message #2 by fhub

So to clarify: The 48GX can 'Simplify'?

Re: HP 28S - Partial CAS?

*Message #4 Posted by **fhub** on 4 June 2011, 11:07 a.m.,*
in response to message #3 by mr-scorpio

> Quote:

> So to clarify: The 48GX can 'Simplify'?

Don't ask me about any details, because I've not used it since many years.
IMHO any 'CAS' on HP-calculators is not a CAS bust just a nightmare.
If you want to use a serious CAS on a handheld then there's only one choice: TI-92Plus or TI-Voyage200 (although I prefer the 92 because of its much better keyboard).

Re: HP 28S - Partial CAS?

*Message #5 Posted by **Gilles Carpentier** on 4 June 2011, 4:59 p.m.,*
in response to message #4 by fhub

"IMHO any 'CAS' on HP-calculators is not a CAS bust just a nightmare."

I desagree. The 49 & 50G CAS is OK.

Re: HP 28S - Partial CAS?

*Message #6 Posted by **Jeroen Van Nieuwenhove** on 4 June 2011, 5:21 p.m.,*
in response to message #3 by mr-scorpio

The HP 48G series have the same ISOL, EXPAN and COLCT commands as the HP 28 series. At the time of the introduction of the HP 28, that was quite a feat, but it is of course nothing compared to the possibilities offered by Erable and ALG48 (or any modern CAS).

Edited: 4 June 2011, 5:26 p.m.

Re: HP 28S - Partial CAS?

*Message #7 Posted by **mr-scorpio** on 5 June 2011, 4:58 a.m.,*
in response to message #6 by Jeroen Van Nieuwenhove

Interesting that you mention that. I have another post requesting whether a comparison exists between Erable & CAS48 - might you know how they compare?

Would it be fair to say then that even though the 48G series 'isn't' touted as having CAS, it 'does' have numerous 'CAS-like' capabilities? Cheers

Edited: 5 June 2011, 5:06 a.m.

Re: HP 28S - Partial CAS?

*Message #8 Posted by **Jeroen Van Nieuwenhove** on 5 June 2011, 4:06 p.m.,*
in response to message #7 by mr-scorpio

ALG48 and Erable share a lot of functionality; in fact Erable is in part derived from ALG48. Head over to hpcalc.org and read the Erable and ALG48 documentation to find out more about the differences (specifically section 3.3 of the Erable documentation). Main point is: if you can have the two of them on your HP 48, do not hesitate.

Re: HP 28S - Partial CAS?

*Message #9 Posted by **mr-scorpio** on 5 June 2011, 5:11 a.m.,*
in response to message #6 by Jeroen Van Nieuwenhove

I've yet to get a serial cable for my 48GX, but when i do....

It is possible to get both Erable AND ALG48 on the 48GX at the SAME time? - How much free memory is left when one or both are installed? Cheers

Re: HP 28S - Partial CAS?

*Message #10 Posted by **Jeroen Van Nieuwenhove** on 5 June 2011, 4:13 p.m.,*
in response to message #9 by mr-scorpio

Well, I only own a physical HP 48G, so I do not have any experience. I stuffed Metakernel, ALG48 and Erable into my Emu48 emulation, but I do not know which memory card you need to accomodate ALG48 and Erable on your HP 48GX. Erable needs 120K and ALG48 4.2 requires 50K, so you obviously need a memory expansion to accomodate both of them.

Re: HP 28S - Partial CAS?

*Message #11 Posted by **mr-scorpio** on 5 June 2011, 5:38 p.m.,*
in response to message #10 by Jeroen Van Nieuwenhove

Many thanks for the responses. What about 'CAS48', have you heard about this CAS system as well? Any idea how it compares to Erable / ALG48? Cheers

Re: HP 28S - Partial CAS?

*Message #12 Posted by **Jeroen Van Nieuwenhove** on 5 June 2011, 5:54 p.m.,*
in response to message #11 by mr-scorpio

I guess the reason why ALG48 and Erable are mentioned together so often is because these two applications were integrated in the later HP 49 and 50 series.

CAS48 and its manual can be found under the link I posted earlier. I have no experience with this application, but the documentation contains a list of its CAS functionality. You also might want to post your questions on comp.sys.hp48, which is a more specialized forum for this.

Cheers, Jeroen

Envisioning how I might use my HP 41CL

*Message #1 Posted by **gene wright** on 3 June 2011, 3:04 p.m.*

Since we early adopters are very close to finally being able to play with the HP 41CL (Thanks Monte!), I have gone through the rom listings and created a few potential "loads" - arrangements of roms - that I think I'll end up trying.

I **think** it will be possible to write small HP 41 programs that will switch back and forth between these loads. The program would handle all the MMU off/on, the PLUG commands, etc.

The first two "loads" are the "fun" loads:

Load 1: This has the CCD OSX to make using the HP 41 easier and games.

```
Port 1: CCD - OSX - 4K, ROM 5 and Trek ROM - 4K, ROM 11
Port 2: Sandbox - 8K, ROM 8, 13
Ports 3 and 4: Funstuff - 16K, ROM 10
```

Load 2: This is the adventure game load.

```
Ports 1 and 2: Adventure ROM 1 - 16K, ROM 12
Ports 3 and 4: Adventure ROM 2 - 16K, ROM 13
```

Work Load 1: This is somewhat a "work" load with some fun in there.

```
Port 1: CCD - OSX - 4K, ROM 5 and Alpha ROM - 4K, ROM 6
Port 2: Finance ROM - 4K, ROM 4 and Games ROM - 4K, ROM 10
Port 3: Sandbox - 8K, ROM 8, 13
Port 4: Trekkies ROM, 4K, Rom 11 and RAM - 4K
```

Work Load 2: This is an example of a work load. Not for me, but an example.

```
Port 1: Math Rom - 4K - ROM 1 and Stat Rom - 4K - ROM 2
Port 2: Finance Decisions Rom - 4K, ROM 4 and Circuit Analysis Rom - 4K, Rom 6
Port 3: Advantage Rom - 12K, Rom 22,24
Port 4: Survey Rom - 4K, Rom 3 and Standard Rom - 4K, Rom 5
```

I think this is going to be really fun.

*Message #2 Posted by **Ángel Martin** on 3 June 2011, 4:04 p.m.,*
in response to message #1 by gene wright

Nice to see this much gray matter put in place in anticipation of the big event :-)

One comment I'd make related to the SandBox.:= As seminal it was to get my feet wet on MCODE I should say it's been replaced by other modules since:

- use the the TOOLBox-II for utilities
- use the Sandmtah for ... er math stuff
- use the Alpha ROM for Alpha powerhouse
- and last but not least the Bufferland and Rampage modules for deep & wide buffer and RAM management

I know, too much stuff but hey, this is a live system after all these years :-)

Best, 'AM

Its like the first day you purchased the 41C!!!!!!!!

Have to find a cave and play for hours!!!

Hunt the wumpus, wasn't that a game?????

Geoff

And, hunt the wumpus is in the ADV1/ADV2 rom file in the 41CL

*Message #4 Posted by **gene wright** on 3 June 2011, 4:25 p.m.,*

Gene,

I should point out that all of these presuppose that you have the 41CL Extra Functions in Page 6 or Page 7. Otherwise there's no way to change the configuration.

Monte

Re: Envisioning how I might use my HP 41CL

*Message #6 Posted by **gene wright** on 3 June 2011, 5:22 p.m.,*
in response to message #5 by Monte Dalrymple

Oops. Yes.

But I am assuming that you could have a program in regular ram memory that could enable the MMU and load up the ports, right?

It would need to...

```
LBL SETUP
MMUCLR
804070-8007 in alpha and YPOKE (for me since I want YFNZ at page 7)
MMUEN
RTN

LBL FUNLOAD
```

```
UPLUG1
UPLUG2
UPLUG3
UPLUG4
CCDX in alpha
PLUG1L
TREK in alpha
PLUG1U
SBOX in alpha
PLUG2
FUNS in alpha
PLUG3
RTN
```

or such. That way, you can have multiple programs in main memory to change the roms loaded between "sets."

Will the entire thing work like that or do the MMU functions need to be separate?

Re: Envisioning how I might use my HP 41CL

*Message #7 Posted by **Monte Dalrymple** on 3 June 2011, 5:41 p.m.,*
in response to message #6 by gene wright

This should work. Note that you don't really need to UNPLUG the current modules from the Ports. The PLUG functions will just overwrite the current MMU programming, effectively replacing what's currently in the Port. The UNPLUG commands are mostly there for when you want to plug a physical module into a Port.

Monte

VERY COOL...

*Message #8 Posted by **Gene wright** on 3 June 2011, 5:47 p.m.,*
in response to message #7 by Monte Dalrymple

That's what I was hoping. I can imagine a set of 4 or 5 such "load roms into ports" programs if that works.

Woohoo!

Re: Envisioning: plugging modules

> PLUG1U
> SBOX in alpha
> PLUG2
> FUNS in alpha
> PLUG3
> ```

```
     RTN

     ...
```

Couldn't that be executed like this:

```
LBL FUNLOAD
CX in alpha
PLUG1L
TK in alpha
PLUG1U
SX in alpha
PLUG2
FS in alpha
PLUG3
RTN
```

because only the first and the last char are parsed?!
Or do you check that the module identifier has four chars?
then this:

```
LBL FUNLOAD
CAAX in alpha
PLUG1L
TAAK in alpha
PLUG1U
SAAX in alpha
PLUG2
FAAS in alpha
PLUG3
RTN
```

would do it because the two middle chars will not matter, right?

Re: Envisioning: plugging modules

*Message #10 Posted by **gene wright** on 7 June 2011, 9:31 a.m.,*
in response to message #9 by exschr

I believe 4 character labels are required, so yes, your second approach would work.

Re: Envisioning: plugging modules

*Message #11 Posted by **Monte Dalrymple** on 7 June 2011, 10:45 a.m.,*
in response to message #10 by gene wright

Yes, four-character labels are required, although only the first and last characters are parsed. I went with four in an attempt to make the labels more user-friendly. When I started writing the parse routine I realized that it was going to take too much code to check all four characters. Hence the first-and-last check. I suppose that I should have just reduced it to two at that point, but I felt that a two-character code might appear too "techie" to the casual user. One of my primary goals was to make this machine accessible to users like myself.

Monte

Another approach - shucking the clamshell, further. Book?

*Message #1 Posted by **Wanderley Navarro** on 3 June 2011, 2:13 p.m.*

After swapping several good HP-18C bodies with good HP-19BII & HP-28S CPUs I find now that dealing with the Clamshells is not too dificult. Not true for patience however...

For part of this demonstration was used the body of an 19BII without the CPU that was previously removed prying the upper part of the front since both front and back was already broken. This is why you see that the keyboard stakes are intact. The labels are from the 18C body donor.

Warm up well before attempting to remove the labels.

Initiate the removal lifting one corner with the help of a sharp blade and keep blowing hot hair.

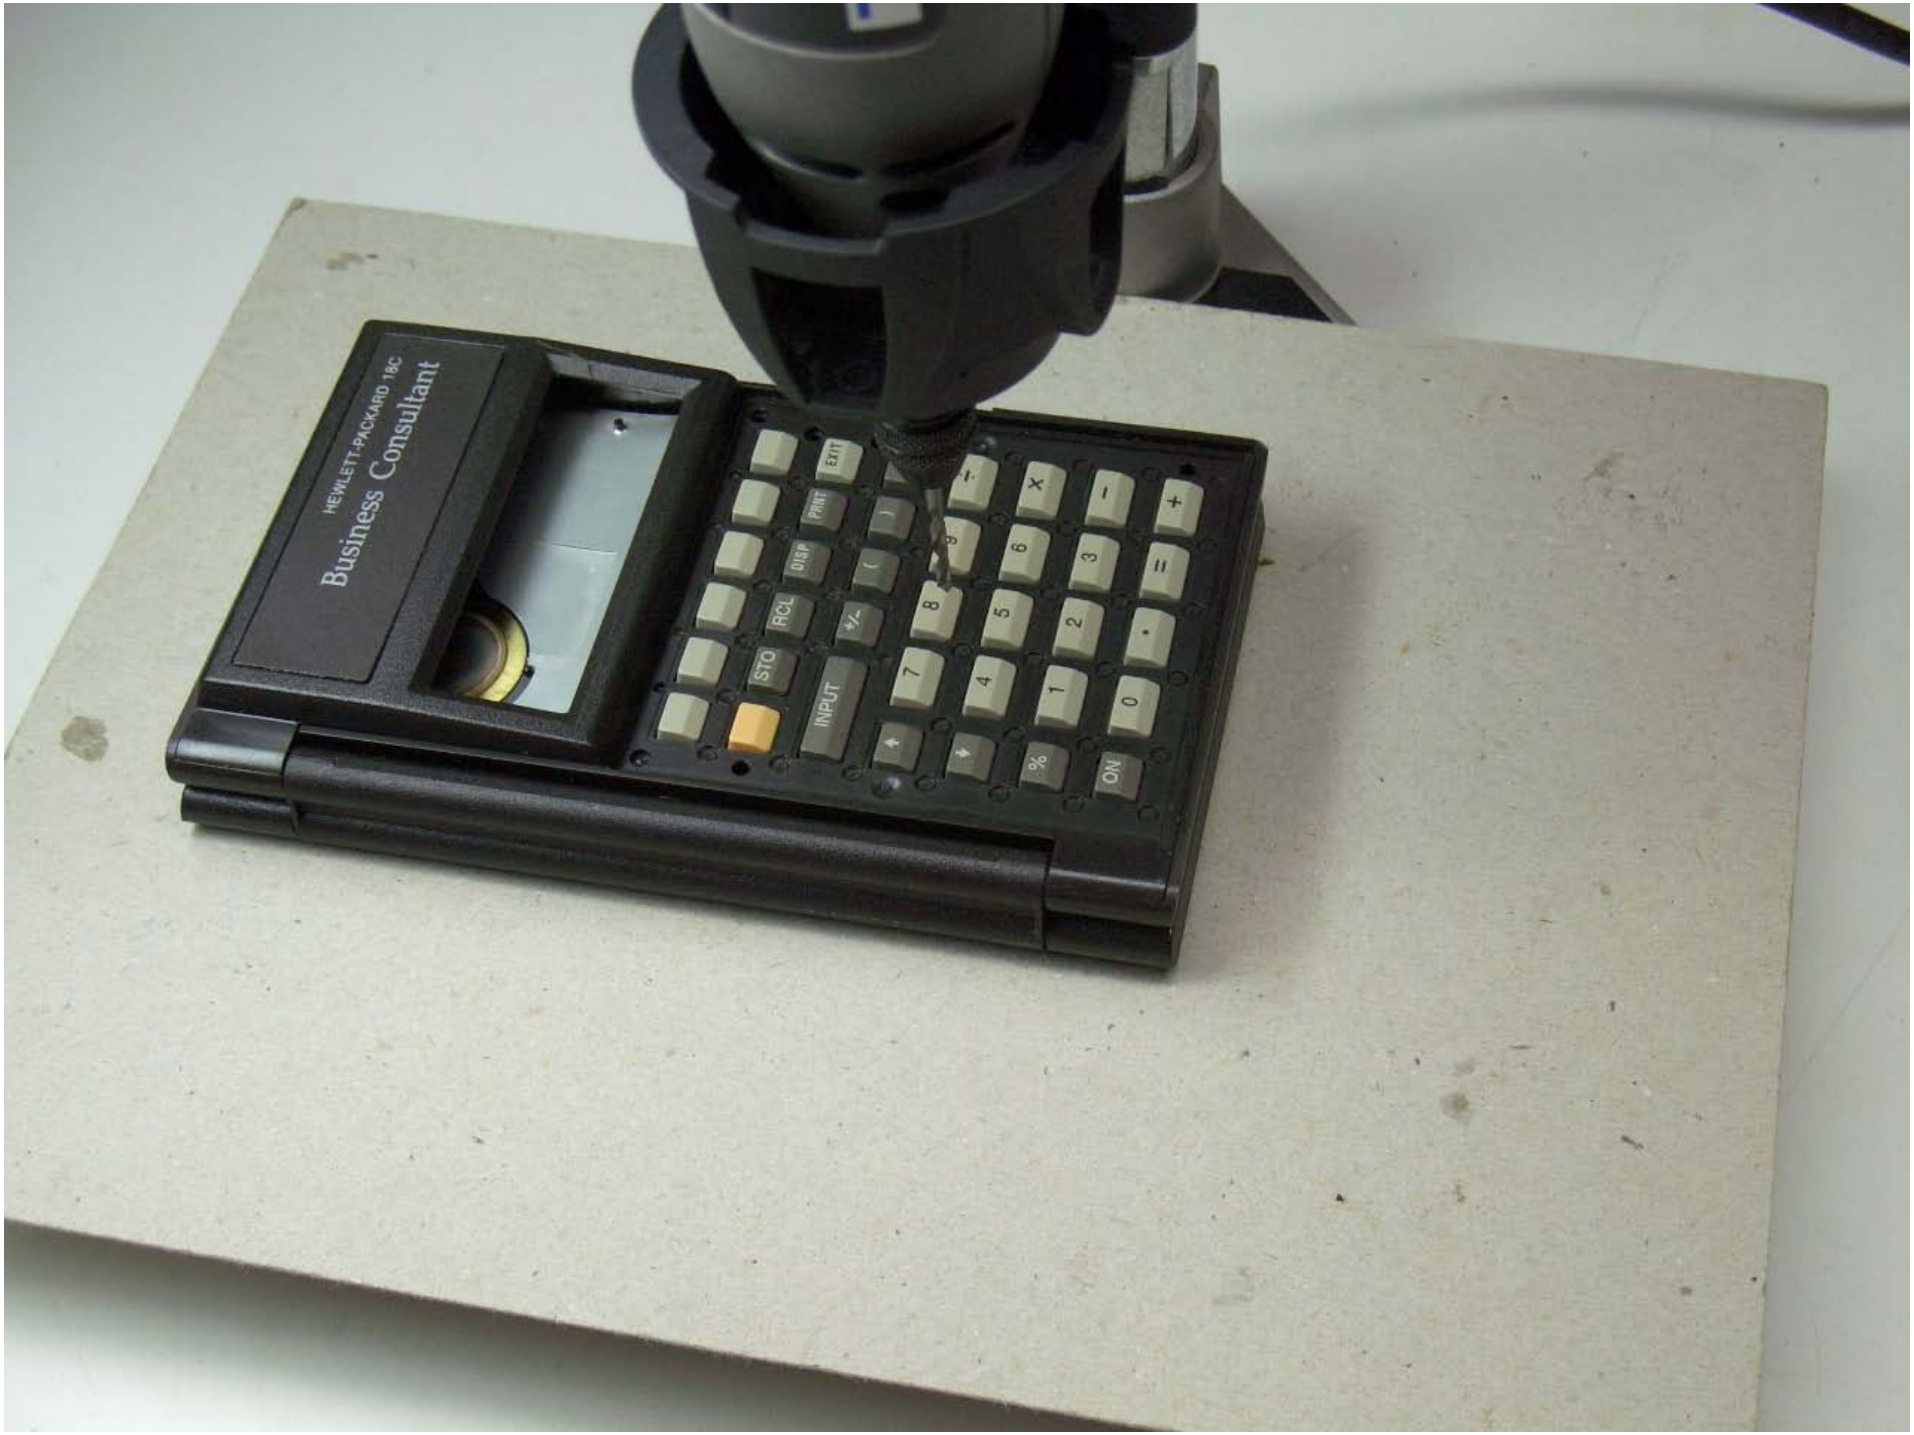
This is what you will find. Notice that the stakes near the latch area was already broken at its base and came off entirely along with the label (as pointed out by Randy on the previous thread).

I use a Dremel with vertical suport and a drill bit of 3/32" to remove the mushroomed heads of the stakes. Remember that there are stakes under the label located above the display too.

To set up the maximum down movement of the drill: First - lower the drill just enough to touch the stake head with the drill bit.

Second - with the drill bit touching the stake head adjust the lever on the suport to have the vertical movement stoped at this point.

Third - release the drill to its upper position and insert a sheet (+/- 1 mm) of cardboard below the calculator that will be lifted a bit. This way the cardboard thickness will define the deep of the drill.



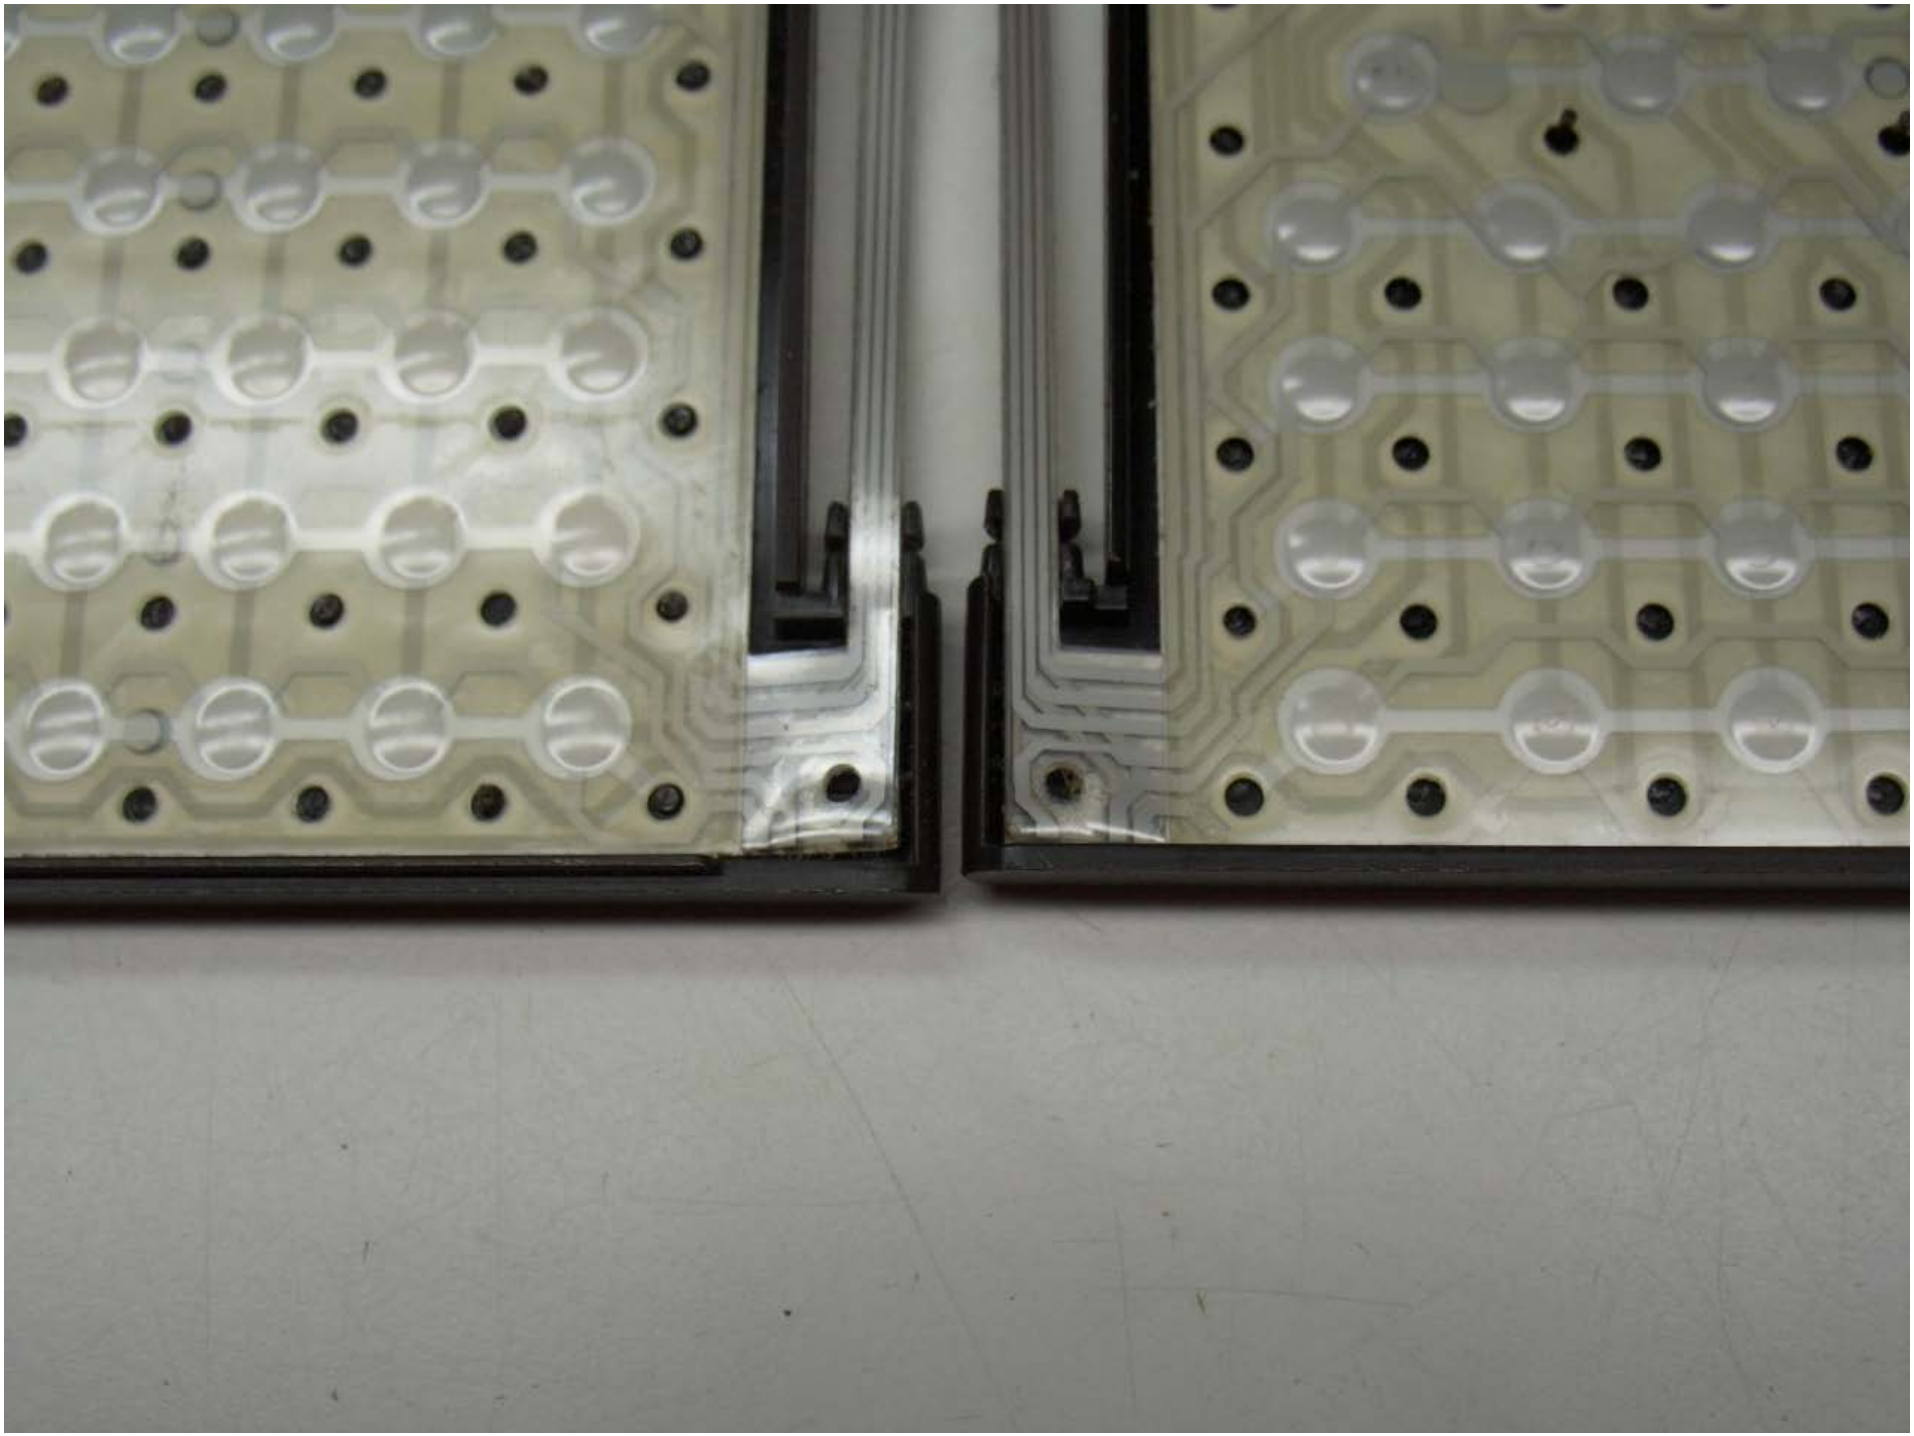
Notice (between the keys 5-6-8-9) that after drilling the head a small portion of the stake must remain available to be mushroomed in the reassembling process.

The stake's head that was removed.

So, let's take a look at the most common key issues that affect the models of this series:

1 - Broken threads on the keyboard flex PCB;

The most common area to search for broken threads are located on the lower center corners where the flex PCB folds. Look at the other areas where the PCB folds also.



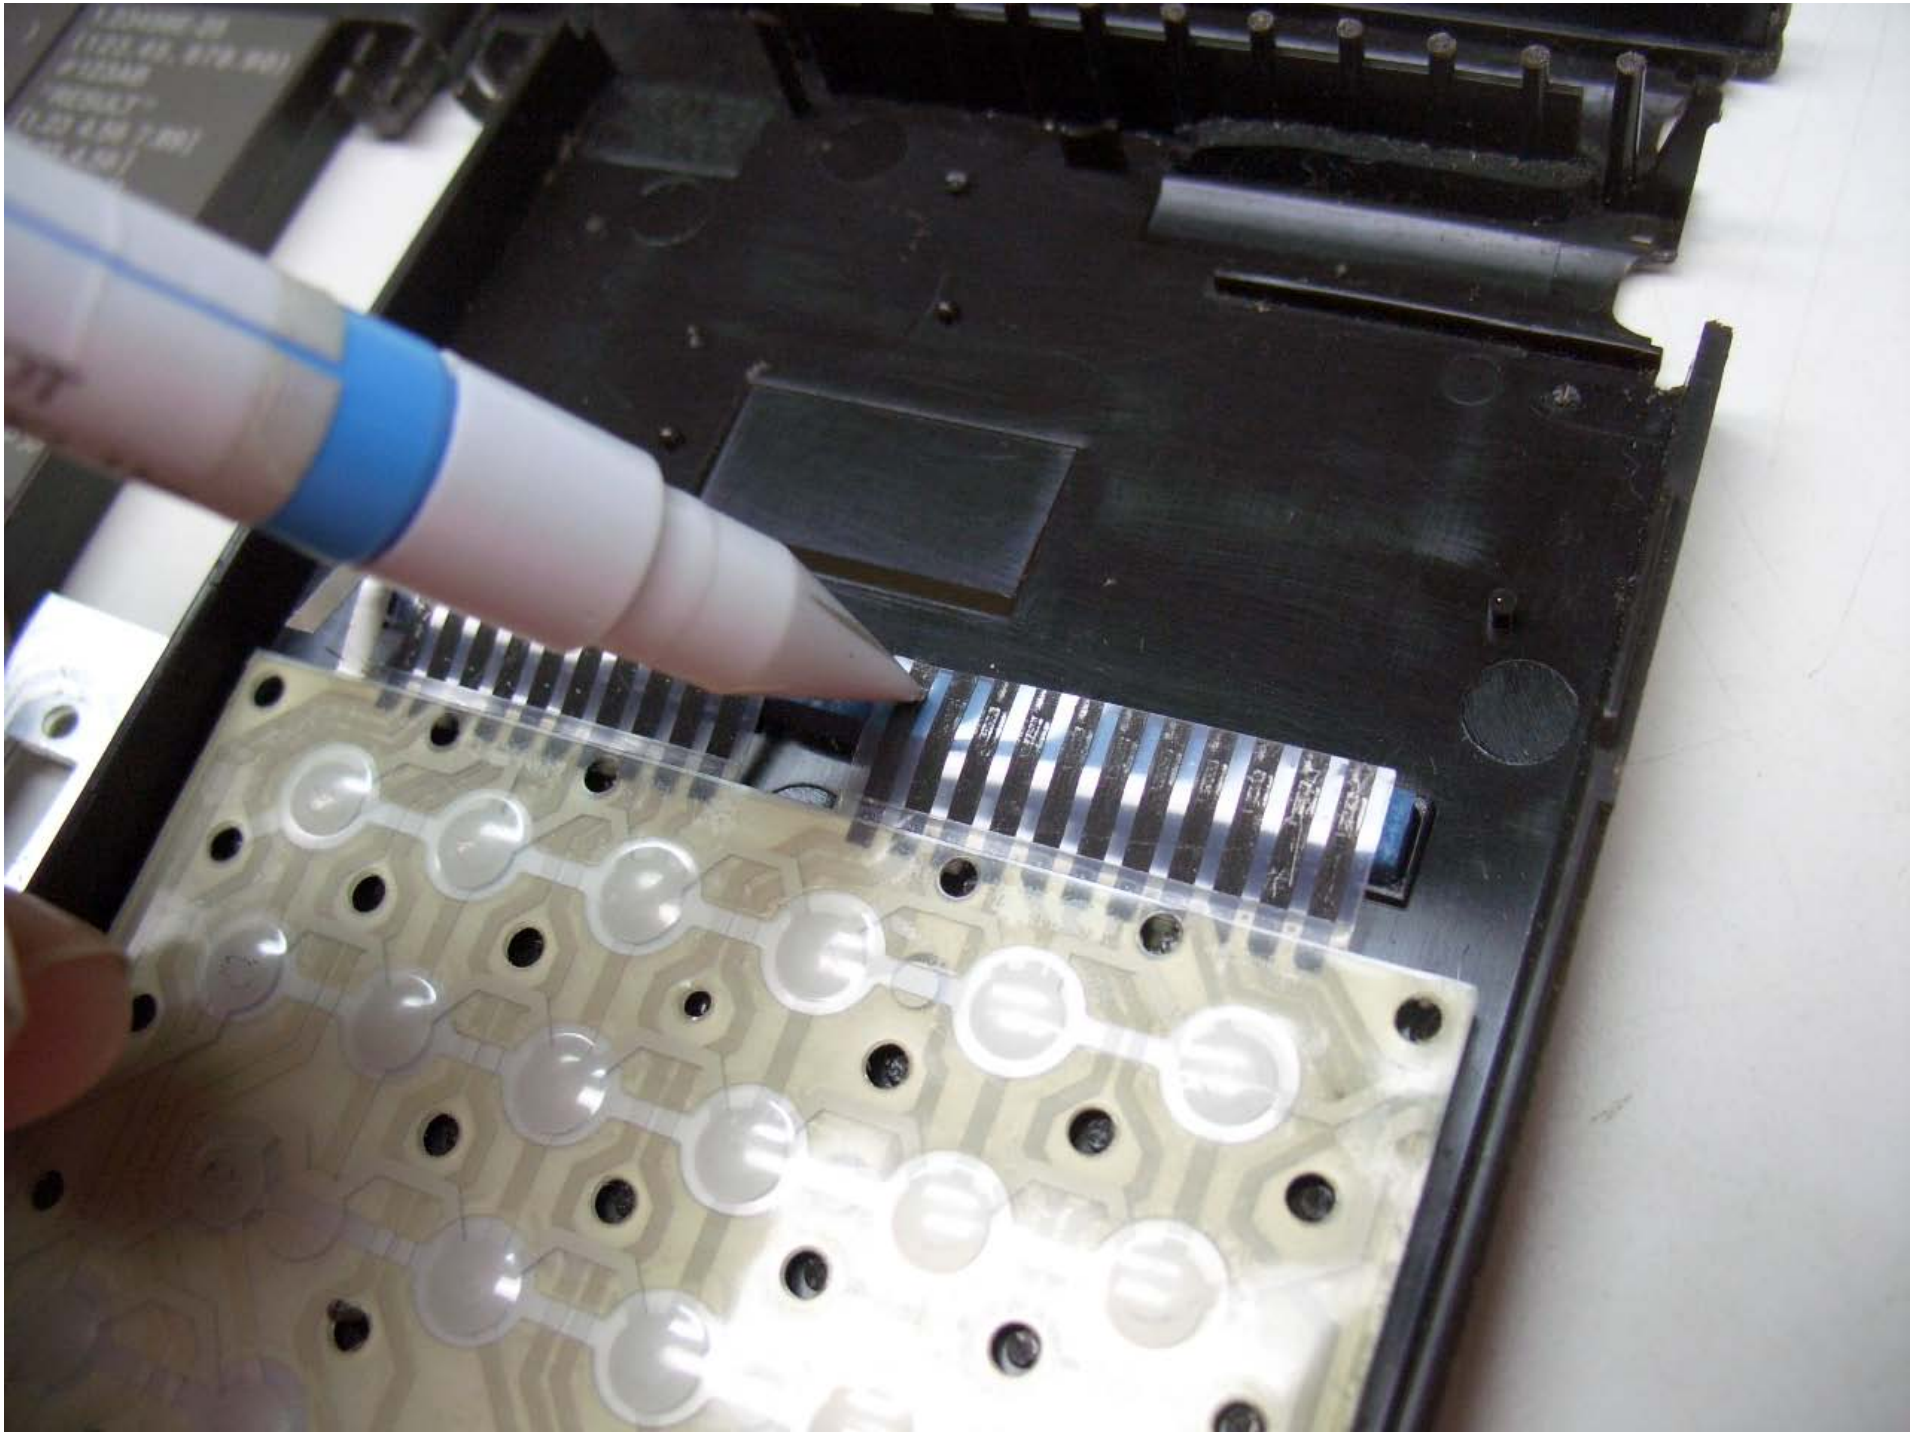
Use the keyboard schematic (provided below at the end) to find the faulty thread and fix it using something like a conductive silver mix for heat sensitive surfaces.

2 - Bad connection between the keyboard flex PCB and the main PCB that can be due to:

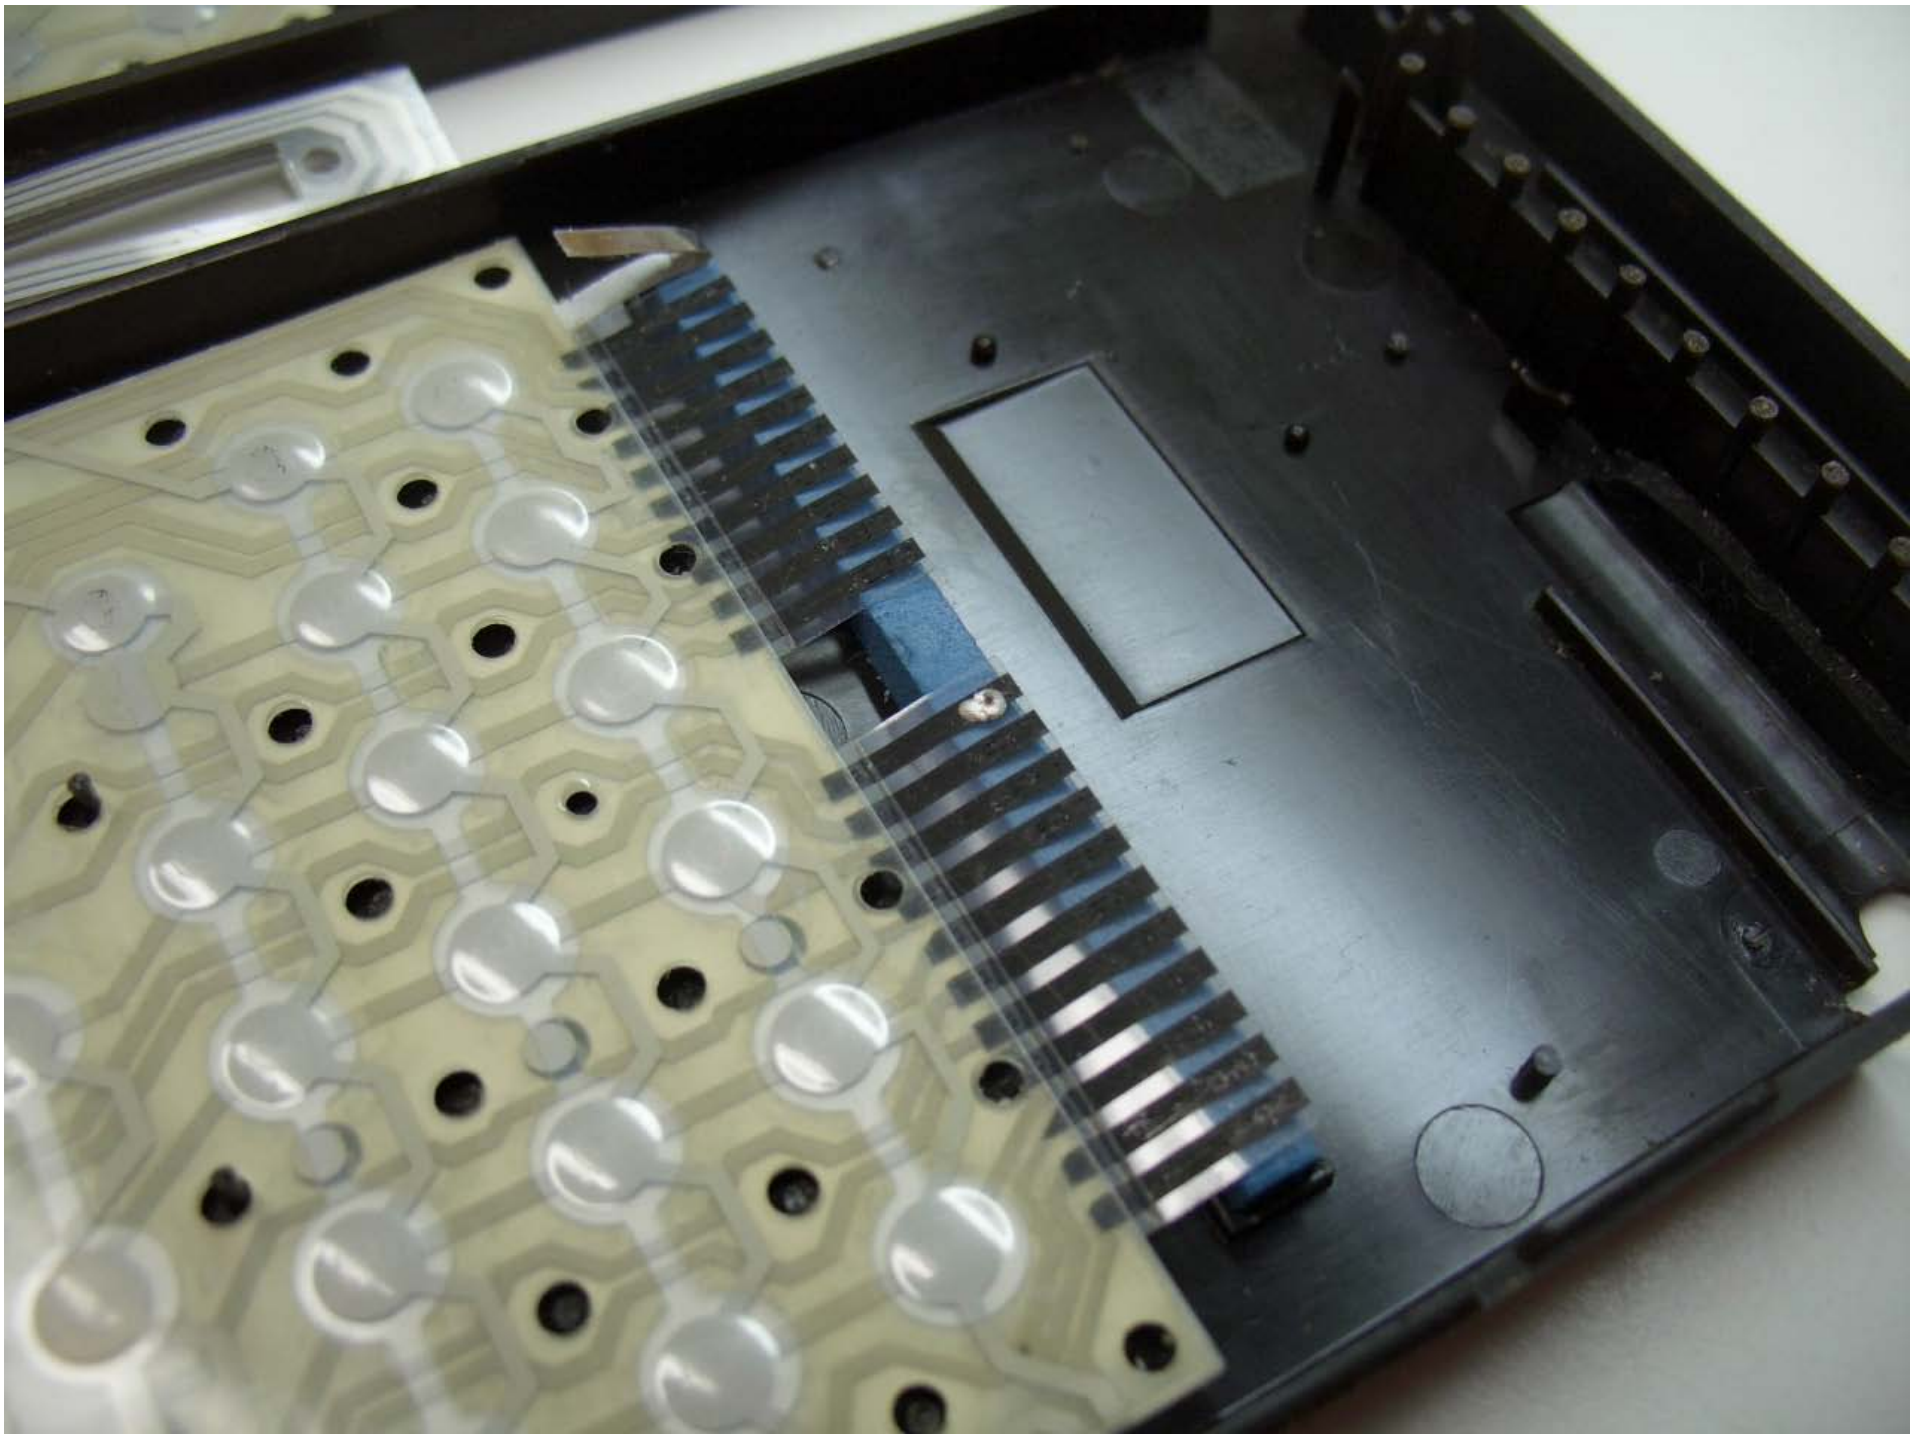
2.1 - Decomposing compression foam;

To solve this problem I go in another direction instead of replacing the foam, with the use of the silver mix on the contact points of the two PCBs. Depositing a good amount to form a small mound will fill the gap of contact between the two PCBs.

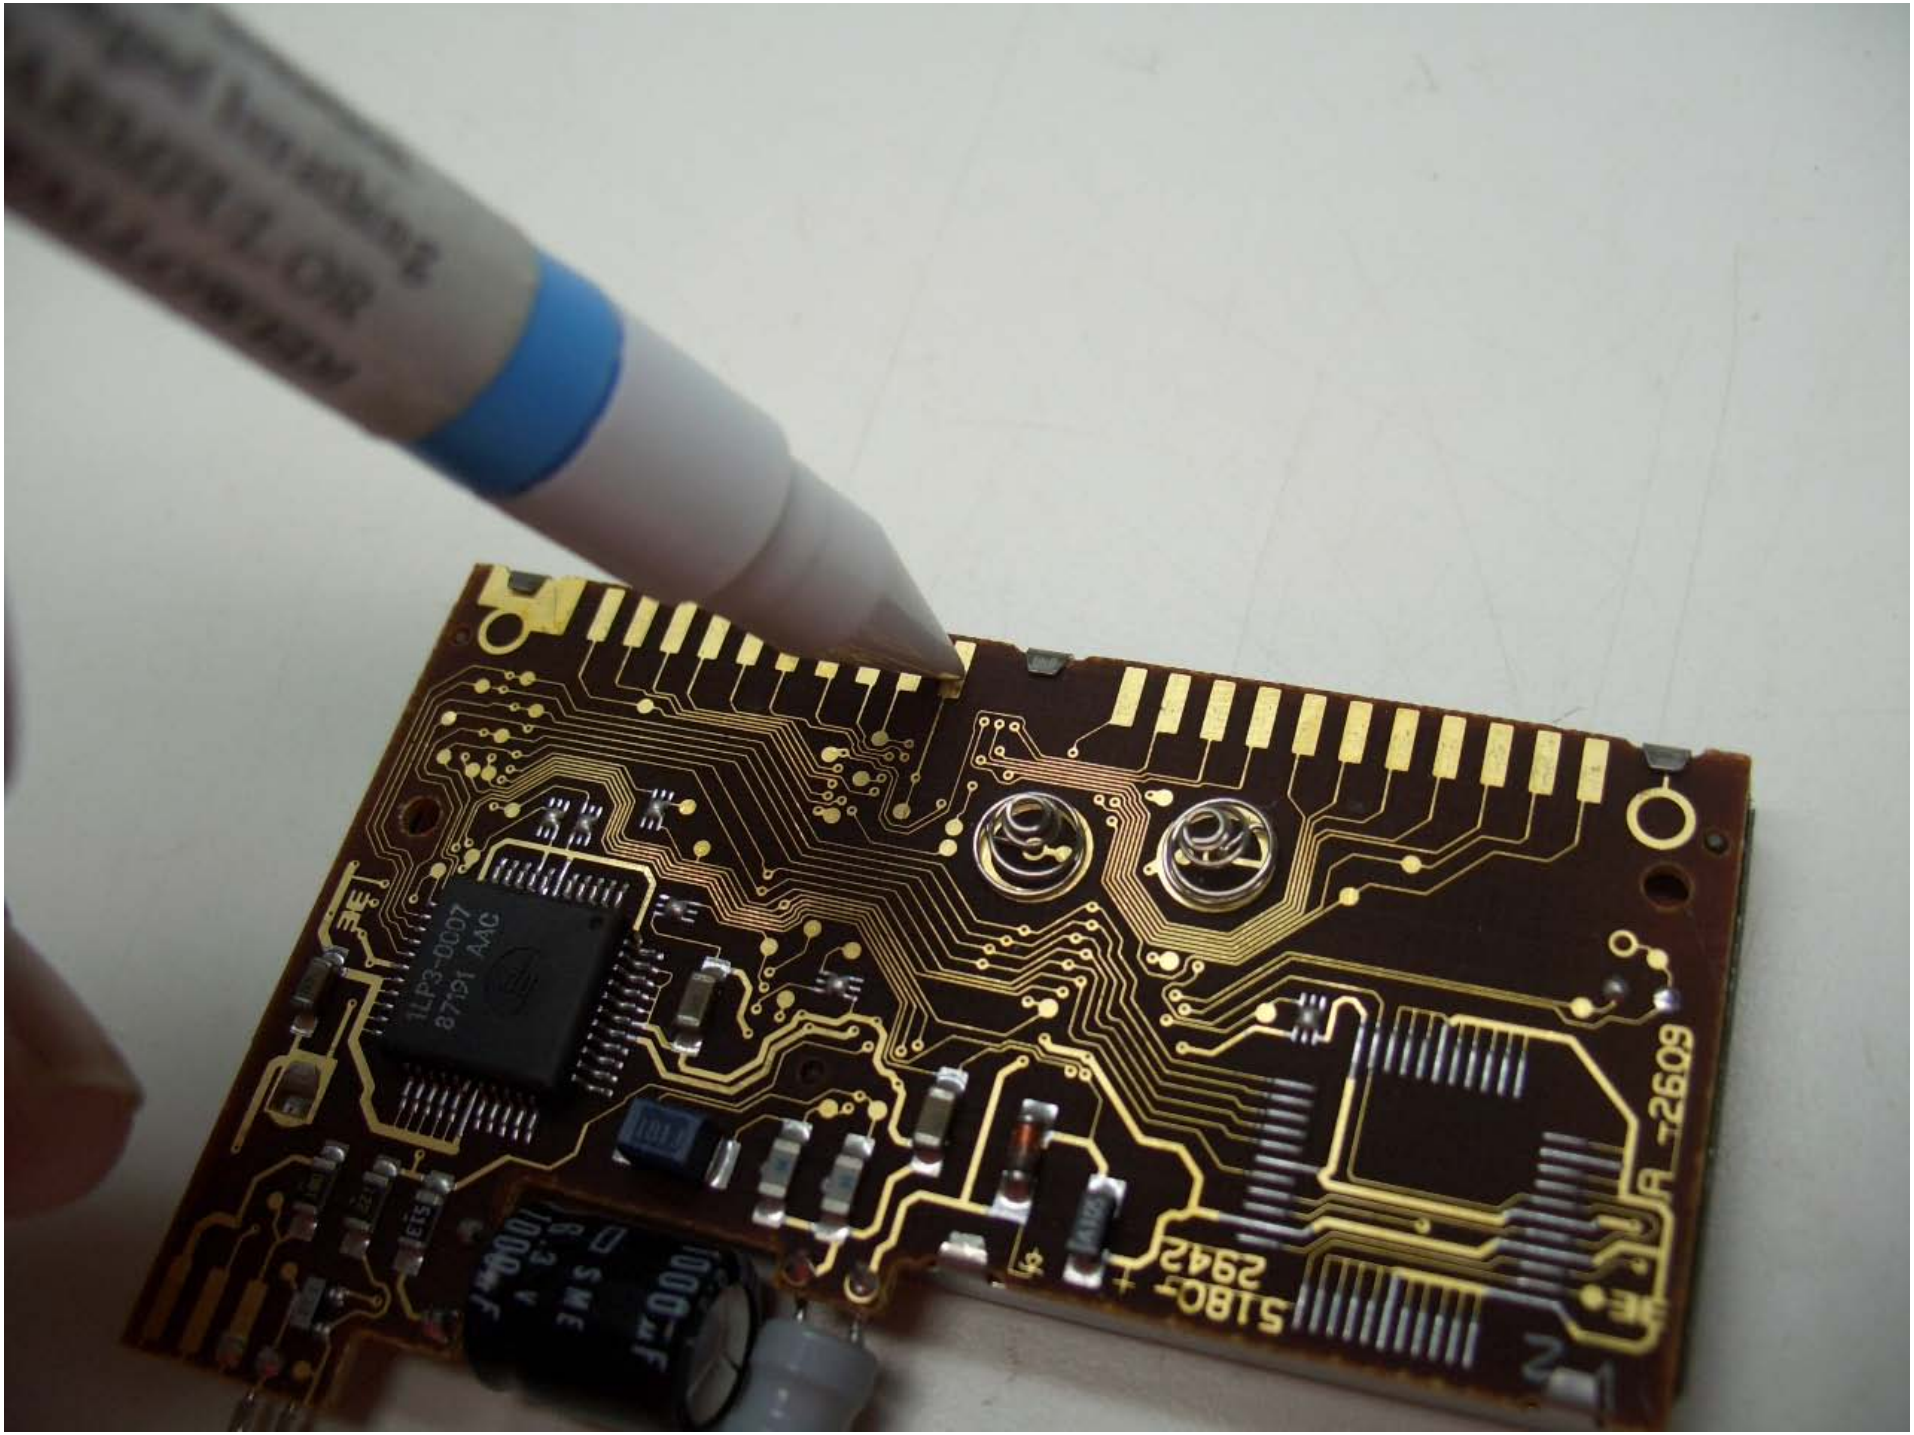
On the flex PCB points of contact...



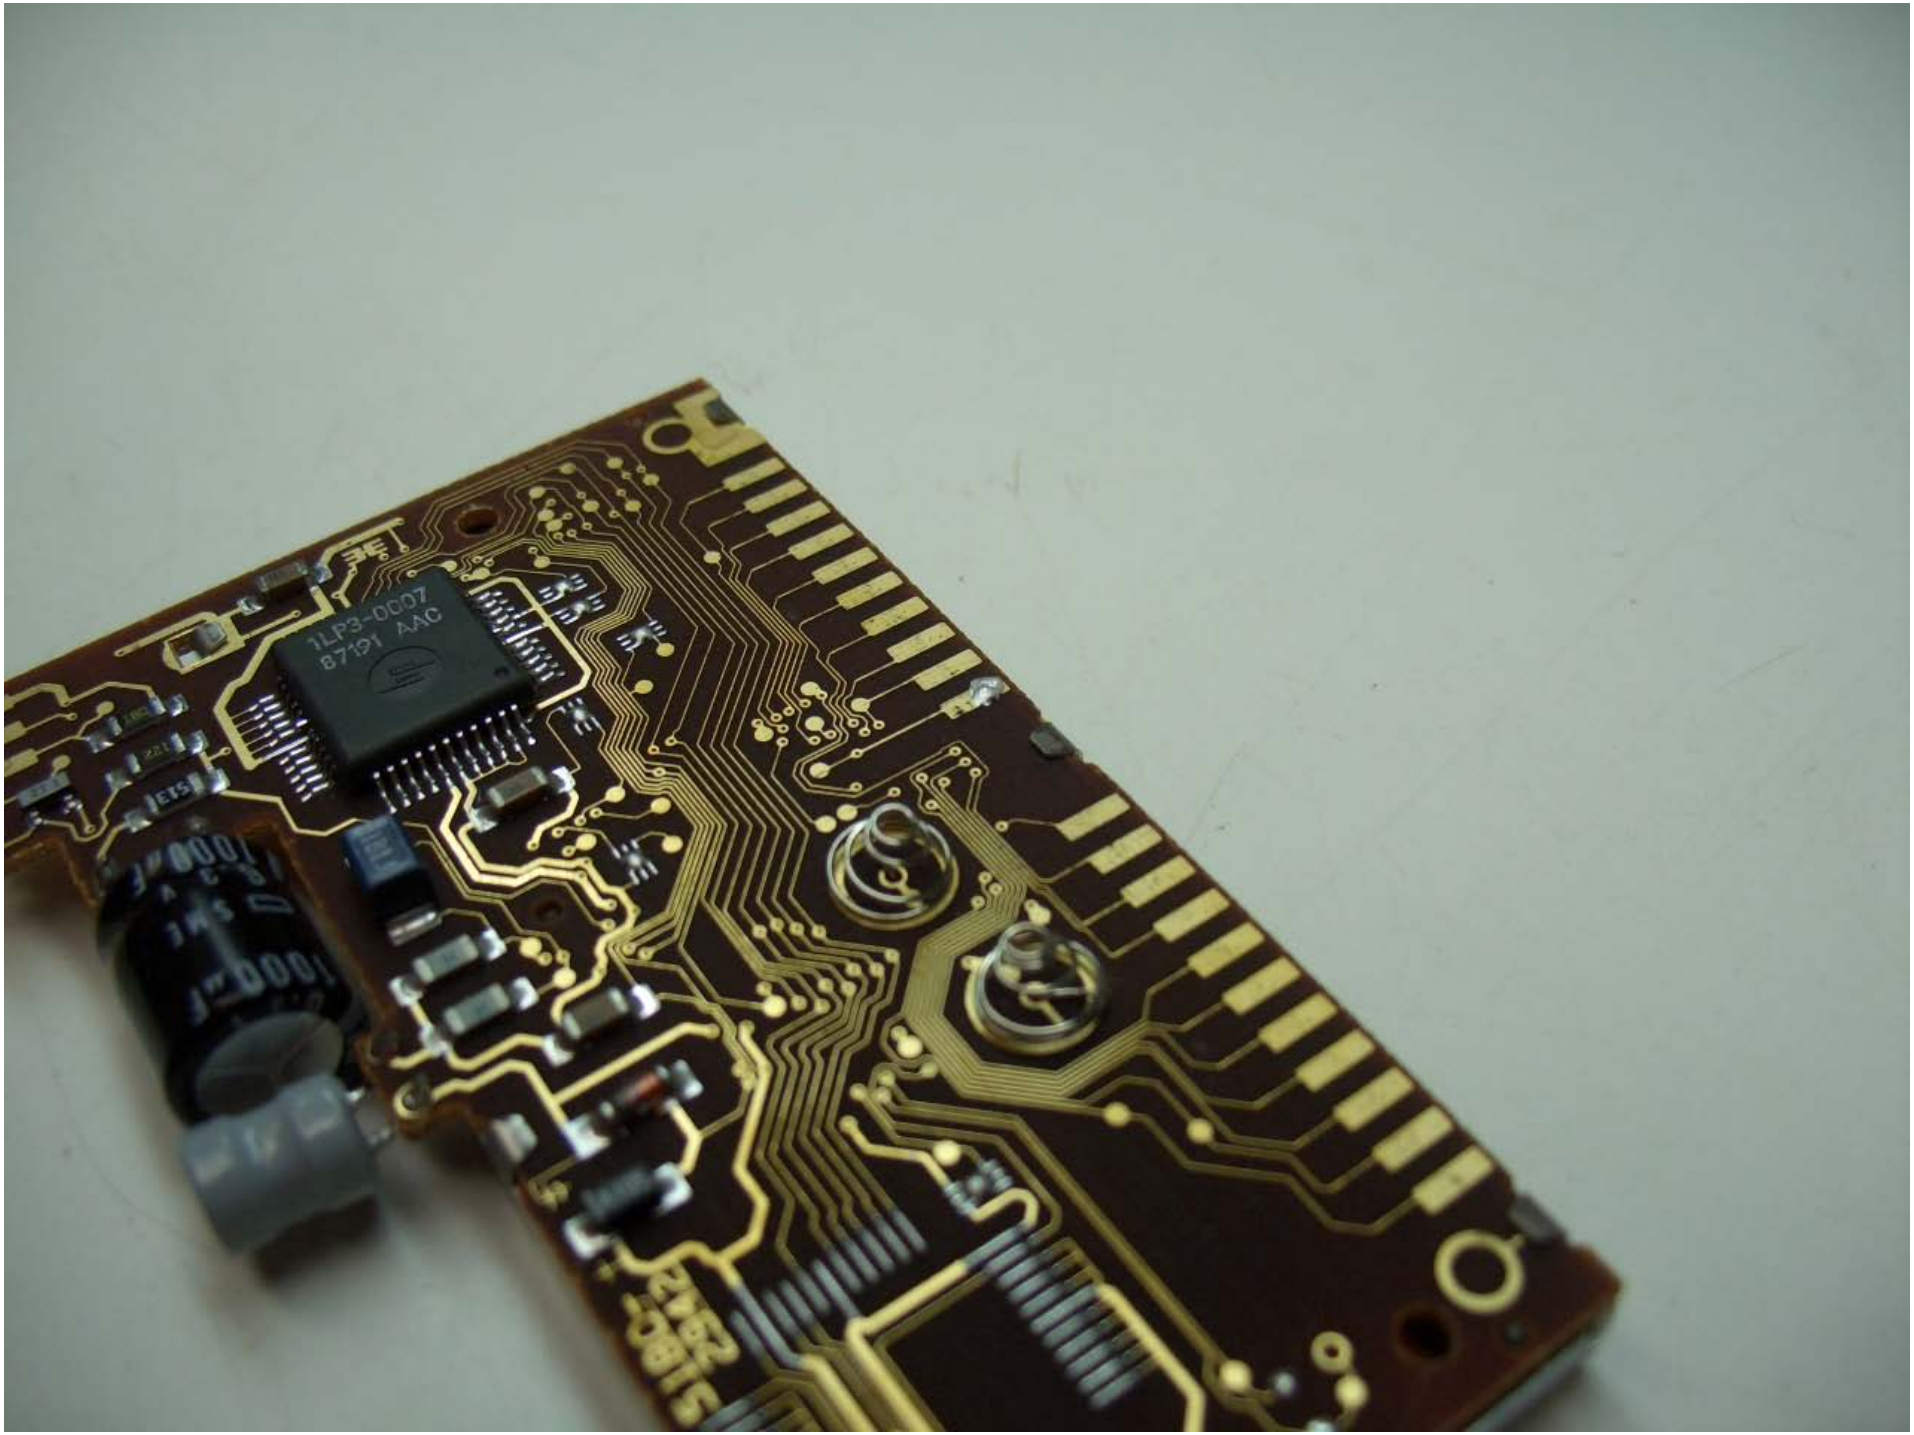
Notice the small mound...



On the main PCB contacts...



Small mounds also...



2.2 - Broken stakes near the display area;

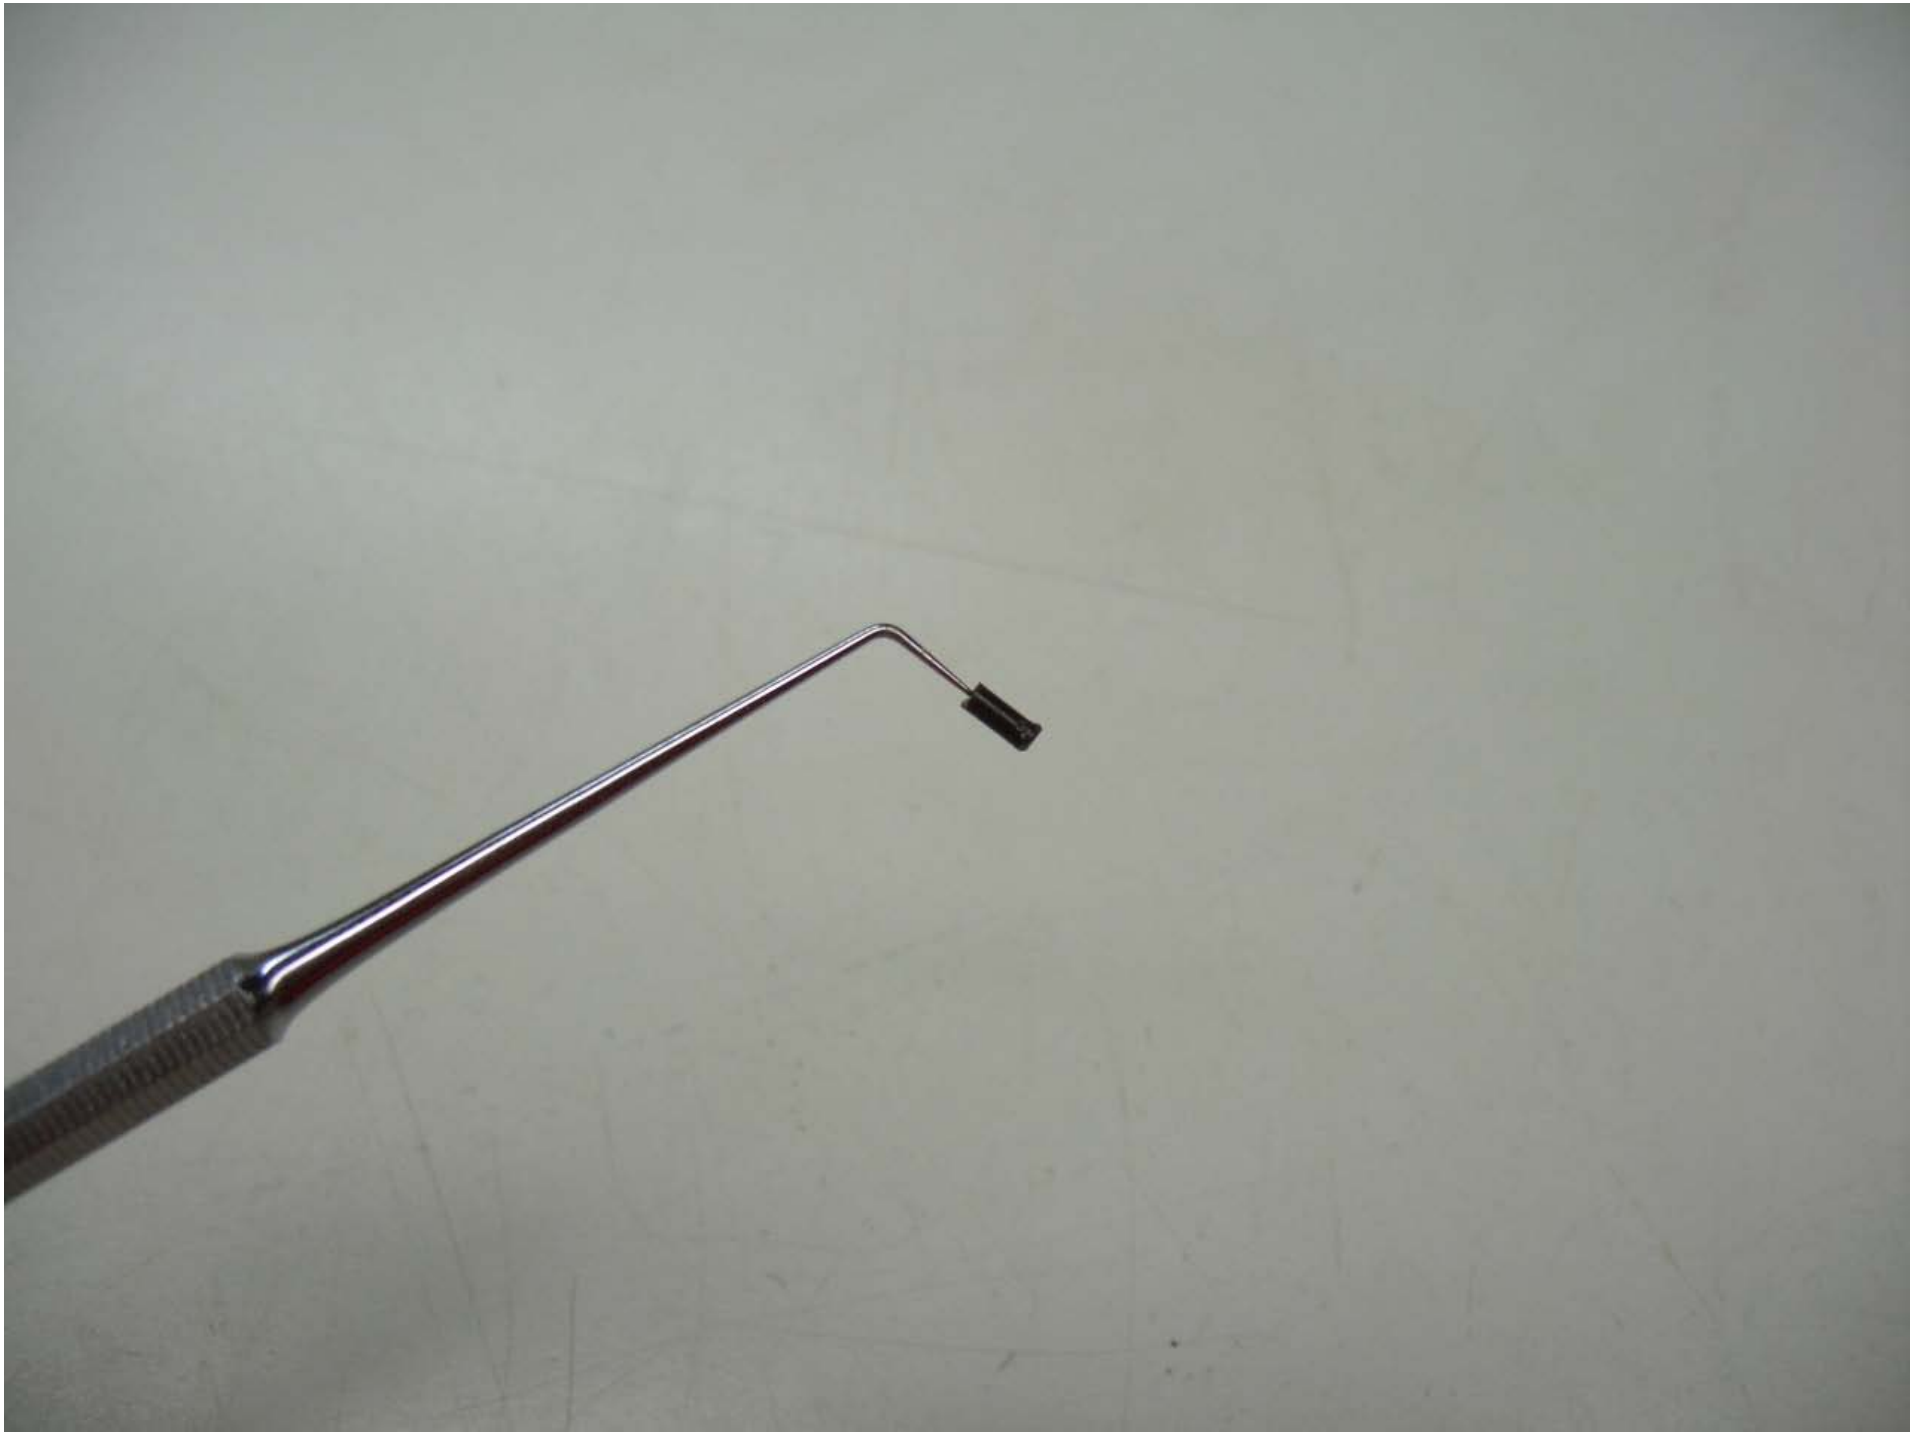
2.2.1 - You saved the original stakes. Better if they are still glued on the keyboard overlay in its original position. This is relevant since the stakes broke at variable angles and lenghts.

2.2.2 - The original stakes are missing. So a request from a donor is needed.

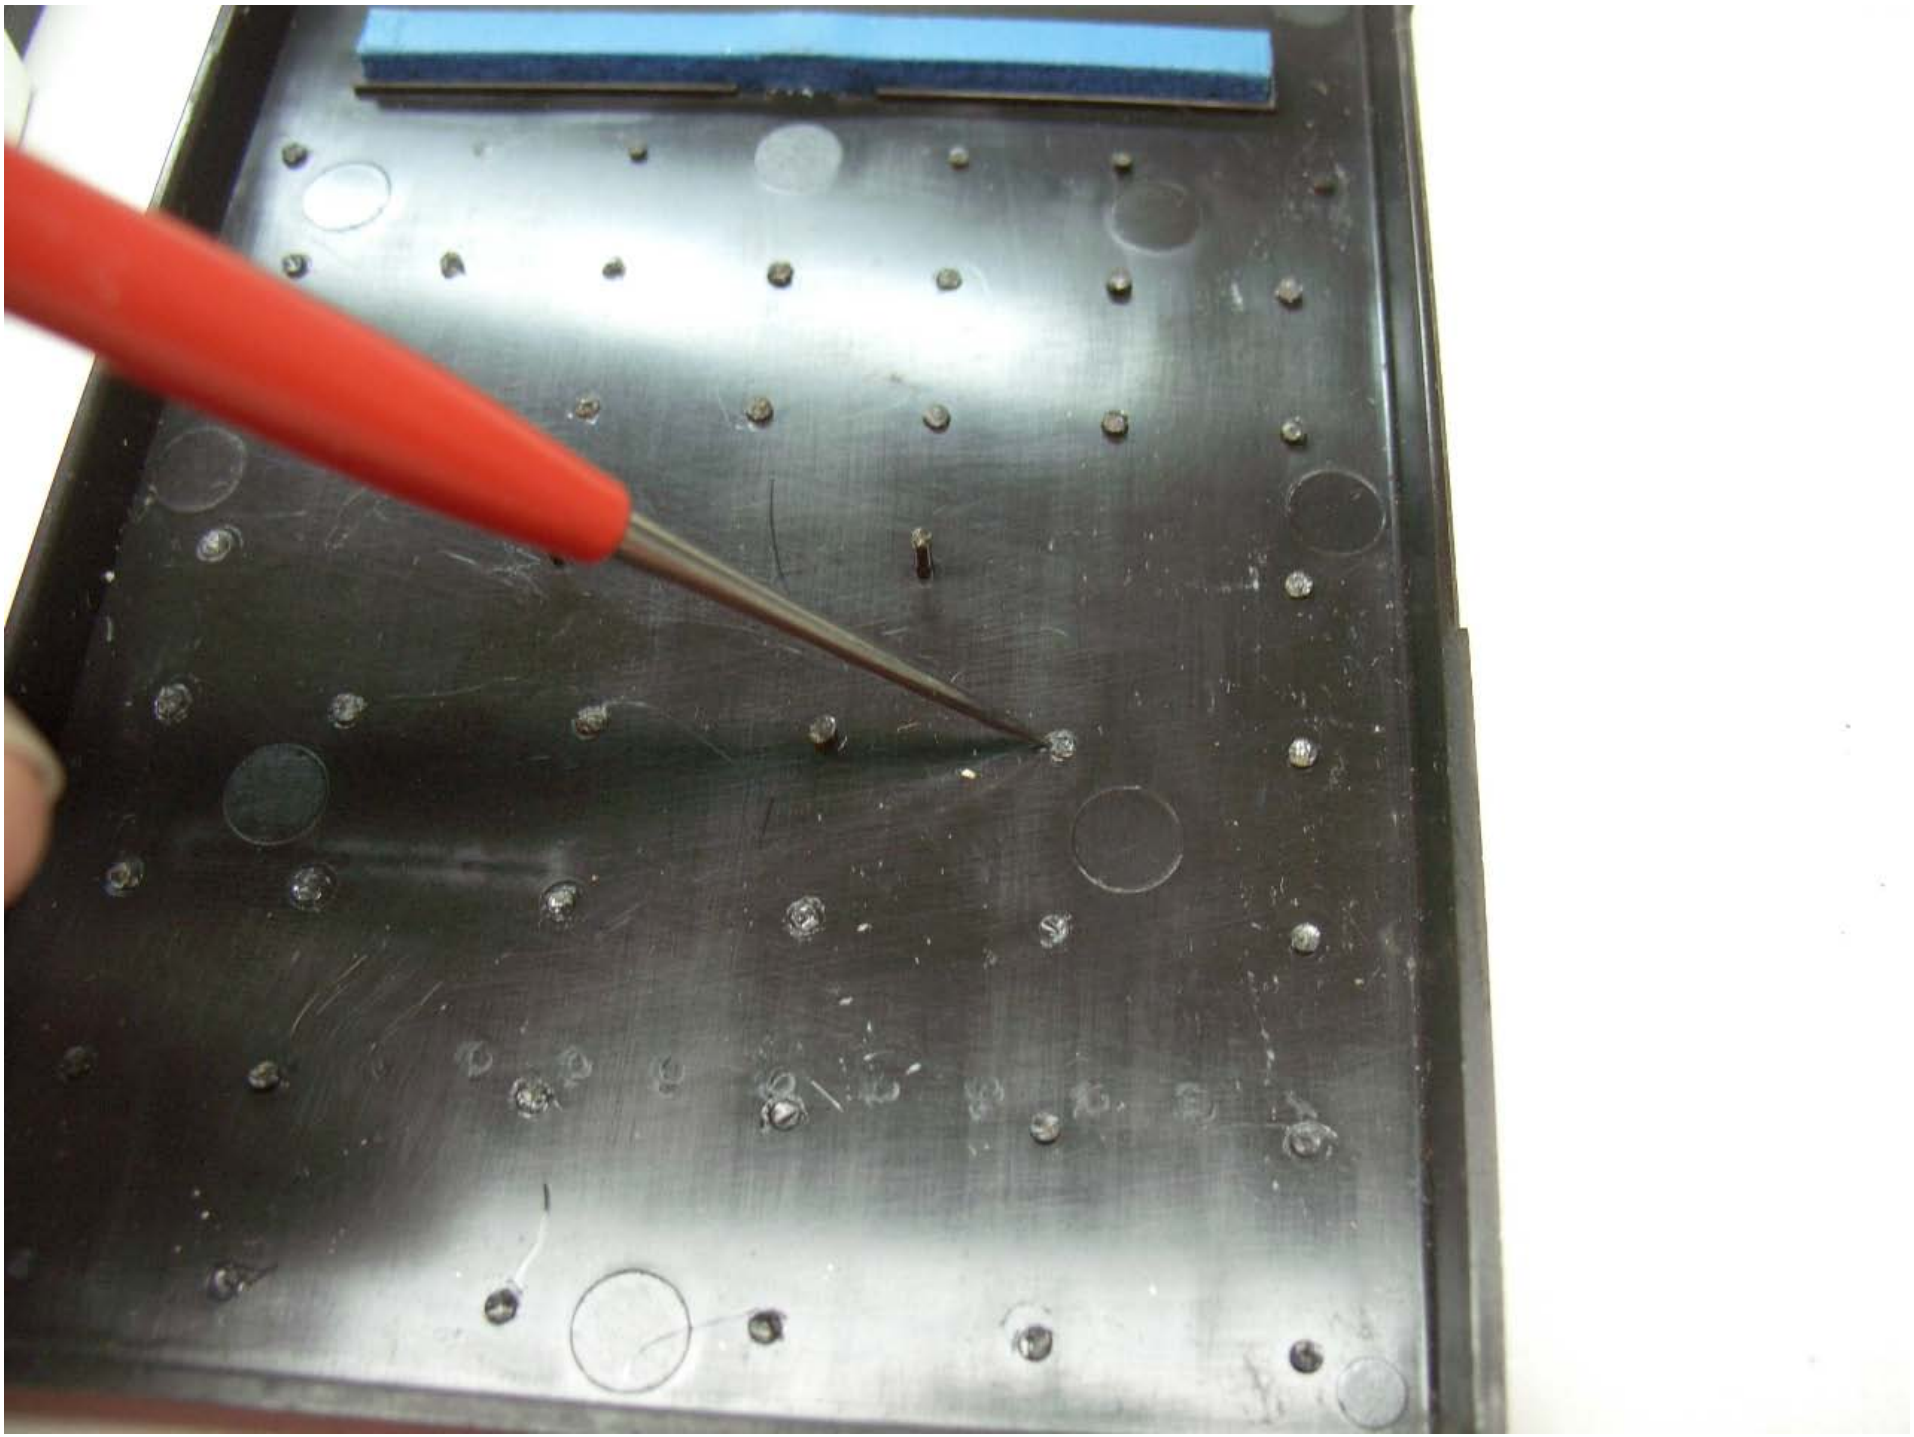
Cut flush to the back of the donor and sand any eventual remaining piece of stake on the receiver. See that the model on the picture below has already donated almost all its stakes.

With the stakes at hand some tools will be needed to accomplish the task of reinsert them. Super glue, a sharp pointing tool, a needle alike tool and a small piece of plastic to serve as the glue base.

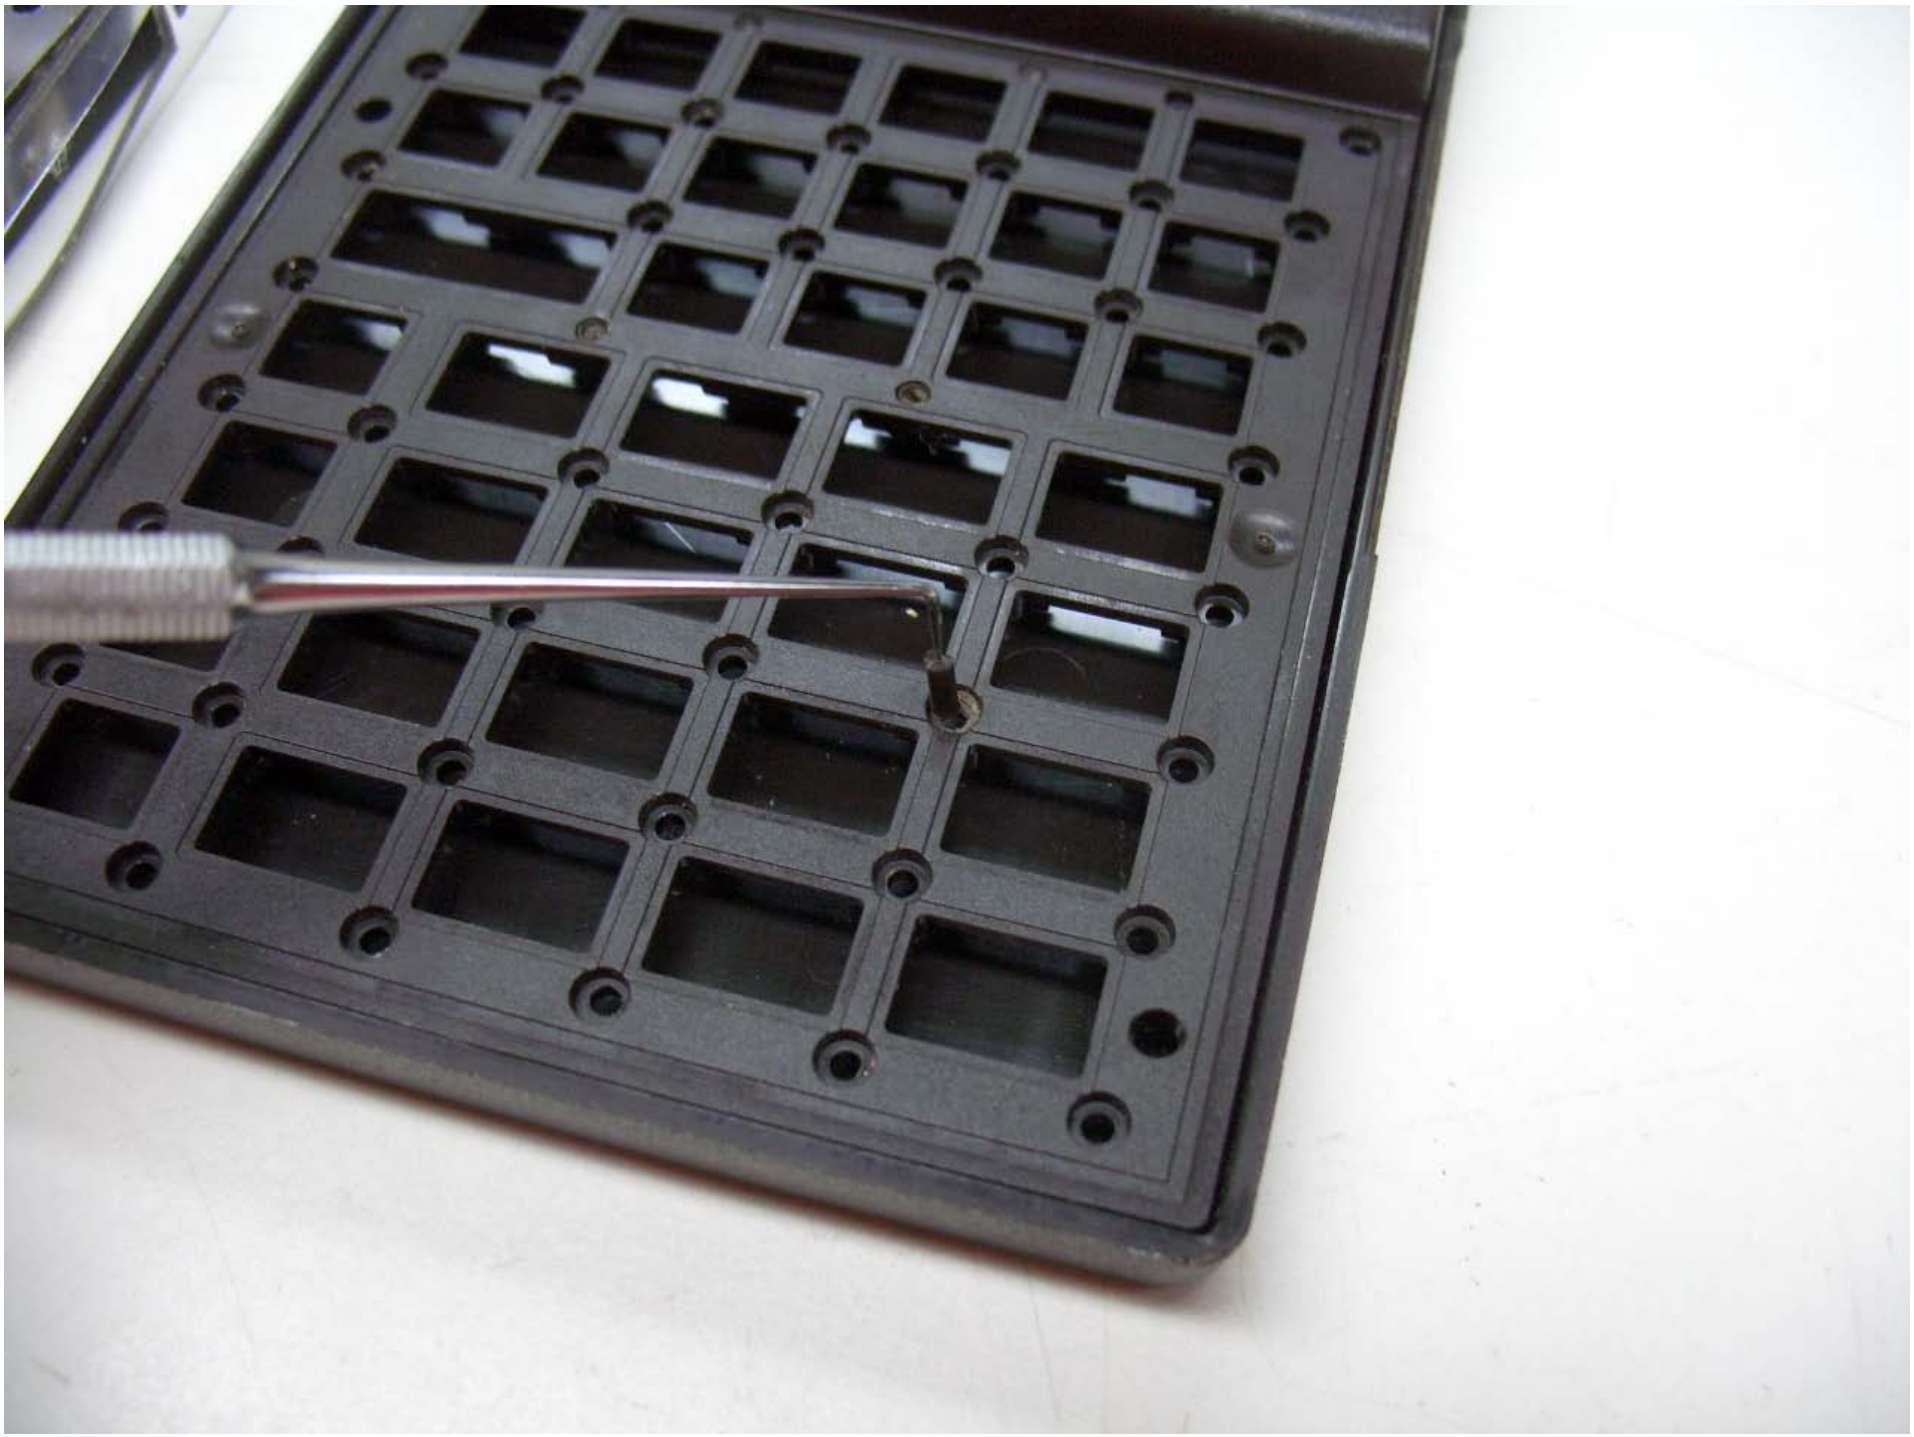
Press the needle at the top of the stake and you will have a good way to work with it.



Drop a small amount of glue on the plastic base and use the pointing tool to put only the amount needed on the place where the stake will be glued.



Reposition the empty keyboard structure back in place and insert the stake on its hole. Allow a bit for the glue to dry. Remove the keyboard structure and repeat for the next stake. After all the glued stakes in place allow some time (I use a day) to work on the next step.



Now in the process of reassembling you will mushroom the stakes to form a head. Use a not too hard tool to apply pressure near the stake that will be mushroomed.

The pressure must be applied and maintained while the stake is mushroomed. This is maybe the most important moment since pressure between the halves is a key factor. So avoiding any damage apply how much you can. Wait the tool a second in place for the plastic cool down.

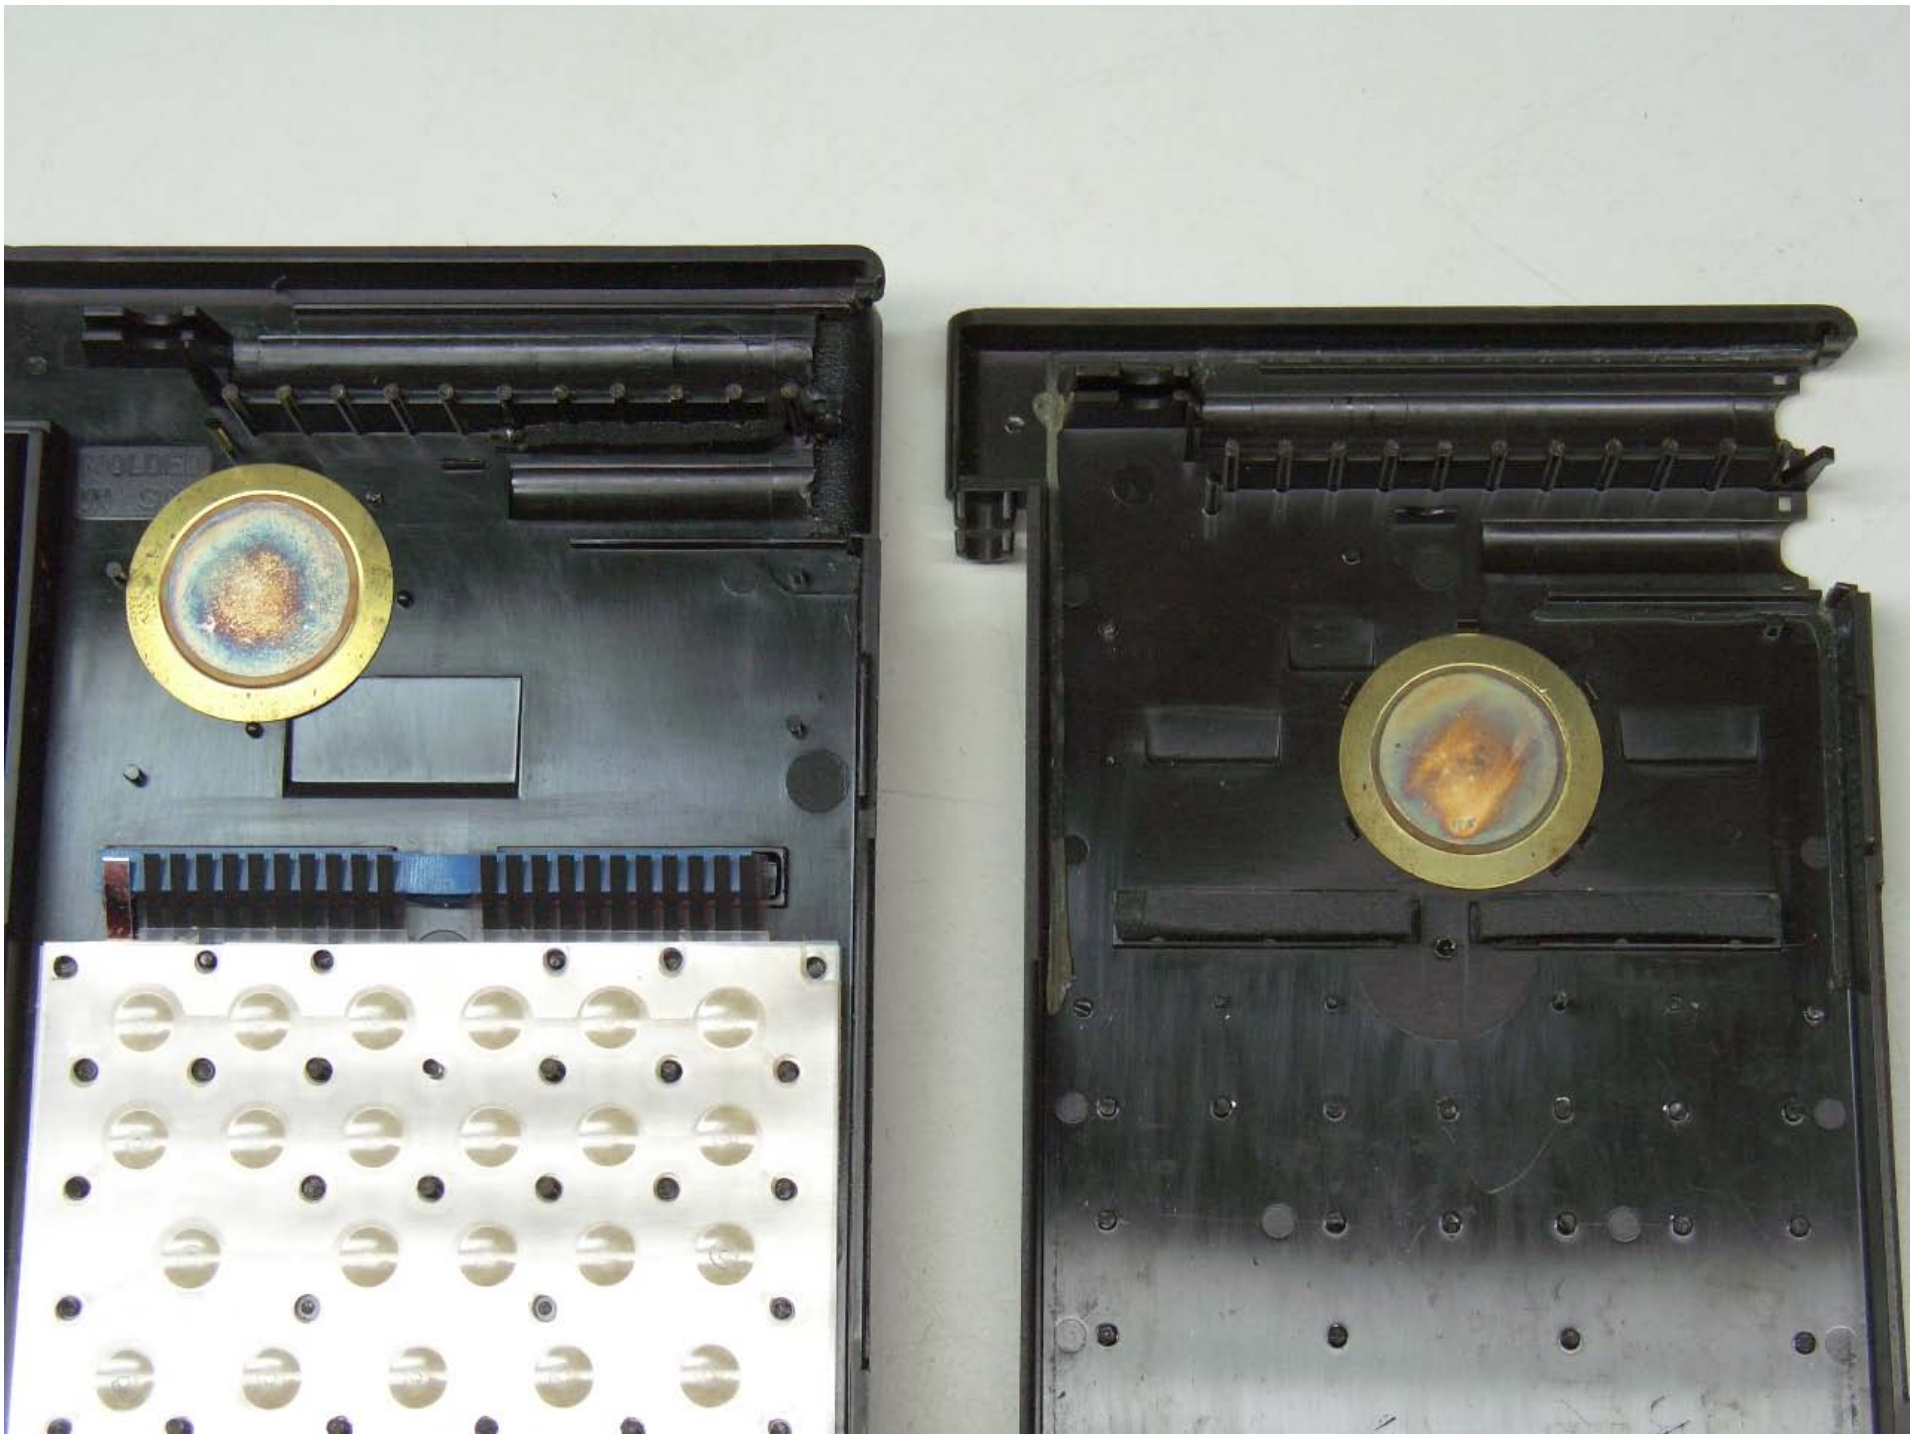
This is how it will look after the melting process. The new head must be entirely inside the hole. With the above mentioned pressure the result is a calculator as sturdy as the original.

For good mushroomed heads try to use a not too sharp iron tip.

Color of body, labels, keys and CPUs aside the five models of the series are all the same. But one thing to do when swapping is to reposition the beeper since the 18C have it on the middle and the others on the upper left. The front HP logo can be swapped too. Just heat it a bit and remove with the aid of

a sharp blade. Another diference between the 18C and the others is the lenght of the springs inside batteries's chamber. On the 18C they are a bit short and that is the reason you do not see too much 18Cs with broken batteries door area. It seems that at some point HP changed the project using longer

springs that resulted in more pressure on the door. So, this is why changing batteries on a 18C is a much more easier task than on the others. Not sure now but I think the 28C has the short springs too.



I was able to map the keyboard schematic as follows. In the absence of a more appropriate design tool the good old manual method was used. I'm sure several of you will be able to do a better job translating it with a proper sofware.

*Message #2 Posted by **Geoff Quickfall** on 3 June 2011, 3:52 p.m.,*
in response to message #1 by Wanderley Navarro

Lots of useful information here, great job. The restaking looks fantastic and allows for an unblemished outer case. Your dremel looks to be alot cleaner then mine ;-). I like the dremel as it allows a quick drill job with perfect depth control.

some questions;

```
1.  How is the long term survival of the posts once glued?  I ask
 as the glue option does not seem as strong as the original one
 piece design.  This is not a critism at all, as your repair is
 extremely elegant.  I ask as this is an option I now have to
 include in the text of the book, (with your permission).
 I elected to continue throught the back with new stakes as the
 glue weld option has a larger surface area to work with for
 strength.

2.  I see the strip contacts on the ribbon were reinforced with
 the silver conducter paint.  They appear to be worn or scratched
 probably due to the housing flexing as the stakes broke.  How did
 you address a compressed foam, or did you replace it along with
 addressing the worn stips on the ribbon.
```

Thanks for the posting also!

Cheers, Geoff

Hello Geoff,

First, I want to thank you for all your repair tips. Has been invaluable to me. Second, congrats for the book initiative... and put my name on the list.

> Quote:
>
> 1. How is the long term survival of the posts once glued?

Dificult to determine or even know since after reassembled the calc may still work well after the fail of some glued stakes due to the use of the silver conductive mix to "enlarge" the thickness of the contacts.

> Quote:
>
> I see the strip contacts on the ribbon were reinforced with...

Two diferent keyboard PCBs was used in the demonstration.

On the picture where the conductive silver pen is pointing: the worn on the ribbon contacts are due I used this keyboard PCB to map the schematic. So during this work the multmeter leads scratched the contacts.

On the picture where the keyboard schematic is presented: there are some contact points that received the silver mix that I used to test the conductivity of the product when I bought it.

> Quote:
>
> How did you address a compressed foam, or did you replace it...

As I mentioned on the post I do not replace the foam but I use an amount of the silver mix to form a small mound to compensate the lack of pressure the foam should make.

Cheers. Wanderley

Re: Another approach - shucking the clamshell, further. Book?

*Message #4 Posted by **Dave Shaffer (Arizona)** on 3 June 2011, 10:30 p.m.,*
in response to message #3 by Wanderley Navarro

I have not worked on any of these calculators, but a question about your drills:

I assume you want as much of the original heat stake to remain as possible. So, instead of using standard drills (which leave a v-shaped depresion at the top of the heat stake), how about removing the tip of the drill (with a grinder?) so that the tip of the drill is flat (looking more like a router bit), which would leave a flat top on the "drilled" out heat stake? i.e. More like it was milled away.

Re: Another approach - shucking the clamshell, further. Book?

*Message #5 Posted by **Wanderley Navarro** on 3 June 2011, 11:45 p.m.,*
in response to message #4 by Dave Shaffer (Arizona)

I think it's a good idea. Just not sure how better is to work with since the tip helps to determine and keep the drill centered.

Re: Another approach - shucking the clamshell, further. Book?

*Message #6 Posted by **Dave Shaffer (Arizona)** on 4 June 2011, 12:25 a.m.,*
in response to message #5 by Wanderley Navarro

If you can make the end really flat, then how well you center the Dremel bit will determine where you take off the plastic (and, I think, the faster you spin your Dremel, the better). I have a battery-powered, hand-held Dremel tool, and I find the faster I spin it, the better, for almost everything I (try to) do with it.

Not even close as the clamshell appeared in 1986.

Print heads in the 67/97/19C (1976) where possibly first followed by the HP41C Battery & I/O block (1979). These were followed by the original Voyager design flex circuit (1981).

41-MCODE: Updated AECROM w/ 13-digit Math

*Message #1 Posted by **Ángel Martin** on 3 June 2011, 11:17 a.m.*

Greetings fellow 41-comrades,

No doubt you all know about the AECROM, the module published by Wilson Holes from "RedShift SW", and programmed by Nelson F. Crowle and others. If you do, you'll be aware of its very original approach and ground-breaking contents, but if it passed unperceived to you (perhaps due to the late release date, or due to the US-centric unit convertion features) it'll probably feel like a mystery to you.

Fact is the AECROM is full of tricks and treats for the MCODE programmer. It's surely hard to follow the intricate code, but also surprisingly innovative and very rewarding once you get your bearings and get the hang of it.

I can't say that I completely understand the full extent of sophisticated techniques that went into putting it together, but I've managed to "upgrade" it by using 13-digit math routines - replacing the standard 10-digit it originally came with. Not sure if the programmers didn't know about them, or they chose not to use them - after all the subjects of the programs are not accuracy-critical: curve fitting for instance - but the fact is that they were not used at all.

So the updated ROM image now uses the 13-digit OS calls in the Hyperbolics, Curve Fitting and the Triangle, Circle, and SARR solvers as well. Lots of careful editing was required - this module is tricky, and there are multitude of calls from either page using unusual methods, so it's almost impossible to MOVE things around and one has to play within the current boundaries of the routines.

Here's some examples:
- extensive usage of GOTO ADR between pages
- jumps from the ROM-ID section of the lower page to the upper one
- tables, tables, and then more tables to hold lots of data
- pseudo FOCAL programs using just ONE menu function that does multiple things depending on HOW it's accessed!
- and a lot more... have you used the PROG function?? An amazing feat that pushes the limits of the 41 MCODE, really a hard nut to crack.

The new MOD image Will be posted at TOS in a couple of days. If you're interested I can send you the "blueprints" - result of the reverse-engineering effort so far (still going on BTW).

Best, ÁM

Re: 41-MCODE: Updated AECROM w/ 13-digit Math

*Message #2 Posted by **Geir Isene** on 3 June 2011, 11:30 a.m.,*
in response to message #1 by Ángel Martin

Please send me the blueprints.

It would be cool to make it less US-centric, though.

Re: 41-MCODE: Updated AECROM w/ 13-digit Math

*Message #3 Posted by **gene wright** on 3 June 2011, 11:40 a.m.,*
in response to message #2 by Geir Isene

Great! This will be a perfect example for the community to lay out the BEST way to get this new rom image loaded into the soon to be shipped 41CL.

I'm not sure most of us will want to try transferring / copying a rom image into flash on the 41CL, but the 41CL does include 50+ 4K ram pages that are much easier to load rom images into.

What we need is a good, step-by-step set of instructions for how to go from a .rom file on the PC to having it in a ram page in the 41CL.

I'm hopeful that the first adopters will be seeing their 41CL boards within a week!

Yay!

Re: 41-MCODE: Updated AECROM w/ 13-digit Math

*Message #4 Posted by **Monte Dalrymple** on 3 June 2011, 2:49 p.m.,*
in response to message #3 by gene wright

Since both pages in the .MOD file have the same name, translating the image to a .ROM format (which is the first step in getting it into the 41CL) doesn't work very well. The second page overwrites the first...

Monte

Re: 41-MCODE: Updated AECROM w/ 13-digit Math

*Message #5 Posted by **Ángel Martin** on 3 June 2011, 3:11 p.m.,*
in response to message #2 by Geir Isene

you´ve got mail...

BTW the foot-meter-etc. stuff is also a beauty to behold in action. I t uses the I/O interrupt of the module to display the values in the "selected" unit, seemingly transparent to the user and creating the impression it is the machine's native "language" for the corresponding mode.

It's good if you need to work in "imperial" units of length, those invented by the British and later on dropped in favor (or favour rather) of the metric system (well, not quite of course... but that's another story). At any rate, it's an MCODE tour-de-force worth watching :-)

Unfortunately it conflicts with the CCD usage of the same interrupt, so you have to choose. Oh well, life isn't perfect!

Hey Angel...how about changing the 2nd MOD page's name?

*Message #6 Posted by **gene wright** on 3 June 2011, 3:20 p.m.,*
in response to message #5 by Ángel Martin

As Monte points out, that will allow it to be moved to the 41CL... ?

Re: Hey Angel...how about changing the 2nd MOD page's name?

*Message #7 Posted by **Ángel Martin** on 3 June 2011, 4:08 p.m.,*
in response to message #6 by gene wright

> Quote:
>
> how about changing the 2nd MOD page's name?

Well, I´m not sure this is anything related to the module itself (read: the MOD file) but to the way it ´s named as a ROM file, or two of them to be precise. My guess is you can use the MOD2ROM utility posted at TOS and label it as you want, thus overcoming the issue.

Best, \'AM

Re: Hey Angel...how about changing the 2nd MOD page's name?

*Message #8 Posted by **Monte Dalrymple** on 3 June 2011, 4:52 p.m.,*
in response to message #7 by Ángel Martin

I use ModFile or ModFileWin from TOS. Neither allow you to name the .ROM pages, but take them from the .MOD file itself.

Monte

Re: Hey Angel...how about changing the 2nd MOD page's name?

*Message #9 Posted by **Ángel Martin** on 4 June 2011, 2:55 a.m.,*
in response to message #8 by Monte Dalrymple

I see... but you can certainly use M2kManager (which does not require the MLDL to be present) to edit the ROM files of a MOD image ' including giving it another ¨name¨.

Somewhat OT: WOIM

*Message #1 Posted by **Geir Isene** on 3 June 2011, 10:56 a.m.*

After having worked a few years on a comprehensive description system, WOIM has now reached a mature and stable level.

It's an Outliner, a TODO-list solution, a project management tool, a Business Process Management aid, a data modeler, a Use Case facilitator, a way to describe the human DNA or the history of the universe ;)

It is the notation I use for sketching new ideas, when outlining new FOCAL or MCODE programs or when structuring a technical architecture. I use it for meeting minutes, for Use Cases, for logical breakdowns of ideas, for Business Process implementations and for so much more.

And there is a software solution that tags along with it; A WOIM plugin for the best text editor in the world (VIM :) With this plugin you can handle WOIM lists in many sophisticated ways, all neatly syntax highlighted of course.

Just wanted to let you know. More at my blog.

Dang

WP34S key 'SHOW' ?

*Message #1 Posted by **fhub** on 3 June 2011, 10:37 a.m.*

What's the use of this function 'SHOW' (h EXIT) ?
It seems to work only in program mode (where it displays any hex-numbers), but I couldn't find any description in the manual.

Re: WP34S key 'SHOW' ?

*Message #2 Posted by **Walter B** on 3 June 2011, 10:55 a.m.,*
in response to message #1 by fhub

Please look on page 57 of v1.18.

Walter

Re: WP34S key 'SHOW' ?

*Message #3 Posted by **fhub** on 3 June 2011, 11:02 a.m.,*
in response to message #2 by Walter B

Thanks Walter, now I see it!
The search function of my Adobe reader didn't find this ...

Re: WP34S key 'SHOW' ?

*Message #4 Posted by **Walter B** on 3 June 2011, 11:07 a.m.,*
in response to message #3 by fhub

Luiz' font seems to be not searchable/findable for standard search functions - it doesn't work in MS Word either :-)

Re: WP34S key 'SHOW' ?

*Message #5 Posted by **fhub** on 3 June 2011, 12:00 p.m.,*
in response to message #4 by Walter B

Ok, there are a few other questions of mine: ;-)

1) are there any plans to make a list (catalog) of ALL WP34" functions/commands?
(I remember having read something like this some time ago)
For this the above mentioned SHOW key would be a choice ...

2) IIRC I've read that the cursor-up/down keys are repeatable!?
Has this still not been implemented, or does it only work on the real calculator? (at least is doesn't work on the emulator, but would of course be comfortable for scrolling through catalog lists)

Franz

Edited: 3 June 2011, 12:01 p.m.

Re: WP34S key 'SHOW' ?

*Message #6 Posted by **Walter B** on 3 June 2011, 2:28 p.m.,*
in response to message #5 by fhub

AFAIK, all functions are listed in the index. We use different catalogs for some structuring - and we didn't have such convenient search tools when we started.

Repeating the arrow keys is HW-driven, so it won't work with the emulator.

Walter

Re: WP34S key 'SHOW' ?

*Message #7 Posted by **Paul Dale** on 3 June 2011, 10:04 p.m.,*
in response to message #5 by fhub

> Quote:
>
> 1) are there any plans to make a list (catalog) of ALL WP34" functions/commands?

Unlikely. The full catalogue will run us out of flash -- about 950 distinct commands in the command set at two bytes each. I can think of a better use for this much flash e.g. another user code page or two e.g.

> Quote:
>
> IIRC I've read that the cursor-up/down keys are repeatable!?

On the real device yes. Although I don't use this feature much given the alpha navigation in the catalogues.

Edited: 3 June 2011, 10:10 p.m.

Re: WP34S key 'SHOW' ?

*Message #8 Posted by **fhub** on 4 June 2011, 7:36 a.m.,*
in response to message #7 by Paul Dale

Now that I'm becoming more familar with the some 'special' keystrokes, I wonder why you haven't use a bit modified assignment of the alpha characters to the calculator keys!?

As it is now you have to press an additional ENTER for some functions when addressing the registers Z and T (e.g. STO Z or RCL T), because these T and Z are on the * and + keys.

Why didn't you use the following layout for the letters M to Z:
M N O P Q on XEQ 7 8 9 /
R S T on 4 5 6
U V W on 1 2 3

X Y Z on 0 . R/S

With this shifting left one column of R..Z this additional ENTER for addressing Z and T registers could have been avoided.
I know it's now a bit (too?) late for any changes, but maybe it's worth thinking about it.

Franz

Re: WP34S key 'SHOW' ?

*Message #9 Posted by **fhub** on 4 June 2011, 9:46 a.m.,*
in response to message #8 by fhub

Ok, forget it, in my idea above now T would be in conflict with 6 and X with 0, and that's in fact the same problem, too!

There are just not enough keys for so many functions ... ;-)

Re: WP34S key 'SHOW' ?

*Message #10 Posted by **Paul Dale** on 4 June 2011, 7:39 p.m.,*
in response to message #9 by fhub

There is also the extra constraint that 0 and 1 had to be left (mostly) alpha-free for use with conditional tests. Believe me a **lot** of thought has gone into the layout and interface.

Need Info on HP-82905B Printer

*Message #1 Posted by **Ángel Martin** on 3 June 2011, 1:50 a.m.*

Recently I unearthed a couple of items from the storage room where I had them for a few years, one being the 82905B printer (HP-IL option).

The unit is in excelent condition but unfortunately the paraffin capacitor on the power supply board (where the power-on switch is placed) died with a nasty "pop". Not a major issue, it didn't cause more harm but I need to find a suitable replacement and have no reference. Anybody has access to the schematics or a replacement board?

Being a clone of the Epson MX-80 should help, that was a popular model back then. It also needs a new ribbon cartridge of course, not surprising after its extended "sleep".

Appreciate any information you can send. Cheers, 'AM

Edited: 3 June 2011, 4:32 a.m.

Re: Need Info on HP-82905B Printer

*Message #2 Posted by **Tony Duell** on 3 June 2011, 4:34 a.m.,*
in response to message #1 by Ángel Martin

You can get some information on this printer, including my schematic, from the Australian museum site.

There appear to be 3 capacitors on the power switch PCB (MFIL II PCB). C1, the large 1, is 100nF. C2 and C3 are 4.7nF each. I assume that C1 is class X (rated to stand mains) and C2,C3 are Class Y2 (rated to stand mains and cannot fail short-circuit).

The printer will run (at least for testing) with any/all of these capacitors removed.

Re: Need Info on HP-82905B Printer

Accepting some orders for WP 34s overlays

*Message #1 Posted by **Eric Rechlin** on 3 June 2011, 1:36 a.m.*

I am going to accept a small number of orders for the self-adhesive vinyl overlays for the WP 34s keyboard layout. I'll probably close this off after a week to limit the number that are out there and to get feedback.

I have updated the overlay for the latest 1.18 layout and have incorporated many of the suggestions seen here.

For the time being the overlay is $6 for one or $5 each for multiple, including shipping anywhere in the world. I may have to adjust this later depending on what consumables end up costing me, but I think this is a reasonable price for now.

You can order them from a special page on my commerce site.

Eric

I just ordered two... But in case you find a reason to change the layout again for whatever reason, I'd be more than pleased to buy a new set. I have a question: will this overlay be removable? I mean, if I try to peel it off, will it leave the calc clean and ready for another one, or will it leave "a mess"?

The product isn't out yet, and our US American friends are already going to make money with it ... :-?

As you may see on the photograph, some label positions are pretty tight and some are a bit asymmetric. I'm working on it as mentioned earlier. This work would be easier if you'd tell me the key positions assumed in your graphic, please.

I doubt there is much profit making going on here. A little maybe but a service is being offered. Getting die cut overlays isn't easy. Cutting by hand takes time and some equipment to do properly and neatly. I value my free time at a lot more than $6 or even $12 an hour.

I bet it would look good stuck to the leather(ish) case for my 50g or perhaps on the back of my iPhone (might have to shrink it a little for that).

That reminds me, when are you going to port this to iOS? (just kidding really. I have several iOS calculators that all pale in comparison to pushing real keys for me.) %^}

*Message #11 Posted by **gene wright** on 3 June 2011, 11:42 a.m.,*
in response to message #9 by Walter B

By the same token, the product is the 20b / 30b unit.

Aren't you guys just making an accessory for the product, i.e., a new rom image?

:-)

Seems that is just as much an "accessory" as an overlay.

Well, the wp 34s will work without the overlay, but the overlay will not work without the wp 34s. Different layers.Seems an almost neglectable difference though. But anyway, you *are* the masters of marketing, and further posts will continue revealing this.

FWIW

If you are referring to the buttons themselves, that is because I applied the stickers at 1:00am and was too tired to do them accurately. Whether they are crooked is entirely up to the person doing the work. :)

> Quote:

That won't do me any good, since you are making changes to the exported PNG rather than the original SVG. Any changes you have made, I have to redo myself from scratch to my original. I have offered the SVG but you seemed to have no interest.

Oooh rats! Royal British thumbs!!

And somebody's talking about Sihouette Studio, while there were Illustrator and Inkscape mentioned before. I don't know, but sometimes I think people tend breaking flies on wheels in this matter - if I make the graphics with tool xyz and copy the picture into MS Word, scale it down to the right size (looks like 67.6 to 67.8, so 67.7 mm) and print it using a quality printer then I'd think I'm done. Maybe too simple ...? d:-?

in response to message #6 by Walter B

> Quote:
>
> The product isn't out yet, and our US American friends are already going to make money with it ... :-?

I think everyone is making money off it except us. Let me break it down.

Let's assume that you buy an overlay from me. You send me $6. PayPal takes 53 cents of that, bringing me down to $5.47 received. To mail it to you, I need an envelope (10 cents) and a stamp (98 cents). We are now down to $4.39 for the overlay.

Next we have the cost of the vinyl. I am not very efficient in my use of vinyl right now, but I hope to eventually get the cost down to the 25-50 cent range per overlay. Then there is ink, for which I don't yet know the cost. The overlay itself has near 100% coverage of ink, though, so that is quite a lot of ink.

Then there are the consumables related to cutting -- the blade and the cutting mat. Again, I don't yet know what these will cost me.

Next would be the amortization of costs incurred to get me to this point. I bought the cutter and the printer specifically for this, so those both need to be amortized out. Additionally, there are the R&D costs (for example, I spent over $100 on various media for printing to find the best materials for overlays).

At this point it is entirely possible I am losing money on each one of these, though I honestly don't know yet. And this, of course, assumes that my labor is free, which is normally not valid, but since you and Pauli are assuming free labor as well it's only fair for me to do the same.

So I guess if by "US American friends" you mean our friends at companies like Hewlett Packard, PayPal, and the US Postal Service, then yes, they are making money with it. But at the same time one could argue that the battery manufacturers are making money as a direct results of your work, because you need batteries to power your 20b or 30b, so this is getting kind of ridiculous.

*Message #22 Posted by **Marcus von Cube, Germany** on 4 June 2011, 6:35 p.m.,*
in response to message #21 by Eric Rechlin

Eric

I'm *not* arguing about your expenses. The only problem at the moment is that we might still change some key positions. :-(

Whenever your overlay will be finalized, please send me at least two of them, whatever the cost will be.

BTW, I've invested more than a few bucks in equipment to do the development you have seen in the last few months. I did that for my and your fun. So be it for all people involved in the project, agreed?

Matters may change when a big company starts showing commercial interest in our work but that seems to be quite remote...

They will never be finalized.

At first I was waiting for the layout to be final before I started selling overlays. But then after asking when it would be finalized, Walter said it was a moving target, so I assume that means that it will constantly change. This meant that I don't feel bad about selling them now, because no matter how long I wait they will eventually be obsolete.

Plus, as Jake pointed out, he spent something like 4 hours cutting out and applying stickers to his calculator, and I think almost anybody would rather pay $6 to get something precut to avoid the vast majority of that work, even if they pay $6 again later to get an updated layout.

The whole reason why I am only temporarily accepting orders is because I treat these initial customers as beta testers. I will make additional tweaks to my overlay based on their feedback, so I don't want to sell too many of them right now. After I close down the orders in a few days, I probably won't accept any more orders for a month or more, to give people time to try them out and give suggestions.

Eric

...and needless to say how much trouble it has been to remove it in order to replace it with a newer one.... After scraping whatever comes off by hand, then I use rubbing alcohol to get the sticky "gum" off, and finally use an Exacto knife to lift and remove the key labels, and finally another application of alcohol to clean the keys. It has been quite an adventure :-)

*Message #31 Posted by **Katie Wasserman** on 6 June 2011, 12:33 a.m.,*
in response to message #30 by Neil Hamilton (Ottawa)

I've halfheartedly been following all the activity on this project. I think it's wonderful that it's progressed as far as it has and that it's an amazing piece of work. But the critical factor in any custom calculator is the keyboard, we've all said so many, many times before on the forum.

Stick-on key labels that require a great effort to apply and will almost certainly not last all that long are not the way to go no matter how good they look. The only answer are custom keys and a matching faceplate as HP can offer.

A month ago Pauli wrote, quoting Cyrille:

> Quote:
>
> I was told at least 1,000 would be the minimum for custom printed keys (but not faceplate) and didn't pursue things any further.

IMHO, this should be persued even if the number turned out to be several thousand. I think that there would easily be a big enough following to sell these at $50+ creating a nice profit for the seller (perhaps Eric) and the authors.

Frankly I'm not interested in stickers for the keys and faceplate, but I'd definitely buy a customized calculator and I'd pay in advance of the order so that the seller would have minimal out of pocket risk. Would 2000 people (or however many it would take be reach the break even point) be willing to do that same? I'll bet so.

Why not investigate the true minimum quantity from HP and set up a survey to see what can be optimistically expected in the way of numbers of orders. If the results look good set up a Paypal account to take pre-orders -- and if need be allow cancellation of pre-orders. Never having done this before, I'm guessing that the financial risk would only be the Paypal fees.

-Katie

Re: Accepting some orders for WP 34s overlays

*Message #32 Posted by **Walter B** on 6 June 2011, 2:08 a.m.,*
in response to message #31 by Katie Wasserman

Katie,

According to what Tim wrote to Pauli, a custom faceplate for the 30b is out of reach. The reason - as far as I understood - is Black S :-(is written in a special way in the plastic material and this process can't be changed easily. So we'll need an overlay anyway.

For the individual keys, I agree with you on individual labels being - politely - suboptimal. Many weeks ago, I suggested an overlay in one single piece with flaps for the keys. I applied a paper prototype on my 20b and it works fine. Maybe this is a feasible solution before going in the custom key business - which would be nowaday's optimum of course.

Walter

Re: Accepting some orders for WP 34s overlays

*Message #33 Posted by **Paul Dale** on 6 June 2011, 5:01 a.m.,*
in response to message #32 by Walter B

The silver face plate is pretty much verboten.

The keys and their labels are possible given a large enough quantity which I'm not willing to commit to privately and I doubt anyone else is.

So, buy a 30b or five (& I know you've got several already :) and reflash them. get an overlay and use that.

My fairly rough overlay is standing up surprisingly well after much use. I did run it through my xyron before applying but still it is very good and the visible wear isn't on the key tops, rather on the overlay. I'll add that I probably have the most used 34s on the planet.

I didn't realize that the faceplate was so impossible to change, that's too bad. So given the need for a faceplate overlay one might as well have key "overlays" as well.

Re: Accepting some orders for WP 34s overlays

*Message #36 Posted by **Paul Dale** on 7 June 2011, 2:52 a.m.,*
in response to message #35 by Katie Wasserman

It isn't impossible, it will just require impractical quantities. This is very much a niche product for a select small few.

I very much doubt we'd sell 1,000 WP34s which would be the kind of minimum for just the reprinted keys. 10,000 is more realistic for a reworked faceplate or an alternative LCD display both of which would be very useful -- just having proper scientific annunicators would be a boon.

And indeed, the 34s has essentially been the only calc I've used in the past two months or so. I only wish a machine with the equivalent of the 17BII+/42S dot-matrix 2-line LCD had been available to be repurposed. I miss those top-row soft keys....

Jake

Repurposing...

*Message #40 Posted by **Marcus von Cube, Germany** on 7 June 2011, 4:37 p.m.,*
in response to message #39 by Jake Schwartz

What do we need (or better: dream of)?

- More flash and RAM and more battery power. The processor isn't bad for a calculator but for a programmable device, the limitations are obvious.

- A better display for menus and longer alpha messages.

- One additional row of keys.

- Provisions for easier key labeling.

Re: Repurposing...

*Message #41 Posted by **Paul Dale** on 8 June 2011, 4:59 a.m.,*
in response to message #40 by Marcus von Cube, Germany

I'm a bit different here. While I'd like more flash and RAM, a better display and more keys, the platform is really very capable as it stands.

The single biggest omission I see, which hasn't been mentioned here, is I/O. We're thinking about this for the successor device but nothing firm yet. Ideally, a small SD card or the like but more realistically a serial port.

Flash is very tight now but how many more functions do we need? I'd say none. There are always possibilities to add a few more and if we had some more flash clear I'd probably put a few in however we've got everything we need and a bit more already. We've a few more ideas to reduce the flash footprint for next time around which might allow us to pad the device a bit more or free up extra code/data flash segments. I see the latter as more useful than another bunch of esoteric functions.

RAM is also very tight, increasing it would correspond to an immediate increase in the number of registers and program steps, although there are limits to the increases for both. We'd also be able to have types associated with values so that alpha manipulations and complex support were made easier.

> The display has been a major limiting factor, the dot matrix portion isn't very wide and we've struggled to fit things into it. Hence the dual fonts. Scrolling was HP's solution, I hate scrolling displays so we took another route. More or even different annunicators would also be a boon.

IMHO this will not likely happen, because money is made with software (alone or the combination of software and hardware together).

*Message #46 Posted by **Andrés C. Rodríguez (Argentina)** on 6 June 2011, 3:43 p.m.,*
in response to message #32 by Walter B

I think that the "Black S" legend in the faceplate could be maintained, assigned to a "Black Sciences" menu and/or application that undoubtedly deserves its place in any scientific calculator worth its salt. Magic numbers, "Finagle's" constant, "adjustment" factors (many), quotes of important laws (from Murphy to Moore), and similar gems will find their place here, after those many years of unanswered prayers.

Practicing engineers will surely agree.

:-)

It might be possible to print directly on the faceplate early in the production process.

HP 35 charger/case questions

*Message #1 Posted by **Adam Vaughn** on 2 June 2011, 11:15 p.m.*

Hello, everyone! I recently became the proud owner of a Hewlett Packard 35 calculator (version 3). It came with several original accessories, including the hard plastic case, the leather soft case, a restuffed 82001A battery pack, and the manual. However, the power supply included with it was decidedly non-original: basically a 9V 200mA DC wall-wart connected to the charging pins of the original connector! For the hell of it, I measured the voltage at these pins without a load (I didn't try connecting the adapter to the calculator), and the meter immediately went to around the 20V mark! Even so, this worked to some degree, since the battery pack had a charge in it when I got it; of course, the battery understandably got hot during charging, according to the previous owner, so he didn't charge it often.

Just recently, I bought a genuine HP 82002A charger on CraigsList. When I got it, I decided to test the voltages from it, unloaded, using a Triplett 310 VOM. The side which powers the calculator during charging measures out to what seems like a proper 4.5V or so. The set of pins which charge the battery (marked with a '+'), however, seems to output closer to 16V! Is this normal for this portion of the charger while unloaded, or has something gone wrong inside the unit?

As an aside, how are the accessories supposed to be arranged within the hard case? I see a portion which is presumably meant for the power supply, but the 82002A I have doesn't have the same shape (nor does any other original supply I've seen pictures of). Is the leather soft case supposed to go in there as well, and if so, where? Anyway, thanks in advance! -Adam

Re: HP 35 charger/case questions

*Message #2 Posted by **Michael de Estrada** on 3 June 2011, 12:09 a.m.,*
in response to message #1 by Adam Vaughn

The no load output from a typical 82002A adapter / charger is about 5 vdc on the adapter side and 16-17 vdc on the charger side, so your unit seems normal. Some older units output about 4 vdc on both sides, so charging took much longer.

The leather soft case must be tightly wrapped and placed inside a plastic ring to fit inside the case just behind the charger.

Re: HP 35 charger/case questions

*Message #3 Posted by **Adam Vaughn** on 3 June 2011, 2:52 a.m.,*
in response to message #2 by Michael de Estrada

Thanks for the reply! Due to this apparently being a newer charger, should I charge the pack for less than the 14 hours recommended in the manual?

Also, could the apparent overcharging I mentioned earlier (due to the improper wall wart) have hurt the battery capacity? Both the battery pack and the transformer were apparently derived from a cordless phone of some sort.

Finally, what do you mean by 'behind the charger'? As it stands now, I have the charger near the front of the accessory compartment (sitting in the 'well' area), the charger cable in the middle (in front of the prongs), and the leather case rolled tightly against the back of the compartment. Doesn't quite close, but considering the lack of a plastic latch, I think it's doing fairly well. Anyway, once again, thanks in advance! -Adam

Re: HP 35 charger/case questions

*Message #4 Posted by **Michael de Estrada** on 3 June 2011, 7:45 a.m.,*
in response to message #3 by Adam Vaughn

I don't think you can overcharge the battery. I would check it's voltage at its terminals, and if it's over 4vdc, then I'd stop further charging. As far as it's life being degraded due to the use of the wrong charger, I tend to think not. More important with NiCd batteries is the number charging cycles and it's better to go through a complete discharge / recharge cycle.

Yes, I meant that the soft leather case sits at the back of the hard case on the right side where the charger sits. Those latches are often broken off and missing, which is why cases with good latches command a premium.

Re: HP 35 charger/case questions

*Message #5 Posted by **Adam Vaughn** on 3 June 2011, 1:19 p.m.,*

in response to message #4 by Michael de Estrada

Yet again, thanks! Is there a way to monitor the voltages from the adapter while connected to the calculator without crudely wrapping wires around the pins themselves? There are small holes behind each pin of the charger's connector, but I'd rather not stick my multimeter's leads in there if there's a chance it could cause a connection to break internally.

Glad to hear that the NiCads are somewhat forgiving of this sort of torture. I was worried when I discovered that 3.6V of NiCads had been charged with 9V (or more!) for some period of time, but since they're still holding a charge, the damage couldn't have been too bad. I am indeed waiting for the battery pack to discharge enough before I try charging it with the adapter.

Thanks for confirming the layout. Having everything together makes for a really neat package. I figured that latch would've been a weak point; this case looks like it was held shut using masking tape for some time, due to the amount of residue near the front of the case. While this looks rather crude, to me, it just makes the unit look well-used and well-loved, likely for a very long time after the unit was originally purchased. I may look for a new case someday, but it's not a huge priority. -Adam

Re: HP 35 charger/case questions

*Message #6 Posted by **Michael de Estrada** on 3 June 2011, 2:43 p.m.,*
in response to message #5 by Adam Vaughn

I wouldn't recommend trying to insert probes in the back holes of the charger plug to monitor battery charging. While on the charger you will see a much higher voltage anyway, and have to unplug the charger for a minute to let the battery float to its no load voltage. I just leave mine on the charger for about 4-6 hours and then remove the battery to check its charge. It very rarely needs any additional charging.

As to the plastic latches, I open mine only enough to clear the case to minimize the fatigue on the hinge. Of course, this advice is a bit late in your case. I used to have a plastic case with a broken latch for an HP 45, which is similar in design to the HP-35 case. I just used a large and long rubber band to keep it closed.

Re: HP 35 charger/case questions

*Message #7 Posted by **Adam Vaughn** on 6 June 2011, 12:54 p.m.,*
in response to message #6 by Michael de Estrada

I'm more interested in seeing whether or not the voltage from the charging section drops to something more acceptable than 16V when the charger is connected to the calculator. Since this battery pack has been overvoltaged at least once, I want to make sure that it being put on charge doesn't cause it to get heated up again.

I'll probably use a rubber band or two to keep the case closed in the long run. It's a shame that the latch turned out to be a weak link in an otherwise excellent design. Of course, the case does a pretty good job staying closed on it's own, and it likely isn't gonna be doing much traveling around these days.

Anyway, for your viewing pleasure, here's a photo of my HP 35, with the case and accessories:

Original Box Pictures

*Message #1 Posted by **aj04062** on 2 June 2011, 8:00 p.m.*

Has anyone seen pictures of how the original Classics (55, 65) were packed with all their OEM items in the cardboard boxes? I searched last night and struck out.

Re: Original Box Pictures

*Message #2 Posted by **Michael de Estrada** on 2 June 2011, 8:12 p.m.,*
in response to message #1 by aj04062

It depends. Some came with plastic hard cases (35,45,65) or metal hard case (80), and the cardboard boxes were only used for shipping. The 55 and 67 had a 2-part box with an insert, similar to Woodstocks and Spices, and the 70 had a hard shipping box with an insert.

Re: Original Box Pictures

*Message #3 Posted by **aj04062** on 2 June 2011, 8:14 p.m.,*
in response to message #2 by Michael de Estrada

I have a 55 with the box & inserts.

Have both manuals, property labels, charger and pad. What I can't quite figure out is how it was packed in there. Seems like everything will flop all around too easy for shipping.

Re: Original Box Pictures

*Message #6 Posted by **Michael de Estrada** on 2 June 2011, 8:26 p.m.,*
in response to message #5 by aj04062

It's possible that the HP-55 was also supplied with the same plastic hard case used for the HP-

45 and HP-65. I just checked the museum listing for the HP-55, and it shows one with accessories in a plastic hard case.

Also, I checked the HP-55 manuals and the Owner's handbook in Appendix A, page 85, states that the standard accessories include a "Travel Safety Case." However, the addenda for the manual printed February 1975 says to "delete the reference to the travel safety case." So, either the case was initally supplied and then later deleted to reduce cost, or it was never supplied in the first place. I also have an Owner's Handbook, dated December 1974, and the previous owner has lined out the travel safety case.

Re: Original Box Pictures

*Message #7 Posted by **aj04062** on 2 June 2011, 8:46 p.m.,*
in response to message #6 by Michael de Estrada

right,

so does this arrangement look right with Pad on top?

Still note, there is 1/2" or more above the pad. Was there another piece of cardboard filler?

Edited: 2 June 2011, 8:47 p.m.

Re: Original Box Pictures

*Message #8 Posted by **Michael de Estrada** on 2 June 2011, 10:45 p.m.,*
in response to message #7 by aj04062

It's possible that you are missing a bottom filler piece that fits between the bottom of the box and the cutout filler piece. Some boxes such as the one for my HP-25C are made that way.

Calculator Buyer's Guide

*Message #1 Posted by **Joerg Woerner** on 2 June 2011, 2:22 p.m.*

I just received the Calculator Buyer's Guide 1978 - 1979, puplished by Application Calculators Incorporated in 1978.

It covers not only the HP and TI products but includes Casio and Sharp and features such iconic calculators like the Casio fx-8000 and Sharp CT-500/CT-600, EL-5804/5806/5808.

Pretty intereting to see a HP-10 compared to a TI-5025 or a TI Datachron next to the Casio AQ-1000. Overall, with technical data and a pricelist, an incredible resource for us calculator collectors.

Short question: Are there Buyer's Guides from Application Calculators Incorporated out covering earlier or later years? What happened to the company? Not a lot on the web - just a nice patent application for a calculator display stand ;-))

Thanks and Regards,

Joerg

HP-21

Re: Calculator Buyer's Guide

*Message #3 Posted by **Bob Patton** on 2 June 2011, 8:43 p.m.,*
in response to message #1 by Joerg Woerner

Hi Joerg,

I have paper copies of such guides from Machine Design, November 14,1974 and Popular Science, February 1975. I will see what I can do about getting them scanned and posted and probably added to my 1970s calc ads notebook and disk. The 1975 list is a somewhat poor photocopy given by a friend, but the table is readable.

Regards

HP-15C stuck in USER mode

*Message #1 Posted by **Tom Ligon** on 2 June 2011, 12:14 p.m.*

Back in the archives there is another post on this same problem. My venerable -15C did the exact same thing this past week after I replaced its very dead batteries. No amount of button-pushing tricks would clear it. The USER flag remained on even when f USER was pressed and the top row function keys were operating in the inverted condition, per the USER function. Even ON y^x had no effect.

Removing the batteries initially did not work, and I noticed the memory stayed up even with the batteries out ten minutes or so. This little CMOS wonder is amazingly robust with no power. However, removing the batteries overnight did clear the fault.

I could not work up the courage to try the paper-clip shorting of the batteries suggested in the Users Manual.

I'm glad to have my personal copy of the finest pocket calulator ever built back in perfect operating condition.

Re: HP-15C stuck in USER mode

*Message #2 Posted by **Mike Morrow** on 2 June 2011, 2:54 p.m.,*
in response to message #1 by Tom Ligon

> Quote:
>
> I'm glad to have my personal copy of the finest pocket calulator ever built back in perfect operating condition.

You are now obviously talking about the HP 42S. :-)

Re: HP-15C stuck in USER mode

*Message #3 Posted by **Tom Ligon** on 2 June 2011, 3:50 p.m.,*
in response to message #2 by Mike Morrow

My basis for comparison is Brand X (no RPN), my HP-35, my HP-67, and my HP-48GX. I still have the first two, but rarely dig them out as their batteries are history. I gave the -48GX away (I bought it when I thought I'd lost the -15C, and by the time I got it I used a computer for the fancy stuff).

The 15C, OTOH, runs for years on three button cells, programs like my -67, and always makes me smile.

I never had a -42S, but I can understand why you would like it ... many similar charms.

Re: HP-15C stuck in USER mode

*Message #4 Posted by **Etienne Victoria** on 2 June 2011, 4:45 p.m.,*
in response to message #2 by Mike Morrow

Funny, the Hp-80 has now such "USER" mode :-))

HP 12C, 12C Platinum & 15C iOS App

*Message #1 Posted by **Walter Lam** on 2 June 2011, 11:58 a.m.*

Just wondering whether people at HPMuseum.org forum bought the official iOS app of Hewlett Packard 12C, 12C Platinum or 15C calculator with their Apple iOS device (iPhone/iPod/iPad)?

Re: HP 12C, 12C Platinum & 15C iOS App

*Message #2 Posted by **Norman Dziedzic** on 2 June 2011, 1:23 p.m.,*
in response to message #1 by Walter Lam

I have the hp 15C ap on an iPhone 3GS. I never had the real 15c so I can't compare that way. That is actually why I bought it. It was cheaper than getting a real 15C from TAS and I was hopin to see what all the hype is about.

I don't use it as my 1st choice because I like the free42 and i41CX+ calculators tha I have better.

One major annoyance on the 15C for iOS is that the keyboard click volume is not adjustable. The clicking of the keys seems obnoxiously loud to me. Also, there is a manual included but it is not the complete version. Only the first part is included which leaves out programming and perhaps some other stuff.

I'm not sure I have ever seen an update on the ap so I'm assuming hp is leaving it as it is and not doing any improvements / changes to the ap.

It is kinda cool from a nostalgia standpoint but there are much better RPN implementations for iOS if you are looking for a GoTo ap. (my opinion only, YMMV)

Re: HP 12C, 12C Platinum & 15C iOS App

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 2 June 2011, 1:25 p.m.,*
in response to message #1 by Walter Lam

I downloaded and use Free42 and 42S (both!). I paid for them, am very satisfied, and use them very frequently.

Not for serious usage, I downloaded RPN-21, Calc12C+, i48 and m48.

There is also a HP-35 simulator, but it is not a downloadable program; you just access a web page with the simulator and use it online.

HP15C app is interesting but expensive in my opinion; it seems there are better options (cost/benefit-wise) in the App Store (i.e.: other 15C emulators).

Just my AR$ 1e-1

HP 16C - loose keys

*Message #1 Posted by **Antonio Petri (UK)** on 2 June 2011, 4:58 a.m.*

Hello, I have bought on TAS a 16C in very good conditions, it works perfectly and it looks almost new. However, some keys are a bit wobbling, the feel of pressing them seems ok though. The most affected keys are the ENTER key and the keys around it, whilst the wobbling gradually disappears towards the right and left sides of the calculator. Does anybody know what could be the cause of this and whether it can be fixed? Thank you Cheers Antonio

Re: HP 16C - loose keys

*Message #2 Posted by **exschr** on 2 June 2011, 1:27 p.m.,*
in response to message #1 by Antonio Petri (UK)

If you look at the case from a low angle you will notice that towards the ends (left and right in your description) where the screws are squeezing the case together the gap between the two halfes is significant smaller than in the middle. That's the reason why the keys in the middle of almost all the voyagers keyboard have more "freedom of movement" (aka wobbling) and lesser towards the sides.

I don't know what could be done about this except loosening the screws a little bit to relax the pressure on the case (which makes it bend), maybee someone else has a better "cheat" to this?!

Re: HP 16C - loose keys

*Message #3 Posted by **Antonio Petri (UK)** on 3 June 2011, 10:11 a.m.,*
in response to message #2 by exschr

Thank you for the hint. I can see a very mild curvature of the bottom half of the calculator and the keys that rock side to side most are the ENTER one and the other two in the same column. I cannot see the same curvature on my other three Voyager models whose keys are all firm.

Cheers Antonio

HP 28S: shucking the clamshell, further. Book?
*Message #1 Posted by **Geoff Quickfall** on 1 June 2011, 5:11 p.m.*

Hello all!

I should wait for the relevant chapter of the book to be finished but I had to share the preliminaries of the Clamshell section and the book.

The book

Firstly, the book! Just a quick note, every calculator family up to the stretch pioneers has been disassembled, repaired and restored. Mostly based on my collection, but with some help from two loaners, the 10C and the 19C printing calculators.

Most of the chapters are complete, but I did not realize how big an undertaking this was at first. Especially considering the ease of repair the early calculators are versus the later calculators. Also the HP 41C up to the 41CL now, almost deserves a book on its own!

Today and the 28s

Case in point, I have a 28S that has a bad connection between the keyboard and the PCA. I assumed this was due to a decomposing compression foam connection between the keyboard and the PCA. After looking up info and emailing I decided to remove the keypad overlay and enter the calculator via the heat stakes in the front. This will entail shaving a minor amount off the top of the heat stakes so that reassembly will be facilitated. Enough info on the pry method leaving the keypad overlay in place indicated to much damage can occur to the plethora of heat stakes present.

Well, I did not apply heat to the top label as I tried to remove it from the calc. This resulted in half the label remaining on the calc and half staying with the clear plastic overlay. By heating the remaining half of the overlay the label came off cleanly. I can make up a reasonable facsimile with the printer reusing the clear plastic of the overlay.

Using this knowledge, I heated the lower overlay and gently removed it in perfect condition. Much easier then the overlay removal of the pioneers. The overlay is composed of three parts:

```
1.  clear plastic cover
2.  reverse applied label
3.  glue layer.
```

If the label is not heated gently, then the glue and label separate from the clear plastic cover and is not salvageable at that point. Not a problem on the top, but a big problem on the lower keyboard overlay.

Back to the calculator, WHICH, I thought I would disassemble to the nth degree for documentation. This was due to the ASS-U-MED need to get to the deteriorated foam. In my defence the problem with the calculator keypad; non functional ENTER, 7,4, 1 keys manifested itself exactly like a Pioneer/Stretch Pioneer with a deteriorated compression foam.

From the pictures below you can see the actual problem with the keyboard PCA connection and the importance of heat stakes. Due to a manufacture flaw OR severe flexing of the calculator, some of the heat stakes separated from their bases.

In retrospect, I did notice that the side with the weak heat stakes was sitting prouder to the back shell then the rest of the keypad. Also that pressing gently on that corner facilitated a functioning calculator!

Okay, now to edit in light of a careful examination and help from Randy (the stuff in italics is wrong). I thought I would leave the wrong stuff in but italicize it to show how, without manuals or fore knowledge, as system can be mis-interprete; at least by me

;-0

I thought the loose parts were replaceable. In fact they are broken stakes. I will try Randys suggestion of using a styrene post affixed from the back, and protruding through the now vacant hole in the keyboard side. I will have to drill a hole through the back to facilitate this. Once the base is securely glued in place I will melt the top into position. I guess one could also sew with wire throught the holes and back down the side with the broken stakes. Not pretty though as the wire would be visible from the back.

Now the dilemma, I have a very easy repair that does not require further disassembly of the good heat stakes. Simply a glue fix with clamps overnight and then reapplication of the keyboard bezel.

Fortunately for me and the book, I have a second functional 28S with a dropped LCD column in the display. Something I could live with but don't have to now. I also have a, according to the seller a completely defunct 19B Business Consultant II on its way which is a candidate for complete disassembly.

So I thought I would have all the documentation done today for the Clamshells but it has now been delayed for the arrival of styrene rods.

In any case I thought you would appreciated some preliminary photos of the 28S disassembly, to the point where the fault was found.

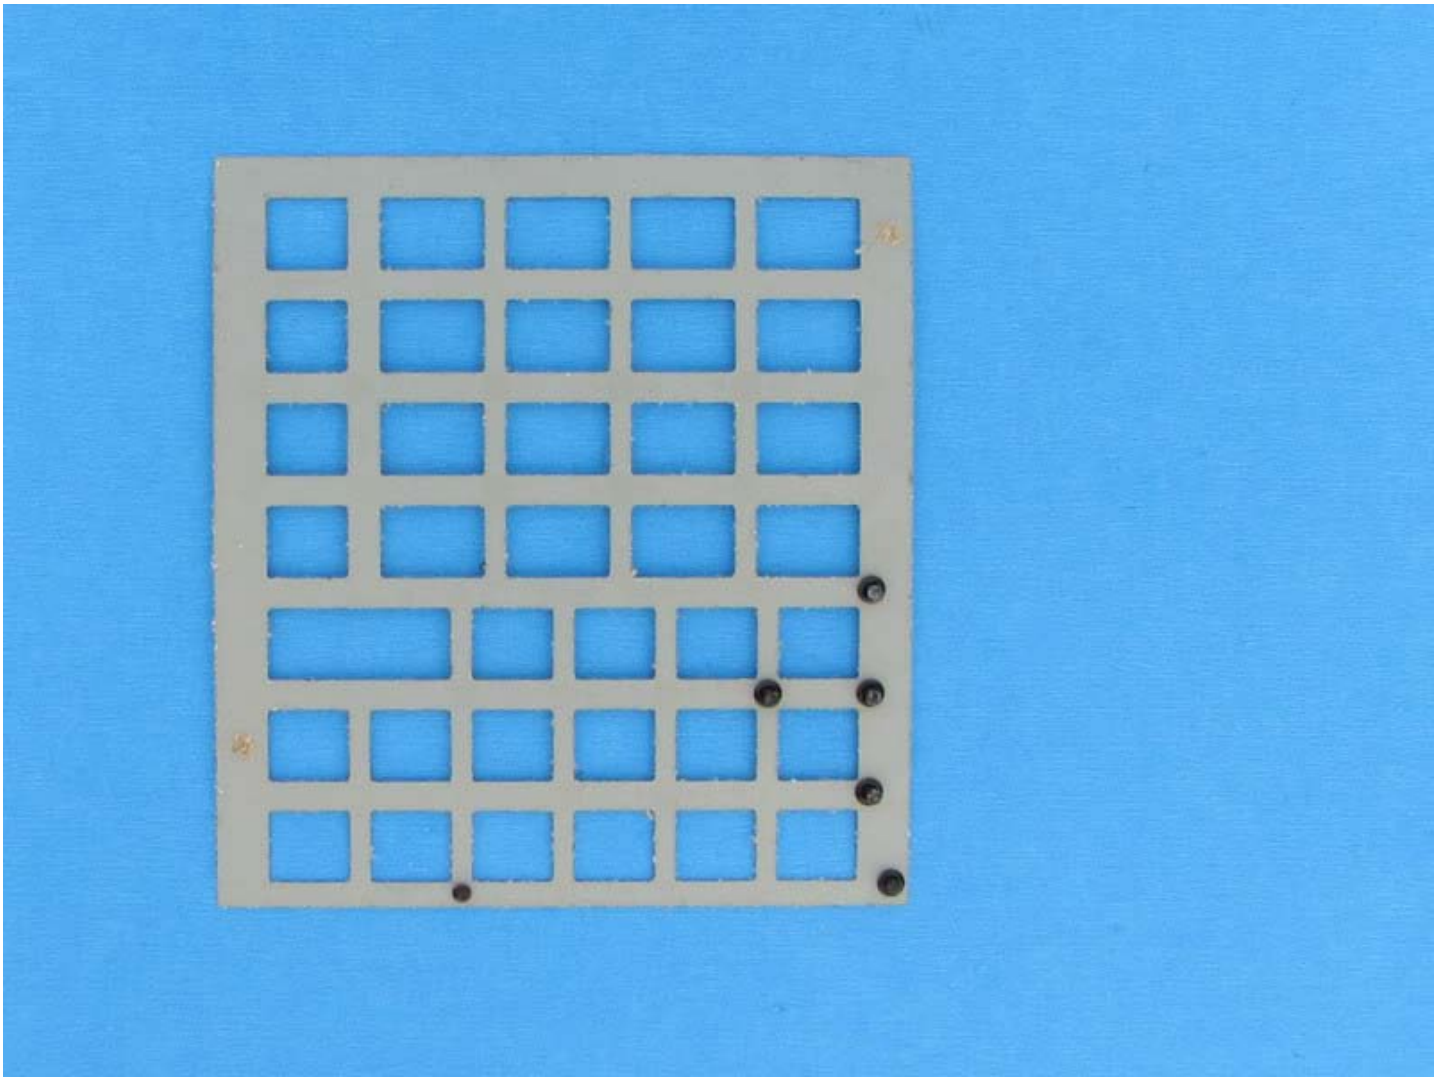
Cheers, Geoff

The calculator as it arrived:

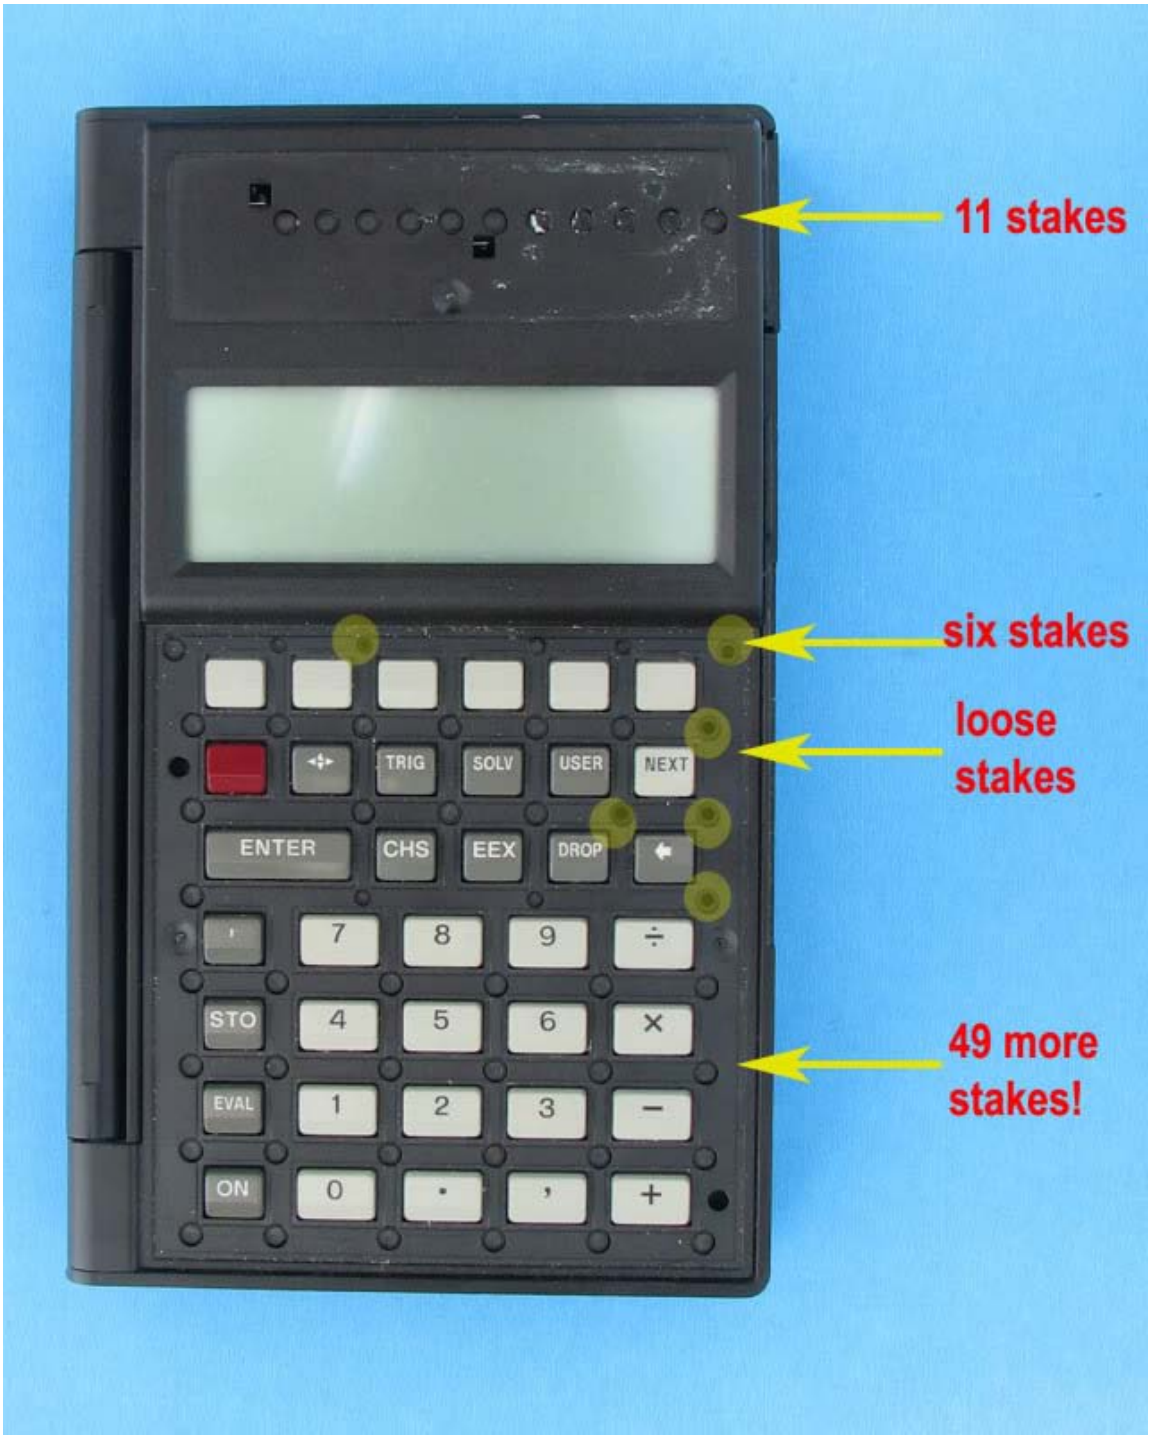
The fault label that succinctly describes the problems:

How not to remove the label as explained in the text! The fix will be to photoshop a new label and use the original plastic overlay to protect it. If done correctly it should almost be identical.

The keyboard label removed intact, with the loose heat stake caps. These mushroom caps ends of the stakes are heated to form a single piece rivet. The flaw in the flex of the keyboard and the fact that this is where the latch is located indicate a flaw in the design. Randys posting also reinforces the idea that this is due to a bad flex in the design. They are actually stuck to the adhesive back of the keyboard label:



The location of all the heat stake tops including the broken ones highlighted with translucent yellow circles.



Functional calculator as evidenced by the display when gently pressing down where the broken heatstakes are missing:

ADDENDUM:

on closer inspection, these are broken posts, as Randy discusses. So opening the calculator up will now go ahead as it is not a case of simply gluing these into position

Edited: 1 June 2011, 7:20 p.m. after one or more responses were posted

Re: HP 28S: shucking the clamshell, further. Book?

*Message #2 Posted by **Randy** on 1 June 2011, 6:17 p.m.,*
in response to message #1 by Geoff Quickfall

Quote:

Due to a manufacture flaw OR severe flexing of the calculator, some of the heat stakes separated from their

tubes.

I had about 50 dead 19Bii's from a purchase many years ago. I sorted out the units that did not turn on and proceeded to trouble-shoot about 20 units. It became very quickly evident that the sole problem was exactly what you found, heat stakes that had sheared off, primarily from the case back, not the mushroomed heads. I suspect it is the physical force from opening the case that stresses the heat stakes in the latch area that causes them to fail. Once that happens, there is a zipper effect to the left that eventually leads to failure of the smaller diameter stakes under the display that causes the classic loss of keyboard to logic board contact. Same symptom but a different cause.

The only idea I had for repair was to drill holes through the back of the case and solvent weld new posts in. The only issue was that I could only find white styrene rod stock so it would not be a "pretty" repair but it would certainly work.

IMO, if you add up the time required, the horrible battery door design and the lack of supply for replacement doors, I decided it was wasn't worth the effort to undertake commercially.

Re: HP 28S: shucking the clamshell, further. Book?

*Message #3 Posted by **Geoff Quickfall** on 1 June 2011, 6:27 p.m.,*
in response to message #2 by Randy

Randy,

You are absolutely correct, the time involved versus the outcome does leave alot to be desired.

For the hobbiest though, with free time, a little guide to get in and get out might be helpful.

To bad the casio, sharp and other cheapies from the early era and many screws wasn't the case here.

In any case, these have to be the most tedious to repair as you forced to deal with so many heat stakes and the styrene post repair. I guess your styrene post could be sanded and the back of the calc painted a close match, but again, just how much work for the outcome. I will try your suggestion though after I open it up.

Cheers, Geoff

I think I'll stick to the repair of LED models only

*Message #4 Posted by **Michael de Estrada** on 1 June 2011, 7:25 p.m.,*
in response to message #3 by Geoff Quickfall

It seems to me like repair of most of the LCD models is terribly involved and time consuming with a high likelihood of disappointment and frustration. Fortunately, all of my LCD models, even my HP-28S, are still in good working order. I've had great success repairing Classics, Woodstocks and Spices due mainly to their ease of entry and soldered connections (Spice first versions excepted), but think I wouldn't have the patience or skill to attack one of the newer LCD models. Some day no doubt my HP-28S will no longer fire up, at which time I will simply remove the batteries and bid it adieu.

Re: I think I'll stick to the repair of LED models only

*Message #5 Posted by **Geoff Quickfall** on 1 June 2011, 8:17 p.m.,*
in response to message #4 by Michael de Estrada

I would have to agree with you Michael!

But I have to do this for the book. I shure wouldn't take these on for repair!

In any case, they may become rare enough one day that someone will want to fix them!

I have a 19C comming my way (29C cousin) and even if I can't get it working (it isn't) it is still fun to work on!

Geoff

Quick update on the 28S and thanks Randy!

*Message #6 Posted by **Geoff Quickfall** on 2 June 2011, 8:09 p.m.,*
in response to message #1 by Geoff Quickfall

IT WORKS,

Well I drilled out the offending broken stakes, I thought. I did this without opening the calculator. Selected the correct sized bit and drilled straight through the body of the calculator starting at the keyboard side.

Purchased some styrene piping from a hobby store of the correct diameter. The holes were slightly smaller then the styrene creating a very tight fit which did not need glue.

When I cut these down and glued the backs of the piping as it protruded from the back of the calculator. Let them dry and then shaved them flush.

This corrected the faulty 7,8,9, key response but left the x,+, -, / keys unresponsive. Pressing firmly under the lower edge of the display reactivated the keys so now its time for major surgery.

I drilled out the top of ALL the stakes leaving my new ones in place. Pried open the calculator and found that 15 more of the stakes in the numeric part of the keyboard were also defunct!

Well, the culprit for unresponsive keys, the PCA to keyboard foam compression. I cut two new ones, (over sized) and fitted them in place. Dry assembled the calculator and IT WORKS.

All the remaining heat stakes have more then enough left to melt them into position plus a drop of styrene glue solvent. That combined with my stake fix (idea suggested by "RANDY") and the calculator will have a 100% recovery after surgery.

Some shots (for more detailed explanation with labeled pictures you will have to get the book ;-)

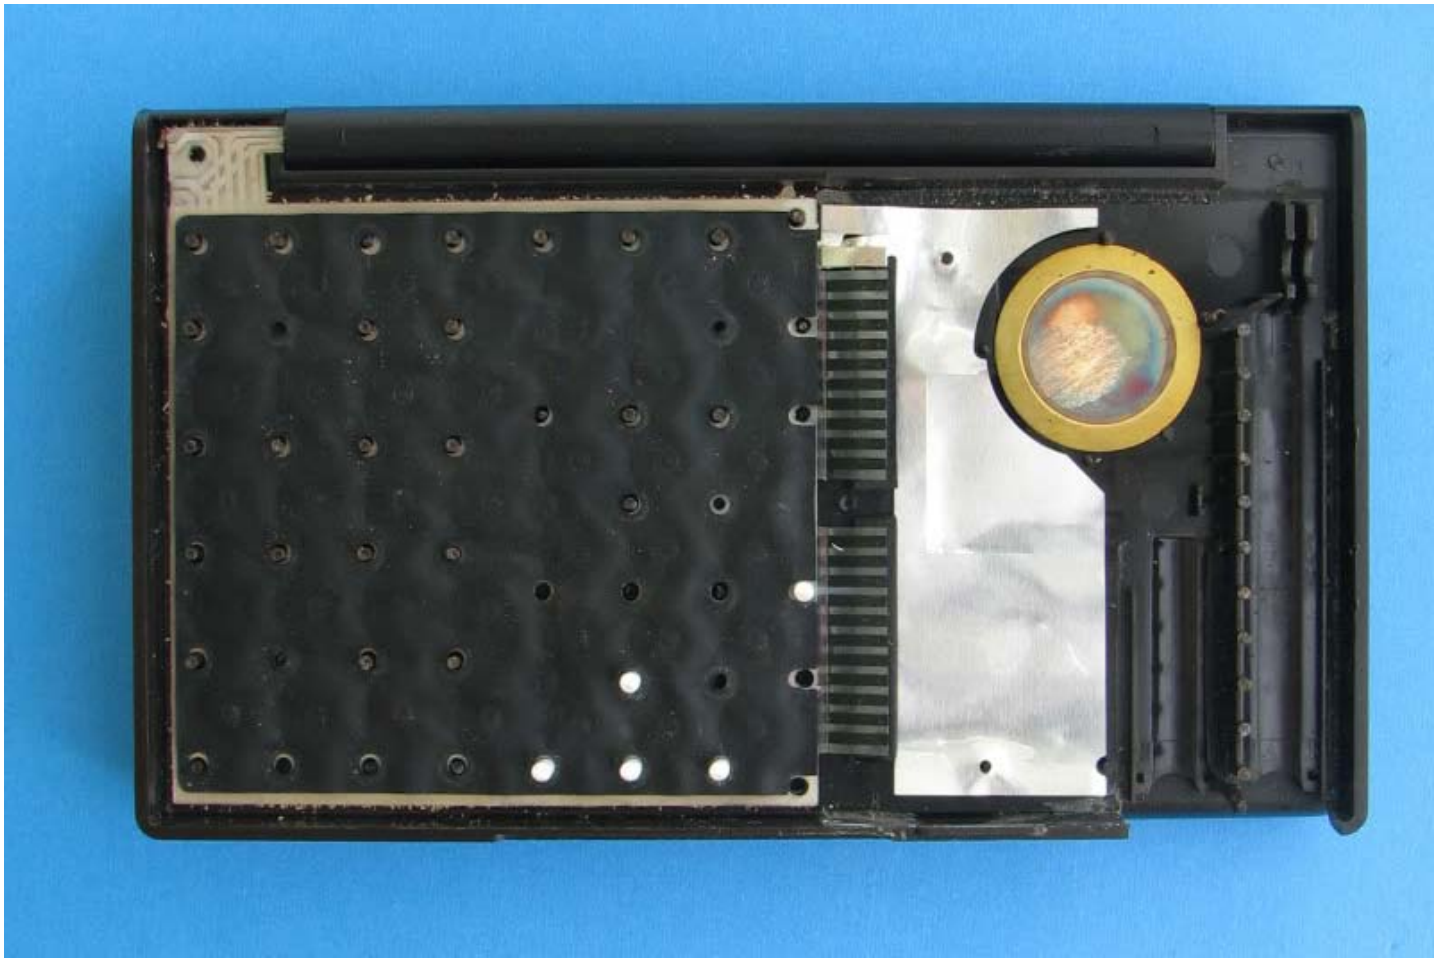
The drill press set so the depth is controlled by the drill press lever. This allows for just the right amount of stake shaving in a controlled motion and consistent manor:

The drill press was used to bore through the broken stakes and to shave the good stakes:

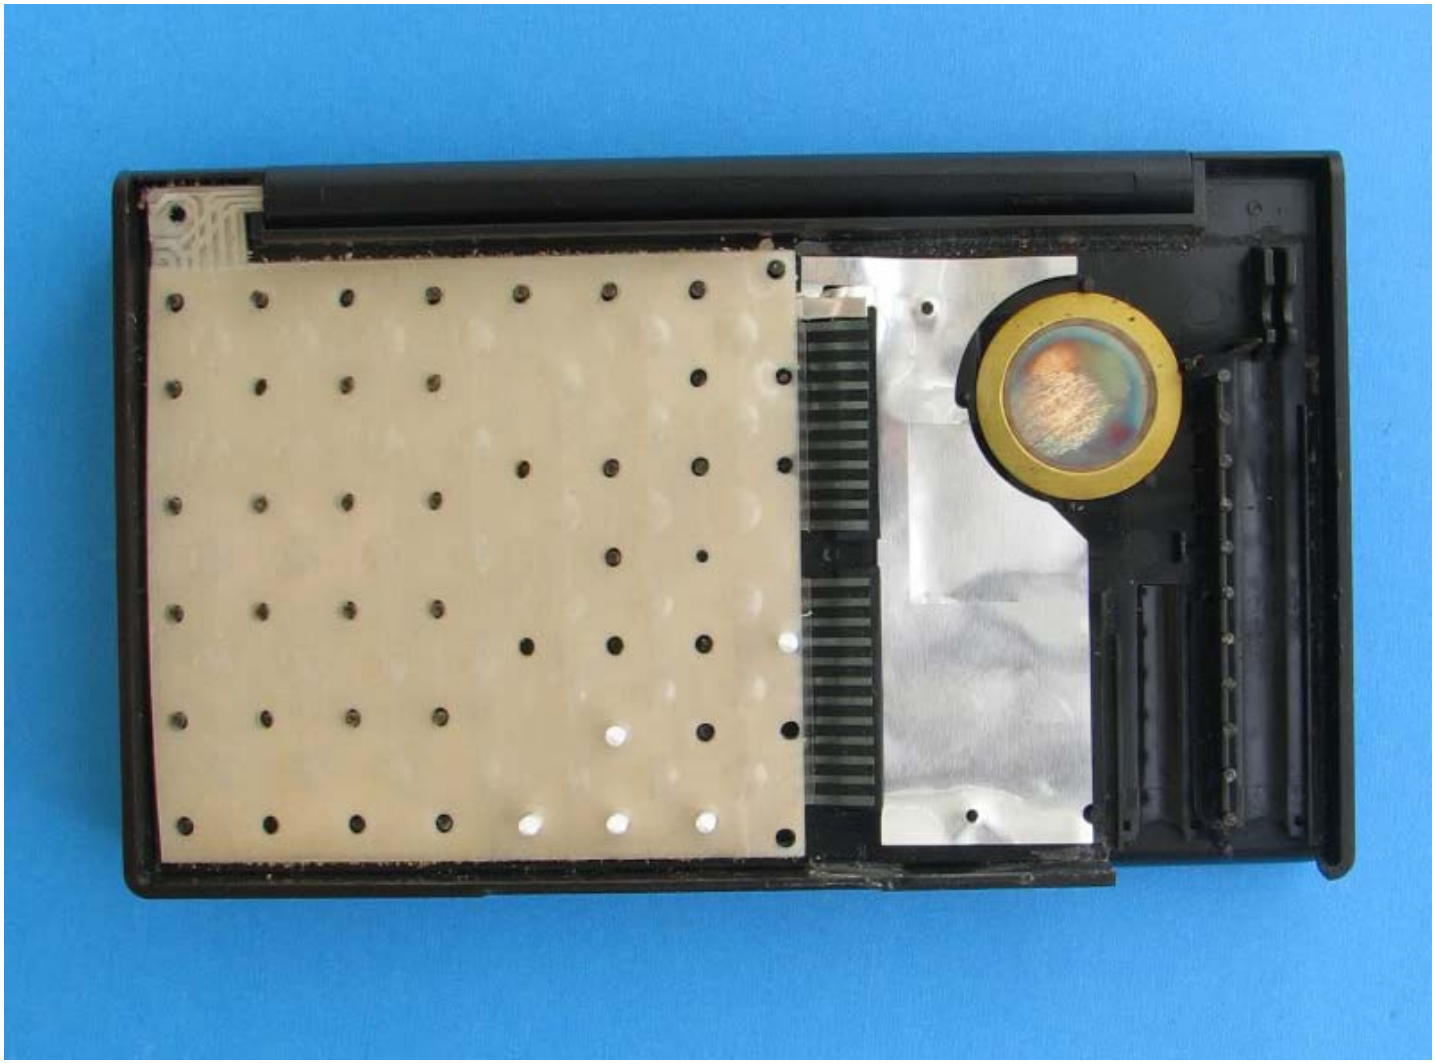
You can see the new stakes are in place in the above photos and here is a slant view:

All the heat stake tops are shaved in this view and the calculator is ready to be gently pried apart.

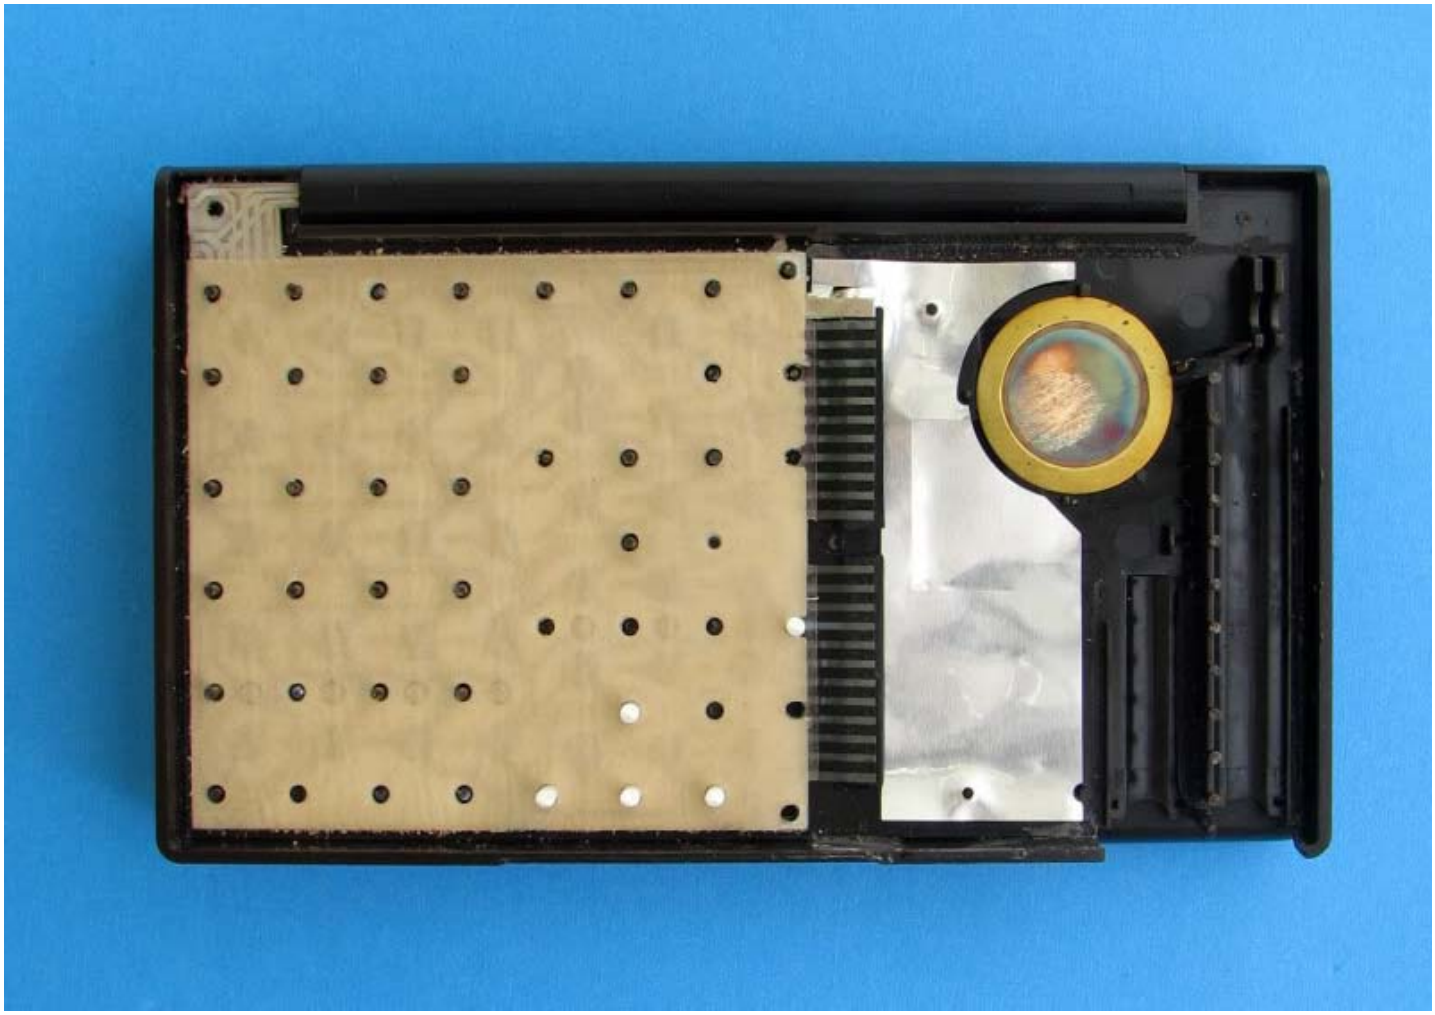
Under the keys once the top is removed with the keys (they fall out so be ready to catch them!) are four layers sandwiched above the keyboard circuitry. Here they are starting at the top rubber layer:



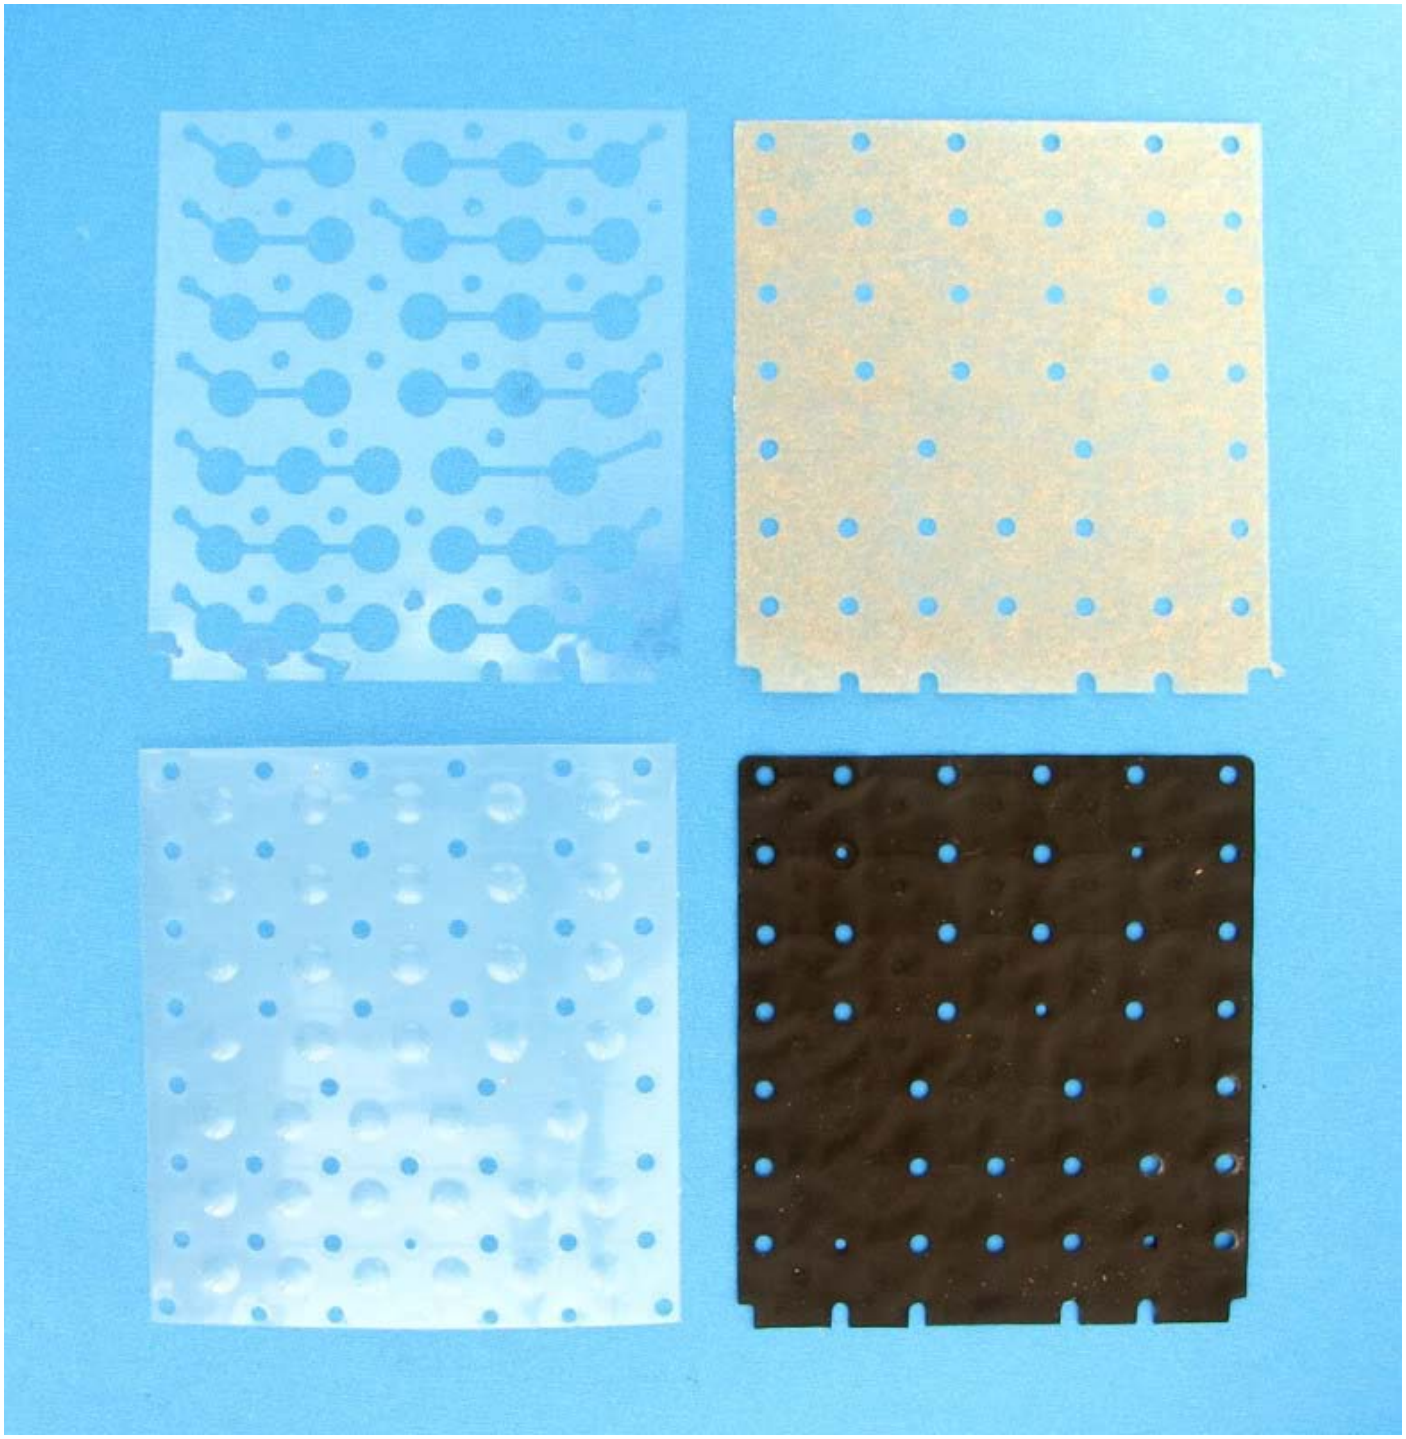
Next the snap layer that gives the keys their feel:



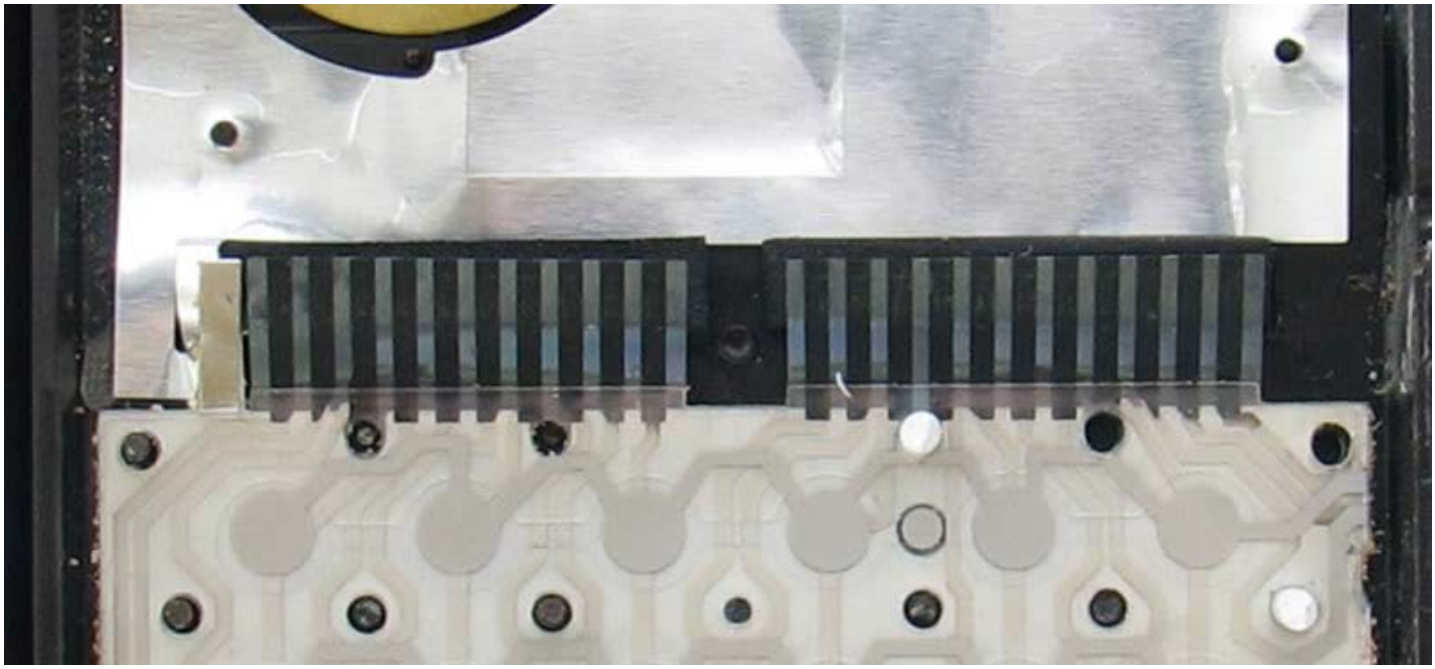
Next a thin paper layer:



Under the paper and covering the keyboard circuitry is a clear film, not visible unless removed so once again here are all four layers:



Of course all this was to get to the compressed foam which I have replaced with new foam cut to a thicker dimension. The foam lies underneath the vertical striped ribbon:



Here is a shot of the back of the calculator before the stakes are shaved flush. Next step will be a permanent reassembly with the rear case cleaned up and the stakes painted to match. When done the fix should be almost invisible from behind and seamless from the keyboard side.

That is for tomorrow when the glue has set and the paint has dried.

Stay tuned:

Geoff

p.s. thanks Randy for suggesting the styrene piping.

Completed HP28S pictures!

*Message #7 Posted by **Geoff Quickfall** on 3 June 2011, 1:55 p.m.,*
in response to message #6 by Geoff Quickfall

Well, what started as a restaking of the 28S without taking it apart ended up being a complete dissection of the right hand side to the PCA.

This was due to two problems, misinterpreted as one problem, a faulty keyboard PCA connection due to broken stakes at the hatch lock side of the numeric keyboard.

In fact, after replacing the stakes, described above, most of the play observed before restaking was removed and a lot of the faulty keys were rectified. However this left the = - X / key still unservicable.

So diving in the culprit was found to be the foam that is used to press the keyboard ribbon into the contacts of the PCA. After replacing the foam and a dry assembly the calculator performed flawlessly.

Here it is assembled with a keyboard test done.

New stakes cut flush and sanded flush. I might touch them up or paint the back completely in the appropriate colour. New rubber pads and it is done:

Looking at the keyboard side, the stakes are flush, and all the remaining original stakes have been remelted with a soldering iron. I also placed a tiny drop of styrene glue on each remaining rivet:

The keyboard test started (you can see the tops of the new stakes):

The keyboard test finished:

The finished product, I am still working on the top label since I destroyed the original. Just printed one off to cover the rivets:

I will compile the photos for the article section, but there will be much more detail including the left hand side and hinge for the book.

Cheers, Geoff

*Message #9 Posted by **Geoff Quickfall** on 3 June 2011, 3:42 p.m.,*
in response to message #8 by Gerson W. Barbosa

Hello Gerson,

With a dissembled calc the removal should be very easy. Heat it up a hair dryer, and since you are not concerned with overheating the internals, heat it up enough to be very warm (not hot) to the touch.

Slip a sharp blade underneath on corner and lift, apply heat when it feels like it is adhering to much. You don't want to crease as you lift it.

And thanks for the offer, I would greatly appreciate the label.

I will pm you with an address.

Thanks and cheers, Geoff

main problem with my removal of the top label is that I did not apply ANY heat, just peeled it off cold. Don't know what I was thinking ;-(

My HP 12C+ impression

*Message #1 Posted by **Walter Lam** on 1 June 2011, 1:09 p.m.*

I bought a golden HP 12C+ (uses 2 CR2032 Coin Cell) today (Serial no. 4CY01300046 Can anyone decode this?) to replace my old broken down 12C (can't power on) and 12c platinum 25th Anniversary Version (Body's loosing after I dropped it on the floor during exams). I still have one healthy 12C which is made in 1984.

I chose 12c rather than 12cp because I prefer 12c's larger and bolder digit and annunciator. But I missed 12cp's 400 program steps (In practice, I didn't use all 400 steps and I found that it's quite trouble to locate the 2nd program to run in 12cp). I don't use ALG and I don't like to press Shift key to do backspacing or Undo an operation.

The keyboard of this new 12C+ keyboard is good. It responds quickly and not mushy.

For calculation, it's really faster than my old 12c, especially computing IRR. I love it.

However, I found that this 12C+'s self test does not show "-8,8,8,8,8,8,8,8" like what the user guide describes. At first, I thought the first 12C+ that I got is a faulty machine. Then, I asked for a change. When I get the second 12C+ (i.e. the current one on my hand), it also cannot show "-8,8,8,8,8,8,8,8" as well. But when I enter some figures to try out NPV, IRR and Bond Calculation, this 12C+ gives correct answer. It's strange. As it gives correct answer, I think my 12C+ works properly and didn't ask for a change again. Can any user enlighten me on this matter?

Re: My HP 12C+ impression

*Message #2 Posted by **Tim Wessman** on 1 June 2011, 1:51 p.m.,*
in response to message #1 by Walter Lam

Does the manual you received talk about a self test mode? Is there a paper in there that has an addendum?

The old "self tests" may not even be there any more. We were definitely talking about completely removing it at some point. I am 100% certain that both the original unit and your replacement were working fine though.

The new self test menu can be reached by turning the unit off, then press and hold both G and ENTER. When you power on, release the G and ENTER and you will be in the new test system.

Re: My HP 12C+ impression

*Message #3 Posted by **Walter Lam** on 2 June 2011, 11:38 a.m.,*
in response to message #2 by Tim Wessman

TIm:

Thanks for reply me.

My current 12C+ on my hand is the second one after I requested the vendor to changed another 12C+ with new more environmental friendly paper package. It does have a Quick User Guide and a CD with full User's Guide. It no longer provides printed full User's Gude. I didn't find any paper addendum.

Then, I found Katie's posts about the change of self-test of 12C+. I could perform new self test. My 12C+ is running a 2008-06-28 firmware.

I put in Tony Hutchins' Black-Scholes Program to 12C+ (included in 12C user's guide). It gives answer terribly faster than old 12C.

Walter

Re: My HP 12C+ impression

*Message #4 Posted by **Jeff O.** on 1 June 2011, 3:10 p.m.,*
in response to message #1 by Walter Lam

Walter,
Pending your response to Tim's questions, it sounds to me like your 12C+ has an older version of the firmware. If I recall correctly, the "original" 12C self-tests did not work quite right in the first 12C+ units. See the following threads for information on the various versions and how to tell which one you have:

Katie Wasserman's original review

12C+ thread

another 12C+ thread

yet another 12C+ thread

Also found this one. Did it take you nearly 2 years to get your calculator?

I think your serial number decodes as follows:

```
4CY - made in Chinese factory coded 4CY
0 - year 2010
13 - week 13
00046 - individual unit no.
```

Re: My HP 12C+ impression

*Message #5 Posted by **Walter Lam** on 2 June 2011, 11:50 a.m.,*
in response to message #4 by Jeff O.

Jeff O.:

Yes, it takes almost 2 years to get this 12C+. In Hong Kong, most people who needs a financial calculator are usually buy either a TI BAII Plus or Casio. In HK, the price of 12C is almost a double of TI and Casio. At the store that I bought my 12C+, a 12C+ is selling at HK$650 (around US$83.55). A 12C Platinum sells at HK$750 (around US$96.40). A TI BAII Plus costs HK$320 (US$41.30). That's why HP calculators are rare in HK as it costs more.

Thanks for decoding the serial no. Also, thanks for the help to posting Katie's posts about 12C+.

Regards,

Walter

HP-41 Repair Parts

*Message #1 Posted by **aj04062** on 1 June 2011, 12:20 p.m.*

Been thinking about commissioning a couple of parts.

1. New flex circuit to replace corroded battery terminals. 2. Stamped plates to reinforce broken holes on calculator backs

I'd appreciate some honest feedback on what "the market might bear" on these two items.

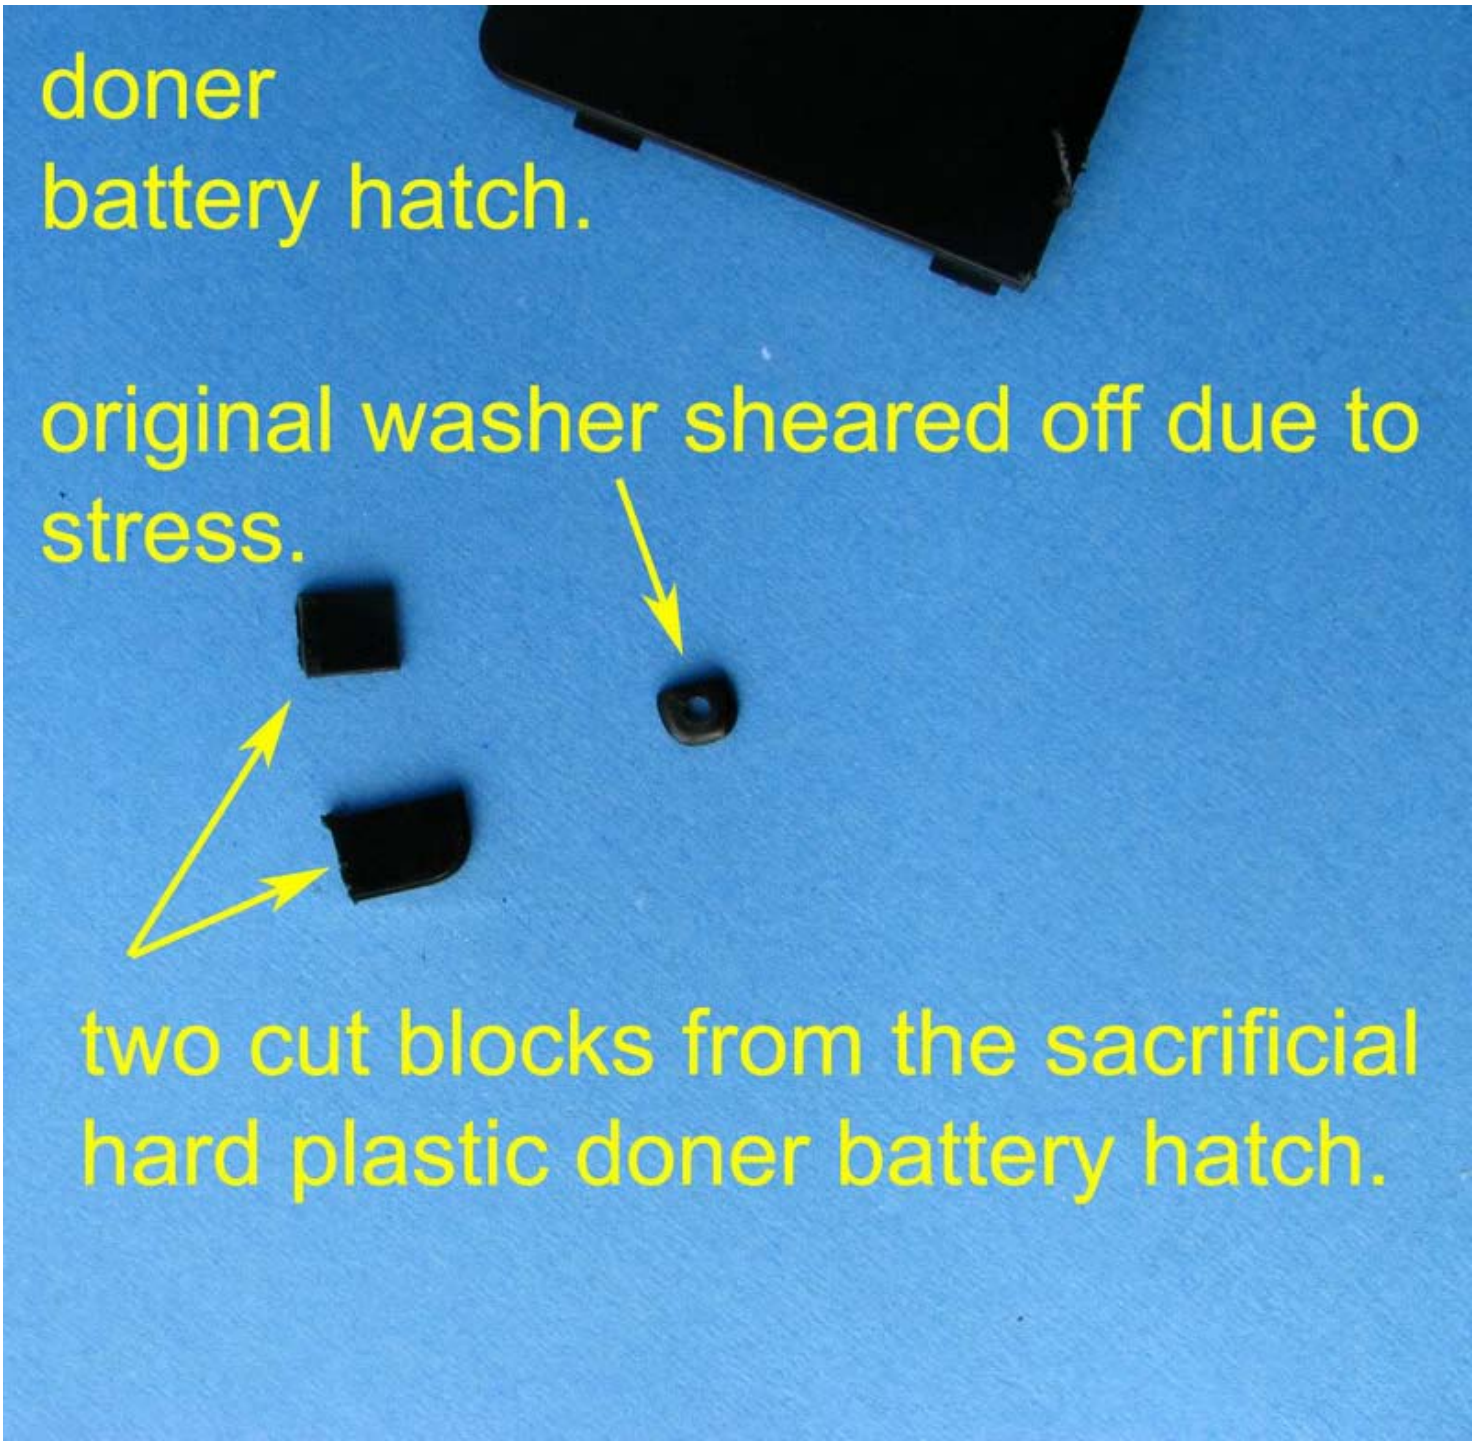
Please reply to my email if you care to vote.

Re: HP-41 Repair Parts

*Message #2 Posted by **Geoff Quickfall** on 1 June 2011, 1:46 p.m.,*
in response to message #1 by aj04062

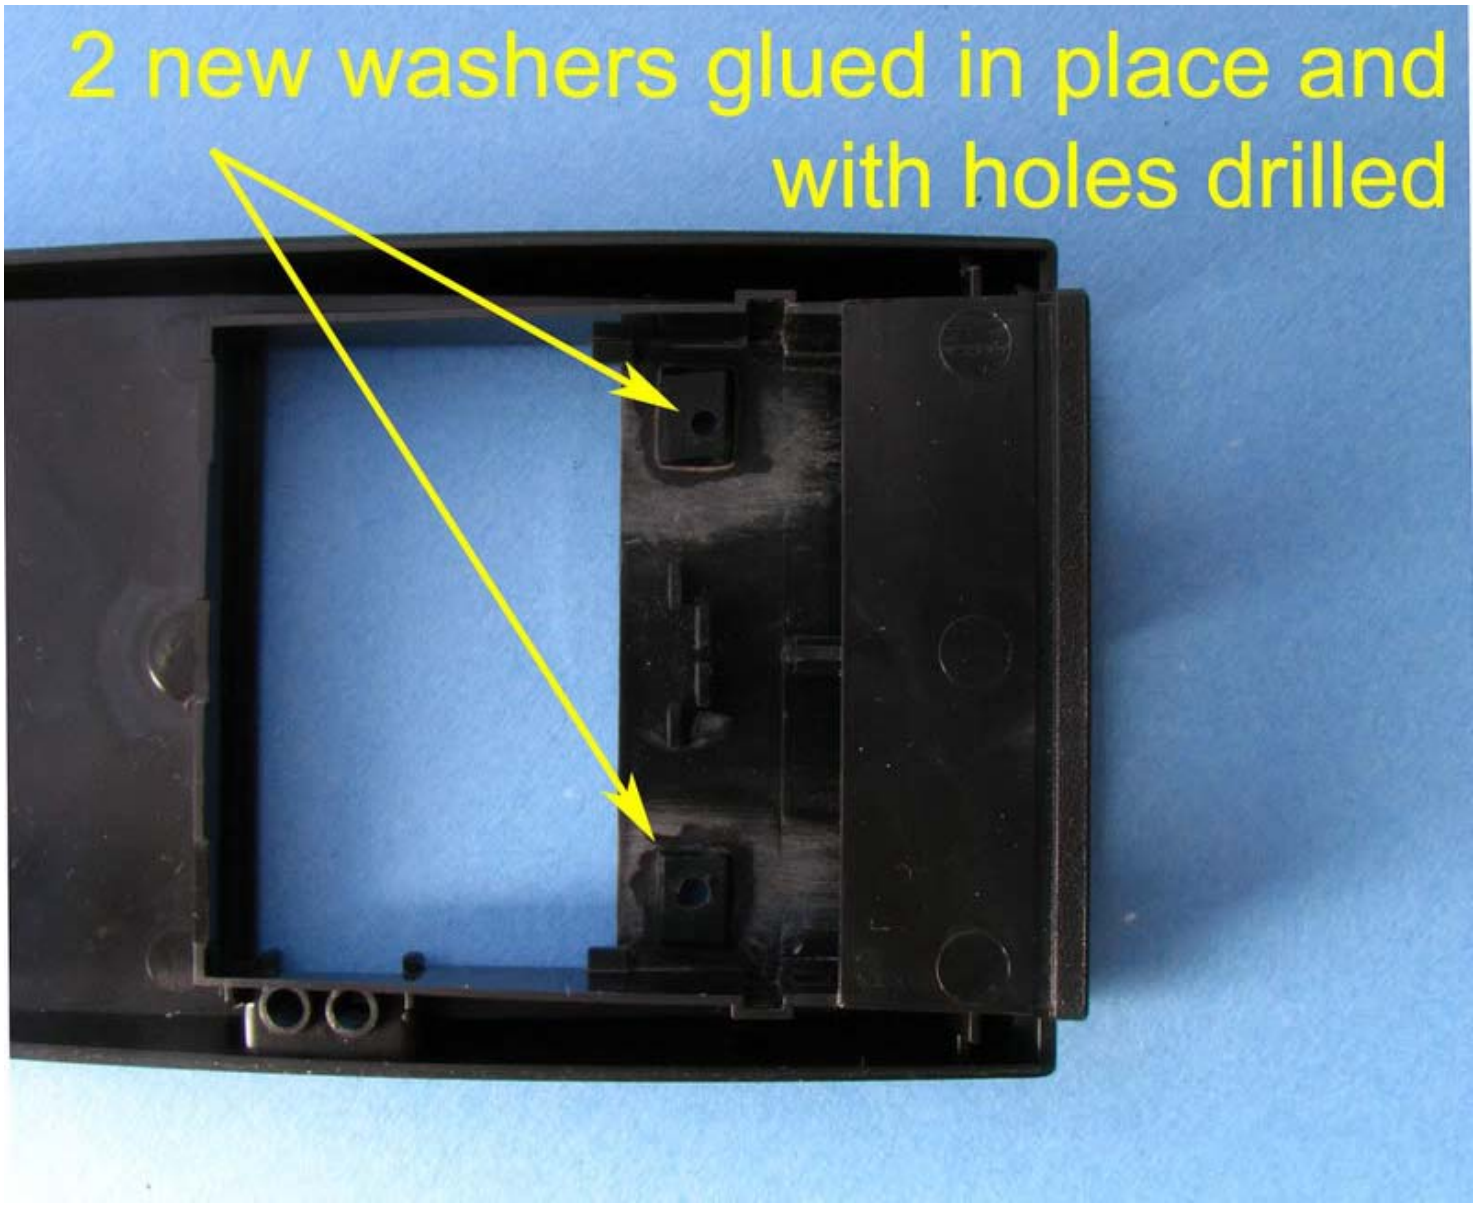
Both projects are worthy but lets see if they have been done before as your expense may not outway the benefits from and easy repair:

Reinforcing the rear shell screw holes can be accomplished easily with spare plastic pieces:

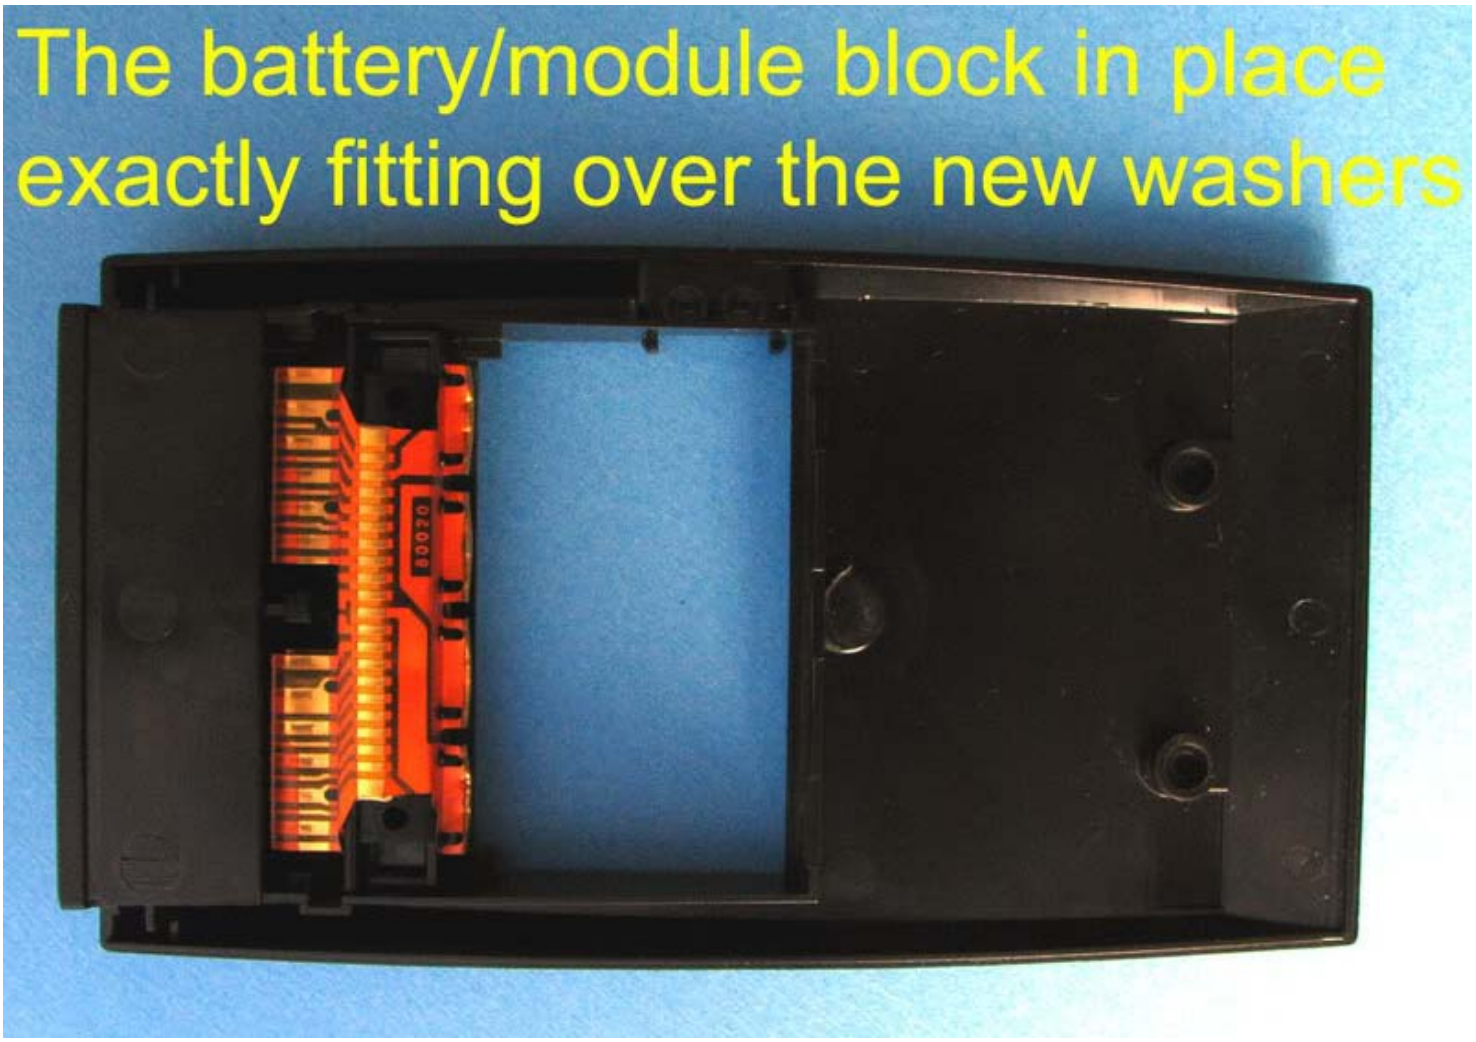


doner
battery hatch.
original washer sheared off due to stress.
two cut blocks from the sacrificial hard plastic doner battery hatch.

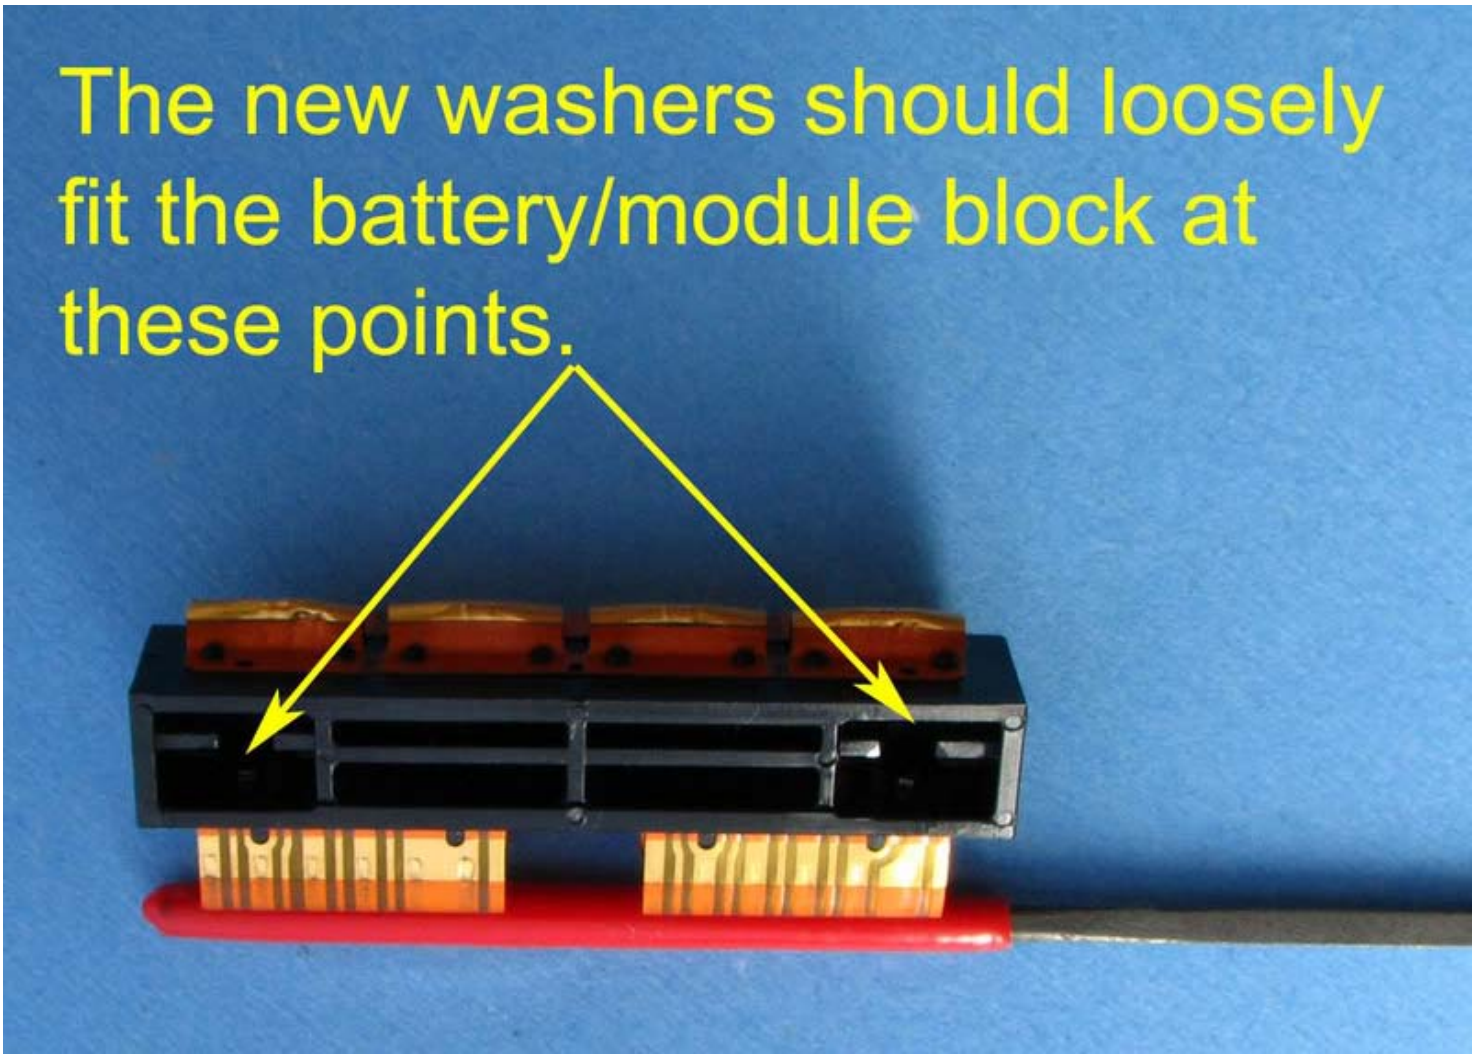
The two washers in place
waiting to be drilled.



2 new washers glued in place and
with holes drilled



The battery/module block in place
exactly fitting over the new washers



I can't find the original article I posted but the above photos show the main points. I am only posting this as this is an extremely easy fix and cheap versus a prefab piece and associated costs. Of course, I may have misinterpreted your intent. If so, sorry.

As far as the ribbon battery contact idea, have you seen:

Deigo Diaz site

Is this the ribbon contact you are refering to. I have used three of these and they are fantastic!

Hope this helps and again if I misinterpreted your intent I apologize ahead of time.

Cheers, Geoff

Idea for the WP34S PC-emulator

*Message #1 Posted by **fhub** on 1 June 2011, 8:50 a.m.*

Hi,

now that my first idea (EEX instead of E) has been well received, I dare to present one of my other ideas for the WP34S emulator. ;-)

First of all many thanks to the developers of this fantastic project, which I've discovered only a few weeks ago. I've been a fan of all kinds of calculators (and especially of their PC-emulators) since almost 30 years, and this WP34S project is indeed the most interesting one.

I don't know who of the developers (Walter/Paul/Marcus?) is responsible for the PC-emulation, but at least here's my idea:

What I always found very annoying with these calculator emulations is the complicated way to access the calculator keys (or functions) via the PC-keyboard: either you have to make many mouseclicks or you have to remember lots of keyboard-shortcuts for the calculator keys (mostly not mapped very well).

Some time ago I found a TI-58/59C emulator on this website: http://83.156.189.247/ti58c/index.php?langue=EN And this emulator uses a (IMHO) very comfortable way to access the calculator keys and functions, which I've never seen before in any other emulator program: You can simply enter the keys/functions on the PC-keyboard by their names! :-)

Now my question to the author of the WP34S PC-emulation: would it be possible to implement such a feature, i.e. being able to use any of the WP34S functions by just entering the name on the keyboard?

My idea would be like this: maybe the easiest way (requiring minmal code in the emulation program itself) would be an external key-file *.key (like the *.skin files), which contains the names (abbreviations) and the required calculator keystrokes (as key-codes) to execute this function. Such an external file would also have the advantage that the user can modify and extend the names of the functions himself.

Let me give you a few examples how this key-file could look like:

SIN 24 12

SINH 24 11 12

ASINH 25 11 12

LN 25 41

MOD 26 45 (for RMDR)

...

For the numbers I just used a kind of key-code (row/column of the calculator key), but this could of course be

coded in a different way.

If parsing these names (SIN, SINH, ASINH, ...) during the normal usage of the calculator keys (e.g. while entering a number) would be too complicated to implement, then using this special keyboard-mode might also be switched on and off by a special key, e.g. <Space>. With this I mean that after having entered a number I press the <Space>-key, then enter my name (SIN, ASIN, ...) and finally end my name with <Space> again, and then the emulator executes the keystrokes for this name. (Of course it would be nice if the entered name would appear somewhere, e.g. in an extra window or better on the calculator display).

So what do you think about this idea? For me it's definitely more comfortable (and also much faster) to directly enter the name of a function than clicking on several keys with the mouse to finally get the desired function.

Regards, Franz

Edited: 1 June 2011, 9:00 a.m.

Re: Idea for the WP34S PC-emulator

*Message #2 Posted by **Marcus von Cube, Germany** on 1 June 2011, 9:24 a.m.,*
in response to message #1 by fhub

Franz, its me.

To be honest, it used to be Cyrille de Brebisson. The emulator kernel is a Windows MFC program originally furnished by HP as part of the development kit for the 20b platform. I changed the linkage to the rest of the project to be a DLL so that the rest can be compiled with the free version of Visual Studio. To change the inner workings of the GUI, you will need a full blown Visual Studio installation to compile the DLL itself. The sources are included in the SVN repository so feel free to adapt them to your needs. ;-)

Now back to your idea: On a TI-59 there are no hidden functions except for some OP nn and PGM nn combinations. In principle, all is on the keyboard. So mapping SIN to the key labeled SIN is relatively straight forward. This is not the case with wp34s. It has hundreds of functions in its catalogues. If you want to address all of these by name, the mapping file will become very convoluted. And how do you enter a greek alpha or gamma as part of the function name?

The easier way would be to just address the visible keyboard labels. None of the typeable names may then start with f, g, or h because otherwise you can not reach the prefix keys. I fear none of the above will be done by me in the foreseeable future.

You can change the mapping of keyboard keys to calculator keys yourself, its all in the skin files.

Marcus

These are assigned to F10, F11 and F12 already.

Re: Idea for the WP34S PC-emulator

*Message #4 Posted by **Marcus von Cube, Germany** on 1 June 2011, 9:50 a.m.,*
in response to message #3 by Gerson W. Barbosa

On my Mac I had to sacrifice F11 and F12 in Windows for INS and DEL. We can of course map the keys anywhere we want. As stated before, just modify the skin files to your liking!

Re: Idea for the WP34S PC-emulator

*Message #5 Posted by **fhub** on 1 June 2011, 10:02 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Ok Marcus, I see that my idea doesn't seem to attract much interest. ;-)

> Quote:
>
> You can change the mapping of keyboard keys to calculator keys yourself, its all in the skin files.

Of course I've done this already (this QWERTY layout is in fact terrible!), but unfortunately I've found some limitations for these keyboard mappings:

I don't know which codes you've used in those *.skin files (some are ASCII, but others are absolutely unknown for me, don't even look like the usual keyboard scan codes). And one big problem is that I can't access shifted keys, at least it seems so. :-(

If I don't want to use the * and / on the numeric keypad (not every notebook keyboard has a separated numeric block), then I would have to use these / and * on the usual keyboard, and on the German keyboards these are the shifted keys of 7 and +.

Now I've not found a way to access these shifted keys with any code in the *.skin file, even if I press Shift-7 the normal 7 is entered in the emulator (and the same is true for Shift-+, which executes + instead of *).

Is there any method to assign such shifted keys in the *.skin file?

Edited: 1 June 2011, 10:03 a.m.

In theory, adding 1000 to the code should do the trick but I seem to have problems with this. You will have to wait until next week before I can debug the situation. As you probably know I do have a German keyboard myself.

Re: Idea for the WP34S PC-emulator

*Message #7 Posted by **Tim Wessman** on 1 June 2011, 10:59 a.m.,*
in response to message #6 by Marcus von Cube, Germany

We have that problem as well. The way we currently do the keys doesn't really handle different keyboard layouts at all. . . :-(

Haven't really come up with a good way to do it yet.

In your todays build I saw a non-GUI version (wp34s.exe) for the first time, and testing this version I found that here the situation is just the opposite: the shifted PC-keys are working (e.g. Shift-7 gives / and Shift-+ gives *), but the same keys on the numeric block don't work.

So the problem with the non-working shifted PC-keys must be somewhere in the GUI version, maybe this will help you in finding the location of this bug ...

Re: Idea for the WP34S PC-emulator

*Message #9 Posted by **Paul Dale** on 1 June 2011, 5:38 p.m.,*
in response to message #1 by fhub

I find the keyboard to emulator mapping quite natural and easy to use.

The mapping is based on the top three rows of keys mapping to the top leftside three rows of the keyboard (US/UK/AUS layout though). This puts f, g & h in their correct positions BTW. Digits are digits, the arithmetic symbols are unchanged, the column down the left is UJM & space. Leaving two keys unaccounted for . and , being . and R/S respectively.

> I find the keyboard to emulator mapping quite natural and easy to use.

Well, that's of course all a matter of taste. ;-)

I like my own mapping much more - e.g. S for STO, R for RCL, X for XEQ, E for EEX etc. is much easier to remember. I also have mapped the 4 cursor keys (left/right/up/down) to exactly the same keys on the calculator. And for the (only) few keys for which there's no direct PC-key I could in fact find a very good representation which is easy to remember (e.g. Y for x<>y, Z for RDN, # for +/-, etc.)

But as I said: everybody as he likes it ...

> Well, that's of course all a matter of taste. ;-)

It is of course and it is also basically irrelevant to the goals of the project -- we're making a calculator not an emulator :-) The emulator is a step on that path just like the console version was (and still is).

wp34s EXIT key during number entry

*Message #1 Posted by **Cristian Arezzini** on 1 June 2011, 12:42 a.m.*

I noticed that during number entry, pressing (even repeatedly) the EXIT key does nothing. I don't know if that's the intended behavior for some reason, but wouldn't it be nice if pressing EXIT during number entry just canceled that entry, without modifying the stack at all? While using my 34s, a couple of times I started entering a number, then realized I didn't have to, so I had to clear x and roll down the stack, and I lost the top level of the stack...

Cristian

Re: wp34s EXIT key during number entry

*Message #2 Posted by **Walter B** on 1 June 2011, 1:20 a.m.,*
in response to message #1 by Cristian Arezzini

Ciao Christian,

Thanks for your observation. Following page 55 of the recent manual, this behaviour is a bug since numeric entry is a pending operation :-/ We'll look into it.

Grazie,

Walter

Re: wp34s EXIT key during number entry

*Message #3 Posted by **Paul Dale** on 1 June 2011, 2:19 a.m.,*
in response to message #2 by Walter B

Fixed I hope :-)

Well, fix in the next build.

wp34s: Version 979 Crashed 20b and 30b

*Message #1 Posted by **Jake Schwartz** on 31 May 2011, 6:24 p.m.*

Hi,

I just loaded version 979 onto my 20b and 30b and after just a few keystrokes, either machine locks up, requiring pulling the batteries. I just did 2 ENTER 5 * and by the time * was pressed, it was unresponsive. I reflashed one of my two machines a second time, but there was no change.

Thanks,

Jake

Re: wp34s: Version 979 Crashed 20b and 30b

*Message #2 Posted by **Paul Dale** on 31 May 2011, 6:41 p.m.,*
in response to message #1 by Jake Schwartz

Try 975 for the moment. 979 has a space optimisation included that isn't finished yet.

- Pauli

Re: wp34s: Version 979 Crashed 20b and 30b

*Message #3 Posted by **Marcus von Cube, Germany** on 1 June 2011, 7:10 a.m.,*
in response to message #2 by Paul Dale

The most recent update should have fixed the issue. I was saving some space in flash by replacing 4 byte wide function pointers by 2 byte short integers. I learned something about the ARM processor on the way. ;-)

HP 10B continuous memory

*Message #1 Posted by **hpnut** on 31 May 2011, 10:54 a.m.*

Hi all,

I just acquired an HP 10B, serial no. 3246S05152 made in Singapore. This is the original model algebraic financial calculator.

It passed the keyboard and display self tests as described here
http://www.keesvandersanden.nl/calculators/selftest_pioneer.php

I found that every time I switch off the unit, it will display a "0" i.e. it does not have continuous memory. Can anyone please confirm this model has no continuous memory?

I thought that all HP models after the HP 25C featured continuous memory.

hpnut in Malaysia

Edited: 31 May 2011, 10:54 a.m.

Re: HP 10B continuous memory

*Message #2 Posted by **Michael de Estrada** on 31 May 2011, 11:52 a.m.,*
in response to message #1 by hpnut

Yes, the HP-10B definitely has CMOS (continuous) memory. If the contents of memory are not being retained when the calculator is switched off, then probably power is not reaching memory. This can be due to component failure or a bad circuit connection.

Edited: 31 May 2011, 11:55 a.m.

Re: HP 10B continuous memory

*Message #3 Posted by **Bart (UK)** on 31 May 2011, 12:13 p.m.,*
in response to message #1 by hpnut

I believe it's correct that it does not remember the last displayed number. However, it does keep all the memory registers and financial registers. IIRC the 20S is the same. I do not have them with me, but will check when I get home tonight.

Bart

Re: HP 10B continuous memory

*Message #4 Posted by **Mike Morrow** on 31 May 2011, 1:25 p.m.,*
in response to message #1 by hpnut

What you see is normal. Stack (or rather, Display) contents are not preserved on the 10B and 20S, as Bart states. Registers and program memory (on the 20S) are preserved. (I just turned on my 10B and 20S for the first time in several years, they still have what I left in them from that time.)

Store something in Register 3, turn the 10B OFF, then back ON. If Register 3 still has what you stored, its CM is working.

FWIW, I think the HP-41C and the Voyagers were the first HPs to preserve everything including the stack. I don't recall that *any* LED HP calculators with CM preserved the stack. I know that the HP-19C, -29C, and -34C don't, so I suspect the 25C that you cited doesn't either (but I don't own one to test). Perhaps the LCD 10B and 20S Pioneers don't preserve the display (and internal stack) the way RPN Pioneers preserve their stack is due to them being non-RPN algebraic models. The HP 10bii doesn't preserve the display either. What about the new HP 10bii+? The HP 30b in algebraic mode *does* preserve the display.

Certainly some other HP calcs contemporary to the 25C do not have any CM. Stuff like the HP-67, -97, etc.

Edited: 31 May 2011, 1:46 p.m. after one or more responses were posted

Re: HP 10B continuous memory

*Message #5 Posted by **Michael de Estrada** on 31 May 2011, 1:37 p.m.,*
in response to message #4 by Mike Morrow

The HP-19c and HP-29c do preserved the display (x stack register), however, they do no preserve the raised stack (y,z,t). The HP-25c and HP-34c don't not preserve the display.

Re: HP 10B continuous memory

*Message #6 Posted by **Jim Yohe** on 31 May 2011, 3:11 p.m.,*
in response to message #4 by Mike Morrow

> Quote:
>
> What about the new HP 10bii+?

All's preserved in the 10bii+ from what I can tell in my use of it.

Regarding the 20s, that explains why I lose display data. Glad that was brought up.

Re: HP 10B continuous memory

*Message #7 Posted by **Tim Wessman** on 31 May 2011, 4:26 p.m.,*
in response to message #6 by Jim Yohe

That is correct.

Basically, on the 10bII+ and 20/30b the calculator shuts itself off immediately after executing your keystroke. The display is left on, but everything else is shut down if possible. Essentially, unless it is saved in the "snapshot" of the system, it is lost immediately.

Re: HP 10B continuous memory

*Message #8 Posted by **Kiyoshi Akima** on 31 May 2011, 5:01 p.m.,*
in response to message #7 by Tim Wessman

I've got a 20B that periodically loses all memory. Not just the display, but everything: data, modes, etc. Sometimes it'll happen after just a day of sitting on the shelf, sometimes it'll keep for a week or so. The 30B sitting next to it hasn't had the problem. Any ideas?

The 20B was one of the handouts at HHC 2010, if that means anything.

Re: HP 10B continuous memory

*Message #9 Posted by **Tim Wessman** on 31 May 2011, 5:12 p.m.,*
in response to message #8 by Kiyoshi Akima

Your 20b has a super old firmware that was on the first batch of units ever built. That bug was fixed in the next back that was shipped less than a month later. If you have a cable, you can flash with the latest and you'll never see it again. Gene Wright can send either cable/firmare to you if needed.

What is going on?

*Message #1 Posted by **Keith Midson** on 31 May 2011, 6:24 a.m.*

I won a VER$ 0AAAA 71B prototype complete with box, manuals and card reader on TAS for only $405!!! Not long ago, that would have been the asking price for a 'regular' production version complete boxed 71B.
There seems to be a few other rare listings on TAS at the moment (like an Xpander) for 'low' prices and not selling.
Has the world's economy died, or is there no longer any interest in HP rare stuff and prototypes?
Don't get me wrong, i'm VERY happy, but my maximum bid was MUCH higher than $405 ready for the last 10 seconds of bidding frenzy ... I'm just really surprised that there wasn't more interest. Cheers, Keith

Edited: 31 May 2011, 6:42 a.m.

Re: What is going on?

*Message #2 Posted by **Keith Midson** on 31 May 2011, 6:44 a.m.,*
in response to message #1 by Keith Midson

Just to highlight this, I found this old link to 'regular' 71B selling prices: Link to old thread
Cheers, Keith

Edited: 31 May 2011, 6:46 a.m.

Re: What is going on?

*Message #3 Posted by **Bart (UK)** on 31 May 2011, 7:20 a.m.,*
in response to message #2 by Keith Midson

There seems to be a downturn. I recently got a 1BBBB in good shape with HPIL for £37. Even though it's not boxed, this would easily go for over £100 in the past.

Re: What is going on?

*Message #4 Posted by **John Robinson** on 31 May 2011, 8:26 a.m.,*
in response to message #2 by Keith Midson

It's all in your mind Keith, just the high $AU playing havoc with your brain :-)

Cheers, John

Re: What is going on?

*Message #5 Posted by **Keith Midson** on 31 May 2011, 8:59 a.m.,*
in response to message #4 by John Robinson

Haha yes it's hard to get used to!

Re: What is going on?

*Message #6 Posted by **Allen** on 31 May 2011, 8:43 p.m.,*
in response to message #1 by Keith Midson

Keith.. congrats on the win.. I, too was watching that.

FYI, My data suggests October and May are among the two slowest buying/sales month on ebay. I think because of the holidays and vacations. Perhaps the decreased competition makes it easier to win rare listings??

Re: What is going on?

*Message #7 Posted by **Keith Midson** on 31 May 2011, 11:24 p.m.,*
in response to message #6 by Allen

Thanks Allen. Interesting - good to know that someone is keeping records. There must also be a corresponding drop in the number of items listed at those times for the same reasons.
I guess there also aren't too many people collecting the protos - i'm not even really sure why I do! So if a few aren't actively monitoring, then there will be less bids. Cheers, Keith

Clamshell, shucking the clamshell, any thoughts!

*Message #1 Posted by **Geoff Quickfall** on 30 May 2011, 8:29 p.m.*

Starting the clam shell with a non-functional 18C and a partially functional 28S

I am thinking it is the foam compression strip for the connectors on both, but, this means an operation.

I have searched the web and the only thing I see is a discourse with Tony Duell and others about heat stakes. Tony mentions that the heat stakes in this case are required to hold the upper and lower halfs together and there fore just breaking into it as some do with the pioneers is a no-no.

He recomends that the keyboard overlay be removed and the heat stakes drilled out in a careful manner, leaving enough for a good snap back into position.

My question:

Anyone out there done this or tried SUCCESSFULLY any other method?

Geoff

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #2 Posted by **db (martinez, ca.)** on 30 May 2011, 11:41 p.m.,*
in response to message #1 by Geoff Quickfall

Someone here once posted that he cut the cap portion off of the stakes while leaving as much of the projection of the stem as he could. Then he slid the pcb off/up. He mentioned that this took a lot of time and care, but it left just barely enough stem to melt back down over the pcb one time. I never tried this. Never had the patience.

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #3 Posted by **Geoff Quickfall** on 31 May 2011, 12:26 a.m.,*
in response to message #2 by db (martinez, ca.)

Think you nailed it,

patience!!!! Well, I will lift the keyboard bezel off to expose the stakes and take it from there. Maybe I will end up with a fixed calculator or a spare battery hatch at worst.

Cheers, Geoff

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #4 Posted by **db (martinez, ca.)** on 31 May 2011, 2:24 a.m.,*
in response to message #3 by Geoff Quickfall

I think that the highest use an algebraic 18c can be put to is to be the battery door donor for an RPN 28 C or S that needs one.

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #5 Posted by **Mike Morrow** on 31 May 2011, 2:08 p.m.,*
in response to message #4 by db (martinez, ca.)

Unfortunately, about the only reason a 28C or 28S will have lost its battery door is because the plastic of the calculator *around* the battery opening has cracked or broken away. AFAIK, nothing can repair the real problem that would be worth the effort. Replace the missing door, and you're left with a permanently disfigured calculator that is very likely to

lose its new door sometime in the future for the same reason the first door was lost.

A really nasty mechanical/industrial design, those clamshells!

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #6 Posted by **Paul Berger (Canada)** on 31 May 2011, 9:20 a.m.,*
in response to message #3 by Geoff Quickfall

You also need to lift the label above the display there is 10 heat stakes across the middle of the battery compartment. If you like I can send you pictures of a 28S I have open, and you can see what you are up against. I pried it apart without doing any damage to the case or the electronics inside. It still works but I have not put it back together as I need the hinge piece and I have not been looking too hard for a donor as I have another 28S in good condition.

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #7 Posted by **Geoff Quickfall** on 31 May 2011, 1:02 p.m.,*
in response to message #6 by Paul Berger (Canada)

Hello Paul,

Some pics would be highly appreciated. I have three non functioning to partially functioning clamshells aquired for the clamshell chapter in the book.

So by hook or by crook I will be operating on them. Of course any info in advance would be extremely appreciated. Pictures; YES!

Cheers, Geoff

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #9 Posted by **Keith Midson** on 31 May 2011, 6:17 a.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff, I tried to transplant working 28S guts into the shell of another 28S (a case where a 'mint' 28S didn't work and its beaten up cousin worked fine but wasn't nice to look at). It is a very fiddly job - the clamshells were not designed to be taken apart *ever*. In my case, I did manage to do the transplant, but it is hard to get the stakes to reattach to the new donor because you lose some of their length when you drill them out. You need to use a soldering iron on low strength to reattach them. I do know someone who does have the patients and is very good at it though. I can ask if he is willing to help. Cheers, Keith

Re: Clamshell, shucking the clamshell, any thoughts!

*Message #10 Posted by **Geoff Quickfall** on 31 May 2011, 1:04 p.m.,*
in response to message #9 by Keith Midson

Thanks for the info and the offer Keith.

Must do the operating for the book and document each step so I will be doing the procedure here.

Cheers, Geoff

Emu41

*Message #1 Posted by **Richard L. Taylor** on 30 May 2011, 5:40 p.m.*

Hi, I am having trouble using the Emu41 calculator emulator for the PC.

I am running the Emu41 on my Mac G4 using Virtual PC 4.0 In a Dos window. I am also running the ILPer HP-il file transfer program, using the PIL-Box hardware setup on the same Mac G4 - Virtual PC 4.0 configuration.

The PIL-Box works great. I am transfering programs and data between my Mac G4 and my HP41cx under the windows98 OS.

What I am trying to do is to create an ASCII data file called Emu41in.dat that contains one column of numbers that is stored in the Emu41 folder.

Then, have this short program in the Emu41 read the numbers into the Emu41's registers.

Ê01*LBL "IMPORT" Ê02 AUTOIO Ê03 "DOSLINK" Ê04 FINDID Ê05 SELECT Ê06 CLRDEV Ê07 0 Ê08*LBL 01 Ê09 INA Ê10 ALENG Ê11 X=0? Ê12 GTO 02 Ê13 AVIEW Ê14 RDN Ê15 ANUM Ê16 STO IND Y Ê17 RDN Ê18 1 Ê19 + Ê20 GTO 01 Ê21*LBL 02 Ê22 END

Then, have the Emu41 save the registers to an Lif format file in the Emu41 folder.

Then, read the Lif file with my HP41cx using the PIL-Box.

The trouble I am having is that I can't make the Emu41 turn the left hand display on to see the numbers in the X,Y,Z,T registers and the CAT the program listings.

One more thing is that in Virtual PC, the F1 TO F15 function keys don't work right in the Emu41 program. I am still having trouble typing the Emu41 commands right from the CMD line prompt. The manual is not helpful enough.

Is there any one who is working with this Emu41 program that would be able to give me some help. Thanks in advance.

Rich T

Re: Emu41

*Message #5 Posted by **J-F Garnier** on 31 May 2011, 1:12 p.m.,*
in response to message #1 by Richard L. Taylor

>> The trouble I am having is that I can't make the Emu41 turn the left hand display on to see the numbers in the X,Y,Z,T registers and the CAT the program listings.

With the default Emu41.ini configuration that uses HP82143 printer emulation, the normal way is to use the F9 key to switch through the OFF-MANUAL-NORMAL-TRACE printer modes.

If you can't access the F9 key, a workaround is to use the HP-IL printer emulation. To do so, just change this line in Emu41.ini:

```
6  4 prter1e.bin
to
6  4 prter2e.bin
```

Now, you can control the printer modes with the flags 15 and 16.

Maybe Mac users can help regarding how to access the function keys?

J-F

Re: Emu41

*Message #6 Posted by **Richard L. Taylor** on 31 May 2011, 6:42 p.m.,*
in response to message #5 by J-F Garnier

J-F, I did what you said to change the 6 4 prter1e.bin to 6 4 prter2e.bin. then I SF 15 and did a CAT 0 and a CAT 2 The SF and CAT worked from the CMD line, but i didn't see anything come up on the screen that was not there before the commands were sent. It is sure strange that the PIL-Box works great but not the Emu41. I guess I should give up on trying to run your EMU41 on my Virtual PC.

Classic keyboard re-lacquer ?

*Message #1 Posted by **John Robinson** on 29 May 2011, 10:05 p.m.*

Hi,

Has anyone tried to re-lacquer a classic keyboard ?, not the keys, the whole surround over the lettering etc. I presume a matt finish is required.

Any advice / comments ??

Thanks John

Re: Classic keyboard re-lacquer ?

*Message #2 Posted by **geoff quickfall** on 30 May 2011, 1:24 a.m.,*
in response to message #1 by John Robinson

Yes, this 45 was laquered:

45 restoration

as well as a few of these.

Matte spray from a model makers shop, on the label marked 'safe for plastics and decals'. See the HP 55 and 35 for spray laqueur results in the following link:

collection

Cheers, Geoff

Edited: 30 May 2011, 1:27 a.m.

Re: Classic keyboard re-lacquer ?

*Message #3 Posted by **John Robinson** on 30 May 2011, 2:00 a.m.,*
in response to message #2 by geoff quickfall

Ahhh, thanks Geoff - good point. I take it from your comment that automotive type lacquer is not recommended - it will end in tears ?

Cheers, John

Re: Classic keyboard re-lacquer ?

*Message #4 Posted by **Alberto Fenini** on 30 May 2011, 3:46 a.m.,*
in response to message #2 by geoff quickfall

ciao Geoff,

always exciting to read your articles,
can you give us any hint on the brand of the matte you are using ?
I'd like to finish mines as well, but I'm too afraid to ruin them,
it would be nice to know what you are using, may be it can be purchased on the internet.

Thanks again, take care Alberto

Re: Classic keyboard re-lacquer ?

*Message #5 Posted by **John Robinson** on 30 May 2011, 7:37 a.m.,*
in response to message #4 by Alberto Fenini

I was about to ask the same question Alberto, I noticed in Tamiya's website they have several ranges of spray paints, for instance the "TS" range has TS-13 "Clear", TS-79 "Semi Gloss" and TS-80 "Flat Clear". Presumably Flat Clear would be best ??

Thanks John

Re: Classic keyboard re-lacquer ?

*Message #6 Posted by **Geoff Quickfall** on 30 May 2011, 12:31 p.m.,*
in response to message #5 by John Robinson

TS-80 "Flat Clear". These are used on plastic models and due not melt the decals. As such they are safe on the labels.

After cleaning some of my keyboard bezels with decomposed laqueur due to UV damage and age, I was left with a white bloom after allowing the bezel to dry.

The laqueur caused that to vanish. Also, when washing the keyboard be very gently. Use a soft paint brush with natural bristles and when drying, pat dry, do not rub or scrub as the silk screening, especially on the woodstocks as the silk screening may also dissappear.

I also masked the chrome outwards:

Thank you very much Geoff,

Re: Classic keyboard re-lacquer ?

*Message #8 Posted by **Alberto Fenini** on 30 May 2011, 4:26 p.m.,*
in response to message #6 by Geoff Quickfall

Thank you very much Geoff !!
I had tried with several products, and the best results (however far from yours),
were obtained with a Saratoga cream or a cream for wood ("Pronto")from Johnson Wax,
both have some "carnauba" ingredient which works quite well.
I have just inquired the local resellers from Tamiya and I'll keep you posted on the results.
Take care and thank you very much ! Alberto

O.T. : I have seen a couple of your posts on the DWF forum, and I have a couple of questions about restoring LCD/LED watches,
can I pm you on this ??

in response to message #8 by Alberto Fenini

One more thing ...
On the classic, spice and other series I can understand that keys have to be removed,
but when it comes to the Woodstock, the Voyager and the 7X family (71/75) is it really necessary to remove the keys ?
Thanks again, alberto

Re: Classic keyboard re-lacquer ?

*Message #10 Posted by **Geoff Quickfall** on 30 May 2011, 5:09 p.m.,*
in response to message #9 by Alberto Fenini

For an even non messy application one should remove the keys. Of course, woodstocks et. al. are problematical.

I personally would live with a bad keyboard as opposed to dissecting any of the riveted keyboards for the sake of appearance only.

Wait till a dead woodstock with good keyboard comes up and swap the PCA.

Otherwise you would have to mask each key and prevent the laqueur from leaking to the keyboard membrane and etc.

Must say, never attempted that! Only dealt with keyboards that come apart easily.

If you used a wax on some of the bezels you will have to remove it before laqueuring. And without scrubbing. Luke warm water with a mild soap solution. Also, some waxes come with volatiles such as toluene. These can lift the silk screening and melt the surface so be careful with wax. Also, do not wax the LED red plastic. Wax contracts when drying and can craze the surface of the plastic. Learnt this in the aviation world, I have seen wat waxed plexiglass windshield looks like. Took ours of polishing with

cerium oxide to remove the crazing.

Cheers, Geoff

in response to message #6 by Geoff Quickfall

Hi Geoff,

Thanks for the confirmation re TS-80. I have been using a soft bristle tooth brush - my wife's (only joking !!) to clean up the keyboard, it's probably a little harsher than the shaving brush, but so far no problem.

Also, thanks for the pic showing how you mask it for spraying, I had imagined something like that, but I wasn't sure about the section which holds the magcard, i.e. whether to spray it or leave it alone.

Cheers, John

ok Geoff, I have ordered some Tamiya flat clear spray paint. I guess the follow up question is : what do recommend for the silver trim ? Some kind of "chrome" paint ? and is auto paint a possibility here since there are no decals ?? I can't see a chrome paint in the Tamiya range.

Thanks John

Re: Classic keyboard re-lacquer ?

*Message #16 Posted by **Geoff Quickfall** on 30 May 2011, 9:29 p.m.,*
in response to message #15 by John Robinson

That is the proverbial question John!

The original is a vacuum chrome plate and we can't do that here.

I use testors or tamiya silver/chrome paint. It comes in a bottle, or as a marker in some stores. I hand paint although you could mask again (time consuming and same result as hand paint if you are careful). It doesn't give the chrome shine.

Some people have proposed silver guilt using a sizing compound.

Painting is the easiest, although if you use the calc daily it will need a repeat. Just got an airbrush but haven't set it up yet. Don't know it it would be shinier then the paint technique.

Cheers, Geoff

Re: Classic keyboard re-lacquer ?

*Message #17 Posted by **Alberto Fenini** on 31 May 2011, 5:44 a.m.,*
in response to message #16 by Geoff Quickfall

Personally, I have tried at least five different types of pens, none is shining as the original, but some are quite close.
I have been told that this is because the chrome component is toxic and therefore not included any more in the pens.
I'm thinking about thin self adhesive plastic which is available in a flavour of colors, including shining chrome.
If cutted in thin stripes it should be not too difficult to put it on the top trim, like that on the HP35.
Retouching the rounded corners is another story, and for that I'm happy with the pens.
I'll post a picture later tonight with all the kind I have tried.
take care Alberto

*Message #18 Posted by **Alberto Fenini** on 2 June 2011, 6:31 a.m.,*
in response to message #17 by Alberto Fenini

Dear All,
these are all the types of pens I have tried.

Some have rounded head, some have squared head.

All of them looks shine, but when applied the results may be very different.
I have obtained the best results with the Nettuno.
The only problem I have had, is that since I used a Saratoga cream to get a good aspect of the keyboard, this (and other creams) will dilute the silver painting.
Today is bank holiday in Italy, so no luck to get the Tamiya spray ....

HP15c as a financial tool - ended!

*Message #1 Posted by **Jose Gonzalez Divasson** on 29 May 2011, 3:58 p.m.*

With the last blog (number IV) we end the series try to get the most important financial tools that were missing in the plain HP15c, while leaving 16 free registers for a 4x4 matrix inversion, or solving two 3-equation systems using the same set of coefficients (9+3+3)

NutStudio tools goes RPN (HP-41)

*Message #1 Posted by **Håkan Thörngren** on 29 May 2011, 3:24 p.m.*

I made new major release of NutStudio tools for the HP-41 back in January, but did not announce it. Anyway, here it is.

NutStudio tools allows you to make module images for the HP-41.

New major features in release 2.1.1 are:

1. An RPN compiler (rpncomp) that will turn your RPN programs, text source or raw files into relocatable object files. Such object files can be linked with others to create your own RPN (or mixed RPN and MCODE) modules.
    - Branch size are selected for reachability and are properly compiled.
    - Automatic extraction of global lables for the FAT (exceptions can be specified on the command line).
    - Copy header words are also properly generated.
2. A barcode generator that accepts RPN programs in the same format as rpncomp that generates Postscript output that can be read by the 82153A Wand.
3. Simple import mechanism for using functions from (other) modules in RPN programs.
4. Example projects, Hello World and a mixed RPN/MCODE games module.
5. Better support for more precise section placement in the linker. Any old linker rules files from version 1 need to be updated due to this.
6. Full support for UTF-8 encoded unicode source files. The assembler and compiler expects UTF-8 input and will handle unicode properly all the way to the output files. (ASCII being a subset of UTF-8 works equally well).
7. Better handling of HP-41 special characters and conversions to ASCII or LCD characters depending on context. Make use of Halfnut characters in your MCODE instruction names if you dare!
8. Arbitrary characters allowed in assembler labels by using backquote syntax.
9. Proper treatment of quoted characters as in the C language, in character and string literals, as well as backquoted labels.
10. Updated manual.

Pre-built download images are available from http://code.google.com/p/nutstudio/downloads/list You will find documentation, installers for Mac OS X (both PowerPC and Intel x86), Linux Debian/Unbuntu as well as release zip for Windows and a generic Linux release.

in response to message #1 by Håkan Thörngren

Thanks a lot; this is very useful. Of course I just had to create a bar code but I got strange compiler errors. It turned out it was a file created by *HP41UC.EXE* thus the lines ended with *\r \n* instead of *\n*. Once *dos2unix* was applied everything was fine. But it took me some time to figure it out.

Cheers and keep the good work going
Thomas

> Thomas

Thanks for pointing this out. It should of course support native host line ends. I will need to look into this.

A quick look reveal that I get source out with LF line ends, Emacs adapts to it and makes it look fine, and all tools are also happy, so I never noticed it.

a cute little challenge

*Message #1 Posted by **Don Shepherd** on 28 May 2011, 9:30 p.m.*

OK, this is similar to a challenge I offered in January, but it's a bit different.

Write a program on whatever HP calculator you want to answer this question: is there a 4-digit number abcd such that $a^a+b^b+c^c+d^d$ = abcd?

Brute force is easy. How about a non-brute force?

Don

Re: a cute little challenge

*Message #2 Posted by **Thomas Klemm** on 28 May 2011, 11:14 p.m.,*
in response to message #1 by Don Shepherd

An (easy) solution for the HP-48:

```
\<<
    {1 4 27 256 3125} \-> P
    \<<
        { }
        1 5 FOR a
        1 5 FOR b
        1 5 FOR c
        1 5 FOR d

          a 10 *
        b + 10 *
        c + 10 *
        d +

        P a GET
        P b GET +
        P c GET +
        P d GET +
        OVER
        IF == THEN + ELSE DROP END

        NEXT
        NEXT
        NEXT
        NEXT
    \>>
\>>
```

Gives the solution: { 3435 }
With 625 trials probably still using too much force.
At least a little better than testing 10,000.

Thanks for the challenge
Thomas

Re: a cute little challenge

*Message #3 Posted by **Thomas Okken** on 29 May 2011, 3:07 a.m.,*
in response to message #1 by Don Shepherd

Nice puzzle! Let's see...

None of the digits can be larger than 5, because 6^6=46656, which is not a 4-digit number.
The digits can't all be 5, because 4*5^5 is too large. There also can't be 3 fives, because then the sum would be >= 9375, and there can be no digits larger than 5 in the right-hand side. There also can't be 2 fives, because then the sum would be >= 6250.
There can't be no fives, because four fours would give a sum of 1024, which is not a solution, and anything with no fives and less than four fours gives a sum of less than 1000, which is not a four-digit number. Ergo, there must be exactly one five.
The remaining three digits must all be less than five, so the sum of the powers can be no more than 5^5+3*4^4=3893. One five and three fours isn't a solution. One five and two fours gives a sum of >= 3637, which fails because the second digit of the sum is always too large. So there can be at most one four in the solution.
Given that there must be exactly one five and no more than one four, the sum of the powers can be no more than 5^5+4^4+2*3^3=3435, which happens to be a solution. The lower bound on the sum of the powers is 5^5=3125, so the first digit of the solution must be 3.
Given that the solution must have one five, at least one three, and at most one four, there are two groups of potential solutions: five, three, and two digits <= 3, and five, four, three, and one digit <= 3.
In the first group, with a five, at least one three, and no fours, the sum of the powers is between 3152 and 3206, so the second digit can't be a 3, so there are at most two threes, which lowers the upper bound of the sum to 3183, which means there must be at least one one, which lowers the upper bound of the sum to 3180.
So, the solution must have 5, 4, 3, and one digit between 0 and 3, or it must have 5, 3, 1, and one digit between 0 and 3. Out of those 8 potential solutions, only 5, 4, 3, 3 works. That's technically still a brute-force answer, but brute-forcing among 8 solutions is better than doing it among 9000, I guess. :-)

Edited: 29 May 2011, 3:30 a.m.

Re: a cute little challenge

*Message #4 Posted by **Thomas Klemm** on 29 May 2011, 5:51 a.m.,*
in response to message #3 by Thomas Okken

What a profound analysis! Great work!
But we'd still have to check (at most) 4! = 24 permutations for each of these 8 possible solutions. Instead we can calculate MOD 9 on the sum.

We start with a table:

```
n       :     0     1     2     3     4     5
n^n     :     0     1     4    27   256  3125
n^n % 9 :     0     1     4     0     4     2
```

First we check: 5, 3, 1, 0..3:

```
    5 + 3 + 1 = 0      2 + 0 + 1 = 3

0   0 + 0 = 0            3 + 0 = 3
1   0 + 1 = 1            3 + 1 = 4
2   0 + 2 = 2            3 + 4 = 7
3   0 + 3 = 3            3 + 0 = 3
```

But 5,3,1,3 yields 3125+27+1+27=3,180.

No solution so far. Let's try: 5, 4, 3, 0..3:

```
    5 + 4 + 3 = 3      2 + 4 + 0 = 6

0   3 + 0 = 3            6 + 0 = 6
1   3 + 1 = 4            6 + 1 = 7
2   3 + 2 = 5            6 + 4 = 1
3   3 + 3 = 6            6 + 0 = 6
```

This leaves the only solution: 5, 4, 3, 3
But we still don't know the correct order. So here's the program for the HP-42S:

```
LBL "CUTE"
5
ENTER
y^x
4
ENTER
y^x
+
3
ENTER
y^x
+
LASTx
+
END
```

This gives the correct answer: 3,435

Cheers
Thomas

Edited: 29 May 2011, 6:34 a.m.

Re: a cute little challenge

*Message #5 Posted by **Thomas Okken** on 29 May 2011, 3:02 p.m.,*
in response to message #4 by Thomas Klemm

There's no need to check permutations; you just brute-force check the 8 possible digit combinations (5310 5311 5312 5313 5430 5431 5432 5433), by calculating the sum of powers for each, and check if the result contains the same digits as the digit combination. 5433 yields the sum of powers 3435, which has the same digits as 5433, so 3435 is your answer.

Edited: 29 May 2011, 3:08 p.m.

Re: a cute little challenge

*Message #6 Posted by **Thomas Klemm** on 29 May 2011, 10:20 p.m.,*
in response to message #5 by Thomas Okken

My assumption was that we have the four digits a, b, c, d and the sum $s = a^a+b^b+c^c+d^d$.

We could calculate 10(10(10x+y)+z)+t for each permutation of a, b, c, d and compare that to s.

Or we could split s into four digits A, B, C, D and check that each is contained in the set {a, b, c, d} as you suggested. For this we could use flags with the HP-42s or POS with the HP-48.

My suggestion was to compare (a+b+c+d) % 9 with (A+B+C+D) % 9 = s % 9 as we wouldn't have to split s into four digits.

Unfortunately we'd still have a false positive with 5 3 1 3; we could leave its falsification as an exercise to the user.

Best regards
Thomas

Edited: 29 May 2011, 10:34 p.m.

Re: a cute little challenge

*Message #7 Posted by **Thomas Okken** on 29 May 2011, 11:13 p.m.,*
in response to message #6 by Thomas Klemm

That's a lot less efficient than doing it the other way around, though: if you enumerate all combinations of 4 digits, you have only 715 combinations to check, and if you restrict it to the digits 0...5, there are only 126. The logic for the efficient brute-force approach would be like this:

```
for (a = 0; a <= 9; a++) {
    for (b = a; b <= 9; b++) {
        for (c = b; c <= 9; c++) {
            for (d = c; d <= 9; d++) {
                s = a^a + b^b + c^c + d^d;
                t = sort_digits_ascending(s);
                if (abcd == t) print("Solution found: " + s);
            }
        }
    }
}
```

Re: a cute little challenge

*Message #8 Posted by **Thomas Klemm** on 30 May 2011, 3:56 p.m.,*
in response to message #7 by Thomas Okken

My first attempt was the following python script:

```
N = range(5+1)

for a in N:
    for b in N:
        for c in N:
            for d in N:
                if ((10*a + b)*10 + c)*10 + d == a**a + b**b + c**c + d**d:
                    print a, b, c, d
```

It took me a few minutes to type that and I got the result in 0m0.018s.
IMHO there's no reason to optimize that.

It took me probably an hour or so to translate that to the RPL program I already posted.
That's because I'm not too familiar with it and furthermore I fumbled a while until I succeeded
to transfer the program to the calculator using kermit.

Nothing to be proud of. Maybe a little improved since the powers are cached.
But I'm not even sure since accessing an element of a list seems to be quite slow.
It takes about 36s to complete.

Here's my last attempt for the HP-41:

```
 01 LBL "CUTE"      18 RCL 11           35 RCL 15           52 RCL 14
```

```
02 1              19 RCL 00          36 STO 13          53 +
03 STO 01         20 *               37 LBL 13          54 VIEW X
04 4              21 STO 06          38 RCL 07          55 RCL 10
05 STO 02         22 RCL 15          39 RCL 13          56 RCL IND 14
06 27             23 STO 12          40 +               57 +
07 STO 03         24 LBL 12          41 RCL 00          58 X=Y?
08 256            25 RCL 06          42 *               59 STOP
09 STO 04         26 RCL 12          43 STO 09          60 DSE 14
10 3125           27 +               44 RCL 08          61 GTO 14
11 STO 05         28 RCL 00          45 RCL IND 13      62 DSE 13
12 10             29 *               46 +               63 GTO 13
13 STO 00         30 STO 07          47 STO 10          64 DSE 12
14 5              31 RCL IND 11      48 RCL 15          65 GTO 12
15 STO 15         32 RCL IND 12      49 STO 14          66 DSE 11
16 STO 11         33 +               50 LBL 14          67 GTO 11
17 LBL 11         34 STO 08          51 RCL 09          68 END
```

Now also intermediate results are cached in registers 06-10 which makes the innermost loop shorter.

You're using a magic function "sort_digits_ascending(s)" which I couldn't find neither within the HP-48 nor the HP-41. Both calculators lack a split-function. The HP-41 doesn't have a built-in sort-function. So you'd have to implement that which might be a little more than just two additions and a comparison.

While you're correct that 126 is smaller than 625 the elapsed time depends also on what you're
doing within the innermost loop. So my solution for the HP-41 could still be faster.

And then it might also take a little more to implement your solution than my rather dumb straightforward programs.

Kind regards
Thomas

PS: Just adapted the program above for the HP-42S using RCL-arithmetic, removing line 54

and using VIEW ST X instead of line 59. I got the result within 0.06s in Free42 on my iPhone.
That's fast enough for me. Thanks a lot for making that possible.

Edited: 30 May 2011, 4:44 p.m.

Re: a cute little challenge

*Message #9 Posted by **Gerson W. Barbosa** on 30 May 2011, 6:59 p.m.,*
in response to message #8 by Thomas Klemm

It's a bit late, but I've decided to implement my idea as of yesterday night, when Thomas & Thomas came and solved the challenge nicely. (I'd gone as far as seeing there was no digit greater than five and there was only one five, and I was also thinking of sorting the digits - that's all I'll be using).

The "cuteness" of Don's problem resides in the fact that it can be solved without brute force (or at least with moderate force as in the program below) unlike, I think, "finding a 4-digit number abcd such as a^b+c^d = abcd".

```
%%HP: T(3)A(D)F(,);
DIR
  CLC
  \<< 1, 4,
    FOR a 1, 4,
```

```
      FOR b 1, 4,
        FOR c { a b c } DUP DUP ^ \GSLIST 3125, + N2L SORT SWAP 1, * {
5, } + SORT DUP2 == { ^ \GSLIST KILL } { DROP2 } IFTE
        NEXT
      NEXT
    NEXT
  \>>
  N2L
  \<< \->STR DUP HEAD SWAP 1, 3,
    START TAIL HEAD LASTARG
    NEXT DROP 4, \->LIST STR\->
  \>>
END
```

The solution is found in 17 seconds on the hp-50g, which is too much time when compared to the 36 seconds you have obtained on your HP-41 program.

Best regards,

Gerson.

Re: a cute little challenge

*Message #10 Posted by **Gerson W. Barbosa** on 31 May 2011, 7:23 p.m.,*
in response to message #9 by Gerson W. Barbosa

Seven seconds on the hp50g and there's still a lot of room for improvement as the inner loop is not so efficient as is could be. I have disregarded digits 0 because 0^0 is defined as 1 on the hp50g. BTW, it is defined differently in these two related OEIS sequences.

```
%%HP: T(3)A(D)F(,);
DIR
  CLC
  \<< 1, 4,
    FOR a a 4,
      FOR b b 4,
        FOR c { a b c } DUPDUP ^ \GSLIST 3125, + N2L SORT SWAP 1, * {
5, } + SORT DUP2 == { ^ \GSLIST KILL } { DROP2 } IFTE
        NEXT
      NEXT
    NEXT
  \>>
  N2L
  \<< \->STR 1, 4,
    FOR i DUP i i SUB SWAP
    NEXT DROP 4, \->LIST STR\->
  \>>
END
```

> ```

Very nice! That's one of the reasons I like RPL.

> Quote:

there's still a lot of room for improvement as the inner loop is not so efficient as it could be

---

Using the '9 MOD' trick the expensive check is avoided in most of the cases:

```
\<< { } 1 4
  FOR a a 4
    FOR b b 4
      FOR c { 5 } a + b + c +
        DUP DUP ^
        \GSLIST OVER
        \GSLIST OVER
        - 9 MOD
        IF 0 ==
        THEN N2L
          SORT SWAP SORT
          IF DUP2 ==
          THEN ^ \GSLIST +
          ELSE DROP2
          END
        ELSE DROP2
        END
      NEXT
    NEXT
  NEXT
\>>
```

I had problems using { a b c } with the HP-48. The local variables are not evaluated resulting in an algebraic expression. However adding them to the list is fine. Maybe using \->LIST is faster. Other suggestions?

The execution time dropped from about 1.5s to 0.6s using m48 on the iPhone.

Cheers
Thomas Klemm

*Message #12 Posted by **Gerson W. Barbosa** on 2 June 2011, 8:35 a.m.,*
in response to message #11 by Thomas Klemm

Great improvement! 2.67 seconds on the hp50g.

You're right, \->LIST is faster, 2.46 seconds:

```
%%HP: T(3)A(D)F(,);
DIR
  CLC
  \<< { } 1, 4,
    FOR a a 4,
      FOR b b 4,
        FOR c a b c 3, \->LIST 5, + DUP DUP ^ \GSLIST OVER
\GSLIST OVER - 9, MOD
          IF NOT
          THEN N2L SORT SWAP SORT
            IF DUP2 ==
            THEN ^ \GSLIST +
            ELSE DROP2
            END
          ELSE DROP2
          END
        NEXT
      NEXT
    NEXT
  \>>
  N2L
  \<< \->STR 1, 4,
```

```
    FOR i DUP i DUP SUB SWAP
    NEXT DROP 4, \->LIST STR\->
  \>>
END
```

Regards,

Gerson.

A naive translation to the 34s of this hp-41 program takes about 0.4 seconds to find the solution in real mode and 0.3 seconds in integer mode.

Wow, that's fast. Thanks for taking the time to measure it. Just keep in mind that here we count down from 5555 to 3435. Thus bailing out at the first occurence of a solution might not be fair. Or just be careful when comparing the figures.

Kind regards
Thomas

> n^n % 9 :     0     1     4     0     4     2
> ```

Dear Tomas,

In your table we read that $n^n=0$ when $n = 0$. This is an interesting assumption. We generaly assume that 0^0 is either *1* or *undefined*.

I am always surprise how a so little detail can reveal so great philosophical aspect of day to day and primary mathematic !

These thinkings lead me to ask one stupid question.

Is twelve (when written as *0012*) a four digits number ?

If the answer to this question is true, then when have to consider that 30 and 31 are also solutions of the general formulea $a^a+b^b+c^c+d^d$ when considering 0^0 to be equal to *1*.

Re: a cute little challenge

*Message #19 Posted by **Thomas Klemm** on 31 May 2011, 8:01 a.m.,*
in response to message #18 by C.Ret

> Quote:
>
> This is an interesting assumption. We generaly assume that 0^0 is either *1* or *undefined*.

There are several ways to define 0^0 as a limit:

- $\lim_{x \to 0} x^x = 1$
- $\lim_{x \to 0} x^0 = 1$
- $\lim_{x \to 0^+} 0^x = 0$

Given that we look at numbers of the form n^n you may consider *0* a poor choice.

Some may have noted that I cheated a little in my programs since I omitted *0*. The main reason was not gain in speed
but that lists in the HP-48 start with index *1*. And then again *DSE* skips *0*.

I wouldn't consider twelve a four digits number. Otherwise what's gained with this expression compared to "smaller than 10^4"?

Thomas

About 0031... how could it be a solution?

Edited: 2 June 2011, 12:53 p.m.

Re: a cute little challenge

*Message #21 Posted by **C.Ret** on 3 June 2011, 8:55 a.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

Yes, you are right, sorry for that. 31 have to be consider as a 5 digits number :

[pre] $00031 = 0^0 + 0^0+0^0+3^3+1^1 = 1+1+1+27+1 = 31$

HP41E question

*Message #1 Posted by **Dwight Sturrock** on 28 May 2011, 8:26 p.m.*

Based on Egan Ford's article on this site on "HP41C to HP50G Migration", I started to enter a program using the 50G keyboard. Everything went fine until I tried to insert something from the catalog into the program. ANY key I press enters that key's function instead of what I have selected in the catalog.

[while in program mode] CAT 3 (I scroll down until I find the selection I want, for example,) X#0 ENTER

Instead of giving me the "X#0" I get the ENTER key placed in the program.

Any ideas anyone?

OT: New Hand-Written Math Solver

*Message #1 Posted by **Steve S** on 27 May 2011, 7:43 p.m.*

Although we all lover our HP calculators, there are some things to be said for other math solving approaches.

For those who have tablet PCs, a new math solver, apparently intended for classroom use, has just surfaced: FluidMath. See:

www.fluiditysoftware.com

A 10-day trial version is available after you register at the website. FluidMath is clearly a work in progress (it only does arithmatic, roots, logs, trig and sums) but the developers are clearly intending to expand FM's capabilities.

Unfortunately, the intended price (and terms)make it clear that this is a product mostly intended for institutions. MathJournal by xThink has a much wider scope of application and is less than half the price (but it's also now 5 years old).

ATTENTION 41CL Early Adopters

*Message #1 Posted by **Monte Dalrymple** on 27 May 2011, 2:41 p.m.*

If you were on the list for one of the first batch of 41CL circuit boards you should have received an email with a link to the order form last week. To date I have only received replies from eleven out of twenty people. I should be ready to start shipping next week, so if you want to maintain your place on the list please email me to that effect. If you know that you want to pass on the offer I would appreciate an email to that effect too. I'll send a confirmation email to those of you who have replied so you know that I have your information.

Thanks, Monte

HP-41 + card reader = "Malfunction" ?

*Message #1 Posted by **BobVA** on 27 May 2011, 6:37 a.m.*

Hi:

I've got a pre-overhauled HP-41 card reader from eBay that works fine with one Fullnut HP-41C and not with another. I suspect it's a problem with that calculator, but can't figure out what it is. Here's what I've found/done:

- Inserting a card in the reader immediately results in a display of "Malfunction" followed by "Card". I don't hear the motor start at all.

- If the calculator is off, inserting a card can cause the motor to start and turn very slowly.

- A module or printer plugged into to the same physical port the reader uses works fine.

- No other modules installed.

- No other problems noted with the calculator.

- Catalog correctly shows the card reader functions.

History: I had some intermittent turn-on problems with this calculator, which I first tried to resolve by cleaning the zebra connector and all board connectors. Seemed to work for a while but eventually the problem returned. Second try was to re-solder all the display board wires which appeared to permanently resolve the problem.

I re-cleaned the board / module connection again but didn't notice any improvement in the card reader problem.

Any speculations whether this is a calculator problem or reader problem? Any suggestions for troubleshooting?

Thanks!

Bob

Re: HP-41 + card reader = "Malfunction" ?

*Message #2 Posted by **Michael de Estrada** on 27 May 2011, 7:52 a.m.,*
in response to message #1 by BobVA

Have you tried changing out the batteries? The card reader motor pulls more current than other periferals and might not function properly if the batteries are low.

Re: HP-41 + card reader = "Malfunction" ?

*Message #3 Posted by **BobVA** on 28 May 2011, 9:46 a.m.,*
in response to message #2 by Michael de Estrada

Thanks! I did swap the battery packs. No luck.

Re: HP-41 + card reader = "Malfunction" ?

*Message #4 Posted by **Randy** on 27 May 2011, 8:35 a.m.,*
in response to message #1 by BobVA

If the zebras are the pink elastomer version, that's the problem.

Re: HP-41 + card reader = "Malfunction" ?

*Message #5 Posted by **geoff quickfall** on 27 May 2011, 2:33 p.m.,*
in response to message #4 by Randy

Hello Randy,

Is it a cleaning that is required or a new elastomer strip? If a new strip, any sources other then another calc? Also any sources for the wire wrap connectors?

That is, has the carbon in the elastomer lost its (due to cracks or aging) conductivity?

Thanks, Geoff

Edited: 27 May 2011, 2:36 p.m.

Re: HP-41 + card reader = "Malfunction" ?

*Message #6 Posted by **Randy** on 27 May 2011, 6:28 p.m.,*
in response to message #5 by geoff quickfall

Cleaning almost always makes the condition worse. They need to be replaced with either gold version from another unit. The pinkies have relatively high resistance, usually above 50 ohms when good. They reach 1000 ohms and higher which is okay for most signals but doesn't play well suppling power to Clonix, card readers and other high draw items.

The other cause can be corrosion or other sources of poor connectivity on the battery i/o block to keyboard connection.

Re: HP-41 + card reader = "Malfunction" ?

*Message #7 Posted by **Geoff Quickfall** on 27 May 2011, 9:42 p.m.,*
in response to message #6 by Randy

Thanks Randy.

Re: HP-41 + card reader = "Malfunction" ?

*Message #8 Posted by **BobVA** on 27 May 2011, 10:51 p.m.,*
in response to message #4 by Randy

This is the first one I've seen, but it looks white to me. After I read the responses I took a look at the schematic and saw that the power for the card reader motor runs through that zebra connector. Ugh.

I guess the next step would be to replace that connector with wires?

Thanks for all the responses!

Bob

Re: HP-41 + card reader = "Malfunction" ?

*Message #9 Posted by **Randy** on 28 May 2011, 8:08 a.m.,*
in response to message #8 by BobVA

You could ohm out the circuit before doing something drastic like soldering wires to things...

Re: HP-41 + card reader = "Malfunction" ?

*Message #10 Posted by **BobVA** on 28 May 2011, 9:55 a.m.,*
in response to message #9 by Randy

I'll check the zebra strip and see what I find. But if I do find a bad spot, is there anything I can do about it?

Or is the idea if I don't find anything amiss then the problem is elsewhere?

If the strip is bad has anyone identified a compatible replacement?

Thanks for the help!

Bob

Re: HP-41 + card reader = "Malfunction" ?

*Message #11 Posted by **geoff quickfall** on 29 May 2011, 1:56 p.m.,*
in response to message #10 by BobVA

thats the problem Bob!

the only solution is to find a defunct 41 (non repairable) and harvest the elastomer or wire wrapped (peferable) connector.

i have tried to find replacements but have been relegated to the harvesting.

no spares I am afraid.

Geoff

*Message #12 Posted by **BobVA** on 30 May 2011, 8:22 a.m.,*
in response to message #11 by geoff quickfall

I disassembled the 41 and, contrary to my memory, the elastomer contact strip is of the pink species. A quick check with a VOM showed several spots with high (>1k ohm) resistance.

I saw a replacement flex wire connector on TAS (just the flex part, not the plastic frame), I'm not sure if the plastic frame used for the elastomer strips can be used/adapted for that style of interconnect. I'll probably give that a shot before doing the zillion wire solder job, though.

I'll post if I have any good results.

Thanks Geoff and Randy.

Edited: 30 May 2011, 8:22 a.m.

Re: HP-41 + card reader = "Malfunction" ?

*Message #13 Posted by **BobVA** on 5 June 2011, 4:35 p.m.,*
in response to message #12 by BobVA

Just to close the loop on this - I replaced the elastomer strips with a new old stock flex wire strip and that fixed the card reader problem.

Thanks again for the help, everyone.

Regards, Bob

Documentation for ROMs in the 41CL ... link included...help needed

*Message #1 Posted by **gene wright** on 26 May 2011, 4:19 p.m.*

So, what documentation (apart from finding the Grapevine book for the Advantage rom) exists for the Advantage applications rom?

What documentation exists for a lot of these? :-)

This will be a work in process. Link below will be to the current version of this document, which I will attempt to update.

FEEL FREE to download the document and add information. :-)

I hope you can see what I'm trying to do with this...

The column that is VERY important is the link to documentation online somewhere for the roms. This file is a work in process and I will update the file linked to as needed.

Help?

Excel version of HP 41 module list with 41CL notes and documentation links

Re: Documentation for ROMs in the 41CL ... link included...help needed

*Message #2 Posted by **gene wright** on 27 May 2011, 1:03 p.m.,*
in response to message #1 by gene wright

Thanks to Angel Martin for providing a file with lots of information in it. Here's an example of the function level detail I think we should try to make available for the HP 41 roms. Suggestions on the best place to host this file going forward? TOS?

http://dl.dropbox.com/u/10022608/Alpha%20ROM%20Functions.pdf

Here is Angel's list of all (mostly) rom functions:

http://dl.dropbox.com/u/10022608/Most%20ROM%20Functions.pdf

Link is provided as I can't get the hotlink to work on this for some reason.

Edited: 27 May 2011, 1:33 p.m.

HP41 MLDL2000 add-on wins Distinctive Excellence award

*Message #1 Posted by **Meindert Kuipers** on 26 May 2011, 3:38 p.m.*

With some pride I am happy to announce that my ARM-based expansion for the MLDL2000 V2 has won a Distinctive Excellence award in the Circuit Cellar NXP mbed Design Challenge. The list of DE awards and winners can be found here.

For those interesting in a demo, please have a look at youtube here.

Next step is to make this into something real, as this currently exists only on a breadboard on my desk ...

Meindert

Re: HP41 MLDL2000 add-on wins Distinctive Excellence award

*Message #2 Posted by **PeterP** on 26 May 2011, 5:57 p.m.,*
in response to message #1 by Meindert Kuipers

that is awesome Meindert, Congratulations!!!

Sorry that I fell of the earth a bit for the last few month, new job, moving, and some other non-friendly stressors have moved my HP-41 all but out of reach. I have not written a line of code or read an article or done any such thing for months....

Heartfelt congrats to you though, this is phenominal!!!

Cheers

Peter

34S Keyboard help

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 25 May 2011, 7:31 p.m.*

Some time ago, and responding to a query for new functionality, I mentioned the keyboard behavior of the HP41C and HP42S. On these calculators (and emulators like v41 and Free42), when a key is pressed and held down, the name of the function is displayed and, if the key is kept down for a couple of seconds, the display reverts to NULL, and no operation is carried out at key release. It's very useful in the HP41 due to the USER redefinable keyboard (by means of the ASSIGN function); and perhaps not as important in the HP42S, but helpful anyway.

I learned from the responses that such behavior may be difficult to implement on the 34S, and I understand (and respect) the reasons and decisions of the design team. However, playing for the first time with my own 34S, I noticed that, in program mode, the alpha display shows the function name for each step. So, when you press a key in program mode, the display shows the function name... only that it is also recorded as a program step. In the meantime until I make or get a reasonable overlay, this helps to "map" functions to key locations.

Would it be possible to reuse some of the program-mode function-name-display-at-keypress code to offer some of the suggested functionality (perhaps without NULL)? In such a mode (a flag may activate/deactivate it), the alpha display will show the last function name for a second or two, before reverting to its "normal" usage.

Just my (additional) AR$ 0.12

Re: 34S Keyboard help

*Message #2 Posted by **Walter B** on 26 May 2011, 1:35 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Buenas tardes, Andrés,

One difference of the 34S to the 41C is we don't have assignable keys except the now four hotkeys. So a more or less permanent overlay will help a lot - I do it with a sheet of paper so far. Else I'd be lost - only Pauli knows by heart where all the labels are located so he can operate the calc without an overlay ;-)

The difference to the 42S is we can't have a complete separation of indicators and alphanumeric display in the 34S due to hardware restrictions. The LCD features only a very limited number of fixed annunciators (and we abuse some of them already). So we have to put some indicators in the dot matrix where they should stay constant as long as applicable. With displaying the function called for a short time, we'd return to the flicker of the 41C.

Nevertheless, I see the benefits of your suggestion. Pauli will tell if it's something which can be done within the code space limits set.

Walter

*Message #3 Posted by **Paul Dale** on 26 May 2011, 2:44 a.m.,*
in response to message #2 by Walter B

> Quote:
>
> Else I'd be lost - only Pauli knows by heart where all the labels are located so he can operate the calc without an overlay ;-)

Sadly this is true, apart from some of the alpha keys. I also know the keyboard to function mapping in console emulator.

> Quote:
>
> Nevertheless, I see the benefits of your suggestion. Pauli will tell if it's something which can be done within the code space limits set.

Marcus would be better at deciding this one.

The space to actually take an internal op-code returned from the keyboard handler and generate a string from it isn't going to be large. The code to display this and null it after a time period will be more complex I suspect. You'll get the command printed after every completion of a command (unlike the 41 which doesn't do this for commands that take arguments) unless extra effort/code is added.

That said, I don't really see the necessity of this once you've got an overlay.

- Pauli

Re: 34S Keyboard help

*Message #4 Posted by **Marcus von Cube, Germany** on 26 May 2011, 2:48 a.m.,*
in response to message #2 by Walter B

The question is what to do with long running functions (they display "wait..." at the moment) and if the code will fit in the roughly 1000 bytes of flash space left.

Walter has mentioned the annunciator problem. We might go the route of displaying the function name while the function is executing but with a minimum time to make it noticeable. We already have part of the infrastructure in place. Just look at the RPN indicator which flashes when a key is pressed.

Re: 34S Keyboard help

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 26 May 2011, 8:25 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Thank you Walter, Paul and Marcus, for taking this into consideration. I cannot evaluate by myself the convenience for the majority of users, nor the "cost" of firmware space, development time, and risks of damaging other features; so I'm more than glad that you take a look at this idea.

Best regards,

Re: 34S Keyboard help

*Message #6 Posted by **Paul Dale** on 26 May 2011, 5:22 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

The firmware space cost is an interesting one.

* 1000 bytes is another user code page.

* It is also space for fixing functional bugs.

* It could also be space for adding features (as this is).

Basically, the 128kb of flash is full. There are things that can be done to reclaim small amounts but I'm not aware of any low hanging fruit here anymore -- we've collected these already. I.e. nothing "big" & "relatively easy" remains to my knowledge.

Thus, it comes down to is displaying the command name more important that another page of user code? Is it more important that leaving a bit extra for bug fixing? And are future bug fixes more important that that elusive page of programs?

I'd suggest the answers to these are: don't know, probably not and definitely respectively. Still, we won't know for sure how much space it takes until it is implemented.

BTW: We've got Hugh's number factorisation in the code but disabled. Who'd be interested in this instead of the above? The reason it isn't in yet is that is isn't tiny :-) The function takes the number in X (integer or real of course) and returns the smallest prime factor.

- Pauli

Re: 34S Keyboard help

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 26 May 2011, 7:49 p.m.,*
in response to message #6 by Paul Dale

It seems that the cost in flash space is too high to afford, so let's put our hopes in the development of good overlays. Certainly other functions, improvements and revisions deserve priority for a such scarce resource. I feel that keyboard help may have been a "nice to have" item, but hardly critical or essential at all.

Thank you again for looking at my suggestion.

Best regards.

Re: 34S Keyboard help

*Message #8 Posted by **Marcus von Cube, Germany** on 27 May 2011, 3:30 a.m.,*
in response to message #6 by Paul Dale

As the "maintainer of flash space" I have my own ideas:

A program region is always 1KB in size, a total of 4 flash pages. What we have now is a few bytes too short.

We always need some headroom for bug fixing. What would you say if we offered another page for code which you are happily using and then we find out we have to reclaim the space again for other purposes on the next minor release?

Saving space without losing any functionality mainly means a redesign of the numerical algorithms. For now, most of them are coded in C. We will eventually define our own compact interpreted language for these so that adding more brain doesn't take too much code space. An

intermediate step might be to relocate some of the commands to user code, sacrificing some speed and accuracy but gaining space. We already have some functions implemented this way.

34S keyboard layout

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 25 May 2011, 7:06 p.m.*

I know the issue is complex, and the designers had indeed put much attention trying to harmonize many criteria, including color assignments, proximity of related functions, frequency of use, menu access, and many other aspects. However, as happy and grateful as I am with the 34S, I would like to mention that the up and down arrows on the 34S are just one position off from the original 30B layout.

If the blue shift key in the original 30B were to be assigned to XEQ, the arrows may be kept in their original place, easing the current labeling issues. In fact, I think that the arrow keys, numeric entry keys and basic math symbols could be kept, perhaps with just new front-side stickers. As finger-induced wearing may affect the top-surface labels, I feel that an attempt to keep original printing where possible may be considered.

Just my AR$ 0.12

Andrés,

This has been discussed here:

http://webcache.googleusercontent.com/search?q=cache:dcLfMbJCCVsJ:www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi%3Fread%3D183270+site:www.hpmuseum.org+%22keyboard+arrangement%22&cd=1&hl=en&ct=clnk&source=www.google.com

My AR$ 0.08 (I ask for less :-)

Re: 34S keyboard layout

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 25 May 2011, 7:54 p.m.,*
in response to message #2 by Gerson W. Barbosa

Gerson, thank you for pointing it out. Perhaps I briefly read it at the time, but now it's different with a "real" 34S here...

Let's see how good those vinyl stickers can be... or we may ask (again) to HP, not for a 43S but just for a "blacknut" 30B...

Re: 34S keyboard layout

*Message #4 Posted by **Walter B** on 26 May 2011, 1:45 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Andrés,

> Quote:
>
> I would like to mention that the up and down arrows on the 34S are just one position off from the original 30B layout.

Please note this problem is a transient one only. Who - outside of the financial world - will care about the layout of the 30B when the 34S is stable? d;-)

Just my 20m€ (knowing it's slightly less than the amount you mentioned ;-)

Walter

Re: 34S keyboard layout

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 26 May 2011, 8:18 a.m.,*
in response to message #4 by Walter B

Walter, thank you for your answer and for your friendly references to our local details, I really appreciate them.

Granted; if the vinyl overlays work as expected, or if HP (or someone else) offers a "blacknut" 3Xx (legendless and flashable) calculator, most keyboard issues will become moot. I agree. At least for me, I will not miss 30B functionality at all!

Best regards,

Some minimal information about roms in the upcoming 41CL library...

*Message #1 Posted by **gene wright** on 25 May 2011, 3:31 p.m.*

41CL Manual

The HP 41CL is nearing completion! Yay! On pages 18-21 of the 41CL manual, linked to above, are the ROMs that Monte has included on the 41CL flash, which again is another YAY.

However, even I have some questions on some of these ROMs as to what they even are, much less what functions are on them or even how large they are. I mean, what is the Advantage Applications rom and how would I find out? :-)

So... I'm hoping that collectively we can help put together some sort of minimal documentation on as many of these roms as we can.

Perhaps, something like this:

ROM: TREK SIZE: 4K Link to list of functions/programs: Http://.... (and yes, I know some of those links will be to TOS).

I will be glad to coordinate information if sent to me. I plan to make a presentation on using the 41CL at HHC 2011 and this would help people see this as more user friendly.

Helpers?

Re: Some minimal information about roms in the upcoming 41CL library...

*Message #2 Posted by **Juergen Keller** on 25 May 2011, 4:20 p.m.,*
in response to message #1 by gene wright

Perhaps the HP-41 Module Database might be a place to host this information. I put together this page with the help of Matthias' module list.

Some time ago I started to collect information about HP-41 modules but didn't progress due to many other projects. However, search for the 'CCD A' module and click on the name, then you see how it may look like.

Re: Some minimal information about roms in the upcoming 41CL library...

*Message #3 Posted by **gene wright** on 25 May 2011, 4:47 p.m.,*
in response to message #2 by Juergen Keller

Great. Can I get that table in a .csv (or excel) format?

But it shows part of the problem. One of the first modules listed is the advantage applications rom. What is that? :-)

If I can get the table referenced into Excel, I can add a column for links to documentation (if any).

Re: Some minimal information about roms in the upcoming 41CL library...

*Message #4 Posted by **Juergen Keller** on 25 May 2011, 5:06 p.m.,*
in response to message #3 by gene wright

The module list is available on TOS as PDF document. It needs some cut&paste operations to get it into Excel. Well, it might be quite difficult to get information about not-so-common (or in eBay slang: EXTREMLY RARE) modules.

Re: Some minimal information about roms in the upcoming 41CL library...

*Message #5 Posted by **Ángel Martin** on 26 May 2011, 8:03 a.m.,*
in response to message #3 by gene wright

> Quote:
>
> the advantage applications rom. What is that? :-)

JF-Garnier put that one thogether. It's a ROM version of the Advantage applications published on the Grapevine booklets, a nice job indeed. It has the three sections you'd expect: EE, Binary, Statics.

WRT the ROM inventory, I kept an Excel sheet for a while including many of the modules. I stopped updating it a long time ago, I think I sent it to Jürgen too. It goes to the function level, so you have a list of functions per module, per XROM, per type, etc... Will send it to you tomight.

Cheers, ÁM

I now have the excel sheet and would like contributions...

*Message #6 Posted by **gene wright** on 26 May 2011, 3:01 p.m.,*
in response to message #5 by Ángel Martin

So, what documentation (apart from finding the Grapevine book for the Advantage rom) exists for the Advantage applications rom?

What documentation exists for a lot of these? :-)

This will be a work in process. Link below will be to the current version of this document, which I will attempt to update.

FEEL FREE to download the document and add information. :-)

I hope you can see what I'm trying to do with this...

Excel version of HP 41 module list with 41CL notes and documentation links

41CV Fullnut shows "Memory Lost" consantly

*Message #1 Posted by **John Robinson** on 25 May 2011, 8:28 a.m.*

I have tried all the reset techniques, and have even swapped out the CPU board. The calc works fine with other boards. The "memory lost" board looks to be the same as the first "C/CV common board" on Diego's CPU board page : http://www.clonix41.org/Maintenance/hp-41_PCBs.htm i.e. the one with blue electro capacitors.

Can anyone help please ?

Thanks John

Edited: 25 May 2011, 8:30 a.m.

Re: 41CV Fullnut shows "Memory Lost" consantly

*Message #2 Posted by **Marcus von Cube, Germany** on 25 May 2011, 8:43 a.m.,*
in response to message #1 by John Robinson

If it can't be repaired, the machine is a perfect home for Monte's new CPU. :-)

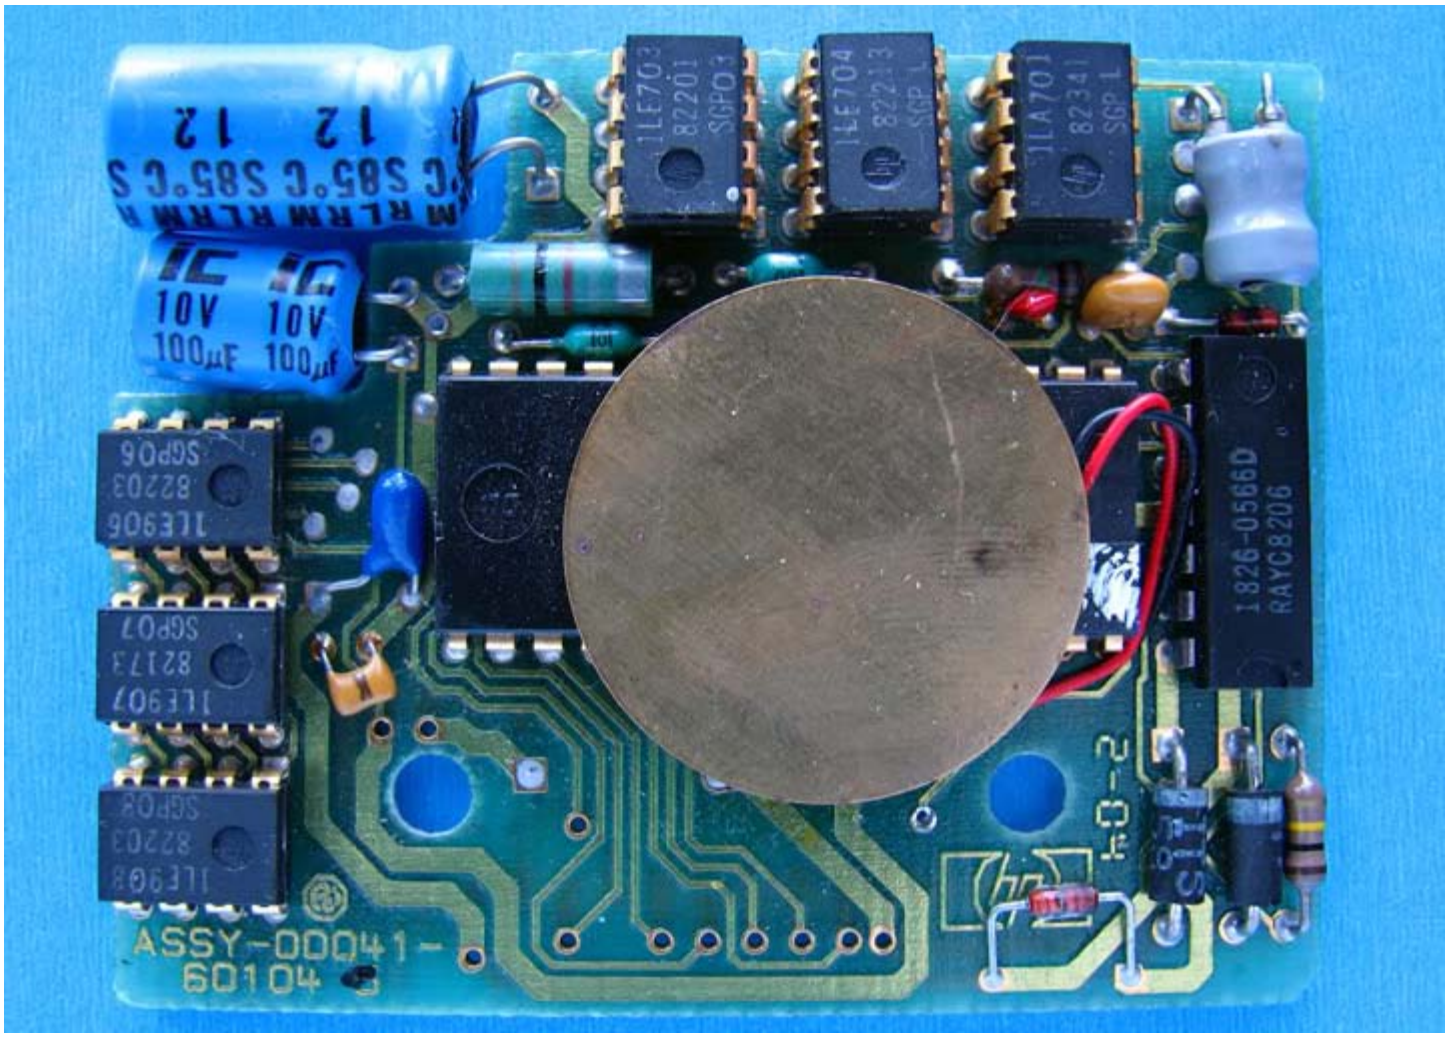
Re: 41CV Fullnut shows "Memory Lost" consantly

*Message #3 Posted by **Geoff Quickfall** on 25 May 2011, 1:31 p.m.,*
in response to message #1 by John Robinson

Questions:

It looks to be this one if I have the correct reference selected:

hp41CV/c common board, CV version:



Questions:

```
1..does the Memory Lost occur when you turn it on?
2..once on does the Memory Lost remain displayed blocking
   all key inputs?
3..once on can you then use the calculator correctly?
4..once on does the Memory Lost display intermittantly
   interupting the correct use of the calculator?
```

Hazarding a guess, if 1 and 3 then the continuous memory appears to be at fault. If 1 and 2, a faulty pca. If 4 a faulty continuous memory and connection to the pca.

If 1 and 3 then the blue electrolytic capacitors should be replaced. Someone correct me as I am away from home and my reference material. The larger capacitor is responsible for the continuous memory. As both are the same age I would recap both.

here is an excerpt from the HP 41C repair guide (this is from a 41C repair guide however the C1 capacitor still powers the calc in the off state):

2-32. Power Supply

2-33. Four replaceable 1.5V, size N batteries connected in series are the standard source of power for the HP-41C. Three diodes (CR1, CR5, and CR6, figure 4-7) protect against reverse polarity and provide isolation for the batteries and other power sources (such as in a plug-in accessory). A storage capacitor (C1) temporarily supplies power to maintain the system memory while the calculator is off and the batteries are being changed.

If 1 and 2 the power control of the cpu may be at fault although maybe the capacitor again is at fault.

Cheers, Geoff

Edited: 25 May 2011, 6:41 p.m.

Re: 41CV Fullnut shows "Memory Lost" consantly

*Message #4 Posted by **John Robinson** on 26 May 2011, 6:05 a.m.,*
in response to message #3 by Geoff Quickfall

Yes Geoff, correct CPU board. I'm afraid it's a case of 1 and 2. and in fact even the on/off switch fails to turn the calc off. So I guess that means faulty PCA, which brings me to my next question, what's a PCA ? :-)

I guess C1 is the big one ?

Thanks John

Re: 41CV Fullnut shows "Memory Lost" consantly

*Message #5 Posted by **Geoff Quickfall** on 26 May 2011, 12:32 p.m.,*
in response to message #4 by John Robinson

Yes, the big one!

Printed Circuit Assembly, PCA, aka PCB. PCA is the term HP uses for the big board.

Now, if it is the board and the C1 capacitor doesn't fix it (they cost about 10 cents) then hold on to the calc. Marcus is correct, this is a perfect candidate for Monte 41CL board.

Cheers, Geoff

Re: 41CV Fullnut shows "Memory Lost" consantly

*Message #6 Posted by **John Robinson** on 26 May 2011, 11:31 p.m.,*
in response to message #5 by Geoff Quickfall

Thanks Geoff, I'll replace C1 and report back :-)

Cheers, John

Re: 41CV Fullnut shows "Memory Lost" consantly

*Message #7 Posted by **Randy** on 27 May 2011, 8:34 a.m.,*
in response to message #6 by John Robinson

If you have case 2 after it is on, it is not a capacitor problem, its most likely a bad rom.

IMO, a bad cap is... unlikely.

Re: 41CV Fullnut shows "Memory Lost" consantly

*Message #8 Posted by **John Robinson** on 27 May 2011, 5:51 p.m.,*
in response to message #7 by Randy

Thanks Randy, you could well be right. I replaced the cap C1, and no difference in the behaviour - oh well.

Thanks for all the inup guys.

Cheers, John

Wp34s: word size lost?

*Message #1 Posted by **Cristian Arezzini** on 25 May 2011, 7:19 a.m.*

With version 946 (svn updated a few minutes ago to 955, and I flashed the newly-updated calc.bin, but on the real calc it shows 946... Is that because only the emulator was updated with the latest builds?) Anyway: if I go to integer mode, Hex, and set word size to 16 ("un 16" displayed); then I go back to decimal mode with H.d; then go back to integer Hex mode; the word size is reset to 64 bit ("un 64"). Is this a regression or has it always been like this? I can't remember now...

Cristian

Re: Wp34s: word size lost?

*Message #2 Posted by **Marcus von Cube, Germany** on 25 May 2011, 8:28 a.m.,*
in response to message #1 by Cristian Arezzini

The revision number is strange. The most recent build should now be at 956.

I can't help with the word size question. We have to wait for Pauli or Walter on this one. I assume that the word size is reset when switching back to floating point. IIRC Pauli has simplified the switch between integer and floating point by just rounding the stack values instead of mimicking the 16C behavior (which I still don't understand).

Re: Wp34s: word size lost?

*Message #3 Posted by **Cristian Arezzini** on 25 May 2011, 8:35 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Hm... I myself don't care how the stack is modified when switching back and forth (for me integer and floating are totally separate sessions), as long as it remembers my settings... I use the integer mode almost exclusively in 16 bit unsigned mode, so I'd like to avoid having to re-set it everytime I need integer! :)

Cristian

Re: Wp34s: word size lost? - More changes

*Message #4 Posted by **Marcus von Cube, Germany** on 25 May 2011, 9:24 a.m.,*
in response to message #3 by Cristian Arezzini

I've modified Pauli's mode switching code so as not to reset the word size. I hope this did not break anything in floating point mode. I doubt it because it had always been possible to switch the word size when not in integer mode.

The MODE catalogue is now context sensitive, just like X.FCN is. :-)

Edited: 25 May 2011, 10:55 a.m.

Re: Wp34s: word size lost?

*Message #5 Posted by **Marcus von Cube, Germany** on 25 May 2011, 11:14 a.m.,*
in response to message #1 by Cristian Arezzini

> Quote:
>
> Is this a regression or has it always been like this? I can't remember now...

I checked it with my 16C. It does the same and I know why. :-)

In integer mode, the 16C reallocates the registers depending on the word size. When switching back to floating point, the size must be adjusted to at least the width of a floating point number.

Re: Wp34s: word size lost?

*Message #6 Posted by **Cristian Arezzini** on 26 May 2011, 12:29 a.m.,*
in response to message #5 by Marcus von Cube, Germany

I just checked 960, and it seems to do what I wanted! Thanks! :)

Well... I didn't remember that because I only exclusively use the 16c in integer mode... But, then this is an occasion where "total 16C compatibility" isn't the best choice, in my opinion! :) Anyway, thanks for implementing this feature, and I hope it didn't break anything anywhere else!

WP34S 956 crashing in wine

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 25 May 2011, 6:15 a.m.*

I updated to 956 this AM and tried to run it up under wine (wine-1.2.2 on ubuntu 10.04) with the following crash. Does anyone know what is going wrong? This has been working beautifully under wine thus far.

(I have removed some of the svn update output and most of the debugger dump for clarity.)

Thanks...

```
nhamilton@hp-ubuntu:~/Downloads/wp34s$ svn up https://wp34s.svn.sourceforge.net/svnroot/wp34s
wp34s_svn

Re: WP34S 956 crashing in wine - fixed! (?)

*Message #2 Posted by **Marcus von Cube, Germany** on 25 May 2011, 6:30 a.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

What happens if you delete your old state file wp34s.dat?

P.S.: Your SVN command is way to complicated. Just go to the top level directory of the project (wp34s_svn in your case) and type "svn update". SVN knows from the hidden .svn directory what to do.

Edit: I think I know what happened: Your state file was too old and some garbage was interpreted as a length field. I've added a sanity check there but deleting the file will certainly help. It's invalid anyway. If you have a program in your file which you want to save, just forward it to me. I can extract the code for you.

Edited: 25 May 2011, 7:04 a.m. after one or more responses were posted

Re: WP34S 956 crashing in wine

*Message #3 Posted by **Neil Hamilton (Ottawa)** on 25 May 2011, 7:00 a.m.,*

in response to message #2 by Marcus von Cube, Germany

As suggested, I deleted all the copies of wp34s.dat in the tree (there were several so I suspect that it saves this file out to whatever directory I launched from). Still no luck.

I poked around a few other revision to see what would happen. If I wind back to 954 (svn up -r 954), everything works fine. However, 955 crashes in the same manner as 956.

Thanks for the svn wisdom. I'll admit that I am much more familiar with cvs than svn. Your suggestion is certainly much shorter. I was just using what was documented on the sourceforge website (your know: if it ain't broke, ... you're not trying hard enough :-)).

Thanks...

WP34S running here at 34S

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 24 May 2011, 8:44 a.m.*

(The latitude of Buenos Aires city is 34S...)

I flashed my 30B with the special cable, an USB to serial converter (FTDI chip), SAM-BA 2.6 (patched) and my Windows 7 32- bit notebook.

It took a bit of trial and error, and some helpful emails (thank you, Katie and Gene!).

The actual download time was about 3 minutes; reasonable for a 126 KBy file at 9600 bps with some protocol overhead. My USB to serial converter has activity LEDs which flashed all the time during the download. A timeout message appeared on the screen, but was duly ignored. Also, at some point, SAM-BA (or its daughter screens) appeared as "not responding", but that was to be ignored too. It's kind of a "patience and faith" test. :-)

When using SAM-BA 2.6, it is obviously important to aim the download to "Flash". The tabs labeled as "SRAM" and "SRAM2" should not be active.

Now I need to improve my understanding of the SVN repository and such, to download the very last ROM image. And I need to print an overlay right now!!

Re: WP34S running here at 34S

*Message #2 Posted by **Marcus von Cube, Germany** on 24 May 2011, 8:55 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Have you set-up the board correctly? I don't have an SRAM2 tab, at least not on my SAM-BA 2.10 screen. My board setting is at91sam7l128-ek.

Re: WP34S running here at 34S

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 24 May 2011, 9:17 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Yes, there were no problems with the board. Due to SAM-BA 2.10 not working with Windows 7 and USB converters (mine was just one more confirmation of such incompatibility), I tried with SAM-BA 2.6. This is the one where the SRAM/SRAM2/Flash tabs appeared.

Please update!

*Message #4 Posted by **Marcus von Cube, Germany** on 24 May 2011, 12:17 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

The latest version seems to work while the earlier versions from the last few days are buggy. The writing to flash was badly broken.

About newest 34S version to download

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 24 May 2011, 2:50 p.m.,*
in response to message #4 by Marcus von Cube, Germany

From the project site I got a zip file with the calc.bin firmware image that I used last night. It is dated May 11... is there a new version available? How is the SVN system to be used to download the succesive releases?

Excuse me if I'm not asking the right question, perhaps I'm missing something important which was previously discussed.

Re: About newest 34S version to download

*Message #6 Posted by **Walter B** on 24 May 2011, 3:03 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Buenas tardes, Andrés,

Just go here: http://wp34s.svn.sourceforge.net/viewvc/wp34s/trunk/realbuild/ and download the file calc.bin - that's all.

Walter

Re: Please update!

*Message #8 Posted by **Jeff O.** on 24 May 2011, 4:08 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Thanks for the warning, I was just about to ask if flash writing was broken.

I was also going to ask if something happened to BACK and SKIP, so I will go ahead and do so. Did something happen to BACK and SKIP? They are no longer in the "secret" CPX-h-CPX menu. I thought perhaps iC (increment counter?) replaced them, but get odd looking results when I try it.

I did look around sourceforge for documentation/explanation of the above, but did not find any. My apologies if such data is sitting in plain sight.

Re: Please update!

*Message #9 Posted by **Marcus von Cube, Germany** on 24 May 2011, 4:35 p.m.,*
in response to message #8 by Jeff O.

BACK & SKIP have been promoted to the program functions catalogue. iC is "internal constant". A List of these can be found in the manual.

The flash commands are on h+STO. PSTO, PRCL and P[<->] have a parameter ranging from 0 to 2. It addresses one of 3 separate regions in flash where a copy of the program area can reside. Backup and restore use region 0 implicitly plus a special region for the data and status.

Start your program with an alpha label before you copy it to flash. This way, it can be directly called from the new label browser found on h+RCL.

A good start may be:

```
LBL 'CB'
CL[alpha]
[alpha] CodeBreaker
[alpha]VIEW
STOP
LBL C
...
```

Once selected from the browser, the program can be easily started with the hot key C.

I'm not talking about flashing the image into the calculator but the operations from the I/O menu when it is running (PSTO, SAVE, ...)

Re: Please update!

*Message #14 Posted by **Cristian Arezzini** on 25 May 2011, 1:03 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Marcus, I just updated to 950... I haven't flashed the real calc yet, but the emulator has a problem: it doesn't save the state. Everytime I run it, it displays "Erased". It didn't happen with previous versions. I also tried deleting the file wp34s.dat, and it gets recreated at next run, but it still shows "Erased" everytime.

Re: Please update!

*Message #15 Posted by **Walter B** on 25 May 2011, 1:25 a.m.,*
in response to message #14 by Cristian Arezzini

Ciao Christian,

Thanks for your observation. This is a bug definitively :-/

wp34s.dat will be created the first time time you start the emulator and should be updated every time you resume it.

We'll get that repaired.

Walter

I've mentioned a 43s. No 25s yet.

A 25s isn't on the radar at the moment. It would be straightforward to emulate or replicate the 25c on the 20b/30b hardware.

- Pauli

Wp34s - my flashing experience

*Message #1 Posted by **Cristian Arezzini** on 24 May 2011, 6:53 a.m.*

I just received my flashing cable today (thanks again Gene!) and of course I couldn't wait to flash my 30b. Now, I had an old laptop lying around, and I thought it had WinXP installed - so I went to boot it, and was deeply disappointed to find out it had Win98 instead. So I can't use that. On my "modern" computers, I don't even have Windows at all - only Linux, in all of them. So this is what I've got: a modern computer with a recent Linux install, with no Windows and NO hardware serial port. So, it looks like this is the worst possible combination... But in Linux, I have Virtualbox installed, and a virtual WinXP running under it. And I have a USB-to-serial converter. So I thought, what the heck, I will try anyway. I installed Sam-ba v2.10, I plugged the USB-to-Serial converter, set the correct board type and COM2 as the port... and it worked on first try!! I'm so happy! :) It looks like the setup is less critical than expected... at least with my combination of components.

I have one question though... I followed the instructions on the file "Flashing a 20b calculator.pdf", and they worked; but at last, it says to enter the test screen to check the checksum, by using the On+PMT combination. If I press On+PMT on the new wp34s, it says "Debug ON" but then I can't find the checksum, nor I know how to turn debug off... I searched on the 34s manual but couldn't find anything regarding checksums or debug modes... So: has the key combination changed? How do I enter test screen now?

Thanks, Cristian

Re: Wp34s - my flashing experience

*Message #2 Posted by **Marcus von Cube, Germany** on 24 May 2011, 7:05 a.m.,*
in response to message #1 by Cristian Arezzini

Debug mode just disables all power saving, allowing hardware debugging on the device. The firmware info you're after is in the X.FCN catalogue under the VERS command.

Turning Debug mode off is as easy as turning it on. :-)

Re: Wp34s - my flashing experience

*Message #3 Posted by **Cristian Arezzini** on 24 May 2011, 7:14 a.m.,*
in response to message #2 by Marcus von Cube, Germany

D'oh... I really don't know how I missed how to turn debug mode off! I suppose I was too excited to think rationally! :)

But concerning the VERS command: I know about that, but - unless I'm missing something obvious again - it only shows the firmware revision, not the checksum... The checksum is supposed to have an integer and a decimal part, and if they match you know the firmware was flashed correctly...

Cristian

Re: Wp34s - my flashing experience

*Message #4 Posted by **Marcus von Cube, Germany** on 24 May 2011, 7:20 a.m.,*
in response to message #3 by Cristian Arezzini

We do not support a flash checksum. If the program runs, you can assume the process was successful.

Re: Wp34s - my flashing experience

*Message #5 Posted by **Cristian Arezzini** on 24 May 2011, 7:47 a.m.,*
in response to message #4 by Marcus von Cube, Germany

I had followed the document linked in the wp34 manual, thinking it had been written *for* the wp34, but only now I realized it was written for who wants to upgrade the 20b with a newer firmware, but still keeping it a 20b! :) Of course the flashing procedure is the same, but that's why I expected a test screen while there is none. Sorry for talking nonsense! :)

Cristian

Re: Wp34s - my flashing experience

*Message #6 Posted by **Tim Wessman** on 24 May 2011, 1:18 p.m.,*
in response to message #2 by Marcus von Cube, Germany

If anyone is interested in getting the source for the MySamba program, send me an email. It is written in Delphi, but could save you some time in needing to monitor the Atmel Samba program if you want to make your own (or a Delphi wizard may just take it and run with it).

If there is interest, I will work on making sure there is no issue with releasing it and get it to you if possible.

HP 20B Now Accepted By GARP For FRM Exam

*Message #1 Posted by **bink** on 24 May 2011, 4:45 a.m.*

Hi,

It appears that the HP 20B is now accepted for the FRM exam, along with the HP 12C (including variants), and HP 10B II.

http://www.garp.org/frm/overview/policies/calculator.aspx

Re: HP 20B Now Accepted By GARP For FRM Exam

*Message #2 Posted by **Katie Wasserman** on 24 May 2011, 10:29 a.m.,*
in response to message #1 by bink

This brings up an interesting point. Now that all these accepted calculators (the 12C, 20b and 10bii+) can be repurposed, what's the point of certification? They can be programmed to be memory limited cheat sheets. Are the exam proctors supposed to run a set of diagnostics on each calculator brought to the test?

While HP has given out a limited number of programming cables I'm sure it won't be long before someone (one of us most likely) shows the world how to create your own cable.

Re: HP 20B Now Accepted By GARP For FRM Exam

*Message #3 Posted by **Gene wright** on 24 May 2011, 11:27 a.m.,*
in response to message #2 by Katie Wasserman

Re: I wonder...

*Message #7 Posted by **Eric Smith** on 24 May 2011, 9:35 p.m.,*
in response to message #6 by Tim Wessman

There were bugs causing wrong answers even in the calculators developed by the original "regime". It's actually fairly amazing what great work you guys are doing now with as little resources as you have, compared to what the old regime had.

Re: HP 20B Now Accepted By GARP For FRM Exam

*Message #8 Posted by **Geoff Quickfall** on 24 May 2011, 5:12 p.m.,*
in response to message #2 by Katie Wasserman

> Quote:
>
> Are the exam proctors supposed to run a set of diagnostics on each calculator brought to the test?

I remember taking my 41CX into an arial cartography exam. I had thirty five different programs loaded, some in reference to the formulas used on the exam. I removed the pertinent programs but not having the card reader or any other saving device I did not want to lose all the other programs also. Two of them were over 400 lines each, and a whole bunch of synthetics that I DID not want to have to reload with the byte jumper.

The proctors knew nothing about the 41C series other then to ask you to show them the alpa display, "MEMORY LOST". Of course it was an easy deal to write a short program attached to the SF 11 "on and run flag" routine. So when I turned the calculator on; "MEMORY LOST" was displayed. That was enough to satisfy them!

d;-)

Well, if it happens then I am sure you (forum in general) will never get another user flashable calc from HP. . . :-(

TW

Re: HP 20B Now Accepted By GARP For FRM Exam

*Message #12 Posted by **Katie Wasserman** on 24 May 2011, 9:58 p.m.,*
in response to message #11 by Tim Wessman

These days, it wouldn't be hard to hack any calculator to put in your own "stuff". Stuff might very well mean replacing the one potted chip that drives the calculator and just using the LCD and keyboard. I did this with an old, dead HP-25 by gutting it and adding a single SX-28 processor. It was pretty easy.

I think that if exams insist on you having an approved calculator that they should let you borrow one of theirs for the test. It's really the only way to eliminate calculator cheating.

34s Vinyl Overlay Second Attempt

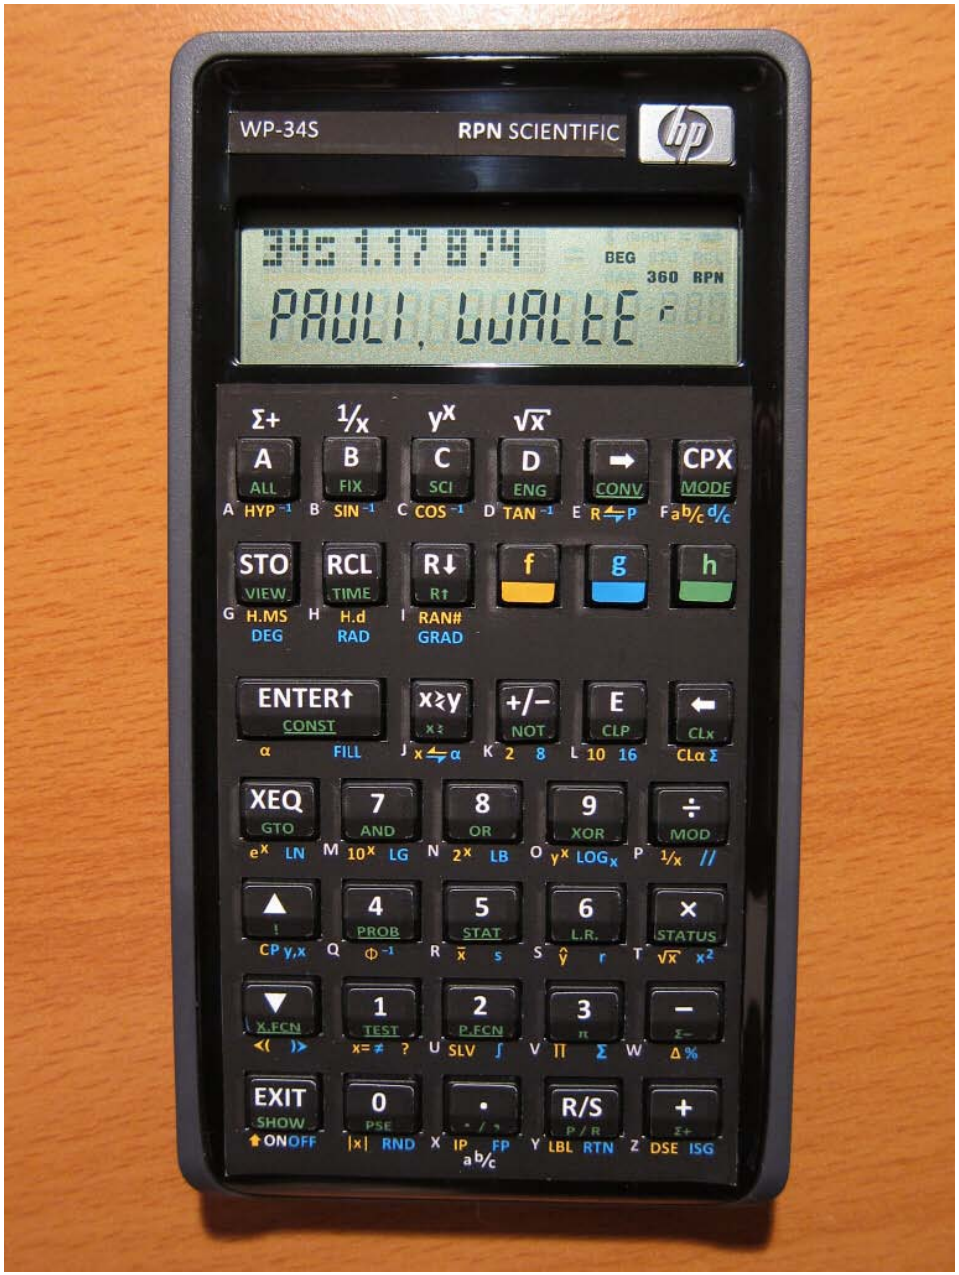
*Message #1 Posted by **Eric Rechlin** on 24 May 2011, 2:50 a.m.*

Hi everyone,

I have now made a second attempt with the vinyl overlay for the 34s. I've incorporated a lot of the feedback and made a bunch of changes. I'm still learning and will make some more minor changes still, but I think it's getting very close.

This time I made the button labels a single sticker rather than two, and I am going to see how durable it is. I have also updated the artwork to use the latest labels.

Here is what it looks like:



Here is a closeup of the keys:

And you can download the latest artwork here.

Eric

Not until you guys finalize the keyboard layout. :)

Eric

in response to message #1 by Eric Rechlin

We've just changed the layout again...

h+STO is now I/O. h+RCL is now a label browser. Pauli, Walter how will it be named?

Eric, do you take orders? ;-)

Re: 34s Vinyl Overlay Second Attempt

in response to message #4 by Marcus von Cube, Germany

Those new key labels are just proposed at the moment. They quite possibly will relocate and/or rename.

And before everyone gets really excited, I/O doesn't do off device input/output and possibly never will. It is used to read/write to user flash segments. Currently, a second set of read only registers and three more program spaces (again mostly read only). The registers and one of the program spaces are used for backups.

Re: 34s Vinyl Overlay Second Attempt

*Message #6 Posted by **Marcus von Cube, Germany** on 24 May 2011, 7:02 a.m.,*
in response to message #5 by Paul Dale

To be more precise, we're using 4 KB or flash for backup and program storage at the moment. 2 KB serve as backup but the program area of the backup can be used like the other program areas for libraries.

More than 2000 steps if you use it all and don't use backup as a copy of RAM. 1500+ of these steps are in flash. And it's all executable.

in response to message #1 by Eric Rechlin

Looks very nice again. Bright and clear letter set. However, since you know me, you know you won't go without some personal remarks (in random order):

1. In your artwork, some marks for cutting the keys would be helpful.
2. The super- and subscripts should have a smaller letter size than the letters on the base.
3. f- and g-shifted labels of key 3 are bigger than their siblings.
4. Default primary function of the division key got a wrong symbol.
5. g-shifted // is too big in comparison.
6. In the font you chose (which one?), lower case y is quite close to v. IMO an y standing more apart will be better.
7. The comma in h-shifted decimal mark is hardly differentiable due to its hook being too faint (as before). This may be appropriate if you want to disguise the difference (e.g. for the default primary function of that key, which may be read as a point or a comma depending on the reader). But in the h-shifted label you should point out the difference instead. The comma in g-shifted ^ looks significantly clearer.
8. I don't like the bottom bar of the digit 1 - it doesn't really match the very decent style of the other digits and letters IMHO.
9. While you seem to have taken most of your symbols from one single font, some fall out obviously (or the designer didn't take care of coherence): Phi, g, <, >, <>, and <->. A coherent set will make an even better impression.

As always - just my personal 20m€ :-)

Walter

Quote:

> In your artwork, some marks for cutting the keys would be helpful.

I will be shipping them pre-cut so this is irrelevant. I pity anyone who would actually want to cut these by hand.

> Quote:
>
> The super- and subscripts should have a smaller letter size than the letters on the base.

I debated that. Using bigger superscripts and subscripts makes them more legible. I might shrink them slightly, though.

> Quote:
>
> f- and g-shifted labels of key 3 are bigger than their siblings.

That's because you (or someone?) complained about their relative sizes last time. I will see what I can do.

> Quote:
>
> Default primary function of the division key got a wrong symbol.

Not wrong, just different. I'm keeping it because I prefer HP's traditional symbol.

> Quote:
>
> g-shifted // is too big in comparison.

It's the same size as everything else, but I suppose I could shrink it.

> Quote:
>
> In the font you chose (which one?), lower case y is quite close to v. IMO an y standing more apart will be better.

I am using Calibri as the font. I will see what I can do about altering the 'y' in that font.

> Quote:
>
> The comma in h-shifted decimal mark is hardly differentiable due to its hook being too faint (as before).

That is the one place where I used a font other than Calibri, in hopes of avoiding complaints about the character shape, but I see that plan backfired. I will switch that to Calibri for consistency.

> Quote:
>
> I don't like the bottom bar of the digit 1 - it doesn't really match the very decent style of the other digits and letters IMHO.

I like it as it is, but I can look into altering the character in the font.

> Quote:

How should they look to be coherent? Please draw me an example of how you want it to look to be coherent and I will attempt to adopt your suggestion. Everything is from the font Calibri, although I had to manually alter some characters to get them to look right (for example, I made the arrows in x<->a and R<->P by taking the regular arrow from the font and splitting it in two). Also, the square root character was hand drawn by me.

I admit I was the one - but now you made the then smaller bigger instead of making the bigger smaller. Well, the odds were 50/50 ...

Sorry, it is wrong - in alpha mode, this key will enter a slash, not a colon plus a horizontal bar.

> Quote:
>
> > Quote:
> >
> > g-shifted // is too big in comparison.
>
> It's the same size as everything else, but I suppose I could shrink it.

It's significantly higher than the golden slash next to it below the same key.

> Quote:
>
> > Quote:
> >

Also, the square root character was hand drawn by me.

While the regular characters have rounded corners, the arrows are very pointy. The lines of Phi are too narrow/slim compared with the other letters. And for g look at Arial, for example. I will try to draw some sample bitmaps for you.

Anyway, thanks for listening.

Walter

Re: 34s Vinyl Overlay Second Attempt

*Message #11 Posted by **Neil Hamilton (Ottawa)** on 25 May 2011, 2:10 p.m.,*
in response to message #10 by Walter B

For what it is worth, when I first saw the keyboard of the WP34S, I too thought the slash instead of the traditional division symbol looked out of place. My vote would be for the division symbol on the keyboard as opposed to the slash (I am not concerned with what is written in a program step).

For that matter, I am still trying to figure out what "//" means. I presume that it is in either the HP34C or HP42S manual but I have not come across it yet.

On a slightly different topic: I saw a reference to the MOD operation a while back (and cannot find it anymore) where someone expressed surprise that something like "-14 mod 5" would yield -4. If I repeat this on the HP42S (well actually free42, to be honest) I get the expected value of 1, not -4. My current profession has me heavily involved with public key cryptography, which is rife with modular arithmetic (often called "clock arithmetic"). Traditionally, the modular set is composed of (0 <= x < modulus). Negative numbers are always rationalized back into the modular set (ie: positive). If I look at what the function was called on the HP16C, it was "RMD" (for remainder?). Similarly (from memory), on the HP15C it was called RMDR. I think this is how HP managed to "get away with it" since RMDR is not, strictly speaking, a MOD operation.

The benchmark for this site seems to be Wolfram so the following link states this as well: http://mathworld.wolfram.com/ModularArithmetic.html. See 4th paragraph.

Perhaps a flag could be added for MOD to alternate between true modular mode (0 <= x < modulus) and remainder mode (0 <= |x| < modulus). The only difference is that after the division reduction is complete, if the number is negative, you add in the modulus to bring in to the modular set (the rationalization step).

Note that you will see negative numbers in modular settings (eg: see the FIPS-186 elliptical curves "A" parameter of -3) but this representation is fairly uncommon in the modular world.

My vote was for a proper division sign too from memory. I don't mind much either way though.

> Quote:
>

You could try the 34s manual for this one :-) Actually, that should be the first point of reference for everything about this device. Many of the operations are not done exactly the same as previous devices.

> Quote:
>
> On a slightly different topic: I saw a reference to the MOD operation a while back (and cannot find it anymore) where someone expressed surprise that something like "-14 mod 5" would yield -4.

Our mod operator is the IEEE remainder operator. So in this case, Wolfram doesn't apply. We claim support for IEEE 854 numbers after all. The integer mode double precision remainder operator does something different with the sign but that is to stay compatible with the 16c.

Now, if there is sufficient demand, it would be possible to add a second operator that does what is asked for here.

For cryptographic operations, I'd suggest sticking to integer mode if not unsigned integer mode. Our integers can represent larger integers exactly, cryptography doesn't usually use floats and it often requires the kind of operations we support for integers (okay, not for public key stuff that I remember).

I didn't need the manual to figure out what "//" meant because in circuit analysis I used this symbol for "in parallel", as in $R_1 // R_2 = (R_1*R_2)/(R_1+R_2)$. I'm glad it means the same on wp34s and it is available right from the keyboard. Walter's idea, I presume.

```
Examples:

1) What is the equivalent resistance of two resistors in parallel, R1 = 56 ohms and R2 = 39 ohms?

   56 ENTER 39 g //        -->   22.9894736842

2) What resistor should be connected in parallel to a 91-ohm resistor so that the equivalent resistance is 31 ohms?

   91 +/- ENTER 31 g //    -->   47.0166666667
```

Let's not be confused: the two **parallel** slashes operator can be also used to compute the equivalent capacitance of two capacitors connected in **series**.

Gerson.

I doubt either of us remember :-)

The desire for the operation came from these forums (Dave Jones rings a bell but I'm probably wrong). It has been on the keyboard forever. It also works in the complex domain :-)

*Message #15 Posted by **Katie Wasserman** on 26 May 2011, 12:37 a.m.,*
in response to message #14 by Paul Dale

I've seen the symbol || used for resistors in parallel. This might look better on the keyboard than // and I think is a standard in some sense.

For reference, the || symbol is used in Wikipedia and more importantly it's used in the Handbook of Electronics Calculations. This books defines || to mean "in parallel with".

-Katie

Edited: 26 May 2011, 12:38 a.m.

Solution: // means "parallel" (surprise ;)

*Message #16 Posted by **Walter B** on 26 May 2011, 2:17 a.m.,*
in response to message #15 by Katie Wasserman

Aha, that may be the reason why Eric printed the // so big. Thanks, Katie. The label may be changed easily. Shall I start another poll?

Walter

Edited adding the emoticon - you never know ;)

Edited: 26 May 2011, 2:18 a.m.

*Message #17 Posted by **Gerson W. Barbosa** on 26 May 2011, 2:14 p.m.,*
in response to message #15 by Katie Wasserman

Indeed the symbol || is shown when in program mode. // is a notation I had created for my own use, so it was a surprise when I first saw it below the / key and meaning what I imagined it might mean :-) Anyway, given your reference and in order to match the symbol in program mode perhaps it should be changed to ||.

Gerson.

P.S.: Thanks to the wp34s team I won't need this anymore :-)

```
001- f LBL A
002-   ENTER
003-   Rv
004-   x<>y
005-   *
006-   LSTx
007- g R^
008-   +
009-   /
010- g RTN
```

Re: 34s Vinyl Overlay Second Attempt

*Message #18 Posted by **Thomas Klemm** on 26 May 2011, 3:09 p.m.,*
in response to message #17 by Gerson W. Barbosa

You could use the following program as suggested by Sam in his article : EE calculations, some not obvious

> Quote:
>
> when calculating from known resistors, enter the lower resistor repeatedly. Key in the top resistor, and (...)

```
001- f LBL A
```

```
002-   +
003-   /
004-   *
005-   -
006- g RTN
```

I guess I like this solution best because all the elementary arithmetic operations are used exactly once.

Kind regards
Thomas

Hmmm, "IEEE remainder operator". That sounds a lot like REMAINDER to me and not MOD. :-)

I believe my argument is still correct; you have remainder encoded and not a MOD operation. Hence HP's use of the RMDR and RMD on their calculators -- though, interestingly, my 35S actually calculates a MOD even though its mnemonic is "Rmdr" (HP35S: -14 Rmdr 5 => 1).

I guess my quibble is with the name on the key. Personally, I would prefer the "real" MOD operation for the MOD mnemonic but YMMV.

Sorry, I missed the "//" in the WP34S manual. However, I would not have suspected that it meant parallel. As stated by others, the double pipe would have been a more conventional symbol -- but that symbol would itself likely be confused with a some variant of OR (logical or bitwise). It just goes to show that you can't win when trying to condense information into a very few short symbols on a keyboard! Best of luck satisfying everyone! :-)

Great project!!!!

I'm looking forward to seeing those -- I'd be happy to change the arrows if they still can look good. I agree that Phi doesn't look right. I manually tried to improve it already, but you're right, I should make it thicker.

For the letter 'g', you'll have to take that up with Lucas de Groot, as he clearly intended it to look that way. You might recognize his typographical design from Der Spiegel.

> Quote:
>
> [The // is] significantly higher than the golden slash next to it below the same key.

Virtually all of the shifted labels are the same 8-point Calibri (except the Sigma which I increased to 10.5 points and the ones I custom-made). The golden slash is part of the 1/x fraction and is a totally separate character -- notice it's not even angled the same. If you prefer I could change the double slashes to use that fractional slash rather than the forward slash character, and then it would match.

Eric,

This looks significantly better now. I wonder, however, what's so difficult in making all the golden, blue and green Greek letters the same size, matching the size of the Latin letters? Perhaps that's the reason for your saying "sounds all Greek to me" ? ;-)

Besides that, there's some symmetry balancing work to be done only IMHO.

Walter

I already told you. I made them all the same size, 8 points. If there are differences in heights, it's because the font designer designed the font that way. You'd have to take it up with him.

Also, I too am in favor of changing the parallel symbol to || instead of //, since it was always taught to me as || in my EE curriculum. And no, I didn't intentionally make it bigger.

Eric

Those are not all Sigmas. Some are Sigmas and some are N-Ary Summation symbols. They are not the same height within the same font. Don't ask me why; that's just how the font was designed.

- Sigma is Unicode character U+03A3.
- N-Ary Summation is Unicode character U+2211.

Please don't be snarky when you have imperfect information.

Perhaps I should have used the N-Ary Summation character everywhere, but I wasn't sure when you meant Sigma and when you meant N-Ary Summation.

Please don't make life more complicated than it is already. So (FYI if still necessary) what you call "N-Ary Summation" is far better represented by a capital Greek Sigma than by anything else, e.g. the E seen in this forum every once and a while. In fact, it is a Sigma taken over by the mathematicians. Same story with "N-Ary Product" (? just guessing the term in a foreign language) and capital Pi.

about the durability of the button stick-ons:

Are you using vinyl sheeting with adhesive backing? Is it transparent? If so, is it possible to print on the sticky side (in reverse, probably), so that the lettering is under the vinyl when the labels are applied. Then, touching the buttons would not tend to erode the printing.

I am using white vinyl sheeting with adhesive backing. Even if I bought transparent vinyl I wouldn't be able to print on the sticky side, because then it would just stick itself to the rollers in the printers when it feeds it through!

in response to message #33 by Eric Rechlin

Eric, nice overlay!

Have you thought about printing an inverse overlay? What I mean is white or light color background instead of black, with symbols painted in the appropriate colors. I'm wondering if over time the black ink on the vinyl, as well as the symbols, will erode as Dave suggests.

And perhaps an inverse color scheme, like the current 48gii, would look good on the 30b as its faceplate is chrome (or simulated?).

Wouldn't it also save ink?

Just some thoughts..

> Quote:
>
> Have you thought about printing an inverse overlay?

No, I hadn't, and that's a good idea. We could keep the blue and green colors, but what color should we use instead of gold? The background could indeed be white or light gray, and that would definitely save ink. The vinyl costs a lot more than the ink, though, so the cost savings wouldn't be very noticeable.

Another possibility is to keep the keys black so the stickers wouldn't be so obvious, but that partially defeats the intent of reducing the visibility of wear.

I do have some spray protectant that is supposed to add more physical protection to the ink, but I haven't tried it yet.

Eric

Re: 34s Vinyl Overlay Second Attempt - (ideas for a gray background)
*Message #36 Posted by **Andrés C. Rodríguez (Argentina)** on 26 May 2011, 1:14 p.m.,*
in response to message #35 by Eric Rechlin

Some shade of orange (tending a little to the dark side) may do, and the background (light gray or silver) should be similar to the 30B faceplate. Perhaps Tim can comment about the background color specification (color-space coordinates).

Would you experiment with a "complete" overlay with a large window for the display?

Best regards.

Why not add a matte transparent layer of vinyl before cutting? This should be totally wear resistant. Pauli's 50% lamination technique goes that route.

Re: 34s Vinyl Overlay Second Attempt

in response to message #37 by Marcus von Cube, Germany

I can definitely confirm that the laminate covered keycaps on my 34s aren't showing any signs of wear. Not that all of course but still, they've seen a bit of use.

Hm... I have a question... I've only seen pictures of overlays applied to 20b's. I have a 30b, and while the layout is the same, I can't be sure that the dimensions are exactly the same. For example, just by looking at it, it seems that the 30b's gap between lines is a little shorter. Can anyone confirm if this is the case? If it is, is a 30b overlay file available somewhere?

Cristian

*Message #41 Posted by **Marcus von Cube, Germany** on 25 May 2011, 2:01 a.m.,*
in response to message #1 by Eric Rechlin

I would leave some of the keys alone: The digits, decimal marker, back arrow and arithmetic keys should only get new front labels.

I don't like the "brownish" finish of the background or is this a problem of the photo?

Printing the labels on the backside of a transparent sheet would require a multi layer construction to hide the markings on the keys and the gray background of the 30b.

Re: 34s Vinyl Overlay Second Attempt

*Message #42 Posted by **robert rozee** on 25 May 2011, 2:32 a.m.,*
in response to message #41 by Marcus von Cube, Germany

an interesting experiment would be to print onto the vinyl, then apply a thin laminate before cutting out.

the laminating process tends to add a 'depth' to the colours, especially making black appear much darker.

That's what I did the first time, but I think I like this better. Now everything looks consistent in terms of the font used. If you don't like it you can always cut the key labels in half and only apply the bottom half.

> Quote:
>
> I don't like the "brownish" finish of the background or is this a problem of the photo?

It's a deep black in real life. No brown at all.

*Message #47 Posted by **Marcus von Cube, Germany** on 30 May 2011, 6:21 a.m.,*
in response to message #1 by Eric Rechlin

Hi Eric,

I'm still longing for your work to become available. But before you proceed, you need to adapt your overlay again.

VIEW has moved from STO to the RCL key where it makes more sense. TIME is now in a catalogue.

h shifted STO has become CAT and should be underlined as it is a browsable list.

MOD has become RMDR which better reflects the implemented behavior.

Edit: RMDR function

in response to message #52 by Eric Rechlin

> Quote:
>
> How final is this?

Not at all - I'm changing it again. As stated here many times, the WP 34S is a fast moving target ;-)

All I'm interested in are the sizes and positions of the stamps (their outlines would be even better) in this graphic file as I mentioned in an earlier post already. Taking an arbitrary font and typing on black background is no witchwork - more experienced sorcerers are needed for manual character improvements and adjustments, which are quite a lot here.

Walter

Hi,

what would you think about renaming the "E" key to "EE" (or "EEX")? Almost every HP-calculator uses EE or EEX, and this single E could easily be confused with a letter E (or even a label E).

Franz

Re: 34s Vinyl Overlay Second Attempt - Some updates
*Message #55 Posted by **Dieter** on 1 June 2011, 7:14 a.m.,*
in response to message #54 by fhub

Although I do not think someone will confuse the E-key with something else, I absolutely agree with the idea of labelling it the classic way: EEX. I would also appreciate the classic CHS instead of that modern-style +/- (as on any ordinary other calculator). For me these two keys (and the big ENTER, with the up-arrow of course) make the look of a "true" HP calculator.

Okay, this is not an HP, but a WP. 8-)

Dieter

E vs. EE vs. EEX
*Message #56 Posted by **Walter B** on 1 June 2011, 7:23 a.m.,*
in response to message #54 by fhub

Hallo Franz,

As a matter of fact I copied that label from the HP-42S and its siblings ;-) And we used it for some more functions in the early stage of the 34S, but that lost necessity recently. So, yes, we may think of relabeling that key. EE has no tradition as a HP-key, so I'd reduce the poll to E vs. EEX.

Your votes, please :-)

I third(?) the motion: EEX and CHS.

Any more thoughts on a slash vs. a proper division symbol?

Re: E vs. EE vs. EEX
*Message #60 Posted by **Walter B** on 1 June 2011, 8:36 a.m.,*
in response to message #59 by Neil Hamilton (Ottawa)

As the custodian of the layout (according to Pauli ;-) I must tell you you will not get CHS instead of +/- nor colon plus bar instead of a proper slash. For the latter, I'm willing to discuss a colon alone, being the proper division symbol on this side of the pond. AFAIK the slash is a symbol employed for division on both sides of the Atlantic, and makes sense in texts as well. - CHS is nice for people thinking English, but +/- or Â± is the more international symbol. Sorry folks [;-)

OTOH, we don't know a better alternative for E or EEX, thus I started this poll strictly for this key only.

Walter

Re: E vs. EE vs. EEX
*Message #61 Posted by **Neil Hamilton (Ottawa)** on 1 June 2011, 9:32 a.m.,*
in response to message #60 by Walter B

Sorry, I had thought that the obelus (colon with a superimposed minus sign) was universal. It has been used on all HP calculators that I can recall. I have never heard of a single colon being used as division (only as a ratio indicator). Just goes to show you how provincial I am!

I am also fine with +/- as this is intuitively obvious as well.

It is the EEX that I was really voting for.

Best regards...

Re: E vs. EE vs. EEX
*Message #62 Posted by **Marcus von Cube, Germany** on 1 June 2011, 9:41 a.m.,*
in response to message #61 by Neil Hamilton (Ottawa)

The single colon would serve as a separator between hours, minutes and seconds, so this will not be the best choice for the division symbol.

If you look at the BASIC calculators of the eighties you'll notice that some have the obelus (new word for me) on the key but enter a slash in BASIC mode. I can live with either version.

EEX (Enter EXponent) makes most sense to English speaking people while a single E as an abbreviation for Exponent is universal. The same is true for CHS (CHange Sign) versus +/-. I prefer the latter.

Re: E vs. EE vs. EEX
*Message #63 Posted by **Gerson W. Barbosa** on 1 June 2011, 9:34 a.m.,*
in response to message #60 by Walter B

> Quote:
>
> CHS is nice for people thinking English, but +/- or ± is the more international symbol.

So are EEX (Enter EXponent) and XEQ (ex-e-cute), but no problem about them. I do agree +/- is better.

Gerson.

Re: E vs. EE vs. EEX
*Message #64 Posted by **Dieter** on 1 June 2011, 9:39 a.m.,*
in response to message #60 by Walter B

Hallo, Walter -

> Quote:
>
> CHS is nice for people thinking English, but +/- or Â± is the more international symbol. Sorry folks [;-)

I assume this means we will also get rid of the "English-only" XEQ and the EXIT key in favor of more international symbols ?-) And now let's think about STO, RCL, VIEW, SHOW, TIME, MODE, PROB, CONST, CLP, RAN#, GTO, AND, NOT, OR, PSE, ALL, FIX, SCI, ENG, DEG, X.FCN, P.FCN. etc. etc. etc.

C'mon, Walter - all these keys, including ENTER, are English. I cannot see the point of one more key showing a "more international symbol". Otherwise the EXIT-key should be labelled with the usual icon of an open door. ;-)

Let us have the classic CHS label - the community seems to like it. I am sure you can have your own version with a +/- symbol. ;-)

Regarding the division symbol, I am completely with you. I never understood the usage of this strange "colon and bar" symbol, and on the 35s display (during programming) I often confuse it with the plus sign. So, for me the slash is fine, both in the display and as a key label.

Dieter

Re: E vs. EE vs. EEX
*Message #65 Posted by **Marcus von Cube, Germany** on 1 June 2011, 9:48 a.m.,*
in response to message #64 by Dieter

Dieter, you are right with the list of "Englishish" abbreviations, but these are very common, at least to programmers. Personally I dislike EEX and CHS, notably the latter. These are symbols, not commands. Casio has invented a special character for the exponent, looking like **lE** (E with a bar to the left of it) to emphasize the special meaning.

Overlays and HHC 2011 presentations...
*Message #66 Posted by **gene wright** on 1 June 2011, 11:03 a.m.,*
in response to message #64 by Dieter

Of course, the only place these symbol choices really matter is the emulator.

The overlays can and probably will be printed with the symbols the user community wants.

Perhaps I can encourage Eric Rechlin to use CHS and the proper divide symbol?

I'm fairly certain members of the user group will have all sorts of presentations about the 34s at HHC 2011. Jake is working on one and so am I.

In addition, I plan to make a 41CL presentation, since I hope to have a working board in a week or two. Woohoo!

Re: Overlays and HHC 2011 presentations...
*Message #67 Posted by **Eric Rechlin** on 1 June 2011, 12:05 p.m.,*
in response to message #66 by gene wright

My personal preference is the obelus for the division symbol (instead of the slash), because that is what has been used on virtually all calculators HP made (the only exception I can think of is the largely-forgotten 38G), as well as the vast majority of calculators made by other manufacturers.

I also personally prefer +/- over CHS because that is universal on calculators, including nearly all HP calculators sold in the last couple decades, with the 12C being the only exception. Anybody can look at +/- and know exactly what it does. The same cannot be said for CHS, even among English speakers. The only reason for CHS is for nostalgia to the HP calculators that came out 25-40 years ago.

I have no preference on E vs EEX. It's currently E, and I wouldn't change it without a good reason, because E seems to work well.

I've updated my artwork for 1.18 and applied it to my calculator last night and will make another post about it within the next day or so.

Eric

Re: Overlays and HHC 2011 presentations...
*Message #68 Posted by **Dave Shaffer (Arizona)** on 1 June 2011, 1:52 p.m.,*

in response to message #67 by Eric Rechlin

I don't know how much work it is (will be!) for Eric to make various overlays, but, as alluded to by Walter, seems to me that anybody can have whatever customized overlay they want. It's just a graphic file.

If there is enough market, whoever ultimately makes and sells overlays can offer various versions: an "English" version (CHS, EEX) and an "International" version (+/-, something else for EEX), with the user's choice of the division symbol.

Re: Overlays and HHC 2011 presentations...
*Message #69 Posted by **Walter B** on 1 June 2011, 3:14 p.m.,*
in response to message #68 by Dave Shaffer (Arizona)

Dave,

Correct, it's just a graphic file. And the overlay sheet has its cuts always at the same positions. And, sorry, the functions are the same. Beyond that, you're free to print Gothic or Burmese or Egyptian on that sheet, on pink or mint background, and have the unique opportunity to experience the whole history of graphic design once again repeated especially for you ;-) Everyone can do it. Great learning adventure ...

IMHO, the work will be at the designers - the cutting machine doesn't care for colors or fonts, it cuts. Precisely, I assume.

Enjoy!

Walter

Re: Overlays and HHC 2011 presentations...

in response to message #66 by gene wright

> Quote:
>
> Perhaps I can encourage Eric Rechlin to use CHS and the proper divide symbol?

Which "proper divide symbol"? ;-) Of course everyone is free to draw his/her own overlay to his/her best ability. Please note in alpha mode, however, a slash will be called via the division key and a ± via the +/- key. If you want to simplify life, I recommend you take this into account.

Nice to hear of presentations prepared by "members of the user group". Feel free to send them readily in advance for crosschecking by members of the wp 34s project team - so far neither Pauli nor Marcus nor me can justify traveling half around the world for this two day San Diego meeting. No matter how interesting this will be (for sure it will), how many potential customers may be there (for sure there will be a significant two-digit-number), and how tempting the door prizes are, the return on investment in this journey looks terrificly poor still. That's plain economy :-/

Walter

Re: Overlays and HHC 2011 presentations...
*Message #71 Posted by **gene wright** on 1 June 2011, 1:12 p.m.,*

Not completely. In program mode the displays are:

```
EEX
+/-
/
```

Currently the keyboard has E for the first which isn't completely consistent.

- Pauli

Re: Overlays and HHC 2011 presentations...
*Message #73 Posted by **Walter B** on 1 June 2011, 5:57 p.m.,*
in response to message #72 by Paul Dale

There are minor differences in handling numeric data in programming mode:

Where the Pioneers take one single step for an entire number (sign, mantissa, sign plus exponent), the wp 34s falls back to HP's very first programming paradigma with every single digit taking one program step. Press 'E' on a 32S or 42S and you'll get '1E' waiting for the exponent to complete the number. On the wp 34s, you can see the progress of two decades ;-)

in response to message #60 by Walter B

Hi

> Quote:
>
> CHS is nice for people thinking English

Walter, I think this is a moot point as there are many other English words and abbreviations on the keyboard ;-)

Anyway, I have no preference for the +/- or CHS and neither for E, EE or EEX. I do however feel quite strongly about the division symbol. I do not know of many physical calculators that have the "/" for a division symbol (I'm excluding the so-called "pocket computer" devices).

However, to answer your poll, I have a slight preference for EEX. (probably because of my first HP - the 28C)

Bart

Re: E vs. EE vs. EEX

*Message #79 Posted by **htom trites jr** on 1 June 2011, 9:06 p.m.,*
in response to message #56 by Walter B

Preferences:
EEX enter exponent
+|- change sign
|| absolute value
obelus for real and rational division, with large open dots, not like a colon overstruck with a minus or endash
/ solidus (slash) for integer division
\ back slash for modulus
\\ double backslash for remainder

Multiple Period Percentage Change Program for the 30b

*Message #1 Posted by **Mark Harman** on 24 May 2011, 1:46 a.m.*

Hello everyone,

Previously, I posted a program that add a top-level shifted percentage change function to the 30b while using the RPN stack.

I decided that this was not enough. If amounts change over multiple periods, discounting or compounding take place. The best way to solve this dilemma is to incorporate this into a brand new program.

Here it goes:

SH% (put this on line zero to assign the program to this key combination)
STO 1
Roll down
swap
/
RCL 1
1/x
y^X
1
-
100
*
(you can add a message like delta (the symbol) % or Pct chng here if you want)

The way this program works is such:

Say you had $50 two years ago and you have $90 today. You want to know what the percentage increase is over these two years:

50 input 90 input 2 SH% (SH is shift hold)

You should get an answer of 34.16

Now say you have the opposite situation and want to know the percentage decrease.

90 input 50 input 2 SH%

You should get an answer of -25.46440

Keep in mind that if you have only one period, you MUST enter a 1 for the third argument - otherwise you will get an error. This program requires three arguments to work.

(Now, if your logic works such that you prefer to have the new amount first, then get rid of the swap command and

then enter the new first, old second, and # periods third.)

Hope this helps anyone who doesn't like going through the %Calc menu to get to this function.

If any of you have questions regarding this program, please feel free to ask.

Regards,

Mark

HP 9114 disk drive battery charging

*Message #1 Posted by **David Ramsey** on 23 May 2011, 6:56 p.m.*

Oddly enough, the 6V lead-acid batteries these things use are still widely available.

The charger, now...

I got this at least a decade ago and while I'm pretty sure I had a charger at one point, I don't seem to now. I say "Don't seem to" because although the charger receptacle on the battery box takes the same plug as do the desktop and handheld computer HPs (such as the HP-97), I kinda doubt that charger would work well. For one thing, the battery box notes:

"20V / 500MA MAX INPUT"

20V to charge a 6V battery seems high to me, but in any case it's way more than any of the chargers I have put out. Perhaps it's because the charger would be expected to run the disk drive (old-style Sony 3.5" drive and a large controller board) while the battery is charging.

I guess I could simply put the battery on a car battery charger set to 6V. That should work.

Re: HP 9114 disk drive battery charging

*Message #2 Posted by **M. Joury** on 23 May 2011, 11:22 p.m.,*
in response to message #1 by David Ramsey

Hi David,

The 9114 uses the same charger as the HP41, the HP41 printer, the 41 IL printer, the 71/75, etc. Specifically the 82059 (US) charger with an output of 8VAC and 3VA. The charger will NOT run the unit with a dead battery. The battery needs to be able to maintain a charge for the disk drive to operate.

Hope this helps.

Re: HP 9114 disk drive battery charging

*Message #3 Posted by **David Ramsey** on 24 May 2011, 1:48 a.m.,*
in response to message #2 by M. Joury

That does help, thanks. I have several of those chargers.

Re: HP 9114 disk drive battery charging

*Message #4 Posted by **David Ramsey** on 24 May 2011, 12:13 p.m.,*
in response to message #2 by M. Joury

I charged the battery all night, and while I can read just over 6 volts off the battery terminals, there's 0 volts at the plug that connects to its mate inside the drive's battery bay.

There's a small circuit board in the battery box containing a 4-pin device that I assume is some sort of rectifier, a single transistor, and three discrete components (a resistor and probably some diodes.)

A three-pin and a two-pin cable plug into a 5-pin connector on the board. You can plug them in in either of two arrangements (2 pin first or 3 pin first), but neither produces any voltage at the output plug.

I assume there's a problem on the little circuit board. Is this worth trying to fix (and if so, any suggestions other than replacing every component)? It seems many of these old drives just wire the battery in directly to the drive and charge the battery externally.

Re: HP 9114 disk drive battery charging

*Message #5 Posted by **M. Joury** on 24 May 2011, 2:48 p.m.,*
in response to message #4 by David Ramsey

Hi David,

Ok, lets see what I can make of this. First off let me tell you that I am a programmer NOT an electronics person so there are much more qualified people on this site. But here we go...

1. I am looking at the battery carrier for a 9114A My B units are packed at the moment. 2. That 5 pin connector that you refer to. On my unit there is a 3 pin orange plug that connects to the side farther from the connector that mates inside the bay and a white 2 pin plug that plugs in closer to the bay connector. The white plug has 2 grey wires running to the charger socket while the orange connector has red black and white wires running to the battery and the internal (bay) connector. 3. I guess if I were to tackle it I would try to see how far I could trace the power (at the moment my voltmeter is also packed). And see if you can identify what component is failing.

Sorry, I realize that this is not much help other than telling you which plugs go into which part of the socket on the board assuming that yours is the same (my board is labeled Rev A). Hopefully one of those electronic types will chime in with more info.

Good luck.

*Message #6 Posted by **David Ramsey** on 24 May 2011, 4:04 p.m.,*
in response to message #5 by M. Joury

Yeah, I'm a programmer, too. I can solder but that's about it. I think I remember the resistor color code.

I see 6V from the battery up to the rightmost pin on the transistor. On the other two contacts the reading is 0.03V, so the power isn't making it through that component.

Re: HP 9114 disk drive battery charging

*Message #7 Posted by **David Ramsey** on 24 May 2011, 5:45 p.m.,*
in response to message #6 by David Ramsey

I think I see the problem: the lowest component on the PCB, right under the resistor, is a green resistor-sized object labeled "3A". It's obviously been replaced at some point judging by the solder marks. The 6V goes through this component to the output, and none of this is making it through.

I suspect this is a blown 3A fuse. I also suspect it's too small: 6V@3A is only 18 watts, and I think the 9114 probably requires more than that.

The transistor and rectifier are only used for charging, as far as I can tell. Mind you, I don't know much about electronic hardware.

So I plan to replace this fuse with a 5A fuse in the next day or so unless someone thinks it would be a really bad idea.

*Message #8 Posted by **Paul Berger (Canada)** on 24 May 2011, 5:54 p.m.,*
in response to message #6 by David Ramsey

One of those things that looks like a resistor is probably a micro-fuse, your description of the electronics in the battery pack would seem to match the 88014A battery pack and according to Mr. Duell's schematic the fuse is in between the + side of the battery and the W/R (white/red?) wire that goes to the connector between the battery pack and the 9114. The schematic can be found at http://www.hpmuseum.net/document.php?hwfile=2718

Numerical Integration: HP, TI, etc.

*Message #1 Posted by **Chuck** on 23 May 2011, 3:09 p.m.*

I feel like this has been discussed before, but I can't find any info.

It's generally claimed that many, if not most, calculators that have numerical integration capabilities usually use an Adaptive Gauss-Kronrod Quadrature method.

Today in my Calc II class I introduced the students to this numerical method by first integrating Cos[1/(8-x)] from 0 to b, changing b from 5 to 6, 7, and 8 to show them the computing time increases substantially. From there we looked at a little G-K theory.

We discovered the TI calculators will eventually compute a result for b=8, but takes several minutes due to the improper upper limit. The value it gives is 6.491864009, while Mathematica gives 6.4916765549 (claiming to use Guass-Kronrod). So, the TI was accurate to 3 decimal places using an undetermined number of nodes.

However, testing with Mathematica, a Gauss-Kronrod 63 point quadrature only gives, 6.42284; way off. Even a 1000+ point quadrature doesn't give the same accuracy as the TI. And I know the TI isn't doing a 2000 point quadrature. So, what other strategies are being used?

Also, back to HP. My HP-42S, when setting the accuracy to 0.001, I get 6.4811 (almost within 0.01 not 0.001) after several minutes. So, what method is the 42S using?

I wish I took more numerical analysis 30 years ago.

Thanks, CHUCK

Re: Numerical Integration: HP, TI, etc.

*Message #3 Posted by **Dieter** on 23 May 2011, 5:16 p.m.,*
in response to message #1 by Chuck

The classic implementation of the Integrate function (HP-34C, 15C and others) uses a kind of adaptive Romberg method. With every iteration more and more (clevery placed) nodes are used. The integration limits are not evaluated so that a result can be determined even if the function is not defined there.

Please take a look at this page in the articles section. There you will also find a reference to a detailled discussion of the Integrate function and its properties on the 34C, written by W.H. Kahan in HP magazine issues more than thirty years ago.

FWIW: the 35s, set to FIX 3, returns 6,491 for the mentioned integral.

While you're at it, try integrating FRAC(x) (the fractional portion of x, sometimes called FRAC, sometimes called FP, depending on the calculator) from 0.0 to 6.4 . All HP calculators fail spectacularly on this simple function, but at least they do it quickly :-(

Re: Numerical Integration: HP, TI, etc.

*Message #6 Posted by **Thomas Okken** on 24 May 2011, 10:13 p.m.,*
in response to message #5 by Kiyoshi Akima

FP is a spectacularly non-analytical function... All the clever quadrature algorithms assume that the function to be integrated is well-behaved. Functions that go wild like cos(1/x) around x=0, or FP which is discontinuous at all integers, are always going to be a problem. This is why numerical integrators on calculators will never be a complete substitute for actual mathematical insight.

> Quote:
>
> All the clever quadrature algorithms assume that the function to be integrated is well-behaved.

Now consider the following polynomial of 6th degree:

```
f(x) = 44 (x-1) (5 x-27) (5 x-16) (8 x-49) (8 x-35) (40 x-81)/4671275427
     + 4 (x-1) (5 x-27) (5 x-16) (8 x-49) (8 x-35) (40 x-11)/701819181
     + 25 (49-8 x) (x-1) (5 x-27) (8 x-35) (40 x-81) (40 x-11)/3658919121
     + 4 (x-1) (5 x-27) (5 x-16) (8 x-49) (40 x-81) (40 x-11)/233939727
     + (49-8 x) (x-1) (5 x-16) (8 x-35) (40 x-81) (40 x-11)/159262983
     + 4 (x-1) (5 x-27) (5 x-16) (8 x-35) (40 x-81) (40 x-11)/4671275427
```

It was chosen to match exactly the FRAC function at the points mentioned by Kiyoshi Akima: {0.275, 1, 2.025, 3.2, 4.375, 5.4, 6.125}.

This polynomial is well behaved but still the programs that fail with FRAC will also fail with this function.

Cheers
Thomas

Here's a C++ program for those who'd like to verify:

```
#include <stdio.h>
#include <math.h>

double f(double x) {
    return
        44*(x-1)*(5*x-27)*(5*x-16)*(8*x-49)*(8*x-35)*(40*x-81)/4671275427LL
        +4*(x-1)*(5*x-27)*(5*x-16)*(8*x-49)*(8*x-35)*(40*x-11)/701819181LL
        +25*(49-8*x)*(x-1)*(5*x-27)*(8*x-35)*(40*x-81)*(40*x-11)/3658919121LL
        +4*(x-1)*(5*x-27)*(5*x-16)*(8*x-49)*(40*x-81)*(40*x-11)/233939727LL
        +(49-8*x)*(x-1)*(5*x-16)*(8*x-35)*(40*x-81)*(40*x-11)/159262983LL
        +4*(x-1)*(5*x-27)*(5*x-16)*(8*x-35)*(40*x-81)*(40*x-11)/4671275427LL
    ;
}

double x[] = {
    0.275, 1.0, 2.025, 3.2, 4.375, 5.4, 6.125
};

int main() {
    for (int i = 0; i < 7; i++) {
        printf("%d: x = %5.3f    frac(x) = %8.6f   f(x) = %8.6f\n", i, x[i], x[i] -
floor(x[i]), f(x[i]));
    }
}
```

It creates the following output:

```
0: x = 0.275    frac(x) = 0.275000   f(x) = 0.275000
1: x = 1.000    frac(x) = 0.000000   f(x) = 0.000000
2: x = 2.025    frac(x) = 0.025000   f(x) = 0.025000
3: x = 3.200    frac(x) = 0.200000   f(x) = 0.200000
4: x = 4.375    frac(x) = 0.375000   f(x) = 0.375000
5: x = 5.400    frac(x) = 0.400000   f(x) = 0.400000
6: x = 6.125    frac(x) = 0.125000   f(x) = 0.125000
```

Why would all estimations fail on this polynomial?

Gauss/Kronrod quadratures provide some guarantees about correctness when integrating polynomials. I believe Gaussian quadratures of order n are exact for polynomials of degree 2n-1 or less (I might be out by +/- 1 on the degree, it has been a while). Kronrod quadratures extend the Gauss quadrature by using the Gauss points and additional points that provide two estimates of the integral, They do, however, lose something on the degree of polynomial they handle exactly when compared to a Gaussian quadrature with the same number of points (the degree change here has slipped my mind for the moment).

I wrote: "programs that fail with FRAC will also fail with this function."

My assumption was that they fail with FRAC for the same reason as explained in Message #22.

It's obvious that numeric integration algorithms may have problems with "functions that go wild" but this is not obvious in the case of the FRAC function.
You can always construct a polynomial for which a specific integration algorithm fails. What surprised me was that the algorithm used in HP calculators fails for such a simple function as FRAC.

Those who think the polynomial given above is too complicated may try to integrate x^2(x^2-47^2)(x^2-88^2)(x^2-117^2) from -128 to 128.

My HP48 gives 0 as a result whereas WolframAlpha returns 2.72663×10^{16}.

The 34s gets $2.72663118082 \times 10^{16}$.

This isn't surprising given that the algorithm used should be exact for this polynomial. However, it fails badly for FRAC.

It's also a matter of the limits. The built-in integrator works perfectly well integrating FRAC from 0 to 1, for example. Or from 0 to 3. It has a little more difficulty with integrating from 0 to 2. Also note that it does come up with a more-or-less correct answer if the upper limit is changed from 6.4 to 5.4 .

Re: Numerical Integration: HP, TI, etc.

*Message #13 Posted by **Chuck** on 25 May 2011, 12:24 a.m.,*
in response to message #5 by Kiyoshi Akima

Cool. They also fail spectacularly slowly. I played around with the limits a bit. Lower=0 and upper=2 on the HP42 was integrating for about an hour (forgot it was on and let it sit unattended). I ended up hitting EXIT so as to not run out of batteries. (accuracy was set at 0.00001)

The HP71 does indeed fail (and quickly at that):

```
>INTEGRAL(0,6.4,0,FP(IVAR))

   1.28
```

but just halving the interval gives a decently correct result:

```
>INTEGRAL(0,3.2,0,FP(IVAR))+INTEGRAL(3.2,6.4,0,FP(IVAR))

   3.08006142853
```

My own experimental integration program succeeds as well at minimum settings:

```
>200 DEF FNF(X)=FP(X)
>RUN
   X1,X2,Err,# Points: 0,6.4,1E-10,2

       32  3.08  .16
```

which is the exact result, not a 5-digit approximation like the one obtained with the halving trick above.

Best regards from V.

> Otherwise he could be using a WP34s!

The 34s isn't that accurate. It is using an 10/21 point Gauss Kronrod method with no adaptive component.

If someone wants to write a better integration routine, we'd be very interested.

- Pauli

Re: Numerical Integration: HP, TI, etc.

*Message #23 Posted by **Crawl** on 26 May 2011, 10:51 a.m.,*
in response to message #5 by Kiyoshi Akima

Yeah, the HP50g gives 1.28 in much less than a second.

The TI89 gives the correct answer of 3.08, taking about 15 seconds.

It looks like what's happening with the HPs is that it first does a midpoint rectangle rule (FP(6.4/2) = FP(3.2) = 0.2. Then 0.2*6.4 = 1.28).

I'm not sure why it terminates there, though.

I'd guess if it wanted to add more points, it would go to three point normal Gaussian integration (so it could reuse the middle point). But if you do that, you get 3.057777777..., not the same answer, and in fact one that is much closer to the correct answer.

Re: Numerical Integration: HP, TI, etc.

*Message #24 Posted by **Kiyoshi Akima** on 26 May 2011, 2:33 p.m.,*
in response to message #23 by Crawl

The scheme used, as far as I can tell on every HP calculator that has a built-in integrator, is a modified Romberg with argument scaling designed to reduce problems with periodic functions. The Romberg terminates when three passes evaluate to the same value under the current display setting.

The first pass is a one-point midpoint rule, evaluated at 3.2, giving 1.28.

The second pass adds evaluations at 1.0 and 5.4, which also gives 1.28.

The third pass adds evaluations at 2.025, 4.375, .275, and 6.125, which also happens to come out as 1.28. Since these three results agree regardless of the display setting, the routine decides it must be correct and terminates.

I stumbled across this particular example quite by accident. But when the result came out this bad, I had to investigate.

Re your original question about the TI and Mathematica results for cos(1/(8-x)).

You're saying "while Mathematica gives 6.4916765549 (claiming to use Guass-Kronrod)".

Can you tell us exactly how you tested? Are you sure about it using Gauss-Kronrod?

I spent some time in keisan which permits playing with a number of integration schemes, incl. Gauss-Kronrod. keisan num integration

I can confirm that Gauss-Kronrod (for n=15, 41, 71), does *not* return good results, just as you found in Mathematica. (Using some *other* kind of testing, I assume.)

Interestingly, the result for n=63 does not match the one you got in Mathematica. At 6.46.. it's a little better.

```
n=15
Gauss-Legendre  7       6.876098950292528094576
Gauss-Kronrod   15      6.574616683680514255335
accuracy        -       7

n=41
Gauss-Legendre  20      6.57836956143155286915
Gauss-Kronrod   41      6.566852251450387088799
accuracy        -       6.6
```

```
n=63 (slow)
Gauss-Legendre  31      6.46414119548917882461
Gauss-Kronrod   63      6.46066504369567408219 7
accuracy        -       6.46

n=71 (slow)
Gauss-Legendre  35      6.392977564788352852733
Gauss-Kronrod   71      6.479392744161763499238
accuracy        -       6.5
```

I'm unable to obtain a result good for two decimal places using *any* of the integration methods and ranges for n supported by keisan, even when the server is busy for 15s or so!

Instead, I'm getting frequent input errors with some methods (=function not accepted) and compute errors for "high" values of n.

Using a different implementation, I know that a 2K Gauss-Legendre integration returns 6.4902... which is still worse than your TI result.

WolframAlpha returns a result good to 5 decimal places. Assuming the keisan results are correct, and Gauss-Kronrod does not return a good result for this function using "typical" values of n, I suppose it either
- uses much higher values for n
- or, uses a different integration scheme for this function
- or, quite simply (for Mathematica), integrates symbolically and evaluates!

(ND1's result, which is accurate to 4 decimal places, is obtained via double exponential integration with a computational expense roughly equivalent to a 512-point Gauss integration.)

> - or, quite simply (for Mathematica), integrates symbolically and evaluates!

Most likely the latter, as we can verify by submitting "Integrate Cos[1/(8-x)]dx, from 0 to 8" to WolframAlpha:

http://www.wolframalpha.com/input/?i=Integrate++Cos%5B1%2F%288-x%29%5Ddx%2C+from+0+to+8

The closed form solution is:

```
8*cos(1/8) - pi/2 + Si(1/8)
```

Of course Si(1/8) requires a numerical method, but Si(x) is a well-behaved function. By using this result, we can get nine correct digits on the HP-15C:

```
01- f LBL A
02-   SIN
03-   x<>y
04-   /
05- g RTN
```

That's the program used to integrate Si(x) or sin(x)/x in the HP-15C manual.

```
keystrokes              display

f FIX 9 g RAD 0         0
ENTER 8 1/x             0.125000000
Integrate A             0.124891544         (after 57 seconds)
8 1/x COS 8 * +         8.062472882
pi 2 / -                6.491676555
```

The WolframAlpha result, when asking once for "More digits" is:

```
6.491676554944408058430579466432314289173766677622807687289708221434167607237729760058869965621893294
```

Now, changing the upper limit a bit and multiplying the integral by 100 for a weird result :-)

```
Integrate  100 Cos[1/(8-x)]dx, from 0 to 100*(1/3+Exp[-pi])^2/W[100*(1/3+Exp[-pi])^2]
```

Edited: 28 May 2011, 11:17 a.m.

> Integrate  100 Cos[1/(8-x)]dx, from 0 to 100*(1/3+Exp[-pi])^2/W[100*(1/3+Exp[-pi])^2]
> ```

Let's see ...

```
1   DEF FNW(X)=FNROOT(0,10,FVAR*EXP(FVAR)-X)
2   N=100*(1/3+EXP(-PI))^2 @ DISP INTEGRAL(0,N/FNW(N),0,100*COS(1/(8-IVAR)))

>RUN
     665.999991757
```

... so I guess your *"weird result"* was intended to be **666**.

As for the original troublesome integral, this keyboard statement ...

```
INTEGRAL(0,7.99,0,COS(1/(8-IVAR)))+INTEGRAL(7.99,8,0,COS(1/(8-IVAR)))

   6.4916773758
```

... gives the result correct to **7** digits.

Best regards from V.

Unidynamics

*Message #1 Posted by **Howard Owen** on 23 May 2011, 3:05 p.m.*

I was searching for calculator resources just now and came across The HP Memory Project. I'm certain that site must be familiar to many of you, but it was new to me. I noticed that they have "new" sections devoted to desktop and pocket calculators. I've only read the beginning section on the HP 35, but the pocket calculator page promises to be a detailed and interesting walk through the history of HP's pocket calculators from the HP-35 to the HP-41C.

Something that really caught my eye is an excerpt from INSIDE HP: A narrative history of Hewlett-Packard from 1939-1990 (PDF link) written by John Minck. Mr Minck was a technical marketing exec at the HPA division. He describes the calculator project that an HP customer called Unidynamics had underway, but then abandoned. Mr Minck is the guy that subsequently passed the information on to HP labs. This then led HP labs to create a design using HP ICs that became the HP-35.

Apologies if this is already known to most of you. It might be worth a re-read, even so. :)

Regards,
Howard

wp 34s: DSE vs. DSZ (poll)

*Message #1 Posted by **Walter B** on 23 May 2011, 12:58 a.m.*

Hi all,

Your opinion is requested once more:
Bottom right on the wp 34s, on the '+' key, we've got DSE as f-shifted function (the traditional Decrement and Skip if Equal). Shall this be replaced by DSZ (Decrement and Skip if Zero as on the 16c)? ISG will stay there g-shifted anyway.

Your votes, please :-)

Walter

Re: wp 34s: DSE vs. DSZ (poll)

*Message #2 Posted by **Paul Dale** on 23 May 2011, 1:02 a.m.,*
in response to message #1 by Walter B

My vote is for DSZ. I use this a lot more than I use DSE.

On the other hand, I use ISG more than ISZ. Weird huh?

- Pauli

Re: wp 34s: DSE vs. DSZ (poll)

*Message #3 Posted by **Walter B** on 23 May 2011, 1:19 a.m.,*
in response to message #1 by Walter B

For symmetry reasons, I'd like DSE staying there. OTOH I acknowledge DSZ is easier to use due to its predefined decrement and final. Nevertheless, DSE is my (slight) favourite.

Walter

Re: wp 34s: DSE vs. DSZ (poll)

*Message #4 Posted by **Angel Martin** on 23 May 2011, 1:50 a.m.,*
in response to message #3 by Walter B

Considering that DSZ was on the 67 and DSE made its way on the 41, I'd say DSE added flexibility to the mix - despite the slight inconvenience of having to define the lower limit.

I don't suppose you can have both? If I had to chose, I'd go for DSE.

Re: wp 34s: DSE vs. DSZ (poll)

*Message #5 Posted by **Paul Dale** on 23 May 2011, 2:09 a.m.,*
in response to message #4 by Angel Martin

We have both commands and that isn't going to change.

What we're trying to decide is which should be on the keyboard and readily accessible and which goes into the program catalogue and be slightly less accessible.

- Pauli

Re: wp 34s: DSE vs. DSZ (poll)

*Message #6 Posted by **Marcus von Cube, Germany** on 23 May 2011, 2:09 a.m.,*
in response to message #4 by Angel Martin

They're both available, one on the keyboard, the other in a catalogue. The question is which one to put where for convenience. Not a big deal, really.

Re: wp 34s: DSE vs. DSZ (poll)

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 23 May 2011, 9:28 a.m.,*
in response to message #4 by Angel Martin

As far as I recall, if you use an integer no larger than 99999 as the starting value, DSE and DSZ will behave exactly the same. The final value would be 0, and the step, by default is 1 (or -1 in this case). So no special initialization will be needed for DSE in most cases.

I would consider a change for ISG, since the initial value can have up to 5 digits and the final value may only have 3; which is not very convenient for an incrementing operation. But backwards compatibility and symmetry with DSE make it better to keep it the way it has been for the last 30 years.

So my preference is to keep ISG and DSE in the traditional way. For the keyboard, my priority is ISG, then DSE and, last, DSZ.

Re: wp 34s: DSE vs. DSZ (poll)

*Message #8 Posted by **M. Joury** on 23 May 2011, 12:51 p.m.,*
in response to message #7 by Andrés C. Rodríguez (Argentina)

I was going to say: Given that DSE with no parameters is (from the programmers point of view and as noted earlier) the same as DSZ so my choice would be to go with DSE on the keyboard.

However, on second thought, I suspect that internally DSZ is more efficient (?) and 9/10 time (maybe 99/100) when I use DSE I default it to the DSZ equivalent. I can always go looking for DSE when I really need it but as a keyboard default (and only if DSZ is more efficient) I would go with DSZ.

BTW, I am going to assume that there is an ISZ function to match DSZ? I guess I could go look couldn't I but I don't currently have the emulator or manual handy.

Cheers

Correct, DSZ is more efficient than DSE. Several multiplies, integer and fractional parts more efficient since the finishing value and increment don't need to be extract every time.

DSZ also behaves differently when the value has a fractional component which can sometime be useful. Likewise, when the number is negative (which can be useful in integer mode).

Re: wp 34s: DSE vs. DSZ (poll)

*Message #13 Posted by **Eddie W. Shore** on 23 May 2011, 10:36 p.m.,*
in response to message #1 by Walter B

DSE. I like the flexibility of having an ending term.

Re: wp 34s: DSE vs. DSZ (poll)

*Message #14 Posted by **M. Joury** on 23 May 2011, 11:31 p.m.,*
in response to message #13 by Eddie W. Shore

Just making sure that we are not speaking apples and oranges. The choice is not between the functionality of DSZ vs. DSE (as noted elsewhere in this thread both are available as are ISZ and ISG -- thanks Gerson!). The question is which should appear on the keyboard. So, just to confirm, are you saying that you want DSE on the keyboard due to the availability of an ending term?

Cheers

MJ

Re: wp 34s: DSE vs. DSZ (poll)

*Message #15 Posted by **Eddie W. Shore** on 24 May 2011, 12:23 a.m.,*
in response to message #14 by M. Joury

Yes. I'll confirm my choice.

Re: wp 34s: DSE vs. DSZ (poll)

*Message #16 Posted by **Walter B** on 24 May 2011, 12:26 p.m.,*
in response to message #15 by Eddie W. Shore

So we have 4 votes for DSE and 2 for DSZ on the keyboard. As mentioned, DSE, DSZ, ISG, and ISZ are all featured in any case, two in P.FCN and two on the keyboard for direct access.

Any more votes? I'll close the polling station 24h after this post or the last vote, whatever comes last :-)

Walter

Re: wp 34s: DSE vs. DSZ (poll)

*Message #17 Posted by **Dieter** on 24 May 2011, 3:51 p.m.,*
in response to message #16 by Walter B

I would like to add a slightly different thought.

In my humble opinion the whole keyboard layout should ensure fast and straightforward operation in most situations the user typically faces in his daily use. A programmable calculator that is first of all a calculator, and then a programmable device, should emphasize fast and easy manual calculations. Functions that are mostly used in programs, such as DSE, ISG, DSZ, ISZ are not required to be found on keys - for me it's perfectly fine if they are somewhere in a menu. I think their keyboard space can be used more efficiently for other everyday-functions that now are buried in the menues. For instance cube or cuberoot, or even better an x-th root function (does the 34s have one at all?).

The only exceptions - programing functions that should be directly accessible from the keyboard - are some basic functions for short everyday programs. I would say this applies to LBL, RTN, GTO, XEQ and a few others.

In other words: I would use the keyboard space used for DSE and ISG, as well as the two tests X=? and X<>? (which are the only ones that are not in the TEST menu) for something more useful, i.e. especially commonly used mathematical functions. Even a "Parts"-menu (like on other HP-calculators) for IP, FP, Trunc, Floor, Ceil etc., and maybe also RND and ABS might be fine if it makes room for other useful functions.

How about that ?-)

Dieter

Functions for PRG mode on the keyboard

For instance cube or cuberoot, or even better an x-th root function (does the 34s have one at all?).

Personally, I didn't use a cuberoot for years. And for the 17th root of x, I'm able to press 17 1/x y^x, so why waste one label for the x-th root of y? You see, mileages may vary.

> Quote:
>
> The only exceptions - programing functions that should be directly accessible from the keyboard - are some basic functions for short everyday programs. I would say this applies to LBL, RTN, GTO, XEQ and a few others.

Agree on the first four, but which are the "few others"? After all, we don't have many of them on the keyboard ... 8-)

> Quote:
>
> I would use the keyboard space used for DSE and ISG, as well as the two tests X=? and X<>? (which are the only ones that are not in the TEST menu) ...

since they are the only ones working with real numbers as well as with complex

Come on, which "everyday-functions" are you thinking of which aren't on the keyboard yet?

Walter

Re: Functions for PRG mode on the keyboard

*Message #19 Posted by **Dieter** on 25 May 2011, 5:28 p.m.,*
in response to message #18 by Walter B

Hallo, Walter -

> Quote:
>
> Personally, I didn't use a cuberoot for years. And for the 17th root of x, I'm able to press 17 1/x y^x, so why waste one label for the x-th root of y? You see, mileages may vary.

You bet they do. Personally, I haven't used complex numbers *at all*. And P<>R is essentially used here for nothing but the fast evaluation of sqrt(x^2 + y^2). ;-)

I think the XROOT function, which is available on most "serious" HP calucators, is a useful addition. Typing x ENTER 17 1/x y^x does not compute the 17th root of x, it exaluates x^0,0588235294118. I like functions that provide a result as precise as possible, and XROOT is one of them, ensuring the result is exact to all 16 digits within 0,5 ULP. It also saves two keys since virtually all mathematical functions are shifted on the 34s (not your fault - the 34s has only seven rows of keys instead of the usual eight).

The same goes for ln1+x and e^x-1. I often use these functions and I really miss them on the 35s. So I'm glad they are back on the 34s - deep down in a menu. By the way these are two candidates that can take the keyboard space of other functions that are mainly used in program mode.

> Quote:
>
> Come on, which "everyday-functions" are you thinking of which aren't on the keyboard yet?

I already mentioned ln1+x and e^x-1. I also miss H.MS+ for standard calculations with angles and time. Another example is the VIEW function, I heard its position on the keyboard (h STO) is now replaced by something else. Also the date functions (dDAYS and DATE+) are handy for everyday use.

For basic programming I like to have at least an input/output function like PROMPT or AVIEW. Personally, I also like the direct use of flags to set a mode or configuration for a program: for instance set a flag or clear it to tell the calculator you want fast results with mid-precision or you'll accept longer execution times for full precision results. That's why I like SF and CF on the keyboard (and flag announciators in the display).

in response to message #19 by Dieter

Reading your post I can't help but think about the 41 keyboard design - which offers much of what you mention. I think it deserved much more praise than was given, an

impeccable solution to balance the open-ended character of the system with the simplicity and elegance of a superb key layout - not intimidating at all, yet flexible and well thought-out...

Oh well, such was life back then.

Re: Functions for PRG mode on the keyboard

*Message #21 Posted by **Walter B** on 26 May 2011, 10:15 a.m.,*
in response to message #20 by Ángel Martin

Ángel & Dieter,

The HP41C got 39 keys, the WP34S 37. Besides the trivial equalities, where are the differences?

The 41C features five keys without a shifted operation: ON, USER, PRGM, ALPHA, and the golden prefix. The 34S sports only three, i.e. f, g, and h.

The 41C in ground state has Sigma+, 1/x, SQRT, SIN, COS, TAN, LN, LOG, and SST unshifted. For the 34S in ground state, Sigma+, 1/x, SQRT, y^x, SST, BST, and EXIT are primary. So the difference is SIN, COS, TAN, LN, LOG versus y^x, BST, and EXIT - 5 vs. 3 matching the different amount of keys. BST and EXIT are set for the 34S, y^x may be stored for later discussion.

Of the shifted operations on the 41C, what does the 34S not show on its surface? Most prominent, the 41C features ASN and only one CATALOG. It shows five tests on its keyboard including FS?, and two more flag commands, and BEEP. That's it. OTOH, the 34S gives you keyboard access to hyperbolics, fraction modes, integer modes and operations, statistics, etc. plus a structured system of catalogs. We do not feature anything like ASN beyond the four hotkeys so far, however, and it's improbable we will ever do in this project.

VIEW is not decided yet - it may well stay on the keyboard of the 34S.

Yes, we don't show SF, CF, FS? - just tell me three adjacent places on the 34S where to put them and what to kick out there and we'll check. And yes, we didn't put the other functions on the surface Dieter mentioned. Again, feel free to suggest where you want them and what shall be dropped instead. But we are in a project stage now where I can hardly accept such plain wishes like "put this or that on the keyboard" - you have to tell me what you want off in exchange.

XROOT is a function we may consider taking in X.FCN - if my fellow projecteers agree on it d:-)

*Message #24 Posted by **M. Joury** on 26 May 2011, 2:41 p.m.,*
in response to message #21 by Walter B

Hi Walter,

I have been wondering about ASN. After all a lot of us have different requirements for our machines and the wonderful thing about the 41 was how easy it was to configure the keyboard layout to the users' requirements. So, is ASN terribly difficult to implement or is it an issue of available ROM space, or...?

Has there been a discussion of this previously? If so sorry for the repetition.

Cheers,

MJ

ASN

*Message #25 Posted by **Walter B** on 26 May 2011, 4:52 p.m.,*
in response to message #24 by M. Joury

IIRC, Pauli and me had an internal discussion about key assigning quite early in this project but I don't find any reference right now. I guess we

agreed on ASN being too difficult or complicated for our hobbyist's project. BTW, up to 2009 I used to place an ASSIGN or ASN in my (vapourware) layouts based on different calcs though not on the 20B.

Walter

Re: ASN

*Message #26 Posted by **Marcus von Cube, Germany** on 27 May 2011, 3:11 a.m.,*
in response to message #25 by Walter B

For the time being, we have some constraints:

Flash is running out, we need to improve on code size before we will add new functionality.

Battery backed RAM is limited to 2KB and is full now. We plan to relocate the user program space almost completely to flash in a future version so we gain SRAM for other purposes such as more (type tagged) registers and/or key assignments.

The present infrastructure on the device and the emulator do not provide the mechanics of detecting key down / key up. This is essential for the "NULL" operation of the 41C which makes perfect sense if you have an assignable keyboard.

Re: ASN

*Message #27 Posted by **Tim Wessman** on 27 May 2011, 10:16 a.m.,*
in response to message #26 by Marcus von Cube, Germany

There is a rather simple solution to this that I used in the 10bII+ for keys needing to be held down.

Put a short timer on your key that waits a short time, and then checks if it is still down. If so, it will loop again for up to 2 seconds or whatever your threshold is (slowing down in the loop to save batts). Check inside your longer loop every 150 ms or something to see if still down.

With proper tuning, it works great.

TW

Re: ASN

*Message #28 Posted by **Marcus von Cube, Germany** on 27 May 2011, 10:41 a.m.,*
in response to message #27 by Tim Wessman

Tim, I've put the keyboard scan into a timer interrupt,

generated by the LCD controller(*). Checking if a key goes down or up is just a matter of some additional binary logic in this routine. I don't allow deep sleep while a key is down, so 'up' can be reliably detected. The only problem is that I haven't implemented the 'up' logic yet. If I add it, 'key up' will simply change the sign of the queued character. IIRC, the emulator kernel has provisions for this, too, which just need to be activated.

(*) Why the LCD controller and not one of the timers? The former runs at the same speed always, while the latter depend on the current clock setting. I had a hard time implementing a reliable time base while switching CPU speed back and forth to conserve power. I was glad to find out that the LCD controller can do this for me much easier. The frequency is 51 Hz which can be tricked into a 100ms heart beat by some smart counting.

Re: Functions for PRG mode on the keyboard

*Message #29 Posted by **Paul Dale** on 26 May 2011, 5:32 p.m.,*
in response to message #24 by M. Joury

Yes, lots of discussion. Several discussions.

The final decider was space. RAM is very limited (2kb in total, or so we thought at the time, Marcus found us a very small amount more).

Keyboard assignments will require two bytes minimum per assignment. 37 keys with four shift planes is 296 bytes and this number is a minimum, there would be additional overheads as well. That isn't bothering to distinguish alpha mode, integer mode, complex as a prefix, -> as a prefix (all of we we do do).

Being able to define keys on a non-expandable calculator with a relatively easy to navigate catalogue system simply wasn't worth the space.

Bear the above in light of the "no dynamic memory allocation" rule I'd set myself early on. Then also consider the non-expandable nature unlike the 41c -- the function set is completely determined.

I'm sure some people think that losing a minimum of 15% of available RAM for an assignable keyboard is worthwhile. We didn't.

- Pauli

Re: Functions for PRG mode on the keyboard

*Message #30 Posted by **M. Joury** on 26 May 2011, 10:32 p.m.,*
in response to message #29 by Paul Dale

Fair enough. Sounds like it was carefully considered.

I do have one question though: Why did you impose a "no dynamic

memory allocation" rule on yourself? Allowing dynamic allocation would allow keyboard assignment ala the 41 where memory usage would not be fixed and could be determined by the needs of the user. Of course dynamic memory allocation does risk introducing bugs (is reliability the primary concern here) or is it something in the hardware, or something else entirely?

Cheers,

MJ

Re: Functions for PRG mode on the keyboard

*Message #31 Posted by **Paul Dale** on 26 May 2011, 11:52 p.m.,*
in response to message #30 by M. Joury

Reliability was my main concern. All other things were secondary at least in this project.

A calculator has to just work always. You also need to be able to implicitly trust the results.

*Message #32 Posted by **gene wright** on 27 May 2011, 12:05 a.m.,*
in response to message #31 by Paul Dale

The ability to have programs in flash and to call them as subroutines as well as simply RUN them, greatly diminished my desire for dynamic memory allocation.

Good job, guys.

Why we don't take every suggestion (sorry ;-)

*Message #33 Posted by **Walter B** on 27 May 2011, 12:03 a.m.,*
in response to message #30 by M. Joury

AFAIK, it's simply a matter of complexity. Most people are happy with a mid-range scientific which works (almost so far, we're working on it) while only very few would appreciate a high end study failing to become a product. Remember it's a hobbyist's project and we started from scratch in 2008.

Personally, I didn't expect the size of the function set we've got now (the last manual of 2008 had 16 pages) - and during the last months, my main concern is the WP 34S may die in increasing complexity eventually. IMHO, OpenRPN (hi, old guys :-) died by that combined with the lack of project management. Pauli and me were contributing to OpenRPN, and we don't want to see the same result again. Hope that explains us being a bit reluctant sometimes ... :-/

Nevertheless, thanks for each and every suggestion :-)

Walter

Which is partly the reason we've agreed to a feature freeze once the currently flash segment stuff is ironed out. The other reason is we're out of flash :-)

If anyone here wants to rework the integer routines in ARM assembly, there is some decent savings to be had. Checking for carry and overflow is tedious and large using straight C but relatively easy in assembler.

- Pauli

Re: Why we don't take every suggestion (sorry ;-)

*Message #36 Posted by **Paul Dale** on 27 May 2011, 8:07 a.m.,*
in response to message #33 by Walter B

To give people an idea of the amount of functionality we've squeezed in, there are:

```
        niladic commands 151   commands not taking
an argument (ALL/Rv)
        monadic commands 116   commands that take
one argument and return one result
        dyadic commands 37     commands taking two
arguments and returning one result
        triadic commands 5     commands taking
three arguments and returning a single result
        argument commands 110  commands that take
an immediate argument (STO/RCL)
        multiword commands 10  commands that handle
alpha labels
        special commands 43    others that didn't
fit nicely
```

That is a total of 472 distinct commands (plus a few extras mentioned below). Monadic and dyadic functions can often take complex and integer arguments -- these aren't counted separately here.

In all there are 22164 op-codes (only counting one for the commands that address multiple character alpha labels so in reality there are many many many more 167 million or so). Complex argument commands are counted separately to real argument commands here. However, integer commands that can also take real arguments are not.

This also doesn't include the ON + key combinations and some of the immediate action keys (SST, BST, EXIT and a few others).

Re: Functions for PRG mode on the keyboard

*Message #37 Posted by **Paul Dale** on 27 May 2011, 2:31 a.m.,*
in response to message #30 by M. Joury

Dynamic key assignments will definitely take up more memory per key -- you've got to store the key (6 bits), the shift plane (3 - 5 bites) as well as the function code (16 bits, although this can likely be reduced a little bit with a fair amount of effort).

- Pauli

*Message #40 Posted by **Paul Dale** on 27 May 2011, 5:53 p.m.,*
in response to message #39 by Marcus von Cube, Germany

Come clean, the sources are available for Tim to inspect if he really wants. It is the LCD memory.

It stays active while the screen is showing so things which need to be kept between keystrokes but not over power cycles can be cached there and main RAM turned off. A very nice find which netted us a extra program steps. Also a bit fiddle to use without destroying the display integrity.

in response to message #21 by Walter B

> Quote:
>
> Yes, we don't show SF, CF, FS? - just tell me three adjacent places on the 34S where to put them and what to kick out there and we'll check.

We have far less need of these three on the keyboard than other devices. Our flags are for programming only. All mode changes in the device are done via dedicated commands. Again this was a design decision early on. The result is the user doesn't need to remember any magic numbers to set the device up.

Much as I like the 41 and 48 series calculators, their use of magically numbered flags for mode settings irks me -- more so for the 48 series that should have been able to use text (with later models providing a browser that did just this).

Then when I'm writing and keying in programs for the 41, I find I don't use these three all that often -- FS?C and FC? seem to pop up a lot. The 34s extends the available flag operations considerably BTW.

Anyway, I'll finish with a flag heavy program from the small 34s library. The sieve of Eratosthenes done without touching a single non-stack register -- everything is stored in the flags.

```
001: LBL B
002: 9
003: 9
```

```
004: SF->X
005: DSE X

HP9800e emulator

*Message #1 Posted by **Tim** on 22 May 2011, 8:43 p.m.*

Does anyone know how to run the HP9800e on source forge? I downloaded the file. It is written in java. How do you run the software?

Re: HP9800e emulator

*Message #2 Posted by **Eric Smith** on 22 May 2011, 9:19 p.m.,*
in response to message #1 by Tim

I'm using Linux, but I think this same process would work under Windows:

1. Make sure you have the Java Runtime Environment (JRE) or Java Development Kit (JDK) installed. If you don't already have one of these, get them here.
2. Open a terminal (commmand-line) window.
3. Make a directory for the emulator (e.g., using the "mkdir" command).
4. cd into the directory
5. unzip the binary distribution of the emulator
6. launch using the command "java -jar HP9800E.jar HP9830A" (or replace the HP9830A with the base name of any of the .cfg files, such as HP9810A, HP9820A, or HP9821A)

Re: HP9800e emulator

*Message #3 Posted by **Tim** on 22 May 2011, 11:52 p.m.,*
in response to message #2 by Eric Smith

Where can I find t he .jar file? I can only find the files written in java. They are the source files.

Re: HP9800e emulator

*Message #4 Posted by **Eric Smith** on 23 May 2011, 4:52 p.m.,*
in response to message #3 by Tim

Then you downloaded the source ZIP file instead of the binary ZIP file.

Re: HP9800e emulator

*Message #5 Posted by **Tim** on 23 May 2011, 5:51 p.m.,*
in response to message #4 by Eric Smith

I did that. How do I convert them to a jar file or do I have to. What is the next step?

Re: HP9800e emulator

*Message #6 Posted by **Eric Smith** on 24 May 2011, 1:12 a.m.,*

in response to message #5 by Tim

Well, if you had download the binary ZIP file rather than the source ZIP file, you wouldn't have to do anything.

If you really want to tough it out with the source ZIP file, you need to compile everything. It's not entirely obvious what the procedure is, so if I wanted to do it, I'd look at the jar file in the binary ZIP file to see how it is organized, compile the source files, and package them into a jar similar to the one in the source ZIP file. This seems tedious and error-prone, so I'm not going to try to do it myself unless I decide that I want to modify the source code.

Edited: 24 May 2011, 1:14 a.m.

Re: HP9800e emulator

*Message #7 Posted by **Achim (Germany)** on 31 May 2011, 4:30 p.m.,*
in response to message #5 by Tim

Tim,

if you download the binary zip you find a user manual inside which explains the usage of the emulator. Nevertheless the emulator can be quite easily compiled from the sources using eclipse.

BTW there is a new version 1.50 in preparation which will be released soon. One mayor feature is a hardcopy of printer and plotter output.

Achim

Nspire CX available?

*Message #1 Posted by **David Ramsey** on 22 May 2011, 11:07 a.m.*

Well, not according to TI's web site, but Office Depot swears they're in stock and will have one on my doorstep by the 25th. We'll see, I suppose.

Re: Nspire CX available?

*Message #2 Posted by **Eddie W. Shore** on 22 May 2011, 12:17 p.m.,*
in response to message #1 by David Ramsey

I have not seen one in any stores near me. If I get one, I will only get the CAS version.

Re: Nspire CX available?

*Message #3 Posted by **Joerg Woerner** on 22 May 2011, 3:35 p.m.,*
in response to message #1 by David Ramsey

You'll find it probably on time on your doorstep.

TI released at least the new OS 3.0 just a few hours ago ;-))

Regards, Joerg

Re: Nspire CX available?

*Message #4 Posted by **Jesse Dodd** on 22 May 2011, 7:25 p.m.,*
in response to message #1 by David Ramsey

I just purchased one at the local Office Depot. If they have them in Grand Junction, CO. I imagine that they will have them anywhere.

Re: Nspire CX available?

*Message #5 Posted by **Eddie W. Shore** on 23 May 2011, 10:38 p.m.,*
in response to message #4 by Jesse Dodd

I saw it at the West Covina, CA store too (along with the 10bii+ :)) - just the numeric version. No sight of the CAS version.

Re: Nspire CX available?

*Message #6 Posted by **Eric Smith** on 24 May 2011, 1:21 a.m.,*
in response to message #1 by David Ramsey

Just got one from a local Office Depot today. The display is quite good. The most intriguing thing to me is how the cursor thing acts both as a directional pad with click buttons, and as a touch pad. I've only had a few

minutes to play with it. It seems that to use the touch pad you have to keep your finger on it until the cursor appears.

The first thing I did was select calculator mode and compute e to the i pi, which gave -1 as expected.

I liked that it defaulted to radians rather than degrees. I suppose some people will hate that, but at least it is trivial to change.

Apparently the Nspire OS 3.x has an undocumented Lua interpreter, which is more powerful than the crippled "BASIC" of the NSpire. Unfortunately it appears that there is no way to get powerful programming that actually integrates with the calculator features like you can with the HP 28/48/49/50.

Re: Nspire CX available?

*Message #7 Posted by **Eddie W. Shore** on 24 May 2011, 1:33 a.m.,*
in response to message #6 by Eric Smith

Thanks for the comments Eric. One Question: How is the alphabetic keyboard? My experience with the Touchpad was that the keys on the alphabetic keyboard was small and hard to press. For me, it got uncomfortable after typing notes for five minutes on the B&W Touchpad.

Edited: 24 May 2011, 1:35 a.m.

Re: Nspire CX available?

*Message #8 Posted by **Eric Smith** on 24 May 2011, 1:53 a.m.,*
in response to message #7 by Eddie W. Shore

I haven't used the non-CX Nspire with either the original clickpad (with the tiny alpha keys between the "normal" keys) or the touchpad (with the alpha keys grouped at the bottom). I imagine that the CX alpha keys at the bottom are probably pretty similar to the touchpad. Thus far I've only used them for entering the occasional variable name, and they are fine for that, but I definitely wouldn't want to write a novel with it.

Re: Nspire CX available?

*Message #9 Posted by **Eddie W. Shore** on 26 May 2011, 9:19 p.m.,*
in response to message #8 by Eric Smith

Compared to the B&W Touchpad, the keys on the CX are better to the touch. It does not hurt to type notes on it.

Testing functionality of older HP calculators

*Message #1 Posted by **Pat Slattery** on 21 May 2011, 1:38 p.m.*

Hi everyone, I've got a few older HPs listed on ebay (a couple 45's, a 46, a 32s, and a 12c, username slattery52), and I'd like to be one hundred percent sure they're in full working order before they sell. If all the basic arithmetic functions work, can it be reasonably assumed that all the more advanced functions will work as well? Alternately, is there a list of tests for more advanced RPN functions somewhere?

Re: Testing functionality of older HP calculators

*Message #2 Posted by **Michael de Estrada** on 21 May 2011, 9:02 p.m.,*
in response to message #1 by Pat Slattery

The 12c and 32s have self tests. The 45, 46 are basically ok if all keys respond properly, e.g. 4 key displays 4, 1 shift e^x displays 10, etc. Enter all 8's to verify all LED segments and chs for mantissa and exponent. Also you can test the storage registers 1 thru 9 by storing and recalling a number.

Edited: 21 May 2011, 9:22 p.m.

matrix element operation

*Message #1 Posted by **Sok-khieng Chum Hun** on 21 May 2011, 11:58 a.m.*

Hi, is it possible to do matrix element operation on the hp48 or hp50g?

In exemple, in matlab, if A = [1 2 3] and B = [2 3 4]

A.*B gives [1*2 2*3 3*4] -> [2 6 12]

Or A./B gives [1/2 2/2 3/4] -> [.5 1 .75]

Or A.^B gives [1^1 2^3 3^4] -> [1 8 81]

Thank you :)

Re: matrix element operation

*Message #2 Posted by **Jose Gonzalez Divasson** on 21 May 2011, 2:32 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

In HP50g at least it exists the function HADAMARD, that multiplies 2 matrices term by term. Very useful for business purposes, but not for physics or mathematics.

I don't know how to divide, because 1/[matrix] is a defined operation - and different.

Re: matrix element operation

*Message #3 Posted by **Thomas Klemm** on 21 May 2011, 3:25 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

You could use lists instead of vectors:

```
1st example: A * B

4:  {1 2 3}
3:  {2 3 4}
2:  2
1:  \<< * \>>
DOLIST
```

(PRG -> LIST -> PROC -> DOLIS)

Cheers
Thomas

PS: I guess the next question will be, how to turn a vector into a list:

```
\<<
  OBJ\->
  OBJ\->
```

```
  DROP
  \->LIST
\>>
```

Re: matrix element operation

*Message #4 Posted by **Donald Ingram** on 21 May 2011, 3:33 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

Enter the values as lists using { } or 1 2 3 3 ->LIST and you get the results you desire.

Re: matrix element operation

*Message #5 Posted by **Gilles Carpentier** on 21 May 2011, 5:36 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

Hi,

On the 50G you can use the HADAMARD command for this type of matrices multiplication :

[1 2 3] [2 3 4] HADAMARD

-> [2 6 12]

To transform LIST <-> MATRICE, uses AXL

[1 2 3] AXL -> { 1 2 3 }

{ 1 2 3 } AXL -> [1 2 3]

[1 2 3] 'a' STO [2 3 4] 'b' STO

« a b HADAMARD

a AXL b AXL / AXL

a AXL b AXL ^ AXL

»

You can create news commands

« AXL SWAP AXL SWAP / AXL » 'MDiv' STO

« AXL SWAP AXL SWAP ^ AXL » 'MPuis' STO

There is no need of DOLIST in this case. If you use lists instead of matrices * / and ^ does the job

{ 1 2 3 } { 2 3 4 } * -> { 2 6 12 }

{ 1 2 3 } { 2 3 4 } / -> { 1/2 2/3 3/4 }

{ 1 2 3 } { 2 3 4 } ^ -> { 1 8 81 }

Symbolic are allowed

{ 1 2 3 } { 'A' 'B' 'C' } ^ -> { 1^A 2^B 3^C }

Edited: 21 May 2011, 5:59 p.m.

Re: matrix element operation

*Message #6 Posted by **Thomas Klemm** on 21 May 2011, 6:32 p.m.,*
in response to message #5 by Gilles Carpentier

> Quote:
>
> There is no need of DOLIST in this case.

Thanks for the hint. This works also with the 48G.

> Quote:
>
> Symbolic are allowed
>
> { 1 2 3 } { 'A' 'B' 'C' } ^ -> { 1^A 2^B 3^C }

I get the following with the 48G:

```
{ 1 2 3 } { 'A' 'B' 'C' } ^ -> { 1 '2^B' '3^C' }
```

Cheers
Thomas

Re: matrix element operation

*Message #7 Posted by **Gilles Carpentier** on 21 May 2011, 6:54 p.m.,*
in response to message #6 by Thomas Klemm

>I get the following with the 48G:

>{ 1 2 3 } { 'A' 'B' 'C' } ^ -> { 1 '2^B' '3^C' }

>Cheers >Thomas

Seems different on the 50

1 'A' ^ -> 1^A

EVAL -> 1

(I suppose that 'A' don't exists)

Re: matrix element operation

*Message #8 Posted by **Oliver Unter Ecker** on 22 May 2011, 6:00 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

Not regarding the devices you ask, but probably still helpful:

On ND1, an iOS app with a feature set that closely resembles a 50g without CAS but with other additions (incl. programmability in RPL+ and JavaScript), "lists" and "vectors" are unified, and [1 2 3] [2 3 4] * will return [2 6 12].

"+", "-", "1/x" and all single-valued operators and functions (such as "sin", "!", "loggamma", ...(a list of >100)) work on both real and symbolic vectors.

This also works with large vectors (of, say, 10^5 elements).

The DOLIST and DOSUBS techniques mentioned also work, and, as on the 48 and 50g, can be used on more than two vectors at once.

48, 50g, ND1 have other vector-processing type functionality, btw, sometimes hiding under unusual names. The common "fold" operation is known as STREAM, for example.

Re: matrix element operation

*Message #9 Posted by **C.Ret** on 22 May 2011, 4:25 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

Hi,

I also use MatLab, but I own only an HP-28S. That why to get .* .+ ./ or any vectorialized operation on matrix or line/column vector on my HP28, I have to use a dedicated program:

Considering two matrix/vectors A and B of the same shape :

```
A B « * » EXE2 returns matrix/vector ‘A.*B’
A B « / » EXE2 returns matrix/vector ‘A./B’
A B « ^ » EXE2 returns matrix/vector ‘A.^B’
etc

where EXE2 is :
«  -> B prg
   «
     1                        @@  initialize i at first position
     DO
        DUP2 GET              @@  A i GET
        OVER B SWAP GET       @@  B i GET
        prg EVAL              @@  execute 'prg' for each i-element
        PUTI                  @@  store result
     UNTIL DUP 1 == END       @@  loop for each i-element
     DROP
    »
»
'EXE2' STO
```

This way also si possible on HP48/49/50 and you don’t have to worry about objet type list or array ! The only restriction is that the function « … » pick exactly two arguments in the stack and returns only one (exactly as * / ^ + - etc.) and a lot of dyadic functions or programs.

```
[ 1 2 3 ]   [ 10 20 30 ] « * »  EXE2 is  [10 40 90]

[ 1 2 3 ]   { 10 20 30 } « * »  EXE2 is  [10 40 90]

{ 1 2 3 }   { 10 20 30 } « * »  EXE2 is  {10 40 90}

[[ 1 2 3 ]] { 10 20 30 } « * »  EXE2 is  [[10 40 90]]

[[ 1 ]                                    [[ 10 ]
 [ 2 ]                                     [ 40 ]
 [ 3 ]]     [ 10 20 30 ] « * »  EXE2 is    [ 90 ]]

[ 1 2 3 ]   [[ 10 ]
```

```

HP15c for financial duties - I and II

*Message #1 Posted by **Jose Gonzalez Divasson** on 20 May 2011, 1:18 p.m.*

While a significant part of us are engineers, some (like me) have to make their living in other duties - in my case, financial manager in an industrial company.

As I flat-out refuse to "wear" a financial calculator, I equipped both my 42s and 15c with financial formulae - at least the ones I use more. It is not only about the software, but how you use it - and it may be different in your case (For example, in my multinational no IRR calculations beyond 10 years - this limits the number of registers to be used and shortens significatively the program shown in the Advanced Functions Handbook - allowing for more programs or free registers. It is also about grouping new programs with related keyboard functions)

Here are "instalments" I and II:

How I have configured my HP 15c for financial duties (I)

...same, same but (II)

The rest will come as I type them in EXCEL with the nice Luiz HP fonts.

(By the way - am I the only one "betraying" our engineering roots?)

Re: HP15c for financial duties - I and II

> (By the way - am I the only one "betraying" our engineering roots?)

I've been going the other way recently. With a math/engineering background, I've been using scientific calculators since acquiring my first HP-25 back in the seventies. Now that I've finally bought my first financial calculator, I've been programming the 30b to do things like Bessel functions and elliptic integrals (and the Towers of Hanoi).

Re: HP15c for financial duties - I and II

in response to message #2 by Kiyoshi Akima

Kiyoshi, I too have always had/used scientific, and now I'm playing with the 30b which I rather like... and I like Hanoi too! Could you share the Hanoi program you're using? I'm curious to see how you did it! :)

Cristian

*Message #9 Posted by **bill platt** on 22 May 2011, 12:43 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

As a hobby and for personal curiosity and programming enjoyment, it can be fun to do this sort of thing. But for me, for real-world problems, I don't bother. I just take a machine that does what I need. If I am carrying a laptop anyway, that solves it. Otherwise the 27s does everything. So does the 408/49/50 series. If I am at home, I grab the machine that suits the situation best.

Re: HP15c for financial duties - I and II

*Message #10 Posted by **Jose Gonzalez Divasson** on 22 May 2011, 2:19 p.m.,*
in response to message #9 by bill platt

Bill,

I have all of them -and a laptop, of course.

The laptop involves switching it on, open Excel or Mathematica, and find your way. You need a table and both hands. Say 1 min for setting it up - best case (My company does not allow Mac!)

The 48/50 family is excellent, but too big to carry them around. I take it for trips to play with it at the hotel. No way you can memorise the whole list of functions and menus.

The only real alternative for a calculator you can carry everywhere (in my case in the right pocket of my jacket) is the 42s - and that is a little too big). There is some stiff competition there - and even myself have not made up my mind 100%. You change the easy access to fucntions in the 15c for a much more powerful set of functions, and two lines. I take the 42s with me on 25% of the trips I make, but there will be no replacement for it - I cannot afford to harm it.

Even the 17bII+ come with a case that is a little too think to be carried in that pocket (the original one could)

Of all these, the 15c is the one that occupies less real estate - important in an European economy flight.

I feel the same, it's just too much hassle to start a laptop.
And the 15c is just such a nice toy (I mean tool) to play with that it feels always right to have it with me.
But that's personal preference and "your mileage may vary"
Roger

Before you ask - new feature in wp34s

*Message #1 Posted by **Marcus von Cube, Germany** on 20 May 2011, 10:39 a.m.*

Jeff has noticed that the flash file for the most recent release of wp34s is shorter than before.

Before you ask more questions, here is the file doc/flash.txt which explains it.

```
Commands to handle the flash memory on the real calculator
==========================================================

Hold down ON (EXIT) and press one of the following keys:

STO - Backup:  This creates a copy of the RAM in flash memory.

RCL - Restore: This restores a previously created backup.

S - SAM-BA:    Clears the GPNVM1 bit and turns the calculator off.
               S is on the '6' key.
               ATTENTION: You can now only boot into SAM-BA mode!
               Without the SAM-BA software and the cable, you're lost!

These ON key combinations have to be pressed twice in a row without
releasing the ON key to be executed.

Do an ON+STO before you want to flash a new release! After flashing,
your backup should still be in place if you didn't press the ERASE
button on the cable but used ON+S instead to get into SAM-BA boot mode.

There are additional commands in the program functions catalogue:

PSTO n   Store program in region n. n is 0 or 1. A region is a
         block of flash memory that can hold a copy of the
         user program area. In a later version, alphanumeric
         labels in flash can be called with XEQ. This allows
         creation of libraries.

PRCL n   Restore region n to the program area where data can be edited.

P<> n    Swap the current program with the contents of region n.

How to transfer data between the calculator and your PC
=======================================================

The whole RAM is saved to address 0x11F800 (relative address 0x1F800)
with ON+STO. This can be copied to your PC or loaded from it.

1. From calculator to PC

   a) Do an ON+STO, then ON+S, then RESET with the cable connected.
   b) Press ON once and start SAM-BA on the PC. It should connect.
```

```
   c) Set the start address to 0x11F800 and the size to 0x800
   d) Enter a file name in the receive field.
   e) You can now receive the file with SAM-BA.
   f) Move it under the name wp34s.dat into your emulator directory.
   g) The emulator should accept the file. Your registers and programs
      will than be in place.
   h) To get your calculator back in business, start the "Boot from flash"
      script in SAM-BA, the same procedure you should know from flashing
      the firmware.
   i) Power the calculator up and perform a restore with ON+RCL. The
      latest version does the restore automatically when RAM is not
      valid.

2. From PC to calculator

   a) Perform steps (a) to (c) from above. No need to set the size.
   b) Point SAM-BA to your wp34s.dat file from the emulator.
   c) You can now send the short file with SAM-BA.
   d) Perform steps (h) and (i) from above.

The program regions accessible with the commands PSTO, PRCL and P<> are
stored at addresses 0x11F000 and 0x11F400 respectively and have a length
of 0x400 (1 KB) each. The emulator creates files wp32s-#.dat, # being the
region number. You can handle these files the same way as the complete
state file from the emulator. The regions have identical formatting and
can be swapped by copying their data to the "wrong" place. The backup
area is formatted differently.

If you want to get your emulator data into the calculator in one go,
do the following in Windows:

C:\wp34s>copy /b calc.bin+wp34s-0.dat+wp34s-1.dat+wp34s.dat calc-full.bin

The resulting file can be programmed into flash and all data is readily
available.
```

Re: Before you ask - new feature in wp34s

*Message #2 Posted by **Eric Rechlin** on 20 May 2011, 11:13 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Quote:

```
S - SAM-BA:    Clears the GPNVM1 bit and turns the calculator off.
               S is on the '6' key.
               ATTENTION: You can now only boot into SAM-BA mode!
               Without the SAM-BA software and the cable, you're lost!

These ON key combinations have to be pressed twice in a row without
releasing the ON key to be executed.
```

A set of keystrokes that renders a calculator in a state that requires SAM-BA and a cable to repair does not seem like a good idea to me. Is it really that important, when you can do the same thing with the cable?

Re: Before you ask - new feature in wp34s

*Message #3 Posted by **Marcus von Cube, Germany** on 20 May 2011, 11:21 a.m.,*
in response to message #2 by Eric Rechlin

It's not the same thing. On the cable you can press ERASE which will flatten you flash contents. ON+S will preserve the flash data and just reset the boot bit.

Re: Before you ask - new feature in wp34s

*Message #4 Posted by **gene wright** on 20 May 2011, 11:55 a.m.,*
in response to message #3 by Marcus von Cube, Germany

Then how about a key sequence that will put the boot bit back?

Otherwise, as Eric says, wouldn't the calculator still be unusable if you did not have a cable?

I think I understand now, but it still seems very dangerous. Is there no way to get this feature without this side effect? I can see this being a support nightmare for people who had the calculator programmed by somebody else (that is, they don't have a cable and someone else did the 34S conversion). Remember, if something can go wrong, it will go wrong.

If I were you I would require a special bit sequence to be sent over the serial cable before it resets the boot bit. If you remember the HP 49G mechanism for flashing, it took this same approach -- it wouldn't let you into the menu for wiping flash banks until it received the right series of bits over the serial cable.

Eric

At the moment, I don't use any custom software for flashing so I can't control what goes over the interface. The idea isn't bad. To make things less dangerous, all destructive key combinations have to be pressed twice in a row. As soon as you release the ON key, the whole sequence is canceled. It might be possible to detect the presence of the cable (it should tie the input pins to a different level than without it). I have to test this.

We might introduce a system protection bit which needs to be set with a command or other key combination before this command and some other possibly dangerous functions become available.

This is not a problem in the present stage of development. We are not targeting the average user with wp34s.

*Message #7 Posted by **BobVA** on 20 May 2011, 4:21 p.m.,*
in response to message #5 by Eric Rechlin

For the "production" code would it be possible to either:

- Require typing in a password as confirmation? For example pressing ON-S gives the "password?" prompt in the alpha area. Then you have to know it (e.g "marcus").

- Making the boot bit enable an unlisted/undocumented XFCN? Something like "SAMBAX"?

- Have a flash byte that has to have a particular value before ON-S will work (i.e. the boot bit code checks it before executing)? Then if you want to lock out the boot-bit capability you just need to alter that byte with a hex editor (or custom utility) before flashing it into the calc?

Yes, with two flash banks, 1500+ steps makes sense. Now, it approaches an HP41 with quad memory. One might then want a way to step through those program labels like the HP41 CAT 1 function did.

Jake

Re: Before you ask - new feature in wp34s

> Yes, with two flash banks, 1500+ steps makes sense. Now, it approaches an HP41 with quad memory.

I think we'll effectively be well past this point. Even though a quad memory HP41 can have 2233 steps of program, that means no registers and every step has to be a single byte instruction. The 34s's steps are merged, the 100+ registers are always available and the function set is richer in many ways.

Before anyone mentions them, numbers and alpha on the 34s take less steps/bytes than their equivalents on the 41 even though they don't display as nicely.

> Quote:
>

in response to message #1 by Marcus von Cube, Germany

Quote:

Before you ask more questions...

Probably not possible to stop me asking more questions :-)

Here we go: When I used the emulator to create the wp34s-0.dat and wp34s-1.dat files for the purpose of creating a full 128 kB bin file, the wp34s-1.dat is 2 kB, the first 1kb of which is all zeros. I compensated by using the wp34s-0.dat file twice, i.e.

copy /b calc.bin+wp34s-0.dat+wp34s-**0**.dat+wp34s.dat calc-full.bin

The above worked fine, but I presume I made yet another error somewhere to necessitate the workaround.

Re: Before you ask - new feature in wp34s

*Message #19 Posted by **Paul Dale** on 21 May 2011, 1:44 a.m.,*
in response to message #18 by Paul Dale

But they will be working very very soon. Expect some teething issues.

Alpha labels in any of the four sections will be globally reachable. The search order is RAM, first flash segment, second flash segment and finally internal XROM code space, only the first instance of a name will be found. All other labels (numeric & hot key) are local to the section in which they are defined. GTO.nnn works within the current section. GTO.. brings you to step 000 of RAM.

- Pauli

Re: Before you ask - new feature in wp34s - Attention!

*Message #21 Posted by **Marcus von Cube, Germany** on 21 May 2011, 9:16 p.m.,*
in response to message #1 by Marcus von Cube, Germany

We are in the course of updating the state file and internal backup format again. This will render existing data unreadable. But there is a way out, at least for programs:

Get the current release 928 from SVN and use the command PSTO to create a copy of your program area in flash or an emulator file (see first post). This file will work in later versions and can be restored or burned into flash on the real hardware!

Sorry for any inconvenience. wp34s is a fast moving target. ;-)

EDIT: Revision 936 is still compatible. Later versions will not!

Edited: 23 May 2011, 3:04 a.m.

Re: Before you ask - new feature in wp34s - Attention!

*Message #22 Posted by **Marcus von Cube, Germany** on 23 May 2011, 12:26 p.m.,*
in response to message #21 by Marcus von Cube, Germany

I just discovered an error with the checksum calculation in the areas saved with PSTO. So I cannot guarantee, they will be intact with the next release. The saved regions are most probably broken anyway. :-(

Sorry for any inconvenience. Be prepared to type your programs in again.

Edit: I'm working on a solution, at least in the emulator. You need to copy the flash pages on your device to the PC where they can be converted.

HP17bii+ solver vs. HP17bii/HP19bii/HP27S

*Message #1 Posted by **M. Joury** on 19 May 2011, 11:46 p.m.*

Let me start by saying that I know the solvers of these various machines have been discussed before but searches on HP17bii and CTIME did not come up with anything. I apologize if this is a repeat of something that has gone before.

I was trying to time a summation within the solver to see if it could be done. I ended up with the following formula:

A=L(ST:HRS(CTIME))*0+SIGMA(I:1:1000:1:0)+HMS(HRS(CTIME)-G(ST))

I was experimenting with different operations in the last position of the summation clause '0' vs '1' vs ... The solution result should have been the total run time in H.MS notation.

At any rate this 'code' worked for my HP17bii, my HP19bii, and my HP27S (I still need to try it on my HP95LX). It did not work on the HP17bii+. Trying to narrow down the problem I tried the following two formulas:

1. A=L(ST:CTIME)*0+SIGMA(I:1:1000:1:0)+G(ST) -> Expected result should be the start time in H.MS

and

2. A=SIGMA(I:1:1000:1:0)+CTIME) -> Expected result should be the end time in H.MS

The first was expected to report the start time of the run while the second should have reported the end time. On the 17bii+ formula 1 worked as expected reporting the start time of the run but formula 2 reported a time midway through the run. I realize that in the above formula there is no order implied as to how the calc should solve the problem except that I might expect it to work from left to right and I certainly would not expect it to pull a time from midway through the run. It is almost as if the problem were being executed on a multithreading system and the code had dispatched the two halves of the problem on two separate threads. Now I know that our little toys are powerful but I somehow doubt that this is what is going on :-).

Any ideas as to what is happening here? Am I missing something obvious? Or is the 17bii+ solver implementation doing something weird?

Marwan

Re: HP17bii+ solver vs. HP17bii/HP19bii/HP27S

*Message #2 Posted by **Don Shepherd** on 20 May 2011, 12:25 a.m.,*
in response to message #1 by M. Joury

> Quote:
>
> is the 17bii+ solver implementation doing something weird?

The 17bii+ solver behaves differently than the 17b solver and the 17bii solver. The 17bii+ solver actually

evaluates your equation twice. The first pass is supposedly for the purpose of pre-calculating values that can be pre-calculated, and the second pass is the real run. This causes problems when you update a menu variable within your equation because it updates the variable during the first pass and then again during the second pass, and sometimes you do not get the result you would expect. This behavior has been discussed many times in this forum, and the general consensus is that if you really want a good solver that behaves as you would expect, use the 17b or 17bii. I concur.

I tried your formula 2 and I do get the ending time of the run, but the time required to loop from 1 to 1000 is not that great (less than a minute). Also, CTIME does not always report the correct time. For instance, in a solver equation it reports the time as 12.30 and if you immediately look at the time on the calculator (after solving the equation) it might be 12.29 and 50 seconds.

Hope this helps.

Re: HP17bii+ solver vs. HP17bii/HP19bii/HP27S

*Message #3 Posted by **M. Joury** on 20 May 2011, 1:35 a.m.,*
in response to message #2 by Don Shepherd

Hi Don,

That explains what I am seeing. To test this I synchronized the 17bii+ clock with another clock and then ran the second equation. I am seeing results well within the middle of the timespan and not near either the beginning or end. It is interesting that you do see the correct ending time on your unit (I assume that when you say you tried this you meant that you tried it on a 17bii+). Of course the explanation for what I am seeing is the two pass nature of the algorithm used on the 17bii+. I will need to perform a more general search to find the earlier discussions of this subject as I have to wonder what the supposed benefits (if any) are to doing it the 17bii+ way. Perhaps, as your comment on 'good' solvers might suggest, there is NO benefit.

On the issue of accuracy of CTIME: With the display set to FIX 4 the HP17bii reports a completion time within a second of the synchronized clock so I am not seeing the disparity in times that you mention. I do recognize that CTIME is only accurate to a second so if I were doing real timings I would probably make the summation loop much longer (10000?) and divide the resulting time interval by 10 to get the timespan for 1000 iterations (or if I was patient enough I could do 100000 and divide by 100). Furthermore, using the original timing equation on a 17bii I see total times for the run within a second of those obtained by using a handheld stopwatch so, again, I am not seeing the inaccuracies that you mention.

Cheers,

Marwan

Re: HP17bii+ solver vs. HP17bii/HP19bii/HP27S

in response to message #3 by M. Joury

> Quote:
>
> I assume that when you say you tried this you meant that you tried it on a 17bii+

Yes, the 17bii+.

> Quote:
>
> I will need to perform a more general search to find the earlier discussions of this subject

Searching the archives has always been tricky. Here is a post I made back in 2007 regarding the fact that the prime factors algorithm contained in the Technical Applications Manual for the 27S and 19B did not work on the 17bii+, and it contains a workaround I came up with to get it to work.

> Quote:
>
> there is NO benefit

I wouldn't say that. Most users will never run into this particular solver problem, and the 17bii+ will work fine for them. But everyone should be aware of this potential problem.

> Quote:
>
> I am not seeing the inaccuracies that you mention

I think there may have been some changes to the 17bii+ over the years, and this may explain that. I know that some users reported benchmark times on their 17bii+ that were significantly different than the times I obtained.

Don

i41CX Reduce

*Message #1 Posted by **Jack Nolan** on 19 May 2011, 5:21 p.m.*

I'm using i41CX for the iPad which is a great piece of software. In addition to the HP41 emulator, it contains a computer algebra solver called REDUCE. There is a version of REDUCE at Source Forge that supposedly runs on a macbook. I would like to write and debug REDUCE programs on my macbook before moving them to the iPad i41CX app. However, when I download, unzip and run the REDUCE application on the macbook, nothing happens. I've looked for specific installation instructions for the macbook but can't find them anywhere. I just purchased the macbook and I'm brand new to apple so I'm sure that's the problem. :)

Anyone using REDUCE on i41CX that would know how to install and run the OSX version of REDUCE software on a macbook? Thank you in advance for the help

Re: i41CX Reduce

*Message #2 Posted by **Egan Ford** on 20 May 2011, 9:03 a.m.,*
in response to message #1 by Jack Nolan

Can you provide a URL?

I was only able to find this version on sf.net: http://sourceforge.net/projects/reduce-algebra/files/reduce-x86_64-mac_10.6_snowleopard-darwin10.7.0-20110414.tar.bz2/download

That version is not a native Mac Cocoa app. And I do not know if there is a native Mac Cocoa app available. Cocoa is Mac's GUI interface/API.

To run that version you'll have to install X11. X11 may or may not be installed on your Mac. If not, you can get the install package from your OS/X installation media.

X11 is cross-platform client-server windowing technology. Thankfully it's included and supported by Apple. I use X11 everyday.

If that is the correct download URL, then launch X11 (Command-Space, then type X11 in spotlight and the X11 app should be a the top of the list if installed). When you launch X11 you'll be greeted with an xterm terminal window. From that window type:

```
cd ~/Downloads #or /Application if you dragged to Applications
tar jxvf reduce-x86_64-mac_10.6_snowleopard-darwin10.7.0-20110414.tar.bz2
#you may not need to execute "tar" if Safari automatically extracted for you.
#BTW you should turn off that "feature" of Safari for security reasons.
cd reduce-x86_64-mac_10.6_snowleopard-darwin10.7.0-20110414
./reduce
```

To make repeated invocations easier, then right click (or 2 finger tap) the X11 icon in the dock and select Options/Keep In Dock and then right click again and select Applications/Customize and add the above commands separated by semi-colons (e.g. cd ~/Downloads/reduce-x86_64-mac_10.6_snowleopard-darwin10.7.0-20110414; ./reduce). In the future you will just need to right-click on X11, then select Applications/Reduce.

I've never used this version of Reduce. I built my own from the source and run it from the CLI (xterm in my case).

Good luck.

Update, I forgot to add that you'll want to add the math fonts to your font path:

```
xset +fp $PWD/reduce.fonts/
```

This will make your X11 command line look like this assuming you extracted or moved the app to /Applications:

cd /Applications/reduce-x86_64-mac_10.6_snowleopard-darwin10.7.0-20110414; xset +fp $PWD/reduce.fonts/; ./reduce

Screen shot from my testing:

Re: i41CX Reduce

*Message #3 Posted by **Jack Nolan** on 20 May 2011, 10:50 a.m.,*
in response to message #2 by Egan Ford

Egan thanks so much for the help, but now I'm really confused.

I have a macbook Air - the latest version running Snow Leopard. I downloaded the version of REDUCE that you referenced. I assumed, since the file name contains snow leopard in it, that it was compatible. I unzipped it and moved it into the application direction like any other normal mac applications, click on the application icon, it appears to run (I see it in the dock for a second or two) and then shut down with no error messages.

I assumed that since the file name had "snow leopard" in it it would run like any other application. Are you saying the version I downloaded is NOT compatible with Snow Leopard or do I have to do something other than install it like you would normally install a standard program on an Apple with Snow Leopard?

To help you understand my background, I'm a chief consulting engineer for a large corporation and I'm

spending a lot of time reviewing the work of less experienced engineers designing power generation components. As such, having an HP calculator on an iPad handy gives me a way of quickly reviewing their work with simple calculations. With the addition of REDUCE, it's much more powerful. But I'm afraid that, other than HP calculators and systems like Mathematica and ANSYS, ProEngineer, etc. , my programming days ended during the last century with FORTRAN, BASIC, Turbo Pascal, TRS80's, and VAX 11/780s. It's been a very long time!

Thanks for the help, but I may be too far gone for this! lol

Jack

*Message #4 Posted by **Marcus von Cube, Germany** on 20 May 2011, 10:56 a.m.,*
in response to message #3 by Jack Nolan

Jack, did you check if X11 is available on you Mac? It comes with the MacOS install disk under additional features.

Re: i41CX Reduce

*Message #5 Posted by **Jack Nolan** on 20 May 2011, 11:14 a.m.,*
in response to message #4 by Marcus von Cube, Germany

I do have X11 on my macbook air. I can run it from utilities. I can't yet figure out how to run reduce from X11.

I'm ancient, and not familiar with the Mac system but it looks a lot like my DOS days. lol So please forgive me if I'm using incorrect terminology here.

I am assuming I have to install reduce and all it's supporting files (including the fonts Egan referenced) in a particular DIRECTORY. Then I need to ensure that X11 knows the correct PATH to all of these files. Then I assume I run REDUCE by just typing REDUCE at the X11 command prompt?

Since I don't know anything about how to set paths or the X11 command syntax it should be interesting.

Jack

Re: i41CX Reduce

*Message #6 Posted by **Marcus von Cube, Germany** on 20 May 2011, 11:19 a.m.,*
in response to message #5 by Jack Nolan

Where have you installed the reduce package? Tell us the directory. If it is in applications, the base path is something like ~/Applications/reduce-<something>

The ~ is an abbreviation for your home directory. Omit it if you have installed the file in the global Application directory.

In the shell, you can type part of a directory or file name and then hit the tab key for a completion.

Re: i41CX Reduce

*Message #7 Posted by **Jack Nolan** on 20 May 2011, 2:56 p.m.,*
in response to message #6 by Marcus von Cube, Germany

Got it working! Here is what I did:

1) downloaded the Snow Leopard version of REDUCE from SourceForge, 2) unzipped the files into the /Application/ folder (the zip file includes fonts),, 3) went to /Applications/Utilities/ and ran X11 4) typed in /Applications/reduce at the prompt.

Thank you so much Markus and Egan!

Jack

Re: i41CX Reduce 2

*Message #8 Posted by **Pascal B.** on 22 May 2011, 9:26 a.m.,*
in response to message #2 by Egan Ford

Hi Egan,

I installed REDUCE on Mac os x according to your instructions. It works well. However, gnuplot package does not work. I also installed gnuplot. It works alone, but it still does not work into REDUCE. May be gnuplot must be installed in a specific path or something like that, but I don't know this path. So, do you have an idea to install REDUCE including gnuplot package?

Thank you Pascal

34s/16C Compat. #6

*Message #1 Posted by **Jake Schwartz** on 19 May 2011, 2:17 p.m.*

Hi,

I was playing with some programs in the 16C manual and ran into something on the 34s which I thought should be shared. In unsigned, 64-bit mode with base HEX, if I press 0 ENTER 1 - it correctly yields "FFFF FFFF FFFF FFFF", and changing over to decimal base correctly shows 18,446,744,073,709,551,615. This value is greater than 1.8 * 10^19. Now I am aware that on the 34s, one cannot enter numeric values with more than 12 digits. I wanted to enter the decimal number 1*10^19, so in decimal base I pressed 1000000 ENTER * which correctly yielded 1,000,000,000,000 or 10^12. Doing another 1000000 * produced 1,000,000,000,000,000,000 (or 10^18) and converting to HEX correctly showed DE0 B6B3 A764 0000. Now, if I multiply by ten again by 10 * in base decimal, it suddenly shows 776,627,963,145,224,192 instead of the expected 10,000,000,000,000,000,000. Switching over to HEX at this point reveals AC7 2304 89E8 0000. For some reason, the machine will not allow values as large as 10^19 to be generated, despite the fact that a 64-bit word should be able to hold numbers above 1.8 * 10^19. Paul, any ideas?

Thanks, Jake

Artist of HP Manuals

*Message #1 Posted by **Csaba Tizedes (Hungary)** on 19 May 2011, 4:55 a.m.*

Can anybody tell me any information about the graphic artist of earlier HP Manuals? Who is this person, where can I see more works from he/she, actually he/she active as artist, or something similar...

Thanks for any info!

Re: Artist of HP Manuals

*Message #2 Posted by **Glenn Shields** on 28 May 2011, 3:19 p.m.,*
in response to message #1 by Csaba Tizedes (Hungary)

These are great images, and although I haven't saved any of my old manuals (or calculators) one must ask, is there no one with such a manual who can just look through it and see if the artist is listed? Not to sound impertinent, but isn't that the main purpose of this forum, rather than so much "repurposing" and whatnot? Thanks so much in advance.

> than so much "repurposing" and whatnot? Thanks so much in advance.

I have the HP-85 Owner's Manual and Programming Guide, (c)1979, p/n 00085-90002 Rev. D 1/81, and the HP-85 I/O Programming Guide, (c)1980, p/n 00085-90142 Rev. C 2/81, both with that kind of pictures, but I don't see credits in either one.

These manuals BTW appear to be completely unused except that they've been in and out of 3-ring binders and bookshelves, and I don't have an HP-85 and probably never will; so I guess I should eBay them unless someone offers a reasonable price before I get that far. They're 8.5x11", and the pair of them adds up to an inch and a half thick.

I think I know what you mean. ;-)

For me, the repurposing project I'm involved in has more nostalgia in it than some of the other ongoing discussions here. Let me explain.

My professional career started in the early eighties as a programmer of machines with very limited resources, micro controller based machine controls. We were facing very similar problems I'm dealing with in my current project here. The saying "every little bit counts" had to be taken literally then as it is now. Todays programming paradigms deal with dynamic memory in the gigabyte range and processor power measured in gigaflops. Nothing of this is true for the machine I'm dealing with at the moment. For me, it's a time machine, taking me back some thirty years of my life.

Katie,

that's not correct, strictly speaking.

I have an HP 38G User's Guide that acknowledges "members of the Education Advisory Committee (list of names follows) for their assistance in the development of this product."

I also recall seeing credits for someone who pioneered the applications in the Advanced Pac for the HP 41 module (something to do with the top row interface). let me check if I have the Advanced Pac manual.

sad but true, I have not seen any credits for the artist(s?), perhaps he/she was/were outsourced.

IIRC, rules for naming artists (incl. photographers) in the last century weren't as they are today. Today you find the picture sources in almost every printed matter, then there were a lot of anonymous contributors.

Walter

That's just so true, I long for the 8- and 16-bit processors of that time. PIC-Programming with the smaller PIC's (not the DSP-ones) gives me the same kind of feeling about it, it's just pure fun without this gigantic overhead of todays SW-development techniques (not to mention OOP!)
Not to be misunderstood, this new approach has it's advantages too, but sometimes I can't resist the feeling that "too much is just too much"

Excuse me the rephrasing of your words like this: "It gives me another thirty years of my life (almost :-)"

Cheers
Roger

Re: Artist of HP Manuals

*Message #13 Posted by **Ronald Williams** on 29 May 2011, 10:13 p.m.,*
in response to message #1 by Csaba Tizedes (Hungary)

FYI - I checked my old hp documentation and here is what I discovered.

There was no graphic art in the HP-35 manual.

On the cover of the HP-67 / HP-97 User's Library Solutions the artist signed his work as Ron Henry. Other renderings in the User Manual, Standard Pac and Civil Engineering Pac 1 are anonymous but share a similar Ron Henry style.

HP gave credit to NASA, AMES Research Center for the Lunar Module photo on page 122 of the User Manual.

Hope you find that useful.

But if you look closely at one of the paintings, I'll bet that bulge in the cowboy's shirt pocket is an HP-35 B^)

Seriously, it _could_ be the same artist, the style of art on the old manuals would not feed an artist today, but Western Art is popular.

EMU 48 for Linux

*Message #1 Posted by **J Grim** on 18 May 2011, 11:49 p.m.*

Greetings everyone. Do any of you know if there is a Linux native version of EMU 48? I checked Christoph's site, but it appears to be Windows specific. I have tried other emulators, but I prefer EMU 48. Currently, I run it via the WINE application with a KML script for the 50g. Thanks.

Re: EMU 48 for Linux

*Message #2 Posted by **Egan Ford** on 19 May 2011, 1:39 a.m.,*
in response to message #1 by J Grim

Your options are:

1. EMU48+Wine
2. x48 (SX/GX only)
3. x49gp (50g emulation: http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART). x49gp is the only 50g/ARM emulator publicly available. This means you can run just about any 50g programing including ARM C and ASM.

EXIT in wp34s

*Message #1 Posted by **Jeff O.** on 18 May 2011, 3:53 p.m.*

I seem to recall some discussion of the EXIT command, possibly with regard to exiting menus and such. If the following discussion is repetitious or the answers can be found in the manual, please accept my apologies. I looked (possibly too briefly) through the manual and found the following information regarding the EXIT function:

Mode	Remarks
Catalog Open	Leaves the catalog without executing anything.
Input Pending	Cancels the execution of pending operations, returning to the calculator status as it was before.
\PRG & program running	Stops the running program like R/S below.
PRG	Leaves programming mode like h-P/R below.
Else	Does nothing

In several cases it seems that EXIT returns the program pointer to step 000.

Based on my usage, I observe the following behavior:

Mode	Remarks
Catalog Open	Leaves the catalog without executing anything.
Input Pending	Cancels the execution of pending operations, returning to the calculator status as it was before except returns program pointer to step 000.
\PRG & program running	Stops the running program like R/S below.
PRG	Leaves programming mode like h-P/R below except returns program pointer to step 000.
Else	Returns program pointer to step 000.

Also when used as the ON key (i.e., pressing EXIT when the calculator is off) it turns the calculator on and returns the program pointer to step 000.

If the above is correct, I would like to propose that EXIT only return the program pointer to step 000 in the "Else" case above, i.e.:

Mode	Remarks
Catalog Open	Leaves the catalog without executing anything.
Input Pending	Cancels the execution of pending operations, returning to the calculator status as it was before.
\PRG & program running	Stops the running program like R/S below.
PRG	Leaves programming mode like h-P/R below.
Else	Returns program pointer to step 000.

Included in the above request is that when turning the calculator on, it comes on with the program pointer where it was when it was turned off, although it is OK with me to leave programming mode if the calculator was turned off in programming mode.

Re: EXIT in wp34s

*Message #2 Posted by **Marcus von Cube, Germany** on 18 May 2011, 4:15 p.m.,*
in response to message #1 by Jeff O.

The program counter is stored in non volatile memory so your wish to leave it untouched on power off should be achievable. You probably just hit an unwanted behavior. We've to check that.

Re: EXIT in wp34s

*Message #3 Posted by **Walter B** on 18 May 2011, 4:37 p.m.,*
in response to message #1 by Jeff O.

Jeff, the observed (re)setting of the program pointer to 000 is definitively not intended. Some reasons you mentioned already. So - congratulations! - you found another bug :-?

*Message #5 Posted by **Paul Dale** on 18 May 2011, 6:00 p.m.,*
in response to message #1 by Jeff O.

Yep, the PC is being reset. Easy to fix.

What about the subroutine return stack? Should that be preserved over EXIT to exit program mode?

- Pauli

Re: EXIT in wp34s

*Message #6 Posted by **Jeff O.** on 18 May 2011, 10:02 p.m.,*
in response to message #5 by Paul Dale

I may misunderstand, but if you are in program(ming?) mode, is the subroutine return stack even active? If you use EXIT to stop a running program, I would say the subroutine return stack should be preserved, assuming this happens if you stop with R/S. Pressing EXIT again would reset the program counter and clear the subroutine return stack. Maybe.

Re: EXIT in wp34s

*Message #7 Posted by **Paul Dale** on 18 May 2011, 11:27 p.m.,*
in response to message #6 by Jeff O.

Nothing stops you press R/S to stop execution, entering program mode, exiting program mode and pressing R/S to continue.

At least currently.

- Pauli

in response to message #6 by Jeff O.

Please note that R/S is the normal key to stop execution of a running program as it has been since the HP-65. The key EXIT is just another channel to reach the same, introduced because of the fact 1/3 of our team wanted it and 2/3 didn't care ;-)

Walter

Re: EXIT in wp34s

*Message #9 Posted by **Marcus von Cube, Germany** on 19 May 2011, 2:18 a.m.,*
in response to message #8 by Walter B

:-)

I agree with Jeff that EXIT shouldn't do any harm to the return stack or the program counter if used to stop a program. We have CLP to do the latter, do we want EXIT to do the same? It may be of some value or not.

I normally use RTN to end a program: LBL A; do somthing; RTN. If I start this from the keyboard, I assume that the return brings me back to keyboard entry mode. If I had stopped a running program before with the return stack active, what will happen if I press A? Maybe XEQ or its implicit variant if entered from the keyboard shall clear the return stack and EXIT leave it as is?

Maybe XEQ or its implicit variant if entered from the keyboard shall clear the return stack and EXIT leave it as is?

I'd expect pressing 'A' or XEQ A will call this routine, starting at its very beginning, regardless of the return stack status before. KISS. YMMV

Walter

Re: EXIT in wp34s

*Message #11 Posted by **Jeff O.** on 19 May 2011, 10:16 a.m.,*
in response to message #10 by Walter B

I see that EXIT behavior has been changed in revision 905. Thanks! Two minor issues:

1. It seems that now EXIT does nothing regarding the program counter, ever. Would it be possible (and/or desirable, opinions welcome) to have it return the program counter to step 000 only when in calculation mode (i.e., not in programming mode or while a program is running). I see that GTO .. returns the PC to 000, but that takes four keystrokes vs. one if using EXIT in this particular case would do it, might be a nice shortcut.
2. In programming mode, would it be possible (and/or desirable, opinions welcome) to have EXIT cancel pending input and remain in programming mode after pressing commands such as STO, RCL, XEQ, GTO and especially whilst in alpha entry mode? In other words, the same behavior as if you want to get out of a menu while in programming mode. I realize that the back-arrow will do what I want for STO, RCL, XEQ, GTO, but the only way out of alpha mode while remaining in programming mode is f-alpha.* (Two keystrokes vs. one if EXIT could stay in programming mode, yes I guess I am lazy.)

* edit - I was incorrect here. Alpha mode can be exited by simply pressing ENTER.

Re: EXIT in wp34s

*Message #12 Posted by **Walter B** on 19 May 2011, 10:45 a.m.,*
in response to message #11 by Jeff O.

Two humble answers:

1. As mentioned, EXIT is often just an additional channel to access some traditional functions. Then it does what the original function does. I'll check for a lazybone's way to reset the program pointer - I think there was one at least.
2. That's the curse of context sensitive multiple functionality :-(Looking to the description of EXIT in the manual, it should do what you want provided we swap the sequence/priorities of R/S and ENTER there. Correct?

Walter

Re: EXIT in wp34s

*Message #13 Posted by **Jeff O.** on 19 May 2011, 12:22 p.m.,*
in response to message #12 by Walter B

Sorry, I missed that ENTER takes you out of alpha mode, so that is an easy single keystroke solution. Not quite sure what you mean by "swap the sequence/priorities of R/S and ENTER."

Re: EXIT in wp34s

*Message #14 Posted by **Walter B** on 19 May 2011, 2:45 p.m.,*
in response to message #13 by Jeff O.

> Quote:
>
> Not quite sure what you mean by "swap the sequence/priorities of R/S and ENTER."

You may have noted the arrow right of [EXIT] on page 53 in columnn 1 of the table. This means the conditions in column 2 will be tested top down for this key. In pseudo code:

```
if (EXIT is pressed)
  then begin
  if (a catalog is open)
    then (leave it without executing anything)
    else if (there's any input pending)
      then (cancel the execution of the respective operation ...)
      else if (...)
        then (...)
        else if (...)
          then (...)
          else if (...)
            then (...)
            else (do nothing)
  end {of EXIT conditions checking}
```

So the sequence of conditions listed is important.

Walter

Re: EXIT in wp34s

*Message #15 Posted by **Jeff O.** on 19 May 2011, 8:47 p.m.,*
in response to message #14 by Walter B

Yes I saw the arrow, I though it just meant that the command applied in several modes of operation or conditions. I see what you are saying now. Based on subsequent posts, no need to do anything else.

In any mode: GTO . . resets the program counter to 0. Since that is too many keystrokes for the lazy we have another shortcut in run mode: CLP. Just like many HP machines.

hp19c value?

*Message #1 Posted by **ais** on 18 May 2011, 1:16 p.m.*

Hi

I have been holding onto my HP19C for many a year. It is complete with original box, manuals and leather case. Last used about 20 years ago and been "stored" ever since. I would guess the batteries must be dead by now. Just wondering if anyone can give me an idea of value. Thanks in advance for any input.

Re: hp19c value?

*Message #2 Posted by **DavidShenk** on 18 May 2011, 1:34 p.m.,*
in response to message #1 by ais

Hi, If you rebuilt the original battery pack and could confirm that it was working, with original box, manuals, etc. I would say you could get $300 or so. Less if it is sold "as is" Much depends on the condition of the calculator and if it is printing properly. If it was in mint condition without any wear, I would think it could go for $400+. Dave

Re: hp19c value?

*Message #3 Posted by **ais** on 19 May 2011, 2:50 a.m.,*
in response to message #2 by DavidShenk

How would one go about rebuilding the original battery pack?

Re: hp19c value?

*Message #4 Posted by **DavidShenk** on 19 May 2011, 3:55 p.m.,*
in response to message #3 by ais

The pack contains 4 AA size NiCd batteries. You can open it carefully with a razor blade and a little careful prying at the seam between the two halves. I bought tabbed replacement cells and soldered them together. Regular rechargeables with the "bump" on the positive side may not fit. Pay careful attention to polarity. When done, I just used a little tape along the seam to close it up.

There is also a spring or springs inside the pack on one side that you'll want to put back. They are important to how the pack fits into the calculator.

Dave

Re: hp19c value?

*Message #5 Posted by **Michael de Estrada** on 18 May 2011, 1:42 p.m.,*
in response to message #1 by ais

The batteries will be dead for sure, and you should *not* attempt to operate it with the AC adapter either with

a dead battery pack or with the battery pack removed. More than likely the batteries will have leaked and outgassed during the time it was stored, which can cause serious damage to the calculator internals if the battery pack was not removed during storage.

Edited: 18 May 2011, 1:44 p.m.

Re: hp19c value?

*Message #6 Posted by **ais** on 18 May 2011, 2:12 p.m.,*
in response to message #5 by Michael de Estrada

Thanks for the input so far. I had the foresight to remove the batteries before storing it. It was working perfectly up to the time I stopped using it.

Re: hp19c value?

*Message #7 Posted by **Michael de Estrada** on 18 May 2011, 3:12 p.m.,*
in response to message #6 by ais

The fact that it was working fine at the time of storage does not necessarily equate to it working properly now, 20 years later. There are parts in the printer such as paper advance rollers that can deteriorate over time and there may be electronic components such as electrolytic capacitors that go bad with age, although I don't know if this particular model has any. The only way you will know for sure is to either rebuild the battery pack or connect the calc battery terminals to a regulated DC power supply providing approximately 5 vdc and test it.

HP RPN stack permutations graph

*Message #1 Posted by **Xavier A. (Brazil)** on 18 May 2011, 9:47 a.m.*

Hello happy few,

After reading – very lately, I confess - the excellent French book « Programmer HP-41 » published in the 80's, I decided to redraw the « Logigraphe » of page 41, very confused to everyone, even to French people (yes, it's possible).

The « Logigraphe » is the graph of all permutations available in the RPN (4 elements) stack, a very useful tool to anyone who wants to program a calc from HP-65 to 16c model. You can view and read the original document here:

Link to Programmer HP-41's PDF version

Using this strange map is simple : focus on the beginning of the graph, search for the aimed combination, and find the shortest path using Rd, x<->y, etc.

Nevertheless in these ancient times without OpenOffice, drawing a good graph was not easy, and this document appears 30 years later a bit old-fashioned. By thanking the two writers P. Descamps & J.-J. Dhénin for this wonderful book and their precious work, I chose to publish this new graph (a flattened truncated octahedron) which will be perhaps useful to some people, at least in this museum.

Here it is :

HP RPN stack permutations graph PDF version

For any OpenOffice version, please mail me.

Many thanks to Luiz C. Vieira for his HP fonts.

Xavier

Post Scriptum : I didn't read every documentation about it (!), and perhaps this graph is a very old idea published already in some country… In this case, I do apologize for this wasted time of reading. If not, maybe that a further step in this direction (in my humble opinion) would be an HP-41 program to inform the shortest path for any permutation combining the 4-elements stack plus the L register : the 120 permutations are by far too many for a simple 2D-graph.

Re: HP RPN stack permutations graph

*Message #2 Posted by **x34** on 18 May 2011, 4:06 p.m.,*
in response to message #1 by Xavier A. (Brazil)

Excellent idea, I'll try to do 35s version adding Lastx and xyzt stack commands.

Re: HP RPN stack permutations graph

*Message #3 Posted by **Paul Dale** on 18 May 2011, 5:53 p.m.,*
in response to message #1 by Xavier A. (Brazil)

This reminds me of a command I had in the WP-34s for a while.

```
SHFL abcde
```

Where a, b, c, d & e are all from the set { X, Y, Z, T, L } allowing duplication.

This command shuffled the stack and LastX register in any permutation. For example:

- *SHFL YXZTL* was X<>Y
- *SHFL YZTXL* was Rv
- *SHFL TXYZL* was R^
- *SHFL LXYZL* was LastX
- *SHFL XXXXL* was FILL

Anyway, these examples ought to give an idea of the kinds of things that were possible.

- Pauli

Poor fellow that gets the assignement to draw that graph!
;^)

Re: HP RPN stack permutations graph

*Message #7 Posted by **Paul Dale** on 19 May 2011, 5:30 a.m.,*
in response to message #6 by exschr

The nice bit about the stack shuffle is that the graph becomes very simple. Everything is one step away from the initial stack state.

- Pauli

Re: HP RPN stack permutations graph

*Message #8 Posted by **Marcus von Cube, Germany** on 19 May 2011, 5:47 a.m.,*
in response to message #7 by Paul Dale

But will such a command fit our op code scheme? I doubt it. And what do you do if the stack depth is set to 4 and you encounter a command that treats all 8 or 9 registers? What about complex mode?

If we could ignore LastX and allow shuffling of ABCD in any mode, things become easier. Then we only need an abbreviated notation so that only registers which are to be affected are named such as SHFL ZXY. This would leave T, A, B, C and D alone. We would still need 3 bits per register in eight positions, totaling 24 bits for every possible combination.

Edited: 19 May 2011, 5:47 a.m.

Re: HP RPN stack permutations graph

*Message #9 Posted by **Paul Dale** on 19 May 2011, 6:00 a.m.,*
in response to message #8 by Marcus von Cube, Germany

There were only four stack levels plus last x when I implemented this and 5^5 fitted easily. I even contemplated allowing 0 as well :-)

- Pauli

Re: HP RPN stack permutations graph

*Message #10 Posted by **Frido Bohn** on 19 May 2011, 7:38 a.m.,*
in response to message #1 by Xavier A. (Brazil)

Interestingly, already in the "HP-45 Applications Book" a Section "Stack Register Operations" describes how to manipulate the stack.
It has not the nice graphical representation but shows the keystrokes to be applied, and also interestingly, what HP considered to be noteworthy:

- Clear stack
- Delete x
- Delete y
- Reverse the stack
- Fetch t or roll up
- Fetch t to Y
- Fetch z
- Copy x into Z and T
- Copy y into Z
- Copy y into Z and T
- Copy y and x into Z and T respectively
- Copy y and x into T and Z respectively
- Swap x and rk [k: number of storage register]
- Swap y and z

- Swap z and t
- Swap x and t
- Swap x and z
- Swap y and t

Wp34s base mode question

*Message #1 Posted by **Cristian Arezzini** on 18 May 2011, 7:09 a.m.*

I'm still "playing" with the emulator, waiting for the cable to arrive so that I can reprogram my 30b (by the way, I'm sort of liking the 30b even before reprogramming! Is there a place to download the original 30b firmware, so I can flash it back should I want to?) I'm mostly interested in the "integer base" mode, as I still do some programming in old 8 bit computers - and I used the 16c until now.

On the 16c, if for example you set 2's complement, and 8 bits word, then the numeric entry is interpreted "on the fly": i.e. if I am in base 10 and try to enter 254, this is what happens: I press 2 and the display shows "2"; I press 5 and the display shows "25"; I press 4 and the display shows "-2" because 254 doesn't exist in 8-bit 2's complement, but its bit pattern represents a decimal "-2". The same happens if I try to enter a number too big, i.e. 400: I press 4,0 and the display shows "40", then further digits are completely ignored (because no number starting with "40" and with 3 or more digits has a meaning in 8 bit words). I liked being able to see what was "going on" before actually entering the number on the stack. Is this a behavior that will eventually be implemented, or will it stay as it is?

Second question: I noticed that the current version of the emulator (1.17 build 874) still has the hexadecimal "E" bug - i.e. if you enter E by itself (or as a last digit), it is ignored and a 0 is entered instead. What's the status of that bug? Will it be fixed in a new emulator? Or, is there a way to tell the emulator to use the latest firmware?

Third, unrelated question: Does anyone know if there is a way to have the 16c integer base capabilities (especially with respect to settable word size, and carry/overflow bits management) with the 50G? Either natively or with some additional software?

Thank you, Cristian

Re: Wp34s base mode question

*Message #2 Posted by **Marcus von Cube, Germany** on 18 May 2011, 7:20 a.m.,*
in response to message #1 by Cristian Arezzini

Cristian, V1.17 is frozen with all its bugs. You can get 1.18 from the SVN repository. The emulator is in the trunk/windows/bin subdirectory. This is "software in motion" and may be broken at any time. If that's the case, SVN allows to retrieve older versions.

The emulator does not use the actual flash file as it does not try to emulate the hardware. It uses the same software base (written in C) but is compiled with an MS compiler to produce a Windows executable.

Re: Wp34s base mode question

*Message #3 Posted by **Cristian Arezzini** on 18 May 2011, 8:08 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Hi Marcus, Thank you for your reply. I just installed the most recent version. The "E" digit bug is indeed gone, but my other questions still stand. I noticed that when you enter a number larger than the word size, it is entered "modulo" the word size... What happens, do you just drop the extra most-significant bits when Enter is pressed? Do you have any plans to implement the 16c behavior (the live interpreting of the

entries)?

Thanks again, Cristian

Re: Wp34s base mode question

*Message #4 Posted by **Marcus von Cube, Germany** on 18 May 2011, 8:45 a.m.,*
in response to message #3 by Cristian Arezzini

The question has to go to Pauli who wrote that stuff. I don't believe that he will implement the life interpretation because wp34s has an internal command line which gets interpreted only when some function is performed. So the interpretation needs to be implemented directly in the input editor.

Your assumption about the modulo interpretation makes sense to me.

Re: Wp34s base mode question

*Message #5 Posted by **Paul Dale** on 18 May 2011, 5:46 p.m.,*
in response to message #1 by Cristian Arezzini

Yes, we do the input modulo the word size.

No, I'm not planning on changing the way numbers are input. The sources are freely available, so feel free to send us a patch :-)

Marcus is correct about the input going into a command line buffer. It should be possible to process the command line on keyboard entry and do what the 16c does.

You'll have to write the bit manipulation code for the 50g if you want carry and overflow. The ancient *fix project includes a pile of RPL code I wrote that does this. I don't remember where to find the repository nor how easy it would be to move to the 50g.

- Pauli

Re: Wp34s base mode question

*Message #6 Posted by **Cristian Arezzini** on 18 May 2011, 11:25 p.m.,*
in response to message #5 by Paul Dale

Thank you both for your replies! :) I don't know C well enough to understand (let alone patch) a project like this, so I think I'll be content with the wp34s as it is - after all, once you know how it works and what to expect from the machine, then it's not that different. But I'm a little better at RPL than at C, so I may try implementing something on the 50g when I have the time... might be fun! :)

Cristian

Re: Wp34s base mode question

*Message #7 Posted by **Neil Hamilton Ottawa** on 19 May 2011, 6:19 a.m.,*
in response to message #1 by Cristian Arezzini

I too am waiting for both my cable and my new HP30b to arrive. I am very willing to sacrifice my current HP20b -- especially since there seems to be a replacement F/W image in the HP SDK -- but I might like to revert the (yet to arrive) 30b back to its native state.

Does anyone know the answer to Cristian's question about restoring the original HP30b F/W? Is it available

from HP by special request or can it be downloaded from the calculator?

BTW: My 20b F/W has a checksum of 130 (copyright 8 01 2008) whereas all the examples I have seen online have different checksums. Does anyone know what F/W versions are out there? What version is in the SDK?

Cheers...

Re: Wp34s base mode question

*Message #8 Posted by **Marcus von Cube, Germany** on 19 May 2011, 6:46 a.m.,*
in response to message #7 by Neil Hamilton Ottawa

HP 30b firmware is available from Tim Wessman on request. I can't give any information about existing versions.

There is no way to read out the flash through the serial connector. In order to get into SAM-BA mode, you'll need to erase the flash first. After this, the original firmware is gone. In wp34s, I've added a command to just clear the boot bit and boot into SAM-BA. This preserves the flash contents. To my knowledge no such feature exists in the original firmware.

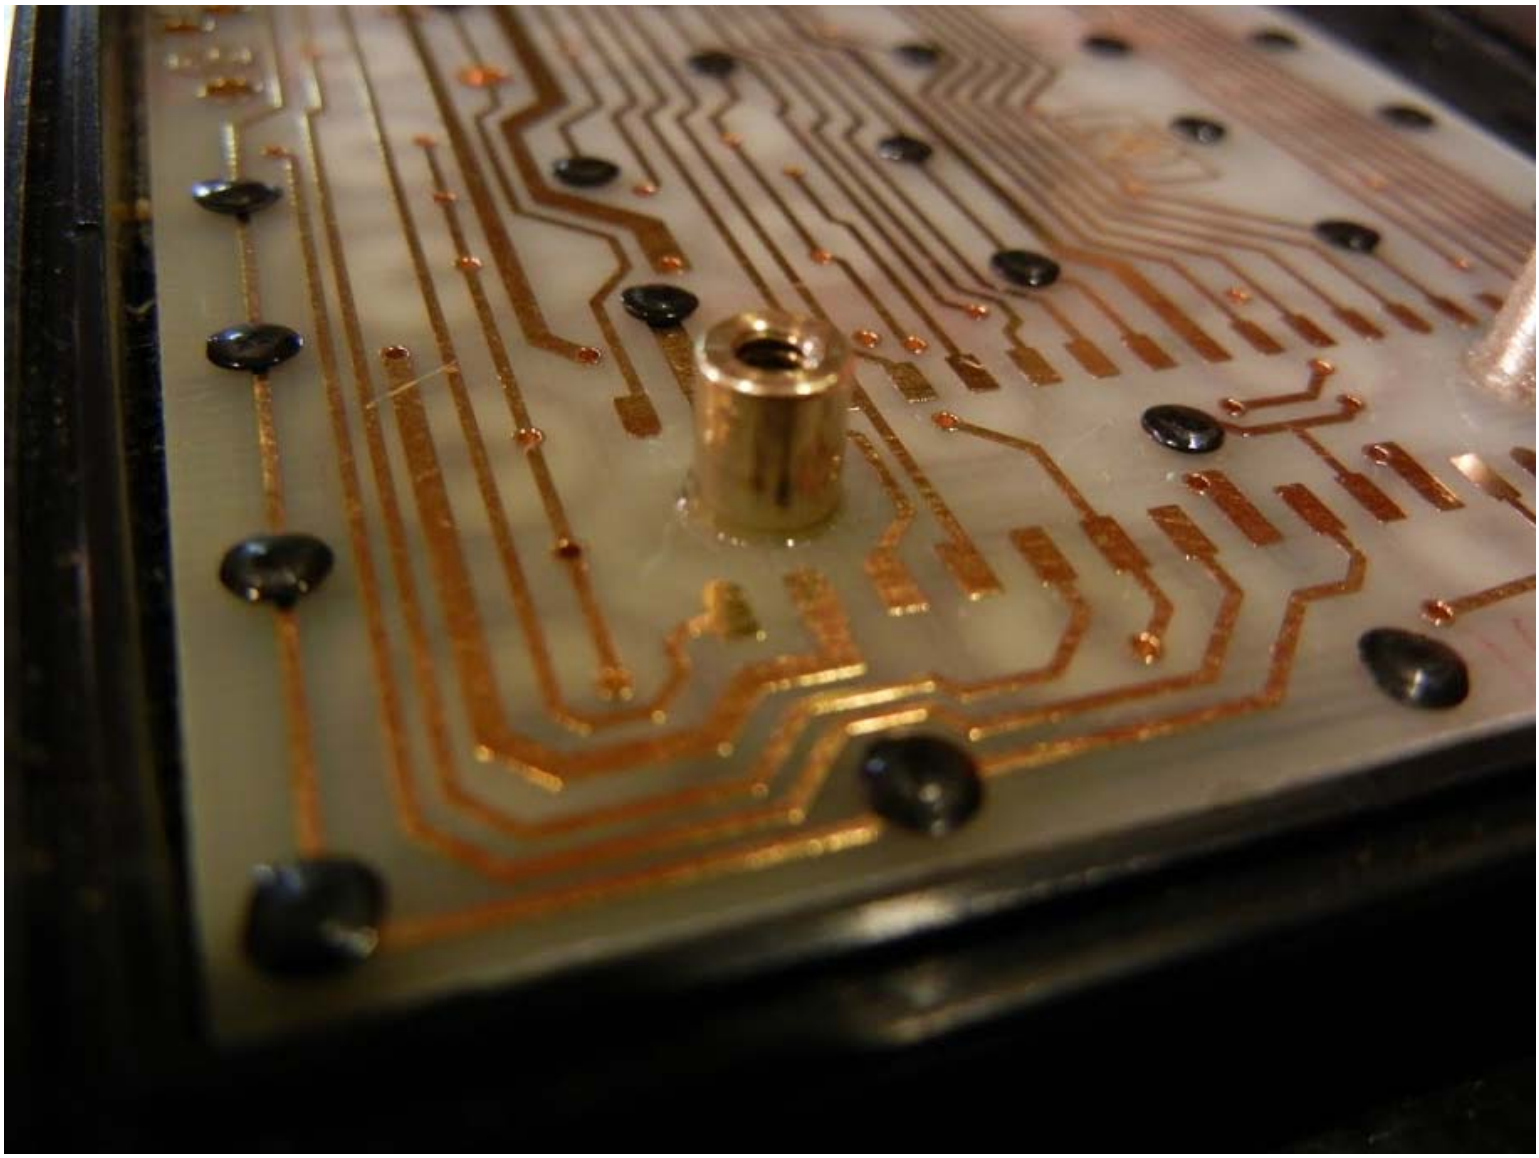
HP-41 Permanent broken Post Fix

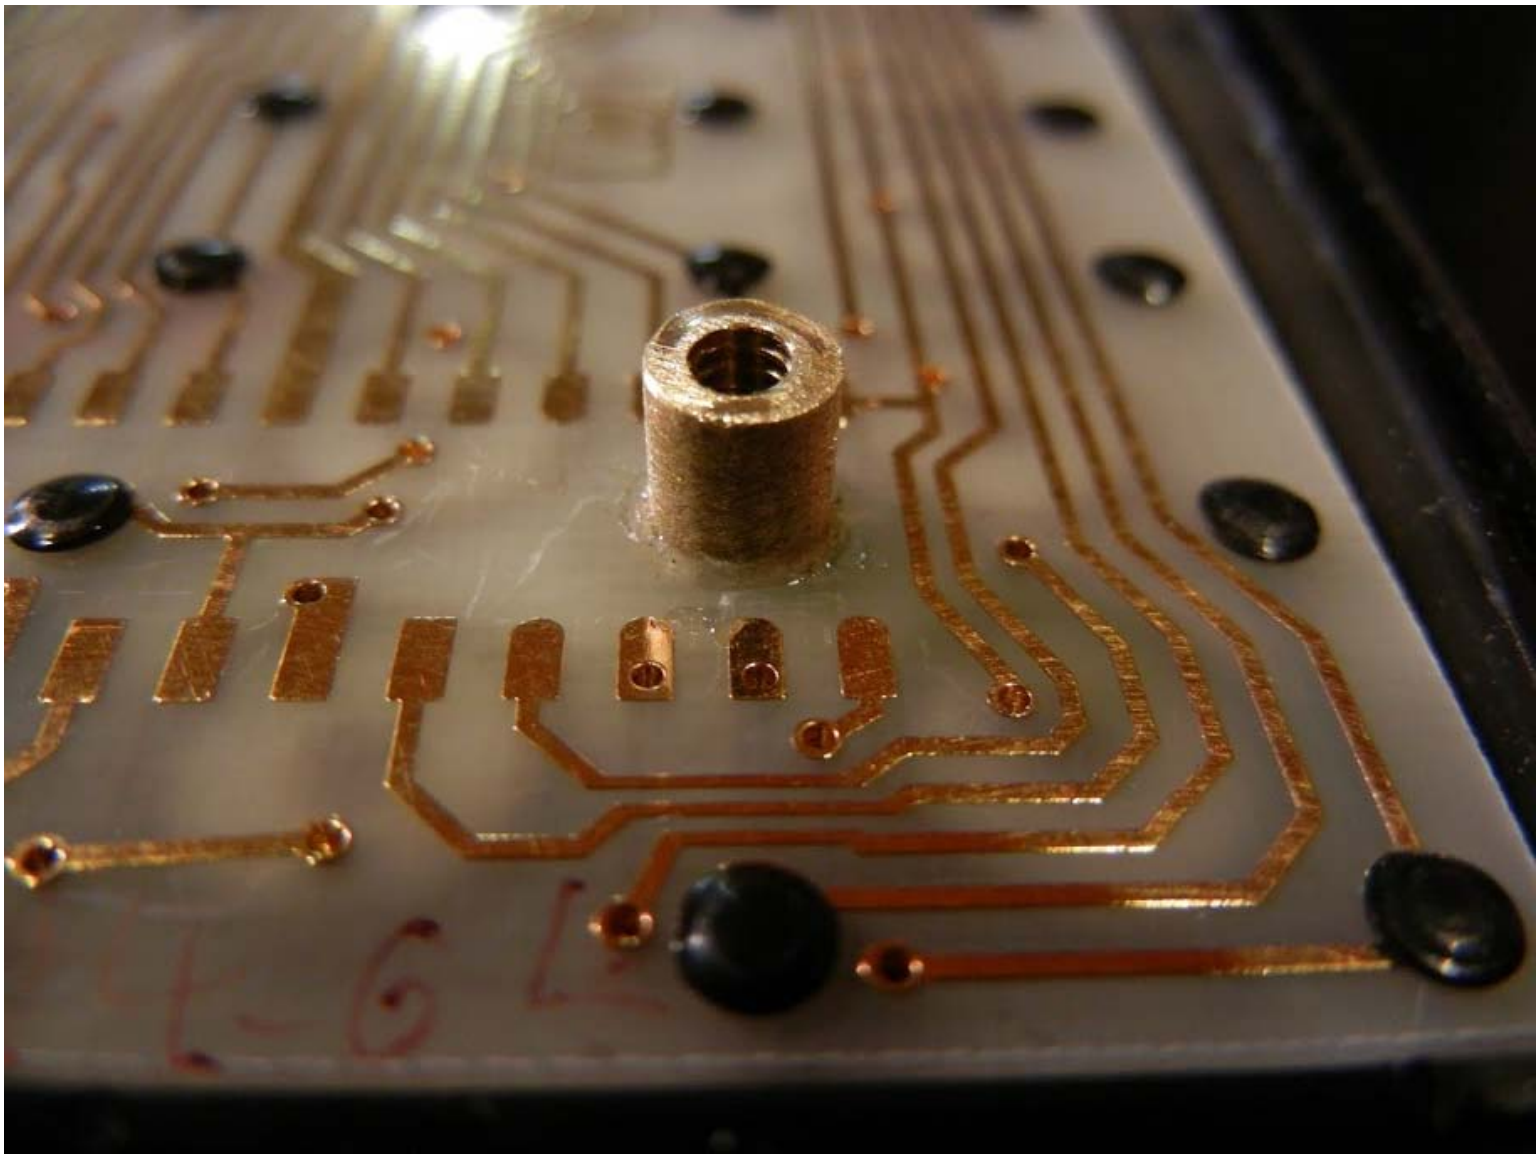
*Message #1 Posted by **aj04062** on 17 May 2011, 10:35 p.m.*

Up for review is my permanent repair to fix your ailing 41.

As some in the forum know, I had posted the question why my two 41CVs were acting strangely. POSTS. Nothing more, nothing less. Well the following is my permanent cure for one. It's posts where helplessly cracked beyond repair. What I resorted to were two 4-40 brass standoffs about .25-.27 inches long x .1875 OD.

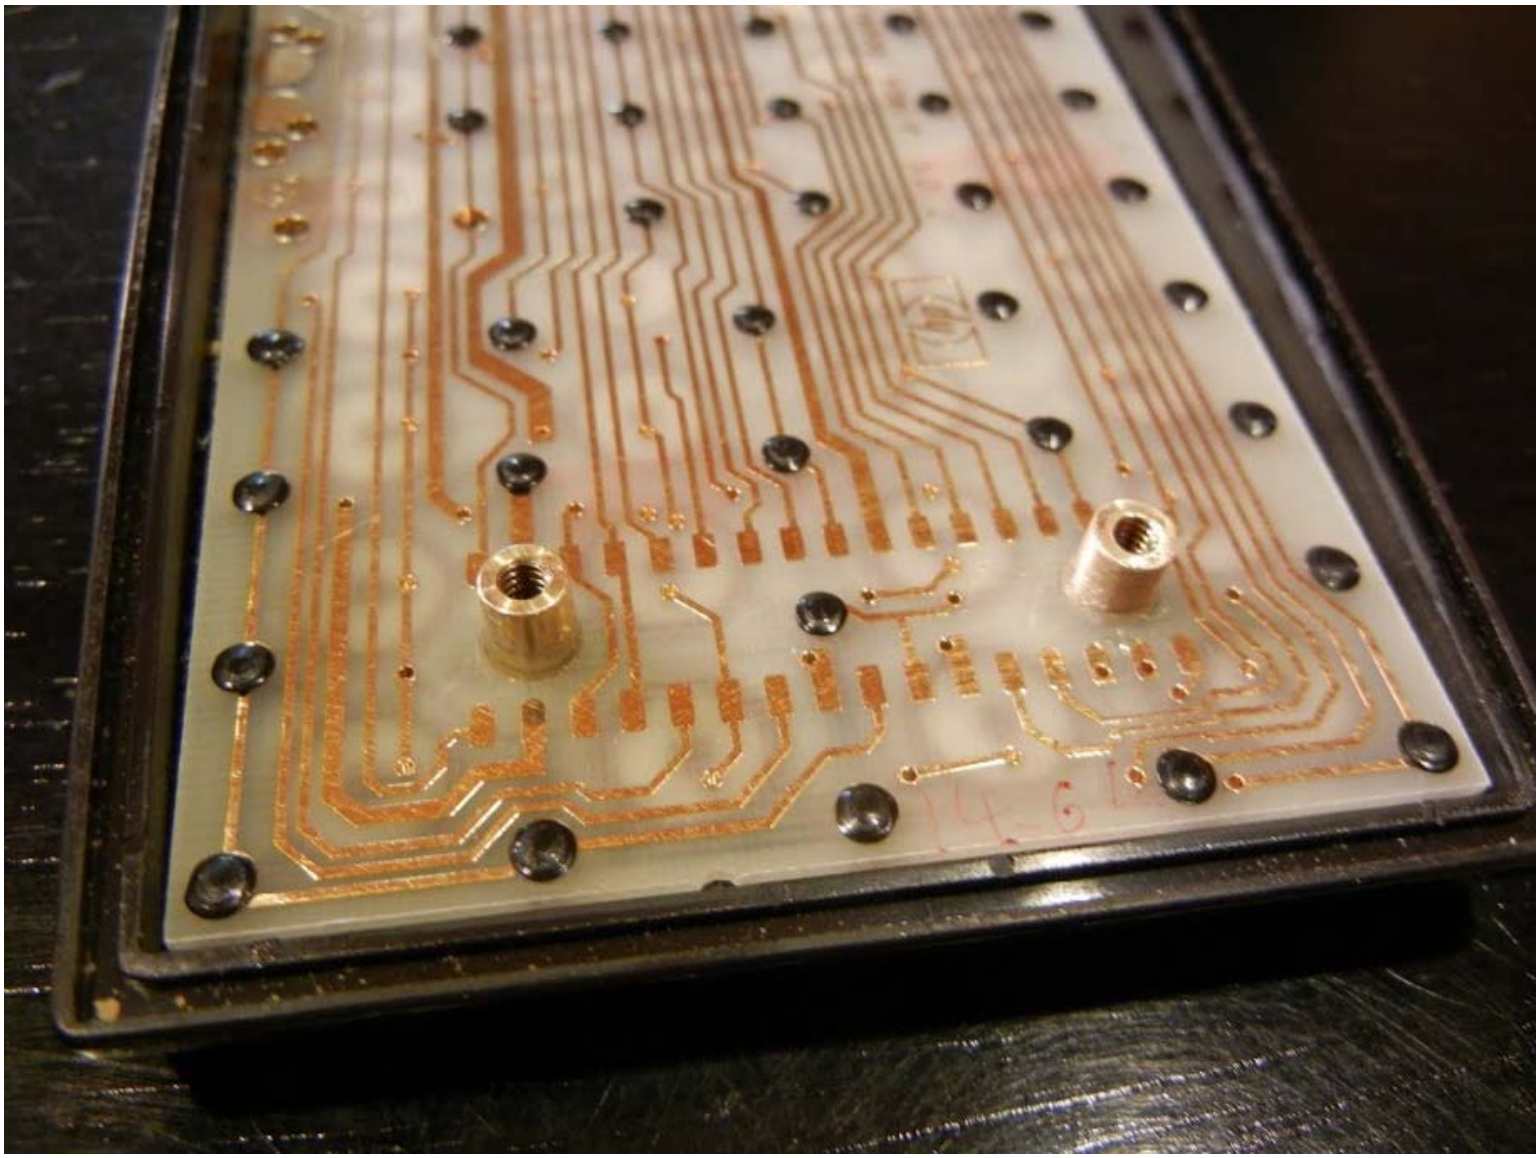


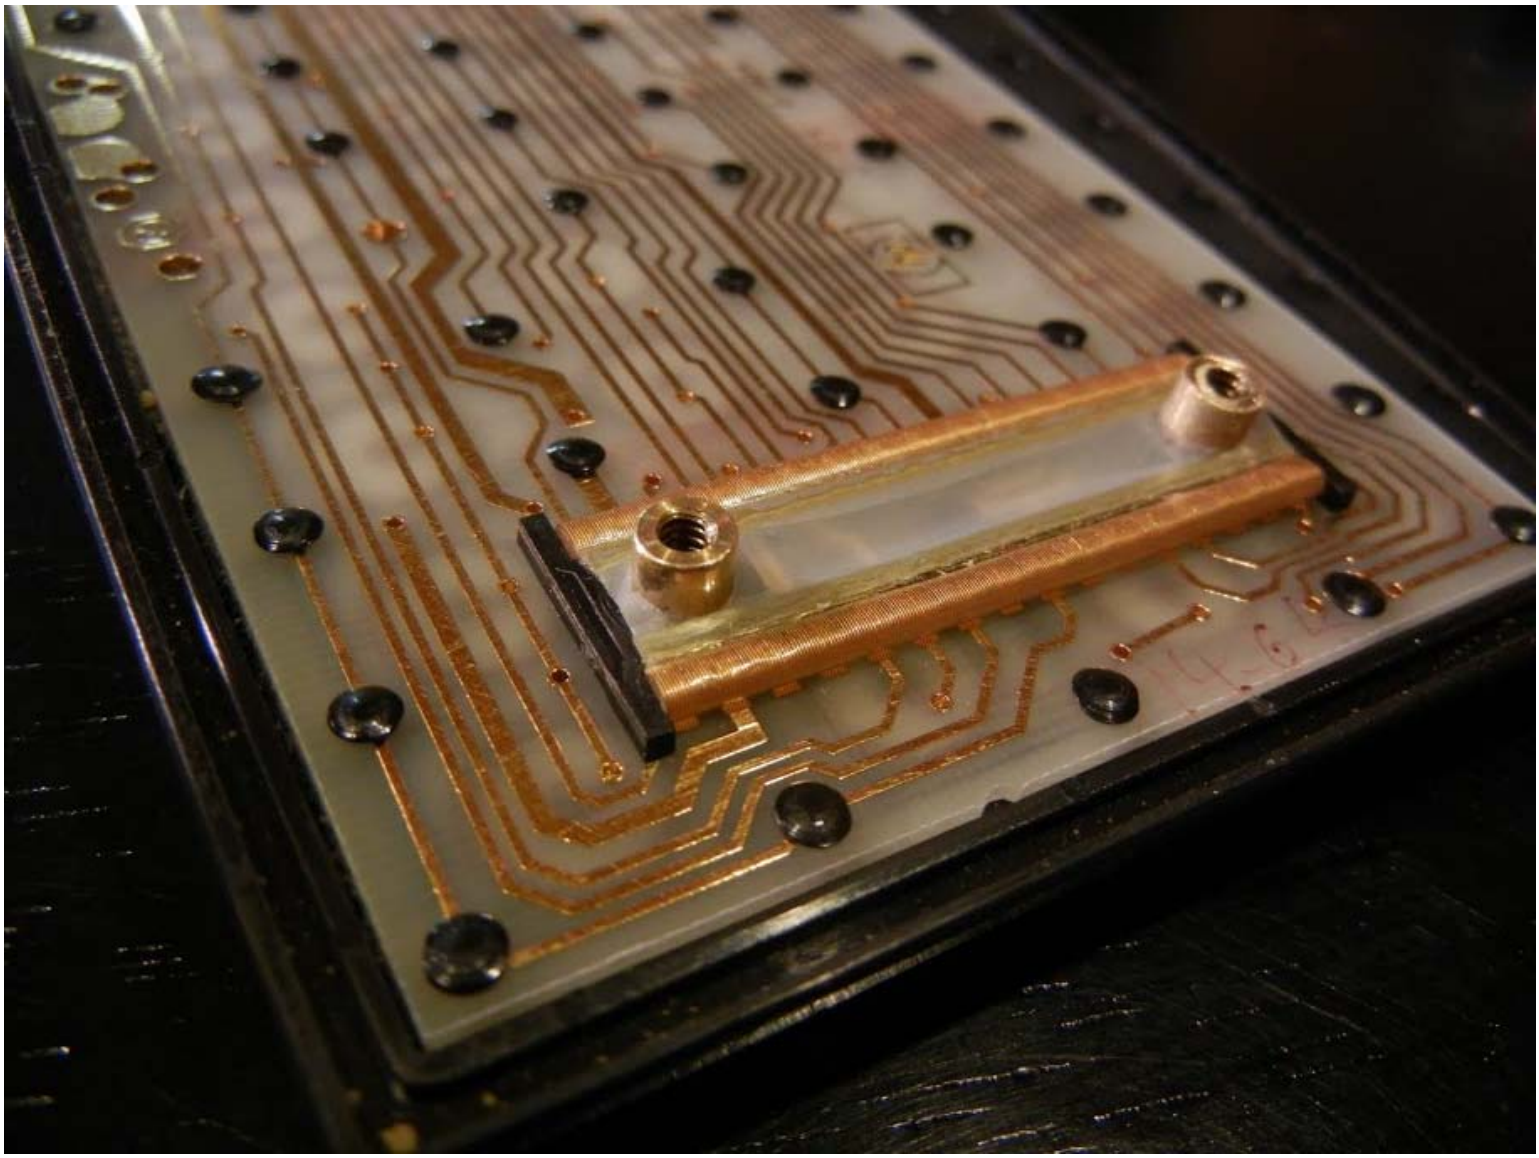
Finished height above board = .200

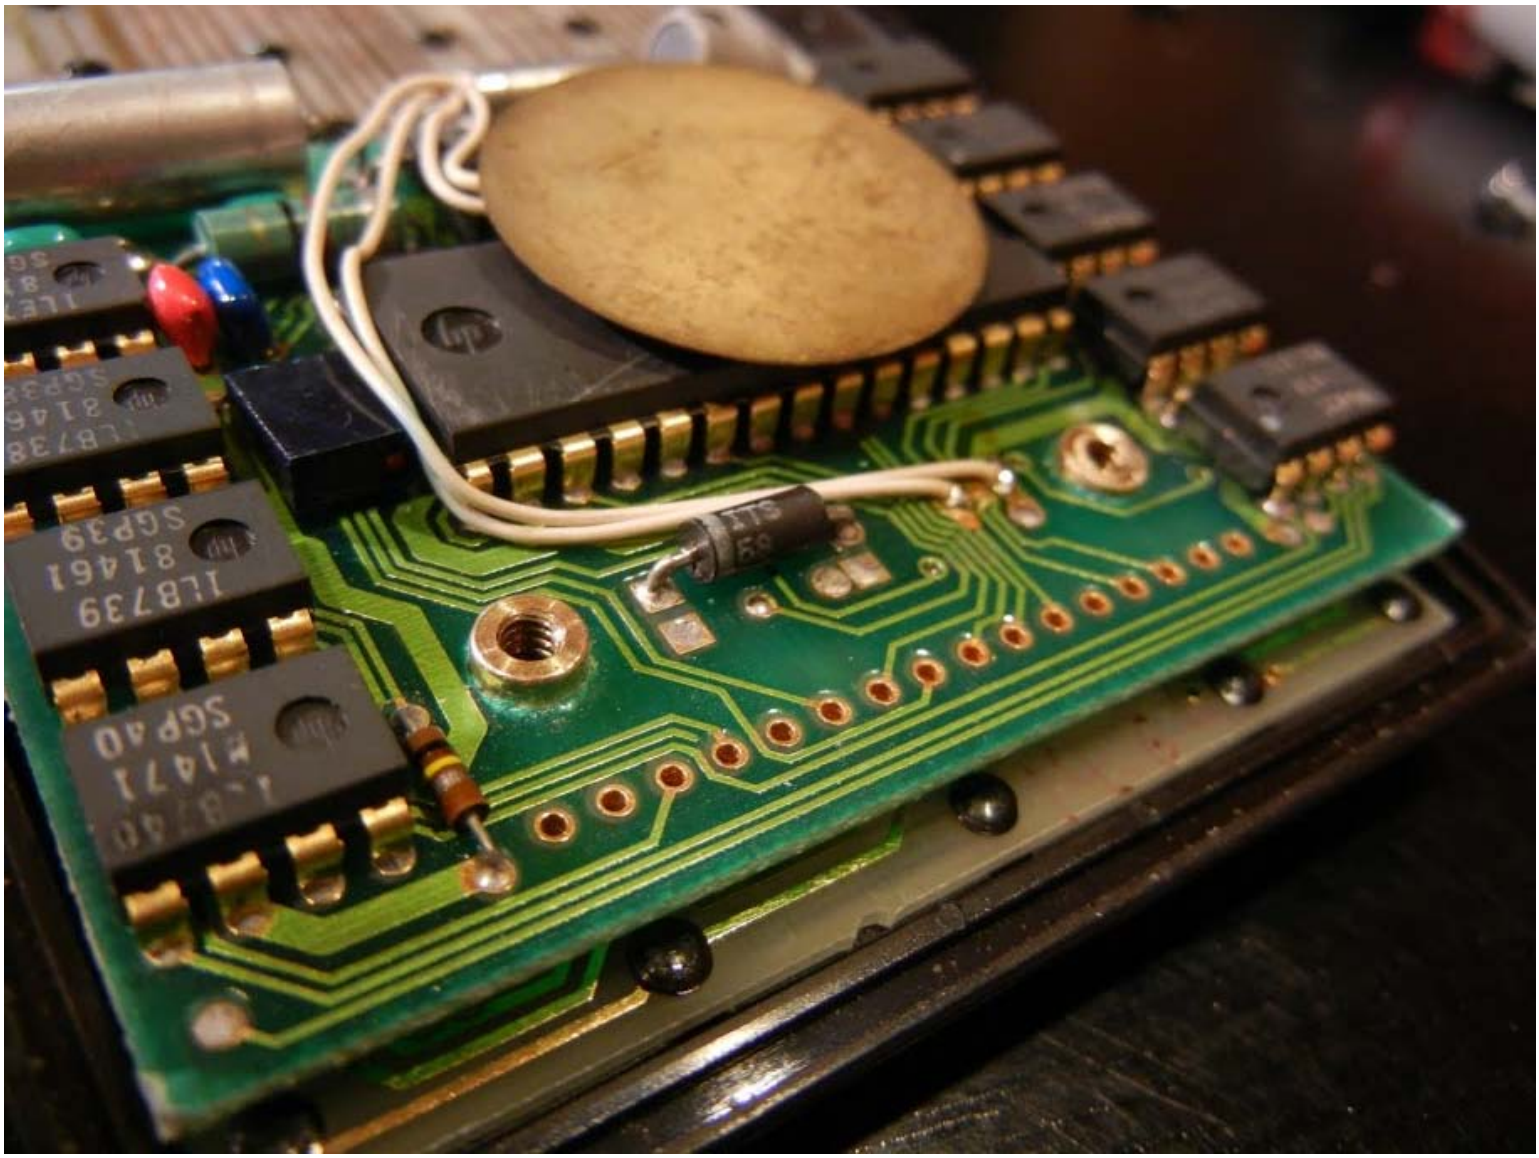


The old post was milled off with a .1875 end mill and bored down about the thickness of the board (.070)

They were then epoxied into place.







Now proper torque can be applied to the 4-40 screws and the unit behaves as it should. Hopefully it will last another 29 years!

Edited: 17 May 2011, 10:49 p.m.

Re: HP-41 Permanent broken Post Fix

*Message #2 Posted by **db (martinez, ca.)** on 17 May 2011, 11:54 p.m.,*
in response to message #1 by aj04062

That's a very elegant solution. I just lazy out and slip slightly too-tight springs over the split plastic. It works but not as prettily as your brass fittings.

Re: HP-41 Permanent broken Post Fix

*Message #3 Posted by **aj04062** on 18 May 2011, 6:04 a.m.,*
in response to message #2 by db (martinez, ca.)

These ones were shattered and sheared off at the board. No spring would have helped them!

in response to message #8 by PeterP

I'm interested in a couple of these brass cylinders, too.

Are these available in the suitable legth for the upper posts, too?

Is the screw thread already there?

Thanks

Ray

WP34s 1.17 Build 874 possible SETTIM bug?

*Message #1 Posted by **BobVA** on 17 May 2011, 10:29 p.m.*

Hi: I noticed when using SETTIM that the input argument's seconds value seems to be ignored and replaced with some value between 10 and 14.

For example if I have 22.0400 on the stack, execute SETTIM then immediately press hTIME I get a value back of 22.0412 instead of an expected 22.0402 or something close to that.

Regards, Bob

Questions about "flashing" a 30B

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 17 May 2011, 8:47 a.m.*

I would like to receive comments about the following questions:

a) Comments about incompatibility of SAM-BA and Windows 7 appeared elsewhere, suggesting to only use it on Win XP and machines with a physical serial port. While I still have accesss to one of these, I also read (Atmel web site) that SAM-BA is compatible with Windows 7 and with USB serial ports that support CDC (Communication Device Class). Would this work? BTW, I just received the special serial cable.

b) Which is the device type in the HP 30B (SAMxxyy)?

c) What are the steps to replace original firmware with a new image?

d) How critical is to use an external power supply during the "flash" operation?

I know most of this information has been already discussed and posted over the last months. It may be good if some of the experts uploads an article to the Articles Forum on the MoHPC, so information is easier to locate (compared with volatile forum threads).

Thanks in advance,

Andres.

It worked fine, thank you!!

Re: Questions about "flashing" a 30B

*Message #4 Posted by **cyrille de brebisson** on 17 May 2011, 1:35 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Hello,

a) SAM-BA, serial port and windows7 - I don't know about win7, but Sam-Ba does not work well with USB serial coms... seomthing having to do with the fact that USB is packet based and serial byte based, creates timing issues with most serial designed communication protocols. I developped an alternative to SAM-BA, which work better, but I was told that it was not detecting serial ports under win7. bottom line, XP and physical com port is best...

b) Which is the device type in the HP 30B (SAMxxyy)? - AT91SAM7L128

c) What are the steps to replace original firmware with a new image? - connect all, press on reset on cable, press and hold erase on cable, turn calc on, relase erase, press reset on cable, turn calc on (it will not show anything), start SAM-BA program, at end of download, press reset again on cable.

d) How critical is to use an external power supply during the "flash" operation? - not at all. if you run out of power, repeat as above with new batteries.

cyrille

Re: Questions about "flashing" a 30B

*Message #5 Posted by **Katie Wasserman** on 17 May 2011, 2:19 p.m.,*
in response to message #4 by cyrille de brebisson

I've had no problem using SAM-BA V2.6 (you need a patch that includes the AT91SAM7L128) under WinXP and Win7-32bit with USB-to-serial port adapters (I've used 2 different ones). It also works fine on both op-sys with a real serial port, naturally.

That said, I did have some trouble with a later version of SAM-BA with USB-to-serial adapters that I tried.

-Katie

Re: Questions about "flashing" a 30B

*Message #6 Posted by **Marcus von Cube, Germany** on 17 May 2011, 2:29 p.m.,*
in response to message #5 by Katie Wasserman

For me SAM-BA.EXE V2.10 works fine under WinXP in a virtual machine on my Mac. In very rare occasions the transmission hangs and I have to repeat the process: Stop SAM-BA, reset and turn on the calculator (no need to erase again), restart SAM-BA and repeat the download.

In any case, don't forget to set the "Boot from flash" bit before you stop the GUI!

Cyrille, I've heard that MySamba has a problem flashing the recent wp34s images which are shorter than 128KB. I leave some space free for data at the end of the flash memory. Does this cause trouble?

Rebuilding a HP41 battery pack

*Message #1 Posted by **M. Joury** on 16 May 2011, 5:15 p.m.*

I have several old HP41 battery packs that require rebuilding so I have been perusing some old articles on the topic. Unfortunately I have never figured out how to search this forum efficiently and am quite sure that I have missed relevant data. At any rate, since I absolutely hate soldering anything I decided today to take a trip down to the local Batteries Plus and see what they had available. The only thing they had was a 50MAh NiCd cell that specifies a charge rate of 5ma for 14-16 hours. Since these are the cells that were already in the pack (from a trip to B+ some 15 years ago) I went ahead and had them rebuild 2 packs for me.

On returning home I got online and found a NiMh 1/3 AAA that is rated at 170 MAh and that got me thinking...

Looking at the 82059D charger sitting in front of me I see that it has an output of 8VAC with a maximum power output of 3VA. If I remember my high school and college physics that translates into a max current of 375MA. So, given that the output is AC and that 375MA would absolutely toast a 1/3 AAA cell rated at 50MAh (that would be a whopping 7.5C rate for a very small cell) I am assuming that there is some circuitry that regulates the charging current. If this is so, and if the charge rate is limited to 5MA or thereabouts, it would seem to me that replacing a 50MAh cell with a 170MAh cell would push the charge time to upwards of 34 hours. So my question is: Has anyone tried a higher capacity cell in a 41 pack and what sort of capacity, charge times, and run times are you seeing?

Cheers,

Marwan

Edited: 16 May 2011, 5:15 p.m.

Re: Rebuilding a HP41 battery pack

*Message #2 Posted by **John Robinson** on 16 May 2011, 9:40 p.m.,*
in response to message #1 by M. Joury

Hi Marwan,

I use GP cell GP17AAAH1A1H cells for my rebuilds, and change nothing else. I charge overnight, so 12 hours (ish), but I couldn't tell you how long that charge lasts. But, you could change R1 (see http://www.keesvandersanden.nl/calculators/hp82120A.php) in the battery pack circuit to increase the charge rate.

Cheers, John

Re: Rebuilding a HP41 battery pack

*Message #3 Posted by **M. Joury** on 16 May 2011, 10:35 p.m.,*
in response to message #2 by John Robinson

Hi John,

Thanks for the info. This is the cell I located online: [link: http://www.interstatebatteries.com/cs_eStore/Products/RT/PID-ASC0994(Other+Products).aspx?dsNavigation=Ns~product+Type|101|1|%2cN~2147384805-4294765403-4290305461&Title=1.2V+170MAH+NIMH+1%2f3+AAA]NiMh Cell[/link]

Sorry, I can't seem to get the darn link to display correctly.

It appears very similar to the cell you are using. According to the specs for your battery they recommend 16 hours at 17 MA. My guess is that you are not getting a full charge. However, I have to wonder, if the charge rate of the unmodified pack is right around 5MA, whether you could keep the pack plugged in indefinitely without fear of overcharging and only unplug it when away from your desk. I mention this possibility because a C/34 rate is extremely low and would generally be considered a safe trickle charge rate (at least for a NiCd and I do realize that we are talking NiMh here).

I think that I will grab 4 of these and get out the old soldering iron and give it a try. Admittedly, as stated in my initial posting, I am terrible with a soldering iron but I can always hijack the services of a friend.

Cheers,

Marwan

Edited: 16 May 2011, 10:45 p.m.

Re: Rebuilding a HP41 battery pack

*Message #4 Posted by **John Robinson** on 16 May 2011, 11:26 p.m.,*
in response to message #3 by M. Joury

Hi Marwan,

Yes I am probably undercharging the GP cells, I may change the value of R1 so I see ~17mA going into the cells, and that should suffice.

Before you buy the cells, just make sure they have solder tabs. I clicked through that link, and I couldn't really tell from the pic on that page. The GP17AAAH1A1H definitely do have solder tabs.

If you need help sourcing suitable cells let me know, I don't think I have any spares, but I can possibly get some for you, or help you to find a supplier in the US which would make more sense as I'm in Australia.

Also, I have a documented procedure for doing the cell replacement, so I can mail that to you if you like.

Cheers, John

Re: Rebuilding a HP41 battery pack

*Message #5 Posted by **M. Joury** on 17 May 2011, 12:33 a.m.,*
in response to message #4 by John Robinson

Hi John,

I would love to get hold of that procedure. I'll contact you offline and send you my email. I think that I found a US source for the cells you are using but I'll have to take another look in the morning.

Thanks for your help!

Marwan

Re: Rebuilding a HP41 battery pack

*Message #6 Posted by **Dieter** on 17 May 2011, 2:35 p.m.,*
in response to message #1 by M. Joury

Here is some information you might find useful:

- The 82059 (or 82066) charger is rated at 8 V AC (!) and 3 VA, but this is not relevant at all here. The AC-adapter does not push current into the batteries, it's the charging circuit that sets the charging current. The PCB inside the 82120A battery pack sets this current to something like 15 mA (DC of course). This means, that a completely empty (BAT announciator on) common 150 or 170 mAh 1/3-AAA-size NiMH-battery will be charged within 12-14 hours.

- 1/3 AAA is the right size here, and the net knows various instructions on how to refurbish an old 82120A-pack with current NiMH batteries.

- Soldering tabs are nice, but there is a better solution. For instance, my local battery distributor does not only stock this type of "industrial use" batteries, they also offer custom-built packs with nicely welded (!) tabs, even shrink-wrapped, if you wish. Maybe you will find a similar service in your area, or at least on the net.

- There is another option: Use N-size NiMH cells. Their capacity is 500 mA, i.e. three times the 1/3 AAA type. Use these cells in the regular 41-series battery holder and charge them externally. You can even use an old AA-charger rated at 45-60 or 100...120 mA, since back in the Eighties 500 mA was the usual capacity for AA-size NiCds. Charging time = 1,2 * capacity / current. There are mechanical adapters to fit N-batteries in AA-chargers. But beware - do not use chargers with higher currents.

Dieter

Re: Rebuilding a HP41 battery pack

*Message #7 Posted by **M. Joury** on 17 May 2011, 5:06 p.m.,*
in response to message #6 by Dieter

Hi Dieter,

You confirmed some of the information that I suspected. What I was not aware of was the 15MA charge rate. This seems somewhat high for a 1/3 AAA cell of that period (early to mid 80's) but I will accept this info as fact. If so, obviously replacing with a higher capacity NiMh cell without any changes to the internal circuitry becomes trivial. It would also seem that charge times for an original capacity NiCd rated at 50MAh should be kept around 4 hours.

At one point I tried the rechargeable 'N' cell approach. For various reasons (primarily the quality of the cells available at the time) this did not work very well for me. I am going to look into this again as it would be a great option.

Now for a completely different approach... I fly electric powered radio control aircraft and there are a plethora of packs available for these planes. I have sitting in front of me a 3.7V (single cell) 400mAh LiPo pack that is about 30mm*25mm*8mm in size. This pack would easily fit in the space available in a 41 battery pack. A singe cell LiPo pack has a nominal voltage of 3.7 V and a full charge voltage of 4.2 V. Will a 41 run off this voltage and if not would the next size up (7.4/8.4) destroy it? Of course this approach would require a very specialized charger (which I have) and probably require that it be charged outside of

the calculator.

Thanks again for the information that you provided. Any thoughts on the above idea would be appreciated.

Marwan

Re: Rebuilding a HP41 battery pack

*Message #8 Posted by **Dieter** on 18 May 2011, 3:00 p.m.,*
in response to message #7 by M. Joury

This topic - rebuilding a 82120A pack and related questions - has been discussed here not too long ago. You will find further information there.

The 82120A battery pack did not use 1/3 AAA size cells, but 1/2 N size batteries. This size is no longer available, but 1/3 AAA is a nice (slightly smaller) replacement. The original batteries had a capacity of about 70-80 mAh, so an empty pack was fully charged after 7 hours. Now think of thousands and millions of users who left their pack charging for 10 or 12 hours, or even longer...

The charging current indeed is about 15 mA. A friend of mine measured 15,6 mA in his pack, and this is confirmed by a quick look at the schematics. Please take a look at this site. The AC-adapter 82066 (European version) provides the usual nominal 8 V AC, but since there is virtually no load the effective voltage is more like 11 V AC. Behind the rectifier and the smoothing capacitor the voltage should be something like 15 V DC, just right for the following 12 V DC-regulator. The charging circuit finally is essentially a 365 Ohm resistor across which the voltage is 12 V minus the 6,2 V Zener diode minus roughly 0,6 V drop caused by D6. Thus the nominal charging current is (12 - 6,2 - 0,6) V / 365 Ohm = 14 mA. Voila.

There are slight differences between earlier and later 82120A packs, there were even packs with three pins. However, I assume the basic schematics are similar.

Using Li-Ion or Li-Po batteries is an option that comes to mind soon once you think about alternative solutions. But the voltage will be a problem. The BAT announciator comes on at 4 Volts, and two cells (around 8 Volts) are too much in my humble opinion.

Dieter

Re: Rebuilding a HP41 battery pack

*Message #9 Posted by **M. Joury** on 18 May 2011, 5:47 p.m.,*
in response to message #8 by Dieter

Hi Dieter,

Since I had some difficulty searching the forum for this topic the information you provided is useful and appreciated. Your opinion that 7.4 - 8.4 volts is too high for the 41 will keep me from trying the 2 cell LiPo option at this time. The information on the battery annunciator voltage is also useful. The LiPo cell I was considering is designed for extremely high discharge rates (this particular cell is rated at 20C) so it might be that a single cell solution would actually work since the extremely low current requirement imposed by the 41 would cause little or no voltage depression for a large part of the cells life. When I have some time I might try to test this theory and see if a single cell LiPo works.

I have also done an online search for rechargeable NiMh N cells and find that they are actually quite easy to locate. The problem is that I can't find adapters to charge them in a standard AA/AAA

charger. I am still looking into this as it appears to be an attractive option.

Thanks again for all your help!

Marwan

Re: Rebuilding a HP41 battery pack

*Message #10 Posted by **Dieter** on 19 May 2011, 1:41 p.m.,*
in response to message #9 by M. Joury

The mentioned AA-adapter is readily available in many stores that sell electronic components. I do not know where you live, but here's an example from a major German supplier (Conrad Electronics). There even is a PDF data sheet. As you can see the adapter is made of aluminium. Real cowboys of course will make their own adapters. ;-) I have a set of four, handmade by a friend with far better skills in this area than mine.

Charging N-cells can be done in many ways. A long time ago I built a simple constant-current charger that can be set to 75 and 150 mA (basically the same design as the one used in the 82120A pack). Simply put four N-cells in a usual battery holder (like this one) and connect the charger of your choice.

Dieter

Re: Rebuilding a HP41 battery pack

*Message #11 Posted by **M. Joury** on 19 May 2011, 5:28 p.m.,*
in response to message #10 by Dieter

Hi Dieter,

I thought about charging serially but if at all possible I would prefer to charge cells individually. I will continue to search for a commercial solution and if I can't find one I'll try the build-my-own approach or go for charging them in series.

When I get the time I am going to try a single cell LiPo battery and I'll post my findings.

Again, thank you for all the information you have provided.

12C

*Message #1 Posted by **Diehl-Peshkur** on 16 May 2011, 11:48 a.m.*

Another question for the collective wisdom: Did ALL early 12C models have the gold bezel? Or were there exceptions? Thanks! Theo

Re: 12C

*Message #2 Posted by **Geoff Quickfall** on 16 May 2011, 1:36 p.m.,*
in response to message #1 by Diehl-Peshkur

By all early models, the three cell (357, 1.5v) versions were all gold.

I think the only non gold is the platinum version.

Others will correct me I am sure!!!!

Geoff

P.S. I see from an earlier post that you may be thinking of swapping the bezel. Just a caveat. The bezel may or may not be easy to remove due to the amount of glue used to hold it down. My 10c was so damaged that I did not care about removing it without destroying it. The donor calc was so corroded (the batteries were fused together by rust) that I was able to sacrifice the interior for the bezel. That is, I was not afraid to heat the bezel to a high temperature that might ruin the LCD panel or internals.

I also think, that a silver bezel with the 12C badge would be a novelty. But that would be a personal choice. If you refinish the bezel while still on the calculator (part of the post you were directed to), then you would remove the gold finish. Spray paint would not be an option. The aluminum would be attractive however.

Edited: 16 May 2011, 1:42 p.m.

*Message #12 Posted by **Marc Ferrer (France)** on 18 May 2011, 1:36 p.m.,*
in response to message #10 by geoff quickfall

Hello Geoff,

40 years... this is the very least I wish you :-)

I don't show up very often on this forum (so much to learn from you all...). So I grab the opportunity to tell you that I'm very interested in your book.

The excerpts I've already seen clearly show that this is an outstanding work. Congratulations ! Please, would you add me on your list ? Thank you very much.

Regards from France, Marc

Has anyone seen the 10bii+ in the office stores yet?

*Message #1 Posted by **Eddie W. Shore** on 16 May 2011, 9:51 a.m.*

Even though I have one, I have not seen this calculator in office stores. I live in the San Gabriel Valley (east of Los Angeles).

Re: Has anyone seen the 10bii+ in the office stores yet? Availability outside U.S.?

*Message #2 Posted by **Marcus von Cube, Germany** on 16 May 2011, 11:16 a.m.,*
in response to message #1 by Eddie W. Shore

I'd like to ask a similar question. Is there a chance to get the 10bii+ outside the U.S.? The HP online store does not ship to foreign countries and the German store does not list it. I could neither find it in any other online store. :-(

Re: Has anyone seen the 10bii+ in the office stores yet? Availability outside U.S.?

*Message #3 Posted by **Katie Wasserman** on 16 May 2011, 11:57 a.m.,*
in response to message #2 by Marcus von Cube, Germany

It seems to be available in France. Don't they ship to Germany?

Edited: 16 May 2011, 11:58 a.m.

HP67 for the Android

*Message #1 Posted by **MikeO** on 16 May 2011, 2:48 a.m.*

I've just about completed a version of my HP-67 simulator for the Android operating system. Just need to complete packaging it for the Android app marketplace.

Since I have an HTC EVO device, that happens to be the one I tested. So, right now, the compatible Android phones would have these specifications:
1. 480*800 display
2. Touch screen

You can go to here to find devices with the above specs.

Just wondering how many of you out there would be interested in this.
Also, if you happen to have Android-based phones, what models do you have?

I plan to expand the screen size support to include other models, but want to get an idea of what everyone's using at the moment.

Thanks, Mike

Samsung Galaxy S 480x800

Thanks, I'm interested in using the Simulator too.

Re: HP67 for the Android

*Message #7 Posted by **Marcus von Cube, Germany** on 16 May 2011, 7:55 a.m.,*
in response to message #1 by MikeO

Hi Mike,

> Quote:
>
> 1. 480*800 display
> 2. Touch screen

My Archos 70 should then qualify, too. Not a phone but an Internet device, running Andiroid 2.2 (if I'm not mistaken).

Re: HP67 for the Android

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 16 May 2011, 7:57 a.m.,*
in response to message #1 by MikeO

I have a Motorola MB502, a.k.a. "Charm", with Android 2.2 (?) and a 320 x 240 touch screen. I run Free42 on it, although the screen looks not even near to the iPod Touch 4 (960 x 480), where I also run Free42 and/or 42S. I would ask for a low-res skin for phones like mine. I read that the MB502 is exclusively sold in the USA by T.Mobile.

Re: HP67 for the Android

*Message #9 Posted by **MikeO** on 16 May 2011, 5:25 p.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

That screen size would be a challenge more from a readability/usability standpoint. I'm game though ;)

Re: HP67 for the Android

*Message #10 Posted by **Pal G.** on 16 May 2011, 11:26 a.m.,*
in response to message #1 by MikeO

I am definitely interested.

Motorola Droid (1) 854x480 version 2.2.2 (FRG83G)

Thanks.

Re: HP67 for the Android

*Message #11 Posted by **Vincent Weber** on 16 May 2011, 11:51 a.m.,*
in response to message #10 by Pal G.

I'm definitely interested. I have an Archos 43 (odd but large 854*480 resolution, hope it won't be a problem).

When is the release coming ? anyway to betatest it ? :)

I would also be very interested in an Iphone version.

Is your simulator complete ? Any known problems / differences with the original ? does it do import/export through a virtual card reader ? Many thanks, best regards,

Vincent

Re: HP67 for the Android

*Message #12 Posted by **MikeO** on 16 May 2011, 5:35 p.m.,*
in response to message #11 by Vincent Weber

The simulators are pretty complete. You can check out the desktop version at my website (see website link in original post). If you haven't already played with those, you can get a pretty good idea of the fidelity.

The mobile version is a java port of my desktop versions for Android. I added some extra features in the desktop version - such as auto loading data and program cards - which I haven't yet ported in the mobile version.

Programs written in the desktop versions and mobile versions are interchangable between any version. Drop files on the phone connected in USB disk drive mode and from phone to computer to share.

Also, obvious things like program listings, internals trace windows, available on the desktop versions are not practical in the mobile version.

I'm planning on having it out there in the next couple days.

Edited: 16 May 2011, 5:38 p.m.

Re: HP67 for the Android

*Message #13 Posted by **Dimitri** on 17 May 2011, 3:52 a.m.,*
in response to message #12 by MikeO

HTC Desire Z 480x800.

I'm interested because I have a real HP67.

Thanks.

Re: HP67 for the Android

*Message #14 Posted by **MikeO** on 19 May 2011, 11:26 a.m.,*
in response to message #1 by MikeO

Wow, got some good ideas on the Android models that are out there.

I'll fold this into the mobile version as quickly as I can. Shooting for this weekend to work on getting a release out to the android Market.

-Mike

Re: HP67 for the Android

*Message #15 Posted by **Vincent Weber** on 19 May 2011, 11:40 a.m.,*
in response to message #14 by MikeO

Thanks Mike ! Can you tell us which resolution(s) will be supported ? Cheers, Vincent

Re: HP67 for the Android

*Message #16 Posted by **MikeO** on 20 May 2011, 10:24 a.m.,*
in response to message #15 by Vincent Weber

Vincent, I think I can add 480*835 support fairly easily.

(in addition to the 480*800 size).

Re: HP67 for the Android

*Message #17 Posted by **Vincent Weber** on 20 May 2011, 12:21 p.m.,*
in response to message #16 by MikeO

What about 854*480 ?

Re: HP67 for the Android

*Message #18 Posted by **Vincent Weber** on 24 May 2011, 10:05 a.m.,*
in response to message #17 by Vincent Weber

Hi Mike,

Can you give us the status of the emulator ? will it be released any time soon ? can't wait ! :)

Thanks and cheers,

Vincent

HP 10bII+ self test

*Message #1 Posted by **hpnut** on 15 May 2011, 6:36 a.m.*

Hi all,

I found this self test for the old HP 10bII.

http://www.educalc.net/1776086.page

it does not appear to work for the new HP 10bII+ - all i get is a "620_ " display.

Re: HP 10bII+ self test

*Message #2 Posted by **Tim Wessman** on 15 May 2011, 10:40 a.m.,*
in response to message #1 by hpnut

That factory test is no longer there. It is more a factory test like the 20/30b. You get a menu which you can select different types of tests/information using + or - to move up or down, and then INPUT enters the test.

Also, we no longer publish the factory test information in the manuals. There have been problems in the past of users doing things incorrectly in there and deciding the calculator is "broken" when in fact it is just fine. Thus the decision was made to not publish the information.

I guess the idea is that "if it isn't in the manual, nobody will know about it. . ." ;-)

TW

Edited: 15 May 2011, 9:00 p.m. after one or more responses were posted

Re: HP 10bII+ self test

*Message #3 Posted by **Katie Wasserman** on 15 May 2011, 12:26 p.m.,*
in response to message #2 by Tim Wessman

Indeed, your comment will achieve exactly the opposite effect!

Outside of those who already know how to do this from "inside information", who's going to be the first one here to figure it out?

-Katie

Re: HP 10bII+ self test

*Message #4 Posted by **Jim Yohe** on 15 May 2011, 6:33 p.m.,*
in response to message #3 by Katie Wasserman

It would save us time if one of you would just tell us but ... I guess it wouldn't be a challenge then. :-)

Re: HP 10bII+ self test

*Message #5 Posted by **Tim Wessman** on 15 May 2011, 9:00 p.m.,*
in response to message #4 by Jim Yohe

It isn't a secret or anything. Just press ON-PMT (from memory - might be remembering wrong) and then you are in a menu. From there, it is pretty easy to figure out - especially if you've seen the 20/30b menu before.

There is one easter egg in the calculator, and it is in the test system menu. :-)

TW

Ah, well that is correct then. I made that about a year ago so its been a while. :-)

TW

Re: HP 10bII+ self test

*Message #12 Posted by **Mark Storkamp** on 16 May 2011, 9:28 a.m.,*
in response to message #5 by Tim Wessman

On my 20b the battery test gives a 2.7. Is that good or bad? I've never had a low battery warning, but most times when I turn the calculator on it's completely reset.

Re: HP 10bII+ self test

*Message #13 Posted by **Jim Yohe** on 16 May 2011, 11:31 a.m.,*
in response to message #12 by Mark Storkamp

I'd say try to notice when the low battery warning comes on then check what the voltage says at that time so you'll know where HP set the lower threshold.

Re: HP 10bII+ self test

*Message #14 Posted by **Marcus von Cube, Germany** on 16 May 2011, 11:43 a.m.,*
in response to message #13 by Jim Yohe

FWIW, in wp23s I've set the threshold to 2.4V. If I understand the HP 20b SDK sources correctly, HP sets the low battery annunciator below 2.4V and shuts down the calculator below 2.1V.

Re: HP 10bII+ self test

*Message #15 Posted by **Katie Wasserman** on 16 May 2011, 12:34 p.m.,*
in response to message #14 by Marcus von Cube, Germany

I'd set the low voltage threshold somewhat higher then 2.4 volts to give the user more warning time, especially if the firmware doesn't check the shutdown voltage pretty much constantly.

The 20b/30 draws a lot of current when running a program (assuming a reasonable

clock speed) and becasue of this the internal resistance on the CR2032 cells gets up to a very high value near their end of life. When this happens the voltage drops precipitously when running a program. A measured 2.4 volts when idle might be well under 2.0 volts as soon as a program starts

IMHO, two CR2032 cells in parallel is an extremely poor choice for a power source on a programmable calculator that runs at high speed. While the 10bii+ and 20b were never intended to be programmable the 12C+ (certainly) and 30b (probably, Cyrille has pointed out here that it was supposed to just have keystroke macros) were.

Re: HP 10bII+ self test

*Message #16 Posted by **Mark Storkamp** on 16 May 2011, 12:55 p.m.,*
in response to message #15 by Katie Wasserman

Thanks for the responses. Between the constant resets and the keyboard problems I think it's time to use it for target practice. Maybe I'll put up a YouTube video of the results.

Re: HP 10bII+ self test

*Message #17 Posted by **hpnut** on 17 May 2011, 3:45 a.m.,*
in response to message #16 by Mark Storkamp

Here's my HP 10bII+ (serial no. CNA 04201622) self test results:

1 Screen -lights up all segments, icons, display

2 Keyboard - at the end of the test, yields "Good"

3 Checksum - yields 244.244 (anyone got a different value?)

4 battery - 3.500

5 version - 7-13-2010 (any different version?)

6 copyright - HP 2010 then 1,752

7 test sys - pressing = turns test sys off ?

8 Slow clk (clock?) SC -28,500.00 - what does this mean?

where's and what's the Easter Egg then, huh? :-)

actually, I am beginning to fall in love with this little algebraic HP ;-)

Re: HP 10bII+ self test

*Message #18 Posted by **Marcus von Cube, Germany** on 17 May 2011, 4:06 a.m.,*
in response to message #17 by hpnut

> Quote:
>
> 8 Slow clk (clock?) SC -28,500.00 - what does this mean?

I have an idea. The chip is equipped with two independent oscillators with frequencies of 32.768 KHz and 2 MHz respectively. Since none of them is quartz controlled the precision of the oscillators is questionable at best. In the 20b/30b a quartz can be added to the 32KHz oscillator but in the 10bii+ there are no pads on the board.

The "slow clock" is the 32KHz oscillator, driving the RTC, the LCD, the watchdog timer, and the PLL for the higher operating speeds (up to around 40 MHz). The 2MHz oscillator is an alternate clock source for the CPU. Since the two are independent, they can be compared. There is a special register in the chip counting the clock pulses of the 2MHz oscillator with respect to 16 pulses of the slow clock. The interpretation of this value depends very much on the confidence in the precision of the two oscillators. I assume that HP believes the 2MHz clock to be more precise than the slow clock and tries to guess the actual slow clock speed from there.

Re: HP 10bII+ self test

*Message #19 Posted by **Tim Wessman** on 17 May 2011, 10:57 a.m.,*
in response to message #18 by Marcus von Cube, Germany

I believe this has been talked about before when looking at the 20/30b menu.

Basically, it allows some adjustment of the clock speed if the serial communications are behaving unreliably. This was needed on a few early models that has some issues and needed some "fine tuning" to get talking properly.

I don't think it has been needed/used in quite a while.

You can give it a new value by giving it a number and pressing INPUT (I think you must load the value into the INPUT register before going into the menu unless I am remembering incorrectly).

TW

Re: HP 10bII+ self test

*Message #20 Posted by **Marcus von Cube, Germany** on 17 May 2011, 11:04 a.m.,*
in response to message #19 by Tim Wessman

So the value seen here is not a measured but a "believed to be correct" value settable by a user. Are you using the DBGU pins in production machines?

Re: HP 10bII+ self test

*Message #21 Posted by **Tim Wessman** on 17 May 2011, 11:01 a.m.,*
in response to message #17 by hpnut

3 - No other checksum. Basically the numbers before and after should

match (on is the calculated number, the other is the number put in the flash to compare against). We've never seen a non-match. . .

5 - Only version. Hopefully forever since that means there have not been any bugs reported! :-)

I am pretty sure I mentioned it at HHC last year, but maybe not. If nobody gets it by then I will consider mentioning it again. ;-)

Glad to hear you like it! I think its a fine unit, but of course I am biased. I did essentially the whole thing (taking 20/30b code as a base), so this qualifies as my first calc.

TW

Re: HP 10bII+ self test

*Message #22 Posted by **Katie Wasserman** on 17 May 2011, 12:14 p.m.,*
in response to message #21 by Tim Wessman

While I'm sure that this is not the easter egg....

When starting the LCD test, if the first key you press is [=] then when the test ends it will keep looping by itself after the 11th key-press. If the first key you press is not [=] the test will terminate. Also, there appears to be a tiny bug in this test... if you end the auto-loop (by pressing any key) when the up and down shift arrows are displayed they will remain on the screen when the test ends.

I'm wondering if this behavior is indicative that the easter egg is in the LCD test routine since the code is clearly paying attention to what keys are pressed and when.

Re: HP 10bII+ self test

*Message #23 Posted by **Tim Wessman** on 17 May 2011, 12:51 p.m.,*
in response to message #22 by Katie Wasserman

Nah, not a bug (re:indicators). Just a "I didn't bother to fix it when I found it" as it doesn't really cause any problems and isn't meant to be used outside the factory.

TW

Re: HP 10bII+ self test

*Message #24 Posted by **Katie Wasserman** on 17 May 2011, 1:49 p.m.,*
in response to message #23 by Tim Wessman

Hi hpnut. How do you like the keyboard? Can you descibe it?

Thanks,

John

Re: HP 10bII+ self test

*Message #30 Posted by **hpnut** on 18 May 2011, 8:20 a.m.,*
in response to message #29 by John B. Smitherman

I am OK with the keyboard. It does not have the mushy feeling of the HP 20b. It does not feel like the HP 12C keyboard which IMHO is better.

i have many HP models in my collection and most of them feel quite different to press.

Re: HP 10bII+ self test

*Message #31 Posted by **Tim Wessman** on 18 May 2011, 9:33 a.m.,*
in response to message #29 by John B. Smitherman

The keyboard has two mylar sheets on top of the circuit board. Each sheet has its own dome. When you press the key, it does not have to 'bridge' a connection on the circuit board or anything like that to make an electrical connection, but just make a single point of connection between the two sides. This is mechanically more resistant to small alignment issues and the like.

While it does have more moving parts, it seems to be more resistant to missed key presses and things. The 10bII was produced by two different sources the past few years, and this design proved to be very reliable.

The 12c, 35s, 17bII+, 30b, and graphing calcs all use a metal dome underneath the keys. The feel on them will be more crisp then the mylar as the metal has more snap to it, but the keyboard on the 10bII+ is definitely not bad in any sense of the word.

Tim,

yesterday, I just got the original HP 10B (made in Singapore, circa 1992 from the serial number).

the keypad is excellent, I would rate it even better than the new HP 10bII+.

I guess HP should "reverse engineer" and look back at the old production materials and methods :-)

cheers,

hpnut in Malaysia

(HP calculator user since acquiring HP 10C in 1980 in the United Kingdom as a student)

Re: Coin Cells and Battery draw

*Message #33 Posted by **Marcus von Cube, Germany** on 16 May 2011, 1:41 p.m.,*
in response to message #15 by Katie Wasserman

Katie, that's a lot of insight. In wp34s, I reduce the maximum speed to 10 MHz when the voltage drops to 2.4V. I hope that helps. Power measurement is continuous while the system is doing work. I hope that helps, too. I tried to write the flash at 2.4V which worked but the power source was a lab supply. I don't know what happens when aging batteries are used instead.

HP-41 Advanced Matrix Pac

*Message #1 Posted by **Ángel Martin** on 15 May 2011, 2:33 a.m.*

Greetings from the archaelogy SW dept.- This time the focus goes to a tweaked HP-41 Advantage Pac, surely one of the better modules produced - yet if you're like me I'm sure you'd like to customize it a bit or two... Read on if you're interested.

No doubt being bank-switched gives this module a great, er.. advantage. If you haven't thought about this before, it's because of the very long code required to implement SOLVE and INTEG that the bank-switching was probably used: both functions together use almost 3k of the upper page (bank_1), whilst only thre/four FAT entries are required.

The second bank contains the code for matrix functions, and some for the Binary conversions as well. The matrix set is an extension of the CCD's "Array Fns" group - a marvel on itself that got enhanced by HP, topping it up with major matrix operations (Inverse, Determinant,Simultaneous Equations, etc. - as well as some FOCAL programs for easy usage of the main subjects.

If the CCD set the basis for a Matrix-capable Coconut OS-extension, certainly HP rounded it off very nicely. Matrix programs changed from being a convoluted maze or data registers utilization to just a discerning usage of the Alpha register as data entry, relying on XMEM files for the data storage. Simply a brilliant design and a superb execution.

BTW I always wondered about that particular deal: the CCD code is copied almost entirely bit-by-bit, save the bank-switching tricks of course. That speaks tons about the quality of the CCD implementation!

So what about the rest of the Pac? Well, certainly great but a few things could be improved. For starters, the Complex program is a nice beginners pac, nowadays dwarfed by the 41Z. The other FOCAL programs are beautiful, and the menu-driven style is convenient and elegant to say the least. A wide-ranging scope that provided a complete set of frequent topics, all in an 8k-footprint module.

Move on to the present, with emulators, Clonix, and MLDL. Rom images abound and are not an issue as long as they're self-contained and don't have dependencies on other modules. So what about extending the Matrix capabilities of the Advantange Pac, replacing the non-Matrix content with additional Matrix programs? Welcome to the "Advanced Matrix Pac", featuring:

- All the -ADV MATRX functions from the advantage Pac
- All the Matrix Functions & Programs from the ALGEBRA module
- A New Matrix Input mode, for fast data entry using Alpha.
- All Binary Conversion Functions, and last but not least...
- Also keeping SOLVE & INTEG, a monumental tour-de-force in Buffer manipulation and MCODE feats by itself.

This is a lengthy post so we'd better stop here. More details will follow, and for those interested in taking it for a spin, the image will be posted at TOS shortly.

Cheers, 'AM

*Message #5 Posted by **Frido Bohn** on 15 May 2011, 7:56 a.m.,*
in response to message #1 by Ángel Martin

Ángel, it is a great idea to strip off the best of the ADV pack to get a versatile ROM.
However, I imagine that the restructured code will fit into one bank.
In the last time, Diego Diaz provided an update of his burning program to overcome the afflictions due to the bank switching stuff.
Although Diego's solution led to the use of the ADV pack some of the flexibility on his modules was lost.

Re: HP-41 Advanced Matrix Pac

*Message #6 Posted by **Ángel Martin** on 15 May 2011, 8:42 a.m.,*
in response to message #5 by Frido Bohn

Hi Frido,

> Quote:
>
> I imagine that the restructured code will fit into one bank.

Actually not. First off, only SOLVE and INTEG occupy 3/4ths. of a 4k-page. Secondly, the matrix functions are a very large and comprehensive set, all written in MCODE - which despite its better perfromance and speed advantage takes up more room than FOCAL for sure. Third, the idea is not to shrink it to the minimum expression possible but to leverage on the bank-switched approach. Nothing can beat that, and I'm pretty sure there are work-arounds for Clonix/NoVoRAM's. I'm certain of it.

Cheers, 'AM

Re: HP-41 Advanced Matrix Pac

*Message #7 Posted by **Angel Martin** on 17 May 2011, 2:33 a.m.,*
in response to message #5 by Frido Bohn

Two updates:

1. Module image posted at TOS
2. Successful burning to Clonix. Simply rename the ROM files with the Advantage ROM names (make a backup copy first) and use the standard version of ClonixConfig.exe with the "Advantage" option enabled.

Cheers, 'AM

Re: HP-41 Advanced Matrix Pac

*Message #8 Posted by **Monte Dalrymple** on 17 May 2011, 12:19 p.m.,*
in response to message #7 by Angel Martin

The .MOD file on TOS does not include a name for the third page.
This doesn't matter if you're loading the .MOD file directly
but it makes it difficult to translate to a different format.

Monte

HP-41CVs will not turn on

*Message #1 Posted by **aj04062** on 14 May 2011, 10:42 p.m.*

So I have rebuilt and cleaned two Fullnut CVs in recent days.

Both are exhibiting behavior that is documented on the Museum, but I thought I'd ask again as I cannot seem to find the solution in the posts.

Steve's Post

One calc behaves as such:

Once on, will turn off normally with on button. No matter how many times I press on by itself, the display will not come on. However, if after turning off, I press on ONCE and then press BACKSPACE, ENTER, ON the calculator will ALWAYS come on. If I try that sequence after turning off, it will not turn on. If I do that sequence twice, it will turn on.

I cannot get the calculator to reset via BACKSPACE, ON

Once the calculator is on, it seems to work fine.

HELP!?

Re: HP-41CVs will not turn on

*Message #2 Posted by **Frido Bohn** on 15 May 2011, 7:42 a.m.,*
in response to message #1 by aj04062

Lastly, I had similar problems with a halfnut HP41CX.
Eventually, all problems were resolved with a reset. A simple achievement of MEMORY LOST in the display did not help. Try this link.

Re: HP-41CVs will not turn on

*Message #3 Posted by **Randy** on 15 May 2011, 1:30 p.m.,*
in response to message #1 by aj04062

Short the 470 uf cap on the processor to reset the unit to all defaults. If the problem persists, my guess would be a bad rom or D/S IC. Swap processor board to verify. If it is a bad board, it would be almost impossible to troubleshoot without a service rom.

> This HP Leather Pouch comes with the magnetic Flap to keep it shut.

How sensitive would a HP12C be to magnetic fields?
Any experiences with this?
However, for only 999 bucks its a real bargain, isn't it?
Let's await further devaluation of the currency and in about 5 years its nothing. :-))

Re: ebay 380123273833 wtf ?

*Message #7 Posted by **Don Shepherd** on 15 May 2011, 9:53 a.m.,*
in response to message #6 by Frido Bohn

> Quote:
>
> How sensitive would a HP12C be to magnetic fields?

The case is fine for the 12c, it doesn't affect program memory. It DOES affect HP-65 magnetic program cards however, if they get too close.

HP-67 Error message

*Message #1 Posted by **aj04062** on 14 May 2011, 2:27 p.m.*

Hi ya all,

Seeing there is some activity regarding 67's, who can tell me what is ailing this unit? Is the processor fried? I picked this up from Goverment Auction (los alomos lab source)

Note: I have the back off and am pressing down to make contact. It is behaving the same way before I took it apart.

Please see the video below.

Video

Pressing keys will halt the cylcling. It will everntually stop and seems to repeat the same code.

Re: HP-67 Error message

*Message #2 Posted by **BobVA** on 15 May 2011, 8:51 a.m.,*
in response to message #1 by aj04062

"Could be a lot of things..." How's that for helpful? :-)

First, don't try reading any more cards until you take a look at the friction roller for the reader - it's probably turned to goo unless somebody has replaced it. (Although I'm somewhat surprised it actually pulled the card through on yours...)

The problem could be as simple as a bad battery - have you checked the voltage? Tried running it from a bench supply?

The next lucky break would be a bad/dirty connection between one of the three internal boards, a dirty power or run switch, etc. That will require disassembly. If you want to try that, check out the guides here. Disassembly requires some experience working on electronics and small mechanical gizmos. The guides provide enough information/photos to let you decide if you're comfortable with trying it.

If you don't want to try a repair, I'm sure you can sell it easily here or on the 'bay as a parts unit.

Regards, Bob

Re: HP-67 Error message HP-65 common parts?

*Message #3 Posted by **aj04062** on 15 May 2011, 9:25 a.m.,*
in response to message #2 by BobVA

This wheel actually looks very good. I am amazed.

I've tried a new battery (worked on other 67 I have). I don't have a bench supply so that experiment is out. I will check voltage and make sure it is fully charged.

I'll try some deoxit on the contacts. I cleaned the switches with iso-alch already.

does anyone know what boards are interchangeable between the 67 & 65? I have a 65 with a card reader board that has been ravaged by a leaky battery. Can these be swapped?

Re: HP-67 Error message HP-65 common parts?

*Message #4 Posted by **Randy** on 15 May 2011, 1:32 p.m.,*
in response to message #3 by aj04062

HP-65 Internals

HP67 Internals

The only thing the two boards have in common is the same 28 pin connection area :-(

Hard to tell what is wrong but based on the most common 67/97 failures, I'd suspect a faulty rom.

Cell leakage in my 48S

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 14 May 2011, 11:41 a.m.*

I left the cells in my 48S longer than I should have. One of the cells leaked. The leakage got into the foam that provides the spring for the cell contacts. The leakage dissolved (if that is the correct word) the adhesive that attached the cell contacts to the foam. I have cleaned the compartment and have demonstrated that the calculator still works by simply holding the contact against the foam while inserting the cells.

I think that some of the leakage is still in the foam. How can I remove the leakage safely? What adhesive should I use to attach the contact to the foam? If I replace the foam where do I find foam that does not deteriorate in a few years?

Separate subject: If you wonder why H-P doesn't always implement your latest good idea I suggest that you read the article "Creation Myth" in the May 16 issue of *The New Yorker*.

Re: Cell leakage in my 48S

*Message #2 Posted by **geoff quickfall** on 14 May 2011, 3:23 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I find the old thick mouse pads have the correct width. So:

```
1  remove the old foam and glue.
2  Slice out a new chunk of foam using the original as a template.
3  attach foam to metal tab to foam with double sided tape
4  attach foam to calc with same.
```

Cheers, Geoff

p.s. replace batteries every 5 years ;-) (just kidding)

Edited: 14 May 2011, 3:23 p.m.

Re: Cell leakage in my 48S

*Message #3 Posted by **Katie Wasserman** on 14 May 2011, 4:11 p.m.,*
in response to message #2 by geoff quickfall

Almost any high-density foam work in this calculator and likely last many years. I've had some small peices of Dow Ethafoam that have lasted for 40+ years with no obvious breakdown. It's not hard to find, but is relatively expensive. Here's some.

To avoid the battery leaking issue, I would suggest using Energizer lithium cells. I've never seen one leak and I've had hundreds of them in my calculators (and just about everything else the needs AA or AAA cells) for many years.

HP-67 - polarity of wires to keyboard/display board?

*Message #1 Posted by **BobVA** on 13 May 2011, 8:25 p.m.*

Hi: I was disassembling an HP-67 and the two power wires that go to the keyboard/display board popped out of their sockets before I had noted which goes where. Based on how the wires are arranged it looks like the black wire goes to the upper connector (board oriented with the display at the top) and the red goes to the one below it?

I couldn't find a photo that was clear enough to be sure, so if anyone knows or can point me to a reference, I'd be grateful.

Thanks! Bob

Re: HP-67 - polarity of wires to keyboard/display board?

*Message #2 Posted by **geoff quickfall** on 13 May 2011, 9:39 p.m.,*
in response to message #1 by BobVA

HALT!!!

Here is a quote from Steve Loboyko's excellent post:

67 posting

> Quote:
>
> Remove the very thick keyboard pad from the middle plastic of the sandwitch. There are two Augat sockets that connect two wires to this board. They are NOT soldered. NOTE THE COLORS OF THESE WIRES AND WHERE THEY WENT BEFORE REMOVING. A MISTAKE HERE COULD BE ABSOLUTELY FATAL TO THE CALCULATOR WHEN REASSEMBLED AND POWERED. I would rather not give you the colors or positions here because this could vary during the production run, but on my 3 67's, the black striped wire was at the top, and the red striped wire was beneath.

I personally have had all wiring described as above, but substitute striped for solid colours.

Maybe Randy can be more specific on this however Steve is correct. There are many differing production runs and production sites.

Cheers, Geoff.

Re: HP-67 - polarity of wires to keyboard/display board?

*Message #3 Posted by **BobVA** on 13 May 2011, 9:42 p.m.,*
in response to message #2 by geoff quickfall

Thanks Geoff! I'll see if I can confirm that arrangement by doing a little circuit tracing to a known Vcc or

ground somewhere.

Regards, Bob

Re: HP-67 - polarity of wires to keyboard/display board?

*Message #4 Posted by **Michael de Estrada** on 13 May 2011, 10:36 p.m.,*
in response to message #1 by BobVA

Hi Bob,

I have a schematic that I prepared when I worked on the card reader in my HP-67, and it shows a black negative wire connected to the top right side of the main keyboard pcb and a red positive wire connected directly beneath it. These wires go to the center negative pin on the ac adapter receptacle and the 5vdc positive pin respectively.

Michael

Re: HP-67 - polarity of wires to keyboard/display board?

*Message #5 Posted by **BobVA** on 13 May 2011, 11:22 p.m.,*
in response to message #4 by Michael de Estrada

Mine turned out to be the same arrangement. Thanks very much Geoff & Michael.

And I got the card reader to work again! Guess I'll be building a battery pack tomorrow.

Regards, Bob

Edited: 14 May 2011, 1:37 a.m.

Re: HP-67 - polarity of wires to keyboard/display board?

*Message #6 Posted by **Geoff Quickfall** on 14 May 2011, 12:55 a.m.,*
in response to message #4 by Michael de Estrada

Production runs change. The caution is 'what applies to one calc may not apply to another.'

Anecdotalely, but with no direct evidence, I have been informed that the wire positions have been moved during differing production runs.

I have three different coloured wires for power supply in my 65's and 67's from vertical striped to solid. I have yet to see changes in the positioning but have seen that in other boards from other calcs that have undergone revision during production.

That is why I say, don't assume they are all identical.

Cheers, Geoff

Re: HP-67 - polarity of wires to keyboard/display board?

*Message #7 Posted by **Randy** on 14 May 2011, 8:45 a.m.,*
in response to message #6 by Geoff Quickfall

It's simple to determine polarity on any classic, any version. The positive terminal always terminates on the left side pad of the power switch.

Also, you can sanity check yourself using Tony Duell's excellent crib sheets on all the classics in the archives. HP-67 Internals

hp 41 synthetic programming

*Message #1 Posted by **Sok-khieng Chum Hun** on 13 May 2011, 6:33 p.m.*

Hi,

I tried to figure out how to do this instruction : STO IND O but I did not find how :(

(it is the instruction 28 from the main program from this --> http://www.hpmuseum.org/software/41/41crmat.htm)

Someone can help me out?

Thank you :)

Re: hp 41 synthetic programming

*Message #2 Posted by **Geoff Quickfall** on 13 May 2011, 7:15 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

Have you created the program Load Bytes, or the byte jump key assignment?

All synthetic lines must be created manually by manipulating memory through tricks or automated programs such as LB (loadbytes).

I just state the above and ask if you have a knowledge base for sythetic programming?

Otherwise, it would be a long and drawn out process if LB or any other form of sythetic byte production is not immediately available.

Cheers, Geoff

Re: hp 41 synthetic programming

*Message #3 Posted by **Thomas Klemm** on 14 May 2011, 7:14 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

cf. HP-41C Synthetic Programming

As stated in the description of the program you can avoid synthetic programming:

> Quote:
>
> **N.B:** Synthetic registers M N O can be replaced by R01 R02 R03 but, in this case, delete line 31, replace line 02 with 0 STO 01 RDN in the following listing and choose bb > 03.

I recommend to give it a try, though.

> Quote:

> how to do this instruction : STO IND O

Only now I've realized that you might already have succeeded to enter STO O and you just have a problem with this specific command. Enter the following program and execute GTO . . (PACKING):

```
ENTER
STO IND 17
"1234567"
```

Now you go to the ENTER line and execute the byte-grabber, which will leave the sequence:

```
91: STO
F7: IND O
31: STO 01
32: STO 02
33: STO 03
34: STO 04
35: STO 05
36: STO 06
37: STO 07
```

in response to message #3 by Thomas Klemm

> Quote:
>
> cf. HP-41C Synthetic Programming

The byte code table linked there at http://www.hpmuseum.org/prog/synth.gif appears to be the one Synthetix put out in 1982 as a quick-reference card (same fonts, arrangement of what's in each little box, etc.), except that Synthetix' had color coding of boxes for instruction length, and the structure of multi-byte instructions on the right. I wonder if that's posted somewhere. I got my start in synthetic programming in the book "Extend your HP-41" using the byte grabber, but later got the ZENROM which lets you key the synthetic instructions directly in, so for example to get STO IND O you just press STO <shift> . O

Re: hp 41 synthetic programming

*Message #5 Posted by **geoff quickfall** on 14 May 2011, 5:17 p.m.,*
in response to message #4 by Garth Wilson

Same book, green cover. Read it back to front and again and again.

Created the byte jumper and then Load Bytes and then carded the LB. Never looked back. All my HP41CX programs contain sythetics.

Cheers, Geoff

sure got used to seeing "MEMORY LOST" !!!!!!

Re: hp 41 synthetic programming

*Message #6 Posted by **M. Joury** on 16 May 2011, 12:45 p.m.,*
in response to message #5 by geoff quickfall

Or get hold of a Zenrom or one of the other ROMS that support synthetics... I believe that the PPC ROM has some support? I have to say that I love my Zenrom, makes things just a whole lot easier.

Re: hp 41 synthetic programming

*Message #7 Posted by **geoff quickfall** on 16 May 2011, 2:50 p.m.,*
in response to message #6 by M. Joury

PPC rom has the load bytes as well as a few other synthetic programs.

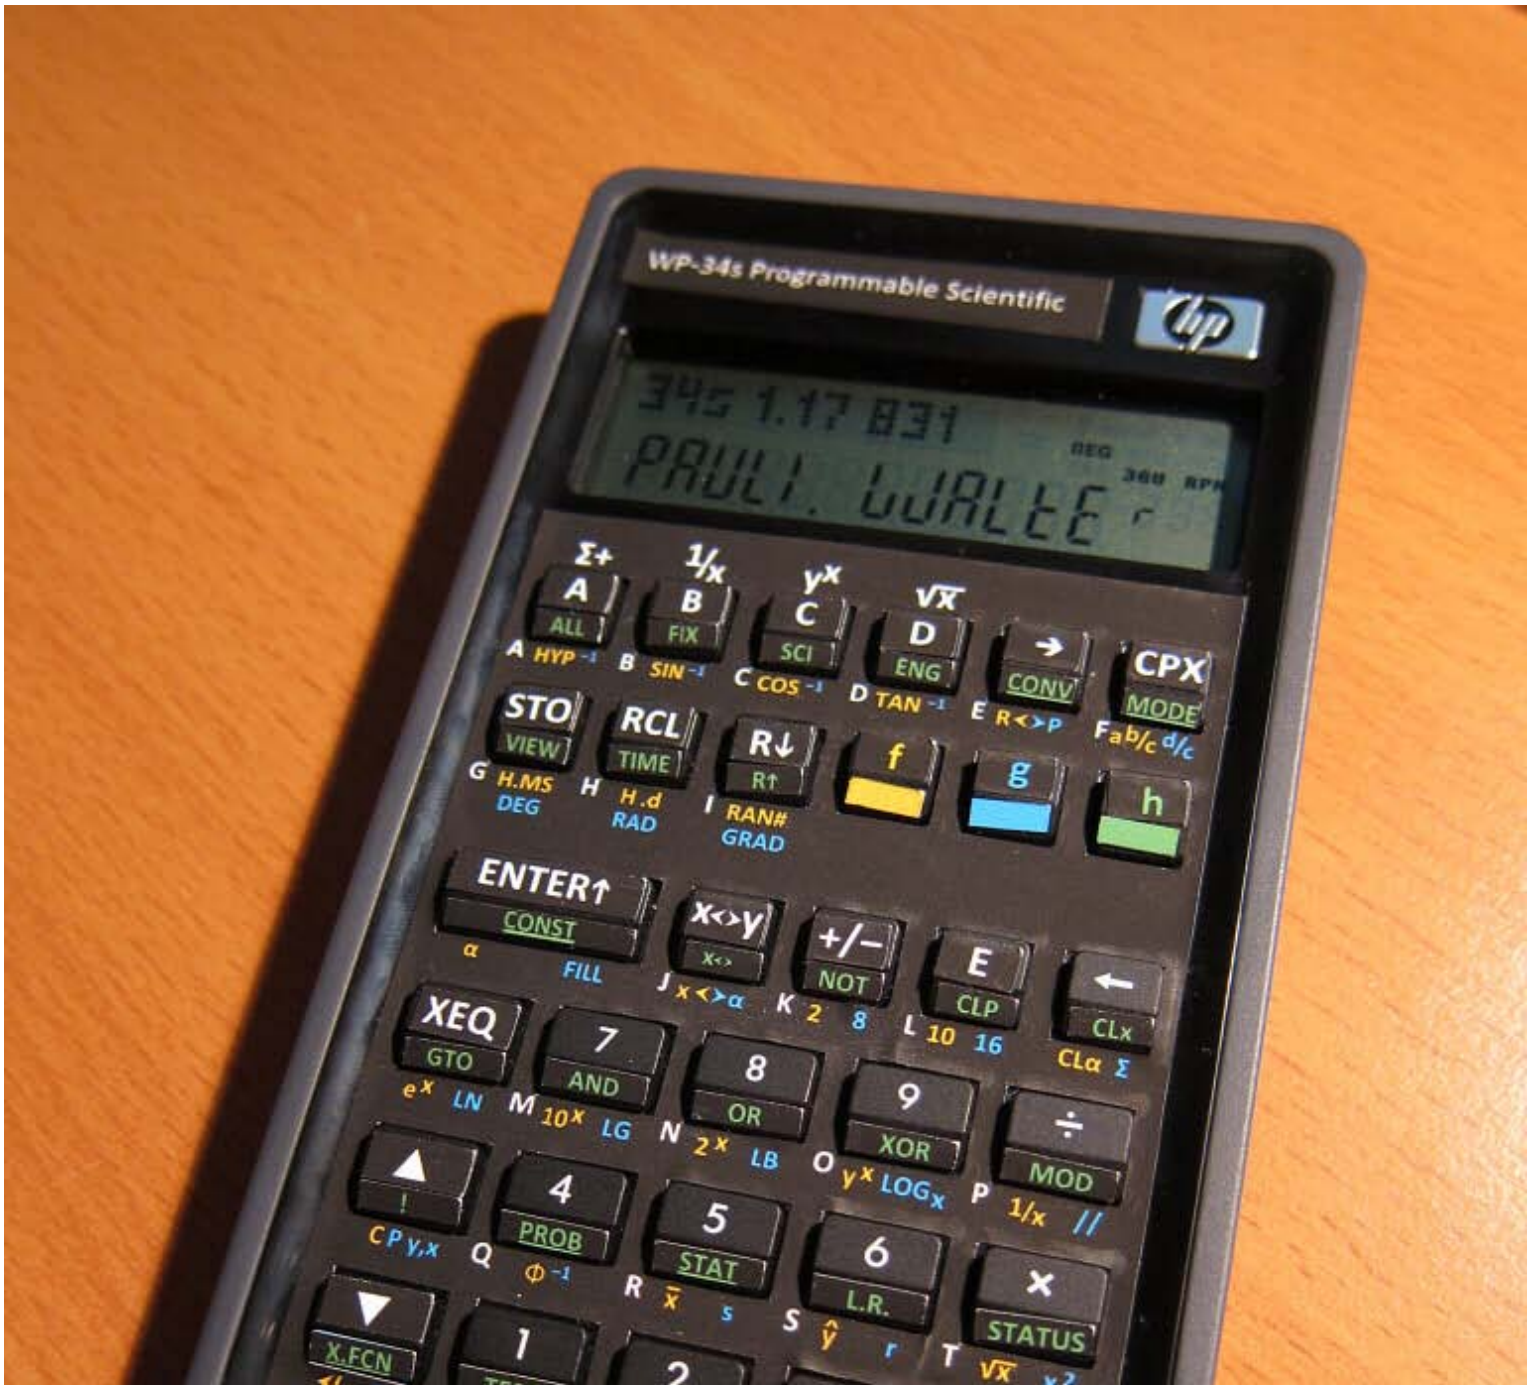
34s Vinyl Overlay First Attempt

*Message #1 Posted by **Eric Rechlin** on 13 May 2011, 2:53 a.m.*

Hi everyone,

I just made my very first overlay on vinyl. I still have a few things I need to tweak, but considering I'd never done anything like this before, I'm surprised at how well it turned out:



The image I drew to make the overlay can be downloaded from here.

Maybe next week I'll have something even better.

Eric

Re: 34s Vinyl Overlay First Attempt (edited)

*Message #2 Posted by **Marcus von Cube, Germany** on 13 May 2011, 3:07 a.m.,*
in response to message #1 by Eric Rechlin

I want one!

Walter has redesigned some of the key legends. Refer to the latest emulator build (medium skin) for details.

For a 30b, a full size overlay with cutout for the display would make sense.

BTW, I disagree a little with Walter about the importance of the alpha labels. Many of them are used in addressing which justifies a somewhat brighter color than he suggests.

Edited: 13 May 2011, 3:12 a.m.

Re: 34s Vinyl Overlay First Attempt (alternative)

*Message #3 Posted by **Walter B** on 13 May 2011, 12:35 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Just for clarification: I don't vote for unconditionally keeping the dark red I proposed for the skins, but you may suggest another color you find appropriate. White, however, if used with the same font as gold and blue is far too light IMHO for such a "backstage" functionality. A light grey may be an alternative on such a black background if you don't want to introduce another color.

Walter

Re: 34s Vinyl Overlay First Attempt (edited)

in response to message #2 by Marcus von Cube, Germany

I would favor the full-size overlay with display cutting and avoiding the wordy "Scientific Calculator" legend. I wonder why, in the last years, HP included such large and self-evident legends as "Scientific Calculator", "Financial Calculator", "Business Professional" or similar ones.

in response to message #1 by Eric Rechlin

Eric,

Impressive! What printer did you use?

Some small remarks:

- Capital Pi is bigger than capital Sigmas are.
- Green comma is too faint IMHO.
- I'd appreciate a better font for the blue 'g' on the prefix key.
- Alpha characters are far less important than the mathematical functions. So their color shall reflect this IMHO.

Did you test it with the key labels uncut before - i.e. with flaps? Would be interesting ...

Walter

*Message #6 Posted by **Geir Isene** on 13 May 2011, 8:04 a.m.,*
in response to message #5 by Walter B

Anybody thinking about selling the final product - with ready ROM, keyboard overlay and all?

Because some of us may be squeezed on time and still want this calc asap.

HP OfficeJet 8000. It's a surprisingly good printer.

> Quote:
>
> Capital Pi is bigger than capital Sigmas are.

Fixed, thanks. I already had made the Sigma a bigger font size, but it wasn't enough, so I made it even bigger now.

> Quote:
>
> Green comma is too faint IMHO.

Fixed.

> Quote:
>
> I'd appreciate a better font for the blue 'g' on the prefix key.

I'll think about this. I actually like the font that it is now, and it's consistent with the font on the rest of the keys. However, I will do some font tweaking so I may end up changing it after all.

> Quote:
>
> Alpha characters are far less important than the mathematical functions. So their color shall reflect this IMHO.

I think I will keep them white, but maybe I will make them a little smaller. With them red, it turns the calculator into too much of a rainbow, with too many colors, and the red is harder to see, too. But I might do one test with red to see how it looks. I'd be interested in hearing others' thoughts on this.

> Quote:
>
> Did you test it with the key labels uncut before - i.e. with flaps? Would be interesting ...

No, but I will next test it with the key labels as a single piece instead of two, and we'll see how that works first.

Thanks for your input.

Eric

in response to message #7 by Eric Rechlin

Re: flaps. While making the keyboard face harder to clean, this would give one less place for dust to enter the keys. A good trade-off if it works.

Re: 34s Vinyl Overlay First Attempt

*Message #9 Posted by **BobVA** on 13 May 2011, 10:01 a.m.,*
in response to message #1 by Eric Rechlin

Nice! I'm certainly interested in a couple if you decide to sell them.

I agree with Marcus's idea about a full-panel version for the 30b.

For keys that have both a top and face label, would it practical to do that as a single piece? Or does the bend cause some complications?

Regards,

Bob

I have already decided to do that for my second revision. The vinyl bends fairly easily, and I think it would look a lot cleaner. Plus, I think it would be easier to install (it took me closer to half an hour to get this one done).

Eric

OT: hpcalc

> Eric, what has happened to your HPCalc.org site? Why no updates for half a year?

I'll update it before too long. Definitely in the next month or two.

There haven't been all that many things submitted to it in the last 6 months, so you aren't missing much, and more importantly, the vast majority of submissions do not follow my very simple directions on the submission page. That frustrates me, because it means a lot more work for me, and it shows that the submitters don't even care to follow directions.

Eric

HP 10bii+ "soft" reset

*Message #1 Posted by **Jim Yohe** on 13 May 2011, 1:34 a.m.*

When I try to do a full clear memory and reset of calculator modes using the steps outlined on page 38 of the User Guide (*hold down* **ON** *and press both* **N** *and* **PV** *buttons, then release*) it doesn't come back with the **All Clear** message. What might I be missing or is this a bug?

Re: HP 10bii+ "soft" reset

*Message #2 Posted by **Marcus von Cube, Germany** on 13 May 2011, 2:10 a.m.,*
in response to message #1 by Jim Yohe

Have you tried turning the calc off, pressing and holding N+PV and then turning it on with the ON key? Maybe the sequence is only checked at power on.

Re: HP 10bii+ "soft" reset

*Message #3 Posted by **Jim Yohe** on 13 May 2011, 2:12 a.m.,*
in response to message #2 by Marcus von Cube, Germany

No but I just discovered that page 38 should have referenced the **FV** key and not the **PV** key. It's properly listed on page 164 under "Erasing the calculator's memory".

Re: HP 10bii+ "soft" reset

*Message #4 Posted by **Tim Wessman** on 13 May 2011, 2:32 a.m.,*
in response to message #3 by Jim Yohe

Oops. :-(

Internally though, just doing the C ALL does the same thing.

HP9810A

*Message #1 Posted by **aj04062** on 12 May 2011, 8:14 p.m.*

I think I'm getting carried away with this collecting stuff.

Had a friend of mine just pick up a 9810A. Hopefully it will arrive safely via UPS next week. Owner claimed one of the fuses is blown.

Hopefully that's it and can get placed into service again. I wonder what the folks in the office will think if this lands on my desk? They already think the 97 has neon tubes for a display.

Re: HP9810A

*Message #2 Posted by **Tony Duell** on 13 May 2011, 4:49 a.m.,*
in response to message #1 by aj04062

Unfortunately fuses don't blow for no good reason...

There are 2 fuses on the back of the 9810. One is 6A, and is in series with the mains input to everything, including the mains output sockets. The other is 1A (220/240V mains) or 2A (100/120V mains) and is in series with the feed to the mains transformer/fan only.

I hope you get the old fuse, you can tell a bit by examining it. If it's blown softly, then just replace it and try again. If it's shattered or blackened, you have more serious fault.

If the 6A fuse is blown, it's probable that either some device plugged into the output socket was resposible, or there's a fault in the mains input/switch circuitry. If the other fuse has blown, the fault could be in the power supply section of the machine or the mains transformer.

What I would do is remove the top cover, the keyboard, all the logic PCBs (you're working on the PSU, you don't want to damage anything if you make a mistake), the memory box, the printer, the PSU cover and the 3 boards under it. All that should remain in the machine is the rear panel (mains circuitry), the backplane, and the card reader mechanism (but this is not connected to anything now). Replace the fuse. Reconnect the keyboard mains switch cable (5 pin in-line connector), and turn on the switch. Do an insulation test between the mains live/neutral pins (strapped together) and the case. If that's the problem, check the mains filter, transformer, etc.

Now apply mains, preferably with a (filament) light bulb in series. A 100W bulb should be fine. The bulb should be dark (there's no load on the transformer after all). Teh fan should be running. Check the trasnformer secondary voltages at the PSU board edge connectors. Unplug the mains.

Check the rectifier diodes, smoothing capacitors, power transistors, etc on the PSU boards. Fit the PSU boards and plug the machine in, again with a light bulb in series if you can. Again the bulb should be dark (or at least very dim). If it's bright, you have a PSU problem. If the bulb is dark, check the PSU output voltages, there are testpoints for all of them apart from +5V on the PSU boards, check +5V on the backplane connector of one of the boards. When they're all OK, unplug the mains, reassemble the logic boards, and power up (with no light bulb this time). Hopefully the machine will then work, if not, you'll have a logic fault to trace.

You can download the HP service manual (mostly a boardswapper guide, but with PSU schematics) and full schematics for the machine from the Australian museum site. There should be an article on repairing this PSU in Datafile (HPCC journal) sometime, but I think you'll have to wait over a year for that.

Feel free to contact me about this fine machine

m48 for iPhone is brilliant

*Message #1 Posted by **Dave** on 12 May 2011, 11:57 a.m.*

This is probably old news to most. But since I just got my first iPhone, I just wanted to make people aware that thanks to the latest "Don't Panic" skin, m48 is vastly more usable and the best 48 emulator I've seen on the iPhone. It looks absolutely stunning on the iPhone 4. The keyboard changes when shift and alpha keys are pressed, and you can use swipes on the LCD instead of the cursor keys. Very nicely done. Before "Don't Panic" there were a lot of skins, but many were hard to use/read. So if you haven't tried m48 lately, give it another shot. You'll be pleasantly surprised.

When I got my iPhone, I tried all the free HP emulators, and this one is by far the nicest. (I use m48 which is the free version. m48+ is the fully featured version).

Kudos to Marcus and ultimately Christoph and Sebastian who made this 48 emulator possible.

Edited: 12 May 2011, 11:58 a.m.

BASIC BEEP

*Message #1 Posted by **Howard Owen** on 12 May 2011, 2:59 a.m.*

The beeper on the HP-71B is pretty cool. You can do lots of fun 1980s retro sounds with it. I had some fun with that in my dice games for the 71B. I even had a "raspberry" sound for when you zeroed out yatz. :)

When I got back into RMB, I wasn't expecting to find anything as capable on my 9816. I vaguely remembered that the beeper on that machine is severely limited. Indeed, I find that RMB 2.0 running on a 9816 is limited to some oddly spaced frequencies. These appear on page 27 of the BASIC Language Reference. They are mostly useless for music, and limited for audible prompts. A lot of them are too high to listen to comfortably. But I found a use for the first three frequencies greater than zero on the list.

BASIC Beep

Re: BASIC BEEP

*Message #2 Posted by **Raymond Del Tondo** on 12 May 2011, 7:26 a.m.,*
in response to message #1 by Howard Owen

Nothing to hear when played using MPC-HC , but I assume it should sound like the HP-41 BEEP ;-)

Re: BASIC BEEP

*Message #3 Posted by **Marcus von Cube, Germany** on 12 May 2011, 7:37 a.m.,*
in response to message #2 by Raymond Del Tondo

It's recorded at a very low volume. I had to increase the volume to maximum and put the ears near the speakers.

Re: BASIC BEEP

*Message #4 Posted by **Walter B** on 12 May 2011, 7:38 a.m.,*
in response to message #1 by Howard Owen

Quite a faint beep even with the amplifier turned to full volume ... hardly sufficient for a prompt IMHO.

Re: BASIC BEEP

*Message #5 Posted by **Howard Owen** on 12 May 2011, 11:40 a.m.,*
in response to message #1 by Howard Owen

Sorry guys. I forgot to turn on normalization when I rendered it to MP3. I had headphones on, so I didn't notice it was so quiet. It's fixed now.

Walter, it sounds OK when you sit in front of the machine. :)

Re: BASIC BEEP

*Message #6 Posted by **Garth Wilson** on 12 May 2011, 5:03 p.m.,*
in response to message #1 by Howard Owen

The HP-71 NOISE LEX file statement was neat too. It seemed that with enough patience, you could make it talk (although I never tried).

34s / 16C Compat. #5 - DBL/

*Message #1 Posted by **Jake Schwartz** on 11 May 2011, 10:13 p.m.*

Hi,

Using 34S build 874, I was attempting the double-word divide example in the 16C manual on page 54. With 2's compliment mode and a word size of 5, an attempt was made to divide the double word representation of -88 decimal in Y and Z by the single-word 11 decimal in X to get the single-word result in X of -8 decimal. All values were entered in binary, so the sequence is: 1000 ENTER 11101 ENTER 1011 DBL/ and the expected result is 11000 binary. Only, on the 34S I get zero as a result with the carry flag set. It does work on my 16C. The followup example in the manual on pages 54-55 does work, however, using unsigned mode and 64-bit word size. Any ideas?

Thanks, Jake

Re: 34s / 16C Compat. #5 - DBL/

*Message #2 Posted by **Paul Dale** on 11 May 2011, 11:01 p.m.,*
in response to message #1 by Jake Schwartz

Another integer bug :-(

This one is broken. There is a problem joining the two halves of the number together when the word size is not 64. DBLMOD is broken too.

DBL* will likely have problems with negatives as well :-(

- Pauli

Re: 34s / 16C Compat. #5 - DBL/

*Message #3 Posted by **Paul Dale** on 11 May 2011, 11:19 p.m.,*
in response to message #1 by Jake Schwartz

And hopefully fixed in the next build :-)

- Pauli

Re: 34s / 16C Compat. #5 - DBL/

*Message #4 Posted by **Angel Martin** on 12 May 2011, 1:56 a.m.,*
in response to message #1 by Jake Schwartz

That's really thorough beta testing - many SW development firms would pay big bucks for this... well, assuming they're after a real quality product instead of larger profits of course.

Cheers, 'AM.

Re: 34s / 16C Compat. #5 - DBL/

*Message #5 Posted by **Paul Dale** on 12 May 2011, 2:29 a.m.,*
in response to message #4 by Angel Martin

I'm glad someone is going through the integer mode in depth. Various people found quite a few bugs in the real mode fairly quickly and integer mode really needs similar attention.

I tried to test when I coded everything but there was so much to implement and so many special cases. And things have changed quite a bit over time resulting in bit rot in the code.

Still, I think we're getting close to a decent calculator.

I've actually started using mine for real calculations at work :-)

- Pauli

Re: 34s / 16C Compat. #5 - DBL/

*Message #6 Posted by **Marcus von Cube, Germany** on 12 May 2011, 2:48 a.m.,*
in response to message #5 by Paul Dale

Pauli,

how is your one looking? What type of overlay are you using?

Re: 34s / 16C Compat. #5 - DBL/

*Message #7 Posted by **Paul Dale** on 12 May 2011, 3:29 a.m.,*
in response to message #6 by Marcus von Cube, Germany

My overlay hasn't changed from the picture posted here.

Sadly, I don't need an overlay, I know what all the keys do :-)

- Pauli

Integer Mode

*Message #8 Posted by **Jake Schwartz** on 12 May 2011, 11:22 a.m.,*
in response to message #5 by Paul Dale

> Quote:
>
> I'm glad someone is going through the integer mode in depth.

Hi,

It is my intention to work through the entire 16C manual and report any anomalies....as long as I'm not considered a pain, I'll keep doing it.

Thanks for everyones' diligent work, Jake

Re: Integer Mode

*Message #9 Posted by **Walter B** on 12 May 2011, 11:36 a.m.,*

in response to message #8 by Jake Schwartz

Hi Jake, all,

as mentioned we appreciate all testing very much - it's quite obvious we can't do it alone nor will we be so successful as any thorough (wo)man not being part of the development team. So thanks for the checks you've done already - and in advance for those to come :-)

Walter

HP45 Battery Pack Disassembly

*Message #1 Posted by **Eric_G** on 11 May 2011, 9:10 p.m.*

I found my dad's old HP45 calculator, it works on AC power but of course the battery pack is long dead. I modified it to use a cordless phone NiCd pack, however I am unhappy with this, as the pack fits quite tightly and puts some pressure on the battery cover.

I want to take apart the original battery pack and replace the cells in it (with NiCds), I am however having a hard time cracking the original pack open. Does anyone have any experience with the disassembly of the original HP battery pack?

Thanks.

Re: HP45 Battery Pack Disassembly

*Message #2 Posted by **aj04062** on 11 May 2011, 9:15 p.m.,*
in response to message #1 by Eric_G

You just need to work at the seem. Use the widest, thinnest blade you have. It is fused together, but will usually pop apart. Alternatively you may need to cut through where the fused tabs are.

Re: HP45 Battery Pack Disassembly

*Message #3 Posted by **Eric_G** on 11 May 2011, 10:46 p.m.,*
in response to message #2 by aj04062

Working along the longer sides I was easily able to pop the seams, however it still didn't come apart. Is it also fused along the shorter sides? I have worked at these with a blade, no luck. I am considering just cutting the thing. I never expected this to be so challenging!

Re: HP45 Battery Pack Disassembly

*Message #4 Posted by **Katie Wasserman** on 11 May 2011, 10:50 p.m.,*
in response to message #3 by Eric_G

It's not connected along the longer sides, just the ends. Packs differ greatly in how difficult they are to take apart. In the worst case you need to cut almost all the way through.

Re: HP45 Battery Pack Disassembly

*Message #5 Posted by **Eric_G** on 11 May 2011, 11:42 p.m.,*
in response to message #4 by Katie Wasserman

"Packs differ greatly in how difficult they are to take apart."

I had to cut it, after inspecting it opened up, there was no other way, each side had 3 little tabs that were glued/fused to the other half. I soldered in 3 AA NiCds and closed everything up. Works

nicely and fits well.

Now I will be the envy of my lab :).

Thanks Katie and Aj for the info.

WP34S Build 874 Possible HEX entry bug?

*Message #1 Posted by **M. Joury** on 11 May 2011, 6:48 p.m.*

I may have found a problem with entering numbers in hex mode. I can't seem to enter a value of 'E' as the only (or the last--least significant) digit. I have tried in Unsigned, 1's Complement and 2's Complement. I can enter all other values but 'E' returns a 0 as the only digit and is eliminated as the last digit.

I am currently working with the emulator and not the real hardware.

Cheers,

Marwan

Re: WP34S Build 874 Possible HEX entry bug?

*Message #2 Posted by **Paul Dale** on 11 May 2011, 8:09 p.m.,*
in response to message #1 by M. Joury

Nice catch. Yes this is a bug.

- Pauli

Re: WP34S Build 874 Possible HEX entry bug?

*Message #3 Posted by **Paul Dale** on 11 May 2011, 8:11 p.m.,*
in response to message #1 by M. Joury

And fixed :-)

Well when the next build happens.

- Pauli

Re: WP34S Build 874 Possible HEX entry bug?

in response to message #3 by Paul Dale

Wow! That is what one calls response time! :-). Thanks!

Re: WP34S Build 874 Possible HEX entry bug?

*Message #5 Posted by **Marcus von Cube, Germany** on 12 May 2011, 2:07 a.m.,*
in response to message #4 by M. Joury

It's in but untested by me.

Re: WP34S Build 874 Possible HEX entry bug?

*Message #6 Posted by **M. Joury** on 12 May 2011, 12:09 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Thanks. I'll take a look when a new build becomes available. The one I just downloaded is still showing Build 874.

Re: WP34S Build 874 Possible HEX entry bug?

*Message #7 Posted by **Marcus von Cube, Germany** on 12 May 2011, 12:32 p.m.,*
in response to message #6 by M. Joury

Where did you get your build from? We're currently not updating the release package as we have just switched the internal version number from 1.17 to 1.18. If you want to play around with the newest version, you need to resort to an SVN client.

Re: WP34S Build 874 Possible HEX entry bug?

*Message #8 Posted by **M. Joury** on 12 May 2011, 1:17 p.m.,*
in response to message #7 by Marcus von Cube, Germany

Thanks Marcus. I have a client already installed for other development so I will try to get the latest version that way. Anything in particular I need to know?

Edited: 12 May 2011, 1:19 p.m.

Re: WP34S Build 874 Possible HEX entry bug?

*Message #9 Posted by **Marcus von Cube, Germany** on 12 May 2011, 1:41 p.m.,*
in response to message #8 by M. Joury

No, just follow the instructions on our SF page under the Code tab. The flash file is under trunk/realbuild, the emulator under trunk/windows/bin.

You can likewise browse the repository on the web and download single files. The downside of this approach is that the revision number is blanked out. This must be a SVN peculiarity.

Re: WP34S Build 874 Possible HEX entry bug?

*Message #10 Posted by **M. Joury** on 12 May 2011, 3:04 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Thanks Marcus.

9825A use 9121 disk drive?

*Message #1 Posted by **David Ramsey** on 11 May 2011, 4:03 p.m.*

Can a 9825A calculator use a 9121D disk drive connected via HP1B? I know that separate special ROMS are required for it to control some of the old 8" and 5.25" drives, but I haven't seen anything on the newer 3.5" drives...

Simulation vs Emulation

*Message #1 Posted by **Carl Utter** on 11 May 2011, 1:04 p.m.*

I found this forum on accident and read an archived thread with the same title as this one. There was no consensus overall in the thread and many good points were made in the argument. It was interesting. My contribution (though late) would be to say:

Despite the medium through which results are delivered (physics, hardware, software, etc…) a simulator produces the exact same expected results and an emulator is differentiated by also producing the exact same unexpected results. *Oh to Error!*

Re: Simulation vs Emulation

*Message #2 Posted by **Namir** on 11 May 2011, 2:34 p.m.,*
in response to message #1 by Carl Utter

The difference between simulation and emulation reminds me of the difference between Dementia and Alzheimer's disease.

I like writing calculator emulators because they give me more freedom on how to mimic commands.

Namir

Re: Simulation vs Emulation

*Message #3 Posted by **Marcus von Cube, Germany** on 11 May 2011, 4:08 p.m.,*
in response to message #2 by Namir

Carl, I like your statement. :-)

In a simulation, you can easily extend the bounds of the original system, be it speed, memory or function set. See Free42 for a good example. But it's a lot of work to implement the original functionality so that the emulator behaves as a superset of the original system and not as a subset with extensions.

In an emulation, you have other problems: You cannot easily extend the bounds of the original hardware like speed or memory because the original firmware needs to be patched to recognize the new possibilities. Keyboard scan or display are examples where an unmodified firmware needs a relatively exact emulation of the original hardware to work reliably. You cannot easily add a dot matrix display to a 15C without severe changes to the old system.

Re: Simulation vs Emulation

*Message #4 Posted by **Didier Lachieze** on 11 May 2011, 5:51 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Well, for the HP-15C emulation I think you should be able to add an alphanumeric display and use it to show in program mode the instruction name instead of the keycode, without patching the original

firmware.

[Edited to replace simulation by emulation]

*Message #5 Posted by **robert rozee** on 11 May 2011, 10:59 p.m.,*
in response to message #4 by Didier Lachieze

interesting you say that, as i've thought over the same thing - a 15c with a dot-matrix display ability PURELY for showing the instruction mnemonics). if the code that displays that data on screen was well compartmentized in the original code, a simulator could substitute it's own alpha-driving routine when it was jumped to.

has anyone sat down and tried to disassemble (at least partially) the original 15c roms back into the original assembly code?

Re: Simulation vs Emulation

*Message #6 Posted by **Didier Lachieze** on 12 May 2011, 2:46 a.m.,*
in response to message #5 by robert rozee

I don't think you need to look at the original code, an emulator should already have a routine to drive the physical display, so it "knows" the state of the display. When the PRGM indicator is on it can interpret the keycodes and replace them by the mnemonics.

Re: Simulation vs Emulation

*Message #7 Posted by **robert rozee** on 12 May 2011, 5:54 a.m.,*
in response to message #6 by Didier Lachieze

good point - that would (as far as i can see) work, and add a great deal to the 'user experience' of the calculator with very little programming effort beyond writing the initial 10-series simulator.

What was the reason to quote me on this?

Re: Simulation vs Emulation

*Message #13 Posted by **Dave Britten** on 12 May 2011, 12:02 a.m.,*
in response to message #1 by Carl Utter

From what I understand, the traditional definition is/was thus:

Simulation - software-based facsimile
Emulation - hardware-based facsimile

But in the past 15 or so years, it seems to have shifted somewhat:

Simulation - A reimplementation designed for some subset of compatibility with the original, usually at a somewhat high or superficial level
Emulation - A software implementation of the lowest-level details of something, allowing comatibility to kind of fall into place on top of that fundamental layer of functionality

OT: New Commodore PC coming out

*Message #1 Posted by **Namir** on 11 May 2011, 12:43 p.m.*

Commodore USA is launching several old models with new OS (Linus) and good hardware specs (typical 4 GB RAM and 500GB to 1TB hard drive) at the end of the month. Looks like HP-15C is not the only vintage machine that has a nostalgia club!!

You can click here to visit the Commodore USA web site and look at the different models, configurations, and prices.

Namir

15C re-release questions.

*Message #1 Posted by **Pal G.** on 11 May 2011, 11:55 a.m.*

One month 'till June - why not more rumors regarding the potential 15c re-release? Wouldn't more rumor milling assist Sales?

Second, why would HP re-release the 15c the same year as the 30th anniversary of the 12c (1981-2011), and not the 30th anniversary of the 15c (1982-2012)? The timing is odd to me. Will the 15c somehow ride the 12c's anniversary's coattails?

Third, I am hoping against, and wondering why HP would only manufacture 10,000 initial units. I haven't seen hp15c.org mentioned here yet. That petition claims 14,347 people, in 174 countries, would buy 82,021 15c calculators. Is the 12% a reasonable economic decision? Was the petition even considered?

Finally, how are those 10,000 units going to be sold? According to Wikipedia, Staples has over 2,000 stores and Office Max has over 1,000 stores. That's about 3 units per store. What about Amazon, Walmart, Target?

Re: 15C re-release questions.

*Message #2 Posted by **rav walia** on 11 May 2011, 12:40 p.m.,*
in response to message #1 by Pal G.

I don't know any rumours apart from what I've seen on the board, but a number of the guys that I work with, seem to have picked up on it too.

I want this release to happen, will it, I don't know. If it does, at least it gives me hope that HP is still thinking about the scientific calculator crowd.

Re: 15C re-release questions.

*Message #3 Posted by **Namir** on 11 May 2011, 12:52 p.m.,*
in response to message #1 by Pal G.

Pal,

Maybe we can redo the math, because 10,000 seems to me to be a small number.

```
Staples           2000 * 5 units/store =  10,000
Office Max        1000 * 5 unit/store =    5,000
Amazon                                    15,000
Walmart           10000 * 5 units/store = 50,000
Target            7000 * 3 units/store  = 21,000

Total                                    101,000
```

So a run of 100,000 units seems more likely than a piddle of 10,000. IF HP ever really does this then my guess is that there will be plenty of units to go around. No need for hoarding.

Of course many people on TAS will go out and buy these units from the retailers and selling them in auctions.

This number is fictitious. The original article that started this rumor did not say a number, only "limited run."

> Quote:
>
> Finally, how are those 10,000 units going to be sold?

Most will be sold direct from HP's website. Most of the brick and mortar stores will not even be interested in stocking them.

Re: 15C re-release questions.

*Message #10 Posted by **gene wright** on 11 May 2011, 3:38 p.m.,*
in response to message #9 by Martin Pinckney

It is very difficult to get products into brick and mortar stores. Often, to get something into a store it must replace an item making less gross profit dollars than the new addition. This can be very difficult to demonstrate to store corporate management.

After all, we all love HP calculators but how many brick and mortar stores carry HPs at all? How many that DO carry HPs carry more than one or two?

Re: 15C re-release questions.

*Message #11 Posted by **Bart (UK)** on 12 May 2011, 6:25 a.m.,*
in response to message #10 by gene wright

My recent calculators have indeed been purchased through online stores, as the calculators I am interested in have generally not been available in brick and mortar stores. They are generally cheaper online anyway. (Amazing though how new items are always more expensive on eBay).

However, I am also concerned then if the 15C will only be available on the HP online store, if it is only going to be the US store then we in the UK can't purchase because as of yet we cannot purchase there from outside the US. It also seems that the UK HP online store does not sell calculators online.

So please HP, make enough and make them available through the normal channels (online calculator stores etc.)

Re: 15C re-release questions.

*Message #12 Posted by **M. Joury** on 12 May 2011, 12:06 p.m.,*
in response to message #11 by Bart (UK)

If one is truly desperate (and this might be such a case) there are ways around HP not shipping to Europe. I have a family member overseas and he uses a service in the US that acts as a forwarding agent. So a shipment will go out to the local (US) address and automatically get forwarded to the individual overseas. I have no idea how much this service costs but for certain items there is simply no other way to get them.

Re: 15C re-release questions.

*Message #13 Posted by **Marcus von Cube, Germany** on 12 May 2011, 12:37 p.m.,*
in response to message #12 by M. Joury

*Message #17 Posted by **David Ramsey** on 12 May 2011, 5:46 p.m.,*
in response to message #10 by gene wright

Remember at the 2006 conference where HP handed out free HP-12C Anniversary Editions to all attendees? Maybe we'll get 15Cs this year!

Yes, I can hope.

Re: 15C re-release questions.

*Message #18 Posted by **Pal G.** on 12 May 2011, 7:11 p.m.,*
in response to message #17 by David Ramsey

Well, in my first post in this thread I mentioned I was puzzled why HP would re-release the 15c the same year as the 12c's anniversary? Wouldn't a 12c+ be a more appropriate giveaway for this years HHC? If the 15c is released this June, it might overshadow the 12c anniversary.

Edited: 13 May 2011, 4:38 p.m.

Re: 15C re-release questions.

*Message #19 Posted by **Eric Smith** on 15 May 2011, 4:05 p.m.,*
in response to message #18 by Pal G.

Aside from occasionally selling a variant of an existing model with an anniversary logo, I really

don't think HP does very much planning of new model introductions based on anniversaries. The 35s is the only one I can think of, and I suspect that the choice of the 35s model number was done more as a matter of recognizing the coincidence that they had a new scientific model to be introduced at approximately the anniversary of the 35, rather than based on any long-term planning for that anniversary. Of course, I wasn't involved, so I could be mistaken. Generally new products are designed and introduced as soon as they possibly can be, since the objective is to make as much revenue as possible.

Conference giveaways have generally been of new models, not old models that happen to be having an anniversary.

I really don't think that HP giving out something (or nothing) at a conference is going to overshadow the anniversary of anything.

wp34s Version 1.18 Rev 875 Backup and Restore

*Message #1 Posted by **Jeff O.** on 11 May 2011, 9:38 a.m.*

Marcus,
I see that you have added confirmation to the ON+ key commands. That's a good thing, as I worried that at some point I would hit ON+S instead of ON+R as they are right next to each other. Not a disaster, but would require firing up SAM-BA to get things running again. In any case, I assume that the confirmation is to press the key again while holding ON down, i.e. Restore would be ON+5, hold ON, release 5, keep holding ON, press 5, correct? If so, then there may be a problem as I now get "Invalid" when I attempt to restore from a state file that worked with previous versions.

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #2 Posted by **Marcus von Cube, Germany** on 11 May 2011, 3:30 p.m.,*
in response to message #1 by Jeff O.

> Quote:
>

1.17 is not compatible with 1.18. We changed the number of program steps and therefore the checksum is no longer valid. The keyboard sequence is exactly as you describe.

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #3 Posted by **Jeff O.** on 11 May 2011, 4:01 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Any way to get around this? When you provided back-up and restore capability, I finally decided to try entering a longer program since I would not lose it with the next revision. Not a big deal if not, I'll just re-enter it.

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #4 Posted by **Marcus von Cube, Germany** on 11 May 2011, 4:10 p.m.,*
in response to message #3 by Jeff O.

Send me your state file, I may create an upgrade path. You find me under marcus at mvcsys dot de.

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #5 Posted by **Jeff O.** on 11 May 2011, 10:14 p.m.,*
in response to message #4 by Marcus von Cube, Germany

State file sent, fixed, and returned. Thanks Marcus!

*Message #7 Posted by **Jeff O.** on 11 May 2011, 10:13 p.m.,*
in response to message #6 by Paul Dale

Nothing special, just my old four-digit number guessing game that I have ported to various machines over the years.

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #8 Posted by **Jeff O.** on 13 May 2011, 12:47 p.m.,*
in response to message #7 by Jeff O.

Here is the wp34s state file with the program in case anyone is interested:

wp34s state file with number guessing game

Once you get the state file into your calculator and restore it to main memory, game play is as follows:

To play: Press C to execute program label C. The calculator will generate a random four digit number with no repeated digits, zero not allowed, then stop and display 0.0. Key in a four digit guess, (e.g. 1234, 9753, etc.) and press R/S. The calculator will compare your guess to the secret number it generated and return a score in the following format:

x.y

where x is the number of digits in your guess that are both in the secret number and in the correct position, and y is the number of digits which are in the secret number but not in the correct position. So, for example, if the secret number is 3214 and you guess 1234, the score will be 2.2, as the 2 and 4 are in the correct positions and the 1 and 3 are in the number but in the incorrect position in your guess. After each guess, pressing x<>y will show the number of guesses so far. Keep entering guesses until 4.0 is displayed, indicating you have solved the puzzle.

```
Wp34s program listing:
Step # Command         Comment
001     LBL C     Label C for "Code Breaker"
002     Cl x      clear x to get zero to store in 1 - 5, 10
003     STO 01
004     STO 02
005     STO 03
006     STO 04
007     STO 05
008     STO 10
009     FIX 01    set display mode Fix 1 so scores are presented as x.x
010     1         enter 1 for first digit of 10
011     0         enter 0 for second digit of 10
012     STO 06    Store constant 10 in register 6
```

```
013     4         enter 4
014     STO I     Store 4 in I for loop index and indirect storage.
015     LBL 02    Label 2
016     RAN#      generate random number
017     RCL x 06  Multiply times 10 to get a digit left of decimal point
018     INT       drop fractional portion
019     RCL 01    Recall register 1
020     XEQ 10    execute subroutine that checks against random number
021     RCL 02    Recall register 2
022     XEQ 10    execute subroutine that checks against random number
023     RCL 03    Recall register 3
024     XEQ 10    execute subroutine that checks against random number
025     RCL 04    Recall register 4
026     XEQ 10    execute subroutine that checks against random number
027     STO->I    If random number is not equal to any existing digit,
                  store in register pointed to by I
028     DSE I     Decrement index
029     GTO 02    Go back to random number generator to store next digit
030     LBL 03    Label 3
031     RCL 10    Recall 10, count of guesses for guessing portion
032     RCL 05    Recall 5, score of guess for guessing portion
033     STOP      Stop
034     STO 09    Store 4 digit guess in register 9
035     CL x      Clear x for 0 in x
036     STO 05    Store in register 5, which will hold score for the current
guess
037     4         Enter 4
038     STO I     Store 4 in I for loop index and indirect recalling.
039     LBL 08    Label 8
040     RCL 09    Recall guess
041     RCL / 06  Divide guess by 10
042     STO 09    Store back in register 9
043     FRAC      Take fractional part
044     RCL x 06  Multiply times 10 to get a digit left of decimal point
045     INT       drop fractional portion
046     RCL->I    Recall register pointed to by I
047     x=y?      Compare to digit extracted from guess for the I position
048     GTO 04    If equal, go to scoring for correct digit in correct location

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #9 Posted by **Gerson W. Barbosa** on 15 May 2011, 8:25 p.m.,*
in response to message #8 by Jeff O.

Thanks for posting it!

I liked to play this game on my TI-59, in '82 (there was a listing in the manual). Unfortunately it was stolen two months after I had purchased it. The first thing I did when I replaced it with an HP-15C was writing an RPN version, or to what I thought an RPN version was:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=68346

As I was not acquainted to the HP-15C, it was a slow and long program but it ran fast on the HP-32SII. Even faster on the PC :-)

```
-----------------------------------------------

Program Guessing_Game;
var c,e,i,j,nt,tmp: byte;
             ad,adv: integer;
                 op: char;
                a,n: array [1..4] of byte;
begin
  repeat
    nt:=0;
    ClrScr;
    Write(' ':9,'G U E S S I N G  G A M E');
    GoToXY(14,5); Write('Guess   C  I');
    repeat
      for i:=1 to 4 do
        n[i]:=Random(9)+1
    until (n[1]<>n[2]) and (n[1]<>n[3]) and (n[1]<>n[4]) and
          (n[2]<>n[3]) and (n[2]<>n[4]) and (n[3]<>n[4]);
    repeat
      c:=0; e:=0; nt:=nt+1;
      GoToXY(10,3); Write('Enter your guess: ');
      repeat
        repeat
          GoToXY(30,3); Read (adv);
          GoToXY(30,3); ClrEol
        until (adv>1233) and (adv<9877) and (IOresult=0);
        ad:=adv;
        for i:=4 downto 1 do begin
          a[i]:=adv mod 10;
          adv:=adv div 10
        end
      until (a[1]<>a[2]) and (a[1]<>a[3]) and (a[1]<>a[4]) and (a[2]<>a[3]) and
            (a[2]<>a[4]) and (a[3]<>a[4]) and (a[1]*a[2]*a[3]*a[4]<>0);
      for i:=1 to 4 do
        if a[i]=n[i] then c:=c+1;
      for i:=1 to 3 do begin
        tmp:=a[1];
        for j:=1 to 3 do
          a[j]:=a[j+1];
        a[4]:=tmp;
        for j:=1 to 4 do
          if a[j]=n[j] then e:=e+1
      end;
      GoToXY(10,nt+6); WriteLn(nt:2,':  ',ad:4,'   ',c:1,'  ',e:1)
    until (c=4) or (nt=10);
    GoToXY(15,20);
    if c=4 then
        case nt of
                      1: Write('That',#39,'s witchcraft!');
                    2,3: Write('Excellent!');
                      4: Write('Good!');
                    5,6: Write('Fair.');
                    7,8: Write('Poor.');
                      9: Write('Bad.');
                     10: Write('Better luck next time!')
```

```
        end
      else
        Write('Secret number: ',n[1]:1,n[2]:1,n[3]:1,n[4]:1);
    GoToXY(10,3); ClrEol;
    GoToXY(15,22); Write('New game?  <Y,N> ');
    repeat
      Read(kbd,op); op:=UpCase(op)
    until (op='Y') or (op='N')
  until op='N'
end.

------------------------------------------------

         G U E S S I N G  G A M E

             Guess    C  I

          1:  1234    1  0
          2:  5678    0  2
          3:  9287    0  3
          4:  2986    0  2

I also first encountered TI-59 version of the program. I had a 29C at the time and was able to create playable version for it.

I can't believe I missed your post from 2005. My 15C version is also very slow. The wp34s version is lightning fast.

*Message #11 Posted by **Paul Dale** on 15 May 2011, 8:46 p.m.,*
in response to message #8 by Jeff O.

Nice program. If you're agreeable, I'll add it to the library of programs.

A couple of minor comments (well more taking advantage of features of the 34s).

Lines 77/78 can be replaced by "INC 10".

The checking for duplicate digits code can be simplified. Lines 19-26 can be changed to

```
019: x=? 01
020: GTO 02
021: x=? 02
022: GTO 02
023: x=? 03
024: GTO 02
025: x=? 04
026: GTO 02
```

and lines 83 - 87 removed. This will be shorter, faster and not abuse the return stack so badly :-)

This section of code can be streamlined further by making it a loop:

```
015: 4
016: RAN#
017: RCL* 06
018: INT
019: LBL 99
020: x=?->Y
021: GTO 02
022: DSZ Y
023: GTO 99
```

and an extra step saved by deleting the label and using BACK instead.

The 34s really is a programmers' machine :-)

- Pauli

*Message #12 Posted by **Jeff O.** on 16 May 2011, 8:04 a.m.,*
in response to message #11 by Paul Dale

Thanks Pauli. You may certainly add it (or preferably an improved version) to the library of programs.

I am not surprised that it can be improved, thanks for your suggestions, I'll check them out. I'd also like to take advantage of the alpha capabilities of wp34s by adding some prompts or messages.

...

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #13 Posted by **Jeff O.** on 16 May 2011, 1:13 p.m.,*
in response to message #11 by Paul Dale

>
> The checking for duplicate digits code can be simplified...This section of code can be streamlined further by making it a loop...and an extra step saved by deleting the label and using BACK instead.

Which would look like this, I presume:

```
015: 4
016: RAN#
017: RCL* 06
018: INT
019: x=?->Y
020: GTO 02
021: DSZ Y
023: BACK 03
```

A similar improvement can be made to the digit checking routine, replacing steps 46 to 64 of the original program with:

```
x=?->I
GTO 04
4
x<>y
x=?->Y
GTO 05
DSZ Y
BACK 03
```

I'm sure there are other improvements that could be made, but the above changes plus a couple of skips get the program down to 64 steps, listed below. Oh yes, I forgot to say that after each guess is scored, the guess will be in register Z in case you forget what you just guessed.

> Quote:
>
> The 34s really is a programmers' machine :-)

Yes, it certainly is!

Improved wp34s version

State file

```
Program Listing
Step #  Command  Comment
001     LBL C    Label C for "Code Breaker"
002     CLx      clear x to get zero to store in 1 - 5, 10
003     STO 01
004     STO 02
005     STO 03
006     STO 04
```

```
007     STO 05
008     STO 10
009     FIX 01   set display mode Fix 1 so scores are presented as x.x
010     1        enter 1 for first digit of 10
011     0        enter 0 for second digit of 10
012     STO 06   Store constant 10 in register 6
013     4        enter 4
014     STO I    Store 4 in I for loop index and indirect storage.
015     LBL 02   Label 02
016     4        enter 4
017     RAN#     generate random number, 4 pushed to Y
018     RCLx 06  Multiply times 10 to get a digit left of decimal point
019     IP       drop fractional portion
020     x=?->Y   check random number against register pointed to ny Y
021     GTO 02   if equal, go back and generate new number
022     DSZ Y    decrement Y register, skip when zero
023     BACK 03  jump back three steps to compare digit to next register
pointed to by Y
024     STO->I   If random number is not equal to any existing digit,
store in register pointed to by I
025     DSE I    Decrement index
026     GTO 02   Go back to random number generator to store next digit
027     LBL 03   Label 03
028     RCL 10   Recall 10, count of guesses for guessing portion
029     RCL 05   Recall 5, score of guess for guessing portion
030     STOP     Stop, display 0.0 after start or score after guess
031     STO 09   Store 4 digit guess in register 9
032     STO 08   Store second copy of guess
033     CLx      Clear x for 0 in x
034     STO 05   Store in register 5, which will hold score for the
current guess
035     4        Enter 4
036     STO I    Store 4 in I for loop index and indirect recalling
037     LBL 08   Label 08
038     RCL 09   Recall guess
039     RCL/ 06  Divide guess by 10
040     STO 09   Store back in register 9
041     FP       Take fractional part
042     RCLx 06  Multiply times 10 to get a digit left of decimal point
043     IP       drop fractional portion
044     x=?->I   Compare to digit pointed to by I
045     GTO 04   If equal, go to scoring for correct digit in correct
location
046     4        enter 4
047     x<>y
048     x=?->Y   Compare to digit pointed to by Y
049     GTO 05   if equal, go to scoring for correct digit in incorrect
location
050     DSZ Y    decrement Y register, skip when zero
051     BACK 03  jump back three steps to compare digit to next register
pointed to by Y
052     0        enter 0 to indicate digit not in number
053     SKIP 05  Go to scoring
054     LBL 04   Label 04
055     SKIP 02  skip two steps to enter 1 for correct digit in correct
location
056     LBL 05   Label 05
057     .        enter decimal point
058     1        enter 1 (for .1 for guess digit in number in incorrect
                 location, 1 for correct digit in correct location.)
059     STO+ 05 Add 1, .1 or 0 to score
060     DSE I   Decrement index
061     GTO 08  Go to Label 08 to extract next guess digit
062     INC 10  Increment register 10, count of guesses
063     RCL 08  Recall original guess
064     GTO 03  Go to label 03 to display score and count of guesses
```

edited to add state file and listing of further improved version of program

Please bear in mind that the internal op-codes for commands are not yet set in stone. Of course, we're not going to make changes for the sake of it and we'll try to stay backwards compatible but there is no absolute guarantee of this.

One future we're discussing is user program libraries in flash. Before this can be done we must fix the existing op-codes. Retyping the limited RAM program memory is painful and a bit annoying but not really that much of chore. Retyping multiple kb's of libraries would be.

- Pauli

*Message #16 Posted by **Marcus von Cube, Germany** on 12 May 2011, 1:55 a.m.,*
in response to message #15 by Paul Dale

We should add a disassembler and an assembler to the emulator. This would make programming much easier. The state file or its program part can then be easily transfered to the real machine.

Re: wp34s Version 1.18 Rev 875 Backup and Restore

*Message #17 Posted by **Paul Dale** on 12 May 2011, 2:30 a.m.,*
in response to message #16 by Marcus von Cube, Germany

This would be great. I'd use an assembler to compile the internal key stroke programs e.g. :-)

There is a kind of disassembler for the internals. Build the console version and run "calc xrom"

Adding a crystal to a 20b or 30b

*Message #1 Posted by **Marcus von Cube, Germany** on 11 May 2011, 4:24 a.m.*

I'm not a hardware guy so I need advice here.

I want to add a 32768 Hz crystal to my 20b and my 30b. HP's schematics show a value of 15 nF for the capacitors while Atmel says something in the 10 pF range. Who is correct on the matter?

Edited: 11 May 2011, 4:24 a.m.

Re: Adding a crystal to a 20b or 30b

*Message #2 Posted by **Eric Smith** on 11 May 2011, 6:21 a.m.,*
in response to message #1 by Marcus von Cube, Germany

10 pF is in the right ballpark. 15 nF is three orders of magnitude too much! I guess since they're not actually using it in the calculator they didn't double-check that they specified the right value on the schematic.

It is somewhat tricky to determine the optimal value to use because it depends on the capacitance characteristics of the chip, the crystal, and the PCB layout. 32kHz crystal oscillators can be particularly finicky compared to more traditional crystal oscillators (e.g., 4-20 MHz).

LOL

Or perhaps "crystal isn't working, we don't need it so leave it off the build and also leave off its capacitor."

*Message #4 Posted by **Eric Rechlin** on 11 May 2011, 12:25 p.m.,*
in response to message #1 by Marcus von Cube, Germany

HP's schematics are wrong.

In my personally-untested "20b hacker's kit" I include 18 pF capacitors, which are probably close enough, but

nobody has reported success or failure with them.

Re: Adding a crystal to a 20b or 30b - success!

*Message #5 Posted by **Marcus von Cube, Germany** on 11 May 2011, 3:25 p.m.,*
in response to message #4 by Eric Rechlin

Eric, so it was your page that led me to the right physical dimensions 0603. :-) Thanks for the info!

I bought 15pF capacitors. They are so tiny that I call them "Fliegenschiss". Soldering required a tiny 12V soldering "iron" (more of a needle), a magnifying glass (originally bought for my aging mother as a reading aid) and two attempts. If you solder the crystal, be careful not to place it outside the marked area. Mine came off when I reassembled the case. The second attempt was successful.

With the most recent wp34s build you can press ON+X (twice) to activate the crystal. If you do it without the mod, your calc needs a reset.

Glad to hear the information was useful!

> Quote:
>
> They are so tiny that I call them "Fliegenschiss".

Oh, I like soldering 0603 capacitors a lot more than 0402 capacitors. My first revision of the 50g serial cable used 0402s, and that was a real pain to solder without a stereoscope.

> Quote:

Excellent! Looking forward to that.

Eric

Re: Adding a crystal to a 20b or 30b

*Message #7 Posted by **BobVA** on 17 May 2011, 9:56 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Eric: I used your kit (with the 18 pF caps) and it seems to work fine on my 30b. I found the little strip of Kapton tape from the crystal package useful for sticking the crystal to the board before soldering it in. Thanks for making the kit available!

Marcus: Only ein Flieger. :-) Is the ON-X-X a one-way setting (i.e. not a toggle)? That is, once it's selected the calculator uses the external oscillator unless it's reset? Thanks for including that function!

Regards, Bob

> Is the ON-X-X a one-way setting (i.e. not a toggle)?

Yes! The reason is easy: The chip allows to switch the oscillator exactly once after a reset. No way (and no reason) to go back. Likewise there is no way to check the presence of the crystal. If you select the function without a working oscillator, the device hangs. Even the LCD stops working as it's driven by the same oscillator. There is neither hope that the watchdog may kick in: It uses the same clock source.

16C Compat. #4 - LASTx

*Message #1 Posted by **Jake Schwartz** on 10 May 2011, 8:26 p.m.*

Hi,

While continuing to work through the 16C manual with the 34s, I found that a bunch of bit functions did not set LAST X as the 16C does: LJ, ASR, RL, RR, RLC, RRC, SL, SR, RLC, RRC, MASKL, MASKR, SB and CB. Perhaps these really should set LAST X.

Thanks, Jake

Re: 16C Compat. #4 - LASTx

*Message #2 Posted by **Paul Dale** on 10 May 2011, 8:53 p.m.,*
in response to message #1 by Jake Schwartz

RLC and RRC are in the list twice :-) But the shifts and rotates didn't set lastX properly :-(

MASKL and MASKR don't modify the X register so they don't need to save lastX. They do push stack. Unlike the 16c we take the number of bits to mask as an argument to the command not from the stack. Our integer mode isn't identical to the 16c in this respect for quite a few commands.

LJ was just plain broken :-(

All the rest will be fixed with the next build.

- Pauli

hp48gx pc cable

*Message #1 Posted by **tim peterson** on 10 May 2011, 6:52 p.m.*

I have an HP48gx with an HP standard PC cable. However my computer does not have this particular version of serial connection. Is there any relatively simple way to come up with an adapter setup? I have the 48 and the cable for something like 15 years, haven't used them for at least 8 years, and need help. Thanks in advance.

Re: hp48gx pc cable

*Message #2 Posted by **Marcus von Cube, Germany** on 10 May 2011, 7:06 p.m.,*
in response to message #1 by tim peterson

Any USB to serial converter should do nicely. The ones made by FTDI or containing their chips are renowned. I have no problems with my setup where Windows resides in a virtual machine on my Mac but controls the FTDI adapters.

Re: hp48gx pc cable

HP 32S style ridgid case

*Message #1 Posted by **Anoop Sahal** on 10 May 2011, 4:08 p.m.*

Thank you for reading my posting.

I wonder if anyone can inform me of a source for a rigid case for the HP 32S style of calculator.

Years ago I bought a rigid case for one of my 10 series calculators. It was like a data cassette case with one end flipping open , like a cigarette box lid. It fitted the calculator perfectly. However, at £5 plus shipping each I only bought one instead of the six I should have bought.

Thanks again

Too Long With No New Calculators!

*Message #1 Posted by **Jeff** on 10 May 2011, 12:13 p.m.*

Casio, HP, Sharp, TI, etc. Same old stuff month after month. Or has it been years? I wonder if anything new is on the horizon.

Re: Too Long With No New Calculators!

*Message #2 Posted by **Don Shepherd** on 10 May 2011, 12:27 p.m.,*
in response to message #1 by Jeff

Both Casio and TI have (relatively) new color graphing calculators with screens that are second to none.

Re: Too Long With No New Calculators!

*Message #3 Posted by **Marcus von Cube, Germany** on 10 May 2011, 12:27 p.m.,*
in response to message #1 by Jeff

Ask Jörg Wörner for TI's offerings. I think there has been some progress on that front. Only to mention the color Nspire.

I can't speak for Sharp, but Casio has recently introduced the Prizm color graphic calculator.

HP? Think of the HP 20b/30b and the recently updated 12C. This is a basis for many new devices, our wp34s repurposing project being just one possible outcome, a new 15C another.

Re: Too Long With No New Calculators!

*Message #4 Posted by **Joerg Woerner** on 10 May 2011, 3:50 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Just for Texas Instruments:

Worldwide: TI-Nspire CX, TI-Nspire CX CAS, TI-36X Pro (in some countries TI-30X Pro)

France: TI-84 Pocket.fr, TI College Plus, TI-106 (old calc in new colors)

Regards, Joerg

Re: Too Long With No New Calculators!

*Message #5 Posted by **Chuck** on 10 May 2011, 11:49 p.m.,*
in response to message #4 by Joerg Woerner

Was at a conference and played with the new TI-Nspire. Although I am mildly impressed with the advances in technology, there is no way I want a student of mine to have one of those things (talk about impeding progress). I think they cause a person to lose sight of real education due to the eye-

candy bling factor. I see them more of a novelty and curiosity and being carnival barked by pseudo-educatiors as an educational necessity. Meh.

Re: Too Long With No New Calculators!

*Message #6 Posted by **Eric Smith** on 11 May 2011, 12:42 a.m.,*
in response to message #5 by Chuck

Would you want your students to have an HP 50g?

Re: Too Long With No New Calculators!

*Message #7 Posted by **Chuck** on 11 May 2011, 1:22 a.m.,*
in response to message #6 by Eric Smith

Very rarely. The right tool at the right time. Students often can't tell when technology should be used and when it shouldn't. Too many aren't developing necessary cognitive skills because of the easy and accepted use of the almighty calculator. I'm still old school: $10 scientific calc on in class exams; graphing calc and/or mathematica on take home assignments. I have a few colleagues that think any calculator at anytime to solve any problem is appropriate in today's world. I just can't go that far yet.

Re: Too Long With No New Calculators!

*Message #8 Posted by **Eddie W. Shore** on 12 May 2011, 11:08 p.m.,*
in response to message #7 by Chuck

```
I think calculators should used by students as such:

Pre-Alegbra:  a simple four-function calculator, if at all

Algebra (I and II), Geometry, Trigonometry: a basic scientific calculator
will be (more than) sufficient (TI-30, Casio fx260, any of the Cannon
models) - I would not allow graphing calculators on tests

Pre-Calculus: more advanced scientific calculator (Casio fx-115ES, TI-36X
Pro, HP 35S); graphing calculator optional (but encouraged)

Calculus and Undergraduate Level Math:  graphing calculator

Graduate and PhD. Level: graphing calculator with CAS abilities
```

in response to message #3 by Marcus von Cube, Germany

Also the 10bII+. That is brand new. Other then the name and look, it shares nothing from the old one.

TW

Re: Too Long With No New Calculators!

*Message #10 Posted by **Jim Yohe** on 13 May 2011, 1:45 a.m.,*

in response to message #9 by Tim Wessman

All of the same primary and secondary key and faceplate nomenclature appears to be in the same places and as Gene says in his Solve (#23) review article the 10bii+ operates the same as the 10bii with the same keystroke sequences. Do you mean there are no internal hardware and display similarities?

Re: Too Long With No New Calculators!

*Message #11 Posted by **Marcus von Cube, Germany** on 13 May 2011, 2:04 a.m.,*
in response to message #10 by Jim Yohe

> Quote:
>
> Do you mean there are no internal hardware and display similarities?

Similarities - yes, pieces of old code or hardware - no. The new 10bii+ is based on the same architecture as the 20b/30b or the recent 12C: An Atmel AT91SAM7L128 low power ARM core processor with integrated 128KB flash rom, 2 KB battery backed RAM, 4 KB working memory, LCD controller and enough I/O pins to drive a keyboard. In other words: It's just one chip, yet a general purpose one, and a bare LCD without any further integrated circuits.

The software, the visible display layout, and the keys are designed in a way that makes the new device behave in a compatible way to the old one. That's it! In other words: It's a simulator.

The new 12C uses the old firmware in a completely new hardware. HP has implemented an emulation layer that makes it possible to reuse old proven code in a current setup. You can expect the very same results as the original 12C in every respect except execution speed.

Re: Too Long With No New Calculators!

*Message #12 Posted by **Tim Wessman** on 13 May 2011, 9:41 a.m.,*
in response to message #10 by Jim Yohe

The display is the same type of display, but a completely new display (since there are significant indicator changes).

The chip running the code is the Atmel as Marcus said. This required a complete re-write from the ground up because:

1. Not enough space on the old one for new features.
2. Difficult to work on the old codebase (assembly vs C).
3. Doing so allowed reuse of the same math library that has now been used on the 20/30b, 10bII+, 12cp iphone versions, and the calc pad PC software.
4. Didn't have enough speed to do things like inverse T with any hope of enough speed.
5. The 20/30b codebase could be used as a nice starting point.

So basically like you said, the keys that were there didn't change (except very minor ones like changing C SIGMA to C STAT as it was clearer - the position didn't change), and the look/body didn't change. The hope is that the vast majority of 10bII users wouldn't notice a difference other then the calculations now go faster and there are a *few* more features. :-)

However, in actuality had a lobotomy to put in a new brain and guts. It's a zombie calc! :-)

TW

Re: Too Long With No New Calculators!

*Message #13 Posted by **Marcus von Cube, Germany** on 13 May 2011, 10:28 a.m.,*
in response to message #12 by Tim Wessman

Tim, it would be nice to have display and keyboard schematics for all the new calcs so that the devices are open for independent developers. Even without a JTAG connector it should be possible to do useful things.

If you had skins for them which match the windows emulation used for the 20b/30b SDK it would be even more practical to develop software for them.

wp34S V.865 - Can't Fill up Full Word in Comp Modes

*Message #1 Posted by **Jake Schwartz** on 10 May 2011, 8:29 a.m.*

Hi,

I loaded version 865 this morning and found a bunch of issues repaired, for which I am grateful. However, now in either 1's or 2's compliment mode, I cannot enter a value which occupies all the bits in the word. For example, in either 1's or 2's compliment mode and with a 16-bit word, if I attempt to enter FFFF in hex, I get 7FFF instead. This seems to be the case in any base, and it was not like this before.

Thanks

Re: wp34S V.865 - Can't Fill up Full Word in Comp Modes

*Message #2 Posted by **Walter B** on 10 May 2011, 9:05 a.m.,*
in response to message #1 by Jake Schwartz

Hi Jake,

Thanks for the compl**i**ments. Assume you are talking about compl**e**ments, however ;-> Anyway, you found another difference to 16C, where you can enter FFFF (h) and also 65535 (d) - the latter will be displayed as -1 (d) immediately if entered in 2's complement mode.

Walter

P.S.: On the WP 34S, press 1 [+/-] ENTER and you get FFFF (h). Yes, I know, it's just a workaround ...

Edited: 10 May 2011, 9:12 a.m.

Re: wp34S V.865 - Can't Fill up Full Word in Comp Modes

*Message #3 Posted by **Jake Schwartz** on 10 May 2011, 10:47 a.m.,*
in response to message #2 by Walter B

> Quote:
>
> Anyway, you found another difference to 16C...

But, it didn't work this way just two days ago. So this change was recently inserted intentionally? I have a 20b with a new ROM image flashed 3 hours ago which exhibits this behavior, and my 30b, which was flashed two days ago works like the 16C.

Jake

Re: wp34S V.865 - Can't Fill up Full Word in Comp Modes

*Message #4 Posted by **Walter B** on 10 May 2011, 11:12 a.m.,*

in response to message #3 by Jake Schwartz

Jake, I guess that's due to the other discrepancy you discovered earlier. Remember it was concerning complements as well. So it looks like in mending this the new bug was introduced. Such is life - progress is a snail - or sometimes an elephant in a china shop ;-)

wp34S "last catalog" function

*Message #1 Posted by **Jake Schwartz** on 9 May 2011, 9:19 p.m.*

Hi,

(I hope I'm not getting into too much hot water for asking too many questions....)

On page 56 of the wp34s manual for version 832, it says that "Reopening the very last catalog called, the last command selected therein is displayed for repetitive use." This turns out to be an extremely useful feature. However, it seems to only work if the catalog command last accessed is one which does not require an input parameter, such as WSIZE _ _ or alphaSTO _ _. In these cases, reentering the catalog takes the user back to the first item. Would there be, by any chance, a way to make these functions requiring arguments to also be directly accessible via CATALOG?

Thanks, Jake

Re: wp34S "last catalog" function

*Message #2 Posted by **Paul Dale** on 9 May 2011, 9:42 p.m.,*
in response to message #1 by Jake Schwartz

Fixed in the next build :-)

- Pauli

New 15C - Greed and Hoarding

*Message #1 Posted by **John Stark** on 9 May 2011, 7:39 p.m.*

To all:

It is increasingly obvious that HP is getting ready to release some interesting new apparatus, specifically a 10.000 unit limited "anniversary" reissue of the HP.15C scientific and some revision of the 49/50 series (pray for big ENTER key and tapered/sweeping cross-section "Classic" case design).

Please let me know your opinion on the possible issue of some collectors "hoarding" the 15.C reissue (and its effects on the E**y auction scene).

As for me, I love the "Classic" series and keep a whole stable of them running with many parts donors. 12.C comes into play when financial questions arise not congruent with HP.80.

Just some food for thought: I believe this group has too much "class" to hoard, but let me know what you think of the (semi)-outside world's reaction to HP's newest crop.

Best regards.

John Stark

Re: New 15C - Greed and Hoarding

*Message #2 Posted by **Namir** on 9 May 2011, 7:54 p.m.,*
in response to message #1 by John Stark

John,

How is it increasingly obvious that HP is getting ready to relaunch a revived HP-15C? And how is it obvious that they will make 10,000 units and not some other number???

I am all ears!

:-)

Namir

Re: New 15C - Greed and Hoarding

*Message #3 Posted by **John Stark** on 9 May 2011, 8:14 p.m.,*
in response to message #2 by Namir

Namir:

Here is one site discussing this development:

http://www.techpoweredmath.com/hp-12c-special-edition-hp-15c-re-release/

HTH - Even I am excited about the re release of a machine I used many years ago.

Best Regards,

John Stark

Re: New 15C - Greed and Hoarding

*Message #4 Posted by **Namir** on 9 May 2011, 10:00 p.m.,*
in response to message #3 by John Stark

I think it's time to ask Donald Trump to check out the roomers about the HP-15C .... after all he has a team of crack investigators.

Let me see ... where did I write Trump's number .....

:-)

Namir

Re: New 15C - Greed and Hoarding

*Message #5 Posted by **M. Joury** on 9 May 2011, 8:22 p.m.,*
in response to message #1 by John Stark

I appreciate your contention that this group has class... However, if this machine comes to pass, what would you consider "hoarding". Does the purchase of 2-3 units qualify <g>?

Re: New 15C - Greed and Hoarding

*Message #6 Posted by **Dave Britten** on 9 May 2011, 9:08 p.m.,*
in response to message #5 by M. Joury

Nah. One for the office, one for at home, and one for the briefcase, or just as a spare. I don't think you're in hoarding territory until five and up.

And I'll certainly be in for one - possibly two - if this all comes to fruition. I love the 48SX on my desk, but the viewing angle and contrast are a little harsh, and input isn't as speedy with all the fancy RPL stuff. Wouldn't mind getting a 15C for basic work and saving the 48 for the heavier stuff.

Re: New 15C - Greed and Hoarding

*Message #7 Posted by **Katie Wasserman** on 9 May 2011, 11:22 p.m.,*
in response to message #5 by M. Joury

IIRC, there was some hording by this group on the 42S. Someone here found out and reported that HP still had these in inventory as "replacement" machines long after they had been discontinued. Those of us who didn't act fast didn't get in on this find as not everyone limited themselves to 1 or 2.

-Katie

Edited: 9 May 2011, 11:25 p.m.

Re: New 15C - Greed and Hoarding

*Message #8 Posted by **Howard Owen** on 10 May 2011, 2:36 a.m.,*
in response to message #1 by John Stark

Supposing that rumor turns out to be true, and further supposing that certain "greedy hoarders" snap up the limited run of 10,000, so the rest of us poor enthusiasts can't get one, then wouldn't that tend to encourage HP to make more 15Cs?

I personally hope both things happen, and that I also get my place at the first trough, but I'm not holding my breath for either eventuality.:)

Regards,
Howard

Re: New 15C - Greed and Hoarding

*Message #9 Posted by **Namir** on 10 May 2011, 9:41 a.m.,*
in response to message #8 by Howard Owen

Howard,

If one (or even a few) person snatches 10,000 units, then HP would be clever to make more runs. Storing many units (in the thousands) is not easy and is a big gamble. I think buying 2 or 3 units will be, by collectors' standards, "reasonable" (sounds ironic coming from someone who has six vintage HP-15C ... and always uses an HP-15C emulator).

Namir

Edited: 10 May 2011, 9:42 a.m.

Hoarding?

*Message #10 Posted by **Frank Boehm (Germany)** on 10 May 2011, 6:46 a.m.,*
in response to message #1 by John Stark

I assume the limited production run has one good reason: there is only a (very) limited market, most buyers can be found in this forum :)
Hoarding might happen, but probably won't mean a profit, the limited buyer group will grab 1-3 calculators early, which will be enough for at least a dozen years. To push prices up early, one would need to purchase all available calculators - 10000 times 100USD is certainly a freak investment and not going to happen.

Re: Hoarding?

*Message #11 Posted by **Dave Britten** on 10 May 2011, 8:18 a.m.,*
in response to message #10 by Frank Boehm (Germany)

But really, who hasn't dropped a million bucks on a niche calculator model for speculative purposes? Haven't we all?

Re: Hoarding?

*Message #12 Posted by **Katie Wasserman** on 10 May 2011, 10:33 a.m.,*
in response to message #11 by Dave Britten

Just a million? Well, I guess that we're still in a recession of sorts.

Re: Hoarding?

*Message #13 Posted by **Antonio Petri (UK)** on 10 May 2011, 8:20 a.m.,*
in response to message #10 by Frank Boehm (Germany)

I agree that there would be a only limited market for a re-introduction of the 15C. Most of us who praise it are those who had it at that time and experienced its real value compared to the other calculators, but I wouldn't be surprised that the youngest generations were not interested in it at all. However, in my opinion there is still something in terms of absolute value in the 15C and 10 series in general: it is the form factor, the compact shape, the nice look, its unsurpassed keyboard and its overall impression of a good quality build. These are things that still matter, maybe not too much to a student, but definitely to a professional. With the present technology it could be provided with a lot more functionality and made a lot faster than the original model. Matching the features and speed of the current scientific calculators, the qualities mentioned above would be the differentiating factor and what could make everybody, not just the nostalgic bunch, buy it.

Re: Hoarding?

*Message #14 Posted by **Eddie W. Shore** on 10 May 2011, 10:00 a.m.,*
in response to message #13 by Antonio Petri (UK)

I just hope that there is one for me when it is released. :)

Re: Hoarding?

*Message #15 Posted by **Walter B** on 10 May 2011, 11:15 a.m.,*
in response to message #14 by Eddie W. Shore

Seems like HP should run an auction ... pssst, don't tell them! d;-)

Re: Hoarding?

*Message #16 Posted by **M. Joury** on 10 May 2011, 12:00 p.m.,*
in response to message #10 by Frank Boehm (Germany)

After I posted yesterday I got to thinking about this question some more. I was wondering how many people were on this forum. Surely not more than 1000? Lets say that 80% of forum members would like 1 or more units (2-3 seems to be a common theme in various posts past and present). So lets use 3 as a figure. Say 2400 units between 800 forum members (I didn't need an HP15C for that particular calculation). Should be more than enough for all of us. UNLESS some distributor grabs a whole bunch as some have suggested might happen. Sounds like that would be prohibitively expensive and somewhat risky. If that person or entity purchased say all 10,000 units (or even if they were all bought up by 5 entities) to push up the price, what then? Sitting on those units for any length of time becomes a liability. They would have to sell them to recoup their investment. And that would mean that it would be very difficult to hoard at the level required to make the calcs either unavailable to those that want them or to push up the prices.

Just my 2 cents worth.

And, of course, it would be nice if the limited number became general availability. It seems to me that the risk to HP would be minimal since the machine is based on the same architecture, case, etc. as the 12C. There are only two differences as far as I can tell. The keyboard and the firmware. Worst case one could take the firmware and apply it to the 12C and figure out how to create a keyboard template. Certainly not as nice as having a "real" 15C but effectively the same capabilities.

Cheers,

Marwan

Re: Hoarding?

*Message #17 Posted by **Ren** on 10 May 2011, 12:46 p.m.,*
in response to message #16 by M. Joury

I'm just guessing it will be a reprogrammed "modern" 12C.

Do the modern 12C's have the reliability or battery life of the originals? I guess not.

While I would like to own a newer one, I'm not going to even consider buying one at "speculative" prices on TAS. The original I bought for $15 will be good enough, and considering "modern" electronics don't have the reliability/long life of similar products built 20 years ago. Televisions for instance, "stocking up" for future need could be foolish (leaky capacitors and such).

Re: Hoarding?

*Message #18 Posted by **Marcus von Cube, Germany** on 10 May 2011, 12:58 p.m.,*
in response to message #17 by Ren

I've an original 15C which I only use very occasionally because it's so incredibly slow. Decent speed makes a huge difference.

As the programmer of the "hardware part" of wp34s, essentially the same hardware as the new 12C and the (hopefully) upcoming 15C, I can assure you that performance and economy on batteries can go hand in hand. Of course not if you are running a tight loop which will rapidly eat your coin cells. But with normal use, you can expect a battery life measured in years, not months or weeks.

Re: Hoarding?

*Message #19 Posted by **exschr** on 10 May 2011, 4:25 p.m.,*
in response to message #18 by Marcus von Cube, Germany

slow: yes
but it is small and simple to operate! That's why it's one of my favorites for the simple stuff and it's quite powerful to fit into the pocket:
- complex numbers
- matrix operations
- easy RPN programming and even recall arithmetic

I will for sure check it out if there is a new 15c edition.
Roger

Re: Hoarding?

*Message #20 Posted by **Michael de Estrada** on 10 May 2011, 4:33 p.m.,*
in response to message #19 by exschr

Personally, the HP-15c is one of my favorites for all the reasons you list and more. The real disgrace is that nearly 30 years later we have the HP-35s that can't even do matrix math and has an inferior keyboard and display.

What I hate most of the 35S is, that you can label program just with one letter. This really yields all that nice memory to be a silly joke.

The 35S looked at least again like a real calculator and not like a spaceship :-)

but I leave the 35s all the time in the drawer and rather pick up the 15c or a 41c to have with me.

We're restricted to numeric labels and five designated letters on the 15C.

I think it stands for "That Auction Site"... At any rate it refers to eBay.

Re: Hoarding?

*Message #26 Posted by **bill platt** on 10 May 2011, 2:36 p.m.,*
in response to message #24 by Antonio Petri (UK)

Some people find the word, "ebay" so distasteful that they find other ways of expressing themselves. But it is also similar to TOS which has much more significance here.

in response to message #17 by Ren

I own both old and new 12C's as well as the newer 12C Platinum (2 x CR2032 cells). I can't speak to reliability as I have not had the new ones long enough and I don't use them enough anyway but I can tell you that they are FAST. I can also say that I have had no problems with the keyboards on either the 12C+ or the Plat and that I do like the keyboard feel.

*Message #31 Posted by **rav walia** on 10 May 2011, 1:10 p.m.,*
in response to message #16 by M. Joury

I don't think that I would be hoarding, but I would definitely be buying three. One for the office, one for home and a spare.

My hope would be that these would be released as some limited edition and then HP would release a 15C general edition.

Will this happen who knows, we've been waiting so long it seems that I don't want to tempt fate.

*Message #32 Posted by **geoff quickfall** on 10 May 2011, 3:08 p.m.,*
in response to message #31 by rav walia

Sitting in the cockpit last week on the way to Tokyo when the guy beside me pulled out a beat up 15C. Of course, I had to talk to him about it and pulled out my 71B, 42S and 15C.

Now I have to explain why I have 3 HP's in the flight bag:

```
1.  71B is a new toy that was just reconditioned and I was
    converting all 42S RPN programs into basic.
2.  42S was a replacement for the 41CX, my favourite, because it
    was not as buggy as the 41CX in the static environment of the
    cockpit.
3.  15C because it fits in the pocket and is just fun to play with!
```

So, after examining his, I noticed his program memory was empty. I went ahead and a programmed it with 15 routines applicable to our specific job. Gave him my overlay card and program outline notes. He played with it for the next few hours and on the way home. He bought it new in the eighties and uses for simple stuff, and now the complicated stuff.

He asked me if there was a replacement and I mentioned the used market and the value for a good example. He was stunned. I asked him if he would by a new replacement if one was available. His answer was YES, probably 2.

So, there is a market, even for non collectors and HP museum attendees.

Myself, at least 2, backup and spare just because of the projected speed of the machine. Currently a Great Circle, and Intermediate latitude programs take 30 seconds of "Running" prior to display! The 42S takes about 2 seconds, and doing the comparison of the standard:

```
LBL A
+
GOT A
```

With 1's loaded in the stack on the newest 12C I would suggest the answers will be instantaneous if they do reissue the calculator based on the newest 12C platform.

Does that make me a horder? No.

Cheers, Geoff

Hi Geoff!

> Quote:

> Sitting in the cockpit last week on the way to Tokyo when the guy beside me pulled out a beat up 15C ... He bought it new in the eighties ...

This must be long-haul flying then :-) Enough time to "pull out" things to play with and colleagues who were already born in the eighties. In my sector (comparatively short range business aviation), the guys next to me are all born in the nineties and if they find space somewhere in the cockpit for their bag, they pull out iPhones or iPads with very smart real-time GPS based aviation apps running on them. When my HP-15 sees those, it blushes with embarrassment and creeps back into it's pouch. No, there's definitely no market here for old or new 15Cs.

Personally, I'm not interested in a new 15C either. I have an original one that I don't like enough for actually using it (I always found grey LC displays awful and it dosen't have a proper CLx key either) and that I only keep for collecting purposes. And I can't imagine that the new 15 will become a collectible for a long time, even if only a limited number is made: There are simply not enough collectors!

Regards, Max

NB: I owe you an answer to a very old mail regarding a CompuCorp calculator. I made a mess of my emails then when trying to synchronise my two Macintosh notebooks and have only recently recovered a bunch of lost messages! Will be in the next few days!

> ...and it dosen't have a proper CLx key either...

To each his/her own. The design of the keyboard - even though the CLx key is shifted - is a model of efficiency and practicality. There is an excellent article worth reading (if you haven't done so already) by Valentin Albillo that elaborates on this called "Long Live the HP-15C". I cannot link to the original as there seems to be a problem with his website and the locked .pdf I have will not allow copy/paste. That article, along with his others, is a collectible too!

I for one, regard this calculator as one of the very best ever designed, notwithstanding its slow processor. A faster, à la 12C+, version would be of interest to me. Let's hope there will be some available to those of us who want one.

Jeff Kearns

Hi Max

*Message #35 Posted by **Geoff Quickfall** on 10 May 2011, 11:05 p.m.,*
in response to message #33 by Maximilian Hohmann

Heh heh (laughing)..

Long haul indeed, just finished a YVR - SYD turn with a layover in Sydney Australia (24 hours) ant then back to Vancouver.

```
YVR - SYD  15:38 in the air and 17 hour duty
SYD - YVR  14:24 in the air.
```

More then enough time to pull out the toys. Must say though, that with an augmented crew those legs included two; three hour rest periods in a nice bunk above business class. In fact, I get most of the book typing done in the bunk area during my 'rest' period.

As to the age of my fellow workers, the guys and gals on the B777 at Air Canada are all plus 50 (including me). The relief pilots are usually junior checking in at 40.

Yeah there are faster calcs with more power, but for my ops, a few subroutines without the need of alpha and the 15 performs. I bring the HP 71B and 42S because of the printer wow factor and alpha display and output formatting. In fact the 15C does quite well on it's own.

It would be nice to see a 15C with more memory, back light, alpha and timing clock abilities. Just a thought TIM!!!

Cheers, Geoff

>
> Cheers, Geoff

A 747 pilot told a cow-orker of mine years ago something to the effect that...

By the time a pilot has the seniority to join a 747 crew, and that a 747 is so much easier to fly, a pilot is at the age where their flying skills will rapidly decrease if not frequently used, and the 747 doesn't provide them with that opportunity!

Catch-22

Re: Hi Max

*Message #37 Posted by **geoff quickfall** on 11 May 2011, 5:03 p.m.,*
in response to message #36 by Ren

More of a problem of being to old to switch technology then skill level.

DC-8 to DC-10; 707-747. introduced master control panels and complex flight

directors along with simple programming of on board computers. As a result many good pilots with high standards could not transition to the different flight paradigms.

747 300 to 747 400's as with DC-10 to MD-11 removed flight engineers and simplified the cockpit for two man crews versus three man crews. This meant the computer took over the engineers seat. But this has added to the knowledge requirement and trouble shooting abilities of the crew.

So it is not a factor of ability to fly, but ability to transfer to new pardigms and technology. Many pilots retired by remaining on the older technology aircraft that they were familiar with.

Like anything, hang around and do not exercise the brain and it will deteriorate.

I don't find the 777 any easier to fly, yes more automation, but my training and ability is there for when the automation fails or is degraded. Six month exams (simulator), line checks, six month medicals are designed to catch and remove problems in ability be it physical or mental. Even a regular flight is considered a flight exam as anyone on the flight deck may note mistakes and must discuss and report depending on the severity of the error. We even have a check list with memory items that are designed to catch a degraded mental process in the air.

I look at the aircraft I have flown from ca. 1938 Beech 18's on floats to brand new 777's and see different skill sets for all of them.

You are correct that a long haul pilot may do three take off and landings a month whereas the 737 three take off and landings a day for 20 days. But that skill level was transfered to the 777 and is demonstrated continually.

> Quote:
>
> a pilot is at the age where their flying skills will rapidly decrease if not frequently used

So although at face value the above quote may have merit, in reallity it doesn't; for those that continually surpass all tests thrown at them be it a formal simulator, line check, medical or regular line flight.

Cheers, Geoff

*Message #38 Posted by **Dave Britten** on 10 May 2011, 4:53 p.m.,*
in response to message #32 by geoff quickfall

Sounds like HP would do quite well to run a few half-page advertisements in various trade and hobbyist publications, then, such as those for pilots, mechanical/industrial engineers, etc. Just include a nice large, clear photo of a 15C, and anybody reading that's fond of that model will be quickly drawn to it, and read the details of how to get a brand new faster one.

Re: Hoarding?

*Message #39 Posted by **Allen** on 10 May 2011, 8:59 p.m.,*
in response to message #38 by Dave Britten

I think HP also runs the risk of stumbling into an uncanny valley for calculators if the alleged 15C's are close in function but lack the quality of the namesake.

We have all that for the 12C+. If you contact Cyrille or Tim I'm sure that they'll send you the minimal SDK for it which contains all the keyboard and display mapping. I've already done some playing around with re-purposing the 12C+.

My problem with all these re-purposing projects is the keyboard labeling. Having the correct easy to read and impossible to rub off labels is critical for user-friendly calculator usage.

HP20b inert - how to get it working again?

*Message #1 Posted by **Jim Horn** on 9 May 2011, 5:58 p.m.*

Hello, all - I received the cable from Gene (thanks!) and, prior to trying the '34 code, decided to back up the flash to my PC. It connected fine but only read a file of all 1s. Oh well.

Meanwhile, now my 20b doesn't do anything. Fresh batteries still leave a blank display. Hooking up the cable isn't sufficient - running SAM-BA v2.10 refuses to connect with it.

So time to dig into piles of documentation. Meanwhile, any suggestions on (1) how to talk to it again and (2) how to get it running?

Many thanks to all!

Jim Horn, Cell 1-707-327-6253

*Message #2 Posted by **Jeff O.** on 9 May 2011, 9:48 p.m.,*
in response to message #1 by Jim Horn

Jim,
Did you try just pretending it is working and connect the cable, follow the normal button pushing sequence, start the software, etc.? I got my 20b into a blank, non-responsive state at one point and was able to revive it thusly.

Re: HP20b inert - how to get it working again?

*Message #3 Posted by **BobVA** on 9 May 2011, 11:41 p.m.,*
in response to message #1 by Jim Horn

Just in case you don't have the flashing documentation, Tim's step-by-step is linked in this thread.

I think Jeff's idea is excellent: just pretend it's working and follow those steps.

Good luck!

Bob

*Message #4 Posted by **Marcus von Cube, Germany** on 10 May 2011, 2:11 a.m.,*
in response to message #3 by BobVA

The ERASE button on the cable does what it says: It erases the flash. This clears the bit controlling

whether the built-in SAM-BA boot loader is started, a prerequisite for reflashing the device. With only the boot loader active, you can only use the flashing software to resurrect the calculator.

There is no way of extracting the original firmware because the only means of getting into SAM-BA mode is clearing the flash. You can get the original firmware from Tim.

in response to message #1 by Jim Horn

Thank you, all! I followed the original instructions using the flash image in the 20b Development Kit and have my calculator working again with Version 14.014. Now that I know I can get it back as a '20b again, I'll dive into the wp34s - can't wait!

Re: HP20b inert - how to get it working again?

*Message #8 Posted by **Marcus von Cube, Germany** on 10 May 2011, 6:23 p.m.,*
in response to message #7 by Jim Horn

Once you've repainted the keys, you'll need another 20b. ;-)

For serious use, the 30b is recommended. My development system is a butchered 20b but I've just ordered another 30b for a permanent brain transplant and some plastic surgery.

I'm thinking of "Letraset" transferable letters for the white key legends. Will that work?

Right now I am stuck with an inert 20b myself... I've tried three computers so far, two OS's (Vista and Seven), SAMBA v2.9 and v.10 but it won't connect. Ok, the manual says "Serial port must not be USB-serial converter." but one of the computers does have a real RS-232 port. The CR-2032 batteries have been replaced with fresh ones (but their voltages have now dropped from 3.15V down to 2.8V). Any idea? Thanks!

P.S.: I don't care about restoring the original firmware.

> The CR-2032 batteries have been replaced with fresh ones (but their voltages have now dropped from 3.15V down to 2.8V). Any idea? Thanks!

Gerson, that's bad news. :-(The current draw of SAM-BA is considerable as it does not make any power saving attempts. As soon as you turn on your calculator, it starts eating batteries. Remove them if you do not get the firmware loaded successfully.

I normally do the following: I start SAM-BA on the PC (using an FTDI equipped serial cable, in fact it's my Olimex JTAG adapter right now, but not its JTAG connector but its serial port). Wait until the connect prompt appears. You need to select the correct board type (at91sam7l128-ek) and the correct serial port.

Before I press Enter, I push the reset button on the cable, release it, and hold down ON for half a second or so. I then press enter on the PC to connect.

You can see some diagnostic output from SAM-BA if you start it from a Windows command prompt and redirect the output to a file. I'm using sam-ba.exe V 2.10. The command line is

```
sam-ba.exe >log.txt
```

Re: HP20b inert - how to get it working again?

*Message #15 Posted by **BobVA** on 17 May 2011, 5:52 p.m.,*
in response to message #13 by Gerson W. Barbosa

Hi Gerson:

Unfortunately Vista & Win7 are a no-go with SAM-BA 2.10 and the serial connection on the HP 20/30. You'll need to find a machine with XP to reflash the calculator.

In this thread Katie reported success with Sam-BA 2.6 + a patch under Win 7, so if you can't use XP, you might try that.

I've not had any problems using a USB-serial cable, your mileage will vary depending on the chip set. If you can start with a hardware RS-232 port that may eliminate one variable if you need to troubleshoot

Good luck!

Bob

Bob and Marcus,

Thanks for your responses. I tried MySamba on Windows 7 (compatibility mode set to WinXP) and real RS-232 port, but it was unable to connect. Perhaps because the batteries are low (2.75 V). I'll try again later with fresh batteries.

Gerson.

Re: HP20b inert - how to get it working again?

*Message #17 Posted by **Marcus von Cube, Germany** on 18 May 2011, 8:50 a.m.,*
in response to message #16 by Gerson W. Barbosa

I don't think the batteries are the problem even if the cable itself draws some power, so its best to leave it disconnected when not in used.

Two points:

1/ Use the SAM-BA.EXE executable, not the alternate version!

2/ Redirect its output to a file and post the results here. You need to go to the command line to do this.

Re: HP20b inert - how to get it working again?

*Message #18 Posted by **BobVA** on 18 May 2011, 7:58 p.m.,*
in response to message #16 by Gerson W. Barbosa

Compatibility mode won't do it, I'm afraid. V2.10 really, really wants XP to operate.

If you have Win7 Pro or Ultimate you can try the XP virtual machine. I've had that sort out driver issues, but don't have it any more so I can't try it with SAM-BA.

Regards, Bob

wp34s / 16C Compatibility Items #2 and #3

*Message #1 Posted by **Jake Schwartz** on 9 May 2011, 1:12 p.m.*

Hi,

As I have been continuing through the HP16C manual, exercising the examples with the wp34s (currently with version 843), two additional items were encountered:

1. Pages 40-41 discuss the Out-of-Range flag with respect to the arithmetic operations, and it mentions that "when a result is out-of-range, the lower bits ...of the full answer will be returned. If the operations was multiply or divide in 1's or 2's Compliment mode, the most significant bit (sign bit) returned will match the sign bit of the full answer." At the top of page 41 is an example where with 2's compliment mode and word size 16, the decimal number 32767 is entered, followed by [2] [multiply] and the result on the 16C is decimal 32766 with the out-of-range flag set. On the wp34s, the result displayed is "-2" decimal. This would represent the entire lower 16 bits of the result (65534), had the word size been large enough to hold the entire result. It would seem important to me to preserve the sign of the result, like in the 16C.

2. In this same section, there is discussion of the absolute value function (ABS). It appears, however, that ABS does not apply to integers in the 34s, both from trying it out and from reading the manual's Index of Operations. Would it be possible to extend ABS to be relevant to integers as well?

Thanks,

Jake

in response to message #1 by Jake Schwartz

Hi Jake,

Thanks for testing. Again, both calculators obviously do not match. I agree on ABS should work for integers, too, unless in UNSIGN. Our software maintenance division is asleep now, however, so I ask for your patience.

Walter

Is there any reason the absolute value shouldn't work in unsigned mode as well? I should think the implementation would be quite simple.

*Message #4 Posted by **Walter B** on 9 May 2011, 3:47 p.m.,*
in response to message #3 by Kiyoshi Akima

By definition, the unsigned mode uses all bits for the mantissa and *none* for the sign. So there can't be negative numbers ...

Exactly. The absolute value should leave the number unchanged. It should not give an error, or the number of steps needed by Ulam's conjecture to reach one, or any other number.

in response to message #6 by Jake Schwartz

As you've probably already seen: If you are using the hardware port, please update. I had to fix some nasty bugs in the last few days.

As for ABS in integer unsigned mode: If it doesn't through an error, everything is fine as ABS is a NOP here. I agree that in the signed modes, ABS should be implemented.

Should ABS be a NOP? Shouldn't it set LASTx?

Re: wp34s / 16C Compatibility Items #2 and #3

*Message #9 Posted by **Paul Dale** on 10 May 2011, 2:53 a.m.,*
in response to message #8 by Kiyoshi Akima

It sets last x.

It also terminates digit entry and sets stack lift.

i.e. all the usual things you'd expect of a single value single answer function.

*Message #11 Posted by **Paul Dale** on 9 May 2011, 5:50 p.m.,*
in response to message #1 by Jake Schwartz

I'm confused. ABS is implemented for integers and I just checked it on my 30b and it appears to work fine.

The minus sign is shown way off to the left in base ten only. The base ten only part is correct, the sign placement is silly & I'll see about a fix.

Fixing the sign problem will be more involved. The basic arithmetic operations work a bit differently to most others in the way they handle the numbers -- needed for overflow and carry computation without resorting to assembly.

*Message #12 Posted by **Jake Schwartz** on 9 May 2011, 9:06 p.m.,*
in response to message #11 by Paul Dale

Hi Pauli,

> Quote:
>
> I'm confused. ABS is implemented for integers and I just checked it on my 30b and it appears to work fine.

I was working with the reflashed 30b at my work before and I am now trying it on my reflashed 20b at home. It appears to work with 1's compliment mode, but not 2's compliment mode. For instance, in 1's compliment mode with WSIZE at 16 bits and base decimal, if you enter 252 +/- ENTER, then |x| changes the sign from negative to positive. Now change it to 2's compliment mode and re-enter 252 +/- and press |x| and the sign does not change to positive.

Thanks, Jake

OT - Vintage Computer Festival East

*Message #1 Posted by **David Hayden** on 8 May 2011, 12:52 p.m.*

The Vintage Computer Festival will be held next weekend in Wall NJ at the site of the Marconi radio receiving station. I went a couple of years ago and it was really fun. They have a computer mueseum, a radio museum and all sorts of vintage stuff.

See link here.

Unfortunately I can't go myself this year due to preparations for a wedding at our house the following weekend.

Dave

OT ->Tim Wessman: TI-Nspire current draw

*Message #1 Posted by **Joerg Woerner** on 8 May 2011, 12:07 p.m.*

Hi Tim,

It is already a week since I promised you to measure the current of the TI-Nspire. With my mother in Germany, my wife in North Carolina and me in Up-state New York it was a nice Sunday morning to solder a current probe ;-))

Please remember that the Nspire uses 4 1.5V batteries:

Calculator off: 0.4 mA

Booting: 30...35 mA

"Idle" 7...10 mA

"Redrawing" 15...25 mA

"Heavy typing" 15...30 mA

"Typical use" 10...20 mA

Hope this helps.

Have a great Sunday and treat your wife accordingly!

Regards, Joerg

HP-9114A Drive

*Message #1 Posted by **aj04062** on 7 May 2011, 11:24 p.m.*

Can anyone tell me if 4 D Cell batteries provide enough power to test the function on one of these?

I know the lead acid battery is toast so I hooked up 4 D's to it in a tray. It is a bit livelier than before, but the power light always blinks and the fault light stays on.

Power does sag below 6V (about 5.3V) when the test runs. Is that too low?

The case is open and I notice the drive does not spin. If the head is moved off home, it does return, but that's it.

Re: HP-9114A Drive

*Message #2 Posted by **Gerson W. Barbosa** on 8 May 2011, 12:31 a.m.,*
in response to message #1 by aj04062

I tried both a 6V-1A and a switched 6V-2.8A power source but I haven't succeeded. I haven't noticed any voltage sag in the latter, but I was told the voltage has to be greater than 6.0V.

Edited: 8 May 2011, 12:31 a.m.

Re: HP-9114A Drive

*Message #3 Posted by **Paul Berger (Canada)** on 8 May 2011, 11:50 a.m.,*
in response to message #1 by aj04062

Looking at the schematic created by Tony Duell I would suspect that if it sags down to 5.3V that the -PWR OK signal would go inactive this would likely inhibit much if the operation of the drive. I do not have a 9114A but on the 9114B the state of this signal is checked before most operations involving the diskette drive, I would not expect the 9114A to be a lot different. The schematic can be found at http://www.hpmuseum.net/document.php?hwfile=2718. As you may know the B model has 3 LEDs on the front that indicate the battery state, when connected to 6V only two of the 3 come on however when connected to 7.5V all 3 come on. The 6V supply I used is rated for 1.8A and would operate the the dive without issue however I did notice that when the motor started the voltage would sag a bit and one more light would go out. The 7.5V supply is rated for 2.5A and I do not notice any significant voltage sag with it. It seems the general consensuses is that a supply rated for at least 2A is required for operation without a battery pack.

in response to message #1 by aj04062

I'll check it.. But I think there are 04 batteries (4 x 1,2 V = 4,8V). Be carefull with excess of charge...

Re: HP-9114A Drive

*Message #5 Posted by **Paul Berger (Canada)** on 8 May 2011, 6:21 p.m.,*
in response to message #4 by dinamarco

The 9114s use a pack with 3 lead-acid gel-cells which have a nominal voltage of 2V per cell however when fully charged they go a little beyond that, which is likely why on a B you do not get full battery indication at 6V. Looking at the schematic for the B the full light would come on when battery is at about 6.3V. If the batteries that where used where alkaline batteries with a nominal cell voltage of 1.5V then 4 would equal 6V however alkaline batteries can only provide around one 1A of current which is likely why the voltage sagged so much. Five NiMH or NiCd cells would work better with a nominal cell voltage of 1.2V each and capable of a lot more current output that alkaline batteries.

in response to message #5 by Paul Berger (Canada)

Thanks guys for leading me straight. I look all over to find a charger that would provide this power. I finally found one from my old Panasonic camcorder. Haven't used it in years. Now it's good for something.

It works and passes self test now. Now, I'm trying to format a disk. I activated the external drive (the 9114A) on the HP 110 laptop and everything seems to work as expected except it will not format a disk. I found 2 old Standard Density disks. I know I read that HD will not work.

Can anyone tell me what the right disk is? 720 KB Single Density?

Edited: 8 May 2011, 9:38 p.m.

Re: HP-9114A Drive

*Message #7 Posted by **Paul Berger (Canada)** on 8 May 2011, 10:33 p.m.,*
in response to message #6 by aj04062

720K diskettes are the right ones. That is the formatted capacity, several of the diskettes I have are marked 1MB Double sided on the shutter. The 720K diskette is not single density, it is a double sided double density format the 1.44MB diskettes that came along later are usually refer to as high density diskettes, and I have heard of them being successfully in 9114 drives, however the composition of the oxide coating on the diskette is different so results may vary and it may take a couple tries to get them to format clean, but I have not tried it as I still have a large quantity of 720K diskettes. What happens when you try to initialize a diskette? Is there an error message?

Re: HP-9114A Drive

*Message #8 Posted by **aj04062** on 9 May 2011, 12:22 p.m.,*
in response to message #7 by Paul Berger (Canada)

I am not at the computer right now, so I am going by memory from last night.

The disk intitializes and the head travels back and forth (I know this as the cover was off) several times.

I tried several times. I thought it could have been from the read/write slider being in the wrong position, but I don't think that is the case.

One or two times it seemed to step slowly across the disk.

In either case, I believe it ended with a message such as "bad media" or "unable to format, Abort, Retry or Ignore?"

I tried formatting @ 720k on an old laptop I had and that didn't work, the drive didn't recognize the disk. I am going to clean the head tonight. I do have an old floppy disk cleaning kit.

*Message #9 Posted by **M. Joury** on 9 May 2011, 2:46 p.m.,*
in response to message #8 by aj04062

Hi,

I am using 1.44 MB (2.0 unformatted) disks on both my 'A' and 'B' models. The trick is to format them on a computer first. Unfortunately I can't remember the exact options but it is something like: format A: /F:720. Now the bad news... I think that you have to have a Windows 2000 or earlier OS to accomplish this. Per MS Windows XP (and I would assume the same is true for Vista / 7) will not accept the /F:720 switch. See MS Support

A little bit of hunting came up with this:

How to format 720 KB diskette on WIndows XP.

See if this works for you. I would try it myself but my diskette drive is turned off in the BIOS and I can't reboot at the moment.

And finally, here is a source for the rechargeable battery if you need it. I replaced all 3 of mine recently and they appear to work fine. Usual disclaimers apply:

9114 replacement battery

Re: HP-9114A Drive

*Message #10 Posted by **Eric Smith** on 9 May 2011, 3:30 p.m.,*
in response to message #7 by Paul Berger (Canada)

For 3.5" disks, the difference in coercivity of the medium is relatively small, 600 vs. 750 Oe for standard vs. high density. Formatting them for the "wrong" density will generally work, though I wouldn't do it myself except in an emergency. The coercivity of extended density 3.5" disks (2.88MB format) is 900 Oe, but they are extremely rare (at least in the US).

For 5.25" disks, the difference is 300 Oe vs. 600 Oe, and formatting them at the wrong density (in either direction) is extremely unreliable. Note that the so-called "quad density" is actually double-density with higher track pitch, so you need standard density media for that, not high-density.

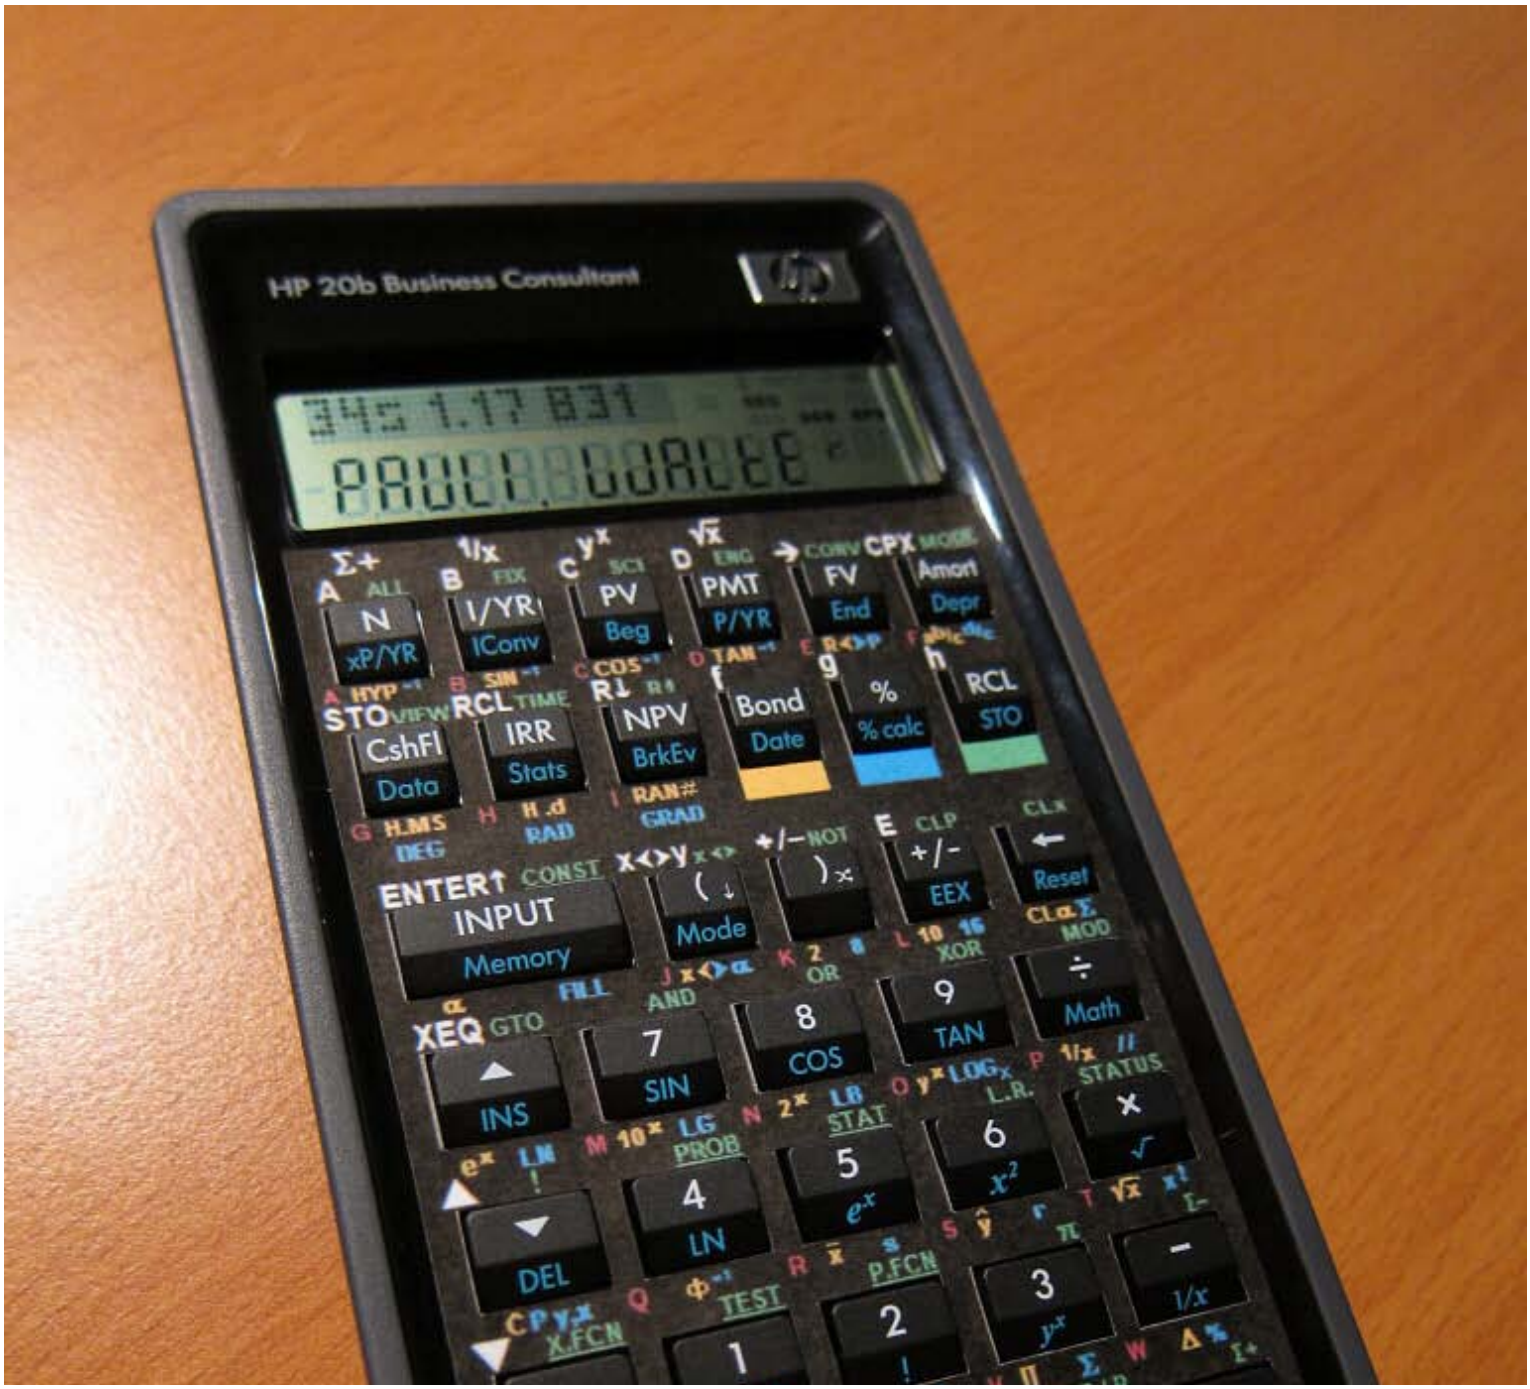
34s Keyboard Overlays

*Message #1 Posted by **Eric Rechlin** on 7 May 2011, 8:04 p.m.*

I just bought an electronic die cutter so I can cut professional quality overlays for calculators.

As my first test of it, I printed the 34s overlay on plain copier paper, ran it through the cutter to cut out the keys, and set it on the calculator:



My next step is to experiment with different materials, and also with sticking new legends directly on the keys. Maybe some of you might be interested in having an overlay made for your calculator? I hope to have something more interesting to demonstrate within a week or two.

Eric

in response to message #4 by exschr

There's the Craftwell eCraft, the USCutter MH, the Black Cat cutters, the BossKut Gazelle, and the Silhouette SD, all of which are well under $1000.

It's this last one, the Silhouette, that I bought. It's actually one of the cheapest, but it got good reviews and seems to work pretty well. It won't cut thick stock, like cardboard, but ones that will do that cost more like $700.

Re: 34s Keyboard Overlays

*Message #8 Posted by **Raymond Del Tondo** on 7 May 2011, 9:34 p.m.,*
in response to message #1 by Eric Rechlin

Nice thing, this cutter:-)

Apart from that, the overlay is way too full for my taste. Letters everywhere, in five different colors. Heavily cluttered keyboard layouts like these were the reason for HP to look for a different way of user interface.

One can hardly see the most important numeric and arithmetic keys.

Another thing: To turn the unit off, one has to press the blue key _near_ (but not next to) the top right corner, and then the ON key on the bottom left corner. Is there any other HP calc where the key combination for turning off the unit is that crazy? If it were the green key (at the right edge) it would at least ease turn-off: Right

edge - left edge.

I think it would be better if the shift key for turning off the unit would be next to the ON key, like on the unmodified 20b/30b, and all Pioneer series calcs.

Even better would be an unshifted ON/OFF key. The Clear Entry (CE) key is very similar to the CLx key, or a longhold backspace key . The code behind the key would have to check whether data entry was active, and act accordingly.

I'd prefer a less cluttered keyboard layout with fewer key legends.

IMHO The original 30b looks much better with the reduced original keyboard overlay.

Don't get me wrong: You did a great job to create the wp34s.

But the overloaded keyboard overlay reminds me of the early Casios and Sharps of the Eighties...

Re: 34s Keyboard Overlays

*Message #9 Posted by **Eric Rechlin** on 7 May 2011, 10:30 p.m.,*
in response to message #8 by Raymond Del Tondo

It looks a lot better and less cluttered when you move the labels onto the keys, as the emulator uses, and that's how my overlays will work, assuming I can get the durability issue resolved:

For my overlays, I am considering moving the Sigma+, 1/x, y^x, and SQRT key labels to be directly on the keys rather than above, since there's no need to have a duplication of the letters. Or is there a good reason to show A, B, C, and D directly on the face of the keys?

(I haven't played around enough with the 34s to know for sure.)

The only annoyance is this overlay won't look as good on the 30b as it does on the 20b, because of the metalized plastic of the calculator, which is unfortunate since the 30b's keyboard is so much better than the 20b's keyboard.

Re: 34s Keyboard Overlays

*Message #10 Posted by **Gerson W. Barbosa** on 7 May 2011, 11:18 p.m.,*
in response to message #9 by Eric Rechlin

From Cyrille, in the HP-20b Development Kit Readme file:

"If you represent a company that has a need for large volumes, please contact cyrille@hp.com as HP might be able (depending on the cases) to make a special manufacturing run with your program pre-loaded and/or modification to the calculator color and artwork."

I wonder what a large volume might be. 200? 500? 1000? In the olden days HP would sell blank key calculators and overlays and burn eprom memory modules, the PPC ROM being an example. How many of them were produced?

Re: 34s Keyboard Overlays

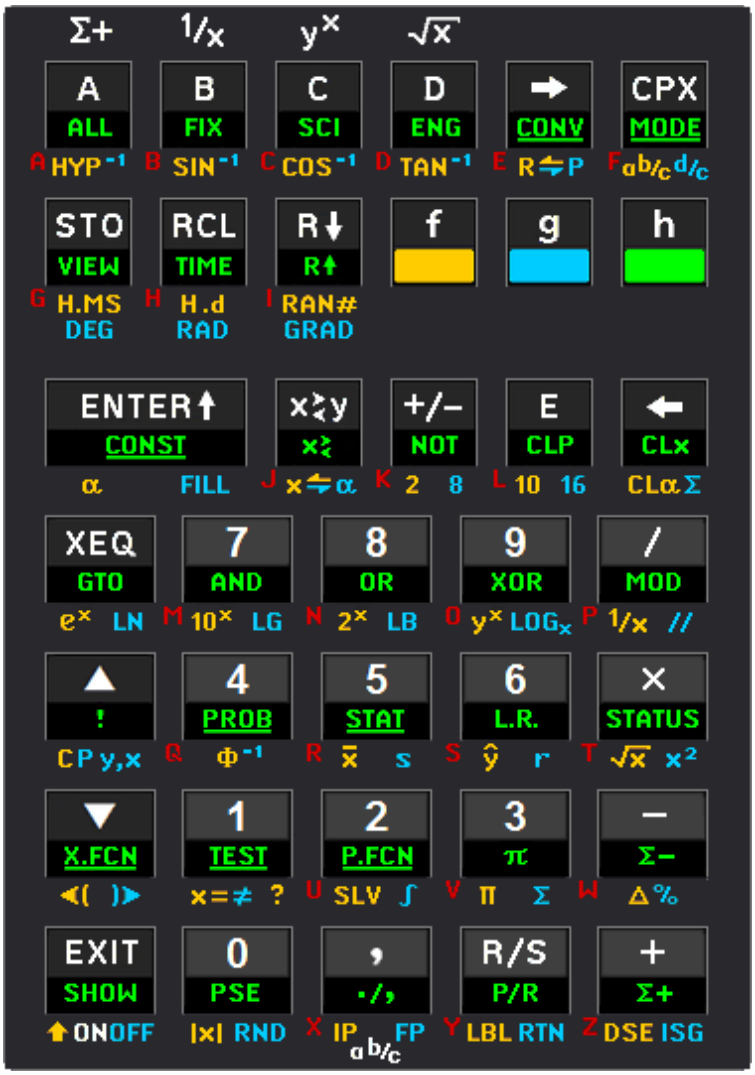
*Message #13 Posted by **Walter B** on 8 May 2011, 2:37 a.m.,*
in response to message #9 by Eric Rechlin

Eric, all,

Testing it on different printers, I found an alternative may result in better prints (on paper at least):



I mentioned this earlier already, but it may have slipped your attention.

With respect to the keys A ... D, Eric, you're right from a logical point of view. The primary purpose of these keys, however, is serving as hotkeys for whatever functions or programs you want to bring up to the surface. Please note Sigma+, 1/x, y^x, and SQRT are all accessible as shifted functions as well on the bottom half of the layout - so there will be no loss of accessability if you redefine some of the hotkeys. Compare the HP-65 or 67.

> Quote:
>
> The only annoyance is this overlay won't look as good on the 30b as it does on the 20b, because of the metalized plastic of the calculator, which is unfortunate since the 30b's keyboard is so much better than the 20b's keyboard.

I'd suggest you cover the display window (for obvious reasons) and the key area (for safety, don't want to have paint on the electronic parts) with some tape and "paint it black" (it = parts of the metallized surface still accessible).

Walter

The latter would cost one complete primary function, a waste of keyboard space IMHO :(With an LCD calculator, there's little need for manually turning it off at all - just wait for auto-shut-down :)

> Quote:
>
> The Clear Entry (CE) key is very similar to the CLx key, or a longhold backspace key . The code behind the key would have to check whether data entry was active, and act accordingly.

In already for long. If you don't mind, please check the manual.

> Quote:

Come on, create one! But remember you get the credit for a complete layout only :) Looking forward to your upcoming results,

Walter

Re: 34s Keyboard Overlays

*Message #17 Posted by **BobVA** on 7 May 2011, 11:21 p.m.,*
in response to message #1 by Eric Rechlin

I printed an overlay on a small inexpensive dye sublimation photo printer (i.e. the type for 4x6 inch prints). Since it's a photo printer the result looks very nice, and the paper is relatively durable. This particular model puts a final transparent coat over the print for UV stability, which I think also provides some wear protection.

So, long way of saying you might give photo paper a try. (I'm guessing dye sub will be more durable than ink jet, but not sure.)

Your die cut results look really, really nice (particularly compared to my work with a hobby knife!)

Regards, Bob

in response to message #17 by BobVA

Yes, those do do a nice job.

I am using an inkjet printer that uses pigment-based ink, rather than the more typical dye-based, which makes it water resistant even on plain paper.

I ordered a couple different kinds of inkjet-safe adhesive vinyl, and I also bought a special spray that is supposed to make it more durable, so when those arrive (possibly as early as Tuesday) I will be able to experiment to see how well it all works. I am also concerned with oil resistance (from fingers) and physical wear.

The ink from this printer is surprisingly durable even on plain copier paper. I have tried to damage it with water, isopropanol, and even brake cleaner, and nothing so much as even smears it.

Re: 34s Keyboard Overlays

in response to message #18 by Eric Rechlin

I laminated the overlay I did (half laminate, half adhesive). This seems to be very durable even on the key tops.

in response to message #19 by Paul Dale

If you are using the overlay only solution of mine, the one presented here in the opening post, it looks much better if you get rid of the original key markings. An Edding pen isn't very wear resistant though, grinding may be much better.

in response to message #20 by Marcus von Cube, Germany

Heh, heh, here Pauli's Dremel comes into play again :) We had this topic some weeks ago already ...

Re: 34s Keyboard Overlays

*Message #22 Posted by **Paul Dale** on 8 May 2011, 4:02 a.m.,*
in response to message #21 by Walter B

:-)

It ought to be possible to remove the labels chemically using a cotton bud and some kind of solvent or paint stripper. This would give a nicer finish I think.

I'll try this route when I convert my other 30b.

The 20b converts much better with a rotary tool, the keys can be individually removed from the case with ease.

- Pauli

Re: 34s Keyboard Overlays

*Message #23 Posted by **Marcus von Cube, Germany** on 19 May 2011, 6:55 a.m.,*
in response to message #22 by Paul Dale

Don't use paint remover on the keys! I tried it on one key only to notice that the paint is much more resistant to the solvent than the plastic used for the keys. :-(

I've resorted to black enamel paint for the job on my newly acquired 30b. Due to my experiments with paint remover, the top left key looks a bit battered now.

Re: 34s Keyboard Overlays

*Message #24 Posted by **Paul Dale** on 19 May 2011, 7:15 a.m.,*
in response to message #23 by Marcus von Cube, Germany

A commercial paint stripper or neat caustic soda?

The latter doesn't usually damage plastics and it takes paint off really well.

- Pauli

Re: 34s Keyboard Overlays

*Message #25 Posted by **Marcus von Cube, Germany** on 19 May 2011, 7:36 a.m.,*
in response to message #24 by Paul Dale

It's a commercial paint stripper. Not recommended. I didn't try any other substances.

> Maybe some of you might be interested in having an overlay made for your calculator?

I would be very interested in an overlay for the 50g that is similar in function to the ones for the 41 series. More specifically, I'm thinking of something that has the existing key functions printed on it, but also comes with small stick-on labels that you can write on. I'd use this with user-assignable keys to create custom keyboard layouts for different functions (one for programming, one for statistics work, one for calculus, etc.). The stick-on labels let you play around with different layouts. Once you have something that you really like, maybe you'd buy a few custom printed ones from Eric.

Dave

HP-15C mini-challenge (Project Euler - problem #1)

*Message #1 Posted by **Gerson W. Barbosa** on 7 May 2011, 8:00 p.m.*

The first Project Euler problem is

If we list all the natural numbers below 10 that are multiples of 3 or 5, we get 3, 5, 6 and 9. The sum of these multiples is 23. Find the sum of all the multiples of 3 or 5 below 1000.

The challenge is to solve this one on the HP-15C (or HP-11C) in 30 seconds or less. Have fun!

Re: HP-15C mini-challenge (Project Euler - problem #1)

*Message #2 Posted by **Gerson W. Barbosa** on 7 May 2011, 11:00 p.m.,*
in response to message #1 by Gerson W. Barbosa

Forget about it! My solution uses essentially the same formula in the reference article and is not as fast as it could be. Other interesting problems in the list, but I fear the HP-15C is not a good tool here (at least the ordinary 15C...)

http://projecteuler.net/index.php?section=problems

Re: HP-15C mini-challenge (Project Euler - problem #1)

*Message #3 Posted by **Namir** on 7 May 2011, 11:54 p.m.,*
in response to message #2 by Gerson W. Barbosa

Bummer! I was working on a solution that does NOT uses loops. The sum we seek is:

sum = sum of 3 and multiples in range 3 to 999 + sum of 5 and multiples in range 5 to 999 - sum of 15 and multiples in range 15 to 999

I calculate each sum using the same basic approach Gauss used to calculate the sum of integer sequences--no loops needed.

Namir

> Quote:
>
> I calculate each sum using the same basic approach Gauss used to calculate the sum of integer sequences.

Yes, I remembered Gauss's approach too but was not clever enough to find a formula in terms of n only (and not to notice the one in my own reference was better :-)

```
S =  n1*(n1 + 3)/6 + n2*(n2 + 5)/10 - n3(n3 + 15)/30

where
n1 = greatest divisor of 3 <=  n;
n2 = greatest divisor of 5 <= n;
n3 = greatest divisor of 15 <= n

if n = 999, then n1 = 999, n2 = 995 and n3 = 990
```

Regards,

Gerson.

*Message #5 Posted by **Katie Wasserman** on 8 May 2011, 9:23 a.m.,*
in response to message #4 by Gerson W. Barbosa

The 12C+ makes this easy. The "brute force" method comes up with the answer in under 7 seconds.

Re: HP-15C mini-challenge (Project Euler - problem #1)

*Message #6 Posted by **C.Ret** on 8 May 2011, 4:13 p.m.,*
in response to message #4 by Gerson W. Barbosa

Thank you for the formulae.

At first glance, I was surprise by the divisor (6, 10 and 30), since using my own production I use the multiplier 3x, 5x and -15x, not the divisor, until I realise that what you use k and n the opposite way I used !

I also have trouble with the limit, here 1000. Due to the example give for natural integers below 10, we have to understand that we have to consider only integer strictly below 1000. This makes a difference, since 1000 is a multiple of 5.

999/3 is 333, we have 333 multiples of 3 from in the set (from 0 to 1000 exclude). The sum of all these multiple of 3 is SUM_3 = 3x(333.(333+1))/2

999/5 is 199.8, we have 199 multiples of 5 in the set. The sum of all these multiple is SUM_5 = 5x(199.200)/2

999/15 is 66.6, we have 66 multiples of 15 in the set. The sum of all these multiple of both 3 and 5 have to be substrated from the total, to avoid twiced counts. That why I put a minus sign in from of it : SUM_-15 = -15x(66.(66+1))/2 = -33165

Here is the time to generalize the method:

Since I have no HP15C at hand, here is a cool code for HP41C, reader of this forum main easely convert it or adpted it for an HP15C.

```
01 * LBL "EULER
02   "UPPER LIM
03   PROMPT            @ User enter upper limit (ie 999)
04   1
05   -                 @ may have a DSE X spare a prgm step here ?
```

```
06   STO 00
07   0                  @ init Total SUM
08   LBL 01             @ HP display current sum of multiple
09   STOP               @ User enter next multiple to add (+k)
                           Or to substract (-k)
10   RCL 00
11   RCL Y
12   ABS                @ throw sign away !
13   /
14   INT                @ for positive numbers, IP or INT is FLOOR (not CEIL)
15   *
16   LastX
17   1
18   +
19   *
20   2
21   /                  @ compute SUM_k
22   +                  @ add or substratc it to Total
23   GTO 01
```

Usage: EXQ “EULER
Enter upper limit : 1000 and press [R/S]
Enter first multiple to add in sum : +3 and press [R/S]
The calculator display intermediate summation: 166833
Enter second multiple to add in sum : +5 and press [R/S]
The calculator display intermediate summation: 266333.
Enter co-multiple to subtract from sum : 15 [CHS] and press [R/S]
The calculator display expected result: 233168.

Note that it is so easy to get the sum from the 10000 first integers or 500000 as well sum of other multiple.
For example: To find the sum of all the multiples of 3, 5 or 7 below 10000.

EXQ “EULER
ENTER: 1 [EEX] 4 press [R/S]
Calculator display 0.0000
ENTER: 3 press [R/S], the calculator display intermediate summation: 16668333.
ENTER: 5 press [R/S], intermediate sum: 26663333.
ENTER: 7 press [R/S], intermediate display : 33805475.
ENTER: 15 [CHS] [R/S], intermediate corrected sum: 30473810.
ENTER: 21 [CHS] [R/S], intermediate corrected sum: 28089764.
ENTER: 35 [CHS] [R/S], intermediate corrected sum: 26663339.
ENTER: 105 [CHS][CHS] [R/S], note that this last (double)-multiple have to be add, not substract from the current sum.
The calculator display expected sum of all the multiples of 3, 5 or 7 below 1000 : 27142139.

P.S.: An alternative version for HP41, using stack manipulation and no register:

```
01 LBL 'EULER        @ user enter upper limit (ie 1000) in x:
02 DSE X
03 0
04 LBL 01            @ upper lim in y: and current sum in x:
05 STOP
06 RCL Z
07 X<->Y
08 ST/ Y
09 x<->y
10 ABS
11 INT
12 *
13 LASTX
14 ISG X
15 SF 00              @ any operation there, always skipped
16 *
17 2
```

```
18 /
19 +
20 GTO 01
```

Re: HP-15C mini-challenge (Project Euler - problem #1)

*Message #7 Posted by **Gerson W. Barbosa** on 8 May 2011, 8:36 p.m.,*
in response to message #6 by C.Ret

Here is an HP-15C version of your short and versatile program:

```
001- f LBL B
002- STO 0
003- 0
004- f LBL 6
005- R/S
006- RCL 0
007- x<>y
008- /
009- g LSTx
010- x<>y
011- g ABS
012- g INT
013- *
014- g LSTx
015- 1
016- +
017- *
018- 2
019- /
020- +
021- GTO 6
```

Usage is the same, except that it now sums up to n, not to n-1.

Example: Find the sum of all the multiples of 3 and 5 up to 180,000.

```
 keystrokes               display

180000 GSB B               0.000000000
3 R/S                  5,400,090,000.
5 R/S                  8,640,180,000.
15 CHS R/S             7,560,090,000.
```

I'd written a generalized program myself (n>14), only to discover the formula at wikipedia would allow for a faster and shorter program. Anyway, here it is:

```
001- f LBL A            019- g x=0              037- +                  055- +
073- f LBL 2
002- STO 0              020- g GSB 2            038- g LSTx             056- g
LSTx             074- g F?2
003- 0                  021- RCL 0              039- *                  057- *
075- g RTN
004- STO 4              022- 1                  040- 6                  058- 3
076- RCL 0
005- g CF 1             023- 5                  041- /                  059- 0
077- STO 2
006- g CF 2             024- /                  042- STO 5              060- /
078- 1
007- g CF 3             025- f FRAC             043- 5                  061-
STO+ 5             079- STO+ 4
008- f LBL 0            026- g x=0              044- RCL 2              062-
RCL 5              080- g SF 2
009- RCL 0              027- g GSB 3            045- +                  063- g
RTN              081- g RTN
010- 3                  028- 3                  046- g LSTx             064- f
LBL 1            082- f LBL 3
011- /                  029- RCL 4              047- *                  065- g
F?1              083- g F?3
012- f FRAC             030- g TEST 5  @ (x=y)  048- 1                  066- g
```

```
RTN               084- g RTN
013- g x=0              031- GTO 4              049- 0                  067-
RCL 0               085- RCL 0
014- GSB 1              032- f DSE 0            050- /                  068-
STO 1               086- STO 3
015- RCL 0              033- GTO 0              051- STO+ 5             069- 1
087- 1
016- 5                  034- f LBL 4            052- 1                  070-
STO+ 4              088- STO+ 4
017- /                  035- 3                  053- 5                  071- g
SF 1              089- g SF 3
018- f FRAC             036- RCL 1              054- RCL 3              072- g
RTN               090- g RTN
```

Example:

```
180,000 GSB A    ->    7,560,090,000.    ( ~ 8 seconds)

    999 GSB A    ->    233,168.0000      ( ~ 29 seconds)
```

Perhaps someone would be willing to use the formula in the wikipedia article. It might well fit in the HP-25C or HP-33C/E :-)

Regards,

Gerson.

Re: HP-15C mini-challenge (Project Euler - problem #1)

*Message #8 Posted by **Namir** on 9 May 2011, 12:06 p.m.,*
in response to message #7 by Gerson W. Barbosa

If we "upgrade" the problem to say **calculate the sum of all numbers up to 1000 that are multiples of 3, 5, AND 7**, does it complicate matters greatly or can we use the Wikipedia functions as follows:

```
Sum = sum_3(1000) + sum_5(1000) + sum_7(1000) -
      { sum_15(1000) + sum_21(1000) + sum_35(1000) + sum_105(1000) }
```

In calculating sum_105(1000) will there be duplicates with sum_15(1000), sum_21(1000), and sum_35(1000)?

If we expand the set of numbers further to be multiples of 3, 5, 7, and 11, things get more complicated, making a solution that uses a loop easier to implement albeit at the cost of additional CPU time.

Namir

> If we "upgrade" the problem to say **calculate the sum of all numbers up to 1000 that are multiples of 3, 5, AND 7**, does it complicate matters greatly or can we use the Wikipedia functions as follows:

```
Sum = sum_3(1000) + sum_5(1000) + sum_7(1000) -
      { sum_15(1000) + sum_21(1000) + sum_35(1000) +
sum_105(1000) }
```

Namir,

That's what I would have done myself too. It appears, however, the correct formula is

```
Sum = sum_3(1000) + sum_5(1000) + sum_7(1000) + sum_105(1000) -
      { sum_15(1000) + sum_21(1000) + sum_35(1000)  }
```

Using C.Ret's program, which uses the Wikipedia formula, I get

```
1000 GSB B              0.000000000
3 R/S                   166,833.0000.
5 R/S                   267,333.0000.
7 R/S                   338,404.0000.
15 CHS R/S              305,239.0000.
21 CHS R/S              281,551.0000.
35 CHR R/S              267,341.0000.
105 R/S                 272,066.0000.
```

That's what I get on the HP-71B, using the brute force program:

```
10 DESTROY ALL
20 T=0
30 FOR N=1 TO 1000
40 IF MOD(N,3)=0 OR MOD(N,5)=0 OR MOD(N,7)=0 THEN T=T+N
50 NEXT N
60 DISP T
>run
 272066
```

Any explanation?

Regards,

Gerson.

Re: HP-15C mini-challenge (Project Euler - problem #1)

*Message #10 Posted by **C.Ret** on 9 May 2011, 3:51 p.m.,*
in response to message #9 by Gerson W. Barbosa

> Quote:
>
> Any explanation?

Yes, of course. The explanation is really simple.

In the case with only two multiples *a* and *b*, the 'Wikipedia Formulae' allow to compute the sum of all multiple bellow *m*:

a [R/S] add the sum of multiples of *a* below *m*, included also the multiples of *a.b* (simultaneous multiples of *a* and *b*) which are a part of the multiples of *a*.

b [R/S] add the sum of multiples of *b* below *m*, included also multiples of *a.b* (simultaneous multiples of *a* and *b*) which are a part of the multiples of *b*.

As **Marcus von Cube** explain it, this make the multiples of *a* and *b* to be count twice and the resulting sum over-estimate the correct sum. That why we have to correct it by subtracting one time the sum of multiples of *a.b* by entering a.b [CHS] [R/S] in the summation process.

When considering three multiples, the same phenomena occur again. But this time, we have to considerer more interactions by correcting the twiced counts of binomial *a.b*, *a.c* and *b.c* multiples as well as full *a.b.c* multiples.

To resume and making things simplest, let me start from scracht the summation sequence:

a [R/S] add sum of all multiples of *a*, included binomial *a.b* and *a.c* and full *a.b.c* multiples.

b [R/S] add sum of all multiples of *b*, included binomial *a.b* and *b.c* and full *a.b.c* multiples. At this point, we already count *a.b* and *a.b.c* twice.

c [R/S] add sum of all multiples of *c*, included binomial *a.c* and *b.c* multiple and trinomial *a.b.c* multiples. At this last step, the sum over estimate the correct sum by mistakenly incorporating two times the *a.b*, *a.c* and *b.c* multiples and three times the *a.b.c*. To correct this, the next steps are to substrate the binomial multiples :

a.b [CHS] [R/S] which remove one time the twiced counted *a.b* multiples. But, this also remove the sum of the *a.b.c* multiples since they are part of the *a.b* multiples. At this point, the total overestimate the correct sum by only twiced counting of *a.c*, *b.c* and *a.b.c* multiples.

a.c [CHS] [R/S] which remove one time the twiced counted *a.c* multiples. But, this also remove again the sum of the *a.b.c* multiples since they are part of the *a.c* multiples. At this point, the total sum overestimate the correct sum by only twiced counting of *b.c*. So the next step would have been the last one, but it is not the case !

b.c [CHS] [R/S] remove one time the twiced counted *b.c* multiples. But, this also remove one more time the sum of the *a.b.c* multiples since they are part of the *b.c* multiples. At this point, the current sum is wrong by under-estimate the correct answer, because the sum of *a.b.c* have been remove one time more than needed.

That why we have to ADD the last full multiple counts to the summation, by endind whith:

a.b.c [R/S] which add one time the missing sum of all *a.b.c* multiples.

At this end point, the resulting sum is the correct sum of all multiples of *a* , *b* and *c* below *m*.

The same reassignment can be used to compute the sum of a set of four multiples: +a, +b, +c, +d, -ab, -ac, -ad, -bc, -bd, -cd, +abc, +abd, +acd, +bcd, -abcd

By the way I've always wondered why some countries have been home to a large number of great mathematicians and some have not. Bad weather conditions? (Too cold to play outside, better staying at home and studying :-). I may be wrong, but in the maps below the densities get lower as climates get warmer:

Also look up "Principle of Inclusion-Exclusion" (often abbreviated PIE). See for instance this page on the Art of Problem Solving wiki. This is a standard tool in combinatorics.

*Message #14 Posted by **gene wright** on 8 May 2011, 8:58 a.m.,*
in response to message #3 by Namir

Why are multiples of 15 included?

They are already totaled by the sum of 3's and the sum of 5's as well.

?

Hp15c (limited edition) june? and a new product?

*Message #1 Posted by **miguel saiz** on 7 May 2011, 7:20 p.m.*

I had read that there are in the HP pipeline an HP 15c (limited edition) and Hp12c 30th anniversary and one additional product (maybe an HP50G color?). Anyone knows about this?

source: http://www.thecalculatorstore.com/epages/eb9376.sf/en_GB/?ObjectPath=/Shops/eb9376/Categories/Calculator_blog

New products coming Our contacts in HP have informed us about several new products in the pipeline. There are ultra-new things and some less new (to say the least) in the works. Estimated time of arrival on European shelves is July - maybe announcement will come sooner.

One of the calculator projects will likely sell in the millions (not hundreds of thousands - millions!) but the other will be a limited run of 10000 units - and that's all.

New HP50g vs Classic 15c Classic HP15c vs new HP50g

I see the old HP15c derided by current users by comparing it with HP 50g. They laugh at the specs, the screen size, the programming model, etc. They wonder how mint units can get over 300 € on ebay and other sites.

I have both. In my common work, I use the HP 50g. I can see everything that I have done - sometimes I need to clear to unclutter the stack. However, it is clear to me that it is not a calculator for all purposes: I cannot take it to meetings, or when discussing with a colleague some alternatives, etc. For that, I have in my jacket the HP15c. (For that matter, I could use the HP42s instead - however, it takes longer to navigate the menus and do what you

wp34S 838 x=0? or x=1? Locks Up in Run Mode

*Message #1 Posted by **Jake Schwartz** on 7 May 2011, 5:29 p.m.*

Hi,

I was playing with x= and x<> in program and run modes and had no problem entering tests in program mode, comparing to two-digit register numbers or to the values zero or one. However in run mode, while tests against registers returns the expected "true" or "false", the same tests against zero or one locks the machine up hard, requiring the batteries to be pulled. I am running version 838 and tested it on both the 20b and 30b.

Jake

Re: wp34S 838 x=0? or x=1? Locks Up in Run Mode

*Message #2 Posted by **Marcus von Cube, Germany** on 8 May 2011, 3:18 a.m.,*
in response to message #1 by Jake Schwartz

That must be the bug I'm hunting. The solver locks up in the same way. Thanks for the tests! I won't have the time to work on the problem today. Maybe later tonight.

Re: wp34S 838 x=0? or x=1? Locks Up in Run Mode

*Message #3 Posted by **Jake Schwartz** on 8 May 2011, 1:39 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Hi,

With the newer version 843, the problems went away and neither of my units lock up any more.

Thanks, Jake

wp34s 1.17 Build 838 SLV

*Message #1 Posted by **Norman Dziedzic** on 7 May 2011, 8:50 a.m.*

I tried to solve my inefficient, quadratic program from a while ago and when I do it seems the solver hangs. Works in the emulator but not on 30b hardware.

I put a PSE in the program and I only see one update and then the screen goes blank. Without the PSE the screen shows "Running Program" with the DEG, 360 and = annunciators on steady.

Re: wp34s 1.17 Build 838 SLV

*Message #2 Posted by **Thomas Radtke** on 7 May 2011, 10:13 a.m.,*
in response to message #1 by Norman Dziedzic

In some years, this will be the museum of WP calculators ;-).

I like this project very much, but traffic would justify setting up a newsgroup or mailing list, leaving this space for on-topic discussions.

Re: wp34s 1.17 Build 838 SLV

*Message #3 Posted by **Marcus von Cube, Germany** on 7 May 2011, 10:53 a.m.,*
in response to message #2 by Thomas Radtke

A separate forum will part us with the expertise of the members of this community which is badly needed for serious progress. Think of wp34s and the corresponding math discussions as an extension to HP's current calculator portfolio. We're still talking typical HP calculator topics, like RPN, the solver, keystroke programming, and the like.

Get your own HP 30b, flash it, and enjoy the progress! :-)

Re: wp34s 1.17 Build 838 SLV

*Message #4 Posted by **Thomas Radtke** on 7 May 2011, 11:37 a.m.,*
in response to message #3 by Marcus von Cube, Germany

> Quote:
>
> Get your own HP 30b, flash it, and enjoy the progress! :-)

Did so with my 20b.

I remember a time when discussions about new HPs (with original firmware) were considered off topic. I don't mind, but we're now at a point that this forum ist abused for support *at a regular basis*.

Fun in the beginning, highly boring at present. And there's no end in sight.

Don't get me wrong: Great project, but still OT *here* (this is a museums forum).

Re: wp34s 1.17 Build 838 SLV

*Message #5 Posted by **Don Shepherd** on 7 May 2011, 11:57 a.m.,*
in response to message #3 by Marcus von Cube, Germany

Marcus, I certainly agree that 100% of the people you want input from are members of this forum. And while hpmuseum is technically, of course, a "museum", discussions of current (not to mention future) HP calculators are enjoyed by all.

While I'm not particularly interested in this development effort, I know that many are. Katie has suggested some type of "sub-forum" and that would be a good idea. As developers, I would think your team would want a dedicated forum for reporting and tracking bugs, documenting each release, and suggesting enhancements, and it seems to me that this forum is not the ideal venue for that, just from a logistical point-of-view.

You guys have done some very good work, and it is relevant to this community (forum), but I would think a dedicated forum would be more beneficial.

Re: wp34s 1.17 Build 838 SLV

*Message #6 Posted by **Gerson W. Barbosa** on 7 May 2011, 10:55 a.m.,*
in response to message #2 by Thomas Radtke

I plead to disagree. WP 34s is an **hp-20b/30b** repurposing project, therefore not off-topic here.

Re: wp34s 1.17 Build 838 SLV

*Message #7 Posted by **Katie Wasserman** on 7 May 2011, 11:07 a.m.,*
in response to message #6 by Gerson W. Barbosa

While I agree that the wp34s is on topic I also agree with Thomas that bug/feature discussions make it difficult to see other topics because of the way threads must be viewed.

Is there some way that the wp34s threads can be encapsulated so as to not be so overwhelming? If Dave Hicks is still "out there" I wonder if he can think of a way to split off a sub-forum on this (and maybe other future topics as well).

-Katie

I second your proposal, that would be a good solution, and is quite common in other forums. But I guess it needs some (substantial?) work on Dave's side.

Re: wp34s 1.17 Build 838 SLV (should be known as: subdividing the forum)

*Message #9 Posted by **Walter B** on 7 May 2011, 3:46 p.m.,*
in response to message #8 by Juergen Keller

> Quote:
>
> If Dave Hicks is still "out there" I wonder if he can think of a way to split off a sub-forum on this (and maybe other future topics as well).

I concur as well. One sub-forum for repurposing, one for TAS-related stuff, one for garage sale and thrift store discussions, one for RPL, one for educational topics, one for the 12C, the 71B, the 41Cx, etc. ;-)

IMHO it's a problem of the way threads are organized (here at least) - they tend to branch and twig, change topics (most times without changing the subject), and there are no tools to bring all these together again. So people lose track after a while and start a new topic ... I don't know if it's really beneficial - we once started one thread about the bugs found and we could have kept that all the way with some intermediate statements - new release, all known bugs killed - up to now.

OTOH, we wouldn't face this problem now if HP had kindly followed our repeated plea for a 43S. Ceterum censeo: you know ;-)

Walter

Re: wp34s 1.17 Build 838 SLV (should be known as: subdividing the forum)

*Message #10 Posted by **Norman Dziedzic** on 8 May 2011, 11:07 a.m.,*
in response to message #9 by Walter B

Most other forums that I frequent use pbpBB as their software. http://www.phpbb.com/

I have no idea what it takes to implement that vs. the current board but I think it would be beneficial to segregate topics a little.

Re: wp34s 1.17 Build 838 SLV

*Message #11 Posted by **Eddie W. Shore** on 8 May 2011, 6:27 p.m.,*
in response to message #6 by Gerson W. Barbosa

I agree, the wp34s is further continuation of how to modify an HP calculator and has generated a lot of interest. IMO, it belongs in the main forum.

Re: wp34s 1.17 Build 838 SLV

*Message #12 Posted by **Marcus von Cube, Germany** on 7 May 2011, 10:58 a.m.,*
in response to message #1 by Norman Dziedzic

A blank screen is certainly a bug. How do you get the calculator back to life? Do you see the "bye..." message?

Reasons for this behavior may be stack overflow, another memory corruption bug or what ever. Hopefully, Pauli will get back online soon and can join the discussion. His Internet connection is flacky at best.

Re: wp34s 1.17 Build 838 SLV

*Message #13 Posted by **Norman Dziedzic** on 7 May 2011, 11:04 a.m.,*
in response to message #12 by Marcus von Cube, Germany

I can being it back with any of the following: - batery pull - reset button with paper clip - reset button on the programming cable.

Re: wp34s 1.17 Build 838 SLV

*Message #14 Posted by **Marcus von Cube, Germany** on 7 May 2011, 1:49 p.m.,*
in response to message #13 by Norman Dziedzic

2 points here:

1/ If Dave can support us with a special forum, I will happily go there for any wp34s stuff. If not, ?

2/ Norm, you must have hit a very nasty bug. I'm trying to find it at the moment but it's very hard work. :-(I report back when I'm done.

Re: wp34s 1.17 Build 838 SLV

*Message #15 Posted by **Norman Dziedzic** on 7 May 2011, 2:21 p.m.,*
in response to message #14 by Marcus von Cube, Germany

I guess someone else should verify that they can duplicate this.

Is anyone else observing problems with this?

And, yes, a forum with subjects would be nice. Of course, much easier for us to say than it is to implement.

Re: wp34s 1.17 Build 838 SLV

*Message #16 Posted by **Marcus von Cube, Germany** on 7 May 2011, 3:54 p.m.,*
in response to message #15 by Norman Dziedzic

I see the bug on my system and I have identified the area where the crash occurs, but I'm still fighting. (In fact not at the very moment, I needed a break. ;-))

Re: wp34s 1.17 Build 838 SLV - Hopefully fixed!

*Message #17 Posted by **Marcus von Cube, Germany** on 8 May 2011, 4:53 a.m.,*
in response to message #1 by Norman Dziedzic

I've reverted to the Yagarto compiler and the bug seems to be gone. Please test!

Re: wp34s 1.17 - Another nasty bug fixed

*Message #18 Posted by **Marcus von Cube, Germany** on 9 May 2011, 1:06 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Please download and install the latest version from SF:

http://sourceforge.net/projects/wp34s/files/

I fixed a serious crash in the CONV catalogue.

Re: wp34s 1.18 v875 SLV

*Message #19 Posted by **Norman Dziedzic** on 12 May 2011, 1:34 a.m.,*
in response to message #18 by Marcus von Cube, Germany

There is an intermittent issue with the solver in 1.18 v875 (30b hardware) where the "Program Running" message is not displayed when the solver is active. The top line just displays SLV _ _. The solver still functions and returns an answer.

I haven't found a firm reproducible sequence that does or doesn't show the program running message. However, more often than not, I will not get the "Program Running" message. It seems that if I re-run the solver with identical guesses I will then see the "Program Running" more often but it is not 100%.

Re: wp34s 1.18 v875 SLV - fixed!

*Message #20 Posted by **Marcus von Cube, Germany** on 12 May 2011, 1:57 a.m.,*
in response to message #19 by Norman Dziedzic

Thanks for the hint. We need to look into it. I guess it's a minor issue but it may hide a more serious bug.

Edit: It seemed to be a minor glitch related to power saving. The most recent build contains a fix for this.

Edited: 12 May 2011, 6:19 a.m.

Re: wp34s 1.18 now on revision 884

*Message #21 Posted by **Marcus von Cube, Germany** on 12 May 2011, 10:18 a.m.,*

Woz at HP

*Message #1 Posted by **ClausB** on 6 May 2011, 8:47 p.m.*

I saw Steve Wozniak at Michigan State University this afternoon. In a Q&A session I asked which HP calculators he worked on before starting Apple. He answered so quickly (and I was a bit nervous in the presence of one of my heros) that all I caught of his product list were the first and last: 45 and 67. He said he did chip design and layout and did not write firmware but he studied it. Then he mentioned CORDIC and talked about how they did everything with integer math internally. That inspired his Apple Integer BASIC, he said.

Later I asked him whether he still had the "Cream Soda" computer (his scratch-built CPU, pre-Apple). He said he might still have the board but he smoked it long ago when he stepped on a wire and shorted 35V to the chips! He also said the Apple II is the design he's most proud of, and the Disk II was one of the most challenging. Fascinating talk!

He signed my Apple II Reference Manual (Red Book) but my pen let us down. It reads "Noz".

Flashing WP-34S Image to an HP-30b

*Message #1 Posted by **Gerry Schultz** on 6 May 2011, 3:59 p.m.*

I have been following the continuing discussions of the ever improving WP-34s image and have downloaded the latest zip file from SourceForge.net. I have two HP-30bs and I would like to re-flash one of them with the 34s image (and yes, I have the special HP serial cable and I recently rebuilt an old desktop PC with serial ports to triple-boot Win98, WinMe and WinXP. I know, I know, why? The MB also supports 5 1/4" floppies but I got carried away, plus it was fun.). I don't know if any hardware modifications need to be done to the 30b but I don't think so.

I checked the 34s documentation but I saw no mention of how to flash the 20b/30b. I've also searched the HP Museum website using Google but any reference to past posts on this topic that show up in the search (using site:hpmuseum.org in the search), the HP museum website says it doesn't exist. I also searched the WP-34s section on SourceForge.net without success.

Now, I'm sure if I spend enough time and energy, I will eventually find this procedure but I suggest that it should be somewhere on the SourceForge website and here on the HP museum website so when someone is ready to look at and play with and then use this new calculator image, it can be easily found.

Finally, knowing me, I'm probably using the wrong search string. I've tried several but here's what I started with: "flashing WP 34s HP 30b site:hpmuseum.org".

Your responses are appreciated.

Thanks, Gerry

Edited: 6 May 2011, 4:06 p.m.

Re: Flashing WP-34S Image to an HP-30b

*Message #2 Posted by **Marcus von Cube, Germany** on 6 May 2011, 4:36 p.m.,*
in response to message #1 by Gerry Schultz

The procedure is described in Tim's document:
http://dl.dropbox.com/u/10022608/Flashing%20a%2020b%20Calculator.pdf.

Hold ERASE and press ON. The calculator should seem dead now. Press RESET and ON. Now start SAM-BA and let it connect. Select the "board" at91sam7l128-ek and your com port.

Load your file and send it to the calculator (three minutes). Execute the "Boot from flash" script from within SAM-BA.

RESET and ON.

Enjoy! :-)

Better Late Than Never--VAL() in HP-71B BASIC

*Message #1 Posted by **Namir** on 6 May 2011, 11:15 a.m.*

I was looking at the HP-71B Math Solutions book. I discovered, to my surprise and delight, that the HP-71B function VAL goes way beyond the typical VAL implementations found in other BASIC interpreters. The HP-71B runs the argument of VAL through the BASIC interpreter engine allow you to evaluate strings as functions. For example, if I have already assigned the value of 1 to variable X, then VAL("X^2-3*x+6") yields 4!! Using this feature you can define the function:

DEF FNX(E$,X) = VAL(E$)

To evaluate functions dynamically as long as the expression in parameter E$ is a string that represents a valid expression of X. Of course the arguments for parameter X in FNX() can be any variable or expression, since VAL(E$) evaluates E$ using the argument for parameter X (and not a variable named X defined in the program).

I was delighted to discover this feature of VAL() .... Oh well .... better late than never!!

Namir

Re: Better Late Than Never--VAL() in HP-71B BASIC

*Message #2 Posted by **Marcus von Cube, Germany** on 6 May 2011, 11:56 a.m.,*
in response to message #1 by Namir

For those who want more info about the different BASIC variants: I've prepared a spreadsheet which compares many BASIC dialects. The VAL() functionality Namir has found should be in the sheet as the 71B is one of the systems discussed.

Here you are: http://www.mvcsys.de/doc/basic_compare.html.

Re: Better Late Than Never--VAL() in HP-71B BASIC

*Message #3 Posted by **Namir** on 6 May 2011, 12:13 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Impressive comparison table!!!

As I suspected, the HP-71B and HP-75 implement the VAL() function that goes beyond simply converting a string image of a number into a number.

Using a function like VAL() (and EVAULATE() in Excel VBA) allows you to write programs that handle functions dynamically. Of course, the price to pay for this flexibility is speed.

Namir

Re: Better Late Than Never--VAL() in HP-71B BASIC

*Message #4 Posted by **Bill Wiese** on 6 May 2011, 2:20 p.m.,*
in response to message #3 by Namir

This was always an irritant to me in other BASICs of the era - most if not all of those MS BASICs (Commodore, Apple, etc.) just implemented an "atof()" function.

I recall I was able to take C64 BASIC's "USR(x)" function and hotwire it to pull a string instead of numeric argument - and then call the FRMEVL routine at $AD9E to do 'formula evaluation'. I think I had to also tokenize the string before calling FRMEVL.

Bill Wiese

Re: Better Late Than Never--VAL() in HP-71B BASIC

*Message #5 Posted by **Mark Storkamp** on 6 May 2011, 2:30 p.m.,*
in response to message #4 by Bill Wiese

You could do something similar as well on the Apple][. Another form of synthetic programming. Your program always started at the same location in memory, so if you made your first line:

10 :::::::::::::::::::::::::::::::: RETURN

Then you could use POKE to enter your tokenized string in place of the :

CALL 10

would execute your line. And the manuals in those days were so thorough that they gave you all of the addresses and token values needed to pull off things like that.

While GW-BASIC implemented a simple VAL() function, I resorted to another trick to support dynamic functions at run time. I used this kind of trick in regression programs that allowed the user to enter transformations for data at run time. My program would convert the user's input into a short/small line-numbered BASIC program that's written out to disk and then use the CHAIN MERGE command to chain/merge the current program with that small programs. This approach turned the dynamic functions and expressions into BASIC statements that are then handled by the interpreter.

When I moved from GW-BASIC to Turbo-Pascal (a compiler) I sure missed that trick!

Nowdays in C++, one can use LLVM to generate object code on the fly. It doesn't parse expressions from a human-readable string representation, though.

*Message #8 Posted by **Oliver Unter Ecker** on 6 May 2011, 4:32 p.m.,*
in response to message #6 by Namir

How does Val() deal with "2^8" (two power eight), or "5!" (five factorial)? ;-)

As other dynamic languages these days, JavaScript has an eval() function that allows you not only to evaluate constant expressions, but any JavaScript code. Also, functions are data and can be constructed on-the-fly.

If you want to write a calculator, though, you still need an expression parser to deal with cases like above (and types other than Reals).

One of the reasons why MorphEngine is called MorphEngine, is because it takes expressions and "morphs" them into dynamically-created functions (written via a LALR parser, fed by a BNR grammar).

I understand, (RPL) HPs have a compiler/decompiler to accomplish making expressions executable, and vice versa.

*Message #9 Posted by **Marcus von Cube, Germany** on 6 May 2011, 4:39 p.m.,*
in response to message #8 by Oliver Unter Ecker

As implemented on the 71b, VAL() parses the string as BASIC text, so any functions known to the interpreter can be used. The string must represent a valid expression as defined for the language.

What happens when you call VAL(E$) and E$ contains the string "VAL(E$)"?

You get an "Invalid Arg" error.

Re: Better Late Than Never--VAL() in HP-71B BASIC

*Message #12 Posted by **J-F Garnier** on 7 May 2011, 4:01 a.m.,*
in response to message #11 by Namir

No, the HP71B goes into infinite recursive calls!!

```
>endall
>destroyall
>mem
 9135
>e$="val(e$)"
>val(e$)
ERR:Insufficient Memory
>mem
 2810
>endall
>mem
 9128
```

(tested on Emu71. On a real HP-71B, you may have to break the long recursion time with INIT 1]

in response to message #12 by J-F Garnier

Interesting! The first time I tried:

```
E$="VAL(E$)"
VAL(E$)
```

I got the invalid arg error using the EMU71. When I do:

```
ENDALL
DESTROY ALL
E$="VAL(E$)"
VAL(E$)
```

I get "insufficient memory" with the EMU71.

EMU71 for 64 Bit Windows?

*Message #14 Posted by **Namir** on 7 May 2011, 6:53 a.m.,*
in response to message #12 by J-F Garnier

Do you have any plans to re-implement the EMU71 so that it can run under Windows 7 64 Bit? To run the EMU71 I have to run "VMLite XP Mode" which runs as 32 Bit OS.

Re: EMU71 for 64 Bit Windows?

*Message #15 Posted by **Marcus von Cube, Germany** on 7 May 2011, 7:07 a.m.,*
in response to message #14 by Namir

As far as I understand, EMU71 is written in x86 16 Bit assembly. Porting will be a huge task!

Have you tried DOSBOX or, as an alternative, plain DOS in any virtual machine like Virtual PC?

Edited: 7 May 2011, 7:08 a.m.

I am using the regular DOS box in VMlite Windows XP.

I will try to locate DOSBOX. Thanks for the tip.

Re: EMU71 for 64 Bit Windows?

*Message #17 Posted by **Namir** on 7 May 2011, 1:42 p.m.,*
in response to message #15 by Marcus von Cube, Germany

Marcus,

I found DOSBOX and it works fine with EMU71. The only feature not supported from the plain DOS box is the ability to pasted source code into the emulator (J-F Garnier had suggested this tip on the site a few months ago). Garnier's tip works when I use the DOS box under VMlite Windows XP.

OT: Re: Better Late Than Never--VAL() in HP-71B BASIC

*Message #18 Posted by **Katie Wasserman** on 6 May 2011, 6:35 p.m.,*
in response to message #6 by Namir

On my Commodore PET (8K original one) I used to do something similar. You could print an expression (or statement) on the screen followed by a RUN or GOTO command; then stuff the keystroke buffer with cursor moments and RETURN characters and end the program. The keystroke buffer would be read out by the "operating system" and execute your commands then start up the program again.

It, made for great self modifying code not just dynamic expression evaluation.

> I discovered, to my surprise and delight, that the HP-71B function VAL goes way beyond the typical VAL implementations found in other BASIC interpreters. The HP-71B runs the argument of VAL through the BASIC interpreter engine allow you to evaluate strings as functions. For example, if I have already assigned the value of 1 to variable X, then VAL("X^2-3*x+6") yields 4!!

The Sinclair ZX Spectrum had this feature, too.

BTW, I'm using a similar function in php to have the user define some conditions inside a semiautomatic risk analysis software. Very useful.

in response to message #20 by Thomas Radtke

I have been playing with Rocky Mountain BASIC again the last couple of days. At least in version 2.1, there's no string evaluation routine. At least I can't find it in the reference manual. It seems like the people in Fort Collins could have taken a hint from the guys in Corvallis in this regard.

You can do recursion in RMB though.

Re: Better Late Than Never--VAL() in HP-71B BASIC

in response to message #22 by Garth Wilson

I think that the finest version of Basic that HP ever created was Business BASIC for the HP 3000

series computers. The statement called COMMAND could dynamically execute almost any command in Basic, not just evaluate an expression. It was also pretty fast because it had a compiler in addition to the interpreter. I wrote a ton of code in this language including a complete email system (before the internet was common place). One of my favorite languages, ever.

The original 3000 series was equally awesome with it's stack-based architecture and (sort of) high-level systems programming language instead of assembly. The good old days.....

*Message #24 Posted by **Howard Owen** on 8 May 2011, 1:21 a.m.,*
in response to message #22 by Garth Wilson

There are things in RMB that the 71B lacks, however. Long variable names, COM blocks (ala FORTRAN) , REPEAT/UNTIL, WHILE, SELECT/CASE are all nice. The integrated code editor/execution environment was my first introduction to such things. It topped my list for productivity until I figured out how to use EMACS with gcc/gdb a couple of years later.

I used the 9816 professionally, and it was a capable little beast for the era. It had an 8Mhz MC68000, which was fast enough to do a whole lot of simultaneous I/O. That CPU had 16MB of addressable memory. I believe the 9816 could only use half that for user memory, but it was still huge by contemporary standards. It was actually practical to have 1MB loaded into the 9816, plus an RS232 card, which together with HPIB made for an extremely capable and portable little computing package. I used these in offshore environments in the mid-1980s.

Nonetheless, I'm very fond of my 71B. The BASIC on that machine has a lot of very nice features. The LEX file concept is very cool, allowing a user to extend the BASIC, but RMB had a similar mechanism.

*Message #25 Posted by **Garth Wilson** on 8 May 2011, 3:45 a.m.,*
in response to message #24 by Howard Owen

One of the 71 modules available had the program structures like CASE and so on, but I never got that one. For longer variable names and vertical alignment and white space for readability and so on, what I did sometimes was write the program in text with my full-featured text editor (waaaaay better than what came in the Forth module for example) and then use another program to take out the blank lines and formatting lines, combine things that had to be on the same line which I had separated for readability, give it line numbers, replace the variable names with HP71-legal ones, remove comments, and TRANSFORM it to BASIC (while keeping a copy of the original file).

One thing I remember from RMB 5.1 running on the HP9000-series 68000 computer was that I couldn't just take lines I had already written and copy them somewhere else outside the structure or subprogram or something like that to reduce the amount of typing where I wanted a near-duplicate somewhere else. It would say that wasn't allowed. One program could not also refer to another program or subprogram in another file like the 71 can. It all had to be written into the same one. My memory of it is pretty foggy now, but I do remember that I kept running up against walls.

The JPCROM has that and more. I have that in EEPROM on m 71, and I love it.

I've set myself up to do editing of 71B programs on my Mac (in Aquamacs. Some habits die hard.) using the PIL-Box to transfer the programs back and forth as text. That's fine as far as it goes, but it doesn't get me an editing/execution environment like RMB's EDIT mode. The 71B itself provides a pretty nifty editor, but it's limited by the one line display.

> Quote:
>
> One thing I remember from RMB 5.1 running on the HP9000-series 68000 computer was that I couldn't just take lines I had already written and copy them somewhere else outside the structure or subprogram or something like that to reduce the amount of typing where I wanted a near-duplicate somewhere else.

You can do that with individual lines, by manually editing the line number, for example. But you can't delete or modify the FN or SUB definition or end markers once you've entered them. You have to delete the "entire context" meaning the whole sub or function. Also, you can't use REN to move lines relative to other lines. So if your renumber would cause the new lines to overlap other lines, or to move after or before preexisting lines, the renumber will fail.

That's annoying, but I have to say, quirks like that are one of the reasons I feel good about getting anything done on any of these old machines. :)

Regards,
Howard

cheap power for the HP41C (while at desk with cardreader)

*Message #1 Posted by **exschr** on 6 May 2011, 5:37 a.m.*

Hi there

I want to attach external power to my 41c because I'm using the cardreader mainly at my desk. (I'm looking for options like wallplug_adaptor or clip with D-cells or the like...)

I read in PPC V7N3 (page 23) about attaching an external battery to not go through to many sets of N-cells because of the hungry CR-motor. But I'm missing some details there.
(R.W.Edelen used a modified TV cheater cable for this)

My Question:
Where can I find circuit schematic with the details I need to know to run the calc off external power while at the desk (aim: N-cell saving while running cardreader at desk)
I know that I could bidding on TAS for a recharger and an akku-pack, but I believe there are cheaper ways of using external power!

Up to now I was using the cardreader with a separate batteryclip with fresh N-cells in it. After using the Cardreader I put in the clip with the N-cells that were not anymore powerful enough to drive the CR motor but let me run the calc still some time without the Bat indicator coming on.

Thanks for hints or pointers
Roger

Re: cheap power for the HP41C (while at desk with cardreader)

*Message #2 Posted by **Diego Diaz** on 6 May 2011, 9:34 a.m.,*
in response to message #1 by exschr

Hi,

As long as you have a USB port handy (or any other stable power source for that matter), there's no need to be messing around with external D-cells, adaptors or anything else.

In fact you don't even need the 41's N-cell battery pack in most cases, (see note on Halfnuts)

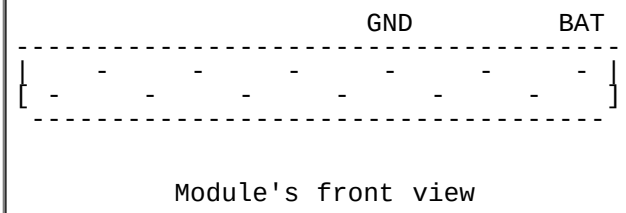
Just a standard USB cable (preferable not too long), and an empty ROM module with a good connector.

- Cut the cable to an appropriate length.

- Identify the +ve and -ve wires.

- Solder the Positive wire to the module's BAT (upper right connector pin, front view -see below-)

- Solder the Negative wire to the module's GND (the upper third one, right to letf -see below-)



Module's front view

Hope this helps.

Diego.

NOTE on Halfnuts: Due to its internal circuit design, Halfnut may show the BAT annunciator permanently ON, with the power arrangement described above, if no battery pack is present; and will more likely fail to operate the Card Rader showing the "LOW BAT" message on the display. Normal operation will perform as expected though (even if no battery pack is present)

> (I'm looking for options like wallplug_adaptor or clip with D-cells or the like...)

That's no problem as long as you have the rechargeable batterypack and its AC-adapter. ;-) However, exactly for the purpose you mentioned I use a small connector made by a friend (with much better mechanical skills than mine). It's essentially based on the back of an obsolete battery pack, but it could also be done (even easier) with a standard battery holder. Two wires are soldered to two handmade contacts (that's why the battery holder is much easier to work with), and the cable ends in a usual button-connector the way it is used on 9V-batteries. Now all what's needed is a usual battery holder for 4x AA - or maybe 4x C or D, if you like.

But that size batteries are not needed here: The original batteries in the 82120A pack had 70...80 mAh, so with current AA-size NiMH batteries you get about 30x (yes, thirty times) the capacity of the original pack. I think Sanyo Eneloop NiMH cells are perfect for this application.

> Quote:
>
> Where can I find circuit schematic with the details I need to know to run the calc off external power while at the desk

What schematics? All you need to know is the position of plus and minus, and the right voltage of course. The BAT announciator comes on as soon as the voltage has dropped to 4 V, and four fresh alkaline batteries will

output something like 6...6,5 Volts. That's your range. So 5 V are fine, e.g. from four Eneloops.

Dieter

wp34s Integer Word Size versus 16C

*Message #1 Posted by **Jake Schwartz** on 5 May 2011, 3:29 p.m.*

Hi,

Since in the wp34S manual (and I'm looking at the version whose page-1 display indicates version 793), it says on page two: "...completely incorporating the functionality of the famous progrmmer's calculator HP16C...", I thought I'd run the machine through its paces with the examples from the 16C manual. On page 32 of the 16C manual is a "word size" example, where when starting with a 16-bit word size in 2's-compliment mode and decimal base, the number 32767 is entered. After changing the word size to 8, the number is displayed as "-1" and then after reverting the word size back to 16, the number is shown as "255 d", since the upper half of the original 16 bits was truncated (as mentioned in the note at the bottom of the page) when the word size was halved.

So on the wp34s, I set word size to 16, 2's compliment mode and BASE10 and entered 32767 and saw "32767 d" as expected; then changed the word size to 8 and saw "-1 d" as expected. However, after changing the word size back to 16, the number reverted back to "32767 d", implying that the value in the x register had not been truncated when the word size had been halved. Since 16C compatability is expressed in the manual, shouldn't the truncation be taking place?

Thanks, Jake

Re: wp34s Integer Word Size versus 16C

*Message #2 Posted by **Walter B** on 5 May 2011, 4:36 p.m.,*
in response to message #1 by Jake Schwartz

Hi Jake,

Thanks for your finding. Looks like you caught me in one of the rare moments when I tried to do some simple advertising ;-) The sentence you quoted of page 2 is a very old one, set up at the time when we defined the scope of the wp34s. What functions did we want to include? Of course, the function set of the 42S was on top of our list - or you may see it as the base of the wp34s. The 16C's bit manipulation functions were something to be added. Cdfs on a non-RPL HP were only available on the 21S at that time, so I put in this model, too. And fractions came with the 32SII - so now we have the four models mentioned on page 2. And then the usual rules of organic growth took over ... and eventually you have the wp34s as it is now. Just for explanation ...

So, what to do? Obviously the 16C works as described and the wp34s deviates from this at least at the point you found. Personally, I can live with either way, I just have to know. (And it's not described yet in the manual - allowing me an escape here ;-) but anyway it's my fault.) IMHO the decisive point, however, is: Do *you want* the wp34s to handle such word size changes exactly the way the 16C does? And why? (Ok, tradition is an argument, but are there better ones?) We have the power to do it either way ...

Walter

Re: wp34s Integer Word Size versus 16C

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 6 May 2011, 6:47 a.m.,*

in response to message #2 by Walter B

Perhaps it deviates from the venerable 16C, but I feel "sign extension" is the right thing to do. At least there may be a flag controlling this choice.

Best regards, and please disregard any mistake.

Re: wp34s Integer Word Size versus 16C

*Message #4 Posted by **Paul Dale** on 5 May 2011, 5:48 p.m.,*
in response to message #1 by Jake Schwartz

Bummer missed this feature of the 16C :-(

What do we want to occur here?

- The 16c changes the entire stack on a word size change.
- The 34s does nothing to the stack but does display and operate correctly at the new size.

- The 16c leaves registers alone but redefines their boundaries.
- The 34s leaves registers alone and leaves their boundaries unchanged.

The latter choice isn't changing. The question is what should we do on word size change with respects to the stack.

- Pauli

Re: wp34s Integer Word Size versus 16C

*Message #5 Posted by **Jake Schwartz** on 5 May 2011, 10:06 p.m.,*

> Quote:
>
> The question is what should we do on word size change with respects to the stack.

My vote would be to truncate the stack values when the word size is reduced....if it is relatively easy to do. Just for consistency with the 16.

Thanks, Jake

in response to message #5 by Jake Schwartz

Truncate the stack, if it's reasonably possible. (This emulates moving a data item to a smaller register, and then to a larger one.)

Re: wp34s Integer Word Size versus 16C

*Message #7 Posted by **Paul Dale** on 5 May 2011, 11:31 p.m.,*
in response to message #5 by Jake Schwartz

Done. Will be in the next build.

There is an extra alternative I missed: truncating the value but preserving sign.

I've just done a plain truncation of the stack and last x register (but not the I register since complex operations aren't permitted in integer mode).

- Pauli

Custom HP 45

*Message #1 Posted by **Jim Gossett** on 5 May 2011, 3:12 p.m.*

I have a HP 45, soft case, battery charger, power cable (and bad battery module). I believe it is unique in that the person I bought it from in the 70's toured the HP plant and complained that the +, -, *, and / keys were all gray.

They took it from him and installed a blue "-" and an orange "+" key.

Does this make it singularly unique and of any extra value?

Overall the condition is well- used but not broken anywhere, working, and all the keys and instructions on back are very legible.

Thanks,

Re: Custom HP 45

*Message #2 Posted by **Marcus von Cube, Germany** on 5 May 2011, 3:52 p.m.,*
in response to message #1 by Jim Gossett

Jim, a photo would be interesting for all.

Re: Custom HP 45

*Message #3 Posted by **Katie Wasserman** on 5 May 2011, 10:37 p.m.,*
in response to message #1 by Jim Gossett

The orange key must have been taken from an HP-70 and the blue one from an HP-35. I suppose that many of use who collect the classics to do this too pretty easily, especially if you have some "parts machines" hanging around. But it would look pretty silly.

Re: Custom HP 45

*Message #4 Posted by **Michael de Estrada** on 6 May 2011, 9:35 a.m.,*
in response to message #3 by Katie Wasserman

I have a very unusual HP 45 with a Red Dot and was wondering what it might be worth.

Re: Custom HP 45

*Message #5 Posted by **Mike Morrow** on 6 May 2011, 8:16 a.m.,*
in response to message #1 by Jim Gossett

It's hard to imagine the basis for the original owner's complaint about the gray keys. Certainly what he finally got was no improvement...whatever it was that was imagined to need improving!

I'm not really a collector, but the HP-45 is on my list of all-time favorite HPs. When it came out, during my

junior year at Georgia Tech, one could buy a good used car for what it cost.

I'd be put off by an example that was bizarrely configured to no good purpose.

wp34s - New features in the SVN repository - now released!

*Message #1 Posted by **Marcus von Cube, Germany** on 5 May 2011, 9:18 a.m.*

I've added a new feature to wp34s: Flash backup of user data. This is still preliminary, more a proof of concept that I can handle flash programming within the firmware but it's useful:

ON + 'B' creates a backup of the 2 KB static RAM in flash where it survives a complete power loss, reset or other trouble.

ON + 'R' restores the backup. Only data with a valid checksum is copied.

You'll find the most recent build in SVN on SourceForge only.

Edit: The package is now released in SF.

Edited: 6 May 2011, 3:50 a.m. after one or more responses were posted

Re: wp34s - New features in the SVN repository

*Message #2 Posted by **Jeff O.** on 5 May 2011, 1:55 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Probably my fault, but version 820 does not work on my 20b. After the download to the calculator is complete, the display stays blank and does not respond to keystrokes.

Assuming the above is just a minor glitch, could this new feature somehow be used to get programs from the outside world, say developed on the emulator, into the calculator? In other words, could a bin file be created with valid data in the flash ram back-up area and then downloaded into the calculator?

Re: wp34s - New features in the SVN repository

*Message #3 Posted by **Marcus von Cube, Germany** on 5 May 2011, 2:01 p.m.,*
in response to message #2 by Jeff O.

I have to check what's possible. It's not clear if the emulator produces exactly the same structure as the real hardware.

I'll check why 820 doesn't respond. Can you retry the download? Have you set the "boot from flash" bit in SAM-BA?

Re: wp34s - New features in the SVN repository

*Message #4 Posted by **Jeff O.** on 5 May 2011, 2:16 p.m.,*
in response to message #3 by Marcus von Cube, Germany

I am using MySamba, not SAM-BA. I tried it using SAM-BA and got it to download successfully. MySamba is a lot easier to use than SAM-BA, so if you could figure out a way to make it work with

MySamba, that would be great :-)

Do any of our tools allow the bin file to be extracted from the calculator? That would allow programs to be developed, uploaded to PC, stored, shared, re-downloaded, etc.

Re: wp34s - New features in the SVN repository

*Message #5 Posted by **Marcus von Cube, Germany** on 5 May 2011, 2:20 p.m.,*
in response to message #4 by Jeff O.

I could add a hidden feature to activate the SAM-BA boot loader on the next reset **without** clearing the flash. That would allow external access to the flash contents. A way to up/download via the cable would be the deluxe variant.

Re: wp34s - New features in the SVN repository

*Message #6 Posted by **Jeff O.** on 5 May 2011, 2:43 p.m.,*
in response to message #5 by Marcus von Cube, Germany

I am not quite sure what you mean by your response, but, I'll assume it would be good. My naive assumption (or hope) about how it should or could work is as follows:

```
Step  Action
  1   wp34s user creates a nifty program on a 20b or 30b running wp34s
  2   wp34s user backs up ram to flash memory
  3   wp34s user extracts current rom from calculator
  4   wp34s user sends rom to another wp34s user
  5   2nd wp34s user downloads rom to his/her 20b/30b
  6   2nd wp34s user executes restore command to move program from
      flash into ram
  7   2nd wp34s user begins using 1st wp34s user's nifty program
```

I tested the back-up and restore commands, they work as advertised. Cool!

...

Re: wp34s - New features in the SVN repository

*Message #7 Posted by **Marcus von Cube, Germany** on 5 May 2011, 3:49 p.m.,*
in response to message #6 by Jeff O.

I was thinking of simply concatenating the wp34s.dat file of the emulator with the flash image and restoring this. This may work or may not, depending on some details which I don't know yet.

The problem with getting the current flash contents out of a real wp34s is that you cannot get into SAM-BA mode without erasing the complete flash contents. :-(I need to add a command to enable SAM-BA without erase or even better to send the flash or user RAM through the serial port from the application.

Re: wp34s - New features in the SVN repository

*Message #8 Posted by **Jeff O.** on 6 May 2011, 8:16 a.m.,*
in response to message #7 by Marcus von Cube, Germany

> Quote:
>
> I was thinking of simply concatenating the wp34s.dat file of the emulator

with the flash image and restoring this. This may work or may not, depending on some details which I don't know yet.

Program development on the emulator would be a great alternative, as long as there is **some** way to get programs onto the calculator from the outside world. My operating paradigm might now look like this:

```
Step  Action
  1   wp34s user creates a nifty program on the wp34s emulator
  2   wp34s user backs up ram to "virtual" flash memory on the emulator
  3   wp34s user extracts wp34s.dat file of the emulator and
      concatenates with calculator bin file
  4   wp34s user downloads rom to his/her 20b/30b
  5   wp34s user executes restore command to move program from
      flash into ram
  6   wp34s user begins using nifty program on the real hardware
```

Of course programs could be shared among users this way also.

Speaking of concatenating to the flash image file, if you recall I mentioned that the new version would not download correctly for me using MySamba. I assumed this had something to do with the new version being only 126k instead of 128k. I tried padding the file out to 128k, but could not get it to work. Do you have any idea why MySamba does not like the shorter file or versions padded out to 128k? Is there some secret character that must come at the end?

Re: wp34s - New features in the SVN repository

*Message #9 Posted by **Marcus von Cube, Germany** on 6 May 2011, 9:49 a.m.,*
in response to message #8 by Jeff O.

See the new file flash.txt in the current release for what is possible now. :-)

Re: wp34s - New features in the SVN repository

*Message #10 Posted by **Jeff O.** on 6 May 2011, 1:24 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Hi Marcus,
Thanks for your continued work on this.

I read the flash.txt file and attempted to follow the instructions, but the uploaded dat file was 4k file. I did not figure I could tack a 4k file on to a 126k file to get a 128k file to download back into my other calculator, so I must be doing something wrong. I was able to get my calculator back in business, so no damage done.

edit - On my second try I was able to upload the state file from my 20b, concatenate to the v831 bin file, load that file onto my 30b, and restore the state file on the 30b. Not sure if I remember exactly how I did it though.

Edited: 6 May 2011, 2:56 p.m.

Re: wp34s - New features in the SVN repository

*Message #11 Posted by **Marcus von Cube, Germany** on 6 May 2011, 4:09 p.m.,*
in response to message #10 by Jeff O.

A state file is always a bit short of 2K. The 4K file must have been something different.

The command is:

copy /b calc.bin+wp34s.dat calc-2.dat

You then send calc-2.dat to your calculator.

Edited: 6 May 2011, 4:10 p.m.

Re: wp34s - New features in the SVN repository

*Message #12 Posted by **Jeff O.** on 6 May 2011, 8:38 p.m.,*
in response to message #11 by Marcus von Cube, Germany

The 4k file was a definite error on my part.

> Quote:
>
> The command is:
>
> copy /b calc.bin+wp34s.dat calc-2.dat

That sounds like some sort of linux mumbo jumbo with which I am totally unfamiliar :-)
I used a much more cumbersome process using a hex editor.

Re: wp34s - New features in the SVN repository

*Message #13 Posted by **Marcus von Cube, Germany** on 7 May 2011, 4:17 a.m.,*
in response to message #12 by Jeff O.

It's plain old DOS respectively Windows command prompt.

Re: wp34s - New features in the SVN repository

*Message #14 Posted by **Jeff O.** on 7 May 2011, 12:13 p.m.,*
in response to message #13 by Marcus von Cube, Germany

Thanks, shows what I know (very little, obviously.)
Turns out I do remember basic DOS commands, the suggested procedure worked great. Thanks Marcus.

Free42 Android Tablet

*Message #1 Posted by **Bill (Smithville, NJ)** on 5 May 2011, 8:02 a.m.*

I just picked up the Acer A500 Android tablet. I've installed the Free42 on it and it works fine, but am having trouble getting the right skin setup.

I mostly use the tablet in a landscape mode and only occansionaly go to portrait mode. I would like for Free 42 to be in standard portrait mode (just like the real 42s). Is there a way to lock free 42 into the same portrait skin whether the tablet is in portrait or landscape mode.

Thanks,

Bill

Re: Free42 Android Tablet

*Message #2 Posted by **Thomas Okken** on 5 May 2011, 6:10 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Bill, you can lock the orientation if you have the latest version (1.4.69); there is an auto/portrait/landscape orientation selector in the Preferences screen.

- Thomas

Re: Free42 Android Tablet

*Message #3 Posted by **Thomas Okken** on 5 May 2011, 6:28 p.m.,*
in response to message #2 by Thomas Okken

N.B. In case I misunderstood your question, and you don't want to lock Free42 into portrait mode, but just want it to use the same skin in both portrait and landscape modes:
Free42 maintains separate skin selections for portrait and landscape modes. If you want to change both, go to portrait mode, use Menu -> More -> Skin: Other and select the skin you want, then go to landscape mode, and repeat the procedure.

- Thomas

Re: Free42 Android Tablet

*Message #4 Posted by **Bill (Smithville, NJ)** on 6 May 2011, 10:11 a.m.,*
in response to message #3 by Thomas Okken

Thomas,

Thanks for help. What I'm seeing is a squished layout when the tablet is in the landscape position. Please send me an email & I'll send you a couple of photos.

I'm thinking that the tablet is squishing/stretching the image when it roates from portrait to landscape. The width of the image in tablet portrait exactly equals the height of the image in landscape mode. It's like it rotates the image and then stretches/shrinks the image to fit te rotated photo frame.

Not sure if there's anyway to really fix this, since it mahe be a factor of my tablet.

Bill

Re: Free42 Android Tablet

*Message #5 Posted by **Thomas Okken** on 6 May 2011, 2:37 p.m.,*
in response to message #4 by Bill (Smithville, NJ)

Free42 has only one built-in skin at the moment, a portrait skin designed for 320x480 screens. The skin is stretched to fill the available screen space exactly. This works out fine on most screens in portrait mode, as long as they have an aspect ratio that's reasonably close to 2:3, but when you switch to landscape mode, the skin will look awfully squashed, as you've noticed.

If you want to use Free42 in landscape mode, the best thing to do it to load one of the landscape skins from the Free42Skins.zip package. I like 42ct myself, but HP42CY and Voyager42 are also worth a look.

I think I'll add 42ct into the apk in the next release, or maybe something else in case a generous user donates a skin designed specifically for 480x320 screens.

- Thomas

Re: Free42 Android Tablet

*Message #6 Posted by **Bill (Smithville, NJ)** on 6 May 2011, 5:48 p.m.,*
in response to message #5 by Thomas Okken

I've tried all the skins in the skin package and agree that the landscape skins look great. But....

What I'm trying to achieve is a vertical HP-42s when the tablet in is in the landscape mode. I guess I would need a special "landscape" skin that looks like a vertical skin. I don't think one exists.

Thanks for your help.

Bill

Re: Free42 Android Tablet

*Message #7 Posted by **Marcus von Cube, Germany** on 6 May 2011, 5:56 p.m.,*
in response to message #6 by Bill (Smithville, NJ)

Wait for Thomas to implement an option not to stretch the bitmap. I've already asked for it.

Re: Free42 Android Tablet

*Message #8 Posted by **Thomas Okken** on 6 May 2011, 6:29 p.m.,*
in response to message #7 by Marcus von Cube, Germany

To support using portrait skins in landscape mode properly, there'd have to be additional options to specify how to place the skin on the screen (left-aligned? centered?) and how

to stretch it (don't stretch, maximize while maintaining aspect ratio, or stretch to fill?). Don't hold your breath for that just yet!

Meanwhile, modifying a portrait skin for use in landscape mode isn't particularly difficult. Open the bitmap in Paint, make it wider without stretching its contents, paint the added space black. Modify the layout file to reflect the larger size, and if you moved the position of the skin within the bitmap, modify the coordinates in the layout accordingly. A bit of a chore, but not difficult.

HP-67 battery question

*Message #1 Posted by **Csaba Tizedes (Hungary)** on 5 May 2011, 5:22 a.m.*

I have a "new" HP-67 without charger and dead battery pack. It is possible to insert new AA batteries to testing unit or this will be cause irreversible malfunction?

Re: HP-67 battery question

*Message #2 Posted by **John Robinson** on 5 May 2011, 6:56 a.m.,*
in response to message #1 by Csaba Tizedes (Hungary)

I've certainly used 3 x alkaline AA batteries to power a 65 with no problem, so I am pretty certain the 67 will be fine too. The DC-DC converter inside the calculator should regulate the voltage(s) to the required level(s) anyway.

Cheers, John

Re: HP-67 battery question

*Message #3 Posted by **Csaba Tizedes (Hungary)** on 5 May 2011, 8:57 a.m.,*
in response to message #2 by John Robinson

Thank you! I'll try to something similar, I think! Maybe you're know the answer to my second problem: It is possible to use higher capacity accumulators than originally installed by HP with factory charger? What will cause when I'll use it?

Re: HP-67 battery question

*Message #4 Posted by **sylvandb** on 5 May 2011, 6:33 p.m.,*
in response to message #3 by Csaba Tizedes (Hungary)

> Quote:
>
> Maybe you're know the answer to my second problem: It is possible to use higher capacity accumulators than originally installed by HP with factory charger? What will cause when I'll use it?

I have 1100mAh NiMH cells in my 67. They charge just fine with the factory charger. Takes a long time tho.

I would not use alkaline. I would use NiCd or NiMH cells charged in an external charger before I used alkaline.

Voyager Series

*Message #1 Posted by **aj04062** on 4 May 2011, 9:59 p.m.*

Can anyone tell me what year the changeover started to happen in the internal designs (1-2 pc boards)

Re: Voyager Series

*Message #2 Posted by **exschr** on 5 May 2011, 11:20 a.m.,*
in response to message #1 by aj04062

I can only say for sure that it changed between 2337A and 2419A!
But I can not narrow it further down.

My investigations so far are like this:

LCDType	Bat.contact	PCB	confirmed Ser-Nr
LCDsepBoard	tin/silver	two separate	2326A,2337A
LCDfullMuPx	spring/gold	onePCB	2419A,2438A,2439A,2509A,2521A,2538A,2623B,2626A
LCDhalfMuPx	spring/gold	onePCB	3437S,3521S

The LCD changed to half as much Multiplex (MuPx) connections somewhere after 2626A and before 3437S.

These numbers are from my samples (which I can verify).
Most probably it depends on the manufacturing location and isn't consistent for different locations.
Hope that this fragment adds to the truth out there ;-)

Re: Voyager Series

*Message #3 Posted by **aj04062** on 5 May 2011, 12:45 p.m.,*
in response to message #2 by exschr

Thank You!

Well the HP-10C that I just bought is 2305A, so my guess is it is 2 pc (have not received yet). That's good as it has a dent in the bezel. Hopefully I can straighten out easier than the 2 pc design.

Edited: 5 May 2011, 10:18 p.m.

Re: Voyager Series

*Message #4 Posted by **Randy** on 5 May 2011, 9:46 p.m.,*
in response to message #1 by aj04062

I doubt you can narrow it any further as it varies among the the different models. The overall range for the

family is somewhere between 3rd Q 83 to 2nd Q 84 which is reflected in exschr's data.

FWIW, I have never seen a one board 10C and I do not believe they where ever built. Supporting this theory is the museum listed Introduction-Discontinuation of 1982-1984. So, it would stand to reason it was discontinued during the design change-over to the single board.

HP41CX - Strange turning-on behaviour

*Message #1 Posted by **Frido Bohn** on 4 May 2011, 3:45 a.m.*

Since a few days I have experienced a strange behaviour of my HP41CX (halfnut version with rounded display corners):
When it is turned off, it can be turned on by pressing any key. The ON key works accuratelly. But it happened that the calculator was turned on while in my bag and the alkalines have drained. Supposedly, because some key has been pressed by random movement as the HP41 was in its softcase.
The reset mechanism does not work, as pressing CLX and ON simultaneously turns the calculator on but does not lead to a MEMORY LOST.
Has anyone an explanation for this phenomenon?

Any hint is greatly appreciated.
Thanks

Re: HP41CX - Strange turning-on behaviour

*Message #2 Posted by **dinamarco** on 4 May 2011, 7:49 a.m.,*
in response to message #1 by Frido Bohn

These happened with a few month ago. I just changed the batteries and no matter... Never more... I can only think, in my case, it was the batteries. Regards...

Re: HP41CX - Strange turning-on behaviour

*Message #3 Posted by **Norman Dziedzic** on 4 May 2011, 9:21 a.m.,*
in response to message #1 by Frido Bohn

I seem to recall there is a way to make a program run as soon as the calculator turns on. I believe we used this feature to terrorize each other In college to show an erroneous Memory Lost message on each others calculators.

Is it possible that there is something running that starts at power up or that mimics power off with a blank screen? If the calculator is not really off, that could explain the battery drain.

Edited: 4 May 2011, 9:22 a.m.

Re: HP41CX - Strange turning-on behaviour

*Message #4 Posted by **Geoff Quickfall** on 4 May 2011, 2:20 p.m.,*
in response to message #3 by Norman Dziedzic

Hello;

Procedure ONE

```
1.  ensure the calculator is off
2.  hold the CLX key first, then press the ON key while holding
    the CLX key.
3.  release keys.
4.  should have MEMORY LOST displayed.
```

unsuccesful?

Procedure TWO

```
1.  remove batteries
2.  hold the CLX key first, then press the ON key.
3.  install batteries and repeat procedure ONE.
```

Unsuccesful?

Procedure THREE

```
1.  remove batteries and short the far left to the far right
    battery terminals.
2.  install batteries and repeat procedure ONE.
```

Unsuccesful?

Procedure FOUR

```
1.  remove batteries and leave alone for 24 to 48 hours or longer!
```

The problem is, the status of the calculator became corrupted and since "ON" is an assignable function, all the keys may have been assigned the "ON" function. Purely speculation! In any event the processes above are meant to initiate a 'clean state' HP 41CX. The continued buggy state arises when the continous memory function (capacitor) causes the calc to retain the corrupted state.

Once you have finished I recomend and use a "LO" program assigned to the shifted R/S (VIEW) key. The code is as follows:

```
LBL 'LO'
SF 11
PSE
OFF
XEQ 'LO'
```

When you are finished with the calc turn it off with the LO function assigned to the shifted R/S (VIEW) key. This has the affect that when the ON key is accidentally pressed while residing in your bag, the calc turns on and executes (SF 11) the program residing in the active memory (LO); which simply commands the calc to immediately turn off.

Of course the next step is to terminate the LO program to gain access to the calc. This is done by turning on the calc and immediately press the R/S key. This haults the LO program midstream and allows you to manually exit the program and run whatever you want.

Cheers, Geoff

There is one more reset method but use with your own discretion. It has worked for me but as a last resort on an unusable machine that refused to reset using the above procedures.

```
1.  remove batteries and install them in reverse polarity.
2.  press and hold the ON key for a few seconds.
3.  release and remove the batteries and install correctly.
4.  repeat procedure ONE.
```

Edited: 4 May 2011, 2:25 p.m.

> 2.  press and hold the ON key for a few seconds.
> 3.  release and remove the batteries and install correctly.
> 4.  repeat procedure ONE.
> ```

this very last method worked for me excellently. I did not have the patience to wait for 48 hours to possibly experience that nothing had become better thereafter.

The calculator offered some more very weird behaviour, as for example

```
- the clock only worked for one second and then freezed.
- the reset condition MEMORY LOST could only be obtained by pressing ENTER and CLX
together while the calc was off.
- although I managed to get a MEMORY LOST the ill state persisted.
```

Thank you for the remedy!
And thank you all for your prompt replies.

Frido

Re: HP41CX - Strange turning-on behaviour

*Message #6 Posted by **Thomas Okken** on 4 May 2011, 3:40 p.m.,*
in response to message #4 by Geoff Quickfall

> Quote:
>
> The problem is, the status of the calculator became corrupted and since "ON" is an assignable function, all the keys may have been assigned the "ON" function. Purely speculation!

That wouldn't work. The ON function doesn't turn the calculator on, it just disables automatic power-off. Also, when the calculator is off, it doesn't scan the keyboard, it only responds to the ON key.

Thomas is correct: Re: HP41CX - Strange turning-on behaviour

*Message #7 Posted by **Geoff Quickfall** on 4 May 2011, 4:15 p.m.,*
in response to message #6 by Thomas Okken

, it has been awhile since I have played with the 41. The ON function cannot turn the calc on when assigned.

Thanks Thomas!

Geoff

Again speculating, could it be that the calc was not turning off? In any case, try the above mentioned resets and let us know what happens.

I remember being tricked by a fellow student that accessed my calc and using alpha, the sf 11 trick and a short program, had the calc never appear to turn on.

Edited: 4 May 2011, 4:19 p.m.

Re: Thomas is correct: Re: HP41CX - Strange turning-on behaviour

*Message #8 Posted by **Thomas Okken** on 4 May 2011, 4:34 p.m.,*
in response to message #7 by Geoff Quickfall

Since Frido was saying that pressing any key appeared to turn the calculator on, that makes me think that the calculator was never actually turned off. I don't think a malicious program can do that, though -- IIRC, it is not possible to override the behavior of the ON key. So, either his calculator is in a bad state, which should go away after a hard reset, or there is a hardware problem.

Regarding malicious use of flag 11 (i.e. the old LBL 00 SF 11 OFF GTO 00 joke): you can override flag eleven by holding down R/S while turning the calculator on. Assuming it was really off, that is. :-)

- Thomas

Re: Thomas is correct: Re: HP41CX - Strange turning-on behaviour

*Message #9 Posted by **geoff quickfall** on 4 May 2011, 6:05 p.m.,*
in response to message #8 by Thomas Okken

Yes, I agree, a bad state. Was the calc actually off or is it always on and awakened by a key press.

"holding down R/S while turning the calculator on"

Thats the procedure used to stop the LO program from running.

It is the "OFF" function that is key assignable, not the "ON" function. And to confuse things, assigning OFF to R/S key, then running the LO program and trying to interrupt it with the R/S key causes the calc to turn off.

Yes, deviousness from fellow students, especially to the novice!

;-)

Didn't synthetics allow the on key to be assignable or maybe that was a PPC ROM or CCD ROM function?

HP-15C Original UK Purchase Price

*Message #1 Posted by **SteveH** on 3 May 2011, 2:59 p.m.*

I'm just wondering what the original price of an HP-15C purchased in the UK in 1983 might have been.

I suspect it was a major investment (my father made in me) at the time and curious how it translates to 2011 prices.

Re: HP-15C Original UK Purchase Price

*Message #2 Posted by **hugh steers** on 3 May 2011, 3:43 p.m.,*
in response to message #1 by SteveH

from a communication on the same topic:

```
here are the 1 February 1983 UK recommended retail prices (including 15% VAT):

HP32E £58.18
HP10C £62.65
HP11C £80.56
HP15C £107.41
HP16C £107.41
HP33C £98.45
HP34C £134.26
HP12C £107.41
HP37E £80.56
HP38C £134.26
HP97A £633.77
HP41C £164.78
HP41CV £232.38
41 memory module £22.20
41 quad module/ time module/ extended functions module £66.60
41 card reader £164.78
HP7470A plotter (HPIL) £1316.75
```

Re: HP-15C Original UK Purchase Price

*Message #3 Posted by **SteveH** on 3 May 2011, 4:08 p.m.,*

IMHO, the investment was rather formativ than material. The early exposition to RPN shaped my expectation of how well designed engineering work should feel like in the hands of the user/consumer.

That's the "real value" of this investment.

Did anyone here buy this? Seems a bit high.

*Message #1 Posted by **Michael de Estrada** on 3 May 2011, 1:08 p.m.*

A recent TAS auction for an HP-92 sold for $1345. Although this vintage calc is somewhat rare, it still seems high to me, especially considering that it lacked the box. I have a complete set and paid less than 1/4 that much for it. It's interesting how much variation there is in prices paid for certain models at different times.

Edited: 3 May 2011, 6:56 p.m. after one or more responses were posted

When you look into the bid history you see a typical situation: a bid war between two bidders. If you have enough money that's no problem; otherwise it's better to bid in the last seconds and enter your maximum bid once to avoid any expensive temptation ...

Re: Did anyone here buy this? Seems a bit high.

*Message #3 Posted by **Keith Midson** on 4 May 2011, 3:01 a.m.,*
in response to message #2 by Juergen Keller

I was actually going to have a bid on this until I saw the prices go silly. The 92 is on my wish list. Even for a bidding war this was high. Cheers, Keith

Collection Data

*Message #1 Posted by **SteveH** on 3 May 2011, 6:19 a.m.*

I was thinking of throwing together a database to document my little collection of calculators. I've come up with a list of attributes I think are worth recording:

- Model or Part no.
- Serial number
- Date of manufacture (from serial no.)
- Place of manufacture (from serial no.)
- Thumbnail photo
- Purchase price
- Purchase date
- Condition
- Notes

Anything else worth including?

Re: Collection Data

*Message #2 Posted by **Katie Wasserman** on 3 May 2011, 9:46 a.m.,*
in response to message #1 by SteveH

I've found that recording information about their power source(s) is useful too -- the number and type of batteries and maybe information on their external AC adapter as well. This is particularly useful for rechargeable calculators because it's often difficult to tell what was originally inside the machine if the battery pack has been removed for avoid leaking issues.

-Katie

Re: Collection Data

*Message #3 Posted by **Bob Patton** on 3 May 2011, 9:52 a.m.,*
in response to message #1 by SteveH

You might consider source. I use New:, Gift:, Flea marker:, Junk store:, ..., etc. where specific information can follow the colon if desired.

Re: Collection Data

*Message #4 Posted by **Didier Lachieze** on 3 May 2011, 10:52 a.m.,*
in response to message #1 by SteveH

I would also add the serie (Pioneer, Voyager ...)

Re: Collection Data

*Message #5 Posted by **SteveH** on 3 May 2011, 4:09 p.m.,*
in response to message #4 by Didier Lachieze

These are all very good points. Thanks.

Re: Collection Data

*Message #6 Posted by **Allen** on 3 May 2011, 7:28 p.m.,*
in response to message #1 by SteveH

I'd include in a list of accessories included and a few pictures of each. Front, back, etc... something more than a thumbnail. This could double for insurance purposes.

One useful thing I've found (related to insurance and appraisals) is a list of "comprable sales" for replacement value. I have ebay listings printed out for several years showing "replacement value" on many mundane and rare calculators. This can be a challenge due to accessories and condition, but it's worth the work.

Atherton HP-85

*Message #1 Posted by **David Ramsey** on 3 May 2011, 12:23 a.m.*

I recently purchased a refurbished HP-85 from Larry Atherton. Here's what it looks like:

To say it's "spotless" is an understatement. Larry refinishes the case with epoxy paint, replaces the CRT, cleans the interior, and upgrades the cassette drive.

Even the bottom looks perfect. The rubber feet might not be precisely the right size, but they're brand new.

Included with the computer were 4 DC100 tapes: two with the HP Standard Pac and Math Pac, and two blanks.

The interior of the computer looks brand new. There is no dirt or dust anywhere. It even *smells* new.

Even the circuit boards appear to have been washed.

The printer belts are replaced, and the tape drive rebuilt as shown here:

The screen is razor sharp, especially considering it's a CRT and we're all used to flat panels now:

Graphics look nice, too, within the limited resolution available:

And the printer is fast, silent, and otherwise perfect:

Performance-wise: well, let's just say we've come a long way. Here's a simple BASIC program to find all the 3-digit numbers equal to the sum of the cubes of their digits:

```
10 OPTION BASE 0 @ DIM A(10)
20 FOR X = 0 TO 9 @ A(X) = X*X*X @ NEXT X
```

```
30 X = 100
40 FOR H = 1 TO 9 @ FOR T = 0 TO 9 @ FOR 0 = 0 TO 9
50 IF X = A(H) + A(T) + A(O) THEN DISP X
60 NEXT X
70 END
```

Bracketing this code with TIME statements reveals that it takes the 85 11.757 seconds to check the numbers 100 to 999. A similar algorithm in C executes in less than a millisecond on my desktop system.

Those sine curves in the graphics images? Just drawing a straight line on the screen from one corner to the other takes almost a second.

Still, there's something nostalgic and attractive about this computer. I love it.

Re: Atherton HP-85

*Message #2 Posted by **Marcus von Cube, Germany** on 3 May 2011, 2:31 a.m.,*
in response to message #1 by David Ramsey

Nice pics!

The code looks strange. The NEXT X in line 60 doesn't match any FOR statement and the three FOR statements in line 40 lack a matching NEXT.

How does DIM work in line 10? M$ BASIC would create 11 elements ranging from 0 to 10. BASIC is not C with respect to arrays.

Re: Atherton HP-85

*Message #3 Posted by **David Ramsey** on 3 May 2011, 7:57 p.m.,*

>
> How does DIM work in line 10? M$ BASIC would create 11 elements ranging from 0 to 10. BASIC is not C with respect to arrays.

Serves me right trying to type the code from memory. Here's the actual listing:

```
10 CLEAR
20 LET S=TIME
30 DISP "This is the Threez program"
40 DIM T1(10)
50 FOR X=0 TO 9 @ T1(X) = X*X*X @ NEXT X
60 C=100
70 FOR H=1 TO 9 @ FOR T=0 TO 9 @ FOR O=0 TO 9
80 IF T1(H) + T1(T) + T1(O) = C THEN DISP C
90 C=C+1
100 NEXT O @ NEXT T @ NEXT H
```

110 DISP "Program completed in ";TIME-S;" seconds."
120 END

You're right, the DIM does allocate 11 elements, but the extra element at the end isn't used and doesn't affect the program. Hey, it's been over 20 years since I've done any BASIC!

Re: Atherton HP-85

*Message #4 Posted by **Marcus von Cube, Germany** on 4 May 2011, 1:58 a.m.,*
in response to message #3 by David Ramsey

> Quote:

> Hey, it's been over 20 years since I've done any BASIC!

BASIC was my first programming language, even before I encountered programmable calculators. I started at the age of 16 (now some 35 years ago) on a Wang, located in a friend's school. It was a half hour ride to get there. :-)

I could never afford any HP equipment until recently. Funnily, my first encounter with a scientific calculator was an HP 35 which the very same friend lent me for a day. This triggers fond memories.

Re: Atherton HP-85

*Message #5 Posted by **Johnny Bjoern Rasmussen** on 3 May 2011, 3:50 a.m.,*
in response to message #1 by David Ramsey

Hi David
Congratulations! It is absolutly perfect looking and working. I also have a HP-85 working but not at all in the same condition as yours. But you're right: It's a wonderfull machine.
Cheers!

Johnny

(Let's see. If I stopped using the stove in my apartment I could probably put one there....)

Re: Atherton HP-85

*Message #8 Posted by **John Robinson** on 4 May 2011, 2:28 a.m.,*
in response to message #1 by David Ramsey

Now that is a restoration !!! very impressive. I wonder where he sources new CRTs from ???

Cheers, John

Re: Atherton HP-85

*Message #9 Posted by **Philippe Lasnier** on 4 May 2011, 8:30 a.m.,*
in response to message #1 by David Ramsey

Ah, so it was you, David, who bought it ;-)

It had been on my watch list for about a month or so and I had been dithering about whether to buy it or not (Larry has just listed another one for sale, so the dithering continues).

I've got two HP-85, one working, one with self-test error, both in need of new printer belts and tape drive overhaul, but I'd really want to have a brand "new" one.

Larry's ones look fantastic (just like the rest of the stuff he refurbishes does), but in my case, being in the UK, the transport cost is large, and the custom charges are horrendous! This makes it quite a decision to take.

Oh well <sigh>, maybe later.

Re: Atherton HP-85

*Message #10 Posted by **Jose Gonzalez Divasson** on 3 May 2011, 5:15 p.m.,*
in response to message #1 by David Ramsey

Atherton provided me with the QIC tape and replacement parts for the printer. Excellent service!

Instructions from HP for disassembling calculators

*Message #1 Posted by **Eric Smith** on 2 May 2011, 10:25 p.m.*

I was searching for something else entirely, and happened across this:
http://www.hp.com/hpinfo/globalcitizenship/environment/productdata/disassemblycalculator.html

Re: Instructions from HP for disassembling calculators

*Message #2 Posted by **Katie Wasserman** on 3 May 2011, 1:07 a.m.,*
in response to message #1 by Eric Smith

Pretty complicated just for the purpose of recycling.

Re: Instructions from HP for disassembling calculators

*Message #3 Posted by **hpnut** on 3 May 2011, 1:31 a.m.,*
in response to message #1 by Eric Smith

looks like they are limited circulation, they have "HP Restricted" at the bottom page.

Re: Instructions from HP for disassembling calculators

*Message #4 Posted by **Eric Smith** on 3 May 2011, 1:43 a.m.,*
in response to message #3 by hpnut

They can't really be "limited circulation" if they're posted on HP's web site.

Re: Instructions from HP for disassembling calculators

*Message #5 Posted by **Glenn Dowdy** on 3 May 2011, 4:26 p.m.,*
in response to message #4 by Eric Smith

Thanks for the heads-up. The content is in fact not HP-Restricted, and we'll be amending the documents to reflect that.

Re: Instructions from HP for disassembling calculators

*Message #6 Posted by **Geoff Quickfall** on 3 May 2011, 2:10 a.m.,*
in response to message #1 by Eric Smith

I guess, for the book, I should include in the 'tools appendix': a hammer and pliers! Or just get permission to include these instructions!

;-)

I find the smaller the calculator the larger the tools required to open it:

all of which helped open this watch:

Edited: 3 May 2011, 2:24 a.m.

Re: Instructions from HP for disassembling calculators

*Message #7 Posted by **Jim Yohe** on 3 May 2011, 3:28 a.m.,*
in response to message #6 by Geoff Quickfall

Nice Geoff. Say ... I have all those tools in the garage. Maybe calculator repair won't be so hard after all. ;-)

Re: Instructions from HP for disassembling calculators

*Message #8 Posted by **Raymond Del Tondo** on 3 May 2011, 4:58 a.m.,*
in response to message #6 by Geoff Quickfall

Best of all is the classic 1701 (even if it has different labels) !

Re: Instructions from HP for disassembling calculators

*Message #9 Posted by **BruceH** on 3 May 2011, 8:56 a.m.,*
in response to message #6 by Geoff Quickfall

Hey Geoff, your attitude to personal safety is pretty poor -- there is no safety equipment shown at all.

You should always wear rigger-gloves, steel-toecap boots and a welding mask when undertaking any sort of calculator repair.

HP 30b programs Interest Rate conversions Negative Periods per Year and Fractional Periods per year

*Message #1 Posted by **gene wright** on 2 May 2011, 2:53 p.m.*

These programs allow the use of negative values for "Periods per year" when converting interest rates. They also allow the use of fractional periods per year. End of period compounding assumed.

First program: Computing the effective rate. Inputs: Nominal rate, =, number of periods.

```
/
Ans
) Swap
1
+
) Swap
Y^X
1
-
Shift+Stop
```

When run from the program catalog, key 0.1224 = 2 +/- = =

Result shown is 0.1346

2nd program: Effective rate to nominal rate. Inputs: Effective rate, =, number of periods.

```
=
=
shift+UP
1
+
) Swap
1/X
Y^X
1
-
*
Shift+STOP
```

Inputs: 0.1346 = 2 +/- = =

Outputs 0.1224

Inputs: 0.1346 = 360 = 210 / =

Outputs: 0.1310

Edited: 2 May 2011, 3:15 p.m.

wp34s Adding decimals to fractions

*Message #1 Posted by **Norman Dziedzic** on 2 May 2011, 10:00 a.m.*

On the 32sii and 35s I can be in fraction mode and type something like 0.125 + Which will add 1/8 to the number in X.

On the wp34s the same keystrokes don't add anything. Entering an integer works but it seems that as soon as I type the first decimal separator, it wants to see the second one as well.

Re: wp34s Adding decimals to fractions

*Message #2 Posted by **Walter B** on 2 May 2011, 11:00 a.m.,*
in response to message #1 by Norman Dziedzic

Hi Norman,

Thanks, you found another bug!

Walter

Re: wp34s Adding decimals to fractions

*Message #3 Posted by **Paul Dale** on 2 May 2011, 5:43 p.m.,*
in response to message #1 by Norman Dziedzic

You are in fraction mode. 0.125 is 0 / 125 which is plain zero.

What would you expect if you added 1.125 ? Or 1.1.125 ?

Where does fraction mode end and real mode being is the question here.

- Pauli

Re: wp34s Adding decimals to fractions

*Message #4 Posted by **gene wright** on 2 May 2011, 6:17 p.m.,*
in response to message #3 by Paul Dale

Hey Pauli.

I think the assumption is that the 32sII paradigm for fractions is "the way things should work".

Re: wp34s Adding decimals to fractions

*Message #5 Posted by **Paul Dale** on 2 May 2011, 7:15 p.m.,*
in response to message #4 by gene wright

Even if it is inconsistent?

I don't have a 32sII to hand so I can't experiment at the moment. However if 1.2 is a half, 0.2 should be 0 IMHO.

The problem might be that we're not changing the display during entry in fraction mode so it isn't clear enough what is happening.

- Pauli

Re: wp34s Adding decimals to fractions

Gene is right. I was going by the 32sii standard.

To enter 0/125 on the 32sii you would enter . 0 . 125

The operative part of enter a fraction is that decimal occurs twice in the entry. With only a single . the entry is considered a decimal entry. The 32sii gives the example of entering 5/8 as either . 5 . 8 OR 5 . . 8

That's inconsistent. By plain and simple logic, 5/8 shall be entered as .5.8 - 5..8 enters 5 0/8 !

For better or worse, it is consistent with the 32sII manual ;-) Perhaps the developers of the 32sII realized that there is virtually no need to ever key in a fraction with numerator of 0.

HOWEVER, this input method which I'm choosing to call a *short cut* does not work on the 35s. (Yes I know it is technically not a short cut since it is the same number of keystrokes as . 5 . 8 but it is easier to key in because of the repeated .).

Working on a my 32sII with FDISP on.

```
Keypress   Display
--------   -------
5          5_
.          5._
.          5/_
8          5/8_
<ENTER>    0 5/8
```

I guess the major question is whether or not the 32SII should be followed exactly or not. If you want to duplicate the 32SII then I highly recommend reading chapter 5 of the 32SII manual which is on the Museum DVDs.

Re: wp34s Adding decimals to fractions

*Message #10 Posted by **Walter B** on 3 May 2011, 4:48 a.m.,*
in response to message #9 by Norman Dziedzic

We don't follow the 32SII exactly - you will never see anything like 0 5/8 on the wp34s I hope ;-)

When PROFRC is set, the logic behind our input is:

```
.5.8 ENTER results in 5/8
.58 ENTER shall result in 29/50
5.8 ENTER shall result in 5 4/5
5.8.9 ENTER results in 5 8/9
5.9.8 ENTER results in 6 1/8
5..8 ENTER results in 5 0/1
```

with the 0/1 indicating you're in fraction mode. One may discuss whether the 0/1 is necessary or should be discarded, since the missing decimal mark may be sufficient evidence.

Walter

Re: wp34s Adding decimals to fractions

*Message #11 Posted by **Marcus von Cube, Germany** on 3 May 2011, 10:43 a.m.,*
in response to message #10 by Walter B

The decimal mark is missing in most cases, so we need some indication.

Re: wp34s Adding decimals to fractions (now in)

*Message #12 Posted by **Walter B** on 6 May 2011, 2:25 a.m.,*
in response to message #10 by Walter B

Hi Norman, all,

FYI, the latest build (820) handles all such inputs and operations properly, as far as I checked. Enjoy - and continue testing :-) !

HP-41 Programming

*Message #1 Posted by **SteveH** on 2 May 2011, 7:35 a.m.*

I've always done my programming on either an HP-42 or HP-1x series calculator an am slightly stuch trying to port a simple program to my HP-41CX.

How does one enter a conditional test such as X<Y? where it's not one that's accessible from the keyboard? I can see it in the catalog and could enter it in ALPHA mode but need the '<' symbol.

I suspect I'm missing something really simple.

Re: HP-41 Programming

Look at the plaque on the back of the calculator to see the characters associated with shifted alpha keys. '<' is on COS. Then enter the command via XEQ ALPHA.

in response to message #1 by SteveH

I remember picking up my first HP41C for university in 1980. Left the manuals in the shrink wrap and started pounding away.

Found I could not create the commands using alpha as I was not used to a catalog of commands nor the requirement to create them!

I undid the shrink wrap ;-)

Cheers Geoff

*Message #5 Posted by **Namir** on 2 May 2011, 1:41 p.m.,*
in response to message #4 by Geoff Quickfall

Geoff,

The announcement of the HP-41C made it in USA Today in July 1979. I remember being in southern CA and looking at the yellow pages to find the nearest calculator dealer--EduCalc (surprise surprise). I drove there and asked about the 41C. They said they did ot have any yet, but they had the manuals. I don't remember if I bought one or borrowed it (with a deposit). I came back to our summer apartment and sat down reading the manual and becoming amazed at the new features of the 41C. Reading the manual made it very easy to work the machine which I obtained early September in Ann Arbor, MI, where I was studying.

in response to message #5 by Namir

Hello Namir!

I was having a cinnamon bun at the University coffee shop (1980 fall) before classes, around 7am. The guy beside me was playing with this HP LCD calculator. I pulled out my hp 25 and he proceded to expound on the capabilities of this new HP-41C.

I think I was most impressed with the Star Trek game he had installed. THAT convinced me to trade in the HP 25 (sold to a fellow student) as I was tired with the lunar landing simulator on the 25.

;-)

HP-49G Connectivity Kit

*Message #1 Posted by **Paolo Cipollone** on 2 May 2011, 6:02 a.m.*

Hi all,

I am getting a 49G (NOT G+) with the PC connectivity kit. I'd like to know if I can use the cable supplied to connect my 48sx and my 95LX to a PC as well. This might have been brought up some other time, but I haven't managed to find a clear answer yet.

Thanks in advance,

Paolo

Re: HP-49G Connectivity Kit

*Message #2 Posted by **Paul Berger (Canada)** on 2 May 2011, 6:50 a.m.,*
in response to message #1 by Paolo Cipollone

No the connector used on the 49G is different from the one use on the 48 series and the 95LX.

Re: HP-49G Connectivity Kit

*Message #3 Posted by **Massimo Gnerucci (Italy)** on 2 May 2011, 2:26 p.m.,*
in response to message #1 by Paolo Cipollone

All my 49Gs came with a serial cable ending in a 10 pin female plug (for the 49) and a 10 pin male to 4 pin female adapter (to use it with a 48).

Greetings,
Massimo

HP-IL RS-232 (a-may-be too-)"techie" questions.

*Message #1 Posted by **Diego Diaz** on 30 Apr 2011, 8:53 a.m.*

Hi all,

To the HW gurus out there: Has someone ever got an image of the program inside the 82164A processor? (I know it's difficult but, where else could I ask?)

HP P/N:1820-3218 => Intel 8048 microcontroller, 1K ROM.

Or, does someone has an 82164A (preferebly non-working) which can be left in loan for me to extract such image? (Yes, this is even more difficult than the previous one... :-))

Thanks and best wishes from the Canary Islands.

Diego.

Re: HP-IL RS-232 (a-may-be too-)"techie" questions.

*Message #2 Posted by **Prabhu Bhooplapur** on 30 Apr 2011, 10:11 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

You have a mail.

Best regards,

Prabhu

Re: HP-IL RS-232 (a-may-be too-)"techie" questions.

*Message #3 Posted by **Eric Smith** on 30 Apr 2011, 11:24 p.m.,*
in response to message #1 by Diego Diaz

Although the pinout shown in the service manual does match the 8048, I think the actual part must be an 8049 or (less likely) 8050. Those are the variants of the 8048 with more memory.

The 82164 is documented as having a 109 byte receive buffer, 14 4-bit R registers, 12 bytes of C registers, and 4 status bytes. That adds up to 131 bytes, and the 8048 only has 64 bytes of RAM. Even with the 128 bytes of RAM of the 8049, it's a tight squeeze; some of the RAM is taken up by working registers and stack, so some of the 82164A R and/or C register values must be used directly rather than buffered, etc.

I doubt that it's an 8050 because that has 256 bytes of RAM, and they would have been able to make the receive buffer even larger with that part.

Be careful when reading the ROM from an 8048/8049/8050. The verify mode is similar to that of the

8748/8749 EPROM version, but the 8048/8049/8050 should have 12V on the EA pin, vs. 18V for the EPROM version. Without realizing that, I did successfully read an 8049 once on a programmer set for the 8749, but when I tried to do that with another 8049 I damaged the part.

Re: HP-IL RS-232 (a-may-be too-)"techie" questions.

*Message #4 Posted by **Diego Diaz** on 1 May 2011, 12:37 p.m.,*
in response to message #3 by Eric Smith

Hi,

Prabhu: Thnaks a lot, you've got mail too.

Eric: Thanks for the remarks. I was certainly aware of the electrical specs for the MSC-48 family. I haven't think of the RAM amount though, and it looks like you must be right in your assumption that the part should be an 8049, despite the designation found in the Xref. tables. Anyhow, I also have the tools to preperly (and safely) read any of the types.

I'm concerned about the need of removing the chip. Does anyone know if it's placed in a socket or just soldered on the board?

Best wishes from Spain.

Diego.

Re: HP-IL RS-232 (a-may-be too-)"techie" questions.

*Message #5 Posted by **Eric Smith** on 1 May 2011, 5:54 p.m.,*
in response to message #4 by Diego Diaz

The service manual doesn't indicate that the part is socketed, so it seems fairly unlikely that it would be.

What equipment do you use for reading the masked-ROM parts? I've got a bunch of different commercial EPROM programmers, and all of them handle the EPROM parts but none of them handle the masked-ROM parts.

The last time I did this I hand-wired an adapter that disconnected pins 7, 25, and 26, wired pin 26 of the chip to pin 40 of the socket (Vcc), and had a 7812 regulator taking the 25V from pin 26 of the socket and providing 12V to pin 7 of the chip. This adapter worked on some programmers but not others, possibly due to the sequencing of the reset signal and Vpp by the programmer.

Re: HP-IL RS-232 (a-may-be too-)"techie" questions.

*Message #6 Posted by **Garth Wilson** on 1 May 2011, 7:16 p.m.,*
in response to message #5 by Eric Smith

I have the FSI164A which is almost identical in operation and instructions but has bigger buffers and more RS-232 channels (2 standard and up to 8 was optional) and had a battery option. It has an EPROM which I refreshed just a few years ago so I could catch it before the data went bad since it was about 20 years old. I thought I kept a .hex file of it I could email you but I can't find it at the moment and have not gotten my old Needham's EPROM programmer going again since changing DOS computers. I'm sure I just have to change the I/O address which is at 300h at the moment.

Re: HP-IL RS-232 (a-may-be too-)"techie" questions.

*Message #7 Posted by **Diego Diaz** on 1 May 2011, 7:41 p.m.,*
in response to message #5 by Eric Smith

Hi,

I'm using a Willem programmer, with some mods on my own, and the corresponding MSC-48 adapter.

It handles the whole family: ROM (8048, 8049, 8050), OTP and EPROM (8748, 8749).

It's a convenient device which also programs a wide range of EPROM's EEPROMs, Flash, Dallas (RTC's)... and serial devices: PIC's, I2C, SPI, Microwire...

Only drawback is that you need a parallel port (farily scarcy nowadays) to connect it to your computer.

Best wishes.

Diego.

Very nice graphics :-)

Re: Free42 for Windows Phone 7

*Message #3 Posted by **Vincent Weber** on 30 Apr 2011, 10:49 a.m.,*
in response to message #1 by Thomas Okken

Thanks Thomas for the info. So, after all, somebody undertook the monstruous task to convert Free42 from C++ to C# ! :) What I can't understand is, why did he base this on Free42 1.4.63, which is a version without the TIME functions, and with two remaing bugs (ASIN and INVRT) ? Did he tell you if there is a particular reason, or if he will upgrade to the latest core any soon ? Anyway, interesting to know that Free42 is now available, with various degrees of maturation, on every mobile plateform that has a future for sure (Symbian is dead, and we still don't know about WebOS).

Cheers,

Vincent

Re: Free42 for Windows Phone 7

*Message #4 Posted by **Thomas Okken** on 30 Apr 2011, 2:55 p.m.,*
in response to message #3 by Vincent Weber

I assume 1.4.63 was the current version when he started. Converting everything to C# was a big task and Steve told me it took several months overall.
Regarding his plans to bring 42S in sync with the latest Free42 bug fixes and enhancements, you'll have to ask the author himself. :-)

Re: Free42 for Windows Phone 7

*Message #5 Posted by **Vincent Weber** on 1 May 2011, 5:46 a.m.,*
in response to message #4 by Thomas Okken

Thanks Thomas. Why not putting a link (with a disclaimer of course, that you did not supervise this) to this version from your website ? it will certainly increase your user base :) Cheers, Vincent

Re: Free42 for Windows Phone 7

*Message #6 Posted by **Thomas Okken** on 2 May 2011, 3:11 a.m.,*
in response to message #5 by Vincent Weber

Re: Why not put a link on my web site?

I removed all the links to third-party Free42 ports from my web site a few months ago, because none of them were being kept in sync with my releases in a timely manner, if at all.
I have no problem with third-party ports, even commercial ones, in fact I like all of them (*), but when it comes to endorsing or supporting them, I think I should focus on promoting the ones that I can actually support **myself**...

N.B. In case it sounds like I'm contradicting myself, given that this thread started with me mentioning the WP7 port: I think that that port is worth mentioning, on this forum, because any HP calculator emulator is a matter of interest here. I hope I've made it clear that I am *not* offering support for that port; anyone who discovers a problem with it should contact Steve, not me.

(*) Except for the INFOWISE iPhone version (I don't mean Byron Foster's iPhone version!). That one is published by a pure leech, not to mention a GPL violator. One of these days I may get the energy to do something about that...

Re: Free42 for Windows Phone 7

*Message #8 Posted by **Steven Ray** on 2 May 2011, 3:57 a.m.,*
in response to message #3 by Vincent Weber

Hi all,

Thomas, thanks for posting about the WP7 version here!

Vincent, to answer your question on the source version, 1.4.63 happened to be the source I had at my disposal when I decided to start this project. As I progressed, I also had to scale back on some features as the project was taking a long time and I decided to concentrate on the baseline functionality of the original HP-42S (hence the lack of extended functions for time, gps, etc).

I wasn't familiar with the ASIN and INVRT issues, so I'll look into those soon. I'll also take a look at the 30ish time functions to see what's involved, but not sure when I'll get to implementing them. Maybe for release 2.0.

In May, Microsoft is releasing 2500 new APIs for WP7 developers including sockets support. I was thinking of looking into using this in version 2.0 to implement program import and export (either to cloud or desktop) and printout file download. Gotta see what the APIs look like before I know what's involved. Also, I don't think apps built on these APIs will be able to go live until much later this year when the major OS update is released.

Anyway, I started this project because I was moving from the iPhone to WP7 to develop other apps and I just couldn't live without Thomas' program! It made a good test case for my first WP7 app and I hope those of you on the WP7 platform enjoy it. Feel free to send me feedback directly at support@rayzzor.com.

Cheers,
Steve

Re: Free42 for Windows Phone 7

*Message #9 Posted by **Thomas Okken** on 2 May 2011, 4:10 a.m.,*
in response to message #8 by Steven Ray

Hi Steve,

Welcome to the HP forum! :-)
Regarding the ASIN and INVRT bugs, those are easy to fix. I don't think I did anything else in the core since 1.4.63, so simply diffing 1.4.63 with the latest source should give you the required code changes without any noise.

UPDATE: Well, without any noise except for changing the copyright notice everywhere and some Android-related changes, anyway!
(I just moved my source repository from CVS to Subversion the other day and looking at the revision history with websvn is very cool...)

- Thomas

Edited: 2 May 2011, 4:30 a.m.

SOT: Subversion

*Message #10 Posted by **exschr** on 2 May 2011, 5:37 a.m.,*
in response to message #9 by Thomas Okken

Hi Thomas and Steve

Thank you for your work for the Android and WP7 versions!
I'm using both of these.

Regarding Subversion:
What platform do you run it on?
I'm looking for subversion on opensolaris, both platforms (SPARC/i386)
But I don't now which distribution to best go with! (Sunfreeware or OpenCSW, or even CollabNet)

Thanks Roger

Re: SOT: Subversion

*Message #11 Posted by **Thomas Okken** on 2 May 2011, 9:23 a.m.,*
in response to message #10 by exschr

I run Subversion on my Mac; it's included with Apple's software development tools. All I had to do was add a plist under /Library/LaunchDaemons to start svnserve at boot time.
I got WebSVN from websvn.tigris.org, and I run it under the Apache server that's included in OS X.

Regarding OpenSolaris, I have no idea!

I think charging money for software is totally respectable even if it is developed on a platform

where development is free! The cost of an Apple iOS developer membership is insignificant compared to the time I'm spending on this.

I decided to drop the price of the iPhone version to $0 because I didn't want to keep charging for an incomplete piece of software, given that I never seem to find the time or have the inclination to work on it lately. Once I finish the printer emulation window and local file import/export, I'll raise the price back to some non-zero level.

Re: Free42 for Windows Phone 7

*Message #14 Posted by **Vincent Weber** on 2 May 2011, 10:28 a.m.,*
in response to message #13 by Thomas Okken

Thomas,

You're absolutely right, sorry if I was unclear and seemed to imply that it would not be respectable to charge money for your time... You could actually charge HP big money for re-using Free42 for their next physical calculator, I don't think their development team can (any more) come even close to the quality of Free42 ! Your contribution to the HP community, by bringing for free a simulator which faithfullness matches the one of an emulator, of an accclaimed calculator which ROM is furthermore copyrighted, hence unavailable for the majority of people, is tremendous - on part with JF Garnier and Christoph Gosselin ! :)

My remark was just that you once posted you were making no apology for charging money to publish on the appstore, whereas other versions were free, so I was wondering why this had changed. Please, please, finish your version ! otherwise we will have to stick with Byron's version. His version is awsome, but is stretching too far in the direction of the HP-48 and I'm affraid someday something will be broken. With you, I'm 100% sure that the app will be 100% HP-42S :)

Cheers,

Vincent

in response to message #8 by Steven Ray

Hi Steve again,

I am thinking out loud, if you do not want to wait for the socket API, can't the user have a WCF service running on the destkop to download .raw files from the phone ?

Thanks and regards,

Vincent

Re: Free42 for Windows Phone 7

*Message #16 Posted by **Steven Ray** on 2 May 2011, 3:15 p.m.,*
in response to message #15 by Vincent Weber

Hi Vincent,

Absolutely. In fact, that was the direction I was headed. I actually delayed the release for a month or two while I started work on feasibility projects to test WCF-based file transfer.

In the end, I decided to hold on this approach and release an initial version without communication support. My reasoning was:

1) With the current APIs, though it is possible, it's certainly not ideal, especially for the user interaction model I wanted to implement (e.g. query from the PC rather than push from the phone).

2) I didn't want to invest a lot of time into a communication link that whould be obsolete or at least much easier to implement as soon as MS came out with the API updates.

3) I figured getting a release out sooner with all the core functionality might be of interest to some. Then I can add on the extras (communication, time functions, gps, etc) as my schedule permits.

Good suggestion though, thanks!

Cheers,
Steve

in response to message #1 by Katie Wasserman

I also found the "Tweaking the HP42S" article interesting. Specially in light of the discussion of the WP34S keyboard layout. Although I have to say that I have a BIG problem with putting the X<>Y key on a shifted keyplane (as seems to be suggested by the image). I use X<>Y a lot more frequently than I use RDN and personally would switch those two if I could not have both unshifted.

Re: Just out.

*Message #12 Posted by **Jake Schwartz** on 29 Apr 2011, 8:17 p.m.,*
in response to message #11 by M. Joury

It is interesting...quickly checking through the models, the only ones I could find which had x<>y shifted

were the 17BII, 17BII+, 19BII, 28C/S (swap), 65 and 67. (For the 65/67, x<>Y and Roll down would be primary only if programs using the appropriate LBL had not been defined in program memory. Also, it is interesting that the 34C, 37E and 38E/C had x<>y primary, but roll down shifted.

...but of course, the purpose of articles like these are specifically for creating a dialog and I'm grateful that any sort of discussion might take place.

Jake Schwartz

Re: Just out.

*Message #13 Posted by **M. Joury** on 30 Apr 2011, 2:12 a.m.,*
in response to message #12 by Jake Schwartz

Hi Jake,

Thanks for the article! Actually of the three business calculators you mention (17BII, 17BII+ and 19BII) the X<>Y and RDN keys are printed as if they are shifted but they act as unshifted keys when in RPN mode.

Marwan

Re: Just out.

*Message #14 Posted by **Walter B** on 30 Apr 2011, 12:52 a.m.,*
in response to message #11 by M. Joury

Jake's new article has ancestors in 2008 as he mentioned in the last paragraph in HP Solve. Looking at them, you'll find tweaking is an hobby with a long tradition in this community, and also the wp34s has its parents and grandparents :-)

> Quote:
>
> I use X<>Y a lot more frequently than I use RDN and personally would switch those two if I could not have both unshifted.

I concur. OTOH only three scientific HPs needed one or both of these functions shifted. Jake listed them.

Walter

Re: Just out.

*Message #15 Posted by **Eddie W. Shore** on 1 May 2011, 5:31 p.m.,*
in response to message #11 by M. Joury

Concur, I prefer the swap and the roll down functions (and the STO function) all to be unshifted as well.

The keyboard with three shifted functions (not counting the alpha characters) is a bit crazy.

The key layout with the gold shift on top and blue shift on the bottom look the best IMO.

Re: Just out.

*Message #16 Posted by **M. Joury** on 2 May 2011, 12:29 a.m.,*
in response to message #15 by Eddie W. Shore

I'll second that on STO! I guess the logic is that you use RCL more than STO so shift STO. However, I like the old Pioneer layout (and the 41 for that matter) with STO, RCL, X<>Y and RDN all unshifted.

Re: Just out.

*Message #17 Posted by **Jose Gonzalez Divasson** on 29 Apr 2011, 6:41 p.m.,*
in response to message #1 by Katie Wasserman

I have to say that Gene's review can be used as a "getting started" guide - better than the one provided with the actual calculator. It's that good!

I say this because it helped me to understand some aspects that I did not "get" from the provided guide at a first reading.

Re: Just out.

*Message #18 Posted by **gene wright** on 29 Apr 2011, 9:17 p.m.,*
in response to message #17 by Jose Gonzalez Divasson

Heh. From your lips to HP's ears.

Seriously, all of that material is in there. I have no idea how the quick start guide was written.

The HP 10bII+ is a great little machine.

Re: Just out.

*Message #19 Posted by **Tim Wessman** on 29 Apr 2011, 10:49 p.m.,*
in response to message #18 by gene wright

Well, the quickstargt guide for the 10bII+ is essentially the "getting started" chapter from the original manual. A lot of the new things were put in there, but there wasn't enough space to cover it all.

The QSG *is* enough for you to effectively use the machine however. Unlike the 30b QSG. :-)

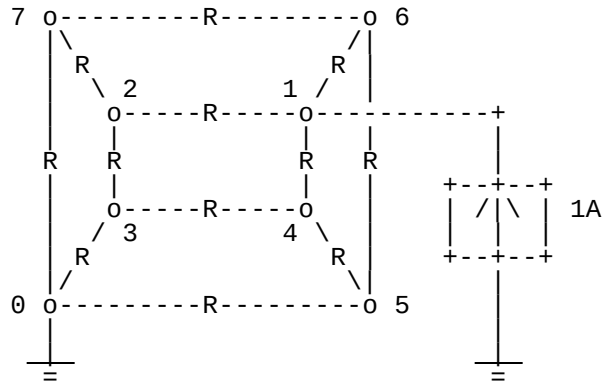
Very good stuff.

Re: Just out.

*Message #21 Posted by **Gerson W. Barbosa** on 1 May 2011, 9:56 p.m.,*
in response to message #1 by Katie Wasserman

Very good stuff indeed, thanks!

I took the time to finally solve the cube resistor problem. I never did all the exercises in my textbooks (quite the contrary!). That one was in Resnick & Halliday's book, but I skipped in '82 :-)



For easy visualization the cube has been redrawn to 2-D. For convenience, let's use 1 ohm resistors. The circuit will be solved through nodal analysis.
Let's take node 0 (ground) as a reference and inject 1 amp into node 1. For convenience, let R = 1 ohm. The seven nodal equations can be readily obtained:

1) $(V_1 - V_6) + (V_1 - V_2) + (V_1 - V_4) = 1$
2) $(V_2 - V_7) + (V_2 - V_1) + (V_2 - V_3) = 0$
3) $(V_3 - V_2) + (V_3 - V_4) + V_3 = 0$
4) $(V_4 - V_5) + (V_4 - V_1) + (V_4 - V_3) = 0$
5) $V_5 + (V_5 - V_6) + (V_5 - V_4) = 0$
6) $(V_6 - V_5) + (V_6 - V_7) + (V_6 - V_1) = 0$
7) $(V_7 - V_6) + (V_7 - V_2) + V_7 = 0$

Instead of putting the system of equations into matrix form before solving it, the equations may be used exactly as they are written and solved with help of the hp-50g program described here. The program finds V_1 = .833333333333, which implies the equivalent resistance across the nodes 0 and 1 is 5/6*R. Likewise, when the 1 Amp current source is connected to the nodes 5 or 6, for instance, other equivalent resistances can be determined. They are 7/12*R and 3/4*R, respectively.

Sets of equations to be used in the program:

```
%%HP: T(3)A(D)F(,);
{ 'V1-V6+V1-V2+V1-V4=1,' 'V2-V7+V2-V1+V2-V3=0,' 'V3-V2+V3-V4+V3=0,' 'V4-V5+V4-V1+V4-V3=0,'
'V5+V5-V6+V5-V4=0,' 'V6-V5+V6-V7+V6-V1=0,' 'V7-V6+V7-V2+V7=0,' }

%%HP: T(3)A(D)F(,);
{ 'V1-V6+V1-V2+V1-V4=0,' 'V2-V7+V2-V1+V2-V3=0,' 'V3-V2+V3-V4+V3=0,' 'V4-V5+V4-V1+V4-V3=0,'
'V5+V5-V6+V5-V4=1,' 'V6-V5+V6-V7+V6-V1=0,' 'V7-V6+V7-V2+V7=0,' }

%%HP: T(3)A(D)F(,);
{ 'V1-V6+V1-V2+V1-V4=0,' 'V2-V7+V2-V1+V2-V3=0,' 'V3-V2+V3-V4+V3=0,' 'V4-V5+V4-V1+V4-V3=0,'
'V5+V5-V6+V5-V4=0,' 'V6-V5+V6-V7+V6-V1=1,' 'V7-V6+V7-V2+V7=0,' }
```

Re: Just out.

in response to message #21 by Gerson W. Barbosa

Nicely done.

When I took first year college physics we called it "Halliday & Resnick", probably the 1st edition. (I must be pretty old because whatever edition it was the section on relativity was a supplement!) I need to dig it out and see if that resistor problem is in there.....

Re: Just out.

*Message #23 Posted by **Gerson W. Barbosa** on 2 May 2011, 8:38 a.m.,*
in response to message #22 by Katie Wasserman

Without nodal analysis, an overkill here, the trick would be redrawing the circuit connecting together the nodes clearly at the same potential, like 2 and 4, for instance. I should have said "Halliday & Resnick". Actually we called it simply Halliday. Mine was probably the Brazilian 1st edition. I think the resistor cube problem is in the chapter 27 (Circuits).

http://www.amazon.com/Fundamentals-Physics-David-Halliday/dp/0471216437/ref=sr_1_6?s=books&ie=UTF8&qid=1304337310&sr=1-6

Getting sucked in

*Message #1 Posted by **David Ramsey** on 29 Apr 2011, 12:06 p.m.*

My HP collecting has been pretty moribund for the last few years. After 20+ years of dedicated searching, I have all of the HP RPN scientific calculators, and even a few random items like an HP-01, Expander, etc. I've got 41C accessories out the wazoo, all four versions of the HP-35, et cetera so on and such forth. There are probably some HP-41 application ROMs I don't have (but I do have a lot of them), but all in all I'm complete. The last calc I got was an HP-35S pre-production model I got for sending an HP guy whose name I forget (but whom I met at the 2006 conference in San Jose) one of my 41s.

In the course of getting the calculators, I'd picked up three desktop machines: an HP-46, a 9815, and a 9825. But I wasn't planning on going after anything else, since they weren't the focus of my collection. Sure, if a 9100 or 9810 had drifted across my field of vision, I probably would have jumped. But I wasn't actively looking.

Due to years of habit I still check eBay calc auctions at least every week or so, which is when I saw Larry Atherton's beautifully refurbished HP-85s. Now, back in the late 1970s I worked at a computer store in Dallas (the KA Computer Store) that among the Apples and Ataris also sold HP-85s, which I could never have afforded at the time. But it made an impression, and I'd always thought if I found a nice one I'd grab it.

Well, Larry's refurbs aren't cheap, although eBay regularly hosts auctions for grotty unrestored and non-guaranteed-to-work versions for significantly more money. After trading a few e-mails I bought one.

It's spectacular: shiny new, with a razor-sharp CRT, whisper-quiet printer, and slick tape drive. The epoxy paint Larry uses on the case seems a bit glossier than I recall, but otherwise the machine might have been boxed in a warehouse since 1979.

Suddenly, my collector urges are coming back, this time aimed at the 9800 series machines. I'm getting an 87 and a 9121 disk drive from 360tech.com, and looking at 9835/45s with an eye towards finding some place to put one of these rather large machines. 360tech.com will be happy to sell me a 9845C for $4500. Fortunately I'm not that far gone. Yet.

Perhaps it's not quite as satisfying and finding unused old HPs at flea markets, yard sales, and at Weird Stuff, but those venues are pretty tapped out these days. And I'm having fun working on 3D rendering programs for the 85. Rough benchmarks indicate that my desktop PC has about 100,000 times the performance of the 85. But somehow it's still fun.

The last thing I'll note is that there seems to be a dedicated web site run by a fanatic for every single HP 98xx model. Didn't expect that, but it's cool.

in response to message #1 by Tim Wessman

i'll do some...

Re: [OT] Casio PRISM Current Draw?

*Message #3 Posted by **hugh steers** on 28 Apr 2011, 9:05 p.m.,*
in response to message #2 by hugh steers

ok, some quick results are:

max current when calculating (also on initial power up) = 30ma. sitting in the main (color) menu = 11ma. idling in the calculator (main app) = 7ma [why this is less than when on the main menu, not sure. unless the brightness is slightly different here]. when screen goes dim = 3ma

one other thing is that the current draw seems to fluctuate by about 1.5ma all the time. not sure why. my numbers above are averages.

Re: [OT] Casio PRISM Current Draw?

*Message #4 Posted by **Tim Wessman** on 29 Apr 2011, 12:37 a.m.,*
in response to message #3 by hugh steers

Interesting numbers. Thanks for that. I've been curious since it came out.

TW

Re: [OT] Casio PRISM Current Draw?

*Message #5 Posted by **Joerg Woerner** on 29 Apr 2011, 8:15 a.m.,*
in response to message #4 by Tim Wessman

I expected that you did these measurements at HP already in December 2010 ;-))

Cheers, Joerg

Re: [OT] Casio PRISM Current Draw?

*Message #6 Posted by **Tim Wessman** on 29 Apr 2011, 10:14 a.m.,*
in response to message #5 by Joerg Woerner

Nope. Just personal interest is all.

Speaking of which, how about some inspiring CX numbers? :-)

TW

Re: [OT] Casio PRISM Current Draw?

*Message #7 Posted by **Joerg Woerner** on 29 Apr 2011, 12:55 p.m.,*
in response to message #6 by Tim Wessman

Tim,

These were pre-production models and I had to sign a NDA that I don't open the units or do any kind of reverse engineering. I sent them back to Dallas a few days ago.

Regards, Joerg

Re: [OT] Casio PRISM Current Draw?

*Message #8 Posted by **Tim Wessman** on 29 Apr 2011, 2:04 p.m.,*
in response to message #7 by Joerg Woerner

Well, how about on just any other nspire model? I don't think I've seen power readings on that either.

TW

Re: [OT] Casio PRISM Current Draw?

*Message #9 Posted by **Joerg Woerner** on 2 May 2011, 7:55 a.m.,*
in response to message #8 by Tim Wessman

Tim,

Give me a few days - it is not that easy. The connection of the two 3V strings to the PCB isn't that straight forward.

Regards, Joerg

RPN hp20s and lcd hp34c proposals

*Message #1 Posted by **Jose Poyan** on 28 Apr 2011, 6:05 p.m.*

Thanks to those who made possible the project wp34s. I would have contributed myself with something if my knowledge on computing would have been a little above zero :-) but it's not the case. However I have had for years a couple of ideas in my head related to the display and I'd like to mention them now, so you can give your opinion about it.

As everyone knows, the last series made by Hewlett Packard when till independent, the Pioneer, did not include a RPN model with segment lcd screen. That is to say, the RPN models in that serie used matrix screens. In other words, the RPN version of the HP20S was never produced. I noticed it when I was a kid and I bought my first Pioneer.

And this wasnt natural. In fact all the previous spice models had segment(obviously) led displays. So it would have been a logical step to make a simple RPN calculator with segment display, for example the lcd version of the HP34C.

I have problems to work with matrix displays. I love segment displays, which are clear and sharp, and I like simple calculators. I think it would be a good idea, based on the wp34s, to make a RPN model with Segment display by avoiding the use of the matrix section on the screen of the hp30b. It would cover a niche and the project would be almost straight forward! By this I mean that the layouts are already there: the HP20s and HP34C keyboards. And the manual doesnt need to be written; it was written decades ago: the HP34C manual.

What's your opinion?

jose poyan

Re: RPN hp20s and lcd hp34c proposals

*Message #2 Posted by **Martin Pinckney** on 28 Apr 2011, 6:56 p.m.,*
in response to message #1 by Jose Poyan

But of course the Voyagers were segment and RPN. But I like Pioneers better myself as well.

Re: RPN hp20s and lcd hp34c proposals

*Message #3 Posted by **Jose Poyan** on 28 Apr 2011, 7:58 p.m.,*
in response to message #2 by Martin Pinckney

I know. I was refering to the models with vertical format only.

Re: RPN hp20s and lcd hp34c proposals

*Message #4 Posted by **Marcus von Cube, Germany** on 29 Apr 2011, 8:47 a.m.,*
in response to message #3 by Jose Poyan

You might want to repurpose the new 10bii+. It comes with a plain segmented LCD, has the Pioneer

keyboard layout, so what would you want more?

Personally, I stick to wp34s. When the firmware is stable, I'll almost certainly will sacrifice a 30b for the purpose.

Re: RPN hp20s and lcd hp34c proposals

*Message #5 Posted by **Martin Pinckney** on 29 Apr 2011, 9:35 a.m.,*
in response to message #4 by Marcus von Cube, Germany

I thought I read Tim saying it could not be repurposed. But I can't find the post.

Re: RPN hp20s and lcd hp34c proposals

*Message #6 Posted by **Marcus von Cube, Germany** on 29 Apr 2011, 10:07 a.m.,*
in response to message #5 by Martin Pinckney

Of course it can. The programming connector is the same. There is no JTAG connector for debugging and HP has yet to release technical information but this is not a principal problem.

Re: RPN hp20s and lcd hp34c proposals

*Message #7 Posted by **Tim Wessman** on 29 Apr 2011, 10:12 a.m.,*
in response to message #6 by Marcus von Cube, Germany

I don't think there will be any release of anything. The only difference between them (20/30b, 10bII+, 12c) is the screen. Just a LCD table is all you need different.

Personally, I am quite excited there is the ability to build using GCC. We always wanted to get around to that but just didn't have the time.

TW

Re: RPN hp20s and lcd hp34c proposals

*Message #8 Posted by **Marcus von Cube, Germany** on 29 Apr 2011, 12:41 p.m.,*
in response to message #7 by Tim Wessman

ATMEL provides the necessary startup files for GCC. I've recently switched to CodeSourcery G++ Lite, the free command line only compiler from them. I have yet to test if this realy works. The code is more compact then with the Yagarto or netX tool chains.

The LCD mapping for the new 12C and 10bii+ units (together with the necessary timing infos, i. e. what to write to the SLCDC controller registers) would be fine.

EDIT: The keyboard arrangement is sufficiently different from the 20b/30b to warrant same explanation, too.

Edited: 29 Apr 2011, 2:03 p.m.

Re: RPN hp20s and lcd hp34c proposals

*Message #9 Posted by **Eric Smith** on 29 Apr 2011, 4:56 p.m.,*
in response to message #8 by Marcus von Cube, Germany

When I've needed to determine a keyboard mapping, I've just used a simple C program to scan the GPIO pins one at a time, drive that pin alternately high and low, and read the other pins to see if any correspond. When a match is found, send the ID of the output and input GPIO pins out the serial port. Then I just press each key in turn and see what comes out.

Similarly for the display, I just sequentially toggle each bit in the LCD bitmap, with a delay (or a wait for a keypress or serial receive), and manually record what segments correspond.

Re: RPN hp20s and lcd hp34c proposals

*Message #10 Posted by **Marcus von Cube, Germany** on 29 Apr 2011, 6:06 p.m.,*
in response to message #9 by Eric Smith

That's a workable idea. The choices are limited as only the WAKEUP pins can be used the way HP designed the software.

For the display, you need to know some details about its physics to be able to configure the number of segments and commons and the corresponding frequencies correctly. Without a JTAG connector, you cannot peek into the settings of the original firmware.

Re: RPN hp20s and lcd hp34c proposals

*Message #11 Posted by **Eric Smith** on 29 Apr 2011, 6:16 p.m.,*
in response to message #10 by Marcus von Cube, Germany

It's not that hard to work out LCD settings by trial and error. There aren't really all that many parameters to adjust, and you don't have to get them all correct to see that you're making progress.

You can use SAM-BA commands over the serial port to write the registers, if you don't want to write a program to do it. See page 175 of the datasheet for the SAM-BA commands. (Prior pages describe how to get into SAM-BA boot mode.)

> It's not that hard to work out LCD settings by trial and error. There aren't really all that many parameters to adjust, and you don't have to get them all correct to see that you're making progress.

Exactly. Besides, there's not much variation in hardware between the units.

Alternate wp34s Keyboard Arrangement?

*Message #1 Posted by **Jeff O.** on 28 Apr 2011, 10:21 a.m.*

I have yet to cut an overlay or otherwise attempt to re-label my 30b keys or keyboard for wp34s. I try to remember some function locations and keep a printed copy of the keyboard layout handy for reference. One thing that I keep doing is scrolling up when I meant to scroll down, or wondering why the display says “XEQ _ _” when I wanted to scroll up. This is of course due to the fact that the up/down scroll arrows of the wp34s keyboard arrangement are moved down one key from the up/down arrow keys on the 30b keyboard. I guess it is hard for my brain to remember to not press the keys labeled for the function I want to do since they are so close to the functional locations of the wp34s key arrangement. (Maybe sort of like when you see the word “yellow” printed in red and are asked what color the letters are.) So I found myself wishing that in this case, the wp34s primary functions could have been assigned to the keys on the 30b keyboard with the proper labels. This made me wonder if there were other “opportunities” for matching the wp34s functions to the keys with the proper label on the 30b keyboard. I came up with two more: RCL and +/-. (I considered x<>y and Rv, but in my opinion the 30b labels for these functions are not worth retaining.) Based on the above, I came up with the arrangement depicted below for the wp34s keyboard. I tried to keep it as close as possible to Walter’s arrangement. It would allow 20 of the standard primary key labels to be re-used, 21 if we can live with INPUT instead of ENTER, vs. 16 (or 17) for the current arrangement. Of course, in a perfect world, the key assignments for all functions could go in their absolute optimum locations without regard to the standard 20b/30b labeling, because some good solution to label the keyboard and re-label the keys will be developed. But until we get to that situation, perhaps something like the below could make it easier to use.

I did present my ideas privately to Walter prior to posting here. He noted (among other things) that he felt that EXIT and XEQ should not be adjacent and that in general if the hardware cannot be used as-is, then the layout should be controlled by ergonomic and/or logic reasons. I can certainly see his point, and as the developers, he, Paul and Marcus can do whatever they feel is best. With that said, I guess I feel that my changes are relatively mild, (and Walter said that I was free to propose anything I want) so I thought I would go ahead and present it and see what others might think. My guess is that it is relatively trivial for Marcus to assign the functions to the key locations, so perhaps he could create a version with this change for people to try out. But if everyone thinks that it is pointless, then, as Emily Litella used to say, “never mind.”

Jeff

Re: Alternate wp34s Keyboard Arrangement?

*Message #2 Posted by **gene wright** on 28 Apr 2011, 10:37 a.m.,*
in response to message #1 by Jeff O.

This arrangement looks good to me and I would like to try it out.

I too have had trouble with the placement of the arrow keys compared to the default 20b/30b locations.

Why make something difficult when there are just as good and easy alternatives?

I have other thoughts, but I will not share them yet.

Re: Alternate wp34s Keyboard Arrangement?

*Message #3 Posted by **gene wright** on 28 Apr 2011, 10:38 a.m.,*
in response to message #2 by gene wright

This is my preferred version of the standard overlay. I had it tweaked in photoshop to improve contrast and readability, IMO.

Re: Alternate wp34s Keyboard Arrangement?

*Message #4 Posted by **Walter B** on 28 Apr 2011, 12:19 p.m.,*
in response to message #3 by gene wright

Gene, I see your points. Just for comparison, the following is what's in the repository since build 757 (Tuesday morning your time):

Walter

Re: Alternate wp34s Keyboard Arrangement?

*Message #5 Posted by **gene wright** on 28 Apr 2011, 1:41 p.m.,*
in response to message #4 by Walter B

That is certainly better, but a printed overlay looks better (IMO), when the back is totally black.

Also, the yellow and blue shifted symbols are not as easily read off the keyboard unless brightened as in the overlay after it was "photoshopped".

And, I have also found that the shift keys read better when they are the full color.

And, the red letters are difficult to read unless you are in very bright light.

Again, all IMO.

So, for now, I will continue to modify the overlay file and make these changes.

Re: Alternate wp34s Keyboard Arrangement?

Enjoy, whatever "the overlay file" may be!

Updated layout and overlay

*Message #7 Posted by **Walter B** on 1 May 2011, 5:24 a.m.,*
in response to message #4 by Walter B

For those interested in, there is an updated layout for the WP34S Windows emulator. And in that course also the overlay was updated - well, actually it was done vice versa, but who cares ;-)

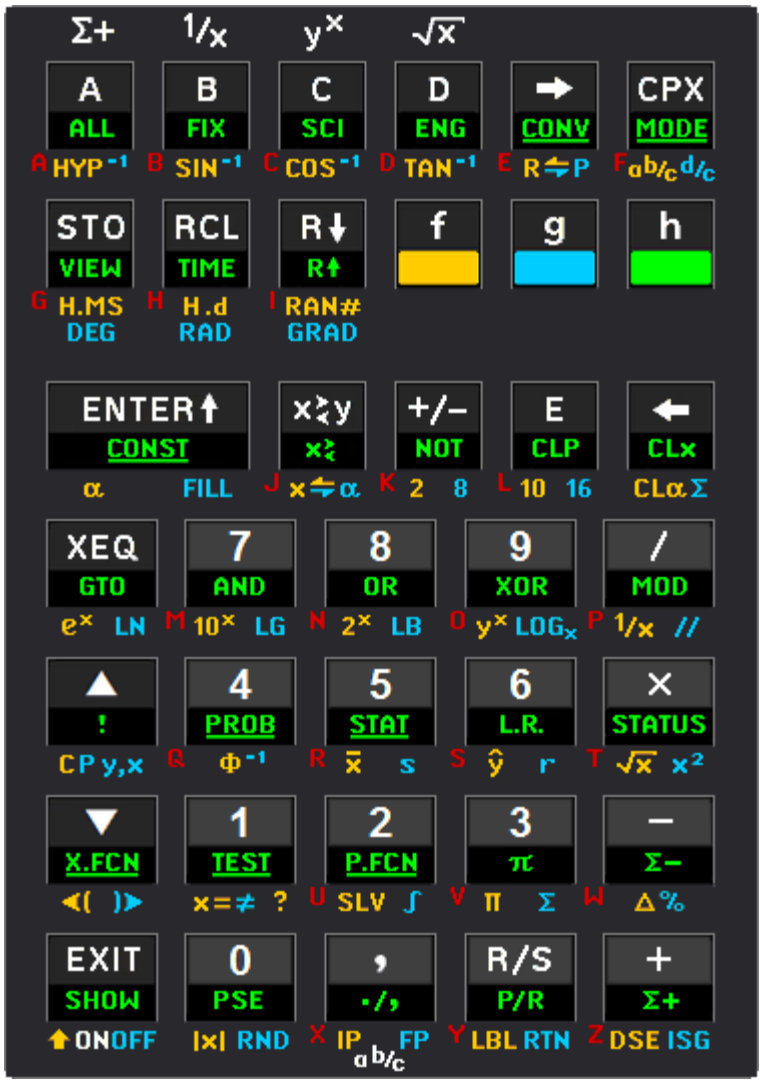
Enjoy,

Walter

Updated overlay

*Message #8 Posted by **Walter B** on 6 May 2011, 3:06 a.m.,*
in response to message #7 by Walter B

There's an update available for prints on whatever media you want to try:



It is less sharp than the emulator skin, thus better for many color printers out there IMO.

Walter

Re: Alternate wp34s Keyboard Arrangement?

*Message #9 Posted by **Marcus von Cube, Germany** on 28 Apr 2011, 11:59 a.m.,*
in response to message #1 by Jeff O.

> Quote:
>
> My guess is that it is relatively trivial for Marcus to assign the functions to the key locations

It would need an internal remap because the reference implementation shall not be changed. Internally, all keys are addressed by codes of the form K_rc, r and c being row and column. Shuffling keys will affect many places of the code if done natively.

I can, of course, add a conditional remapping but this will not change the key codes returned by KEY?, that is "f" will still return 9, not 6.

Re: Alternate wp34s Keyboard Arrangement?

*Message #10 Posted by **Jeff O.** on 28 Apr 2011, 1:11 p.m.,*

in response to message #9 by Marcus von Cube, Germany

Sounds like it is more work than I thought, although I could certainly live with KEY? returning the "original" location. Only try it if it is something you want to do.

Re: Alternate wp34s Keyboard Arrangement?

*Message #11 Posted by **Walter B** on 28 Apr 2011, 1:15 p.m.,*
in response to message #1 by Jeff O.

Jeff,

Thanks for presenting your proposal. It can be made this way for sure. Just allow four humble remarks:

- SW-wise, it seems to be not as trivial as you thought.
- Since you state it shall be a transitional solution, I doubt it's worth the hassle.
- It breaks a number of groups you may have not recognized: +/- and NOT, H.MS and DEG, ! and COMB and PERM, and especially the stack and memory group with STO, RCL, Rv, ENTER, x<>y, +/-, and E. The latter has a long tradition and - as Karl Schneider would say - is carefully arranged and well thought out.
- How about simply using the overlay with flaps and forgetting the old 20/30b labels? Saves extra work and reduces costs d:-)

Walter

in response to message #11 by Walter B

> Quote:
>
> It breaks a number of groups you may have not recognized: +/- and NOT, H.MS and DEG, ! and COMB and PERM...

Yes, I guess I did not pay close attention to those. Most could be set right, I think (except +/- and NOT, which I can sort of see, but could do without.)

> Quote:
>
> ...and especially the stack and memory group with STO, RCL, Rv, ENTER, x<>y, +/-, and E. The latter has a long tradition and - as Karl Schneider would say - is carefully arranged and well thought out.

I see that your arrangement matches the 32S and 42S, but if you look at other models, these functions have moved around quite a bit. My proposal keeps them grouped petty closely, I think.

> Quote:
>
> How about simply using the overlay with flaps and forgetting the old 20/30b labels? Saves extra work and reduces costs d:-)

I'd love to use the overlay with flaps - where can I get one :) In any case, my concept did not get much traction, so, we move on.

Re: Alternate wp34s Keyboard Arrangement?

*Message #13 Posted by **htom trites jr** on 29 Apr 2011, 12:22 p.m.,*
in response to message #11 by Walter B

I think of x<>y, R^, Rv, and LastX as a "group" that works on the stack, with x<>mem and its buddies as being part of the STO/RCL group, and have always wondered why R^, Rv and LastX were not shifts of x<>y. And (while I'm whining) isn't there a LastY? I should really go read the manual, and will.

Re: Alternate wp34s Keyboard Arrangement?

*Message #14 Posted by **Marcus von Cube, Germany** on 29 Apr 2011, 12:46 p.m.,*
in response to message #13 by htom trites jr

You can RCL Y but it's not saved as part of an operation such as X is to LastX (L). We would need a Last Stack command for a complete undo. Being short of battery backed up memory gets in the way here.

Re: Alternate wp34s Keyboard Arrangement?

*Message #15 Posted by **Walter B** on 29 Apr 2011, 1:27 p.m.,*
in response to message #13 by htom trites jr

> Quote:
>
> ... have always wondered why R^, Rv and LastX were not shifts of x<>y.

Many forumers will cry if/when Rv would become a shifted function {;-) I don't use it as much, and I can even live without R^ easily, but these two functions have very true friends here.

Concerning LASTx: if you did execute a complex operation (i.e. an operation on complex numbers) then ^{C}LASTx will recall both components of the complex argument, i.e. x and y. Else no way.

And yes, some reading may help d;-)

Walter

Re: Alternate wp34s Keyboard Arrangement?

*Message #16 Posted by **htom trites jr** on 29 Apr 2011, 5:11 p.m.,*
in response to message #15 by Walter B

The manual is very impressive. It's going to take a couple of hours, and I probably won't get to it until Sunday afternoon.

I understand the love of R^ and Rv. I'd prefer both X<>Y, R^, and Rv to be on keytops, myself, but there are so few of them (STO and RCL make more sense to me as shifted, they're used less from the keyboard) ... LastX and LastY should be shifts of ENTER, maybe, in some ideal world, along with LastEntry (which would be like LastX, but it reaches back in history to the LastX that was directly entered.)

Anyway, off to read more. Didn't mean to sound critical. FORTH may have corrupted my brain.

Edited: 29 Apr 2011, 5:12 p.m.

Re: Alternate wp34s Keyboard Arrangement?

*Message #17 Posted by **Paul Dale** on 28 Apr 2011, 6:34 p.m.,*
in response to message #1 by Jeff O.

I experienced these problems when I first flashed the hardware. With the overlay in place, they all disappeared. Don't let the existing decals trick your mind -- get a permanent marker and obscure the errant labels :-)

Proposal - wp34s GETKEY semantics and other input functions

*Message #1 Posted by **Marcus von Cube, Germany** on 28 Apr 2011, 5:14 a.m.*

I propose a function KEY? nn, nn being a register id.

This is at the same time an input, storage and conditional function:

nn can be any register including the stack registers and indirect addressing. KEY? queries the keyboard buffer (the keys are scanned in the background) and returns an integer value to the selected register. If no key is pressed, the next step is executed. In most cases, this will be a backwards jump.

Key codes are the internally used integer codes: Top left is zero, codes increase with each column by one and with each row by six.

Waiting for a key is performed with the PSE command which can wait from zero to 9.9 seconds. If a key is pressed, the PSE is ended. The key can then be queried with KEY?

What do you think?

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #2 Posted by **Walter B** on 28 Apr 2011, 5:38 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Sounds like an INPUT on HP-42s, but with automatic timeout. Good idea. Two remarks:

1. You didn't mention any output. Is there anything appearing on the display when KEY? is encountered?
2. Personally, I start counting with one and would vote for counting keys alike.

My 20 mâ,¬ only
Walter

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #3 Posted by **Paul Dale** on 28 Apr 2011, 5:52 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Not quite what I just did an outline implementation of :-)

Probably better albeit more complex.

This command polls the keyboard, nothing is displayed and program execution isn't halted.

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #4 Posted by **Walter B** on 28 Apr 2011, 7:13 a.m.,*
in response to message #1 by Marcus von Cube, Germany

OK, so input is limited to natural numbers from zero or one to the number of keys (maybe minus one), and there is no output from KEY?. Then we are missing INPUT still.

> Quote:
>
> Waiting for a key is performed with the PSE command which can wait from zero to 9.9 seconds. If a key is pressed, the PSE ((means: pause)) is ended. The key can then be queried with KEY?

The last sentence isn't quite clear to me. I'd have searched for the key pressed via RCL *nn* with *nn* being the one used in KEY? *nn* before. TIA for enlightenment :-)

Walter

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #5 Posted by **Paul Dale** on 28 Apr 2011, 7:21 a.m.,*
in response to message #4 by Walter B

This function returns the key pressed, don't think of it so much as a numeric input. It polls the keyboard and lets you know which key is down. This suggestion cannot be achieved via any keystroke program with our current command set.

The INPUT function can be achieved by "PROMPT STO" and I still don't see a pressing need for it :-)

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #6 Posted by **Walter B** on 28 Apr 2011, 7:36 a.m.,*
in response to message #5 by Paul Dale

Let me quote Marcus (emphases added by me):

> Quote:
>
> I propose a function KEY? nn, nn being a register id. ... nn can be any register ... . KEY? queries the keyboard buffer (...) and returns an integer value **to the selected register**. ... If a key is pressed, the *pause* is ended. The key can **then** be queried with KEY?

To me, the last sentence doesn't match what was said in the beginning. Marcus?

Walter

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #7 Posted by **Paul Dale** on 28 Apr 2011, 7:40 a.m.,*
in response to message #6 by Walter B

It does match. It is describing the interaction with pause.

```
PSE 99
KEY?
```

A key press terminates the pause early. The key pressed can then be queried using KEY? if desired. Makes sense to me at least.

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #8 Posted by **Walter B** on 28 Apr 2011, 7:52 a.m.,*
in response to message #7 by Paul Dale

Here we reach the limits of linear programming :-)

```
PSE 99
KEY?
NOP
PI
```

PSE 99 sets a 9.9s waiting interval before the next step is executed. What is meant here, however, is KEY? is executed immediately after the waiting interval was started, and *then* either a keystroke or a 9.9s timeout will cause the program to proceed. That's my understanding based on your explanations.

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #9 Posted by **Paul Dale** on 28 Apr 2011, 7:55 a.m.,*
in response to message #8 by Walter B

Not at all. PSE 99 will wait 9.9 seconds. If a key is pressed, it exits early that all. Don't press a key and the full 9.9 seconds elapse. Press a key and it continues right away. This is normal pause behaviour as Marcus wrote it.

KEY? is executed only after the pause has finished either after 9.9 seconds or after a key press.

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #10 Posted by **Marcus von Cube, Germany** on 28 Apr 2011, 8:02 a.m.,*
in response to message #9 by Paul Dale

Pauli, no need to add to your explanations. You got it.

```
PSE 99
KEY? X
BACK 2
```

will wait for a keystroke and return it to the X register. The display is carried out by PSE, just the normal behaviour.

Edited: 28 Apr 2011, 8:02 a.m.

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #11 Posted by **Paul Dale** on 28 Apr 2011, 8:05 a.m.,*
in response to message #10 by Marcus von Cube, Germany

I might have got it, but Walter hadn't :-(

The code in svn has the conditional backward I think...

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #12 Posted by **Walter B** on 28 Apr 2011, 8:06 a.m.,*
in response to message #9 by Paul Dale

OK, so the meaning of PSE was / shall be altered. It shall not wait for the time set before passing control to the next step, but the wait interval shall be interrupted by any keystroke happening within said interval.

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #13 Posted by **Paul Dale** on 28 Apr 2011, 8:10 a.m.,*
in response to message #12 by Walter B

> Quote:
>
> It shall not wait for the time set before passing control to the next step, but the wait interval shall be interrupted by any keystroke happening within said interval.

I hope the first *not* is an error....

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

It would have been if I hadn't written *but* later in this sentence :-)

P.S.: Seems it becomes clear why the real good stuff in mathematics was written in Latin or French ...

Edited: 28 Apr 2011, 8:17 a.m.

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #15 Posted by **Marcus von Cube, Germany** on 28 Apr 2011, 9:35 a.m.,*

in response to message #14 by Walter B

The original intention was to make PSE pause the commanded time but making it interruptible seemed a nice addition to me. If you don't touch the keyboard, the waiting time is honored.

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #16 Posted by **Paul Dale** on 28 Apr 2011, 7:32 a.m.,*
in response to message #4 by Walter B

> Quote:
>
> The last sentence isn't quite clear to me. I'd have searched for the key pressed via RCL *nn* with *nn* being the one used in KEY? *nn* before. TIA for enlightenment :-)

KEY? doesn't say "store a future key press into a register". Rather, it asks "what key is pressed NOW?"

So we can have a wait for key press sequence:

```
LBL 00
PSE 99
KEY? X
RTN
GTO 00
```

Thus, XEQ 00 will keep looping until a key really has been pressed. The key code is in X.

However, there are other uses that don't involve just waiting for the key press -- the program can get on with other things.

e.g. to allow a lengthy calculation to be stopped at a nice place unlike R/S that stops it immediately. E.g. after the next term in a series is summed.

Another possibility would be to allow a program to looks like it has a custom catalogue and which responds properly to arrow keys.

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #17 Posted by **Paul Dale** on 28 Apr 2011, 7:41 a.m.,*
in response to message #16 by Paul Dale

Oops, I've got KEY? executing the next step on a key press in the example, which isn't what Marcus suggested. Still the basic idea should be clear.

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #18 Posted by **Marcus von Cube, Germany** on 28 Apr 2011, 8:05 a.m.,*
in response to message #16 by Paul Dale

Paul, look at my example. The next instruction shall be skipped if a key is pressed. Looping back is by far the more common operation if no key has been pressed. Agreed?

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #19 Posted by **Paul Dale** on 28 Apr 2011, 8:08 a.m.,*
in response to message #18 by Marcus von Cube, Germany

Definitely agreed, execute the next step when no key is pressed is better.

The name is a bit suspect. KEY? would normally execute the next step when a key is present (skip on false rule).

NOKEY? is silly (and too long).

POLL ?

- Pauli

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #20 Posted by **gene wright** on 28 Apr 2011, 10:01 a.m.,*
in response to message #19 by Paul Dale

Do if true is a good consistent rule to follow if at all possible, IMO.

So, Key? would do the next step if true, ISTM.

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #21 Posted by **Marcus von Cube, Germany** on 28 Apr 2011, 11:46 a.m.,*
in response to message #20 by gene wright

What about DSZ? The meaning is "Decrement, Skip if Zero" not "Decrement, Execute if Zero".

Re: Proposal - wp34s GETKEY semantics and other input functions

*Message #22 Posted by **Marcus von Cube, Germany** on 28 Apr 2011, 2:16 p.m.,*
in response to message #21 by Marcus von Cube, Germany

For those interested, I've implemented the proposal together with Pauli. It's in SVN as an emulator build. The flash file is totally untested.

OT: TI 36X Pro and Wishes for a solar RPN calculator

*Message #1 Posted by **Eddie W. Shore** on 27 Apr 2011, 10:07 p.m.*

I am still holding out hope for a solar-powered RPN calculator from HP, even if it is similar to the 11C. However, a solar powered HP 15C or 35S would be sweet.

In the meantime, here is my review of TI's 36X Pro:

TI 36X Pro Review

Re: OT: TI 36X Pro and Wishes for a solar RPN calculator

*Message #2 Posted by **Katie Wasserman** on 27 Apr 2011, 10:26 p.m.,*
in response to message #1 by Eddie W. Shore

This looks like a nice calculator, but I'm curious about the appeal of solar power. On a programmable calculator (like the 11C, 15C or 35s that you mention) you're absolutely going to need a battery anyway, so why bother with having a solar power in addition? I seriously doubt that a modern, high-speed programmable could run at a good speed on the tiny about of current you'd get form such a small solar cell array. I suppose that when running on solar power you could slow down the clock, but it would likely have to be really slow and what fun would that be?

-Katie

Re: OT: TI 36X Pro and Wishes for a solar RPN calculator

*Message #3 Posted by **Crawl** on 27 Apr 2011, 11:21 p.m.,*
in response to message #2 by Katie Wasserman

I love solar in scientific calculators. It might not be entirely rational; I like the idea that if I was on a desert island, my calculator could last forever.

Most calculators now that use solar are dual powered, and I think that does help -- the batteries seem to last an extremely long time.

The last time one of my dual powered calculators had its battery die, I tried some experiments to see what it could do with the solar cell alone. In room lights, some things (possibly root finding, integration, and even statistics [because it didn't keep running totals as you entered data, but only after you call a stat function]) would cause the calculator to reset. In direct sunlight, though, I think it could do anything.

Re: OT: TI 36X Pro and Wishes for a solar RPN calculator

*Message #4 Posted by **Mike Morrow** on 28 Apr 2011, 1:20 a.m.,*
in response to message #3 by Crawl

Quote:

> I love solar in scientific calculators....Most calculators now that use solar are dual powered...

I agree. Non-programmable scientific calculators (what few still remain) should without any question be dual solar/battery powered.

There's just something appealing to a small micro-power consuming device capable of scientific calculations that can power itself. The physics, electrical engineering, materials science, and mathematics that are incorporated into such a calculator are still an object of great fascination for me.

I also agree that a solar-power option for programmable calculators would be of questionable utility. I doubt any solar panel could be incorporated that by itself can power such a calculator during program execution.
