Based on my own personal comparison, the 115ES is an easier to use device than the W516. Both are available for about $17.50 in north Alabama. The only thing that the W516 does that I wish the 115ES did is preserve the state of the machine at shutdown so that it all appears when turned on again. The 115ES wipes the slate clean when it shuts off, manually or automatically.

That having been said, based on your description the 115ES would still be my calculator of choice, even ignoring the 30X Pro's 25 percent higher price. And, like all TI calculators produced over the past 20 years or so, the 30X Pro is god-awful ugly. (Who does TI's horrible industrial design?) I've developed such a liking for the 115ES that I've been able to get over it not being RPN. I carry one everywhere. It's an amazingly powerful device, and if it should get damaged, it's dirt cheap to replace.

As a matter of interest, the numerical integration scheme (Gauss-Kronrod) used by the 115ES greatly outperforms the Simpson's Rule method used by the W516 in terms of speed and accuracy. I wish HP would adopt that method for their machines. What does the 30X Pro use?

Re: OT: TI 36X Pro and Wishes for a solar RPN calculator

*Message #6 Posted by **Crawl** on 27 Apr 2011, 11:38 p.m.,*
in response to message #5 by Mike Morrow

I haven't tried the TI36x pro. I'll admit I'm skeptical, because the only TI calculator I like (love, in fact) is the TI89.

But I prefer the 516w to the 115es.

I had the 506w before I got the 516w, and the upgrade went perfectly smooth. Not only does the 516w add abilities, it loses none.

What's particularly impressive to me (especially over the 115es) is that it added functionality, but it's still just as easy to use, and just about every function is still directly accessible from the keyboard (without needing menus). One function that is buried in a menu is ALG (allows you to repetitively substitute values into an expression), but the ability to assign any function to one of four soft keys fixed that.

I haven't directly compared the 516's integration to the 115es's, but I don't think the 516's is merely Simpson's rule. It can use Simpson's rule in the exact same way the 506 does, if you pass an integer argument after the integration limits, but if you don't give that extra argument I think it uses Romberg integration (since it determines on its own "when to stop")

I haven't used the 115es in a while, so I don't remember how it does constants, but I really like the 516's constant library. It's a big improvement over the 506's. The 506 required you to memorize a two digit code for each constant. The 516 has a menu that shows both the symbol AND the unit of the constant! (even some HP scientifics don't do that, though the HP50g does) You can browse though the menu to find your constant, but if you happen to remember its two digit code you can go to it instantly.

The one thing I like more about the 115es is that it does have the ability to make iterative calculations easier (I call this "weak programming" -- and it's not documented!)

The W516 manual says that it uses Simpson's rule. And for every example I've tried on both the W516 and the 115ES, the 115ES returned more accurate results much more quickly (half the time or less). The Gauss-Kronrod quadrature method is fairly sophisticated, and produces better results quicker, especially on classes of functions that are notoriously hard to numerically integrate.

> Quote:
>
> I haven't used the 115es in a while, so I don't remember how it does constants, but I really like the 516's constant library.

I thought I would like that too, but I found that it takes longer (more keystrokes) to call a constant or conversion on the W516 than on the 115ES. But for the 115ES one has to refer to a chart of codes for such that's printed on the back of the sliding cover. I'll take that over the time the W516 requires.

The numerical accuracy of the 115ES is better as well. A simple show of that is Mike Sebastian's test arcsin(arccos(arctan(tan(cos(sin(9)))))) in DEG mode. The W516 produces 9.000000098906, while the 115ES produces 9.00000000733338. The error percentage is 13.48 times larger for the W516.

I also HATE the DRILL mode of the W516. It's absolutely idiotic. What a waste of firmware!

But I do like very much the preservation of machine state when the W516 shuts down. I wish the 115ES did that.

Thanks for the review - I'm looking forward to getting a TI-36X Pro for my collection when they become available near me.

Regarding the 115ES and the W516 I have both. I noticed a couple of weeks ago that there is a new version of the W516 available at my local Staples and bought one. When I got it home and compared it to my current unit, the only difference I could see is a REALLY significant re-styling. I didn't open the package and returned the newer version. Anyone else seen these? If so, IS there any functional difference?

Re: OT: TI 36X Pro and Wishes for a solar RPN calculator

*Message #9 Posted by **Eddie W. Shore** on 28 Apr 2011, 10:04 a.m.,*
in response to message #5 by Mike Morrow

Thanks, Mike.

I was not able to find the method in the 36X-Pro. Since the 36X-Pro has an 84+ interface, I am going to guess Guass-Kronod because the 84+ uses that method.

The 115ES is a favorite of mine overall - other than having to switch modes to use complex numbers, matrices, and vectors, it is an outstanding.

Casio also has a solar programming model, fx-50p. I had to get one online though. I wished that Casio did not bury the programming mode and commands though.

Nice review! I have noticed that in the fx-115ES (fx-991ES in Europe) there is no keyboard buffering so when entering a very long formula (with many factions, roots...) the calculator redraws after each key press, but as the formula becomes longer and slower redraw, it can miss keystrokes. Does it happen with the TI 36X-Pro and the Sharp's EL-W516? Can you test it please? Thanks

Are you noticing that in "pretty print" mode, line mode, or both? My guess would be that pretty print mode would be the worse for that, but I almost always using line mode.

It happens only in pretty print mode.

Re: OT: TI 36X Pro and Wishes for a solar RPN calculator

*Message #13 Posted by **Eddie W. Shore** on 28 Apr 2011, 10:51 p.m.,*
in response to message #10 by Pablo P (Spain)

Here are a few test calculations: (Sharp) EL-W516 vs. (Casio) fx115-ES vs. (TI) 36X-Pro. All three calculators are set to "pretty print" mode.

#1:
1200+3800+28700+2899+19000+2839+4657+2983-2930-10000 = 53148

I notice a little slowness in the 115ES towards the end, but not in the 36X-Pro. The EL-W516 works fine.

#2:

sqrt(7^2 + 7^3 + 8^2 + 8^3 + 9^2 + 9^3 + 10^2 + 10^3 + 11^2 + 11^3) = 65.80273551
[using the y^x key]

All three calculators work fine.

#3:

$$1 + \cfrac{1}{1 + \cfrac{1}{1 + \cfrac{1}{1 + \cfrac{1}{1}}}} \;*\; \cfrac{2}{2 + \cfrac{2}{2 + \cfrac{2}{2 + \cfrac{2}{3}}}}$$

= 35/24

= 1 + 1 / (1 + 1 / (1 + 1 /(1 + 1 / 2))) *
2 / (2 + 2 /(2 + 2 /(2 + 2 / 3)))

The fx-115ES returns the answer and works fine, and so does the EL-W516.

The 36X-Pro returns "MEMORY LIMIT" Error when using the fraction key, but expression works when using the division key and parenthesis.

4:

$$\pi \cdot \frac{\pi^{2.4} - \pi^{\pi} + e^{(2^{3.1})}}{e^{2.4} - e^{e^1} + \pi^{(2^{3.1})}} - 1.4 \ln(5)$$

= -1.348316376

fx-115ES: Calculator returns Syntax error (at pi^(2^3.1)). The calculator doesn't take every key stroke once I get to the last term

36X-Pro: calculation has to really "refresh" itself as I am finishing the denominator

EL-W516: This calculator wins with this example. Entry was responsive without slow down the entire calculation

```
# 5:

Integrate 3x^3 - x^2 + 1/x - 1/(x^2) + 1 from 1 to 10

= 7176.652585

The fx-115ES works fine.  I can enter the integral on the 36X-Pro fine, but took
several seconds for the integral to calculate.  The EL-W516 operates similarly to the
36X-Pro.

# 6:

Sum of sin(tan(x)) + tan(sin(x)) - cos(x) - cos(x)^2 from 1 to 10 - Radians Mode

= -0.2223937769

fx-115ES: entry is fine, but the calculator took a few seconds to find the sum

36X-Pro: entry is fine and the sum was instantly found

EL-W516: entry is fine but the calculator took a few seconds to find the sum

# 7:

sqrt(3^6 - 2^3 + 1)             2.7^2.5 - 1.7^2.5
-------------------   +  sqrt( ---------------------- )
  2 * cuberoot(4)               1.7^2.5 - cuberoot(6)

= 10.51498832

fx-115ES: the entry really slows down when I am entering the second term

36X-Pro:  The calculator flashes with each keystroke at the second term, but very
little speed slow down

EL-W516: This calculator handled the expression well - no slow down

Overall:

I think the EL-W516 wins with these super long expressions.
```

9121 or 82901?

*Message #1 Posted by **David Ramsey** on 27 Apr 2011, 4:14 p.m.*

Or, to put it another way: if I'm looking to add an HP-1B diskette drive for occasional use with an HP-85 or 87 (yes, I got the 85, and will be posting on it shortly), should I lean towards 3.5" or 5.25" disks?

Storage capacity isn't really an issue; this is just a toy. It seems to me as though the 5.25" drives might be more reliable long term since they lack the complex arrangement of articulating arms that mount and dismount the smaller 3.5" diskettes. 5.25" disks (and they look like Shugarts): they just have that simple lever-operated clamp.

Also, should I ever find a CP/M disk for my Auxiliary Processor module, it would be on 5.25" media, I believe.

Any other reason to choose one drive over the other?

Re: 9121 or 82901?

*Message #2 Posted by **Howard Owen** on 27 Apr 2011, 4:17 p.m.,*
in response to message #1 by David Ramsey

3.5" floppies are easier to store and less fragile than 5.25". The drives take up less space too. On the other hand, if you want to play with the CP/M coprocessor for the 85, the dual 5.25" floppy is mandatory.

Regards,
Howard

*Message #3 Posted by **David Ramsey** on 27 Apr 2011, 4:25 p.m.,*
in response to message #2 by Howard Owen

Well, I have the coprocessor, but wonder what my chances are of finding an original, HP-specific CP/M disk...

Then maybe I could run WordStar!

Re: 9121 or 82901?

*Message #4 Posted by **Juergen Keller** on 27 Apr 2011, 4:42 p.m.,*
in response to message #3 by David Ramsey

No problem, http://www.hpmuseum.net has it all. Use the search field on the home page and enter CP/M. If you have the setup as I described in my other post, you can easily convert the Teledisk image to a LIF image, and HPDrive will read it ...

Re: 9121 or 82901?

*Message #5 Posted by **Juergen Keller** on 27 Apr 2011, 4:37 p.m.,*

in response to message #1 by David Ramsey

PC with HP-IB (ISA or PCI) interface card plus HPDrive software which emulates various disk drives. But with this setup you cannot read real floppy disks. I use it with my HP-85/86/9816/9845B.

Re: 9121 or 82901?

*Message #6 Posted by **David Ramsey** on 27 Apr 2011, 4:40 p.m.,*
in response to message #5 by Juergen Keller

Good suggestion, but my real PCs aren't physically near the old HPs. Also, finding a motherboard that has anything other than PCI-E slots might be hard for me. I love the old stuff, but stay relentlessly updated on my real computers.

Re: 9121 or 82901?

*Message #7 Posted by **Juergen Keller** on 27 Apr 2011, 4:48 p.m.,*
in response to message #6 by David Ramsey

Then I would buy a 9121. With my old PC I can write DS/DD 3.5" floppy disks so if you are in need of a CP/M system disk I can create one for you. On eBay you can still buy new DS/DD 3.5" floppy disks for some bucks.

More to the point, does the Aux Processor card require a special version of CP/M?

Heck, maybe I should get both drives...

Re: 9121 or 82901?

*Message #10 Posted by **Howard Owen** on 27 Apr 2011, 9:42 p.m.,*
in response to message #9 by David Ramsey

I don't currently have an 85 or an 82901, but I still have the coprocessor. My fuzzy recollection is that the coprocessor wouldn't work with the 9121 for some reason. And I do think you need the specific version of CP/M for the coprocessor. I also seem to recall that the CP/M was limited in its ability to read and write data from outside the CP/M environment. For example, you couldn't get it to work with an RS232 card, meaning all that CP/M terminal and file transfer software was useless.

Despite all that, I had a collector's trophy feeling about actually getting that sucker to boot. :)

Regards,
Howard

*Message #12 Posted by **Juergen Keller** on 28 Apr 2011, 1:44 p.m.,*
in response to message #9 by David Ramsey

Yes, a special version of CP/M is required and available on hpmuseum.net. I successfully booted CP/M from my 9133 drive (which has a floppy and a hard disk drive). I do not have an 9121 device but I don't see an obvious reason why it shouldn't work with this drive, too. Please also note that the CP/M module requires an HP-86/87, it does not work with an HP-85 (due to the limited text display, CP/M requires 80x25).

HP-71B Dice Games

*Message #1 Posted by **Howard Owen** on 27 Apr 2011, 4:24 a.m.*

Hello everyone,

I've been out of circulation for a while, but I've recently revived my interest in vintage HP calculators, particularly the HP-41C and the HP-71B. I dusted off my old YATZ71 dice program for the 71B, and packaged it up with a version of High Rollers I wrote. I wrote both of these back in 2005, but I'm announcing the latter program here for the first time. These aren't earth shaking applications, but I had fun writing them, and actually enjoy playing them on my 71. Feedback here or to hbo@egbok.com would be welcome.

A zip file containing text listings, documentation and a LIF image are at http://retrocalculator.com/HP71-Dice-Games-1.2.zip

Enjoy!
Howard

Re: HP-71B Dice Games

*Message #2 Posted by **Christoph Giesselink** on 28 Apr 2011, 3:01 p.m.,*
in response to message #1 by Howard Owen

It's nice to see that there are people interested into these old calculators. I read your article on your homepage about the 71B and your idea writing assembly language programs for this calculators.

You thought about using "areuh" as Saturn assembler.

Let us go back into the dark history of Saturn assembly programming in the late 80'ies. HP hadn't published an assembler for the Saturn CPU until 1989. The first one from HP was HPTOOLS for DOS from Nathan Zelle. So before every developer had to make his own assembler with own mnemonics for the same CPU. When you're looking for example at old HP28S programs quite often the CLASS mnemonics are used. For me the CLASS mnemonics seem to be inspired by the MC68000 mnemonics.

So nowadays it only makes sense to use the "HP mnemonics", because the 71B IDS and all original HP documentation even for the later calculators use these mnemonics.

So my first choice would be the HPTOOLS with the SASM assembler and SLOAD linker. BTW, JFG used the DOS version of the HPTOOLS to recompile the JPC ROM.

I personally used the DOS HPTOOLS from the mid 90'ies until ~2000 for my HP48 development. Since then the HP49G got into my focus and with the old DOS HPTOOLS it wasn't possible to compile HP49G RAMMAP.A assembly file. So I switched to the HPTOOLS 3.0.x series for Win32. These versions of SASM and SLOAD are fully backwards compatible to the sources written for the DOS HPTOOLS. Another positive thing is, besides the sources and the Win32 binaries are available, there are also fully compiled HPTOOLS 3.0.x binaries for Linux and Mac OS.

So IMHO there's no need to search for a different assembler package than HPTOOLS 3.0.x. All documentation

is also written in English so you don't need a language translation program and psychic abilities to understand the translation results. But perhaps you need the gift of second sight to read my "English" especially the grammar. ;-)

Any information about a tutorial writing LEX programs for the 71B and putting them into a LIF file on Win32 to load them on a calculator are welcome.

Best Regards,

Christoph

Re: HP-71B Dice Games

*Message #3 Posted by **Howard Owen** on 28 Apr 2011, 4:29 p.m.,*
in response to message #2 by Christoph Giesselink

Thanks for the informative reply, Christoph! Your English is completely intelligible to me. I've been a fan of your emulators for some time. You figured in my virtual 71B project. I loaded Hrast's HP-71X on emu48 on Windows in a virtual machine running on Linux. I can't recall if I added the HP-41C translator to 71X or not. It's been awhile :).

> Quote:
>
> Another positive thing is, besides the sources and the Win32 binaries are available, there are also fully compiled HPTOOLS 3.0.x binaries for Linux and Mac OS.

I had no idea. This point means I would never consider using anything else unless it had that kind of portability.

> Quote:
>
> All documentation is also written in English so you don't need a language translation program and psychic abilities to understand the translation results.

I read that now and laugh. JF helped me clean up the translation quite a lot and I was embarrassed by some of my errors. Fortunately I'm capable of laughing at myself :)

> Quote:
>
> But perhaps you need the gift of second sight to read my "English" especially the grammar. ;-)

As stated above, I have no problem at all understanding your English. :)

> Quote:
>
> Any information about a tutorial writing LEX programs for the 71B and putting them into a LIF file on Win32 to load them on a calculator are welcome.

I'm considering firing up the project to disassemble and extend the EXTFILES lex to cover the HP85 and 9000 file types. There's a lot I don't know that I will need to understand to accomplish that. I'm not worried though. The documentation exists and there are more than a couple of people here who understand the saturn pretty well :).

As to getting results onto a 71B, I'm currently using the ISA card on an old OmniBook 800CT running Windows 95. I plug in the ethernet cable (on a PCMCIA 10 mbit ethernet card) and scp the LIF image over using Cygwin. I think modern viruses might have trouble recognizing Windows 95, but I disconnect the ethernet anyway. :) Emu71 gets the image on to a 9114 floppy which I then read with my 71B. I can use the same path for the reverse direction too, but it's obviously awkward. I'm awaiting a PILbox, and I hope that will streamline the process. My ideal would be to drive the PILbox with a virtual machine running on my Mac, but I have a real Windows machine too in case that's no good.

Regards,
Howard

in response to message #1 by Howard Owen

Thanks Howard! Have to pull my trusty HP-71B out of the drawer now.

Suggestion..? Try to come to HHC 2011 this year in San Diego and consider writing up a short presentation about the HP 71b focusing on something you like or that might be interesting to some of us. You KNOW that most HP attendees present won't know anything about the 71B.

Be good to see you there again.

different LCDs used in HP41C?

*Message #1 Posted by **exschr** on 26 Apr 2011, 5:06 p.m.*

I have different 41's:
Two of them have a yellowish LCD with lesser contrast and smaller digits: S/N 2227S, 2243S
The other three have sharp, crisp LCDs with digits, that are slightly bigger: 2209S, 2411S, 2505S
My first guess had been, that the older ones have an other LCD in them.
But the S/N seem not to support this (or one of them had it's LCD broken and replaced by the newer product)

Were there two different products in use?
Has anyone similar differences?

I read about the tantalum capacitor story, but I don't see how this applies here.

Re: different LCDs used in HP41C?

*Message #2 Posted by **Håkan Thörngren** on 26 Apr 2011, 5:47 p.m.,*
in response to message #1 by exschr

There were at least 3 different LCD used for the HP-41.

On the early ones (I have an early 1981 CV), you can see the unlit segments quite easily depending on how the light falls on it. On the second generation, seeing the unlit segments is a lot harder and they also look brighter. This LCD was at least in production machines around 1983 (I do not own any machine with it) and later (1985/86) the rounded corner halfnut LCD was introduced.

I think your yellowish are from the first generation, but I do not think they are that bad or maybe they have gone worse over the years?

I think your 2209S machine have had its LCD (or bottom) swapped.

Re: different LCDs used in HP41C?

*Message #3 Posted by **exschr** on 26 Apr 2011, 5:55 p.m.,*
in response to message #2 by Håkan Thörngren

It's exactly as you said, for the first generation I can see the unlit segments quite easily. For the second gen. I hardly can see them.
(And I don't have a halfnut)

The yellowish ones are not bad, but in comparison to the others it's quite remarkable difference!

Thank you for the input.

A first estimate for Student's t quantile (not only) on the WP34s

*Message #1 Posted by **Dieter** on 26 Apr 2011, 4:09 p.m.*

Hi all, hi Pauli. ;-)

over the last weeks there has been some discussion on the normal distribution and its inverse (quantile). I think the 34s performs pretty well now. The CDF should be exact and there also is a good first estimate for the quantile. After this, the Halley method returns results with fast convergence to the exact value. So far, so good.

The second important distribution we should take a closer look at now is Student's t-distribution. I have been experimenting a while with several approaches, and I finally got a result that I think is fine as a first estimate. Use at your own risk, expect any error you can imagine, but try this:

- For df = 1 or 2 degrees of freedom the quantile can be determined directly.
  This also is the case for n = 4, it only requires a bit care at very low t (close to zero) or p close to 0,5.

- For other degrees of freedom, i.e. df >= 3, the following method provides a nice first estimate. As usual, p is assumed to be less than 0,5 and t > 0.

```
if -ln(p) < 1,7 * df then
    x = guess_normal(p)
    u = (x^3 + x) / 4 / df
    v = (x^5 / 12 + x^3 / 4) / df^2
    t = x + u + v
else
    u = 2 * p * df * sqrt(Pi / (2*df - 1))
    t = sqrt(df) / u^(1/df)
end if
```

Here guess_normal is the well-known first estimate of the normal quantile (with the slight modification 1/u^2 instead of 0,2/u, as mentioned earlier). According to my results this estimate for t differs from the exact value by something like typically +/- 1...2%, in some cases a bit more.

This single estimate now can be used for a Newton-iteration - the first derivative simply is the Student PDF, so we get

$$t_{new} = t - \frac{tCDF(t) - p}{tPDF(t)}$$

If two guesses are required (e.g. for the 34s solver) we can simply use 1.1*t and 0.9*t (or something similar).

And now: try it and let me know about your results. ;-)

Dieter

Edit: tail formula now looks slighty more elegant ;-)

*Message #2 Posted by **Paul Dale** on 26 Apr 2011, 6:37 p.m.,*
in response to message #1 by Dieter

We don't currently implement the t pdf and it looks pretty complex so I'd have to go with two bracketing estimates and use the built in solver. This is pretty what I'm doing now but the bracket is the t v=2 value and the upper normal estimate which is wider than I like.

When can we expect Chi^2 and F estimates ;-)

*Message #3 Posted by **Dieter** on 27 Apr 2011, 3:45 p.m.,*
in response to message #2 by Paul Dale

Hi Pauli,

> Quote:
>
> We don't currently implement the t pdf and it looks pretty complex

It *looks* a bit complex because of the two Gamma functions. But there is a nice trick that was also used in the t-quantile estimate: The required Gamma quotient can be approximated with sufficient precision. ;-)

$$\frac{\Gamma\left(\frac{n+1}{2}\right)}{\Gamma\left(\frac{n}{2}\right)} \approx \frac{\sqrt{2n-1}}{2}$$

I tried the Newton method both with the exact PDF and with a simplified substitute containing this approximation. The number of iterations required for two successive results agreeing in 14-15 significant digits was mostly 4 or 5 with the exact PDF and 5 to 7 using the approximation (slightly tweaked by adding 1/n^2 under the square root).

> Quote:
>
> so I'd have to go with two bracketing estimates and use the built in solver. This is pretty what I'm doing now but the bracket is the t v=2 value and the upper normal estimate which is wider than I like.

That's exactly why I proposed this new first estimate. ;-) If you want to use the solver, try a = 0.95 t and b = 1.05 t. The error of the estimate usually is less than 5% so that the true t-quantile can be expected in this interval. Of course an exact t-CDF is essential here for a precise quantile result.

> Quote:
>
> When can we expect Chi^2 and F estimates ;-)

First I need a benchmark algorithm that returns a sufficiently precise result. ;-)

I admit I finally was surprised how compact the final formulas for the t-estimate turned out. They are basically simplified (though improved) versions of two series expansions. The results I got actually were so good, I even detected an error in my reference algorithm far out in the distribution tails. ;-)

Dieter

Re: A first estimate for Student's t quantile (not only) on the WP34s

*Message #4 Posted by **Paul Dale** on 28 Apr 2011, 12:14 a.m.,*
in response to message #3 by Dieter

I've tried out the better initial estimate using the built in sovler. It is better by a couple of iterations across the bulk of the range and a few more in the extremes. Unfortunately, I don't think it is enough better to justify the space unfortunately. The additional code amounts to a bit under a kilobyte which is too much -- we've only got 3kb clear in total at the moment.

Likewise, I don't think specially implementing the pdf so we can use Newton's method will nett enough of a speed gain to justify the space cost.

What I have done is terminate the search when the relative error between estimates is 1e-24 or better, this saves a lot of iterations but should still give us decent accuracy when rounded to 16 digits. I've not timed this on a real unit yet but it should help most of the quantile functions.

- Pauli

Re: A first estimate for Student's t quantile (not only) on the WP34s

*Message #5 Posted by **Dieter** on 28 Apr 2011, 3:00 p.m.,*
in response to message #4 by Paul Dale

What? Just a couple of iterations saved? With the previous method the two initial guesses could be apart by a factor of 10, 100 or even more, and now it's merely 10%. Strange.

I tried the method with the approximate PDF. After the first iteration the error is order of 1E-3, and then each step gives about three more valid digits. Which matches the 5 - 7 iterations for 15 digits mentioned earlier. With the true PDF convergence is almost quadratic, as expected.

Pauli, I know you like results that are far, far more precise than required in the final 16-digit result, but a relative error of just 1E-24 in the t-approximation simply is too much. If two consecutive values differ by not more than 1E-24 this means that they match in 24 significant digits (+1 ULP) and already the *previous(!)* approximation was that precise. In other words, the *current* approximation has 27 or 30 or even more valid digits. But we need just 16... ;-)

Please do not forget: you can use as many digits as you want, but even a 100-digit result rounded to 16 digits has a potential error of 1 digit in the last place. It's only less likely. ;-) I would suggest to exit the iteration as the error drops below 1E-16. This way the last two approximations agree in all 16 digits (+1 ULP) and the current result even has some more correct digits. Too risky? Okay, then use 1E-20. ;-)

Dieter

> What? Just a couple of iterations saved? With the previous method the two initial guesses could be apart by a factor of 10, 100 or even more, and now it's merely 10%. Strange.

I didn't exhaustively test thousands of cases but those I did showed modest improvement over most of the range and not a huge penalty at the extremes. Feel free to test lots more & let us know :-)

I do very much appreciate the efforts you've put into debugging and assisting with the improvements in the statistical functions.

The far more important factor here is space. The improved method uses about one third of the remaining flash space. At this stage, I'm unwilling to commit that much space to one distribution's inverse, especially when we're already getting accurate results albeit slowly. I'm sure there are plenty of bugs that cause inaccuracies and functions that are simply incorrect some of the time waiting to be discovered. We will need to fix those problems so I've always planned to have a small amount of buffer in the flash reserved for this.

If we had the space, your improved estimates would be in immediately. The code is in subversion and if we figure out a way to recover some space (& we've a few ideas floating around), in it will definitely go.

> Quote:
>
> With the true PDF convergence is almost quadratic, as expected.

The built in solver will achieve quadratic convergence almost always BTW. Brent's method is nice.

> Quote:

In other words, the *current* approximation has 27 or 30 or even more valid digits. But we need just 16... ;-)

I like results that are likely to round correctly, more digits makes this more likely. For functions that are used by other functions (e.g. the normal QF) I like more digits again. I'm not a numerical analyst by profession so I'm deliberately applying a sledge hammer where it probably isn't required. Which would people prefer, slower but more accurate functions or faster and possibly incorrect?

Changing from 1e-24 to 1e-20 for the relative error will likely mean one iteration difference and possibly none for either method. I can live with that penalty for the extra security and comfort it brings :-)

Re: A first estimate for Student's t quantile (not only) on the WP34s

*Message #7 Posted by **Dieter** on 30 Apr 2011, 7:11 p.m.,*
in response to message #6 by Paul Dale

Okay, I now tried an implementation of Brent's method in VBA, using two inital guesses the same way it's done now (a = value for 2 d.o.f. and b = normal quantile). These results were

compared to the approximations obtained with initial guesses based on the proposed method.

The results are quite exactly as expected: the current method does not require much more iterations as long as the two initial guesses are sufficiently close, i.e. in the center and not too far out in the tails. Values like p = 0.001 are still handled with only a few iterations more than required by the improved method.

Things change as soon as we get further out in the distribution tails. At n = 10, try p = 0.0001 or 1E-10 or even 1E-20. The number of iterations is twice or three times as high as with an optimized initial guess. It simply makes a difference whether the solver can work with two similar initial estimates or if it only knows the result is somewhere between 6 and 70000. ;-) If the calculation takes a second on a 2-GHz-system, imagine how long it will take on a real 20s or 30s. Maybe someone can try the following calculations on a re-flashed unit.

I tried the $t^{-1}(p)$ function on the emulator, version 1.17 673. Here are some results:

p	n	exact result	WP34s result	
1 E-5	10	-7,526954	-7,526954	so far
1 E-10	10	-25,466008	-25,466008	so good
1 E-15	10	-81,040891	-22360679	
1 E-20	10	-256,434699	-7071067812	oops...
1 E-40	10	-2,564 E+05	-7,071 E+19	
1 E-100	10	-2,564 E+10	"domain error"	

I think it's obvious where this 7,071... mantissa comes from. ;-)

The t quantile function works fine in the center. Maybe not as fast as possible, but the results are okay. The more we get out in the tails of the t-distribution, the less reliable the results get. Below a certain limit they are far off.

I see the problem with the available RAM. But I think something has to be done to get at least correct results. Precision is not optional. ;-)

That is a very old version of the software. Current is 793. The results I get aren't anything like what you're seeing. Not in a good way: 1E-15 is giving a domain error instead of a wrong result. I guess this is slightly better.

At these small values, t(x) seems like it might be wrong too.

> Quote:
>
> I see the problem with the available RAM. But I think something has to be done to get at least correct results. Precision is not optional.

Agreed, I'll look into this. The lack of space is in flash not RAM. Well it is in both, but this isn't requiring much RAM.

If I can't fix it, the domain gets reduced or the function removed :-(

WP34s code size - Keep the functionality!

*Message #11 Posted by **Marcus von Cube, Germany** on 1 May 2011, 2:40 a.m.,*
in response to message #10 by Walter B

I'm working on the space issue. Maybe a combination of GCC 4.6.0 with some options used by CodeSourcery G++ (based on GCC 4.5.1) may help. At the moment, the latter produces tighter code then GCC 4.6.0 which puzzles me and which lets me hope that we can do even better.

Re: WP34s code size - Keep the functionality!

*Message #12 Posted by **Eric Smith** on 1 May 2011, 3:47 a.m.,*
in response to message #11 by Marcus von Cube, Germany

FSF GCC for the ARM always lags behind the development at CodeSourcery. CodeSourcery does send their improvements to the FSF, but it takes a while for them to get integrated into an FSF release. For ARM, using the latest CodeSourcery release is generally better in every way than using the FSF release.

Re: WP34s code size - Keep the functionality!

*Message #13 Posted by **Paul Dale** on 1 May 2011, 6:36 a.m.,*
in response to message #12 by Eric Smith

Being a contributor to GCC, I have a fair idea why this lag is occurring.... My changes were a couple of weeks' work, getting them accepted was far more painful.

Marcus,

Are you compiling with -Os?

Have you guys considered/tried LLVM? In my experience (and following Apple's party line) you can expect both greater speed and smaller size for ARM (and IA) code.

Re: WP34s code size - Keep the functionality!

*Message #15 Posted by **Paul Dale** on 1 May 2011, 7:16 p.m.,*
in response to message #14 by Oliver Unter Ecker

> Quote:
>
> Are you compiling with -Os?

We are but don't blindly trust -Os to reduce code size. On many platforms -O1 is small & often faster :-)

Gcc 4 for ARM, -Os seems to be the winner. For Gcc 3 for ARM it was -O1 almost always.

We've not tried llvm.

*Message #16 Posted by **Paul Dale** on 1 May 2011, 7:15 a.m.,*
in response to message #9 by gene wright

I feel that domain reduction is the right way to go here.

Unlike the normal distribution which has uses as a function in its own right, the T-distribution is only used for statistical tests (as far as I'm aware -- let me know if I'm wrong here) and nobody in statistics really cares about probabilities less than 1e-10. Actually, a lot larger than this is sufficiently good :-)

Still, I'd like to fix the underlying problem and have it work globally. I was out most of today so didn't make any significant progress.

- Pauli

WP34s

*Message #17 Posted by **Dieter** on 1 May 2011, 10:25 a.m.,*
in response to message #16 by Paul Dale

I would not recommend a domain reduction for Student's distribution. There sure are other candidates that might get stripped somehow. Imagine a financial calculator accepting no values beyond 1E10 - *"because you won't have that much money anyway"*. ;-)))

Also, according to my results there is no fixed lowest probability for a cutoff. The limit depends on the degrees of freedom. For instance, the switch between the two formulas for the improved initial guess is done at $e^{-1,7\ df}$. Beyond that limit, the guess is so close to the true value that at least this (rounded) estimate could be returned. But, as mentioned before, I think neither the domain nor the precision of the results should be reduced as far as the t-distribution is concerned.

Dieter

I looked at http://sourceforge.net/projects/wp34s/files/ and there was no newer version of the emulator than this, dated April 17. Where can I find a newer one? The emulator, that is. ;-)

> Quote:
>
> At these small values, t(x) seems like it might be wrong too.

That's my impression as well. Despite the extremely high internal precision there are lots of pitfalls as far as numeric accuracy is concerned. In my own programs for the 41C and 35s I often use different ways to evaluate a term, so that e.g. small and large values take different paths on their way through the algorithm. Even a simple term like 4*p*(1-p) is not trivial.

> Quote:
>
> If I can't fix it, the domain gets reduced or the function removed :-(

There are three destributions I would consider mandatory: Normal, Binomial and Student. Removing one of these, or even reducing their domain, is not an option, I think. There sure are other candidates that might get removed without major loss in functionality. If neccessary we could have another poll here. ;-)

*Message #22 Posted by **Dieter** on 2 May 2011, 3:38 p.m.,*
in response to message #21 by Oliver Unter Ecker

Sure. Try this:

```
p = min(probability, 1-probability);   /* make sure p =< 0.5 */
s = sign(0.5 - probability);           /* set  correct sign  */

if ((-ln(p)) < 1.7 * df)
    {                                   /* first guess = normal quantile estimate */
    if (p < 0.2)
       {u=-2*ln(p); x=sqrt(-2*ln(p*sqrt((u-1)*2*pi))) + 1/u^2;}
    else
       {u = (0.5-p)*sqrt(2*pi); x = u + u^3/6;}
    u = (x^3 + x) / 4 / df;
    v = (x^5 / 12 + x^3 / 4) / df^2;
    t = x + u + v;}
else
    {u = 2*p*df*sqrt(pi/(2*df - 1));
    t = sqrt(df) / u^(1/df);}

println(t*s,0);                             /* print first guess (and a dummy zero) */
k = 0;
```

```
do {
   d = (tcd(t,df)-p)/tpd(t,df);
   t = t + d;
   err = d / t;
   r = int(-log(abs(err)));
   err = round(10^r * err, 3)/10^r;       /* round error */
   println(t*s, err);                     /* print current approximation and error */
   k = k+1;
   }
while(1 + abs(err)^2 <> 1);            /* a somewhat different exit condition ;-)
*/
                                        /* more conservative users may omit the square
*/
println(ticd(probability,df),k);       /* print exact t-value and number of iterations
*/
```

This will generate a small table with the current approximation and the relative error, compared to the previous iteration. You can also nicely see the (well, almost) quadratic convergence.

However, the t-distribution will push Keisan close to its limits - and beyond. Try 1E-100 and 50 degrees of freedom. The iteration returns a result, while Keisan returns a "system error". ;-) Also, too much digits may cause Keisan-problems because of insufficient internal precision. So better try 18, 30 or 38 digits.

A real-world implementation would require a bit more, for instance a check for p = 0,5 where t = 0 (leading to a division by zero here).

Dieter

Thank you very much, Dieter!

Here's my JavaScript "production" code, based on yours:

```
    "StudentTQuantile": function(df, x) {
        if (df != Math.floor(df)) throw Error("bad arg");
        if (x <= 0) return +Infinity; else if (x >= 1) return -Infinity; else if (x
== 0.5) return 0;
        var t, p = Math.min(x, 1-x), s = this.sign(0.5 - x);
        if (-this.ln(p) < 1.7 * df) {
            if (p < 0.2) {
                var u = -2*this.ln(p);
                x = Math.sqrt(-2*this.ln(p*Math.sqrt((u-1)*2*Math.PI))) + 1/(u*u);
            }
            else {
                var u = (0.5-p)*Math.sqrt(2*Math.PI);
                x = u + (u*u*u)/6;
            }
            var x3 = x*x*x;
            u = (x3 + x) / 4 / df;
            v = (x3*x*x / 12 + x3 / 4) / (df*df);
            t = x + u + v;
        }
        else {
            u = 2*p*df*Math.sqrt(Math.PI/(2*df - 1));
            t = Math.sqrt(df) / Math.pow(u,(1/df));
        }

        var d, k = 10;
        do {
            d = (this.StudentTDistribution(df, t) - p) / this.StudentTPDF(df, t);
            t += d;
        }
        while (d*d > 1e-30 && --k);

        return t*s;
```

```
    }
```

You'll notice the change in the termination criterion to get the result within one ULP (for IEEE754 doubles) but providing a hard iteration max to deal with too slow convergence and oscillations.

Here the results for your extreme values test:

```
     p        n           exact result        ND1 (max 10 iters)   ND1 (max 100
iters)
  ---------------------------------------------------------------------------
--
   1 E-5     10          7.526954019339    7.526954019333            7.526954019334
   1 E-10    10         25.466008           25.466010               25.466008
   1 E-15    10         81.040891           80.3924                 81.05831
   1 E-20    10        256.434699          -Infinity               -Infinity
   1 E-40    10        2.564 E+05          -Infinity               -Infinity
   1 E-100   10        2.564 E+10       19881486106.20             -Infinity
```

I guess a PDF at the mercy of the gamma function, may, in part, explain the slow convergence.

I'm going with the max of 10 iterations. For non-extreme values, results within +/- 1 ULP seem to be found in typically 3-5 iterations. The first estimate is great!

Do you have an iOS device? I'd love to give you a redeem code for a copy of ND1 (and CalcPad when it comes out).

Cheers.

Re: A first estimate for Student's t quantile (not only) on the WP34s

*Message #24 Posted by **Dieter** on 3 May 2011, 2:18 p.m.,*
in response to message #23 by Oliver Unter Ecker

There must be a problem in the Student PDF or (more likely) the CDF. Here are the results evaluated by Keisan, set to 18 digits. All results were obtained after just 2 to 4 (!) iterations. Ten or even more iterations were not required. That's why I think the results of the CDF you use are not exact. But an exact CDF ist crucial for an exact quantile.

The initial estimate has a relative error order of 10^-2. So quadratic convergence should give a 15-digit result after three iterations, or let's say 4 or 5 under real world conditions. And that's exactly what I got. ;-)

```
   p        n           quantile           algorithm @ Keisan
 ------------------------------------------------------------------
  1 E-5     10          7.526954           7.52695401933965106
  1 E-10    10         25.466008          25.4660080216977262
  1 E-15    10         81.040891          81.040890880039345
  1 E-20    10        256.434699         256.434699318526186
  1 E-40    10        2.564 E+05         2.5645257010761472 E+05
  1 E-100   10        2.564 E+10         2.5645257189481978 E+10
```

The results seem to be okay. Maybe someone can check them with Mathematica or Maple. I'll see what can be done in Excel/VBA (15 digit floating point arithmetics). Here, decent distribution functions and quantiles are sorely missing. Excel seems to have a very... "special" reputation among statisticians. ;-)

BTW - no, I do not have any kind of i-device. I'm a bit conservative in these things. ;-)

Dieter

Re: A first estimate for Student's t quantile (not only) on the WP34s

*Message #25 Posted by **Oliver Unter Ecker** on 3 May 2011, 4:22 p.m.,*
in response to message #24 by Dieter

The algorithm is great and not to be blamed for slow convergence.

You were quite right: I found the CDF to be the culprit. For t=25.4, df=10, I'm only getting 5 good digits after the point.

The PDF, conversely, is exact.

I'll see how I can improve this, but as results seem to be quite good already, and convergence does occur for most values with 2 (corrected from 3, after testing) to 5 iterations, I'm quite happy with it already.

The CDF isn't entirely flawed. For t=25.4, df=2 I'm getting 16 good digits.

It's obvious you can do real math. So, yes, I can see how you don't need a permanent math i-companion. ;-)

Good news, the better initial estimate is back in (or will be when we build next). Some flash space was recovered.

I'm not using Newton's method however, the pdf will be large and we're going to need the space for estimates for the other distributions I expect.

Re: A first estimate for Student's t quantile (not only) on the WP34s

*Message #28 Posted by **Dieter** on 6 May 2011, 3:46 p.m.,*
in response to message #27 by Paul Dale

As far as I can see the max. error of the t quantile estimate is about 4%. So the initial interval could even be set to 0,95...1,05 t. ;-)

I was about to write this and that concerning numeric accuracy in the distributions, e.g. using ln1+x and e^x-1, and avoiding terms like p-0.5 where values below a certain limit simply return 0,5 (cf Logistic quantile). But I see much of this work already has been done now, e.g. in the Exponential and Weibull CDF, but not in its QF which should be updated the same way. There also is an improvement in the t-quantile for 1 d.o.f. where tan(pi*(p-0,5)) was replaced by cot(p*Pi), which I wanted to suggest as well. So it seems this time you were faster, Pauli. At least at some points. ;-)

The improved evaluation of the t-quantile (1 d.o.f.) should also to be applied to the Cauchy distribution. The latter could be omitted completely since it's nothing but the t-distribution with 1 d.o.f. Without Cauchy there also is no need to rework its cdf - since the final step is adding 0,5 there is a point beyond which the result is a plain zero.

I did not look at the t CDF. Does it return 16 valid digits for any t-value or is there something that can be improved?

By the way - how fast do these functions execute on a real 20s or 30s?

Dieter

*Message #29 Posted by **Dieter** on 7 May 2011, 4:38 p.m.,*
in response to message #27 by Paul Dale

Pauli, I think there is a bug in the t-quantile routine: the solver seems to exit as soon as the result has reached display accuracy. Try p = 0,1 and 4 d.o.f. and you will get 1,5535 in FIX 2, while ALL returns the correct result 1,5532.

The Student CDF also does not work far out in the tails. Again, with four degrees of freedom, t = -1E10 returns 3E-40, and -1E20 should return 3E-80, but instead you get a plain zero. I assume the reason is some kind of digit cancellation: the limit is t = -sqrt(1E39). This also leads to substantial execution times for the quantile in that area, probably because more and more significant digits get lost as p drops below something like 1E-70. Values below 1E-78 simply throw a domain error.

Dieter

Not so much a digit cancellation as digit loss. The transform I used from the T cdf to the incomplete beta function involved a sqrt($v + t^2$) term which got uninteresting as |t| got large.

I've found an alternative transformation that looks like it works a lot better.

Now to see if my Internet connection will allow me to commit these two changes or not...

wp34S TIME Function

*Message #1 Posted by **Jake Schwartz** on 26 Apr 2011, 9:18 a.m.*

Hi Guys,

I know that the TIME function recalls the time from the internal clock, and I also believe that neither the 20b nor the 30b have a crystal. Yesterday I used SETTIM to set in the time of day in my 20b running wp34s, then checked back around 12 hours later and it was off by an hour and a half. (I kind of expected this....) Assuming that none of the available HP hardware platforms have a crystal to assure even modest accuracy, I wonder about the merits of having the TIME function occupying a precious position on the keyboard (even if it is on an h-shifted position), as opposed to being in the "X.FCN" menu like SETTIM, DATE and SETDAT. If this function is not going to be accurate, wouldn't one expect that no experienced user will ever press that button, and therefore something more useful could be "promoted" to the shifted keyboard?

Thanks,

Jake

Re: wp34S TIME Function

*Message #2 Posted by **Marcus von Cube, Germany** on 26 Apr 2011, 10:25 a.m.,*
in response to message #1 by Jake Schwartz

Even with a crystal installed, the clock will only be more accurate if the firmware actually uses the additional hardware. If users here are interested, I can prepare a special version of the image with the crystal oscillator enabled.

Re: wp34S TIME Function

*Message #3 Posted by **Walter B** on 26 Apr 2011, 10:53 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Intention of TIME was using it for runtime measurements, i.e. for typical intervals of seconds to minutes.

Walter

Re: wp34S TIME Function

*Message #4 Posted by **BobVA** on 26 Apr 2011, 7:33 p.m.,*
in response to message #2 by Marcus von Cube, Germany

A user is interested :-)

A separate file would be fine for me, but if it's inconvenient to provide/update perhaps the switch could be included as an X.FCN (something like "XTAL"). Downside is I think it will crash the calculator if executed without the appropriate hardware.

Other less crash prone possibilities:

- Use an X.FCN and prompt for confirmation, or

- Enable the crystal if a particular key is held down while coming out of a reset. This would need some kind of confirmation that it worked, though, after boot. Perhaps a message or number on the stack?

Having fun with the WP-34. Thanks for your efforts.

Regards, Bob

Re: wp34S TIME Function

*Message #5 Posted by **gene wright** on 26 Apr 2011, 7:42 p.m.,*
in response to message #4 by BobVA

For anyone reading this who isn't as versed in the 20b/30b hardware...Remember, the base 20b / 30b does not have a crystal at all, which means you would have to physically add one to the unit before using a 34s image that sees the added hardware.

I think that's correct.

Edited: 26 Apr 2011, 7:44 p.m.

Re: wp34S TIME Function

*Message #6 Posted by **Paul Dale** on 26 Apr 2011, 8:03 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Can't we detect if the oscillator is present?

Either start using it and rely on the watchdog to recover enough to not use it if it isn't installed or insist on an extra solder connection is made to an IO pin when the crystal is installed. If you are already soldering two tiny capacitors and a crystal onto the board, one extra wire link isn't asking too much.

Re: wp34S TIME Function

*Message #7 Posted by **Marcus von Cube, Germany** on 27 Apr 2011, 4:48 a.m.,*
in response to message #6 by Paul Dale

Both ideas are worth investigating. I start liking the watchdog idea.

Re: wp34S TIME Function

*Message #8 Posted by **hugh steers** on 26 Apr 2011, 11:04 a.m.,*
in response to message #1 by Jake Schwartz

i second this.

fwiw, i also think there should be a FIN (finance) menu. eg put L.R. into STAT and put FIN menu on h6. put TVM into the FIN menu.

would also like a way to use TVM (and other finance functions not yet implemented) without writing a program for the solver.

also CLP has no function outside of program mode (or does it?) perhaps this key (ie h-E) could do something else in normal mode.

Re: wp34S TIME Function

*Message #9 Posted by **Walter B** on 26 Apr 2011, 11:20 a.m.,*
in response to message #8 by hugh steers

A finance menu is quite improbable. We offer a scientific calc, we don't want to cannibalize HP's successful line of "business calculators". The few financial functions implemented (all starting with the letter % and thus easily accessed in X.FCN) may well vanish if we need the space for something important. And TVM was only added on my request, since IMHO it's one of the few advanced financial function being of use for common (wo)men. For more, please turn to the controller you trust in ;-) and his HP :-)

Walter

Re: wp34S TIME Function

*Message #10 Posted by **gene wright** on 26 Apr 2011, 11:51 a.m.,*
in response to message #9 by Walter B

Ah, but I am busy sometimes. :-)

Seriously, one thing that would help with TVM the way it is now (which is fine to me) would be a flag that could detect digit entry, like flag 22 on the HP 41.

Is such a thing possible? Sorry if it is in the PDF already, but I didn't see it.

Re: wp34S TIME Function

*Message #11 Posted by **Marcus von Cube, Germany** on 26 Apr 2011, 2:36 p.m.,*
in response to message #10 by gene wright

I don't think it is. I second the flag idea because it's useful in its own right. Clear the flag an a HALT and set it with any key that is not R/S or SST. We could even add a new conditional command ENTRY? So there is no need for the programmer to remember a numerical flag.

So, a digit entry flag on the 34s?

*Message #12 Posted by **gene wright** on 26 Apr 2011, 3:39 p.m.,*
in response to message #11 by Marcus von Cube, Germany

Like Flag 22 on the HP 41.

Marcus suggested an "ENTRY?" conditional that is essentially a flag test.

How does that sound as an enhancement?

Good for games (ha).

Would make coding a routine for the TVM command MUCH easier. Prompt. FS?22? sequence for example.

Although, I would only set the flag after a PROMPT or a R/S if a 0-9 or CHS has been pressed.

Edited: 26 Apr 2011, 3:51 p.m.

Re: So, a digit entry flag on the 34s?

*Message #13 Posted by **Marcus von Cube, Germany** on 27 Apr 2011, 4:50 a.m.,*
in response to message #12 by gene wright

> Quote:
>
> Although, I would only set the flag after a PROMPT or a R/S if a 0-9 or CHS has been pressed.

I disagree. What about values you've stored in registers before?

Re: So, a digit entry flag on the 34s?

*Message #14 Posted by **Paul Dale** on 27 Apr 2011, 5:02 a.m.,*
in response to message #13 by Marcus von Cube, Germany

Then it would no longer be a digit entry flag :-)

- Pauli

Re: So, a digit entry flag on the 34s?

*Message #15 Posted by **gene wright** on 27 Apr 2011, 6:55 a.m.,*
in response to message #13 by Marcus von Cube, Germany

Ah, let me rephrase. :-)

```
CF ENTRY
PROMPT
ENTRY?
GTO X
```

something like that. What was I thinking? Ha!

Re: So, a digit entry flag on the 34s?

*Message #16 Posted by **Paul Dale** on 27 Apr 2011, 7:04 a.m.,*
in response to message #15 by gene wright

How about:

```
PROMPT
ENTRY?
GOT X
```

The prompt automatically clears the flag for you. So does anything else that stops program execution.

- Pauli

Re: So, a digit entry flag on the 34s?

*Message #17 Posted by **gene wright** on 27 Apr 2011, 8:21 a.m.,*

in response to message #16 by Paul Dale

Sure. The only thing I would ask is to try making it work as much like the 41c as possible. Whatever set flag 22 on the 41c should set the ENTRY? flag on the 34s.

By the way... what about a pause? Does Pause allow for a digit entry? (yes, I know I could check it :-) but my 34s is not at hand!)

Re: So, a digit entry flag on the 34s?

*Message #18 Posted by **Marcus von Cube, Germany** on 27 Apr 2011, 8:36 a.m.,*
in response to message #17 by gene wright

PSE does not allow digit entry, it just gets interrupted by a key press so you can shorten a programmed pause by pressing any key.

Re: So, a digit entry flag on the 34s?

*Message #19 Posted by **Walter B** on 27 Apr 2011, 10:22 a.m.,*
in response to message #17 by gene wright

Gene,

PROMPT is the command designated for digit or alpha entry. Good ol' STOP does it, too, but without message output. PSE may be used for message output, but doesn't allow for input. That's it IIRC.

Walter

P.S.: We are not featuring INPUT yet (as employed in HP-42S).

Edited: 27 Apr 2011, 10:55 a.m.

Re: wp34S TIME Function

*Message #20 Posted by **Paul Dale** on 26 Apr 2011, 6:31 p.m.,*

We don't have this feature.

I like the ENTRY? conditional test for this.

Will have a think about this.

- Pauli

Re: wp34S TIME Function

*Message #21 Posted by **htom trites jr** on 27 Apr 2011, 6:06 p.m.,*
in response to message #20 by Paul Dale

There are several things being confounded: Was a key pressed? (I'm doing my thing, user wants to provide input.) Was a prompt answered? (I asked and wait.) Was a number pressed? (are . or eex numbers?) Was a digit pressed? (what about hex digits?) Was a shift key pressed? (which?

) Which key was pressed? Should the shift state change?

If the user wants to interrupt, I'm not into this project enough to provide input.

If the user has been asked, PROMPT would seem sufficient, if it waits and returns a value indicating which key was pressed. There are two especially handy things to return, a numeric value which indicates a key (0..99, zero meaning no key and we timed out waiting) or a set indicating a key (an array of bits, KEY, zero other than that bit that corresponds to the key; useful with boolean operations to branch depending on the values. If KEY and DIGITS then ... If KEY and HEXDIGIT then ...)

Re: wp34S TIME Function

*Message #22 Posted by **Paul Dale** on 26 Apr 2011, 6:29 p.m.,*
in response to message #8 by hugh steers

I'm with Walter here. No financial catalogue. Ever.

This is a scientific device. We barely have space for the scientific functions we want to include. We certainly don't have space to do even a half hearted financial function set as well let alone a proper financial implementation.

Doing TVM properly will require a lot more space than the current pathetic implementation. We'd actually have to care about accuracy and probably use different solving methods for each of the different parameters. I really don't want to go there -- this is not simple stuff to get right.

If you want a financial calculator, don't reflash your 20b / 30b :-)

CLP does what CLP does on many vintage HPs in run mode. Watch the BEG annunicator carefully.

Re: wp34S TIME Function

*Message #23 Posted by **Eddie W. Shore** on 27 Apr 2011, 10:10 p.m.,*
in response to message #22 by Paul Dale

In addition we can program TVM and other financial calculations if so desired. That's the beauty of a programmable calculator.

:)

We can probably find a suitable program for the common financial functions in the Museum's own program listing - or adopt and port a program from any of the HP's manuals.

Re: wp34S TIME Function

*Message #24 Posted by **Paul Dale** on 26 Apr 2011, 6:16 p.m.,*
in response to message #1 by Jake Schwartz

We considered this one long and hard and the poor accuracy was mentioned several times. I certainly agree that the clock is hopeless as it stands. However, both the 20b and 30b have pads on the circuit board for a crystal (& two capacitors) the addition of which would make the time keeping (more) reasonable.

Personally, I don't mind if the time functions are kept or removed (not the date ones of course). This would save a small amount of code but not a great deal. It would free up one of the most precious of resources -- a key.

For program timings we've got the TICKS command which is basically as good or better.

- Pauli

Re: wp34S TIME Function

*Message #25 Posted by **gene wright** on 26 Apr 2011, 6:44 p.m.,*
in response to message #24 by Paul Dale

Speaking for Jake here, but perhaps it is the keyboard spot being used for TIME that is a higher concern, given its limited utility?

Since it may only be used sparingly, perhaps placement in X.FCNS and something else brought out to the keyboard might be more useful?

Just a thought.

Re: wp34S TIME Function

> Speaking for Jake here, but perhaps it is the keyboard spot being used for TIME that is a higher concern, given its limited utility?

Agreed. It is not that the TIME function is included - by all means, I would NOT vote to have it removed from the firmware. I would only vote to swap it off the keyboard with something more useful on a day-to-day basis with something else in a catalog.

Thanks, Jake

We had it there for a very long time, however RCL L (RCL EEX) serves the same purpose and also requires two keystrokes -- there is no way LASTx will get an unshifted position. You can do CPX RCL EEX for the complex lastx.

We've still got the code for last x and complex last x in the firmware image. I guess I should remove them since they cannot be accessed anymore.

- Pauli

Re: wp34S TIME Function

*Message #32 Posted by **gene wright** on 27 Apr 2011, 6:56 a.m.,*
in response to message #31 by Paul Dale

RCL L is good for lastX.

As long as complex "RCL L" (or RCL EEX) recalls both L *and* I registers. It is kind of a misnomer to call it "CPX RCL L" in that case; complex "Last x" is closer to the actual meaning IMHO. I understand the thinking, however.

Re: wp34S TIME Function

*Message #34 Posted by **Walter B** on 27 Apr 2011, 1:53 p.m.,*
in response to message #33 by Jake Schwartz

To make it crystal clear: The **command** is called LASTx. The **keystrokes** are RCL L. In complex domain, the **command** is ^{C}LASTx and the **keystrokes** are CPX RCL L. All this is readily readable in the manual. According to the bible: "Those having eyes for reading, read!"

HTH (but doubt it)

Okay okay.... and Bill Wickes had a great proverb of his own: "Never piss off a volunteer". I am sorry, Walter, we have supported your efforts for a bunch of years now, but you are getting a bit too pompous for us volunteers.

Jake,

> Quote:
>
> ... but you are getting a bit too pompous for us volunteers.

AFAIK this whole project is a work of volunteers, mainly of two of that kind

being mad enough to pursue it for some 30 months. In the last few weeks the number of volunteers has increased steeply. Please note that a lot of thought went into that project in those months before, when many volunteers of today volunteered elsewhere. They are free to do this, of course, but then they should please show a little respect for the work done - be it only by reading thoroughly before claiming anything.

On topic again: Math is mainly about terms and definitions and then playing with them. So it's important IMHO not confusing things, for the sake of math.

WP34s quadrature

*Message #1 Posted by **hugh steers** on 26 Apr 2011, 5:52 a.m.*

Hi,

the manual says this works like the 15c, but i get no difference when changing (eg) FIX mode size. is there some way of specifying the accuracy - or am i doing something wrong.

right now, im getting really appalling results. 2 figures correct, for example.

Re: WP34s quadrature

*Message #2 Posted by **Paul Dale** on 26 Apr 2011, 5:54 a.m.,*
in response to message #1 by hugh steers

There is no way to change the precision of the integration.

We're using a Gauss/Kronrod quadrature with a fixed number of points. It won't be terribly good for "difficult" functions.

- Pauli

Re: WP34s quadrature

*Message #3 Posted by **Walter B** on 26 Apr 2011, 6:40 a.m.,*
in response to message #1 by hugh steers

The manual clearly says "the user interface is as in HP-15C." Nothing more.

Walter

We can add a more sophisticated approach as a user code routine. Any contributions are welcome.

Re: WP34s quadrature

*Message #5 Posted by **Namir** on 26 Apr 2011, 7:59 a.m.,*
in response to message #1 by hugh steers

If I am not mistaken, the SOLVE and INTEGRATE functions had Professor Kahan as it's mentor. Kahan's philosophy was to push the accuracy to the machine limits and not by a user-defined value.

The HP-15C Advanced Functions Handbook has a section "Accuracy of the Function to be Integrated" that

specifies the accuracy of the integral, which is basically the accuracy of the function you are integrating. This tells me that if you are integrating a function using an empirical approximation, then expect more error in the integral.

Namir

WP34S

*Message #1 Posted by **geoff quickfall** on 26 Apr 2011, 3:13 a.m.*

Firstly, let me thank you both for your work on this project! Also for Cyrille, Tim and HP for providing the platform.

It is late here, and I should be working on the book, but I had to see what the hoopla was all about and, well, I am astounded.

Been flashing and playing and programming today, (pouring with rain) and I have a few questions:

```
1: when I select the function version I get 34s 1.17 673.  This
   appears to be the latest, what does the 673 stand for?

2: in program mode I cannot get HMS to appear in the program.
   Decimal does as well as a multitude of other functions, but HMS
   will not work in program mode as an instruction.  In fact it
   does not even appear in the step.  It does work in run mode. however.
```

Again, thanks! for more programming fun!!!!

Cheers, Geoff

That is the subversion revision number. Larger is later & hopefully better. Currently we're at 754 although the functionality hasn't changed much quite a few bugs have been fixed.

Ideally, we'll remove this revision number once we're ready to release a final version.

> Quote:
>
> 2 in program mode I cannot get HMS to appear in the program. Decimal does as well as a multitude of other functions, but HMS will not work in program mode as an instruction.

HMS is a display mode and doesn't work in program mode. We recently removed HMS as a fully fledged mode because it just wasn't working out properly.

Sorry.

> Quote:
>

Not a complaint but I have noticed that most of the subversion calc.bin files do not show a version number for the VERS command. It would be very helpful to have this in for every image with more and more ppl flashing real hardware and testing.

Currently I'm bungling around with alpha prompts in Programs in 754. Occasionally I get the Bye... in the top alpha display area when leaving program mode and not when the calc is turned off. So far I don't have a reproduceable keystroke sequence as I'm still gettin used to getting into and out of alpha mode and writing down all my steps.

Re: WP34S

*Message #4 Posted by **Paul Dale** on 26 Apr 2011, 7:18 a.m.,*
in response to message #3 by Norman Dziedzic

Early versions of the firmware didn't have the release number. Later versions do. We're not going to go back and retrofit this to those.

What we might do is remove the version on the final version of a given number. Then again we might not.

- Pauli

Re: WP34S

> Quote:
>
> ...I have noticed that most of the subversion calc.bin files do not show a version number for the VERS command.

Whenever I download a new version, I append the version number to the saved file name, e.g. calc754.bin. Then I open it with a hex editor and add the version number in the appropriate locations (1FFFB, 1FFFC and 1FFFD). Me poking around the bin file is akin to letting a monkey poke around the cockpit of a in-flight airplane, but so far I don't seem to have done any damage. For editing, I use a program called XVI32 which I found by searching the internet for "hex editor". The above process seems to work as the VERS command shows the version after I make the change.

SVN Client for Windows(XP)

*Message #9 Posted by **svisvanatha** on 26 Apr 2011, 9:54 a.m.,*
in response to message #8 by Marcus von Cube, Germany

I am using TortoiseSVN on WinXP. It is quite good actually. Once you have downloaded and unpacked the zip file for the WP34S from SourceForge, you can simply right-click and hit 'update' on the folder where WP34S resides on your drive. It updates the calc.bin, emulators, artwork, manuals, etc to the latest and greatest. No need to fumble through the Sourceforge site anymore!

I make it easy - I have the WP34S folder as a shortcut on my desktop, and simply right click and update the SVN from there.

I'm not getting the Update Option when I right click the wp34s directory? Did you have to somehow tell TortoiseSVN that the directory is associated with the project?

Thanks,

Norm

Re: SVN Client for Windows(XP)

*Message #12 Posted by **svisvanatha** on 27 Apr 2011, 9:45 p.m.,*
in response to message #11 by Norman Dziedzic

Here are some detailed instructions. Open Windows Explorer, navigate to the directory that you want the 'wp34s' directory to appear:

```
1. right click on an empty space within the directory
2. you will see 'SVN Checkout'
3. Click on that
4. In the URL field, enter:
https://wp34s.svn.sourceforge.net/svnroot/wp34s
5. hit 'OK'
6. wait for the files to download
7. you should then have a directory named 'wp34s', with a green mark in
the folder.
8. Now try the right-click and update SVN.
```

Thanks for the voice of support, comments like this make it all worthwhile. We've been designing & implementing the calculator we want to use. If it ends up being a worthy successor to many of the classic HP models, all the better.

Also, don't delay the book on our behalf. Many are waiting for it..... :-)

- Pauli

PS: bug reports are also very useful at the moment.

Re: WP34S

*Message #16 Posted by **Marcus von Cube, Germany** on 26 Apr 2011, 4:00 a.m.,*
in response to message #15 by Paul Dale

I think we will have to reintroduce HMS as a mode or even better as a tag, be it for the sake of Geoff and his flight schedules. :-)

Re: WP34S

*Message #17 Posted by **Paul Dale** on 26 Apr 2011, 4:04 a.m.,*
in response to message #16 by Marcus von Cube, Germany

Or a HMS view command :-)

HMS as a mode just didn't work. We're not going back there.

HMS as a tag comes after we've tagged integer and alpha.

- Pauli

Re: WP34S

*Message #18 Posted by **Marcus von Cube, Germany** on 26 Apr 2011, 5:16 a.m.,*
in response to message #17 by Paul Dale

I've a new idea for saving some precious ram. :-) This will not be enough for all tag bits we'll need, but at least for some, I hope. We can probably restrict tagging to a subset of all registers.

Re: WP34S

*Message #19 Posted by **Walter B** on 26 Apr 2011, 7:07 a.m.,*
in response to message #1 by geoff quickfall

Geoff,

Thanks for your kind words :-)

The basic idea behind HMS mode was having an easy way for displaying, adding and subtracting times. However, as Pauli mentioned already, it didn't work the way we wanted it. So the only remnants of this mode

are H.MS and [alpha]TIME displaying the time the way we planned.

Now, if you want to add or subtract times entered in the format hh.mmss, the functions H.MS+ and H.MS- are available in P.FCN. For keyboard use, assign them to one or two hotkeys and you're done - alternatively, use ->H.d, add/subtract and reconvert the result via ->H.MS. That's it so far.

We are all waiting for your book to appear, so please come on.

Walter

Re: WP34S

*Message #20 Posted by **Geoff Quickfall** on 26 Apr 2011, 1:05 p.m.,*
in response to message #19 by Walter B

I remember talking with Hugh Steers when he flashed the new software into my U-watch. HMS algorthim was problematical.

Of course I could always write a subroutine to create an hours, minutes seconds display with fix4 and round function but it does eat up the lack of programming lines.

I use the HMS to flip a decimal 'time' after a calculation into the HMS display with refernce to Latitude and Longitude calculations. No big deal to hit the HMS key once the calculation has run (IN A TENTH OF A SECOND! compared to 30 seconds on the HP 15C), but it would be convenient.

Like to second Jake's comment (posting above) about removing the time function since it does not keep time accurately. How about the HMS algorithim instead ;-)

Keep up the good work, (this is more fun then writing; focus, focus).

Cheers, Geoff

WP34 base page view

*Message #1 Posted by **Cristian Arezzini** on 26 Apr 2011, 2:21 a.m.*

I've been trying the emulator for quite some time, while I wait for the "real hardware"... and I have a question. I tend to use base functions a lot (mainly in binary) so I use the "multiple-page" feature much, because most of the numbers I encounter are more than 12 bits. The keys to change "page" are both shifted. I was wondering if maybe the two up/down arrow (unshifted) keys could be used instead? I think that if you have a multi-page number, you want to be able to flip through the pages very quickly...

Cristian

Re: WP34 base page view

*Message #2 Posted by **Paul Dale** on 26 Apr 2011, 2:36 a.m.,*
in response to message #1 by Cristian Arezzini

> Quote:
>
> I was wondering if maybe the two up/down arrow (unshifted) keys could be used instead? I think that if you have a multi-page number, you want to be able to flip through the pages very quickly...

They single step programs forwards and backwards so giving them a different use here isn't going to happen I suspect.

We do have a shortcut that will assist you here. Press and hold the f-shift or g-shift and repeatedly press the windowing key and you will advance more quickly. This works for all three shift keys for any function I believe.

I don't know if it will work on the emulator or not but it definitely works on the real hardware. Until your real hardware arrives, you'd better learn your binary to hex conversions. Then it becomes a moot point ;-P

- Pauli

Re: WP34 base page view

*Message #3 Posted by **Cristian Arezzini** on 26 Apr 2011, 2:42 a.m.,*
in response to message #2 by Paul Dale

Pauli, thanks, I see your point. But for people who wouldn't use SST/BST much (am I the only one?), maybe there could be a system setting to choose whether the arrows behave as SST/BST or as general arrows (for navigating menus, switching pages and so on)... would that be conceivable?

Cristian

Re: WP34 base page view

*Message #4 Posted by **Walter B** on 26 Apr 2011, 2:54 a.m.,*
in response to message #3 by Cristian Arezzini

Ciao Christian,

Please look at page 52 (of 73) of the most recent version of the wp34s manual available in the doc-subdirectory at SourceForge. There's listed what has to be checked if the user simply presses one of the navigation keys, to find out what's to be done with this request. It's all about detecting what the user really wants ;-) when pressing such a key. If you find a nice and unambiguous clause to be included there for base page scrolling, please suggest.

Walter

Re: WP34 base page view

*Message #5 Posted by **Paul Dale** on 26 Apr 2011, 3:07 a.m.,*
in response to message #3 by Cristian Arezzini

I don't much like the idea of another system flag for what is really a fairly niche piece of functionality. This has always been a highly programmable device after all.

The only way I can think of to support this would be to allow integer windowing if there aren't any program steps defined. I think this would qualify as too confusing (and coming from me that is exceedingly rare -- some of my suggestions have been *interesting* to say the least).

I also don't think the shortcut I mentioned is too onerous. It is certainly no worse than all the transcendental functions (and better than most) which will be more commonly use I suspect.

something interesting in early computer history

*Message #1 Posted by **Don Shepherd** on 26 Apr 2011, 12:20 a.m.*

I'm reading a recent book on Paul Allen, co-founder of Microsoft with Bill Gates. When IBM developed their personal computer, they asked Microsoft to develop the programming languages and the operating system for it. Bill Gates told them he had not developed an operating system before and referred them to Digital Research and Gary Kildall who had developed CP/M. The IBM reps went to Digital Research for a meeting. Gary Kildall was traveling on that day, so they met with his wife who was also involved with the company. IBM asked her to sign an NDA; she refused and asked them to sign Digital Research's NDA. IBM came back to Bill Gates and said they could not work with the Digital Research people, and Bill Gates agreed to develop what would become MS-DOS.

It's interesting to think what might have happened had Ms. Kildall just signed the NDA.

ROFL

One Question: What is the reason to use the acronyms "TSS" for "10^99-Software" or "TAS" for "the expensive place to bet for vintage RPN calculators"?

Maybe I sould search the archive, but I beg on your grace to shed some light on this tread (or should I say treat, or even threat?!)

thanks in advance

Re: OT: Re: something interesting: Micro versus Mega

*Message #7 Posted by **Walter B** on 26 Apr 2011, 12:43 p.m.,*
in response to message #6 by exschr

IMHO, it all evolved from TOS, being a well established acronym in this forum for a site whose name must not be mentioned here (see older posts, and books of J.K. Rowling).

TAS: There were repeated discussions about to weight of that electronic concave costal section in the forum. Taking into account that forum discussions are archived and distributed on DC/DVD, links to that site will be broken soon and turn useless. Some forumers decided to

circumvent the original name of that site (erroneously assuming this name itself triggered anger) and soon TAS arose, pointing to That Auction Site. In fact, there even was a decision some years ago that pure auction stuff should not spoil this forum.

TSS: I guess that was created in analogy, calling it That Search Site.

That's a myth. The IBM'ers met with Dorothy McEwen, who was married to Gary Kildall and was marketing director of Digital Research, as well their corporate counsel (Jerry Davis, if I recall correctly). I understand the stumbling block was the IBM non-disclosure agreement.

Best,

Don,

The story I heard that time was Kildall went flying in a small plane when the IBM came to see him. They felt snubbed and left. Also Bill gates purchased something like QDOS (a rival for CP/M) for $80K and sold it (or a variant of it) to IBM as PC-DOS.

*Message #13 Posted by **Don Shepherd** on 26 Apr 2011, 4:28 p.m.,*
in response to message #12 by Namir

Namir, according to Paul Allen, Kildall said he was flying on business that day. And, yes, IBM purchased QDOS from Seattle Computer Products for $10,000 plus a royalty fee of $15,000 for every company that licensed the software from Microsoft, which initially was only IBM, so Bill Gates immediately paid $25,000 to Seattle Computer Products.

At the time, Microsoft was doing a tidy business in BASIC interpreters for various microcomputers, including Apple. As I heard it, IBM asked them to create a BASIC interpreter for the PC, but IBM didn't have an operating system for it at the time. MS quickly realized that they needed an OS before they could do much of anything with BASIC.

So they were into basic interpreters and not OS's, which only proofs that they should have better stayed with what they (thought they) were good at.

It's us that have to endure the mess out of it!
;-)

I was making my living using various pre-IBM PC's all of which ran Digital Research's CP/M back then. When the IBM-PC was released, I appreciated MS-DOS as it was easier to use than CP/M was and got much better over time. It wasn't until Windows that things started to head in the wrong direction, at least as far as reliability is concerned.

*Message #17 Posted by **Don Shepherd** on 27 Apr 2011, 11:09 a.m.,*
in response to message #16 by Katie Wasserman

I agree. The thing I always disliked about MS Windows was the thousands of files that are required, some of which are undoubtedly needed but many of which, I am sure, you probably don't need, but it's almost impossible to know which is which.

And if you do a CTRL+ALT+DELETE and bring up the list of processes that are running, without an exhaustive Internet search it's hard to determine what all of those are for. Somehow the mentality of the Microsoft Windows designers was that it is OK to have thousands of operating system files present on the user's PC and it is not necessary to tell the user what they are for. I don't like that.

I'm still running Windows XP, which gives you access to the MSDOS prompt. Is that true for Vista and Windows 7?

Re: really interesting, isn't it

in response to message #17 by Don Shepherd

I have a casual interest in Minix, as an OS it has a "micro kernal" of ~4000 lines of code. This allows the kernel to run more efficiently (such as not running/storing in near memory, drivers that are not going to be used, such as for a lightpen or cassette tape drive). But so far it seems little more than a novelty.

As far as Windows command line goes, I believe Win98 stopped using DOS underpinnings and hence the "command line" simulates a DOS environment. Newer PC processors have RISC cores surrounded by silicon that adapts the x86 CISC commands to the RISC cores.

It was Windows NT which stopped using DOS below the hood, Windows 98 and ME (the "latest and greatest") sticked to the old DOS first, then let Windows take as much control as necessary dogma.

If you're interested in MINIX, Andrew Tannenbaum's *Operating Systems: Design and Implementation* is worth a read. MINIX was written by Tannenbaum to illustrate different principles of OS design, and the above text is essentially an extended commentary on MINIX.

It's also a commonly used textbook in OS design classes, so it's usually pretty easy to find used copies for next to nothing.

Vista an 7 have a command window that looks very much like DOS.

I mostly use it to run the ping command which isn't in the help that comes up when you type HELP but never the less is useful.

I don't want to start a war about which OS or what preference, just some thoughts of mine:
I agree to what Katie and Don said. DOS was ok, even batch programming had it's sophisticated not so obvious "features" that allowed for powerful scripts too.

But with Windows, it changed to "security through obscurity": The problem with that approach

is, it hinders the innocent user but the malicious mind still finds the holes and hidden information and will do harm.

Unfortunately we can't always freely choose, what OS is running on some computers. Every OS has it's disadvantages, just find the pearls and try to find a way around the ugly.

There are still pearls out there :-)

I'm used to working in the Guardian environment, the operating system created for the Tandem NonStop servers now being HP machines. You really need to get used to it and its paradigms but it has a bunch of features making it ideal for its purposes: Data safety, reliability, performance, scalability. It's a bit of a niche market but working with these machines is more fun than with other commercial offerings. I even have an old Tandem K202 in my basement.

Help! HP-19C printer gone mad - fixed :-)

*Message #1 Posted by **Philippe Lasnier** on 25 Apr 2011, 6:04 p.m.*

Hi All,

Back in March, just over a month ago in fact, I posted a topic about my newly acquired HP-19C whose printer refused to behave. Donald Williams and Katie Wasserman responded and helped me out. As the discussion petered out, the action was left on me to try to make progress with connectivity and the power supply.

I am happy to report that, after cleaning up the inside, and managing to source a nice Sanyo NiCd battery pack which I soldered in directly, the HP-19C is now behaving very well.

Well, as well as can be for such a vintage calculator.

With the battery pack fully charged (it's 1000mAh), the calculator lasted over 9 hours running a closed-loop program before running out of juice (sometime after 9 hours; don't know when for sure). 7 hours after the start, I could still pause the program and do some printing successfully (that didn't work anymore past the 8th hour).

Again with the battery pack fully charged, I ran a test printing continuously for 25 minutes, over 1000 lines. I stopped it because I didn't want to wear it out ;-)

So a successful revitalisation of an old machine. Excellent!

Thanks for the help.

Re: Help! HP-19C printer gone mad - fixed :-)

*Message #2 Posted by **Katie Wasserman** on 25 Apr 2011, 10:08 p.m.,*
in response to message #1 by Philippe Lasnier

Thanks for the update and I'm happy to hear you've got it working again. I find that the 19C is the most fun HP calculator to play with. LEDs, printing and programming in such a small package!

HP 30b RND function

*Message #1 Posted by **Sujith Abraham** on 25 Apr 2011, 6:33 a.m.*

I am just curious how this is supposed to work. The manual says, on page 19 that it: "Rounds x to the number specified by the display format"

What is display format? Is it FIX?

When I press [Shift]+[RND] nothing is happening.

An illustration of how it is supposed to be used would be very helpful.

Thanks

Re: HP 30b RND function

*Message #2 Posted by **Norman Dziedzic** on 25 Apr 2011, 6:54 a.m.,*
in response to message #1 by Sujith Abraham

You are correct, it rounds to the number of decimals set with FIX.

To see the effects, calculate something with a repeating decimal like 1/3. Then set FIX 3 and RND. Then show all digits or set FIX higher than 3 and you will see 0.33300000..

You don't see it when you do it because it is rounding away the decimals you cannot see at the time.

Re: HP 30b RND function

*Message #3 Posted by **Dieter** on 25 Apr 2011, 8:36 a.m.,*
in response to message #1 by Sujith Abraham

You will find the answer yourself once you realize that there are two different things here:

- On the one hand there is the number of digits the calculator is working with. This may be something like 10, 12 or 16 digits, depending on the model. The calculator always uses this many digits for all its calculations, and all results have this precision.
- On the other hand there is the number of digits you want to see in the display. If you set FIX 2 you tell the calculator "just show me two decimals - I don't need to know the rest". This display setting only affects the number of digits you *see*, while internally all values and results still have their full 10, 12 or 16 digits.

The round function now does this: it replaces the current full-precision value by the rounded number you see in the display. In other words: before, the number only was *displayed* with two decimals, and afterwards it actually *has* only two decimals.

Assume the current value is Pi = 3,14159265358979323846264 3... and your calculator works with 12 digits. This is what happens:

```
              --- display set to ---
              FIX 2            FIX 4
                                                 now
  you see     3,14             3,1416            press      3,1416
                                                 [RND]
  calculator  3,14159265359    3,14159265359           =>  3,141600000000
  works with
```

So in FIX the round function rounds to the chosen number of digits behind the decimal point. In SCI and ENG it rounds to the number of *significant* digits you see. Finally try FIX 2, enter a value like 0,000004 and see what the round function does now.

Dieter

Re: HP 30b RND function

*Message #4 Posted by **Sujith Abraham** on 1 May 2011, 10:10 p.m.,*
in response to message #3 by Dieter

Thanks for the replies Norman and Dieter. I had RND in my Casio also, but it is only now I get its use!

One area I may be able to use this may be to get *correct* answers: answers in my text's TVM calculations, which uses data from PV Tables.

Can you please share what you use **RND** on your HPs? Since many of you use it in *real life situations*, it would be interesting.

Re: HP 30b RND function

*Message #5 Posted by **Thomas Radtke** on 25 Apr 2011, 9:18 a.m.,*
in response to message #1 by Sujith Abraham

> Quote:
>
> The manual says, on page 19 that it: "Rounds x to the number specified by the display format"

That sentence has to be corrected. The 35s manual is clear about RND: "Rounds x to n decimal places in FIX n display mode".

Re: HP 30b RND function

*Message #6 Posted by **C.Ret** on 25 Apr 2011, 12:32 p.m.,*
in response to message #5 by Thomas Radtke

Hi,

Perhaps a more correct sentence wil only mention "Display Format" since the RND instruction is rounding depending of displayed numbers in SCI n or ENG n modes (on model whre these modes are available).

Example: '4.pi'

```
Mode  :        DISPLAY:    RND result:
STD       12.5663706144    12.5663706144
FIX 4     12.5664          12.5664000000    (note the fourth decimal round up)
SCI 4      1.2566  E+01    12.5660000000
ENG 4     12.566   E+00    12.5660000000
```

Re: HP 30b RND function

*Message #7 Posted by **Thomas Radtke** on 25 Apr 2011, 12:55 p.m.,*
in response to message #6 by C.Ret

The manual actually mentions that. I've omitted it since it appeared to me 'FIX' was in focus of this thread. My fault.

The Sigma Function on the WP34

*Message #1 Posted by **Eddie W. Shore** on 25 Apr 2011, 12:17 a.m.*

How is the Sigma function used?

I am trying to find the sum:

```
10
Sigma  .5^x * .2   (= .399805)
x=0
```

If understand the manual correctly, I am supposed to enter the counter in the x stack as ccc.fffiii:

So I would enter 0.01001? (final = 10, increment = 0, c = 0)

I am not getting the answer I expected. Please help.

Here is what I have:

```
LBL FF
.
5
x<>y
y^x
.2
x
RTN
```

.01001 g [3] f [ENTER] FF ?? (I'm not getting what I am expecting, I get .2000)

Thanks in advance.

Re: The Sigma Function on the WP34

*Message #2 Posted by **Paul Dale** on 25 Apr 2011, 12:54 a.m.,*
in response to message #1 by Eddie W. Shore

The source for sum is in the subversion repository.

The big problem I think you're encountering is that the loop is a DSE loop not an ISG one. So, try entering 10 SUM'FF

The finish value defaults to 0 and the increment/decrement defaults to 1.

- Pauli

Re: The Sigma Function on the WP34

*Message #3 Posted by **Paul Dale** on 25 Apr 2011, 6:20 a.m.,*
in response to message #2 by Paul Dale

Small correction.

You need to start the sum from 11 and subtract 1 at the start of the function. The sum stops before the zero term is evaluated.

Thus,

```
LBL A
DEC x
.
5
x<>y
y^x
5
/
RTN
```

Then 11 g Sigma A gives 0.3998046875

- Pauli

Not just him. ;-) That's one of the things that made me read the manual twice before I finally realized that the sum and product loops are working backwards.

Pauli, I think this is a quite unintuitive feature. I'm a big fan of POLA user interfaces (policy of least astonishment - things should work the way the average user expects). That's why I think the sum and product functions should count upwards. Simply think of the way you write down a sum: it's from 1 to n, not from n down to 1. And this way there is also no problem with an index starting at zero. ;-)

Dieter

Re: The Sigma Function on the WP34

*Message #5 Posted by **Paul Dale** on 25 Apr 2011, 6:32 p.m.,*
in response to message #4 by Dieter

Originally I had both product and sum counting up then the documentation had them counting down so I switched.

There are arguments both ways on this:

- Counting up limits you to a final value to 999, counting down doesn't.

- Counting up lets you get a zero index easily, counting down doesn't.
- Counting up requires more keystrokes (e.g. sum 1 to 5 requires 1.005 SUM as opposed to 5 SUM).
- For summations whose terms diminish as the index increases (i.e. many), counting down is generally more accurate.

The change to make the count go the other way is trivial -- the DSE becomes an ISG in the main loop. I guess we could implement alternate commands to count the other way or switch to counting up again. I'm indecisive on this one, like I said advantages both ways.

- Pauli

Submissions

*Message #1 Posted by **Paul Dale** on 24 Apr 2011, 4:08 a.m.*

After Gerson's rather nice quadratic solver routine, we figured it would be good if we could include some other keystroke programs as internal commands. So we've decided to accept code from everyone here for possible inclusion.

1. Usefulness. Kind of self-explanatory.
2. Brevity. The shorter the better. We don't have a huge amount of flash remaining and the more we fit in the better.
3. Similarity. Any new user code program would ideally be as close as possible to a built in command. I.e. not use any stack levels beyond what its arguments take, return results in the stack and do something sensible with LastX.

Gerson's quadratic solver scores highly on all three of these criteria.

So if you've a pet function which we haven't included, code it as compactly as you can and submit it here.

Being internal code, there are a few extras and limitations.

- Registers 00 through 04 and flags 00 through 14 are special internals and can be freely used without impacting the user's registers and flags. However, using these requires an extra instruction to prevent nesting and collisions.
- The stack will always be four levels and cannot be changed.
- The number of labels you can use is quite limited. Forward jumps and subroutines use labels 00 through 09 -- reuse these labels lots. Backward jumps are very very limited. Use the SKIP and BACK commands where ever possible.

Walter, Marcus and I will decide what, if anything, goes in. We'll also consider adding any submitted routines to the growing library of WP-34S code.

- Pauli

Important SpeedUI update to 11.05

*Message #1 Posted by **Raymond Del Tondo** on 23 Apr 2011, 6:04 p.m.*

Hello all,

here's an important update for SpeedUI.

SpeedUI 11.05 fixes a display bug when starting a new edit line.

The whole SpeedUI package has been shrunken by several KB.

Prior to installation of the new SpeedUI, please remove ALL older SpeedUI components,
since CF.LIB has changed internally, and all other components have been adjusted to the new CF.LIB layout.

There are now two different favours of the SpeedBrowser, one compact version, and one ultra compact version.

For installation/uninstallation, please take a look into StartHere.pdf supplied with the SpeedUI 11.05 archive.

The new version is available here:
http://www.hpmuseum.org/guest/deltondo/speedui.pdf (Walkthrough PDF)
http://www.hpmuseum.org/guest/deltondo/sui_1105.zip (SpeedUI zip archive)

but _not_ on www.hpcalc.org (since the site has not been updated for more than 3 months now)

Have fun, and happy Easter days:-)

Raymond

wp34s SLV questions

*Message #1 Posted by **Norman Dziedzic** on 23 Apr 2011, 4:19 p.m.*

While using SLV is it normal that when one of the initial guesses is a root that it returns 0.0 instead of the root?

Is the convergence criteria determined by the number of decimals displayed like other calculators? I ask this because answers seem to return very quickly with FIX 1 but goes up drastically with FIX 2.

I'm using a simple quadratic 2*x^2-3*x+1 with initial guesses of -1 and 2.

Program:

```
LBL B
STO 99
X^2
2
*
RCL 99
3
*
-
1
+
RTN
```

with FIX 1 I get an answer almost instantly. With FIX 2 it's about 16 seconds? Is this right?

<Build 721 on 30b hardware>

Edited: 23 Apr 2011, 4:19 p.m.

Re: wp34s SLV questions

*Message #2 Posted by **gene wright** on 23 Apr 2011, 5:41 p.m.,*
in response to message #1 by Norman Dziedzic

Hey Norman. Glad you got the cable! :-)

On build 725 in Fix 4, it returns 1 in about 15-20 seconds.

With guesses of 0.98 and 1.02, it returns 1 in about 2 seconds. :-)

Re: wp34s SLV questions

in response to message #2 by gene wright

> Quote:
>
> With guesses of 0.98 and 1.02, it returns 1 in about 2 seconds. :-)

While this is not improved, for quadratic equations I would suggest the following:

```
                                  X                                  Y                  Z
T             L

001 LBL A                         c                                  b                  a
T             L
002 RCL/ Z                      c/a                                  b                  a
T             c
003 X<> Z                         a                                  b                c/a
T             c

Gene, I should have sent you a thank you for the cable. "Thank You"

I wrote my PGM that way because I didn't know exactly how the solver worked but I knew if I stored the value in a register, then no matter how it worked my PGM would work. I don't have a 15C nor a manual for one so the reference in the wp34s manual didn't give me any guidance.

But really, I was just playing around and the main thing was that I had expected a result in less than a sec. And, looks like I found some anomalies that are being fixed.

Quadratic solver sounds like a good addition.

I guessed as much. They aren't being fixed, they are fixed in subversion.

We need a lot more testing to find the rough spots (of which I'm sure there are many).

- Pauli

Of course. In subversion there is a version in *library/integrate.txt* and the actual code that is used internally is in *trunk/xrom.c*.

> Quote:
>
> how much room is left if someone suggests an improvement?

As much as is required. This is a sufficiently important function that we'll remove other things to ensure it fits in. If required, we can also partially merge the code into C as has been done with solve.

What we are short of is registers for the integrator to use. Five are currently dedicated and we could squeeze a sixth out of RAM. A seventh is when things would get very difficult. Unfortunately, we've got to use non-volatile RAM for these.

Re: wp34s SLV questions

*Message #12 Posted by **Dieter** on 23 Apr 2011, 6:37 p.m.,*
in response to message #1 by Norman Dziedzic

Solve should work independent from the display setting. But I wanted to mention another point: you have stored x in R99 in order to recall it a second time later in the formula. This is not necessary - the whole stack is filled with x, so you can recall it anytime you like from there. However, "real cowboys" of course would use the Horner scheme here - it's virtually *made for* RPN calculators:

```
conventional      Horner
approach          scheme

LBL B             LBL B
X^2               2
2                 *
*                 3
X<>Y              -
3                 *
*                 1
-                 +
1                 RTN
+
RTN
```

BTW - on the 35s it takes not much more than a second to obtain the result x = 1 from the initial guesses -1 and 2. Since the 20b and 30b are blazingly fast compared to the 35s, it sounds like something does not work the way it is supposed to. But let's wait for the software specialists. ;-)

Dieter

No. Solve iterates until successive estimates are the same based on the display setting. It uses the x[approx]? conditional test. This is the same as HP's solve has always done (i.e. from the 34c onwards).

> Quote:
>
> the whole stack is filled with x, so you can recall it anytime you like from there.

Again no. X, Y, Z and T are filled with the estimate. If you are using an eight level stack then A, B, C & D aren't filled. Is anyone using an eight level stack?

> Quote:
>
> BTW - on the 35s it takes not much more than a second to obtain the result x = 1 from the initial guesses -1 and 2. Since the 20b and 30b are blazingly fast compared to the 35s, it sounds like something does not work the way it is supposed to. But let's wait for the software specialists. ;-)

Try putting a short pause at the start of the routine and watching the successive estimates to see what is going on :-) The only way I could see this taking a long time is if the initial estimates cause a wild divergence from the true solution which then has to be found anew. If your initial estimates bracket the solution, this can never happen.

The returning zero for an initial guess of the root is wrong and will be fixed. It should return the guess -- probably just some stack management gone awry.

For those who are interested, sample source code for the solver is in the top level library folder in subversion. The real source is in xrom.c in trunk and this is ever so slightly different.

I beg to differ. The Solve-implementations I know of return a full precision result at any display setting (as opposed to Integrate, here the display setting matters). As far as I remember the 34C manual even suggests a method to cut down solving times by rounding the result at the end of the function call (return zero if the result is small enough). The display setting really does not matter here. Which, in most cases, is a good idea, I think. However, I also like the idea of additional user control offered by changing the display setting. ;-)

The 34s manual says the user interface is the same as in the 15C. That's why I said Solve should work independent from the display setting. Obviously it doesn't. So I think either the manual or the algorithm should be changed.

You mentioned the X~= test in the 34s. I think this is an interesting feature... once you know how it works *exactly*. ;-) The manual says it tests true if the rounded values agree. So at FIX 4, for example, 1E-5 and 1E-10 would test true as they are both rounded to zero?

Dieter

Now you know one that does :-)

Maybe I was misremembering integrate when I did this. Changing from approximately zero to exactly zero is easy. Which is better here?

Our integrate doesn't depend on the display setting, it uses a fixed Gauss/Kronrod quadrature. Fast, small and a limited number of registers required.

> Quote:
>
> You mentioned the X~= test in the 34s. I think this is an interesting feature... once you know how it works *exactly*. ;-) The manual says it tests true if the rounded values agree. So at FIX 4, for example, 1E-5 and 1E-10 would test true as they are both rounded to zero?

Try it and find out :-)

Fortunately, the full source code is available so you can work out exactly how it works if you need to and far better than the manual could explain.

in response to message #1 by Norman Dziedzic

The bad stack when an initial guess is correct has been fixed and will be in the next build. A roll up fixes things for a 4 level stack.

The slowness to converge is as I suspected, the estimates send the solver wandering around due to the secant step.

- Pauli

Re: wp34s SLV questions

*Message #17 Posted by **Paul Dale** on 23 Apr 2011, 8:45 p.m.,*
in response to message #16 by Paul Dale

I've forced a bisection step to occur if the two initial estimates are both on the same side of zero. This should stop the solver drifting far away from the solution here and having to work hard to get back.

*Message #3 Posted by **Marcus von Cube, Germany** on 23 Apr 2011, 2:44 a.m.,*
in response to message #2 by Raymond Del Tondo

The processor works at three volts, not at six. So the batteries are wired in parallel. Older designs used to need higher voltages and had the batteries wired in a serial configuration. The two main cells were often accompanied by an extra cell for memory retention.

Re: HP 10BII+ Battery removal warning

*Message #4 Posted by **Martin Pinckney** on 23 Apr 2011, 6:03 a.m.,*
in response to message #2 by Raymond Del Tondo

Sounds ominous to me. Does it not have a capacitor to retain memory during battery changes like all other HP's since - what, the Voyagers?

Re: HP 10BII+ Battery removal warning

*Message #5 Posted by **Katie Wasserman** on 23 Apr 2011, 11:39 a.m.,*
in response to message #4 by Martin Pinckney

There's no capacitor in there to retain memory. None of the HP ARM-based calculators have a capacitor for memory retention. You've got at best a few seconds before you'll lose memory if you remove both coin cells in any of these machines.

Here's a pic of 10bii+ pcb:

Excuse my (electronic) ignorance, but if there in no capacitor, why would you get even a few seconds?

Re: HP 10BII+ Battery removal warning

*Message #7 Posted by **Jim Yohe** on 23 Apr 2011, 9:27 p.m.,*
in response to message #6 by Martin Pinckney

If there were enough small valued (0.1uF) capacitors used for bypassing they might retrain enough of a small charge long enough, depending on the current drain in the circuit, to provide current to circuits to keep them active.

Re: HP 10BII+ Battery removal warning

Although there is not a large capacitor for long-term memory retention the small valued bypass capacitors might retain the memory for a short while. They are the small SMD components (CXX) around the black blob IC and elsewhere in the printed circuit board.

More about bypass capacitors here. The first two paragraphs and the Figure 4 might give you an idea.

Re: HP 10BII+ Battery removal warning

*Message #11 Posted by **Jim Yohe** on 25 Apr 2011, 9:54 p.m.,*
in response to message #10 by Gerson W. Barbosa

Nice article. It's obvious that nobody would think of distributing 76 64nF caps around that one device and normally a much smaller number of 0.1uF and 0.01uF caps around that "one" device being used in the article.

Some manufactures (i.e., Intel - since I use to work there as a PCB designer) would design in the number of caps they thought would be needed and then when the board was working satisfactorily would remove components to reduce costs but not so much as to exceed the amount of noise they needed to stay under to pass tests.

Never-the-less, thanks.

Re: HP 10BII+ Battery removal warning

*Message #12 Posted by **Gerson W. Barbosa** on 25 Apr 2011, 11:01 p.m.,*
in response to message #11 by Jim Yohe

The capacitors I am more familiarized with are somewhat bigger and are rated in kvar instead of nF or uF, but their smaller siblings are always interesting :-)

Regards,

Gerson.

Re: HP 10BII+ Battery removal warning

*Message #14 Posted by **Katie Wasserman** on 25 Apr 2011, 5:02 p.m.,*
in response to message #9 by Martin Pinckney

Let me try to explain.....

Whenever an IC is used on a printed circuit board you will typically use a "bypass capacitor" across the power terminals as close to the IC as possible. The reason for this is to create a very small reservoir of current just for that IC. When IC needs to momentarily draw a larger amount of current it will have that available without the resistive drop created by the thin traces on the circuit board that would happen if the current had to come from further away on the board. This is particularly true for microprocessors that have high momentary current needs. Really any CMOS circuit with a lot of transistors has this issue.

It's pretty much a given that there's going to be a bypass capacitor for the ARM chip. Bypass capacitors are typically 0.1uF -- not very much capacitance. Depending on the off state current draw of the ARM chip (maybe .1uA, just a guess) you might get a few seconds (roughly: time=V*F/A; 3*.1uF/.1uA = 3 seconds) of memory retention from the bypass capacitor. A memory retention capacitor might be 100uF (often much more) depending on the off state current draw.

-Katie

in response to message #15 by Mike Morrow

This where my knowledge comes from.

Re: HP 10BII+ Battery removal warning

*Message #17 Posted by **Jim Yohe** on 23 Apr 2011, 12:19 p.m.,*
in response to message #15 by Mike Morrow

The difference with this one is the stronger message in the first sentence "Batteries must not ...".

Well, if it only has to do with loosing settings or data stored in memory then there's little to worry about since we can't program it. With programs that you don't really want to lose is when you'd want to be more cautious.

Thanks all.

HP 10BII+ Two Number Function

*Message #18 Posted by **Gerardo Rincon** on 23 Apr 2011, 1:03 p.m.,*
in response to message #1 by Jim Yohe

I wonder why the Y^x does not work like a"Two-number function"? for instance a % change works:

number 1 <INPUT> number 2 <% Chg>

However the Y^x works diferently using the "=" sign:

number 1 <Y^x> Number 2 <=>

% Change works like an RPN machine, but Y^x work like an algebraic machine. It is like using two different logics with "two-number functions". I would have called a Y^x a "two number function" and treat it like the % change. It's little confusing at first until one remembers they function differently...

Re: HP 10BII+ Two Number Function

*Message #19 Posted by **Tim Wessman** on 23 Apr 2011, 2:07 p.m.,*
in response to message #18 by Gerardo Rincon

Hello,

Please see page 37 on your manual where it talks about which functions function in the dual way. They are perm, comb, %chg, ddays, date, t, and inverse t.

The reason why not all are supported is that it needed to be able to support the fact that INPUT does an = for any pending operators. If something like * or ^ worked the same, if you wanted to do 4*5 INPUT then 4*2 %CHG, it would actually do 4*5*4 when you pressed the second * key.

TW

Re: HP 10BII+ Two Number Function

*Message #20 Posted by **Eddie W. Shore** on 24 Apr 2011, 9:52 a.m.,*
in response to message #19 by Tim Wessman

I like that the 10bii+ allows the number1 FUNCTION number2 = key sequence on two-argument functions (%CHG, DAYS, COMB, etc...).

The sequence is straight forward and consistent with the two-argument arithmetic operators.

Overwriting 41C module internals

*Message #1 Posted by **spb** on 22 Apr 2011, 8:05 p.m.*

I have an Advantage module that appears to be slightly damaged. All of the functions I've tested work as expected, with the exception of the MDET routine. Whenever the determinant of a matrix is computed either from the MATRX programme or by calling MDET directly the matrix whose determinant is being computed is overwritten with garbage. The correct determinant is computed, although immediately recomputing it will result in an incorrect result due to the matrix being overwritten. In particular the diagonal elements are being rewritten with garbage, often involving non-alphanumeric characters. The garbage is not, however, random---the same input matrix is consistently overwritten with the same garbage elements.

My first inclination was to simply write my own programme to compute the determinant of a matrix, call it MDET, and then expect that it would be called in preference to the MDET routine in the module, as per the documentation. Unfortunately while this works for direct invocation (e.g. via [ALPHA]MDET[ALPHA]) this does not work within the MATRX programme. I gather that this means that the MATRX programme is using some sort of direct addressing of the routine that has precedence over a user-written function.

My question is if there is some way to coerce a programme (like MATRX) to use a user-written function in the way I want to.

Re: Overwriting 41C module internals

*Message #2 Posted by **Raymond Del Tondo** on 22 Apr 2011, 9:30 p.m.,*
in response to message #1 by spb

The ROM-based MATRX program calls MDET via a ROMPTR / XROM call, not by name.
So if you want to override the (obviously faulty) ROM MDET, you may have to write your own MATRX program, and call your MDET from there.
Actually this could be achieved by copying the ROM-based MATRX program to main RAM via COPY, then replace the MDET call to your own routine, which should have a different name, like MDET1.
The latter insures the correct call is gerenrated, not an XROM call again;-)

That makes sense. I was just wondering/hoping if there was some way to instruct the calculator to always prefer one routine over the other. Like if there was a hash table for all the routines defined by connected modules and user programmes that you could overwrite or something like that.

Re: Overwriting 41C module internals

in response to message #1 by spb

Like the HP15C, MDET uses a technique called LU Decomposition. The Advantage implementation re-writes some of the elements of the original matrix to save storage space, but that doesn't mean that the code is wrong or the function misbehaves.

Try to execute MINV *twice* on the matrix after the determinant is calculated - this should restore the "original" matrix in its unaltered status.

I'm familiar with LU decomposition; I wrote an RPN implementation of Crout's algorithm (shamelessly cribbed/transposed from the FORTRAN from my ancient copy of *Numerical Recipes*) when I had problems with the builtin function.

But unfortunately the function is definitely misbehaving; it is not overwriting the input matrix with numeric data, it's overwriting the matrix with nonsense. This also causes functions which opaquely call the in-module MDET (e.g. the solver in the MATRX programme) to provide incorrect results.

This is standard behavior, it's done to save storage space.

Try the double inversion and see what results...

Re: Overwriting 41C module internals

in response to message #6 by Ángel Martin

> Quote:
>
> This is standard behavior, it's done to save storage space. Try the double inversion and see what results...

Two inversions doesn't give the original matrix after taking the determinant. If I enter a matrix and then invert it twice without taking any other action it works as expected. If the matrix is entered, the determinate computed, and then the matrix is inverted twice then the diagonal elements are all incorrect in an apparently arbitrary (but consistent) way.

And like I said, this also affects functions which (I presume) invoke MDET internally. Working through the examples in the Advantage module documentation, for example, consistently gives incorrect results. It's also easy to determine that the solver is giving incorrect results with trivial cases (a matrix full of zeros, for example).

Thanks for pointing out that the non-numeric data isn't indicative of a fault by itself; I don't have another copy of the module to compare with.

I can't think of anything that could be causing the behaviour I'm seeing in the module apart from some sort of damage to the module itself. I'm using it in a 41-CV, and I've reset the calculator's memory (several times) with power on-backspace. If it was a 15C I might think it was some problem with real/imaginary data entry, but the MATRX programme explicitly queries for this and I presume handles things appropriately (I've just been testing with 2x2 and 3x3 real matrices).

I'd be delighted if this turned out to be some sort of error on my part (since that would be easier to fix than replacing the module or writing a bunch of code to work around the problem), but I can't think of anything it could be.

*Message #8 Posted by **Ángel Martin** on 27 Apr 2011, 10:29 a.m.,*
in response to message #7 by spb

All I can suggest is trying w/ another module - perhaps you can share your matrix data (which - forgive me for being so basic, but I'm assuming it's invertible and det#0).

I appreciate the offer, but it's pretty obvious something's wrong somewhere. Given an input matrix of [[0, 0], [0, 0]], taking the determinant, then inverting twice gives something like [[-11.2, 0], [0, 23.7]].

The first data I noticed this with was the sample problem in the Advantage module documentation---I started looking into it when following the example led to a bogus result. And since then I've just been testing with toy examples (like an all-zero 2x2 matrix) for

which mistakes are easy to identify by analysis.

Well, any singular Matrix (with Det=0) will yield the same absurd result since it won't be invertible. That's why I asked before if det#0 as a condition.

It's highly unlikely (albeit of course possible) that there's such an issue in the module, affecting just one function - that's what made me suspicious in the first place.

So I'm not saying there isn't a problem, but definitely the all-zero Matrix won't be a good troubleshooting aid.

> Well, any singular Matrix (with Det=0) will yield the same absurd result since it won't be invertible. That's why I asked before if det#0 as a condition.

Is this true on a working Advantage module? I would've expected it, like for example the 15C, to `invert' [[0, 0], [0, 0]] to [[10e99, 0], [0, 10e99]] as an artefact of the numerical algorithm used (and the limits of the machine itself). This is what the Advantage module I have gives if the matrix is inverted immediately after entering. Inverting again gives [[10e-99, 0], [0, 10e-99]], again matching the behaviour of the 15C. Attempting to do the same thing following taking the determinant gives the nonsensical result.

In any case it gives a similarly nonsensical result for [[1, 2], [3, 4]]. Specifically, inverting and re-inverting after taking the determinate does not give the original matrix, but rather apparently arbitrary values in the diagonal elements.

> Quote:
>
> It's highly unlikely (albeit of course possible) that there's such an issue in the module, affecting just one function - that's what made me suspicious in the first place.

I don't know if it's only in one function; I've only seen problems with one function, but I haven't attempted to manually check every function in the module. It's even possible that there are different errors in, for example, the solver used by MATRX as

well as MDET. I was just assuming that the solver called MDET internally and so the problem with MDET explained the spurious results given by the solver.

*Message #12 Posted by **Raymond Del Tondo** on 27 Apr 2011, 3:11 p.m.,*
in response to message #7 by spb

Have you tried to reset your HP-41, after doing a backup of course?

There are many occasions for memory contents (main and extended) getting invalid in the HP-41,
so that would be a way to filter out a (rather unlikely) hardware defect.

HTH

Ray

I've cleared memory (several times) via power on/backspace. Are you aware of any flags that if set/unset might result in weird module behaviour?

I know that the 41C doesn't have a builtin self-test. Are there any user programmes that do self-testing or diagnostics? I know there's a (rare) module for this, but unfortunately I don't have one.

Does anyone have a copy of this keyset font PDF from Luiz?

*Message #1 Posted by **gene wright** on 22 Apr 2011, 7:25 p.m.*

He had put it here:

http://www.logeng.com.br/downloads/using_keyset_ttf.pdf

But that link is no longer active.

He describes it here in this museum thread from 6 years ago:

Luiz PDF for fonts

Re: Does anyone have a copy of this keyset font PDF from Luiz?

*Message #2 Posted by **Didier Lachieze** on 23 Apr 2011, 12:46 a.m.,*
in response to message #1 by gene wright

Is this file - luizfonts.zip - including what's you're looking for?

Re: Does anyone have a copy of this keyset font PDF from Luiz?

*Message #3 Posted by **gene wright** on 23 Apr 2011, 9:25 a.m.,*
in response to message #2 by Didier Lachieze

Yes, that had it. Thank you.

Now my question is ...

the way the font works, you type (SIN) ad it will create a key looking symbol for the sine key.

But... if you try to color that key, the text and outer symbol will be colored if you change the text color.

What if you wanted to have SIN be in white and all the area inside the key symbol to be the color? How do you do that?

Luiz says "using the native functions of your word processor" but I haven't figured that out yet.

So...anyone want to try it and tell me?

It is using the Keyset 4 ttf font in Luiz's file.

Re: Does anyone have a copy of this keyset font PDF from Luiz?

*Message #4 Posted by **Dieter** on 23 Apr 2011, 11:26 a.m.,*
in response to message #3 by gene wright

> Quote:

> Luiz says "using the native functions of your word processor" but I haven't figured that out yet.

I do not know which word processor you use, but here's the way this can be accomplished with MS Word (at least with my good old Word 2000 ;-)).

Select the text for which you want to set color (here: mark the word "(sin)" including the parentheses). The background color is set in the Format menu, using the command for drawing frames and boxes around text, applying background shading and colors. In my German version it's called "Rahmen und Schattierung". In one of the tabs you can select your preferred color. There also should be an option that allows coloring only the selected text (as required here) or the whole paragraph. Then, in a second step, choose the font color as usual.

Please note that the background color fills the whole space taken by the character. So the color will also be applied to a little space outside of the surrounding parentheses. That's not nice but that's all an ordinary word processor can do. ;-)

Dieter

Thank you, that gets me close...but... :-)

*Message #5 Posted by **gene wright** on 23 Apr 2011, 11:55 a.m.,*
in response to message #4 by Dieter

The PDF shown below from Luiz shows key symbols nicely filled in, which nothing going outside the symbols.

The 34s manual looks the same.

The Word approach Dieter has suggested is very close, but not as nice as these two documents.

How do you get the very nice symbols?

How to use Keyset 4 PDF link

Re: Thank you, that gets me close...but... :-)

*Message #6 Posted by **Dieter** on 23 Apr 2011, 12:23 p.m.,*
in response to message #5 by gene wright

?!? - the method described for Word gives the same results as those in the PDF. Look at the example with the Enter-key. That's white letters on black background. This black background also appears slighty out of the white line that surrounds the letters. Above and below with any character entered, and left and right as the parentheses are added. That's exactly the way it looks here in Word. Maybe you can make a screenshot and post it here. ;-)

If you look at the first line ("1) Creating an arbitrary key lettering"): that's black letters on white background. Which is not visible if white paper is used. :-D And the "specific symbols" in the second paragraph already have their own surrounding line. Here you just set the font color.

Dieter

Ah, that led me to the final push I needed...

*Message #7 Posted by **gene wright** on 23 Apr 2011, 12:34 p.m.,*
in response to message #6 by Dieter

I have now seen how to make the "inverse" color things I needed. A bit dense today.

Thank you!

HP 41CX Decimal Point restore

*Message #1 Posted by **Joseph Banki** on 22 Apr 2011, 7:06 p.m.*

Hi;

After replacing the batteries, the decimal point became a comma, and can not restore it. Also I always used 4 decimals before and that does not come back either. I have the Basics Volume 1 only, and Volume 2 or 3 (?) handles that. Could you help?

Thank you

Joseph Banki enj-banki@sbcglobal.net 281-788-4007

Re: HP 41CX Decimal Point restore

*Message #2 Posted by **spb** on 22 Apr 2011, 7:52 p.m.,*
in response to message #1 by Joseph Banki

SF 28

Flag 28 controls the behaviour; when set the separator between the integer and decimal part is a period and the digit separator for the powers of three (if set) is a comma, and when cleared the semantics are reversed.

Re: HP 41CX Decimal Point restore

*Message #3 Posted by **Joseph Banki** on 25 Apr 2011, 11:48 a.m.,*
in response to message #2 by spb

Hello SPB;

It worked, and thank you very much.

Joseph

Re: HP 41CX Decimal Point restore

*Message #4 Posted by **Dieter** on 23 Apr 2011, 7:07 a.m.,*
in response to message #1 by Joseph Banki

That sounds more than strange. Replacing the batteries definitely does not affect the display setting or anything else of interest. Maybe something happened that put the 41 in an undefined state. If the calculator does not hold any important data I would recommend a master clear: Turn off, hold down the backspace key (left arrow), press ON and release all keys. This will reset and clear the whole unit, all data is lost and the calculator returns to its default settings. Including the display (FIX 4, decimal point, thousands separators on). So 12345 will display as "12,345.0000".

The decimal separator is controlled by Flag 28. Use CF 28 for a comma or SF 28 for a point (= default).

The thousands separator is controlled by Flag 29. Use CF 29 to turn it off or SF 29 to turn it on (= default).

The display format is set with FIX, SCI or ENG and the number of digits you want. You say Fix 4 "does not come back either". So you press FIX 4 and nothing happens?!? In this case it's definitely time for a reset.

Dieter

Help with flashing HP30 ROM / WP-34s

*Message #1 Posted by **BobVA** on 22 Apr 2011, 7:05 p.m.*

Hi All: I'm trying to flash the WP-34s image into my HP-30b, but haven't had much luck. What I've done:

- Installed SAM-BA V2.10 on my computer (Win 7)

- Connected HP-30b via a programming cable (thanks Tim!!) and USB/Serial cable.

- Followed Cyrille's instructions in the Development Kit on how to erase the flash, connect and download the image via SAM-BA.

Results:

- The original flash image was successfully erased! :-)

- I started SAM-BA, selected the correct serial port (COM7) for the USB adapter and then tried both the "no_board" and "at91sam7L128" settings for the "board" entry in the start screen

- In both cases I see a process called sam-ba_cdc.exe running in the system process list, but I never get a window or other indication that it's started correctly. It doesn't show up in the Application List, either.

The USB/Serial cable I'm using has been very reliable with all kinds of other weird software run on the machine (e.g. DOS disk drive emulators for old computers, flash programmers for radios, etc.) so I don't think it's the problem.

Any ideas or help greatly appreciated. The HP-30S is too light to use as a proper paperweight (the only function currently working). And sorry if I'm being especially thick.

Thanks! Bob

*Message #2 Posted by **gene wright** on 22 Apr 2011, 7:19 p.m.,*
in response to message #1 by BobVA

I had trouble with USB to serial converters, but others have had success. Tough to troubleshoot.

I have up and only use PCs with a serial port. Bought a $50 old laptop just for that purpose.

Have you tried the "MySamba" version of the flashing software? If you don't have it, email me and I will send the .zip file to you.

It probably should be loaded on the sourceforge location. Anyone want to do that?

If all else fails, you can send the 30b to me and I can probably reflash it for you. :-)

I have been unable to get it to work with win7.

TW

Re: Help with flashing HP30 ROM / WP-34s

*Message #7 Posted by **BobVA** on 23 Apr 2011, 12:18 a.m.,*
in response to message #1 by BobVA

Thanks all!

Gene/Pauli: your suggestions got me poking around on the web looking for more information on SAM-BA (no "_CDC"), MYSAMBA and USB/Serial links. That led me to discover (as Tim notes) that Win7 + USB/Serial is a no-go for SAM-BA.

I successfully flashed the WP-34s firmware using SAM-BA under XP.

...and there, I suspect, goes my weekend :-)

For anyone playing along at home: when you install the package under XP it creates two shortcuts to executables. As Pauli said, try the one one called just "SAM-BA Vx.xx" first. I also had no luck with the "_cdc" version (Interestingly, that version didn't even show up when installed under Win7.)

Thanks again, Bob

in response to message #1 by Eddie W. Shore

Nice review, but I need to take exception to your "last answer" bug report. In fact RCL =, is not a "last answer" function it's a "last =" function. It simply returns the last value shown after your pressed the = key. If you obtained an answer that did not use the = key then the value returned from RCL = will still be whatever was shown on the display the last time you pressed the = key.

*Message #3 Posted by **Tim Wessman** on 22 Apr 2011, 11:58 a.m.,*
in response to message #2 by Katie Wasserman

Actually, it worked like this but a (rather unfortunate) 10bII behavior required a change. INPUT, N and so on does a = internally when you press those keys. Thus if you do 5*6 INPUT, RCL = will be 30. This behavior of doing the = when there are pending operations was actually used in some textbooks.

*Message #4 Posted by **Katie Wasserman** on 22 Apr 2011, 10:24 p.m.,*
in response to message #3 by Tim Wessman

I stand corrected. Apparently I don't have the latest release of the firmware in my 10bii+.

TW, Can I get that somehow?

Thanks, Katie

Re: HP 10bii+ Review

*Message #5 Posted by **Tim Wessman** on 23 Apr 2011, 10:43 a.m.,*
in response to message #4 by Katie Wasserman

Just looked at it. I am sure you've got the latest/final firmware.

Basically, I misspoke. When you press INPUT it does do an internal = to evaluate anything. However, when you enter the next number and press something like %CHG, it does another =.

So if you do 20+30 INPUT, RCL = at this point will give 50. If you then do 30 %CHG, RCL = will return 30.

TW

>
> But I wait your opinions.

I was surprised by the comment "The TI-8X calculators give the third-glance result (-1)" with no mention of the capability to yield the so-called "second glance" result. The actual situation is

1. The TI-80, TI-81 and TI-82 can only give the "third glance" result since those machines do not have a built-in complex number capability. A program which would yield the "second glance" result may be able to be written for one or more of those machines but I am not aware of one.

2. The TI-83, TI-84, TI-85, TI-86 and TI-89 give the "third glance" result if the -1 is entered as a real number. Those machines will give the "second glance " result if the user enters the -1 as a complex number; i.e., as (-1 + 0i) with the TI-83, TI-84 and TI-89, or as (-1,0) with the TI-85 and 86. All that is required is that the user understand how the machines operate..

"What do other calculators (hp or non hp) give ...?" With my HP-41's the keyboard sequence

1 CHS ENTER 2 ENTER 6 / Shift y^x yields DATA ERROR

where Appendix E (Messages and Errors) says that "The HP-41 attempted to perform a meaningless operation." where y<0 and x is non-integer. If the Math Pac module is installed then the sequence

0 ENTER 1 CHS ENTER 2 ENTER 6 / XEQ ALPHA Z Shift ENTER N ALPHA

yields the "second glance" result even though the instructions say that this method will "Raise z to an integer power." I have tried other non-integer powers and get resultst which is the same as that received from my HP-28S, TI-83, etc. The sequence includes sixteen keystrokes.

On my TI-59 the sequence (1 +/-) y^x (2 / 6) = yields a flashing one error indication. The fourth error condition on page B-1 of the manual is "Raising a negative number to any power (or root). The power (Ior root) of the absolute value of the number is flashed. With the Master Library module installed the sequence

2nd Pgm 0 4 2 / 6 = A 0 A 1 +/-2nd A 0 2nd A D

yields the "second glance" result after niineteen keystrokes versus the sixteen keystrokes with the HP-41C with the Math Pac installed. My friend Richard Nelson would tell me that is one more demonstration of the keystroke efficiency of RPN.

The TI-59 with the Master Library module will permit the use of complex exponents. My HP-41C with the Math Pac module does not seem to permit the use of complex exponents -- but, maybe I just haven't figured out how to do that. I would expect that some other HP-41 module or stand-alone program will permit the use of complex exponents. I just don't have such a module or program in my collection.

Finally, I note that all the machines I tested can be induced to yield positive one for the problem if the user first squares the -1 value and then raises the intermediate result to the 1/6 power. Of course, that isn't consisten with the problem as written if one interprets parentheses in the standard manner. Positive one can be obtained if a different problem were proposed; i.e., ((-1)^2))(1/6) . Isn't it wonderful what a few added parentheses can achieve?

Right. The point is that the calculator cannot check if the reciprocal of the exponent is an odd integer (which is required for a valid real result). In fact, 1/0,3333333333 actually is 3,000000000300 when rounded to the internal 13 digits. ;-)

Well, you forgot to mention that in your example seven of these "sixteen keystrokes" are used to call the Z^N function. Of course any HP-41 user handling complex numbers will assign the complex functions to the keys of their real counterpart. AFAIR this is even suggested in the math pac manual. So it's actually 10 keystrokes, maybe 11 if the function is shifted. So yes, 10 keystrokes instead of 19 really is a nice example of the keystroke efficiency of RPN. ;-)

> Quote:

> The TI-59 with the Master Library module will permit the use of complex exponents. My HP-41C with the Math Pac module does not seem to permit the use of complex exponents -- but, maybe I just haven't figured out how to do that. I would expect that some other HP-41 module or stand-alone program will permit the use of complex exponents.

Sure. I admit I always wondered why the software modules included so much examples of poor programming.

in response to message #1 by Palmer O. Hanson, Jr.

Hi Palmer,
I went the rounds with this very phenomenon a couple of years back when my classmates TI 89's returned -1 for (-1)^(2/6), and my 50g returned 1/2 + sqrt(3)/2 i, or 1 at angle 60deg, or 1 at angle pi/3, even with complex deselected on the CAS screen. Of course, both machine naturally reduced the exponent to 1/3. The conclusion I came to was that the HP's algorithm was just written to return the principle root of any complex number. To remedy this, I wrote a short program for my 50G which would return all N of the Nth roots of ANY number, complex or real. (Of course, all numbers are complex, some just have an imaginary component of zero :) I could then select which ever root struck my fancy.
It is interesting how the order in which you apply the fractional exponent affects the outcome. Square first, then take the sixth root, and you just get 1. Reverse that order, and you get the aforementioned principle cube

root of 1.

I'm curious, however, as to how you got your 15C to return -1. For (-1)^(2/6) My 15C returns (.5, .87), or 1 at angle 60 if I convert to polar form. Although not at hand at the moment, I'm 99% sure my 42s returns likewise. Best regards, Hal

My 42S does exactly what you suspected - and so does the 41Z module. Not surprisingly since it's the principal root.

I don't have a 15C. It was Chuck who stated in the original thread that his 15C returned -1. We'll have to wait for him to explain. I do have an 11C and a 12C. Those devices don't offer complex mathematics and return the message "Error 0" which indicates a mathematics error. y^x with y<0 and x a noninteger is one of the options that gives "Error 0".

A fast and compact algorithm for the normal quantile

*Message #1 Posted by **Dieter** on 21 Apr 2011, 4:58 p.m.*

In earlier threads in this forum various improvements have been discussed concerning the most efficient way to evaluate the inverse normal distribution (quantile) on the 34s. Since this might be of some interest for other calculators and/or implementations I think it's okay to start a new topic here.

As usual, it's a tradeoff between memory usage, execution speed and numeric accuracy. The current implementation starts with two quite good initial guesses - one value slightly high, the other a bit low. Then the solver is called to determine the exact result.

We can do better. ;-)

I have tried the one or other approach, and finally it turned out that there is a simple method that converges very fast and might even use less memory than the current method. The very sophisticated 34s solver is not required here. There is a much simpler, yet effective way to determine the quantile with a different algorithm:

First we guess a good estimate for the quantile. Only one single value is required, for instance this one:

```
        p > 0,2                    p < 0,2
---------------------      --------------------
u = sqrt(2*pi)*(0,5-p)     u = -2 * ln p
x = u + u^3 / 6            x = sqrt(-2 * ln(p * sqrt((u-1)*2*pi))) + 0,2/u
```

Yes, the second term is a bit more complex than before but it's worth it.

After this, a dedicated though simple solver is used. The preferred algorithm here is the Halley method, which uses both the first and the second derivative of a function. In our case, the first derivative simply is the PDF, and the second derivative is a simple function thereof. This leads to a very compact form of the Halley equation:

Assuming x > 0 and p < 0.5, first the well-known Newton-Raphson quotient f / f' is evaluated:

$$t = \frac{cdf(x) - p}{pdf(x)}$$

The pdf already has been evaluated within the cdf routine, so its value is known and no additional calculation is required. Now the new and improved approximation is:

$$x_{new} = x + \frac{t}{1 - t*x/2}$$

Look, Pauli - no slow logs required here. ;-)

Okay, how does it perform? I tried this method in Excel/VBA with 15 significant digits. After just two (!) iterations the final result was achieved. The method seems to converge at least quadratic, theoretically it's even cubic. So a third iteration probably should return something like 30 valid digits.

Pauli, what do you think? This should be faster than before and maybe it even requires less memory since no equation for the solver has to be set up. And only three (hard-coded) iterations should return a result with far more

valid digits than actually required.

Dieter

(Edit: corrected error in first guess formula)

Re: A fast and compact algorithm for the normal quantile

*Message #2 Posted by **hugh steers** on 21 Apr 2011, 8:26 p.m.,*
in response to message #1 by Dieter

can you check your formula,

```
set p = 0.97, and p > 0.2, so
u = -2*ln(p) = 0.060918414969417091838522 5
then (u-1)*2*pi = -5.900423617307076027606582
```

which does not sqrt.

i'm trying a little LUA program of your idea...

```
sqrt = math.sqrt
pi = math.pi
ln = math.ln
norm = math.norm
exp = math.exp

function pdf(x)
   return exp(-x*x/2)/sqrt(2*pi)
end

function invQ(p)

   local x, u
   local t, x2;

   -- initial values for iteration
   if p < 0.2 then
      u = sqrt(2*pi)*(0.5-p)
      x = u + u^3/6
   else
      u = -2*ln(p)
      x = sqrt(-2*ln(p * sqrt((u-1)*2*pi))) + 0.2/u
   end

   while true do
      t = (norm(x) - p)/pdf(x)
      x2 = x + t/(1-t*x/2)
      --print(x2)
      if x2 == x then break end
      x = x2
   end
   return x
end
```

Re: A fast and compact algorithm for the normal quantile

*Message #3 Posted by **Namir** on 21 Apr 2011, 9:18 p.m.,*
in response to message #2 by hugh steers

You can also try the following empirical formula that I have obtained using one of my best-curve fitting

programs:

```
Qinv = x/(0.063493571 - 0.198675274*x^2 - 0.017195871 * x^3)^(1/3)
```

Where x = 0.5 - alpha, Qinv is the inverse normal distribution, and alpha is the significance level in decimals.

Re: A fast and compact algorithm for the normal quantile

*Message #4 Posted by **Dieter** on 22 Apr 2011, 6:03 a.m.,*
in response to message #2 by hugh steers

Hugh, the algorithm is based on the assumption that p =< 0,5 and the result x is positive. This means that - as usual in approximations of the normal quantile - we only consider one half of the bell curve and the other half is obtained by simple symmetry.

In your case, simply replace p = 0,97 by p = 1 - 0,97 = 0,03 and finally adjust the sign of the result. In this case the first estimate for x is 1,867 (exact value: 1,881).

In other words and pseudo code:

```
signflag = false

if p > 0.5 then
   p = 1-p
   signflag = true
   end if

... (calculation)

if signflag then x = -x
```

However, there actually was an error in the formulas for the first estimate - I simply confused both cases (less or greater than 0,2). I just corrected this. The approximation x = u + u^3/6 is used in the center, i.e. 0,2 < p =< 0,5 - sorry for the mistake. ;-)

Your LUA program looks interesting. However, be sure that norm(x) returns a value < 0.5 for positive x. If norm(2) returns 0.9775 instead of 0.0225, simply use norm(-x) here. Do you have a sample output of your program?

I'm tempted to give it a try, the built in solver should give quadratic convergence but this might be better and in avoids the slow logs. It won't be smaller however, the arithmetic to set things up is more involved.

There isn't a solver function for these inverses, I just use the cdf directly for most of them.

Re: A fast and compact algorithm for the normal quantile

*Message #6 Posted by **Paul Dale** on 22 Apr 2011, 7:23 a.m.,*
in response to message #1 by Dieter

The worst I've seen so far is five iterations to get to a relative error of 1e-32. Going to complete convergence takes a lot more -- I'm suspecting there is some oscillating going on in the last digit. Best case I've seen is convergence to that degree of relative error is one iteration. Seems to average four or five. Still it is better than what was there and it should be a lot faster.

Pauli, thanks for trying. ;-)

> Quote:
>
> The worst I've seen so far is five iterations to get to a relative error of 1e-32.

The algorithm should give at least quadratic, maybe even cubic convergence. If the exit condition is based on the difference of the last two approximations the result has more accuracy than required. A typical example: the new guess and the previous one differ by 1E-7. But actually the new result already has 15 correct digits now, so there is no need for another iteration.

For example, try p = 0,1:

```
                                 current approx.   actual
               estimate for x    minus previous    error
-----------------------------------------------------------
first guess:  1,2620 04083 42513     .             1,95 E-2
1st approx.:  1,2815 49321 97319    1,96 E-2       2,24 E-6
2nd approx.:  1,2815 51565 54460    2,24 E-6       0,00
```

So, after two iterations the result has not just five valid decimals, but all 15 digits are correct.

The algorithm assumes x is greater than zero and p less than 0,5. Just an idea: try 1 + t*x/2 in the denominator. Does it converge faster or slower now?

Dieter

> > The algorithm assumes x is greater than zero and p less than 0,5. Just an idea: try 1 + t*x/2 in the denominator. Does it converge faster or slower now?

Much slower (assuming I got the code change correct which seems likely).

The algorithm seems to work for all values of p converging at the same rate for p>0.5 as for 1-p. Care has to be taken with the initial estimates since they do depend on p<0.5.

I know that the final iteration is to recognise that the previous iteration converged, I'd prefer to wear this cost than have a pathological case turn up where convergence isn't achieved in four iterations (I'm limiting the maximum iteration count to 10 regardless, at least until someone finds an accuracy problem). As usual, I'm also going well past the 16 digits we return to the user.

Anyway, I feel the new algorithm is a significant improvement over what was there previously.

Fine, so your original code was correct.

The algorithm indeed assumes p < 0.5 and the sign of the result is adjusted in a final step. However, after your results I had to check the original claim that three iterations should be sufficient for up to 30 digits. ;-) With 42 digits working precision the results look like this (initial guess rounded to 10 significant digits):

```
                          40 digits limit ---+
p = 0.49999                                  |

Have a test drive! (was: A fast and compact algorithm for the normal quantile)

*Message #11 Posted by **Dieter** on 23 Apr 2011, 10:55 a.m.,*
in response to message #10 by Dieter

Actually it's something near 50 digits. ;-)

If you don't want to look at endless tables with 50-digit numbers, simply try it yourself: I already mentioned Casios Keisan website in an earlier post. There also is a nice programmable calculator that we can use to test-drive the algorithm:

Visit the Keisan calculator and set it to 50 digits. Pauli may use 38 digits instead. ;-) Clear the "Expression" form and insert the following code:

```
/*********************************************/
/*                                           */
/*   Halley's method for the normal quantile   */
/*                                           */
/*********************************************/

p = min(probability, 1-probability);   /* make sure p =< 0.5 */
s = sign(0.5 - probability);           /* set  correct sign  */

if (p < 0.2)                            /* make a first guess */
   {u=-2*ln(p); z=sqrt(-2*ln(p*sqrt((u-1)*2*pi))) + 1/u^2;}
else
  {u = (0.5-p)*sqrt(2*pi); z = u + u^3/6;}

print(z*s);                             /* print first guess  */

k = 1;

do {
   t = (normalcd(z)-p)/normalpd(z);
   z = z + t/(1 - t*z/2);
   print(z*s);                          /* print current approximation */
   k = k+1;
   }
while(k=<3);                            /* three iterations should do  */

print(normalicd(probability));         /* compare with exact z-value  */
```

Press "Execute" and an input control labelled "probability" will appear.

Now enter a probability and press "Execute". Five lines of data will be printed. The first one is the initial guess, followed by three Halley-iterations, and the last line is the correct value as returned by the system. If you wish, the output labels ("ans1" ... "ans5") can be edited (double-click).

Dieter

Another taker (was: A fast and compact algorithm for the normal quantile)

*Message #12 Posted by **Oliver Unter Ecker** on 1 May 2011, 5:23 p.m.,*
in response to message #11 by Dieter

Hi Dieter,

This is *very* nice. Thank you for sharing this, and the beautiful development!

I'm adopting it in MorphEngine (ND1, CalcPad), which lacked all quantiles.

Here's how your code looks as a JavaScript user function in ND1:

```
function(probability) {
    var p = min(probability, 1-probability); /* make sure p =< 0.5 */
    var s = sign(0.5 - probability); /* set correct sign */

    if (p < 0.2) { /* make a first guess */
        var u=-2*ln(p);
        var z=sqrt(-2*ln(p*sqrt((u-1)*2*pi))) + 1/(u*u);
    }
    else {
        var u = (0.5-p)*sqrt(2*pi);
        var z = u + (u*u*u)/6;
    }

    calculator.stack.push(z*s); /* print first guess */

    var k = 1;

    do {
        var t = (NormalDistribution(0, 1, z)-p)/NormalPDF(0, 1, z);
        z = z + t/(1 - t*z/2);
        calculator.stack.push(z*s); /* print current approximation */
        k = k+1;
    }
    while(k <= 3); /* three iterations should do */

    return z;
}
```

(Notice, this is almost identical to your keisan code. Btw, I was surprised that keisan accepts =< as "less or equal than". The calculator.stack.push() statements above would be removed after debugging.)

Btw, one can write code like this on a desktop and automatically import into the calculator via WiFi, by "visiting" the variable under which the function is stored. (See Get and display remote code with mod'ed VISIT key)

I added returns of +Infinity and -Infinity for out-of-domain inputs and plan to look into making the code work with add'l mean and variance args for compatibility to UTPN and NDIST. (A first quick pass at that wasn't successful.)

I was surprised to see that on hp 50g one cannot use NDIST (or any of the distributions) in an expression for use in graphing (I'm getting "INVALID SYNTAX").

On ND1 this works, and I can report that NormalQuantile() runs quick enough to be graphed and zoomed/panned in real-time. (An advantage of returning Infinities over "out-of-

domain" error would also be that the user can still graph the function and visually discover the defined domain.)

Thanks again.

*Message #13 Posted by **Dieter** on 22 Apr 2011, 1:47 p.m.,*
in response to message #9 by Paul Dale

> Quote:
>
> The algorithm seems to work for all values of p converging at the same rate for p>0.5 as for 1-p.

Still I would suggest to use "the usual approach" here, i.e. use p or 1 - p and finally adjust the sign of the result. Otherwise for p close to 1 accuracy is wasted. Okay, with 39 digits you can look at this quite relaxed. ;-)

> Quote:
>
> (I'm limiting the maximum iteration count to 10 regardless, at least until someone finds an accuracy problem). As usual, I'm also going well past the 16 digits we return to the user.

I agree that there should be a few "guard digits", at least for the programmer's and user's peace of mind. In the olden days, HP was satisfied with two or three internal digits more than those displayed to the user. ;-) I have yet to find a case where the second iteration after the initial guess did *not* return a result with an error less than one unit of the 18th significant digit, and the third iteration returned at least 42 valid digits. If (!) the CDF is evaluated to full machine precision, that is. I assume the CDF algorithm will return results with slight errors beyond the 35th digit, but I do not think this is a problem here.

There still may be an issue we have not discussed yet: how does the 34s behave as the lower working limit is approached, i.e. at probablities like 1E-383...1E-399. Here numbers start getting subnormal. I think it's a good idea if in this range the first estimate is a little bit low (in absolute terms), so that the CDF does not underflow. This can be achieved with an alternative way of calculating (cdf(x)-p)/pdf(x) where the pdf can be cancelled out, or with a slight adjustment of the initial guess far out in the tail: I would recommend to replace the 0,2/u term in the current formula by a simple 1/u^2. This way the approximation is slightly low here (instead of slighty high). At least down to p = 1E-4000. ;-)

The first estimate for larger x still is a bit complex and requires two roots and two logs. Do you think it should be replaced by a (tiny ;-)) rational approximation with four three-digit constants? I think this might be faster, and the error of the first estimate would be uniformly distributed within something like +/- 0,002. But I cannot say if this would require more or less memory than now.

Dieter

What brand / name / type were the Original 12c batteries?

*Message #1 Posted by **gene wright** on 21 Apr 2011, 11:56 a.m.*

I know you can use three Energizer 357 type cells, but does anyone know what was shipped with the first 12c models?

Curiosity and a cat have a meeting later.

Re: What brand / name / type were the Original 12c batteries?

*Message #2 Posted by **Michael de Estrada** on 21 Apr 2011, 12:56 p.m.,*
in response to message #1 by gene wright

According to the handbook dated August 1981, various batteries were recommended replacements:

Alkaline:

Eveready A76, UCAR A76, RAY-O-VAC RW82, National or Panasonic LR44

Silver-Oxide:

Eveready 357, UCAR 357, RAY-O-VAC RS76 or RW42, Duracell MS76

Silver-Oxide will last more than twice as long as Alkaline

Edited: 21 Apr 2011, 12:59 p.m.

Re: What brand / name / type were the Original 12c batteries?

*Message #3 Posted by **bill platt** on 21 Apr 2011, 1:30 p.m.,*
in response to message #2 by Michael de Estrada

but that doesn't answer the question. (And Gene already knows that list by heart :-)

I have to query my crainial database for memory of the 1st time I opened the battery compartment of my 11c, to see if I remember the brand, and then extrapolate that to the 12c.

Something jogs in me that they were alkaline. But how could that be a reliable memory? Too long ago and not an important thing to remember. I do remember being interested in the Silver for two reasons: one being the longer life, and the other being the interesting fact that alkalines go dead more gracefully.

Re: What brand / name / type were the Original 12c batteries?

*Message #4 Posted by **Michael de Estrada** on 21 Apr 2011, 1:37 p.m.,*
in response to message #3 by bill platt

Doesn't it stand to reason that the original batteries would have been the same as one of the recommended replacements? I seem to recall when I changed the original batteries in my HP-15c that

they were A76 alkalines.

free42 runs on Curtis KLU LT8025??

*Message #1 Posted by **Mike Reed** on 21 Apr 2011, 10:56 a.m.*

Hi e'1!! Anybody have a Curtis KLU LT8025?? I'm thinking of getting one and if i do, i want to put free42 on it, but don't know if it will run. the Klu is Android 2.1 o/s, 800x600 tablet, 2gb x 32gb, 256ram, Processor: IMAPx200 ARM 11 1 GHz. THANX!

Re: free42 runs on Curtis KLU LT8025??

*Message #2 Posted by **Marcus von Cube, Germany** on 21 Apr 2011, 10:59 a.m.,*
in response to message #1 by Mike Reed

At least it runs on my Archos 70 Internet tablet. Chances are high that your device will be supported, too. You will have to find a suitable skin, though.

Re: free42 runs on Curtis KLU LT8025??

*Message #3 Posted by **Thomas Okken** on 21 Apr 2011, 2:59 p.m.,*
in response to message #1 by Mike Reed

I believe that model has a resistive touchscreen... I once had the opportunity to play with an Archos 5, which has a resistive touchscreen as well, and I didn't like it. I find the capacitive ones *much* nicer to use -- you only have to touch the capacitive ones, while the resistive ones require pressure. YMMV, of course, but I'd recommend trying one to make sure that that is something you can live with.

(Regarding Free42 compatibility: I can't promise that Free42 will run on the LT8025, but I haven't received any reports of Free42 not working on any Android >= 1.5 device so far, so the odds appear to be good. There are one or two where the skins don't get scaled properly... Best thing to do is to try before you buy, if Free42 compatibility is a must for you.)

wp34s stability update

*Message #1 Posted by **Marcus von Cube, Germany** on 21 Apr 2011, 10:06 a.m.*

I've prepared a new stability release to the wp34s flash image. It's still in SVN only, not yet in the release package. There are significant changes in the internal workings (keyboard scan, timers, power management) and only a few adaptions in the visible part of the software. So it is still at version 1.17.

It would be nice to hear from a few educated testers if the ROM image is stable enough for being put in the release package. Any comments are welcome.

Re: wp34s stability update

*Message #2 Posted by **Jeff O.** on 21 Apr 2011, 3:04 p.m.,*
in response to message #1 by Marcus von Cube, Germany

I would not call myself educated, but it seems stable to me. The only program I have entered is as follows:

```
001: LBL A
002: 1
003: +
004: GTO A
005: RTN
```

If I let the above run for 60 seconds, both the 20b and 30b on which I am loading each version of the ROM count up to about 170,000.

I noticed that the BATT command returns 3.0 on both the 20b and 30b. A couple versions ago, I was getting 2.9 on the 20b and 2.8 on the 30b. I did not change batteries, so I was curious if this function has changed.

On the 30b, I noticed that when I turn it off the "Bye..." message appears only fleetingly, while on the 20b the message appears for a brief time (maybe 0.5 second?) and then the display fades away. Is there a hardware difference which causes this?

Re: wp34s stability update

*Message #3 Posted by **Marcus von Cube, Germany** on 21 Apr 2011, 5:00 p.m.,*
in response to message #2 by Jeff O.

The voltage display may be inaccurate because of the way it is measured (which has changed with the latest release. I'll check that again.) You can get a better result if you run BATT in a loop and display the value with PSE.

The "Bye..." message is a new addition. I start calculating the SRAM checksum and at the same time let fade the display out in an interrupt routine. I might be that both calculators have different performance so that you can see a difference but I'm not sure about this. If Tim could send me the original 30b firmware, I will try it on my 30b too.

Re: wp34s stability update

*Message #4 Posted by **svisvanatha** on 21 Apr 2011, 6:44 p.m.,*
in response to message #3 by Marcus von Cube, Germany

I have the 30b firmware....ping me if you want it!

Re: wp34s stability update

*Message #5 Posted by **svisvanatha** on 21 Apr 2011, 8:55 p.m.,*
in response to message #1 by Marcus von Cube, Germany

build 718 issues: - P(69,2) briefly displays the correct result, then replaces X with an integer. - this appears on the 30B/WP34S hardware, but not on the windows emulator.

Re: wp34s stability update

*Message #6 Posted by **Marcus von Cube, Germany** on 22 Apr 2011, 1:15 a.m.,*
in response to message #5 by svisvanatha

Damn, the keyboard driver issue again! I was hoping I fixed it. :(

I just tried again on my hardware and there is no problem so it seems to be hardware dependent. I've increased the delay and committed a new build. Can you test it?

Re: wp34s stability update - Forget revision 725! - Or not?

*Message #7 Posted by **Marcus von Cube, Germany** on 22 Apr 2011, 2:16 p.m.,*
in response to message #1 by Marcus von Cube, Germany

If you have already downloaded revision 725 from SVN, ignore it because it's broken. Get the latest release before you flash!

EDIT: Sorry for the confusion! It seemed to be a local problem with my working copy.

Edited: 24 Apr 2011, 5:10 a.m. after one or more responses were posted

Re: wp34s stability update - Forget revision 725!

*Message #8 Posted by **svisvanatha** on 22 Apr 2011, 2:50 p.m.,*
in response to message #7 by Marcus von Cube, Germany

I downloaded earlier, and it caused reboots of the 30b. Will try latest later today.

Re: wp34s stability update - Forget revision 725! --- then what revision? :-)

*Message #9 Posted by **gene wright** on 23 Apr 2011, 10:02 a.m.,*
in response to message #7 by Marcus von Cube, Germany

You are suggesting ignoring 725 and waiting on the next release, correct?

And, as 725 is the highest revision of calc.bin out there right now... wait a bit longer? :-)

Re: wp34s stability update - Forget revision 725! --- then what revision? :-)

*Message #10 Posted by **Marcus von Cube, Germany** on 23 Apr 2011, 11:39 a.m.,*
in response to message #9 by gene wright

I did an update which should work. There must have been something wrong with the image I was assuming to be 725. Just get what is in the repository and try it. If it's broken it hangs directly on reset. If you can type in something, it's ok.

Re: wp34s stability update - Forget revision 725! --- then what revision? :-)
*Message #11 Posted by **Paul Dale** on 23 Apr 2011, 7:16 p.m.,*
in response to message #10 by Marcus von Cube, Germany

I've got 725 flashed in here and it seems to be fine for all that I've tried.

HP75 Plug-Module Simulator Manual pdf

*Message #1 Posted by **Jake Schwartz** on 20 Apr 2011, 10:29 p.m.*

Hi,

Fairly recently, a quick discussion came up regarding the HP75 Plug-module simulator manual and Jim Horn mentioned my having his copy. I did locate that binder and scanned the 40-page manual to pdf this evening. It may be accessed at: http://www.pahhc.org/2011/HP75_PMS.pdf for anyone who would wish to download a copy.

Jake

Re: HP75 Plug-Module Simulator Manual pdf

*Message #2 Posted by **Jim Horn** on 21 Apr 2011, 5:11 p.m.,*
in response to message #1 by Jake Schwartz

Wonderful! Thank you, Jake - I've often thought it would be fun to put that into a modern FPGA either in a plug-in module shell or even in the '75 itself. Of course, with my '75 long gone it's all acedemic but we engineers have a wierd sense of fun...

Re: HP75 Plug-Module Simulator Manual pdf

*Message #3 Posted by **Paul Berger (Canada)** on 23 Apr 2011, 7:59 p.m.,*
in response to message #2 by Jim Horn

I would also like to add my thanks to Jake for scanning this manual and making it available. I plan to build an expanded version of this, but fitting it into a module case is a little ambitious for me right now. At the very least I will end up with something that I could load ROM images into to expand my 75C. Now if I could only find an I/O ROM...

Another WP-34S overlay option with costs

*Message #1 Posted by **svisvanatha** on 20 Apr 2011, 9:49 p.m.*

There are a few overlay options presented so far for the WP-34S. I contacted a company specializing in custom overlays for a quotation. They provided the following:

- 0.005" 8B35 lexan, Laminate 3M 467 Adhesive, Digitally cut to size
- 100 @ $12.96 each
- 1 NRE @ $350.00 (non-recurring expenses)
- NRE Includes: Create & Output Generate art and film positives from customer supplied electronic file, create custom tool. Includes color matching

For 100 overlays, the cost would come out to approximately $16.50 USD plus shipping from the supplier, plus shipping to individual customers.

The overlay will include the cuts for the keys. They were reluctant to attempt the labels for the keys for two reasons:
- in their experience, such small labels on keys do not last long - they tend to pop off
- they were worried about the size of the print on the keys being legible.

If key labels are not important, we could use the overlay that includes the primary function and green shift labels, and blank out the existing key labels.

This was a company I found online, so other suppliers may have better experience with such projects, and different costs.

I would really like the key labels, but according to this supplier, it seems to be difficult to accomplish.

If any others are interested in getting quotations, let's share them on this forum and go with the one that provides the best cost, durability and features (e.g. key labels in addition to overlay).

Re: Another WP-34S overlay option with costs

*Message #2 Posted by **Paul Dale** on 21 Apr 2011, 1:09 a.m.,*
in response to message #1 by svisvanatha

I could live with this price. The time saved cutting the holes makes it worthwhile I suspect.

- Pauli

Re: Another WP-34S overlay option with costs

*Message #3 Posted by **Walter B** on 21 Apr 2011, 1:33 a.m.,*
in response to message #2 by Paul Dale

:-) If I understand Svisvanatha correctly there will be no holes, just 3 cuts per key. If true I can live with that offer, too. Thanks, Svisvanatha! Nevertheless, a second offer (or more) will be interesting.

Walter

Re: Another WP-34S overlay option with costs

*Message #4 Posted by **Paul Dale** on 21 Apr 2011, 1:41 a.m.,*

> Quote:
>
> If I understand Svisvanatha correctly there will be no holes, just 3 cuts per key. If true I can live with that offer, too. Thanks, Svisvanatha!

My reading of this was that the keys would have holes not flaps (i.e. four cuts per key, although likely die punched). I can live with too, blanking the keys is easy.

- Pauli

Re: Another WP-34S overlay option with costs

*Message #5 Posted by **svisvanatha** on 21 Apr 2011, 6:25 a.m.,*
in response to message #4 by Paul Dale

Sorry if it was not clear in the original post. The overlay would look like a 41C overlay, with 4 cuts per key. It is adhesive-backed Lexan with graphics as supplied by us. No attempt at providing labels for the keys. They did not specify if it was die punched, but I believe that to be the case due to the specification of 'tool' in the NRE.

Re: Another WP-34S overlay option with costs

*Message #6 Posted by **Walter B** on 21 Apr 2011, 1:38 a.m.,*
in response to message #1 by svisvanatha

Svisvanatha,

Please specify: did their worries concern the height of the print or the width of the lines within the letters?

TIA, Walter

Re: Another WP-34S overlay option with costs

*Message #7 Posted by **svisvanatha** on 21 Apr 2011, 6:31 a.m.,*
in response to message #6 by Walter B

Here is where having exact dimensions of the keys would be beneficial.

They need to provide a 'rebate', if you will, from the edge of the physical keys so that the labels do not lift off easily. Since they do not have an actual unit, and are judging from pictures. They thought the overall size (read: Font size) of the lettering on the keys was too large for the size of label they could produce. If the font size was smaller, then they were worried about the readability. I believe this concern is more for the angled faces than the flat tops. Also, they were concerned about the durability of the labels on the keys

- in their experience such small labels do not last long. They recommended that the keys be labeled during the manufacturing of the unit!

It would be nice to get further feedback from other suppliers, and users of this forum if they have experience in this area.

Re: Another WP-34S overlay option with costs

*Message #8 Posted by **cyrille de brebisson** on 21 Apr 2011, 9:24 a.m.,*
in response to message #1 by svisvanatha

hello,

did you look at skin-it? they can do stuff like that relatively cheap...

cyrille

Re: Another WP-34S overlay option with costs

*Message #9 Posted by **svisvanatha** on 21 Apr 2011, 9:39 a.m.,*

Nope - I will look into that and contact them. Thank you!

What's your opinion?

*Message #10 Posted by **Marcus von Cube, Germany** on 21 Apr 2011, 9:55 a.m.,*
in response to message #8 by cyrille de brebisson

Bonjour Cyrille !

What do you think of our work? When you prepared the SDK, did you ever imagine, it would be exploited the way Walter, Paul and I did?

The same question goes to Tim, of course.

Re: What's your opinion?

*Message #11 Posted by **Tim Wessman** on 21 Apr 2011, 10:40 a.m.,*
in response to message #10 by Marcus von Cube, Germany

I personally am excited there is finally a full project taking advantage of what cyrille fought hard to get included.

While I personally feel the keyboard is a bit complicated and this would never be something that would sell well the the average consumer, it looks great for the enthusiast!

TW

Edited: 21 Apr 2011, 10:53 a.m. after one or more responses were posted

Re: What's your opinion?

*Message #12 Posted by **Marcus von Cube, Germany** on 21 Apr 2011, 10:45 a.m.,*
in response to message #11 by Tim Wessman

I think Walter has to comment on this. The keyboard is a compromise between directly accessible commands and menu driven access. It's as always: So many functions, so little keys! At least there are no hidden keyboard functions as in the 50G.

One additional remark: wp34s is based purely on open source software, no expensive development tools are necessary. To be on the safe side, when implementing the hardware parts, I certainly did have a look at what Cyrille had done in the SDK in order to understand how things should work, but I haven't copied a single line of HP code.

Edited: 21 Apr 2011, 11:08 a.m.

Re: What's your opinion?

*Message #13 Posted by **Walter B** on 21 Apr 2011, 4:05 p.m.,*
in response to message #11 by Tim Wessman

Hi Tim,

> Quote:
>
> While I personally feel the keyboard is a bit complicated and this would never be something that would sell well the the average consumer, it looks great for the enthusiast!

:-) Two points:

1. The "average consumer" will hardly ever get beyond +, -, x, / after (s)he finished school. % is just a shortcut. Seeing what the average banker does with these five, I'm grateful we didn't give them more powerful functions.
2. The user interface reflects a) the features of the LCD, b) the opinions of the active forum members. The layout would have looked significantly different if we had a full dot matrix like featured by the 17bii+ Silver allowing six softkeys - but we have not. And we learned many of our fellow forumers don't like menus - at least on their desk ;-) - which results in them preferring the 32sii over the 32s. Both a) and b) led to a layout well filled with 5 functions per average key. We still have to have a few menus to provide habitats for all the extra functions people are used to have (HP did spoil us ;-) or wanted to see implemented, though in the latter case "people" seldom exceeded 5 persons per function ;-) And as people say here "Der Appetit kommt beim Essen" (~ 'appetite grows while eating') ...

Anyway, thanks to HP calculator division and its technical staff (one, two, ...?) for providing such a repurposable platform, though we aren't finished yet. And personally, just in case you'll do it once more, I think the greatest space for improvement is the display. But you know this from many previous posts already ;-)

Walter

*Message #17 Posted by **Jake Schwartz** on 22 Apr 2011, 2:06 p.m.,*
in response to message #16 by Marcus von Cube, Germany

If you guys would enable the "Donate Money" button at Sourceforge, I am sure that a few of us would be willing to help offset any costs you might have incurred up to this point....even if it simply represents time spent. As Chris Farley (late of "Saturday Night Live" fame) might have said, "This project is AWWWWSOME!!!"

Thanks, Jake

Re: What's your opinion?

*Message #18 Posted by **Marcus von Cube, Germany** on 22 Apr 2011, 2:27 p.m.,*
in response to message #17 by Jake Schwartz

Jake, I love these comments!

It's by far not only time spent. I've invested a considerable amount of €s in Visual Studio and my Olimex adapter. But I did it without any direct financial interest. I'm hoping that my work will support my career. (I'm a freelance programmer with experience ranging from micro-controllers to HP NonStop hosts.) So it's sort of a PR investment concerning myself.

Re: What's your opinion?

*Message #19 Posted by **Walter B** on 22 Apr 2011, 2:41 p.m.,*
in response to message #17 by Jake Schwartz

Thank you, Jake! For me it's almost exclusively "time spent", though it has been quite a lot since Pauli and me started in December 2008. Personally, the driving force was to prove it can be done - something as close to a hypothetic 43S as possible can be made with next to no resources compared to the budgets of the companies being in that business. And it has materialized - no more "only vaporware" d:-) though it's not

finished yet.

Thanks again - after all it's a nice reward

Walter

Re: What's your opinion?

*Message #20 Posted by **Jose Poyan** on 22 Apr 2011, 6:37 p.m.,*
in response to message #19 by Walter B

I think too that the project is Spectacular ! When I saw the manual I was amazed. Just to imagen that someone carried on with the project and it didnt stay in words and it was made in such a professional way was shocking. It's the best thing since the hp42s emuler!

I plan to get my wp34s in some time when it's completly finished and the issue of the ovelay is solved. Hopefully I'll get my hands on the uCalc when Dave Jones complete his project and starts selling them. I also agree with the view that you shoud get donations, that will show how much people appreciate your idea.

Thank you guys for this great calculator !!

Interesting news about the HP 15C

*Message #1 Posted by **Paul Guertin** on 20 Apr 2011, 8:57 p.m.*

While looking for something completely different, I found the following web page, with some information that might be of interest to readers of this forum.

http://www.techpoweredmath.com/hp-12c-special-edition-hp-15c-re-release/

"HP has informed Bach that in June, there will be a special limited edition run of the HP-15C."

Re: Interesting news about the HP 15C

*Message #2 Posted by **Eddie W. Shore** on 20 Apr 2011, 9:35 p.m.,*

Olá Gerson,

That makes sense. Shall the "million-seller" be the HP10BII+ ? Rats, I feared the financial guys have spread but didn't know :-(

Walter

Re: Interesting news about the HP 15C

*Message #9 Posted by **Gerson W. Barbosa** on 21 Apr 2011, 2:29 a.m.,*
in response to message #8 by Walter B

Hello Walter,

The HP-10BII+ is already available. Since they mention July and June perhaps the "million-seller" has yet to come... Another financial calculator, most likely. Not the 43s this time, I fear...

Gerson.

Re: Interesting news about the HP 15C

*Message #10 Posted by **Pal G.** on 22 Apr 2011, 12:13 a.m.,*
in response to message #9 by Gerson W. Barbosa

For them to sell a million units of one type of calculator won't they be keychain four bangers, that cost consumers $1.99 each, and cost HP about $0.12 each to have manufactured in China?

It will probably have a white LED built in so you can illuminate your door locks in the dark.

*Message #12 Posted by **Namir** on 21 Apr 2011, 6:57 a.m.,*
in response to message #1 by Paul Guertin

Given the limited resources of HP (and I say that with great sadness), I think you already have seen the "new HP-15C":

new HP-15C = HP-10BII+

The new machine is probably (my own guess) **it** for the rest of the year.

So cool your jets Mary!!!

> Given the limited resources of HP (and I say that with great sadness), I think you already have seen the "new HP-15C":

And given their limited resources, I would argue that HP would try to leverage the effort and experience gained reusing the original 12C ROM in the 12C ARM variant. A limited run of the 15C would make sense if most of the development costs associated with such an effort were already expended during the 12C ARM development. And HP could charge a premium for this one, and people (like us) would still buy it. I would like a new 15C at the same price as the 12C, but probably wouldn't flinch at the checkout if it was 50% more than that.

While I am not one to frequent TAS for these things, so I may be uninformed as to what happened with 12C's - I think the law of supply and demand will hold ;)

Re: Interesting news about the HP 15C

*Message #19 Posted by **Allen** on 21 Apr 2011, 8:11 p.m.,*
in response to message #18 by svisvanatha

As long as the quality of the Keyboard is better than the 49g/20s class of calculator, I'd expect a 30 to 50% drop in prices for the vintage 15C machines available on TAS.

My reasoning is split between 3 factors: 1) Most of the older 15C's have bezel damage or logo damage which is unsightly for collectors and users alike

2) Based on my experience with the new 12C+, I should hope that any proposed ARM variant of the 15c would likely be faster than the original.

3) The more recent HP releases have seen a good increase in quality and keyboard feel.

Without that 'special sauce' of keyboard feel and speed, I do not believe a new 15C release will reduce TAS prices for original 15C's- much like the 33S had little effect on the 32sii pricing.

I suspect the 35S impacted the price of used 32Sii's more, but I believe neither the 33S nor 35S

release had much effect on the more capable 42S machines.

*Message #20 Posted by **Pal G.** on 22 Apr 2011, 12:32 a.m.,*
in response to message #15 by Namir

Does anyone have any idea what effect the new retro Ford Mustangs and Chevy Camaros, have had on late 60's and early 70's Mustangs and Camaros? I think originals are still fetching high prices. My guess would be original 15Cs will be ok, as long as folks can differentiate between original and new. I suspect the new 15C would have an extra battery and some other mark of distinction.

While I'm typing, I certainly hope HP does not limit the number of 15Cs they manufacture for reasons of maintaining some kind of exclusivity. They're not manufacturing Rolexes. Why would they limit production on a piece of plastic made in China? I'm sure if they manufacture 100,000 eventually they will be sold. They're not going to be tossed in a landfill like some cheap four banger.

Tim has mentioned some of these stores are uptight about what products are using up which hooks. I'm sure if large quantities are available, Amazon will sell them for years until they are all gone. Shoot, Amazon is still selling 35Ses for $49.99USD with this written below the price: "Only 20 left in stock--order soon (more on the way)." See that?! More on the way. Where are they getting more? The 35s came out in '97 (I think). Is HP still manufacturing them?

Re: Interesting news about the HP 15C

Weak analogy, IMO. The retro Mustangs, Camaros, Chargers, Challengers, T-birds, etc. are modern cars that simply *evoke* the cars of yesteryear. OTOH, the 15c+, when it happens, will be a nearly *exact* copy of the original.

Collectors who want (and can afford) a real '57 T-bird will still pay big bucks for it. A driver who just has nostalgia for it will buy a modern one.

Similar situation with the 15c, except there's more than nostalgia at work. Many users actually

like - well, *using* the 15c. So the originals will go down in price, at least somewhat.

That all depends on what percentage of the demand for original 15Cs is collector interest vs people looking for a capable/comfortable scientific calculator. At the risk of annoying 15C fans (among whose number I count myself,) I suspect that people who buy the 15C for the latter reason may overlap a lot with the former group. In other words, given a limited 15C reissue, the price on TAS for original 15Cs may not be affected much.

On the other hand, I first bought an original 15C in poor condition, just so I could get my hands on a working device to play with. So there might be some damping of enthusiast (vs collector) interest.

> Quote:
>
> While I'm typing, I certainly hope HP does not limit the number of 15Cs they manufacture for reasons of maintaining some kind of exclusivity. They're not manufacturing Rolexes. They're not going to be tossed in a landfill like some cheap four banger.

A production run of 15Cs would not be cost free. If they failed to sell out a run of 10,000, it would be insane to keep producing them.

If this rumor turns out to be genuine, then perhaps HP is seriously test marketing the commercial viability of an updated 15C. They should already have some idea of the actual demand based on sales of the (expensive) 15C iPhone app. If that's the case, and the pilot run sells out, then the price of original 15Cs might well go down in the face of a larger supply of new 15Cs, as long ago happened to the 12C. This would be good news for collectors, I should think. An early 12C in good condition is still attractive to a serious collector.

Regards,
Howard

*Message #27 Posted by **Michael de Estrada** on 26 Apr 2011, 10:10 p.m.,*
in response to message #26 by Martin Pinckney

Not quite. The HP-15C does matrix math; the HP-32SII doesn't.

Re: My dreams about the HP 15C

*Message #28 Posted by **Mike Morrow** on 26 Apr 2011, 10:31 p.m.,*
in response to message #27 by Michael de Estrada

More importantly, the HP-15C does complex math naturally and (almost) effortlessly. The HP-32SII and its follow-ons really do not.

But the calculator that is absolutely unique in capability and deserves restoration to the HP product line is the HP 42S, which is a grossly better calculator than the HP-15C in every particular except style.

Symbolic Integration, Continued

*Message #1 Posted by **Austin W.** on 19 Apr 2011, 10:23 p.m.*

Hi all!

A while back, I was lurking on these forums and I came across this thread: Symbolic Integration

I attempted to integrate dx /(1+x^16) like Mr. von Cube did with his NSpire. However, I used my 50g.

I am almost POSITIVE that I got an answer (Lots of ln and atan terms.) However, I tried again recently, and I got an INTVX (or RISCH) error: Unable to factor.

This really isn't terribly important; it just bothers me! Any ideas as to why it may have worked back then but doesn't now?

Thanks, Austin W.

Re: Symbolic Integration, Continued

>
> This really isn't terribly important; it just bothers me! Any ideas as to why it may have worked back then but doesn't now?

Most likely one of the following:

1) Insufficient memory. Free a respectable quantity, then try again.

2) Hitting some limit on the number of factors or length of the answer. See parameter settings.

3) Hitting some limit in the depth of factoring. See parameter settings.

If the above doesn't help, try changing the exponent 16 to 2, then 4, then 8, then 16, and see where it fails.

Regards from V. .

Re: Symbolic Integration, Continued

*Message #6 Posted by **Austin W.** on 20 Apr 2011, 12:12 p.m.,*
in response to message #2 by Valentin Albillo

Hi there,

I did as you suggested, and I may have partially solved the problem. In exact mode,I set the "factorize" flag to numeric (I'm afraid I don't have the calculator with me at the moment, and so I can't tell you the flag number) and I use INTVX I'm are asked to switch modes (exact->appx) and I'm are given a large answer with ln and atan terms and a bunch of decimals. Using XQ I can get an integer answer. A wierd thing though, if I try it already in appx mode, the calculator "hangs." No error, it just sits for awhile. It may be that I am too impatient to let it finish. I may be mixing some things up too; I'll go look at it and come back later.

For now though, try setting "Num. factorize" and trying it.

Thanks, all of you for your responses!

-Austin W.

Any suggestions for cleaning a calculator?

*Message #1 Posted by **Eddie W. Shore** on 19 Apr 2011, 9:08 p.m.*

... Without having to take the calculator apart or leaving scratches or streaks? Thanks in advance.

Re: Any suggestions for cleaning a calculator?

*Message #2 Posted by **Allen** on 20 Apr 2011, 6:25 p.m.,*
in response to message #1 by Eddie W. Shore

I like the Delrin-handled Clean Room brushes available from McMaster Carr. They are pricey, but the 0.008" diameter bristles are the perfect size and stiffness to clean dust and lint out keyboards and LCD bezels gently and will not scratch.

The part number is 7265T33.

bristle material	dia.	bristle length	part	cost
0.008" Nylon	3/8"	3/4"	5 1/4"	7265T33	$8.86

OT - Pi used in a symphony now in court

*Message #1 Posted by **DavidShenk** on 19 Apr 2011, 5:28 p.m.*

It seems that two people (at least) had the idea of turning the digits of pi into music, and now one is suing the other for a copyright violation:

HP 15C Displaying Incorrect Values!

*Message #1 Posted by **Ian McParland** on 19 Apr 2011, 4:06 p.m.*

Hi,

My HP 15C displays the correct numbers for ln(2/3) but says it is positive!

Please, someone help me!

Complex mode?

Re: HP 15C Displaying Incorrect Values!

*Message #3 Posted by **Jeff Kearns** on 19 Apr 2011, 5:21 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Even in Complex mode the answer is negative.

Try something simple:

type 7 CHS

do you see

- 7

or do you see

7

?

If the latter, you have a dead segment in the display.

Luckily I see the first! I have absolutely no idea what I did, but it is now working! Could someone please tell me what the complex mode is, and how it affects answers, because I am writing an exam on Thursday, and it would be disastrous if all my calculations were wrong because of my calculator? :D

Oh, and does anyone know where you can get cases for the HP 15C, and the original manuals? Not a PDF format, but a hard copy?

Thanks again.

In complex mode, you work with complex numbers instead of plain ol' real numbers. If you're not familiar with complex numbers, you can read about them on Wikipedia or Mathworld, so I'm not going to explain them here. Just to make sure that they don't trip you up, you can turn complex mode off by clearing flag 8: [g] [CF] 8

> Quote:
>
> does anyone know where you can get cases for the HP 15C, and the original manuals? Not a PDF format, but a hard copy?

eBay. Oops, I guess I was supposed to say "TAS".

Re: HP 15C Displaying Incorrect Values!

*Message #7 Posted by **Jeff O.** on 20 Apr 2011, 7:41 a.m.,*
in response to message #5 by Ian McParland

Please don't take offense, but are you absolutely, positively sure that you did not take ln(3/2)?

Regarding complex mode, like Eric said it is a mode that accepts complex numbers as arguments to functions, and returns complex numbers when appropriate. It is activated on the 15C by setting flag 8 (g SF 8), or by pressing f I. When active, it creates a parallel, unseen stack which holds the imaginary components of complex numbers. The real portions are held in the regular viewable stack. A small "c" appears in the lower right of the screen when in complex mode. The biggest potential gotcha is that all arguments are treated as radians for trigonometric functions when in complex mode, regardless of the angular mode setting of the calculator. So in complex mode, sin(60) will return -0.3048 instead of 0.8660.

..

Well, I am positive I did, but nevertheless, the keystrokes I made are as follows: 2 {Enter} 3 {/} {g} and then {e^x}

Be sure you know your calculator before using it in your exam. Verify you know RPN. Then your 15C will serve you well for sure.

I love RPN, and have been using it for three years. How do I know if both my HP 35s and HP 15C are in complex mode?

Re: HP 15C Displaying Incorrect Values!

*Message #11 Posted by **bill platt** on 20 Apr 2011, 11:11 a.m.,*
in response to message #10 by Ian McParland

Hi Ian,

I think the reason Walter said that is that if you do:

```
3
enter
2
/
Ln
```

you get 0.4055, whereas if you do:

```
2
enter
3
/
Ln
```

you get -0.4055, and this inversion can happen if you accidentally do your operations infix instead of postifx.

For edification,

```
Ln(2/3) is carrried out as
2
enter
3
/
Ln
```

Re: HP 15C Displaying Incorrect Values!

in response to message #10 by Ian McParland

The 35s does not have a complex mode in the same way that the 15c does. To learn how it works, refer to your manual. It can also be downloaded. In addition, you can buy the 15c manual in PDF by buying the appropriate museum dvd(s) or cd(s).

http://h10010.www1.hp.com/wwpc/pscmisc/vac/us/product_pdfs/user_guide.pdf

Re: HP 15C Displaying Incorrect Values!

*Message #13 Posted by **Bart (UK)** on 20 Apr 2011, 12:40 p.m.,*
in response to message #10 by Ian McParland

The 35s does not give complex answers unless it was given a complex argument, e.g. -2 {LN} returns error "LOG(NEG)" but -2+0**i** {LN} returns 0.69314718056+3.14159265359**i**. So it should not be a concern when working with real numbers.

Note that complex number display depends on settings and can be either x**i**y, x+y**i** or r**@**a (where @ represents theta symbol).

HP-71B FRAM Extension: an update

*Message #1 Posted by **Hans Brueggemann** on 19 Apr 2011, 2:32 p.m.*

hi all,
still working on my HP-71 FRAM extension, i've gained some progress so far:
1) PEEks, POKEs, burst reads and writes are working now.
2) FRAM can be segmented into 16 individual blocks of 2kB to 32 KB each.
3) an additional feature to swap 64kBytes from $30000 into the ROM address space is working, too.
so, theoretically, there is an upgrade path from 1BBBB to 1CDCC (or anything you poked into $30000 and above) by simply setting a jumper...
4) and the best news: the complete hardware will most likely fit into one regular memory module (still working on the layout, it *is* cramped)

actually, there are still two problems to solve, and i would like know any opinion on how to address these.

a) although read / writes to the FRAM are working fine, FREE PORT does not. instead, FREE PORT is getting executed without error message, but the memory is still fully accessible and doesn't show up as freed memory during a SHOW PORT command.

b) copying the rom area into $30000, and afterwards swapping rom and ram area works...for ver 1BBBB, that is. any attempt to swap a ver 1CDCC into the rom area results in a crash after a power-on cycle. i suspect hardware incompatibilities with my 1BBBB machine and the 1CDCC rom data. can anybody shed some light on this? in fact i didn't use a "real" 1CDCC image for testing, but used the rom image from jeff's emu71.

thank you in advance for any hints!

cheers,
hans

>
> thank you in advance for any hints!

First one remark to the different CPU models. Early HP71B use a 1LF2 CPU, the later models a 1LK7 CPU from the 18C/28C calculators. The only difference between these two CPU revisions are the additional opcodes

PC=(A) and RSI in the 1LK7 revision.

Whether the 1AAAA, 1BBBB, 2CCCC or the 2CDCC ROM revision make use of these additional two opcodes.

The internal 16KB main RAM made with 16 1LG8 RAM chips (2K nibble). Four of them are always connected to a 4KB hybrid chip.

So lets have a look on the memory configuration after startup:

Hard configured:

```
ROM (64K)
$00000-$07FFF
$08000-$0FFFF
$10000-$17FFF
$18000-$1FFFF

Display Driver 1
I/O: $2E100-$2E1FF
RAM: $2F400-$2F7FF

Display Driver 2
I/O: $2E200-$2E2FF
RAM: $2F800-$2FBFF

Display Driver 3
I/O: $2E300-$2E3FF
RAM: $2FC00-$2FFFF
```

Soft configured:

```
Port0:
RAM (4K)
$30000-$307FF
$30800-$30FFF
$31000-$317FF
$31800-$31FFF

RAM (4K)
$32000-$327FF
$32800-$32FFF
$33000-$337FF
$33800-$33FFF

RAM (4K)
$34000-$347FF
$34800-$34FFF
$35000-$357FF
$35800-$35FFF

RAM (4K)
$36000-$367FF
$36800-$36FFF
$37000-$377FF
$37800-$37FFF
```

In the 2nd step let us add a HPIL module. The HPIL module is connected to the internal port0.

```
HPIL I/0
$20000-$2000F

ROM (16K)
$40000-47FFF
```

In the 3rd step let us add a MATHROM module in port slot4. The MATHROM module has 32KB made with two 1LG7 (32K nibble) chips. The address layout then

```
ROM (32K)
$48000-$4FFFF
$50000-$57FFF
```

In the 4th step let us add a 4KB module in port slot1. The RAM content is merged to the main RAM. The address layout then

```
RAM (4K)
$38000-$387FF
$38800-$38FFF
$39000-$397FF
$39800-$39FFF
```

This is directly behind the internal RAM.

Now let us free the port1 RAM to independent RAM with:

FREE PORT(1)

Now the RAM mapping in port1 moved from

```
RAM (4K)
$38000-$387FF
$38800-$38FFF
$39000-$397FF
$39800-$39FFF
```

to

```
RAM (4K)
$58000-$587FF
$58800-$58FFF
$59000-$597FF
$59800-$59FFF
```

That's directly behind the MATHROM.

Back to your entire question. As you see the address area beginning at $30000 is occupied by the internal RAM and not free. On "Emu71/DOS" the internal single 32KB main RAM is mapped at:

```
RAM (32K)
$30000-$3FFFF
```

The soft configuration mapping strategy seem to be (from lower to higher addresses):

1. I/O MEM
2. Main RAM MEM
3. ROM MEM
4. Independent RAM

In consequence this means after a FREE or CLAIM port or adding or removing a module the complete memory mapping can reordered by the HP71B OS.

Cheers

Christoph

Re: HP-71B FRAM Extension: an update

*Message #4 Posted by **Hans Brueggemann** on 21 Apr 2011, 12:16 p.m.,*
in response to message #2 by Christoph Giesselink

christoph,
thank you for the info. (btw., i received youremail).
i totally agree with you concerning the memory handling that you are explaining in your post. i know that the HP-71B itself cares for the address handling of the plugins. to be more precise: for testing, i configured the FRAM extender as 2 x 32kByte RAM. therefore, the HP-71B reordered internal ram and plugin-ram in descending size order, meaning that the two 32kB RAMs became located from $30000 to $4FFFF, while the internal RAM got located at $50000 to $57FFF.
that's why memory swap between ROM address space $00000-$1FFFF and RAM address space $30000-$4FFFF will be working o.k., as long as the neccessary 64kB of plugin-RAM is configured as an assortment of modules that are all bigger than 4kB modules. otherwise...amnesia. (hm... should have mentioned that ;o) but that's not my headache. the problem is, that i don't have fully discovered yet how the FREE PORT command works, and whether it uses hardware commands that my extender does not properly decode yet.
at the moment,the commands as layed out in chapter 2.1.2 of the hardware IDS are all implemented with the exception of POLL and BUSCC, and the ominous command "B", which is described as being "reserved".

hans

Re: HP-71B FRAM Extension: an update

*Message #5 Posted by **Christoph Giesselink** on 26 Apr 2011, 5:23 p.m.,*
in response to message #4 by Hans Brueggemann

> Quote:

> i totally agree with you concerning the memory handling that you are explaining in your post. i know that the HP-71B itself cares for the address handling of the plugins. to be more precise: for testing, i configured the FRAM extender as 2 x 32kByte RAM. therefore, the HP-71B reordered internal ram and plugin-ram in descending size order, meaning that the two 32kB RAMs became located from $30000 to $4FFFF, while the internal RAM got located at $50000 to $57FFF.

Sorry, you're right. Larger RAM modules than the internal 4K are configured first. I missed that, so the addresses above are correct.

> Quote:
>
> but that's not my headache. the problem is, that i don't have fully discovered yet how the FREE PORT command works, and whether it uses hardware commands that my extender does not properly decode yet.

I added a hybrid 64KB (2*32KB) RAM in port 1 to a standard HP71B.

The C=ID codes for the two 32KB modules are: $00009 and $80009.

So the address layout for port 1 is

```
$30000-$3FFFF
$40000-$4FFFF
```

The address layout of the internal RAM for port 0 is

```
$50000-$507FF
$50800-$50FFF
$51000-$517FF
$51800-$51FFF

$52000-$527FF
$52800-$52FFF
$53000-$537FF
$53800-$53FFF

$54000-$547FF
$54800-$54FFF
$55000-$557FF
$55800-$55FFF

$56000-$567FF
$56800-$56FFF
$57000-$577FF
$57800-$57FFF
```

When you now call FREE PORT(1), first the independent RAM marker $B3DDDDDE is written to address $30000 (start of the port 1 memory) and the rest of the port 1 memory is set to 0.

Then the RESET command is called.

Now all soft configurated modules are getting a CONFIG command. Every first chip of a hybrid RAM is configured at address $80000, all other chips at $40000. I think, but not checked, the HP71B OS is trying to detect the independent RAM marker $B3DDDDDE.

When all modules have been configured, the RESET command is called a 2nd time.

But now we have differences between HP71B ROM rev. 1BBBB and 2CDCC.

In the new module configuration process with the CONFIG command, all modules are placed at their final memory address.

Port 0 with the internal RAM:

```
$30000-$307FF
$30800-$30FFF
$31000-$317FF
$31800-$31FFF

$32000-$327FF
```

```
$32800-$32FFF
$33000-$337FF
$33800-$33FFF

$34000-$347FF
$34800-$34FFF
$35000-$357FF
$35800-$35FFF

$36000-$367FF
$36800-$36FFF
$37000-$377FF
$37800-$37FFF
```

Port 1 with the 64KB independent RAM @ ROM rev 2CDCC:

```
$D0000-$DFFFF
$E0000-$EFFFF
```

Port 1 with the 64KB independent RAM @ ROM rev 1BBBB:

```
$E0000-$FFFFF
Unconfigured Size = $10000
```

The 2nd RAM with ID = $80009 is unconfigured because the HP71B OS is doing an UNCFG with C[A] = $FFF00. This is a known bug of ROM rev 1BBBB mentioned in the Soft Forth Manual p.2-2.

Everything works fine on a 1BBBB ROM when you have two 32KB modules both returning the ID's $80009 or with a 96KB hybrid module (32KB + 64KB) returnig the ID's $80009, $00009, $80009.

> Quote:
>
> at the moment,the commands as layed out in chapter 2.1.2 of the hardware IDS are all implemented with the exception of POLL and BUSCC, and the ominous command "B", which is described as being "reserved".

I don't think that a RAM or ROM module answer to a POLL command. I assume the timers inside the 1LF3 chips and for example the HPIL mailbox will answer for a POLL command in the case of a service request.

From the functional Saturn emulation aspect the bus commands described in chapter 2.1.2 of the hardware IDS are not emulated in Emu48 based emulators, so I can't say to much about this.

Christoph

Repairing a cracked Spice case

*Message #1 Posted by **Jeff Kearns** on 19 Apr 2011, 12:47 p.m.*

Hi everyone,

I just received a much anticipated 'Perfect Condition - Like New' HP 34C that is anything but...

It has a cracked case (1.5 cm hairline crack) on the lower edge of the battery compartment and the case is separated above one of the screws. Needless to say, the battery door does not stay on. Despite getting pictures and trying to ensure the state of the calculator, one can never be guaranteed that the unit will arrive as advertized. The front face is in decent shape at least.

I know a good technique for separating the case halves on a Spice based on Spice Repair and have successfully separated the cases of my 32E and 33E in this manner.

My question is: Can I successfully repair the case cracks from the underside (to hide any residue) with a special glue made for adhering plastic to plastic? Will it resist the outward pressure of the battery? Which glue is recommended?

Geoff: When can I get a copy of your book??

Thanks,

Jeff Kearns

Re: Repairing a cracked Spice case

*Message #2 Posted by **Jose Poyan** on 19 Apr 2011, 6:37 p.m.,*
in response to message #1 by Jeff Kearns

Hi Jeff,

I had one with exactly the same defecf. I put trasluscent epoxy glue, the one you mix. It holded it for a short time. After three times installing and removing the battery cover, it broke again. I used a screw driver to introduce the glue through a gap, since I didnt want to remove the back cover. That is to say, I didnt have the chance to prepare the surface propperly. You may try by sanding the plastic to get good grip, but I feel that the case is subjected to too much pressure and the glue wont hold. Anyway you could remove it easily if it doent work. Of course, dont evey try super-glue.

jose

Re: Repairing a cracked Spice case

*Message #3 Posted by **Jeff Kearns** on 20 Apr 2011, 7:57 a.m.,*
in response to message #2 by Jose Poyan

I have been in touch with Geoff Quickfall by email who is offering to guide me through a repair process. The fellow from whom I bought the calculator claims to not have been aware of the crack(s), and I want to give him the benefit of the doubt. Geoff points out that the likely cause of the stress fracture is the increased length of modern AA batteries. I wonder if the custom rechargeable battery packs that are sold on TAS (of which I have two sets) for Spice calculators are of the correct length? Has anyone else had this problem?

Nonetheless, I paid a substantial sum for the unit, believing it to be in "Perfect, Like New" condition. He has offered a reversal of the transaction and an apology, but I prefer to keep the calculator and simply ask for a rebate. If this is not an inappropriate question for the forum, could someone please tell me what a fair price 'should' be for this unit, based on the description above? If the forum is not the place to discuss this, please email me with your answer.

Thanks in advance!

Jeff Kearns

Re: Repairing a cracked Spice case

*Message #4 Posted by **Jose Poyan** on 20 Apr 2011, 7:27 p.m.,*
in response to message #3 by Jeff Kearns

Hi,

Yes, it is a fact that the batteries in the original pack are shorter and if you replace them with normal batteries, leaving the aluminium case that keeps both cells toguether, the plastic case will visible suffer and actually you wont be able to introduce the pack into the calculator at all.

So in my case I replaced them with rechargable batteries and they got inside but only becouse the battery contacts were corroded and I had replaced them with copper foil which is very thin. They didnt make good contact though.

I imagen that the original pack used tagged rechargable batteries, but without tags so they are shorter.

wp34s Overlay Interest

*Message #1 Posted by **Norman Dziedzic** on 18 Apr 2011, 7:31 p.m.*

I have a friend that does printing and may be able to do overlays on a vinyl medium with adhesive back.

Would ppl be willing to pay 5 to 10 usd for something like this? I believe cutting would still be with your own exacto at the peril of your own digits?

To that end does anyone have an Adobe vector graphic file or something similar where I could get some preliminary work done?

Would it be more desired to have as many overlay copies on a sheet as possible for a slightly higher cost? Would ppl want a couple different colors on a sheet?

Thanks,

Norm

What font(s) did you use creating your images?

Re: wp34s Overlay Interest

*Message #7 Posted by **Walter B** on 19 Apr 2011, 1:27 p.m.,*
in response to message #6 by Norman Dziedzic

The golden, blue, green, and dark red characters are all homegrown graphics, edited pixel by pixel for optimum legibility. At least the golden, blue, and green letters are identical. For the white print, however, I used Arial as a starter though not everywhere. An the white print is the most blurred now, so maybe I'll go over that when I've got time.

HTH (probably not much)

Walter

Re: wp34s Overlay Interest (update)

*Message #8 Posted by **Walter B** on 20 Apr 2011, 8:41 a.m.,*
in response to message #7 by Walter B

Hi all,

Please find an updated layout in the repository, build 704. Optimized with respect to legibility of the white labels. Digit keys are (almost) Arial. Now, that's it IMO if we don't change any keys anymore d:-)

Walter

> Would it be more desired to have as many overlay copies on a sheet as possible for a slightly higher cost? Would ppl want a couple different colors on a sheet?

I'm certainly going to make more than one WP-34S so a couple on a sheet would be good for me.

I don't see much point in different colours. We've red, green, yellow, blue and white labels. It will be difficult to find decent, well contrasting backgrounds to all of these -- black or dark grey seems like the only choices.

I'd like a single sheet that covered the entire front front, not just the keyboard area.

Also, something to cover the key fronts and tops would be required. In fact, this is likely more important than a keyboard overlay -- it isn't all that difficult to make a decent overlay, it is harder to make key covers. I've done this by cutting separate pieces for each key which fiddly and time consuming.

*Message #11 Posted by **svisvanatha** on 19 Apr 2011, 6:14 a.m.,*
in response to message #10 by Paul Dale

I am in contact with a company which produces overlays and keyboard re-purposing labels. They are currently pricing out the job. It may prove to be expensive (relatively), but would also likely require siginificant volume. Will update here when I get more info from them.

Again, IMHO it's not required to have something separate. Just get some wear-resistant foil and make 3 cuts instead of 4 for each key (please see here). KISS :-)

Re: wp34s Overlay Interest

*Message #13 Posted by **Paul Dale** on 19 Apr 2011, 6:31 a.m.,*
in response to message #12 by Walter B

Which means either the tab isn't stuck to the key or you will be stretching the joint to the real overlay on every keystroke. Neither is good long term.

As an interim measure and for development, is is fine.

- Pauli

Re: wp34s Overlay Interest

*Message #14 Posted by **Walter B** on 19 Apr 2011, 7:35 a.m.,*
in response to message #13 by Paul Dale

If you'd watch the key movements carefully you may see that the relative dislocation of "tab" and key top is next to zero in a keystroke. I'm not going to make a drawing 50:1, however. I'd simply try it :-)

Walter

Re: wp34s Overlay Interest

*Message #15 Posted by **Paul Dale** on 19 Apr 2011, 7:41 a.m.,*
in response to message #14 by Walter B

Press a key, watch the gap widen at the bottom. That is more than enough to wreck a single piece overlap given time :-) I don't want to have to resurface the keyboard ever.

The pivot point of the key is below the keyboard surface so this is unavoidable.

Anyway, the overlay you suggest can be modified by removing the key covers and putting them on separately.

- Pauli

Re: wp34s Overlay Interest

*Message #16 Posted by **Jeff O.** on 19 Apr 2011, 7:54 a.m.,*
in response to message #15 by Paul Dale

How about Walter's idea, which I think makes the left, top and right cuts around each key and sticks the whole overlay on the keyboard, then after application, the bottom key-cut could be made to finish the job. Avoids having to attempt to stick on all the individual key covers separately. Hope this makes sense.

Re: wp34s Overlay Interest

20b/30b flashing question

*Message #1 Posted by **sjthomas** on 18 Apr 2011, 3:17 p.m.*

Can the 20B or 30B be re-flashed using Windows XP Compatibility Mode under Windows 7? The flashing guide says that Windows XP and a serial port are required, but my only remaining computer running XP does not have a serial port (and it's a laptop, so I can't add one).

Re: 20b/30b flashing question

*Message #2 Posted by **Marcus von Cube, Germany** on 18 Apr 2011, 3:22 p.m.,*
in response to message #1 by sjthomas

A USB adapter is working fine on mine. I have no idea if Windows 7 gets in the way.

Re: 20b/30b flashing question

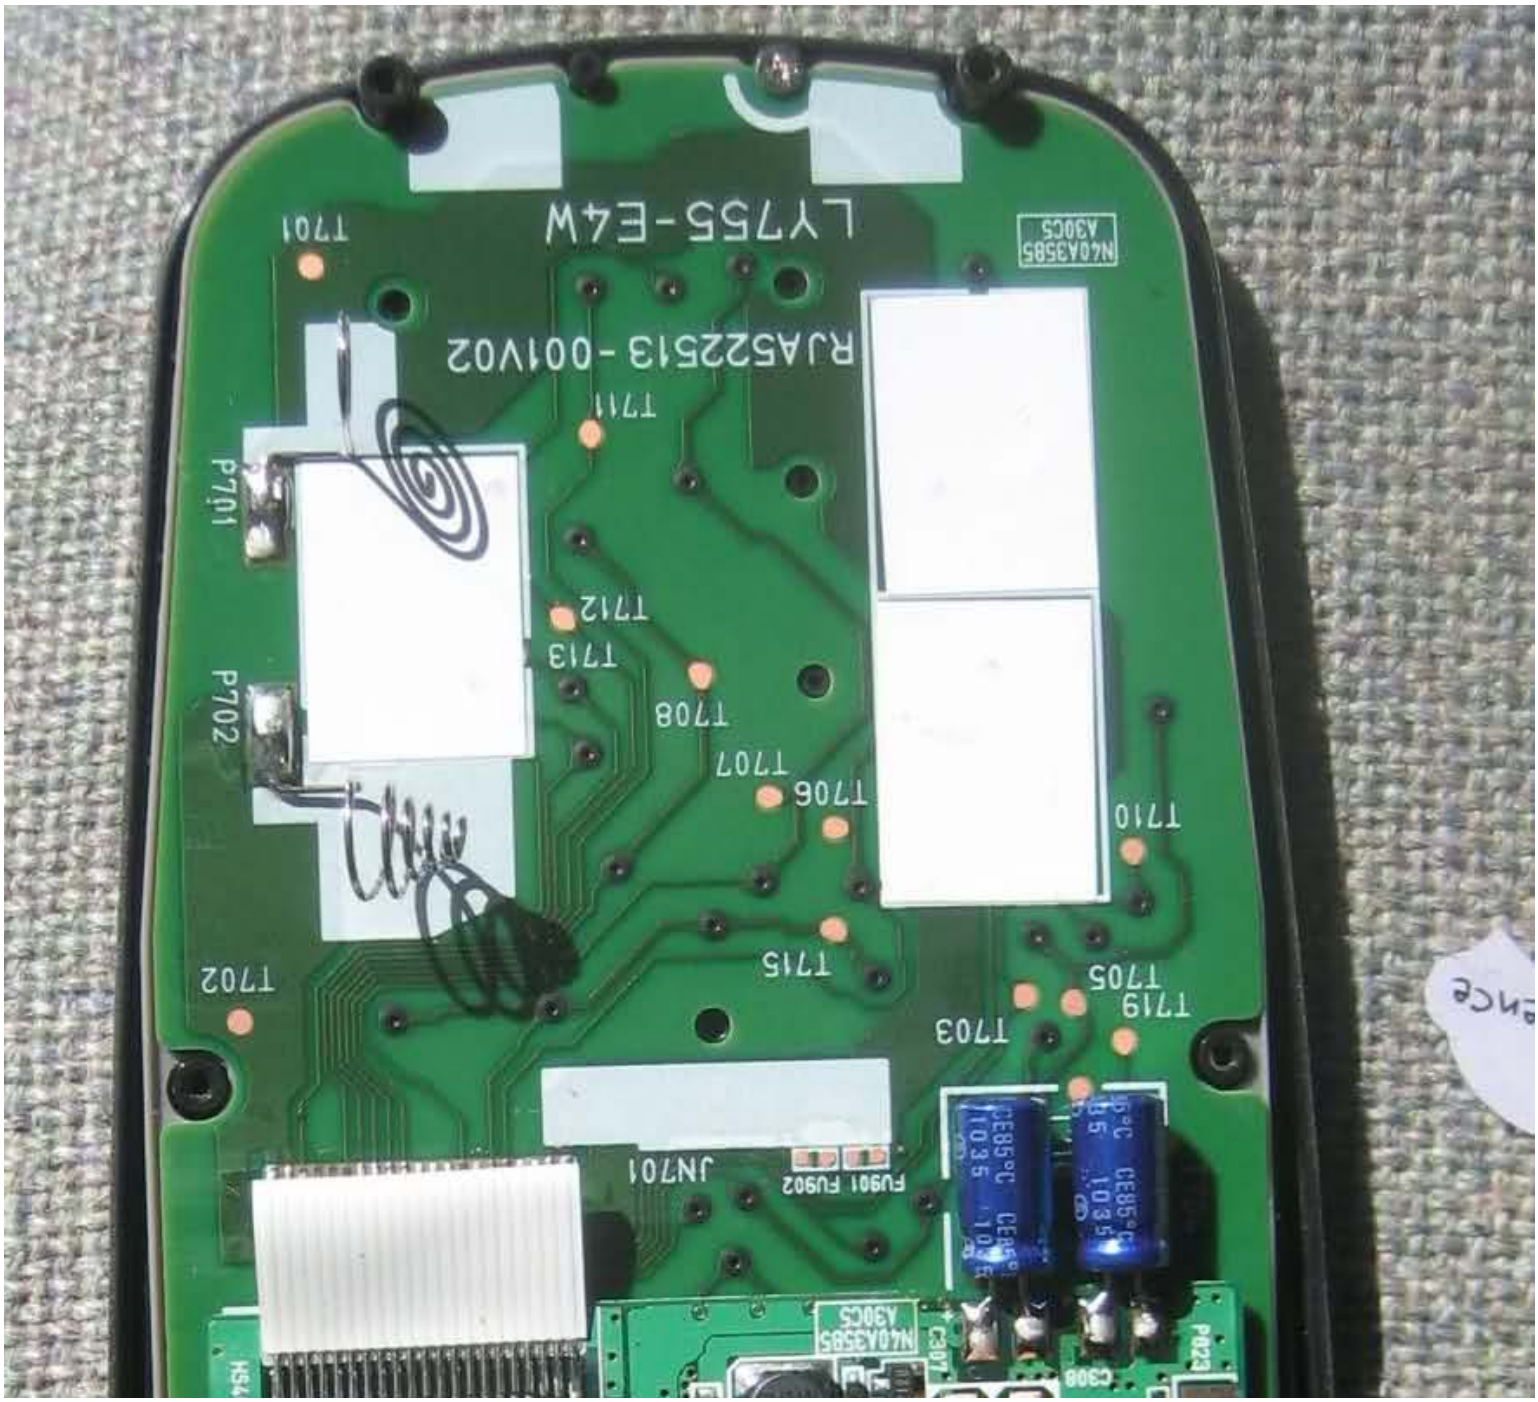
casio fx-cg10 topless!

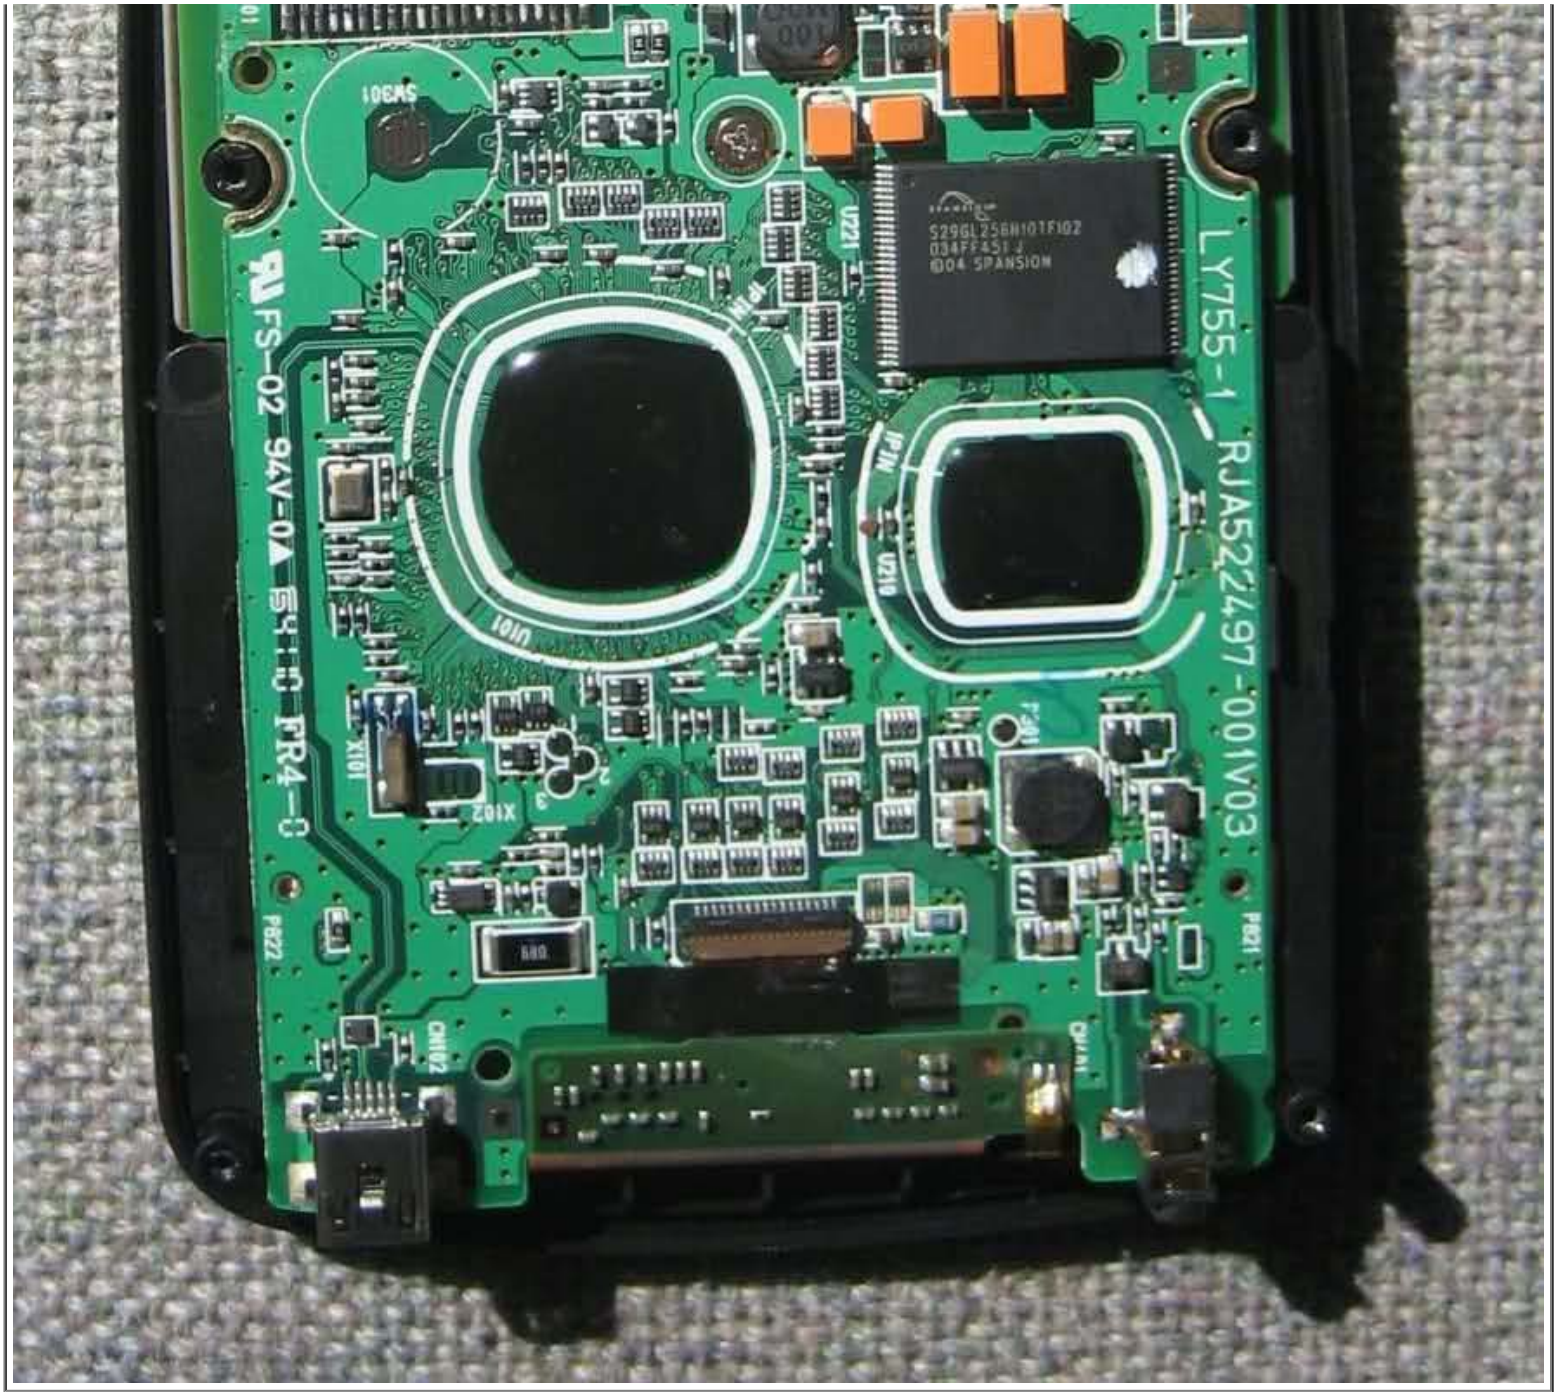
*Message #1 Posted by **hugh steers** on 18 Apr 2011, 2:38 p.m.*

off topic for HP, but some of you might be interested. here's a pic of the circuit board from the casio fx-cg10. im assuming the large blob is the processor (SH3) and the others are flash and ram?

i've been trying to find out how much ram it actually has. i know it's more than the official 64k. im thinking it might be 512k.

anyhow,





Re: casio fx-cg10 topless!

*Message #2 Posted by **Eric Smith** on 18 Apr 2011, 3:47 p.m.,*
in response to message #1 by hugh steers

Seems more likely to be 256KB. They need 165,888 bytes for the frame buffer, if they aren't using a CLUT (color lookup table).

Note that the flash chip shown is 32MB, so they must be reserving half of it for the firmware and other system use.

Edited: 18 Apr 2011, 6:08 p.m.

Re: casio fx-cg10 topless!

*Message #3 Posted by **hugh steers** on 18 Apr 2011, 6:56 p.m.,*
in response to message #2 by Eric Smith

i know that the screen is 162k at 16bpp. im told that the system needs to buffer a copy of the screen. this would require 324k and therefore more than 256, if true.

with a lot of help, i've managed to get some native code running on it. i'll have to write some hacks to explore the ram limits.

i took the back off, incase it was obvious from the board, but the blob attack has thwarted me.

Edited: 18 Apr 2011, 6:57 p.m.

Re: casio fx-cg10 topless!

*Message #4 Posted by **Eric Smith** on 18 Apr 2011, 8:42 p.m.,*
in response to message #3 by hugh steers

A screen buffer, sure. The hardware reads the buffer, serializes the data, and presents it to the display drivers. But there's no good reason for a product like this to have TWO screen buffers unless they are doing some major animation. For small animations, they can simply update the relevant portions of the buffer during retrace time.

Good job getting native code running! It will be interesting to hear what else you discover.

Re: casio fx-cg10 topless!

*Message #5 Posted by **hugh steers** on 19 Apr 2011, 9:07 a.m.,*
in response to message #4 by Eric Smith

i can't claim any credit for getting the native code running. i got all the help from the casio hackers. but im hoping to port some of my graphical stuff to it. that's why im interested in the ram and the screen layout.

Voyager key repair?

*Message #1 Posted by **Nicholas Winterer** on 18 Apr 2011, 1:27 p.m.*

I bought a 16C on eBay with a messed up 5 key. The key still has a click and still registers, but there seems to be less travel then the other keys (the problem is especially noticeable if you use the 16c while its sitting on a desk instead of holding it in the hand and pressing the keys with the thumbs).

Is this something that can be fixed, or should I try to get a return? I have a USA 12c with a similar feeling on the FV key (though not as bad) which I can use for practice.

Re: Voyager key repair?

*Message #2 Posted by **exschr** on 19 Apr 2011, 3:44 a.m.,*
in response to message #1 by Nicholas Winterer

If the click is still noticable it must be the rubberpad, that has a worn-out spot exactly there.

This could IMHO easily be replaced from an other spare voyager (say a cheap 12C from EBAY). There is just some efford needed to get underneed the PCBoard and for the putting together afterwards!

If the 16c is functioning properly besides the keyboard problem, I would consider repairing the issue and not sending it back. Maybe you will be lucky and get some refund though.

good luck

HP 20b/30b programming cable eats on batteries!

*Message #1 Posted by **Marcus von Cube, Germany** on 18 Apr 2011, 12:15 p.m.*

I've made some new current draw measurements with my lab HP 20b. I was astonished to see that having HP's cable plugged in alone, even with the calculator turned off, draws permanently 5 mA. This is 20 times what the wp34s firmware draws in idle mode!

So unplug the cable when you're done with flashing!

BTW, I'm working on the power requirements of the wp34s. It will go down, at least in idle mode, be assured! :-)

Re: HP 20b/30b programming cable eats on batteries!

*Message #2 Posted by **gene wright** on 18 Apr 2011, 1:41 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Hey Marcus, if / when you can, let us know when you post a good calc.bin file or note on the calc.bin area on sourceforge whether a calc.bin file is good to install.

:-)

Please? that would help

Re: HP 20b/30b programming cable eats on batteries!

*Message #3 Posted by **Marcus von Cube, Germany** on 18 Apr 2011, 3:01 p.m.,*
in response to message #2 by gene wright

What's in the ZIP should be usable. My latest SVN update is working, too.

Re: HP 20b/30b programming cable eats on batteries!

*Message #4 Posted by **gene wright** on 18 Apr 2011, 4:27 p.m.,*
in response to message #3 by Marcus von Cube, Germany

For example, the Revision 685 calc.bin file has this as its comment: "Turn of flash memory while idle"

which probably says turns off flash memory when idle.

But... is it a stable build? is it worth loading? Or should I load for real testing Revision 673 from Sunday?

That's the only reason I thought to ask you to note on the builds if it is a partial "I fixed X but haven't looked at Y" build or "Hey, this is a pretty solid build and you can use this to load your 34s" build.

:-)

Sorry for causing trouble...

Re: HP 20b/30b programming cable eats on batteries!

*Message #5 Posted by **Paul Dale** on 18 Apr 2011, 5:50 p.m.,*
in response to message #4 by gene wright

There are no stable builds at the moment :-)

Generally the latest subversion build will be best, we're bug fixing not featuring adding presently.

- Pauli

Re: HP 20b/30b programming cable eats on batteries!

*Message #6 Posted by **Walter B** on 19 Apr 2011, 1:31 a.m.,*
in response to message #4 by gene wright

Well, we're in an alpha-beta test phase still. So expect surprises. That said, the last builds were pretty stable for what I'd call standard functions. So you won't see any smoke nor too many crashes ;-)

Safe for testing by educated users, I'd say.

Walter

in response to message #1 by hugh steers

Hi Hugh, you created the backpacker's calculator d:-)

Re: dealing with 20b/30b/wp34s power drain

*Message #3 Posted by **hugh steers** on 18 Apr 2011, 2:25 p.m.,*
in response to message #2 by Walter B

more seriously, i do think HP should consider a model with a slightly thicker part to accommodate maybe AAA batteries.

This would give a much extended battery life, could afford to run the processor faster on average, plus it could provide the current to drive a micro SD card slot.

my hack shown in the pictures is the result of some goose chase regarding weak button batteries. basically, i had a situation where the unit did flash, but drained the battery whilst doing so to the point that it wouldnt operate the unit. i thought i'd bricked it until i tried driving from a psu.

incidentally, im thinking the WP34s rom requires more current to run, since a weak battery wouldnt activate it, but the same battery worked in another unit. something to watch out for.

-- hugh.

Re: dealing with 20b/30b/wp34s power drain

I'm working on it...

Re: dealing with 20b/30b/wp34s power drain - new findings

*Message #5 Posted by **Marcus von Cube, Germany** on 19 Apr 2011, 1:49 p.m.,*
in response to message #4 by Marcus von Cube, Germany

To be more precise:

I'm now able to power the processor down when there is no program running and no key down. This lowers the current draw to 0.15 mA. I have the feeling that this is just the PIO being active for wake up.

During a programmed pause, the CPU stays on and the current draw is between 0.25 and 0.3 mA. With full power at 32 MHz, the demands are significantly higher. I measured 15 mA while a program was running.

In my very first attempts, in CPU off mode the draw was higher than with the PIO off but the CPU on. That was until I figured out that I had the pull-up resistors active on the outputs which were tied low. I must have measured the current flowing through these resistors (summing up to 0.4 mA).

Tim, what does the 20b firmware demand on the batteries in idle mode? Can I get below my 0.15 mA?

BTW, the new image is on SF in the repository.

Re: dealing with 20b/30b/wp34s power drain - new findings

*Message #6 Posted by **Marcus von Cube, Germany** on 20 Apr 2011, 4:54 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Paul has reported problems with the stability of the last build (699). As a measure, I've relaxed the power saving strategies slightly. Turning of the flash rom while idling doesn't seem to save enough power to be worth the hazzle. So it's gone for now. Going to processor off mode is now postponed to half a second after the last keystroke. You can see it by watching the tiny equals sign in the display.

The new release is in the repository. If it is reported to be stable I'll put it in the standard download.

Re: dealing with 20b/30b/wp34s power drain - new findings

*Message #7 Posted by **Marcus von Cube, Germany** on 20 Apr 2011, 10:39 a.m.,*
in response to message #6 by Marcus von Cube, Germany

Once again! I've posted another update of the flash image to the SVN repository. The auto power down feature which is supposed to turn the calculator off after about three minutes of inactivity seems still to be a bit flaky. Please try out the new build!

Re: dealing with 20b/30b/wp34s power drain

*Message #8 Posted by **Paul Dale** on 18 Apr 2011, 5:48 p.m.,*

in response to message #8 by Paul Dale

> Quote:
>
> All that effort to save replacing some twenty five cent button cells

a more accurate response would have been :
All that effort to save **THE INCONVENIENCE OF** replacing some twenty five cent button cells

it's not so much the cost of the batteries i suspect, but the hassle of having to change them so often. the cost of a pair of 2032 cells is miniscule compared to the cost of the petrol consumed driving down to the battery shop, and the time taken for the trip.

Re: dealing with 20b/30b/wp34s power drain

*Message #10 Posted by **Paul Dale** on 18 Apr 2011, 7:11 p.m.,*
in response to message #9 by robert rozee

Buy them in bulk lots from eBay or the like. Then they arrive at your door and the price is still twenty five cents including shipping.

At least this is what I do for button cells.

- Pauli

Re: dealing with 20b/30b/wp34s power drain

*Message #11 Posted by **hugh steers** on 19 Apr 2011, 9:16 a.m.,*
in response to message #10 by Paul Dale

it only takes for those button cells to be not quite tip-top, and there's a problem, either flashing or operational brown out (try Q^-1). you'll all be crying into your beers when you're hacking at 3am and run out of 'em :-)

but more seriously, now ive made my paper overlay and have the 34s here on my desk, the angle incline is rather nice. doesn't rock about either!

:-)

PS. how do i enter more than 12 digits in DEC 10 mode?

Re: dealing with 20b/30b/wp34s power drain

HP41 Blinky or Red Eye

*Message #1 Posted by **Mike (Stgt)** on 18 Apr 2011, 9:08 a.m.*

Hello emulators and simulators!

Anybody here who may shed some light on the internals of the HP41 Infrared Printer Module? I am still not able to use it in an emulator or simulator. TIA.

Ciao.....Mike

Re: HP41 Blinky or Red Eye

*Message #2 Posted by **Eric Smith** on 18 Apr 2011, 8:43 p.m.,*
in response to message #1 by Mike (Stgt)

I looked at it a few years ago. It seems like the ASIC in it has *lots* of registers or flags. I didn't make much progress.

Re: HP41 Blinky or Red Eye

*Message #3 Posted by **Mike (Stgt)** on 19 Apr 2011, 11:36 a.m.,*
in response to message #2 by Eric Smith

Same with me, every 4th year I take half an hour and give up. But perhaps I should try harder and keep going deeper into it. With no knowledge about the internals the only chance is to do some tests with real hard ware, not to analyze only the trace of an incomplete emulator/simulator.

Wonder who will be first with a solution.

Ciao.....Mike

Re: HP41 Blinky or Red Eye

*Message #4 Posted by **Eric Smith** on 19 Apr 2011, 5:43 p.m.,*
in response to message #3 by Mike (Stgt)

I doubt that anyone but us emulation writers care about it; "normal" users are probably perfectly satisfied with 82143A and 82162A emulation. The 82242A doesn't really bring that much more to the table.

Re: HP41 Blinky or Red Eye

*Message #5 Posted by **Mike (Stgt)** on 20 Apr 2011, 4:27 a.m.,*
in response to message #4 by Eric Smith

Correct, it is an emulator programmer who reminded me lately about this unexplored field. Well, there remains some white space on the map, at least for the HP-41. <VBG>

Re: HP41 Blinky or Red Eye

*Message #6 Posted by **Ángel Martin** on 20 Apr 2011, 3:07 p.m.,*
in response to message #5 by Mike (Stgt)

so many "secrets" lost in the sands of time... this just another one.

Best,'AM

Re: HP41 Blinky or Red Eye

*Message #7 Posted by **Mike (Stgt)** on 21 Apr 2011, 8:46 a.m.,*
in response to message #6 by Ángel Martin

Well, in this case it is not too much a pitty. As Eric sayed, 'it will not bring that much to the table' because there are 82143A and 82162A emulators. But for me its just an interest of comparing technology: has Blinky it's own clock or is the IR signal triggert with timers of the HP-41?

BTW, is there an graphing printer ermulator I may attach to the V-41?

Ciao.....Mike

HP75D AT&T Version

*Message #1 Posted by **Alberto Fenini** on 17 Apr 2011, 5:08 p.m.*

ciao a tutti
this is a unit that I have received few days ago,
it is in working conditions, and the battery compartment has been fully cleaned
however, I'd like to remove the docking station from the unit for further inspection.
Later on, I have also purchased the optical wand that should go with the unit
Does anyone know how to separate the unit and the docking station,
and where I could find the additional documentation from AT&T ??
What was the difference from the standard HP75D (beside the modem and the additional memmory) ??
Thanks in advnace to everyone, take care Alberto

*Message #2 Posted by **John Pierce** on 17 Apr 2011, 10:46 p.m.,*
in response to message #1 by Alberto Fenini

I have a .pdf copy of the Pod's manual which has installation instructions. Send me your email address and I can send it to you. John Pierce

Re: HP75D AT&T Version

*Message #3 Posted by **Jeff O.** on 18 Apr 2011, 8:21 a.m.,*
in response to message #1 by Alberto Fenini

In case you have not connected with John, and/or for anyone else who needs to know, here is how to remove the pod:

How to Remove Pod from HP-75D:
Turn the pod upside-down and you'll see various philips screws. Unscrew the 6 large ones (3 on either side of the pod). Then you can take away the two side-panels which hold the HP75 in place. Gently lift the HP75 and you'll see that the port-plug is connected with a flex-cable. Unplug the HP75 and there you are. A common problem is that HP75 which come in a pod don't have the battery door to run them independently.

Above is not my own, is courtesy of Daniel (last name not known by me), probably from this Forum.

I needed the instructions for the exact same reason you do, to remove the pod from ATT-branded 75D's. I found four of them at a Hamvention seven or eight years ago. I think one or two of them worked (they were wet, having been exposed to rain.) I never found any information on what ATT did with them.

...

Thanks Jeff,
I have sent him an email few minutes ago,
but your note is very helpful anyway.
Where you able to dial a number and make a data connection ?
Why has the modem two ports ?

Take care and thanks, Alberto

Re: HP75D AT&T Version

in response to message #4 by Alberto Fenini

Alberto,
I made no attempt to dial a number or make a data connection. When I said that one or two of mine worked, I meant that they seemed to function as a 75D. I never attempted to use any of the functions provided by the pod.
Good luck with yours,
Jeff

Anyone have a copy of this?

*Message #1 Posted by **gene wright** on 17 Apr 2011, 2:22 p.m.*

Or any other old SR-52 SR-56 books or materials? I made it my aim a few years ago to help encourage the documenting of the TI calculator story since the HP side was already pretty well documented.

For example, at one time, there was a quite extensive user collected library of game programs for the 100 step SR-56 calculator, but I have not been able to find copies of the programs anywhere.

So, anyone?

Book Review Statistics for the SR-52: Keyboard Data, 188 pages $10.00; Statistics for the SR-52: Card Data, 100 pages $11.00; and Statistics for the SR-56, 79 pages $9.30; all by C Donaldson Ellis, published 1977 by Wilmardon Publishing Box 461 Storrs, CT 06268.

All three volumes are printed in a pica typewriter font, one side of 8½ x 11 paper, with direct copy of PC-100 printer listings opposite manually generated mnemonics for program listings. Each program begins with a brief description of what it does (assuming user familiarity with statistics usage), along with special requirements and limitations.

User instructions are contained in a step-numbered Procedure section. This is followed by a table of register contents, and the program listing. Applicable formulas and algorithms are noted as being found in one or more of five references, but are not printed in the text; there are no sample problems. All programs are written for use with the PC-100, with notes covering required modifications for SR-52/56 use only.

The SR-52 keyboard manual covers 54 statistics programs, some requiring more than 224 steps. Input data are entered as required from the keyboard. The card manual arranges half of the keyboard programs to allow for data storage and retrieval via mag cards.

Data packing and unpacking routines are given, but actual card storage is by program step only (no mention is made of direct storage to/from program registers. Register tables show data assignments to Reg 98, 99, 00, ... 19.

Note that a 2 X 2/ 3 X 3 matrix inversion program requires 445 steps, and one titled "Four-way ANOVA--Unweighted Means" requires 1736 steps (8 cards).

The SR-56 manual follows along the same lines, covering 40 programs, some of which require more than 100 steps. The longest program is "Mixed ANOVA 1 Within and 1 Between" which requires 242 steps (3 programs to key in).

*Message #2 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 2:35 p.m.,*
in response to message #1 by gene wright

I used to have an SR-56 at the time and even managed to write my own 3x3 linear equation solver. Sadly, the material is long gone. :(

Re: Anyone have a copy of this?

*Message #3 Posted by **Frido Bohn** on 18 Apr 2011, 3:52 a.m.,*
in response to message #1 by gene wright

Hello Gene,

in the download area of Joerg Woerner's Datamath Museum (www.datamath.org) you will find countless documentation about TI calculators, among others:

- SR-56 Coding Form (European)
- SR-56 Owners Manual
- SR-56 Programming Workbook

The "SR-56 Applications Library" was somewhere I cannot recall, in case of interest send me an email.

Frido

Re: Anyone have a copy of this?

*Message #4 Posted by **gene wright** on 18 Apr 2011, 7:50 a.m.,*
in response to message #3 by Frido Bohn

Thank you, but I have all of that. It is the slightly more obscure materials I had hoped to find.

In fact, on www.rskey.org in the "Library" section, you'll find a ton of documentation for the old SR52 and SR56 that I arranged to be published on that site. :-)

Angular modes (another poll)

*Message #1 Posted by **Walter B** on 17 Apr 2011, 12:33 p.m.*

Hi all,

So far, we have the traditional three DEG, RAD, GRAD implemented in the WP 34S. All trigonometric functions will sense the mode set and operate within the respective mode. There are also five conversion commands as follow:

```
Assumed input                      Operation   Output
---------------------------------+-----------+-------------------------------

decimal value in degrees             D>R      radians, ang. mode as before
decimal value in radians             R>D      degrees, ang. mode as before
decimal value in any ang. mode       >DEG     degrees, ang. mode set to DEG
decimal value in any ang. mode       >GRAD    grads, ang. mode set to GRAD
decimal value in any ang. mode       >RAD     radians, ang. mode set to RAD
```

That said, is there anything missing? Or any suggestions for a better set of operations?

Walter

Re: Angular modes (another poll)

*Message #2 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 1:12 p.m.,*
in response to message #1 by Walter B

I wasn't aware of the different sets of operations with and without change of mode. This makes obsolete my former idea of a user flag which decides whether with the conversion the mode shall be updated. I prefer the set of operations as pictured above.

In fact, we have 4 possible modes (not completely implemented):

RAD, GRAD, DEG and HMS. HMS only exists as a display option. We should investigate the possibility of tagging register content with the associated mode, at least concerning HMS or decimal. OK, I know that Pauli believes we cannot find the necessary bits for this. But I already have an idea. :)

Re: Angular modes (another poll)

in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> We should investigate the possibility of tagging register content with the associated mode, at least concerning HMS or decimal. OK, I know that Pauli believes we cannot find the necessary bits for this. But I already have an idea. :)

Far more important than tagging a value as being H.MS is tagging it as being an integer or alpha data. So after you've found two bits for each of our 112 registers then go looking for space for a H.MS tag :-)

Actually, I know how to get some tag bits for reals. Reduce the accuracy of reals to 12 digits plus exponent and use the saved space to tag values. We could then mark angular mode (all four not just one), fraction, whatever.

- Pauli

Re: Angular modes (another poll)

*Message #4 Posted by **Marcus von Cube, Germany** on 18 Apr 2011, 1:55 a.m.,*
in response to message #3 by Paul Dale

I was thinking of a single decimal digit for the purpose. For H.MS we could even stick to subnormal numbers.

Re: Angular modes (another poll)

*Message #5 Posted by **Dieter** on 18 Apr 2011, 1:45 p.m.,*
in response to message #4 by Marcus von Cube, Germany

One single digit should do - that's four bits, as far as I can see, so 16 different tags are possible. This could mean that there are some additional options - for instance calendar dates. They could be handled as integers, representing their Julian day number, this way allowing simple addition and subtraction instead of special commands. In a similar way, values tagged as h°m's" could be handled without special commands as well. Okay, all this needs some coding... ;-)

In a way it's similar to the Excel approach: every value is stored in a number that can stand for a real number, a date, a percentage, whatever.

If all this can be done with one single digit less I think the advantages outweigh the minimal loss of precision. 15 digits (or 12 displayed plus three "guard digits") are fine for me.

BTW - in earlier HP machines like the HP-41 these tags were simply coded in four mantissa sign bits. I assume this is not an option here?

Dieter

Re: Angular modes (another poll)

*Message #6 Posted by **Marcus von Cube, Germany** on 18 Apr 2011, 3:10 p.m.,*
in response to message #5 by Dieter

The decimal64 is described in detail in Wikipedia. It's not as easy as it seems. 3 digits are packed in ten bits. You cannot simply take a digit and hope it's four bits worth. In fact, 10 different tags would be possible this way. I had anther idea: If we can live without subnormal numbers (numbers which start with one or more zero digits) we could use a limited range of numbers with tags without losing precision on normal reals.

Edited: 18 Apr 2011, 3:11 p.m.

Re: Angular modes (another poll)

*Message #7 Posted by **Paul Dale** on 18 Apr 2011, 8:58 p.m.,*
in response to message #5 by Dieter

This won't work as is. Integers are separate and use all 64 bits available. Likewise, alpha data probably needs a separate bit -- a 64 bit integer holds 64 bits worth of alpha data.

I think we're better defining our own numeric format (which is what this suggestion is doing anyway) and using that.

I'm not sure how we'll go on the code size front. Tagging values will require extra code.

And the first digit in a decimal64 only has 10 states we could use but it would be possible to use I guess. Things are BCD and tightly packed.

- Pauli

Re: Angular modes (another poll)

*Message #8 Posted by **Dieter** on 17 Apr 2011, 1:39 p.m.,*
in response to message #1 by Walter B

First I would suggest a complete set of conversions without any change of the current angular mode. Second, I like the idea of conversions with a simultaneous switch to the target angular mode as well. In other words:

command name	command description	angular mode after execution
D->R	degrees to radians	unchanged
R->D	radians to degrees	unchanged
D->G	degrees to grads	unchanged
G->D	grads to degrees	unchanged
R->G	radians to grads	unchanged
G->R	grads to radians	unchanged
->R	current to radians	Radians
->D	current to degrees	Degrees
->G	current to grads	Grads

By the way: for programming purposes I always liked the idea to get certain key values (like a full or half or quarter circle) in the current angular mode. This usually is done with an inverse trig function: for instance, arccos(-1) returns 180 degrees or Pi or 200 grads. I wonder if this can be done more elegantly with the 34s command set.

Dieter

Re: Angular modes (another poll)

*Message #9 Posted by **Paul Dale** on 17 Apr 2011, 5:45 p.m.,*
in response to message #8 by Dieter

Dieter missed three options:

R->	radians to current	unchanged
D->	degrees to current	unchanged
G->	grads to current	unchanged

Making the full suite:

command name	command description	angular mode after execution
D->R	degrees to radians	unchanged
R->D	radians to degrees	unchanged
D->G	degrees to grads	unchanged
G->D	grads to degrees	unchanged
R->G	radians to grads	unchanged

```
 G->R        grads to radians       unchanged
  ->R        current to radians     Radians
  ->D        current to degrees     Degrees
  ->G        current to grads       Grads
  R->        radians to current     unchanged
  D->       degrees to current     unchanged
  G->        grads to current       unchanged
```

Ask what people want and they come back everything and then some :-)

- Pauli

Re: Angular modes (another poll)

> D->        degrees to current     unchanged
> G->        grads to current       unchanged
> ```

Well, I was not sure if these three make sense. But now I see these three additions will solve exactly the problem I mentioned in my last sentence:

```
Pi   R->    returns the equivalent of a half circle
180  D->    dto.
90   D->    returns the equivalent of a right angle
400  G->    returns the equivalent of a full circle

...in units of the current angular mode.
```

Great! I like it! :-)

Dieter

Re: Angular modes (another poll)

*Message #11 Posted by **Gerson W. Barbosa** on 17 Apr 2011, 2:33 p.m.,*
in response to message #1 by Walter B

However the most useful conversions (that is, keeping the current mode) one would like to do from the keyboard , D>R and R>D, require at least five keystrokes each:

```
D->R:  h  X.FCN  ->  ^  ENTER

R->D:  h  X.FCN  6   ^  ENTER
```

Why not define shortcuts for them?

```
D->R:  ->  5

R->D:  ->  D
```

Furthermore, since simultaneous conversions and changes of mode is not a concern to you, why not save two positions by using cyclic angle mode switching as Pauli has suggested? The blue GRAD under Rv could be

replaced with DRG so our table now would be:

```
Assumed input                    Operation          Output                  Shortcut
-------------------------------+----------+-------------------------------+--------------
---
decimal value in any ang. mode     D>R      radians, ang. mode as before       -> 5
decimal value in any ang. mode     R>D      degrees, ang. mode as before       -> D

decimal value in any ang. mode     DRG      unchanged, angle mode
                                            annunciators changed cyclically
                                            from ...360 to RAD to G...

            .                                                                    \
            .                                                                     |
decimal value in degrees          >DRG      radians, ang. mode set to RAD      -> Rv   |
                                   >DRG      grads, ang. mode set to GRAD       -> Rv   |
cyclically
                                   >DRG      degree, ang. mode set to DEG       -> Rv   |
            .                                                                     |
            .                                                                    /
```

Of course DRG and ->DRG could not be programmable commands.

The drawback would be another poll for choosing the functions that should occupy the free positions.

Regards,

Gerson.

a "gradient" is something different d:-)

Re: Angular modes (another poll)

*Message #17 Posted by **David Hayden** on 17 Apr 2011, 5:52 p.m.,*
in response to message #1 by Walter B

You're missing another set of conversions: going *to* the current angle mode:

```
DEG>   Degrees to current angle mode
RAD>   Radians to current angle mode
GRAD>  Grads to current angle mode.
```

Rather than doing a full set of conversions, I'd consider converting to/from radians only. So a conversion from degrees to grads would be done in two steps (D>R, R->G). This would cut down on the number of commands needed and might make it more feasible to add HMS a fully supported mode. HMS would be useful for navigation and surveying, which seem to be applications that these machines are commonly used for.

Dave

HMS would be useful for navigation and surveying, which seem to be applications that these machines are commonly used for.

One small problem here, conversion to and from radians implies a rounding step and an accuracy loss. I can convert degrees directly to gradians exactly e.g.

Does it matter in real life? Probably not.

Just a thought: Why not have an "exact radians" mode where the numbers are multiples of PI? In this mode, 1.5 SIN would return -1.

Re: Angular modes (another poll)

*Message #20 Posted by **Paul Dale** on 18 Apr 2011, 5:57 a.m.,*
in response to message #1 by Walter B

Since they seem to be wanted, I've added commands for D->G, R->G, G->D and G->R.

To reiterate the big open question, does anyone really want ->DEG, ->RAD and ->GRAD to change the trig mode or just convert the number? Those who've commented about this above don't need to comment again.

We're going to have a flooding if we continue this way: remember we've included R>D and D>R for backward compatibility only. So I vote for keeping these two with their traditional names in X.FCN or P.FCN for exactly that reason, and for putting all 6 conversions possible between DEG, RAD and GRAD into CONV, operating without a mode change.

Additionally, we have 3 conversions "current" to DEG/RAD/GRAD. We get them for free as long as we keep DEG, RAD, and GRAD on the keyboard.

And there was the desire introducing DEG/RAD/GRAD to "current", FWIW.

> Quote:

> To reiterate the big open question, does anyone really want ->DEG, ->RAD and ->GRAD to change the trig mode or just convert the number? Those who've commented about this above don't need to comment again.

To change or not to change (modes in these conversions), that's the question.

Walter

I would just convert the number, without changing the trig mode. In general I've found that commands that do too much usually hurt more than they help. It's easy to forget about the side effect (where the "side effect" is "the thing that the command does in addition to the thing that I want it to do") and this can easily lead to programming bugs. Also, if a command is going to change the way future commands work, I think it needs to be very explicit.

There's my 2 cents worth. :)

in response to message #23 by Jeff O.

I'd like degrees minutes seconds.fractionalseconds too, please. Abbreviation DMS. Navigation and old-fashioned surveying.

Four modes, five if we allow real*PI, which would be handy sometimes. There are going to be few exact conversions from one to another, other than some special values.

Free42/Android skin handling change

*Message #1 Posted by **Thomas Okken** on 17 Apr 2011, 11:32 a.m.*

Yesterday I updated Free42 in the Android Market and on my web site. I posted four updates in quick succession, but only the release notes for the most recent one (1.4.67.4) appear on the Market page, and to make things even more confusing, the "updated" date still shows April 10th.

There have been a couple of minor bug fixes, but the important change is skin handling. Originally, the app would look for the *.gif and *.layout files in /sdcard/Free42, but that causes problems on some devices, because of an incorrect /sdcard symlink, or because of case-smashing in the FAT32 filesystem. This new version of Free42 for Android is meant to avoid these problems, by letting the user select skins from anywhere, using a file selection dialog.

I had originally planned to make the skins directory location configurable, but then it occurred to me that making the user select the directory in one place and then choose the skin in another made no sense; I might as well combine the two.

Note that if a skin is selected from an SD card, Free42 will not be able to load that skin if it is relaunched later when that SD card has been removed. In that case, Free42 will revert to the built-in skin, but it will remember the external skin's path, and when it is relaunched with the SD card once again present, it will load the external skin again.

If you want to have a set of custom skins permanently available, regardless if what's in the SD card slot, you may have to root your phone and/or use a file manager to copy the skins to a directory in the built-in storage. Free42 does not help with the process of copying skins, but it can use them once they are copied.

This new implementation is not perfect, but I think it will meet the needs of most users, without adding a lot of complexity to the code or the user interface.

- Thomas

Re: Free42/Android skin handling change

*Message #2 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 11:48 a.m.,*
in response to message #1 by Thomas Okken

Locating skins works fine, but Free42 does not react on the orientation of my device, nor does it revert to landscape mode, if the skin is wider then high. I usually hold my Archos in landscape mode. :(

I never said it would. Landscape mode support is still on my to-do list.

Re: Free42/Android skin handling change

*Message #4 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 12:14 p.m.,*
in response to message #3 by Thomas Okken

Thanks for the clarification. So I need to find a suitable portrait skin for my device. Will go hunting.

Re: Free42/Android skin handling change

*Message #5 Posted by **Jeroen Van Nieuwenhove** on 18 Apr 2011, 4:14 a.m.,*
in response to message #1 by Thomas Okken

Thanks, Thomas, for the update of this excellent port of Free42. Free42 is my favorite calc on my desktop computer and I was delighted to find it on Android Market when I purchased an Android phone recently. Would it be possible to provide an option to (de)activate key click sounds in a future update? Thanks in advance.

Re: Free42/Android skin handling change

*Message #6 Posted by **Thomas Okken** on 18 Apr 2011, 4:16 p.m.,*
in response to message #5 by Jeroen Van Nieuwenhove

Such an option is on my to-do list; in the meantime, until I get around to implementing it, you can make the key clicks stop using CF 26 (but that will disable TONE, BEEP, and the error beeps as well).

Re: Free42/Android skin handling change

*Message #7 Posted by **Jeroen Van Nieuwenhove** on 19 Apr 2011, 6:38 p.m.,*
in response to message #6 by Thomas Okken

I should have thought of the native quiet mode. That will do for me.

Re: Free42/Android skin handling change

*Message #8 Posted by **Thomas Okken** on 20 Apr 2011, 12:27 p.m.,*
in response to message #1 by Thomas Okken

I added landscape mode support, and an "enable key clicks" Preferences setting (so you can control key clicks independently of TONE/BEEP).

Landscape support is a bit primitive: apart from allowing the orientation change, Free42 doesn't do anything to support it actively, which means the OS has to shut down the app and then relaunch it with the new orientation. While this works fine, it means that the orientation switch can be slow, particularly if you are working with large matrices.

I haven't added a built-in landscape skin yet, because the ones I have don't look very good at 480x320, but depending on screen size, the 42ct, HP42CY, or Voyager42 skins from the Free42Skins.zip package may be usable. By default, you're just going to get the built-in 320x480 skin (or whatever you had selected instead), squished to fit, which will probably not look very good. :-)

I'll have to do something about the file selection dialog to make it look better in landscape mode, and find or create a decent landscape skin, but for the time being, this should be usable. Looking forward to your

feedback!

- Thomas

Re: Free42/Android skin handling change

*Message #9 Posted by **Jeroen Van Nieuwenhove** on 21 Apr 2011, 5:33 p.m.,*
in response to message #8 by Thomas Okken

Now THAT was fast. Thanks a lot, Thomas. Key click selection works fine and orientation switch is smooth. I am going to try out the existing landscape skins you mentioned, although I never use them on my desktop computer.

Re: Free42/Android skin handling change

*Message #10 Posted by **Günter Schink** on 24 Apr 2011, 12:43 p.m.,*
in response to message #8 by Thomas Okken

I've installed the latest release 1.4.69 now, and played around a little bit. I found the best fitting skins for the Galaxy I9000 (800x480) in the maemo5 port for the Nokia N900. There are both, portrait and landscape skins that look rather good. Automatic change of orientation works sufficiently good, though the appearance change from a pionneer to a voyager layout is rather funny

The landscape skin is 42ct-maemo5. The Skin uses 800x428 of the bitmap

The portrait skin is Ehrling42sl-new-maemo5-full. This skin uses 480x729 of the bitmap.

What size is the status line of Android?

Günter

Re: Free42/Android skin handling change

*Message #11 Posted by **Thomas Okken** on 24 Apr 2011, 4:44 p.m.,*
in response to message #10 by Günter Schink

In the Android Emulator and on the HTC Aria/Liberty, the status line is 25 pixels. Those both have 320x480 screens; on devices with higher-resolution screens the status bar is probably higher.

Re: Free42/Android skin handling change

*Message #12 Posted by **Marcus von Cube, Germany** on 24 Apr 2011, 5:34 p.m.,*
in response to message #11 by Thomas Okken

On the large screen devices, an option not to stretch the skin to the full window dimensions might be useful.

Re: Free42/Android skin handling change

*Message #13 Posted by **Thomas Okken** on 26 Apr 2011, 8:03 p.m.,*
in response to message #12 by Marcus von Cube, Germany

I agree. I added it to my to-do list.

HP71B ROM PAC "UDL-71*" by Viewtronics

*Message #1 Posted by **John Pierce** on 17 Apr 2011, 11:20 a.m.*

Does anyone have info or knowledge of an HP-71B ROM PAC produced by Viewtronics in 1986 titled "UDL-71*"? I bought it to use an a 32k EPROM but it has five protected files on it. The ROM PAC may be useful to someone for its software. John Pierce

Hello Jean-Francois, You have mail. John Pierce

Re: HP71B ROM PAC "UDL-71*" by Viewtronics

*Message #4 Posted by **Howard Owen** on 21 Apr 2011, 4:38 a.m.,*
in response to message #1 by John Pierce

Viewtronics was a monitor and terminal maker in the 80s. I purchased several of the inexpensive VTxxx compatible terminals they made when I was the computer manager at the UCSB Physics department. The company seems to be defunct. The domain name is registered to an individual in Ahrensburg, Germany, but no name server answers for a query on "www.viewtronics.com" or "viewtronics.com." Reading the wikipedia entry on ViewSonics, it is clear that company is not a successor or otherwise related to Viewtronics.

I'd be interested to know what that module is about. The obvious thing would be if it contained a driver for a Viewtronics terminals. Regardless, it should be interesting.

Re: HP71B ROM PAC "UDL-71*" by Viewtronics

*Message #5 Posted by **J-F Garnier** on 21 Apr 2011, 1:31 p.m.,*
in response to message #4 by Howard Owen

Thanks to John, I was able to have a look at the ROM PAC.

The ROM is mainly made of a large BASIC program that deals with files, the Wand, and HP-IL devices (the well known "HP82164A" interface, but also two unknown HP-IL devices: "KBUSL48" and "DMX1"). I have no idea of the purpose of this program.

If someone is interested, I have the ROM image available on a LIF image file (for Emu71 or for the HP-71B using the PIL-Box/ILPer), with protection removed...

```
UDL71D     LEX     531 12/16/87 14:52 5.01

Re: HP71B ROM PAC "UDL-71*" by Viewtronics

*Message #6 Posted by **John Pierce** on 21 Apr 2011, 7:09 p.m.,*
in response to message #4 by Howard Owen

After J-F posted his reply I double checked the ROM. My error !!! When I was with Hughes Aircraft we used Viewtronics terminals also. The printing on the UDL-71* ROM PAC is very small and my imagination and 72 year old eyes morphed it from Viewsonics to Viewtronics. I apologize. John Pierce

Re: HP71B ROM PAC "UDL-71*" by Viewtronics

*Message #7 Posted by **Howard Owen** on 22 Apr 2011, 10:49 a.m.,*
in response to message #6 by John Pierce

Curiouser and curiouser. The display company is actually "Viewsonic" without the trailing "s." Wikipedia's entry on the company says that it was formed in 1987, but that it wasn't called Viewsonic until 1990. So this ROM may have been produced by a company I've never heard of before. The ROM dump shows that this code isn't display related on its face, although I suppose it could turn out to be on closer inspection.

Here's some speculation based again on the name "Viewsonics." Perhaps this is a data collection component for a system designed to visualize audio data?

Regards,
Howard

P.S. Obviously you aren't the only one to get confused over subtle name differences. :)

The legend lives on: Two new 41 Modules announced

*Message #1 Posted by **Ángel Martin** on 17 Apr 2011, 7:10 a.m.*

Joining forces with Jean-Marc Baillard, two new 8k Power-Math modules are being released in a few days, as follows:

1. The BESSEL ROM, a compendium of MCODE functions and FOCAL programs to calculate Bessel, Gamma, and other Bessel-Type functions. Real and Complex variables, Integro-differeciation, Spherical, Asymptotic expansion... just to name a few. Includes an all-new Reiman's Zeta using the Borwein algorithm for real and complex variables, don't miss that!

2. The (ultimate) Polynomial ROM, a collection of utilities and programs for Polynomial analysis - Roots, Interpolation, Factorization... both real and complex variables. Don't miss the new LIST capability to introduced the coefficients as list elements using Alpha and dedicated MCODE functions.

Rounding off the final touches - will be coming soon at a TOS near you, the legend lives on.

Cheers, 'AM.

Re: The legend lives on: Two new 41 Modules announced

*Message #2 Posted by **Namir** on 17 Apr 2011, 7:24 a.m.,*
in response to message #1 by Ángel Martin

Jean-Marc is an exceptional mathematician/programmer. He has written advanced calculus applications for the HP-41C that I thought to be beyond the 41's reach!! His skills to push the calculator programming to the limit remind of those the late Swiss professor Peter Henrici had for the HP-25C and HP-33C.

Since the 41C is very dear to me, Jean-Marc's new modules for that machine is a true joy to have. It's like Christmas in spring!

Thank you Angel for sharing and thank you Jean-Marc for developing these new modules. I hope you can attend HHC 2011 so many folks, like myself, could meet you in person!!!

Namir

Re: The legend lives on: Two new 41 Modules announced

*Message #3 Posted by **Ángel Martin** on 17 Apr 2011, 9:22 a.m.,*
in response to message #2 by Namir

I gree with your assessment Namir. In this case it's a 50-50 cooperation between the both of us, so hopefully you've got the "best of both styles".

These modules comprise the best of the SandMath, 41Z, JMB_Math and JMB_Matrix - for the subjects they're concerned with, of course. That plus a few new tricks to round it all off nicely, if I'm allowed to say.

BTW I neglected to mention that the MCODE functions use the 13-digit accuracy wherever possible - and it sure makes a difference.

Cheers, 'AM

Re: The legend lives on: Two new 41 Modules announced

*Message #4 Posted by **Namir** on 17 Apr 2011, 10:10 a.m.,*
in response to message #3 by Ángel Martin

Angel,

When it comes to complex math on the HP-41C you are the "Hercules" of this aspect.

I am really looking forward to downloading these modules.

Namir

HP65 vs HP67 card reader

*Message #1 Posted by **Alberto Fenini** on 17 Apr 2011, 6:26 a.m.*

ciao a tutti,
I'm trying to repair the HP65 shown on the left of the picture,
it is working but the previous owner has ruined the head cabling.
Between my HP67s I have found the one pictured on the right,
which differently from the others has a card reader apparently identical.
What do you think ??
Can I take this HP67 card reader and use it on the HP65 ??
Or, on the other hand, does anyone has ever found a replacement for the HP65 magnetic head ??
As usual, thanks for any suggestion, enjoy the weekend !!!
Alberto

Re: HP65 vs HP67 card reader

*Message #2 Posted by **Ignazio Cara (Italy)** on 17 Apr 2011, 1:18 p.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto,

IMHO, you can swap entirely the card reader assembly (head/motor/Reader PCB) among the calculators. The 67's sense-amplifier is compatible with the 65, I have changed this chip with success in one of mine. For sure you can't make damage to the calculator's logic PCB.

About your second question,

> Quote:
>
> Or, on the other hand, does anyone has ever found a replacement for the HP65 magnetic head ??

take a look at this old post:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=167082#167082

Let me know how the work proceeds, take care.

Ignazio

HP 10bII+ first impressions

*Message #1 Posted by **Jose Gonzalez Divasson** on 16 Apr 2011, 2:46 p.m.*

We have received the new HP10bII+ and have posted our first impressions

HP 10bII+ first impressions

While not a substitute for the whole review that will come in a few days, I think that there is another candidate for repurposing - with a far better keyboard than the 20b!

Re: HP 10bII+ first impressions

*Message #2 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 3:17 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Thanks for the review. Now that I'm in the repurposing business, I would love to see a review of the ongoing wp34s project.

Re: HP 10bII+ first impressions

*Message #3 Posted by **svisvanatha** on 16 Apr 2011, 3:30 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I was thinking of devoting a post on my blog to the very same...

And in terms of repurposing projects - I believe that most of the elements are in place to create a '15c+' using the new 12c+ as the hardware, and reusing functions from the wp34s. Matrix operations to mimic the 15c's would need to be developed though.

<hides under desk>

Re: HP 10bII+ first impressions

*Message #4 Posted by **Paul Dale** on 17 Apr 2011, 4:02 a.m.,*
in response to message #3 by svisvanatha

The screen makes it not worthwhile.

*Message #14 Posted by **Tim Wessman** on 16 Apr 2011, 10:43 p.m.,*
in response to message #11 by hpnut

We tried hard to put it in (even as a hidden mode or something), but I can tell you that there was a lot of research done with various professors and real estate people (the main target for this machine) and it was unanimous that even if it was well hidden they didn't want it in there. . .

Too much concern about possibility of messing things up for students and test takers. Yeah, I think it is dumb too but the target research was clear.

TW

To recall something something that I think most here already know:
From HP's own website, see the Fun Fact on this page. (I know this is on the Museum site too, but I like to remind manufacturers what's on their own website :-)

Without which we may never have been here at all! Thanks Bill :-)

Re: HP 10bII+ first impressions

*Message #16 Posted by **Jim Yohe** on 17 Apr 2011, 12:13 p.m.,*
in response to message #15 by DeboT

Yes we would need mighty large pockets to carry a "calculator be the size of a typewriter or adding machine" had marketing had their way. ;-)

Re: HP 10bII+ first impressions

*Message #17 Posted by **Palmer O. Hanson, Jr.** on 18 Apr 2011, 9:56 p.m.,*
in response to message #15 by DeboT

> Quote:

> Without which we may never have been here at all! Thanks Bill :-)

There already were some pocket sized four-bangers. Sooner or later some manufacturer was going to build a pocket sized scientific calculator. H-P's good fortune was that they built the first one, even though everyone knows that it took a really big pocket to hold an HP-35.

Re: HP 10bII+ first impressions

Refurbished HP-85

*Message #1 Posted by **David Ramsey** on 16 Apr 2011, 1:26 p.m.*

I've been casually looking for a good-condition HP-85 for my collection for some years. Not too seriously-- I'm mainly into the scientific handhelds, but I've got all of those, and have picked up a 9815, 9826, and HP-46 along the way.

This auction on the auction site describes a "professionally refurbished" HP-85. The company, LA Tech Renewal, claims to have replaced the CRT, installed a new QIC tape drive, repainted the case with epoxy paint, and all in all gone to a lot of trouble to bring this device back as close to "as new" condition as possible.

Looks like a dream machine, really.

So: any advice from the membership? Has anyone dealt with these folks before? The Buy It Now price is admittedly high, but there's at least one other non-refurb 85 available that's even higher.

Re: Refurbished HP-85

*Message #2 Posted by **gene wright** on 16 Apr 2011, 1:44 p.m.,*
in response to message #1 by David Ramsey

Very interesting, David! But yes, a bit high for MY tastes. :-)

That said, do you think you might come down to HHC this year in San Diego? Lots of fun things this year and would be good to see you again.

Had MacPaint 2.0 open just last week for fun. ;-)

Re: Refurbished HP-85

*Message #3 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 2:16 p.m.,*
in response to message #2 by gene wright

Any HHC sponsors for the 34s team? :)

Re: Refurbished HP-85

*Message #4 Posted by **David Ramsey** on 16 Apr 2011, 3:11 p.m.,*
in response to message #2 by gene wright

Hm. Maybe I should-- it's been years, after all! When is the get-together this year?

(And I'm impressed that you're still running a Mac that can handle MacPaint; they took the 68K emulator out of the OS back with Leopard, I believe...)

Edited: 17 Apr 2011, 12:25 p.m. after one or more responses were posted

Email me, David...

*Message #5 Posted by **gene wright** on 16 Apr 2011, 3:45 p.m.,*
in response to message #4 by David Ramsey

Give me a shout through the forum email.

Good to know. I'm very tempted...

Re: Refurbished HP-85

*Message #8 Posted by **Eric Smith** on 16 Apr 2011, 8:35 p.m.,*
in response to message #1 by David Ramsey

Might be a "new old stock" QIC tape drive, but there's no such thing as a "new" QIC tape drive that will work in an HP-85.

Re: Refurbished HP-85

*Message #9 Posted by **Steve Leibson** on 16 Apr 2011, 9:46 p.m.,*

in response to message #8 by Eric Smith

It's not a new QIC drive, if you read the article, Atherton refurbishes the old drive and mills the rails to take new QIC cartridge tapes.

Re: Refurbished HP-85

*Message #10 Posted by **Jose Gonzalez Divasson** on 17 Apr 2011, 8:28 a.m.,*
in response to message #9 by Steve Leibson

I bought a refurbished drive from Atherton for my HP-85, and I received the standard applications and math pacs in brand new tapes. I had the service manual to perform all the changes.

It has worked flawlessly since. It was a pleasure to deal with him!

Re: Refurbished HP-85

*Message #11 Posted by **Jeff Davis** on 17 Apr 2011, 8:03 p.m.,*
in response to message #1 by David Ramsey

I have a HP-85A that I hand picked from several units that is in need of re-furbish. I am sure we can work a deal if you want to refurbish yourself. Let me know

Re: Refurbished HP-85

*Message #12 Posted by **David Ramsey** on 18 Apr 2011, 1:55 p.m.,*
in response to message #11 by Jeff Davis

Hm. How functional is the unit you have? I've repaired the tape readers before (heat-shrink tubing around the drive wheel in my 9825 has worked for about 15 years now), but wouldn't be able to do any electronics...

Re: Refurbished HP-85

*Message #13 Posted by **Jeff Davis** on 20 Apr 2011, 7:07 p.m.,*
in response to message #12 by David Ramsey

Well, the keyboard will need to be cleaned good. The printer will need new belts and of course the tape drive will need the gummy wheel replaced. The case is slightly yellowed but was picked from five units to be the least yellow. The CRT is probably original but does still work.Shoot me a private e-mail and I can get some pictures to you.

I am really, really glad I don't have room for that :-) Fantastic looking, and I'm sure it would be a blast to play with.

Re: Refurbished HP-85

*Message #15 Posted by **David Ramsey** on 18 Apr 2011, 1:57 p.m.,*
in response to message #14 by BobVA

Yeah...I used to work at the KA Computer Store in Dallas, Texas, in the late 1970s. We sold HP-85s (as well as Apple][s and Ataris). I used to love playing with the 85s but could never have afforded one then.

Frankly the Apple and Atari computers of the time were both cheaper and more capable than the 85, as long as you didn't need the 85's connectivity. But there was just something about it...

Re: Refurbished HP-85

*Message #16 Posted by **Namir** on 18 Apr 2011, 2:35 p.m.,*
in response to message #15 by David Ramsey

The HP-85 was my first personal computer. I bought it in December 1980 and added the matrix ROM, more memory, and the advanced programming ROM. I was able to write cool programs that did matrix manipulation very easily (you can find similar program for the HP-71B and its math ROM on my web site).

The thing that bugged me was the data cartridge. It was slow. I considered adding a disk drive but when I looked at the cost (it cost more than an Apple][+), I decided to sell the HP-85 (and its accessories and applications) and buy an Apple][+. I ended up with THREE disk drives for the Apple. It was a wonderful computer. I had VisiCalc and other VISI programs. I also ran UCSD Pascal (learning Pascal was awesome), and eventually added a CP/M board.

I finally sold the Apple for the then new CP/M machine and eventually getting an IBM XT (with an 15 MB hard drive), ushering me in the world of DOS.

I still long for the HP-85. Space is what makes me shy away from buying a refurbished machine. That's why I enjoy the HP-85 emulator.

in response to message #16 by Namir

My first computer was an HP-85 also and still own it. It was purchased at EduCalc, sits in storage in near perfect condition with no case discoloration. I bought one of the big HP cases to store it. At this point I think it has more upside potential than the US dollar, so will keep it.

NEW WP 34S bug list

*Message #1 Posted by **Walter B** on 16 Apr 2011, 12:02 p.m.*

Hi all,

I start a new thread herewith since the old has become quite long, and OTOH we have a new build since yesterday where we don't know of any bugs so far :-)

So come on, you alpha-beta testers: check the device and the emulator and please report your findings. I suggest we start counting again from 1.

Walter

Re: *NEW* WP 34S bug list - and new release

*Message #2 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 12:22 p.m.,*
in response to message #1 by Walter B

We are preparing a new "offical" release of version 1.17 complete with manual, emulator and flash image. It will be available on SourceForge as a standard download. So no need to go to the SVN repository. I'll keep you posted...

New release 1.17

*Message #3 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 2:50 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I've updated the release package on SourceForge.net. There may a few minor updates to this package if we detect errors in the software or documentation, but major function updates will only be introduced with the next release.

Go here: https://sourceforge.net/projects/wp34s/

The green download button should work for all of you. The flash image is included.

Re: New release 1.17 - bug fixes

*Message #4 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 3:31 a.m.,*
in response to message #3 by Marcus von Cube, Germany

I've put up an new zip file to SF. Instead of having the manual twice in the file, I've added a small Windows cmd file to copy it to the emulator to make Help work.

Untested from my side.

Re: New release 1.17 - more bug fixes

*Message #5 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 7:22 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Current release now is 673. If you find errors, try this one first!

Re: New release 1.17 - more bug fixes

*Message #6 Posted by **Paul Dale** on 17 Apr 2011, 7:25 a.m.,*
in response to message #5 by Marcus von Cube, Germany

All the problems mentioned so far (except the SUM lock up) plus a couple of others should have been fixed in this release.

- Pauli

Re: New release 1.17 - what is my revision?

*Message #7 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 7:36 a.m.,*
in response to message #6 by Paul Dale

The VERS command displays the internal revision number along with the version number. If you look at the flash image calc.bin with a hex editor, the revision number is at the very end of the 128 KB long file.

Re: New release 1.17 - what is my revision?

*Message #8 Posted by **svisvanatha** on 17 Apr 2011, 8:18 a.m.,*
in response to message #7 by Marcus von Cube, Germany

This will make bug reporting and tracking easier. Thanks.

Re: New release 1.17 - what is my revision?

*Message #9 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 8:32 a.m.,*
in response to message #8 by svisvanatha

It will *not* work, if you get your files via the SVN web interface. This is a peculiarity of SVN. No problem if you use an SVN client on your computer.

Re: New release 1.17 - what is my revision?

*Message #10 Posted by **svisvanatha** on 17 Apr 2011, 9:15 a.m.,*
in response to message #9 by Marcus von Cube, Germany

I am using an SVN client ... easier to update that way.

Bug 16 - binomial

*Message #11 Posted by **gene wright** on 16 Apr 2011, 1:36 p.m.,*
in response to message #1 by Walter B

This is using the flash from late yesterday afternoon, so I think it is the proper calc.bin file.

The binomial distribution calculation has an apparent problem with an argument of 0 successes.

Store 0.5 in J, 5 in K.

Key 0 green PROB ENTER.

A value of 0 is returned.

I think it should have been 0.03125 instead.

As a check, I keyed 4 green PROB ENTER and got 0.96875, which implies a 0.03125 probability of exactly 5 successes.

Since the distribution is symmetrical at these values, 0 should return the 0.03125 I think.

Re: Bug 16 - binomial

*Message #12 Posted by **Walter B** on 16 Apr 2011, 2:30 p.m.,*
in response to message #11 by gene wright

Gene,

This looks like a simple counting error. When you take Binom[sub-p], you find the pdf is indeed symmetric, but with

```
p(0) = p(5) = 0 which should be 0.03125
p(1) = p(4) = 0.3125 which should be 1/2 of it, i.e. 0.15625
p(2) = p(3) = 0.3125 which is correct.
```

So the sum of all these probabilities exceeds 1 obviously.
OTOH, the cdf returns

```
P(0) = 0        which should equal p(0)
P(1) = 0.1875   which is correct, as well as the following values
P(2) = 0.5
P(3) = 0.8125
P(4) = 0.96875
P(5) = 1
```

Pauli will know what he did there.

Walter

Edited: 16 Apr 2011, 2:47 p.m.

Re: Bug 16 - binomial

*Message #13 Posted by **Paul Dale** on 16 Apr 2011, 8:09 p.m.,*
in response to message #12 by Walter B

Fixed in next release.

Wasn't a counting error, it was a x<=0 boundary test instead of an x<0 test. The same was present in the Poisson distribution.

- Pauli

Bug 17 - lockup doing Sum label

*Message #14 Posted by **gene wright** on 16 Apr 2011, 3:15 p.m.,*
in response to message #1 by Walter B

Ok, have reproduced this twice.

First, make LBL A RTN as a program.

Then key 10 BLUE SUM (the 3 key) A to sum from 1 to 10, showing 55 as result.

Then, key 10 YELLOW PI A to show the factorial of 10, which is 3,628,800.

Then as a mistake, press BLUE SUM A with the 3,628,800 in the display. Realize after a second or two that this was a mistake and press R/S to stop.

Here comes the lockup...

Now key 10 blue SUM A and you're locked. Have to yank the batteries.

:-)

Re: Bug 17 - lockup doing Sum label

*Message #15 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 3:18 p.m.,*
in response to message #14 by gene wright

Can you test this on the emulator, please?

Re: Bug 17 - lockup doing Sum label - same on emulator

*Message #16 Posted by **gene wright** on 16 Apr 2011, 3:24 p.m.,*
in response to message #15 by Marcus von Cube, Germany

emulator locks too.

Re: Bug 17 - lockup doing Sum label - same on emulator

*Message #17 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 3:54 p.m.,*
in response to message #16 by gene wright

Something for Paul to look into. I may help with the debugger. It's always helpful when a problem occurs in the emulator, too. It's far easier to debug this way.

I ask you a favour: We've updated the release a few minutes ago. Can you check with the current emulator revision please?

Re: Bug 17 - lockup doing Sum label - same on emulator

*Message #18 Posted by **gene wright** on 16 Apr 2011, 4:04 p.m.,*
in response to message #17 by Marcus von Cube, Germany

I downloaded using the green button you pointed out earlier today. :-)

Build date is 2011-4-16 (654)

Re: Bug 17 - lockup doing Sum label - same on emulator

*Message #19 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 4:09 p.m.,*
in response to message #18 by gene wright

What for Pauli to report back.

Re: Bug 17 - lockup doing Sum label

*Message #20 Posted by **Paul Dale** on 16 Apr 2011, 8:15 p.m.,*
in response to message #14 by gene wright

Without having tested anything here, I *think* I know what might be going on.

The final SUM command executes fine and returns into the previous SUM command when it finishes which then continues. SUM is just a keystroke program and you stopped it with R/S so the return stack stays intact.

I thought there was locking to prevent nesting here but clearly it isn't working. Or I've diagnosed this incorrectly.

- Pauli

Re: Bug 17 - lockup doing Sum label

*Message #21 Posted by **Paul Dale** on 19 Apr 2011, 3:28 a.m.,*
in response to message #14 by gene wright

I made a change so that R/S cannot interrupt an internal program. Rather it waits until we're back in user code before stopping. This shouldn't take very long and I doubt it will ever be noticeable.

On the Windows emulator, I now get the "SLV [integrate] [Sigma] [Pi] Nested" error which is what I'd have expected the originally. Twice out of two tries. I haven't tried this on the hardware yet.

Doing 10 g-shift SUM A after this works properly as the error clears the nesting flag and resets the subroutine return stack.

- Pauli

Re: *NEW* WP 34S bug list

*Message #22 Posted by **Dieter** on 16 Apr 2011, 4:23 p.m.,*
in response to message #1 by Walter B

Start with an completely erased 34s. Enter program mode, see 477 available steps. Enter LBL A or RCL 01 or some other step. See 476 steps left - but not the previously entered program step. Clear program (CLP), and still see 476 available steps, not 477. The first step seems to have disappeared somewhere where it is not visible while it still occupies some memory.

Dieter

Re: *NEW* WP 34S bug list

*Message #23 Posted by **Andrés C. Rodríguez (Argentina)** on 16 Apr 2011, 4:47 p.m.,*
in response to message #22 by Dieter

Is there a PACK function on the WP34S?

:-) with fond HP-41 memories

Re: *NEW* WP 34S bug list

*Message #24 Posted by **Marcus von Cube, Germany** on 16 Apr 2011, 5:01 p.m.,*
in response to message #23 by Andrés C. Rodríguez (Argentina)

I don't think you'll need this. Because its processor is fairly slow, the 41C had to postpone memory reorganization until it was inevitable. We have some more horsepower, so it's done in real time.

Re: *NEW* WP 34S bug list

*Message #25 Posted by **Andrés C. Rodríguez (Argentina)** on 16 Apr 2011, 8:05 p.m.,*
in response to message #24 by Marcus von Cube, Germany

I know; it was just a non-serious comment about the "missing" memory capacity mentioned in a previous post.

Re: *NEW* WP 34S bug list

*Message #26 Posted by **Paul Dale** on 16 Apr 2011, 8:57 p.m.,*
in response to message #23 by Andrés C. Rodríguez (Argentina)

> Quote:
>
> Is there a PACK function on the WP34S?

We'll we've something similar to PACK. "h-shift 0 9 9" is the magic invocation sequence to activate this special command. It doesn't say packing but otherwise has all the visible effects of PACK :-)

- Pauli

Re: *NEW* WP 34S bug list

*Message #27 Posted by **Paul Dale** on 16 Apr 2011, 8:18 p.m.,*
in response to message #22 by Dieter

There is no step 477. I don't yet know why it appears on cold start.

- Pauli

Re: *NEW* WP 34S bug list

*Message #28 Posted by **Paul Dale** on 16 Apr 2011, 8:35 p.m.,*
in response to message #27 by Paul Dale

Got it, the RAM integrity check didn't work on a clean power up. Fixed.

Until then I recommend a CLALL after first turning the device on. This isn't necessary after an Erased message however.

- Pauli

Re: *NEW* WP 34S bug list

*Message #29 Posted by **Gerson W. Barbosa** on 17 Apr 2011, 8:48 a.m.,*
in response to message #1 by Walter B

Not a bug, but a cumbersome feature: combined angle conversion and angle mode switching. Pauli told me this was done on request, but I would ask you to consider changing back to the original feature (perhaps after a democratic poll). If I let the calculator in DEG mode, for instance, that's because most angles I am dealing with at the moment are in degrees. In case an angle in radians appear while in that mode, I would just do the conversion (-> g DEG). Under the current implementation two additional keystrokes (g DEG) are required after every conversion in order to keep the calculator in the desired DEG mode. Thanks!

Gerson.

Automatic mode switching

*Message #30 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 9:10 a.m.,*
in response to message #29 by Gerson W. Barbosa

Gerson, automatic mode switching is not to everyone's liking. I vote for having a user settable flag decide if ->DEG switches to degrees mode or not. In order not to compromise the portability of user programs the setting should only influence direct mode. In program mode, all mode switching should be explicit.

Re: *NEW* WP 34S bug list

*Message #31 Posted by **Dieter** on 17 Apr 2011, 11:32 a.m.,*
in response to message #1 by Walter B

I took a look at stats.c (revision 672) and the code for the normal cdf and its inverse. At some points it looks familiar. ;-) However, here are some suggestions for improvements and even a bugfix:

- The quantile is determined by solving ln [1 + (cdf(x)-p)/p] for x, as suggested in an earlier post. However, if I get the code right, it actually evaluates ln[1+(cdf(x)-p)]/p. Obviously lines 902 and 903 should get swapped here.

  The log1+x may even be omitted since the initial guesses are rather close to the final result now. Without log1+x we simply solve for the relative error to become zero (or less than 1E-16). I haven't tried this, so please check. The log may be useful since it makes the remaining error more linear which might lead to faster convergence.

- The normal CDF is evaluated either by a series (center) or a continued fraction expansion (tails), with s split at x=10. This means that even for x=5 or x=8 the series is used, which converges very slowly here (in fact the series works best for |x|<1). That's why the split between both methods should be done much earlier, usually somewhere between 2 and 3. In this range both methods require roughly the same time

so that the result is obtained as fast as possible. But there's another, even more important reason for an earlier split: the series expansion finally adds a constant 0,5 - which means that there is a loss of precision because of cancelled digits. With 39 digits this might be tolerable as we only need 16 digits in the final result. But at x=10 the CDF is 7,6 E-24, so things get very close here. Mathematically, the best point to split would be quantile(0,1) = 1,28155. As mentioned, a value between 2 and 3 would be better in terms of execution speed, so the optimum here is quantile(0,01) = 2,3263. Up to this point only one digit is lost in the CDF. So just one guard digit is required, while we got more than 20 of those. ;-) And the final result is obtained much faster than before.

This of course means that the number of terms for the CF calculation has to be known. Right now 20 terms are used for any value > 10, which should give about 20 valid digits. For this precision I would suggest to try n = 5 + k/(|x|-1) with k = 150...180. This seems to be a good estimate for |x| > 2.

BTW the CF implementaion has a minor error which usually does not show up in the result but should be removed anyway. It was obviously copied from an earlier post (also found in "normal-formulas") that includes the same error:

```
"not quite right" ;-)             correct
-------------------------------------------------------
n := [ see above ]                n := [ see above ]
s := 1/n                          s := 0
for c := n-1 downto 1 do          for c := n downto 1 do
    s := c / (s + x)                  s := c / (s + x)
s := s + x                        s := s + x
cdf := pdf(x) / s                 cdf := pdf(x) / s
```

This should be corrected.

At the moment the CF method is used only for large *negative* arguments, so x = +5 or x = +8 are calculated by the series expansion. I strongly suggest to use the series only for arguments with an *absolute value* less than a certain limit, and finally return the result or 1-result. As mentioned, the split between CF and series should be done somewhere near x = 2...3.

- The documentation ("formulas") includes a series for the inverse error function. This can be used here as well. I also mentioned a short (four-term) series for the inverse quantile which gives exact results near the center (p = 0,495...0,505). This is quite useful since here the solver may return a slightly imprecise result, because very close to the center there are hundreds or even millions of quantiles that return the same CDF.

Finally two remarks on the date functions:

- The split between Julian and Gregorian dates now is done in 1752, which is the date the British Empire and its colonies happened to switch. Please, use the "official" date, which is 4 October 1582 (last Julian date) resp. 15 October 1582 (first Gregorian date). I do not know of any other calendar algorithm that would use a different date. Okay, Unix may be an exception. ;-)

- There also seems to be an extensive error check for illegal dates. This could be simplified by converting the date to its Julian day number and back again. If this result is the same as the original date it's valid, otherwise it's not. ;-)

Dieter

Re: *NEW* WP 34S bug list

*Message #32 Posted by **Marcus von Cube, Germany** on 17 Apr 2011, 11:57 a.m.,*
in response to message #31 by Dieter

Pauli should add you to the list of developers so that you can implement your welcome suggestions

yourself. The tools needed are either open source (gcc and friends) or freely available (MSVC Express).

Pauli, Walter, what do you think?

Re: *NEW* WP 34S bug list

*Message #33 Posted by **Dieter** on 17 Apr 2011, 1:20 p.m.,*
in response to message #32 by Marcus von Cube, Germany

Waaaah! No way! ;-) I just know a little bit about algorithms for the normal distribution and its inverse. My programming skills include a bit Pascal and VBA, and that's it. By no means I am some kind of "software developer". I only can try to understand a bit of your C-code and suggest some minor improvements. GCC (and the whole world of C) is absolutely foreign territory to me. ;-)

I managed to split the emulator functions into a DLL requiring the full blown Visual Studio to compile (because of MFC dependencies) and the wp34s kernel. The latter can be compiled (and even debugged) with VC++ Express. Pauli does so all the time. :)

For the real build, you need MinGW, Yagarto and the common unix utilities like uname, make, and the like.

Thanks for the suggested improvements. I'll have a look later today hopefully. Anything which makes the code better is good.

> Quote:
>
> The log1+x may even be omitted since the initial guesses are rather close to the final result now. Without log1+x we simply solve for the relative error to become zero (or less than 1E-16).

Our initial guesses aren't very good for all the distributions we invert. e.g. the F distribution is very bad but others suffer from this as well. We're solving down to a relative error way below 1e-16 btw,

> Quote:
>
> The normal CDF is evaluated either by a series (center) or a continued fraction expansion (tails), with s split at x=10. This means that even for x=5 or x=8 the series is used, which converges very slowly here ...

The split point was determined by the number of terms I happened to have integer constants for :-) It isn't difficult to change, it will mean building some of these constants at run time which isn't a problem.

> Quote:
>
> The documentation ("formulas") includes a series for the inverse error function. This can be used here as well. I also mentioned a short (four-term) series for the inverse quantile which gives exact results near the center (p = 0,495...0,505). This is quite useful since here the solver may return a slightly imprecise result, because very close to the center there are hundreds or even millions of quantiles that return the same CDF.

I've not done this at this stage due to space limitations. Your recent proposals will use more flash than I'd like currently :-(The imprecise result shouldn't be an issue because the calculation is done to an insanely high internal precision.

> Quote:
>
> The split between Julian and Gregorian dates now is done in 1752, which is the date the British Empire and its colonies happened to switch. Please, use the "official" date, which is 4 October 1582 (last Julian date) resp. 15 October 1582 (first Gregorian date). I do not know of any other calendar algorithm that would use a different date. Okay, Unix may be an exception. ;-)\

Far more people use the 1752 change over date than the 1582 one. The population of India alone exceeds the world Catholic population and that was only a portion of the British empire. Walter didn't want me to add a flag to indicate which so I'm sticking with the more popular date even if it is wrong for most of Europe :-)

That's less than half true. I wanted Pauli to switch to 1582 and I did use population as an auxiliary

argument :-) Whoever cares in India about the British Empire of 1752 anymore ...

That's exactly the point. ;-)

Please take a look at this overview on en.wikipedia.org. Here you can see how the Gregorian calendar has been adopted throughout the world, spanning a time of several centuries. There is no single switch date. If the size of the population is an argument, the preferred date was 1912 - at that time China switched, which accounts for about 20% of the world's population.

Just *because* the switch dates are so different the only option that really makes sense is the choice of "the official source" (tm), which is Pope Gregory's document dated February 1582, stating the switch in October that year. I don't think this is a question of one's confession, or if you live in a country of the Commonwealth, the European Union or elsewhere in the world. We should consider *Inter Gravissimas* a simple administrative act (if the term is correct here ;-).

That's why I think that JG1582 should be at least the default setting on the WP34s. :-)

India + USA far exceeds China's population BTW. Both ex-British colonies. And the latter is probably the bulk of our user base.

> Quote:
>

Except that India has its own national calendar:

http://en.wikipedia.org/wiki/Indian_national_calendar

Native Spanish and Portuguese speakers outnumber by far native English speakers, if this can give a clue who is the majority :-)

http://geography.about.com/od/culturalgeography/a/10languages.htm

Incidentally two of the greatest writers of the two most spoken western languages share the same death dates: both William Shakespeare and Miguel de Cervantes Saavedra died on April 23rd, 1616. However Cervantes died ten days earlier. This is only a small example of confusion caused by the late adoption of the Gregorian calendar by the English.

I'd put this down to the introduction of the Gregorian calendar. That was the change that made dates diverge. The calendar's equivalent of day light saving time. Check out the aforementioned wikipedia page to see the widespread chaos that this introduction caused :-)

> Quote:
>
> The quantile is determined by solving ln [1 + (cdf(x)-p)/p] for x, as suggested in an earlier post. However, if I get the code right, it actually evaluates ln[1+(cdf(x)-p)]/p. Obviously lines 902 and 903 should get swapped here.

Fixed. Ln() is a very expensive function on the device. It takes about 0.06 seconds to execute once. I can do a lot of adds, multiplies, divides and even square roots in this time. Thus, this transformation isn't ideal from a time perspective, but it is good for accuracy.

I've changed the normal cdf to use the series below x = PI and the CF expansion above this point. PI was fortuitous, the actual break even point is fractionally higher circa 3.2 to 3.3 but the difference is small. One iteration of the series is approximately twice the work of one iteration of the CF expansion BTW. I increased the number of terms in the CF expansion to give us accuracy beyond the 16 digits displayed to the user -- we need some extra to get correct rounding and we need potentially quite a few extra so the solver can invert correctly.

> Quote:
>
> BTW the CF implementaion has a minor error which usually does not show up in the result but should be removed anyway.

Fixed. Nice find. You know coding better than you let on :-)

> Quote:
>
> There also seems to be an extensive error check for illegal dates. This could be simplified by converting the date to its Julian day number and back again. If this result is the same as the original date it's valid, otherwise it's not. ;-)

Changed. Smaller code is always good even if this means slightly slower execution.

First WP 34S R&D Meeting Central Europe

*Message #1 Posted by **Walter B** on 15 Apr 2011, 2:50 p.m.*

Hi all,

It's a great pleasure for me telling you we had said meeting in Wehrheim (next to the center of Europe ;-) today and made great progress. We increased the number of flashed 20bs in our development team by breathtaking 50% in half a day. Together we got rid of the nasty LNGamma bug. In consequence, also the COMB and PERM and FACT bugs flew away :-) Thus there is a new build on SVN. Try it out!

On behalf of the R&D division
Walter

P.S.: There will be some pictures online soon. - Oh, here they are already! Now you know how a GAWP looks like (a German After Work Party) ;-)

Edited: 15 Apr 2011, 3:20 p.m.

*Message #2 Posted by **Namir** on 15 Apr 2011, 11:48 a.m.,*
in response to message #1 by Jeff Kearns

If you need the documentation to *play* with the HP-41C, then I can't help you.

If on the other hand you mean to **use** the module to do forecasting, then let me suggest the open source R language. It is free (actually a free clone for the S and S-PLUS commercial packages) and a very powerful statistical tool. The software has a GUI interface and uses a "command prompt" window. You can also open script windows and data windows (where each such window edits a specific vector or matrix). Since R is free it has gained a lot of momentum and many books have been published that use R as the software to drive the books' code.

I have written several free tutorials on various aspects of using and programming R. Click here to get to the main page for my tutorials for R. One tutorial focuses on regression and provides powerful R code that allows you to test hundreds of regression models to select a few best models. This R program takes the Best Fit routines in the HP41CV's Advantage module and PPC-ROM, or the HP42S to new limits!!

Namir

HP-41C Overlay Generator

*Message #1 Posted by **spb** on 14 Apr 2011, 7:54 p.m.*

I recently wrote a little web-based application that generates overlays for the HP-41C. The interface allows you to edit the label for each key on the overlay, choose the font and colour for the labels, and choose the colour and label for the decorative stripe around the perimeter of the overlay.

The output is an SVG file containing the overlay. Most browsers of recent vintage should have no problem correctly displaying and printing SVG. IE is the notable exception; if you're using IE you'll have to save the output (use .svg as the extension) and use an external application that understands SVG (like PhotoShop or Inkscape).

The generator is at http://hp.meshuggeneh.net/.

I put this together for personal use, but figured other people might find it useful. Feedback is welcome.

> Quote:
>
> After testing: accentuated letters (é, è, ê, etc.) are not welcome apparently.

You should now be able to use any characters that are allowed in UTF-8 (assuming the font you've selected supports them). Originally I had written it to support only special characters that are defined as HTML entities; this covers most mathematical symbols, Greek letters, and so on, and as a North American English speaker it didn't occur to me to bother with umlauts and so forth.

Re: HP-41C Overlay Generator

> Quote:
>
> I could suggest you to change the "HP-41C" for "HP-41CX" or other... and add in the side of the layer the "name".

The label is editable; just change what's in the **stripe label** blank. The `HP41C' text is just a default, which I expect most people will change to reflect the function of the overlay, following the conventions of the original module-specific overlays from HP.

If I'm feeling ambitious I might add in the ability to add labels/text along the sides. The main difficulty there is that the sides of the overlay are curved, which complicates text placement.

Re: HP-41C Overlay Generator

*Message #7 Posted by **Xavier A. (Brazil)** on 16 Apr 2011, 9:10 a.m.,*
in response to message #6 by spb

I hope you will.

2nd functions are pretty common, particularly on the first line ('a to e' labels).

But at this time it is ever possible to print two times on the same overlay to place first and second functions on the same line, even if the result may appear confusing or fuzzy.

Re: HP-41C Overlay Generator

*Message #8 Posted by **spb** on 18 Apr 2011, 8:15 p.m.,*
in response to message #7 by Xavier A. (Brazil)

> Quote:
>
> 2nd functions are pretty common, particularly on the first line ('a to e' labels).

There are now two label blanks for each key. The first is for the label that goes over the key and the

second is for a label to be placed to the left of the key. The side labels are all blank by default.

You can label every key, but if you also leave the decorative stripe and label enabled this will tend to conflict with side labels on the leftmost keys on the lower rows.

The numbering of the keys has also been changed to reflect the HP-41C's internal numbering semantics. So now if you click on the top left key it will tell you you're editing key 11, click on the middle key in the second row and it's key 23, and so forth. This has no practical effect on the overlay and is done entirely for consistency.

It should be working now.

For anyone who's interested, the image was displayed using the OBJECT tag, and it appears that Chrome won't use an image map with an image in an OBJECT tag. I believe this is a bug, but it's easy enough to work around.

Re: HP-41C Overlay Generator

Hm. I'm not sure what the problem is. I'm using Chrome 10.0.648.205 on linux and it works as expected. I don't have access to a mac, so I'm not sure when I'll be able to fix it if it's some sort of mac-specific issue.

If you're comfortable with the debugging built into Chrome, you could try clicking on the keys with the debugger open and telling me or copy/pasting what errors (if any) are showing up.

If you have any CNC hardware---for example a laser cutter---they generally either accept SVG or come with software that will convert SVG into what they do accept. This is in fact one of the motivations that lead me to decide to use SVG as the output format.

in response to message #24 by Marcus von Cube, Germany

Hallo Marcus,

Thanks for finding & sharing. Now we only have to find a way to get it printed in reasonable quality on the right material.

Walter

Re: Overlay Cutting Machine !

*Message #26 Posted by **svisvanatha** on 22 Apr 2011, 9:21 a.m.,*
in response to message #25 by Walter B

Interesting indeed! I did not know that such machines existed for personal use!

Some experimentation on one of these Cricut machines would likely lead to a reasonable homegrown solution. And, not being tied to a 'external' supplier is advantageous for smaller runs, adjustments, etc.

I will poke around with people that I know are into scrapbooking to see if any of them use these types of cutters.

Re: Overlay Cutting Machine !

*Message #27 Posted by **spb** on 22 Apr 2011, 7:41 p.m.,*
in response to message #26 by svisvanatha

Yes, this is one of the main reasons the overlay generator produces output in the form of an SVG.

If you look at a rasterised image format (like for example JPG or GIF) it consists of a list of pixels and their values. So if you could read the binary blob of a JPG directly, it would look something like: draw a dot of such-and-such colour, then draw a dot of such-and-such colour, then draw a dot of such-and-such colour, and so on for however many pixels there are in the image. This is a bit of a simplification, but that's the basic idea.

If you look at the SVG output created by the overlay generator, you can see it is a text file (specifically an XML document). It contains instructions like `make a rectangle so wide and so high'.

In something like a CNC machine or laser cutter the statements in the SVG can be directly translated into instructions to the device: `make a rectangle so wide and so high' becomes, directly, `make a rectangular cut so wide and so high'. And so on.

SVG also has the advantage of being scalable without loss. This is really useful when you're trying to produce something like a keyboard overlay that has to physically match the dimensions of an existing object. Since different output devices might slightly change the size of the overlay (although they *shouldn't* because everything is given in dimensions of mm) this is very useful if you have to tweak the size of the overlay---changing the size won't result in any blurriness or other scaling artefacts.

If you are planning on outputting an overlay to a cutter of some sort, you'll need to use two passes. One to output the labels and so forth to the sheet to be cut, and then another to do the cutting. Most cutter frontends should allow you to select which objects/paths to cut and which to ignore. Alternately you can just manually create a second SVG that contains only the cut lines (the key outlines and the outline of the overlay itself).

If this is something a lot of people plan on doing I could easily modify the generator to create both a `cut' and a `label' SVG file.

in response to message #1 by Gerardo Rincon

The 10bii+ sells for $40, same as 20b.

HP's pricing structure is interesting. The 30b, according to those on here who have used it, is the most capable of all HP's financial models, yet at $50, its half the price of the 17bii+.

The 12cp is more than the new super-fast 12c.

Probably the 10bii+ was priced both to generate extra profit from excitement over it's release, and to help clear out remaining 10bii's, then the plus will drop down to $30.

Re: HP 10BII+ available for sell

*Message #5 Posted by **Katie Wasserman** on 15 Apr 2011, 12:29 a.m.,*
in response to message #4 by Martin Pinckney

The 17bii+ can do many things that the 30b can't do: real time functions, large number of cash flows and statistics, easy to use and powerful algebraic solver and printer output. I think that justifies the much higher price.

I'll bet that you're right about the 10bii+ price drop after the 10bii's are gone.

-Katie

in response to message #7 by Don Shepherd

Don, thanks for an excellent illustration.

The 17bii+ solver is easier to configure, but in my outlook that doesn't make it more "powerful" than that of the 30b. Unless, of course, there's some class of problem that the 17bii+ handles which the 30b can not.

Mike, I doubt that there is a particular class of problem that the 17bii solver can do that the 30b solver cannot do. The 17b solver has IF and Σ, but the 30b can do that via programming of course.

I've just always appreciated solvers that don't make you write programs.

Re: HP 10BII+ available for sell

*Message #10 Posted by **Bruce Bergman** on 16 Apr 2011, 11:17 a.m.,*
in response to message #9 by Don Shepherd

The only limit to the number of programs (solve equations) in the 17bii+ is memory. You could have 100, if you wanted. All named, be able to scroll through them, retain variables, etc.

On the 30b, you can have 10 programs.

Just one difference. There's a reason why the 17bii+ is priced the way it is.

Re: HP 10BII+ available for sell

*Message #11 Posted by **Mike Morrow** on 15 Apr 2011, 12:36 a.m.,*

AFAIK, about the only thing important that the 17bii+ has and the 30b does not is real-time clock and calendar. Also, there's no IR printer output or beeper tone. I believe that the 30b hardware could have supported the clock function. Maybe there'll be a 30bii out someday that adds the RT clock.

For a $10 difference there's not much reason to select the 10bii+ over the 30b. (I know...direct keyboard access to certain functions and all that.) The HP 30b is the first financial calculator that I've ever liked, because it's so useful in areas outside of finance.

in response to message #11 by Mike Morrow

1. Tests/ease of transition from current teaching materials. 2. Some like the form factor. 3. Familiarity.

Anyway, I agree at first glance there doesn't seem to be a place for this one. However, when the current install base and customer is considered (students, school, real estate exams), this will probably have the quickest uptake of any HP unit ever.

I think you're on to something. I bought three 35S calcs, two of the 20B calcs, and a 12C+ as soon as I could find one. I'll probably buy one of these to play with too, even though I really dislike non-RPN business calcs. At least they changed the part number this time so we don't have to peer through the edge of the packaging to ID the new model by the size of the battery door!

Why is the regular 12c faster than the platinum 12c? Isn't the 12cp more recent and I'd assume using either the same or faster processor?

If this was covered earlier in archives please tell me where and I'll read about it there. Thanks.

Re: HP 10BII+ available for sell

*Message #18 Posted by **Martin Pinckney** on 15 Apr 2011, 5:36 p.m.,*
in response to message #17 by Jim Yohe

Jim, it's been covered a lot. In a nutshell, HP made a new 12c that uses an ARM processor (whatever that is), that emulates the original 12c code, and runs, maybe 100 times (!) faster than the original 12c. HP never made an announcement, just started shipping the new version and buyers just discovered this on their own. There are a lot of posts about it, just search the archives.

Try this or this for starters.

Re: HP 10BII+ available for sell

*Message #19 Posted by **Jim Yohe** on 20 Apr 2011, 10:28 p.m.,*
in response to message #4 by Martin Pinckney

It appears that HP may be preparing for a price reduction. I found this link, http://www.shopping.hp.com/webapp/shopping/product_detail.do?product_code=NW239AA%23ABA&aoid=20715&ci_src=14110944&ci_sku=NW239AA#ABA showing a $29.99 price.

I got to the shopping cart and the only difference was they tacked on shipping because my potential purchase was just about $10 short of where I needed to be for free shipping.

11c Badge Touch Up

*Message #1 Posted by **Matt_12c** on 14 Apr 2011, 6:15 p.m.*

Hi, I have an 11c with a badge where the silver(?) paint has essentially been rubbed away (70%). Is there a paint pen or some other way to refurbish it to look good? I also have some chrome paint but it's a spray so I'd probably have to find a way to blot it on. What has worked for you? Is this a heat gun/remove and touch up procedure or is it something to do in place? It is a mid/late '80s model.

I did a search but most badge content was related to replacement and not touching up rubbed away finish.

Thanks. Matt

Re: 11c Badge Touch Up

*Message #2 Posted by **Dallas Osborne** on 14 Apr 2011, 7:30 p.m.,*
in response to message #1 by Matt_12c

That stuff isn't paint I am sorry to say. It is a very thin layer of metal across the top of the plastic logos. Early logos were metallic; those will last forever. But, if you aren't going for the like-new look and don't mind if it looks painted, the "silver leaf" paint pen at your local hobby store will be the best compromise in ease of application and look. It will not be reflectively smooth, though.

I have tried nearly everything from aluminum leaf, silver laquer paint, to paint pens. I even tried electro-plating. (It wasn't cool at all.) (I don't have access to the equipment to try milling, but that could work.) No die maker would machine a die set to strike new ones from aluminum sheet stock. So I did the only thing I could imagine after that and started casting them in silver. That was moderately successful and I had to justify the entire endeavor as entertainment so I wouldn't have to face the massively embarrassing history of my quest. I am sure I could have bought a spanking new 11c and 15c for what I put into trying to restore my logo.

But it was fun.

I have a few of the poorer 11c logos if you want me to send you a couple photos. I have eight investments of 15c logos with 5 waxes each in the kiln right now and will cast them tomorrow.

Edited: 14 Apr 2011, 7:35 p.m.

Re: 11c Badge Touch Up

*Message #3 Posted by **robert rozee** on 14 Apr 2011, 8:48 p.m.,*
in response to message #2 by Dallas Osborne

has anyone ever tried this stuff :
http://www.krylon.com/products/looking_glass_mirror_like_paint/

i've been thinking about it for making reflectors for LED torches. some of the torches you can buy do have aluminium reflectors with a mirror paint applied, in particular the ones with an 'orange peel' finish (think of a cross between the old-fashioned 'hammered finish' paint and the above mirror paint).

another option i'm surprised nobody has tried is simply a small square of aluminium with the logo silk screened on in black. it would be non-original, but where a logo is missing would fill the space. in many circumstances a restoration with obviously non-original parts is considered quite acceptable, sometimes more so than a near-identical-to-original fake.

Re: 11c Badge Touch Up

*Message #4 Posted by **Martin Pinckney** on 14 Apr 2011, 11:27 p.m.,*
in response to message #3 by robert rozee

Haven't tried that particular product, but every other spray paint that claims to produce a metallic mirror finish, doesn't.

Re: 11c Badge Touch Up

*Message #5 Posted by **Dallas Osborne** on 15 Apr 2011, 1:05 p.m.,*
in response to message #4 by Martin Pinckney

I have to agree with Martin on this one. This type of product is designed to work with glass so that it uses the very plane surface to keep the viewing side mirror smooth. To get this stuff to work, you would spray it at the back side of a piece of glass. The mirror finish is then the surface as viewed through the glass.

The only way I know of to get a true mirror finish is to use a process called vacuum metallization. Not. Cheap.

wp34S ALPHA

*Message #1 Posted by **Jake Schwartz** on 14 Apr 2011, 10:50 a.m.*

Hi,

First, let me say that I have read the 1.16 and 1.17 manuals many times....but I have some questions regarding use of ALPHA: 1. If I fill ALPHA with more characters than can be displayed at once and only the right-hand end is shown, how do I get to view the left end again? Is there any way to scroll ALPHA left and right, like with integers? At least the HP41 did automatic scrolling when ALPHA was larger than the display. 2. The manual indicates that alpha-STO stores the leftmost 6 characters into a destination, but after doing ASTO 00 (for instance), a RCL 00 only shows me a numeric value and not the six characters I expected to see. Nothing I could find in the manual indicates how ALPHA characters are stored (or encoded) in a numeric register. If there is any insight into these items, I'd appreciate hearing it.

Thanks, Jake

Re: wp34S ALPHA

*Message #2 Posted by **Marcus von Cube, Germany** on 14 Apr 2011, 11:27 a.m.,*
in response to message #1 by Jake Schwartz

Windowing the alpha register is still under discussion and will be implemented somehow. Scrolling will not.

The companion to aSTO is aRCL which has to be done in alpha mode or from a program. It might be a useful addition to allow a range of numeric registers be stored from and recalled to alpha, at least two for the full display length. To be negotiated...

A short explanation: Until now, registers are not tagged as containing alpha or integer or HMS data or whatever. So a RCL always interprets the contents as a real number with strange effects.

Re: wp34S ALPHA

*Message #3 Posted by **Walter B** on 14 Apr 2011, 3:10 p.m.,*
in response to message #1 by Jake Schwartz

Jake,

Alpha is - in a way - the ugly duckling in this project. It took some effort to get in even the standard alpha operations of the 42S. It isn't complete yet.

Answer 1: As Marcus mentioned, alpha scrolling is waiting for implementation, so the respective description on page 52 of the recent documentation is only wishful thinking so far (though it shows our plans). The sample string of page 24 (v1.17) was carefully keyed in and documented in parallel :-)

Answer 2: Whatever you store using alphaSTO, you may recall with alphaRCL. We've also added a new command alphaRC# for appending numbers to the string as well. Please check and play, it's working fine IMHO.

Walter

Edited: 14 Apr 2011, 3:12 p.m.

Re: wp34S ALPHA

*Message #4 Posted by **Paul Dale** on 14 Apr 2011, 7:02 p.m.,*
in response to message #1 by Jake Schwartz

As has been mentioned alpha-RCL is needed. There simply isn't space in our registers to have a flag indicating alpha data or not. We might be able to squeeze this into reals with a bit of trickery but there is no chance for integers which also support alpha STO and RCL operations.

Alpha characters are stored as their byte values first character highest. The number of characters varies in integer mode based on the current word size. The function that does this is basically:

```
z = 0
n = #characters per register

for i = 1 to n
        z = (z * 256) + alpha[i]
return z
```

Take some alpha data and reduce it modulo 256 to extract the characters again.

- Pauli

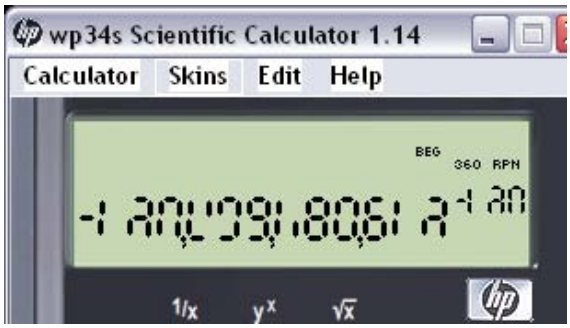
wp34s Gallery

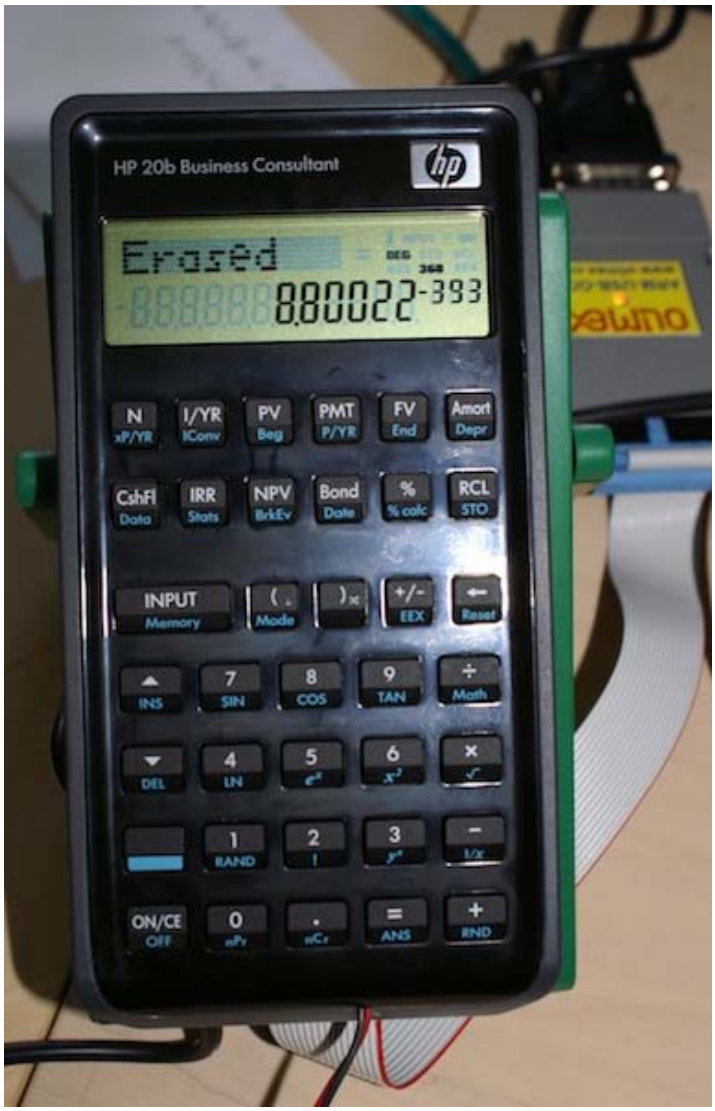
*Message #1 Posted by **Marcus von Cube, Germany** on 13 Apr 2011, 3:30 a.m.*

I'd like you to post photos or links to videos with wp34s in action here. I expect a lot of fun from this thread.

Let's start early! My first attempts at implementing the emulator weren't really working well:

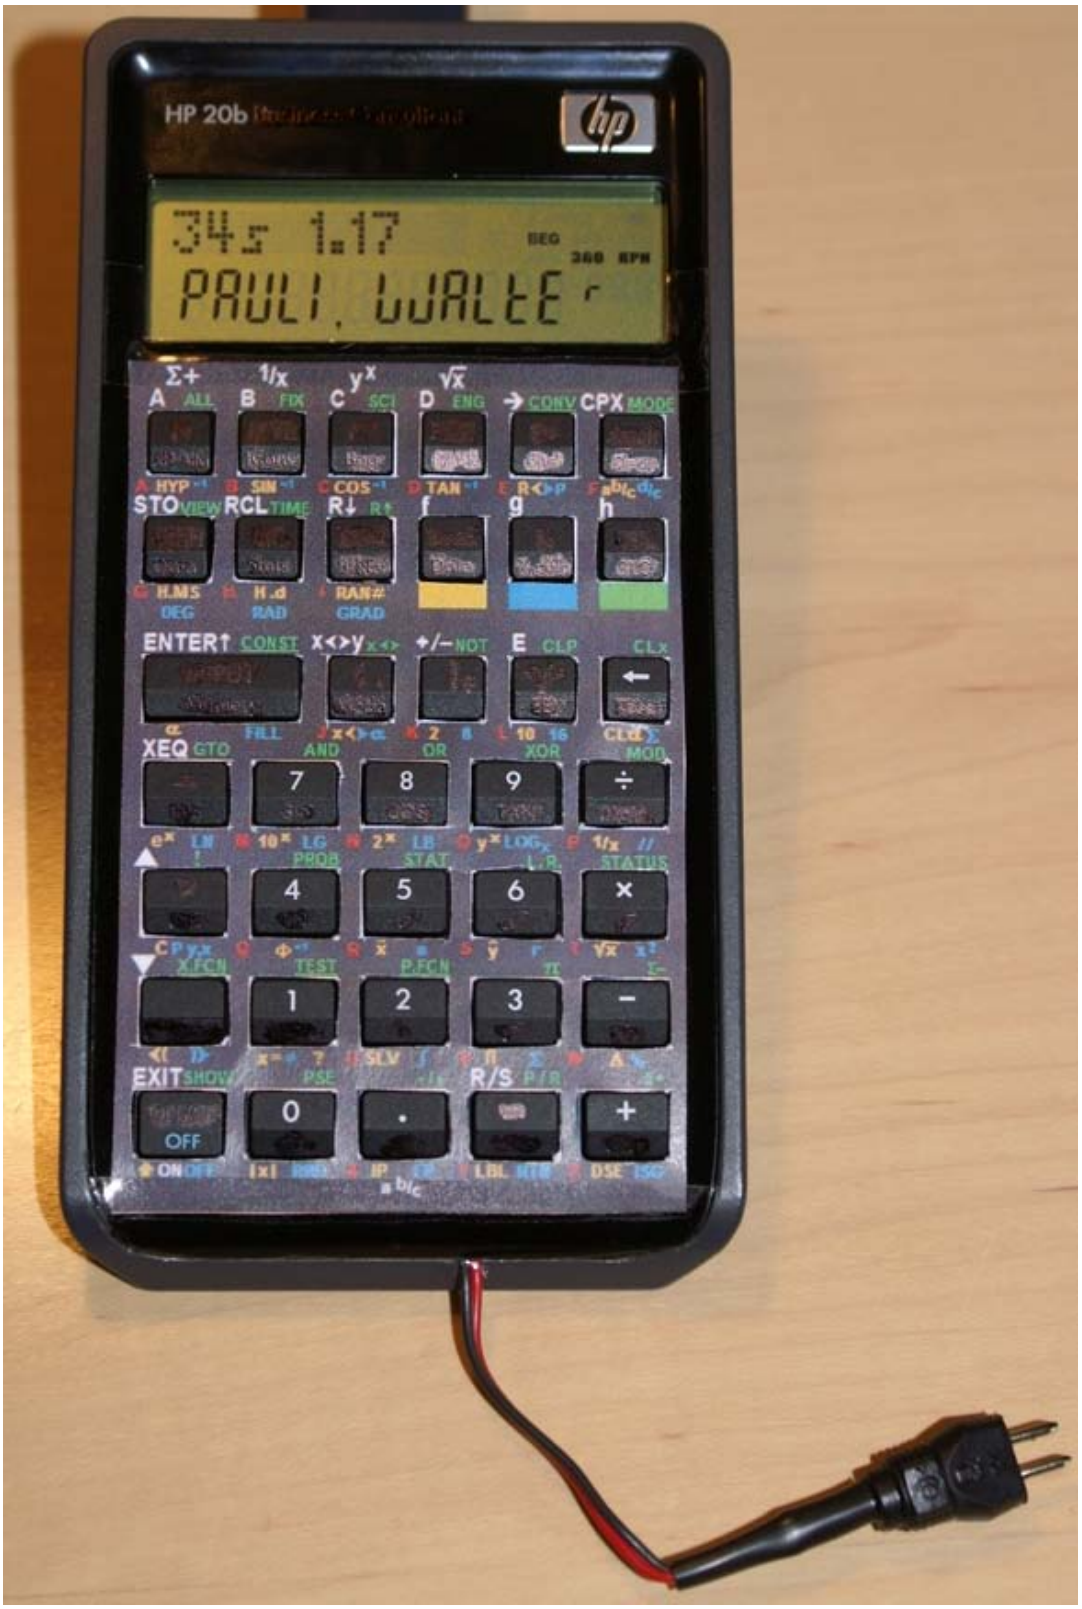


Here is the very first photo I took of my 20b in action. It was the initial boot of the very first flash image downloaded to my development 20b:



The keyboard was still unresponsive and as you can see, there was a problem with the proper display of zero. ;)

Compare this to my second picture:



What a difference!

I have made some pictures from my opened 20b when I added the JTAG connector and the power cord. I'll post them later.

How did the ROM get loaded into the calculator? Am I correct to assume that the calculator had to be taken apart for the ROM to be downloaded.

Re: wp34s Gallery - Gene's pictures

*Message #8 Posted by **Marcus von Cube, Germany** on 13 Apr 2011, 3:46 p.m.,*
in response to message #7 by Eddie W. Shore

Flashing the 20b is perfectly described in Tim's document here. No taking apart necessary. :) In fact that wouldn't even help because the flash ROM is inside the main chip and is only accessible through either special hardware or, even easier, through the built in SAM-BA boot loader software.

I'd like to see more pictures and less discussion in this thread, agreed?

I just flashed the 20b this evening. The overlay was done this morning. During the cutting of the key holes with Exacto knife and ruler, I realized that "the index finger never forgets" (See PPC Journal Volume 7 Number 4 Page 4 [May, 1980] under the "Club Projects" column).

Slightly OT: simple math dilemma

*Message #1 Posted by **Chuck** on 12 Apr 2011, 10:46 p.m.*

I was asked by a colleague yesterday about real solutions to equations, i.e.,

sqrt(1-x)-sqrt(x-3)= 0

Question: is 2 a solution? and at what level of math should it be accepted as a solution. Most math texts will say it's not a solution: if y=sqrt(1-x) and y=sqrt(x-3) are graphed, they don't intersect in the real plane, yet the real number 2 is a solution (can't argue with that). So what constitutes a real solution. I claim you can't slide into the complex world and then back to real world; or since 2 isn't in the real domain of the functions, it can't be considered as a solution.

One thing led to another, and it got me thinking about the value of (-1)^(2/6).

At first glance I "want" it to be +1, since we have "even" powers, (sort of).

On second glance it could be 1/2 + sqrt(3)/2 i, (the principal sixth root of a negative is complex; and then squared).

But, on third glance, basic algebra says to reduce all rational exponents to lowest terms before evaluating, which gives us -1. Hmmmm.

The TI-8X calculators give the third-glance result (-1) and produces a graph from -inf to +inf (the typical cube root function).

Mathematica gives the second-glance result (complex value), and a graph from 0 to +inf accordingly.

Back On-track, slightly: my HP-15 gives -1 (as expected). Haven't checked the others. my 28S gives the complex answer (as does my Casio) and graphs for only x>0.

I've yet to find one that gives +1 (bummer,even powers and all).

What do other calculators (hp or non-hp) give,and what "should" it be?

I now can only presume TI's are for the less mathematically mature student, and HP's are for the more mathematically advanced. (Ouch!)

But I wait your opinions.

Enjoy.

Re: Slightly OT: simple math dilemma

*Message #2 Posted by **Eddie W. Shore** on 13 Apr 2011, 1:15 a.m.,*
in response to message #1 by Chuck

Anything that solves the equation is a solution IMHO. Just not always the desirable or sensible one.

Re: Slightly OT: simple math dilemma

*Message #3 Posted by **Frido Bohn** on 13 Apr 2011, 5:43 a.m.,*
in response to message #1 by Chuck

sqrt(1-x)-sqrt(x-3)= 0

can be transformed into:

sqrt(1-x)=sqrt(x-3)

thus, squaring both sides leads to:

1-x = x-3

and consequently to:

1+3 = 2x

and to:

x = 2

Is this too simplistic?

Regards

Re: Slightly OT: simple math dilemma

*Message #4 Posted by **Dieter** on 13 Apr 2011, 2:04 p.m.,*
in response to message #3 by Frido Bohn

> Quote:
>
> x = 2
>
> Is this too simplistic?

Nothing it soo simplistic as long as it's correct. ;-) But this solution isn't. You ran into an absolutely classic error here.

Consider the original equation

```
sqrt(1-x) - sqrt(x-3) = 0
```

For a real result this implies that both 1-x >= 0 and x-3 >=0.

```
1 - x >= 0  =>  x =< 1
x - 3 >= 0  =>  x >= 3
```

So x must to be not more than 1, and at the same time it has to be greater or equal to 3. In other words, a (real) solution is impossible here. Your result 2 as well as any other.

What's wrong with your result? There are two things.

First, you did not check the valid domain for a possible (real) result. Since the obtained value 2 does not

fall in the domain for a valid result, it simply is no solution at all.

Second, the step where both sides of the equation are squared is the weak point here. While "-4 = 4" is obviously wrong, squaring turns it to "16 = 16", which is correct. ;-)

There are lots of other occasions that look tricker than initially expected:

```
   (x^2 - 1)  /  (x - 1)
 =  (x+1)(x-1) /  (x - 1)    ; x-1 cancels out
 =   x + 1     ; really ?-)
```

Of course the first and third line are not equal. Try to plot both graphs and look at the point where x equals 1. ;-)

Dieter

Re: Slightly OT: simple math dilemma

*Message #5 Posted by **Maarten Ambaum (Reading, UK)** on 14 Apr 2011, 5:14 a.m.,*
in response to message #4 by Dieter

Dieter,

I don;t understand your last example. The two expressions _are_ the same: the only difference would be that (x^2-1)/(x-1) appears to be undefined at x=1, but the limit of x -> 1 for (x^2-1)/(x-1) is perfectly defined (just write x=1+e, for small e, to find (x^2-1)/(x-1) = 2+e, and take the limit e-> 0)

The confusion in all this discussion is whether certain factors can be undefined, such as 1/(x-1) in your example, while the full expression (x^2-1)/(x-1) is perfectly valid and has correct continuous limits at all points on the real axis (which is the case).

Maarten

Re: Slightly OT: simple math dilemma

*Message #6 Posted by **Frido Bohn** on 14 Apr 2011, 2:00 p.m.,*
in response to message #4 by Dieter

Quote:

```
   (x^2 - 1)  /  (x - 1)
 =  (x+1)(x-1) /  (x - 1)    ; x-1 cancels out
 =   x + 1     ; really ?-)
```

Well, for me is

(x^2 - 1) / (x - 1) = x + 1

If you factor

(x^2 - 1)

you get

(x+1)(x-1)

and thus, the equation I quoted is an identity.

If you try it the hard way with cancelling out

(x-1) off (x+1)(x-1) / (x - 1)

you get

x+1.

Then, we have the "challenging" equation

(x^2 - 1) / (x - 1) = x + 1

Factoring (x^2 - 1) gets

(x+1)(x-1) / (x-1) = x+1

Cancelling again x-1 gets

x+1 = x+1

and needless to say

x = x

I never tried to graph x=x, and neither the ancients greeks tried to solve a mathematical problem by means of graphing. They used geometry, and it worked fairly well. Perhaps, somebody can show me a geometric solution of this '(x^2 - 1) / (x - 1) = (x+1)(x-1) / (x - 1)' problem?

*Message #7 Posted by **Manolo Sobrino** on 13 Apr 2011, 10:30 p.m.,*
in response to message #3 by Frido Bohn

f(z)= + sqrt(1-z) - sqrt(z-3) over C has a root in z = 2, it comes from the imaginary part of f(z), there's nothing weird.

wolfram alpha

(I prefer this one,

sqrt(1-z) - sqrt(z-3) = 0

i sqrt(z-1) = i sqrt(3-z)

(z-1) = (3-z)

z = 2

)

Cheers

No, there are situations where you may only find _real_ solutions by using complex math.

Ciao.....Mike

Re: Slightly OT: simple math dilemma

*Message #10 Posted by **Mike Morrow** on 13 Apr 2011, 5:05 p.m.,*
in response to message #9 by Mike (Stgt)

I always liked i^i = exp(-PI/2). The result "seems" (at first) so non-intuitive.

Probably the group that has the most day-to-day routine control of a process whose behaviour is described by real and imaginary complex variables is AC electric generating plant control room operators. They control their station's output of REAL load (MW) and REACTIVE load (MVAR), which can be represented by vectors in phase quadrature with each other. Unlike the MW loading, the MVAR loading can be grossly varied with no effect upon the fuel consumption of the machine driving the generator. Thus it even has a sort of "imaginary" aspect to it. :-)

Re: Slightly OT: simple math dilemma

*Message #11 Posted by **Thomas Klemm** on 13 Apr 2011, 1:30 p.m.,*
in response to message #1 by Chuck

The confusion arises because you don't define the domain of the sqrt-function. If it should give only real results then the best you could use is: 0 <= x.

But with this condition you would get:

```
0 <= 1-x   ->   x <= 1

0 <= x-3   ->   3 <= x
```

These two conditions are contradictory, thus no solution exists.

However when you allow all real numbers as domain of the sqrt-function you will get complex numbers as intermediate results. There's no problem with the fact that the end-result is real.

Conclusion: without specification of the domain, a function is not defined, thus the equation is meaningless.

Cheers
Thomas

Re: Slightly OT: simple math dilemma

*Message #12 Posted by **Marcus von Cube, Germany** on 13 Apr 2011, 2:56 p.m.,*
in response to message #1 by Chuck

The result of (-1)^(2/6) is defined as a number which, raised to the power of 6/2 (or 3), gives -1, hence one of the three possible values in the complex plane.

Is there a point in rearranging the expression to ((-1)^2)^(1/6) ? Or to ((-1)^(1/6))^2. The former would reduce the number of solutions to 1, the latter to 6 (which might collapse to less by squaring, I haven't checked.) In the latter case, 1 should be one of the solutions.

Writing this down, I tend to the idea that the expression has six solutions in the complex plane, the real values -1 and 1 being amongst them. I'm still puzzled.

Re: Slightly OT: simple math dilemma

*Message #13 Posted by **Chuck** on 13 Apr 2011, 11:22 p.m.,*
in response to message #12 by Marcus von Cube, Germany

They actually do collapse to only three values; two complex and -1 (using De Moivre's formula) . My desired +1 just isn't there. :(

Re: Slightly OT: simple math dilemma

*Message #14 Posted by **Chuck** on 13 Apr 2011, 11:13 p.m.,*
in response to message #1 by Chuck

Excellent discussion. It seems the level of math a student has is what may determine the expected result. I presume a student who has not been introduced to complex numbers would have to assume square-roots of negatives are not possible and therefore no solution.

A student with a rudimentary knowledge of complex numbers would conclude that 2 is an easily found and appropriate answer.

And a student with a fairly thorough knowledge of complex numbers would recognize that the complex result for (-1)^(2/6) is preferred, but that there are a total of three solutions.

Along with this, I find it very interesting the results that are given by various calculators and math programs. One can start to glimpse the mathematical sophistication of the manufacturers target consumer population. Fun

stuff.

Putting at least one dimension on it may be beneficial ...

Re: Link to 34s overlay... Instructions for artists

*Message #3 Posted by **Marcus von Cube, Germany** on 13 Apr 2011, 3:20 a.m.,*
in response to message #2 by Walter B

The PNG file has the resolution embedded. With proper software, it is printed at the correct dimensions.

The resolution is 141 dpi, the printed size is 6.4 x 9.9 cm or 2.5 x 3.9 inches.

For all the designers among us who want to improve on the skins or the overlay: Go to the repository at http://wp34s.svn.sourceforge.net/viewvc/wp34s/artwork/ and get the XCF files! I've done all my work with The Gimp. The files contain multiple layers and the bitmap files are simply exports with different layers made visible or hidden. The effect that Gene was aiming at with his version can be easily reproduced with the file wp34s_medium.xcf:

1. Make visible the two layers named Overlay and Overlay-Background.

2. Hide all other layers.

3. Adjust the *opacity* of the background to your liking.

4. Print or export the result.

The exported file has the dimensions of the medium skin file. You can easily crop it by reloading the result into Gimp and doing it there. The reason why I've put the overlay in the same file as the medium skin is easy to follow: Just turn on the visibility of the original bitmap background image and you see the keys shine through. This made it possible for me to get the dimensions right.

in response to message #5 by Marcus von Cube, Germany

The newest advertising spam is attaching ads to the ground in e.g. train stations. These foils or films really last though many people walk over them everyday. Maybe we can employ this "technology" for something beneficial. It doesn't even have to stick so hard :-) Anyone having more insight?

Edited: 13 Apr 2011, 7:59 a.m.

Re: Link to 34s overlay... Instructions for lazybones - Print shop wanted :-)

*Message #7 Posted by **Paul Dale** on 13 Apr 2011, 8:59 p.m.,*
in response to message #6 by Walter B

Another possibility. Print the overlay and laminate it with a sheet of paper behind (so the laminate only sticks to the printed side). Cut carefully and use spray adhesive to glue onto

the calculator.

Another possibility is it use a Xyron machine with a combined adhesive/laminate roll. Not as nice a finish as the above but quicker and less messy.

- Pauli

Re: Link to 34s overlay... Instructions for lazybones - Print shop wanted :-)

*Message #8 Posted by **exschr** on 13 Apr 2011, 11:32 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Great work done! Thank you all.

Just one thought:

The green on the overlay somehow sticks out like a sore thumb and makes the classic yellow and blue somehow disapear.

It doesn't look like a HP (sorry to be that picky...)

would it be possible to use a HP-like color, say the orange that's used on the 42s?

(I just don't know if the yellow and the orange would be distinguishable?!)

Re: Link to 34s overlay... Instructions for lazybones - Print shop wanted :-)

*Message #9 Posted by **Walter B** on 15 Apr 2011, 5:12 a.m.,*
in response to message #8 by exschr

The basic challenge is finding 5 colors being sufficiently differentiable on a grey to black background. Some years ago we had a wider discussion here about this topic. I'm pretty sure I chose "my" colors based on that. We even had at least one "visually challenged" (Hi USA! For the others: "rot-grün blind" IIRC) person participating in said discussion - and he was also happy with that choice.

So, you cannot argue about white ;-) Gold and blue are next to the colors HP chose for good reasons before they went off the track :-) Dark red is a decent color for less important labels (after all, we still have a calculator here, not a text processor). You're right, the green is a bit sore (we call such a color "toxic" here), but it differentiates very well from the others IMHO. I won't use orange - too close to gold. Feel free to return with a better offer :-)

Walter

Yes, the file prints fine in photoshop since it recognizes the inherent dimensions.

Re: Link to 34s overlay...

*Message #11 Posted by **Paul Dale** on 16 Apr 2011, 11:49 p.m.,*

in response to message #1 by Gene Wright

I've done my overlay. Photo coming later.

I printed out Walter's overlay graphic twice.

I ran both of these through a Xyron laminating machine using a laminate/permanent adhesive roll.

With a razor knife and a steel ruler I carefully cut just outside the white lines for the keys. Peel the backing off and stick to the calculator.

Then cut the keys out of the second overlay just inside the white lines. Keep the face and top of the key decal together. I cut entire rows out and then cut the keys out one at a time after I'd peeled off the backing. Carefully, stick each decal onto the key and down the front.

It is probably possible to do this with a single printout of the overlay but much harder.

- Pauli

12C with sticky keys

*Message #1 Posted by **David Osborne** on 12 Apr 2011, 10:13 a.m.*

Some of the keys on my ancient HP 12C have stopped working. How easy is it to take apart and clean, please?

David

Re: 12C with sticky keys

*Message #2 Posted by **exschr** on 12 Apr 2011, 2:56 p.m.,*
in response to message #1 by David Osborne

First of all: I have an old 12C with no LCD but perfect working keyboard, if you are interested get in contact with me!

This procedure workes for me, maybe others have better ways of doing it: -take out the batteries

-open the case (four screws under the four rubber feet)

-take care not to lose the two tiny springs!

-cut the many black melted heads of plastic carefully with sharp knifeblade (take care not to slip and if possible go underneath and lift up. This way you have a chance to end up with enough plastic to melt again afterwards

-lift up the PCB carefully and out of the case

-underneath the rubber mat are the keys

-clean! Maybe thats all that is needed, otherwise replace parts from an other 12C and put back together in reverse order

-to melt the PCB back in place, put it firmly and tightly back into the case, use a solderung gun to warm the plastic and press it flat with one finger. Do this for all the plastic rods.

If possible take some ESD precautions!

Maybe after all, it's just easier to buy an old working 12c from EBAY? Just don't throw your old buddy out: the LCD is still a great replacement part for other Voyagers! (Now you know why mine has no LCD anymore! It's in a 11C :-)

Cheers an good luck

Re: 12C with sticky keys

*Message #3 Posted by **Randy** on 12 Apr 2011, 5:26 p.m.,*
in response to message #1 by David Osborne

Pulling the keyboard completely out of Voyager to clean a few problematic keys is totally unnecessary as keys can be easily cleaned from the exposed back side of the board through the key vent hole.

Make a miniature wire brush from a few strands of stiff brass wire cut from a small wire wheel. Chuck them in a pin vise and trim the ends flush. Place a few drops of isopropyl alcohol into the key dome and scratch around with the wire brush. Repeat if needed.

30B/34s - adding more RAM

*Message #1 Posted by **robert rozee** on 11 Apr 2011, 11:38 p.m.*

hi, one complaint of the 30B platform seems to be a lack of available RAM, as well as what is emerging as a bit of an issue with running out of space in the flash for all the 34s features people would like to have.

it has occurred to me that the processor used does have a few 'general purpose' pins that come out to the programming header?

why not add external serial (I2C or SPI bus) RAM via these pins, to allow for a much larger (even if slow to access) RAM? one could also extend this concept a little further with a serial flash device used to hold the code associated with less frequently used functions, that could then be paged into the (small) onboard RAM when required.

an interesting concept? if anyone is interested in it, i'd be happy to troll through the datasheets to find potential devices. something with combined RAM and flash would be absolutely ideal!

cheers, rob :-)

Re: 30B/34s - adding more RAM

*Message #2 Posted by **Paul Dale** on 12 Apr 2011, 2:01 a.m.,*
in response to message #1 by robert rozee

The small amount of RAM is limiting. Many of our design decisions concentrated around this limitation. 6kb total, 2kb of which is battery backed. We use the 4kb of volatile memory for the stack plus a few global variables, a fair amount of this is required. The 2kb is committed.

The flash issue isn't so bad. Flash is pretty full, agreed, but no matter how much we had people would want more :-) As it is, the feature set included is very comprehensive. I'd like to get the Bessel & elliptic functions in but that looks unlikely. Fortunately, user code can provide these easily enough (albeit at somewhat reduced accuracy).

It would be possible to add RAM and flash via the IO pins. I'm not sure how useful it would really be. There isn't really enough RAM to load compiled code from flash to run, keystroke programs might be possible however. As you added more external memory, you'd have to consume more of the internal RAM as buffers, cache and for management purposes. I expect you'd have to push all registers and keystroke code onto the external storage fairly quickly. Still it would be possible and might be interesting.

- Pauli

Re: 30B/34s - adding more RAM

*Message #3 Posted by **robert rozee** on 12 Apr 2011, 10:10 a.m.,*
in response to message #2 by Paul Dale

a suitable device may be the N25S818HA / N25S830HA : OnSemi serial SRAM

32k bytes is the larger size listed. you could use this exclusively for holding user programs, then reserve all (or most) of the 2k of battery-backed onboard ram exclusively for registers (ie, no flexible partitioning between variables and program steps). user programs being composed of sequences of high-level keystrokes means that the external ram would end up being accessed at a relatively slow rate (in terms of the number of cpu cycles occurring between fetching stored keystrokes). under such conditions i believe that buffering would provide a minimal speedup, hence would not be necessary.

just an idea :-) since the city i live in was moderately destroyed by an earthquake in february, i find myself, a (now) relatively unemployed electronics engineer, with too much time to muse on such things!

btw, are there any plans floating around for a 10bII+ re-purposing project? i'm assuming that the 10bII+ would appeal as a target as the hardware will be available much cheaper than the 20b/30b.

and a second question: how easy can the 20b/30b be opened up to add the above mentioned RAM internally to the case? will the 10bII+ be similarly easy/hard to crack open?

Re: 30B/34s - adding more RAM

*Message #4 Posted by **Tim Wessman** on 12 Apr 2011, 10:26 a.m.,*
in response to message #3 by robert rozee

The 10bII+ screen is only using some 130 or so of the available pixels, so unless you want even less information it isn't ideal.

I think the 10bII+ is even more difficult to open then the 20/30b. The clips that hold the halves together are much more plentiful and hold with more force. I tried to open at least 4-5 of them and didn't manage to open one without either breaking one of the tabs or cosmetically marring the case somewhere.

Processor wise, either of them are essentially identical.

Also, why use RAM when flash will use less power overall?

TW

> Also, why use RAM when flash will use less power overall?

flash has a limited (though admittedly large) lifetime wrt write cycles, and will consume more peak current (i'm assuming) when carrying out these writes. in a device powered by a couple of button-cells, any operation that draws a higher than average current, even for a short duration, is of concern - one may end up in the embarrassing situation where the cells fail to have enough 'oomph' to ride through the flash writes long before they are otherwise exhausted. and a failed write flash

will lead to... corrupted contents. a bad thing in anyone's books.

the down side of SRAM is the backup current, but for the OnSemi devices this is a somewhat negligible 1uA maximum. assuming a very conservative 30mAh of total capacity, this would be good for nearly 3 1/2 years of backup.

the 12-digit 7-segment display is no worse than that of the hp-15c, which is only 10 digits. and the 10bII+ also has more keys (40) available than the 20b/30b (only 36). hmmm, as i write this i am thinking, "will we see an hp-15cII+ released in the same format/case as the 10bII+?".

Re: 30B/34s - adding more RAM

*Message #6 Posted by **Katie Wasserman** on 12 Apr 2011, 11:54 a.m.,*
in response to message #5 by robert rozee

I like the 10bii+ keyboard and overall case much more than the 20b/30b. It sits on the desk without rocking and fits well in the hand too. While the display is short on annunciators, the digits are large and clear and easier to see than any other HP calculator aside from LED models. I think it would be an excellent calculator to re-purpose.

I agree with Tim that this is a difficult calculator to open and I haven't seriously tried opening mine but I'll give it a try soon (when I have some tools available for stuff like this).

It's been a while since I've looked at the datasheet, but can't you use all 6 kB as nonvolatile? The tradeoff would be increased current consumption when powered off (drop to wait mode instead of backup or off mode). Looks like 9 uA (wait) vs. 3.5 uA (backup) vs. 100 nA (off). That would limit you to what, 5.8 years of power down lifetime, assuming two 230 mAH cells? Someone check me on this.

Re: 30B/34s - adding more RAM

*Message #8 Posted by **Marcus von Cube, Germany** on 12 Apr 2011, 1:48 p.m.,*
in response to message #7 by Scott Newell

How do you get 9 uA for wait mode? What has to be switched off and how do I get out of it? I can see 200 uA for idle mode (processor clock stopped) on my multimeter for my development device. This is what the calculator consumes when it is turned on.

Haven't measured it. I pulled the value straight from table 5-1 ("Low Power Mode Configuration Summary"). Table 35-7 claims to be measured values...note that that 9 uA is pretty optimistic, especially with fresh batteries and at higher temps.

Re: 30B/34s - adding more RAM

*Message #10 Posted by **Marcus von Cube, Germany** on 12 Apr 2011, 3:35 p.m.,*
in response to message #9 by Scott Newell

I've just looked at the manual again. Wait mode has a severe drawback: The processor gets out of it only by a low value on the wakeup pins. The ON key is connected to the force wakeup, not one of the 16 wakeup inputs. Neither works the RTC with this. :(

I have to try it if the processor returns from wait mode on any of the regular wakeup sources but I doubt it.

Re: 30B/34s - adding more RAM

*Message #11 Posted by **Marcus von Cube, Germany** on 12 Apr 2011, 12:33 p.m.,*
in response to message #1 by robert rozee

The only useful application for an external memory chip is program storage. Writing to program memory is certainly much rarer then reading, so flash is a good technology for this. I'd prefer a removable device. I was thinking about saving a few pages of internal flash for the purpose: Write and test some user code and when you're pleased with it, copy it to flash by a special command. You'll need a way to manage your flash area, so this gets the more complicated the more you think about it.

*Message #12 Posted by **Diego Diaz** on 13 Apr 2011, 1:00 p.m.,*
in response to message #11 by Marcus von Cube, Germany

Hi all,

Although I have nothing to do with these new models and the re-purposing project (which IMHO seems an outstanding job), I do have certain experience in adding RAM (or ROM) to existing devices.

One of the main issues when dealing with RAM is the power requirements, and this was the point when it comes to choosing the RAM chips in the NoV's projects for the HP-41 series.

RAMTRON manufactures a wide range of non-volatile RAM, both serial and parallel. In the serial range you'll find SPI and I2C interfaces at Vcc's as low as 2.0v up to 5.5v.

The main benefit is a zero power data retention (like EEPROM/Flash), and byte addessing immediate write (like RAM).

I use the 32KBytes "FM24C256" (do not confuse with 24C256 EEPROM) with I2C interface, which is pretty easy to implement.

I'll be happy to contribute if you think my experience can be useful.

Best from Madrid.

Diego.

50g won't plot summation function, but emulator will.

*Message #1 Posted by **Hal Bitton in Boise** on 11 Apr 2011, 7:16 p.m.*

This one is drivng me a bit nuts. when I try to plot this sigma function on my 50G,:

E(X=1,X,X^2) from 1 to 5 I get a "sigma error: bad argument type" returned.

Plotting the identical function on my 50G emulator gives me the correct graph.

I've checked all flag settings, CAS settings, and even the PPAR variables between the emulator and the real calc to be sure they are the same, to no avail.

The fact that the sigma (summation) function is accepted into the equation field of the plot setop window would seem to indicate it's a valid plot function (and indeed it is so on the emulator).

Any ideas greatly appreciated.

Best regards, Hal

Re: 50g won't plot summation function, but emulator will.

*Message #2 Posted by **Norman Dziedzic** on 11 Apr 2011, 11:41 p.m.,*
in response to message #1 by Hal Bitton in Boise

I got an error with E(x=1,x,x^2) but I was able to plot E(t=1,x,t^2).

But it only evaluate at the integers

Re: 50g won't plot summation function, but emulator will.

*Message #3 Posted by **Hal Bitton in Boise** on 12 Apr 2011, 7:14 p.m.,*
in response to message #2 by Norman Dziedzic

Thanks very much, Norman.
That did the trick. I realize now that x is the independant variable for the plot function, but t (or any variable other than the plot independant variable) serves as the independant variable for the sigma function.

Best regards, Hal

50g won't plot summation function, but emulator will.

HP41CX power consumption

*Message #1 Posted by **Egan Ford** on 11 Apr 2011, 2:15 p.m.*

Can someone please tell me power consumption of a 41CX in use (flying goose)? Thanks.

Re: HP41CX power consumption

*Message #2 Posted by **Eric Smith** on 11 Apr 2011, 2:37 p.m.,*
in response to message #1 by Egan Ford

I've measured a fullnut at about 72 mW (12 mA at 6V). There's probably a moderate amount of variation between units.

I'd expect a halfnut to draw less.

Re: HP41CX power consumption

*Message #3 Posted by **Juergen Keller** on 11 Apr 2011, 5:24 p.m.,*
in response to message #1 by Egan Ford

Is the goose flying forwards or backwards? Sorry, couldn't resist ;-)

Re: HP41CX power consumption

*Message #4 Posted by **Eric Smith** on 11 Apr 2011, 5:53 p.m.,*
in response to message #3 by Juergen Keller

I've modified mine to have a flying grouse.

Re: HP41CX power consumption

*Message #5 Posted by **Patrice** on 11 Apr 2011, 7:50 p.m.,*
in response to message #3 by Juergen Keller

It is POSSIBLE with some synthetic programming :)

Re: HP41CX power consumption

*Message #6 Posted by **exschr** on 12 Apr 2011, 3:22 p.m.,*
in response to message #1 by Egan Ford

From what I could find out there for the flying bird:

From service manual, finseth.com and from 41CL (aka systemyde.com/hp41)

50mA 12.5mA 7.9mA

For IDLE and for OFF:

1mA 1mA 4.2mA

0.05mA 0.02mA 0.11mA

I made once some investigations, I can't remember the details, but the current consumption was in the order of the numbers from service manual (slightly below). But as already mentioned: your mileage might vary

Re: HP41CX power consumption

*Message #7 Posted by **Garth Wilson** on 12 Apr 2011, 11:30 p.m.,*
in response to message #1 by Egan Ford

My owner's manual, P.381-382, says for program running it's 5-20mA; for ON but idle it's .5 to 2.0mA, and for OFF it's .01 to .05mA. This is a 41cx Halfnut. I used to go a couple of years on a set of batteries, then got a double extended memory module and that took the battery life down to about six months.

34s bug reports

*Message #1 Posted by **gene wright** on 11 Apr 2011, 1:44 p.m.*

Suggest numbering bug reports sequentially. These were on the actual unit itself. Here are the first few:

1) Permutations and combinations seem to turn off the display when given 69 ENTER 2 as the arguments.

2) Inverse normal distribution blanks the screen too. Argument used was 0.8413.

3) Where is the = symbol in alpha? :-)

Edited: 11 Apr 2011, 4:40 p.m. after one or more responses were posted

Re: 34s bug reports

*Message #2 Posted by **Walter B** on 11 Apr 2011, 3:39 p.m.,*
in response to message #1 by gene wright

Gene, did you crosscheck on the emulator? Both bugs work fine on the most recent build of the emulator FWIW. I'll get my flashed 20b but don't have it yet ...

Re: 34s bug reports

Quote:

> Awaiting a newer binary from Marcus before listing bugs I have observed.

If the bug is in the emulator and the real hardware, I suspect it is going to be my problem, so you might as well let me know.

Tried programming a 20b and 30b tonight without success :-(Seems Linux doesn't like the serial programming cable. Hopefully, the erase process hasn't bricked them.

On a positive note, I've freed up some more flash space. Slight speed penalty but we'll not know exactly how much for a while.

- Pauli

Re: 34s bug reports

*Message #6 Posted by **svisvanatha** on 12 Apr 2011, 8:37 a.m.,*
in response to message #5 by Paul Dale

FWIW - I cannot get my serial flashing cable to work under Ubuntu. Under WinXP. it is fine.

Bugs appearing in (linux) emulator and 30B/WP34S:

4. When menu items such as h-shift TEST are active, you cannot then select another menu item directly such as h-shift MODE without hitting 'EXIT' first. This is not consistent with the manner in which the 42S treats menus. 4a. Although I did notice that if you select h-shift STAT, and then h-shift PROB, it is equivalent to entering h-shift STAT and then the up arrow

5. Set the BASE to 2 by pressing f-shift 2 (the base 2 on the CHS key). Switch back to base 10. The '2c 64' and 'd' annunciators still persist. There is no way I could find to clear those annunciators. In addition, selections of FIX, SCi, ENG do not work after setting the base back to 10. Battery pull clears this condition on the hardware, but no obvious way to clear in the emulator. 5a. h-shift CONST does not work after setting the base in this manner. Other menus appear to work after setting BASE.

6. Calculator seems to start in HP48 'std' display mode, but after swithcing to FIX 2 for instance, there is no obvious way to switch back to STD.

Bugs appearing the 30B/34S, but working on the (linux) emulator

7. set to 'RAD' mode. h-shift PI - displays value of PI in X. f-shift COS freezes calc. Cannot be turned off, or other entry possible. Battery pull clears this condition.

8. with any numbers on the stack press f-shift R<- (f and then the 2nd key from the right on the top row to convert to rectangular) - should convert to rectangular coords - but all it does is turn off calculator, and calc cannot be turned on again, without battery pull. Similar function f->P (to polar coords) works fine.

9. Dot matrix area (upper left of LCD) has persistent lightly lit vertical bands that shift around randomly after X register changes.

This is not a bug, this is a feature so far as described in the manual. I see no urgent need changing it, but maybe ...

> Quote:
>
> 4a. Also I did notice that if you select h-shift STAT, and then h-shift PROB, it is equivalent to entering h-shift STAT and then the up arrow

Funny. We'll correct that. Thanks :-)

> Quote:
>
> 5. Set the BASE to 2 by pressing f-shift 2 (the base 2 on the CHS key). Switch back to base 10. The '2c 64' and 'd' annunciators still persist. There is no way I could find to clear those annunciators. Battery pull clears this condition.

Base 10 is different to decimal. Base 10 is integer! If you want to set decimal, press f .d instead (f-shifted RCL). Please see the manual.

> Quote:
>
> 5a. h-shift CONST does not work after setting the base in this manner. Other menus appear to work after setting BASE.

Almost all constants are real numbers. Calling them in integer mode doesn't make sense. Please see the manual.

> Quote:
>
> 6. Calculator seems to start in HP48 'std' display mode, but after swithcing to FIX 2 for instance, there is no obvious way to switch back to STD.

This is called ALL mode in RPN. Press h ALL (top left key) to get it back. Please see ...

Summary: Thanks for your reports.

Walter

Svisvanatha,

No problem with errors. All of us make them (sometimes). And they give us the opportunity to learn.

> Quote:
>
> I think I must be using a different version without 'ALL' as an h-shift function. Mine is Sigma- in the top left (version 1.17).

You're right. We changed that yesterday. That's the curse of open development: you're aiming at a moving target ;-) The version in the zipped package is the official one and is (relatively) stable - everything else you may find on SourceForge concerning our project may change several times a day - we don't care since it's our workshop. So use it at your own risk.

Walter

Binomial distribution

*Message #13 Posted by **Gene Wright** on 12 Apr 2011, 4:15 p.m.,*
in response to message #12 by Marcus von Cube, Germany

Another reason I think a more introductory manual would be a good thing.

The Binomial distribution requires three inputs: Number of observations, number of successes, and the probability of a success on an event.

So, 10 coin flips at 50% probability of a head on each flip...what is the probability of 5 heads?

10, 5, 0.5 are the three arguments.

The existing manual suggests on page 24 of 61 that the probability is to be in X. Back on page 10 of 61, there is the statement that registers J and K (110 and 111) may be taken for other probability distributions.

So, are the arguments keyed in the stack as 10 ENTER 5 ENTER 0.5 then shift PROB ?

Or, do you store two of the parameters in J and K and only key the 0.5 then shift PROB?

Inquiring minds want to know. :-)

Re: Binomial distribution

*Message #14 Posted by **Paul Dale** on 12 Apr 2011, 6:10 p.m.,*
in response to message #13 by Gene Wright

Probability in J, total number in K. The number you're asking about in X.

So 0.5 in J, 10 in K and 5 in X.

We tried putting all three on the stack and it ended up painful to use so we put the distribution parameters in registers (originally 01 and 02 and later J and K).

- Pauli

Re: Binomial distribution

*Message #15 Posted by **Gene Wright** on 12 Apr 2011, 6:11 p.m.,*
in response to message #14 by Paul Dale

Ah, thanks. That is the kind of info that has to be spelled out in the manual. :-)

Re: Binomial distribution

Re: Binomial distribution

*Message #17 Posted by **Walter B** on 12 Apr 2011, 7:08 p.m.,*
in response to message #15 by Gene Wright

It is already. Who has eyes to read, please read! Just search for Binom and you'll find it.

Re: Binomial distribution

*Message #18 Posted by **Paul Dale** on 12 Apr 2011, 7:15 p.m.,*
in response to message #17 by Walter B

In the released manual on sourceforge, the parameters are mentioned as being in the J and K registers but the wrong way around. So the question would still have had to be asked even if the manual was fully read and understood :-(

The latest manual is available from subversion: doc/ENTER_20b_1_17.pdf There have been a number of small changes.

- Pauli

Re: Binomial distribution

*Message #19 Posted by **Walter B** on 12 Apr 2011, 7:23 p.m.,*
in response to message #18 by Paul Dale

This is due to the fact we agreed on the order of these arguments after the released manual was released. Such is life in an open environment :-)

> Quote:
>
> There have been a number of small changes.

Oh yes. But mathematically speaking, they are countable still ;-)

Walter

Edited: 12 Apr 2011, 7:25 p.m.

Re: Binomial distribution

*Message #20 Posted by **Gene Wright** on 12 Apr 2011, 7:38 p.m.,*
in response to message #17 by Walter B

Hey Walter.

I did search for "Bino" and found a couple of places, but no where did I see it say "Store this is J and this in K, and put this in X". The only place it really talks about it is on...

Page 24 of 61 says: "= BINOMDIST(x; j; k; 1) in MS Excel, with the sample size j and the gross error probability k. B–1(p) returns the number of successes g for a given probability p in X."

That did not suggest to me to store 10 in J, 0.5 in K and 5 in X. The 0.5 is the probability of a success being observed, not a gross error probability. :-)

TVM function missing from manual

*Message #21 Posted by **Gene Wright** on 12 Apr 2011, 7:49 p.m.,*
in response to message #20 by Gene Wright

In the X.FCN menu. Not in the manual. :-)

Re: TVM function missing from manual

*Message #22 Posted by **svisvanatha** on 12 Apr 2011, 7:59 p.m.,*
in response to message #21 by Gene Wright

Looks like a newer addition

http://wp34s.svn.sourceforge.net/viewvc/wp34s/doc/ENTER_20b_1_17.pdf?revision=588

Re: TVM function missing from manual

*Message #23 Posted by **Paul Dale** on 12 Apr 2011, 8:04 p.m.,*
in response to message #22 by svisvanatha

Yes, this was a late addition. TVM is a user code program in flash that evaluates the TVM equation taking parameters from registers 80-84 and flag 80 from memory.

- Pauli

Re: Binomial distribution

*Message #24 Posted by **Walter B** on 13 Apr 2011, 2:03 a.m.,*
in response to message #20 by Gene Wright

> Quote:
>
> Page 24 of 61 says: "= BINOMDIST(x; j; k; 1) in MS Excel, with the sample size j and the gross error probability k. B–1(p) returns the number of successes g for a given probability p in X."
>
> That did not suggest to me to store 10 in J, 0.5 in K and 5 in X. The 0.5 is the probability of a success being observed, not a gross error probability. :-)

Thanks for the last point. I know why this happened ;-) and I'll correct that.

For the remainder: Please note there are Print Conventions framed at the bottom of page 3. And the memory layout is explained on page 10, explicitely telling the

purpose of registers J and K. So when you read the explanation of the binomial distribution you know what ***j*** and ***k*** represent, don't you? Else please return to page 3.

That said, the manual you refer to is of 28.3. describing v1.16, the last state zipped AFAIK. As soon as v1.17 is in the zipped package, this package will include the respective manual. For the time being, please find a (changing!!) manual representing (almost!) the current state of the SW here: http://wp34s.svn.sourceforge.net/viewvc/wp34s/doc/ENTER_20b_1_17.pdf?view=log

WARNING: Also the manual is work in progress. Since it is written on the other side of the Atlantic it may require some inevitable extra thinking sometimes. Similar requirements are posed by authors from the US of A on global readers every day. Please accept it - we do it as well. Think (sometimes)!

DISCLAIMER: Please apologize I cannot frame the last paragraph.

HTH

Walter

Edit: Bug 10 seems being fixed. The manual is corrected. Continue searching ;-)

Edited: 13 Apr 2011, 2:41 a.m.

Re: 34s bug reports - #10

*Message #25 Posted by **Gene Wright** on 12 Apr 2011, 6:14 p.m.,*
in response to message #1 by gene wright

Binomial locks up the 34s. :-)

So 0.5 in J, 10 in K and 5 in X.

Shift Prob ENTER locks the machine. Battery removal required.

Actually it is an uninitialised return value. Probably from the mucking around and space saving I've done with the distributions recently.

Fix out soon.

- Pauli

Re: 34s bug reports #11

*Message #28 Posted by **svisvanatha** on 12 Apr 2011, 7:40 p.m.,*
in response to message #1 by gene wright

```
11. Trig functions do not always return correct values.

e.g. GRAD 200 COS should be -1
WP34S/30B - result is -1
Wp34S  emulator - result is -1

But, GRAD -200 COS should also be -1
WP34S/30B - result is 0
Wp34S  emulator - result is 0

similarly:

DEG -90 SIN should be -1
WP34S/30B - result is 1
Wp34S  emulator - result is 1

I assume that negative arguments should be allowed similar to HP-35S, and HP-48SX.  I did
not see anything in the manual which stated that positive arguments only are allowed.
```

Re: 34s bug reports #11

*Message #29 Posted by **Paul Dale** on 12 Apr 2011, 8:02 p.m.,*
in response to message #28 by svisvanatha

Nice find.

The code that returns exact answers for multiples of 90 degrees/100 gradians isn't handling negatives properly. A fix in in the pipeline.

The underlying trig routines are working properly. Witness SIN(-PI/2). I don't even remember why I put this special case in :-(

- Pauli

Re: 34s bug reports #11

in response to message #29 by Paul Dale

```
Well, since you point out this specific example ;) :

RAD PI 2 / CHS SIN should be -1

WP34S/30B - result is: calculator blanks out, and returns -6.36619772368E-1!

Wp34S  emulator - result is -1
```

Re: 34s bug reports #11

*Message #31 Posted by **svisvanatha** on 12 Apr 2011, 8:12 p.m.,*
in response to message #30 by svisvanatha

See also Bug #7 above for similar with Cos of PI in RAD mode - that makes the calculator freeze!

What factors would contribute to two different outcomes for hardware vs emulator? Memory on hardware not being addressed correctly? I am nowhere near a hardware guy...

Edited: 12 Apr 2011, 8:14 p.m.

Re: 34s bug reports #11

*Message #32 Posted by **Paul Dale** on 12 Apr 2011, 8:25 p.m.,*
in response to message #31 by svisvanatha

We're probably trashing memory/running out of our 4kb stack :-(

Trig operations in radians require a reduction modulo 2 PI and this has to be done in very high precision to avoid loss of accuracy. For degrees and gradians I do the modulo reduction before converting to radians so this step is fast and accurate.

I'm still without working hardware so have to test everything in the emulator :-(

- Pauli

Re: 34s bug reports #11

*Message #33 Posted by **svisvanatha** on 12 Apr 2011, 8:29 p.m.,*
in response to message #32 by Paul Dale

Thanks - at least you know where the issue is.

Do you/Walter/Marcus think a better bug tracker is required now that the *.bin is being made publicly available? There is one on sourceforge I believe as part of the project page. It would require users to sign up there though. I am happy to keep reporting in this forum if you all wish!

Re: 34s bug reports #11

*Message #34 Posted by **Paul Dale** on 12 Apr 2011, 8:33 p.m.,*
in response to message #33 by svisvanatha

I've thought about this a bit but haven't talked to the others yet. Proper tracking will be essential but at the moment it is probably too heavy weight ... this is well pre-alpha stage software.

- Pauli

Re: 34s bug reports #11

*Message #35 Posted by **svisvanatha** on 12 Apr 2011, 9:39 p.m.,*
in response to message #32 by Paul Dale

```
 Bug 7 and the specific example you gave *appear* to have been fixed with
newer BIN image dated Rev 569 that Marcus uploaded to SF.

With that image, and the latest Windows emulator, try:

RAD PI SIN, which should be 0
```

```
WP34S/30B - result is 2.38462643383E-16
Wp34S emulator - result is 2.38462643383E-16

Now, SIN-1 of that result returns the argument exactly.

RAD PI COS returns -1 for both emulator and 34S/30B

But the SIN behaviour is similar to the 48SX...
```

Re: 34s bug reports #11

*Message #36 Posted by **Paul Dale** on 12 Apr 2011, 11:02 p.m.,*
in response to message #35 by svisvanatha

In this case the 34s is correct. This is not a bug.

PI isn't exactly pi, rather it is pi rounded to 16 significant digits. Thus SIN(PI) has to return the best result for its argument.

From wolfram alpha:

```
SIN(3.141592653589793) =
2.384626433832795028841971693993728458138352436257608... × 10^-16
```

We match exactly with the precision available.

The reason cosine is returning minus one is again due to accuracy. Again from alpha:

```
COS(3.141592653589793) = -
0.99999999999999999999999999999971567783855329432161056631...
```

Round this to sixteen significant digits and you get -1.

Re: 34s bug reports

*Message #37 Posted by **svisvanatha** on 13 Apr 2011, 6:22 a.m.,*
in response to message #1 by gene wright

Regarding Bug #1 - Py,x and Cy,x:

Gene: This appears to have been fixed with newer BIN image dated Rev 569 that Marcus uploaded to SF.

However, the WP34S/30B is *quite* slow at returning the result compared to even the HP-35S. I would say the result is returned some 4 seconds after executing P(69,2). In that time, the LCD contains the the following: dot matrix part - the shift key pressed; numeric part - X

The wait is so long, that if this is indeed expected, there should be a wait annunciator displayed to indicate the calculator is thinking. I know that program execution causes the RCL annunciator to flash.

The speed of the Windows emulator is fine.

Re: 34s bug reports

*Message #38 Posted by **Paul Dale** on 13 Apr 2011, 6:38 a.m.,*
in response to message #37 by svisvanatha

That is very very slow. Cy,x does three log gamma evaluations and some extra work but it doesn't do that much extra. There is a trig evaluation once the reflection comes into play (which it shouldn't) but otherwise it is a basic fixed length series evaluation.

I wonder if the clock rate fails to kick up sometimes or somesuch.

- Pauli

Re: 34s bug reports

*Message #39 Posted by **Marcus von Cube, Germany** on 13 Apr 2011, 3:06 p.m.,*
in response to message #38 by Paul Dale

I've played around with the factorial which is implemented with LNGAMMA as well. It's slow. So I tried next with LN alone. It takes a noticable time to compute, more then the trig functions. I assume "hier ist der Hund begraben" as we say in Germany.

Re: 34s bug reports - speed

*Message #40 Posted by **gene wright** on 13 Apr 2011, 12:05 p.m.,*
in response to message #37 by svisvanatha

Running the addition benchmark under various circumstances.

1) In "10" mode, which is base 10 integer, I think.

LBL A INC X GTO A

with a starting 0 in X, results in a value of about 73000 in a minute.

2) Same "10" mode, but this code:

LBL A + GTO A

with the stack loaded with 1, 1, 1, 0, results in a value of about 71,800.

3) In DECM mode, the code:

LBL A + GTO A

results in a value of about 78,700.

So, this is SLOWER than I got the other day, when I got a value of about 135,000. Thoughts?

Re: 34s bug reports - speed

*Message #41 Posted by **Paul Dale** on 13 Apr 2011, 6:19 p.m.,*
in response to message #40 by gene wright

Quote:

> So, this is SLOWER than I got the other day, when I got a value of about 135,000. Thoughts?

Space saving measures. If we end up not needing them, they will be reverted. That is a lot slower so I might revert them regardless.

- Pauli

Re: 34s bug reports - #12

*Message #42 Posted by **gene wright** on 13 Apr 2011, 12:07 p.m.,*
in response to message #1 by gene wright

Had the 34s in "10" mode to do some base 10 integer calculations.

Then tried to find the DECM command, which was difficult. It appears that the 1.17 manual suggests Yellow H.d on page 28 of 68.

So, I had a value of about 70,000 in X and pressed yellow H.d.

Display shows "infinity".

That seems like a bug.

Also, is there another place the DECM command lives?

Re: 34s bug reports - #12

*Message #43 Posted by **Marcus von Cube, Germany** on 13 Apr 2011, 1:44 p.m.,*
in response to message #42 by gene wright

Switching between integer and float is implemented similar to the 16C. It does some computations which I have never understood.

Re: 34s bug reports - #12

*Message #44 Posted by **Walter B** on 13 Apr 2011, 2:23 p.m.,*
in response to message #43 by Marcus von Cube, Germany

I concur :-) IIRC, it performs the transition from integer to decimal and vice versa exactly like the 16C, FWIW.

Gene, you are right with respect to DECM. There's a table showing the mode transitions on page 17 of the manual v1.17.

Walter

Re: 34s bug reports - #12

*Message #45 Posted by **Paul Dale** on 14 Apr 2011, 2:30 a.m.,*
in response to message #42 by gene wright

As Walter said, it isn't a bug just not entirely obvious.

We do as the 16c does.

We had a discussion about what else could be done but nothing substantial came of it.

Pauli

Re: 34s bug reports #13 - Exit in Catalogs within Program Mode

*Message #46 Posted by **svisvanatha** on 13 Apr 2011, 9:29 p.m.,*
in response to message #1 by gene wright

Scenario: You are within program mode, and want to browse a catalog for a function to use. You enter a catalog, and realize that 1) it is not the correct one (note 1), or 2) the function is accessible from the keyboard. So you EXIT the catalog to return to the program step you are in.

Try this on the WP34S (emulator or WP34S/30B)

```
1. Enter program mode
2. f-Shift MODE
3. EXIT
```

This returns you to the stack instead of the program step that you were on.

Coming from a user of 42S, and 35S, this seems odd. Is this designed behaviour or an oversight?

From the manual pg 52 of v1.17: "...while EXIT leaves the catalog without executing anything, returning to the mode as set before." From this, I assume that my expectation of returning to program mode is correct.

(note 1): Bug #4 I filed previously was shown to be designed behaviour, but having used the WP34S over the past few days, I find it odd. You can switch Shift modes by simply cycling F-G-H, but not for catalogs? I realize enhancements are probably not high on the list at this point, and will leave it at that!

Thanks!

Edited - changed wording

This is as designed. Someone wanted ON to exit program mode and this is a follow on to that. Will be looked into in due course.

> Quote:
>
> You can switch Shift modes by simply cycling F-G-H, but not for catalogs?

The problem here is the catalogue entry keystrokes are often also associated with characters that are used for navigation. You can't have both.

- Pauli

Forgive my naivety - how does being able to switch between different catalogs (without first pressing EXIT) interfere with other calculator functions? e.g. h-SHIFT MODE followed by h-SHIFT CONV. I am simply trying to understand your viewpoint.

Re: 34s bug reports #13 - Exit in Catalogs within Program Mode

*Message #49 Posted by **Paul Dale** on 13 Apr 2011, 11:40 p.m.,*
in response to message #48 by svisvanatha

> Quote:
>
> Forgive my naivety - how does being able to switch between different catalogs (without first pressing EXIT) interfere with other calculator functions? e.g. h-SHIFT MODE followed by h-SHIFT CONV. I am simply trying to understand your viewpoint.

There are some alpha characters defined on the h-shift plane. These characters can be used to quickly navigate catalogues just like any alpha input can when a catalogue is showing.

Thus, they cannot be used to switch between catalgoues. Sure, not all keys have h-shift alpha definitions and these could switch catalogues I guess but then we'd have an inconsistency in that some catalogues could be accessed and others couldn't.

- Pauli

Re: 34s bug reports #13 - Exit in Catalogs within Program Mode

*Message #50 Posted by **Marcus von Cube, Germany** on 14 Apr 2011, 2:18 a.m.,*
in response to message #49 by Paul Dale

Since the shifted alpha characters are not labeled on the keyboard, we could simply ignore the shift keys in navigation mode except for the keys with green catalog labels and treat them separately. Or we could leave the temporary alpha mode with each shift key and simply execute the selected function, be it a catalog or whatever. Even more intuitive: Just exit a catalog upon any of the shift keys. I prefer the latter: easy to implement and visually consistent.

Re: 34s bug reports #13 - Exit in Catalogs within Program Mode

*Message #51 Posted by **Paul Dale** on 14 Apr 2011, 2:29 a.m.,*
in response to message #50 by Marcus von Cube, Germany

It isn't quite that simple. We need g-shifted navigation to access the Greek alphabet.

- Pauli

in response to message #53 by svisvanatha

> Quote:
>
> OK - thank you. I was not using the 'search' function within catalogs. I can see the merits of allowing search, especially for long catalogs.

Several of the catalogues are quite painful to navigate one step at a time. I highly recommend the searching as a time and keyboard saver.

Also remember you can keep typing letters to refine the search (although after a short pause or one of the navigation arrows this is reset). You'll appreciate this most if you start accessing the statistical accumulations in the STATS catalogue :-) Although there are other places where there are long sequences of commands that start with the same letter.

in response to message #1 by gene wright

The moving target has moved again:

http://wp34s.svn.sourceforge.net/viewvc/wp34s/trunk/realbuild/

Re: 34s bug reports - new image

*Message #65 Posted by **gene wright** on 14 Apr 2011, 11:40 a.m.,*
in response to message #64 by Marcus von Cube, Germany

Ok, will reload the rifle and follow that moving target. ;-)

Re: 34s bug reports - new image

*Message #66 Posted by **Marcus von Cube, Germany** on 14 Apr 2011, 11:54 a.m.,*
in response to message #65 by gene wright

You will lose all RAM with the update, I'm afraid.

Re: 34s bug reports - new image

*Message #67 Posted by **gene wright** on 14 Apr 2011, 1:13 p.m.,*
in response to message #66 by Marcus von Cube, Germany

The Perils of Beta testing (and I call it beta...this is too full featured and behaving well to be an Alpha release).

No problem. I'm not keeping much in ram at the moment.

Bug 15

*Message #68 Posted by **gene wright** on 14 Apr 2011, 1:15 p.m.,*
in response to message #67 by gene wright

Heh, no sooner posted than...

Store 0.5 in J, 10 in K. Key 5 then Green PROB ENTER.

Warm start. Erased message shown.

Was just playing around with binomial distribution. Changing J and K values results in invalid parameter, FYI.

Bug 16

*Message #69 Posted by **gene wright** on 14 Apr 2011, 2:18 p.m.,*
in response to message #68 by gene wright

69 ENTER 2 yellow C x,y to do combinations.

Shows the result and then pushes an integer over the result in the X register.

Doing another 69 ENTER 2 blue shift P x,y will show the result and then overwrites the answer with the previous integer plus one.

Re: Bug 16

*Message #70 Posted by **Walter B** on 14 Apr 2011, 3:27 p.m.,*
in response to message #69 by gene wright

Both examples work here and return the correct results. Maybe you should reset your calculator?

Walter

Re: Bug 16

*Message #71 Posted by **svisvanatha** on 14 Apr 2011, 7:52 p.m.,*
in response to message #69 by gene wright

I did a fresh flash to latest bin (611 on SF), and the Cy,x behaviour is erratic. Sometimes gives correct result, sometimes turns calculator off, and sometimes does exactly what Gene has described. Py,x appears fine. Both are faster than I reported before, but not

quick.

Edited: 14 Apr 2011, 7:58 p.m.

Re: Bug 15

*Message #72 Posted by **Walter B** on 14 Apr 2011, 3:23 p.m.,*
in response to message #68 by gene wright

Your example returns reasonable results for various X here on my emulator. What exactly is the bug you are claiming?

Swapping J and K must lead to an invalid parameter error for obvious reasons.

Walter

Re: Bug 15

*Message #73 Posted by **gene wright** on 14 Apr 2011, 3:49 p.m.,*
in response to message #72 by Walter B

The warmstart referenced is the bug I am reporting for the parameters listed.

Re: Bug 15

*Message #74 Posted by **Walter B** on 14 Apr 2011, 3:59 p.m.,*

Whatever you call it, it has been simply amazing and I continue to be in awe of this achievement. Now of course, when all settles down, somebody will inevitably ask "when do we get the iPhone or Android app for wp34s?" <grin>

Keep up the great work!

Jake

Thanks for the vote of confidence. I'll clarify my not beta comment.

We're still fiddling around with the functionality and so forth. e.g. AGM got added last night -- it is used in the new logarithm code.

We're still finding major bugs :-(

Beta software doesn't have the former and shouldn't have the latter.

Re: 34s bug reports - Guide to flashing for new comers?

*Message #90 Posted by **Henry Chan** on 16 Apr 2011, 2:10 a.m.,*
in response to message #64 by Marcus von Cube, Germany

want to try but the thread is getting big and board. Sorry if I were asking newbie questions, how do you prepare the cable for flashing

from tim's guide one would need the amtel software and 20b_flash_kit but i am looking for the URL?

Thirdly, all the sources were on sourceforge, but how is the .bin file under real build related to the rom in windows emulator? which was generated from which?

thanks in advance Henry 4/16

reference

Moving Image Target

Yes, any 30b / 20b could be repurposed into a 34s #68 Flashing the 20b is perfectly described in Tim's document here. No taking apart necessary. :) In fact that wouldn't even help because the flash ROM is inside the main chip and is only accessible through either special hardware or, even easier, through the built in SAM-BA boot loader software.

The creators of WP-34s :) #14

Hi Henry,

there is no such thing like a "ROM" in the windows emulator. wp34sgui.exe is directly compiled from the C sources as a Windows executable which behaves similar to a real machine but not necessarily identical. For the developers it's a test bed to make sure the functionality is there. If some function works in Windows but not on the hardware, the bug must be in the hardware drivers or some such.

In fact, the first flash image was created way after the emulator was finished. I started porting to the hardware after porting Pauli's Unix/Linux code to Windows.

Have fun with the project! It's worth it. :)

Re: 34s bug reports - Guide to flashing for new comers?

Mayby this is a very dumb question, but recently I read a lot about new software versions for "real hardware" while on the other hand the last emulator version I can find is 1.16 which is more than two weeks old now. It doesn't even have an "A"-key. ;-) Am I missing something here?

Dieter

34s screen shots running on a 20b

*Message #1 Posted by **gene wright** on 11 Apr 2011, 11:11 a.m.*

Take a look. Bravo. After 5 minutes, I am impressed, as I thought I would be. Only issue I have seen so far is trying to turn OFF the 20b unit. :-)

Speed test: Did the program of LBL B, +, GTO B with the stack loaded with 1. Counts in one minute were 137,779.

AND... who needs a flash cable? I have some, but will need to cover my shipping cost. A corporation might be able to send them gratis, but I do need to cover shipping. Figure $3 in the USA and $5 international. I certainly will NOT be making a fortune, but have at least 20 cables for those who need one. Paypal will work as the method.

First come, first served...

FYI... I don't know why these pictures show up sideways for me. Oh well.

Instructions for flashing a 20b with a new rom can be found here:

20b flashing instructions

in response to message #5 by svisvanatha

Many bugs should already be fixed in the next release so wait with any complaints until you hear from me. I'm constantly working on the power handling logic which is quite convoluted. HP did a good job but I went my own way. This may use some more power while the calculator is idle but I understand it better. ;)

Edit: typo.

Try it again in integer mode, I'd expect it to be faster there.

Also LBL B INC X GTO B ought to be slightly faster again. And even better INC X BACK 01.

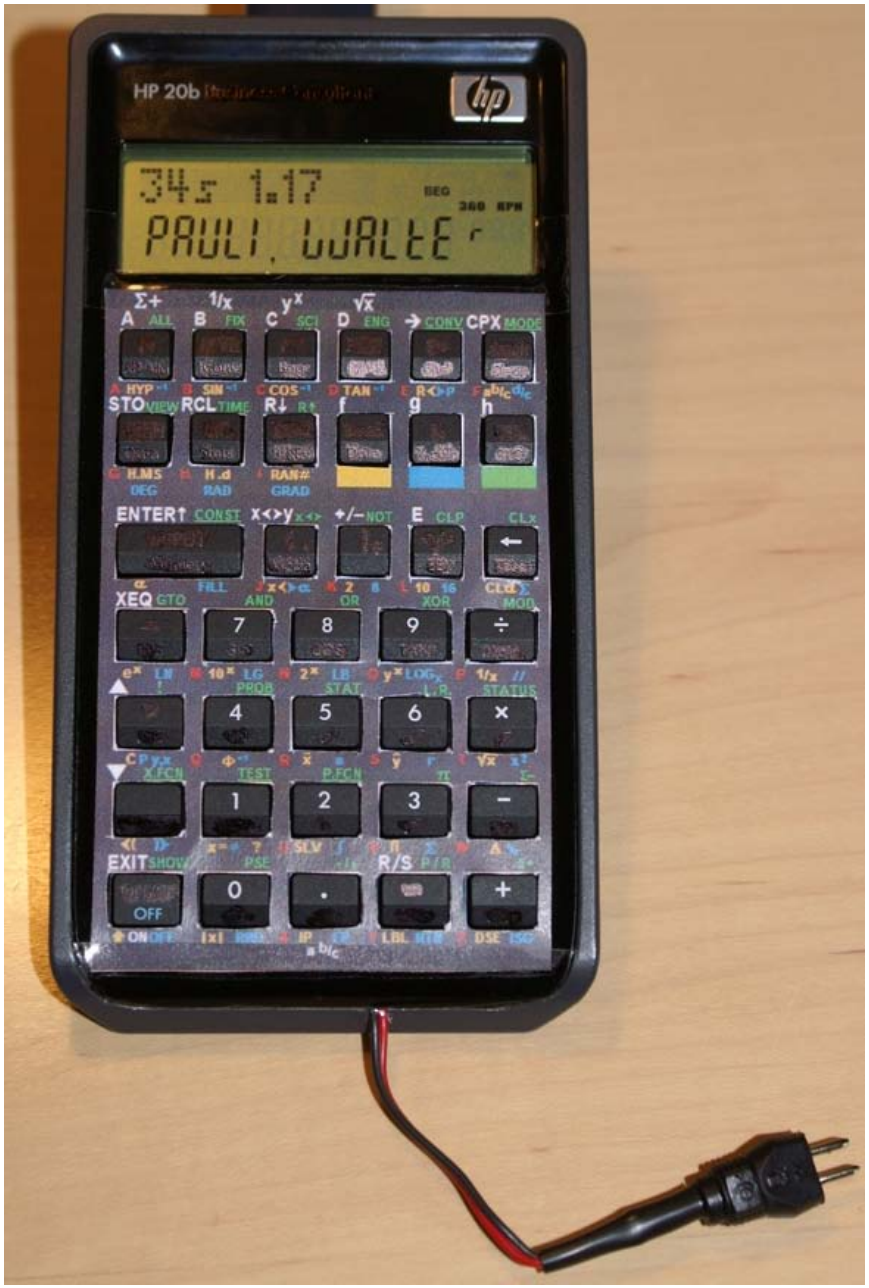
- Pauli

Re: 34s screen shots running on a 20b

*Message #11 Posted by **Marcus von Cube, Germany** on 12 Apr 2011, 8:35 a.m.,*
in response to message #10 by Paul Dale

I've created an overlay for my 20b:

And here is the result:



This is much easier than repainting the keys. I used a black pen to cover the original legends.

The firmware is work in progress and you can expect changes in execution speed. I'm still working on the power saving modes. As you can see, my 20b is equipped with an external power cord. I know, why. ;)

*Message #13 Posted by **Tim Wessman** on 12 Apr 2011, 10:56 a.m.,*
in response to message #11 by Marcus von Cube, Germany

I would recommend trying to follow the power code that is there. It took a long time and many revisions to get to the current level.

Essentially, you are shutting off the CPU between every keystroke.

TW

Re: 34s screen shots running on a 20b

*Message #14 Posted by **Marcus von Cube, Germany** on 12 Apr 2011, 12:12 p.m.,*
in response to message #13 by Tim Wessman

Tim, I understand your approach but I don't like it very much because you lose the 4 K RAM with each power off. I've a running timer (the PIT) which cannot wake up the CPU, only interrupt it. The PIT should at least be running while the calculator is doing useful work. It's also used with the PAUSE command or to implement key repeat on the arrows. If you look at the 20b firmware, it has a similar working scheme if it needs to scroll a message in the display.

What I do is switching speeds between 32MHz, 2MHz and around 32KHz (the latter does not work on SLCK for unknown reasons so I use the internal oscillator / 64). I also play with the voltage regulator and the flash power supply. This is not completed yet and is subject to change.

Eventually I'll follow the original logic after a second of inactivity or so if users complain about wp34s eating their expensive coin cells. The current draw in idle mode at present is 0.2mA. Two 2032s should be good for 90 hours.

An oops in the BACK code. You need something (anything) after the BACK 01 instruction for this to work. That extra instruction is never executed.

- Pauli

Re: 34s screen shots running on a 20b

*Message #17 Posted by **Marcus von Cube, Germany** on 12 Apr 2011, 11:50 a.m.,*
in response to message #1 by gene wright

Gene, the document by Tim discourages the use of USB-Serial converters. I run SAM-BA on a Windows XP virtual machine on my iMac. The 20b is connected through a USB/Serial converter.

Sometimes the connection breaks but normally it works. So no need to buy an old PC for the process.

New thread

Funstuff roms and the 41CL ... questions?

*Message #1 Posted by **gene wright** on 10 Apr 2011, 4:35 p.m.*

Angel's funstuff thread

At the thread above, Angel Martin lays out his very nice game ROM images and their contents.

The Funstuff (volume 2) says that it is a 16K rom. When used with the 41CL (or NoVRAM for that matter), that will take up two logical ports, correct? Port 1 and 2, for example. Top and bottom of 1 and top and bottom of 2.

The Adventure ROM (volume 3) says it is 24K. that means it takes up three ports, correct?

I'm asking because if so, that means we'll need to pass along a correction to Monte and his manual. he indicates modules that take a full port, but does not have any notations about things like the FUNS rom, which would take TWO ports.

Am I thinking properly? If not, wouldn't be the first time. :-)

Re: Funstuff roms and the 41CL ... questions?

*Message #2 Posted by **Monte Dalrymple** on 10 Apr 2011, 5:38 p.m.,*
in response to message #1 by gene wright

Adventure 1 is 16k and needs to be plugged into Port 1.
Adventure 2 is 12k and needs to be plugged into Port 3.
Funstuff is 16k and needs to be plugged into Port 1 or 3.

The PLUG functions only enforce the odd-numbered Port restriction,
so the user will have to PLUG in the Adventure ROMs correctly.

I will have to update the documentation for the Funstuff ROM.

Monte

WP 34S Top Left Key Poll

*Message #1 Posted by **Walter B** on 10 Apr 2011, 3:37 a.m.*

Hi all,

I start a new thread for this else it's deeply buried in an older one.

You all know how the WP 34S is looking now. There has been some discussion about the set of hotkeys we offer. A few people stumbled across the B C D layout and did ask where 'A' did go to ;-) or why we don't show it.

Though I bet all forumers are perfectly aware of the alphabet and able to start at an arbitrary position within, I offer the following alternative layout for the peace of mind of whom it may concern:

This would bring up another hotkey top left at the cost of deleting the two functions %- and %+. Default primary function of said hotkey will be Sigma+ and that's not negotiable. Please compare with the present layout.

I ask for your votes, please.

Walter

Re: WP 34S Top Left Key Poll

*Message #2 Posted by **Marcus von Cube, Germany** on 10 Apr 2011, 8:22 a.m.,*
in response to message #1 by Walter B

I agree with Walter's suggestion.

That's not cost, that's profit. ;-)

> Quote:
>
> Default primary function of said hotkey will be Sigma+ and that's not negotiable.

If the Sigma+ really is not negotiable (why?) I'll agree with the new layout. It's much better than before.

And now let's talk about the "//" function. ;-)

Dieter

Re: WP 34S Top Left Key Poll

*Message #4 Posted by **Gerson W. Barbosa** on 10 Apr 2011, 3:09 p.m.,*
in response to message #3 by Dieter

I do agree with Walter's suggestion.

> Quote:
>
> And now let's talk about the "//" function. ;-)

I have liked this one. Now, why can't GRAD reside only inside a menu?

Gerson.

Re: WP 34S Top Left Key Poll

*Message #5 Posted by **Paul Dale** on 10 Apr 2011, 5:25 p.m.,*
in response to message #4 by Gerson W. Barbosa

> Quote:
>
> I have liked this one. Now, why can't GRAD reside only inside a menu?

Or a DRG command that cycles through the three trig modes?

We'd still need DEG, RAD and GRAD but they can be buried in catalogues.

- Pauli

Re: WP 34S Top Left Key Poll

*Message #6 Posted by **Walter B** on 10 Apr 2011, 5:29 p.m.,*
in response to message #5 by Paul Dale

With DEG, RAD, GRAD in a catalogue, conversions would become significantly more difficult. With DEG, RAD, GRAD readily accessible on the keyboard, you simply press e.g. -> and RAD and voilá d:-)

Re: WP 34S Top Left Key Poll

*Message #7 Posted by **Gerson W. Barbosa** on 10 Apr 2011, 6:38 p.m.,*
in response to message #6 by Walter B

I've noticed -> g RAD does the conversion but changes the angular mode also. Furthermore, if the calculator is is Degrees mode and I want to convert 1 rad to degrees, I just can't. If GRAD is deleted from the keyboard, then -> g RAD and -> g DEG could consistently mean DEG->RAD and RAD->DEG, respectively. I would also suggest the prefix keys should be omitted whenever possible.

Re: WP 34S Top Left Key Poll

*Message #8 Posted by **Walter B** on 10 Apr 2011, 7:18 p.m.,*
in response to message #7 by Gerson W. Barbosa

There's a command R->D in X.FCN doing exactly what you want, i.e. conversion keeping the present angular mode set. And yes, we omit the prefixes whenever it's unambiguously possible.

Re: WP 34S Top Left Key Poll

*Message #9 Posted by **Gerson W. Barbosa** on 10 Apr 2011, 8:58 p.m.,*
in response to message #8 by Walter B

> Quote:
>
> And yes, we omit the prefixes whenever it's unambiguously possible.

Oh, I see. In order to minimize the use of prefixes, perhaps H.MS/DEG and H.d/RAD should not have shared the same key. I am sure, however, the keyboard layout has been carefully thought out, so changes at this stage are not advisable. In the hp-33s, for instance, it appears they swapped the Rv and RCL keys in the last moment so that STO and RCL were located in the same row. As a result HYP has been moved a bit away from the trig keys. Likewise Rv and R^ have been separated from the x<>y key.

Gerson.

Re: WP 34S Top Left Key Poll

*Message #10 Posted by **Paul Dale** on 10 Apr 2011, 9:17 p.m.,*
in response to message #9 by Gerson W. Barbosa

As a special case "-> g RAD" can omit the 'g' Likewise for DEG and GRAD. The thinking was that the trig conversions are more commonly used than the H.MS ones.

- Pauli

Re: WP 34S Top Left Key Poll

*Message #11 Posted by **Paul Dale** on 10 Apr 2011, 9:20 p.m.,*
in response to message #7 by Gerson W. Barbosa

An earlier version didn't change the trig mode on these operations and doing so was suggested. Can't win either way ;-)

- Pauli

in response to message #5 by Paul Dale

I had thought about that myself, but I wasn't aware DEG, RAD and GRAD can be used with -> for angle conversions. Non-programmable calculator used to have also a cyclic angle conversion key ->DRG.

Gerson.

*Message #15 Posted by **Jim Yohe** on 10 Apr 2011, 1:31 p.m.,*
in response to message #1 by Walter B

Okay, it may have been discussed elsewhere and I apologize for bring it up as a question but, why isn't the primary key function printed on the key and the hotkey printed on the surface of the faceplate above the key instead of the way it's shown now?

Otherwise I'm in agreement with you Walter.

Edited: 10 Apr 2011, 1:33 p.m.

Re: WP 34S Top Left Key Poll

*Message #16 Posted by **Marcus von Cube, Germany** on 10 Apr 2011, 1:36 p.m.,*
in response to message #15 by Jim Yohe

The "primary" function is only active if you are in run mode and label "A" is not assigned. So it's more of a backup function, not a real primary.

*Message #17 Posted by **Gerson W. Barbosa** on 10 Apr 2011, 3:03 p.m.,*
in response to message #16 by Marcus von Cube, Germany

What if the user forgets there are programs assigned to those top row keys? The lack of annunciators for the presence of programs 'A'..'D' might lead to wrong results. What about 2-key access to 1-letter label programs? For instance, XEQ H instead of XEQ f alpha H ENTER? This wouldn't apply to M, N, O, Q, R, S, U and V of course, but we would have 18 of these left. If one-key access to programs are really necessary, then a USER mode à la 15C would be a better option, IMHO. I have noticed the program counter skips one step for two or three-letter labels, for instance,

```
001 LBL'AB'
003 RTN
```

Am I missing something here? I haven't found anything in the manual about this (I may not have searched enough - if such is the case, sorry!).

Re: WP 34S Top Left Key Poll

Olá Gerson,

> Quote:
>
> What if the user forgets there are programs assigned to those top row keys?

Hmmmh, on this side of the Atlantic it's his/her fault. For the other side we could print a warning: **Do not forget you put something in your calculator's memory!** or **Items stored in your calculator may look less existent than they are!** Please choose your favourite.

> Quote:
>
> The lack of annunciators for the presence of programs 'A'..'D' might lead to wrong results.

May be. But we're not as nasty as it seems. STATUS will tell you the hotkey labels defined in user program memory. But I admit, now you've to remember this keystroke. Want another recommendation message in the manual?

No offense intended, just couldn't resist. Will think about your access suggestions later.

Walter

Local proverb: "When everything else fails, read the manual!" :-). I think I will print a hardcopy of the manual (and read it) now most changes have been made.

Another reason why I should have read it: somehow I thought the wp-34s firmware would run only on the hp-30b, so I didn't buy the only 20b I found after searching in many stores in São Paulo yesterday morning. It was selling for only R$ 80.00 (about 50 dollars), a bargain compared to Walmart, I mean *our* Walmart:

http://www.walmart.com.br/Produto/Eletronicos/Calculadoras/HP/107001-Calculadora-Financeira-HP-20B?Filtro=&strBusca=&utm_source=ShoppingUOL&utm_medium=Calculadoras&utm_campaign=107001-Calculadora-Financeira-HP-20B&idsku=

If one-key access to programs are really necessary, then a USER mode à la 15C would be a better option, IMHO.

Looking at page 16 (of 70) you see you have the fastest and easiest access to the labels A, B, C, D. Second easiest are two-digit numeric labels. Further alpha labels need more keystrokes. This addressing scheme was an arbitrary decision pretty early in this project - we could have made the access to alpha labels easier, then numeric labels had become difficult. We can't please everybody with every feature.

No, you're right - I was missing something. Thanks for your report. I'll update the documentation. The reason for taking two steps for the longer alpha label is simply the need for a bit more memory.

Walter

*Message #22 Posted by **Gerson W. Barbosa** on 14 Apr 2011, 4:29 p.m.,*
in response to message #21 by Walter B

> Quote:
>
> The reason for taking two steps for the longer alpha label is simply the need for a bit more memory.

Quite correct, but shouldn't sequential step numbering be preferrable than just skipping line numbers?

```
HP-42S examples

00 { 6-Byte Prgm }          00 { 7-Byte Prgm }
01 LBL "AB"                 01 LBL "ABC"
02 END                      02 END
```

Gerson.

*Message #23 Posted by **gene wright** on 14 Apr 2011, 4:35 p.m.,*
in response to message #22 by Gerson W. Barbosa

Under the current 001 to 003 change for LBL AB, what would happen if you did this:

```
010 SKIP 02
011 LBL AB
013 R/S
```

The SKIP 02 would jump into the middle of the LBL, correct?

Re: WP 34S Top Left Key Poll

*Message #24 Posted by **Marcus von Cube, Germany** on 14 Apr 2011, 4:37 p.m.,*
in response to message #23 by gene wright

That is the reason why these functions are hidden. They were originally intended for internal firmware use only. To be used with care.

Re: WP 34S Top Left Key Poll

*Message #25 Posted by **Gerson W. Barbosa** on 15 Apr 2011, 4:32 p.m.,*

> Quote:
>
> BACK would be a problem also. I don't see why the program counter shouldn't be fixed. In this side of the Atlantic, n is usally followed by n+1 :-)

There is a reason for letting the PC skip like it does. Partly laziness and partly practicality.

Alpha labels take two steps. So do all the other commands that can accept alpha labels as arguments: GTO, XEQ, solve, integrate, product, sum, f' and f".

Now to figure out what the "real" step number is and display it would require scanning program memory from the beginning and counting steps. I figured it wasn't worth the effort and CPU to do this. I figured these are likely to be fairly uncommon instructions & Walter agreed, at least at the time, that the step skip was a minor inconvenience

Now if somebody wants to code around this (efficiently in both time and space use), I don't see why we wouldn't include it.

Hot key and numeric labels take a single step for all of the aforementioned instructions so this isn't an issue unless you use alpha labels.

Nope, the SKIP goes past the R/S. No branching to the middle of steps. Ditto for BACK. They are fairly safe operations in reality.

This is condescending.

See the difference?

Re: WP 34S Top Left Key Poll

*Message #42 Posted by **Walter B** on 11 Apr 2011, 1:12 a.m.,*
in response to message #41 by Martin Pinckney

Martin,

If you feel this way for these dialogues, I like your feelings about the first better, of course. For the second, please see its development:

It started with Jim's question and a quick and concise response of mine pointing to two obvious examples. Images of the 65 and 67 are readily available at this very museum. Then his response with that trailing "Oh well..." after more than an hour. I admit I was feeling provoked and thinking he was blind - sorry, "visually challenged" - or even worse: it was so obvious >:-(Maybe I should have left this response unanswered ... without that "Oh well..." I might have done.

You see I'm not made for diplomacy. I beg your pardon.

Can this actually work?

*Message #1 Posted by **Michael de Estrada** on 9 Apr 2011, 10:41 p.m.*

I came across this TAS Auction which includes a so-called "USB Power Adapter" that directly connects the calculator AC adapter pins to a computer USB port. Since this is a Classic series calculator, its AC adapter has two separate outputs to operate the calculator, approximately 5 vdc, and to charge the battery, approximately 17 vdc. So I don't see how a USB cord could do this. Also, I don't see how a USB port could provide sufficient power for these tasks. So I ask, can this device actually work, and if so how?

Re: Can this actually work?

*Message #2 Posted by **Katie Wasserman** on 9 Apr 2011, 11:56 p.m.,*
in response to message #1 by Michael de Estrada

This looks like a straight USB cable with no molded-in voltage conversion circuit, however.....

A USB port can supply at least 500ma, so powering the calculator is certainly possible. 5 volts is also fine, I power all my classic calculators from 3 x AAA Energizer lithium cells which works out to be 5.1 volts when they are new.

Charging the 3 nicad cells in a classic from a 5V DC source will work fine as well. Nicads are fully charged at 1.45 volts per cell, so 5 volts will do it.

The high voltage that you measure from the standard HP chargers/adapter is an open circuit voltage, it drops considerably when loaded. Also as long as the voltage across the nicads cells being charged is greater than 1.45 per cell they will fully charge. The current flowing determines how fast they charge.

-Katie

Free42 for Android

*Message #1 Posted by **Thomas Okken** on 9 Apr 2011, 8:05 p.m.*

I finished my Android port of Free42; the big missing features (program import & export and printing to files) are done. It's on my web site now.
Once I have tested it on a few real phones, I'll put it in the Android Market, too, but that may take another week or so.

- Thomas

Re: Free42 for Android

*Message #2 Posted by **Forrest Switzer** on 9 Apr 2011, 11:17 p.m.,*
in response to message #1 by Thomas Okken

Thomas,

That is FANTASTIC. Thank you very much. Let us know when it hits the market. :)

Forrest

Re: Free42 for Android

in response to message #2 by Forrest Switzer

I second this - Fantastic work you have done.

Having file i/o now makes it the perfect calculator for my Droid X. Works great on Droid X.

One small suggestion - could you add a preference to turn off key clicks? Or better yet, toggle it to vibrate?

I'm now busy downloading RAW files to the phone.

Thanks.

Bill

Re: Free42 for Android

*Message #4 Posted by **Thomas Okken** on 10 Apr 2011, 12:47 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

Bill, your suggestion is noted. I can't say when I'll implement it, but in the meantime, you can make the key clicks go away by clearing flag 26. Of course that disables *all* sounds.

Re: Free42 for Android

*Message #5 Posted by **Bill (Smithville, NJ)** on 10 Apr 2011, 6:45 p.m.,*
in response to message #4 by Thomas Okken

Thomas,

Thanks. The clicks are anoying during meetings.

Bill

Re: Free42 for Android

*Message #6 Posted by **Marcus von Cube, Germany** on 10 Apr 2011, 8:34 a.m.,*
in response to message #1 by Thomas Okken

A quick check on my Archos 70 is promising. The real estate for the keys is pure luxury. I'd like to see a hires skin, the image looks very "pixely".

Re: Free42 for Android

*Message #7 Posted by **Thomas Okken** on 10 Apr 2011, 12:36 p.m.,*
in response to message #6 by Marcus von Cube, Germany

I don't have any skins designed specifically for Androids yet, but you could try some of the other "mobile" skins (from the Pocket PC, PalmOS, or iPhone skins packages). The Android version stretches skins to fill the screen so you don't need an exact fit.

Re: Free42 for Android

*Message #8 Posted by **Marcus von Cube, Germany** on 10 Apr 2011, 2:33 p.m.,*
in response to message #7 by Thomas Okken

How do I install new skins? I managed to copy them to a local file. The filer isn't very helpful, it seems to hide most of the file system.

Re: Free42 for Android

*Message #9 Posted by **Thomas Okken** on 10 Apr 2011, 2:55 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Put them in /sdcard/Free42. They will be picked up the next time Free42 is launched.

Re: Free42 for Android

*Message #10 Posted by **Marcus von Cube, Germany** on 10 Apr 2011, 3:55 p.m.,*
in response to message #9 by Thomas Okken

My /sdcard link is wrong, it points to /mnt/storage instead of /mnt/storage/sdcard. This must be a bug in the firmware. :(

Do you know of an ssh server so that I can administer my device better? I try rooting my device and correct the link but I don't know if that's permanent.

Re: Free42 for Android

*Message #11 Posted by **Thomas Okken** on 10 Apr 2011, 5:08 p.m.,*
in response to message #10 by Marcus von Cube, Germany

I'm afraid I'm an Android newbie myself -- I can't help you with advanced topics like rooting the device or setting up ssh.
You're not the first one I've heard from that said that the /sdcard path doesn't work; I think in the next release I'll add a field to the Preferences dialog to let you specify the skins directory yourself.

Re: Free42 for Android

*Message #12 Posted by **Marcus von Cube, Germany** on 10 Apr 2011, 5:30 p.m.,*
in response to message #11 by Thomas Okken

I suggest dropping /sdcard and using /mnt/storage/sdcard instead.

A custom option would be fine, too, for devices without an SD card. You should copy the skins to a local directory and update the files if a newer version is found in the configured directory. This way, you can add or update skins via the SD card without having to keep the card in the device. If the automatic update isn't feasible, a dialog "Import skins" would solve the problem.

*Message #15 Posted by **Alex L** on 11 Apr 2011, 5:05 p.m.,*
in response to message #10 by Marcus von Cube, Germany

ConnectBot can open a local console. I have it on my HTC Droid Incredible and it works like a charm.

Free42 in Android Market

*Message #16 Posted by **Thomas Okken** on 10 Apr 2011, 3:02 p.m.,*
in response to message #1 by Thomas Okken

I just posted it in Android Market. Just search for "Free42", or click this link.

N.B. This is my first time interacting with the Market; it was pretty painless, but in case anyone notices a problem, please let me know.

Also N.B. The app in the Market was signed with a different key than the ones I have been posting on my web site so far, so you will not be able to upgrade from the previous versions; this will be a new install and your persistent state from the previous install will not be preserved. You'll have to transfer your programs manually. I'll leave the version with the old signature on my web site for a while so you can upgrade to that first (in case you were using one of my alpha releases), export your programs, then uninstall and get the latest from the Market, then import your programs.

All future releases will be signed with this new key, both on the Market and on my web site, so this upgrade headache should not happen again in the future.

Edited: 10 Apr 2011, 3:30 p.m.

Re: Free42 for Android

*Message #17 Posted by **Pal G.** on 11 Apr 2011, 9:30 a.m.,*
in response to message #1 by Thomas Okken

Thomas,

Thank you so much for the port of Free42. I installed it on my Motorola Droid (first gen) last night and look forward to using it. I did notice the "LCD display" is quite blurry on Droid. My screen is 854x480. Have other users mentioned this? Is there currently a way to sharpen the output?

Thanks again.

Edited: 11 Apr 2011, 9:30 a.m.

Re: Free42 for Android

*Message #18 Posted by **Thomas Okken** on 11 Apr 2011, 3:45 p.m.,*
in response to message #17 by Pal G.

Hi Pal,

Free42 for Android stretches the skin to fit the screen, and the display is stretched along with it. If you're using a skin whose size is much smaller than the screen's, the end result is that both the skin and the display look blurry (*).

You say your phone has an 480x854 screen; compare that to the 320x480 screen that the built-in skin was designed for, and you can see the problem. Try using a larger skin, for example, one of the 640x920 skins designed for the iPhone/iPod "retina" displays; there are a few in the Free42iPhoneSkins.zip package. You have to copy the skins' *.gif and *.layout files to /sdcard/Free42, and Free42 will recognize them the next time it is launched.

Apart from the built-in skin, I currently don't have any skins that were specifically designed for Android screen sizes, but if/when I receive any, I'll put them up on my web site in an Android-specific package.

- Thomas

(*) I actually tried using graphics options to disable smoothing there, since scaling a blocky monochrome bitmap like the HP-42S display gives much better results without it... Unfortunately, it appears that some devices don't honor that option, and apply smoothing whether you want them or not.
I had the same problem with the iPhone version, interestingly enough, and had to resort to using a screen-resolution (UPDATE: I said "display-resolution" before, but that was wrong) off-screen bitmap for my buffering, since I just couldn't make scaling work the way I wanted it to. I may end up doing the same in

the Android version at some point.

Re: Free42 for Android

*Message #19 Posted by **Pal G.** on 11 Apr 2011, 4:03 p.m.,*
in response to message #18 by Thomas Okken

Thank you for the quick response. I thought the LCD and the Skin might be drawn differently, so I did not think to try another skin yet. I will try it right away.

I may attempt to make an WVGA skin. I will report back if it is presentable..

Thanks again.

Update: Two of the iphone skins look excellent on my Droid (HofferthHiRes, Andy480x800), but the LCD is still slightly blurry, but usable.

Not complaining! Just saying..

Thomas,

You wrote:

> Quote:
>
> to /sdcard/Free42

This originally confused me a little bit. I created a /sdcard directory and then a Free42 directory.

In reality, on a locked phone, the root is already at the /sdcard and I only needed to create the Free42 directory. The /sdcartd is hidden from the user.

This may not be true with all phones, but is what happens on a Droid X locked phone.

Bill

Re: Free42 for Android

*Message #22 Posted by **Thomas Okken** on 11 Apr 2011, 7:14 p.m.,*
in response to message #21 by Bill (Smithville, NJ)

Bill,

(Unix jargon alert!) The SD card is a separate filesystem which is mounted on /sdcard on most phones; on others, it may be mounted on some other mount point like /mnt/storage/sdcard, with a symbolic link from /sdcard to the actual mount point. Either way, when you connect the phone to your PC and select the "connect as disk" option, what gets mounted on the PC is only the SD card, and not the phone's entire filesystem hierarchy, so what you saw -- no /sdcard being in evidence, nor other directories you'd expect at the top level in a Unix system, like /etc -- is normal.

I suppose I should write a README file explaining all this. :-) Once I add an option in Preferences to let users select their own skins directory, I expect most of the confusion will take care of itself, since you can just browse the filesystem then and tell Free42 to use whichever directory you happen to have your skins in. That'll be in 1.4.68.

in response to message #22 by Thomas Okken

Thomas,

Understood. I'm an old unix hack from a long time ago. But it did take me a little thinking about it before I got it right. I'm guessing that most of us here are aware that Android is based on Unix/Linux, but there are probally a few people that just see the phone as it is and really don't think in terms of file systems.

Like you say, it'll all get clearer when you can browse the file system.

Since the real HP-42S is my favorite calculator, I'm having a blast with Free42S. Thanks again for all your hard work on it and for making it available.

Bill

OT : Seiko Worldtime

*Message #1 Posted by **Alberto Fenini** on 9 Apr 2011, 6:02 p.m.*

Dear All,
I know it's OT, but still, I'll give it a try.
Beside my HP collection, I have started to collect LED/LCD watches,
and I like the Worldtime serie from Seiko.
Does anyone has instructions booklets for these models ?
Eventually a spare 708-5000 module is something i'm looking for.
On the other end, if anyone else is interested in how to remove
scratches from mineral glasses (not plastic, you read right) I'll be happy to share my mistakes and my little progresses !!
take care and thanks in advance Alberto !!

HP41C overlays

*Message #1 Posted by **Art Leyenberger** on 9 Apr 2011, 4:36 p.m.*

I have two HP41C overlays which I cannot determine what they are.

1) Functions on the overlay (top row) include: DCV/ACV, TEM/REF,2W(ohm symbol)/4w(ohm symbol), FRQ/TOT, RED/WRT

2) Functions on the overlay (top row) include: T/E, J/K, S/R, RTD/4WRTD, THM, 4WTHM.

2nd func is f (gold) shift - e.g. f ACV on the top left key of the first overlay.

Anybody know what these two overlays are for?

Thanks.

.....Art

Re: HP41C overlays

*Message #2 Posted by **Donald Williams** on 9 Apr 2011, 7:18 p.m.,*
in response to message #1 by Art Leyenberger

Sounds like the overlays for the HP 3421A Data Acquisition unit control module. I have the module but have never seen the overlays.

Re: HP41C overlays

*Message #3 Posted by **Raymond Del Tondo** on 9 Apr 2011, 8:59 p.m.,*
in response to message #2 by Donald Williams

The overlays for the 3421A control module are of the protective type,
which means they cover the whole keyboard, like the 82220A protective keyboard overlay.

Re: HP41C overlays

*Message #4 Posted by **Donald Williams** on 9 Apr 2011, 11:42 p.m.,*
in response to message #3 by Raymond Del Tondo

The 3421A was my first thought, but there are no CLS or OPN commands described, which would be used on the 3421A. So my next guess would be the overlay for an HP 3468A/B Digital Multimeter. The commands described on the overlay would be used for multimeter functions. I was not aware that the 3468 module even existed, but I can't think of any other HPIL controlled multimeter.

Edit

Is this your overlay

Here - see page 17

This would be used for a very rare module

> ...but turned out to be useless. Experienced user doesn't look at key legend anyway.

Oh - so you asked every experienced user and the results were unanimous? I wholeheartedly disagree, so here's a 32-year HP41 user feeling the opposite way. Making "declarations" like that seem foolhardy to me. Plus, the blank overlays were great for markings for new programs with a new set of assignments. They may not have sold well from HP, but that may have been due to the relatively high cost.

Re: HP41C overlays

*Message #8 Posted by **reth** on 11 Apr 2011, 2:07 a.m.,*
in response to message #7 by Jake Schwartz

What I wrote is my observation only. All people I know using HP41 *knew* their module user keys so did I. I believe you asked every user out there with the exception of the ones I know and they can't live without overlays; I didn't so I'm sorry for not been clear enough.

Re: HP41C overlays

*Message #9 Posted by **Ángel Martin** on 10 Apr 2011, 2:14 p.m.,*

in response to message #6 by reth

Overlays on the 41 were just great, and continue to be. Its user interface has the power of a juggernaught and the simplicity and elegance of a keypad, talk about ease of use - can you spell Soft-Alpha? No thanks.

That of course assumes that you use the calculator for multiple, different aaplications. The USER keyboard(s) will be impossible to navigate without the overlays as visual keys.

Re: HP41C overlays

*Message #10 Posted by **reth** on 11 Apr 2011, 2:17 a.m.,*
in response to message #9 by Ángel Martin

Well that assumption solves the problem. As a surveyor I never used the overlay. I used to work with structural engineers and they knew their user keys and I have never seen them using the overlay. I agree if someone uses multiple modules overlays would be necessary, but I do not know such people.

OT: What is so special with the Casio fx-602P

*Message #1 Posted by **Joerg Woerner** on 9 Apr 2011, 2:16 p.m.*

Hi There,

I tried multiple times on e**y to obtain a Casio fx-602P for the Datamath Calculator Museum as a reference for LCD calculators with dotmatrix displays.

Well, they usually sell above $100 - any idea what makes them "so" collectible?

The one I watch now (Casio fx-602P) is already at EUR 45,50 (about USD 65.00) and still one day left.

Any hints welcome.

Thanks and Regards, Joerg

Re: OT: What is so special with the Casio fx-602P

*Message #2 Posted by **marais** on 9 Apr 2011, 5:43 p.m.,*
in response to message #1 by Joerg Woerner

Well, it simply is a great calculator. Back at the time, the FX-602P competed with the HP-41C and a TI machine, and I couldn't help but consider the FX 602 the superior machine: It features a real dot-matrix display, has a bounce-free keyboard, a decent programming model, and an extension slot which allows to save programs on tape recorders. It lacks the 41C system approach and some of the more advanced higher math functions, but overall is a very capable (and cute - with its slim metal case) machine. I replaced mine eventually with a 28S, when complex math became a necessity and my complex arithmetic programs written for the 602P no longer did the job. Casio later issued a successor, the FX-603P, which is even more difficult to find.

Andreas

Re: OT: What is so special with the Casio fx-602P

*Message #3 Posted by **Paul Dale** on 9 Apr 2011, 7:12 p.m.,*
in response to message #1 by Joerg Woerner

The 602p was simply a great calculator.

Lots of program memory (511 steps I think) & registers (22), alpha messages and prompts, a good selection of functions on the keyboard, IO via cassette tape and a printer and it is fast. It could play music via the cassette interface. Oh, and best of all it was cheap.

This one drew me away from HP for quite a few years. I wish mine hadn't died.

I've lots of fond memories here. I spent more than a bit of time programming a minimax search so it could play tic-tac-toe :-)

*Message #6 Posted by **Donald Ingram** on 9 Apr 2011, 11:00 p.m.,*
in response to message #5 by Joerg Woerner

The Casio is one of those calculators I regret giving out on a loan ... never to see it again.

It was blindingly fast compared to the HP41CX I upgraded to.

The Casio had a cassette interface - which could be use for output tones : the same as Kraftwerk did with the predecessor Casio fx-501.

It was also possible to save programs and interestingly if the read back was interrupted mid text, the corrupted string could be manipulated to access extra non keyboard characters.

*Message #11 Posted by **Paul Dale** on 21 Apr 2011, 1:20 a.m.,*
in response to message #10 by Donald Ingram

I'm pretty sure the programs were stored using the Kansas City standard at 300 baud. The music on the other hand, wasn't -- it was tones at the correct frequency. I've no idea what form they took (square, sine, triangle, whatever wave).

*Message #13 Posted by **Marcus von Cube, Germany** on 21 Apr 2011, 7:19 a.m.,*
in response to message #12 by Donald Ingram

I've created a software package for dealing with Casio (and others) cassette recordings. The software does not deal with the fx-602, only its BASIC siblings and the fx-8000G graphic calculator. It may serve as a head start as all the low level stuff of reading and creating the correct wave patterns is already there.

IIRC, there exists some software specifically written for the fx-602. It's some time ago that I stumbled across it. I don't have the name or the author at hand right now.

My work is here: http://www.mvcsys.de/doc/casioutil.html

Ebay

*Message #1 Posted by **Matthias Wehrli** on 9 Apr 2011, 6:57 a.m.*

Hi

I was "away" for a longer periode of time. From time to time I looked on the electronical bay if there is something interesting for my HP collection. during the last year I only found two items that were really interesting: one HP-41 module I didn't knew, a HP prototyp. Most of the items sold on ebay are new (selaed) calculators, that aren't worth looking for them each day. Do I fail or do you also observe that ebay becomes more and more a marketplace for new calculaotrs? I can not find that many old items I found 2-3 years ago. Also aside of ebay I only had one really interesting deal: one of the "holy grails" of all HPs has found a new home. Seems that all HP goodies are in collectors hands now. True? Did I miss really nice items? (Oh, good fu***ing geocaching. Takes a lot of time I should better have used for searching the Web for HPs?)

Matthias

Re: Ebay

*Message #2 Posted by **bill platt** on 9 Apr 2011, 8:07 a.m.,*
in response to message #1 by Matthias Wehrli

I agree with your observation that ebay is becoming overrun with new stuff. It is annoying. If I wanted new, I'd go to a store!

But the collection stuff not being there? You know more than I do about that.

Re: Ebay

*Message #3 Posted by **Namir** on 9 Apr 2011, 11:19 a.m.,*
in response to message #2 by bill platt

Hello Matthias,

Yes, I see more new calculators too. At the same time I think your collection has reached saturation where you have your wide range (if I did not see it with my own eyes a few years ago, I would not believe it) of vintage machines as well as rare custom specimen and rare modules.

Namir

Re: Ebay

*Message #4 Posted by **Michael de Estrada** on 9 Apr 2011, 12:24 p.m.,*
in response to message #1 by Matthias Wehrli

TAS has become much less friendly to amateur small time sellers who are more likely to have unique vintage calculators for sale. Nowadays, it's mostly junk dealers that are selling randomly. Having said that, on occasion I've seen unique items such as a prototype HP-45 with a green LED display, although it sold for a very high

price. I've stopped selling on TAS and all my most recent sales have come via the classifieds on this forum, where I've had 100% success.

Re: Ebay

*Message #5 Posted by **Matthias Wehrli** on 9 Apr 2011, 1:51 p.m.,*
in response to message #4 by Michael de Estrada

The HP-45A with the green display is in my collection now ;) It was the only intersting part in this year.

Re: Ebay

*Message #6 Posted by **Keith Midson** on 10 Apr 2011, 9:34 p.m.,*
in response to message #1 by Matthias Wehrli

Hi Matthias, I have also noticed that ebay has become less 'interesting', but having said that, my collection is fairly mature - I have most items that I want in my collection.
I think if I were just starting out collecting then i'd be excited about items like a boxed 65, or a mint 42S, etc. It gets harder to get excited about items that are listed that you already have.
There are definitely more new items being listed now compared to a few years ago - there also seems to be a lot of 'refurbished' sellers out there now. Obviously there is a market for cheap new models. Cheers, Keith

Re: Ebay

*Message #7 Posted by **Michael de Estrada** on 10 Apr 2011, 10:07 p.m.,*
in response to message #6 by Keith Midson

I agree that mostly it really hasn't changed that much, it's just that many of us have pretty much completed our collections to the extent that we've met our core goals. So, we don't pay attention to items that previously would have been interesting. For example, for many years I kept looking for an HP-70 to complete my set of HP Classics. Then last year there was a veritable flood of them on TAS, I picked one up, and now I don't notice whether any more appear for auction. Really rare items like an HP-35 Red Dot only appear in geologic time anyways, so trying to judge TAS within a short time frame cannot produce enough data to reach a conclusion regarding its truly unique items.

HP 75 memory repair assistance request

*Message #1 Posted by **Greg Angelow** on 9 Apr 2011, 6:30 a.m.*

I have my 75C now for about 30 years and it still works fine, in general. A few day ago I got error message <17 RAM is invalid>. I found out, that the 8k RAM extension module (Part. 82700A) has a problem with half of its capacity (4k) not working. When I open it, I find 4 chips CMOS RAM Toshiba TC5516 AF. A lot of googling gives me the impression that these chips are no longer available.

Can anyone help me kindly how I can get the memory working with a schematic of the memory, a chip source or maybe a spare module 82700A to sell. BTW: I'm also interested to acquire used 75's. Thanks.

Re: HP 75 memory repair assistance request

*Message #2 Posted by **Paul Berger (Canada)** on 9 Apr 2011, 12:28 p.m.,*
in response to message #1 by Greg Angelow

The RAM chip used in there is a standard pinout 2Kx8 CMOS static RAM so there are many other type that would be suitable replacements. From the datasheet I found online for the TC5516 it would seem to be a 250nS part, so any 2K part with an access time equal to or faster than that would be suitable. For instance I have in front of me a Sony CXK5816 and a Fujitsu MB9416 and looking at the specs for them either one of them would be suitable.

As for a schematic, there only seems to be the 4 SRAMs in the module so I would suspect that all the address and data lines and R/-W are connected to pins common to all 4 chips and then there would be separate -enable lines for each chip. Since there is no glue logic in the module It seems that the -enable for each chip comes from the main logic of the 75, likely from the chip called 'MAR' this chip seems to provide all of the RAM control logic, and the SRAM chips on board are also 2K x 8 so it would seem likely that this chip divides the RAM space into 2K pages and provides -enable lines for each of them. unfortunately the copy of the service guide I found is missing some of the schematic pages so I cannot confirm that.

Since the -enable is supplied by the 75 this raises the possibility of the problem being inside, or perhaps even a connection issue between the module and the main board, did you try reseating it? It is possible, depending on how the 75 'discovers' the RAM that only one chip is at fault. If it reads through the memory until it detects that it does not read back what it wrote and from that assumes it is the end of memory then if the 3rd 2K chip was bad you would still loose 4K.

Re: HP 75 memory repair assistance request

*Message #3 Posted by **Greg Angelow** on 9 Apr 2011, 5:30 p.m.,*
in response to message #2 by Paul Berger (Canada)

Thanks, Paul, for your prompt expertise.

I will follow you and examine the substitute chips you mention. Maybe my problem is, that I'm not familiar with this kind of electronics and the distributors I get my components usually from (e.g. Farnell) do not offer CMOS RAM. At the other side, datasheets are easy to find.

As you recommend, I inspected the board and the edge connector and cannot find any wear - the contacts are bright. I also re-soldered the edgeconnector to consider a cold joint.

The enable signal at the RAM should be detectable with the scope, I guess.

Re: HP 75 memory repair assistance request

*Message #4 Posted by **Paul Berger (Canada)** on 9 Apr 2011, 7:21 p.m.,*
in response to message #3 by Greg Angelow

Yes you could see it on a scope but it might be hard to catch as it would not be a regular pulse, a storage scope would be able to capture it or a logic probe. These RAM chips have two -enable lines, pins 18 and 20 but in the 8K module they are tied together on each chip.

Re: HP 75 memory repair assistance request

*Message #5 Posted by **Eric Smith** on 9 Apr 2011, 6:25 p.m.,*
in response to message #2 by Paul Berger (Canada)

One of the most common part numbers for a CMOS 2K*8 static ram is 6116 (originally from Hitachi as HM6116). You want the L suffix for low power, e.g., 6116L-3 which is 150 ns. They should be available from many sources, such as Unicorn Electronics.

Re: HP 75 memory repair assistance request

*Message #6 Posted by **Paul Berger (Canada)** on 9 Apr 2011, 7:24 p.m.,*
in response to message #5 by Eric Smith

Yes I looked there too but they do not say what package they are, for the 8K module the plastic flat pack package is required.

Re: HP 75 memory repair assistance request

*Message #7 Posted by **Bart (UK)** on 11 Apr 2011, 5:11 p.m.,*
in response to message #6 by Paul Berger (Canada)

I purchased the HT6116-70S from here (see under heading "RAM's - SMD Type"). That is a 330mil (~8.5mm) wide plastic flat pack (the actual IC that I received is HM6116LFP-3). I used for my PC1251 (which I ended up upgrading to 10k, picture and description - the 2k IC on the left is the 6116 from Futurlec)

Edited: 11 Apr 2011, 5:33 p.m.

Re: HP 75 memory repair assistance request

*Message #8 Posted by **Jakob B. Sorensen** on 10 Apr 2011, 4:44 p.m.,*
in response to message #2 by Paul Berger (Canada)

The system Sw supports RAM increments of 2K (ref. HP-75 Service manual). The schematics shows the following signals for the J1 connector to expansion RAM:

```
Signal  Pin             Signal  Pin
------------              ------------
VC      1               VC      A
GND     2               GND     B
-E6/-E10        3               -E7/-E11        C
```

```
-E4/-E8 4               -E5/-E9 D
-W      5               A9      E
A8      6               A7      F
A6      7               A5      H
A4      8               A3      J
A2      9               A1      K
A0      10              R07     L
R06     11              R05     M
R04     12              R03     N
R02     13              R01     P
R00     14              A10     R
```

The four enable lines are either connected to -E8..-E11 or to -E4..-E9 supporting the discussion about HP-75 originally was planned with 8K RAM onboard.

Re: HP 75 memory repair assistance request

*Message #9 Posted by **Greg Angelow** on 11 Apr 2011, 5:33 a.m.,*
in response to message #8 by Jakob B. Sorensen

Very interesting info. I'm asking myself, if the memory controller, which Paul named 'MAR', has some spare enable lines to feed more memory. As far as I know, the Series 80 desktops have 32k at the bottom end and 512k with bank switching. I have a source now for IDT6116LA45SO chips and try to replace the Toshiba chips of the extension board.

Re: HP 75 memory repair assistance request

*Message #10 Posted by **Paul Berger (Canada)** on 11 Apr 2011, 6:58 a.m.,*
in response to message #9 by Greg Angelow

Unfortunately no, it provides 12 select lines for 2K pages of memory, for a total of 24K, that is all that the 75 was designed for. It is possible to install RAM in the front bank selected ports, however memory installed there cannot be used as regular RAM. HP made a device "82713A HP-75 Plug-In Module Simulator" that contained battery backed up RAM. The intent of this device was to assist with the development of ROM plug-ins. I have no first hand experience with this device but it is my understanding that programs and LEX files can be stored in it to free up space in RAM.

New Updated Version of The "PPC DVD" of HP Handheld Calculator Materials Available

*Message #1 Posted by **Jake Schwartz** on 8 Apr 2011, 7:08 p.m.*

Hi, The "PPC DVD", consisting of the four original PPC CDs of HP-calculator users' publications from the U.S., U.K. and Australia, along with various other historical materials has been updated with almost 4000 additional pages. For more information, check out http://www.pahhc.org/ppccdrom.htm.

A comparison of three Hp 17bII generations

*Message #1 Posted by **Jose Gonzalez Divasson** on 8 Apr 2011, 6:51 p.m.*

I have the chance of having all three models (original, gold trim and silver), and I have made a comparison in the blog:

Comparison between all three HP 17bII generations

Surprisingly, the original one was the nearly the fastest (the silver being the slowest!), and the key feel is still the best.

The silver one is a clear improvement over the gold trim version in all respects but speed. And there is a quality factor that I had not considered until now: how they are suited for single-handed calculations (handling the calculator and keying numbers with the same hand, like in a presentation). There were huge differences in that respect!!

Re: A comparison of three Hp 17bII generations

*Message #2 Posted by **Don Shepherd** on 8 Apr 2011, 7:35 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Jose, this is a good comparison of the three 17bii units, but I have to believe that your speed figures for the 17bii+ gold are in error. I don't currently have the silver unit, but a few years ago I did some benchmarks of the solver and found virtually no difference between the 17bii+ gold and silver: both were substantially slower than the 17b or 17bii. You reported the gold unit took 78 seconds to do your benchmark; I just ran it on my gold unit and it took 167 seconds, comparable to the 17bii+ silver. My 17b ran it in 80 seconds.

You mention that later units do not have the Let and Get functions, nor do their manuals mention those. My experience is different. All versions of the 17b, including 17b, 17bii, 17bii+ gold, and 17bii+ silver, have the Let and Get functions. The manuals for the 17b and 17bii do not mention Let and Get, but the calculators have the functions. The manuals for the 17bii+ gold and 17bii+ silver do mention Let and Get, and those calculators have those functions as well.

While the plus units have much more memory, the solvers are different between the 17b/17bii and the plusses; the original solvers were faster and executed in a logical way. The new solvers are inferior.

Re: A comparison of three Hp 17bII generations

*Message #3 Posted by **Jose Gonzalez Divasson** on 9 Apr 2011, 5:28 a.m.,*
in response to message #2 by Don Shepherd

Don,

I have rechecked the loop results - I might have lost 1 minute in the count - but I still get 85 seconds (today is 5º colder than yesterday - I don't know if that can be a factor), still much better than the silver model and in the same region as the original,

When it comes to Let and Get, I cannot find them in my Spanish hp 17bII manual, first edition; but it does come in the downloadable English manual, second edition. I stand corrected !!

Best regards,

José

Re: A comparison of three Hp 17bII generations

*Message #4 Posted by **Don Shepherd** on 9 Apr 2011, 8:22 a.m.,*
in response to message #3 by Jose Gonzalez Divasson

Thanks Jose.

I have a hunch that Let and Get may have been put in the original 17b solver as a debugging tool for the developers, and perhaps they found it so useful that they left it in the production version but forgot to update the manual. Later, when users discovered it (probably in this forum!), the manuals were updated. The "Technical Applications for the HP-27S and HP-19B" manual (on the museum DVD) has a whole section on the Let and Get functions and many equations using those instructions.

I read a post a few years ago in this forum that Let and Get were not in the original 17b solver, but I got a 17b on EBay and they are there.

These are the types of things I really admire in HP calculators. For the 17b, Let and Get, If, and Σ turn the solver into a minimal programming language capable of many things that a simpler solver would be unable to do. And on the 12c, cfj effectively gives you indirect addressing, and Valentin pointed out how NPV and IRR can turn the 12c into an equation solver. Amazing.

in response to message #3 by Jose Gonzalez Divasson

Hi Jose,

Nice review of the three generations of the 17bII's. I ran that loop test twice on my 17bII+ (gold) and got 85 and 87 seconds respectively.

The one small gripe I do have with mine is the grey rubber on the sides of it. When holding the calculator, it kind of feels like your fingers are sweating. Also, the case provides good protection but it's bulky.

What case is supplied with the silver one?

Regards,

James

Re: A comparison of three Hp 17bII generations

*Message #6 Posted by **Jose Gonzalez Divasson** on 10 Apr 2011, 9:09 a.m.,*
in response to message #5 by James Lee

James,

The case is equal in material, slightly large for the silver one. It looks better than the previous Pioneers, but when you look at how you use, the original is better for most applications (jacket pockets and so on)

The gold is not a bad calculator, but pales in comparison with the former and the latter ones

With fresh batteries I got 170 seconds on my gold 17bii+ which has s/n CNA61801536.

John

Re: A comparison of three Hp 17bII generations

*Message #9 Posted by **Don Shepherd** on 12 Apr 2011, 12:49 p.m.,*
in response to message #8 by John B. Smitherman

Thanks John. It seems that a couple of people got a much quicker response on their 17bii+ gold units, so I have to wonder if maybe later gold units had a faster processor or something, compared to earlier gold units. Oh well, I guess it doesn't matter since the silver unit replaced the gold one. I assume that the gold ones aren't in the supply chain anymore.

As for me, I'll take the 17b or 17bii.

82240B / HP48 Interaction poorly documented

*Message #1 Posted by **Thomas Chrapkiewicz** on 8 Apr 2011, 6:03 p.m.*

While working with an HP48 and a HP82240B printer, I noticed that the printer seems to be stuck in ECMA font mode.

This violated what the HP82240B technical interface guide indicates - that is - that the font settings are 'sticky' and will remain in the font setting until changed with the other font escape code.

Well, printing from the HP48 after having set the printer to ROMAN8 font, the printout was still in ECMA font.

I then tried the same code from an HP28. This seemed to work fine. Very strange.

I then discovered that the HP48 pre-appends all strings sent out of the IR with the ECMA font setting string (27 249). I found this documented (in the very last paragraph)here:

http://page.mi.fu-berlin.de/raut/WR49/Ioman.htm

I then verified this using INPRT on another HP48 to capture the IR output of the sending HP48.

[I am surprised that this is not documented elsewhere; I checked the AUR, Wickes and Donnelly!]

'New' HP10bii+

*Message #1 Posted by **Michael O** on 8 Apr 2011, 12:54 p.m.*

Not sure if I missed something - quickly scanned forum and did not pick up any threads in recent posts - I noticed a new 10bii+ with added math capability and Breakeven and Probability :

http://h10010.www1.hp.com/wwpc/us/en/sm/WF06a/215348-215348-64232-20036-215349-5034296.html

I am sure I haven't seen this before- the keyboard layout is exact as latest model 10bii but with many more blue key functions including math. Can someone point me to thread where forum experts discussed this model - when was it launched?

Re: 'New' HP10bii+

*Message #2 Posted by **Jim Yohe** on 8 Apr 2011, 2:40 p.m.,*
in response to message #1 by Michael O

That's nice to see trig functions, Pi, etc in the revision!

How, if you don't mind revealing, did you discover this new revision? That link doesn't show a current part number, manual, or even that you can purchase it (quote: The product you selected is not available in HP's online store.)

Under the "old"/current HP10bii it says, "Out of stock / Please check back soon" so I bet they are cleared of stock and going to put that new one in it's place soon.

Re: 'New' HP10bii+

*Message #3 Posted by **Gerson W. Barbosa** on 8 Apr 2011, 6:31 p.m.,*
in response to message #2 by Jim Yohe

> Quote:
>
> That's nice to see trig functions, Pi, etc in the revision!

I've always wondered why these have not been included in the HP-12C Platinum, since its code has been rewritten from scratch. The only trouble I see is backward compatibility with old 12C programs. For instance,

```
01-    42 9  f 9
```

would have to be replaced with

```
01-42, X, 9  f FIX 9
```

This would occur very rarely however to be a problem.

What do you want to know? Ask away.

A full review will be in the next HP Solve, due out shortly.

Great unit.

For 25 years, I have begged, pleaded, harassed, and begged some more for a financial calculator with at least trig and some other scientific features to allow college students to have one calculator that handled all of their classes.

The new 10bII+ is SO MUCH more than I ever dreamed would be available in an entry level machine. It is marvelous.

But, before anyone asks... No, it does not have RPN. :-(

Re: 'New' HP10bii+

*Message #10 Posted by **gene wright** on 8 Apr 2011, 3:22 p.m.,*
in response to message #9 by Tim Wessman

So, this does everything the existing / previous HP 10bII will do PLUS...

Depreciation

Bonds

Breakeven

Date calculations

6 regression models

Data editing abilities for cash flow and statistics. Data does not disappear into register sums like the 10bII or 12c approach does.

Trig and inverse in degrees or radians.

Hyperbolics (heh)

Single key permutations and combinations

Normal and inverse normal distribution. Students t distribution and inverse.

Selective clearing of just the bond, breakeven, TVM or cash flow data rather than having to clear the entire machine.

Algebraic hierarchy or chain calculation mode.

Parentheses!

As I said this is a really great machine.

Re: 'New' HP10bii+

*Message #11 Posted by **Martin Pinckney** on 8 Apr 2011, 3:37 p.m.,*
in response to message #10 by gene wright

Almost seems like HP is competing with itself. If the keyboard is good, why do we need the 20b?

I still can't believe that with all this recent activity in financial, there is no new scientific on the horizon.

Re: 'New' HP10bii+

*Message #12 Posted by **gene wright** on 8 Apr 2011, 3:48 p.m.,*
in response to message #11 by Martin Pinckney

Couple of thoughts.

!) The HP 10bII+ uses a different approach to the solution than the 20b/30b/TIBAII+ models. The HP 10bII+ is much more a function-per-key and uses few menus. The 20b/30b/TIBAII+ use menus/worksheets. Each have their advantages and disadvantages.

I know those tradeoffs well, having taught business math and stats to college students for 20 years.

2) The HP 20b has RPN. HP 10bII+ does not. The 20b function set is broader as well. More features on the 20b.

That said, the 10bII+ is a great little machine.

Re: 'New' HP10bii+

*Message #13 Posted by **Pal G.** on 8 Apr 2011, 4:09 p.m.,*
in response to message #12 by gene wright

Gene,

> Quote:
>
> I know those tradeoffs well, having taught business math and stats to college students for 20 years.

Are any of your course materials available online/download (besides all of your fabulous learning modules)? I wouldn't mind taking a bus. math or stats class that focuses on an HP calc. Or is that the cart before the horse?

> Quote:
>
> The HP 20b has RPN. HP 10bII+ does not. The 20b function set is broader as well.

> More features on the 20b.

Just curious. Why did you mention the 20b three times, and not the 30b? Is the 20b somehow superior to the 30b? I thought the 30b superseded the 20b. (I own neither, but would like to buy one or the other, if recommended).

Thanks.

Re: 'New' HP10bii+

*Message #14 Posted by **gene wright** on 8 Apr 2011, 4:13 p.m.,*
in response to message #13 by Pal G.

1) the materials are in my business math book still available :-) on amazon or Eric's hpcalc.org website.

2) The 30b is more expensive and in a somewhat different league with programming, etc. The real competitors for the college student $30-ish market are the 10bII, 10bII+ now, the 20b, and the TI BAII+ calculators.

Re: 'New' HP10bii+

*Message #18 Posted by **Joerg Woerner** on 8 Apr 2011, 4:23 p.m.,*

in response to message #12 by gene wright

Gene,

Any idea why the 20b is only on the Business section of HP's "wonderful" website and not on the Home and Home Office part?

Surprisingly I had to google into the Business section to catch the 10bii+ and 20b - starting with hp.com didn't work out for me.

Cheers,

Joerg

The HP website...

*Message #19 Posted by **gene wright** on 8 Apr 2011, 5:10 p.m.,*
in response to message #18 by Joerg Woerner

The HP website is riddle wrapped in an enigma carried by a black cat at midnight in a coal mine.

Seriously, it is often really messed up. What else can explain why the HP 17bII+ learning modules are the ones done back in 2003 and not the updated ones including several using the solver that were done in 2007.

Bizarre. Really. :-)

Re: 'New' HP10bii+

*Message #20 Posted by **Mark Harman** on 8 Apr 2011, 3:54 p.m.,*
in response to message #11 by Martin Pinckney

Actually it is competing against TI. But, that is a good question about the 20b. I think it has a weird spot to fill between the 10bII+ and the 30b that may seem unnecessary. I wouldn't be surprised if the 20b is eventually discontinued. Then again, the 20b is still a good unit with an excellent function set. Additionally, it is the lowest priced RPN unit from HP.

Financial calculators are a huge business, also. My inkling is that HP is releasing this unit to be super competitive in the collegiate arena.

On another note, I've had a prerelease version of one of these for a while now and I will have to say that it is the nicest entry level financial calculator I have ever used. It is ridiculously feature-packed for its price (I think it is starting at $29.99). Given my experience with TI's - their products don't hold a candle to this amazing machine. It is extremely competitive with their offerings.

It is amazingly fast, as it uses the same ARM7 chip that the 30b uses.

The keys on the unit I received are absolutely fantastic. The aesthetics are really nice. It FEELS like a quality device. It is nice and light without feeling insubstantial. Ergonomics are good, too. Of course, anyone with the most recent version of the 10bII will have experienced that, as well. Really, this machine is just a function-extended version of the prior model.

Function-wise, it has a really strong set of statistical functions with two probability models and their inverses. It has 6 regressions and best fit. When I saw that this calculator had these things, my eyes almost popped out of my head.

There are some features it lacks, such as RPN, MIRR, and DUR, that I would have appreciated. However, not having these features is far from being a deal breaker. I will certainly recommend it to people who are going through business programs who don't have the need for something as advanced as the 30b.

All-in-all, either this or the 30b are the calculators I wish I had when I was going through my undergrad program. I think if the device is well marketed, it would result in A LOT of lost sales for TI in the financial calculator segment.

Like Gene, I am also happy to answer any questions regarding the 10bII+. Of course, the link to the manual that Tim posted should leave the reader fairly well informed.

Regards,

Mark

*Message #21 Posted by **gene wright** on 8 Apr 2011, 4:11 p.m.,*
in response to message #20 by Mark Harman

And, HP added all this functionality to the 10bII and did not break ANYTHING from the original 10bII.

All keystroke sequences that perform a valid function on the 10bII model still work. Nothing was broken.

That is a tremendous help to teachers and authors. Everything that worked last week on the 10bII still works perfectly on the new HP 10bII+.

Therein lies the problem, IMO. Does HP do *any* marketing, other than on their own websites?

Re: 'New' HP10bii+

*Message #24 Posted by **Mark Harman** on 8 Apr 2011, 4:54 p.m.,*
in response to message #23 by Martin Pinckney

There are many marketing avenues. Word of mouth has been, in my experience, the best method of selling product.

However, I am pretty sure HP does do marketing by engaging educators and professionals that are likely to use calculators - and also subsequently have influence over their students' and peers' buying decisions. If they can get accounting, finance, and other business professors on board with these devices, I think they will see a huge upswing in sales.

For only $20 more the excellent and grossly more capable HP 30b could be purchased. And that's assuming HP's non-discounted MSRP is the price to be paid. It's hard to understand the appeal or the point of the HP 10BII+ under that circumstance. I'd have thought that HP should be trying to thin the "b" herd.

Re: 'New' HP10bii+

*Message #26 Posted by **Mark Harman** on 8 Apr 2011, 11:08 p.m.,*
in response to message #25 by Mike Morrow

Mike,

You won't get an argument from me regarding the value of the 30b. I honestly think it is the best financial calculator ever made. I only paid $39 for mine from a dealer on Amazon. I got a great deal and it was essentially free to me since I used a gift card I got from a brother.

The 10bII+, on the other hand, doesn't just have a lower price. It also has a different operating paradigm. I can imagine that with discounts, it will go for a bit less than the MSRP from other retailers. The appeal of the 10bII+ is that it will work for any business major without having a lot of complication added. It hits a sweet spot for functionality and price that positions it much better than the TI BA II Plus. I would have loved to have had a calculator like the 10bII+ during my collegiate courses - especially stats, where I used a 20s.

Regards,

Mark

What's under the hood? I haven't seen specs on CPU model, CPU speed, memory, etc..

The "Specifications" tab on its webpage at HP is inoperable.

Since it is coined a "+", is it as fast or faster than the "12c+"?

Will it soon be on the benchmark list?

Re: 'New' HP10bii+

*Message #29 Posted by **gene wright** on 9 Apr 2011, 8:41 a.m.,*
in response to message #28 by Pal G.

Since it is not programmable, there wont' be any loop of addition program tests to benchmark. :-)

Solving any pre-programmed function on the unit is essentially instantaneous with the exception of some tough inverse Students t distribution problems where it can take a second or two.

Re: 'New' HP10bii+

*Message #30 Posted by **Katie Wasserman** on 9 Apr 2011, 10:43 a.m.,*
in response to message #28 by Pal G.

What's under the hood is the same ARM processor used in the 20b, 30b and 12C+. It's extremely fast, same speed as the HP20b/HP30b as far as I can tell. Unless the final product has changed, it also has the same 6-pin programming port so this calculator too can be re-purposed. However, I don't know if HP is planning on making an SDK available so it might take some playing around to figure out the keyboard and LCD mapping.

Re: 'New' HP10bii+

*Message #31 Posted by **Tim Wessman** on 9 Apr 2011, 5:44 p.m.,*
in response to message #30 by Katie Wasserman

No changes. It still has the serial connecter (no internal JTAG).

Basically, the keyboard/screen works the same on all the units. Same memory position for the screen buffer and the same calls for the keyboard reading. Once there is one project working on the

platform, putting in others is actually quite simple.

TW

Question: 'New' HP10bii+

*Message #32 Posted by **Gerardo Rincon** on 8 Apr 2011, 6:03 p.m.,*
in response to message #1 by Michael O

How is the Keyboard feel? Smooshy like the HP 20b? or "clicker" like the 30b?

It looks like a great calculator, if it only offered RPN as an option.....

Re: Question: 'New' HP10bii+

*Message #33 Posted by **gene wright** on 8 Apr 2011, 6:08 p.m.,*
in response to message #32 by Gerardo Rincon

Clicky, like the existing 10bII and 30b.

Want RPN? there's the 30b which is more capable with programming and clicky keys or the 12c, etc. :-)

Re: Question: 'New' HP10bii+

*Message #34 Posted by **Gerardo Rincon** on 8 Apr 2011, 6:39 p.m.,*
in response to message #33 by gene wright

Thanks Gene! I have the 30b.... I don't use it very much because of the Menus. I really don't like menu driven functions...

I prefer a one-key function type calculator. The size of the 10bii is great! That's why I find this one so attractive. I only wish it offered RPN.

I like to use the HP 12C and HP 35S at work....the 35S is little too big to carry around, so I end up using the 12C most of the time.

This is my collection: www.rinconcentral.com

I'll be adding this one to the collection... great looking calculator! Great job!

That's the same reason I rarely am using my 30b as well, though I recognize it's power and appreciate what I can do with it, but I too like "one-key" functions and think this revised 10bii+ will be the one I settle into for financial and other work. (Though I may change my mind as I

"fight" with it since it's not RPN)

I wish it had engineering notation instead of scientific ... ;-)

Re: Question: 'New' HP10bii+

*Message #36 Posted by **Don Shepherd** on 8 Apr 2011, 8:21 p.m.,*
in response to message #35 by Jim Yohe

Jim, remember that any function in a 30b menu can be assigned to any key (or shift+key or shift+hold+key, with a few exceptions), so you won't need to go through the menu to get it.

Don

Re: Question: 'New' HP10bii+

*Message #37 Posted by **Mark Harman** on 8 Apr 2011, 10:44 p.m.,*
in response to message #36 by Don Shepherd

Exactly. Plus, if you want customized features that work a certain way, the 30b can do that too with key assignments. I have programmed quite a few features into my 30b that take advantage of the key assignments. They include a mod function, a combinatorial with repetition function, and a percentage change function that doesn't require a menu, amongst other things.

Regards,

Mark

Re: Question: 'New' HP10bii+

*Message #38 Posted by **Katie Wasserman** on 8 Apr 2011, 10:17 p.m.,*
in response to message #35 by Jim Yohe

The 10bii+ is really excellent. It's easy to get used to with good key clicks, display visibility and function layout. While it's not RPN some of the function allow both algebraic and RPN-ish function entry. For example, you can use the date difference function as either:

```
date1
delta-days
date2
=
```

or

```
date1
INPUT
date2
delta-days
```

This won't work for basic arithmetic.

Gene left out that the factorial function is also gamma (x+1). There's also a useful feature that allows you to recall the last result after press the '=' key, something like LASTx. The CF and Stat Data editor is unique and at first blush seems quirky but it works well.

in response to message #34 by Gerardo Rincon

Gerardo

You know, I seem to recall you having a complaint about this in a previous post. Your biggest problem was that the 30b didn't have a top level percentage change function. I am pretty sure I wrote a program for you that did this. In fact, I thought it was a really good program as it behaves exactly like top-level percentage change functions on other RPN models and takes very few lines.

Please look back in the old posts for my response. I really thought I was being helpful to you. Please don't hold it against me if I am a bit frustrated by your response.

Regards,

Mark

Re: Question: 'New' HP10bii+

*Message #42 Posted by **Gerardo Rincon** on 8 Apr 2011, 10:57 p.m.,*
in response to message #41 by Mark Harman

Mark,

You are correct on the % change. You and Katie both wrote a program for % change. I entered it and it works wonderfuly. I have the program saved in case I have to re-enter it in the future.

I am not much of a programmer, so I am really thankful to you for it. I use it al the time.

Re: Question: 'New' HP10bii+

*Message #43 Posted by **Mark Harman** on 8 Apr 2011, 11:31 p.m.,*
in response to message #42 by Gerardo Rincon

I'm glad you like it. For some reason, I was under the impression that it was overlooked or something since I didn't get a response to my original post.

You can also save 4 bytes of memory on my % change program by eliminating the message at the end. It will make the program 9 bytes with a checksum of 003. I just like adding the

messages because it actually tells you what the function does when they are executed.

I was looking at Katie's program that you posted and I was a little confused by the entry. Something must have gotten lost in the copy and paste, or something.

The great thing about the programming function on the 30b is that you don't even have to be an adept programmer to use it. If you have a series of keystrokes that you follow to perform an operation, you just record those as you would enter them and then you can execute it later. I wasn't much of a programmer when I got the 30b. However, I love its customizability.

If you would like, I can post my combinatorial with repetition function (nCr Rept) and mod function programs here, too.

Regards,

Mark

Re:30b% change

*Message #44 Posted by **Gerardo Rincon** on 8 Apr 2011, 11:18 p.m.,*
in response to message #41 by Mark Harman

Mark: This is the solutions you gave me for % change for the 30b

> Quote:
>
> Here is a program I whipped up really quick to add a straight %Change function to the 30b. I have it assigned as a Shift-hold to the percentage key. Use a high-numbered program space so you can keep the low numbered ones for processor-intensive programs.
>
> When programming it, scroll up to start at line zero so you can assign the key. Press Shift-hold %
>
> SH%
>
> Swap
>
> -
>
> Ans (this is the same as Lastx)
>
> /
>
> 1
>
> 0
>
> 0
>
> *
>
> You can enter a message on line 9 so your function is represented. I entered in [delta symbol] %

It takes 13 bytes and your checksum should be 050

To get it to work. Just enter in your old number first and the number it is changing to second, then hit shift-hold % to execute this function.

For example, what is the percentage change from 80 to 200?

80 Input 200 shift-hold %

Nine lines is all it takes - and now you can bring your 30b with you to work!

Cheers,

Mark

% Change 30b

*Message #45 Posted by **Gerardo Rincon** on 8 Apr 2011, 11:32 p.m.,*
in response to message #44 by Gerardo Rincon

Here is Katie's solution for programming % change on the 30b:

%-change is really an interactive menu on the 30b. If you want the good old RPN way of doing it you need to write a little program and assign that program to the '%' key.

I do this (assuming you're in RPN mode)

Enter program mode by pressing SHIFT Keypad. Choose a program slot (0 is the default) and press INPUT. Then enter the following steps. (You'll need to press the up arrow to get to line 0.)

0 % ; line zero is the (optional) key assignment location

1) Swap ; this is just swap but shows the ')' too

2 -

3 ANS ; same as LASTx in RPN mode

4 /

5 1

6 0

7 0

8 x

9 Stop ; (This is SHIFT-HOLD RCL)

Press SHIFT Keypad again and you'll see: 10.126 (10 bytes used, checksum = 126)

Use the above program like you would %-change on most HP RPN calculators:

4 INPUT 5 %

and you'll see: 25

Re: 'New' HP10bii+

*Message #51 Posted by **Jim Yohe** on 10 Apr 2011, 1:23 a.m.,*
in response to message #49 by Martin Pinckney

Is the meaning of the "C" designation one that originated with the HP-25C for "continuous memory" (CMOS) or was it because of the whole landscape "compact" calculator series (10, 11, 12,

15, 16)?

I can see the "B" designation meaning "business", the "S" meaning scientific, and maybe the "E" for engineering (?) but even that would have been used inconsistently.

I know this is somewhat unrelated to mathematically converting a '10b2+' <--looks RPNish or '10b+2' <--looks algebraic into a 12B.

Re: 'New' HP10bii+

*Message #52 Posted by **Walter B** on 10 Apr 2011, 3:55 a.m.,*

> Is the meaning of the "C" designation one that originated with the HP-25C for "continuous memory" (CMOS) or was it because of the whole landscape "compact" calculator series (10, 11, 12, 15, 16)?

The first is correct. You can verify this looking at the pairs 33E/33C and 38E/38C. The rule of 'C' began with the 25C and ended with the 28C IIRC - the 12C is just a continuation of the old one. No idea what 'E' should mean then, maybe 'electronic'?

'S' and 'B' came up with the launch of the Pioneers. Before, there wasn't any easy separation of scientific and business models.

Walter

Is there a self-test program for the HP 25 or 29c ?

*Message #1 Posted by **Michael de Estrada** on 8 Apr 2011, 10:30 a.m.*

Has anyone written a self-test routine that can be run on a HP 25/25c or 29c? The HP 65/67/97 have self-tests (diagnostic program)that are part of their Standard Pacs and the Spices have built-in self-tests (STO ENTER).

Re: Is there a self-test program for the HP 25 or 29c ?

*Message #2 Posted by **Xavier A. (Brazil)** on 10 Apr 2011, 3:09 p.m.,*
in response to message #1 by Michael de Estrada

Hello,

In my humble opinion, and with my experience of those two calcs, unfortunately the answer is: NO.

Typing an efficient program that would examine every function would be longer than typing the functions themselves and adding a simple "x+1" pgm.

wisdom from old Carl Sagan book

*Message #1 Posted by **Don Shepherd** on 8 Apr 2011, 3:19 a.m.*

Here is a brief excerpt from an old Carl Sagan book from 1973 that I think we all can appreciate. I especially like his comment about if kids can survive twelve years of regimented education. I think it is probably as true today as it was in 1973: kids are smarter than we generally believe.

Re: wisdom from old Carl Sagan book

*Message #2 Posted by **Mike Morrow** on 8 Apr 2011, 10:27 a.m.,*
in response to message #1 by Don Shepherd

Sagan wrote two of my favorite books, "Broca's Brain" and "The Demon-Haunted World". "Cosmos" is still, 31 years after first appearance, THE best popular science series of all time.

Sagan wishes in the article that the students will grow up fast and start running things. Those students today are 44 years old. Just how well did that work out? :-(

Re: wisdom from old Carl Sagan book

*Message #3 Posted by **Namir** on 8 Apr 2011, 12:35 p.m.,*
in response to message #2 by Mike Morrow

Indeed his TV shows is awesome. About 10 years ago I bought the DVD set and watched a few DVD. I need to go back and watch the whole series.

I also remember when Sagan would be a guest of Johny Carson on the Tonight Show. Johny would make fun of Sagan's use of the world "billion" in reporting the typical number of stars in a galaxy and the number of galaxies. As the years went by and I started buying Cosmos-related DVDs, I realized that Sagan was not exaggerating. Perhaps the only number he left out is the billions of universes that may well exist in the big, mighty, and mind-boggling multiverse.

Light Scratches on 12c Bezel - Steel Wool?

*Message #1 Posted by **Matt_12c** on 7 Apr 2011, 5:20 p.m.*

For a 12c with light scratches on the metal bezel (or whatever the correct term is), do you have any good solutions on getting rid of those? I don't want to make it worse! Any tips appreciated.

Matt

Re: Light Scratches on 12c Bezel - Steel Wool?

*Message #2 Posted by **geoff quickfall** on 7 Apr 2011, 6:04 p.m.,*
in response to message #1 by Matt_12c

There is a light coating of laqueur on the bezel. So any attempt to remove scratches will involve removing all the laqueur and then using "3m pot scrubber" or re laqueuring.

check out this posting and do a search:

bezel restoration

Geoff

Re: Light Scratches on 12c Bezel - Steel Wool?

*Message #3 Posted by **Randy** on 8 Apr 2011, 1:10 a.m.,*
in response to message #1 by Matt_12c

Refinishing only works for the 10/11/15/16C as the 12C finish is a gold anodize. Any attempts to remove scratches will result in a partially silver bezel once you remove the anodized coating.

HP-71B slower with HP-IL

*Message #1 Posted by **scalpa49** on 7 Apr 2011, 5:28 a.m.*

I've found that my HP-71b is much slower with hp-il 82401 plugged in (with no cables attached). It take more than 4 seconds to compute a square root ! When HP-IL is unplugged, the speed is back to normal. Is it the normal behavior ?

Re: HP-71B slower with HP-IL

*Message #2 Posted by **Eric Smith** on 7 Apr 2011, 5:32 a.m.,*
in response to message #1 by scalpa49

Yes. The HP-71B is trying to communicate on the HP-IL loop, and failing due to the lack of a loop. If you're not using any HP-IL devices, either connect a cable directly between the two ports, or give an "OFF IO" command.

If you use "OFF IO", to reenable I/O you use the "RESTORE IO" command. It always seemed to me that it should be "ON IO", but that doesn't work.

Re: HP-71B slower with HP-IL

*Message #3 Posted by **scalpa49** on 7 Apr 2011, 5:45 a.m.,*
in response to message #2 by Eric Smith

Thank you for your quick answer. This machine is rather new for me but i find the community very pleasant. As i have no cable (yet), i'll be using OFF IO/RESTORE IO commands.

Re: HP-71B slower with HP-IL

*Message #4 Posted by **Garth Wilson** on 7 Apr 2011, 2:42 p.m.,*
in response to message #1 by scalpa49

Isn't the long time just to turn on, and it's fast after that? Mine always takes a couple of seconds upon turn-on to check out the loop before the time-out makes it conclude that the loop is broken since otherwise everything would have resonded by then, but after that everything has always been fast, even with no cable. I never use OFF IO but just leave I/O on all the time.

Edited: 7 Apr 2011, 2:44 p.m.

To the Atmel ARM gurus: Problems with OpenOCD

*Message #1 Posted by **Marcus von Cube, Germany** on 6 Apr 2011, 3:34 p.m.*

This is a very technical question, but probably someone has a pointer for me. I'm working on the hardware port of wp34s, i. e. the flashing of the Atmel AT91SAM7L128 in the HP 20b. We (Pauli, Walter & me) are doing all our work with open source tools (except the Windows emulator which requires Visual Studio 2010 because of its MFC dependency).

One of the tools is OpenOCD, a software suite that supports on chip debugging with low cost JTAG probes. In my csae, it's an Olimex ARM-OCD. The problem I'm facing is that the ATM91SAM7**L**128 chip is not directly supported. I've had mixed success so far. The software detects my HP20b and I can submit commands like clock setup or flash erase. What I'm unable to do so far is programming the flash through OpenOCD. The pages are written with 00000008 and an error (protection bit set) is returned.

Is anybody here who has some experience with OpenOCD and the AT91SAM7L128 chip and can help me?

Re: To the Atmel ARM gurus: Problems with OpenOCD

*Message #2 Posted by **Scott Newell** on 6 Apr 2011, 9:02 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Here's an example of my OpenOCD config (note I'm using a different JTAG dongle):

```
interface ft2232
target arm7tdmi little reset_run 0 arm7tdmi
jtag_device 4 0x1 0xf 0xe
jtag_speed 0x8
ft2232_layout evb_lm3s811
ft2232_device_desc "LM3S811 Evaluation Board A"
ft2232_vid_pid 0x0403 0xbcd9
working_area 0 0x2ff000 0x1000 nobackup
flash bank at91sam7 0 0 0 0 0
```

I ended up either using SAM-BA to burn flash, or running a little OpenOCD script to burn a sector at a time. It looked something like:

```
soft_reset_halt
load_image page-000.bin 0x100000 bin
mww 0xffffff64 0x5a000003 # command flash controller to erase/burn
sleep 10
load_image page-001.bin 0x100100 bin
mww 0xffffff64 0x5a000103 # command flash controller to erase/burn
sleep 10

...

load_image page-070.bin 0x104600 bin
mww 0xffffff64 0x5a004603 # command flash controller to erase/burn
sleep 10
verify_image test.bin 0x100000 bin
```

Pretty hacky, I know. Somewhere I've got a little windows program to build those .bin files if you need it.

Obviously on the 12C+, I was just doing crash and burn debugging with SAM-BA directly (no JTAG pins, no need for OpenOCD).

Scott, thanks for you config file. It's not what I was hoping for. :(

Maybe I have to add myself to the list of OpenOCD developers and modify the respective algorithms. Do you think it may have to do with the processor speed? Have you tried different settings?

```
working_area 0 0x2ff000 0x1000 nobackup
flash bank at91sam7 0 0 0 0 0
```

These two lines make me curious. I thought the working area needs to be in RAM which is @ 0x200000 and not @ 0x2ff000. The size (4K) is correct.

The second line simply doesn't work for me because the flash algorithm does not identify the chip and therefore does not know about the flash layout and size. AFAIK, it makes no attempt at reading the flash layout info directly from the respective control registers.

Your splitting idea isn't very elegant at first sight but it might be improved by some TCL code. I'm new to TCL but if everything else fails, I can try this approach.

For the time being I'll stick to SAM-BA for flashing and use the adapter only for debugging.

Oh, that's just a trick I used to have a solid 6k block of ram...check the databook (section 8 in my old copy): "The user can see the 6 Kbytes of SRAM contiguously at address 0x002F F000"

> Quote:
>
> The second line simply doesn't work for me because the flash algorithm does not identify the chip and therefore does not know about the flash layout and size. AFAIK, it makes no attempt at reading the flash layout info directly from the respective control registers.

I'll have to dig everything out and check, but I wasn't using much, if any, flash support from OpenOCD. Seems like I was doing a block copy from ram to the flash, then telling the flash controller to actually program the flash. That's what the script snippet was all about.

> Quote:
>
> Your splitting idea isn't very elegant at first sight but it might be improved by some TCL code. I'm new to TCL but if everything else fails, I can try this approach.

I think (it's been a while) that the script was generated as part of the makefile, so everytime I compiled the OpenOCD command script and flash image chunks were built automatically. If not, it certainly could be.

> Quote:
>
> For the time being I'll stick to SAM-BA for flashing and use the adapter only for debugging.

That's what I ended up with, once I upgraded to XP and SAM-BA ran quick enough. I started on win2k, and program times through SAM-BA were very long (~15 minutes).

*Message #6 Posted by **Marcus von Cube, Germany** on 7 Apr 2011, 1:07 p.m.,*
in response to message #5 by Scott Newell

Hi Scott,

Yes I've checked every mention of the AT91SAM7L on the Net...

I can debug now and I still use SAM-BA for flashing. It's not perfect but I can proceed with the real problems in my code. And there are many...

OT: The Dream

*Message #1 Posted by **Bob Patton** on 5 Apr 2011, 3:00 p.m.*

Has everyone discovered that almost all techies have the same recurring nightmare: you are back in school and suddenly realize an exam is due in a course you have totally ignored.

Our group realized this when it appeared in Ann or Abby around 1980. Twenty years later Ed Nitley mentioned it in Dr. Dobbs Journal.

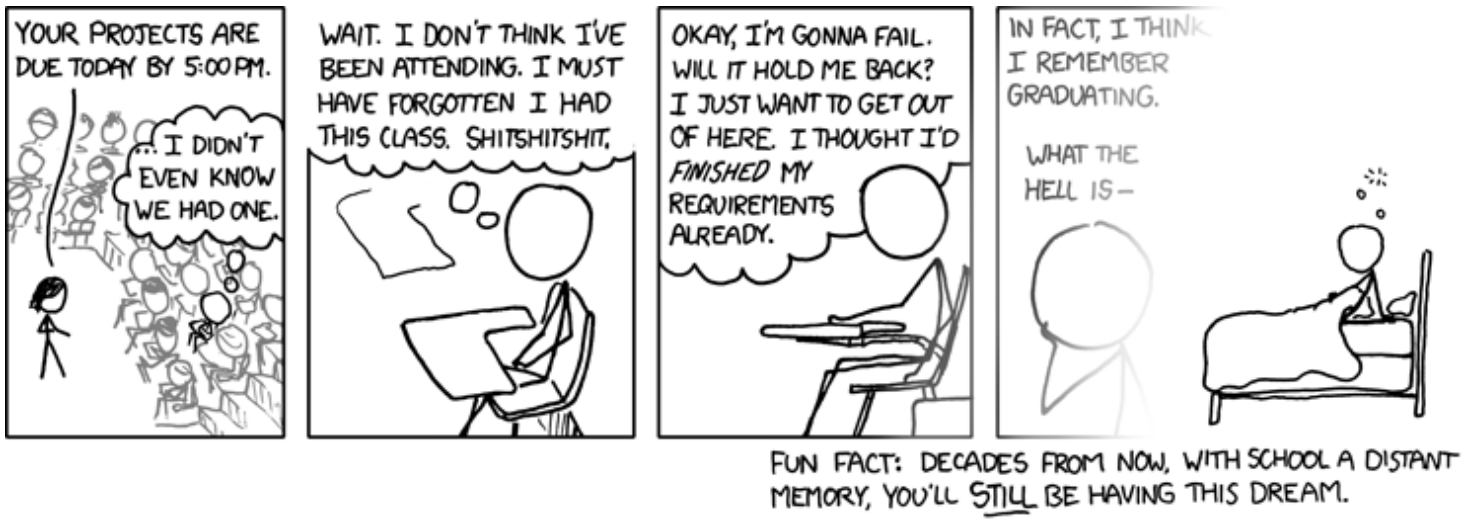
You can be relieved that you are not alone in this.

Re: OT: The Dream

*Message #2 Posted by **Jeff O.** on 5 Apr 2011, 3:45 p.m.,*
in response to message #1 by Bob Patton

I have that dream all the time. Most times I can't even find the classroom, or a copy of my schedule to tell me where the room is.

Do you have evidence it is just "techies?" The cartoon below seems to indicate it is more widespread. I guess I figured it might be anyone who attended college.



Re: OT: The Dream

*Message #3 Posted by **JJB299** on 5 Apr 2011, 4:08 p.m.,*
in response to message #2 by Jeff O.

The cartoon is right on. I still have that dream years out of school. And what's interesting is the progression of thought the cartoon outlines. The first thought is always surprise/fear, then moving right to acceptance, and THEN the logical reasoning that wakes me up. I wonder why I don't take the time to stop to think about the situation first? Cool post.

I too often have this dream. Usually, I am in a crowded hallway fighting my way to a final exam in a subject that I had forgotten signing up for and for which I have attended no lectures and have read no textbooks/primary material. What's weird is that I always write the exam anyway... The dream usually ends somewhere in the middle of me realizing that I am going to completely bomb the exam.

Exactly! I'll write and write and then realize I don't know what the question is and what I have written makes no sense.

Re: OT: The Dream

*Message #10 Posted by **Namir** on 5 Apr 2011, 5:53 p.m.,*
in response to message #4 by designnut

I was very talented in Chemistry so the night before final Chemistry exams in College I'd go to our social club to watch a 7-pm movie. On many occasions, people at the club would ask me if I had finished the final exams altogether! I'd give it a wide grin and say "No, no yet. It's just that tomorrow is the Chemistry final! exam"

in response to message #11 by Martin Pinckney

> Quote:
>
> There's one in every crowd...

Actually, there are at least two in this crowd since I have never had that dream. A possible reason is that very early in my college career I was introduced to the idea that hours spent studying during the early weeks of a course were much more effective in successful completion of the course than hours spent cramming for the final exam.

Another possible answer: If I am not mistaken I think that "design nut" was in school at the same time as I was.

The naked dream for nerds.

Re: OT: The Dream

*Message #14 Posted by **Bob Patton** on 5 Apr 2011, 8:14 p.m.,*
in response to message #2 by Jeff O.

I have no personal indication that it's only techies, but Nitley in his Dr. Dobb's blurb did say he had asked several liberal arts majors with negative results. He conjectured it was due to the intensity of the curriculum.

Re: OT: The Dream

*Message #15 Posted by **Katie Wasserman** on 5 Apr 2011, 8:21 p.m.,*
in response to message #14 by Bob Patton

I've asked many people and I've come to the opposite conclusion -- that it's a very common dream for anyone that's been to college.

Re: OT: The Dream

*Message #16 Posted by **Martin Pinckney** on 5 Apr 2011, 9:39 p.m.,*

in response to message #17 by John B. Smitherman

Seems that we all have hidden backup copies of recurring dreams. We'd all like to delete them, but they keep coming back. I was reading this thread while listening to a song which has a line "but I'll be back again, because my backups are forever". I never interpreted the song as a recurring dream, but with a bit of an imaginative stretch, it fits that interpretation quite neatly. And the video is suitably dreamy.

Enjoy :)

Backups Are Forever

I have not had this dream lately. I am more calm about exams since I graduated with a Masters in Math recently.

Re: OT: The Dream

*Message #20 Posted by **Bill Zimmerly** on 7 Apr 2011, 2:50 p.m.,*
in response to message #1 by Bob Patton

I've never had a dream like that one, but I do have one like this all the time:

(Background information: I went to the University of Missouri, Rolla, in the mid-70's. It's the weekend, and everybody has gone "home." The place was quite literally a "ghost town.")

In my dream, I'm reliving an experience over and over again of walking the streets of Rolla and seeing no activity at all for long stretches of time. No people, no cars driving on the roads, no businesses open ... this dream is vivid, lonely, and very real. I usually wake up feeling quite good to have waken up!

It's like an episode of the Twilight Zone!

Re: OT: The Dream

*Message #21 Posted by **Gerson W. Barbosa** on 8 Apr 2011, 5:18 p.m.,*

*Message #22 Posted by **Matt_12c** on 7 Apr 2011, 5:57 p.m.,*
in response to message #1 by Bob Patton

I didn't catch this thread initially but it's so true. I had this for two classes - a PE class and a marketing class (with a completely inept teacher). I am glad I'm not alone!

The dreams stopped or at least slowed down about 2-3 years ago. However, I'm in a Master's program now so that should take me almost to retirement with these night terrors.

Re: OT: The Dream

*Message #23 Posted by **Crawl** on 8 Apr 2011, 12:29 p.m.,*
in response to message #1 by Bob Patton

Yeah, I have this dream and a lot of variations on it.

Sometimes it turns out that one of my degrees has been invalidated and I have to go back to take a class to get it back.

Sometimes it turns out that I even have to go back to highschool.

A lot of times, when it's the end of the semester, the reason I will get a bad grade in this particular class is that even from the beginning of the semester I was never able to find the room it was held in.

Other times, I drop in and out of the class, but over the course of the semester I get overwhelmed with all the courses I'm taking and forget about one.

And often the reason I'm doing so badly in the course is that it's something I know nothing about ("Religion in 15th Century France", let's say). Though often, when I'm wondering why I'm taking that course, it's the tip off that I'm dreaming.

Schooling seems to be a pretty traumatizing experience.

Re: OT: The Dream

*Message #24 Posted by **Gerson W. Barbosa** on 8 Apr 2011, 6:01 p.m.,*
in response to message #23 by Crawl

Mine are always the same: I'm puzzled about why I should be taking that one more exam. I have to solve a problem, but time passes and I cannot find a solution. I feel I won't pass the exam. It is a great relief when I wake from the dream.

From the posts above I'm glad to know I'm in good company!

HP-41: New release: The NoV CHAP rom

*Message #1 Posted by **Geir Isene** on 5 Apr 2011, 11:06 a.m.*

Own a NoV or HEPAX module? Want to get the most out of it?

Or maybe you own neither but want to get your hands on a really cool module image for your beloved HP-41?

Finally, after much work and testing, we are proud to release the NOV CHAP rom - the software companion to the HEPAX and NoV modules.

It includes both MCODE and FOCAL functions in four categories;

- NOV functions
- Advanced HEPAX functions
- Advanced Extended Memory (XM) functions
- Special utilities.

Try it out - and please report any bugs or suggested improvements by adding your comment in this thread or send an e-mail to Geir Isene.

Get the ROM, Source and User Manual at the NOV CHAP website

Sincerely yours,

Team IceAngel
(Geir Isene & Ángel Martin :)

Buy, Sell or Neutral?

*Message #1 Posted by **Michael de Estrada** on 5 Apr 2011, 10:52 a.m.*

I'm addressing this query to those on this forum who consider themselves to be calculator "collectors." What do you consider to be the current state of your collection. Are you actively seeking to increase the size of your collection? Are you in the process of reducing it's size or even selling it off? Or are you in a neutral maintenance mode, selling a few duplicate items, while seeking to fill a few holes with missing items? I'm currently in a neutral mode, having been in an aggressive buy mode for the past few years. I've decided that my collection size has reached a sensible limit and I've met most of my criteria in terms of the types of calculators I wish to collect (RPN, LED or VFD, pocket / handheld size). Also, I've tried to maximize the number of working specimens, repairing what I can and disposing of the remainder.

Another question I have is to what extent you consider yourself to be a restorer as opposed to simply a collector of as is condition calculators. Are you willing to tinker with calculators in an attempt to repair them, knowing that you may do further damage, but gain knowledge in the process? How important is it that the calculator be a complete set with all original accessories or that it be in like new "mint" condition? Is there a limit to how much you are willing or able to pay for a very rare item?

Anyways, lots of questions I know, but hopefully this will stimulate some interesting discourse.

Buyer; although I am buying more calculator apps an physical calculators these days.

Re: Buy, Sell or Neutral?

*Message #6 Posted by **David Ramsey** on 7 Apr 2011, 11:10 a.m.,*
in response to message #1 by Michael de Estrada

After almost 30 years of collecting (HP RPN handheld scientifics), I'm in a holding pattern, since I have every one (and all the variations of individual models I'm aware of). Having the complete set (box, accessories, etc.) is nice but a clean working calc is good enough. I got pretty good at restoring first-gen calcs and rebuilding card readers but haven't done any of that in years.

I've bid on (but not won) a couple of oddball versions like a green-LED HP-45 and a 41 built in a blue plastic case.

HP-48/49/50 software sites?

*Message #1 Posted by **x34** on 5 Apr 2011, 3:23 a.m.*

Are there any active hp-48-50 software sites? Hpcalc seems to be dead since last year, no updates and no info.

Re: HP-48/49/50 software sites?

*Message #2 Posted by **Norman Dziedzic** on 5 Apr 2011, 7:28 a.m.,*
in response to message #1 by x34

> Quote:
>
> dead since last year, no updates and no info.

While there haven't been updates, I would hardly call the site "dead".

It is an invaluable resource I find myself viewing at least once a week. A site like hpcalc relies on submissions from users to have material to do updates. No submissions, no updates.

Even making suggestions on a forum such as this for a needed utility or program can help generate content for sites such as hpcalc.

Let the community know what you are looking for and more likely than not, someone will take on the challenge and start working on a new project. Or if you have something not represented there, you could offer it up as a submission.

Re: HP-48/49/50 software sites?

*Message #3 Posted by **x34** on 6 Apr 2011, 2:11 a.m.,*
in response to message #2 by Norman Dziedzic

Well, it was not at all in my thoughts to diminish the value of hpcalc. Sure, i visit it frequently and it is a great site. I just want to know if there are another "consolidated" sites with HP-48 software. I'm really sorry for being rude.

I could not find information on HP-50g emulators with full ARM support on hpcalc. x49gp mentioned there is very old, while newer versions do certainly exist, but have problems with HPGCC integration.

Maybe some links to current HPGCC and HPLUA projects?

Re: HP-48/49/50 software sites?

*Message #4 Posted by **David Hayden** on 7 Apr 2011, 5:44 p.m.,*
in response to message #3 by x34

> Quote:

> Maybe some links to current HPGCC and HPLUA projects?

I'll make a shameless plug for my HPObjects library for HPGCC. This library lets you create and decode native HP objects from within your C code. It largely eliminates the need to write wrapper functions.

I've also been successful at getting C++ to work with HPGCC (thanks to a post by Claudio) and I've gotten HPGCC code working on the 48gii. I'd be happy help you do either of these things if you're interested.

Dave

TDS-256k RAM Card

*Message #1 Posted by **aj04062** on 4 Apr 2011, 11:15 p.m.*

Do these work on a 48-GX?

I cannot initialize this on my GX and was wondering if that is the problem.

Re: TDS-256k RAM Card

*Message #2 Posted by **geoff quickfall** on 5 Apr 2011, 2:16 a.m.,*
in response to message #1 by aj04062

Built in battery or replaceable? My TDS had a built in battery which needed replacing.

check out this posting from a while ago to gain access for the built in battery:

Access to the TDS battery

Of course, format the card and etc before accessing the battery.

Cheers, Geoff

Re: TDS-256k RAM Card

*Message #3 Posted by **aj04062** on 5 Apr 2011, 6:30 a.m.,*
in response to message #2 by geoff quickfall

I've replaced the battery. It came to me with none. I run PINIT but I can't eliminate the message "bad card data".

Do I need the TDS softare to use this ram card?

Re: TDS-256k RAM Card

*Message #4 Posted by **Bart (UK)** on 5 Apr 2011, 6:49 a.m.,*
in response to message #3 by aj04062

> Quote:
>
> Do I need the TDS softare to use this ram card?

No, I have used one in my 48GX without TDS software.
(Mine came with a TDS surveying card, the RAM card can be used without the surveying software, but the surveying software can't be used without a RAM card)

My 2c worth

Bart

Edit: on reading Geoff's post, a note: I had a 256K TDS RAM card specifically for the GX, thus not a bank switching type.

Edited: 5 Apr 2011, 6:17 p.m.

Re: TDS-256k RAM Card

*Message #5 Posted by **Geoff Quickfall** on 5 Apr 2011, 11:27 a.m.,*
in response to message #1 by aj04062

Someone may correct me but I just googled tds ram card hp48gx and came up with the following link:

256 and 512 TDS cards

I don't know if this is true but I pulled the following quote from the site:

6.24 I've heard about other manufacturer's RAM cards. Will they work? While some cards may work, there is a chance that you may severely damage your HP48. You should only use cards specifically designed for the HP48. Naturally, HP sells such cards, and some third parties also make cards that will work in an HP48. Some cards work with both the S/SX and the G/GX. Some, however only work on the S/SX, or only on the G/GX. Make sure that the card is designed to work for your version before using it.

SX: The S/SX can only naturally support up to 128K per port. HP sells 32K and 128K RAM cards. However, TDS, using software "bank switches" produces 256K and 512K RAM cards. These bank switching cards do not work in the G/GX series. CMT also makes 128K cards, which work in all HP48 calculators.

GX: While you cannot use the TDS 256K and 512K cards, Sparcom has come out with 256K and 512K cards for the G/GX only. HP also sells 1MB RAM cards that work for G/GX only. The G/GX is able to accept a 4MB RAM card, but none are on the market at this time.

It may be that your card will not work, also try the card in slot two.

google "256K tds ram card hp48gx" and review the use of pinit and pinvar.

Cheers, Geoff

or wait for a 48GX expert, I have 4 and one with a 512K TDS card (see above post) and a 1MB card (HP) but I am by no means an expert 48GX user, I just fix them occasionally ;-)

Re: TDS-256k RAM Card

*Message #6 Posted by **aj04062** on 5 Apr 2011, 12:08 p.m.,*
in response to message #5 by Geoff Quickfall

Thanks Geoff,

I've seen some of the same posts. I've tried many of the suggestions. I need to download some data and try and store it to the card, I think.

Haven't tried pinvar...

Re: TDS-256k RAM Card

*Message #7 Posted by **Geoff Quickfall** on 5 Apr 2011, 12:55 p.m.,*

in response to message #6 by aj04062

I know there is a specific TDS site that walks you through a TDS RAM card set up. I was trying to find it and will still try if it has not been removed.

Cheers, Geoff

p.s. you replaced the battery, I know there is a program that keeps the GX on so the battery can be recharged. It defeats the timed turn off function but you do need a new set of batteries installed. It turns the calc on every 4 minutes and 55 seconds. Run it over night and the card battery will be fully charged. A new uncharged (or barely charged) battery will cause memory and card reading problems. Have you tried this?

pps this is all from memory (2 years ago!) and my battery has not been charged for awhile ;0)

Edited: 5 Apr 2011, 1:08 p.m.

Re: TDS-256k RAM Card

*Message #8 Posted by **aj04062** on 5 Apr 2011, 1:27 p.m.,*
in response to message #7 by Geoff Quickfall

There was no 2016 battery in the card when I got it. I replaced it with a new lithium 2016 a few days ago.

This is a different style card with a removable tray for the battery. I'll post some pictures tonight.

Edited: 5 Apr 2011, 2:34 p.m.

Re: TDS-256k RAM Card

*Message #9 Posted by **aj04062** on 7 Apr 2011, 12:27 p.m.,*
in response to message #8 by aj04062

Okay, no pictures, but here's what made it work (for others if needed)

Card was made for 48SX. This was determined by the fact it was made in 91 and the GX came out in 93.

Given that, it needs a program call Super Switch installed (available on hpcalc.org) to switch between the two 128k banks. After this was installed AND some files were written to the two banks, the Invalid Card Data message stopped.

17bII+ available for $72.99

*Message #1 Posted by **Jeff O.** on 4 Apr 2011, 12:37 p.m.*

In case there is any interest, my daily e-mail from Buy.com had the 17bII+ for $72.99 with free shipping. Not sure how long it will be available. I have no connection to the seller, just passing along information.

...

Re: 17bII+ available for $72.99

*Message #2 Posted by **Jim Yohe** on 4 Apr 2011, 5:35 p.m.,*
in response to message #1 by Jeff O.

Though you take your chances making a purchase from many of those unknown dealers you could always place an order on Walmart's site and get it for $80.56 plus $3.97 shipping. Just a thought and have no affiliation with the retail mega-giant.

Re: 17bII+ available for $72.99

*Message #3 Posted by **gene wright** on 4 Apr 2011, 5:52 p.m.,*
in response to message #2 by Jim Yohe

buy.com has been around for 5+ years and has good ratings at resellerratings.com

No association with them myself either and I have no plans to buy the 17b2+ from them, but buy.com is a fairly well known e-tailer.

Re: 17bII+ available for $72.99

*Message #4 Posted by **Jim Yohe** on 4 Apr 2011, 6:07 p.m.,*
in response to message #3 by gene wright

buy.com may be well know of recent years and I've heard of them before but they funnel sales, it appears, to other e-retailers who make the sale. Are return policies and the quality of merchandise guarenteed by buy.com or the e-retailer you're purchasing from?

Re: 17bII+ available for $72.99

*Message #5 Posted by **Don Shepherd** on 4 Apr 2011, 7:29 p.m.,*
in response to message #1 by Jeff O.

The 17bii+ is going for a whole lot less than $70 or $80 on EBay; typical recent auctions were in the $30-$50 range, some in the $20's.

Re: 17bII+ available for $72.99

*Message #6 Posted by **Jeff O.** on 5 Apr 2011, 7:34 a.m.,*

in response to message #5 by Don Shepherd

Don,
Are those prices for new units?

I posted the link mostly because I was surprised to see it pop up in the buy.com ad and it seemed to be a good price. I checked the HP.com price which was was higher, but did not think to look at Walmart or eBay.

Re: 17bII+ available for $72.99

*Message #7 Posted by **Don Shepherd** on 5 Apr 2011, 12:02 p.m.,*
in response to message #6 by Jeff O.

Jeff, those price are for used units, the owners of which are selling them on EBay. I've bought a lot of calculators on EBay over the years and have never been disappointed. I'd much rather pay $30 for a slightly used unit than $80 for a new unit.

But regarding the 17bii+, I'd much rather have a 17b or 17bii to play around with solver programming, because the solver on the + disappoints.

HP32s Relative GTO

*Message #1 Posted by **Mike T.** on 4 Apr 2011, 10:29 a.m.*

I've just managed to obtain an HP32s - but it does seem to be a little limited when it comes to labels, I find that having to use a label when I could use a relative jump seems rather wasteful goven the number of program steps...

Can't figure out how to do a relative GTO - is there another (more efficent) way of constructing a (conditional) loop...?

Mike T.

Re: HP32s Relative GTO

*Message #2 Posted by **Katie Wasserman** on 4 Apr 2011, 10:50 a.m.,*
in response to message #1 by Mike T.

There is no relative branching mechanism on the 32s, you've got just the 26 labels available. However, there's a very limited program memory space (390 bytes), the ratio of one label per 15 bytes seems pretty reasonable to me. Considering that most instructions take 1.5 bytes that's one label per 10 steps. Furthermore, in practice you'd use some of those 390 bytes for variables so you'd have even more than 1 label per 10 steps.

-Katie

Re: HP32s Relative GTO

*Message #3 Posted by **Mike T.** on 4 Apr 2011, 4:33 p.m.,*
in response to message #2 by Katie Wasserman

Thanks for your reply.

Not having a relative jump is a pity - but I'm still very pleased with the HP32S. I almost brought one in London in the late '80s to replace my HP33C but didn't as it seemed 'too complicated'. I think it was the menus that put me off, and the huge price tag!

I'm still not a big fan of menus but having used my 'new' machine for a few hours I have to admit that the HP32S implements them in a reasonably intuitive fashion (the only function I have trouble finding is PSE).

Mike T.

Re: HP32s Relative GTO

*Message #4 Posted by **Jim Yohe** on 4 Apr 2011, 5:40 p.m.,*
in response to message #1 by Mike T.

There's indirect addressing in the 32sii if that helps but I don't know if the 32s (rather than the 32sii) is more limited. Page 13-19 of the manual.

Re: HP32s Relative GTO

*Message #5 Posted by **Don Shepherd** on 4 Apr 2011, 7:33 p.m.,*
in response to message #4 by Jim Yohe

The 32s has indirect addressing too (except for indirect access to the 6 stats registers which only the sii has). The 32sii programming also adds text prompts via EQN, which is nice. And the algebraic solver is very nice.

Free Calculator Day

*Message #1 Posted by **Chuck** on 3 Apr 2011, 8:35 p.m.*

A co-worker gave me a virtually brand new 17BII last week. I doubt it's been touched in the last 15-18 years (I believe its a 1993 model). Not having many business models in the collection, this is a fine addition. And after a new set of batteries, and 20 minutes of playing just about everything is self explanatory except one feature: pressing MODES and BEEP a few times to set the beeper off and on, there is also a BEEPER ON: APPTS ONLY setting. Whatever could this be for?

CHUCK

HP-01 Back Cover Tool

*Message #1 Posted by **aj04062** on 3 Apr 2011, 11:41 a.m.*

I'm considering having my machine shop make one of these for my own use.

Is anyone else interested? I will likely make it out of aluminum with brass pins to engage the cover.

Re: HP-01 Back Cover Tool

*Message #2 Posted by **Matthias Wehrli** on 3 Apr 2011, 12:51 p.m.,*
in response to message #1 by aj04062

Interesting. And what will be the price?

Re: HP-01 Back Cover Tool

*Message #3 Posted by **aj04062** on 3 Apr 2011, 4:31 p.m.,*
in response to message #2 by Matthias Wehrli

The more people there are, the lower.

I would guess at this point $30-40

Re: HP-01 Back Cover Tool

*Message #4 Posted by **Allen** on 3 Apr 2011, 7:23 p.m.,*
in response to message #1 by aj04062

If it were made of metal, could it not damage the back plate and/or strip the threads? The original ones were made of hard plastic, if I recall.. cheap to manufacture and would likely break before shearing any of the metal watch parts.

Re: HP-01 Back Cover Tool

*Message #5 Posted by **aj04062** on 3 Apr 2011, 8:56 p.m.,*
in response to message #4 by Allen

I don't think what I am proposing would damage the back. Both Aluminum and Brass have a lower hardness than the Stainless Steel back.

What I was thinking of producing was something like this one

Except make it in aluminum with brass pins. I suppose it could be made with plastic (Delrin or CPVC) and the pins pressed into it.

traces of metal

*Message #6 Posted by **Frank Boehm (Germany)** on 4 Apr 2011, 7:41 a.m.,*
in response to message #5 by aj04062

I'd suggest to grab a cheap watch and do some tests. I could imagine, that brass and aluminium will leave traces on brushed steel, and it's probably hard to remove these traces.

Re: HP-01 Back Cover Tool (pictures to hook your interest)

*Message #7 Posted by **Geoff Quickfall** on 4 Apr 2011, 2:32 p.m.,*
in response to message #1 by aj04062

Hello AJ....

I think that it is a great idea (and I would order at least one), and if manufactured correctly then marking the case back would not be a problem.

I have restored over 150 watches, including 10 hp-01's and some of the main case markings are done by over-zealous rough watch repairers scoring the case backs. Mainly due to the incorrect use of the wrench. However a wrench of this style would be unlikely to slip and score the case back.

Another type of case wrench I use is an old India rubber ball (super ball). This of course does not scratch a case back but will also not remove a 'stuck' case either.

The HP-01 'Cricket' comes with (if you are lucky enough) a plastic wrench which contains 5 357 spare batteries, two back case gaskets and of course the prongs which mesh with the grooves in the case back. So the caveat would be that the prongs are not too long!

The problem with standard watch wrenches(figure 1 and 2) is that the prongs are too deep and will ruin the piezo

transducer (figure 3 "A") which is attached to the inside case back:

figure 1:

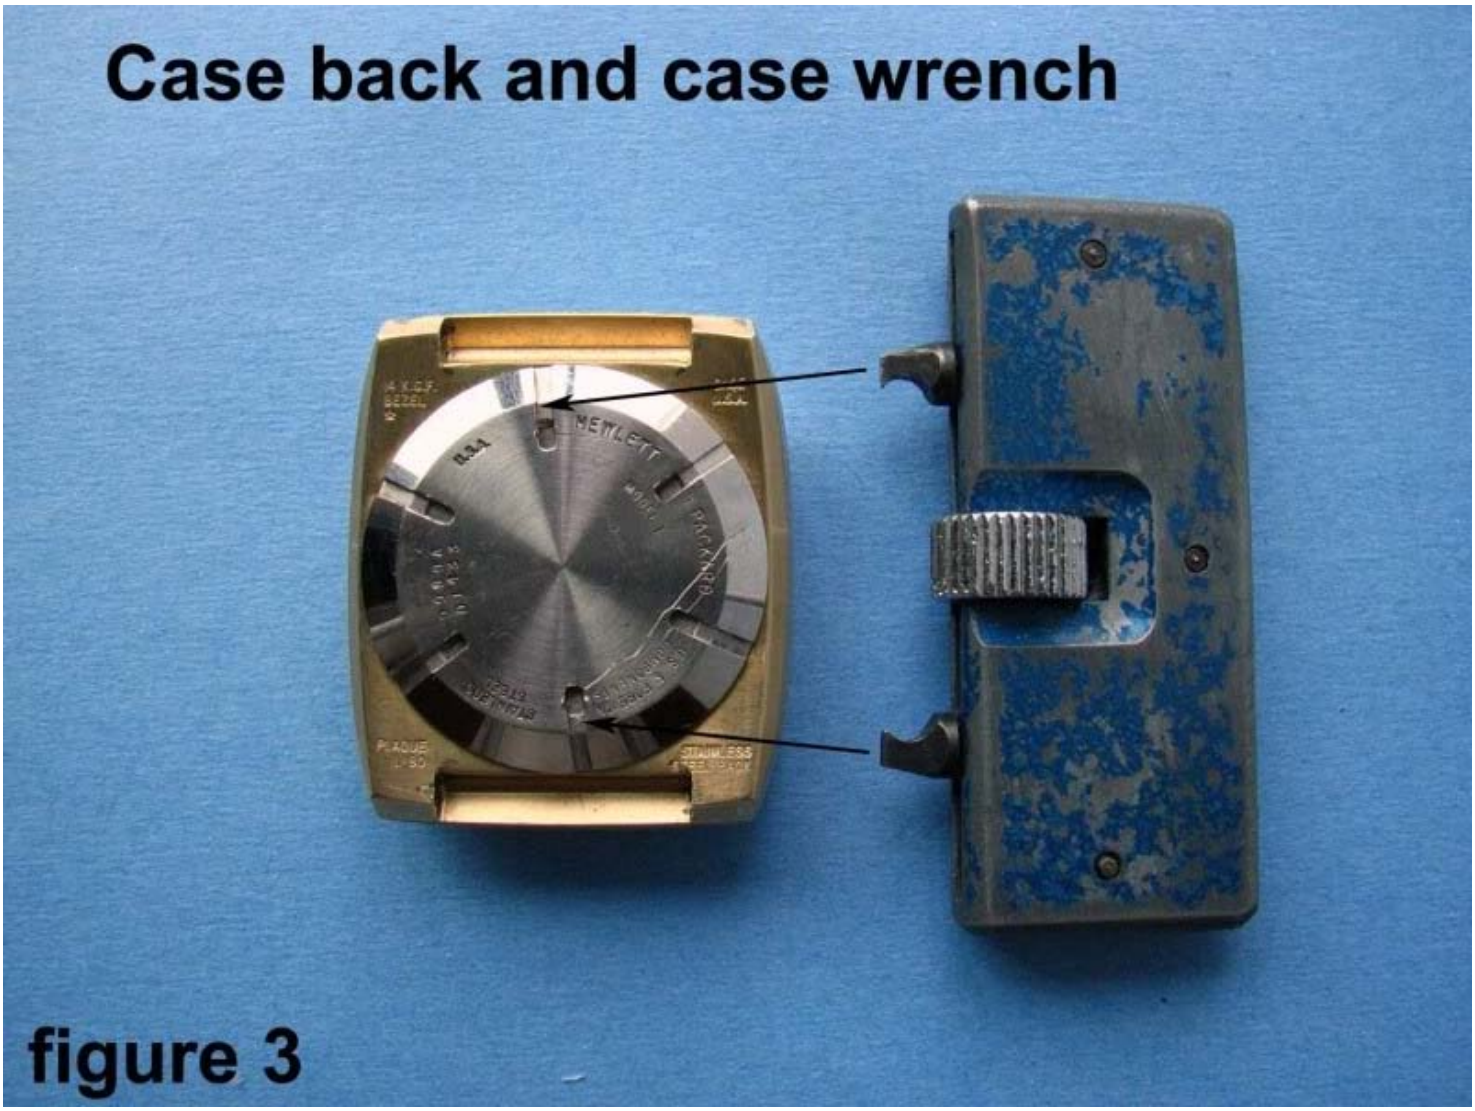

figure 2:

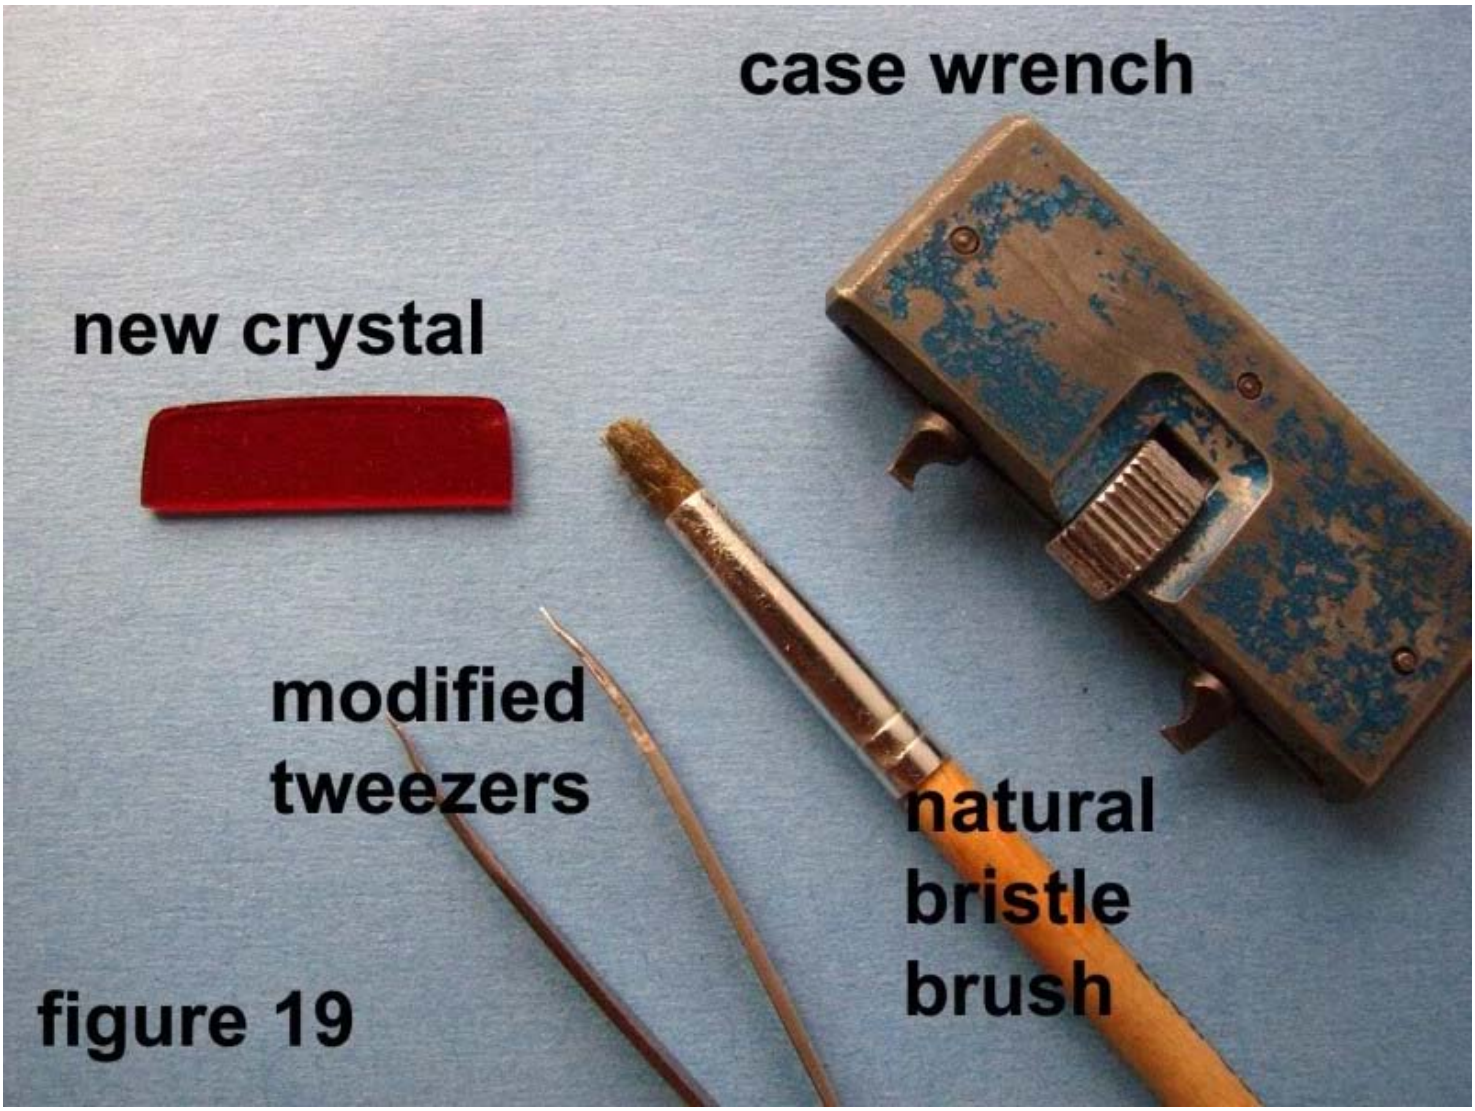
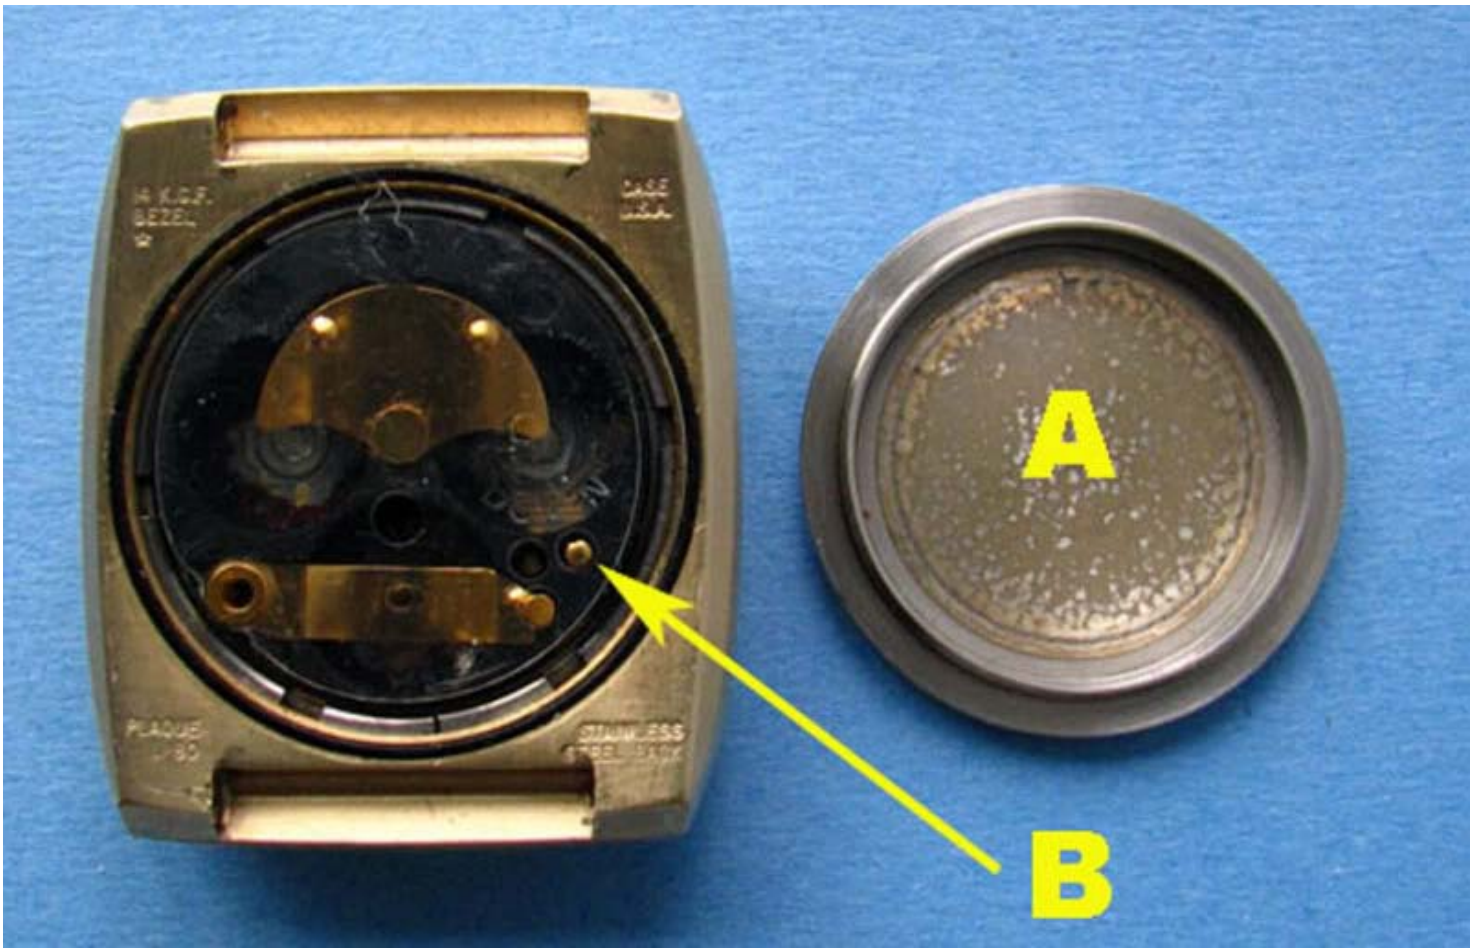


figrue 3 (A: piezo transducer which is visible from the top side of the back case in the deeper part of the recess.)



Of course what posting would be complete without some gratuitous eye candy. For the full posting of this restoration see the following

link: **HP 01 RESTORATION**. This is an older post and the book contains a much more refined series of photos and labels sans humor! This one actually made it on the BBC series "Antiques Roadshow", albiet, in the background on a display table surrounded by other LED watches.

*Message #8 Posted by **aj04062** on 4 Apr 2011, 10:54 p.m.,*
in response to message #7 by Geoff Quickfall

Okay,

I am going to make from UMHW (Delrin) with some metal pins.

Re: HP-01 Back Cover Tool (pictures to hook your interest)

*Message #9 Posted by **Geoff Quickfall** on 5 Apr 2011, 2:13 a.m.,*
in response to message #8 by aj04062

Delrin is excellent.

Actually Omega and Lemania use it in their 861 Speedmaster movements due to its self hardness and 'slipperiness' as part of the cam system for stopping and starting the chronograph.

Good choice and sign me up for one!

Geoff

RPL+

*Message #1 Posted by **Oliver Unter Ecker** on 3 Apr 2011, 9:39 a.m.*

This does not relate to HPs, but to an RPL platform being built:

I think that RPL, the language, can be improved.
I've started to implement a few strictly optional language features that I think make for a better language.
The result is called "RPL+".

I just posted another round of planned features here.
These are pretty drastic, yet I hope they will do good.

Is code like this

```
\<< =n
   0 'n>295' {R\->I} IFT =zero
   n mkpents =pents
   [0 1 1 0] =signs
   {1} =partitions
   1 n FOR j
      zero @ running sum
      1 =k
      WHILE
         pents[k]
         j \=<
      REPEAT
         partitions[pents[k] j -]
         signs[k 4 MOD] {+} {-} IFTE
         ++k
      END
      partitions push @ add to partitions
   NEXT
   partitions[n]
\>>
```

recognizable to you as RPL?

Would you like to write code like this?

Or do you think RPL should not be changed?

I'd love some input.

Edited: 3 Apr 2011, 12:13 p.m.

Re: RPL+

*Message #2 Posted by **Namir** on 3 Apr 2011, 2:24 p.m.,*
in response to message #1 by Oliver Unter Ecker

Do you have an emulator for RPL+???

A few years ago I implemented RPN2 (an extension to RPN) using Excel. The Excel interface helped type in and run RPN2 programs which supported a whole variety of registers (stack, multiple Alpha registers,

multiple array indexing registers), strings, matrices, and flags. I presented RPN2 in HHC2009 (i believe).

The point I am making is the having an emulator allows you to breath life into your concepts.

Namir

Re: RPL+

*Message #3 Posted by **Oliver Unter Ecker** on 3 Apr 2011, 3:56 p.m.,*
in response to message #2 by Namir

Namir,

RPN2? That sounds cool. (I will confess to you, though, that I barely know RPN...)

>Do you have an emulator for RPL+???

Well. I'm not re-purposing hardware (my hat's off to everyone involved in the WP34s project, btw; it's beautiful), so I don't need an emulator. I'm building the real thing.

In the post I referred to, what is not flagged as "(planned)" already exists. And it's out in the wild, actually. Today, there're many thousands of RPL+ calculators (really: apps; currently ND0 and ND1) in the hands of users. So, RPL+ is real.

(Caveat: app buyers are not like calculator buyers. Most of my users don't know what RPL is, and, I suspect, don't use it. But then, 50g language capability and one-tap downloading of code only appeared in an update a month ago.)

What I'm proposing today, I may implement today. And you may download it in two weeks. (The framework that enables me to do that I built over the course of two years.)

RPN2

*Message #4 Posted by **Oliver Unter Ecker** on 3 Apr 2011, 4:17 p.m.,*
in response to message #2 by Namir

Namir,

I don't want to be annoying, but let me tell you that you *could* implement your RPN2 for MorphEngine calculators (the two mentioned before for iOS, but more are in the pipeline, for more OSes; see the road-map).

Either in JavaScript. Using or not using the math and type functionality that is provided by MorphEngine (which is much easier to use than you'd think; essentially, if you know your calculator command-set, you know how to use it after 20 minutes of reading documentation).

Or in RPL. (Is there possibly even something like an RPN emulator implemented in RPL? Should be possible.)

You don't need a development environment. You can do this on the device! (In either language.) (Though, if you have an iPad, you may want to wait for CalcPad (another MorphEngine calc) for a larger editing window.)

You could also develop on a desktop, in JavaScript, and transfer files to run on the device. Setting up a custom server is described in the ND1 reference docs and makes this a one-tap, one-second affair.

If you have a stand-alone JavaScript implementation, developed on a desktop, it takes very little time (probably minutes!) to adapt to MorphEngine, and make it run in the calculator. You could then make it available to all users as a (free) shared folder download. There's a concept of an "extension" and your language could be permanently installed in all calculators of users who press your Install button. It will then be as if the calculator had RPN2 built-in!

If you'd like any of this, I'd be happy to point you the right way and lend some support.

Re: RPN2

*Message #5 Posted by **Namir** on 4 Apr 2011, 12:30 a.m.,*
in response to message #4 by Oliver Unter Ecker

The Excel interface allowed me to view a lot of information simultaneously. Behind the RPN's functions and operation stands thousands of lines of VBA code.

The main goal for RPN2 is to provide structured or modular programming that allows the development of reusable code where one can not worry about clashing register number/names and label names. RPN2 supports modules and each module define a scope for its memory registers and labels.

Anyway, this project of mine is not active. I may add a few small features to enhance decision-making, but there is no rush now.

Namir

Re: RPN2

*Message #6 Posted by **Oliver Unter Ecker** on 4 Apr 2011, 3:06 a.m.,*
in response to message #5 by Namir

Sounds like a really nice project. Love the idea of using Excel as emulator.

Cheers.

Re: RPN2

*Message #8 Posted by **Oliver Unter Ecker** on 4 Apr 2011, 9:37 a.m.,*
in response to message #7 by Namir

Hi Namir,

I didn't know you were a prolific writer, and a language whiz.

Thanks for the link. I started to peruse the RPN2 material and am well impressed. Also, I found the root finding articles interesting and may come back to it (my project is in dire need of a capable solver).

Your R "tutorial" is a book! (But you know that...)

It's a pity your RPN2 project's not active. You put a lot of work into that! (It looks really good to me.)

Edited: 4 Apr 2011, 9:38 a.m.

Re: RPN2

*Message #9 Posted by **Namir** on 4 Apr 2011, 11:36 a.m.,*
in response to message #8 by Oliver Unter Ecker

Oliver,

Thank you for your most kind compliments.

I am very glad that the R tutorials attracted your attention. I agree, they can be a book.

Regards,

Namir

[] operator

*Message #10 Posted by **Oliver Unter Ecker** on 3 Apr 2011, 4:35 p.m.,*
in response to message #1 by Oliver Unter Ecker

Ok. I know I want the array access operator "[]".

But which one of the following two would you choose:

A

```
                  |   syntax   |
                  v     v v    v
ex1    partitions[pents[k] j -]
ex2    signs[k 4 MOD]
       ^        ^
       | local  | any RPL
```

or

B

```
ex1    partitions[pents[k] - j]
ex2    signs[MOD(k, 4)]
       ^        ^
       | local  | an expression (w/o quotes)
```

?

Note, **B** makes array access look identical to a C-like language.

Is this too scary for the RPL mind? Think of it as replacing

```
signs 'MOD(k, 4)' EVAL 1 + GET
```

To me "signs[MOD(k, 4)]" reads better. (And the comfort doesn't come at a price. Quite the opposite. It's way faster to run.)

Edited: 4 Apr 2011, 3:01 a.m.

Re: [] operator

*Message #11 Posted by **David Hayden** on 4 Apr 2011, 4:29 p.m.,*
in response to message #10 by Oliver Unter Ecker

Oliver,

I think it's really a question of what syntax will you use for an expression. In both cases, the general syntax appears to be

```
partitions[ any expression ]
example: partitions[pents[k] + 2]
```

Note that HP solved this by inventing the algebraic object, so in RPL it might be

```
'partitions[pents[k] + 2]'
```

But I'm not sure how you'd distinguish between an array reference and an object followed by a single entry array. For example, is

```
partitions [1]
```

a reference to an element in partitions, or does it put the value of partitions on the stack, followed by the array [1]?

Dave

Re: [] operator

*Message #12 Posted by **Oliver Unter Ecker** on 4 Apr 2011, 8:16 p.m.,*
in response to message #11 by David Hayden

David,

The overall structure of both cases is

```
    array[something]
```

In case A, "something" is RPL.
In case B, "something" is an algebraic expression without quotes.

Each case gives two examples.

I'm getting an "invalid syntax" error if I try to place brackets inside an expression, so 'partitions[pents[k] + 2]' does not work for me (on an HP-49).
Maybe you mean 'partitions(pents(k) + 2)'?

Yes, case B

```
   partitions[pents[k] + 2]
```

would indeed be equivalent to

```
   'partitions(pents(k) + 2)' EVAL
```

Thanks for pointing this out. This should make the syntax look friendlier in RPL eyes. I know the lack of quotes may be weird. But the proposed syntax is equivalent to the one in C-like languages.

(Conversely, the expression syntax, what with having "()"s, needing quotes, and an EVAL, is probably very weird from the point of view of most other languages.)

Unsurprisingly, this

```
\<< [1 2 3] \-> x \<< 1. 1000. START 'x(1)' EVAL DROP NEXT \>>
```

runs 6.5x slower than this

```
\<< [1 2 3] \-> x \<< 1. 1000. START x 1 GET DROP NEXT \>>
```

on Emu-48/HP-49.

So, using expressions instead of GET for array access seems unfeasible. But, again, thank you for pointing out that my proposed syntax B looks almost like the whole thing wrapped in an expression.

> partitions [1]

This one is easy. The proposed operators are "fused": they *must* be connected to the name of a local. No white-space inbetween allowed. So, your example has the regular meaning. Only

```
partitions[1]
```

would be the new thing.

If you try to enter "partitions[1]" on an HP-calc you get "partitions [1]" on the stack, so that wouldn't work. But, then, RPL+ is not meant to (or, rather, cannot) be retro-fitted to existing HP calcs.

Thanks for feeding in!

New update for Clonix, NoV's and configuration utility.

*Message #1 Posted by **Diego Diaz** on 2 Apr 2011, 7:33 p.m.*

Hi all,

I've built a new configuration utility interface.

It is intended to make users life easier, by handling many of the different options that required a spacific file to be loaded.

Main points are:

- Advantage module is now available for every module that can load it into its ROM.

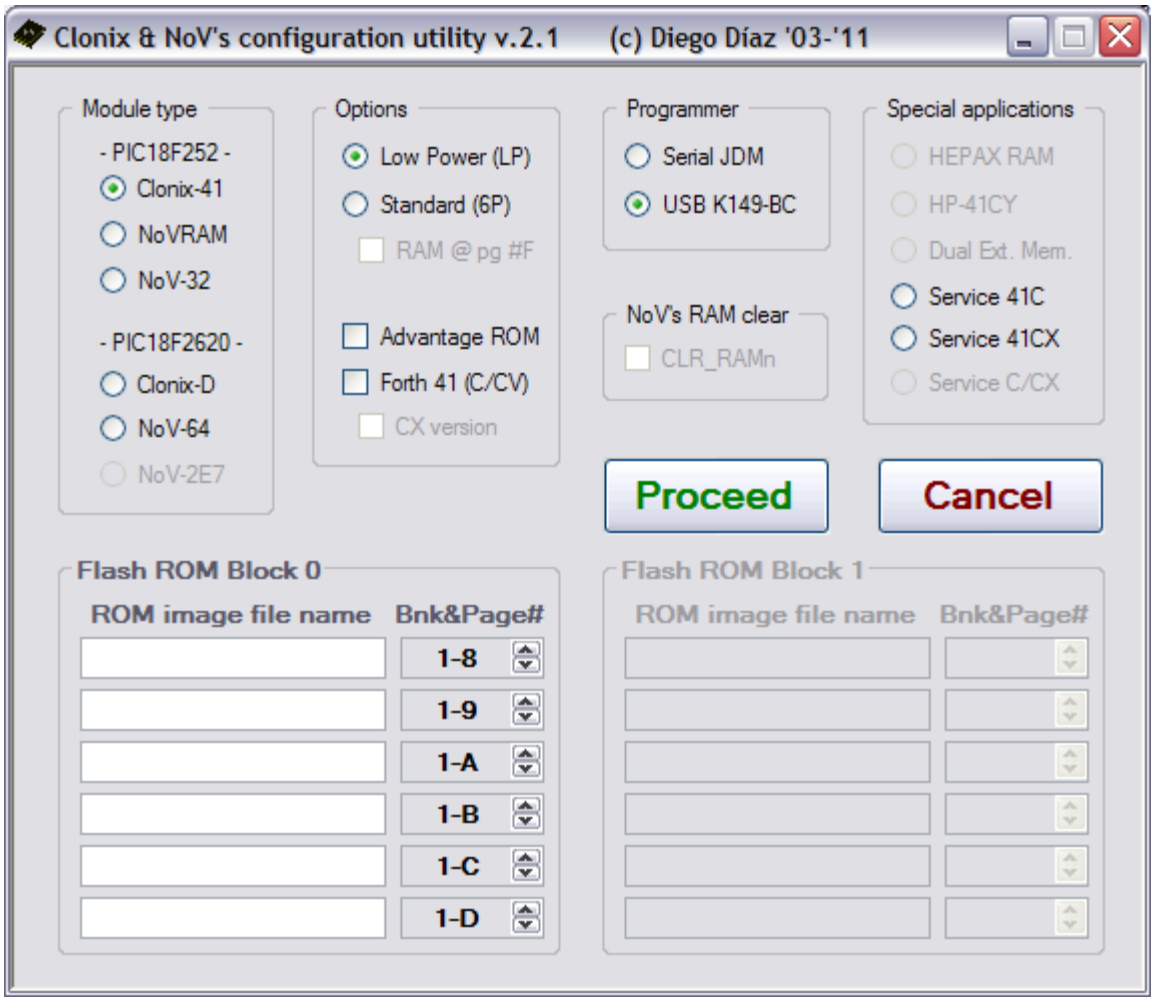
- Also Forth-41 (for CV and CX) is available.

- The "fast" 6P version for Clonix-41, including its 512 RAM words is available too.

- Latest SW for NoV-64, including Crash Recovery function and RAM shadowing is included. Updated NoV-64 manual is also included.

- New dedicated application: emulation of HEPAX 2 MEM module is available for NoVRAM, NoV-32 and NoV-64.

This is how it looks:



Please visit clonix41 to download; and (if you're so kind...) read the manual... ;-))

Enjoy your 41's!

Best from the Canary Islands.

Diego

Edited: 2 Apr 2011, 7:39 p.m.

in response to message #1 by Diego Diaz

Sorry for my curiosity: What is the Clonix-D project? Matthias

Re: New update for Clonix, NoV's and configuration utility.

*Message #5 Posted by **Diego Diaz** on 3 Apr 2011, 2:34 p.m.,*
in response to message #4 by Matthias Wehrli

Hi Matthias,

Your curiosity is welcome :-)

Clonix-D ("D" stands for Double) is a superset of the original Clonix-41 module.

It has two ROM blocks of 6 pages each, hence the "double"; and user can select which block is active by choosing the port where the module is plugged: Odd ports select block 0 while even ports select block 1.

Hope this helps.

Best wishes.

Diego.

Re: New update for Clonix, NoV's and configuration utility.

in response to message #1 by Diego Diaz

Saludos Diego

Looks like "a good thing just got better" - or more aptly, an excellent thing just got even more so!

Definitely good news. So glad you're rounding off the "Clonix GUI" and providing more flexibility to the configurations even for "non-expert" users :-)

Best, ÁM

Re: New update for Clonix, NoV's and configuration utility.

in response to message #6 by Ángel Martin

Hi Ángel,

And thanks again.

Seems you and Geir are also easing things a lot for the NoV's, HEPAX, XM and IL users with the new NOVCHAP. (this will probably fulfill the whole HP-41 users range... :-))

Best from the Canaries.

Diego.

HP 25 Battery Cover Stuck?

*Message #1 Posted by **M. Pollock (Canada)** on 2 Apr 2011, 5:35 p.m.*

Hi, I just acquired an HP25 calculator. It's in mint physical condition but I can't seem to remove the rear battery cover. Either I'm doing something wrong or there is a corrosion issue. Any suggestions? Thanks.

Re: HP 25 Battery Cover Stuck?

*Message #2 Posted by **Michael de Estrada** on 2 Apr 2011, 6:01 p.m.,*
in response to message #1 by M. Pollock (Canada)

The door is really the top of the battery pack, which you remove by sliding it forward towards the bottom of the calculator and then pushing down to release the rear of the pack. The battery cells are spring loaded and the springs should compress to allow the pack to slide forward when you push on it.

Edited: 2 Apr 2011, 6:02 p.m.

Re: HP 25 Battery Cover Stuck?

*Message #3 Posted by **M. Pollock (Canada)** on 2 Apr 2011, 6:29 p.m.,*

Hi, Thanks, I tried that, it just doesn't budge.

Re: HP 25 Battery Cover Stuck?

*Message #4 Posted by **Michael de Estrada** on 2 Apr 2011, 7:28 p.m.,*
in response to message #3 by M. Pollock (Canada)

Is it possible for you to contact the seller about this? Sometimes these battery packs are rebuilt by splitting the case and then gluing it back together, such that the pack is slightly thicker and becomes a very tight fit in the calculator. I have a few that are a bit tight and require a bit of force to open, however, I've always been able to open them without resorting to prying, which will cause some cosmetic damage.

Re: HP 25 Battery Cover Stuck?

*Message #5 Posted by **Randy** on 2 Apr 2011, 8:33 p.m.,*
in response to message #4 by Michael de Estrada

Pop out the top two rubber feet and remove the two Phillips screws underneath. Now, with the same Phillips you removed the screws with, push on either one of the two charger input pins and push the keyboard assembly out at the top. Now you can lift the electronics up and out leaving you with the battery and case back as one piece. Once that is complete, you can easily remove the battery.

Re: HP 25 Battery Cover Stuck?

*Message #6 Posted by **Michael de Estrada** on 2 Apr 2011, 9:57 p.m.,*
in response to message #5 by Randy

I've opened plenty of Woodstock cases with the battery pack removed, but never with one installed. Wouldn't the pressure of the battery terminals against the pcb contacts prevent you from separating the keyboard assembly from the case and battery pack?

Re: HP 25 Battery Cover Stuck?

*Message #7 Posted by **Geoff Quickfall** on 3 Apr 2011, 3:19 a.m.,*
in response to message #6 by Michael de Estrada

As usual, Randy is absolutely correct. Simple undo the screws and gently push the contacts so that they clear the case internally.

I have had a few 'stuck' battery packs on the woodstocks.

Geoff

WP-34s Functionality Poll

*Message #1 Posted by **Paul Dale** on 2 Apr 2011, 5:29 a.m.*

It looks like there is a small amount of flash free after all the current functions are included plus a couple of extras recently finished. So we're taking suggestions as to what should be included. There is no guarantee that anything specific will go in of course. There isn't even a guarantee that we'll add anything else.

We've recently added additional statistics and a very simple TVM equation. We will likely add a keyboard poll routine.

Things that aren't going to be possible, so don't bother suggesting these:

- User writable flash based storage - there isn't a clear page.
- I/O commands - there is none on the device.
- Financial commands - we've got a TVM command and quite a few percentages already and that is enough. This is a scientific calculator not a business one.
- Cannot use any RAM storage - persistent RAM is full and there isn't any spare.

What we do have implemented already and thus are easy to add are:

1. **AGM** - The limit of the arithmetic / geometric mean. Defined in both reals and complex versions.
2. **Riemann's Zeta function** - Defined for both real and complex argument.
3. **Digamma (Psi)** - The digamma function d/dx Ln(Gamma(x)). Defined for both real and complex arguments.
4. **Jacobi's Elliptical Functions** - SN, CN & DN defined for real and complex arguments.
5. **Bessel Functions (real)** - J_n, I_n, Y_n & K_n. Real order and argument. I've separated the real from the complex here since these functions are quite large and the complex versions aren't working yet.
6. **Bessel Functions (complex)** - J_n, I_n, Y_n & K_n. Complex order and argument. I've separated the real from the complex here since these functions are quite large and the complex versions aren't working yet.
7. **Fused Multiply Add** - A single operation that returns X*Y+Z correctly rounded in the last digit. Defined for real arguments only. This operation can be done using a complex multiplication but less nicely.
8. **Cubes** - Cube root of X and X^3. The cube root correctly handles negative values unlike 3 1/x y^x. Defined for real and complex arguments as well as in integer mode.
9. **x!!** - The double factorial function defined for real and complex argument.
10. **!n** - The subfactorial or derangement function defined for integer real arguments only.
11. **Easter** - Given a year or date, return the date of Easter for that year.

The only other piece of functionality that can be easily included is to add a Ridder's Step into the solver. The solver

uses a variation of Brent's Method and I didn't notice any improvement by adding Ridder's Step in the little testing I undertook.

Feel free to suggest other functions or capabilities (or better submit code for them).

We can also add keystroke programs to flash and these are generally fairly code dense. If people have pet programs of this nature, feel free to port them to the 34s and submit the code. There are fifteen hidden flags (00-14) and five hidden registers (00-04) that flash based programs can use freely without disturbing user programs. Flash based programs can optionally take a user label as an argument and can call back to this user code -- this being how solve and integrate are implemented.

- Pauli

edit: added note that RAM is full

Re: WP-34s Functionality Poll

*Message #8 Posted by **Dieter** on 3 Apr 2011, 10:38 a.m.,*
in response to message #7 by Paul Dale

The date routines only work for Gregorian Dates (i.e. since 15-Oct-1582). Adding Julian calendar support (by assuming a proleptic Julian calendar for every earlier date) is virtually no effort. Common algorithms handle years down to -4712. Various methods can be found on this Website. Readers interested in the basics of calendar calculations start here.

Another option is a general calendar flag (similar to the date mode setting) that switches between the Gregorian and Julian calendar - which is still used in some parts of the world.

This example is one of the reasons why I think the WP34s does not need *more* functions, but *better*

implementations instead.

Dieter

Where's the beef? What do you want implemented differently?

Walter

Re: WP-34s Functionality Poll

*Message #10 Posted by **Dieter** on 3 Apr 2011, 2:30 p.m.,*
in response to message #9 by Walter B

Hallo, Walter -

> Quote:
>
> I count this as your suggestion.

The addition of earlier dates than 15-Oct-1582, yes. The calculator should be able to handle dates both before and after this date. So that, for example, ddays(4.10.1582, 15.10.1582) will return 1 in Gregorian mode and 11 in Julian mode.

> Quote:
>
> Where's the beef? What do you want implemented differently?

There are issues with some functions regarding numeric accuracy. I expect a quality calculator to return results within 1 ULP. Otherwise this has to be documented and the result should be rounded to the number of actually valid digits. Back in the Seventies, my first calculator could evaluate all transcendent functions to not more than 5 significant digits.

So it returned lg 2 as "0,30103" - and not one single digit more. At least an honest answer. It didn't pretend to be more precise than it actually was. ;-)

I haven't checked all more or less exotic functions on the 34s, but I took a closer look at the normal distribution. With 39 internal digits a 16-digit result should be no major problem, even with the quantile function. Right now this function returns good results in the far tails (the values I checked were correct within 1 ULP), but there is a problem with common values in the range p = 0,01 ... 0,2. Here, the emulator sometimes requires up to one whole second (!) on a 1,8 GHz system before it returns a result with not more than 11-12 valid digits:

```
   p        exact z-quantile           WP34s result
0,01    -2,326 3478 7404 0841   -2,326 3478 7404 0841  so far,
0,03    -1,880 7936 0815 1251   -1,880 7936 0815 1251  so good. ;-)
0,05    -1,644 8536 2695 1473   -1,644 8536 2697 9906  but then...
0,10    -1,281 5515 6554 4600   -1,281 5515 6554 8626
0,15    -1,036 4333 8949 3790   -1,036 4333 8949 4112
0,20    -,8416 2123 3572 9142   -,8416 2123 3574 9220
```

The problem already starts with the simple CDF:

```
   x        exact CDF                 WP34s result
-0,5    3,085 3753 8725 9869 E-1   3,085 3753 8726 0659 E-1
-0,8    2,118 5539 8583 3967 E-1   2,118 5539 8583 5966 E-1
-1,0    1,586 5525 3931 4571 E-1   1,586 5525 3932 2540 E-1
-1,5    6,680 7201 2688 5807 E-2   6,680 7201 2717 4097 E-2  (!)
-2,0    2,275 0131 9481 7921 E-2   2,275 0131 9481 7921 E-2
```

I also tried some calculations with Student's distribution - with similar results.

```
   p    df     exact t-quantile          WP34s result
0,01     3   -4,540 7028 5856 8134    -4,540 7028 5856 8325
0,05     5   -2,015 0483 7333 3024    -2,015 0483 7333 3021
0,10     5   -1,475 8840 4882 4481    -1,475 8840 4882 4385

   t    df     exact CDF                 WP34s result
-1       5   0,1816 0873 3824 5613    0,1816 0873 3823 9048
-2       7   0,0428 0966 4281 48803   0,0428 0966 4281 48889
```

So the precision is something between 10 and 16 digits. I just noticed that the latest 34s-version uses only the displayed 12 digits when "copy number" is used (instead of all 16 before). This makes some sense... ;-)

Dieter

Edit: correction because of cdf and pdf confusion. ;-)

Edited: 4 Apr 2011, 2:28 p.m. after one or more responses were posted

Re: WP-34s Functionality Poll

*Message #11 Posted by **Paul Dale** on 3 Apr 2011, 6:01 p.m.,*
in response to message #10 by Dieter

I'm wondering how bad these values really are.

For the values I tested, applying the cdf to the answer comes back to the initial value within a couple of ULP and in many cases back to the exact initial value.

- Pauli

Re: WP-34s Functionality Poll

*Message #12 Posted by **Dieter** on 4 Apr 2011, 2:20 p.m.,*
in response to message #11 by Paul Dale

Yes, that's exactly the point: there are errors both in the CDF and its inverse. If the inverse (quantile) is calculated by the solver, it *has to* return an erroneous result, because it *thinks* it has found the correct inverse, since the CDF of the current root indeed returns the expected probability (and not the correct value, slightly off).

Example:

```
    Exact normal quantile for p = 0,1:
          z = -1,281 5515 6554 4600
    Normal CDF for this value on WP34s:
     =>   p =  0,1000000000007065
    Which makes the solver think it has to correct the already exact
z-result.

    Actually the CDF is (almost) exactly 0,1:
          p =  0,1  (+8E-17)

    On the 34s only the "wrong" value
          z = -1,281 5515 6554 8626
    returns the same nearly-exact
          p =  0,1  (-7E-17)
```

In other words, most of the inaccuracies (not all) should be gone once the CDF is computed correctly.

Pauli, please forgive me if I'm a bit picky here. I really appreciate all your (and Walter's) effort for the WP34s project. But all I want is a calculator that returns correct results. :-)

Dieter

Drat, I thought I'd fixed the normal cdf problems :-(Obviously not quite yet.

Even if the cdf was correct, there will still be problems with the qf. The inversion maps p in the range 0, 1 onto x in the range -infinity, infinity. There must be multiple floating point values of x that map from the same p simply because there are more values of x than p.

> Quote:

> Pauli, please forgive me if I'm a bit picky here. I really appreciate all your (and Walter's) effort for the WP34s project. But all I want is a calculator that returns correct results. :-)

No, keep it up. This is the best way to identify and fix problems :-)

It's the main point of having ported the Windows emulator from the SDK over to wp34s: Attract more testers to find bugs or get their opinions.

Re: WP-34s Functionality Poll

*Message #15 Posted by **Dieter** on 6 Apr 2011, 5:22 p.m.,*
in response to message #13 by Paul Dale

I think the major problem here is the general common approach that's used for different distributions, not only for the Normal case. If I remember correctly, some time ago you said the Normal integral as well as some other CDFs are treated as a special case of some kind of Beta function, and for the inverse the solver is used.

Obviously the CDF is not evaluated exactly enough to get near machine precision. On the other hand, at least for the normal distribution the CDF can be computed with arbitrary precision - fast and with little memory usage. I tried the usual two algorithms (cf. Abramowitz and Stegun 26.2.11 for the center and 2.26.14 for the tails) on the emulator and the results are mostly within 1 ULP when rounded to 15 significant digits. With a working precision of 20 digits a full 16-digit result is no problem at all.

There are also fast and precise ways to determine the inverse. If the classic approach (three (7;7) rational approximations) is not possible the value can be evaluated to 9 digits with an additional Newton step, which is trivial since we know the CDF's derivative, i.e. the PDF.

However, using the solver should not be a problem here. First, the equation to solve for x can be ln(x) = ln(p), as discussed before. This requires at least three guard digits, so we're already on the safe side when we use the proposed 20 internal digits (39 are fine, but not necessary).

You said there will be a problem with the inverse since it maps the]0; 1[range to]-inf, +inf[: *"There must be multiple floating point values of x that map from the same p simply because there are more values of x than p."* Well, this is also true for functions like arcsin or arccos. ;-)

For most values of p using the solver should return the correct result. Consider this example:

```
    p =  1 E-99
 => x = -21,16 5179 3439 3891 1286 9902 2340 ...
```

If this value, rounded to 16 digits, is fed back into the CDF routine, the correct result is

```
    x = -21,16 5179 3439 3891
 => p =   1,000 0000 0000 0027 E-99
```

If x is now increased only by 1 ULP, the CDF will change significantly:

```
    x = -21,16 5179 3439 3892
    p =  0,9999 9999 9999 8152 E-99
```

So the solver "knows" that the exact value is somewhere between these two adjacent x-values, and there simply is no 16-digit result which would return an exact 16-digit 1,000 0000 0000 0000 E-99. The closest possible result is -21,16 5179 3439 3891.

It can be shown that there is no problem with any x >= 1. Here, changing x by one ULP means that the CDF will change by more than 1,7 ULP, up to several hundred ULPs (like in the example). In other words: any change in x will result in a more or less even bigger change in the CDF. So the solver can be used.

The only problem are values where x < 1. Here in fact several x-values can return the same CDF. Right in the center even a difference in the first or second (!) significant digit of x makes no difference for the CDF. So here the solver will fail. However, it will work if the calculation can be done with twice the number if digits required in the final result, i.e. in this case with 32 digits.

Dieter

I'm using the regularised incomplete gamma function for the normal. The incomplete beta is used for the F and T distributions amongst others. I've had doubts about the implementation of these two for a while now.

We've also found a problem with using for solver for Chi squared distribution. I'm going to rework all these distributions so that the solver isn't used. It will consume a goodly amount of our remaining space but it should be worthwhile.

*Message #18 Posted by **Paul Dale** on 7 Apr 2011, 6:31 a.m.,*
in response to message #15 by Dieter

I've recoded the normal CDF and it looks good now. Your examples above are all coming out correct to the last digit. The solver seems to work okay but the time to computer will likely be large. The new binary is in subversion on sourceforge but not properly released yet.

Now the rest of the distributions...

- Pauli

Re: WP-34s Functionality Poll

*Message #19 Posted by **Dieter** on 7 Apr 2011, 8:40 a.m.,*
in response to message #18 by Paul Dale

> Quote:
>

Fine. BTW, for those who need high precision values for various functions (or simply want to check the results of their algorithms without a Mathematica installation): try this service by an unnamed calculator manufacturer. ;-) The maximum precision is 50 digits.

> Quote:
>
> The solver seems to work okay but the time to computer will likely be large.

So the two initial guesses are somewhat off. There are various simple ways to fix this for the normal quantile:

- Determine a high-quality estimate by using a known approximation, such as the good old Hastings method (absolute error < 0,00045). Or, even better, the Bailey method (cf. Applied Statistics vol. 30 no. 3, 1981), or an improved version I

worked out some time ago. ;-) After this, a few Newton iterations will provide the exact quantile. Or, even better, two or three Newton-Halley steps, which is trivially simple here, giving about 2-3 times the number of correct digits with each step. Of course also the solver can be used instead.

- If the solver is used two quite good initial guesses can be evaluated this way:

```
0,5 >= p >= 0,15          0,15 >= p > 0
-----------------------------------------------
a = 3 * (0,5 - p)         a = sqrt(-2*ln(p) - e)
b = a * 5/6               b = a - 1/4
```

  The exact result is in this interval. The two guesses differ only by 20% resp. by merely 0,25 so that the solver will find the result fast with only a few iterations.

Addendum: I just tried the solver in a WP34s user program with the two initial guesses mentioned above, solving for the root of the equation ln 1 + (cdf(x)-p)/p to avoid problems in the far tails, using the ln1+x function. The results are returned immediately and the values I checked show about 15 valid digits (out of the 16 used for all calculations).

Dieter

This works wonderfully. I've modified the normal quantile function to start with these guesses and convergence to full precision is a matter or ten or so iterations everywhere except at the very extremes.

I've also fixed up the solver based quantile functions for the chi^2, t, f, binomial and Poisson distributions. Although the initial estimates here aren't very good so convergence isn't always quick. If anyone can suggest decent initial values for these distributions, it would be appreciated.

Fine. Although it should take less than ten iterations. ;-)

> Quote:

> ...everywhere except at the very extremes.
>
> ---

The mentioned formulas for the two initial guesses are very simple. But they approximate the exact value with a relative error less than 20% resp. an absolut error less than 0,25. With a little more effort we can easily provide two better guesses which can nail down the true value with an absolute error in the order of 10^-5 to 10^-8 (!) in the far tails (p =< 10^-10). This is possible because here the quantile can be evaluated by a series - the farther out in the tail, the less terms are required, especially with a little tweaking of the "exact" series. ;-) So it comes down to the question how much effort (and memory) can be spent for two even better initial guesses which would require, say, only 1/2 or 1/3 the number of iterations.

Here's a quick and dirty improvement for the far tail. It's a slight modification of the original formula, now providing two guesses that are only 0,09 or even merely 0,025 apart:

```
    0,15 >= p > 0
    ------------------------
    a = sqrt(-2*ln(p) - e)
    b = a - 1/4
    if a >= 4,5 then a = a - 1/a ; b = a - 1/11
```

or, even better, but on a smaller interval:

```
    if a >= 9 then a = a - a^-(3/4) ; b = a - 1/40
```

On the other hand, in the very center (i. e. p close to 0,5 resp. z close to zero) using the solver will cause problems because there are multiple z-values that will return the same 16-digit CDF. I would suggest the following solution:

Near p = 0,5 the quantile can easily be calculated directly (!) by a simple series:

```
     u  =  sqrt(2*Pi) * (p - 0,5)
                1          7          127
4369          243649
     z  =  u +  -- u^3  +  -- u^5  +  --- u^7  +  -
--- u^9  +  ------ u^11  +  ...
                3!         5!          7!
9!           11!
```

The nominators of the coefficients are integer series A002067.

For 0,495...0,505 (or |u| =< 0,0125) an exact 16-digit results requires only four terms, i.e. up to u^7. With one more term (u^9) the result is exact for p = 0,486...514 (or |u| =< 0,035).

This leads to the following algorithm (assuming p =< 0,5):

```
    if p > 0,15 then
       u = sqrt(2*Pi) * (p - 0,5)
       a = u + (u^3)/6 + (u^5)*7/120 +
(u^7)*127/5040
       if p > 0,495
         then return a and quit   ; a already is
exact
         else
              b = a * 1,006
```

```
            return solverresult(a, b)
      end if
   else     ; p =< 0,15
      a = sqrt(-2 * ln(p) - e)
      b = a - 1/4
      if a >= 9 then   ; far tail
         a = a - a^-(3/4)
         b = a - 1/40
      end if
      return solverresult (a, b)
   end if
```

In other words: for p > 0,15 determine a very good first guess. If p is close enough to 0,5 this guess already is exact, so simply return it as the final result. Otherwise provide a second guess slightly higher and let the solver do the rest. Which is done very quickly since the error is less than 0,6%. In the tails determine two reasonably good guesses, and in the far tails two even better ones that reduce the remaining error by a factor of 10.

For these distributions things are a bit more complicated, especially in those cases where there's more than one parameter.

> Quote:
>
> Although it should take less than ten iterations.

Not to full precision it shouldn't :-) I could cut back the accuracy to a few more than the 16 digits we need if performance is lacking.

I'll have a look at your other suggestions, this function is used internally in a couple of places so making it faster is worth a bit more flash (but not a lot).

I've done approximations for the chi^2 and t distributions that aren't awful. For chi^2 I'm using one of the asymptotic normal approximation to provide bounds -- unfortunately not fantastically tight but better than nothing.

For t, I'm solving exactly for v=1 or 2 and using the v=2 estimate and the normal estimate as bounds for the search -- the result must lie in this range. I looked at using the exact v=4 solution but it seemed to be more effort than it was worth. These bounds are fairly tight around the middle of the distribution and become progressively looser at the far extremes.

No way! I got this off-brand RPN-calculator, probably a kind of Novus clone, that needs several seconds for all its inverse trig functions, before it finally displays a 12-digit result... with usually 10 valid digits. I think we can do better. ;-)

> Quote:
>
> I'll have a look at your other suggestions, this function is used internally in a couple of places so making it faster is worth a bit more flash (but not a lot).

There are several options. It is quite easy to set up a simple approximation for the normal quantile with a combination of elementary functions. I tried a slighty more sophisticated approach than before, resulting in a maximum absolute error near 0.02, approaching zero in the center and something close to 1E-4 for p < 1E-50. On the other hand a very simple rational approximation can be used, which requires only four 3-digit coefficients and returns a result with absolute error less than +/- 0.002 over the whole range from p = 0,5...1E-400. I think this is the preferred solution.

> Quote:

> I've done approximations for the chi^2 and t distributions that aren't awful. For chi^2 I'm using one of the asymptotic normal approximation to provide bounds -- unfortunately not fantastically tight but better than nothing.

Sorry, right now I got no idea for the Chi^2 case.

> Quote:

I looked at using the exact v=4 solution but it seemed to be more effort than it was worth. These bounds are fairly tight around the middle of the distribution and become progressively looser at the far extremes.

There are algorithms like the good old A396 which - with some small improvements - can give results with errors near 1E-6. This method requires a more or less precise estimate for the normal quantile, where 6 digits of z should be fine for a decent t-approximation. Afterwards the solver should find the exact value with just a few iterations.

Dieter

Re: WP-34s Functionality Poll

*Message #26 Posted by **Dieter** on 15 Apr 2011, 2:23 p.m.,*
in response to message #25 by Dieter

A few days ago I wrote:

> Quote:
>
> On the other hand a very simple rational approximation can be used, which requires only four 3-digit coefficients and returns a result with absolute error less than +/- 0.002 over the whole range from p = 0,5...1E-400. I think this is the preferred solution.

And here it is - I designed a rational approximation, hand crafted to meet our needs. ;-) It has the following properties:

- It works for probabilities down to 1E-500 or |z| up to 48.
- It requires only four numeric constants with just two or three significant digits.
- No special care has been taken of the center (z very close to zero) since here the exact quantile can be evaluated easily.
- It returns an estimate for |z| which is slightly high (in absolute terms). The absolute error is greater than 0,0001 and less than 0,0036. So this estimate and a second guess 0,0037 lower define an interval that definitely includes the exact quantile.

So the normal quantile can now be evaluated this way:

```
if p > 0,5
   then
      signflag = false
      q = 1 - p
   else
      signflag = true
      q = p
   endif
if q >= 0,495
   then  ; use series and determine exact
result
      t = (0,5 - q)^2 * 2 * Pi
      z = (127/5040*t + 7/120)*t + 1/6)*t
+ 1) * sqrt(t)
   else  ; use solver with two close
guesses a and b
      t = sqrt(-2 * ln(q))
      a = t - (0,373*t + 2,37)/((0,068*t +
1,1)*t + 1)
      b = a - 0,0037
      z = solver(a, b)
   endif
if signflag then z = -z
return z
```

And now for the t-quantile... ;-)

Now I feel ashamed.

My implementation of the incomplete beta function terminated when successive terms were 1e-10 apart. Fixing this, and the T distribution matches your values.

This should follow over for the F and binomial distributions which are also special cases of the incomplete beta function.

Still, the inverses could do with some work to avoid the solver.

- Pauli

[edit: and a similar problem in the incomplete gamma function]

Hi Pauli,

> Quote:
>
> They are coded to work for Gregorian and Julian dates with a change over 2nd of September 1752 the next day being the 14th.

Yes, indeed. I was quite sure that the last time I checked, dates before 1582-10-15 were rejected. Which made perfect sense to me. Sorry for the confusion, you're right.

However, the switch between Julian and Gregorian dates should be between 1582-10-04 and 1582-10-15. This is the official date of the calendar switch, initiated by pope Gregory XIII - cf. Wikipedia: *The last day of the Julian calendar was Thursday, 4 October 1582 and this was followed by the first day of the Gregorian calendar, Friday, 15 October 1582 (...).*

It is correct that the Gregorian calendar was only gradually adopted throughout the world, especially in Protestant regions it took a while before the new calendar was used. In Britain (including its American colonies) the switch indeed took place in September 1752, while

here in the Holy Roman Empire the Catholic parts of the country switched immediately in 1582, just as some South European countries, while others did so not before 1700. Japan followed in 1873 and Russia even continued to use the Julian calendar up to the 1920ies.

But if we have to set *one single* switch date, in my very humble opinion the only date that makes sense here is the 15th of October 1582, the official date mentioned in *Inter Gravissimas*. In this case the Julian day number for 1582-10-15 is 2299161, while the day before was 1582-10-04 with JD 2299160 (last day of the Julian calendar). The calendar algorithms I know of use this convention. OK, I don't know anything about Unix. ;-)

*Message #31 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Apr 2011, 10:35 a.m.,*
in response to message #1 by Paul Dale

I have just played for a few moments with the emulator, and browsed the overwhelming manual. In my opinion, mathematical/scientific needs have been impressively covered, beyond limits; so in first place receive my congratulations.

Given the display limitations and, worse, the key legends / overlay pending solution, I would suggest to implement one of the most useful features of the HP41/42, regrettably absent from other models, as the 48/49/50 and 32/33 lines: NULL. Holding down a key causes the function name to be dispayed and, after a couple of seconds, the function is cancelled. Going further, hints to function syntax may even be displayed in some cases.

For me, it's a good thing to check what function I'm about to invoke and, if the function is not the intended one, have a simple manner to cancel it. This is mostly useful when the keyboard can be remapped, but it also helps when the legends are not very readable, or when you just made a mistake.

Other possible feature on the "convenience" side may be a welcome screen with programmable owner's name (it must be a short string, indeed) and telephone number, allowing international formats as "+54 90 1234-5678","11 22 33 44", and "(212) 123-4567". The welcome screen should last for a configurable interval (for instance, 0, 5 and 10 seconds); the name may be scrolled due to display limitations. Regrettably, owner's email may be difficult to display.

Both of these functions don't need their own keyboard space, which seems to be more valuable and scarce than Flash space.

Best regards.

(Please disregard idiomatic mistakes)

I have yet to create the keyboard code for the real hardware. The emulator doesn't provide "key released" so this option is some more work if it should be available on the emulator as well as the hardware. Isn't it a bit confusing that a function is only executed as the key is released? What about repeating keys, e. g. the arrows?

Re: WP-34s Functionality Poll

*Message #33 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Apr 2011, 2:13 p.m.,*
in response to message #32 by Marcus von Cube, Germany

Just some quick answers:

I don't think there is a serious problem if the emulator doesn't have the NULL option and the real hardware does.

In a calculator you don't have many auto-repeating keys, I can only think about Backspace and the up-down scrolling keys.

In normal use, there is no noticeable difference between functions executed on key press or on key release. Of course, a menu item may enable-disable this feature as per user preference.

Holding down a key causes the function name to be dispayed and, after a couple of seconds, the function is cancelled. Going further, hints to function syntax may even be displayed in some cases.

Some syntax hints are displayed already, like on the HP 42S. I don't think we can go much further: the useable display space is very (!) limited indeed. Nevertheless, whenever you have ideas what may be displayed within 43x6 pixels, suggest it :-)

Personally, I think NULL is a good idea for the reasons you gave - and everybody can see it working on the 42S - but I'm not the HW guy in this project. I've experienced cases, however, where I'd wished NULL had been implemented already.

> Quote:
>

We don't support scrolling yet - manual scrolling of alpha strings will come, automatic presumably not. Phone numbers may be displayed in the bottom line, but have a HW limit of 12 digits. So you better forget brackets, spaces and the like. Within these limits, almost everything is possible - see the extended character set provided d8-)

We can display alpha or the contents of a user register on power up, if a flag is set.

Re: WP-34s Functionality Poll

*Message #38 Posted by **Andrés C. Rodríguez (Argentina)** on 3 Apr 2011, 5:15 p.m.,*
in response to message #37 by Marcus von Cube, Germany

Using a flag (or timeout values of 0, 5 and 10 secs, for instance) to display ALPHA and a user register may be a good way to show a welcome message and a telephone number without using extra memory. It would be nice to have some format options for the phone number, because not all countries have the same number and grouping of digits. Usual number formats will be of little help. Of course, the limitations of memory and flash space are there, and quite restrictive.

Re: WP-34s Functionality Poll

*Message #39 Posted by **George Bailey (Bedford Falls)** on 4 Apr 2011, 2:43 a.m.,*
in response to message #38 by Andrés C. Rodríguez (Argentina)

I suppose, the welcome message is intended for people who **find** (not steel) the lost calculator, not to remind the owner of his own phone number. In this case I suggest to just stick a printed label on the back. At least this is what I do with items I'm likely to lose because it doesn't depend on a working battery. And thieves won't be held back by either.

I don't see why Easter date calculation should take up memory. Don't you guys have a calendar? ;)

I also would not rule out business functions for the reason of it being a scientific calculator. These would open a large market. Business people would not mind the scientific functions and scientific users could use them from time to time as an added bonus.

We're taking a perfectly good HP-30b and replacing its business functionality with scientific. Why would any business person want to do this? Any business functionality we add will pale in comparison to the original and the 30b has basic scientific support for those that require it.

in response to message #1 by Paul Dale

Can you implement relational tests that compare the X and Y stack registers and SKIP TWO STEPS steps if the relation is false? I suggest the syntax to include TWO question marks, such as:

X=Y?? will skip two steps if X and Y are unequal.

X=Y? The current version that skips the next step if X and Y are unequal

I have come across many cases where I need to execute two steps if a relation is true. The suggested syntax will save using labels.

Example:

```
X#Y??
```

```
1
-
STO 0
...
```

As opposed to

```
X=Y?
GTO 1
1
-
LBL 1
STO 0
...
```

Yes, skipping two steps after a test would be nice. Or three steps, or four... ;-)

There are occacions where a "real", structured programming language has its advantages. But I don't think we will see much of this in the more assembler-like approach in an RPN calculator.

BTW - the problem you mentioned can be solved easily:

```
X#Y?              STO 01
DEC X     or      X#Y?
STO 01            DEC 01    ; leaves X unchanged
```

Yes, I like these INC and DEC commands. I already liked them 30 years ago on the TI58/59 with their OP 20..29 and OP 30...39. *g,d&r* ;-)

Me too. They are a surprisingly recent addition and I'm finding I'm using them quite a bit already.

As for the initial question, negate the condition and use SKIP is the best solution.

I'm sorely tempted to expose some of the internal commands more freely:

- **SKIP nn** - Skip ahead nn steps.
- **BACK nn** - Skip back nn steps.
- **RTN+1** - Return from subroutine with a skip.

The first two are pretty useful to save labels and code space at the cost of uneditability. The third one is great for making your own conditional tests.

1) How about some extra statistics, if these aren't in already.

Covariance, standard error of the X and Y mean.

2) Of the ones already written, I'd like to see the Bessel functions and the double factorial.

But those are getting VERY picky on my part. :-)

If not too late, you can add this:

casio calculators (I have f9860g slim) has a mode where it is scientific but uses & accepts the greek alphabets to denote the 10^x part. for example. in electrical engineering, you can do 5V / 5k and you get the result in mA (5 / 5k = 1m).

I find it very useful especially in the lab, calculating stuff. I dont think hp calculators have that.

thanks, erturk

Not that k and m look really Greek to me ;-) I understand what you want: kind of a special ENG mode with at least a part of the full line

```
 a   f   p   n   µ   m     k   M   G   T   P
-18 -15 -12 -9  -6  -3  0  3   6   9  12  15
```

I don't think any further prefixes became popular yet. So beyond P and below a the normal ENG mode would rule.

With the LCD given, however, and only 7 segments in the numeric section, displaying M in the exponent may look a bit strange, and I don't have any solution for m nor for differentiating P and p :-(So, sorry, I'd suggest a paper strip attached above of the display d:-)

'c' is quite popular :-) It doesn't fit ENG mode.

At one stage, I did suggest some SI prefix constants/commands to do the multiply by the appropriate power of ten. It didn't make the cut.

Sharing my habitat with these units, I can tell you cm is the only really popular. And for beverages, you see cl on the jars. And that's it. But people understanding cm and cl understand mm and ml as well, so no need for an exception here. And those not understanding don't care either way.

Not for the WP-34S, but we may consider that, after P (peta) comes E (Exa). Certainly it would not fit, and an "E" may even be confusing with the "exponent" abbreviation for scientific notation. Oh , and now we have the "IT" prefixes like Ki (2^10), Mi (2^20) and so on. At least we don't have binary subunits!!

Re: WP-34s Functionality Poll

*Message #60 Posted by **Andrew H.** on 7 Apr 2011, 12:05 a.m.,*
in response to message #1 by Paul Dale

Paul,

My suggestion is the 'two-sided' inverse chi-square cumulative distribution function (to calculate confidence intervals for the variance and standard deviation).

Take example 1 on p. 18-34 of the HP 50g User's Guide (which is wrong).

'Determine the 95% confidence interval for the population variance σ² based on the results from a sample of size n = 25 that indicates that the sample variance is $s^2 = 12.5$.'

The calculator would return two values, a = 12.79 and b = 40.38 (NOT a = 12.40 and b = 39.36 as given in the User's Guide), such that the integral from a to b of f(x), the chi-square probability density function, is 0.95 and that of x.f(x) is 24 (the number of degrees of freedom). The second criterion produces an 'unbiased' confidence interval that matches the unbiased estimator s^2. An equivalent criterion is that the integral from a to b of f(x) with an additional two degrees of freedom (i.e. 26) is also 0.95.

The confidence interval is then (7.43, 23.45).

Andrew

PS The work you have done is just outstanding.

Re: WP-34s Functionality Poll

*Message #62 Posted by **Walter B** on 7 Apr 2011, 12:03 p.m.,*
in response to message #61 by Walter B

Andrew,

please apologize the long response time, but your question helped us unveiling a bug. Now here we go:

> Quote:
>
> 'Determine the 95% confidence interval for the population variance σ² based on the results from a sample of size n = 25 that indicates that the sample variance is $s^2 = 12.5$.'

Pedestrian's approach: 24 degrees of freedom, lower Chi^2 for 2.5% probability, upper Chi^2 for 97.5%.

Start WP 34S in FIX 2 mode (you can't do the following yet due to a bug in chi^2INV, but soon you will):

```
24 STO J
.025 chi^2INV  ;returns 12.40 (access this function via PROB ^ XEQ)
/
12.5
x              ;returns 7.62 as lower limit
RCL L
RCL J
x
.975 chi^2INV  ;returns 39.36
/              ;returns 24.19 as upper limit
```

d8-)

IMHO the values given in the 50G manual are correct. Anyway, you suggest a function taking inputs of variance, probability, and degrees of freedom, and returning the limits of the confidence interval. For sake of equal opportunities, we shall then have similar functions for standard deviations and mean values. And other people may prefer single-sided limits. Eventually we'd have a whole bunch of special commands, where IMHO the look up time would exceed the time saved compared with keying in the formula directly. It's really easy as shown above. I'd prefer having a small routine for this task when I need such results frequently, assigned to one of the hotkeys. YMMV.

Walter

Re: WP-34s Functionality Poll

*Message #63 Posted by **Andrew H.** on 7 Apr 2011, 7:20 p.m.,*
in response to message #62 by Walter B

Walter,

Your response time is an order of magnitude better than mine. In helping you find a bug, at least I've made a small contibution to your work.

I'm not sure whether you are referring to the arithmetic or to the methodology in the HP 50g User's Guide. The arithmetic, as you have shown, is correct; the methodology is not.

An edge case will demonstrate why.

Let's change the example to calculate a 0% confidence interval, which must be [12.5, 12.5] because the confidence interval must contain the point estimator. According to the methodology of the User's Guide, the confidence interval would be [12.4998, 12.4998], which cannot be correct (although it is a very good approximation). The error arises from basing the confidence interval on the median instead of on the mean.

This only becomes relevant when calculating two-sided confidence intervals for asymmetric distributions, which excludes the normal and Student's t-distribution, leaving the chi-square and F-distributions, and I'm not sure there is any requirement to calculate two-sided confidence intervals for the F-distribution. Consequently, this would only need to be implemented for the chi-square distribution.

The function would take two inputs, the number of degrees of freedom (e.g. 24) and the size of the confidence interval (e.g. 0.95), and return two outputs, the lower and upper boundaries of the confidence interval (e.g. 12.79 and 40.38), which is different from combining the results for the

lower and upper tails (e.g. 12.40 and 39.36) as you have done.

Andrew

Re: WP-34s Functionality Poll

*Message #64 Posted by **Walter B** on 8 Apr 2011, 5:38 a.m.,*

IMHO the function needs the point estimator, too, so three inputs. Anyway, please explain how you get 12.79 and 40.38.

Walter

Re: WP-34s Functionality Poll

*Message #65 Posted by **Andrew H.** on 8 Apr 2011, 8:29 p.m.,*
in response to message #64 by Walter B

Walter,

Thanks for your patience.

Let me run you through the steps. I used Excel to calculate the values, so I'll use Excel functions in what follows.

1. We're seeking a 95% two-sided confidence interval, which implies that CHIDIST(a, 24) – CHIDIST(b, 24) = 0.95, where a and b are the values from which we'll calculate the upper and lower bounds of the confidence interval respectively.

2. There are an infinite number of pairs of values (a, b) that meet this criterion, so we need a further criterion by which to choose the best one. We do this by noting that S^2 is an unbiased estimator, i.e. $E(S^2) = \text{sigma}^2$, because the mean of the chi-square distribution is equal to the number of its degrees of freedom (24 in this case). Consequently, we choose the best interval to be the one that is unbiased. The unbiased interval will be the one such that the integral from a to b of x.f(x).dx, where f(x) is the chi-square probability density function, is equal to the number of degrees of freedom of f(x). This is equivalent to the additional criterion that CHIDIST(a, 24 + 2) – CHIDIST(b, 24 + 2) = 0.95 (i.e. the number of degrees of freedom increases by 2).

As an aside, S^2 is the maximum-likelihood estimator of sigma^2, and the unbiased interval is also the interval of maximum likelihood.

3. Iteration using Excel yields a = 12.79 and b = 40.38.

4. Checking against our criteria yields:

CHIDIST(12.79, 24) – CHIDIST(40.38, 24) = 0.9695 – 0.0195 = 0.9500; and

CHIDIST(12.79, 26) – CHIDIST(40.38, 26) = 0.9858 – 0.0358 = 0.9500.

Note that calculating a and b does not depend on s^2, so a function to determine a and b would not require s^2 (12.5) as an input.

5. We can now calculate the upper and lower bounds of the confidence interval:

Upper bound = 24 * 12.5 / 12.79 = 23.45; and

Lower bound = 24 * 12.5 / 40.38 = 7.43.

Note that this step is the same as in the HP 50g User's Guide, except that the values are different.

Andrew, can you provide a reference or link to this method that describes why it does what it does? It isn't obvious to me why adding two to the degrees of freedom results in centrality of the confidence interval you suggest or how it ties into the sample standard deviation. It isn't something I remember encountering during my degree in statistics years ago (not that that means much these days).

Re: WP-34s Functionality Poll

*Message #67 Posted by **Andrew H.** on 10 Apr 2011, 7:42 p.m.,*
in response to message #66 by Paul Dale

Paul,

I don't have a reference. I tried googling for one, but only papers in academic journals seem relevant, and they'e all behind paywalls. I'd have to do a proper literature search, but I'm not a student or faculty member. Maybe someone on the forum could help.

As for why adding two degrees of freedom results in an unbiased confidence interval, it's just a matter of integrating by parts. I'd be happy to write out the derivation (in LaTeX or by hand) and forward it to you, although it would have to wait until the end of the week.

Re: WP-34s Functionality Poll

*Message #69 Posted by **Dieter** on 7 Apr 2011, 3:49 p.m.,*
in response to message #1 by Paul Dale

After all these suggestions concerning new functions to add (and existing ones that should be improved) I would like to hear if the community also thinks that certain functions are obsolete and can be removed. This might also free up some RAM (or keys) that might be used for other, more useful things.

Okay, I'll start the list:

- The // function IMHO is too special and is of only very limited use - if it is really required it takes only a few key presses or a very short routine in program memory.
- After my first look at the %+ and %- functions I wondered what kind of image the programmers might have of "those business guys" that might use these functions. #-) Let's face it: noone (yes: noone) needs a function that does nothing but [%] [+], saving one single key. The %MU function (buried deep down in the X.FCN menu, and therefore obviously not intended for everyday use) is obsolete as well since the delta-% function can do the same job.

  If a percent function *really* makes sense it should be implemented similar to the %+MG function: 100 [ENTER] 20 [function] should not return 80, but 16,67. Pressing [-] then gives 83,33. That's a useful function e.g. for calculating prices with and without VAT, returning both tax and net price. Currently this can also be accomplished by keying 100 [ENTER] -20 [%+MG] if (!) this useful function was directly accessible on the keyboard (e.g. instead of the useless %+ and %- functions). It also should leave the y-register unchanged (no stack drop), just like the standard %-function.

- Once again, I would like to mention that I really would prefer an "A" key instead of the current Sigma+. Does anyone really use this function so extensively that a primary key is required? In my humble opinion f Sigma+ and g Sigma- are fine, while on the other hand I really miss an "A"-key.

What could be implemeted instead of these functions? A few suggestions:

- I could not find a function that calculates the population standard deviation (only the sample SD). It it really missing?
- A cube and cube root function, or more generally an XROOT function would be nice. Not just because it's more convenient to use but also because the numeric precision is better. And finally that's what a calculator is all about, isn't it ?-)
- We had this discussion about useful display formats. I think there were some good points that deserve to be realized on the 34s.

Dieter

I'd certainly be ok with that. More useful, I would think! :-)

And, Walter... do you have a word document of the 34s owners manual rather than the PDF? If so, can I have it? I'd like to start thinking of making some introductory material for it.

Re: WP-34s Functionality Poll

*Message #73 Posted by **Walter B** on 9 Apr 2011, 2:54 p.m.,*
in response to message #72 by gene wright

Gene,

Thanks for your kind offer. How about you setting up what you want to include, and then sending me a little .doc-file? Will be easier this way IMHO - though I've many years experience in repairing confused MS WORD formatting, it's not sufficient yet to make me like this job ;-) No personal offence intended, of course - I've simply seen enough. TIA

Walter

Re: WP-34s Functionality Poll

*Message #74 Posted by **gene wright** on 9 Apr 2011, 3:06 p.m.,*
in response to message #73 by Walter B

My feeling now is that the existing manual assumes way too much on the previous knowledge of the user. I mean, I have been using HP scientifics and programming for a long time and it is tough for ME to read...much less someone with less experience.

I think it needs some introductory material surrounding it.

My thought was to take the existing word document and start modifying it to add such material.

Sending you a word document probably would not work, since I would be taking a completely different approach to trying to explain things than has been done so far. I would work to create a complementary document, not a replacement for the existing one or the one you guys create/update.

Example: The bottom of the first page of explanation is already talking about the -> function and how it operates. Imagine the HP 67 owners manual talking about P<>S or MERGE on the first page.

I think it assumes a lot. Room for making it more "idiot friendly" ... and I'm an expert on

being an idiot.

My 2 cents and worth less than that.

Re: WP-34s Functionality Poll

*Message #75 Posted by **Walter B** on 9 Apr 2011, 5:32 p.m.,*
in response to message #74 by gene wright

Gene, all,

Thanks for your advise. I never thought of this little file becoming a stand-alone manual. It was designed to be an addition to the manuals of the 'parent calculators', mainly the HP-42S and HP-16C. This intention was always clearly stated in the header of the Index of Operations. This statement is still there, but due to a lot of text preceding this index now it went to page 24 in my copy. Presumably I shall pull it to the front again :-)

I acknowledged your point about -> and changed the basic example, taking the key 5 now instead.

Wherever you find similar stuff feel free to point it out. That was our intention in publishing the emulator and its manual: take your chance and stand up - yes you can change things here, more than elsewhere. We will not follow everything, however, since we've got our own ideas as well and want them becoming reality with our project we pursue for some 28 months so far. But we read carefully - most times ;-)

Walter

Re: WP-34s Functionality Poll

*Message #76 Posted by **Paul Dale** on 10 Apr 2011, 1:31 a.m.,*
in response to message #74 by gene wright

Is there a problem with Gene writing a user's guide? I'd like that I think.

Walter's manual is very impressive but, as mentioned, it really isn't for novice users. It is a complete reference manual and specifications document for the device.

I vote for two manuals. One introductory and novice friendly and the other containing all the exquisite details.

Should this thing make it to the real hardware and be relatively stable by HHC2011

conference time, that would be an excellent place for at least one "workshop"-type session on introducing wp34S to the "masses". If we could round up enough 20bs, maybe they could all be re-flashed prior to the event and handed out to attendees. Of course re-labeling the keys is still a problem to be tackled.

Jake

P.S. - HHC2011 is now firm in San Diego in September....see http://hhuc.us/2011/index.htm for details

34s user's guide

*Message #79 Posted by **gene wright** on 11 Apr 2011, 10:22 a.m.,*
in response to message #76 by Paul Dale

I could certainly write a manual on my own without any direct permission :-) but what I was hoping to do was to not have to start from scratch. There is a great deal of information in the existing technical summary manual thing, but it is quite overwhelming and needs a lot of flushing out and added explanations.

That's why I was hoping to get a word document of the manual...not to edit it and send it back to the developers as a change of the existing technical document, but to create a totally separate user's guide that made fewer assumptions about the reader.

Lacking that, I can try starting from scratch, but the joy factor will be less. :-)

Re: WP-34s Functionality Poll

*Message #81 Posted by **Dieter** on 9 Apr 2011, 1:27 p.m.,*
in response to message #71 by Walter B

Walter, maybe there is an even better idea. ;-) Since %+ and %- are shifted functions of the Plus and Minus-key they are the perfect place for Σ+ and Σ-. This would free up the key in the upper left

corner and allow for a dedicated "A"-key (finally). Even with another useful default function, for instance LN.

The 34s has one row of keys less than the 41-series or the 35s so that actually every single mathematical function (except + - x /) is shifted. So the default key assignments of the top row really make sense. My proposal would allow for another often used function. Yes, and an "A"-key as well. ;-)

Be brave! Use SVN to get the most recent flash image out of SourceFourge!

Where is the latest flash image?

*Message #89 Posted by **gene wright** on 10 Apr 2011, 1:52 p.m.,*
in response to message #88 by Marcus von Cube, Germany

I went to the sourceforge link and the file seemed 10 days old.

What is the link to the most recent files?

Re: WP-34s Functionality Poll

*Message #90 Posted by **svisvanatha** on 10 Apr 2011, 2:09 p.m.,*
in response to message #88 by Marcus von Cube, Germany

I used SVN to get the latest, and there appears to be 2 *.bin files: calc.bin and calc2.bin - which to use?

Re: WP-34s Functionality Poll

*Message #91 Posted by **svisvanatha** on 10 Apr 2011, 2:26 p.m.,*
in response to message #90 by svisvanatha

calc.bin did not flash for me. calc2.bin did flash to the device, but the LCD is entirely lit up, but calculator is not functioning!

Re: WP-34s Functionality Poll (with link!)

*Message #92 Posted by **Marcus von Cube, Germany** on 10 Apr 2011, 2:37 p.m.,*
in response to message #91 by svisvanatha

calc2.bin is outdated, calc.bin is the one to use. Why doesn't it flash?

If the problems persist, I can copy the binary elsewhere.

Here is a direct link to the repository. I've removed the outdated versions. The file to use is calc.bin.

Edited: 10 Apr 2011, 2:46 p.m.

Re: WP-34s Functionality Poll (with link!)

*Message #93 Posted by **svisvanatha** on 10 Apr 2011, 5:29 p.m.,*
in response to message #92 by Marcus von Cube, Germany

Sweet! I wasn't patient enough! It did flash with calc.bin. I am pressed for time at this moment, but will do a video of it in action!

Thank you to Pauli, Walter and Marcus - amazing!

Maybe you have told us already, but I don't remember: What do you want to do with an "A"-key?

Walter

Re: WP-34s Functionality Poll

*Message #95 Posted by **gene wright** on 8 Apr 2011, 5:49 p.m.,*
in response to message #94 by Walter B

My guess is that it just looks odd and feels odd to some of us to have a Binary Coded Decimal key layout (BCD ha), but to have Sigma+ taking the spot where the A key would be.

Is the location of Sigma+ at that top corner that sacrosanct or important to make B, C, and D be the default user defined keys? Could it be moved over to the D location and BCD become ABC?

Eh... I'll just be tickled to have firmware to load and play with. Great job guys.

Re: WP-34s Functionality Poll

*Message #96 Posted by **Marcus von Cube, Germany** on 9 Apr 2011, 11:52 a.m.,*
in response to message #95 by gene wright

I'm trying hard to get past the most basic power saving options which are essential if you don't want to replace two 2032s on a daily basis. I was a bit busy today with other things. So you'll probably have to wait some more days. Days, not weeks! :)

I propose to delegate the sigma+/- functions to where the percentages are now. This gets us an A key and another secondary function.

Regarding H.MS+/-, I'm thinking of a different approach: It would be nice if numbers where flagged to be H.MS or real. H.MS values are converted to reals on the fly before processing. This renders + and - to H.MS arithmetic keys.

Re: WP-34s Functionality Poll

*Message #99 Posted by **Dieter** on 9 Apr 2011, 3:42 p.m.,*
in response to message #98 by Walter B

I felt another explanation was not necessary because the "A"-key was already eplained here. ;-)

Yes, the label keys in the top row (now "B", "C" and "D") are fine. But can you imagine a TI58/59, a HP65 or HP67 with a top row labelled Σ+ B C D ? Even my HP-34C has A and B, not B and C. ;-) Another advantage is the additional default function that can be assigned to this key as long as LBL A is not defined. As proposed in my earlier post. This idea (assign the Sigma-functions to h + and h - and use the key in the upper left

corner as an "A"-key, working just as the B, C and D-keys) seems to be so obvious that Marcus and I had exactly the same idea here. :-)

Dieter

Re: WP-34s Functionality Poll

> IMHO it's not really logic but psychologic (i.e. the opposite).

Life is far more than just logic. ;-)

> Quote:
>
> What do you think?

That's better. However I would prefer a more useful function as default for the

A-key. For instance LN.

In my humble opinion the idea that Sigma+ should be on a primary key "because it's important for the statistics guys" in about as correct as "those business guys need a [%+] and [%-] function". ;-)

Maybe we should have another poll here. :-D

Dieter

Re: WP-34s Functionality Poll - Space considerations

*Message #103 Posted by **Marcus von Cube, Germany** on 11 Apr 2011, 2:02 a.m.,*
in response to message #1 by Paul Dale

Hi world ! ;)

We are running out of flash space in the moment. I therefore ask you to think about functions you don't need or you would like to swap against different ones.

It might be necessary to create a common ground wp34s where functions can be added from several groups by changing options during compile. The final release will then include different versions of the flash image. That's some logistic work and I really don't like it. We're working on some more space savings but I see limits to this approach. So be inventive, please!

Reciting digits of pi

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 2 Apr 2011, 1:25 a.m.*

Calvin Trillin's article "DIGITS - TRY TO REMEMBER" on pages 23-24 of the April 4 issue of *The New Yorker* offers some interesting comments the recitation of many digits of pi.

Re: Reciting digits of pi

*Message #2 Posted by **Ed Look** on 2 Apr 2011, 11:16 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I learned this sentence from a little paperbound book I ordered from Scholastic (or some such outfit) Books as a little kid in elementary school:

May I have a large container of coffee?

3___1__4_1___5____9___2___6

I sometimes teach it to some students. Some got a kick out of it, some didn't really care, and I think, unfortunately, few remember it!

Edited: 2 Apr 2011, 11:20 a.m.

Re: Reciting digits of pi

*Message #3 Posted by **Jim Yohe** on 2 Apr 2011, 1:32 p.m.,*
in response to message #2 by Ed Look

Why would some of them care about memorizing a mnemonic when it's so easy to press a key on a calculator and come up with 8-12 digits of Pi in an instant? Yet the subject of "Piphilology" is very interesting and fun. I like, "See, I have a rhyme assisting my feeble brain, its tasks oft-times resisting".

Did you bring the subject up to your students on Pi Day (March 14th)? Have them check out how far they've memorized Pi by testing them here if they'd prefer something interactive: http://www.cow-pi.com/eng

Re: Reciting digits of pi

*Message #4 Posted by **Jim Yohe** on 2 Apr 2011, 2:12 p.m.,*
in response to message #2 by Ed Look

Challenge your students (especially if you're a math teacher) to an instant "A" if they can beat either the current world record holder Chao Lu (http://pi-world-ranking-list.com/lists/memo/) for memorizing 67,890 digits of Pi or the unrecognized (by Guinness that is) of Akira Haraguchi (http://en.wikipedia.org/wiki/Akira_Haraguchi) at a 100,000 digits.

Re: Reciting digits of pi

*Message #5 Posted by **Crawl** on 2 Apr 2011, 11:19 p.m.,*
in response to message #4 by Jim Yohe

A mere "A" for getting a world record seems kind of a pathetic reward.

That'd be like an English teacher using Shakespeare to challenge his students: Write 38 plays that are likely to be remembered as some of the greatest ever even 400 years from now, and you can get an A in the course!

Or maybe a business teacher offering an A to the person in the class who becomes the world's richest person.

I think even memorizing enough digits to get a 100% score on this game is worth a reward. Maybe an automatic 3 full letter grade boost. Though if the person was likely to get an A anyway (which would probably be the case for anyone willing to make the effort) they'd need an extra reward on top. Maybe a calculator?

Re: Reciting digits of pi

*Message #6 Posted by **Paul Dale** on 2 Apr 2011, 11:22 p.m.,*
in response to message #5 by Crawl

It isn't pathetic if it is the only way to achieve an A :-)

- Pauli

Re: Reciting digits of pi

*Message #7 Posted by **Jim Yohe** on 3 Apr 2011, 2:02 a.m.,*
in response to message #6 by Paul Dale

I remember my last high school electronics teacher telling me that the only way I could get an "A" in his class was to get my ham radio license so ... I studied for it in the classroom storage area so I could do it in relative quiet. Got my "A".

Wasn't quite the achievement as memorizing nth digits of Pi would have been ...

Re: Reciting digits of pi

*Message #8 Posted by **Jim Yohe** on 3 Apr 2011, 1:55 a.m.,*
in response to message #5 by Crawl

I agree that receiving an "A" would be a pathetic reward for such an achievement. If one could memorize that many of "anything", Pi or otherwise, they probably could go on achieve whatever they set their mind to.

Re: Reciting digits of pi

*Message #9 Posted by **Ed Look** on 4 Apr 2011, 2:32 p.m.,*
in response to message #4 by Jim Yohe

No Jim, I'm not a math teacher; but I'm a chemist and these are college courses. I suspect (hope??) a couple of them could teach ME some math. I've heard some folks kid around about Mole Day (June 23), but I never remember.

I actually use that little pi mnemonic sometimes to chide them for their over-reliance on things electronical, even my beloved calculators. They (well, mainly freshmen and sophomores) report digits, as those of pi, as if they were a totalitarian secret police intended to spy on numerals, because that's what the stoolie calculator told them. No thought is given to the reality of the situation as far as the precision of the input figures, so how much less is given to the results!

In most science, even the classroom, how many significant digits are generally used? Certainly, it isn't nine or twelve. So, often I tell them when the ask, "It's 3.14; that's good enough for us!" Sometimes, it's even 3.1415!

(And let's not even worry about the error of the result, or even how many digits ought to be reported in that value itself!) What was that word used once, innumeracy?

Re: Reciting digits of pi

*Message #10 Posted by **Gerson W. Barbosa** on 2 Apr 2011, 3:32 p.m.,*
in response to message #2 by Ed Look

Pi up to 12 digits is not much of a problem: 3.14159265359, from memory. Now, just in case I forget about 32, I've made this little reminder :-)

163/ln(163)+1/((744+1/(19*pi^6*(744/12+1/33)+1/(744(Sqrt(2)-1))))^2(sqrt(3)-3/10+1/(3^4*(744+1/(19*pi^6*(744/12+1/33)+1/(744 (sqrt(2)-1)))))))

Now seriously, I prefer this one:

```
How I want a drink, alcoholic of course, after the heavy lectures involving quantum
mechanics!
 3. 1   4  1   5       9       2    6      5     3   5      8         9        7
9
```

Not to be taught to young students though.

Regards,

Gerson.

Re: Reciting digits of pi

*Message #13 Posted by **Palmer O. Hanson, Jr.** on 3 Apr 2011, 9:33 p.m.,*
in response to message #10 by Gerson W. Barbosa

How I want a drink, alcoholic of course, after the heavy lectures involving quantum mechanics!

The article in *The New Yorker* offered nearly the same mnemonic, but with "chapters" replacing "lectures".

The article also stated that this form of poetry (?) is known as a piem. I don't find that word in any of my dictionaries.

Back in the 1980's My friend George Thomson (now deceased) sent a mnemonic for remembering the first thirty digits of pi which had appeared on page 309 of the April 1969 issue of *Datamation*;

Now I, even I, would celebrate in rhymes inept, The great immortal Syracusan, rivaled nevermore, Who in his wondrous lore passed on before, Left men his guidance how to circles mensurate.

> The article also stated that this form of poetry (?) is known as a piem. I don't find that word in any of my dictionaries.

That's a wordplay with poem. In the mathworld link elsewhere in this thread there's a mnemonic by M. Keith based on Edgar Allan Poe's "The Raven". Here is a link to the full *piem* or ***Poe***m:

http://www.cadaeic.net/naraven.htm

> Quote:
>
> Now I, even I, would celebrate in rhymes inept, The great immortal Syracusan, rivaled nevermore, Who in his wondrous lore passed on before, Left men his guidance how to circles mensurate.

That's also a very nice one. I first read about it in this old thread.

Once I mentioned a series that would converge quickly to pi, but only for the first few digits. I couldn't help bragging then: "Hey, I have a nifty algorithm to better solve the first decimals!" :-)

Re: Reciting digits of pi

*Message #15 Posted by **Ed Look** on 4 Apr 2011, 2:37 p.m.,*
in response to message #10 by Gerson W. Barbosa

Unfortunate, Gerson!

Most taking quantum mechanics as a class are still kids! But who needs pi to anything more than three to five digits in quantum??! Not even in stat mech (thermo)!...

... maybe such precision could be needed in calibrating a thermocouple or some reference volume... or maybe not!

Invisible message passing

*Message #1 Posted by **Jim Yohe** on 1 Apr 2011, 6:30 p.m.*

In MoHPC's information about the HP-48S/SX's infrared output a statement says, "HP limited the range of 2-way communication at the request of teachers who were nervous about invisible message passing". Now-a-days, of course, you can't stop students from passing messages short of taking their cell phones away from them ... which I think would be a great idea. ;-)

Re: Invisible message passing

*Message #2 Posted by **Don Shepherd** on 1 Apr 2011, 10:51 p.m.,*
in response to message #1 by Jim Yohe

> Quote:
>
> Now-a-days, of course, you can't stop students from passing messages short of taking their cell phones away from them ... which I think would be a great idea. ;-)

While most schools don't actually ban cell phones, they do prohibit their presence during classes. Students can keep their phone in their pocket (or purse), but if a teacher sees the student in class with a phone, it then belongs to the principal.

The school at which I teach (a private boarding school) prohibits cell phones and all electronic devices. Public schools probably couldn't get away with that.

Re: Invisible message passing

*Message #3 Posted by **David Hayden** on 2 Apr 2011, 10:23 a.m.,*
in response to message #1 by Jim Yohe

My daughter said that in 7th and 8th grade, she and her friends could send text messages without even taking the phone out of their pocket. They learned to do it entirely by feel. So the only hard part was sneaking a peek at the phone to read the messages.

Re: Invisible message passing

*Message #4 Posted by **Don Shepherd** on 2 Apr 2011, 10:41 a.m.,*
in response to message #3 by David Hayden

Perhaps that skill may one day lead to everyone having a tiny wireless transmitter/receiver implanted in the body, and the brain is able to send and receive messages and thoughts from other brains.

Cleaning up the collection

*Message #1 Posted by **Michael de Estrada** on 1 Apr 2011, 10:09 a.m.*

I think it's inevitable that collectors such as myself end up with too many redundant instances of a particular calculator model and too many broken / non-functioning calculators. For example I had 10 HP-45s and over a dozen broken calcs. The time had come to perform collection triage and decide which calcs to sell / junk and which to retain / repair. I ended up disposing of a dozen calcs, including 4 HP-45s, and successfully repairing 2 of them. I now have only 4 broken calcs and only one that is possibly repairable, the remainder being spare parts. Although there is certainly room for further improvement, I feel much better with the current state of my collection.

A more useful standard display format

*Message #1 Posted by **Dieter** on 1 Apr 2011, 9:24 a.m.*

First time users of classic HP calculators may be slighty puzzled when the display shows 0,00 or 0,0000 as the device is turned on. I even remember the question why *"such an expensive calculator"* would only give a three-digit result, while a cheap 5-Euro-Casio... ;-)

Both the first HP (-35) and newer models (last 20 years) offer a display format ALL or STD where the whole singificant mantissa is shown. So 1/8 is displayed as 0,125 and 1/3 as 3,33333333333E-1. The WP34s project even uses this format as its default display mode.

However, for everyday use there's a major drawback in this implementation. Even moderately small values like 0,5153... or 0,03543... are displayed in scientific notation, which means that the user's eye has to move all the way across the display to its right end, read the exponent there and translate it back into a meaningful result. As far as I am concerned, I do *not* want to see "2,04135445874E-2" if a calculated price simply is "2 cents", or "3,35283587165E-1" if the result is 33,5% or even just "roughly one third". It's even worse on the HP-35s with its 14-digit-display hiding the complete exponent. The user has to scroll the display manually before he is able to see whether the result is 0,33 or 0,03 or something even less.

A simple FIX 2 or FIX 4 is not an option here since in this case the major advantages of the ALL format are lost: if the result is an integer, the display shows an integer (3 instead of 3,00 which could also stand for 2,99835 or 3,00208). Generally, useless trailing zeroes are omitted while on the other hand all significant digits are visible.

Okay, what's my point now? I would like to suggest a useful standard display format similar to what I remember from earlier non-HP calculators: Moderately small results should *not* be displayed in scientific notation, even if this means the last two mantissa digits are not visible. The advantage is a much more intuitive and "natural" display format that allows the user to capture the result faster, easier and without any "exponent translation error". My suggestion is: All numbers with absolute value >= 0,01 or 0,001 should be displayed like 0,012345... resp. 0,0012345... and only values *below* this limit should be displayed in scientific notation. Like this:

```
  current display           improved display
-------------------------------------------
 3,12354882604E-2            0,03123548826
 6,66666666667E-1            0,66666666667
-1,41421356237E-3           -0,00141421356
 3,14159265359E-6            3,14159265359E-6
```

For obvious reasons this cannot be implemented in current HP calculators. But it can be done on the WP34s. :-)

Dieter

Re: A more useful standard display format

*Message #2 Posted by **Timo** on 1 Apr 2011, 9:56 a.m.,*
in response to message #1 by Dieter

Hi Dieter,

a very interesting thought! Personally as an engineer, I'd prefer you 0,001 limit, since the "Mili"-Something

units (what a terminus for an engineer... :o) are found more frequently when doeing engineering calculations.

Personally, I almost exclusively work with the FIX4 or FIX6 setting since these modes display the digits I'm usually most interested in. However, I'd really like to see your proposal implemented, at least for beta testing purposes.

Re: A more useful standard display format

*Message #3 Posted by **Martin Pinckney** on 1 Apr 2011, 11:01 a.m.,*
in response to message #2 by Timo

I almost always use FIX format because the nature of my work seldom requires displaying very large or small numbers, and FIX is easier to read. I change the number of decimal digits displayed depending on the needs of the project at hand. Most often I use FIX 2 or 3; occasionally 4.

Re: A more useful standard display format

*Message #4 Posted by **Garth Wilson** on 1 Apr 2011, 2:19 p.m.,*
in response to message #2 by Timo

My 41 is rarely in a mode other than ENG 3. The exponent in ENG quickly translates to "giga," "mega," "kilo," units, "milli," "micro," "nano," etc. which we use all the time in engineering. SCI is a small waste of time in figuring it out. On a couple of programs on the 71, I have it replace those exponents with the letters representing the above before printing, like "kHz" (instead of "___E3 Hz"), "µA" (instead of "___E-6 Amp"), etc., or just removing "E0". So what I would prefer, if the current situation were a problem at all, would be a mode that puts the exponent into letters, which take less display room than the E numbers with possible minus signs.

As for the size of the decimal point, the 71 uses a square of four dots instead of a single dot. It is very visible without looking like a huge pot hole.

Re: A more useful standard display format

*Message #5 Posted by **Walter B** on 1 Apr 2011, 6:43 p.m.,*
in response to message #4 by Garth Wilson

ENG 3 is a very useful mode, I fullheartedly agree. With the mantissa right adjusted, you get all the important information within a small area. It would be nice to get E0 suppressed, but it's only this - nice, not really necessary IMHO.

In most real life calculations (except in finance, of course), 4 significant figures are sufficiently precise - if they are significant at all ;-)

Re: A more useful standard display format

A bit of an over generalisation here I suspect. My day job requires 7+ digits all the time. Look up ECEF coordinates. To get centimeter accuracy, 9 digits are required. Likewise, for a field that is

10km long, 4 digits just aren't close to sufficient.

- Pauli

Re: A more useful standard display format

> I want a FIX mode that over-/under-flows to ENG instead of SCI. It was possible to do that on the HP-41 with synthetic programming, but it should be a standard mode.

The wp34s now has this ability :-)

For FIX *and* ALL modes when gaining an exponent.

- Pauli

Edit: added the commands effected.

in response to message #1 by Dieter

And that's why some classic "EOS" Casios are great. Fx-5000f did exactly like that, it switched to scientific mode when results were too small, otherwise it remained in standard notation up to the third decimal digit (maybe fourth, mine is not here to check). More recent ones (e.g fx-6300G, fx-5500LA -I'd like to try fx-4000P and fx-4500PA, don't like newer ones too much- switch to scientific just when there's no mantissa to show, pain in the neck...) Throw in the nice ENG button and I'd get one.

Re: A more useful standard display format

*Message #12 Posted by **designnut** on 1 Apr 2011, 10:56 a.m.,*
in response to message #11 by Manolo Sobrino

I think displays might use a more prominent symbol for the decimal point. It tends to be obscured by the numbers. I suggest a ddouble height symbol in place of a single dot. I get a little lost when we have a long string after the decimal with no thousands delineators. couldn't some symbol be used as a marker to aid this display.

Re: A more useful standard display format

*Message #13 Posted by **Marcus von Cube, Germany** on 1 Apr 2011, 12:12 p.m.,*
in response to message #12 by designnut

We Europeans don't have the visibility problems you mention. :)

The format mentioned by Dieter is used by many Casio calculators. It's called NORM 1 and switches to scientific notation for 0.001 but shows 0.01 as is.

Re: A more useful standard display format

*Message #14 Posted by **Manolo Sobrino** on 1 Apr 2011, 12:28 p.m.,*
in response to message #13 by Marcus von Cube, Germany

You're absolutely right about Casio, I hadn't even noticed (what a shame), thank you. By selecting NORM mode once you enter into NORM 1 mode: 10^-2(0.01)>|x|, by selecting NORM mode twice you enter into NORM 2 mode: 10^-9(0.000000001)>|x|. Apparently FX-1000F/5000F,6500G,7500G just have a single NORM mode that cancels FIX or SCI modes and works like NORM 1.

Re: A more useful standard display format

*Message #15 Posted by **Dieter** on 2 Apr 2011, 12:13 p.m.,*
in response to message #14 by Manolo Sobrino

Of course a HP or even WP calculator has to top this, so we will have to introduce a general NORM n mode, switching to scientific notation not before the value is less than 1E-n. So NORM 3 would display 0,0123 and 0,00123 while smaller values are shown as 1,23E-4 or 1,23E-16. ;-)

*Message #16 Posted by **Nigel J Dowrick** on 1 Apr 2011, 5:07 p.m.,*
in response to message #1 by Dieter

I too find the "fixed decimal" format annoying; I also feel that ALL modes or their equivalent give me too much information. When would I ever want 10 significant figures? (I'm a physics teacher, not an accountant.) Scientific or Engineering mode is good for limiting significant figures, but I don't like to see powers of 10 for numbers that aren't too big or too small.

When I wrote my own calculator program (a RPN calculator for the Casio FX-9860G series) I hard-wired in a limit of 6 significant figures. Numbers are displayed without trailing zeroes after the decimal point; standard form is used if a number is greater than 1e9 or smaller than 1e-4.

So 2.4 is 2.4 (not 2.40000); pi is 3.14159; pi times 1e8 is 314159000; pi times 1e-4 is 0.000314159. (Sixteen significant figures are stored internally.)

I really like this system, but I suppose it's a personal thing. I've never missed the undisplayed significant figures. Does anyone else feel that six is enough? (except when dealing with sums of money greater than £10000, of course! Not often a problem for me.)

Nigel (UK)

Another useful display format

*Message #17 Posted by **Dieter** on 2 Apr 2011, 11:54 a.m.,*
in response to message #16 by Nigel J Dowrick

> Quote:
>
> I too find the "fixed decimal" format annoying; I also feel that ALL modes or their equivalent give me too much information. When would I ever want 10 significant figures?

I think this is a good point. Especially since I was about to propose the following additional display format. ;-)

There is something I always missed on other calculators - a display format showing a certain number of *significant* digits. Yes, this can be done in SCI mode: SCI n simply shows n+1 significant digits. But, you guessed it, in scientific notation. My preferred format would look like this:

```
display format: SIG 6

value          display
-----------------------
Pi             3,14159
e^Pi           23,1407
10^Pi          1385,46
10^(Pi^2)      19333,7
e^-Pi          0,0432139
10^-Pi         7,21784E-4   or   0,000721784
3^25           8,47289E+11  or   847289000000
```

Yes, it's roughly the same as SCI 5 RND ALL. In other words: all values are shown the way they were displayed on a (in this case) 6-digit calculator. So finally SIG 12 is the same as ALL. What do you think about this?

Dieter

Re: Another useful display format

*Message #19 Posted by **Ken Shaw** on 4 Apr 2011, 2:58 p.m.,*
in response to message #17 by Dieter

Agreed. I have the same issues with the difficulty of displaying significant figures in Excel.

On HP calculators, I typically go with FIX 4, which gives a reasonable balance between digits to the left and right of the radix. It's not ideal, though.

Re: A more useful standard display format

*Message #20 Posted by **David Hayden** on 2 Apr 2011, 10:35 a.m.,*
in response to message #1 by Dieter

For a calculator that can display any character in any position of the display, Dieter's proposal not only makes sense but it can be done with no loss of information when the cutoff is 0.01. For example, .00123 requires exactly the same number of characters to display in either format:

```
1.23E-3
0.00123
```

adding more significant digits adds the same number of characters to either display format.

HP-75 EPROM programmer

*Message #1 Posted by **Jeff Davis** on 31 Mar 2011, 9:30 p.m.*

Just noticed a device that looks like an HP-75 EPROM programmer on tas. look at auction 300542525954 . I have two EPROMs for sale if someone buys it!

Re: HP-75 EPROM programmer

*Message #2 Posted by **Paul Berger (Canada)** on 31 Mar 2011, 9:57 p.m.,*
in response to message #1 by Jeff Davis

Darn seller says he will not ship to Canada, and is not available to answer questions. I am looking for just this kind of thing for a 75.

Re: HP-75 EPROM programmer

*Message #3 Posted by **Jim Yohe** on 31 Mar 2011, 10:02 p.m.,*
in response to message #2 by Paul Berger (Canada)

Sounds like something two enterprising individuals on MoHPC might engage in to bypass (so to speak) the TAS's seller's objection to sending goods to our friends to the North.

Re: HP-75 EPROM programmer

*Message #4 Posted by **Paul Berger (Canada)** on 31 Mar 2011, 10:24 p.m.,*
in response to message #3 by Jim Yohe

If it comes to that I would certainly appreciate assistance getting this item. I will keep on trying to contact the seller.

If I where to get it would be happy to reverse engineer it and share a schematic with anyone who was interested. The EPROMs on it look like 2532s which are a non-standard pinout 4K eprom made by TI among others.

*Message #6 Posted by **John Robinson** on 1 Apr 2011, 2:30 a.m.,*
in response to message #2 by Paul Berger (Canada)

Paul,

I recognize the seller handle, I have bought from him before. His name is Bruce Larribee, and I found him to be an extremely helpful guy. From what I know about Bruce, the lack of shipping to Canada is probably just an oversight, as he had the same limitation on shipping to Australia at one point, but he was more than happy to ship here. Bruce is an ebay newbie, so it's probably just a matter of someone in the US or Australia contacting Bruce and asking him to modify the auction etc.

Let me know if you want me to contact him on your behalf.

Cheers, John

Re: HP-75 EPROM programmer

*Message #7 Posted by **Paul Berger (Canada)** on 1 Apr 2011, 6:30 a.m.,*
in response to message #6 by John Robinson

Thanks I think its probably an oversight too. I tried to bid but I got a message saying that seller restriction prevent me from bidding.

If you would contact the seller on my behalf, I would certainly appreciate it.

Re: HP-75 EPROM programmer

*Message #8 Posted by **Eric Smith** on 1 Apr 2011, 1:49 a.m.,*
in response to message #1 by Jeff Davis

There does not appear to be any circuitry to either generate or switch a programming voltage. I suspect that it is a module emulator. HP did their firmware development on various "big" computers, and used commercially available EPROM programmers, so they would have been unlikely to develop their own EPROM programmer specifically for the HP-75.

Based on the number of EPROMs and sockets, it looks like probably emulates the mainframe ROMs in addition to plug-in ROMs. If so, and unless that mainframe ROM emulation can be disabled, it won't be useful with a normal HP-75.

Relatively late in the HP-75 product life, HP introduced the 82713A Plugin Module Simulator, which would be far more useful to a user or developer than this device which was intended for internal HP use.

Re: HP-75 EPROM programmer

*Message #9 Posted by **Paul Berger (Canada)** on 1 Apr 2011, 7:02 a.m.,*
in response to message #8 by Eric Smith

I also noted that there does not seem to be any facility to program EPROMs onboard, but that is not an issue for me have have enough EPROM programmers, evn some that can handle old obsolete type like 2532.

It occurred to me too that they may have been a code development jig for the 75, 10 regular sockets would be 40K and the 4 ZIFs would be another 16K.

Yes I have heard of the 82713A but they seem to be in very short supply, and you may be right that this item may not be of a lot of use, but I think at the very least it would be interesting.

Re: HP-75 EPROM programmer

*Message #10 Posted by **Jim Horn** on 1 Apr 2011, 12:05 p.m.,*
in response to message #9 by Paul Berger (Canada)

If you can't find a HP-75 Eprom emulator, you may be able to make one fairly easily using the tech manual for it. It should be available either from the Museum or from Jake Schwartz. I believe I sent him my manual set many years ago for inclusion in CD-ROMs (including the '41s dedicated printer and various others).

Using a modern CPLD or FPGA the entire emulator could probably be built inside a '75 module or even into the '75 itself, including more flash memory than the entire '75 software universe could fill.

Jim (with many fond memories of my '75, long gone)

*Message #11 Posted by **Jim Horn** on 1 Apr 2011, 12:01 p.m.,*
in response to message #1 by Jeff Davis

I suspect this was the development board that sat outside the prototype HP-75 back when they were still writing the code for it. I had a proto-75 for a while in the early 1980s for use in evaluating the still-being-defined HP-IL in the spectrum analyzers and modular measurement systems (HP70000 series) being designed in their instrumentation group.

One item that made that fun was that I received the proto-75 the same weekend I drove up to Corvallis for a big PPC (HHC) conference there. Needless to say, I had to make sure the trunk of my Scirocco was kept closed when other HP user friends were around lest they see the much-rumored but not-yet-announced 75...

Current design tools - with high quality simulation, TCP/IP, and flash memory in real devices - sure are better than what we had back then!!

No, I don't have that '75 - it went back to Corvallis once HP-IL was defined (and I bought my own '75).

Worthy successor of the HP 41C secretly revealed!

*Message #1 Posted by **Joerg Woerner** on 31 Mar 2011, 8:12 a.m.*

Hello calculator aficionados,

While doing some research on the TI-Nsprire CX prototypes (they are actually loaners from Texas Instruments), I asked the folks in Texas if they could surrender me a Casio Prizm.

I guess it doesn't imply industrial espionage, but these guys actually know, what is going on! And best of all, my NDA with Texas Instruments is limited (I'm not a lawyer but I have some common sense) to TI products only!

Well, Hewlett Packard fans, in the meantime I received an incredible Hewlett Packard calculator. No, it is NOT another graphing calculator, to me it is the best and most exciting development in the past 30 years! I really appreciate that marketing people at Hewlett Packard's calculator division focus on their roots again, I liked already in 2007 the idea to reintroduce kind of a retro HP 35S and notice all the hopes for a HP 43S or similar on this forum.

What I just disassembled is to me the successor of the HP 41C, the machine that killed "our" TI-88 (yes, I'm more into Texas Instruments' calculators).

What I like about the "HP 41 CQ":

Landscape orientation! Since the HP-10C series and the TI-66 the standard for a perfect scientific calculator.

Color! It is color – but not a backlit display, good for the battery lifetime. The viewing angle is an astonishing 180 degrees. LCD, not OLED!

Alphanumeric mode! Once again a calculator with a segment-based alphanumeric display. Works multi-lingual, I tested so far English and German.

Built quality! Ten screws, rigid frame, metal face plate. This is how you do calculators! Even in China…

Innovation! This is to calculators what Swatch was for wristband watches. They manufacture it upside down. It was never that interesting to dismantle a calculator.

Features! Obviously former HP CEO Mark Hurd was involved. "Just add a feature that nobody expects from a calculator". This one is unique – find it out on my brief review!

Ladies and Gentlemen, please allow me to show you the incredible **"HP 41CQ"!**! *(No numeric name tag on the calculator)*

Have a wonderful day.

Regards, Joerg

in response to message #2 by Gerson W. Barbosa

Right !

That will be helpful ! A true 3D display, with or without dedicated glasses, fully graphic oriented calculator. Not a calculator able of pseudo 3D representation in flat 2D screen anymore.

This will help a lot in the spatial representations from chemistry, biochemistry, geometry, design, mechanical conception and engineering and signal processing.

The HP-41C was released in 1979. Pre-release versions of the TI-88 became available in mid-1982. So, it doesn't seem likely that it was the HP-41C which killed the TI-88. My recollection is that the TI-88 was developed as a competitor for the HP-41C. We were told that the TI-88 was abandoned when TI made the big push with the 99/4 in late 1982 and early 1983. Later, I heard that it was the keyboard of the TI-88 which was the problem.

OT but neverthess interesting: A 12 year old takles Einstein's theories

*Message #1 Posted by **Marcus von Cube, Germany** on 31 Mar 2011, 2:23 a.m.*

Here is the article on times.com: http://newsfeed.time.com/2011/03/26/12-year-old-genius-expands-einsteins-theory-of-relativity/

Re: OT but neverthess interesting: A 12 year old takles Einstein's theories

*Message #2 Posted by **Maarten Ambaum (Reading, UK)** on 31 Mar 2011, 5:03 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Fun to see a young boy enjoying his calculus - and being good at it. The video has on the Time site has of course nothing to do with Einstein's theories. He just explains partial integration - something that any student of calculus would do very early on in their course!

The little snippet where he talks about his take on relativity is too vague and doesn't sound particularly profound or interesting.

Ah well, it makes for a good story to fill some pages.

Re: OT but neverthess interesting: A 12 year old takles Einstein's theories

AA NiCad battery cells are now 1100 mAh rated

*Message #1 Posted by **Michael de Estrada** on 30 Mar 2011, 7:48 p.m.*

I stopped by my local Batteries Plus store today to pick up another supply of AA flat top NiCad battery cells for battery pack rebuilds and noticed that they were marked "1100" instead of the customary "1000". I asked the clerk about this and he confirmed that AA NiCads are now available in an 1100 mAh rating, up 10% from the previous 1000 mAh rating. I can remember not so long ago when they were only rated at 700 mAh, and about 450 mAh in the 1970s when the LED HP models were made. It also seems that the self-discharge rate is lower, so they hold their charge longer when placed in storage. I realize that NiCads don't compare with NiMH cells for mAh rating, but I prefer to use them because the original charging systems were designed for them.

Re: AA NiCad battery cells are now 1100 mAh rated

*Message #2 Posted by **Eric Smith** on 31 Mar 2011, 1:42 a.m.,*
in response to message #1 by Michael de Estrada

As far as I can see, the only issue with using NiMH cells in place of NiCd in HP calculators is that it will take longer to charge them. HP's charging circuit is little more than a current limiting resistor, so there doesn't appear to be any potential for mischief that wasn't already present with the NiCD cells.

I prefer to charge cells outside the calculator anyhow.

I now use the "low self discharge" NiMH cells. They have lower capacity (2000 mAh, vs. 2500 mAh for the normal NiMH AA cells). The latest Sanyo eneloop AAs take three years to drop to 75% of their original charge, and are rated for 1500 cycles.

As with alkalines, lithium, and NiCd cells, cheap off-brand NiMH usually have far less actual capacity than claimed on the label and package.

Re: AA NiCad battery cells are now 1100 mAh rated

*Message #3 Posted by **robert rozee** on 31 Mar 2011, 5:35 a.m.,*
in response to message #2 by Eric Smith

you are quite right that in HP calculators a set of Ni-Mh batteries will be a pretty much ok substitute.

the only caveat (in some other applications), is that when charged using any sort of 'smart' charger circuitry that is not designed with Ni-Mh cells in mind, it is likely the charging circuitry will not recognize the 'end of charge' conditions, which are far most subtle with Ni-Mh's than with Nicads.

as a general rule, as long as you don't charge at higher than 1/10th of the rated capacity (1/20th would be preferable), and don't leave the calculator sitting on charge for way TOO long, then all will be well. in other words, a 2000mAh Ni-Mh cell will be perfectly happy being charged at 150mA or so for a not too long time interval (no more than a day perhaps).

btw, Nicads do still have some advantages over Ni-Mh cells in certain quite specific applications. A Nicad can deliver a MUCH higher instantaneous current than a Ni-Mh cell without causing itself internal injury,

making Nicads a good choice in applications like battery drills. The environmental concerns of cadmium in the environment, of course, are a whole different matter!

rob :-)

*Message #6 Posted by **designnut** on 31 Mar 2011, 5:32 p.m.,*
in response to message #5 by Michael de Estrada

NiCad cells also have a memory of usage. One engineer bought an HP65 on a project budget and proudly wore it on his belt, and never used it. He came to me in tears, his battery would only last 5 minutes. I asked him what the instructions said to do, "run it flat and recharge it". My 65 batteries gained strength in use and would last 3 hours. Ordinary Nimh cells have a high self discharge rate, I use Sanyo eneloop with a LaCrosse smart charger. I used to have 2 chargers nearly full time just to replenish the self discharge, now I use one charger seldom. Sam

in response to message #5 by Michael de Estrada

Where has gone the frugality of engineering? 2000 mAH are 2 Ah !

Re: AA NiCad battery cells are now 1100 mAh rated

*Message #8 Posted by **Dieter** on 31 Mar 2011, 6:58 p.m.,*
in response to message #7 by Walter B

Walter! I'm deeply disappointed! I would have expected this from anyone else, but not *you!* 2000 mAH of course is 2000 Milliampere-Henry! What kind of unit is *that*?!

BTW - sure, 2000 mAh = 2 Ah, but would you also recommend to label all 2000 Microfarad capacitors as "2 Millifarad" ?-)

Dieter

Ooops, that quick and dirty post of mine was dirtier than I thought :O

Re: AA NiCad battery cells are now 1100 mAh rated

*Message #10 Posted by **robert rozee** on 31 Mar 2011, 7:14 p.m.,*
in response to message #7 by Walter B

"mAh" is the far more commonly understood unit by the 'general public' these days. for much the same reason LED brightness is often quoted in mcd's (millicandellas): "Brightness at centre of beam measured as 12000 lux at 40cm, or 1,920,000 mcd".

personally, i'd be happier using the 'correct' units, but the 1/1000th unit has crept into folk culture and taken front seat.

Re: AA NiCad battery cells are now 1100 mAh rated

*Message #11 Posted by **Michael de Estrada** on 31 Mar 2011, 8:07 p.m.,*
in response to message #10 by robert rozee

The problem is that if you start using Ah instead of mAh, then you have to use decimal values in most cases, such as 1.1mAh or 1.2mAh. It's always been easier for me to grasp whole integer values.

Re: AA NiCad battery cells are now 1100 mAh rated

*Message #12 Posted by **Randy** on 1 Apr 2011, 1:17 p.m.,*
in response to message #5 by Michael de Estrada

Yes. Here are some bargain cells with tabs if you want to build your own packs: 1200 mah nicd with tabs

Calculator Historical literature unearthed... . ....

*Message #1 Posted by **Thomas Chrapkiewicz** on 30 Mar 2011, 11:08 a.m.*

I am looking for recommendation(s) for any/all 'Calculator Museum' type websites that these recently 'unearthed' documents should be sent. Many may not be of interest in the Hpmuseum website.

TomC

In a recent 'deep dive' into my calculator archives (Which started around 1972), I've come across a number of items which I do not believe have been archived yet.

- Texas Instruments SR-60 sales literature (1976, 8 pages) (An early printing desktop scientific)

- Olympic Sales Company 'Wholesale Price List', 1976, 82 pages

- 'MITS' Creative Electronics Catalog (Scientific, desktop calculators), 1974, 10 pages

- MITS various calculator data sheets (7400, 1200,1440, DC6, DC4, ICT1800) 197?

- Compucalc Model 6500 (a HP65 printer attachment), 1977 1 page

- HP97S I/O Calculator Color Sales brochure, 1977 6 pages

- Casios 'Super Calculators' (fx58,fx68, fx120, etc...), 4 pages

- National Semiconductor Calculator and support Integrated Circuits datasheets (MM5471S VF display and Sci Calc, MM5780 educational calculator, MM5784 8digit, 5function calculator with accumulating memory, MM5767 slide rule calculator, MM5758 Scientific Calculator, MM5760 Slide Rule calculator, MM5762 financial calculator, MM5763 statistical calculator, MM5764 conversion calculator) Calculator Kits guide - 2page brochure Handheld Calculator battery systems App Note 149.

Calculator key mechanics - Which design is more durable?

*Message #1 Posted by **Timo** on 30 Mar 2011, 3:50 a.m.*

Hi forum members,

only yesterday I took out two of my non HP-calculators, namely a Sharp EL-512 and an EL-512H. The first one was used by my father almost daily in office for as long as I can think, the latter was given to me by my father when I entered the Gymnasium (High School). Both saw really extensive use over many many years and still work like a charm especially the keyboards.

I never opened one of my Sharp calcs, but considering the almost total absence of tactile feel for their keys I'd presume, that there is almost no mechanics involved in the keyboard design. Does anyone know how the Sharp mechanics compares to that of the HP keyboard?

Furthermore, that made me wonder which key mechanics design philosophy is the more durable one? The Sharp design with almost now tactile feel but (presumably) very limited and simple key machanics, or the well known HP design?

All my HP calcs still feel pretty new, but I can recall a number of TAS auctions that stated sticky keys or keys that lost their typical "klick".

What is your experience/opinion about this?

Regards, Timo

Re: Calculator key mechanics - Which design is more durable?

*Message #2 Posted by **Eric Smith** on 30 Mar 2011, 3:52 a.m.,*
in response to message #1 by Timo

Compared to **which** HP keyboard? HP has gone through many designs over the years.

Re: Calculator key mechanics - Which design is more durable?

*Message #3 Posted by **Timo** on 30 Mar 2011, 4:36 a.m.,*
in response to message #2 by Eric Smith

Well, the keyboards I thought about are the ones I have experienced first hand, i.e. HP-41, HP-42S, HP-48GX, HP-15C.

Re: Calculator key mechanics - Which design is more durable?

*Message #4 Posted by **Walter B** on 30 Mar 2011, 9:03 a.m.,*
in response to message #3 by Timo

As Eric mentioned, there were and are quite different keyboard technologies used in HP's calculators under the keyboard. Mechanics was very simple (and I guess it still is): the individual keys are held up

by the force of a mechanical spring. This spring also produces the "snap" or tactile feedback. The very first in the Classics were gold-plated sheets of metal since apparently no domes were available ... I leave the details for others who have opened more calcs than me.

Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #1 Posted by **gene wright** on 29 Mar 2011, 11:17 p.m.*

I remember these catalogs from around 1975-1977 that had wonderful line drawings of calculators. In particular, I remember line drawings of the big M55 and S61 Commodore calculators.

Does **anyone** still have a copy of this catalog who could scan it to PDF?

I've been looking for some time for this piece of my past. :-)

Re: Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #2 Posted by **Mark Harman** on 30 Mar 2011, 1:38 a.m.,*
in response to message #1 by gene wright

Gene,

Wow, this brings back some interesting memories from my childhood in the 1980s! I remember getting Boy's Life magazine and seeing the Olympic Sales Club ads that often flanked the back cover. I remember the ads vividly with "Captain O" and telling kids to call the toll free number and "ask for Ruth." Several times, my older brothers and I requested the catalogs and information only to never sell the stuff... :^D

We didn't think it was worth the effort for the prizes or cash. It was more profitable and easier for us to deliver newspapers, where we had steady customers, cash flow, and better opportunities to win prizes. Heck, we all won wads of savings bonds. :)

My oldest brother was involved in Cub Scouts and Boy Scouts in the late 1970's. He likely had some of those catalogs, but I am sure they are long gone as he never sold any of their merchandise. I think actually selling the stuff would be required to form enough of an emotional connection to it to hold on to those catalogs. In other words, I wish you luck.

Anyhow, no copies - but plenty of thanks for bringing back some good (and retrospectively humorous) memories.

Thanks,

Mark

Re: Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #3 Posted by **Thomas Chrapkiewicz** on 30 Mar 2011, 10:25 a.m.,*
in response to message #2 by Mark Harman

Hi Gene:

Got one here!

1976-1977 Olympic Sales Company Catalog. Page 51 has the line drawings you referenced; drop me an email. I had purchased my HP65 from Olympic Sales in 1975ish; their price was discounted by $100.00.

TomC

ps: Found much other 'ancient' (MITS, NSC IC data sheets) lit in my archives which I'll report back on later.

*Message #4 Posted by **Mark Harman** on 30 Mar 2011, 11:16 p.m.,*
in response to message #3 by Thomas Chrapkiewicz

Uhm... Okay, I'm feeling silly now. Are we not talking about the Olympic Sales Club here? Or are we talking about an electronics distributor in the 70's that has nothing to do with what I am thinking of? In any case, the one I was thinking about did offer calculators as prizes that could be earned for selling boxes of Christmas cards and other things.

Mark

Re: Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #5 Posted by **Gene Wright** on 31 Mar 2011, 7:45 a.m.,*
in response to message #4 by Mark Harman

I think it is the Company not the club, but someone had told me they were one and the same, which apparently they are not.

Electronics yes, prizes no. :-)

Re: Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #6 Posted by **Joerg Woerner** on 30 Mar 2011, 10:42 a.m.,*
in response to message #1 by gene wright

I have at least a 16-page Commodore brochure covering the S61, N60 and M55 calculators.

in response to message #7 by Gene Wright

Gene:

You've got mail!

Regards, TomC

Re: Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #9 Posted by **Gene Wright** on 30 Mar 2011, 4:42 p.m.,*
in response to message #8 by Thomas Chrapkiewicz

Thanks Thomas.

I'd love to see most of the catalog... primarily of course the pages dealing with calculators.

I forget what other stuff might have been in there. Been a long time.

Re: Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #10 Posted by **Joerg Woerner** on 30 Mar 2011, 2:19 p.m.,*
in response to message #7 by Gene Wright

Commander Wright:

16 pages equals about 1 hour to scan, photoshop and PDF it. Consider it done by 10:0p PM Eastern Time.

Regards, Joerg

PS: Gene, this will be an exciting evening! I requested a few days ago from Texas Instruments a Casio Prizm to compare it with my TI-Nspire CX's prototypes. Fedex tracking shows the box delivered since a few minutes and according to TI does it include a "surprise with the Hewlett Packard logo"!!! Can't wait to leave the Office today ;-))

Re: Olympic Sales Club - catalog with calculators? Anyone have a copy to scan?

*Message #11 Posted by **Gene Wright** on 30 Mar 2011, 2:40 p.m.,*
in response to message #10 by Joerg Woerner

Hilarious.

TI is buying Casio's to send to you? I need to get on that list. :-)

And, wonder what HP sku TI would be sending you? A 50g perhaps?

A good night, indeed!

and thanks for the scans. I have all three of those Commodores and they are among my favorite.

I distinctly remember having that Olympic Sales catalog with me nearly every day in the 8th grade and would often look at the line drawings of the M55 wondering what each of those wild functions meant.

Re: Commodore Specialized Calculators Leaflet online

*Message #12 Posted by **Joerg Woerner** on 30 Mar 2011, 7:06 p.m.,*
in response to message #7 by Gene Wright

Gene,

The '76 catalogue is online!

Just visit Datamath Calculator Museum and click on the left navigation frame "DOWNLOADS" and "SALES LEAFLETS". You now have to follow the QUICK-LINK to non-TI calculators. You'll find a full-color PDF copy with about 4.3 MByte - original scan was provided by fellow collector Bob Patton!

Regards, Joerg

Re: Commodore Specialized Calculators Leaflet online

*Message #13 Posted by **Gene Wright** on 30 Mar 2011, 10:00 p.m.,*
in response to message #12 by Joerg Woerner

Thanks! That looks great!

Oddity ... Re: Commodore Specialized Calculators Leaflet online

*Message #14 Posted by **Gene Wright** on 31 Mar 2011, 9:20 a.m.,*
in response to message #13 by Gene Wright

Interesting tidbit.

Look at the first page. Shows the calculators covered in the brochure from a side angle.

however, one of them on the front cover is different than the detailed pictures in the brochure itself.

Spot which one? and I wonder why?

Re: Oddity ... Re: Commodore Specialized Calculators Leaflet online

*Message #15 Posted by **Marcus von Cube, Germany** on 31 Mar 2011, 11:50 a.m.,*
in response to message #14 by Gene Wright

The M-55 looks darker in the single shot than on the first page. I guess it's a matter of illumination, not a real difference.

Re: Oddity ... Re: Commodore Specialized Calculators Leaflet online

*Message #16 Posted by **Gene Wright** on 31 Mar 2011, 1:23 p.m.,*
in response to message #15 by Marcus von Cube, Germany

Nope, there is a difference... big difference... between one model on the front page and the detailed pic of the same model later in the brochure.

Re: Oddity ... Re: Commodore Specialized Calculators Leaflet online

*Message #17 Posted by **Gene Wright** on 31 Mar 2011, 1:56 p.m.,*
in response to message #16 by Gene Wright

I'll go ahead and tell what I think the difference is...

The front cover shows the calculator with color keys that is probably the 4190, but the internal detail is the non-color key 9190.

If you look, the non-M55, S61, N60, PR100 calculator has color on the keys, but inside the brochure, the calculator with color on the keys is all non-color.

Just a quirk. Eh.

Interesting Avionics HP-67 on TAS

*Message #1 Posted by **Michael de Estrada** on 29 Mar 2011, 9:36 p.m.*

Browsing TAS I saw this interesting Avionics HP-67. IIRC, something like this was for sale previously, but it wasn't clear what it actually was or how it worked. Perhaps someone here will recognize it.

Re: Interesting Avionics HP-67 on TAS

*Message #2 Posted by **Mike Morrow** on 30 Mar 2011, 2:16 a.m.,*
in response to message #1 by Michael de Estrada

Very interesting! I've owned an HP-67 since 1977, yet this application is one I've never seen, nor heard mentioned.

Re: Interesting Avionics HP-67 on TAS

*Message #3 Posted by **Juergen Keller** on 30 Mar 2011, 9:37 a.m.,*
in response to message #1 by Michael de Estrada

You also find the Control Unit itself on TAS. The device is also pictured on a brochure in the HP-67 auction, unfortunately, the HP-67 covers most of it. The third device involved seems to be the monitor. But I don't know what this is all about ...

Re: Interesting Avionics HP-67 on TAS

*Message #4 Posted by **Katie Wasserman** on 30 Mar 2011, 10:36 a.m.,*
in response to message #3 by Juergen Keller

This has come up before. See discussions here and a followup here.

(and some more posts too I think)

Re: Interesting Avionics HP-67 on TAS

*Message #5 Posted by **BobVA** on 31 Mar 2011, 8:58 p.m.,*
in response to message #1 by Michael de Estrada

I found a couple of references to the BX2000 avionics system. Apparently the calculator was used as both a storage device for loading way points and could also be used as a keyboard for numerical entry. One reference noted that the "controller/programmer" was a TI SR-52; not sure if that's a mistake or if they used both calculators at some point.

Bob

Weird 28S keyboard on Anniversary model

*Message #1 Posted by **Keith Midson** on 29 Mar 2011, 3:53 a.m.*

I bought a 100th Anniversary edition of the 28S a few years ago - mint physical condition but the bottom row of keys on the alpha keyboard didn't work. So I just bought another from TAS thinking that this one would be fine (laws of probability would surely work in my favour ...), but it's got EXACTLY the same problem!!
Now I have about 7 other 28S's as well as 3 x 28C's and a few 18C's and 19B's in my collection and have never come across this before. Has anyone else had this issue? Was there a batch quality control issue with the limited edition version? Very strange. Keith.

Re: Weird 28S keyboard on Anniversary model

*Message #2 Posted by **Martin Pinckney** on 29 Mar 2011, 9:22 a.m.,*
in response to message #1 by Keith Midson

```
I think I ported this from some place (old calculator program perhaps), but here is what I
have.

Days between dates:
1.  Enter date in mm.ddyyyy format, XEQ X001
2.  Store result in A
3.  Enter second date, XEQ X001
4.  Subtract A from the result

Find the date so many days after starting date:
1.  Enter date, XEQ X001
2.  Add the number of days to the result
3.  XEQ X037

General:
X001 - mm.ddyyyy to Julian
X037 - Julian to mm.ddyyyy

HP-42S Repair and Color Match

*Message #1 Posted by **aj04062** on 28 Mar 2011, 7:10 p.m.*

For what it's worth, I have repaired my HP-42S Original Thread:

Original Thread

A very steady hand and several re-dos with the silver trace repair and I have a fully functional LCD again. I repaired about 6 traces in all. Thanks to all who assisted.

Now to make it "almost new" I was wondering if anyone has tried to touch up damaged brown paint on the faceplates of these calcs. Somehow the previous owner spilled something that damaged a small area.

I suppose I could buy a few model paints and start mixing to try and match, but was wondering if anyone has ever found an off the shelf match.

An Encounter at WAL-MART

*Message #1 Posted by **Namir** on 28 Mar 2011, 10:46 a.m.*

Hi All,

I was shopping at my local WAL-MART this morning. As I passed one of the the main isles, my eyes (OK, I had some serious problems with them recently ... as in being half blind for two months) caught the display of a sizable lot of TI Graphing calculators--their location seemed out of place. I walked towards these "machines" and realized they were TI-84 Plus machines ... when I looked at the price ... it was FIVE DOLLARS!!! My gut reaction (for one who watches TAS calculators on a hourly basis) was to grab as many of these machines as I can ... somehow WAL-MART is GIVING AWAY these little darlings away for JUST FIVE DOLLARS. That's when the other part of my brain, which takes time to evaluate and study the situation, kicked in. I realized that the FIVE dollars were buying my plastic calculator covers .. and not the machines itself!!! Bummer!@&^#%@# When I turned to share with my wife (who used to sell calculators at a local university store until 3 years ago) what I found, there was another woman standing next to her who had the same experience I had!!! We laughed about our hasty conclusions and wished the illusion to be true ... oh how much we would have made on TAS.

Sigh!!!!!!!!!!

Namir

Re: An Encounter at WAL-MART

*Message #2 Posted by **Mike Morrow** on 28 Mar 2011, 12:12 p.m.,*
in response to message #1 by Namir

Sometimes great sales can be found at a local Wal-Mart, where there appears to be great discretion allowed to local management in setting prices for items to be cleared from inventory.

Last year my local Wal-Mart cleared most of their high-end calculators. I got a TI-89 Titanium with Version 4 hardware for $42.50, and a Casio fx-9750GII for $23.50. Both brand new in unopened bubble pack.

The excellent Casio fx-115ES was being sold for months last year at $13.00, before disappearance. But these have just been re-stocked again at my local store, but for the old normal price of $17.48.

(No connection here to Wal-Mart except as a customer.)

Some of you may remember a couple years ago I bought 39 10bii's (discontinued bronze version) for $2 each. I gave some to my wife for prizes for her HS students. Sold the rest on eB** for $16 each, I think. This enabled me to pick up a few Pioneers and maybe a Leatherman or two that I wanted.

Re: An Encounter at WAL-MART

*Message #4 Posted by **Mike Morrow** on 28 Mar 2011, 2:57 p.m.,*
in response to message #3 by Martin Pinckney

At my local W-M last year, I picked up two of those HP 10bii units for $5.50 each. I've no complaints even though that's much higher than your $2 price. :-)

If I have time and I'm in an unfamiliar W-M, I usually try to find the clearance aisle to see if there's anything dirt cheap upon which I normally would not waste money. I think that the TI-89 HW4 unit I got was worth $42.50. But given the availability (but NOT at W-M) of the far superior HP 50G at very reasonable price, I'm not sure that the TI-89 was worth any *more* than what I paid.

*Message #5 Posted by **Namir** on 28 Mar 2011, 5:51 p.m.,*
in response to message #2 by Mike Morrow

Several years ago I found in the same WAL-MART an HP-17BII, which they only sell/sold online. When I asked for its price, they huffed and puffed and ended up giving me the same price of an HP-10B. So I bought the machine!

:-)

*Message #6 Posted by **Paul Gaster** on 29 Mar 2011, 12:28 p.m.,*
in response to message #5 by Namir

The calculator section at my local Walmart is always a mess. Calculators are always in the wrong spot so finding the real price takes some work. It's not customers moving things around either. Sometimes you can tell somebody unloaded a case of calculators, had no room, and just stuck them in any open slots based on how many extra of one type of calculator is there. Actually, many items throughout the store are like this as well. You have to be very careful. It seems like the best value items in each section/isle are constantly out of stock and often workers fill in those areas with other more expensive items. If you don't pay close attention you will end up spending a lot more than you think. I have been meaning to complain, but to be honest I don't think they care, or this is deliberately done to make more money. I really should just start shopping elsewhere.

Re: An Encounter at WAL-MART

*Message #7 Posted by **Martin Pinckney** on 29 Mar 2011, 1:30 p.m.,*
in response to message #6 by Paul Gaster

Quote:

> ... to be honest I don't think they care, or this is deliberately done to make more money.

Or just general incompetence. They buy stuff made in China at virtual slave-labor wages, ship it in huge containers, sell it in mega-stores designed to minimize costs, staffed by the cheapest labor money can buy.

Is it any wonder we long for the days of the $300 HP calculators?

Wait - as a matter of fact, those days are still here, thanks to eB**!

not bashing an ebay seller

*Message #1 Posted by **db (martinez, ca.)** on 28 Mar 2011, 12:09 a.m.*

First; i have nothing to do with posting these auctions nor do i know who is doing them.

There is someone selling 5 non-hp-RPN calculators on ebay right now. He clearly knows what they are but instead of starting the bidding out at $250 he priced each of them at .99 to start and is letting them float. I bid on the Harvard myself and there are 4 rare scientifics there that i already have. I think that everyone needs at least one non-hp RPN.

http://shop.ebay.com/hokie1985/m.html?_trksid=p4340.l2562

*Message #4 Posted by **Michael de Estrada** on 28 Mar 2011, 10:50 a.m.,*
in response to message #1 by db (martinez, ca.)

I saw those listings too. He also has a very nice HP-19c starting at $199.99, which is extremely reasonable for that unit. Too bad the Prinztronic is apparently kaput, since I don't have one.

Meanwhile, I continue to sell off my excess HP RPN calcs, while continuing to acquire more non-HP RPN calcs to the point where the non-HP RPN calcs now represent more than 1/4 of the total of RPN calcs in the collection. I've managed to cut down to the point where the total number of working calculators is an even 100, although some of those have serious functional issues such as bad keyboards, displays etc.

Edited: 28 Mar 2011, 11:18 a.m.

Re: not bashing an ebay seller

*Message #5 Posted by **Michael de Estrada** on 6 Apr 2011, 7:27 p.m.,*
in response to message #4 by Michael de Estrada

Well, now that the auction is over, I can happily announce that I am the proud owner of two more non-HP RPN calcs, my second APF Mark 55 and first Prinztronic Program (same chipset as the Novus 4515 Mathematician PR). The Prinztronic was advertised as not working, but it turned out to be nothing more than a bad ON (power) switch. I simply cut the wires connected to the switch terminals inside the calc and spliced them together, and operate the calc using an AC adapter instead of AA cells. In stark contrast to the tiny mushy keyboard buttons on the Novus, the Prinztronic has nice clicky buttons.

Re: not bashing an ebay seller

Summing Function

*Message #1 Posted by **Jim Yohe** on 27 Mar 2011, 9:08 p.m.*

Is there a similar function to the HP-27S Summing {***sigma***} Function (page 108 of Owner's Manual) but available on the HP-42S or the HP-32SII and in the related owner's manual(s)? I can't seem to find one but I could have overlooked it.

FYI, from HP-27S manual:

{***sigma***}(counter variable : starting value : ending value : step size : algebraic expression)

Definition: Sums values of the algebraic expression for values of the counter variable. The counter variable starts with the starting value and is incremented in steps to a final ending value.

I'd like to try out the following equation in SOLVE on my 42S and 32SII if possible.

Solve for PI' (since PI is already a function):

PI'=(6÷SQRT(3))*{***sigma***}(I:0:LAST:1:(-1)^I÷((2xI+1)x3^I))

It takes a value of 21 in variable LAST to produce 12 digits of accuracy (last digit rounded up) for PI'.

Ref: The history of the approximation of the number PI; 4.1. Gottfried Wilhelm Leibniz (1646-1716); Scholz, Werner; http://cwscholz.net/projects/fba/fba.html

=== Confounded ... how, if even possible, do I embed special characters like the {***sigma***} symbol (Σ) into a forum message? :-/

Re: Summing Function

*Message #2 Posted by **Don Shepherd** on 27 Mar 2011, 9:30 p.m.,*
in response to message #1 by Jim Yohe

There is no sigma command in the 32sii solver, but you could do it in a program.

This gives you the sigma character in a forum post (thanks Thomas Klemm):
[img:http://www.hpmuseum.org/software/symsums.gif]

Re: Summing Function

*Message #3 Posted by **Jim Yohe** on 27 Mar 2011, 9:40 p.m.,*
in response to message #2 by Don Shepherd

Yes, thank you Thomas (and Don). Too bad I didn't know it earlier, but better late than never.

PI'=(6÷SQRT(3))*Σ(I:0:LAST:1:(-1)^I÷((2xI+1)x3^I))

That looks better!

Edited: 27 Mar 2011, 10:52 p.m.

Re: Summing Function

*Message #4 Posted by **Thomas Klemm** on 29 Mar 2011, 2:18 a.m.,*
in response to message #2 by Don Shepherd

You might like to read my article: How to use a formula in a post .

Here's the formula in LaTeX:

```
\frac{\pi}{6}=\frac{1}{\sqrt{3}}\sum_{n=0}^{\infty}\frac{(-1)^n}{(2n+1)3^n}
```

At that's the result:

$$\frac{\pi}{6} = \frac{1}{\sqrt{3}} \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)3^n}$$

> Quote:
>
> you could do it in a program

Re: Summing Function

*Message #5 Posted by **Jim Yohe** on 29 Mar 2011, 3:24 a.m.,*
in response to message #4 by Thomas Klemm

Thomas, that looks even better but it's not the why it looks when the equation is entered into the HP-27S, but thank you non-the-less. I'll have to practice playing around with LaTeX a bit in between my studies. So much to do ... so little time. :-)

Thanks for the HP-42S program, as well.

Re: Summing Function

*Message #6 Posted by **Martin Pinckney** on 29 Mar 2011, 9:10 a.m.,*
in response to message #5 by Jim Yohe

> Quote:
>
> Thomas, that looks even better but it's not the why it looks when the equation is entered into the HP-27S...

$$\frac{\pi}{6} = \frac{1}{\sqrt{3}} \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)3^n}$$

Jim, if you want to see something like the above, you'll need a 48GX ;-)

Re: Summing Function

*Message #7 Posted by **Jim Yohe** on 29 Mar 2011, 1:37 p.m.,*
in response to message #6 by Martin Pinckney

That's nice to know and I will be able to see that for myself when I become the owner of a 48GX soon. :-D

Though my main question was whether the 42s and 32sii had a similar "summing function" as the 27s since I failed find one in either of the owner's manuals. Don directly answered my question for the 32sii and I'd assume the 42s doesn't provide that same function either with Thomas' indirect answer of a programming solution.

Obviously you can do so much more through programming than relying on build in "functions" and I'm content with that. Thank you all.

HP 15C Batteries (Update)

*Message #1 Posted by **BrianDH** on 27 Mar 2011, 8:43 p.m.*

I just wanted to let people know that Equilizer 357 batteries worked fine in my 15C. Got them at Target for about $5, so not too expensive.

Re: HP 15C Batteries (Update)

*Message #2 Posted by **Bill (Smithville, NJ)** on 28 Mar 2011, 4:24 a.m.,*
in response to message #1 by BrianDH

Brian,

I have been using the Energizer 357 batteries for several years now, and they do work great. The nice thing is they come three to a package at a very resonable price. I usually keep a few extra packages of batteries around at work and home so I never run out of battery power.

Bill

Re: HP 15C Batteries (Update)

> One tip to keep new batteries "fresh" is to keep them in the fridge... pun intended ;)

Actually, that's a really bad idea. From Enegizer's website FAQ's:

Q: Is it a good idea to store batteries in a refrigerator or freezer?

No, storage in a refrigerator or freezer is not required or recommended for batteries produced today. Cold temperature storage can in fact harm batteries if condensation results in corroded contacts or label or seal damage due to extreme temperature storage. To maximize performance and shelf life, store batteries at normal room temperatures (68°F to 78°F or 20°C to 25°C) with moderated humidity levels (35 to 65% RH).

And this is another good point, especially for 41's and 48's:

Why is mixing batteries of different chemistries, brands or age a potential problem?

Mixing of battery types (different chemistries, brands and/or fresh vs. used) in a device is not recommended and can significantly increase the potential for leakage and reduced device run time. The primary concern is an imbalance in capacities or available energy between the installed batteries. As the weakest battery becomes exhausted, it will be force discharged by the stronger batteries to very low or negative voltage levels which drastically increases the potential for leakage.

*Message #8 Posted by **Bill (Smithville, NJ)** on 28 Mar 2011, 3:48 p.m.,*
in response to message #4 by Jeff Kearns

Hi Jeff,

No, not a power user, but I have several calcs that all use the same batteries and the batteries were installed at different times. I don't keep track of when they were installed, so it's just a nice feeling knowing I have a few spare sets laying around. The shelf life on uninstalled batteries is pretty long - or at least longer than when they are installed. And at $5 for three, they're cheap enough to keep some spares.

Bill

New HP-45 Emulator for iPad

*Message #1 Posted by **Namir** on 27 Mar 2011, 5:47 p.m.*

I just found a new HP-45 emulator for the HP-45. The emulator uses an image of the HP-45. You can run it as the legacy HP-45 or as a Super-45. The latter mode doubles your memory register, supports complex operations, supports linear regression, solves the roots of quadratic and cubic polynomials, solve a system of 2 linear equations, performs basic financial calculations, and supports some basic basic statistical distribution. The emulator also supports the timer!!!

I was happy to add this emulator to my collection of iPad calculator emulators.

Namir

Re: New HP-45 Emulator for iPad

*Message #2 Posted by **Eddie W. Shore** on 27 Mar 2011, 6:21 p.m.,*
in response to message #1 by Namir

I was looking at this the other day. This is like a "do everything" model sans programming.

Re: New HP-45 Emulator for iPad

*Message #3 Posted by **Namir** on 27 Mar 2011, 6:27 p.m.,*
in response to message #2 by Eddie W. Shore

Indeed!!!

What I like about emulators is that you can always offer an enhanced version mode that adds memory, programming steps, and functions.

I think the developer of that HP-45 emulator is Swiss.

Namir

10 Key Calculators vs RPN

*Message #1 Posted by **Matt_12c** on 26 Mar 2011, 8:04 p.m.*

Hi, I'm new to the HP calculators. I am in a graduate accounting program after having graduated with my BS in the mid '90s. I decided I wanted a business calculator, preferably that acted like a 10 key so I researched what was popular. Imagine my amazement when I found that the HP 12C was still a major player! I remember being a "poor college student" back in the '90s wishing I could get a 12c but settling for a weak Casio, that didn't have business functions and barely handled stats! Not to mention that I went through hard core finance classes with it. I digress but I'm sure someone can relate.

So I get a 12c (a nice Malaysian one). I'm curious - what is the difference between 10 key calculators (ie tape calculators) and RPN? They are obviously related somehow. I initially wanted a tape calculator because of what I always thought was RPN, and its fast ability to enter a column of numbers. The business functions of a 12c would be great but I really wanted a portable calculator that was like a 10 key. Why is it that you can buy a 10 key with tape, but can't buy a calculator that operates like a 10 key but not tape (ie compact and portable)? I'd think it would be easy to put one out. I get the whole seeing the tape thing but that's not crucial.

I thoroughly enjoy using my 12C but I'm curious how they are related, and why there doesn't seem to be any such thing as a 10 key without tape! One other thing - I get using the enter key for HP to either fill the stack or for basic operations, but why would a person not want to just enter 5 + 5 + to get 10 rather than 5 ENTER 5 +.

Hope this makes sense.

Matt

Edited: 26 Mar 2011, 8:05 p.m.

Re: 10 Key Calculators vs RPN

*Message #2 Posted by **Glen Sanft** on 26 Mar 2011, 8:52 p.m.,*
in response to message #1 by Matt_12c

"5 + 5 +" would work just fine so long as the Y register initially contained zero. In practice, it's not necessary to clear anything [on the stack] prior to starting a new calculation with an RPN device, so the safest bet would be "5 ENTER 5 +". The ENTER key is really only necessary to separate two subsequent numeric entries; those which don't require any other operations being performed on the first one. That is to say, if you'd enter "25 square-root 5 +", or "0.2 '1/x' 5 +" it'd not be necessary to use the ENTER key at all.

I can't begin to comment on the other aspect of your topic...

Edited: 26 Mar 2011, 8:53 p.m.

Re: 10 Key Calculators vs RPN

*Message #3 Posted by **Paul Berger (Canada)** on 26 Mar 2011, 10:29 p.m.,*
in response to message #1 by Matt_12c

They are quite similar for functions like adding a column of numbers, in both cases you can add up the numbers by entering the number and press the + key, there are however some differences in operation.

On a 10 key machine if you where not sure that the accumulated total was cleared you would press the total key and it would print what ever the accumulated total was and then clear it. Most modern "10 key" machines also have an electronic display that shows you the number as you enter it and also displays the running total after you press the plus key. You enter positive numbers by pressing the + and negative numbers by pressing - key. As you enter the number it goes into a temporary register and when you press the function key the number is added or subtracted from the accumulated total. When you are finished with a column of figures you would press the total key, and the accumulated total would be printed on the tape and the accumulated total is cleared automatically.

On a HP RPN calculator with a one line display, it is always showing you the contents of the X register which would be similar to the accumulator on the 10 key machine. When you start to enter a number the value in the X register gets pushed up to the Y register and then when you press the plus or minus key the value in X will be added or subtracted from the value in Y and the result will be placed in the X reg, sounds very much like the 10 key so far, so here are the differences. When you start to enter a column of figures to make sure you don't end up inadvertently adding to a value that is already in X, you can either press the "clear X" key that most RPN calculators are equipped with or you can press enter after the first number. Pressing enter forces the number you entered to remain in X without having anything else done to it. I am not aware of any HP RPN calculators that have a total key, but like the 10 key machine after you press the function key the running total is displayed.

If you have a model that has printing capabilities, like the HP-97 that sits beside me at my desk, with the printer in normal mode it prints the numbers as entered, and the LED display shows the number as entered, and the running total after the function key is pressed, just, like the 10 key machine, however to print the total on the tape I need to press the "print X" key, but that does not clear the accumulated total from X, however since my 97 is programmable I could easily program it to emulate a 10 key machine if I desired.

Re: 10 Key Calculators vs RPN

*Message #4 Posted by **Eddie W. Shore** on 26 Mar 2011, 10:45 p.m.,*
in response to message #1 by Matt_12c

<pre> You could simulate some basic 10 Key operations by using the Statistics keys:

f CLEAR SIGMA (SST key) clears the Stat registers or "clears the tape"

number SIGMA+ (similar to the + key on the 10 Key) - the calculator displays the item count

To subtract: number CHS SIGMA+ (do not use SIGMA- because it will erase the last input)

Total: RCL 2 - this is similar to the S* key because you can continue an addition. There is no 10-Key T key so to start a new calculation you have to start over (f CLEAR SIGMA)

Item Count: RCL 1

I think this works on the all of the HP RPN calculators, but storage registers used for statistics very with each model. The registers on this post are specific to the HP 12C. </pre>

in response to message #1 by Matt_12c

A 17bii+ Silver with an 82240A or 82240B IR printer would do what you suggest. While the 17bii++ series is not as fast as the 12C, it is much more capable and memory is more spacious. Together with the utility of printing, that's the best you're going to get with RPN+tape.

HP 25c Apps Review: GO 25 SCI, rpn 25

*Message #1 Posted by **Eddie W. Shore** on 25 Mar 2011, 9:32 p.m.*

```
My HP 25c App Face Off

GO 25 Sci RPN - BigCatOS
Looks like the real calculator
Comes with sample programs
You can send programs by email, disk, in another app, or by printer
Keys has good feel, but takes a little getting used to
Programs are retained when app is closed
Comprehensive help included

rpn-25 - Maciej Bartosiak
You can be fast and the key input is accurate
Keys have larger press area
Programs are lost when app is closed
No online help...yet
Execution of program is "real", you see the the calculator "thinking"
```

Verdict: GO 25 Sci RPN - *****, iPad version shines rpn 25 - **** (I am sure that this app will improve with time) - better form factor for iPod/iPhone

John

Re: HP 25c Apps Review: GO 25 SCI, rpn 25

*Message #13 Posted by **Steve Simpkin** on 29 Mar 2011, 4:41 p.m.,*
in response to message #12 by John B. Smitherman

You question is logical. The HP-42 beats the HP-25 in any practical measurement one can think of. In my case, I bought GO-25 because the HP-25 was my first (you never forget your first!) and still my favorite HP calculator. I used it for many years and know every key (including shifted) by heart. Even though I use a HP-48SX as my daily calc, I still have a soft spot for my HP-25. I suspect others have similar reasons.

Re: HP 25c Apps Review: GO 25 SCI, rpn 25

*Message #14 Posted by **Jerry Raia** on 29 Mar 2011, 10:24 p.m.,*
in response to message #13 by Steve Simpkin

I have to agree, the 25 was my first hp calc as well. Got me started down the RPN road as well as other HP handhelds. To have it on my iPhone (along with the rest of the emulated HPs) is quite nice.

Re: HP 25c Apps Review: GO 25 SCI, rpn 25

*Message #15 Posted by **Andrés C. Rodríguez (Argentina)** on 29 Mar 2011, 5:10 p.m.,*
in response to message #12 by John B. Smitherman

I understand your question, and in fact I use Free42 on my iPod touch as my main calculator. Using an HP25 emulator only serves nostalgic feelings, which I indeed have. The HP25 was a very important tool in my university days, and I have fond memories related to this model, as other persons also seem to. To use such emulators is similar to collecting physical calculators; there are few (if any) logical reasons to justify collecting, or paying over U$S 1K for a HP01, so to speak. But many of us do it, at least in a modest way. Paying for such apps also encourages developers not to abandon their efforts; perhaps they may recover some of their costs and time, but I don't think they will obtain significant profits.

Moldy Oldies

*Message #1 Posted by **Michael Meyer** on 25 Mar 2011, 7:02 p.m.*

Well, a first for me. I bought a cheap HP-11C in a calculator lot for $16, hoping it would look better in person than in the photo. This time, it did not. It does, however, work fine. So, being badly in need of restoration, I took it completely apart. I've seen dirt, blue corrosion, green corrosion, etc., but seeing a calculator full of black mold? That's a first for me. I'm surprised it worked... the mold was everywhere! Time for a major bath, this time also in bleach, a first for me.

Re: Moldy Oldies

*Message #2 Posted by **Don Shepherd** on 25 Mar 2011, 7:34 p.m.,*
in response to message #1 by Michael Meyer

Hey Mike, how about a pic of that. I'd like to see it.

Don

in response to message #1 by Jim Yohe

> Quote:
>
> Did HP entitle their HP-27S as "Technical Manager" then at some point then switch over the "Scientific", or perhaps that title was used for a specific customer base?

Hi,

Here are the words from the 1/4/88 HP press release:

"The HP-27S scientific calculator ($110 U.S. list) is designed for technical professionals in management. It has a wide range of technical and financial functions, including time-value of money, amortization, forecasting, trig functions, statistics and standard math and scientific functions...."

All versions of the machine I've ever seen do say "SCIENTIFIC" on the case, but they certainly intended it for a multi-disciplinary user.

Jake Schwartz

Re: HP-27S "Technical Manager" vs. "Scientific"

*Message #3 Posted by **Didier Lachieze** on 25 Mar 2011, 11:55 a.m.,*
in response to message #1 by Jim Yohe

According to the Original Box, the HP-27s is a "Scientific Calculator for the Technical Manager":

*Message #4 Posted by **Jim Yohe** on 25 Mar 2011, 1:48 p.m.,*
in response to message #3 by Didier Lachieze

And here's the one I'm talking about showing the "Technical Manager" title instead of "Scientific":

Re: HP-27S "Technical Manager" vs. "Scientific"

*Message #5 Posted by **Martin Pinckney** on 25 Mar 2011, 2:33 p.m.,*
in response to message #4 by Jim Yohe

I think you may have a rare variant. Want to sell?

Re: HP-27S "Technical Manager" vs. "Scientific"

*Message #6 Posted by **Randy** on 25 Mar 2011, 2:55 p.m.,*
in response to message #5 by Martin Pinckney

It was pre-production, the name changed when it went into production. I have one as well that I obtained from an HP employee that worked in the calculator group. There is no stamped serial number on the unit, only a hand written number of 1691 in black ink.

Note the top row of keys, that too changed when it went into full production.

Re: HP-27S "Technical Manager" vs. "Scientific"

*Message #7 Posted by **Jim Yohe** on 25 Mar 2011, 3:04 p.m.,*
in response to message #6 by Randy

The top row of keys was actually the thing that I noticed first then the title. I just turned mine over and found no stamped serial number either but instead a 665 hand written on it.

Edited: 25 Mar 2011, 3:11 p.m.

Re: HP-27S "Technical Manager" vs. "Scientific"

*Message #8 Posted by **Jim Yohe** on 3 Apr 2011, 2:11 a.m.,*
in response to message #5 by Martin Pinckney

Congrats to Martin who will within days be the new owner of this "rare variant". Wasn't my intent when posting this question but he made a nice offer.

Re: HP-27S "Technical Manager" vs. "Scientific"

*Message #9 Posted by **Eddie W. Shore** on 25 Mar 2011, 9:35 p.m.,*
in response to message #4 by Jim Yohe

That is a rare beauty.

Re: HP-27S "Technical Manager" vs. "Scientific"

*Message #10 Posted by **Walter B** on 26 Mar 2011, 2:38 a.m.,*
in response to message #4 by Jim Yohe

Great find! Congratulations! :->

How to identify the 'new' HP-12C

*Message #1 Posted by **Jeff Kearns** on 24 Mar 2011, 10:01 p.m.*

I was in a Bureau en Gros (Quebec version of Staples) today and saw a $120 HP-12C in a modern blister pack with the following serial number on the back of the pack: 4CY02805760. I assume this is the serial number of the actual calculator but I cannot decipher its meaning in terms of YYWWC##### as in days of old.

How can one tell whether this is the 'super-fast' 12C that everyone has been talking about of late? There was no indication on the blister pack of battery type that I could see, but I was able to press some of the keys and the unit did seem to respond much more rapidly than the relatively modern one I bought second hand last year - serial # MY84005759. The calculator is simply identified as a 12C - no 12C+. Is it the fast 12C referenced in the following link?

New Blazing Fast HP 12C

Jeff Kearns

Re: How to identify the 'new' HP-12C

*Message #2 Posted by **svisvanatha** on 24 Mar 2011, 10:09 p.m.,*
in response to message #1 by Jeff Kearns

Could you get a look at the battery door through the blister pack? If you can get a look at that side of the unit, the battery door should be pretty wide compared to the 3 cell (old) battery door. I'll have a look at Staples here tomorrow!

I could not determine what the battery door looked like, however to quote Allen, it was, as in the above photo "packaged thusly with the blue book behind the calculator in a black package". Of course the one I saw was in a bilingual blister pack but similar to the one pictured above.

Jeff Kearns P.S. Sorry about the size of the image. I do not know to resize it.

Here's an example of a 12c, 12C platinum, and the FAST 12c (last photo)

You can tell the width of each of the battery doors while in the blister pack.

*Message #5 Posted by **Eric Smith** on 25 Mar 2011, 2:21 a.m.,*
in response to message #3 by Jeff Kearns

You have to look at the top edge of the calculator. Look at the blister-pack from above.

in response to message #1 by Jeff Kearns

Jeff, I was at Staples today here in Toronto, and saw the 12c there. It was the new fast unit. It looks like the picture you posted, and when I looked at the top edge of the calculator, I could see the wide battery door edge.

They also had the new 17BII and the 35S on the shelf as well!

Re: How to identify the 'new' HP-12C

*Message #7 Posted by **Jeff Kearns** on 1 Apr 2011, 2:26 p.m.,*
in response to message #6 by svisvanatha

I finally returned to Bureau en Gros and confirmed the 'new battery door' model and purchased one. Then I decided to return it the next day after examining it and trying it out. As an owner of several 1980's era Voyagers, including a 12C, I am appalled at the Made in China low quality feel and construction of this new 12C calculator and its slip case. There is no printed user's manual, the keys don't have an acceptable feel to them, the case is too small and poorly sewn together, the dimensions are also a little different (more than one mm longer that the originals, although I did not precisely measure it), and the foot pads are too thick. Perhaps a valiant attempt to reproduce the look of a 12C, but it falls short of my expectations of a HP calculator.

I could not justify the $144 price tag for this unit just to have a processor 150 X as fast as the original. I can wait the extra couple of seconds for the types of calculations I need to perform. Verdict: not worth more than $20 IMHO.

Admittedly, I am a little biased: if a similar quality 15C that was 150 times as fast as the original were available at Staples today, I would likely buy one and not return it... Bring back the HP 15C.

Jeff Kearns

*Message #8 Posted by **Gene Wright** on 1 Apr 2011, 3:30 p.m.,*
in response to message #7 by Jeff Kearns

Hey Jeff.

I have to admit I'm surprised.

I know full well the terrible 12c units that came from China in the past. It was always funny to show the color drift of the blue and yellow shift symbols to people at HP and ask "Why is this happening?"

But, I have a couple of 12c+ units and I have never thought they felt cheap or low quality.

A shame we can't compare units and exchange ideas across a table at lunch, huh?

Re: How to identify the 'new' HP-12C

*Message #9 Posted by **Jeff Kearns** on 1 Apr 2011, 4:25 p.m.,*
in response to message #8 by Gene Wright

Gene,

Would very much enjoy a discussion with you at some point. I took a couple of snaphots with my BB camera but can not figure out how to load them into this response... Perhaps I can email them to you?

The one I tried out was definitely different than the one pictured above. The % key as an example was made with a different font (more elongated) that did not match that of the D% font. By contrast, older 12Cs, and the one pictured above have a consistent % font. The foot pads were not '~flush' as in the pads of past models, they were significantly thicker and seemed as though they would fall out sooner than later. The calculator body was also a little larger than older Voyagers. It is as though they were given specs, but did not have a 6Sigma process in place to ensure a consistent look and feel with the original 12C.

I suspect your 12C+ units are of a higher quality batch and I would have to refrain from calling the unit I returned a true Voyager. It is a knock-off.

Regards,

Jeff Kearns

*Message #10 Posted by **Katie Wasserman** on 1 Apr 2011, 5:31 p.m.,*
in response to message #9 by Jeff Kearns

Jeff,

The couple of 12C+ calculators that I have are excellent as well. The key-click is possibly the best of any Voyager I've ever had or used. The plastic used to make the keys feels a little cheap but that's my only nit to pick (and it's a very small nit).

I suspect that the one you had is indeed a knock off one somehow. The dimensions of the 12C+ exactly the match those of the original 12C. While I didn't check with a micrometer, I can't imagine that they differ by more than 1mm.

-Katie

*Message #14 Posted by **James Lee** on 4 Apr 2011, 2:34 a.m.,*
in response to message #13 by Tim Wessman

I recently purchased a similar 12C+ from a Staples store here in Vancouver. The serial # has the same three 4YCxxxxxxxx sequence that Jeff shared at the beginning of this thread. It looks and feels like it`s sturdy enough, well, considering the build quality of many manufactured things these days. The font of some characters definitely does look different, and look just a tad bigger. When depressing the keys, they have a similar

feel and sound to my 17bII+ (not the earlier one with the key issues and not the new silver one). The case is definitely cheap and flimsy for a $99.00 calculator!

However, I was very surprised that these newer ones are still going to market with the older 2008-06-28 firmware (i.e. with the bug that Katie discovered). You'd figure that by 2011 they`d be flashed with the latest speedy firmware containing the bug-fixes. Could these particular ones be manufactured in a different plant somewhere in the HP supply chain.

Anyways, I'm wondering if you might be able point me it direction on getting my 12c+ flashed, as it would be greatly appreciated. ;)

Regards,

Jim

*Message #16 Posted by **Ken Shaw** on 4 Apr 2011, 2:35 p.m.,*
in response to message #12 by Katie Wasserman

I think these must be genuine. They're widespread in the Staples stores around Toronto. I don't like the key font either, it looks "skinny".

Also, the price of these is jaw-dropping. Around $150 for a 12C and $175 for the 17BII+. For those prices, it's hard to understand what is keeping them from including luxurious manuals and leather cases.

Oh wait, maybe it's because they aren't selling any...

That's not all--the capital "R" (RCL, R/S, Rdown) font also looks quite different from my 12C+. I'm not so sure about the italic X (as in y^x, CLX, and X<>Y), but it also looks like the serifs are different.

major number theory discovery, if you can translate

*Message #1 Posted by **Don Shepherd** on 24 Mar 2011, 5:39 p.m.*

I read in the current issue of Scientific American that a fellow at Emory University has discovered a formula for determining the number of "partitions" (P) for n.

For example, the number 5 has 7 partitions:

1. 5
2. 1+1+1+1+1
3. 1+1+1+2
4. 1+1+3
5. 1+2+2
6. 1+4
7. 2+3

I was hoping the formula would be "simple" so that I could readily understand it. Alas. I'm hoping somebody here can translate this to "simple" math.

References here and here.

I especially like their 'amusing proof of the fact that p(1) = 1.'

No need for a calculator on that one! -- Jeff Kearns

Re: major number theory discovery, if you can translate

*Message #5 Posted by **Allen** on 24 Mar 2011, 8:37 p.m.,*
in response to message #1 by Don Shepherd

Really, it sounds like a great solution, but they propose a Theorem them offer a proof, but I fail to see a connection between either the proof, or the example, or the p(n) partitions introduction- in fact the whole thing seems like a joke.

Re: major number theory discovery, if you can translate

*Message #6 Posted by **Dave Shaffer (Arizona)** on 24 Mar 2011, 9:19 p.m.,*
in response to message #1 by Don Shepherd

Is it the "APRIL" issue?!

Re: major number theory discovery, if you can translate

*Message #7 Posted by **Don Shepherd** on 24 Mar 2011, 10:29 p.m.,*
in response to message #6 by Dave Shaffer (Arizona)

Dave, yes it is the April issue of Scientific American, it came in the mail today. I would not think a serious journal like Scientific American would be offering up April fools jokes, at least knowingly (the article in SA does not describe the algorithm, only its discovery).

One might wonder, if the description of the algorithm is so complex that an average person can't figure it out, perhaps it could be a practical joke. I teach middle school math, and this stuff is way way beyond my knowledge level. I posted this here hoping some brilliant person could convert this to "simple math," but I have a feeling that is probably not possible.

Re: major number theory discovery, if you can translate

*Message #8 Posted by **Dave Shaffer (Arizona)** on 24 Mar 2011, 10:34 p.m.,*
in response to message #7 by Don Shepherd

Don,

SA may well be joking - I saw somewhere (here?) just the other day a reference to a Scientific American April Fool's article (from the 70's, I think).

Re: major number theory discovery, if you can translate

*Message #9 Posted by **Katie Wasserman** on 25 Mar 2011, 12:01 a.m.,*
in response to message #8 by Dave Shaffer (Arizona)

I don't think this is a joke. Watch the presentation, read the paper and make up your own mind. I'm not a professional mathematician but this looks to me about as as real as it gets. I have no idea if the proof is mistake free but the theorem seems reasonable and makes sense.

-Katie

p.s. here's the full, serious paper.

It's tradition. Even HP did this once. You know which calculator has been targeted by the HP fools? :-)

Re: major number theory discovery, if you can translate

*Message #12 Posted by **Geir Isene** on 25 Mar 2011, 2:42 a.m.,*
in response to message #1 by Don Shepherd

An HP-41 program would make it all very clear. I would have to decipher the maths to be able to make one, and I believe others on this forum is better equipped to decipher this... any takers?

Re: major number theory discovery, if you can translate

*Message #13 Posted by **Katie Wasserman** on 25 Mar 2011, 12:08 p.m.,*
in response to message #12 by Geir Isene

Although this is a major theoretical breakthrough and gives a non-infinite series for computing p(n), for practical purposes Euler's generating function is much faster for reasonably small values of n. It's quite understandable and is described here.

I think that this would make for a good programming exercise on any calculator with a decent amount of memory. You need to store the values of p(n) in order to avoid an impossible amount of recursion. Of course p(100) is a 9-digit number, and p(200) is a 13-digit number, so unless you've got bignums you're going to be limited anyway.

Here is the algorithm in Java

Edited: 25 Mar 2011, 12:12 p.m.

Re: major number theory discovery, if you can translate

*Message #14 Posted by **Geir Isene** on 25 Mar 2011, 5:25 p.m.,*
in response to message #13 by Katie Wasserman

I wasn't really looking for a program to calculate the partitions - but rather a way to understand the new work... and an HP-41 program would (for me) be the easiest way to get my head around it.

Re: major number theory discovery, if you can translate

*Message #15 Posted by **Oliver Unter Ecker** on 26 Mar 2011, 7:28 a.m.,*
in response to message #13 by Katie Wasserman

Thanks, Don, for the links! I watched Ken Ono's presentation. Fascinating stuff.

Katie, thanks for digging out that code.
I did a quick adaptation to JavaScript.
You're quite right, this method by Euler runs fast for reasonably small numbers. It takes about 3s to compute the number of partitions for 1000. The result is returned as a BigInt.
(It would run at similar speed in RPL, btw, because the time is spent in BigInt functions.)

Anyone with ND0 or ND1 can pick this up by downloading the new "Number Theory" shared folder.

I sure would like to try and implement Ken Ono's method. My understanding needs to catch up with the paper first, though...
I'd love to see an implementation.

Cheers.

Code:

```
function(n) {
    var depent = Math.sqrt(1.0+n);
    var signArray = [];
    var pentArray = [];
    signArray[0]=-1; signArray[1]=1;
    pentArray[0]=0; pentArray[1]=1;
    for (var i=1; i<=depent; i++) {
        signArray[2*i] = -signArray[2*i-2];
        signArray[2*i+1] = -signArray[2*i-1];
        pentArray[2*i] = (i*(3*i+1))/2;
        pentArray[2*i+1] = ((i+1)*(3*i+2))/2;
    }
    var partitionArray = [];
    partitionArray[0] = BigInteger.ONE;
    for (var j=1; j<=n; j++) {
        var partSum = BigInteger.ZERO;
        for (var k=1; pentArray[k]<=j; k++) {
            if (signArray[k]==1)
                partSum = partSum.add(partitionArray[j-pentArray[k]]);
            else
                partSum = partSum.subtract(partitionArray[j-pentArray[k]]);
        }
        partitionArray[j] = partSum;
    }
    return partitionArray[n];
}
```

Oliver,

Can you please add some minimal html code so I can save the source code and html tags to an html file and then run it?

Thanks!

Namir

Re: major number theory discovery, if you can translate

*Message #17 Posted by **Oliver Unter Ecker** on 27 Mar 2011, 2:51 p.m.,*
in response to message #16 by Namir

Hi Namir,

Getting this to work in the browser needs a bit more than some HTML tags. You need a bit of a UI and, crucially, you need a BigInteger library. The given code is JavaScript but it assumes one. (BigInteger math is *not* standard in JavaScript.)

As you seem to have an iOS device, can I ask you to do the much easier thing and give ND0 (or ND1) another try?
As you didn't like Modern mode, just go into the Settings app, find ND0 and switch it to "Classic".
In ND0, go to My Data, under Downloadables, tap Folders, tap "Number Theory". That downloads the data and makes it available in the calculator.
Tap ND0, and operate this exactly like an HP-28, -48, 50g: tap VAR, tap Number Theory and you're ready to play with it.

Enter a number, and tap the "p" soft-key. You'll get your result on the stack. (For values to about 100, this is instantaneous.)

If you want to play with the code, edit "p" using the RCL and EDIT keys. (Or use, as on the 50g, the 2nd-level key + soft-key shortcut.) The code will appear in a scrolling editor. When you're done, enter, and use STO to save the code again as 'p', or under a new name.

If you're familiar with any RPL calc, these operations function just the same way.

If you manage to implement Ken Ono's "simple and beautiful function" we'll all be in awe. (And I'm willing to lend support to your efforts.) This can be done either in JavaScript or in RPL.

Oliver

Re: major number theory discovery, HP28C/S and HP41C codes

*Message #18 Posted by **C.Ret** on 31 Mar 2011, 5:19 a.m.,*
in response to message #13 by Katie Wasserman

As a lot of you, I am unable to clearly understand and play with the specific mathematical notioa couple of n, Bessel function and infinite series extensively used in this publication. I am unable to follow the tricky path the authors have used to achieve to an ‘arithmetic expression’ of the partition *p(n)* of any integer *n*.

But the link and recommendations that **Katie** give us in her post, allow me to use one of the recurrent approach of the problem to write of few codes to calculate partitions on any HP28C/S or HP41C.

Recursion, arithmetic and memory

As **Katie** have advert it, my code stores the values of *p(n)* in order to avoid an impossible amount of recursion. In the same time, this makes computation much more time efficient.

The philosophy of my approach is to store the first *m* pre-calculated values of *p(n)* into the calculator register Thus, asking for any partition number *p(n)* where $n \leq m$ is as trivial as recalling a register content. For any non pre-calculated *p(n)*, the following method is used to compute and store in memory *p(n)* from previous (and already store in most case) *p(n-q)* : From Euler's pentagonal number theorem, we have the general sum:

$$p(n) = p(n - 1) + p(n - 2) - p(n - 5) - p(n - 7) + p(n - 12) + p(n - 15)...$$

Where terms of this sum are $(-1)^{(k+1)} p(n - \frac{k(3k-1)}{2})$ where *k* is a relative integer used to generate a suitable set of "Euler's pentagonal numbers" *q*.

This summation gives the new and unknown number of partitions *p(n)* as a function of previous value *p(n-q)*. Validity is that we have to sum for any $0 \leq n\text{-}q < n$, which lead to a sequence of alternatively positive and negative *k* 1, -1, 2, -2, 3, -3, 4, -4, ... and so on until $q \geq n$. A special attention have to be care incase when $q = n$ where $p(0) = 1$ has to be consider. But this will be treated later in code, due to a specific memory usage. Only *p(n)* for $n = 1$ to *m* are store in memory or memory register from R_{01} to R_{mm}

Example1:

```
Already in memory: p(1) = 1, p( 2 ) = 1
Computing p(3)
```

k	1	-1	2
Sign	+	+	-
q	1	2	5 out of range q>n
n-q	2	1	
p(n-q)	+2	+1	

Thus *p(3) = 2 + 1 = 3*

Example2:

```
Already in memory : p(1) = 1, p( 2 ) = 1, p(3) = 3, p(4) = 5
Computing p(5)
```

k	1	-1	2
Sign	+	+	-
q	1	2	5
n-q	3	2	0
p(n-q)	+3	+5	-1

Thus *p(5) = 3 + 5 – 1 = 7*

Example3:

```
Already in memory : p(1) to p(5)
Computing p(10)
```

k	1	-1	2	-2	3	
Sign	+	+	-	-	+	
q	1	2	5	7	12	out of range q>10
n-q	9	2	5	3		
p(n-q)	+(30)	+(22)	-7	-3		() indicate external recursive calls

Thus *p(5) = 30 + 22 – 7 - 3 = 42*

The behavior of the summation when attempting to use an non pre-calculated *p(n-q)* partition depends of the power of the calculator and its ability to recursively compute it.

That why I have first developed an algorithm on my HP28S, since large memory allow directly recursive calls for unknown (and non store) value.

For the HP41C version, the purely recursive algorithm was adapted for using no strictly recursive calls. In fact, the really first tries on the HP28S show me that any attempt to compute a new *p(n)* greater that the last *p(m)* in memory generate cascading recursive calls to compute *p(n-1)*, *p(n-2)*, *p(n-3)*, ... *p(m+1)* since any summation start with q=1. So, the HP41C avoid any recursive calls by simply looping from *m* to *n* by step 1. This spares large among of memory and time.

To generate the *sign* sequence, two flag are used which greatly help generated the *k* sequence and summation/subtraction alternate.

k	ope	Flag#1	Flag#2	q	p(n-q)	sum/sub
1	+1	0	0	1	p(n-1)	+
-1	neg	1	0	2	p(n-2)	+
2	+1	0	1	5	p(n-5)	-
-2	neg	1	1	7	p(n-7)	-
3	+1	0	0	12	p(n-12)	+
etc						

Clearly two flags are needed to code a four steps sequence. Flag#1 indicate when *k* have to be incremented after its sign change. Flag#2 indicate when subtraction is replacing addition of *p(n-q)*

HP 28C/S version

Three programs: INIT to initiate PDAT array in memory and set p(1)=1. P to compute *p(n)* from memory (i.e. PDAT array) or by recursively calling PCALC

PCALC to compute *p(n)* when n is greater then pre-calculated *p(m)*.

Memory usage: The *p(n)* are stored in the array 'PDAT' initialized up to 200 elements with ‘PDAT(1) = 1’ only, all other set to zero.

Usage: Before any use of P, one may invoke initialization of memory array ‘PDAT’ by typing INIT [ENTER] or using USER menu soft key.

Recursive computation of any *p(n)* from 1 to m can be lunch by typing or using softkeys *m* P [ENTER] or equivalently *m* PCALC [ENTER]

After initial pre-calculation, any *p(n)* with $n \leq m$ can be obtain immediately by typing : *n* P [ENTER]

HP 41C version

This version is an adaptation of the HP28S version code. The same sub-programs may be found in the code at the specific labels. Main differences are that direct recursive calls of PCALC have been transform into a from *m+1* to *n* one by one step loop using ISG 00.

Program: Type [EXC][ALPHA]PART[ALPHA] to initiate memory and set p(1)=1. The calculator display 1.0000 indicates a successfully initialization.

Usage To compute *p(n)* simply enter *n* and press [A] soft key (S+ key in USER mode).

If *p(n)* already in memory, result is immediately display. The sequence is equivalent to recalling or viewing register (RCL nn or VIEW nn can be used to display p(nn) for any nn<100). If n is greater than previously computed and memorized *p(n)*, the calculator sequentially compute any *p(n)* from last in memory up to *n*. The larger n, the slowest is the computation.

Memory usage: The *p(n)* are stored in the register from R_{01} up to R_{mm} depending of available memory and the SIZE mmm setting.

The register R_{00} is used to count/loop and store the last register position.

The ALPHA register is used to display progression during extended computations.

Flag#0 is used for indicating erroneous condition (mainly badly initiate register or interrupted R/S) Flag#1, Flag#2 are used for *k* sequence and summation/subtraction alternate. Flag#3 is used for treated the special *n = q* cases.

Conclusion

As expected, this code may not obtain exact partition number up to *p(200)* due to the calculator's number of digit limits. The 12-digit HP28C/S arithmetic allow me to compute exact p(179)= 625846753120. And the limit of exact partition number on the HP41C (with two memory modules) is p(131)=5964539504. This result is confirmed by the HP28S display. Note that expected largest 10-digit partition number was p(135)=9035836076 but is unachieved on the HP41C due to the 10-digits limitation in summation/subtraction process. As well the expected maximal 12-digit number of partition p(184)= 980462880430 is not exact on the HP28S.

I am waiting for any improvements of this from any HP enthusiast user.

Edit: Add missing END of the DO ... UNTIL main loop

Edited: 31 Mar 2011, 12:10 p.m. after one or more responses were posted

Re: major number theory discovery, HP28C/S and HP41C codes

The HP-50g in exact mode gets it right. The last number in the list matches the one in page 155 of my translated copy of Marcus du Sautoy's *The Music of Primes*. Your program runs unchanged (except for a missing END in the DO structure and the CLMF command, which the 50g lacks). For n=200, it takes 11 minutes and 7 seconds:

The math involved is far beyond my skills. I would suggest only a few minor changes to your didactic RPL listing above. Not much gain, though: 10 minutes and 40 seconds for n=200.

Regards,

Gerson.

Re: major number theory discovery, HP28C/S and HP41C codes

*Message #20 Posted by **C.Ret** on 31 Mar 2011, 12:39 p.m.,*
in response to message #19 by Gerson W. Barbosa

Hi,

Thank you **Gerson** for pointing my attention on the missing END.

It is a shame that, I have no way to transmit data from my HP28S to my computer. A way to connect a HP28S to a computer is missing. And I am prone to copy/past error when typing code.

May I have to spend same time to look for a way to use the IR port of my laptop to receive any IR transmissions from my HP28S?

The HP28S is about 23min to compute up to p(200) with << INIT 200 PCALC >>

I am currently looking for sparing a few minutes by using: << INIT 2 200 FOR I I PCALC NEXT >> I am currently suspected the numerous recursive calls to consume a large bunch of memory and as a consequence to be slow in execution time.

The HP 41C's algorithm seems to be much faster than my HP28S (I just start the two computation on both calculators at the same time). The rabbit looks to be beaten by the turtle! again?

Concerning the mathematic underneath, I also not really sure to understand all the detail in depth. It appears to me as a combinational approach. To compute one p(n) partition you have to add partition of previous , but because of a couple of redundancies in your count you have to subtract same of them. Why is working with these specific "Euler's pentagonal number" is a mystery for me ! Is "pentagonality" equivalent in the additions to the "orthogonality" in the multiplication? This is one more mystery. There is a lot of mystery in nature and numbers are really natural mathematical objet. This is part of the charm of the "number theory".

Edited: I was right, INIT 2 200 FOR I I PCALC NEXT reach p(200) in only 12 min. It's less than half the time of brute force direct recursion !!

Edited: 31 Mar 2011, 1:00 p.m.

I think there is an indirect way, by using INPRT and one HP-48.

Once I read about a serial interface design for the HP-28S, perhaps here, but I am not sure. Anyway, I don't think you would be willing to open up your HP-28S :-)

> Quote:
>
> The HP 41C's algorithm seems to be much faster than my HP28S.

Your HP-41C program demonstrates the importance of that new discovery. I don't know about the previous methods, but I guess they would be hard to implement even on the 50g. The program should run very fast and accurately on Free42 Decimal. I'll try it later.

Regards,

Gerson.

Re: major number theory discovery, HP28C/S and HP41C codes

*Message #22 Posted by **C.Ret** on 31 Mar 2011, 3:18 p.m.,*
in response to message #21 by Gerson W. Barbosa

I am sorry. I was mistakely comparing speed of HP41C's to sequently compute from p(2) to p(100) with HP28S's time to compute directly p(200) by worste case using most loads of direct recurrence calls.

In fact, the HP41C is much slower than the HP28C by a factor of nearly 4.

Here are execution times running for HP41C and HP28C

```
 p(n) |   10     25     50     75    100    125    150    175   200
------+-------------------------------------------------------------
 HP41C|   40"  2'05"  5'35" 10'20" 15'30" 21'40" 28'25" 35'40"   na
 HP28S|   10"    30"  1'25"  2'35"  4'00"  5'35"  7'30"  9'20"  12'
```

*Message #23 Posted by **Oliver Unter Ecker** on 31 Mar 2011, 7:36 p.m.,*
in response to message #19 by Gerson W. Barbosa

Hmm.

Something seems to kill performance here.
I bet a non-recursive version would run quite a bit faster.

The JavaScript version takes 0.2s for p(200) on ND1 (on an iPhone 3GS), by the way.

Re: major number theory discovery, HP28C/S and HP41C codes

*Message #24 Posted by **C.Ret** on 1 Apr 2011, 5:29 a.m.,*
in response to message #23 by Oliver Unter Ecker

You are right, recursive calls kill the beast !

The best way to get the *p(n)* list is to compute it one step by one step since the previous and

previous by one are needed. Making things in order is logical and speed up the process.

p(n)	10	25	50	75	100	125	150	175	200
HP41C (1)	40"	2'05"	5'35"	10'20"	15'30"	21'40"	28'25"	35'40"	na
HP28S (1)	10"	30"	1'25"	2'35"	4'00"	5'35"	7'30"	9'20"	12'
(2)	10"	30"	1'30"	2'50"	4'25"	6'10"	8'05"	10'10"	13'
(3)	10"	30"	1'40"	3'25"	5'45"	8'50"	12'40"	17'20"	23'

(1) Best method: each p(n) is compute when any p(n-1) p(n-2) p(n-3) ... are already know and store in memory register. Memory is initiated only once.

(2) Intermediate method: Memory is initiated only once. For each column, the results from the previous run are kept in memory. The recursive depth s limited; only 25 p(n) values are missing at each run.

(3) Worst method: memory is clear before each computation (each column in table) resulting in deepest recursive calls stack.

This table clearly shows the effect of massive recursive calls. This is specific to the HP28C/S calculators which have specific memory management.

Re: major number theory discovery, HP28C/S and HP41C codes

*Message #25 Posted by **Oliver Unter Ecker** on 3 Apr 2011, 7:55 a.m.,*
in response to message #24 by C.Ret

Ok. Here's a non-recursive, stack- and local vars-based implementation:

```
p:
\<< \-> n \<<
   0. 'n>180' {R\->I} IFT \-> zero \<<
   0. \-> k \<<
   n mkpents \-> pents \<<
   [0. 1. 1. 0.] \-> signs \<<
   {1} @ partitions; kept top-of-stack
   1. n FOR j
      zero @ running sum
      1. 'k' STO
      WHILE
         pents k GET
         DUP @ for re-use next
         j \<=
      REPEAT
         PICK3 j ROT - 1. + GET
         signs k 4. MOD 1. + GET {+} {-} IFTE
         1. 'k' STO+
      END
      DROP @ duped condition val
      + @ add to partitions
   NEXT
   n 1. + GET
\>>\>>\>>\>>\>>\>>

mkpents:
\<< DUP 1. + \v/ \-> n m \<<
   {1.}
   1. m FOR i
      i 3. * 1. + i * 2. /
      +
      i 3. * 2. + i 1. + * 2. /
      +
   NEXT
\>>\>>
```

As is, this will only run on HP-49, HP 50g or on ND1.

I *think* I'm using only two commands specific to those.
In order to make this run on HP-28S
- make the second line simply "0 \-> zero" (lacking bignums, I'm not sure how high you'll be able to go before results get wrong on the HP-28S)
- change PICK3 into "3 PICK"

Note, the code switches from using Reals to using Real Integers (bignums) for n>295. I've not tried it on a 50g. It may need a lesser number.

Run-time for p(200) is 7s on ND1. It's 16s, if I set the threshold to n>195 and force it to use bignums.

[EDIT: I changed the threshold value to 180, so this code gives an exact result on HP-49 and 50g, which have lower precision.]

Edited: 6 Apr 2011, 7:11 a.m. after one or more responses were posted

Re: major number theory discovery, HP28C/S and HP41C codes

*Message #26 Posted by **Oliver Unter Ecker** on 6 Apr 2011, 7:05 a.m.,*
in response to message #25 by Oliver Unter Ecker

I implemented recently proposed array and local operators in RPL+.

Here's the RPL+ version of the code above:

```
\<< =n
   0 'n>295' {R\->I} IFT =zero
   n mkpents2 =pents
   [0 1 1 0] =signs
   {1} =partitions
   1 n FOR j
      zero @ running sum
      1 =k
      WHILE
         j pents[k] - =:diff
         0 >=
      REPEAT
         partitions[diff]
           signs[k,4] {+} {-} IFTE
         ++k
      END
      =partitions[j]
   NEXT
   partitions[n]
\>>
```

Run-time for p(200) is 2.3s on ND1. It's 2.7s, if I set the threshold to n>195 and force it to use bignums. That is, the speed gain for RPL+ is 300% and 700%, respectively.

I don't know how fast the RPL code in the previous post runs on a 50g. I'd love to get a result from someone who has one. (I punched the code into HP-49G running on Emu48 on a Mac, and get 35.2s for p(200). Extrapolated from previous results, this suggest 2.5 to 5 minutes for 50g.)

1 minute and 50.3 seconds (HP 50g)

```
<< 200 p >> TEVAL

->     3972999029388
          s:110.4585
```

Re: major number theory discovery, HP28C/S and HP41C codes

*Message #28 Posted by **Oliver Unter Ecker** on 6 Apr 2011, 5:53 p.m.,*
in response to message #27 by Gerson W. Barbosa

Nice.

Thank you, Gerson!

Over at comp.sys.hp48 someone posted a Sys RPL implementation that runs in 8s! I'm impressed at that gain thru Sys RPL. I can't read Sys RPL. I wonder if he's doing anything cleverer algorithmically. The implementation above could be improved by having the full sign array precomputed vs doing the circular buffer.

Re: major number theory discovery, if you can translate

*Message #29 Posted by **Oliver Unter Ecker** on 31 Mar 2011, 7:28 p.m.,*
in response to message #1 by Don Shepherd

After spending more time trying to understand the math (and learning and still failing--by a large shot) I sent email to Mr. Bruinier, congratulating and asking if they have an implementation that they could share, for any kind of math system or platform.

He kindly responded, and told me that they don't have complete code yet, and that he will give this task to a student as a thesis project.

Wow. What a surprise.

Speaking of slightly hard to read and surprising.
Can you believe that this piece of code computes p using the Euler method:

```
f=:[:(0<@-."1~>@{:)](,([:<@;(-i.)@#([,.(>:{."1)#])&.>]))@]^:[(<i.1 0)"_
```

Code Golfing for p()

I'm working on a 3rd language for ND1, which, I think, will allow an even shorter implementation (and be just as unreadable).

Re: major number theory discovery, if you can translate

*Message #30 Posted by **C.Ret** on 2 Apr 2011, 2:44 a.m.,*
in response to message #29 by Oliver Unter Ecker

Hi, It’s true that this code is concise and not really easy readable by human eyes.

Actually it's not Golfing code, pas a true **J** code. **J** is a very terse array programming language, and is most suited to mathematical and statistical programming, especially when performing operations on matrices. J will certainly perfectly fit into the NT1 project.

And precisely, **P** is not computing the partition number *p(n)* but the partition itself.

```
     P =: [: (0 <@-."1~ >@{:) ] (, ([: <@; (- i.)@# ([ ,. (>: {."1) # ])&.> ]))@]^:[
(<i.1 0)"_

   P 1
+-+
|1|
+-+
   P 2
+-+---+
|2|1 1|
+-+---+
   P 3
+-+---+-----+
|3|2 1|1 1 1|
+-+---+-----+
   P 4
+-+---+---+-----+-------+
|4|3 1|2 2|2 1 1|1 1 1 1|
+-+---+---+-----+-------+
   P 5
+-+---+---+-----+-----+-------+---------+
|5|4 1|3 2|3 1 1|2 2 1|2 1 1 1|1 1 1 1 1|
+-+---+---+-----+-----+-------+---------+
```

The useful **#** verb in **J** returns the size of an array, thus the correct **J** program to compute number of partitions *p(n)* is **# P *n***.

```
   #P 1
1
   #P 2
2
   #P 3
3
   #P 4
5
   #P 5
7
   #P 10
42
   #P 50
204226
   #P 100
|out of memory: P
|   #    P 100
```

As can be seen, despite its concise and terse syntax, this code has to draw all the partitions in order to count it. This is not as efficient or power full as it looks at first. On my system (2 Go RAM) draw all the 190569292 partitions of integer 100 seems to be impossible.

Here is a code to display any partition on a HP41C.

It use statistic fonctions Σ+ and Σ- to add or remove element in the partition. This is a trick sparing a few instruction to maintain the sum of element (Σx) and the number of element in the current partition (n).

Usage

Enter the integer and press [EXQ][ALPHA]PART[ALPHA] to get the list of all the way to get this integer. Press R/S key at each individual display to get the next one.

Example

```
7[EXQ]PART
"7             " [R/S]
"6+1           " [R/S]
"5+2           " [R/S]
"5+1+1         " [R/S]
"4+3           " [R/S]
"4+2+1         " [R/S]
"4+1+1+1       " [R/S]
"3+3+1         " [R/S]
"3+2+2         " [R/S]
"3+2+1+1       " [R/S]
"3+1+1+1+1     " [R/S]
"2+2+2+1       " [R/S]
"2+2+1+1+1     " [R/S]
"2+1+1+1+1+1 " [R/S]
"1+1+1+1+1+1+"
"+1+1+1+1+1+1" [R/S]
7.0000
```

Re: major number theory discovery, if you can translate

*Message #31 Posted by **Oliver Unter Ecker** on 2 Apr 2011, 6:58 a.m.,*
in response to message #30 by C.Ret

Hi C.Ret.

Thanks for telling me what the J implementation did. It's so unreadable... I certainly missed that.

The language I'm working on for ND1 (really MorphEngine) is GolfScript. Even terser than J. And even better suited as it starts out as a stack-based language. I morph it into RPL (you can even see the RPL result which makes it so much more readable...), which is byte-code compiled (in the future: morphed) into JavaScript. It will be interesting to see how its performance compares to the Ruby implementation. And it'll be fun to play with those terse one-liners on-the-go.

I've not found a GolfScript implementation of p(n). If you come across one...

wp34s - New Release

*Message #1 Posted by **Marcus von Cube, Germany** on 24 Mar 2011, 8:24 a.m.*

We've made some progress regarding numeric accuracy and usability of wp34s. Find a new release here: http://sourceforge.net/projects/wp34s/files/. You want to grab wp34s.zip.

The math and statistic specialists here are kindly asked to check the probability functions again. Pauli has put some work in better algorithms.

For the rest of us: The overall usability has improved. As an example, navigating in catalog(ue)s is possible with sequences of alpha characters. Typing C L R will bring you directly to CLRREG in the X.FCN catalog(ue). A short time of inactivity resets the sequence, so typing C L, waiting 3 seconds and then typing R will take you to RESET.

You should also notice, that the key labels of the compact and LED skins are better readable then before.

Enjoy!

Edited: 24 Mar 2011, 8:25 a.m.

Re: wp34s - New Release

*Message #2 Posted by **gene wright** on 24 Mar 2011, 9:04 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Question: Was there a specific reason not to have an A key in addition to B C D ?

The Sigma+ function could have been the default above the key and an A key placed there instead.

As well thought out as everything is, I'm betting you guys had a reason. ;-) Just curious.

Re: wp34s - New Release

*Message #3 Posted by **Walter B** on 24 Mar 2011, 9:35 a.m.,*
in response to message #2 by gene wright

Gene,

As you may have seen, the default primary functions of the other hotkeys appear elsewhere on the keyboard. So when any of the labels B, C, D is used in a program, the respective function is easily accessible still. OTOH Sigma+ has no backup location. Sigma+ shall be a primary function in any case IMHO - and in almost all vintage HP calculators it is. And it shall be located either next to '+' or at another position reached easily. Since in the WP 34S R/S took the location often held by Sigma+ in the past (IIRC we even had a poll about that here), top left or top right were two positions coming into my mind next. The top right side takes all the prefixes, so top left was left ;-) Sufficient?

Walter

*Message #9 Posted by **Marcus von Cube, Germany** on 24 Mar 2011, 9:37 a.m.,*

in response to message #2 by gene wright

I was not involved in the decision, I joined the team when the functionality was long decided upon. But I have an opinion, of course. :)

Firstly, I agree. Another directly addressable label seems logical. But, secondly, the default function of the key must exist somewhere else on the keyboard or in a catalogue. Burying Sigma+ too deeply is probably a bad idea because it might not be used by everybody, but if, then it should be readily available on the keyboard for rapid data entry.

Make a suggestion where to put Sigma+ when label A is in use and Pauli and Walter will decide upon this.

Well, thank *you* all - it was a result of a poll on this forum ;-)

Walter

Re: wp34s - New Release

*Message #12 Posted by **Dieter** on 24 Mar 2011, 4:17 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Ah, great - it's LOGxY again. :-)
Both in this and in earlier releases I noticed some details I would like to mention.

1. At several occasions the emulator simply disappeared from the screen and did not come back - although it was still active and its icon was visible in the task bar. Start WP34s, switch to another program (e.g. Notepad), try to switch back to WP34s - and nothings happens. The only way to resolve this: close the program and restart it. OS: Windows XP SP3.

2. After the emulator has been switched to "hide titlebar" there is no way to move it across the screen. The user has to turn the titlebar on, move the program window and hide the titlebar again. I think the usual keyboard shortcuts like Alt+Space (Windows) should work even with the titlebar turned off.

3. A right-click anywhere on the calculator surface works like pressing the f prefix. Is this a bug of a hidden feature?

4. While a program is running the display shows the x-register, not something like "running", like other HPs. The only thing that hints at a running program is a tiny flashing "RCL" in the upper right corner. BTW, I would prefer something moving across the display, like... a running chicken, a swimming duck, ...you get the idea. ;-)

5. VIEW is not working (edit: not SHOW, as originally stated). At least it's not working the way I'd expect. Try this short example:

```
001 LBL B
002 1
003 0
004 STO 01
005 LBL 01
006 VIEW 01
007 PSE
008 DSZ 01    ; aaah, finally DSZ is back. :-)
009 GTO 01
010 RTN
```

   Instead of the expected countdown the display shows nothing but a "10" (or simply X, if interrupted and restarted) and a flashing RCL-announciator - for the whole ten seconds the program is running.

6. -123 mod 5 gives -3 on the 34s. My other HPs with MOD or RMDR function return 2. I assume that's also true for the 42s which the manual refers to regarding this function.

7. The normal CDF now is more precise, but full machine precision is not achieved. Especially in the tails (x >= 2) this could be done easily with a simple continued fraction expansion. Unoptimized pseudo-code:

```
n := 4 + 100 div (x-1)  ; see below
s := 1/n
for c := n-1 downto 1 do
    s := c / (s + x)
s := s + x
cdf := pdf(x) / s
```

   I tried to determine a rule for the number of terms n, depending on x and the desired accuracy (d digits). As far as I can tell on a system working with usual binary double precision numbers (15-16 valid decimals) this value can be estimated for d = 8...16 digits quite exactly by

```
k >= 17 + d * (d-5) / 2   (the example uses k = 100 for d ~= 16)
n >= 4 + int(k / (x-1))
```

   This should return the value for s with d valid digits and an error near 0,2 ULP. With 39 internal digits on the 34s the desired 16-digit result can be evaluated without effort, since the required pdf and its exp(-0,5*x^2) can be evaluated with sufficient precision. All this is calculated in virtually no time.

8. While we're on this topic: the common use of the symbols P and Q for the cumulative normal distribution is P for the lower tail and Q for the upper. The 34s uses both symbols exactly vice versa. Thar's why I think either the symbol should be changed or the values should get the opposite sign:

```
x =  1,5   =>   Q =  0,06681
x = -1,5   =>   Q =  0,93319
Q =  0,1   =>   x =  1,28155
Q =  0,9   =>   x = -1,28155
```

9. Regarding Sigma-plus: I never understood why this function should require a primary key. Even in the days when I used statistics virtually every day I never used this function on any of my calculators. I always wondered if someone *really* used this function at all. ;-) Using my 41C it always drove me mad when I wanted to start a program at label A, but instead Sigma+ was executed because I forgot to turn on user mode. And so one accidental key press destroyed not less than six memory registers. No, LastX Sigma- is not always an option.

   In other words: If I could design a calculator, this Sigma+ key would be the first function I'd remove from a primary key. The 34C uses f Sigma+ and g Sigma-, which is perfectly okay. In simple words: yes, I want a decicated "A"-key.

Otherwise I think an actual "hardware" 34s would be one of the greatest calculators I ever used. ;-)

*Message #13 Posted by **Marcus von Cube, Germany** on 24 Mar 2011, 4:42 p.m.,*
in response to message #12 by Dieter

Dieter, I can only comment on the first few items.

The emulator kernel is still mostly what comes with the SDK. I couldn't reproduce the "can't find the window again" problem you're mentioning. My development system is a WinXP virtual machine, so close enough to what you are using.

Dragging a frameless window should be no problem at all. Just grab the window anywhere and drag it around. I can't comment on standard Windows shortcuts, I just didn't dig deep enough into the emulator mechanics. I was happy enough to cope with the MFC code without being dependent on the runtime DLLs. ;)

The right click anywhere except the logo is borrowed from the original code which sends a blue shift to the application. I just adapted the behavior to the wp34s key layout.

The proper display in run mode is still under investigation. I did some changes to Pauli's routines in preparation for the hardware port which might have broken the intended functionality. Walter should add this to our internal bug list.

All the math questions go to Walter and Pauli...

> Quote:
>
> Otherwise I think an actual "hardware" 34s would be one of the greatest calculators I ever used. ;-)

Danke für die Blumen. :)

Re: wp34s - New Release

*Message #14 Posted by **Tim Wessman** on 24 Mar 2011, 5:27 p.m.,*
in response to message #13 by Marcus von Cube, Germany

If that comes from some of the original emulator UI code from a while back (which I highly suspect is the case), that non redrawing bug can be found in the cDlg file. If it is the same and I am remembering properly, it happens when you minimize and then maximize the window. It could cause a flag not to be set properly and it wouldn't redraw correctly.

Not sure if that is the case, but it could be.

TW

This used to happen here also (Vista). I was able to reproduce it by successively minimizing and maximizing the application by right-clicking the shortcut in the task bar, as Tim has suggested (I've hidden the title bar because I'm using 1280x800 resolution).

Gerson.

Edited to fix a typo

Re: wp34s - New Release

*Message #18 Posted by **Marcus von Cube, Germany** on 25 Mar 2011, 4:57 a.m.,*
in response to message #17 by Gerson W. Barbosa

I can reproduce it now. It only happens with the Window frame hidden. If you leave the title bar on, everything works as expected.

The bug must be deeply hidden in the emulator sources. I'm not sure I'll ever find it.

Re: wp34s - New Release

*Message #19 Posted by **Marcus von Cube, Germany** on 27 Mar 2011, 7:32 a.m.,*
in response to message #18 by Marcus von Cube, Germany

I think I found a fix. I commented out some strange code in the emulator sources and that seems to help. The next release will include the fix.

Re: wp34s - New Release

*Message #20 Posted by **Glen Sanft** on 27 Mar 2011, 10:52 a.m.,*
in response to message #19 by Marcus von Cube, Germany

I apologize. I should have reported earlier that with the titlebar absent, a minimized-to-the-taskbar WP34S could not be made to return for use, running under Wine (I'd assume fairly recent) under Ubuntu 10.04. It's been no big deal, as Alt+mouse_drag on the window for me allows shoving the titlebar off the top of the display anyway.

Re: wp34s - New Release

*Message #21 Posted by **Marcus von Cube, Germany** on 27 Mar 2011, 11:54 a.m.,*
in response to message #20 by Glen Sanft

The vanishing window is one of the issues fixed with the upcoming release. The EXE is ready but there are enough changes to justify a new manual with the release.

Re: wp34s - New Release

*Message #22 Posted by **Walter B** on 27 Mar 2011, 1:56 p.m.,*
in response to message #21 by Marcus von Cube, Germany

The manual is ready now - we'll see to get all the stuff packed and zipped and then ... tataa! :-)

> chicken, a swimming duck, ...you get the idea. ;-)

We should be able to do something here.

> Quote:
>
> SHOW is not working. At least not the way I'd expect. Try this short example:

Yes, this one is known already :-(The pause is forcing a screen redraw which destroys the VIEW. If you replace the pause with a small loop it works okay but that isn't a fix.

We've always has ISZ and DSZ in order to support integer mode where ISG and DSE don't make much sense. They just happen to work on reals like the early HPs :-)

> Quote:
>
> -123 mod 5 gives -3 on the 34s. My other HPs with MOD or RMDR function return 2. I assume that's also true for the 42s which the manual refers to regarding this function.

Hmmm, bug or not? I'm not sure :-) We're honouring the sign the same as division or multiplication would.

> Quote:
>
> The normal CDF now is more precise, but full machine precision is not achieved.

Sadly, I've not got back to this one yet. It will be fixed eventually though.

> Quote:
>
> While we're on this topic: the common use of the symbols P and Q for the cumulative normal distribution is P for the lower tail and Q for the upper. The 34s uses both symbols exactly vice versa. Thar's why I think either the symbol should be changed or the values should get the opposite sign:

My vote was for Z.

Our P is a Poisson distribution not a normal one. The parameter comes from register J. We tried having the parameter(s) on the stack for the distributions but it was painful to do anything.

Again, thanks for the feedback,

- Pauli

Re: wp34s - New Release

*Message #24 Posted by **Marcus von Cube, Germany** on 24 Mar 2011, 6:22 p.m.,*
in response to message #23 by Paul Dale

I'm working on the VIEW problems. The next release will be better (but probably far from perfect) in this respect. VIEW then displays the selected register and PAUSE does not destroy it. You will be able to omit the PAUSE and let the program continue without interruption. This will, of course, interfere

with any flying gooses we might introduce.

Re: wp34s - New Release

*Message #25 Posted by **Dieter** on 24 Mar 2011, 7:05 p.m.,*
in response to message #23 by Paul Dale

Hi Pauli,

> Quote:
>
> The pause is forcing a screen redraw which destroys the VIEW. If you replace the pause with a small loop it works okay but that isn't a fix.

OK, I tried a loop instead of PSE:

```
5
0
0
0
0
0
LBL 02
DSZ X
GTO 02
```

The display now shows "10", then "18" (?!) and stays so until the program finishes after 10 seconds.

> Quote:
>
> My vote was for Z. (...) Our P is a Poisson distribution not a normal one.

The use of "Q" is perfectly okay - just change the sign of x. ;-) "Z" is not very clever here, as it refers to the pdf (cf. Abramovitz & Stegun). There's just one reason why P might be preferred: if for all other distributions the lower tail integral is determined, and using the upper tail only for the normal distribution would make it the only exception. Otherwise the solution is simple: use Q and evaluate the upper tail.

Edit - what about this: simply use an uppercase Greek Phi for the normal integral. This is a commonly used symbol. One might even provide a lowercase phi function that returns the pdf. :-)

Dieter

VIEW works now.

Walter

Re: wp34s - New Release (VIEW)

*Message #27 Posted by **Marcus von Cube, Germany** on 25 Mar 2011, 4:58 a.m.,*
in response to message #26 by Walter B

But has yet to be released?

Re: wp34s - New Release

*Message #28 Posted by **Dieter** on 26 Mar 2011, 12:30 p.m.,*
in response to message #1 by Marcus von Cube, Germany

I've found another problem: Solve (SLV) crashes the emulator. Try this simple test:

```
LBL D
X^2
2
-
RTN

1 ENTER 2
SLV D
```

Instead of the expected instantaneous 1,4142... the emulator simply crashes.

Addendum:
Integrate crashes as well. Test:

```
LBL D
SIN
RTN

DEG FIX 4
0 ENTER 90
Integrate D
```

Instead of the expected 180/Pi = 57,2958 the emulator crashes immediately.

Dieter

*Message #36 Posted by **Paul Dale** on 26 Mar 2011, 8:27 p.m.,*
in response to message #28 by Dieter

This looks to be a problem with Windows. It works fine under Wine on a Mac (and Linux as mentioned below). Likewise the console versions seem to be okay too.

I'm assuming that sum and product are also broken the same way.

Will be looked into.

- Pauli

Re: wp34s - New Release

*Message #37 Posted by **Dieter** on 27 Mar 2011, 5:24 a.m.,*
in response to message #36 by Paul Dale

Right, the sum and product functions also crash.

Dieter

Re: wp34s - New Release

*Message #38 Posted by **Thomas Radtke** on 27 Mar 2011, 6:20 a.m.,*
in response to message #1 by Marcus von Cube, Germany

This morning, wp34s failed to start. I had to remove wp34s.dat (and immediately realized that this file could have been of interest :-/).

About rounding: ROUNDI rounds Integer x + 0.5 to x+1 always. Is there any way to change this behaviour?

And: Change the icon from hp to wp, please ;-).

Re: wp34s - New Release

*Message #39 Posted by **Paul Dale** on 27 Mar 2011, 6:50 a.m.,*
in response to message #38 by Thomas Radtke

The short answer is no. The longer answer involves the rounding modes supported by the IEEE standard.

The underlying mathematics library supports these rounding modes:

Mode	Description	WP34S
CEILING	round towards +infinity	CEIL
DOWN	round towards 0 (truncate)	TRUNC
FLOOR	round towards -infinity	FLOOR
HALF_DOWN	0.5 rounds down	
HALF_EVEN	0.5 rounds to nearest even	
HALF_UP	0.5 rounds up	ROUNDI
UP	round away from 0	

The WP34S also has an extra mode invoked by ROUND. This rounds to the value shown on the display using the current display mode settings.

So we support all but three of the available rounding modes. Half down is easy: CHS ROUNDI CHS. Round half even is more difficult.

It would be easy enough to add extra commands to support the other three modes if there is sufficient interest. So, if you want the extra commands please post which you want (& suggest command names -- limit of six characters).

- Pauli

oops: CHS ROUNDI CHS doesn't do half down :-(

I recommend HALF_EVEN, either as a dedicated function (RHEVEN), or as a MODE to ROUNDI. Anyone supporting this?

> Just for curiosity: what do you need that for?

Round half even is the recommended naive rounding mode for numerical computations. Rounding errors generally tend to cancel out better in this mode. Round half odd is also good but not typically supported. This error cancellation doesn't happen with round half up or round half down.

Of course, we're rounding to integer here (rather than rounding the last digit in the mantissa) so the whole thing is pretty moot. I don't see much reason to include this.

However, including support for the rounding modes is another matter. We use round half even for conversions to our register format.

And yes, it is IP not TRUNC :-(

> Of course, we're rounding to integer here (rather than rounding the last digit in the mantissa) so the whole thing is pretty moot. I don't see much reason to include this.

Back in the late '70s I was working as a draftsman. Our drawings were in decimal inches, using two decimal places. The [rather large] company policy was a "5" in the third decimal place would round up a second-place "odd" but not a second-place "even". This was different from what I'd learned about rounding, namely that a "5" would always round up, so I inquired.

I was given the example of a part being an inch long with a hole placed at 3/8" from one end. If the dimensions were listed to both ends from the hole, they'd add up to 1.01 inches if both 0.375 and 0.625 had gotten rounded up.

Furthermore, all our calculations (figuring torque loads, etc.) were to be recorded on our scratch sheets using this method with the reason given as repeatability by subsequent folks who would likely have a different make/model calculator!

It would be very nice to be able to have a calculator which honored an individually-chosen rounding method, thus eliminating the necessity to "fix" two extra digits in the display. It would make it especially convenient to "RND" the displayed values, knowing that all results thus followed a (whichever) "proper" convention. It is exactly for this type of reason that prospects of such projects as this gives me joy. Depending on how far one might want to roll their sleeves up they should be able to customize to their heart's content.

Re: wp34s - New Release

*Message #45 Posted by **Thomas Radtke** on 27 Mar 2011, 7:23 a.m.,*
in response to message #42 by Walter B

Unbiased rounding, but w/o an application in mind. We discussed this earlier. In rare cases, a user might request a series of rounded numbers for further processing. However, to me it is just that I'm to proud using a rounding function only bankers would use ;-).

And I don't see the point of biased rounding ;-).

Well, hard to imagine anyone is doing statistics on rounded integers. OTOH ... you never know.

It's not at all important to me, I was just curious about the choice of the rounding method. I guess it is tradition, or to not be questioned by people expecting something different.

Re: wp34s - New Release

*Message #48 Posted by **Dieter** on 27 Mar 2011, 2:24 p.m.,*
in response to message #39 by Paul Dale

While we're on this topic: I really would like a special command that rounds the 16-digit value to the displayed 12 significant digits, removing the four additional "guard digits". In other words: a simple shortcut for

```
RCLM
X<>Y       ; save display mode
SCI 11
RND        ; round to 12 sign. digits
X<>Y
STOM       ; restore display mode
DROP
```

...just without disturbing the stack. In the olden days there was a similar key sequence for the TI58/59 which used EE INV EE to remove the three guard digits.

... using whichever "MODE"d method of rounding (or truncating) has been selected would be especially tasty...

Re: wp34s - New Release

*Message #51 Posted by **Dieter** on 27 Mar 2011, 5:10 p.m.,*
in response to message #49 by Walter B

Yes, this could actually be used for three different ways of rounding:

- "RND 4" could round X to 4 digits behind the decimal point
- "RND -4" might round X to 4 significant digits
- "RND ," would round X according to the current display mode

Dieter

Re: wp34s - New Release

*Message #52 Posted by **Paul Dale** on 27 Mar 2011, 6:06 p.m.,*

in response to message #1 by Marcus von Cube, Germany

The latest enhancements, bugfixes and a new manual have been uploaded to SourceForge.

* All known bugs and crashes are hopefully gone.

* PSE (formerly PAUSE) now has a duration parameter in tenth of seconds. Indirection via -> works in the usual way.

* Two new functions compute the first and second derivative of a programmed function. See manual for details.

* Numerical accuracy has improved in certain areas.

It's still "only" an emulator. Feel free to complain. ;)

Re: wp34s - New Release - Version 1.16

*Message #59 Posted by **Dieter** on 27 Mar 2011, 4:12 p.m.,*
in response to message #58 by Marcus von Cube, Germany

Fine - Solve and Integrate no longer chrash now. But Integrate returns its result with the wrong sign. At least if, according to the manual, the lower limit is in Y and the upper limit in X.

```
LBL C                              LBL D
SIN                                X^2
RTN                                2
                                   -
DEG                                RTN
0 ENTER 90  Integrate C            0 ENTER 1  Integrate D
=> -57,2957795131                  =>  1,66666666667
```

Unlike the classic HP implementations, Integrate also does not seem to return the estimated error in Y.

I also noticed that Solve behaves slightly different from the way it is implemented in the 34C and 15C.

There, X and Y return the two best possible approximations, which are usually equal or differ only in the last digit. 1 ENTER 2 SLV D returns 1,41421356237 in X, but 1,41421356696 in Y.

The manual also says that Solve and Integrate work as in the 15C. As far as I know the 15C fills the whole stack with the current x-value, just like my 34C. Here on the 34s, this obviously is not the case.

Is this the way these functions are supposed to work or is the manual wrong?

The sources of the solver and integrator are in the 34slib directory. So you can check for yourself. But I'm sure, Pauli will have some explanations for you.

Re: wp34s - New Release - Version 1.16

*Message #61 Posted by **Dieter** on 27 Mar 2011, 4:42 p.m.,*
in response to message #60 by Marcus von Cube, Germany

I took a look at integrate.txt and found:

```
On return the stack looks like:
     L       integral (Gauss)
     I       unchanged

     T       lower limit (Y on input)
     Z       upper limit (X on input)
     Y       error estimate (Gauss - Kronrod)
     X       integral (Kronrod)
```

In fact, on return T holds the original X-value and Z the original Y-value, which would explain the erroneous sign.

On the other hand I was wrong about the missing error estimate. It actually is returned in Y, but it was zero for the example since the algorithm gives an exact result for the mentioned function.

in response to message #62 by gene wright

"not numeric" indicates an IEEE NaN ("Not a Number"). You can easily create one with "0 ENTER 0 /". I've no idea what caused it in the integrator. We have to wait for Pauli to answer the question properly.

Unless you set the danger flag (flag D), this won't create a NaN, it will show a domain error.

There is, however, an easy way to make one. In the constants catalogue there is a NaN entry :-)

The Kronrod estimate failed because of the divide by zero when evaluating at the mid point, x=0, so the Gauss estimate was returned without an error estimate.

PS: use the built in SINC function instead for this. It handles x=0 properly :-)

This is the same behaviour. We converge slightly faster than the 34c and 15c usually do :-) We not only do a secant step with a bisection guard but we've got a quadratic regression step as well. There is the option for a Ridder's step as well but that didn't seem to improve matters enough to warrant the extra code.

That said, we don't always return the second best estimate, just a recent one. In this case, however, it is returning the previous estimate.

> Quote:

We fill X, Y, Z & T with the value like the 15c and 34c. This is the whole stack in SSIZE 4 mode and not in SSIZE 8 mode.

I've fixed the sign problem with integrate. I have thought it was backwards for ages but didn't check the 15c manual to be sure.

I always considered the 34C/15C way very useful. Solving x^2 - 5 shows immediately that sqrt(5) is somewhere between 2,236067977 and 2,236067978. ;-)

> Quote:
>
> We fill X, Y, Z & T with the value like the 15c and 34c. This is the whole stack in SSIZE 4 mode and not in SSIZE 8 mode.

Sorry, must have been my fault yesterday when it didn't work. Anyway, now it's working fine.

> Quote:
>
> I've fixed the sign problem with integrate. I have thought it was backwards for ages but didn't check the 15c manual to be sure.

If you look very closely the 34C and 15C key labels say "Integral from y to x". The limits are entered just the way you would expect. It's as intuitive as log_x of Y. :-)))

I've just released a new version of the emulator dll. It fixes a minor annoyance with moving the frameless emulator off the screen.

Stay tuned for 1.17 and the "real thing"! we are making progress. :)

Re: wp34s - New Release - Version 1.16

*Message #72 Posted by **Glen Sanft** on 31 Mar 2011, 11:01 p.m.,*
in response to message #71 by Marcus von Cube, Germany

FYI the titlebarless minimize-to-taskbar is now completely borken in my wine/Linux. I must kill the process manually. It's inconsequential to me in any event since I just shove the titlebar out the top of the display anyway. If the program was stopped normally with a hidden titlebar, at next restart it's initially displayed with space allocated above it for a titlebar anyway, so there's absolutely no benefit to be derived for me to hide the titlebar; I must still Alt-grab/move the window anyway.

All else that I've toyed with in the "calculator" seems to work just fine; I realize this current "problem" doesn't reflect upon the calculator operation itself, but I suppose anything worth doing is worth doing right; right? :)

Re: wp34s - New Release - Version 1.16

*Message #73 Posted by **Marcus von Cube, Germany** on 1 Apr 2011, 2:12 a.m.,*
in response to message #72 by Glen Sanft

Glen, I apologize. This is code originally created by HP. It makes some assumptions about what is passed as the position on the screen to the move routine on minimize/restore. Probably Wine works differently here. You should replace the dll by the old version if you still have it. Walter B benefits from the recent changes, as do presumably other Windows users.

Any Wine specialists here who know what gets passed to the window move message in x and y when an application is minimized? On Windows it's -32000 for both.

EDIT: I've updated the DLL again. Please try it out and report here!

Edited: 1 Apr 2011, 4:09 a.m.

*Message #74 Posted by **Walter B** on 1 Apr 2011, 7:13 a.m.,*
in response to message #73 by Marcus von Cube, Germany

Now the old bug returned: Under Windoofs 7 (not that I like it but I have it) I cannot move the emulator window over the top limit of the screen again. We had that once before and repaired it ... :-?

Re: wp34s - New Release - Version 1.16

*Message #75 Posted by **Marcus von Cube, Germany** on 1 Apr 2011, 12:01 p.m.,*
in response to message #74 by Walter B

The repair broke Wine. I can move the emulator (but not beyond the LCD). It works only in frameless mode.

Re: wp34s - New Release - Version 1.16

*Message #76 Posted by **Glen Sanft** on 1 Apr 2011, 3:39 p.m.,*
in response to message #75 by Marcus von Cube, Germany

Oh, well. May just as well get the code compiled where it'll run on the native hardware at this point instead of chasing this little mess. Whatever you want to do with the emulator is fine by me. I rarely run it without the titlebar (mostly just to test what you're ever currently trying at the moment). And I almost-as-rarely minimize a window, seeing how the "device" maintains state and is so readily accessible.

Thanks for all your (plural) work on this project.

*Message #3 Posted by **Jim Yohe** on 24 Mar 2011, 1:09 p.m.,*

in response to message #2 by Nigel J Dowrick

I wonder if you're suggesting that Jose's blog is hinting of a new scientific calculator the size of a 15c but with the capabilities of the 50g? ;-)

It would be nice if more clues were released for us to feed on.

Re: Calculator blog

*Message #4 Posted by **Jose Gonzalez Divasson** on 24 Mar 2011, 5:37 p.m.,*
in response to message #3 by Jim Yohe

Hi, Jim, Nigel,

I have very few details on the "big runner" of the 2 calculators.

I have some more info on the 10.000 uds. model, but I still don't have a protoype in my hands to give an informed opinion.

The blog just shows my personal preferences (with my limited knowledge). I do think that the HP 50g is a substantial improvement over the HP48g family in screen, speed, and software. Not better in keyboard quality, but not bad either. I do think as well that the colour scheme is better than on the 48g/gx (not than 48sx).

As for the 15c, it is a little lovely calculator. It does everything I need on a daily basis, and I can program it with my eyes closed. I like the HP42s and I can admit that is a better overall calculator, but I don't "love" it.

Yesterday I had a nice surprise with the 30b. Good all-rounder for business, and good keyboard. Extremely fast. There is future!

Gene you are WRONG! Hewlett Packard was FIRST!!!

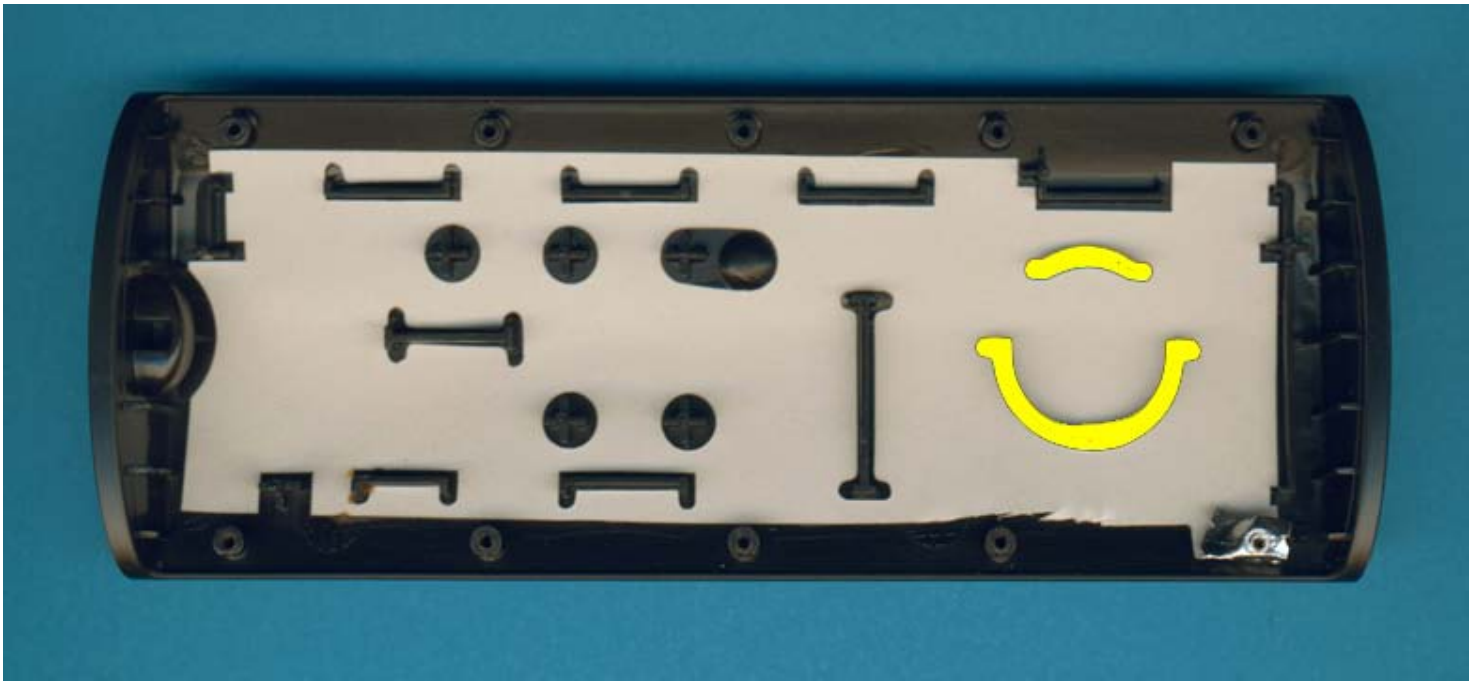
*Message #3 Posted by **Joerg Woerner** on 23 Mar 2011, 8:29 p.m.,*
in response to message #1 by gene wright

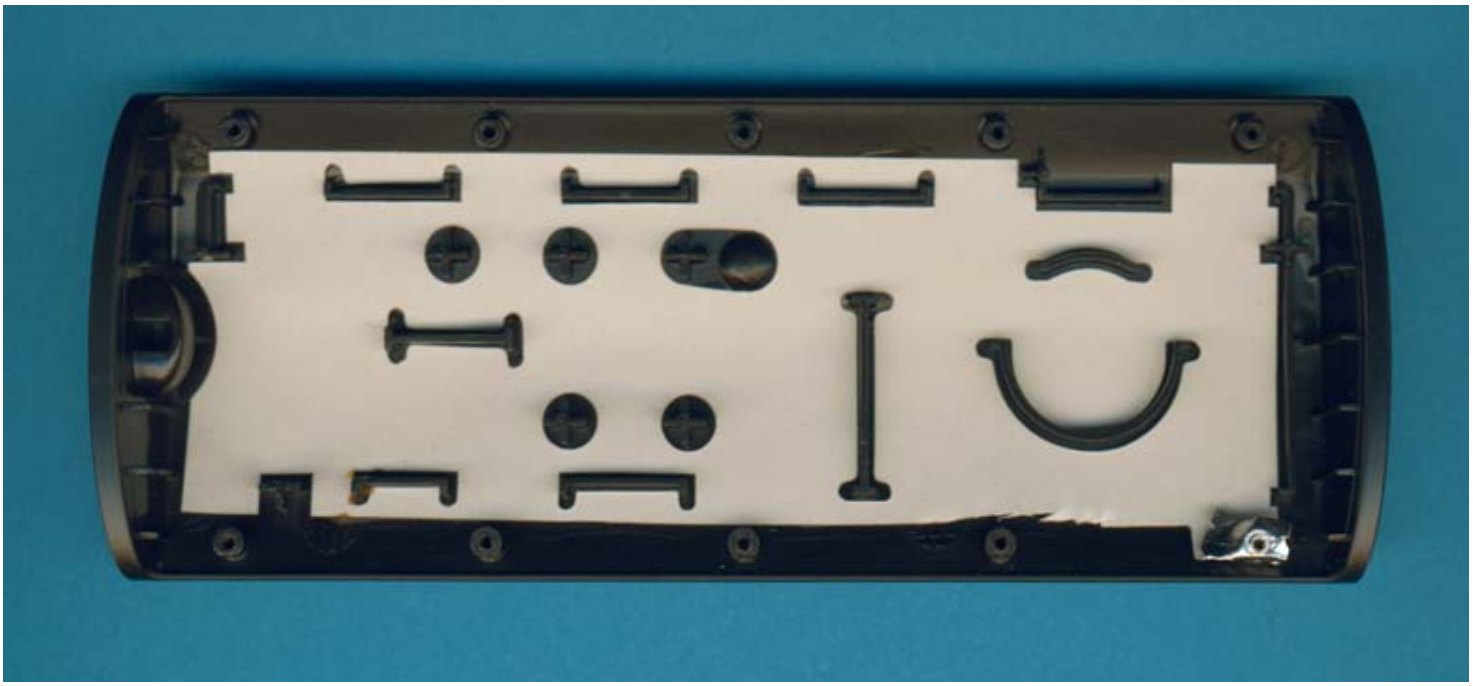
Gene,

You are wrong - and I'm not kidding. The Datamath Calculator Museum is a serious business and we recently reverse engineered the successor of the HP 41C.

After removing no less than 10 (typical HP quality!) screws from the calculator and dismantling it completely I was shocked!

The mold of the calculator frame had a SMILEY embedded:





So what?

Cheers,

Joerg

in response to message #3 by Joerg Woerner

What?! There's no double-wide Enter key. Is it RPN or RPL? How deep is the stack? Does it support IR, SD, serial or USB? Is it LED or LCD? ;-)

Remember, a smile is an upside down frown.

Regards,

John

HP-12C mini-challenge - Heegner numbers

*Message #1 Posted by **Gerson W. Barbosa** on 22 Mar 2011, 7:30 p.m.*

Heegner Numbers is a finite set of integer numbers which share some interesting properties. They were discovered by Gauss who conjectured there were only nine of them {1, 2, 3, 7, 11, 19, 43, 67, 163}, what was eventually proved by Stark and Heegner.

The challenge is to write an HP-12C program that displays these nine numbers, one at a time, using 22 steps or less (final GTO 00, if necessary, included). For example:

```
GTO 00 R/S   =>     1
       R/S   =>     2
        .            .
        .            .
        .            .
       R/S   =>    67
       R/S   =>   163
       R/S   =>   9.999999E99 (to indicate 163 is the last number in the set)
```

The displaying of the last result above is not required, provided the program stops when the last Heegner number is shown.

Have fun! :-)

Gerson.

Re: HP-12C mini-challenge - Heegner numbers

*Message #2 Posted by **Kiyoshi Akima** on 23 Mar 2011, 2:01 a.m.,*
in response to message #1 by Gerson W. Barbosa

I suppose a program like RCL 1 : R/S : RCL 2 : R/S ... RCL 9 : R/S doesn't qualify.

Re: HP-12C mini-challenge - Heegner numbers

*Message #3 Posted by **Paul Dale** on 23 Mar 2011, 2:31 a.m.,*
in response to message #2 by Kiyoshi Akima

Come on, we can do neater:

```
1 R/S 2 R/S 3 R/S 7 R/S 11 R/S 19 R/S 43 R/S 67 R/S RCL 0 GTO 00
```

Where 163 is stored in register 0.

22 steps exactly.

I've had no luck solving this one properly. Not yet at least. I can't think of a generating function for the tail of the sequence. Likewise, I can't see how to save two keystrokes...

- Pauli

Re: HP-12C mini-challenge - Heegner numbers

*Message #4 Posted by **C.Ret** on 23 Mar 2011, 5:01 a.m.,*
in response to message #1 by Gerson W. Barbosa

Here is my humble attempted RPN code to display the nine Heegner's numbers. Nearly adapted for an HP-12C , without any guaranty, since I have no HP12C at hand to verify.

Initialisation

```
 4122175134. STO 01
           1. STO 00
```

Usage:

```
GTO 00 R/S
1.     R/S  2.     R/S  3.     R/S  7.     R/S  11.    R/S
19.    R/S  43.    R/S  67.    R/S  163.   R/S  Error
```

Divide by zero 'Error' statment indicates end of Heegner's integer list.

Program:

```
01 * LBL 00
02   RCL 00
03   STO/ 01
04   R/S
05 * LBL 01
06   1
07   STO+ 00
08   RCL 01
09   RCL 00
10   /
11   FRAC
12   x==0 ?
13   GTO 00
14   LAST x
15   INT
16   x==0 ?
17   1/x
18   GTO 01
```

Edited: 23 Mar 2011, 5:03 a.m.

Re: HP-12C mini-challenge - Heegner numbers

*Message #5 Posted by **Paul Dale** on 23 Mar 2011, 5:27 a.m.,*
in response to message #4 by C.Ret

Converted for the 12c:

```
01-      45 0  RCL 0
02-   44 10 1  STO/ 1
03-        31  R/S
04-         1  1
05-   44 40 0  STO+ 0
06-      45 1  RCL 1
07-      45 0  RCL 0
08-        10  /
09-     43 24  FRAC
10-     43 35  x=0
11- 43,33 01  GTO 01
12-     43 36  LSTx
13-     43 25  INTG
14-     43 35  x=0
```

```
15-        22  1/x
16- 43,33 04  GTO 04
```

So 16 steps plus two registers is the smallest so far.

- Pauli

Re: HP-12C mini-challenge - Heegner numbers

*Message #6 Posted by **Namir** on 23 Mar 2011, 7:54 a.m.,*
in response to message #5 by Paul Dale

Starting with the products of all the Heegner numbers and then using integer division tests certainly works, but I have a feeling it's NOT what Gerson had in mind.

The approach used by the last two listings basically works for any sequence of prime numbers.

:-)

Namir

Re: HP-12C mini-challenge - Heegner numbers

*Message #7 Posted by **Gerson W. Barbosa** on 23 Mar 2011, 10:58 a.m.,*
in response to message #6 by Namir

Playing with the product I've found it is equivalent to

```
'744*(744^2*(10+7/744)-(10+17/744))-1' =

'744*(10+7/744)*(744^2-1)-11' =

'744*(744*(744*10+7)-10)-18'
```

None of these will help towards a better solution though.

In terms of memory usage, each storage register is equivalent to seven steps. However, since I made no restriction about that I think all solutions that have been presented here are valid. Thanks everyone for the interest!

My program uses one register, no initialization and takes up 22 steps, only two shorter than what would be required to just listing the numbers (1 R/S 2 R/S . . . 163 GTO 00).

By the way, it would be nice if there were a neat formula in the OEIS sequence. :-)

Regards,

Gerson.

Re: HP-12C mini-challenge - Heegner numbers

*Message #9 Posted by **Gerson W. Barbosa** on 23 Mar 2011, 6:57 p.m.,*
in response to message #8 by Paul Dale

Well, I checked OEIS prior to trying to find a pattern. The first differences was the next idea. This shows a feeble pattern, but again no formula:

http://oeis.org/A038551

I have used this to get a recurring formula for the fourth Heegner number ownards. No mathematical meaning, but it works.

Gerson.

Re: HP-12C mini-challenge - Heegner numbers

*Message #10 Posted by **Thomas Klemm** on 24 Mar 2011, 4:03 a.m.,*
in response to message #9 by Gerson W. Barbosa

I'm using recursive formulas of the form: $x_{n+1} = a\,x_n + b\,x_{n-1} + c$

- A: $x_{n+1} = 4\,x_{n-1} - 1$
- B: $x_{n+1} = 4\,x_n - 2\,x_{n-1} - 11$
- C: $x_{n+1} = (-\,x_n + 9\,x_{n-1} + 6)/2$

These produce just the next three elements correctly but they may be combined to achieve the whole list of Heegner numbers:

```
A:      1      2      3      7     11     27    ...
B:      3      7     11     19     43    123    ...
C:     11     19     43     67    163    223    ...
```

```
 01>LBL "Heegner"    12>LBL C            24>LBL A            32>LBL B
 02 1                13 X<>Y             25 X<>Y             33 ENTER
 03 STOP             14 9                26 4                34 ENTER
 04 2                15 *                27 *                35 +
 05 STOP             16 RCL Y            28 1                36 R^
 06 XEQ A            17 -                29 -                37 -
 07 XEQ A            18 6                30 STOP             38 ST+ X
 08 XEQ B            19 +                31 RTN              39 11
 09 XEQ B            20 2                                    40 -
 10 XEQ C            21 /                                    41 STOP
 11 XEQ C            22 STOP                                 42 END
                     23 RTN
```

Well, not exactly for the HP-12C but you still might like the solution.

Cheers
Thomas

Edit: Replaced PROMPT by STOP as suggested by Namir below.

in response to message #10 by Thomas Klemm

Thomas,

I like your very elegant solution as it uses two simple values to initialize the sequence and then employed recursive relations to calculate the rest of the sequence numbers. I ran it on my 41CX (replacing PROMPT with R/S) and got the Heegner numbers. I also like the way it ends wihout using errors.

Namir

in response to message #11 by Namir

> Quote:
>
> I also like the way it ends wihout using errors.

So do I. Also, when the program stops at 163 the next R/S displays it again so as to confirm this is really the last number in the sequence. In my first version, written on the HP-32SII, after the last number the sequence would cycle again. I've changed to the 12C because on the 32SII the program required one third more memory than when just displaying the numbers. However, in order to save a couple of steps I had to resort to using an overflow error to stop to program.

Looks like I haven't succeeded in turning this minor shortcoming in an advantage :-)

```
HP-32SII program

B01 LBL B
B02 1
B03 STOP
B04 2.007
B05 STO N
B06 IP
B07 STOP
B08 3

*Message #13 Posted by **Gerson W. Barbosa** on 24 Mar 2011, 9:08 a.m.,*
in response to message #10 by Thomas Klemm

Thomas,

Interesting recursive formulas albeit they don't allow for less memory usage when compared to just displaying the list.

I am not sure whether mine is a true recursive formula though. Not so useful as one third of the elements of such a small set has to be predefined.

Cheers,

Gerson.

```

Re: HP-12C mini-challenge - Heegner numbers

*Message #14 Posted by **Gerson W. Barbosa** on 24 Mar 2011, 10:48 a.m.,*
in response to message #13 by Gerson W. Barbosa

I think this is the proper way to write it:

$h_{n+1} = h_n + 4*(Floor(3/5*n)!)$

3/5, 5/8, 8/13, 13/21, 21/34... would work as well, but 3/5 or .6 is more compact.

A little trivia involving 163:

EVAL these on the HP-48/50g

```
'(163/3)^2*(5/2+1/(2/5*163^2))'

'pi!!'
```

Re: HP-12C mini-challenge - Heegner numbers

*Message #15 Posted by **Thomas Klemm** on 24 Mar 2011, 12:57 p.m.,*
in response to message #14 by Gerson W. Barbosa

My first attempt was to use the continued fraction:

```
1+1/(2+1/(3+1/(7+1/(11+1/(19+1/(43+1/(67+1/163)))))))) =
7,300,315,266/5,100,342,683
```

But unfortunately the accuracy of the HP-12C is not sufficient. However it works with Free42. The program in the main loop would be very short:

```
FRAC
1/X
```

Another idea would be to use the #RAN function of the HP-11C/15C with a well chosen seed. Thanks for the challenge. They are always inspiring.

Best regards
Thomas

Re: HP-12C mini-challenge - Heegner numbers

*Message #16 Posted by **Gerson W. Barbosa** on 24 Mar 2011, 1:56 p.m.,*
in response to message #15 by Thomas Klemm

I've checked your idea manually on WP-34s and it worked up to 67.

The Monte Carlo approach would qualify if the HP-11C were allowed. However you'd need a fast simulator to find a suitable seed.
Unfortunately Nonpareil doesn't offer a maximum speed option.

> Quote:
>
> Thanks for the challenge. They are always inspiring.

You're welcome. The best part of these challenges it they sometimes yield unexpected by-products.

Best regards,

Gerson.

Re: HP-12C mini-challenge - Heegner numbers

*Message #17 Posted by **Gerson W. Barbosa** on 23 Mar 2011, 6:32 p.m.,*
in response to message #5 by Paul Dale

C.Ret's program can be shortened even more:

```
01-        1  1
02-   44   0  STO 0
03-   45   0  RCL 0
04-44 10   1  STO/ 1
05-       31  R/S
06-   43   3  n!
07-        1  1
08-44 40   0  STO+ 0
09-   45   1  RCL 1
10-   45   0  RCL 0
11-       10  /
12-   43  24  FRAC
13-   43  35  x=0
14-43,33  01  GTO 03
15-43,33  04  GTO 07
```

One step and one initialization less if 9.999999e99 after 163 instead of Error is not a concern.

Gerson.

Re: HP-12C mini-challenge - Heegner numbers

*Message #18 Posted by **Gerson W. Barbosa** on 26 Mar 2011, 10:07 a.m.,*
in response to message #1 by Gerson W. Barbosa

I haven't been able to make my HP-12C any shorter than the 22-step program I presented ealier. However, I've come up with a nicer algorithm (not necessarily less memory consuming though). I've noticed the last seven Heegner numbers can be expressed as:

```
  3 =  1*4 - 1
  7 =  2*4 - 1
 11 =  3*4 - 1
 19 =  5*4 - 1
 43 = 11*4 - 1
 67 = 17*4 - 1
163 = 41*4 - 1
```

Notice that 2, 3, 5, 11, 17 and 63 in the sequence of multiplicands above are the Euler's lucky numbers. Since there is not a formula for them this doesn't help much. However, the first differences of the terms of that sequence (1, 1, 2, 6, 6, 24) can be determined by a simple formula:

```
a(n) = (Floor(3*n/4))!, n=1..6)
```

The following HP-71B BASIC program illustrates the algorithm:

```
10 DESTROY ALL @ DISP 1 @ DISP 2
20 A=1
30 FOR N=1 TO 7
40 DISP 4*A-1
50 B=FACT(IP(3*N/4))
```

```
60 A=A+B
70 NEXT N
>
>RUN
 1
 2
 3
 7
 11
 19
 43
 67
 163
>
```

Here is an equivalent 22-step HP-12C program:

```
01- CLEAR SIGMA    ; R2 <- 0
02- SIGMA+         ; R1 <- 1
03- R/S
04- 2
05- R/S
06- 1
07- STO+ 2
08- RCL 1
09- 4
10- *
11- 1
12- -
13- R/S            ; 167! will cause the
14- n!             ; program to stop here
15- RCL 2
16- 9
17- 12/            ; 3/4
18- *
19- INTG
20- n!
21- STO+ 1
22- GTO 06
```

Thanks again to all participants. I hope you have enjoyed.

Gerson.

Solving a cubic equation using trigonometry
*Message #1 Posted by **Thomas Klemm** on 22 Mar 2011, 4:57 a.m.*

A while ago I've posted a program that uses *ACOSH* to solve a quadratic equation:

Short Quadratic Solver (HP-42S) Message #29

Recently I stumbled across a way to solve a cubic equation using trigonometry. Some of you might find that interesting as well.

Cheers
Thomas

Equations

A general cubic equation can be transformed to the following form using a substitution:

$$x^3 + px + q = 0$$

The trick is to use the following identity:

$$\sin 3\theta = 3\sin\theta - 4\sin^3\theta$$

Here we set:

$$x = \sin\theta$$

With the following substitution we can get a closed-form solution:

$$3r = p$$

$$2s = q$$

$$x = 2\sqrt{-r}\sin\frac{1}{3}\sin^{-1}\frac{s}{\sqrt{(-r)^3}}$$

A similar formula can be found using the following identity:

$$\sinh 3\alpha = 3\sinh\alpha + 4\sinh^3\alpha$$

$$x = -2\sqrt{r}\sinh\frac{1}{3}\sinh^{-1}\frac{s}{\sqrt{r^3}}$$

Indeed, the presented formula shows a "depressed cubic".

in response to message #1 by Thomas Klemm

Last fall I spent much time studying the solution of polynomials, from cubic and up. I spent a lot time looking at the algorithms that solve general cubic polynomials. I used Matlab as the primary tool and then attempted to port solutions to Excel VBA and the HP41C.

I came to the conclusion that to solve cubic polynomials you best need a tool that automatically handles complex numbers. Matlab does that well and the graphing HP calculators too (although I only used PROOT to do that and wrote about it in the HP's SOLVE newsletter). The HP-42S is probably useful. J.M. Baillard has developed really cool HP41C programs that solve for the roots of polynomials (with real and complex coefficients. You can find them on this web site's HP41C program library section.

Like the 41Z module perhaps? :-)

Well, notwithstanding all the references you mention (well worthy of their effort) the 41Z includes ZPROOT, adapted from Valentin Albillo's original program for the 41.

We can combine this with a synthetically dividing the cubic equation by the root and then use the quadratic formula to find the other two roots.

Very nice.

Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional

*Message #1 Posted by **Sujith Abraham** on 22 Mar 2011, 4:50 a.m.*

Hi HP Fans!

A friend recently saw my HP 30b and asked me whether I know about HP 12CP and TI BA II Pro (CFAI approved calculators). Since no one here has even heard about calculators made by anyone other than Casio, he thought I could help.

But I don't know a thing about those two machines. Hope you guys can throw some light on which way to go.

From my reading it appears that the *new* 12CP is as fast as the TI. What about the functions? Are they equal or one has more functions than the other?

The input method is OK, he tried RPN on my 35S and 30b and he is open to learning it.

What about programming? Any good programs that may be useful for CFA exams on the HP 12C?

I know that Gene coaches for CFA exams. So I am waiting for your suggestions :-)

- SA

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional

*Message #2 Posted by **bink** on 22 Mar 2011, 6:22 p.m.,*
in response to message #1 by Sujith Abraham

I did the CFA a couple of years ago and used the 12C, and also helped a friend with the TI, so got to know that.

I preferred using the 12C - the types of calculations common to the CFA, such as interest rate conversions, compounding, etc, seem to be easier to execute on the 12C.

Regarding CFA programs, you cannot take any programs into the exam, as all calculators must have the memory cleared beforehand. The proctors are quite strict about enforcing the rules, so don't count on any programs. Regardless, I don't think there are any programs that would be of use, since the questions are generally basic.

> ---

You may be right about that, but I wonder if the proctors are knowledgeable enough to know how to clear program memory on the 12c. Do they know you have to be in program mode first? If not, you could pull a fast one on them!

Don

> I preferred using the 12C - the types of calculations common to the CFA, such as interest rate conversions, compounding, etc, seem to be easier to execute on the 12C.
> ---

The TI financials, both models, are much more feature-packed than the 12c series. The only thing I don't like about them is that they aren't RPN. However, they have built-in interest conversion functions that are extremely easy to use (as easy as the 30b). They also can be set for different compounding and payment frequencies, just like the 30b. The 12c requires jumping through a bunch of hoops to perform interest conversions and asynchronous compounding.

The TIs even have much more robust statistical function set than the 12c series.

The Professional model also has with the ability to calculate MIRR and bond duration.

If I were to take the CFA right now, I would use a TI BA II Plus Professional. However, I would wish that my 30b were allowed.

Regards,

Mark

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional

*Message #6 Posted by **Sujith Abraham** on 23 Mar 2011, 3:29 p.m.,*
in response to message #5 by Mark Harman

So, on sheer feature set TI is better than 12C and 12CP. If someone can live without RPN they should simply choose TI, right?

Another unrelated doubt is why is CFAI not allowing any other calculators other than theese two models? Any ideas?

- SA

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional

*Message #7 Posted by **Mark Harman** on 23 Mar 2011, 5:32 p.m.,*
in response to message #6 by Sujith Abraham

Sujith,

Yes, if someone can live without RPN, the TI *might* be the better choice. It all depends on how comfortable you are with your math ability and memorization of certain formulas. If you can memorize the steps for interest conversions on the 12c, then it might not benefit you much to switch to a TI - especially if you can fly along with RPN. Also, the 12c doesn't have menus to have to worry about - all features are displayed on the keyboard. Even solving for any TVM variable on the TI takes an extra step since you have to press CPT. That hassle isn't a feature on the HPs.

In practice, I am not against owning multiple calculators and I do have more than a few. I haven't dumped my TI just because I plan on taking the CFA exam sometime in the next year or so. Still, a 12c is a tempting option just based on the RPN aspect alone.

CFAI doesn't allow other calculators because the logistics of tracking a multitude of different calculators is tedious. It is easier to keep it down to the two versions of each of the allowed models thus keeping things simple for the exam proctors . However, with the fact that the recent 12c's are ARM-powered and can be repurposed, I wonder if some ambitious and technically savvy user might be tempted to create and load an extended feature set. Personally, I've always felt that the 12c lacks in many ways. It would be nice if it could have built-in interest conversion, nPr, nCr, and other features to make it at least on parity with the TIs. I think that a person who could combine the elegance of the 12c layout and its RPN input with the features of the TI could have a tremendous advantage in an exam setting. At the same time, there are ethical implications to this regardless if it results in having no more features than the TI.

I think the ability to update the flash memory might possibly be considered a huge drawback by the CFAI. I have to wonder if they will ever take notice of this possibility and eventually press HP to create a version without the pogo port.

Regards,

Mark

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #8 Posted by **bink** on 23 Mar 2011, 7:54 p.m.,*
in response to message #7 by Mark Harman

Some further points:

1. The calculator functions used on the exam are limited, and most calculations are very simple, so the additional feature set of the TI is of little or no use.

2. The speed of the original 12C is not a limiting factor for the CFA exam. I don't think you should be concerned at all about the speed differences for the purposes of the exam.

3. Specifically regarding interest rate conversions: Doing them on the HP is trivial, and from my experience showing someone how to use the functions on the TI, this takes longer. Regardless of this, understanding interest rate conversions is quite an important skill, and also one which is simple to learn. I highly recommend learning this and being able to do them on the HP 12C, it will save you time and simplify more complex calculations further down the road.

4. If you look around trading floors, you will see more HP 12C calculators than any other.

Let me know if you have any specific questions.

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #10 Posted by **bink** on 24 Mar 2011, 2:29 a.m.,*
in response to message #9 by Sujith Abraham

Re interest rate conversions, they are trivial, and far more easily executed with simple steps as part of a larger calculation, than entering them longhand into a TI function.

Two basic types - converting into annual equivalent or into a periodic equivalent.

Q: Interest rate is 9% compound monthly. What is the effective annual rate.

HP Shortcut:

.09 <Enter> 12 / 1 + 12 y/x

This spits out 1.0938, and you can subtract 1, but the result is clearly 9.38%

Q: Effective annual rate is 5%. What is the rate compounded quarterly.

HP Shortcut: 1.05 <Enter> 4 1/x y/x 4 x

You could also just enter 0.25 instead of the reciprocal of 4, but I wanted to show the method for generalized periods.

This gives 4.0488, and the answer is 4.88% You could take the extra step of subtracting 1 after the y/x to give you 0.0488 if the leading 4 is confusing.

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #11 Posted by **Mark Harman** on 24 Mar 2011, 5:18 a.m.,*
in response to message #10 by bink

bink,

I am curious why you consider the TI method to be "longhand."

For your first example, using the TI:

2ND 2 (to get into ICONV menu)

9 Enter (for NOM) Up 12 Enter (for C/Y) Up CPT (to compute EFF)

The answer for your second example you posted is incorrect. It should be 4.91%. However, your method is correct. Perhaps, you miskeyed or something...

For your second example, using the TI:

Down 5 Enter Down 4 Down CPT

Now, the shortcuts you gave are good and I am familiar with both of them. But, the TI method is more straightforward, less confusing, and uses fewer keystrokes. Not only that, I can extend this further to easily solve, for example, conversions involving asynchronous compounding.

For example: What is the rate of 5% account that compounds quarterly with monthly deposits?

5 enter up 4 enter up CPT down 12 enter down CPT

4.97931 is the answer - 13 keystrokes

Combining the shortcuts for the HP yields the following solution:

.05 enter 4 / 1 + 4 y/x 12 1/x y/x 12 x

12.0497931 - 17 keystrokes

Regards,

Mark

*Message #12 Posted by **bink** on 24 Mar 2011, 5:48 a.m.,*
in response to message #11 by Mark Harman

Mark,

Thanks for pointing out the error - I didn't have my HP handy, so I used something else for the numbers.

The TI / HP comparison I did was some time ago, but aside from finding RPN better for calculations, I don't find the manual approach onerous, plus I prefer not digging through menus.

Also, I find it easier to incorporate these techniques into a more complex calculation, rather than refocusing on using the menus. I didn't get into the TI, though I still have it as my friend ended up abandoning it, since they didn't like it either (they initially got it because they didn't want to learn RPN).

Actually, I also prefer the landscape format of the HP12C. I looked at the new 30B, but the fact that some important functions have been moved to menus, keeps me using the 12C.

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #13 Posted by **Mark Harman** on 24 Mar 2011, 2:23 p.m.,*
in response to message #12 by bink

I suppose we have to go with what is best for us personally. I don't have a problem with that, either.

I prefer using a 30b over either the TI or the 12c. The 30b combines elegance of RPN with a robust feature set. Because I use my calculator for so much more than what the function set of the 12c provides, it is essential that I have features that do what I need. The only reason why the 30b has so many features in menus is simply because the sheer number of features prevents it from having all the features on the keyboard similar to the 12c. By the way, what are the important functions do you use that have moved to menus?

I do like the landscape format of the 12c, but I also like the portrait format of the 30b, as well. This isn't a deal breaker for me.

If you don't mind me asking, what more complex calculation are you taking about regarding the techniques for interest conversion? I'm interested in knowing more.

Regards,

Mark

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #14 Posted by **bink** on 25 Mar 2011, 3:49 a.m.,*
in response to message #13 by Mark Harman

Mark,

I am not familiar with asynchronous compounding so I looked it up and found an interesting paper, not sure if you have seen it:

http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1001145&http://www.google.com/url?sa=t&source=web&cd=1&ved=0CBMQFjAA&url=http%3A%2F%2Fpapers.ssrn.com%2Fsol3%2FDelivery.cfm%2FSSRN_ID1001145_code341122.pdf%3Fabstractid%3D1001145%26mirid%3D1&rct=j&q=asynchronous%20interest%20compounding&ei=Y0aMTeLLEoyCvgOy55SeDQ&usg=AFQjCNH4cOyfx96ONM4CB1JoK8OMxofl8Q

Anyway, the calculations I refer to are just general calculations where part involves converting rates. For example, swap rates where different conventions are used.

The layout of the 30B I dislike, compared to the 12C is as follows:

- STO key is shifted - I use STO/RCL a lot.

- y/x and 1/x also shifted - used a lot for interest calculations.

- Stat functions and Day changes buried in menus (as I understand it).

(Sorry if formatting is off, program doesn't like carriage returns).

Other differences I don't remember at present, but I wish they had an extra row of keys, and an extra shifted function set (like the 12C with the f and g shifts)

I also don't understand why they have trig functions on the main keys - if anything, these should be in menus. I mean, I haven't seen NPV functions prominently used on a scientific calculator.

Granted, the 30B may be simpler to use, but for everyday use as a supplement to a computer, I prefer the 12C.

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #15 Posted by **gene wright** on 25 Mar 2011, 9:43 a.m.,*
in response to message #14 by bink

Remember a couple of things:

1) The keyboard of the 30b can be fairly easily redefined to "assign" a function in a menu to a key location. If you don't like the trig functions (which I suspect are there to let people KNOW they are there), and would prefer to have DATE and DDAYS on the keyboard instead, that is easy enough to do. Make the machine like you want it. Same thing with STAT functions. Want mean and standard deviation on the keyboard? Easy. This is described in the 30b learning modules with examples.

2) After having used the 12c for nearly 30 years, authored a textbook, and even taught college classes in finance with it, I'm well aware of doing things the "periodic interest" way as well as converting interest rates the way the 12c requires. However, I do believe that interest rate conversions are easier done with the ICONV approach on the 30b.

3) The shifted STO issue is one that is brought to HP's attention quite a bit at HHC conferences. It seems the view is that people tend to store less often than recall, so they do it this way.

4) The 30b is the first HP financial model that a college student could buy and use for all their classes...business, biology, chemistry, math, etc. That's one reason it is done as an "all in one" model.

5) Keep in mind the incredible extra features the 30b has compared to my beloved 12c. Such as...

Built-in probability distributions and inverses for FOUR distributions. Wow. Standard error of the mean, covariance (a first!), multiple regression models, black scholes, MIRR, and lots more.

I understand your dislikes. Truly. I think many of them can be "fixed" using the abilities of the 30b.

I rarely pick up my 12c any longer. I cried a lot at first, but much less now. :-)

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #16 Posted by **bink** on 31 Mar 2011, 10:33 p.m.,*
in response to message #15 by gene wright

Gene,

One of the great things about the 12C is it's ubiquity in finance, so you can pick up any 12C on someone's desk and use it, without worrying about key assignments. That is a disadvantage of the 30B, in that you could use a 30B without knowing that functions have been reassigned.

At least the HP41 series had an overlay with adhesive labels to show function reassignments.

Re: Calculator for CFA; HP 12C Platinum or TI BA II Plus Professional
*Message #17 Posted by **Mark Harman** on 1 Apr 2011, 2:10 a.m.,*
in response to message #16 by bink

I don't think it is a disadvantage of the 30b if one is doesn't use top-level or shifted keys when doing the assignments... All of my functions and programs that I need assigned to keys are assigned using shift-hold instead of shift. Plus, it really isn't reassigning, because the parent location of the function usually stays the same. Meaning, for example, that Pi, probability distributions, etc, will still be in the math menu even if you assign them to a key.

I would agree that if you assign functions as being top-level or shifted, then it might create some confusion. However, having them be shift-hold functions would make no one know any differently.

Mark

What I mean is that if I pick up someone else's 30B, I don't know how their functions are set up, and I probably cannot use it the way that I have set mine up. Even if I use mine without assignments, it is possible that their calculator has been customized.

This is a disadvantage.

In a commercial environment (i.e. bank, brokerage house, etc) people often pick up any calculator on a desk.

Exactly! I often do exactly this as do so many other people. I think that this is exactly the reason why it's still such a big seller for HP after almost 30 years.

It's a standard, important desk accessory in finance, much like a stapler.

Don't know about the speed relative to the TI. But AFAIK the only *new* 12CP(latinum) is the one with the black body and brushed "chrome" bezel. The original 12CP was all chrome. I don't think there is any speed difference between the two.

OHOH the new*12C* with two cells is significantly faster.

> Quote:
>

OK, but don't forget the 12CP has *both* RPN *and* ALG. The 12C is *only* RPN.

*Message #24 Posted by **Martin Pinckney** on 22 Mar 2011, 11:46 p.m.,*
in response to message #23 by Sujith Abraham

There's the original 12c, which has always been RPN only. It has the gold-colored bezel. This was updated a couple years ago with a new processor which runs many times faster than the older version.

Then there's the 12CP (Platinum), which has both RPN and algebraic modes. The first version of this was all silver-colored on the front. It came out about 7(?) years ago. Then it was revised about 4 years ago to have a black keyboard and silver bezel. This one is faster than the original 12C above, but not nearly so fast as the upgraded 12C.

There's a huge amount of info on these variations in previous posts on this forum, but here you have it in a nutshell.

Collection is online

*Message #1 Posted by **Keith Midson** on 22 Mar 2011, 12:21 a.m.*

Hi all, i've been busy uploading a portion of my collection onto Flickr recently. Originally I intended to just upload my clear cased HP's, but i've added many of my HP's, some Sharps and Casios as well. I thought it would be better to share this with everyone than just have it all sitting in my office. I will keep uploading photos over the next few months or so.
http://www.flickr.com/photos/60529780@N02/
Enjoy!
Cheers, Keith

I am speechless :-D

Re: Collection is online

*Message #5 Posted by **Michael de Estrada** on 22 Mar 2011, 1:53 p.m.,*
in response to message #1 by Keith Midson

Beautiful collection! I especially like the clear cased prototypes. I also have a Sharp PC-1211 that is still functional, however, sadly the orange LCD display is bleeding badly. I did find a Radio Shack TRS-80 Pocket Computer (made by Sharp for Radio Shack) with a good display to replace it. I also have the Sharp CE-122 Printer and Cassette Interface for it. I didn't see any Woodstocks in your Flickr photos; do you have any? No collection would be complete without a few Woodstock models.

Re: Collection is online

*Message #6 Posted by **Keith Midson** on 22 Mar 2011, 4:02 p.m.,*
in response to message #5 by Michael de Estrada

Thanks Michael, the Woodstocks are coming! I've got a 21, 25, 27 & 29c to upload. Also got the Tandy/Radio Shack series - my first pocket computer was the PC8 in about 1988 - probably the worst one of the series! Cheers, Keith

Re: Collection is online

*Message #7 Posted by **Keith Midson** on 22 Mar 2011, 7:08 p.m.,*
in response to message #5 by Michael de Estrada

There you go Michael - just added 25, 27 & 29C. I should have transferred the battery pack from the 27 to show the others working. I might even put up a non-HP RPN or a TI just to mix it up. Cheers, Keith

Re: Collection is online

*Message #8 Posted by **Xavier A. (Brazil)** on 22 Mar 2011, 8:49 p.m.,*
in response to message #7 by Keith Midson

Very nice collection! Congratulations!

BTW, I am intending to store/show some HP calcs in wood boxes, and wondering what type of inner foam I could use.

Keith, how did you get your HP-12c woodcase (or did it, or transform it, etc.)?

I would be very happy to read you about this particular aspect of your collector habits.

Re: Collection is online

*Message #9 Posted by **Keith Midson** on 22 Mar 2011, 9:12 p.m.,*
in response to message #8 by Xavier A. (Brazil)

Thanks Xavier, I bought this from TAS a few years ago from someone in the UK. They had a few of them and they were a promotional HP special from memory. It was quite expensive for a humble 12C - I will post another photo of it for you. The foam is quite firm and is covered in a black silk. Cheers, Keith

Re: Collection is online

*Message #10 Posted by **Xavier A. (Brazil)** on 22 Mar 2011, 9:37 p.m.,*
in response to message #9 by Keith Midson

Thank you for this answer.

Well, if I have to spend some time on building a wood case, I might understand this work got its price, above all for a perfect result!

My problem is now to understand foam "industry", or "know-how". Is it complex/easy to do? What does it require as material/machines, etc.? Can it be found easily? and so on...

I would appreciate your new picture, thank you.

Re: Collection is online

*Message #11 Posted by **Keith Midson** on 22 Mar 2011, 10:11 p.m.,*
in response to message #10 by Xavier A. (Brazil)

Sounds like a good plan. I've uploaded some more photos that give you a better idea. Interestingly I keep a large portion of my collection in high quality wooden chocolate boxes. Cheers, Keith

Re: Collection is online

*Message #12 Posted by **Xavier A. (Brazil)** on 23 Mar 2011, 7:44 a.m.,*
in response to message #11 by Keith Midson

Nice picture, thank you Keith.

Re: Collection is online

*Message #13 Posted by **Dave Shaffer (Arizona)** on 23 Mar 2011, 12:26 p.m.,*
in response to message #11 by Keith Midson

High quality chocolate or high quality boxes!? Might help get the wife on board for adding to your collection!

Nice pictures - I teach PHOTO 101 occasionally at the local university and know how hard it is to get such nice lighting. Do you use a light box, soft box, photo diffusers, or ...?

Re: Collection is online

*Message #14 Posted by **Keith Midson** on 24 Mar 2011, 3:44 a.m.,*
in response to message #13 by Dave Shaffer (Arizona)

Thanks Dave, they are just happy snaps from within my office! The diffuse lifting is a combination of natural light from the nearby windows and flouro lights above. You can actually see the reflection of the flouro lights in some of the photos. I do a bit of photography though - one of my other hobbies. Cheers, Keith

Re: Collection is online

*Message #15 Posted by **Keith Midson** on 24 Mar 2011, 3:46 a.m.,*
in response to message #13 by Dave Shaffer (Arizona)

... And the boxes are wood - they used to have German chocolates in them. My wife's parents own two boutique chocolate shops, so life is good! Cheers, Keith

Re: Collection is online

*Message #16 Posted by **Jeroen Van Nieuwenhove** on 23 Mar 2011, 9:09 p.m.,*
in response to message #11 by Keith Midson

Those are nice pictures indeed. Can I make one suggestion? Use a tripod and decrease the aperture of your camera (i.e. increase the f-number) to increase the depth of field (DOF). All the keys, as well as the screen of the calculator should be reasonably sharp. Something like f/9 or f/11 should do, depending on your distance to the object.

Re: Collection is online

*Message #17 Posted by **Keith Midson** on 24 Mar 2011, 3:48 a.m.,*
in response to message #16 by Jeroen Van Nieuwenhove

Hi Jeroen, I will do this. Some pictures I took in a hurry (especially the Woodstocks which I took for Michael!). I've got the tripod in the office now and have another batch of calculators lined up for photos. Cheers, Keith

HP 71B, lurking, thanks and other stuff

*Message #1 Posted by **geoff quickfall** on 21 Mar 2011, 9:23 p.m.*

Hello all,

firstly, thanks to everyone that has lent me a calculator/s for repair for the book. I will be in touch shortly (Gene, DB, Mike and etc...). I have been a lurker here, sporadically as this year has been extremely busy!

Most of the book is done, but every time I get going, something happens, home, work, family...and you PEOPLE. Stop comming up with MORE novel fixes!!!

Just came off a 3 week course on the B777 which interupted the March book and calculator schedule. Suffice to say, I will be in touch, and the book, well, I am aiming for San Diego. I will be there by hook or by crook!

Speaking of the book the Titan chapter is now complete and here are some shots an HP 71B with the following:

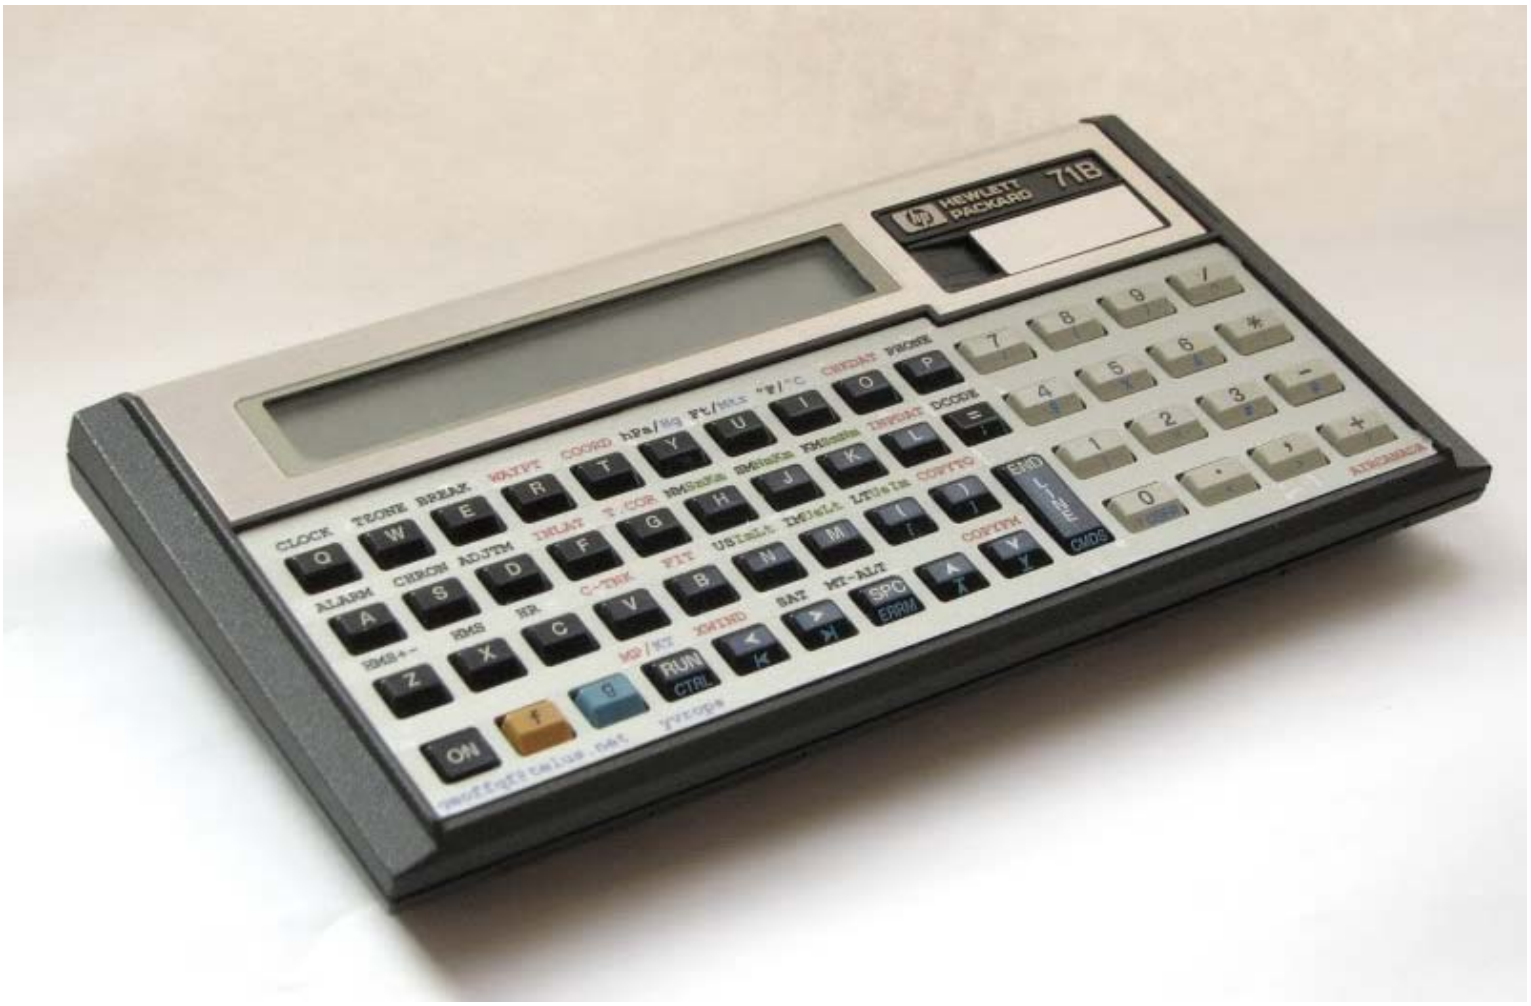
- HP71:1BBB CLK:A HMS:A HPIL:1A MATH:1A - two 32K RAM modules - math ROM - HPIL - Card reader - Customized overlay for the 'office'

I was given four beaters to work with for the titan chapter and one of the projects was to scavenge two 4K rams from one unit and piggy back them to another creating a larger built in RAM, and documenting it. Plus an LCD screen swap from one with a destroyed keyboard to another with a bad LCD but pristine keyboard. Similar to the HP 15C swap just posted lately. Also a repair involving the newer version keyboard to logic board connection.

here are the 71B images:

plan view with overlay used at work. Overlay printed on 'clear label' media then sliced with razor and placed on the overlay.

artsy quarter view of the 71B with overlay



artsy quater view of the 71B without overlay. I prefer the older version with the metal back as the yellow 'F' labels are more visible then the newer versions:

Looking forward to San Diego and returning all the lent items to their rightful owners.

Cheers all, Geoff

Re: HP 71B, lurking, thanks and other stuff

*Message #2 Posted by **John Pierce** on 23 Mar 2011, 3:29 p.m.,*
in response to message #1 by geoff quickfall

Beautiful work, as always. I am anxious to read your book because I have 2 very heavily used 71Bs which I would like to recondition. I hope you write some details on how you were able to do such an outstanding job labelling the keyboard overlays. Thanks for all your work. John Pierce

Re: HP 71B, lurking, thanks and other stuff

*Message #3 Posted by **Karl-Ludwig Butte** on 23 Mar 2011, 4:30 p.m.,*
in response to message #1 by geoff quickfall

Hello Geoff,

the photos you've posted are absolute superb and one could hardly guess how much work goes in these restauration projects. Of course a key factor is the know how. So please notify us, when you're ready to take orders for your book and I hope you're going to send it to overseas, too (Germany in my case).

All the best to you.

Kind regards

Karl

HP-97S with a bad BCD interface: help me!

*Message #1 Posted by **Ignazio Cara (Italy)** on 21 Mar 2011, 2:17 p.m.*

Hi All, I'm looking for a little big help with a not working BCD interface. I have tested it with the Test connector and the test program. Nothing is happened, the program stop at line 005 LBL A waiting a response from the interface. Who can give me an help?

Re: HP-97S with a bad BCD interface: help me!

*Message #2 Posted by **Katie Wasserman** on 21 Mar 2011, 8:10 p.m.,*
in response to message #1 by Ignazio Cara (Italy)

The pod for the 97S has 50 or so 4000 series CMOS chips in it, it's possible one or more of them are bad -- I've seen this happen in one case in particular All of these chips except one ROM are still readily available for purchase and they are very inexpensive.

The 97S manual has a partial schematic of the pod which will help in debugging, but in working with a friend of mine we decided to pull all the chips (i.e., de-solder them) and test them in a handi-dandy IC tester I have. We were able to find the bad chips and replace them pretty easily.

You can find some of the 4000 series part numbers cross referenced to the HP part number here.

Better still, here's an almost complete cross reference list of the IC's used in the 97S pod from my notes:

```
1820-0927 4028
1820-0936 4024
1820-0938 4027
1820-0939 4013
1820-0946 4001
1820-0949 4011
1820-1114 4516
1820-1145 4049
1820-1466 4017
1820-1483 4071
1820-1485 74C221(?)
1820-1665 4099
1820-2037 4081
1820-2080 4035
1820-1518 4076
1820-1408 4073
MC14043B  4043 (obviously)
MC14512   4512 (obviously)
```

If you want to debug by tracing signals you should get a hold of Tony Duell's hand drawn schematics for the 97s pod, that will help a lot.

-Katie

Re: HP-97S with a bad BCD interface: help me!

*Message #3 Posted by **Ignazio Cara (Italy)** on 22 Mar 2011, 3:28 a.m.,*

in response to message #2 by Katie Wasserman

Hi Katie, I have another BCD interface and I have swapped the upper PCB to test where is the issue: this is the bad PCB. Thanks a lot for the great info about the cross reference, I hope to find the spare parts to replace the chip step by step.

Regards from Italy and thanks again

Ignazio

Re: HP-97S with a bad BCD interface: help me!

*Message #4 Posted by **Katie Wasserman** on 22 Mar 2011, 3:54 a.m.,*
in response to message #3 by Ignazio Cara (Italy)

Having a working 97S i/o pod is a big help!

Here's a great place for old and obsolete parts: Unicorn Electronics.

I'm sure that they have all the 4000 IC's you'll need. However, I'm not sure if they'll ship outside the US.

BTW, the IC tester that I have is a clone of this. It's been around for a long time and has been cloned several times. If you look around you may find it for not much money at all.

There's a new RPL kid on the block

*Message #1 Posted by **Oliver Unter Ecker** on 20 Mar 2011, 10:42 p.m.*

I believe ND1 is the only non-HP (and non-HP-ROM emulator) RPL calculator in existence.
The latest version, v1.3, adds significantly to its RPL abilities.

The language is now on the level of the 50g, with a 360-strong command subset.

In addition to being an RPL thing, ND1 is it's own thing.

There's a new visual guide to capabilities that sums it all up.

What RPL ND1 runs, it runs it fast. Check out the benchmark section in the Comparison to HP calculators.

Re: There's a new RPL kid on the block

*Message #2 Posted by **Stuart Sprott** on 21 Mar 2011, 8:44 a.m.,*
in response to message #1 by Oliver Unter Ecker

Just one question. Where do get them ?

Re: There's a new RPL kid on the block

*Message #3 Posted by **bhtooefr** on 21 Mar 2011, 9:06 a.m.,*
in response to message #2 by Stuart Sprott

Looks like you'd get it from the App Store, just like any other iOS app.

(I won't get into my opinions on iOS in this thread, they're best to not be shared in polite company. :))

Re: There's a new RPL kid on the block

*Message #4 Posted by **Oliver Unter Ecker** on 21 Mar 2011, 10:02 a.m.,*
in response to message #2 by Stuart Sprott

Apple AppStore. Just search for "ND1". Or try out free "ND0" first. (Limited to 3 stacks positions, and two shared folder downloads.)

If you like it, it would be great if you could rate the app (either one).

Thousands of people who don't understand what RPN is have downloaded ND0, given it one sec (probably typing "2+2"), ignored all warnings about having to learn RPN (there's almost 300 pages of online documentation), and many go on to rate the app one star. Thousands others keep the app, but never bother to rate it. (This part is very frustrating...)

Everyone who knows what they're talking about (except one person) rate it 5 stars. The average, though, sucks and hurts the project.

Thanks.

P.S. Next month should finally see the release of CalcPad for iPad. That's the same MorphEngine and RPL compatibiliy, but a different UI.

Edited: 21 Mar 2011, 10:06 a.m.

*Message #7 Posted by **Namir** on 21 Mar 2011, 6:23 p.m.,*
in response to message #1 by Oliver Unter Ecker

It's a nice App, but ND1 interface is not very intuitive to folks who have used HP calculators.

Re: There's a new RPL kid on the block

*Message #8 Posted by **Oliver Unter Ecker** on 21 Mar 2011, 7:44 p.m.,*
in response to message #7 by Namir

There're two sets of key layouts, between which you can easily switch:

"Modern", shown in most screenshots in the document, is not recognizable to HP users, I agree.
But give it five minutes, and you'll see that it simply trades what non-HP users would consider cryptic text (STO, RCL, SWAP) with iconic symbols. After those five minutes you may agree it makes the (tight) space look less cluttered. You may also find that you like the Enter in the middle (simply because that's where your thumb likes to rest when holding an iPhone or iPod touch), and you may like 9 (instead of 6) soft-keys.
This mode looks daring, I know, but it's the result of holding the device and experimenting for quite a bit.

"Classic", shown in a couple of screenshots, too, is *exactly* the HP-28S key layout and key caps. Except CHS became +/- and USER became VAR. (Some 2nd level functions moved.)

I don't know what your HP reference is. A 41 sure looks quite different from a 28.

Finally: you can change the keycaps and the function of *any* key. You can even add or remove keys. You could even have a single-wide Enter key, but that would be crazy, of course... ;-)

GO-25 An HP-25C Emulator for the iPod and iPad

*Message #1 Posted by **Namir** on 20 Mar 2011, 10:34 p.m.*

Hello All,

I found in the Apple Store the new GO-25 emulator application for the iPod and iPad. The application emulates an HP-25C. The iPad version allows you to view the stack, memory registers, and program steps (it supports 99 steps instead of 49). When you double tap the memory/registers pad you get a list of the commands you have entered. The program pad shows the program mnemonic as well as the key codes.

I am sooooo happy to have this nice HP-25C emulator in addition to the other RPN-25 emulator for the HP-25.

The GO-25 emulator is brought to us by the same developer who created GO-21 the HP-21 emulator.

Namir

Re: GO-25 An HP-25C Emulator for the iPod and iPad

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Mar 2011, 1:15 p.m.,*
in response to message #1 by Namir

I guess that the name "GO" came from "HP" with each character decremented by one; in the same sense that the name "HAL" (from "2001, An Space Odyssey") was formed decrementing each of the "IBM" characters.

Re: GO-25 An HP-25C Emulator for the iPod and iPad

*Message #6 Posted by **Gerson W. Barbosa** on 21 Mar 2011, 1:42 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

I guess you're right! Also, decrementing the characters by one was the best choice. I guess IQ-21, IQ-25 or even IQ-97 would not sell :-)

Re: GO-25 An HP-25C Emulator for the iPod and iPad

*Message #7 Posted by **Thomas Chrapkiewicz** on 21 Mar 2011, 2:47 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Well 'known' folklore, however the author of 2001 (Sir Arthur C. Clarke) has disputed that claim!

Re: GO-25 An HP-25C Emulator for the iPod and iPad

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Mar 2011, 8:32 a.m.,*
in response to message #7 by Thomas Chrapkiewicz

Correction acknowledged, will be taken into account from now on. Thanks!!

Re: GO-25 An HP-25C Emulator for the iPod and iPad / HAL and Clarke

*Message #9 Posted by **Thomas Chrapkiewicz** on 22 Mar 2011, 9:12 a.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

BTW, see the Forward of the book, 'HAL's Legacy', Stork, editor, forward by Arthur C. Clarke, p.xi.

Also, chapter 11 of, 'The Lost Worlds of 2001', Arthur C. Clarke. (which also references Sir Clarkes gifted HP 9100A calculator).

TomC

Re: GO-25 An HP-25C Emulator for the iPod and iPad / HAL and Clarke

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Mar 2011, 1:57 p.m.,*
in response to message #9 by Thomas Chrapkiewicz

I only hope that the usage of the well-known "The quick brown fox... " string, in the film scene where HAL is being deprived of its memory boards is not an artifact of my... well, memory! :-)

Re: GO-25 An HP-25C Emulator for the iPod and iPad / HAL and Clarke

*Message #11 Posted by **Walter B** on 22 Mar 2011, 2:11 p.m.,*
in response to message #10 by Andrés C. Rodríguez (Argentina)

IIRC, they let him (? it? HAL!) sing "Hänschen klein" at that point in the synchronized German edition of that movie.

Re: GO-25 An HP-25C Emulator for the iPod and iPad / HAL and Clarke

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 23 Mar 2011, 8:35 a.m.,*
in response to message #11 by Walter B

In the english version of "2001" in film, he (granted!) sings a very simple song named "Daisy", in the version with spanish voices the translation of HAL singing was not very good... However, the classic "quick brown fox" string appeared somehow as part of HAL's deconfiguration (sort of). I wonder if it appears in a printed version of the novel I read many years ago; in that case I mixed the printed and film versions.

Re: GO-25 An HP-25C Emulator for the iPod and iPad / HAL and Clarke

*Message #13 Posted by **Walter B** on 23 Mar 2011, 10:38 a.m.,*
in response to message #12 by Andrés C. Rodríguez (Argentina)

Rebalancing my RPN portfolio

*Message #1 Posted by **Michael de Estrada** on 20 Mar 2011, 8:48 p.m.*

Over the past year I've been rebalancing my RPN calculator collection (aka portfolio), by selling off duplications in my HP RPN collection, while seeking out rare non-HP RPN calculators. By my count, I've sold 6 HPs (2 Woodstocks and 4 Classics), whilst acquiring 5 non-HP RPN calcs, the latest being a Commodore 4921. At this time HP RPN calcs represent approximately 59% of the total collection, while non-HP RPN calcs represent 18%. The remaining 23% are non-RPN calcs, although some of them are non-collectible elcheapo 4 bangers. About 90% of them are in good working condition, while the remainder of are in various states of disrepair and are mostly retained for spare parts, although some are junk that I really should just give away or throw in the trash. I really don't see myself acquiring any more vintage HP calcs and unless HP comes out with something really exciting in a new model, I may have bought my last HP calc. I'm selling off a few more HP RPN calcs that are duplicates, while still seeking to fill a few holes in my non-HP collection (anyone have a Privileg PR 55 NC they want to sell?).

Re: Rebalancing my RPN portfolio

*Message #2 Posted by **Joerg Woerner** on 20 Mar 2011, 9:18 p.m.,*
in response to message #1 by Michael de Estrada

Michael,

Not a Privileg but the Hiradástechnika TK-1023.

Unfortunately is it since 2:00 PM Eastern time on TAS :-(

Regards, Joerg

Re: Rebalancing my RPN portfolio

*Message #3 Posted by **Michael de Estrada** on 20 Mar 2011, 10:26 p.m.,*
in response to message #2 by Joerg Woerner

Joerg,

I saw all your listings on TAS. I already own a complete Novus Scientist 4520 in excellent condition with a new battery, which is the same as the TK-1023, so I'm not interested. In fact, I own virtually all the Novus / National Semiconductor RPN models. I also already have an Omron 12SR which I bought from you, along with a Corvus 500 and a APF mark 55. Now, if you can find a good Privileg SR 54 NC or PR 55 NC, then you'll definitely get my attention. :)

Michael

Re: Rebalancing my RPN portfolio

*Message #4 Posted by **db(martinez,ca)** on 20 Mar 2011, 11:05 p.m.,*
in response to message #3 by Michael de Estrada

Michael; I'm not bidding on it either, but Joerg's TK-1023 does have one unique feature i have never seen on any of that family before. There's a yellow racing stripe down the middle. That should have been done to all the 41s with the speeded-up clocks.

Re: Rebalancing my RPN portfolio

*Message #5 Posted by **Michael de Estrada** on 20 Mar 2011, 11:25 p.m.,*
in response to message #4 by db(martinez,ca)

Haha, good point. Tomorrow I'm going to the hobby shop to get a bottle of Testors bright yellow paint so I can put a racing stripe on my Novus Scientist.

On an unrelated note, I read your writeup on the Commodore 4921 on your website, and I think your statement that it has 10 registers is incorrect. I downloaded the manual from Katie's website, and it supposedly has only 3 registers (0,1,2), which are all used when performing statistical operations (sum n, sum x, sum x^2). Anyway, I won't know for sure, and that could be weeks from now, since it's comming from the UK.

Michael

Re: Rebalancing my RPN portfolio

*Message #6 Posted by **db(martinez,ca)** on 21 Mar 2011, 10:33 p.m.,*
in response to message #5 by Michael de Estrada

mine stores and recalls numbers in 0 through 9.

Re: Rebalancing my RPN portfolio

*Message #7 Posted by **Michael de Estrada** on 21 Mar 2011, 11:22 p.m.,*
in response to message #6 by db(martinez,ca)

Weird. I wonder if it's an undocumented feature. We are talking about the SR4921 RPN, correct? Do you have the manual? If so, look at page 24. Anyway, when I get mine, we'll find out for sure.

Re: Rebalancing my RPN portfolio

*Message #8 Posted by **db(martinez,ca)** on 22 Mar 2011, 11:47 p.m.,*
in response to message #7 by Michael de Estrada

yep. 4921. & serial no. 15350. made in Hong Kong.
Mine may have a bug. It does have a red dot on the on switch.
i may be stretching things there.

Re: Rebalancing my RPN portfolio

Red dot or yellow stripe - triples the value of a calculator!

Cheers, Joerg

The mystery is solved.

*Message #10 Posted by **Michael de Estrada** on 28 Mar 2011, 7:46 p.m.,*
in response to message #6 by db(martinez,ca)

My Commodore SR4921 RPN arrived today and I observed that it indeed can store and recall numbers in registers 0 though 9, and in fact can also perform memory arithmetic such as M+ and Mx. But, wait, it is all an illusion, since in fact there are only 3 real independent storage memories and the values in memories 0 through 2 are replicated in the other phantom registers. Registers 0,4,8 are the same storage location, 1,3,5,7,9 are the same and 2,6 are the same. Store a number or perform storage arithemetic on any one of them, and the result will be replicated in the others. Use the statistical functions, and values will be stored in all of them, not just the first three. So basically, the other number keys have been mapped to the same memory locations, instead of giving an error indication as would be the case with most other caculators when attempting such an illegal operation.

Re: The mystery is solved.

*Message #11 Posted by **db (martinez, ca.)** on 28 Mar 2011, 9:36 p.m.,*
in response to message #10 by Michael de Estrada

well i'll be dipped in s.....you're right.
that was sloppy, or trusting, of me. any other calcs do this sort of trick? - other than the 41's sto a = sto 01, sto b = sto 02 etc.

Re: The mystery is solved.

The address code for TI-59/PC-100 printer characters did the same sort of thing. In that case it was the eights digit which was being ignored , not the fours digit as with your units.

*Message #13 Posted by **Mike T.** on 21 Mar 2011, 8:02 p.m.,*
in response to message #1 by Michael de Estrada

That brings back some memories - one of those was my first calculator, beleive it did only have 3 registers and I remember that the trig functions were sometimes only a little better than using 4 digit trig tables, but it was easier to use!

It is amazing to think that it is now a sought after machine...

*Message #17 Posted by **Michael de Estrada** on 26 Mar 2011, 9:20 a.m.,*
in response to message #16 by db(martinez,ca)

Speaking of clones, the Brazilian Dismac HF-90 is an OEM clone of the Commodore SR 4921 RPN, that uses the same Mostek MPS7561 chipset. It also has the same calculator forensic number, which is different from any of the NS / Novus models.

Encountered the second time, so please allow a linguistic question: Do you (i.e. English speaking people) generally replace the Greek "y" by "u"? It's spelled "hybris" on this side of the pond, at least on the continent AFAIK ... but I've already encountered someone claiming the Greek "M" and "N" are spelled "mu" and "nu" in English, respectively. OTOH I've never seen an odussey yet d:-?

Yes.

If you start from the premise that the English language follows a set of logical rules, you've already lost the battle.

Hi Walter,

Despite the rigour with which spelling was taught when I was in school, it is not an exact science - especially when it comes to importing foreign words. Heck, even established words can vary e.g. someone who advises you can be an advisor or adviser - both forms are

accepted. Then there is the argument about that black bit of rubber we put on our car wheels, "tire" or "tyre". Some say the one is American and the other UK spelling, but as this article shows it was never that clear cut. I know a Polish family here in England where different members spell their surname differently in an attempt to get the english to pronounce it correctly, a futile task as 5 miles - that's 8km in continental speak ;) - down the road they could be pronouncing things totally differently anyway.

Re: Can anyone Identify this HP-41 Overlay?

*Message #10 Posted by **Chris Randle (UK)** on 21 Mar 2011, 3:10 p.m.,*
in response to message #7 by Walter B

> Quote:
>
> but I've already encountered someone claiming the Greek "M" and "N" are spelled "mu" and "nu" in English

Well, that's how they're spelt in Greek! The uppercase Greek Ypsilon "Y" is written "u" in lowercase, and "N" is written "v" in lowercase. Hence (in Greek) "mu" and "vu", but MY and NY.

The transliteration, unfortunately, usually leads to a mispronunciation, since we (English) tend to say "mu" as in music, whereas, in Greek, it's pronounced "me" as in me, myself.

Re: Can anyone Identify this HP-41 Overlay?

*Message #11 Posted by **Walter B** on 21 Mar 2011, 6:36 p.m.,*
in response to message #10 by Chris Randle (UK)

Thanks for the explanations. An example of divergent spelling came into my mind after my posting: "hubris" and hybrid - but I'll try hard not to ask questions about the intrinsic logic of this language anymore ;-)

The hypothesis that the English spelling reflects the Greek looks a bit off IMHO. While the Greek lower case Y looks similar to a Latin u, this tells nothing about the pronounciation, neither today nor when Sokrates spoke. Today it's pronounced like an English ee, but short. Way back it was pronounced like an ü - our well known detector for English speaking folks ;-)

Re: Can anyone Identify this HP-41 Overlay?

*Message #12 Posted by **db(martinez,ca)** on 21 Mar 2011, 10:59 p.m.,*
in response to message #7 by Walter B

Walter; When i taught English as a Second Language (yes there IS an American English), my students would often ask "professor, por que...."----- why is the spelling in English so crazy?" I answered that it is not really as bad as it seems. A word from *Ingles viejo* is usually spelled using old English rules. The same goes for Welsh and Celtic words. What we inherited from Latin may have kept a Latin flavor in it's spelling. If we stole it from Spanish, French or Italian; those rules might apply. Our Dutch and German words will try to approximate what guttural sounds we've managed to keep. `A`a- and Pa-hoehoe, the Hawaiian words which have been adopted by English refer to these distinct types of lava, are spelled phonetically.
So our spelling just has lots of mutually exclusive sets of rules.

Re: Can anyone Identify this HP-41 Overlay?

*Message #13 Posted by **Martin Pinckney** on 22 Mar 2011, 9:10 a.m.,*
in response to message #12 by db(martinez,ca)

db, thanks for this. I was trying to formulate a similar response. The many odd spelling "rules" really come from the richness of English because of it's borrowing.

A similar observation can be made about cuisine. I had often heard snobbish American world travelers sniff that American "Italian" cuisine was nothing like "real" Italian cuisine. But I once employed a woman who married an Italian in Germany and lived there many years running a restaurant. On a visit to the U.S., they had tried some "Italian" cuisine. His reaction was something like "Oh, yes, this is just like my grandmother used to cook!"

Re: Can anyone Identify this HP-41 Overlay?

*Message #14 Posted by **Cristian Arezzini** on 23 Mar 2011, 12:22 p.m.,*
in response to message #13 by Martin Pinckney

Hi Martin, Just to add to your "American Italian cuisine"... I'm Italian, and my wife is American (from NY), so I get to travel to the US a lot, and though I don't usually eat at Italian restaurants there, it has happened in the past. There is an Italian place I remember, in Tarrytown (Westchester), where I had the best tiramisu ever - I'm serious, I never had one as good in Italy. But then there were a lot of italian restaurants (especially in Manhattan) that served things I've never, ever seen here in Italy - and which don't even make much sense as far as I'm concerned! :)

Cristian

*Message #15 Posted by **Etienne Victoria** on 21 Mar 2011, 10:25 a.m.,*
in response to message #1 by aj04062

It is THE very overlay that was used on an Hp-41C tall keys with 4 (four) memory modules to trigger the whole economic crisis we're still struggling with.

The keys "Stock", "Index", "Trading" and "System" were incorrectly used by an engineer to try recover the value of the HP stock that went down because of Hp inability to relaunch a proper Hp-15C.

The calculator was connected to the whole financial planet through the Hp-IL --> nutIP and this allowed this evil/uncompetent engineer to contaminate the stock markets with his ill-conceived transactions.

You know the rest of the nightmare...

A "panic button" called "GOLD" was added to the overlay to enable immediate return to the gold stallion which would have allowed a stabilization of the economy.

However, the engineer determined that the "GOLD" key was solely designed to test the Hp-41 gold plated internal strip connector.

Therefore the only key he pressed after understanding his high magnitude mistake was (obviously) "Run"

Adding insult to treachery, a large engineer-driven lobby -including some of the most senior members of this

forum- worked hard to put the blame on investors, bean-counters, marketing people ... and other TI renegates or even SWEKAs ("Simple Width Enter Key Apostates")

As one of the latter, I would like to thank you for allowing the pure simple truth to be established here.

No wonder, this overlay is difficult to identify.

Have a nice spring !

Etienne

Etienne

Having been sworn to secrecy for many years I can finally divulge my knowledge of the events you portray. That renegade engineer finally repented and confessed to me shortly before his demise the facts concerning this catastrophe. May he rest in peace.

Of course the rumors about his activities have circulated for some time, and the details you have described are very accurate, but your dates are wrong. He ran his program in the late 1990's which caused the "dot com" bust. He acknowledged his participation in the 90's and accepted responsibility for the consequences, but he was bitter about the accusation that he caused the 2008 recession. He rightly reasoned that HPIL was just too slow to cause the 2008 recession. Having a penchant for calculator trading systems he was able to do some forensic investigations following the economic meltdown and this is his account of how the 2008 recession came about.

It was done on a TI BA II Plus.

It seems a summer Intern was hired by Wall Street executives to calculate the year end bonus. He was given a BA II Plus calculator to aid in his work. Details are sketchy, but the engineer in question deduced that the intern failed to include a complete set of parenthesis in the complicated formula. He also believed that half way through the task the keyboard had intermittent failures. In any case, instead of receiving bonuses the new calculations indicated the traders and brokers owed the calculated values. The faulty calculation results were posted on Face book for only about 5 minutes but the page received a million hits before it could be taken down. The traders and brokers, well aware of their past treachery, naturally assumed they had been finally caught, and behaved accordingly. Before the end of that day the real estate market was glutted with mansions and summer homes which precipitated the housing meltdown.

The rest of course is history. I believe he was telling the truth.

Re: Can anyone Identify this HP-41 Overlay?

*Message #17 Posted by **Martin Pinckney** on 21 Mar 2011, 2:35 p.m.,*
in response to message #16 by Donald Williams

This is all very speculative, if you will pardon the expression. So far no one has offered an explanation of the labeling below the [3] key.

Does it describe what happened on the banks? The behavior of the traders?

New hp-01 in the making?

*Message #1 Posted by **PeterP** on 20 Mar 2011, 9:23 a.m.*

Nyt article on metawatch from hp

Re: New hp-01 in the making?

*Message #2 Posted by **Allen** on 20 Mar 2011, 2:16 p.m.,*
in response to message #1 by PeterP

May I summarize FOSSIL's idea in one word: STUPID!

I will rely on conservation of energy to explain why I feel this is a boondoggle. Of all the tablets/phones/ect.. devices I use, why pick the **smallest** one to act as a radio-repeater?? It has the smallest battery, the most disadvantaged antenna, and although it's further from center-of-mass, the user's arm in the near-field all day (that is the 20% of the time it's not being charged).

There is a reason Crocodile Dundee didn't pull out a multi-function swiss army knife when he said THIS IS A KNIFE! You wouldn't look for a computer that makes cookies or a document scanner/lawn mower, either?

High-end wristwatches, and before them pocket watches are not problems looking for a solution - they are fashion accessories who are most prized when they do the two things they do best- look nice and tell time - without the hassle of charging batteries, updating OS's or resetting.

Yet another pocket RPL idea...

*Message #1 Posted by **bhtooefr** on 19 Mar 2011, 6:45 p.m.*

So, I'm thinking about how a pocket RPL calculator could be done. (While I don't really do programming on my 50g, I do like using an RPL calculator. And not just because of the infinite stack. I just wish the thing were smaller.)

The basic idea would be a hybrid between the 28C/S capabilties, the 48S/SX/G/G+/GX keyboard, and something like a 42S or even smaller form factor.

(This thing, I know HP wouldn't ever produce it. However, who says someone else can't? There's enough public documentation out there that it's likely possible to make something that's compatible with user and potentially even system RPL, without infringing on HP's intellectual property.)

So, the first thing is... make keys smaller, and go back to a 4-line display. With modern technology, this'll make a nice small handheld. I actually like the keys on my BB Curve 9300 a lot, for tactility, so something like that (but bigger, preferably) would work nicely.

As for keyboard layout, a few changes that could be made:

1. Menu disable button. On a 4 line display, this is EXTREMELY useful for viewing more stack.
2. Move the arrow keys up into the softkeys, and they're functional whenever the menus are disabled. This is how the 28C/S do it.
3. If possible, remove a row of keys, merging all of their functions with the remaining keys, and moving keys into a logical layout. This'll allow keys to be a little larger, or reduce the form factor further. It'll also be only one row more than the 42S and other calculators that are known to do it.
4. If you do 3, then you might have to move Alpha keys around. Potentially a 42S-like solution as an OPTION (not necessarily a default, or maybe a mode that uses both - when hitting Alpha, you get the alpha menu and the alpha keys work as well, and hitting an alpha key gives you 48/49/50-like behavior and the alpha menu goes away, whereas using the alpha menu gives you 42S-like behavior) would work, too.

Hardware... use an ARM7 microcontroller that has a built-in LCD controller, and you're good to go, CPU-wise. LiIon battery would be nice, with USB charging and data, but a couple button cells would probably work, too. (And, you could underclock it significantly to save power - if you're doing a re-implementation of RPL, rather than using HP's actual firmware, you don't have the emulation overhead that the HP calculators have.)

Theoretically, I'd think this thing could be in the 35s pricing ballpark, maybe a little more, if you didn't have to worry about cannibalizing 48gII and 50g sales.

So, anyone interested in making this happen? (For that matter, that includes HP.) Unfortunately, I don't have the skills to make it happen, just some ideas for something I'd like to see.

Re: Yet another pocket RPL idea...

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Mar 2011, 10:53 a.m.,*
in response to message #1 by bhtooefr

For me, the [iPod Touch + Free42] combination provides a current, supported, pocketable (and eventually replaceable) RPN calculator that I use everyday without carrying and risking my physical HP42S. There are many emulators for different calculators on the Apple iOS platform, including at least two for the HP48; some of them are free or have a more than acceptable price tag. There are some for Android OS too. BTW, I also run Free42 in my cellphone, but it doesn't look or feels as good as on the iPod Touch 4G. I know Blackberry has an application development environment, perhaps you may find a suitable emulator for your BB.

Re: Yet another pocket RPL idea...

*Message #3 Posted by **bhtooefr** on 20 Mar 2011, 11:35 a.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

The BB is actually my work phone, my personal phone is (currently) a WinMo 6.5 phone, and I have Emu48 on that.

I prefer real calculator buttons when I'm calculating, though.

*Message #5 Posted by **John B. Smitherman** on 20 Mar 2011, 11:37 a.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Hi Andres. I agree with you that iPod Touch + Free42 is a good solution. I also enjoy using GO-21 which emulates an HP 21 on the iPod Touch, iPhone and iPad. GO-21

Regards,

John

Re: Yet another pocket RPL idea...

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Mar 2011, 11:12 a.m.,*
in response to message #5 by John B. Smitherman

Hi John!,

Well, I have some 10+ emulators on the iPod, but Free42 (or 42S) is the one I use the most. Of course, I would like to have physical keys or, at least, some kind of vibration as feedback (as my Android-based cellphone has); but it's rather useable. Best regards.

Re: Yet another pocket RPL idea...

*Message #7 Posted by **Oliver Unter Ecker** on 20 Mar 2011, 11:34 p.m.,*
in response to message #1 by bhtooefr

Your "hybrid between 28 and 48" is exactly what ND1 is, so your post certainly stroke a chord with me. Check out the link in my other "RPL kid" post, and see what keypad decisions were made.

The project you're proposing would be very sweet. I don't think HP would go for it, though, because, if they

went through the trouble of starting a new generation, they'd want it to scale. At the top of the line needed to be something that's more powerful than a 50g, and creating that (from scratch; required to make true progress) is, I think, a big challenge.

I wouldn't be surprised if someone discovered that the market for such an RPL thing is not worth it. RPL is aging, and not many users seem to be interested in programming these days.

Plus, like it not, it's really an app-world now.

Re: Yet another pocket RPL idea...

*Message #8 Posted by **bhtooefr** on 21 Mar 2011, 6:33 a.m.,*
in response to message #7 by Oliver Unter Ecker

Huh. I see advantages and disadvantages to ND1's approach, but it looks quite impressive. (And, an Android version coming up? Sounds like, when I replace the WinMo pile of garbage with something Android-based, I'll have this up front and center on my home screen.) And, I don't even care about the CAS, so this is perfect. (Honestly, I use my 50g like a 4-banger with an infinite stack, and seamless unit conversion, most of the time.)

I still like real buttons, though... but, the fact that you've reimplemented RPL from scratch means that it's definitely within the realm of possibility, given enough time and resources.

Re: Yet another pocket RPL idea...

*Message #9 Posted by **Oliver Unter Ecker** on 21 Mar 2011, 8:00 a.m.,*
in response to message #8 by bhtooefr

I like real buttons, too. Especially for number keys and basic operators.

But for writing code (RPL or JavaScript), I tell you that I quickly (within a day) much preferred a QWERTY soft-keyboard over small/crammed physical keys. It works even better than on the Kindle, for example, which has a pretty generous keyboard.

Being able to scroll through code and position the cursor at a touch of the finger, is so much better than fiddling with cursor keys.

As for unit conversions. Unit support is about the last thing that's still on HP-28S level. There'll soon be a Units object that will permit you to enter "5cm" and then simply touch the unit badge next to the object (looking like the Color, BigNum, or Chem objects in the doc) and choose from a list of applicable unit conversions.

Re: Yet another pocket RPL idea...

*Message #10 Posted by **Oliver Unter Ecker** on 21 Mar 2011, 8:10 a.m.,*
in response to message #8 by bhtooefr

> but, the fact that you've reimplemented RPL from scratch means that it's definitely within the realm of possibility, given enough time and resources.

Yes. Using the JavaScript approach. I'm a C++ guy, but I swear this would not have been pretty using another approach.

If I were in the hardware business, I'd put my software on a minimal 4 inch EInk minimal Webkit-browser-machine (running some kind of embedded Linux), with a ~15c form factor (maybe just a little

larger). Touch-screen would be very nice, but wouldn't be a must (depending on cost). A color display is pretty useless in a calculator. (Even though ND1 has a Color type...) A screen that can be used outside and sips battery would be so much nicer. A device like this could go a month on a charge.

Edited: 21 Mar 2011, 8:13 a.m.

Re: Yet another pocket RPL idea...

*Message #11 Posted by **Oliver Unter Ecker** on 21 Mar 2011, 8:56 a.m.,*
in response to message #10 by Oliver Unter Ecker

Oh. And it has to have Wi-Fi.

I think what has largely obsoleted the high-end calculator (outside the education niche market), is that it's been, so far, an island.

Have a powerful code-compatible desktop system and let the calculator be the faithful, mobile companion (with one-button, one-second data exchange between the two; like in ND1 today), and you have, in my mind, a new reason for a high-end calculator.

Sell it for $79 (w/ EInk display and physical keys), and everyone will want one.

Make incremental money with selling specialized code libraries, and create a little app-store for 3rd parties to participate. A platform cannot be successful in isolation. (Even if it's from HP.)

There's nothing wrong with keeping RPL, btw. It's lovely to script JavaScript...

Edited: 21 Mar 2011, 9:01 a.m.

Re: Yet another pocket RPL idea...

*Message #12 Posted by **bhtooefr** on 21 Mar 2011, 8:59 a.m.,*
in response to message #10 by Oliver Unter Ecker

Hmm, maybe the best option would be something that combines the modern slider smartphone form factor with some 28 ideas, then, and doing things a bit in reverse.

Have a portrait form factor calculator with the most commonly used functions on the keypad, and a 320x240 display or so. Except it's not really 320x240... slide the keypad off to the side, and it becomes 320x640, with the 320x400 area that's been exposed as a secondary keypad that customizes itself for whatever operation is currently being performed.

Another way I've thought of is to just rip the 28 off, with a slider to hide the alpha keys when in normal operation.

And, there's also going for a ClassPad/Xpander-like approach, where there's a decent-sized touchscreen and a very simple dedicated keypad for number/primary operation entry.

Re: Yet another pocket RPL idea...

*Message #13 Posted by **Oliver Unter Ecker** on 21 Mar 2011, 9:45 a.m.,*
in response to message #12 by bhtooefr

Your slider ideas sound lovely. Though purists (and many HP followers are; and we're talking RPL (an HP thing), here) may not go for it, on account of the potential flimsiness aspect.

But I think you cannot ignore the reality of price.

If it's a dedicated calculator it will sell in much lower quantities than a generic slider-phone. What you're describing sounds more like a mini-tablet, actually. If you need the calculator to be at most half the price of a fully-fleshed small tablet (which may come down to $250 sometime this year; already there's a glut of Android <2.2 devices with capacitive touchscreens (which suck), that you can pick up for $130-160), I fear you cannot afford that kind of hardware.

If I were HP, I'd try to build this with as little HW mods as possible to the existing range. Just a different screen and different keys. Optionally, a low-res touch layer could provide support for soft-menus and soft-keys. (And serve to bring the key count down and give space to the larger screen.)

All just idle dreams, of course. I see no-one but HP actually pulling off building such a new high-end calc.

(Regardless of RPL being a subject here or not, I'm not counting in TI, because they've already chosen their approach: a clunky brick for education, that will probably not be treasured 20 years from now...)

Re: Yet another pocket RPL idea...

*Message #14 Posted by **bhtooefr** on 21 Mar 2011, 7:38 p.m.,*
in response to message #13 by Oliver Unter Ecker

I was going more for something like the HP Xpander, the Casio ClassPad, or the TI PLT, although a smaller form factor.

Being a dedicated calculator, it could get away with a lower-cost (or, more calculator-suited - e-ink would be AWESOME on a calculator) display, with resistive touch instead of capacitive.

Still, soft-keys like the 28/48/49/50 line and the 42S can work well, too, to help reduce cost.

Re: Yet another pocket RPL idea...

*Message #15 Posted by **Oliver Unter Ecker** on 23 Mar 2011, 10:10 a.m.,*
in response to message #14 by bhtooefr

Thanks for those links, bhtooefr.
I had heard of the first two, but never seen them.

Boy, they're ugly. (The new nspire cx, in contrast, looks like 300% overkill to me (though I get the point about its use in education), but very spiffy/good-looking.)

I hadn't thought about this too much, but I come to realize that my personal preference (and I realize it may be way off from what other people want), is pocketability. That is, not much larger than an iPod touch. And about that thick! (That is, very thin.)

Anything larger, you lose pocketability and may just as well make the jump to a tablet.

Continuing to dream, that leaves two options:
- No keys, but a big touchscreen. Something like an iPod touch, with color display swapped for an EInk display. (And 1 GB flash shall be ok...)
- Half and half: 320x240 touch display with equally-sized bottom area for basic physical

keys. Soft-menus, on-screen soft-keys.

I bet this sounds very unattractive for any company to build.
An iPod touch with a slow EInk display?! What the!

The "only" advantages over a smart device (iOS, Android, whatever) would be a lasting battery and a display that displays while it's off (I absolutely love that part on the Kindle...).

Back to reality, I did a search for the smallest e-reader. 5" is actually the smallest (Pearl) display that EInk currently produces (though they'd manufacture anything if you're buying enough units, I'm sure). They're ugly as hell. One is nice and has a touchscreen: The Sony Reader Pocket Edition.

An RPL calculator on that would be nice, IMHO. (Though I'd still prefer smaller.)

Edited: 23 Mar 2011, 10:17 a.m.

*Message #16 Posted by **bhtooefr** on 23 Mar 2011, 12:30 p.m.,*
in response to message #15 by Oliver Unter Ecker

Yeah, I'd want pocketability, too - but that basic idea, just smaller, would be interesting to see, I think.

And, let's face it, a 50g is ugly with its array of buttons, if you're using that definition of ugly.

OT: Help with Logic Dart AC adapter

*Message #1 Posted by **Donald Williams** on 18 Mar 2011, 9:54 p.m.*

I think there may be a few forum members who have access to the HP LogicDart logic probe instrument. I have one which I have recently been using extensively. I would like to ditch the battery mode of operation and go to an AC adapter. Apparently I have put my AC adapter (9100-5557)in such a safe location, that now I cannot find it. The LogicDart owners manual has no description or spec for the AC adapter. On the rear of the unit it states 12V at 0.1 amp , which seems quite reasonable. There is no mention of AC or DC. It is the diagram of the contacts that bothers me. This drawing indicates the center pin as a negative contact and the outer shell as the positive contact, which at least suggests a -12V DC supply which is not a conventional approach but possible. That is not something that I would expect.

I just don't want to connect -12V DC to the unit and accidentally damage the instrument. As far as I can determine HP never released a service manual for this device, therefore I do not know if it is reverse polarity protected. I suppose it is even possible that the device needs 12V AC. I just don't have enough information.

Does anyone on the forum have that AC adapter that they could measure and confirm the contact polarity? Does anyone have a LogicDart with that same diagram on the top rear?

Any information that anyone can provide is really appreciated.

Re: OT: Help with Logic Dart AC adapter

*Message #2 Posted by **Eric Smith** on 19 Mar 2011, 12:02 a.m.,*
in response to message #1 by Donald Williams

I'm looking at a 9100-5557 right now. It is marked 12V DC 150 mA, tip (center) negative, ring (sleeve) positive.

The applied voltage isn't positive or negative; that has no meaning without a common reference. In other words, you don't have to find a -12VDC supply, as a +12VDC supply will work perfectly well. The requirement is simply that the tip be at a 12V lower potential than the ring. 0V tip and +12V ring would work fine, or -12V tip and 0V ring, or -6V tip and +6V ring.

Of course, this supply should be electrically isolated from the circuit you're testing with the LogicDart; with a wall wart this will generally be the case.

Re: OT: Help with Logic Dart AC adapter

*Message #3 Posted by **Donald Williams** on 19 Mar 2011, 12:33 a.m.,*
in response to message #2 by Eric Smith

Eric

Thanks very much for the info. You have confirmed the diagram.

I understand, that of course, everything is relative to the reference, but I thought it odd that the center pin

would be the reference. That is a little unconventional in my experience, but no reason why it should not work.

Now I can strap it to a bench supply and leave it running full time. I was getting annoyed by the automatic turn off after 5 minutes. I cancelled the turn off in system settings and of course 2 nights in a row forgot to tun it off manually. Now I can quit wasting batteries and just run it off a bench supply.

The information available from the members of this forum, once again, proves invaluable.

Thanks.

*Message #4 Posted by **Eric Smith** on 19 Mar 2011, 5:40 a.m.,*
in response to message #3 by Donald Williams

I wish the LogicDart had been more commercially successful, so that I could buy the new Agilent LogicDart II now.

Re: OT: Help with Logic Dart AC adapter

*Message #5 Posted by **Donald Williams** on 19 Mar 2011, 10:20 a.m.,*
in response to message #4 by Eric Smith

Agreed. It is one of the handiest little gadgets I have ever owned. It would have been great to see it evolve over time. Somehow I got the impression it was not developed in house. I was always interested in the design of the unit but could never locate any schematics. I think that the $800.00 initial price was what killed it. At about half that it would have been wildly successful.

Re: OT: Help with Logic Dart AC adapter

*Message #6 Posted by **Eric Smith** on 19 Mar 2011, 4:16 p.m.,*
in response to message #5 by Donald Williams

Actually it was developed in-house at HP, and some of the people involved were from the calculator division. Eric Vogel of HP gave a presentation to the Philadelphia club on June 5, 1997. Jake Schwartz has information and photos here.

Re: OT: Help with Logic Dart AC adapter

*Message #7 Posted by **Donald Williams** on 19 Mar 2011, 9:53 p.m.,*
in response to message #6 by Eric Smith

Interesting| My assumption was based on the lack of documentation. Usually HP eventually releases documentation after an instrument became obsolete and the warranty period expired. Not so with this instrument. I just assumed they didn't possess the doc's. If they exist, I cannot find them. I may try to get that video.

Re: OT: Help with Logic Dart AC adapter

*Message #8 Posted by **Eric Smith** on 19 Mar 2011, 10:22 p.m.,*
in response to message #7 by Donald Williams

In the 1990s HP moved toward keeping the innards of some test instruments secret, as had been done from the outset with calculators.

Re: OT: Help with Logic Dart AC adapter

Chip-Level Question

*Message #1 Posted by **Jeff** on 18 Mar 2011, 11:18 a.m.*

I was wondering how HP calculators arrive at answers. With a PC, of course, it uses the ALU part of the CPU. But how about calculators? Is it software embedded in ROM?

What about simple 4-function units?

Thanks.

Re: Chip-Level Question

*Message #2 Posted by **Eric Smith** on 18 Mar 2011, 3:53 p.m.,*
in response to message #1 by Jeff

Most calculators have software in ROM, often called "firmware". In the early days HP and TI firmware was referred to as "microcode".

Some of the early four-function calculators were hardwired rather than using a processor, but that went out of style quickly once it became relatively easy and inexpensive to use a processor.

In the past most calculator processors were four-bit, with HPs use of a 56-bit word being a notable exception. AFAICT, most calculators now use 8-bit processors, with high-end calculators using 16-bit or 32-bit processors.

Re: Chip-Level Question

*Message #3 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 4:06 p.m.,*
in response to message #2 by Eric Smith

The newer ARM based HPs (12C, 20b, 30b) use a 32 bit core. The "processor" is in fact an all in one solution with all necessary functionality on one chip, including memory.

TI introduced this technology in the early days of the TI-30, the LED model. A single chip, bonded directly to the board which carried the LED bar on its back, contained the complete calculator. The functionality has of course vastly increased over the years. We can assume that the chip contains a processor and its firmware but you can't tell from the outside.

Re: Chip-Level Question

*Message #4 Posted by **Eric Smith** on 18 Mar 2011, 4:25 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Actually the single-chip calculator predates the TI-30 by almost five years (September 1971, vs. June 1976).

Re: Chip-Level Question

*Message #5 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 4:39 p.m.,*
in response to message #4 by Eric Smith

At the age of 12, my interest in calculator electronics hadn't sufficiently developed to recognize this. ;)

Re: Chip-Level Question

*Message #6 Posted by **Mike Morrow** on 19 Mar 2011, 1:48 a.m.,*
in response to message #4 by Eric Smith

Joerg Woerner's interesting TMS-0102 webpage gives some details of the early one-chip design (minus display drivers) that was in many four-function machines of 40 years ago. Including my first, the Bomar 901B that cost me the 2011 equivalent of $700.

Re: Chip-Level Question

*Message #7 Posted by **Joerg Woerner** on 19 Mar 2011, 9:43 a.m.,*
in response to message #4 by Eric Smith

How "single" is single-chip???

The TI-30 included the display drivers while the TMS1802 (1971) needed four additional integrated circuits to drive the LED's.

The TMS08** (1974) needed one display driver and the TMS9** (1975) was the first "single-chip" solution from TI. Think TI-1200!

Regards, Joerg

Re: Chip-Level Question

*Message #8 Posted by **Eric Smith** on 19 Mar 2011, 4:29 p.m.,*
in response to message #7 by Joerg Woerner

I seem to recall that there were single-chip calculators using the Mostek MK6010 by mid-1971. However, they did use some discrete transistors as well.

Re: Chip-Level Question

*Message #9 Posted by **Frank Boehm / Germany** on 18 Mar 2011, 7:00 p.m.,*
in response to message #3 by Marcus von Cube, Germany

The bonded die has been used by National Semiconductor as early as 1975 (Novus 650).
Novus 650
(Even if the page states 1976, the date code 540 aka 7540 is clearly visible.)

Re: Chip-Level Question

*Message #10 Posted by **Joerg Woerner** on 19 Mar 2011, 9:53 a.m.,*
in response to message #9 by Frank Boehm / Germany

Two chips below the blob ;-))

WP-34s Demostration

*Message #1 Posted by **Paul Dale** on 18 Mar 2011, 6:39 a.m.*

It is my pleasure to announce that a proper *demonstration version* of the current **WP-34s** scientific firmware for the HP-20b & HP-30b calculators is now available.

The Source Forge page has the demo software in the files section.

Download *wp34s.zip* and run *wp34sgui.exe* after unpacking. Non-Windows users can run the demonstration using Wine or a virtual PC.

Enjoy & please give us some feedback.

- Pauli

Re: WP-34s Demonstration

Ah, thanks! What was the reason to not just invoke any of the modes by just entering a number with two radices?

> Quote:
>
> As soon as we succeeded porting the code to the real thing. This will not be next week ... d;-)

So there's a chance for the 28th of March 2011! :-D

Re: WP-34s Demostration

*Message #7 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 8:52 a.m.,*
in response to message #6 by Thomas Radtke

Thomas, read my answer to svisvanatha!

Automatic mode switching is not after everybody's taste. We're currently discussing this in more than one area. The emulator has already helped a lot in streamlining the user interface, more than the console emulator could ever provide.

Is anybody here who might want to take care of the hardware side of things? Creating a keyboard overlay end adhesive key labels in a small production run would be a tremendous help.

Unfortunately yes. Being currently in Emsland, I'm far away from *everything* ;-).

Would you mind send it by mail? Of course, I'll refund p&p.

Re: WP-34s Demostration

*Message #12 Posted by **svisvanatha** on 18 Mar 2011, 8:31 a.m.,*
in response to message #1 by Paul Dale

Exciting! Much easier to use than the one I used a month ago from the Linux command line!

Can you give us an idea of the challenges you now face in porting to the hardware?

Many thanks!

Re: WP-34s Demostration

*Message #13 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 8:46 a.m.,*
in response to message #12 by svisvanatha

Some of the challenges:

Cyrille's SDK and the wp34s software are a very close mismatch. ;) I had a lot of fun mating the GUI emulator and Paul's sources to the version you can use now.

We plan to use Eclipse and the Yagarto gcc tool chain which is free, instead of the IAR compiler which would cost more than 1400 Euros. I've already spent more than 500 Euros for the professional edition of Visual Studio and another 80 Euros for a JTAG adapter for my 20b. I have no plans to stretch the budget further. The SDK is written for IAR. You can imagine the work ahead.

I've never written any code for an ARM core, so some getting used to has to be taken into account.

Re: WP-34s Demostration

*Message #14 Posted by **Gerson W. Barbosa** on 18 Mar 2011, 8:48 a.m.,*
in response to message #1 by Paul Dale

Very nice!

Here is the WP-34s version for dartboard pi, without reading the manual for an optimization:

```
001 LBL B
002 STO 00
003 CLx
004 STO 01
005 STO 02
006 LBL 00
007 RAN#
008 x^2
009 RAN#
010 x^2
011 +
012 1
013 x>? Y
014 STO+ 02
015 STO+ 01
016 DSE 00
017 GTO 00
018 4
019 RCL* 02
020 RCL/ 01
021 RTN
```

```
 1,000,000 XEQ B  ->  3.141268

10,000,000 XEQ B  ->  3.1412384 (2 min 27 s @ 1.86 GHz)
```

What is the expected running time for 1,000 loops on hardware?

Ceterum censeo WP-34s esse faciendum. Audis HP? :-)

Gerson.

Re: WP-34s Demostration

*Message #15 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 8:55 a.m.,*
in response to message #14 by Gerson W. Barbosa

We will certainly have to optimize for code size, not for speed. The maximum useful operating frequency of the Atmel ARM chip is something around 40 MHz. So you can extrapolate. Remember, that little thingy works on two lithium cells, not a 300 Watts power supply. ;)

Re: WP-34s Demostration

*Message #16 Posted by **Walter B** on 18 Mar 2011, 9:04 a.m.,*
in response to message #14 by Gerson W. Barbosa

Olá Gerson,

> Quote:
>
> ```
>  1,000,000 XEQ B  ->  3.141268
>
> 10,000,000 XEQ B  ->  3.1412384 (2 min 27 s @ 1.86 GHz)
> ```

You may save keystrokes by simply pressing B instead of XEQ B.

> Quote:
>
> *Ceterum censeo WP-34s esse faciendum. Audis HP?* :-)

Tibi gratia!

Walter

Edited: 18 Mar 2011, 9:20 a.m.

Re: WP-34s Demostration

*Message #17 Posted by **Gerson W. Barbosa** on 18 Mar 2011, 11:33 a.m.,*
in response to message #16 by Walter B

Ave Walter!

> Quote:

> You may save keystrokes by simply pressing B instead of XEQ B.

I should have known better. Looks like I've been using the 33s too much lately :-)

Gerson.

Re: WP-34s Demostration

*Message #18 Posted by **Paul Dale** on 18 Mar 2011, 9:14 a.m.,*
in response to message #14 by Gerson W. Barbosa

Having trouble sleeping....

This is a slightly more optimised version:

```
001 LBL B
002 STO 00
003 STO 01
004 CLx
005 STO 02
006 RAN#
007 x^2
008 RAN#
009 x^2
010 +
011 x<=1?
012 INC 02
013 DSE 00
014 BACK 08
015 4
016 RCL* 02
017 RCL/ 01
018 RTN
```

It highlights a few of the new features. Register increment (and decrement) without a skip; conditional tests again 1 (we've also conditional tests of X versus any register not just Y) and a fast backwards jump (which is well hidden :-)

The zip file contains the start of a software library for the device. Included are versions of the solve, integrate, summation and product builtins (which are implemented as keystroke programs). Additionally:

A generalised Fibonacci function value for any real input (integers generate the Fibonacci numbers.

The eight queens benchmark, slightly optimised.

And a prime number sieve that doesn't use any non-stack registers and leaves its results in the flags (a chance to use STATUS :-)

- Pauli

Re: WP-34s Demostration

*Message #19 Posted by **Dieter** on 18 Mar 2011, 10:53 a.m.,*
in response to message #1 by Paul Dale

Great! And it also shows that a black 30s looks much better than the existing silver one. ;-)

After all the positive feedback I hope you forgive me if I mention some problems I had with the emulator.

The first thing I tried was the normal distribution (sorely missed on most other calculators). It looks like the 34s cannot handle values in the far tails: For x < -10 the results first get less precise, then everything beyond x

= -13.3 simply returns zero. There are similar issues with the inverse function: the problems start somewhere beyond 1E-30, and finally everything less than about 1E-45 returns the same result -12,41...

Then, complex logs do not work for negative numbers without imaginary part. For instance, 0 ENTER -1 CPX LN throws an error, while 1E-99 ENTER -1 CPX LN returns 0 + Pi i as expected. Bug or feature?

At the first look I thought LOGy would give wrong results as it returns the reciprocal of the correct answer. While 1024 LB works fine and returns 10 as expected, 2 ENTER 1024 LOGy returns 0.1. Then I realized: Hey! That's exactly the way I suggested some time ago! In other words, the function now evaluates LOGxY, the base-x log of Y! Great! However, the key label and the manual have to be adjusted: it's LOGxY now, and not LOGy as originally intended.

I also noticed that the clipboard copy functions do not work (copy number, copy screen). However, "paste number" works fine. Can someone confirm this?

Dieter

Re: WP-34s Demostration

*Message #20 Posted by **Walter B** on 18 Mar 2011, 11:20 a.m.,*
in response to message #19 by Dieter

Hallo Dieter,

Copy Screen works flawlessly here (Windows 7). Can you tell something more about it?

I'll check your other points soon.

Walter

Addendum 1: Your observation concerning LOGy is correct. Point 2 on the bug list :-)

Addendum 2: Regarding the Gaussian distribution, the 21S is my handy benchmark (it just calculates the error probability, while we integrate from minus infinity as we were taught in math): According to my quick check, the results of the 21S are well equal to those of the 34s within |z| < 12. Personally, I don't care too much about probabilities below 1E-30, but YMMV.

Addendum 3: Concerning complex logs, you're right. This looks like point 3 on the bug list, and I have to pass it to Pauli - it's too long ago I was fond in this.

Edited: 18 Mar 2011, 12:06 p.m.

I assume you refer to the key label and the manual that have to be corrected. :-)

Quote:

> *Addendum 2:* Regarding the Gaussian distribution, the 21S is my handy benchmark (it just calculates the error probability, while we integrate from minus infinity as we were taught in math): According to my quick check, the results of the 21S are well equal to those of the 34s within |z| < 12. Personally, I don't care too much about probabilities below 1E-30, but YMMV.

Others do not care about angles between 89.9 and 90 degrees, or 12 to 16 places of Pi, but this certainly is no reason why incorrect results are acceptable. Look, this is a scientific calculator. In such a device, the least thing I expect are correct results over the whole working range. For daily use my 35s holds a normal distribution program that, of course, accepts p = 1E-499 and returns z = -47.8372821357. BTW within two seconds, which in some cases is faster than the emulator on a 1,8 GHz machine. ;-) Of course events with such a low probabilty virtually "do not happen at all", but that does not mean such values are meaningsless. A calculator is a "math tool", and it should give mathmatically correct answers. Not interpretations like "a very small number without practical meaning".

If the algorithm really is not able to handle values beyond |z| = 12 or p < 1E-40 it *has to* return an error message, and this restriction has to be documented in the manual.

But, honestly, I would expect the 34s to work like any other HP, TI, Casio, whatever calculator: simply return the correct answer. Am I asking for too much?

Dieter

Re: WP-34s Demostration

*Message #23 Posted by **Dieter** on 18 Mar 2011, 4:04 p.m.,*
in response to message #22 by Walter B

I now would like to know a bit about the working range of the 34s. Obviously it can handle values below 10^{385}. So it makes sense that the calculator does not accept exponents greater than this - an attempt to key in "E385" simply cancels the leading 3.

At the other end of the working range I found a strange behaviour:

- 10^{-384} can not be entered as [E] [+/-] [3][8][4]. On the other hand [E] [3][8][4] [+/-] is possible.
- The calculator can handle even lower numbers down to about 10^{-398}, but with reduced accuracy. Try this: Fill the stack with 1/3, then enter 1E-380 and press the multiplication key several times. As the result drops below about 10^{-387} the number of significant digits decreases. Eventually the result is displayed as "0 $^{-398}$".

Now, what is the official working range of the "real" 30b Hardware? I searched its manual and was quite suprised I couldn't find a specific value. Also, does the hardware use BCD or binary arithmetics? The calculator seems to work with 16 (BCD?) digits while 12 digits are displayed. Compared to the HPs I know of, these four guard digits are not removed, so the user can make them visible if he wants to. Reminds me of the good old days when I used a TI58/59 now and then (10-digit display, three additional hidden digits). Or does the 30b (resp. 34s) handle numbers differently?

*Message #29 Posted by **Gerson W. Barbosa** on 20 Mar 2011, 5:16 p.m.,*
in response to message #28 by Marcus von Cube, Germany

Marcus,

This may have already been discussed, but wouldn't LOG_x be more natural than LOG_y? Surely LOG_y is a useful instruction and should save a couple of steps in a program, but only one step if it has to be used together with $x<>y$, which may happen more often.

Gerson.

Re: WP-34s Demostration

*Message #31 Posted by **Dieter** on 20 Mar 2011, 5:24 p.m.,*
in response to message #28 by Marcus von Cube, Germany

No, I'd prefer it just the other way round, i.e. LOGx of Y. IMHO that's far more useful. Think of something like $\log_3$sqrt(3*pi) - you would first calculate the square root and then the base-3 logarithm. [3] [Pi] * [SQRT] 3 [LOGxY]. Just the way you'd calculate a cube root by pressing 3 [XROOT] - I think HP knew why they did it that way. ;-) The way the log implemented on the 34s now requires an additional x<>y.

Dieter

Re: WP-34s Demostration

Re: WP-34s Demonstration (general LOG)

*Message #36 Posted by **Gerson W. Barbosa** on 22 Mar 2011, 8:53 a.m.,*
in response to message #35 by Paul Dale

The HP-35 is the only HP calculator that had x^y. According to the Museum, because it lacks 10^x. Whilst this allows the decimal logarithm to be computed using only three keystrokes, most of the times it will require an aditional x<>y for the much more common exponentiation operation.

Another reason why y^x is better than x^y is this nice keystroke sequence for the last Heegner number:

1 ENTER 2 ENTER 3 ENTER 4 y^x * +

Gerson.

Re: WP-34s Demonstration (general LOG)

*Message #37 Posted by **Gerson W. Barbosa** on 21 Mar 2011, 9:16 a.m.,*
in response to message #34 by Walter B

LOG_x y, as in the first release. Example:

```
32 ENTER 2 LOGxy       ->  5
```

On the hp 33s, I usually do

```
32 ENTER 2 LN x|/y LN  ->  5

where   x|/y == XROOT
```

because XROOT is a primary function and it's close to LN.

Thanks!

Gerson.

Why on earth not 32 LN 2 LN / ???? One keystroke less and the same entry order.

- Pauli

Re: WP-34s Demonstration (general LOG)

*Message #39 Posted by **Gerson W. Barbosa** on 22 Mar 2011, 8:31 a.m.,*
in response to message #38 by Paul Dale

I should have said 32 was already on the X stack register as the result of a previous calculation when I did that, thus ENTER was not necessary. In that case [2] [LN] [XROOT] [LN] is the shortest way to get $\log_2 32$, both in number of steps and finger travel accross the keyboard. Other options I see are [LN] [x<>y] [LN] [/] [1/x] and

[x<>y] [LN] [x<>y] [LN] [/], but they are one step longer. Furthermore, [/] is way farther than [XROOT] :-)

Gerson.

Re: WP-34s Demonstration (general LOG)

*Message #40 Posted by **Thomas Klemm** on 21 Mar 2011, 11:29 a.m.,*
in response to message #34 by Walter B

Mathematica uses:

Power[*x*, *y*] gives x to the power y.

Binomial[*n*, *m*] gives the binomial coefficient .

Log[*b*, *z*] gives the logarithm to base b.

Therefore I suggest to use: $\mathbf{Log_y\ x}$

Best regards
Thomas

Re: WP-34s Demonstration (general LOG)

*Message #41 Posted by **Dieter** on 21 Mar 2011, 5:45 p.m.,*
in response to message #40 by Thomas Klemm

> Quote:
>
> Log[*b*, *z*] gives the logarithm to base b.

This sure makes sense for a system where an expression is entered essentially the same way it is written on paper, i.e. with a usual computer/typewriter keyboard. There, writing $\mathrm{LOG}_a b$ as LOG[*a*, *b*] is fine and perfectly intuitive. But I do not think this is the case on a pocket calculator, especially with RPN.

Dieter

Re: WP-34s Demonstration (general LOG)

*Message #42 Posted by **Thomas Klemm** on 21 Mar 2011, 10:08 p.m.,*
in response to message #41 by Dieter

What would you expect without reading the manual? Log[*b*, *z*] or Log[*z*, *b*] ?

I just wanted to point out that your favored choice contradicts what probably most people are used to. IMHO this has nothing to do with RPN. Once you've decided whether the base *b* is the first or the second argument of the logarithm function all the rest follows. And yes, *this* has something to do with how RPN works: arguments of a function are pushed to the stack in the order they appear from left to

right.

Cheers
Thomas

Re: WP-34s Demonstration (general LOG)

*Message #43 Posted by **gene wright** on 21 Mar 2011, 11:29 p.m.,*
in response to message #42 by Thomas Klemm

I still think this example makes the choice for me:

Think of something like log3sqrt(3*pi) - you would first calculate the square root and then the base-3 logarithm. [3] [Pi] * [SQRT] 3 [LOGxY].

Compute the value, then enter the log base and compute LogxY.

Re: WP-34s Demonstration (general LOG)

*Message #44 Posted by **Paul Dale** on 22 Mar 2011, 12:08 a.m.,*
in response to message #42 by Thomas Klemm

> Quote:
>

To me, this is a compelling reason for $\log_x$ instead of $\log_y$. The base is likely to be a very simple expression - usually a constant. The argument will probably be more

complicated. So by doing $\log_x$ you likely reduce the number of stack levels needed to evaluate the expression.

Copy screen should work, at least it did once. I'll check it. Try to paste into a graphics application like IrfanView.

Copy number might be broken because it assumes too much about the 20b/30b firmware which was replaced by a totally different beast. Forgive me! I guess I can change that easily. It's just a matter of getting up from the couch back to my development system. ;)

Re: WP-34s Demostration

*Message #49 Posted by **Dieter** on 18 Mar 2011, 11:55 a.m.,*
in response to message #48 by Marcus von Cube, Germany

Okay, so "copy screen" writes an image to the clipboard. I had expected something like an ASCII-representation. :-) Works fine with both XnView and the Faststone Image Viewer (if you only know Irfanview, just give them a try).

However, the "copy number" function obviously needs an update. While we're on this topic: what about the usual shortcuts Ctrl+C, Ctrl+V? Maybe with an additional Ctrl+Shift+C for "copy screen"? At the moment Ctrl+C or V does the same as a simple "C" or "V".

Dieter

Re: WP-34s Demostration

I have yet to understand how to program a Windows GUI. At the moment I'm totally happy with being able to adapt it to our needs. Don't wait for Ctrl-C!

I've updated copy & paste. Just give it a try!

Re: WP-34s Demostration

*Message #51 Posted by **Dieter** on 18 Mar 2011, 3:15 p.m.,*
in response to message #50 by Marcus von Cube, Germany

The copy and paste functions work fine now - thank you very much. Also a new "copy textline" function has been added.

Let me mention just one detail: the copied number always has a decimal *point*, regardless which radix mark is set on the calculator. There also are no thousands separators. In other words: while the display shows 12.345,67 the copied string is 12345.67 - that's no big deal, but... ;-)

Anyway - I really appreciate your work on this project. If it eventually comes alive to run on a physical 30s it sure will be the most remarkable effort of this communitiy. At least I do not know of anything that comes close. :-)

Dieter

Re: WP-34s Demostration

*Message #52 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 3:28 p.m.,*
in response to message #51 by Dieter

In order to convert the X register to something suitable for the clipboard, I use an internal function of the decimal library. This lib has no notion of the calculator flags. It neither honors any FIX or ENG display settings.

On "Copy Textline", I tried to copy the current display string in the upper area, if set, and the alpha register if not. I don't know why, but obviously the function always returns the alpha register. Maybe it will stay like this.

Ok, I want an HP 34s

I was considering using CD label paper and printing the keytop labels on it, cutting them out and then peeling off the backing and sticking them directly to the keys. When the time is right, I'll report on the success of the method. The preparation may be the larger job - which would be figuring out the best size for each key label for printing.

Wouldn't it be cool if at the HHC2011 conference, the user community "announced" a new scientific calculator *to HP* ?

Jake

Re: Ok, I want an HP 34s

*Message #62 Posted by **gene wright** on 18 Mar 2011, 2:03 p.m.,*
in response to message #61 by Timo

My guess is that there won't be any formal reworked "hardware".

the firmware would be available, you would have to flash your 30b (or 20b but why not a 30b?), and then perhaps use a kit someone might make to redo the keyboard and keys with some kind of labels.

Re: Ok, I want an HP 34s

*Message #63 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 2:04 p.m.,*

in response to message #61 by Timo

It will be a DIY project. When we are done, you'll find a flash image which you can download to a 20b or 30b. The rest is up to you. ;)

Re: Ok, I want an HP 34s

Even better so, it cuts waiting time considerably! ;)

However, I wonder what HP would do if you approached them with this "ready to use" firmware. It shouldn't take them too long to come up with a changed 30B faceplate and key labeling, or should it? Is this maybe something to talk about at the upcoming HHC2011?

Re: Ok, I want an HP 34s

*Message #65 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 4:19 p.m.,*
in response to message #64 by Timo

We have already massacred our poor HPs for the project. My 20b still has all the original key labels but I've soldered a JTAG connector and an external power supply to the board. I'll probably create a keyboard overlay next.

It's not a beauty, more of a prototype board. I can post photos when I'm done. At the moment it just runs the 20b firmware or Cyrille's number guessing game. That will certainly change.

Re: Ok, I want an HP 34s

*Message #66 Posted by **Timo** on 18 Mar 2011, 4:31 p.m.,*
in response to message #65 by Marcus von Cube, Germany

A slight problem I see is, that not everyone interested in the WP will possess a flash programmer - I certainly do not. However, I would actually consider buying one as it would give you the possibility to continously upgrade the calc once new bug fix releases of the firmware come out.

As for the labeling: We have a shop next door doing all kind of very professional labeling on whatever you give them for merchandising purposes. I wouldn't be suprised if they could erase the existing labels using some clever laser treatment and then place new lables on the keys and the faceplate. It would maybe not be a bargain, but it would be worth the investment in my eyes (at least considering what some of us do spent on vintage calculatorts anyway...) ;)

Re: Ok, I want an HP 34s

*Message #67 Posted by **Marcus von Cube, Germany** on 18 Mar 2011, 4:36 p.m.,*
in response to message #66 by Timo

Programming is possible through a serial cable that Tim Wessman distributes for free. You just need some free software from Atmel (SAM-BA).

Yes, any 30b / 20b could be repurposed into a 34s

*Message #68 Posted by **gene wright** on 18 Mar 2011, 5:38 p.m.,*
in response to message #67 by Marcus von Cube, Germany

with the appropriate cable (these were given out at HHC 2010) and a free software package and a serial port on a PC.

Sounds great. I have an hp20b & cable ready. Two things:

Marcus; Please use the most standard methods to send this over the internet that you can find. There was a 20b > hp45 rewrite a while back but the writer only provided it through some goofball hermaphroditic sort of file compression that i & no one i know could get to work. It does no good if we can't decompress it. Again, PLEASE.

Gene; Back when they were just cheap and not extremely collectible, i printed the global labels and functions i used onto my cx blanknut. For the function names i used the stickers that came with my first 41. This would probably work better for someone who has cleaner hands at work. I found no *good* way for the program names so i just used some finger nail polish and the tiniest brush i could buy - applied before my morning coffee. It stuck great but is in-elegant.

> Quote:
>
> The first thing I tried was the normal distribution (sorely missed on most other calculators). It looks like the 34s cannot handle values in the far tails: For x < -10 the results first get less precise, then everything beyond x = -13.3 simply returns zero. There are similar issues with the inverse function: the problems start somewhere beyond 1E-30, and finally everything less than about 1E-45 returns the same result -12,41...

Our accuracy on the probabilities distributions isn't as good as I'd like. Especially for their inverses which use the solver code. Something to work on I guess.

I started looking at this and the problem lies in the implementation of the regularised incomplete gamma function. The normal CDF is a special case of this function. Does anyone know of a reliable series approximation that converges over the reals?

Pauli

> than about 1E-45 returns the same result -12,41...

I've mostly fixed the first half of this. For values x >= -10, the function should be returning sixteen digit accuracy. For values x < -10, it is only getting about 10 digits -- increasing as x decreases further. The next release will include this change (probably fairly soon). For the very curious, I calculated Q using the error function ERF: Q(x) = 0.5 * (1 + ERF(x / sqrt(2))). ERF was being calculated to pretty much full precision (39 digits) but its value was very close to -1. Cancellation ensued :-(Thus the loss of accuracy and eventual zero result.

The inverse function is more problematic. The solver is having trouble with these very small values. I'm going to have to implement a specific inverse either to Q, ERF or our regularised incomplete gamma function.

I assume the CDF returns 16 valid digits for 0 <= |x| <= 10, and further out in the tails it drops down to 12...10...8 digits, maybe even less. Did I get you right?

If the problem is in the far tails there is an easy solution that provides exact results, works fast and requires not much effort: simply use the well-known continued fraction representation for the CDF. For |x| > 10 only 12...5 terms are needed.

> Quote:
>
> ERF was being calculated to pretty much full precision (39 digits)

That means... you have 39-digit internal precision? Great! In this case the following suggestion should work:

> Quote:
>
> The inverse function is more problematic. The solver is having trouble with these very small values.

What about this: *If* you really want to use the solver, simply do not solve for p but for ln p instead. This requires up to three additional digits internally: A relative error < 1E-16 means that the logarithm has to carry 16 places behind the decimal point, plus up to three for the integer part. So, if 19-digit accuracy is possible, this might be a way. Use sqrt(-2*ln p) as the initial guess and the solver should find the solution almost instantly.

> Quote:
>
> I'm going to have to implement a specific inverse either to Q, ERF or our regularised

> incomplete gamma function.

There are rational approximations for the normal quantile with relative errors less than 1E-16. If only values far out in the tails are problematic one can think about such an approximation for this interval only.

BTW - the last time I used it the inverse Q function accepted arguments =< 0 and >=1. This should be easy to fix. :-)

Not quite. We should get 16 digits for x >= -10, at least rounded within 1 ULP. Large positive x isn't a problem, the problem came only from negative x losing too many digits due to a subtraction (1 + almost -1 means loss of digits whereas 1 + almost 1 doesn't).

I'm using a continued fraction expansion for x < -10, I should add a few more terms to get those last few digits.

Yes, we carry 39 digits internally. It is an odd number but there are reasons for its choice.

I'm not fixated on using the solver, it makes for very small code thats all and we're pressing against the flash space limit on the device. The lack of range checking in the distribution inverses isn't good & I've just committed a fix.

I usually do it this way: ignore the sign of x, simply take abs(x) and evaluate the upper tail integral, i.e. get a result that's always less than 0.5. If this is done by means of the error function, use the complementary error function erfc() instead of erf(), which solves exactly the problem you mentioned. Finally, return this result or 1-result, depending on the sign of x.

> Quote:

> I'm using a continued fraction expansion for x < -10, I should add a few more terms to get those last few digits.

The larger |x| gets the less terms are needed. However, since speed is not an issue here you can simply use the number of terms required for the lowest x. For x >= 10 and 16 digits this should be something like 12 terms.

> Quote:
>
> Yes, we carry 39 digits internally. It is an odd number but there are reasons for its choice.

Great. So the solver can be used. Suggestion: let q = min(p, 1-p), find x so that ln Q(x) = ln q, and finally adjust the sign of x.

I looked for a nice series for erfc() and didn't find one :-(I am sure some are out there but all too many implementations use 1-erf() which will encounter the same problem I did. I'll keep looking.

I'm actually using the regularised incomplete gamma function to implement erf() which is then used to get Q(x).

> Quote:
>
> Great. So the solver can be used. Suggestion: let q = min(p, 1-p), find x so that ln Q(x) = ln q, and finally adjust the sign of x.

I've implemented solving for the log probability. Not with the minimum you suggest but it seems to work okay, although I've not checked the accuracy properly. Not sure if it made it into the latest release or not.

The min(p, 1-p) isn't going to work for all the other distributions we support -- they are all solved the same way.

Since you've clearly got some insight here, feel free to recode or add to some of the routines. The sources are all available :-)

in response to message #88 by Tim Wessman

What I mainly did was separating the emulator MFC kernel from the application in a DLL with a single interface. If you are interested, look at emulator_ddl.c and wp34sgui.c in the sources available via SVN. Some streamlining made things smoother and the skin files are customized for the modified keyboard layout.

The mechanics of the emulator are well thought out. This made porting it a manageable task. Thanks HP!

in response to message #94 by Marcus von Cube, Germany

Alternatively, a very good commercial packaging of WINE is available from Codeweavers. That company is one of the primary contributors to the WINE project. The principle benefits of the commercial software are lots of prebuilt installers for popular Windows software, and a nice GUI for managing all the bits.

Re: WP-34s Demostration

*Message #97 Posted by **Marcus von Cube, Germany** on 19 Mar 2011, 1:16 p.m.,*
in response to message #96 by Howard Owen

I run Windows XP under Parallels on my Macs, so no need for another commercial offering in this arena. I just wanted to see, how it would look like with MacOS window decorations.

WINE is a bit lighter in its footprint than virtual machines like Parallels or Virtual Box. It's a Windows API compatibility layer so there is no need to boot a separate OS or fire up a virtual machine. On my Mac, all that extracts a penalty in performance. On the other hand, a real copy of Windows running in a VM is obviously going to do better at providing a consistent platform for Windows applications. Some programs won't run in WINE, or run with glitches.

I don't use a lot of Windows software, but if I have to, I try it under WINE first. If that fails, I'll boot Windows on Parallels.

Hi, Marcus,

As I mention above, I use Crossover partly out of laziness, but also because Codeweavers does so much to sustain the WINE project. They contribute all of their extensive work on the WINE core back upstream.

There's a WINE available under Macports. Macports, if you aren't familiar with it, provides a ton of Unix and Linux open source software in packages called "ports." These packages provide source code that the "port" command uses to automatically build and install binary packages. It's an idea derived from FreeBSD, which MacOS uses for a lot of its "userland" environment. With Macports installed, all you have to do is issue a command like "port install wine" or something similar. It can take a while before the binary package gets built from source code. Here's a guide that claims to walk you through the process of installing WINE with Macports. The tutorial looks good to me, but I haven't tried it.

Good luck,
Howard

Edit:

I have a new Mac on which I didn't have Macports installed, so I went through installing wine as described at the above referenced site. It took quite a long time.

With a new Macports installation, a ton of prerequisites needed to be built. The whole thing took over two hours to complete. The results were good, however. I ended up with a fully functional copy of wine accessible from the command line

Regards,
Howard

That isn't an excuse ;-)

At a guess, the console version isn't working because it needs a library of some kind. I included the one which I knew was non-standard but you might need to install XCode as well.

If you're going that far, get X11 (again from Apple) and Wine and run the GUI version. The console version is hideous and difficult to use in comparison.

Can you add in the next version of the emulator a feature to read/write programs, memory registers, and the entire machine's state?

Namir

Re: WP-34s Demostration

*Message #112 Posted by **Paul Dale** on 20 Mar 2011, 11:13 p.m.,*
in response to message #111 by Namir

The entire machine state should be saved into wp34s.dat on quit. This is to simulate continuous memory.

We don't have read/write programs or registers separately. Not too difficult to add but these won't/can't be present on the real hardware.

Re: WP-34s Demostration

*Message #113 Posted by **Werner** on 21 Mar 2011, 4:45 a.m.,*
in response to message #1 by Paul Dale

Why not implement complex support like in the 15C, with a parallel stack for the imaginary numbers? All commands work equally well on reals as on complex numbers, and there's no need to have 'c' counterparts for sin, cos and whatnot.

Re: WP-34s Demostration

*Message #114 Posted by **Paul Dale** on 21 Mar 2011, 5:06 a.m.,*
in response to message #113 by Werner

There was a reason which slips my mind. Walter might remember. It might not even be relevant anymore. I have a vague feeling that originally it might have been that we hadn't allocated enough registers for a parallel complex stack.

Truth be known, I don't much like the 15c's handling of its complex stack. I always get the number entry wrong and having Re<>Im in a shifted position isn't optimal :-(I don't like the complex vs real mode separation all that much either. I do like the comprehensive suite of operations however.

Since the 20b's display isn't up to displaying a full complex number like the 42s can (and we did consider this), we had to compromise. We went the way of the 32sii and its successors. We filled out the operations available since the 32sii is lacking in this regard.

This solution allows for a lot more flexibility: a two or four level complex stack (plus complex last x) or a four or eight level real stack (plus real last x and an extra register I). You also get complete control over the stack and it is a natural extension of traditional RPN operation.

Has anyone played with SSIZE8 (from the Mode catalogue) and complex numbers?

> Quote:
>
> I wouldn't mind feedback from someone (or someones) who use complex numbers often.

I would prefer the 15C paradigm. Replace the CPX key with an "i" key, with a shifted theta function to enter in polar form. (If you want to convert everything to rectangular form after entry, that's OK with me.) That should help you enter the components in the proper order. When you enter a complex number using the "i" or theta key, it automatically switches to complex mode. I would have no problem with re-allocating the 100 storage registers such that R0 is paired with R50, R1 with R51, etc. to form the complex pairs when in complex mode. In other words, I would gladly take 50 complex registers over 100 real registers in order to get the complex number functionality that I want.

I realize the above is easy for me to propose and there may be reasons it cannot be done, including you and Walter simply liking your way better. Thanks for your work on this project, you and Walter have done a great job. I look forward to loading it on a 30b regardless of how it handles complex numbers.

Best regards,
Jeff

I agree with this statement. It is easy to suggest alternate ways of doing things, but not easy to get as far as you have with the WP-34s. I cannot wait to try it out on the actual hardware. Once that is done, you may find that other projects will use the WP-34s as a basis for alternate firwares! (Individual users could have their own custom firmware for example).

From what I can find in the manual, the 100 data registers are fixed... no partitioning between memory and program space?

Re: WP-34s Demostration

*Message #120 Posted by **Paul Dale** on 21 Mar 2011, 6:43 p.m.,*
in response to message #119 by gene wright

Correct, no memory partitioning. Much simpler to code that way. I hope the balance we've achieved is adequate for most.

There are more than 100 registers BTW.

* A, B, C, D are the top four levels of the eight level stack and are freely available if the four level stack is being used.

* I is the complex part of Last X and is free to use if complex operations aren't.

* J & K are used to specify parameters to statistical distributions and are free otherwise.

* Finally, X, Y, Z, T & L which aren't freely usable but are registers nonetheless.

So 112 registers in all. For most operations you can just press the corresponding letter key to get the extra register.

- Pauli

>
> I asked only because I had hoped for more program steps. Can't please everyone eh?

Exactly, we can't please everyone. I'm sure some people will want more registers and others more program space. I'm in the latter camp but we had to draw a line somewhere and 100 registers is a nice round number.

Fortunately, the source code is available and we'd likely be interested in dynamic allocation between programs and registers if somebody took the effort to code it. Four program steps would equal one register.

You are going to have more of both registers and program than the TI-58C. And our program steps are more powerful and fully merged. We've got over twenty thousand different opcodes available in program mode :-)

As usual, it comes back to how many steps do you want on a device with no IO?

True true.

I did have a question about the BACK instruction.

It seemed the manual suggested that was not available in regular programs? Yes? No?

I think they are sane enough and mostly safe enough to be useful in some situations. I've added some sanity checks to their code to prevent some failures.

However, Walter is quite correct, use at own risk.

You will crash your calculator, your pets will expire, your country

will sink, the Moon will explode, the Earth will fall into the Sun and melt and the universe will end. Apart from these, nothing untoward will be noticed.

> I'll go ahead and ask a potentially stupid question. Could programs be developed on an emulator, then uploaded to the calculator as part of or otherwise with the rom?

There are no stupid questions :-)

Yes and no. It depends on exactly what you're wishing to do.

Can you write a program on the emulator and then add it directly to the existing ROM? No. There are more than a few problems to overcome before this would be possible (reducing the firmware footprint, adding some file management commands and hooking everything together).

Can you write a program and add it to the firmware source code which then gets built into the ROM? Yes. Solve, integrate, sum and product are all examples of this -- their key stroke sources are in the xrom.c file. There are hooks to call code in ROM via user commands but they require knowledge of what is there to function and they aren't very flexible.

The big caveat is that there will be very limited ROM space left. The exact amount is not currently known & won't be until there is a hardware port. There are also a few extra functions slated for possible inclusion (see the back of the manual). Then if there is any space left over, I suspect we'll be asking for suggestions for what to put in.

More pie in the sky would be hardware modifications to include a serial port to allow save and restore or even a SD card which could not only

save and restore but allow direct program execution. This kind of thing is just a dream currently. Let's get something going on the hardware first :-)

Re: WP-34s Demostration

*Message #130 Posted by **Marcus von Cube, Germany** on 23 Mar 2011, 4:04 a.m.,*
in response to message #129 by Paul Dale

I see a remote possibility to update the internal RAM via the programming cable under program control. We'll need some space in the ROM to implement a simple up/down-loading protocol. The cable needed would be the same that is needed to reprogram the device.

This has not the highest priority, of course.

Re: WP-34s Demostration

*Message #131 Posted by **Paul Dale** on 23 Mar 2011, 4:16 a.m.,*
in response to message #130 by Marcus von Cube, Germany

We'd need commands to save/restore registers, programs & everything. Maybe the HP-41 card reader would be a good model for this.

Anyway, let's wait until after we've got working hardware.....

[OT] TAS continues to screw sellers

*Message #1 Posted by **Michael de Estrada** on 17 Mar 2011, 1:15 p.m.*

Lately TAS has been changing their seller fee policies to line their greedy pockets at the expense of sellers. I recently sold some items on TAS, and discovered that the final sale price fee has been increased to a 9% flat rate, regardless of the amount of the sale. Previously, it was a decreasing scale based on the sale price, such that it was much less than it is now. Anyway, I received a new "good news" message from TAS stating that they are further changing their policies, as follows:

"Also, because we know buyers take into consideration the total cost of an item, also starting April 19, to encourage sellers to keep shipping costs low, the Final Value Fee will be applied to the total amount of the sale--including shipping."

So now, they are charging a fee for what is actually a cost to the seller. This will be especially damaging to sellers shipping large items or shipping internationally, where the costs are much higher. For example, an HP-81 sold recently to a buyer in Europe, and I suspect the shipping costs exceeded $100, which translates into an additional $9 in TAS fees. Now, I realize that TAS will claim that sellers have been inflating shipping costs, while reducing BIN prices in order to reduce TAS fees, but in reality this is rarely the case, since most sellers such as myself simply use the shipping calculator to determine actual postage and don't charge any additional handling fees.

Basically, this discourages international selling, since any potential increase in sale price will be offset by increased TAS fees. It also discourages no reserve auctions with low start prices, and leaves the buyer with mostly high priced BIN "auctions" from the likes of Mr. C. It is interesting that TAS has also amended their policies to waive initial listing price fee, further encouraging sellers to list their items at high BIN prices.

"Starting April 19, you'll be able to list your items Auction-style FREE, at any start price, up to 50 listings a month. Plus you can add the Buy It Now option to these listings FREE to grab buyers in a hurry. Set the price you want and sell it fast! This is not a limited-time special but a change in eBay Standard fees to help you list more for FREE all the time--even those high ticket items! Pay only if your item sells."

So what this means is that if the items I have now listed in the MoHPC classifieds don't sell, I will list them at higher prices on TAS and won't ship internationally. In the past I sold NR and with a low start price, but no more. I have sold several calcs privately to forum members, and it worked out very well for both of us, so hopefully I won't have to deal with TAS anymore.

Within 3 years, Ebay will no longer be the Auction site of popular culture. It isn't an auction now, at all. Someone else will come in and fill the void.

The beauty of this is that Ebay doesn't think they will lose their position. Yahoo didn't think they'd lose theirs, either....

Re: [OT] TAS continues to screw sellers

*Message #3 Posted by **Paul Gaster** on 17 Mar 2011, 2:52 p.m.,*
in response to message #2 by bill platt

They are out of control. Listing fees, final value fees, paypal fees, which they own anyway, and now they want a cut from the money I needed to ship something? That is pretty insane. Craigslist may be a decent alternative for selling some items, but of course doesn't get enough visibility for specialized items like HP calculators. If all the Craigslists could be searched at once and people would state whether they wanted to ship or just deal locally activity would explode.

Re: [OT] TAS continues to screw sellers

*Message #4 Posted by **Michael Plant** on 17 Mar 2011, 3:37 p.m.,*
in response to message #3 by Paul Gaster

All I see happening is sellers being forced to charge flat rates to ship items and rolling the TAS costs into it, so the buyer will wind up paying more for shipping... Wonderful.

Re: [OT] TAS continues to screw sellers

*Message #5 Posted by **Michael de Estrada** on 17 Mar 2011, 4:10 p.m.,*
in response to message #4 by Michael Plant

Regardless, both seller and buyer are getting the short end of the stick, and eBay gets to line their pockets w/o providing any value added. It's kind of like dealing with a commission stock broker; they make money at both ends of the deal regardless of whether you make or lose money. I don't buy very much from their stores, because most of the time I can find the same item elsewhere for less from an online vendor not affiliated with them that doesn't have to absorb all the fees, not to mention PayPal.

> It's kind of like dealing with a commission stock broker; they make money at both ends of the deal regardless of whether you make or lose money

are you wanting to suggest that if you make a loss on an auction, then the auction site should bear some of that loss?

i must admit that the continual whinging and whining about "TAS" is staring to get a little tedious. they charge a fraction of the fees that a 'bricks and mortar' auction house would charge. and as a seller, one can always VOTE WITH YOUR FEET by simply choosing to not list your wares. nowhere do i see a "TAS" employee holding a gun to anyone's head forcing them to list items.

as an aside, i am personally EXTREMELY pleased to see auction fees extended to cover the postage component. i am currently purchasing (new) items out of china and reselling locally... one item i deal in has a list price of us$1, with us$8 shipping, while the same item can also be purchased via buy-it-now for us$10 with free shipping. clearly a little sleight-of-hand going on there, the raw manufacturing cost of said item well exceeds the us$1 sale price.

sellers need to realize that "TAS" is a business that provides a pretty amazing and unique service. they have opened up whole new markets to buyers and sellers alike, and unshackled everyone from the tyrannical fees charged by 'bricks and mortar' auction houses that would often exceed 30%.

if any buyer or seller is unhappy, simply choose to not partake. if you are a seller, bump up your reserve price by 10% or so to cover the fees. better still, try holding your breath until you turn blue!!

Re: [OT] TAS continues to screw sellers

*Message #7 Posted by **Michael de Estrada** on 17 Mar 2011, 8:49 p.m.,*
in response to message #6 by robert rozee

You need to take a course in reading comprehension.

First off, neither I nor most amateur sellers seek to make a profit on shipping fees. We charge the actual cost and don't charge a handling fee, so if anything we lose money in the process, what with packing supplies and gas driving to the post office.

Second, my auctions are all "no reserve" and start at a low price, so I'm at the mercy of the bidders as to the final sale price. Ebay charges a hefty listing fee for reserve price auctions, so even if your item doesn't sell, you pay a significant fee.

Third, brick and mortar auction houses have a significant overhead that eBay doesn't. So, to compare any brick and mortar retailer to an online store is just plain ignorant. This is why all online retailers can provide goods and services at a substantial savings to consumers.

There is nothing amazing about eBay. They are simply another monopoly that has taken advantage of their current position to gouge their users. But you are correct about one thing; I won't use them anymore. Oh, and I don't visit Walmarts either.

Re: [OT] TAS continues to screw sellers

*Message #8 Posted by **robert rozee** on 18 Mar 2011, 3:22 a.m.,*
in response to message #7 by Michael de Estrada

> Quote:
>
> There is nothing amazing about eBay. They are simply another monopoly that has taken advantage of their current position to gouge their users.

that would be a monopoly that exists because nobody else has stepped in to provide a better service at a better price? again, i don't see EBAY squashing competition, using standover tactics, or hiding behind government regulation. all i see is a company providing a comprehensive service at a quite modest price, a service that no other company in the whole wide world has been able to better.

if any seller of vintage HP calculators is unhappy, i can see no reason why they can not simply VOTE WITH THEIR FEET and freely choose to not sell their wares through said site. after all, they can get so much better prices by selling elsewhere! or not.

in response to message #9 by Michael de Estrada

He ain't a shill--he's just being frank.

Seriously, we have only ourselves to blame (collectively) for ebay's success...

Comparison: Why is google the "only" search engine? Because most people stopped using Lycos, Alta Vista and Yahoo within one year of Google's remarkable early rise.

Re: [OT] TAS continues to screw sellers

*Message #11 Posted by **Michael de Estrada** on 18 Mar 2011, 10:58 a.m.,*
in response to message #10 by bill platt

Until recently, eBay fees were reasonable, which is why I and others happily used them. eBay has always been profitable, and they didn't need to raise their fees dramatically in order to make a reasonable profit. Once they established themselves as the sole widely used service of their type, they took advantage of this to make these dramatic fee increases. To provide a numerical example, let's say I sell a calculator for $200, and then ship it to Europe USPS priority mail medium flat rate box insured for an actual cost to me of $50. Under the old eBay fee structure, the eBay sale fee would be $8.31, whereas under the new fee structure it will be $22.50, or a 270% increase. More notable, since part of the fee is based on a cost, the new fee represents 11.3% of the profit, whereas before it was 4.2%. Add in the eBay PayPal fee ($7.50), and the effective fee rises to 15%. Now the Kiwi can argue that this is reasonable because of some skewed comparison with brick and mortar auction houses or whatever, but for me it is not, and so as I stated before I choose to walk away.

Re: [OT] TAS fees cheaper than any time in 5 years

*Message #12 Posted by **Allen** on 18 Mar 2011, 6:51 p.m.,*
in response to message #11 by Michael de Estrada

> Quote:
>
> Until recently, eBay fees were reasonable...

I question the validity of some of the assertions in this thread. Remember the collective fees depend on many things including annual sales, monthly sales, store type, merchant account type, buyers ratings, listing category, final price, starting price, additions, listing time, etc... You're quoting worse case and calling that an "numerical example". It's not representative of what is happening at ebay.

Ebay/paypal fees have steadily dropped for me from 10% in 2009 to 8% in 2011- the cheapest they've been for over half a decade. If you take into account buyer-incentive programs like Ebay BUCKS program they started in 2010, and paypal cash back credit cards the effective rate slides below 6%. How is that unreasonable??

There are two things I agree with, which are not mentioned much above:

1)The ebay fee structure has become very complex, paralleling the US IRS tax structure in number of categories, tables, exceptions, credits, additions, etc.. This is not helpful for anyone.

2)The current (and likely proposed) fee/incentive structure is skewed to benefit large sellers (>$1000 monthly sales) more than occasional sellers.

Annual ebay fee changes, combined with the frequent change in US Post Office cost/policy structure make it very difficult for infrequent sellers satisfy buyers demands regarding packaging, shipping times, and accurate cost estimates for postage.

There's Amazon for those considering an alternative. ETSY also stands out among non-Ebay sites, though for pre-owned goods both companies have a fraction of the audience commanded by the San Jose hegemony.

Re: [OT] Maybe for you but not for me

*Message #13 Posted by **Michael de Estrada** on 18 Mar 2011, 7:35 p.m.,*
in response to message #12 by Allen

I think you hit the nail on the head, when you state that eBay is totally skewed towards high volume high $ sellers. As you can tell from my example, my fees have more than doubled since I began selling about 5 years ago. This is not conjecture, but hard numerical fact. Frankly, I'm more offended by the concept of taxing someone on an expense (charging a fee for a shipping cost), than the actual fee itself. If they are genuinly trying to crack down on shipping cost fraud ($10 shipping on a $1 item), then why not apply this only to fixed shipping rates, and exempt calculated rates only if the seller actual pays for the shipping through PayPal for the stated and charged shipping method. I'm sure eBay management knows perfectly well what they are doing, and are trying to bury the fee increase under the moniker of shipping honesty. If they had simply come out and said that the sale price fee was being increased to say 10% without all this obfuscation, then it would be a little bit easier to swallow. Anyways, I'm seeking out alternatives, since I really don't want to deal with such duplicity, and if that means that it takes me longer to sell my vintage calcs then so be it.

Just one more thought. I contacted another seller of vintage HP calcs and custom replacement parts as to his thoughts on this, and this was his reply:

"I don't sell much anymore and probably won't for much longer. They are going after the people who charge outrageous shipping charges (then charge next to nothing for the item) to avoid the final value fee. The rest of us get to pay."

Now, I can tell you that this person is one of the most honest and valuable sellers that I've known, and that his leaving will be a great loss to the vintage calculator collector community. Some of my very finest acquisitions were from him, and all at very reasonable prices. Hopefully, he will still be willing to sell parts privately. Otherwise, I fear this is all we may be left with in the future:

HP-45 on TAS

Re: [OT] Maybe for you but not for me

*Message #14 Posted by **Paul Gaster** on 19 Mar 2011, 3:35 p.m.,*
in response to message #13 by Michael de Estrada

I agree and just thought of a few more examples that really upset me.

Recently I was trying to help a friend who needed a TI-83 for a class, so I was looking on TAS. I saw one guy selling 2 of them, separately, for $0.99, but with $74.99 shipping. I reported these auctions and then watched what would happen, which was nothing. I reported them again a few days later, and again, nothing. Ebay is either lazy or incompetent when it comes to policing these kind of people and their auctions, so now it seems they will just push through an unfair policy to make sure they get their money. It's pathetic.

Also, don't forget that TAS limits shipping charges in many categories. I have sold some video game systems for example and there are limits for those types of items, and I'm sure other categories as well. There is no way to tack on some extra to cover the ebay fees there, you will just get screwed.

Re: [OT] TAS continues to screw sellers

*Message #15 Posted by **robert rozee** on 18 Mar 2011, 9:41 a.m.,*
in response to message #9 by Michael de Estrada

> Quote:
>
> Sounds to me like you're a shill for ebaby.

not at all - i just use their site and find it incredibly useful, and for the rock-solid service they provide the fees are extremely reasonable.

'bricks and mortar' auction houses tend to charge around 20-30% in fees these days, made up of selling fee, commission, and a buyer premium. ebay allows me to buy items from around the world, while via paypal they handle the payment for me (including currency conversion across boarders), and to boot they even provide a guarantee service too. literally, i can complete a transaction that spans the globe in less than 60 seconds.

i tend to avoid buying goods from america, as american sellers (with one or two notable exceptions) seem to charge quite ridiculous postage fees - and when the item arrives from america, the postage marked on the package is usually substantially lower than what the seller charged.

on the other hand, out of china the postage costs are minimal, and often 'free'. parts of europe are also pretty cheap for postage, and they have good supplies of old HP calculators.

there are a small number of 'pioneering' companies that have transformed the landscape for the consumer:
ebay
amazon
trademe (in new zealand)

each have opened up otherwise unavailable markets, and at a cost unheard of before the advent of the internet. 99.9% of consumers and merchants are extremely happy with the variety of goods now available and substantially cheaper costs, they don't begrudge the likes of ebay taking a cut.

it is only a very small number who complain incessantly over the fact that these companies are successful - and that is the crux of the complaints. it irks me.

I'd say it's the other way round. Seriously, there are very nice calcs offered in Europe and USA, but you can also get wrecks on both sides of the atlantic sea.

This is just a matter of your shipping quote.

*Message #18 Posted by **Frank Boehm (Germany)** on 18 Mar 2011, 4:48 a.m.,*
in response to message #7 by Michael de Estrada

If you just quote the actual shipping quotes, accepting payments via PayPal mean an overall loss for you (ever been), since the payment fee has been calculated on $itemprice+$shipping. You should have quoted $itemprice+$shipping+$paypalfeeforshipping to cover your costs.
Your new calculation needs to include the ebay-fee too, i.e. the above+$ebayfeeforshipping.

I think the new calculation is very understandable from ebays point of view, from the sellers point of view, it simply sucks to have fees added twice to the shipping costs - but I cannot come up with a clever solution to avoid the general adding of a fee without allowing "ebay sales fee fraud" (aka low item price, high shipping costs).
Maybe it's a little piece of gear towards becoming a shipping agent - in Germany, DHL and Deutsche Post are very tightly integrated into the sales process...

Re: This is just a matter of your shipping quote.

*Message #19 Posted by **Michael de Estrada** on 18 Mar 2011, 9:02 a.m.,*

> I cannot come up with a clever solution to avoid the general adding of a fee without allowing "ebay sales fee fraud" (aka low item price, high shipping costs).

This tactic is only used in fixed price style (Buy it Now) listings, and you rarely if ever see ordinary citizen amateur sellers such as myself doing this. The typical listing is an auction style with the shipping fees calculated automatically, based on the service, such that the shipping amount is the actual cost to the seller. Also, most sellers, be they amateur or pro, do not use this tactic. If this is Ebay's rationale, then they are just using it as an excuse to extort additional fees from all sellers, whether they are honest or not. As I stated above, this will hurt especially with international sales, where shipping costs are much higher. So all you fine folks in Europe are

going to find it even more difficult to obtain HP calcs from sellers in the USA, unless of course you are wise enough to buy them through the MoHPC classifieds.

I wish I could believe you are right. But I don't think this will happen any more than I think something will replace Walmart or Microsoft.

We (American) consumers are complicit in the near monopoly of all of the above, because of our own choices.

We go to eB** because we think we'll get more money selling or have more choices buying. We're rewarded with "policies to line their greedy pockets."

We go to Walmart for the cheap prices, and we're rewarded with nothing but Chinese junk to buy, and loss of jobs to China to boot.

Maybe Clinton was right all along in trying to bust Microsoft.

30 years ago, you might have said Woolworths and Digital Equipment Corporation.

I tend to agree that ebay is in danger of pricing themselves out of the market. Don't bricks and mortar auction houses typically charge 10%? I suspect that someone will pop up to take some of ebay's business. That will force them to lower their fees.

Michael, Bill; A friend used to be into buying/selling/collecting/building/playing-with/designing Lego stuff. His opinion of ebaby was not too high, but it doesn't matter to Lego folks. They have something called bricklink. It was written by a Lego guy (who is no longer alive) and it exists for their community. It made enough profit to keep running and John said it is still running and owned by his family. I remember asking about it and while it didn't seem perfect for the calculator sales market, it looked way better than eblay. He said that some folks had made offers to license the software but the writer didn't want to do that (!?!?!?) Maybe his heirs would. Just taking the bloodsucking mercenary robber-baron aspect out of the system would improve it.

in response to message #28 by PeterP

Have you tried using the MoHPC classifieds? I've already sold several HP calcs to forum members, and we're all satisfied. The worst that can happen is that you don't get any interest, but the ads are free, so you can't lose anything other than time. I recently sold 3 on TAS, but the sale price on 2 of them was shockingly low, so the market seems weak at this time anyway. Had I listed them BIN, then they probably wouldn't have sold anyway. Unless you have something super rare like an HP-70, I don't see a lot of opportunity on TAS at this time.

[OT] Casio fx 98 on TAS

*Message #1 Posted by **Manolo Sobrino** on 16 Mar 2011, 3:10 p.m.*

This oh so cute model has been mentioned on this forum some time ago... Finally one specimen comes up (and I think it's going to break all records on Casio auctions).

link (beware - you really don't need this)

Re: [OT] Casio fx 98 on TAS

*Message #2 Posted by **Mike Morrow** on 16 Mar 2011, 7:50 p.m.,*
in response to message #1 by Manolo Sobrino

An even better version of the fx-98 is the one that Casio made for Radio Shack, the EC-4009. That model was identical except for having permutation and combination functions that the fx-98 lacks (on the same keys as the parenthesis). They were cheap enough that I gave a bunch away as casual gifts 26 years ago. Today, I have only my one remaining.

There was a slightly smaller Casio scientific (non-solar) from 1977 called the fx-48. Mine survives and still works well 34 years after I bought it.

I'd like to see a re-issue of the EC-4009.

Edited: 16 Mar 2011, 7:55 p.m.

Re: [OT] Casio fx 98 on TAS

*Message #3 Posted by **Dave** on 16 Mar 2011, 9:57 p.m.,*
in response to message #2 by Mike Morrow

I also have an EC-4009. It's a great little calculator. I had one in high school in the mid-80s. Several of my friends got them too after they saw mine. Unfortunately it was stolen not long after. After watching ebay for about 5 years, I snagged one for $50 not too long ago. I passed up several high priced ones during my long search.

They don't make 'em like they used to.

How thick is the body of one of these "credit card" calculators, not counting the protrusion of the buttons?

Re: [OT] Casio fx 98 on TAS

*Message #5 Posted by **Julián Miranda (Spain)** on 17 Mar 2011, 4:22 p.m.,*

in response to message #4 by Eric Smith

I had one, I'm sure I didn't throw it away but I don't know where it is. I don't know if it was the solar cell, or the connexions, it began to stop working and in the end didn't even turn on. It was a pitty, I liked it a lot.
I would say it was 3 or 4 mm (0.12 - 0.16 inch) thick, not more.

Re: [OT] Casio fx 98 on TAS

*Message #6 Posted by **hugh steers** on 18 Mar 2011, 7:26 a.m.,*
in response to message #4 by Eric Smith

I seem to remember it being about the same thickness as their regular folding scientific. it's just not as tall.

Re: [OT] Casio fx 98 on TAS

*Message #7 Posted by **Pavel Nemec (CZ)** on 19 Mar 2011, 8:14 a.m.,*
in response to message #4 by Eric Smith

I also like mine - Casio fx68, no solar, 8 digits. Measured dimensions are 54mm x 91mm x 5mm (body only, keys protrusion not included). Still working but about month ago glued metal faceplate peeled off which ended in my first calculator restoration attempt.
My daughter (12) prefers 30b (yet in ALG mode).

Pavel

> Thanks for measuring the dimensions. The outline is, perhaps unsurprisingly, close to the dimensions of a Japanese business card. What is the height with the keys?

Eric, I have tried new more precise measurement which revealed thickens of the body 4,8 mm plus 1,2 mm keys protrusion. There are some pictures in the link. Hope it will help (is there something cooking?)

Pavel

Re: [OT] Casio fx 98 on TAS

*Message #10 Posted by **Eric Smith** on 20 Mar 2011, 4:46 p.m.,*
in response to message #9 by Pavel Nemec (CZ)

Just some thoughts on how one might make a thin calculator. Don't yet know whether anything is likely to result. Wish I had more time to spend on calculator development!

Looks like the case is stamped aluminum? I wonder what it costs to have a suitable die made. Probably not practical for low volume production.

Re: [OT] Casio fx 98 on TAS

*Message #11 Posted by **hugh steers** on 18 Mar 2011, 7:30 a.m.,*
in response to message #2 by Mike Morrow

It could well be that the 98 model also has the permutation function - but the keys are not labelled!

i've seen this before with casio. for example the fx-29 has permutations and combinations on [shift] * and / keys, but it not marked. the labelling is there on the fx-39.

this my guess, since radio shack used to simply rebrand. it should be checked however.

That is a lot for just a scientific calculator. Wow. A nice looking calculator.

Re: [OT] Casio fx 98 on TAS

*Message #13 Posted by **Johnny Bjoern Rasmussen** on 17 Mar 2011, 4:23 a.m.,*
in response to message #1 by Manolo Sobrino

Hi Manolo.
Nice calculator. Regarding the term "beware - you really don't need this" it sometimes gets swept away by "hey I remember that I really wanted that gadget once". By that I mean that I from time to time stumble over (even non-HP) items that I remember reading about in electronics magazines back in the 1980's and 90's. Back then they were too expensive for me (being being just introduced on the market) as the latest technology is almost always expensive. Today the same items are often 20+ years old and the owners have got tired of looking at them in the desktop drawer thinking "I don't need that anymore. Hmm... I wonder if some geek collects those things?". Well, that is just lucky for us collectors so we might find that Holy Grail item that we never got our fingers in back then when we were studying or just did not have eg. $300 to buy that thing. As late as the day before yesterday I came across an Atari Portfolio with a $3 price tag. Now that's a great deal for a collector.
So what I mean is that even if you are not in need for an extra calculator/pda/gadget/bicycle/set of winther tires it would be crazy not to buy it if you can afford it without putting your whole economical situation at risk. If the item is not sold the seller often sends the item for recycling. And that is a shame.

Best regards
Johnny Bjoern Rasmussen

Re: [OT] Casio fx 98 on TAS

*Message #14 Posted by **Manolo Sobrino** on 17 Mar 2011, 11:44 a.m.,*
in response to message #13 by Johnny Bjoern Rasmussen

Hi Johnny,

Of course, if you come upon a bargain like that (3$ for a Portfolio is just plain burglary! ;)), you should get it or else you will regret for decades (and every finely crafted tool deserves a loving home, you know). I understand too the pleasure to fulfil some cravings. But lately, before I wonder if I can afford some new old gadget, I find myself trying to decide whether I just have enough time/room for it, or whether there is another tool that can do the job better (and be easily replaced, I turned down recently a very nice hp 200lx because of that... sometimes it's hard).

I have a NIB casio fx-78 (almost as small as this one, not solar, but ten digits). Build quality is the best I've ever seen, but it is not as useful as my other calcs, so the poor thing sleeps in its box, that's a bit sad too.

Regards,

Manolo

*Message #15 Posted by **Bill Wiese** on 19 Mar 2011, 6:52 p.m.,*
in response to message #14 by Manolo Sobrino

In high school (1979) my geomtry teacher had a Casio FX-28, which was in 'landscape' format and similar to the '98 except perhaps with a few less functions. I recall the FX28 having quite a 'yellow' LCD display.

In 1980 I got a similar Casio FX-68 'credit card' calculator. However, it was arranged in a vertical "portrait" layout and came in a little folding vinyl wallet.

I believe Radio Shack rebranded one of these calcs and it would have had some model number like "EC-nnnn"

Comparing HP and Dell

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 15 Mar 2011, 10:25 p.m.*

The article "Rebooting their systems" on pages 73-74 of the March 12-18 issue of *The Economist* discusses prospects for HP and Dell. It is interesting readiing. Here's a sentence from the article:

> Quote:
>
> HP's boss will also need to decide whether the computers-to-calculators company, which has $126 billion of annual revenues and 325,000 employees, can continue to dabble in so many areas.

Re: Comparing HP and Dell

*Message #2 Posted by **bill platt** on 15 Mar 2011, 10:52 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

$388.000, revenue per employee

Re: Comparing HP and Dell

*Message #3 Posted by **Martin Pinckney** on 16 Mar 2011, 1:20 a.m.,*
in response to message #2 by bill platt

I guess you are using the European radix.

In my little company, I would consider one fourth of that to be wonderful.

Re: Comparing HP and Dell

*Message #4 Posted by **Bill Wiese** on 16 Mar 2011, 3:59 a.m.,*
in response to message #3 by Martin Pinckney

When we were targeting ourselves to be bought (or other 'exit strategy' perhaps) we were trying to achieve/exceed the magic > $1 million per employee that investors love. That's the sign of growth + a lean operation.

Bill Wiese San Jose CA

Re: Comparing HP and Dell

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 16 Mar 2011, 7:53 a.m.,*
in response to message #4 by Bill Wiese

These kind of ratios (revenue/employee, etc.) are meaningless and misleading, except for a few cases where other data is also taken into account. Revenue is not the same than profit, profit is not the same than return from investment, and so on. But, sadly, many decision makers make their

assesments just based on such ratios... Some of the consequences are visible almost everywhere.

Re: Comparing HP and Dell

*Message #6 Posted by **bill platt** on 16 Mar 2011, 10:47 a.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Yes! You could have $2millions revenue per employee, but be borrowing to make their paychecks....

HP 95LX - New Batteries But Still Shows "Main Battery Low"

*Message #1 Posted by **Anthony (USA)** on 15 Mar 2011, 6:12 p.m.*

Hi, everyone. I ordered a humble HP 95LX and received it today. Well, I put two new 1.5V AA batteries and a new 3V CR 2032 coin cell, and every time I turn it on I always get the "Main Battery Low" message. I go to SET UP and to the System menu and the battery status is approximately one-fifth dead. Any suggestions why it's almost out? Thank you. :)

Re: HP 95LX - New Batteries But Still Shows "Main Battery Low"

*Message #2 Posted by **DeboT** on 15 Mar 2011, 6:37 p.m.,*
in response to message #1 by Anthony (USA)

Have you tried a second set? You may just have a dud battery.

Re: HP 95LX - New Batteries But Still Shows "Main Battery Low"

*Message #3 Posted by **Bill (Smithville, NJ)** on 16 Mar 2011, 3:07 a.m.,*
in response to message #2 by DeboT

Do you have any PCMCIA memory or other cards installed. If so they can cause a voltage drop on turn on.

Which battery brand are you using? I remember that on my unit, Duracell batteries would not provide the high turn on current while Everready didn't exhibit the problem. With Duracell, I would get the main battery low every time I turned the unit on.

Of course now, I just use Lithium AA batteries.

Bill

Re: HP 95LX - New Batteries But Still Shows "Main Battery Low"

*Message #4 Posted by **robert rozee** on 15 Mar 2011, 8:25 p.m.,*
in response to message #1 by Anthony (USA)

hi,

this is a known problem with the 95lx, mostly (as far as i can tell) affecting 512kb models. i've never encountered a 1mb model with this problem and assume that by the time the 1mb models were in production HP had made component changes to prevent it.

i am afraid the only solution is a hardware one - replacing a defective tantalum capacitor with a ceramic one. you can find a short item i wrote on the procedure here, including pictures:

http://www.hermocom.com/en/knowledgebase/hplx/95lxlowbattery

you need to find someone nearby who is handy with a soldering iron, and able to follow the pictures :-) HP did

repair defective units for some time free of charge, but that was way back in the 90's.

FYI, i much prefer the 95lx over the later 100/200lx, simply because of the far more readable LCD screen.

cheers, rob :-)

Re: HP 95LX - New Batteries But Still Shows "Main Battery Low"

*Message #5 Posted by **Anthony (USA)** on 15 Mar 2011, 10:14 p.m.,*
in response to message #4 by robert rozee

Thank you all. I don't have access to a soldering iron, but when I find a friend who do, I will definitely get it fixed then. Until then, do you think I could keep using my HP 95LX without having the batteries run dry after just days of use?

Re: HP 95LX - New Batteries But Still Shows "Main Battery Low"

*Message #6 Posted by **robert rozee** on 16 Mar 2011, 7:48 a.m.,*
in response to message #5 by Anthony (USA)

the messages do not affect power consumption, and are purely an annoyance. the only problem will be that you won't know when the batteries are really empty, so you'll need to save frequently and have a spare set handy for when the unit stops running.

Edited: 16 Mar 2011, 7:51 a.m.

Re: HP 95LX - New Batteries But Still Shows "Main Battery Low"

*Message #7 Posted by **Anthony (USA)** on 16 Mar 2011, 3:48 p.m.,*
in response to message #6 by robert rozee

Thank you, that really puts the message into perspective. Okay, I'll make sure to save constantly and carry with me batteries. Thank you. :)

This is it!

*Message #1 Posted by **Joerg Woerner** on 14 Mar 2011, 8:17 p.m.*

Calculator users - stop searching!

Engineers - stop developing!

Competitors - don't even try it!

I received today, almost 40 years after the introduction of the famous Bowmar 901B, samples of the new Texas Instruments TI-nspire CX and TI-nspire CX CAS.

My first reaction after unpacking them: WOW!

The first reaction of my 16 year old test driver Stefan: WOW!

Two hours of playing with both units, comparing it with the different evolutions of the nspire, the TI-84 Plus SE and a TI-89 Titanium: See my headline.

The first pictures of the CX looked nice, but holding this cutie in your own hands is something different. It is sleek, it looks and feels just perfect and both the screen and keyboards are outstanding. Believe it or not - the keys click exactly how we liked it about 35 years ago. Not too much travel, not to hard, simply perfect. Even the plastic material used for the keys, not too mushy, not too soft, not too hard. Feels like a good old SR-51! And the screen? I can't scan it right with my equipment - just believe me. You never saw a calculator screen that crisp and bright.

I guess that in a few hours we will read the news on the CX, the yellow part on one of the provided pictures is actually a Wi-Fi adapter!

Enjoy the two pictures:

Happy Pi Day!

Regards, Joerg

Re: This is it!

*Message #2 Posted by **TychoBrahe** on 14 Mar 2011, 8:40 p.m.,*
in response to message #1 by Joerg Woerner

It really is a nice screen. I'll probably end up getting one of these (unless a worthy successor to the HP50g comes out - one with a display from this century) but I really wish TI would branch the hardware and create a version more engineer friendly.

One with a qwerty keypad, discrete trig keys and a reciprocal key. Hell, while they're at it the ability to remap the keys (at least some of them) the way you want. And much better programming abilities (API, pixel drawing, key and touchpad detection). Since wifi is already available, maybe a web browser is possible on the hardware. Useless for a calculator to do ? Pretty much. But very cool from a geek standpoint. That sounds like a lot but the hardware is 95% in place to do all that.

I realize all of those limitations are probably because the Nspire is geared toward high school students with test acceptance a priority but still I can dream.

I haven't had the chance to test any of the Nspires with the touchpad. How easy is it to get used to the touchpad ?

Re: This is it!

*Message #3 Posted by **robert rozee** on 14 Mar 2011, 9:09 p.m.,*
in response to message #1 by Joerg Woerner

certainly is less ugly than it's predecessor!

can it make phone calls?

cheers, rob ;-)

Re: This is it!

*Message #4 Posted by **Joerg Woerner** on 14 Mar 2011, 10:03 p.m.,*
in response to message #3 by robert rozee

No phone calls so far - but a double-wide ENTER key ;-))

Joerg

Re: This is it!

*Message #5 Posted by **Glen Sanft** on 14 Mar 2011, 10:34 p.m.,*
in response to message #4 by Joerg Woerner

But you're still obliged to drill through menus to get things done, which is tedious enough. (Menu-driven interfaces always suck) Especially so will it be tedious to use without native RPN or RPL! No amount of ancillary whiz-bang can possibly make that thing a joy to use day in and day out. /Play/ with it for a short while? Perhaps /that/ could be some fun.

It'd be entertaining-enough to put through some paces, no doubt, at least until you have to do something as asinine as

"sin-1(cos-1(tan-1(tan(cos(sin 9))))="

Please count out for us all the keystrokes/gestures required for /that/.

Re: This is it!

*Message #6 Posted by **Hal Bitton in Boise** on 15 Mar 2011, 12:02 a.m.,*
in response to message #5 by Glen Sanft

Well put Glen,

When the ordinary student or engineer just wants to see the associated frequency for the period they just computed, "ancillary whiz bang" will make them compose another expression. RPL will put fourth with but 1 keystroke in such an instance (1/x).

Just for the record, your expression "sin-1(cos-1(tan-1(tan(cos(sin 9)))))= Would be summarily rejected by the yellow rose of Texas as not having enough brackets! Yes, 5 sets is not enough...you forgot to put the innermost "9" in brackets! I'm betting that's close to 30 whiz-bangin' keystrokes when it's all said and done. Lacking all this glitz and flash, my poor old RPL machine (50G) makes me solve this expression in a pathetic 10 keystrokes. Gosh, I feel deprived! HB

Re: This is it!

*Message #7 Posted by **Gerson W. Barbosa** on 15 Mar 2011, 7:45 a.m.,*
in response to message #6 by Hal Bitton in Boise

> Quote:
>
> Lacking all this glitz and flash, my poor old RPL machine (50G) makes me solve this expression in a pathetic 10 keystrokes.

The very first RPL machine, the HP-28C, does it in an even more pathetic eight keystrokes :-)

Re: This is it!

*Message #8 Posted by **Crawl** on 15 Mar 2011, 11:17 a.m.,*
in response to message #7 by Gerson W. Barbosa

You might be able to get it down to 7 on the HP50G IF you already had the TRIG softmenu set up (or maybe you're counting that as the 8th keystroke?)

Re: This is it!

*Message #9 Posted by **Gerson W. Barbosa** on 15 Mar 2011, 11:51 a.m.,*
in response to message #8 by Crawl

Yes, only 7 keystrokes on the HP-28C/S if the TRIG menu was already activated. But then again the TRIG menu key had to be pressed previously, therefore it should be counted.

```
[9] [TRIG] [SIN] [COS] [TAN] [ATAN] [ACOS] [ASIN]
```

Re: This is it!

*Message #10 Posted by **Crawl** on 15 Mar 2011, 3:51 p.m.,*
in response to message #9 by Gerson W. Barbosa

Opps, it looks like the 50g's TRIG menu doesn't contain ASIN, ACOS, ATAN. I guess they figured they weren't necessary since they're accessible from the keyboard.

Re: This is it!

*Message #11 Posted by **Martin Pinckney** on 15 Mar 2011, 12:28 p.m.,*
in response to message #6 by Hal Bitton in Boise

> Quote:

> I'm betting that's close to 30 whiz-bangin' keystrokes when it's all said and done.

Surely not on the CAS+ version, which has the trig functions on the keyboard, but perhaps on the others.

> Quote:
>
> ...my poor old RPL machine (50G) makes me solve this expression in a pathetic 10 keystrokes. Gosh, I feel deprived! HB

My old 48sx will also do 10 keystrokes via RPN input. It's so well designed that entering it as an algebraic object only adds one keystroke. Interestingly, the much-maligned HP 38g also takes 11, because it automatically assumes the trailing parentheses.

Yellow rose of texas?

*Message #12 Posted by **Allen** on 16 Mar 2011, 11:38 p.m.,*
in response to message #6 by Hal Bitton in Boise

> Quote:
>
> ... summarily rejected by the yellow rose of Texas ...

Funny moniker for the TI Wifi dongle- probably such a bright yellow so the teachers can easily tell when it's attached during tests.

Ironically the historic "yellow rose of Texas" and subject of so named song was a prostitute instrumental in Texas winning the War with Mexico, IIRC. An interesting history read! The anniversary of the Battle of San Jacinto is just around the corner on April 21st.

Re: This is it!

*Message #13 Posted by **bill platt** on 15 Mar 2011, 11:52 a.m.,*
in response to message #5 by Glen Sanft

Am I missing something? Doesn't Ti use implied parenthesis?

On my 48GX, the count of keystrokes doesn't match what others have done.

```
Method RPL:
9
ENTER
sin
cos
tan
leftshift
tan-1
leftshift
cos-1
leftshift
sin-1

That is eleven keystrokes.

Method ALG:
'
leftshift
sin-1
```

```
leftshift
cos-1
leftshift
tan-1
tan
cos
sin
9
EVAL
```

That is 12 keystrokes. Big deal. Who cares?

Re: This is it!

*Message #14 Posted by **Gerson W. Barbosa** on 15 Mar 2011, 12:10 p.m.,*
in response to message #13 by bill platt

Bill, have you tried omitting the ENTER key?

> Am I missing something? Doesn't Ti use implied parenthesis? ... That is 12 keystrokes. Big deal. Who cares?

Exactly. As Joerg pointed out, only two more for the new TI.

Re: This is it!

*Message #17 Posted by **bill platt** on 15 Mar 2011, 3:21 p.m.,*
in response to message #16 by Martin Pinckney

But as silly as it sounds, to me, a scientific calculator without direct keys for trig is just, um, stupid.

Re: This is it!

*Message #18 Posted by **Don Shepherd** on 15 Mar 2011, 3:45 p.m.,*
in response to message #17 by bill platt

That's true. The NSpire is not a scientific calculator, it is a math student's calculator. I don't know why people are trying to make it into something it is not.

Re: This is it!

*Message #19 Posted by **bill platt** on 15 Mar 2011, 4:24 p.m.,*
in response to message #18 by Don Shepherd

It is also a stupid cutesy name. Nothing a little electrical tape couldn't tame

Re: This is it!

*Message #20 Posted by **Martin Pinckney** on 15 Mar 2011, 10:18 p.m.,*
in response to message #18 by Don Shepherd

Excellent point, Don. I think people are reacting to the OP glowing description, whether meant in jest or not.

Re: This is it!

*Message #21 Posted by **Don Shepherd** on 15 Mar 2011, 10:49 p.m.,*
in response to message #20 by Martin Pinckney

Thanks, Martin.

Yes, Joerg's description is certainly good. The pictures, I'm sure, don't do justice to the quality of the color display. If it is anything like the Casio Prizm (and I'm sure it is), it is indeed a fine display, and this overcomes one of the biggest complaints about the NSpire from day one: you just couldn't discern the display unless you shine a bright light directly on it. I kept a flashlight next to mine, for this reason. So I'm happy to see this improvement.

But this new version still does not overcome another problem of the NSpire, namely, the touchpad (and "clickpad" before it) is a cumbersome human interface for manipulating objects on the screen. Using the touchpad to grab a point or a line or a vertex or a slider and drag it across the screen (which is what students will do to explore math concepts on the NSpire) is not an easy process to learn or execute; it is downright frustrating, frankly. What the NSpire needs is a stylus and a touchscreen. Color certainly adds a lot, but a touch-sensitive screen would make the NSpire about 200% better, in my opinion.

And, yes, TI is not marketing this to engineers. It's place is in the classroom of high schools and colleges.

Don

in response to message #22 by bill platt

Bill, I don't know, but Mathematica for Students (for example) + the cost

of a laptop would undoubtedly be more than the cost of the NSpire. I don't know how many high schools currently use the NSpire but I have a feeling the NSpire is nowhere near as prevalent as the TI-83 and 84. Whether the color NSpire will change that, who knows.

Glen,

Less keystrokes than you expected!

This little thing places all the brackets automatically ;-))

And you might have noticed the little arrow below the [trig]? This key brings up "sin" if you press it, "cos" if you hold it a little longer, then "tan" etc.

It is [trig] [enter] [trig] [enter] [trig] [enter] [trig] [enter] [trig] [enter] [trig] [enter] [9] [enter]

Or 14 keystrokes.

Cheers, Joerg

So does the HP-71B in calc mode:

```
[f] [ASIN] [f] [ACOS] [f] ATAN [f] [TAN] [f] [COS] [f] [SIN] [9] [END LINE]
```

14 keystrokes as well, without worrying about when releasing any of the keys :-)

Regards,

Gerson.

Don't forget that you would have to space over all those closing brackets should you want to continue the expression...that's an instant 6 more keystrokes. =)

*Message #28 Posted by **Jim Horn** on 16 Mar 2011, 1:14 p.m.,*
in response to message #5 by Glen Sanft

Number of keystrokes on *any* calculator, HP or TI: 1: 9

By trivial inspection, the functions cancel each other out. Of course, 9>+/-PI, so you could normalize out the middle two terms with 9 SIN ASIN or 4 keystrokes on the '42S, '50g, etc.

in response to message #1 by Joerg Woerner

Why so many versions? I see six on the TI site. There's only one 50g.

Re: This is it!

*Message #37 Posted by **bhtooefr** on 16 Mar 2011, 8:20 a.m.,*
in response to message #36 by Martin Pinckney

Simple.

The 50g is for engineers, who are buying the calculator as a tool.

The Nspire is for students, who have to buy a specific version of the calculator to meet their class and standardized test requirements. Different versions have different features enabled and disabled.

For something similar in HP's lineup, look at the 39g and 40g lines.

Edit: Oh, and there's six Nspire models, not six Nspire CX models - the original Nspire, in both standard and CAS models, the touchpad version of the original Nspire, also in both standard and CAS models, and the CX, in both standard and CAS models.

The HP equivalent would be saying that there's six models in the 39g line - there are, but four of them (the 39G/40G (which are 49G-based) and the 39g+/40g+ (which are 49g+-based)) are outdated.

Well, I think this calc is kind of a mixed blessing...

On the one hand, I admire the technology. During college I've used a Voyage 200 for some time and the nSpire CAS CX is way beyond the abilities of the Voyage, as far as I can tell from the specs. For students I'm sure that it can definitely be a superb learning aid, provided the teachers know how to use this calculator as a teaching instrument. I'm also fascinated by the Vernier sensors that you can connect to the CX - I wished something comparabel had existed when I attended physics in school...

For engineers I think it's a different story. The whole concept of working with the calc by means of "documents" and "problems" is not very engineering-like. It's only the scratchpad mode that one would use regularly, all the other functionalities might very likely be replaced by computer based tools like Scilab, Ecxel, Matlab, Maple or Mathematica. After all, documenting a development is much easier using these tools than the calculator. Provided you have access to a workstation, that is.

I also second all posts stating that the TI menu system is very tedious to use. In fact, it was the thing that I found most annoying on the Voyage 200. In contrast, the soft-menu used on the 48/49/50-series calculators from HP is something I'm really fond of, sice it provides a very quick way of accessing the individual functions.

So after all, I wouldn't buy this calculator for engineering use. However, it seems to me, that at a certain point it will be hard to resist from an "entertainment" point of view - or maybe out of pure technological curiosity... ;)

*Message #39 Posted by **Han** on 16 Mar 2011, 1:24 p.m.,*
in response to message #1 by Joerg Woerner

Not to rain on anyone's parade, but the screen looks horrible. Perhaps in person the screen is more legible, but from those pictures, how can anyone read anything on the screen? At least the older version of the Inspire has a nice, clear, and legible screen.

I don't understand the point of a wifi connection -- to me that seems like a gimmick add-on that does not serve any real, useful purpose. If you want to connect with a PC, it may save having to use a real cable, but then the transfers are probably slower via wifi.

As said my prior posts, the Inspire's design team does not seem to have a good hold on what exactly they want their product to be. As a calculator, there are not enough dedicated keys (everything is done via a menu). As a handheld with wifi, its screen is extremely poor and the the device is too large and clunky -- not to mention that most handhelds (smart phones) are much more capable for not that much more in terms of price. As a "computer" it has a terrible set of inputs (keyboard and a real mouse is preferable).

This is NOT a student's calculator. It's more of a device for teachers to show examples and do mini-projects in the class. You wouldn't "calculate" with it because the whole notion of a "document" is completely contrary to picking up a calculator to do a few random calculations.

Re: This is it!

*Message #40 Posted by **Marcus von Cube, Germany** on 16 Mar 2011, 1:59 p.m.,*
in response to message #39 by Han

The WiFi is for in classroom connection. A student can be selected to show his solution on his handheld on the teacher's projector. The teacher can download examples to the students devices. The same already existed in form of a more clunky device for the previous models.

The screen is certainly as bright as the Prizm's which is a pleasure to read. On a scan, this is obviously not correctly reproduced.

Counting the number of different Nspire models returns six on first sight but it's in fact much less. Software wise there are just two incarnations: with or without CAS. All models can be updated to the same version in their respective (non) CAS variant.

The clickpad CAS and the touchpad CAS Nspire are physically different because the CAS version does not support keyboard swapping. The newer model has a removable keyboard in order to get to the batteries but no replacement keyboard.

The touchpad (non CAS) Nspire has just an updated keyboard. You can upgrade your old Nspire with a new keyboard to the touchpad version. The only difference is that you don't get the possibility to install the rechargeable battery option.

OK, the both CXs are new. But they still run a version of the software which can be installed on the respective older models.

This is an example where the pictures give a totally unrealistic view of the actual products. The CX screen is crystal clear and bright. The older NSpire screen is nowhere near as legible and bright as it appears in the picture. If you had the actual products in your hand, you would understand.

> Quote:

> I don't understand the point of a wifi connection -- to me that seems like a gimmick add-on that does not serve any real, useful purpose.

I'm sure that wifi connector will be used to communicate with the TI Navigator, a device in the classroom that receives signals from the students' machines and displays the students screens on the whiteboard. I doubt that TI plans to use that connector for Internet access, although it may be possible.

> Quote:
>
> the Inspire's design team does not seem to have a good hold on what exactly they want their product to be.

Oh, I think the design team knows exactly what they want the NSpire to be: a tool to help kids explore and better understand math principles and concepts. That was the purpose of the NSpire from day one, and it hasn't changed. The enhanced screen of the CX will further that purpose.

> Quote:
>
> This is NOT a student's calculator.

Don't think of it as just a calculator. It's actually more than that, it is a device students (and teachers, of course) use to explore and experiment with math concepts, as I said. And the document-based architecture supports this goal by allowing all pages (calculator pages, graph pages, spreadsheet pages, geometry pages, and notes and data) related to a given problem to be stored in a single document. These pages might have been created by the teacher, the student, or a combination of both. The NSpire is actually a very powerful device for helping students to better understand math.

It's not for engineers, and wasn't meant to be.

How does this technology actually help to understand better than chalk? Every time I have been in some lecture with "technology" the technology ends up being the focus and everything you thought you were going to learn goes out the window. Or the machine has to be re-booted. Or the batteries die.

What mathematical concepts actually benefit from such a strange specialized not-a-calculator tool?

Maybe I am just getting so old and grumpy that I cannot see anything new?

Re: This is it!

*Message #43 Posted by **Don Shepherd** on 16 Mar 2011, 4:01 p.m.,*
in response to message #42 by bill platt

Bill, my wife tells me I'm getting old and grumpy too, so you're in good company!

Here is an example of how technology might be used to give students a better understanding of a math concept, rather than chalk. By the way, the school I teach at only a couple of weeks ago replaced the old chalk blackboards with white dry-erase boards. I'm sure we were the last school in Louisville to do so.

The graph is of the quadratic equation ax^2+bx+c. At the upper left hand corner are 3 "sliders" which lets the students dynamically change the values of variables a, b, and c, and observe how the characteristics of the graph change at the same time. Now, you could draw a graph on the blackboard and tell the kids how the graph would change if you changed a, b, and c, and I'm sure they would believe it (especially if you made them draw another graph), but seeing it change electronically before their eyes, direcly from their inputs, possibly makes the learning more interesting and, hopefully, permanent.

I didn't use the handheld NSpire to do this example, I used the teacher PC software because using the mouse is a lot easier than using either the clickpad or touchpad on the actual handheld.

But that's the general idea. Seeing a graph dynamically change might cause some kids to understand the relationship between a, b, and c and the final graph a little easier.

I don't use the NSpire in my classes because my school doesn't have them, but from the nspire google forum I see that several teachers have created very nice NSpire applications, and I think these have value.

Don

Re: This is it!

*Message #46 Posted by **Marcus von Cube, Germany** on 16 Mar 2011, 5:15 p.m.,*
in response to message #42 by bill platt

I'm neither student nor teacher but the machine has still its potential. Some weeks ago, the notebook where my wife used to record the mileage and consumption of her car ran out of pages. She gave it to me and I entered all the numbers into my Nspire. I wanted to analyze the data to know more about the actual consumption of the car over the years.

First of all, the machine is capable enough to store all the data in its spreadsheet. No other calculator has enough working memory for such a data set (probably except the 50g). The spreadsheet has another advantage: You can define column formulas which fill complete columns without repeating the formula in each cell. Next useful feature to mention here: You can program a user function and put it in a column header for customized evaluation.

The formulas I created compute the actual consumption in liters per 100 km (the European way of expressing miles per gallon) and, as a user function, the moving average of the latter over a variable range of elements.

Graphing selected columns of such a table is a no brainer with the Nspire. I graphed the average consumption per 100km against the absolute km value. I added a slider to modify the range value for the moving average to the graph. Moving the slider immediately showed the effect of different values of the number of elements used to compute the average. It was apparent that consumption varies over the seasons of a year if you set the range to a value above 5. With a value of 1 (no average) the graph looks more like random noise.

If you're interested I can upload the document to my site. I must admit that the PC application was more useful in this scenario because the reaction to slider movements is a bit sluggish on the handheld. Data entry has been done on the Nspire and the graph can be used there too. Its just the mere amount of data that slows things down. (The car is 10 years old and has run more the 200,000 km).

Re: This is it!

*Message #47 Posted by **TychoBrahe** on 16 Mar 2011, 8:39 p.m.,*
in response to message #42 by bill platt

I found these links to be helpful in understanding the target audience. I have to admit, I don't have an HP50g and have no idea if things like this are possible on it. And if anyone would care to answer I would interested in knowing that. But as far as seeing how clear the display really is and the things I thought sort of illustrated the supposed purpose of the calculator model, engaging students in math and science and helping them visualize concepts, maybe these are helpful.

As a side note, I've been on the fence for years purchasing my first graphing calculator (and yes, I'm an old man) just for purposes of going through my old electrical engineering textbooks (I have a sick and unpopular idea of fun) again. To me, the HP50g display as it looks in screen shots on web pages, amazon and so on, looks way too pixelated. Then again, so did the rest of the calculators until the grayscale Nspires came out (but too blurry), the Casio Prizm and the Nspire CX. If HP came out with an updated 50g with a screen like this I'd probably buy it in a heartbeat.

Anyway, not being a student or using this for my job I am probably in the tiny minority of people who would prefer the calculator of my choice to be incredibly powerful (hardware wise), flexible, very programmable, and to have a fun and modern feel.

in response to message #1 by Alberto Fenini

I had a Casio fx-4000P calculator that did a similar thing. It's from the late 1980s so I wasn't too surprised, but I was really fond of the calculator.

About 10 years ago the display was starting to get dim, causing me to either up the contrast or buy new batteries (which helped, for a few years). But eventually nothing I would try would help.

I've always wondered if it could be a capacitor that dried out or at least something that I could fix.

Pi Day's ramblings

*Message #1 Posted by **Valentin Albillo** on 14 Mar 2011, 1:02 p.m.*

Hi all, long time no see:

Today's Pi Day, so I feel like indulging in some quick Pi antics to commemorate the event, namely showing off two little-known, rarely seen, extremely short ways to compute this most ubiquitous constant.

I'll use the HP-71B (+ MathROM) to enter and run the algorithms described. If you'd like to key them in as shown and don't own an HP-71B, get the excellent freeware emulator Emu71 by J-F Garnier (Google for it) or any other capable emulator of your choice (Math ROM emulation required) or that failing try and adapt the code to your favorite HP calculator.

Let's see:

1. **An asymptotically exact, probabilistic way:**

   This 50-byte one-liner will compute Pi using random numbers, you'll have to input how many tries (say 100,000) and it'll display the resulting Pi approximation at the end. The more tries the more correct Pi digits you'll get:

```
10 INPUT K @ N=0 @ FOR I=1 TO K @ N=N-MOD(IROUND(RND/RND),2) @ NEXT I @ DISP 1-4*N/K
```

   To run it, key it in and then key in the following at the ">" prompt:

```
>DESTROYALL @ RANDOMIZE 260 @ FIX 4    [Enter]
>RUN   [Enter]

   ? 100000  [Enter]

      3.1416
```

   As I said, the more tries the more correct digits you'll get. See if you can figure how and why it works, and if so check if you can prove that it actually produces the exact value of Pi in the limit.

2. **A faster, very precise, approximate way:**

   Do the following:

   a) Compute the real root of the cubic equation $\mathbf{x^3 - 6*x^2 + 4*x - 2}$**:**

```
>DESTROYALL @ STD
>FNROOT(-10,10,FVAR^3-6*FVAR^2+4*FVAR-2)

    5.31862821775
```

   b) raise it to the 24th power:

```
>RES^24
```

```
2.62537412641E17
```

c) compute the natural logarithm of the result:

```
>LN(RES)

    40.1091699911
```

d) Divide the result by the square root of 163:

```
>RES/SQR(163)

    3.14159265359
```

You'll get Pi correct to all displayed digits and then some. Again, see if you can figure how and why this works and if so, check if you can prove that it won't produce an exact value of Pi but just a fairly good approximation.

That's all. Best regards from V.

>
> I will try the two programs in my 71+MathROM, which I haven't used in ages. It should be fun.

Yes, it should.

You might also want to try this Java version for the first one as well:

```
        private static void pi() {
                double pi = 0.0;
                for (long i = 0; i < Long.MAX_VALUE; i++) {
                        pi = pi - Math.round((Math.random()/Math.random()))%2;
                        if ((i&0x80000)==0x80000) {
                                System.out.printf("%d: %s%n", i, 1-4*pi/i);
                        }
                }
        }
```

I left it running yesterday on one of my servers, all night long (16 hours), and it produced the following:

```
...
487,446,282,239 tries  -> 3.141592254139215
487,447,330,815 tries  -> 3.141592246519439
487,448,379,391 tries  -> 3.141592254556738
...
```

which is as expected, 7 correct digits for some 500 (US) billion tries. Only one core was used and it managed *22,000 tries per millisecond*. Not bad.

The result also shows that Java's random number generator is working Ok, else there would be some bias which would be noticeable in the final result's accuracy.

Best regards from V.

Regarding the second challenge: that's not too hard to solve once you got access to some symbolic math software - Wolfram Alpha will do. ;-)

Determine the real solution of the polynomial, raise the result to the 24th power, take the natural log and divide by sqrt(163), and you'll get a result, whose continued fraction representation looks quite familiar:

```
[3; 7, 1, 15, 292, 1, 1, 1, 2, 1, 3, 1, 14, 2, 1, 1, ...]
```

Right, these are the first sixteen terms of the continued fraction representation of Pi. Its first seventeen significant digits agree with the true value.

I'm sure someone else will provide a decutive proof. ;-)

in response to message #1 by Valentin Albillo

Hello Valentin,

Welcome back!

I've used WolframAlpha to solve the equation (solve x^3 - 6*x^2 + 4*x - 2 = 0 for x) and asked for more digits and repeated the steps using the windows calculator:

```
5.31862821775018565910968015331802247^24

262537412640768767.99999999999922

40.109169991132519846765626111088

3.14159265358979324562286127779 83
```

When I compared the result to pi

```
3.14159265358979323846264338327 95
```

I found the first 17 digits to match.

However, if 24 is subtracted from the result between steps b and c, the approximation is even more impressive:

```
ln(5.31862821775018565910968015331802246772191980883690026023^24-24)/sqrt(163) =

3.14159265358979323846264338327950319783820424737150850414

3.14159265358979323846264338327950288419716939937510582097 4945 (pi)
```

I have no idea why this works though, even after checking this MathWorld reference:

http://mathworld.wolfram.com/RamanujanConstant.html

Best regards,

Gerson.

Yes, I knew. However, I chose to omit the subtraction of 24 as the final result was close enough to Pi that it would nevertheless be indistinguishable in 10-digit and 12-digit calculators, and you wouldn't be able to notice it unless you resorted to multiprecision computations which would deny the simplicity, so I opted for one step less.

Re: Pi Day's ramblings

*Message #11 Posted by **Crawl** on 14 Mar 2011, 9:06 p.m.,*
in response to message #1 by Valentin Albillo

The first one implies that the probability of one (evenly distributed between 0 and 1) random variable divided by another having a result between (.5 to 1.5) or (2.5 to 3.5) or (4.5 to 5.5) or (6.5 to 7.5) or ... is

(pi - 1) / 4.

Wikipedia talks about ratio distributions, and in fact that one in particular here.

Using the result there, you then have to integrate between the limits in the first paragraph, giving

1/4 + 1/2*((1 - 2/3) + (2/5 - 2/7) + (2/9 - 2/11) + (2/13 - 2/15) +...

(the first term is the hardest one: You have to break up the first integral into one from 0.5 to 1, of 1/2; and one

from 1 to 1.5, of 1/(2x^2). The others are all of 1/(2x^2), for the whole range)

or -1/4 + (1-1/3+1/5-1/7+...)

That infinite series is the Leibniz formula for pi, so the probability is

-1/4 + pi / 4.

which is what was to be shown.

By the way, I do think that is a more interesting example than the well-known Buffon needle problem. That is supposedly an example of pi coming up in a non-obvious situation, but I don't agree. It's obvious that when you toss a needle, the possible angles the needle could trace out when it lands will make a circle. And in fact you use circles and geometry to derive the probability.

In this example, however, it's really not obvious how pi is involved. And geometry is not used in the derivation.

> By the way, I do think that is a more interesting example than the well-known Buffon needle problem.

Agreed. As far as obtaining Pi via Monte-Carlo methods (algorithms using random numbers) I think that this is by far the simplest and most elegant, apart from being utterly non-obvious.

How about using the following loop to get an estimate:

```
RAN#
RAN#
R->P
IP
SIGMA+
```

Any takers to finish this?

Had an open day when I was studying mathematics at university. We did this dartboard PI estimate and the value was running a bit low. In stepped one of the older tutors who proceeded to correct the estimate a bit by putting a pile of darts on the same spot :-)

*Message #18 Posted by **Dieter** on 16 Mar 2011, 2:55 p.m.,*
in response to message #17 by Gerson W. Barbosa

May I humbly suggest some improvements? :-)

Since the number of loops is known I think using DSE is the obvious way to go here. When the program finishes the values for n and N are the same, so there is no need to distinguish between both. And since only the sum of all x-values is used, the relatively slow Sigma+ is not required either.

Here's a version for the HP-35s which also shows how to get along without the infamous R->P command. ;-)

```
P001 LBL P
P002 INPUT N   ; get and save n
P003 STO K     ; initialize loop counter
P004 CLX
P005 STO S     ; initialize sum
P006 RANDOM
P007 RANDOM
P008 i
P009 x
P010 +
P011 ABS       ; = sqrt(random1^2 + random2^2)
P012 IP
P013 STO+ S    ; add 0 or 1
P014 DSE K     ; decrement and check loop counter
P015 GTO P006
P016 RCL N
P017 RCL- S
P018 RCL/ N
P019 4
P020 x         ; result = 4*(n-sum)/n
P021 RTN
```

My 35s runs 1000 loops in 2:45 minutes.

Edit: here's another version that requires just one memory register.

```
P001 LBL P
P002 INPUT N    ; get and save n
P003 CLSTK      ; clear sum
P004 RCL N
P005 R^         ; save n in stack
P006 RANDOM
P007 i
P008 x
P009 RANDOM
P010 +
P011 ABS        ; = sqrt(random1^2 + random2^2)
P012 IP
P013 +          ; add 0 or 1
P014 DSE N      ; decrement and check loop counter
P015 GTO P006
P016 -
P017 X<>Y
P018 /
P019 4
P020 x          ; result = 4*(n-sum)/n
P021 RTN
```

Of course, and don't be humble: your improvements are perfect!

I imagined Sigma+ was slow but I wanted to use all the instructionS Paul had provided. Prior to using Sigma+, I tested the idea in the third program below, which runs 1000 loops in 1 minute and 46 seconds (at first, I had used an HP-15C). As a comparison, the HP-33s program above runs in 2 minutes and 1 second, using Sigma+; I was expecting it to take more time.

The first program below is based in another (not so good) idea I had tried on the 15C. The indirect addressing slows it a bit. The second one is based on your first version, except the R->P instruction is still being used. It appears the newer machines don't benefit much from the faster DSE and ISG loop control instructions.

This is an interesting point. Obviously every calculator has its specific "slow" and "fast" instructions. Regarding the 35s I can say that especially numeric constants are processed *very* slowly. So I often use workarounds like these:

```
constant    workaround
 (slow)      (faster)
   1          Clx e^x  (or simply SGN if x>0)
   2          e   IP
   3          Pi  IP
  ...         ...
```

There also is another advantage: on the 35s the "fast" versions even use less memory.

Back to the various Pi-programs. Looking at the second 35s-version I wondered how fast or slow the 35s might process complex numbers, so I replaced lines P006 to P011 by a straightforward...

```
P006 RANDOM
P007 x^2
P008 RANDOM
P009 x^2
P010 +
P011 SQRT
```

...and guess what: it's much faster! 1000 loops are now done in 2:09.

Dieter

Likewise when these instructions replace lines V0002 through V0004 in the third HP-33s program above, the running time drops from 1min 46sec to 1min 04sec. However, I think Paul Dale was concerned about size rather than speed.

Actually SQRT is not necessary. If both terms of SQRT(random#$_1^2$ + random#$_2^2$) > 1 are squared, the inequality still holds. Thus, when SQRT is removed the running time for 1000 loops drops down to 53 seconds for the HP-33s program and to about 2 minutes for your 35s program.

Re: Pi Day's ramblings

*Message #25 Posted by **Dieter** on 17 Mar 2011, 10:27 a.m.,*
in response to message #24 by Gerson W. Barbosa

On the 35s I excpected a version without DSE to run even slower, as it requires a numeric constant ("1") within the loop. And so it was:

```
P001 LBL P
P002 INPUT N
P003 CLSTK
P004 RCL N
P005 R^
P006 ENTER
P007 Clx
P008 RANDOM
P009 x^2
P010 RANDOM
```

```
P011 x^2
P012 +
P013 IP
P014 +
P015 1
P016 STO- N
P017 Clx
P018 RCL N
P019 X>0?
P020 GTO P007
P021 RDN
P022 -
P023 X<>Y
P024 /
P025 4
P026 x
P027 RTN

Running time: 2:16
```

As mentioned before there are several ways to avoid numeric constants:

```
P015 RCL N                    P015 RCL N
P016 SGN                      P016 ENTER
P017 STO- N                   P017 SGN
P018 Clx                      P018 -
P019 RCL N                    P019 STO N
P020 X>0?                     P020 X>0?
P021 GTO P007                 P021 GTO P007
...                           ...

Running time: 1:55            Running time: 1:59
```

So the two last solutions take about the same time as the original version with DSE.

Dieter

There's a good point in there. pi is known to be approximately 22/7, or, even better, approximately 355/113.

If you used a multiple of 113 as the number of trials, you might be able to get very close this way.

The same idea is suggested in the article on Buffon's needle I linked above.

Since the experiment approximates Pi/4 I would suggest an integer multiple of 4*113 = 452.

This way n*452 trials will result in Pi ~= 355/113 if the number of hits is n*355.

Dieter

Re: Pi Day's ramblings

*Message #28 Posted by **Gerson W. Barbosa** on 17 Mar 2011, 2:20 p.m.,*
in response to message #26 by Crawl

> Quote:
>
> If you used a multiple of 113 as the number of trials, you might be able to get very close this way.

I had tried that earlier, but to no avail. I was trying single runs of 113 trials. I've finally made it with a single run of 452, as per Dieter's suggestion, the first time I tried. I little cheating though in order to ensure immediate success ;-)

On the real HP-42 and the 38-byte program above:

```
     94 SEED 452 XEQ PI  =>  3.14159292035  (after 1 min 45 sec)
```

On Free42 Binary 1.4.67:

```
66 SQRT SEED 452 XEQ PI  =>  3.14159292035  (instantaneously)
```

```
--------
```

```
00 { 34-Byte Prgm }
01>LBL "X"
02 STO 04
03>LBL 01
04 RCL 04
05 SQRT
06 SEED
07 452
08 XEQ "PI"
09 PI
10 -
11 ABS
12 1E-4
13 X>Y?
14 STOP
15 DSE 04
16 GTO 01
17 RTN
18 .END.
```

On the real 42S, line 05 is not necessary to find a "right" seed for the random numbers generator. That's because Free42 will always generate the same random number for seeds with same fractional parts, except when the seed is set to 0, when SEED behaves as it does on the real 42S, that is, always generates internally a different random number:

```
                              Free42              HP-42S
1   SEED   RAN  =>  5.23054829358E-1    7.31362440213E-1
2   SEED   RAN  =>  5.23054829358E-1    4.31362440213E-1
3   SEED   RAN  =>  5.23054829358E-1    1.31362440213E-1
3.1 SEED   RAN  =>  1.20349678274e-1    8.01362440213E-1
4.1 SEED   RAN  =>  1.20349678274e-1    5.01362440213E-1
5.1 SEED   RAN  =>  1.20349678274e-1    2.01362440213E-1
0   SEED   RAN  =>   undetermined         undetermined
0   SEED   RAN  =>   undetermined         undetermined

----------------
```

On Free42 Binary 1.4.67 @ 1.86 GHz:

```
9236 SQRT SEED 132408 XEQ PI  =>  3.14159265301  (about half a second)
```

Those days...

*Message #29 Posted by **Frank Boehm (Germany)** on 15 Mar 2011, 8:28 a.m.,*
in response to message #1 by Valentin Albillo

I remember a "Spektrum der Wissenschaft" (the german release of "Scientific American") essay about "shooting at pi", using the random generator. If I remember correctly, I used my newly purchased Amiga to do the calculations and graphical representation. Lots of fun. While googling for the essay, I stumbled across this: Pi
Looks like someone invested quite a bit of time for pi day ;)

Re: Those days...

*Message #30 Posted by **Palmer O. Hanson, Jr.** on 15 Mar 2011, 11:41 p.m.,*
in response to message #29 by Frank Boehm (Germany)

A. K. Dewdney's column "Computer Recreations" in the April 1985 issue of *Scientific American* discussed this methodology. He used the analogy of a cannon firing into a square field which included an inscribed circular pond. Readers were asked to send the results for 1000 shots to him.

Re: Pi Day's ramblings

*Message #31 Posted by **Dieter** on 15 Mar 2011, 12:58 p.m.,*
in response to message #1 by Valentin Albillo

Here's my approach for the second challenge.

The key is a constant found by Ramanujan who showed that

```
R = e^(Pi * sqrt(163))
```

is *almost* an integer. In fact, the exact value for R is

```
R = 262 537 412 640 768 743,999 999 999 999 250...
```

and so

```
R = ~= 262 537 412 640 768 744
```

In other words:

```
Pi ~= sqrt(163) * ln R
```

The value of this expression agrees with Pi in its first 30 decimals.

Now, R also is the intermediate value 2,62537412641 E+17 mentioned in the challenge. At least is looks quite close - the given 12 digits are the same as in R.

So the remaining question is: Why is the real solution of the given cubic equation, raised to the 24th power, so close to R? Or, more precisely, indistinguishable in its first 12 digits.

The analytic solution to the given cubic equation is

$$x = 2 + (5 + \sqrt{489}/9)^{1/3} + (5 - \sqrt{489}/9)^{1/3}$$
$$= 5,318\ 628\ 217\ 750\ 185\ 659\ 109\ 680\ ...$$

Now, the 24th power of x is

$$x^{24} = 262\ 537\ 412\ 640\ 768\ 767,999\ 999\ 999\ 999\ 251\ ...$$

which is quite exactly R + 24. Which in turn is close enough to R to that also

$$R \sim= x^{24} \sim= e^{(Pi * \sqrt{163})}$$

or finally

$$Pi \sim= \ln(x^{24}) * \sqrt{163}$$

which is the value that was calculated in the challenge.

This also explains why the Pi-approximation gets much better if the intermediate is corrected by 24, as Gerson mentioned.

However, there still is one thing left for the perfect solution:

Assume R resp. $R^{1/24}$ is given. Now find a cubic equation with integer coefficents where its real solution is as close as possible to this value.

Dieter

Pi Day Rematch: Apple II vs. HP-41C

*Message #1 Posted by **Egan Ford** on 14 Mar 2011, 12:48 p.m.*

Some retro fun on Pi Day: http://jerkwerks.com/?p=378

Re: Pi Day Rematch: Apple II vs. HP-41C

*Message #2 Posted by **gene wright** on 14 Mar 2011, 3:11 p.m.,*
in response to message #1 by Egan Ford

I'm insulted!

The HP 41c cannot be allowed to lose! :-)

I figure that Monte's 41CL in 50X turbo mode would help things out.

The article states:

==========

"HP-41C cries foul!

If you could only use what came in the box with your Apple II or HP-41C, then what would be the results? Fortunately the Apple II mini-assembler is in the box.

In 1982 Glen Bredon wrote an APPLE PI program in assembly that blows the battery door off the 41C with a time of 194 seconds. Game over! The Apple II wins again. My 1496 second FORTH version doesn't hold an LED to assembly. If you are looking for Glen's program, it is packaged with the Merlin Assembler.

HP-41C Machine Language

To be thorough I asked a friend of mine to compute Pi on the 41C with a 100% machine language (ML) program. He came back with 5 hours, 9 minutes. No question, the Apple II is king."

==========

Gene: I have trouble thinking that a machine language PI program would take 5 hours if a user code program takes 8 hours. That must be a somewhat poor ML program, I would think.

Anyone wish to help put the Apple II in its place? :-)

Re: Pi Day Rematch: Apple II vs. HP-41C

Happy Pi Day -- date formats

*Message #1 Posted by **Katie Wasserman** on 14 Mar 2011, 12:11 p.m.*

Happy Pi Day to those of us in the US (and maybe some in Canada).

According to wikipedia the US is mostly alone in its use of MDY date format. So while we can celebrate Pi Day those using DMY date format can celebrate 'e Day' (27/1). A belated Happy e Day to you!

To make this a non-OT topic, I noticed that China, Japan and Korea use YMD format but I've never seen that on an HP calculator. (I'm not sure that I've ever used any non-HP calculator that allowed for date entries in the YMD format.) Considering that almost all calculators are made in this region of the world I find this remarkable. Do calculators that are made to sell in China, Japan and Korea have YMD as date formats?

-Katie

Edited: 14 Mar 2011, 12:13 p.m.

Re: Happy Pi Day -- date formats

*Message #2 Posted by **Kiyoshi Akima** on 14 Mar 2011, 12:36 p.m.,*
in response to message #1 by Katie Wasserman

I haven't seen any that use the YMD format, but I sure would like one. If nothing else, the YMD format makes sorting dates a lot easier.

Re: Happy Pi Day -- date formats

*Message #3 Posted by **Kiyoshi Akima** on 14 Mar 2011, 3:43 p.m.,*
in response to message #2 by Kiyoshi Akima

I spoke too soon. After I changed the batteries in one of my calculators, I noticed it did have a YMD option. It's the 84Plus Silver Edition from that company in Texas. Their 89Titanium also has that option.

Re: Happy Pi Day -- date formats

*Message #4 Posted by **George Bailey (Bedford Falls)** on 14 Mar 2011, 12:51 p.m.,*
in response to message #1 by Katie Wasserman

I can't answer your question, but have one of my own: For both formats, YMD and DMY, I can come up with a more or less logical explanation. YMD is going from big to small, logically followed by HMS. DMY is presenting the most needed information for every day use first; while you will most certainly remember the year and month you're currently in, the number of the day might escape your attention the easiest and therefor is the most crucial to be noted.

Is there any logic behind MDY? What pupose does this format serve?

Re: Happy Pi Day -- date formats

*Message #5 Posted by **Dave Shaffer (Arizona)** on 14 Mar 2011, 2:33 p.m.,*
in response to message #4 by George Bailey (Bedford Falls)

> Quote:
>
> Is there any logic behind MDY? What pupose does this format serve?

That matches the way we (at least in the US) talk. If somebody asked me when I was born, I would most likely answer that "I was born on February 17, 1946."

I would usually say "Today is March 14th" although I might also say "Today is the 14th of March."

What does someone in Europe say? "I was born (on?) 17 February, 1946"? Perhaps: from my rusty French recollections, I might well say "Je suis ne le dix-sept fevrier, 1946." (Please excuse any missing accents!)

Yes.

"Remember, remember the fifth of November [...]" ;-)

It could have changed to "November the fith" and finally, to save time, "November fifth".

In Germany, it is valid grammar to put it the other way round: "Fu"nfter November".

Re: Happy Pi Day -- date formats

*Message #9 Posted by **Mike Morrow** on 14 Mar 2011, 1:50 p.m.,*
in response to message #1 by Katie Wasserman

And on the periphery of calculator display discussions, who chose the bizarre format of the HP 49/50 TIME and DATE display at the top of LCD?

An example of 49/50 format is: "17:21 MAR:14"
There's no SECOND or YEAR information, the MONTH is non-numeric, and a very non-standard ":" is used to separate month from day.

The earlier format used on the 48 series is much better: "03/14/11 17:21:42"

Even if there is not enough space for the 49/50 LCD to accomodate all the information in the 48 series format, even "03/14 17:21" would be far better than what the 49/50 series uses.

I kept hoping over the years the one of the 49/50 firmware updates would correct the error of using an ALPHA month label and a colon as month-day delineator.

Re: Happy Pi Day -- date formats

*Message #10 Posted by **Gordon Strickland** on 15 Mar 2011, 4:27 a.m.,*
in response to message #9 by Mike Morrow

I am running Meta Kernel on my HP-48GX, and it is interesting to see that it also uses the less desirable 49/50 style of date and time display. I suppose that there is a certain consistency there.

Re: Happy Pi Day -- date formats

*Message #11 Posted by **x34** on 14 Mar 2011, 3:22 p.m.,*
in response to message #1 by Katie Wasserman

YMD format is actually ISO standard (http://en.wikipedia.org/wiki/ISO_8601) and is used all across the world (especially with IT, military and government). It is also national standard in many countries, including many European. Due to spread of computers, it is becoming more and more popular.

Re: Happy Pi Day -- date formats

*Message #12 Posted by **Martin Pinckney** on 14 Mar 2011, 3:46 p.m.,*
in response to message #11 by x34

No more Pi days, then. Anywhere.

Re: Happy Pi Day -- date formats

*Message #13 Posted by **Dave Shaffer (Arizona)** on 14 Mar 2011, 4:11 p.m.,*
in response to message #12 by Martin Pinckney

If you allow 9 instead of 09, then Sept 26 in the year 31415 qualifies!

Re: Happy Pi Day -- date formats

*Message #14 Posted by **x34** on 15 Mar 2011, 6:39 a.m.,*
in response to message #13 by Dave Shaffer (Arizona)

Well, things are not so bad for us geeks. Computers mainly speak binary, so "Binary Pi days" happen!

When is the nearest one?

Re: Happy Pi Day -- date formats

*Message #15 Posted by **bhtooefr** on 16 Mar 2011, 1:32 p.m.,*
in response to message #12 by Martin Pinckney

It becomes 03-14 instead of 03/14, in ISO 8601. Still same MD order, just Y moves in front.

Any other format is middle-endian, which makes no sense, IMO. (Even the European DMY standard - because with two digit day and month, and a four digit year, here are the numbers in order of significance:

YYYY-MM-DD 1234-56-78

That is, it's most important that you get the millenium right, so on, so on.

In DMY, you get something like this:

78.56.1234

Middle-endian.

At least it's not as middle-endian as MDY:

56/78/1234)

Putting n stack levels into a string

*Message #1 Posted by **Bart (UK)** on 14 Mar 2011, 10:55 a.m.*

This is actually a follw-on from Oliver Unter Ecker's *"[RPL] ROLL Challenge (tricky)"*

Is there a command to put n elements from the stack into a string? (i.e. similar to the ->ARRAY and ->LIST commands)

If not, perhaps a challenge to find the best way? My solution so far is:

```
n -> LIST
<< " " SWAP + + >>
STREAM
```

Important SpeedUI update to 11.04

*Message #1 Posted by **Raymond Del Tondo** on 14 Mar 2011, 5:58 a.m.*

Hello all,

here's an important update for SpeedUI.

SpeedUI 11.04 accelerates the stack display and editing even more, and adds a new feature:
You can now switch between 2, 1 or 0 header lines, giving a total of up to 9 stack and edit lines.

A THL (Tog Header Lines) shortcut has been added to the QSM.

The mandatory files to update are CF.LIB, UI.LIB and UF.LIB .
The other components have been recompiled only to reflect the new version number.

For installation/uninstallation, please take a look into StartHere.pdf supplied with the SpeedUI 11.04 archive.

The new version is available here:
SpeedUI Walkthrough SpeedUI Zip Archive

but _not_ on www.hpcalc.org (since the site has not been updated for 3 months now)

Have fun:-)

Raymond

Re: Important SpeedUI update to 11.04

*Message #2 Posted by **Timo** on 14 Mar 2011, 4:17 p.m.,*
in response to message #1 by Raymond Del Tondo

Hi Raymond,

thanks for this update of SpeedUI. I've just uninstalled and the re-installed the three affected libs and it works like a charm!

Also, I think the section on uninstalling the individual SpeedUI libs in your PDF documentation has really improved and is much easier to comprehend and apply now.

Keep up the great work!!!

Kind regards, Timo

HP-41 MCODE breakpoint/trap instruction?

*Message #1 Posted by **Håkan Thörngren** on 13 Mar 2011, 5:12 p.m.*

Has someone defined/allocated an opcode for a breakpoint instruction in HP-41 MCODE? (Similar to what was done with the WRITE-MLDL 040 instruction.)

Re: HP-41 MCODE breakpoint/trap instruction?

*Message #2 Posted by **Eric Smith** on 13 Mar 2011, 6:55 p.m.,*
in response to message #1 by Håkan Thörngren

Not that I've heard. In my simulator, I track breakpoints in a separate array, so that I don't have to modify the code at all. Alternatively, one could use an extra bit stored in the same array as the code, effectively extending the word from ten to eleven (or more) bits. Some simulators have used extra bits in that fashion to define new instructions, extend the addressing range of existing instructions, etc.

Re: HP-41 MCODE breakpoint/trap instruction?

*Message #3 Posted by **Håkan Thörngren** on 15 Mar 2011, 8:40 a.m.,*
in response to message #2 by Eric Smith

Great ideas! They are both easier than rewriting the instructions.

I will start with the challenge of rewriting the code anyway, as I am interested in trying it out.

*Message #4 Posted by **J-F Garnier** on 14 Mar 2011, 4:09 a.m.,*
in response to message #1 by Håkan Thörngren

I used the 080h opcode for breakpoints in Emu41.

BTW, I also defined a FPU extension opcode (0C0h), but I never implemented it. It was supposed to be a 2-word opcode (0C0h xxxh) to speed up math routines in emulators.

J-F

Symbolic Complex Linear System Solver (HP-28S, HP-48G/GX and HP-50g)

*Message #1 Posted by **Gerson W. Barbosa** on 13 Mar 2011, 3:10 p.m.*

This program was written many years ago by Francisco Matheus, one of my classmates back then, originally for the HP-28S. It was particularly useful during Circuit Analysis examinations. The program would accept symbolic equations, no further rearrangement being necessary, which was very impressive.

The author has authorized its free use with the hope it continues to be useful for EE students. No warranty shall be provided though. Test it on your textbook examples before you decide it's suitable for your needs. The HP-48G/GX and HP-50g built-in linear system solver is an option.

1) $V_1 - V_2 = 10*I_x$

2) $V_1/j20 + (V_1 - V_3)/20 + V_2/10 + (V_2 - V_3)/-j10 = 0$

3) $V_3/j10 + (V_3-V_2)/-j10 + 2\underline{/-45} + (V_3 - V_1)/20 = 0$

4) $I_x = -V_3/j10$

where j = sqrt(-1) and 2/-45 is 2 angle -45 degrees.

As an example, the equations in the linear system above would be entered as

```
'V1-V2=10*IX'
'V1/(0,20)+(V1-V3)/20+V2/10+(V2-V3)/(0,-10)=0'
'V3/(0,10)+(V3-V2)/(0,-10)+(1.41421356237,-1.41421356237)+(V3-V1)/20=0'
'IX=-V3/(0,10)'
```

On the HP-28S 2/-45 would have to be previously converted from polar to retangular coordinates. Notice the number of equations could have been reduced to three by substituting eq. 4 in eq. 1, but we'll use the example as it has been presented.

Copy the programs to an empty HP-28S directory. Enter the four equations of the example system, enter the list of unknowns {V1 V2 V3 IX} then run SYS program to solve the linear system. The '<-' program cleans up the directory, that is, it purges all objects at the left of it in the menu.

The lines below can be copied and pasted to Emu42 with an HP-28S ROM and then saved to 'SYS', '<-' and 'EQS', respectively, after applying the STR-> command. ('<-' should be entered as 142 CHR STR->)

’ DUP SIZE l n ’ n LIST 'EQS' STO 0 n FOR i 1 n FOR j i j == 1 0 IFTE l j GET STO NEXT 1 n FOR j 'EQS(j)' NUM NEXT n ARRY i IF NOT THEN NEG 'VET' STO ELSE VET + ARRY DROP END NEXT { n n } ARRY l PURGE TRN CONJ 'MAT' STO VET MAT / n 1 FOR i DUP i GET l i GET STO -1 STEP VET ARRY DROP { n 1 } ARRY 'VET' STO DROP “ “

[RPL] ROLL Challenge (tricky)

*Message #1 Posted by **Oliver Unter Ecker** on 13 Mar 2011, 2:19 p.m.*

Come up with an RPL program that will transform this string
"5 1 2 3 4 6"
into this string
"5 1 4 6 3 2"

using no more than 11 of only these commands: STR->, ROLL
You may also use numbers, quotes and the "+" operator, which we shan't count as commands.
Caveat: Repeated ROLLs may not be provided the same number as argument, unless it's 2.

The program using the smallest number of commands wins.

Hint: There're at least two approaches one can take. And there may be a twist. Or two.

Edited: 13 Mar 2011, 2:26 p.m.

Re: [RPL] ROLL Challenge (tricky)

*Message #2 Posted by **Raymond Del Tondo** on 13 Mar 2011, 7:09 p.m.,*
in response to message #1 by Oliver Unter Ecker

Maybe this one?

```
STR->
6 ROLL " " +
6 ROLL + " " +
3 ROLL + " " +
2 ROLL + " " +
2 ROLL + " " +
2 ROLL +
```

Ray

Re: [RPL] ROLL Challenge (tricky)

*Message #3 Posted by **Eric Smith** on 13 Mar 2011, 7:31 p.m.,*
in response to message #2 by Raymond Del Tondo

He said that you can't use the same roll count more than once, except 2.

Re: [RPL] ROLL Challenge (tricky)

*Message #4 Posted by **Raymond Del Tondo** on 13 Mar 2011, 7:37 p.m.,*
in response to message #3 by Eric Smith

Yes, it's _2_ ROLL, so that should be ok.

Re: [RPL] ROLL Challenge (tricky)

*Message #5 Posted by **Oliver Unter Ecker** on 13 Mar 2011, 7:56 p.m.,*
in response to message #2 by Raymond Del Tondo

Ray,

Very nice! I'm impressed. But, you're using the 6 twice, which violates the caveat.

Without yet revealing what you did, can you tell us if you used FORs, DOSUBs, or lots of Monkeys on typewriters?

Re: [RPL] ROLL Challenge (tricky)

*Message #6 Posted by **Raymond Del Tondo** on 13 Mar 2011, 8:34 p.m.,*
in response to message #5 by Oliver Unter Ecker

Now I see what Eric meant.

Ok, the sequence

```
STR-> 6 ROLL " " +
```

has to be replaced by

```
STR-> " " 7 ROLL 2 ROLL +
```

resulting in one more ROLL;-)

> Quote:
>
> lots of Monkeys on typewriters?

?

Re: [RPL] ROLL Challenge (tricky)

*Message #7 Posted by **Oliver Unter Ecker** on 13 Mar 2011, 11:02 p.m.,*
in response to message #6 by Raymond Del Tondo

Ray,

Cool. Ok. 8 "commands" it is for your entry. You're in the lead.

I figured the solution was of the form
stringToStack ROLL_1..ROLL_N stackToString
and I was wrong.

Your solution meshes rolling and gluing, and that's great.

The monkeys on typewriters will be explained tomorrow.

We're all familiar with the story of how Microsoft develops product...

:)

Re: [RPL] ROLL Challenge (tricky)

*Message #9 Posted by **Eric Smith** on 13 Mar 2011, 7:31 p.m.,*
in response to message #1 by Oliver Unter Ecker

It can be done with only one STR-> command, no ROLL commands, and a modest number of the specified uncounted items (numbers, quotes, "+" operator).

```
<< STR-> + + + + +
-16 + " " +
1 + " " +
4 + " " +
6 + " " +
3 + " " +
2 + >>
```

This assumes exact mode and FIX 0.

If you allow numbers inside quotes it can be even shorter.

Re: [RPL] ROLL Challenge (tricky)

*Message #10 Posted by **Oliver Unter Ecker** on 13 Mar 2011, 8:05 p.m.,*
in response to message #9 by Eric Smith

Eric.

Oh, darn! You out-twisted me. Your solution is perfectly valid and you carry home the price.

But maybe I can be forgiven of not having constructed the challenge in a watertight manner, and amend as follows:

"5 1 2 3 4 6" becomes "5.1 1.2 2.6 3.5 4.3 6.4"

"5 1 4 6 3 2" becomes "5.1 1.2 4.3 6.4 3.5 2.6"

and there's no "."s allowed in the solution... ;-) Thank you!

That is, the challenge really wants you to use ROLLs to solve the problem. But, actually, it might be STR-> that plays center-stage.

Edited: 13 Mar 2011, 8:33 p.m.

Re: [RPL] ROLL Challenge (tricky)

*Message #11 Posted by **Oliver Unter Ecker** on 13 Mar 2011, 8:39 p.m.,*
in response to message #9 by Eric Smith

Hey, wait! What's that "-" doing in your solution? (MOC grabs trophy back from would-be winner.)

Back to original strings.

Re: [RPL] ROLL Challenge (tricky)

*Message #12 Posted by **Oliver Unter Ecker** on 13 Mar 2011, 8:48 p.m.,*
in response to message #11 by Oliver Unter Ecker

Hmm. I guess negative numbers are "numbers" too...
So, apologies, keep that trophy and I'm buying a second one. :-)

The challenge becomes amended to say "natural numbers" or "number keys" instead of "numbers".

Re: [RPL] ROLL Challenge (tricky)

*Message #13 Posted by **Paul Dale** on 14 Mar 2011, 1:06 a.m.,*
in response to message #1 by Oliver Unter Ecker

My first thought is this gem: DROP "5 1 4 6 3 2" for a zero count.

For the amended version, something similar can be done using SREPL I should think.

- Pauli

Re: [RPL] ROLL Challenge (tricky)

*Message #14 Posted by **Tim Wessman** on 14 Mar 2011, 2:05 a.m.,*
in response to message #13 by Paul Dale

SysRPL version:

DOSTR> 2SWAP SWAP DEPTH {}N DO>STR THREE OVERLEN$ #2- SUB$

Makes the assumptions that you are in exact mode, standard format, and no arguments on the stack except the input. Works for any type of valid string input and desired output of the same format.

(I really can't program userRPL... brain too used to sys)

I'd like to know how many people *still* speak Latin only too

Re: [RPL] ROLL Challenge (tricky)

*Message #17 Posted by **Oliver Unter Ecker** on 14 Mar 2011, 6:49 a.m.,*
in response to message #14 by Tim Wessman

Holy...
Ok. This one wins the "most rules-disrespecting while simultaneously unreadable though probably working" price.

(Nice, though, if you like scary...)

Re: [RPL] ROLL Challenge (tricky)

*Message #18 Posted by **Tim Wessman** on 14 Mar 2011, 12:36 p.m.,*
in response to message #17 by Oliver Unter Ecker

Nah, makes perfect sense. :-)

```
DOSTR>  (equivalent to STR->)
2SWAP   (swap with 2 arguments each being swapped, 1 2 3 4 -> 3 4 1 2)
SWAP
DEPTH   (just like userRPL)
{}N     (equivalent to ->LIST)
DO>STR  (equivalent to ->STR)
THREE
OVERLEN$ (get string in level 2 and do SIZE)
#2-      (subtract 2 from length)
SUB$     (SUBSTRING from 3-STRING_LEN_-2)
```

See, perfectly readable.

As to the rules. . . :-P

TW

Re: [RPL] ROLL Challenge (tricky)

*Message #19 Posted by **Eric Smith** on 14 Mar 2011, 2:13 a.m.,*
in response to message #13 by Paul Dale

I don't see "DROP" in the list of allowed commands. Otherwise I would have used it myself. :-)

Re: [RPL] ROLL Challenge (tricky)

*Message #20 Posted by **Oliver Unter Ecker** on 14 Mar 2011, 6:39 a.m.,*
in response to message #1 by Oliver Unter Ecker

This challenge turned from tricky to messy, and I'm in a bit of a pickle: I'm no longer sure what the shortest solution is. I think, though, that the challenge isn't over. There might be a solution of 6 or 7 commands, besting Jay's 8.

Bear with me, if you're patient.

The challenge was meant to not be about writing a solution program. But, rather, writing a program that will find the solution program. That is, if you took the second approach of two approaches I saw:

Two approaches:
- Path of Admirable Intuition
- Brute Force

My basic assumption of the solution template to necessarily look like this

```
  stringToStack instruction1..instructionN stackToString
where
  instructionX: number ROLL
  stringToStack: STR-> (check)
  stackToString: needs "" (check) + bunch of string concatenations (+), " " (check), and
SWAP (missing)
  SWAP: 2 ROLL (check)
```

was proven wrong by Jay's solution, which meshes the ROLLs with building up the result string from the stack.

Here's my development of the brute force approach. It's invalidated to find *the* solution now that my assumed template is known to be not the shortest. But it may be re-tooled to either find a shorter solution OR prove that there are no shorter solutions.

Brute force: write an RPL program that writes all possible RPL programs (within our constraints) and test which ones, when applied to the input string, will yield the output string. (ROLL was meant to be but one "shuffle" function that, when applied a few times would be non-linear/head-spinning enough to have people give up on finding a "manual" solution.)

Note, the challenge said nothing about constraints to a program that would be used to "come up" with the solution program. So you can use all RPL commands for former. (One of the twists...)

There's 6 chars in the string which will end up on the stack. That is, there's a max of 6 sensical ROLLs: 1 ROLL, 2 ROLL, 3 ROLL, 4 ROLL, 5 ROLL, 6 ROLL. As no same-arg ROLLs are allowed -> 6 6 PERM (=720) possible programs. One instruction is a no-op: 1 ROLL -> 5 5 PERM (=120) possible programs.

It's unknown how many instructionX we'll have. Except: it cannot be more than 11 (known number of instructions for a solution) minus 1 (STR->) minus # commands to implement stackToString.

We can write stackToString. Let's.
Given 6 numbers on the stack, we need five concatenations, of numbers and spaces.
stackToString: "" + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL +
commands to implement stackToString: 5

-> upper limit for N: 11 - 1 - 5 -> 5
That is, as per challenge wording, a max of 5 ROLLs is needed. That matches the combinatorial complexity, and doesn't simplify things. But, reading between lines, "program using the smallest number of commands wins" suggests a solution with a lesser number of ROLLs exists. Since we cannot save on any other instructions (OR SO I THOUGHT), it's implied that <= 4 ROLLs are needed.

5 4 PERM (=120) possible programs

Let's implement a program generator:

```
\<< { 2 3 4 5 6 } permutate    @ produce all non-no-op permutations of possible ROLL args
    DUP SIZE V\-> DROP 4 \->V2 RDM       @ reduce to 4 picks
    1
    \<<
      "" SWAP
      1
      \<< + " ROLL " + \>>     @ assemble RPL program, precede each ROLL with element
      DOSUBS                   @ iterate over elements of each permutation
      keepIfSolution           @ test program; keep on stack (->DOSUBS will roll into
result array) if it's a solution
    \>>
    DOSUBS @ iterate over permutations
\>>

permutate: your favorite implementation that will produce an array of permutations, given
an array
```

And a program tester:

```
keepIfSolution:
\<< \-> prg \<<
    X STR\->                     @ unpack input string to stack
    prog STR\->                  @ unpack and execute (!) ROLL instructions
    "" + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL +
    Y ==                         @ compare against desired result string
    prg IFT                      @ keep ROLL instruction string, if match (implied drop,
otherwise)
\>> \>>
```

X: input string Y: desired output string

Run, and 2.6s later (on ND1), a single solution is found: "5 ROLL 3 ROLL 2 ROLL 6 ROLL"

Can we do better?

```
Change this
    DUP SIZE V\-> DROP 4 \->V2 RDM       @ reduce to 4 picks
to
    DUP SIZE V\-> DROP 3 \->V2 RDM       @ reduce to 3 picks
```

Run, and get another single solution: "2 ROLL 5 ROLL 6 ROLL"

That is, the shortest challenge solution program (UNDER THE ASSUMED TEMPLATE) is:

```
\<< STR->
    2 ROLL 5 ROLL 6 ROLL
    "" + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL +
\>>
```

9 commands, as per (odd) challenge definition of "command".

Note, STR-> is used to execute an RPL program that was written on-the-fly. I discovered this feature of STR-> only the other day. I found it so… arbitrary. But inspiring, too, to try and construct a challenge around it. (Btw, one can get the same effect with OBJ-> or LIST->, which seem far more canonical than STR-> for arbitrary command execution.)

The "Path of Admirable Intuition" was a no-go for me, but the solution offered a "Path of Knowing in Hindsight": Play through how 2 ROLL, 5 ROLL, 6 ROLL work on the input. Given the (deceptive) proximity of the input and desired output strings, it transpires that if someone had the intuition that
- the solution string will be built up in reverse
- the *reverse* of the solution is very close after doing one SWAP
they could possibly find the solution in seconds. I find it hard to visualize more than one overlapping ROLL, let alone trying to aim for a solution in reverse.

Anyway. I'm not quite sure how Jay found the solution. If repeated application of overlapping ROLLs was linear enough to "just do it" (without a headache), my challenge failed to pose a challenge to finding *a* solution. But is it the best or only solution?

Can someone deliver a proof?

I'll report on my re-tooling to assume a new template but keeping the brute force approach.

Edited: 14 Mar 2011, 7:09 a.m.

Re: [RPL] ROLL Challenge (tricky)

*Message #21 Posted by **Oliver Unter Ecker** on 14 Mar 2011, 7:14 a.m.,*
in response to message #20 by Oliver Unter Ecker

I guess the monkeys on typewriters are explained now.
If you can't afford DOSUBS or FORs, you gotta have monkeys to write the candidate programs to test for you.

Re: [RPL] ROLL Challenge (tricky)

*Message #22 Posted by **Bart (UK)** on 14 Mar 2011, 10:22 a.m.,*
in response to message #20 by Oliver Unter Ecker

My sulotion is the same count as Raymond's:

```
STR->
3 roll
4 roll
" " 2 ROLL + +
" " 2 ROLL + +
" " 2 ROLL + +
" " 2 ROLL + +
" " 2 ROLL + +
```

Also, your *"That is, the shortest challenge solution program (UNDER THE ASSUMED TEMPLATE)"* can become 8 "commands":

```
\<< STR->
    3 ROLL 4 ROLL
    " " 2 ROLL + + " " 2 ROLL + + " " 2 ROLL + + " " 2 ROLL + + " " 2 ROLL + +
\>>
```

Ideally the solution would be:

StringToStack
3 ROLL
4 ROLL
StackToString

but the ->STR does not work like the ->ARRAY or ->LIST.
However, using some commands not in listed the first post, this is an alternative:

```
STR->
3 ROLL
4 ROLL
6 -> LIST
<< " " 2 ROLL + + >>
STREAM
```

-Bart

Re: [RPL] ROLL Challenge (tricky)

*Message #23 Posted by **Oliver Unter Ecker** on 14 Mar 2011, 12:34 p.m.,*
in response to message #22 by Bart (UK)

Thank you, Bart.
A second valid solution. You're tied with Ray with 8 commands.

Your solution uses different ROLL args, so I wouldn't say it's "the same" as Ray's.
The question remains if there might be a shorter solution.

The ideal solution might be

```
stringToStack
rollIntoRightOrderAndStackToString
```

where rollIntoRightOrderAndStackToString uses up only 5 commands. Even 6 commands for this would still best the current total.

Your STREAM solution is not in the running, but I like it!

*Message #26 Posted by **Tim Wessman** on 14 Mar 2011, 12:38 p.m.,*
in response to message #25 by Oliver Unter Ecker

How about "CLEAR"? :-)

TW

Re: [RPL] ROLL Challenge (tricky)

*Message #27 Posted by **Oliver Unter Ecker** on 14 Mar 2011, 12:53 p.m.,*
in response to message #1 by Oliver Unter Ecker

Here's a solution taking 7 commands.

```
\<< STR->
    "2 ROLL 5 ROLL 6 ROLL" STR->
    "" + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL +
\>>
```

Point here is that "2 ROLL 5 ROLL 6 ROLL" (or Bart's shorter sequence) is a string, the contents of which don't matter and don't count against the commands limit.

If one of you posted this, I'd (reluctantly) accept it as solution. As I posted it, I'm calling this an attempt to circumvent the spirit of the challenge (although here STR-> truly *is* playing center-stage) and say it doesn't count.

Number to beat is still 8.

Edited: 14 Mar 2011, 12:53 p.m.

Re: [RPL] ROLL Challenge (tricky)

*Message #28 Posted by **Oliver Unter Ecker** on 14 Mar 2011, 1:14 p.m.,*
in response to message #27 by Oliver Unter Ecker

Actually, better yet, here's a 6-command solution:

```
\<<
    "STR-> 2 ROLL 5 ROLL 6 ROLL" STR->
    "" + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL + " " + 2 ROLL +
\>>
```

And if string contents don't matter, even a one-command solution is possible:

```
\<<
    "commands to solve problem not requiring quotes" STR->
\>>
```

Btw: There's no escape character for a quote to permit a string in a string in RPL, is there? (Something like "\" \"" in other languages.)

Edited: 14 Mar 2011, 1:40 p.m.

Re: [RPL] ROLL Challenge (tricky)

*Message #29 Posted by **Oliver Unter Ecker** on 17 Mar 2011, 12:50 p.m.,*
in response to message #1 by Oliver Unter Ecker

Ok. It's a challenge, after all.
The number of commands to beat is 6. (With no trickery.)
I'll post the solution tomorrow, if no-one feels inclined to preempt me. ;-)

Edited: 17 Mar 2011, 12:52 p.m.

Re: [RPL] ROLL Challenge (tricky)

*Message #30 Posted by **Oliver Unter Ecker** on 18 Mar 2011, 7:20 p.m.,*
in response to message #29 by Oliver Unter Ecker

Ok, here's the solution:

```
\<< STR\->
  " " + " " 2 ROLL
  + + 2 ROLL +
  " " + 2 ROLL +
  " " 2 ROLL + +
  " " 2 ROLL + +
\>>
```

Note, no ROLL args other than 2 (which effectively is a SWAP) are used. Given that a minimum of 5 swaps are needed to glue the numbers on the stack back into a string, this is a minimal solution.

Thank you to those who participated and spent some time on this!
Apologies, for not having constructed this challenge better and not having a target number to beat when the challenge was fresh.

The intended route--having to use programmatic construction of programs to test--seemingly unraveled, but it actually shifted from having to find indices, to having to find the minimal instruction ordering.

Cheers.

Re: [RPL] list ROLL Challenge (easy)

*Message #31 Posted by **C.Ret** on 23 Mar 2011, 12:22 p.m.,*
in response to message #30 by Oliver Unter Ecker

HI.

Sorry, I read this too late to participate to this interesting challenge.

NOTE to HP28C/S users:

Please note that on HP28C/S the following sequence is illegal :

```
2 " " +   ---------> + Error: Bad Argument Type.
```

So there is no solution to this challenge on HP28C/S since it is impossible to reconstruct any string from integers without a ->STR instruction.

Proposition: Rephrased challenge for HP28C or HP28S users:

> Quote:
>
> Come up with a native RPL program compatible with any RPL's system (from HP28 to HP50 and sysRPL) that will transform
>
> this **list** { 5 1 2 3 4 6 } into this **list** { 5 1 4 6 3 2 }
>
> using no more than 11 of only these commands:
> LIST-> (or OBJ-> which is tolerate on RPL system where no more LIST-> command exists)
> ->LIST
> *n* ROLL (where *n* stand for any single key-digit 0 to 9).
>
> Use of any numbers (except ROLL single key-digit argument), quotes and the "+" or "ADD" operator are prohibited since they may have a different behavior depending of the RPL system.

Caveat: Repeated ROLLs may not be provided the same number as argument, **whenever** it's 2 or not.

The program using the smallest number of commands practicable on any HP28C, HP28S, HP48, HP48gx, HP49 and HP50g wins.

Special extra prize:to any winning program which reorders any list [bold]{ *a b c d e f* } into { *a b e f d c* } where *a..f* stand for any object.

NOTE: *n* ROLL counts as two steps command.

Edited: 23 Mar 2011, 1:11 p.m.

Re: [RPL] list ROLL Challenge (easy)

*Message #32 Posted by **Oliver Unter Ecker** on 23 Mar 2011, 3:08 p.m.,*
in response to message #31 by C.Ret

Hi C.Ret,

Yes, thanks for that correction. It should actually be further changed, because ROLL was a very poor choice. It made finding "a" solution (though not the intended one) way too easy.

You probably guessed it, the solution I posted I didn't actually write myself. My RPL calc did. (Note that the challenge asks to "come up" with a solution, not "write" one...)

I didn't post the full code because a) I'm using a couple of instructions in ND1 that don't exist on the 50g and I didn't have the time (yet) to look up implementations there and b) maybe I can construct a better challenge exploring this theme at another time, when everyone's forgotten about it...

I wonder if algorithmic composition of RPL programs has been explored elsewhere.

Let me say that I would have loved to see your solution on the HP-28S! I know you're an incredible wizard on the HP-28S--having solved the FibTriangle on it, is, I think, the biggest calculator-related surprise I had in my life. :-)

Cheers.

HP clear cased prototypes

*Message #1 Posted by **Keith Midson** on 13 Mar 2011, 12:19 a.m.*

Over the years i've collected some interesting clear cased HP's along with their 'normal' HP counterparts. Thought i'd share them with you - be interesting to see what else other people have. I've seen a 12C and a 65 - be greatful to know of any others.
I've uploaded some photos on Flickr: Link
The clear cased HP's in my collection are: 28S, 71B, 17B, & 67.
Cheers, Keith

Keith my friend, you have a fantastic collection of clear calculators!! Had I know you had these machines, I would have flown, last November, from Sydney to Hobart to meet you and see your collection. I remember several years ago making a six-hour round trip by train to meet Matthias and see his fantastic collection (which I think is among the best, if not THE best collection).

Namir

Another Day Dreamer on TAS

*Message #1 Posted by **Namir** on 12 Mar 2011, 9:12 p.m.*

This HP-15C auction on TAS is asking a lot of bacon for an HP-15C whose LCD has a serious black area and which will most likely need a lot of TLC. Also missing the the HP logo.

What a catch! ..... NOT!!!

Namir

Edited: 12 Mar 2011, 9:13 p.m.

Re: Another Day Dreamer on TAS

*Message #2 Posted by **Michael de Estrada** on 12 Mar 2011, 9:47 p.m.,*
in response to message #1 by Namir

According to the seller:

"The HP Logo in present but the shinney chrom color has faded."

Re: Another Day Dreamer on TAS

*Message #3 Posted by **Philippe Lasnier** on 14 Mar 2011, 9:04 a.m.,*
in response to message #2 by Michael de Estrada

I would not trust this seller.

A couple of years back I noticed that a few HP-16C he had listed all had the same photos, clearly implying that he was using the same photos of *one* of his calculators for all his others.

When I questioned him about it, he implied that because they were all the same in his opinion, there was no need to post actual photos of the item. That's even though the implication (sometimes explicit) in each listing is that the photos are of the actual item for sale. I noticed the same thing again and again on subsequent listings.

He is obviously still doing it, as witness the comments in neutral feedback he got recently.

So I wouldn't even trust that the HP-15C in the photos is the one he is actually selling in this auction. Assuming it is (and even if it isn't) it also looks like an HP-15C I saw doing the rounds on TAS last year...Recycling is good ;-)

Having said all that, the seller has "top-rated seller" status, so despite his deceptions (whether intentional or just through not caring), he must be doing something right.

Philippe

what is the model?

Re: Another Day Dreamer on TAS

*Message #6 Posted by **Namir** on 13 Mar 2011, 9:16 a.m.,*
in response to message #5 by robert rozee

It's an HP-15C.

Re: Another Day Dreamer on TAS

*Message #7 Posted by **robert rozee** on 13 Mar 2011, 9:44 a.m.,*
in response to message #6 by Namir

i kinda meant which model of SHARP does bill have with a broken display!! i'm pretty sure it won't be a sharp-15c :-)

Re: Another Day Dreamer on TAS

*Message #8 Posted by **Namir** on 13 Mar 2011, 10:47 a.m.,*
in response to message #7 by robert rozee

Perhaps Sharp should shock HP (and US) and come out with a 15C ... and sell a ton on the market. I bet the Sharp 15C would have RPN and BASIC as ways to program the machine.

Wouldn't that be something?

Anyone can assemble an image for the Sharp 15C???

:-)

Namir

And would it have all that great HP-15C alphanumeric display capability too? :-)

Re: Another Day Dreamer on TAS

*Message #10 Posted by **Namir** on 13 Mar 2011, 4:50 p.m.,*
in response to message #9 by Mike Morrow

Why not? If it has BASIC with alphanumeric capabilities, then there should be no problem tapping into that!!

It's a very very very tall order!

:-)

Namir

Re: Another Day Dreamer on TAS

*Message #11 Posted by **robert rozee** on 13 Mar 2011, 8:20 a.m.,*
in response to message #1 by Namir

we shall have to see what the reserve is when the auction finishes. the seller might well have no understanding of the technicalities of the compromised display, so might be forgiven the high buy-now price.

HOWEVER, also remember that the calculator would be a prime candidate for a display transplant from a donor 12C. the rest of the machine (case, keyboard, bezel) does appear at first glance to be in fair condition. so with a transplanted display it could indeed be a bargain at the right price.

cheers, rob :-)

ARM-based 12c compared to the old one

*Message #1 Posted by **Jose Gonzalez Divasson** on 12 Mar 2011, 12:11 p.m.*

Here you can find a short comparison of the venerable HP12c (made in Brazil) compared with a new, ARM based HP 12c

HP12c new vs. old comparison

There is hope of a new HP15c being released - as Eric would say, "those who know do not speak, those who speak..."

Re: ARM-based 12c compared to the old one

*Message #2 Posted by **Tim Wessman** on 12 Mar 2011, 5:02 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

>Only HP and Eric Smith know how much Nonpareil lies within the new calculator.

None at all. Cyrille was very thankful to have a resource like Eric available to discuss with as needed, and to have a reliable way to check his emulator was behaving properly, but it is all original HP code. Granted that was before my time at HP, but I do have it direct from at least 1 of the parties involved. :-)

Cyrille's emulator is different since it was designed from the start for a hardware product and so some things were optimized away in order to maximize battery life (sometimes causing problems since special cases are handled individually - the SST capability comes to mind).

Great page!

Regarding the 12cp, have you taken a look at the current models? They have no known bugs I am aware of. I think everyone agrees the first two revisions were rather bad. Once the 25th anniversary one came out though I've not heard any complaints (regarding software at least).

TW

Re: ARM-based 12c compared to the old one

*Message #3 Posted by **Eric Smith** on 12 Mar 2011, 8:42 p.m.,*
in response to message #2 by Tim Wessman

I believe Tim is correct; I don't think there is any of my Nonpareil code in any HP product. The closest thing is that I contributed a short snippet of C code that does parallel BCD addition, vs. digit-at-a-time. That C code has been posted here, and Cyrille also posted a highly-optimized ARM assembly language version here. (HP has filed a patent application on how Cyrille implemented the carry out.) I don't know which calculators HP is using this in, but the 12C, 20b, and 30b are obvious candidates.

As Tim says, I have from time to time tried to help Cyrille with ensuring that some details of his simulation code are accurate.

Re: ARM-based 12c compared to the old one

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Mar 2011, 3:36 p.m.,*
in response to message #3 by Eric Smith

With due respect to people more knowledgeable than me (Eric and Cyrille)... may there be enough originality in a carry-out method to deserve a patent? Would it be generic or processor-architecture dependent? Would it be enforceable?

I understand and respect copyright claims; but I suppose a patent needs more than this kind of substance. Just my humble opinion.

Disclaimer: I'm no lawyer, no patent expert or otherwise intellectual-property expert... I just learned a little about these matters reading IEEE articles about these issues (Richard Stern's MicroLaw column in IEEE Micro magazine, among others) many years ago.

Re: ARM-based 12c compared to the old one

*Message #5 Posted by **Eric Smith** on 14 Mar 2011, 4:08 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

I believe that there is prior art for the way the carry out is done. It remains to be seen whether a patent is actually issued.

Re: ARM-based 12c compared to the old one

*Message #6 Posted by **cyrille de brebisson** on 16 Mar 2011, 10:24 a.m.,*
in response to message #5 by Eric Smith

hello,

I beleive that the patent has actually been issued... one more useless SW patent... but companies love to have large "portfolio" of patent.. my understanding is that it's the size of the patent portfolio (mesured in inches of printed paper) that is important...

To be honnest, I personally do not like SW patents, but hey, the company likes them... so...

all Atmel based calcualtors use this code.

Eric has been of great help, providing me with a modified version of NoPareil that would generate log file of executed instructions... this has been extremly usefull to see when my code path execution was varying from his and find where my emulator was buggy... however, I have never looked at his code to avoid any possible questions about HP using free code without respecting lisences...

cyrille

Why do you think so? While development costs might be rather low, that thing has to be produced and sold ;-). Imagine a 15C between all those calculators with graphical displays and lots of RAM. Only few will buy, since the strengths of the 15C cannot be marketed easily.

You know, 'ease of use' today means 'simple' or 'entry level'. And 'bugfreeness'? One even don't knows if it is. And people are over-optimistic in the light of a high-specs gadget anyway, I fear.

In the end, some more important people might ask why HP needs to get back to a model that ancient. What's their concept of 'innovate'? ;-)

But ... HP could camouflage it as a retro-toy sold for their next anniversary :-D.

I can't imagine a new 15c being sold at retail. Very few HP calcs are sold at retail and as you point out, the 15C would not compare well.

Internet sales should be very inexpensive.

As for production costs, has anyone tried the 15c firmware replacing the 12c firmware component in the current emulated 12c?

If the display is sufficient, and the emulator is sufficient or could be fixed, then incremental production costs for the 15c over the 12c calculator are limited to a different paint job on the keys and a different firmware load. Conceivably even the firmware load could be done post-manufacture if this is a small scale effort.

If no packaging and manual are needed it seems that financing the cost of a small production run would be well within the means of many of the HP calculator hobbyists. (With legal permission from HP, of course.) HP would have no means to deal with a small production run like that, but for an individual or small group selling via the internet then the missing "commercial" package and documentation seem reasonable.

would someone like to humour me and tell me where i might find any repository of information on the ARM based 12C? has anyone had a go at developing a GCC toolchain to do programming of it? is there documentation on port mappings, etc?

am toying with the idea of getting hold of one and having a go at doing something useful with it...

cheers, rob :-)

Re: ARM-based 12c compared to the old one

*Message #12 Posted by **Eric Smith** on 14 Mar 2011, 2:35 a.m.,*
in response to message #11 by robert rozee

There's an SDK from HP for developing on the 20b. The new 12c has basically the same hardware, with different keyboard and LCD mapping, so the 20b SDK is mostly applicable.

As supplied, the SDK works with the IAR toolchain. The "Kickstart" version of the IAR toolchain is available for download from IAR at no charge. It has almost all of the features of the full version, except that it won't link an executable larger than 32KB of object code.

The GNU toolchain from CodeSourcery should be perfectly suitable for developing for the 12c/20b/30b, but using the 20b SDK would then require some modification.

I'm currently using IAR Kickstart on a different platform (ARM Cortex-M3), but plan to switch to CodeSourcery at some point.

restoring an HP11C

*Message #1 Posted by **Alberto Fenini** on 12 Mar 2011, 10:37 a.m.*

ciao a tutti (*Hello everyone*)
I have almost completed the restauration of an HP11C that was in a bad condition, but working perfectly
It's almost done, except for the logo that is drying, I have painted with a silver paint and a very thin brush.
I'm very satisfied with the bezel, which has been done using the 3M scothbrite
while I think the faceplate could have done a little bit better.
I have used a black permanent marker to touch up, but if you look at the faceplate with a strong ligt you can see it
does anybody else has ever tried a different method with better results ??
Hope the pics will help someonelse that as to disassemble a Voyger ...
take care and enjoy the weekend !!
Alberto

Re: restoring an HP11C

in response to message #1 by Alberto Fenini

Nice work! Let me know if you would like a re-fab 11C badge. I ran another batch of silver cast ones.

-Dallas

Re: restoring an HP11C

*Message #3 Posted by **John Robinson** on 12 Mar 2011, 7:55 p.m.,*
in response to message #2 by Dallas Osborne

Hi Dallas, are you reproducing all Voyager series badges, or just the 11c ones ?

Thanks John

Re: restoring an HP11C

*Message #4 Posted by **Dallas Osborne** on 14 Mar 2011, 10:29 a.m.,*
in response to message #3 by John Robinson

I have only done 11c badges so far; no one has been willing to toss a 15c job in the mail to me.

...however, if I get my hands on a 15c badge with decent form I will certainly cast a batch of them. A donor badge doesn't have to be mint with all the shinny stuff on the plastic. It just has to have a good form. I have been casting these in de-ox silver, enameling the badge in matte black paint, and polishing off the surface metal. Touching them up would be wiping it off on your jeans unless you scratch the paint inside the grooves. (In that case, just repaint and strip the surface off with a nail file to give that 'brushed' look.)

Re: restoring an HP11C

*Message #5 Posted by **Gerson W. Barbosa** on 14 Mar 2011, 11:15 a.m.,*
in response to message #4 by Dallas Osborne

I can send you one from my 2740B30986 unit. It appears to be fine, except the silver painting has vanished off. Is it a destructive process, that is, will I have it back when the mold is done?

Re: restoring an HP11C

*Message #6 Posted by **Dallas Osborne** on 14 Mar 2011, 11:33 a.m.,*
in response to message #5 by Gerson W. Barbosa

The process isn't destructive at all. I make a silicone mold from yours and use it to cast little waxes. Then I spree up the waxes and encase them in an investment of fine plaster. I fire the whole thing in a kilm until the wax is burnt out. Then I sling a puddle of melted silver into the mold, cool, and crack it. The actual hard part is cleaning up the badges to look good.

The costs aren't too bad, but I have a good relationship with the silversmith and get a decent rate for equipment time. If I was making only one, it would be one very expensive art project. But when I sell about 10-15, I break even and get a kick out of seeing new badges on old equipment.

So, yes, if you mail me one, I will get your original back and a shinny silver one in exchange for your loan.

My timeline depends a bit on my work schedule.

PM me for mailing details.

*Message #11 Posted by **Alberto Fenini** on 14 Mar 2011, 5:53 p.m.,*
in response to message #10 by Alberto Fenini

By the way, this is how the logo looks now :

take care, Alberto

Re: restoring an HP11C (logo pics)

*Message #12 Posted by **Dallas Osborne** on 14 Mar 2011, 9:12 p.m.,*
in response to message #11 by Alberto Fenini

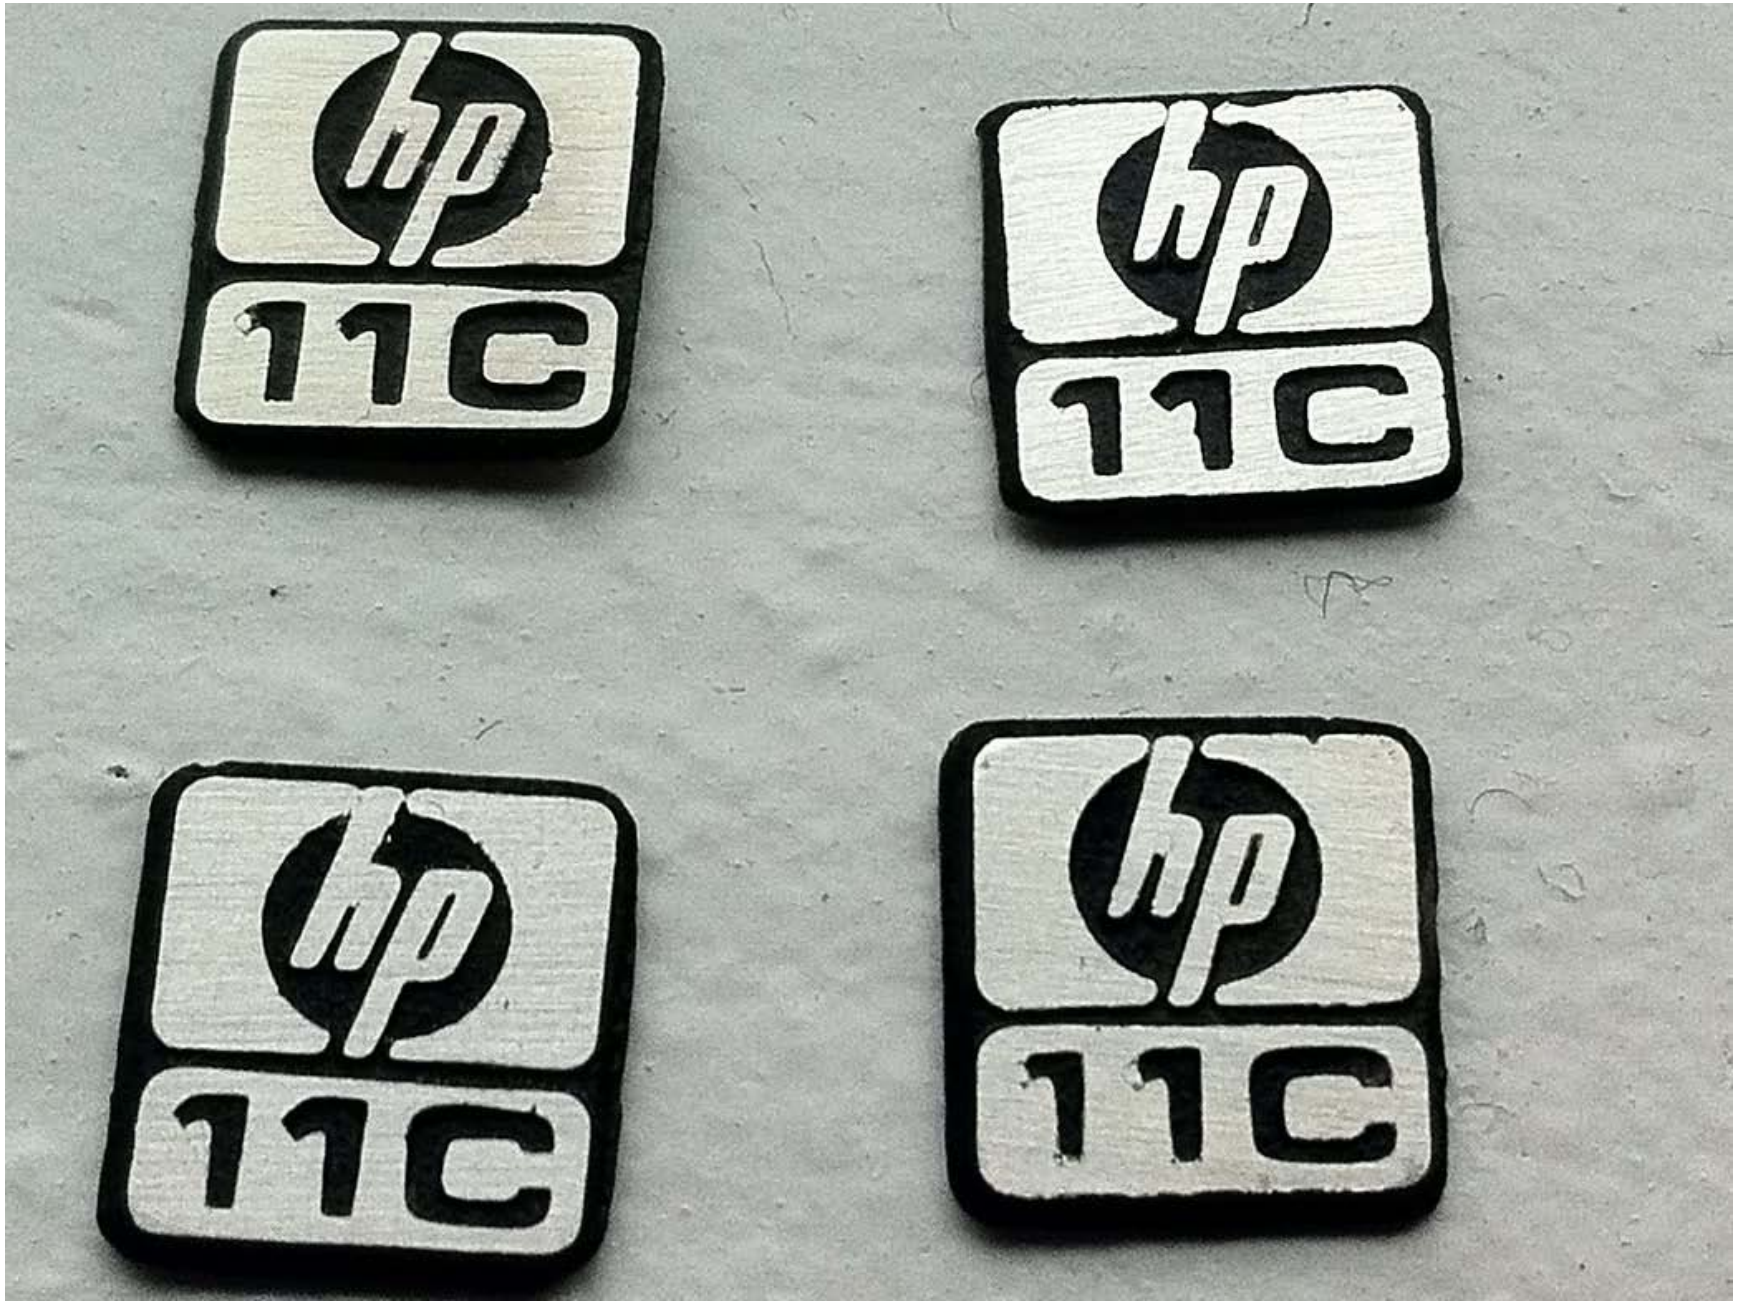
I have been selling the premiums at $35, slightly defected at $25, and the runts of the litter at $20. (And the last slightly defected one went last night.)

Yup, last four. All goofy someway or another. But, they are solid silver and, depending on how skilled you were with a fine needle, some of the bits could be cleaned up. Regardless: sorry, Mates; that's what's left. If I had a world class shop at my disposal, well, I could do wonders for trademark violation.

But covering costs and materials is enough at this point.

So, Alberto: $20 and pick which one you want.

Bill, Assuming I get a heck of lot better at this and produce some beauties, I would run them at $40. If the same quality comes out, then the same prices will stick.



Re: restoring an HP11C (logo pics)

in response to message #11 by Alberto Fenini

Oh, Bill,

This is an example of a good one. (The little dark spot on the upper left hand is a bit of dust that snuck in there. And the yellow shade is due to the poor lighting I just snapped this shot in; this one normally had a very nice white silver look.)

29C needs help!

*Message #1 Posted by **Dieter** on 11 Mar 2011, 5:19 p.m.*

Hi all,

A few days ago I acquired a HP-29C in nice condition for a good price. Aaah... red LEDs. So small and handy - it's a real cutie, isn't it? :-) The battery compartement has been modified so that the unit now runs on regular AA-size NiMH batteries, providing about five times the original operation time and allowing the use of a decent processor-controlled external charger. So far, so good.

First tests showed that the 29C runs significantly faster than my good old (even slightly newer) 34C. So I tried the 8-queens-benchmark on http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=700 to find out more.

Since the 29C is not listed there I used the sample program for the 11C/34C, only slightly modified for the 29C since it uses register 0 for indirect addressing. The result was quite surprising: While the 34C is listed with 73 minutes, the 29C did the job in just 42! Even better, a simple factorial program (i.e. essentially a simple loop) runs quite exactly twice as fast as on the 34C. I had expected an execution speed close to that of the HP-67, or maybe something comparable to the 34C/15C.

Today there was another surprise. The 29C was running a program when, after about half an hour, I suddenly noticed the display showed nothing but twelve zeros: "000000000000" and no reaction on any key press. :-(

Now, there are two questions:

- The calculator worked perfectly for a few days. What might have happened here? What can I do now?
- I wonder if the 29C really is so much faster than the 34C or even the 67. Maybe other 19C or 29C-users may try the 8-queens-benchmark program and state their results. Has my unit possibly been modified? In this case, may this have caused the mentioned problem?

Dieter

in response to message #1 by Dieter

I am not a hardware expert, but I have been burned many times by running HP-25 calculators using AA Alkaline batteries. My humble guess is that the batteries you are using messed up the chips and friend a circuit or two .. or three ... or more. That's why the only HP25 and HP-29C I touch nowadays are emulators.

Maybe hardware savvy folks can offer a better diagnostic.

Namir

Re: 29C needs help!

*Message #3 Posted by **Dieter** on 11 Mar 2011, 6:09 p.m.,*
in response to message #2 by Namir

Namir, thanks for your response, but of course I didn't use Alkaline batteries but rechargeable NiMHs, having exactly the same voltage as as the original NiCds.

However, I wonder if disposable Alkaline batteries really may harm a 25(C) or 29C. Their voltage (1.5 V when new, then continuously dropping) is just about 10% higher than the 1.4 V of a freshly charged NiCd. Which then quickly drops to almost constant 1.3...1.2 Volts in use.

Dieter

Re: 29C needs help!

*Message #4 Posted by **Namir** on 11 Mar 2011, 7:09 p.m.,*
in response to message #3 by Dieter

The alkaline batteries have fried more than one HP-25 which were functional when I received them. So I have some statistical data to back my suspicion.

in response to message #4 by Namir

I use Energizer lithium cells in all my woodstocks and never had a problem. Their initial voltage is around 1.7 per cell, much higher than fully charged nicads. Running up to 3.5 volts or so has never been an issue for me.

The thing to watch out for is the 9 volts or so that you get from running these calculators off the AC adapter with no nicads inside (or at least no nicads making contact with the battery terminals).

Re: 29C needs help!

*Message #6 Posted by **Michael Meyer** on 13 Mar 2011, 7:18 p.m.,*
in response to message #5 by Katie Wasserman

Like Katie, I have fortunately never had a problem with the lithium batteries. I suspect that, if the calculator is "fried", it was already on the verge of failing.

in response to message #1 by Dieter

Hi Dieter, Be sure to check all contacts in the battery loop...scrub them so they shine. As you have put in NiMH cells, I'll bet you've done away with the soldered strap which originally connected the two cells, and are relying on the tensioning spring for the cell to cell connection...just be sure this area is clean.

My 29C has occasionally exhibited whacky behavior, and this has always been the culprit. (Incidentally, I bought my 29C brand new in 1978, and it's been with me ever since!)

Same problem has been discussed before (was: 29C needs help!)

In the meantime I searched the forum and found exactly the same problem in this thread from 2001. Just like here, the 29C crashed after about half an hour while running a program, locking up with twelve zeroes in the display.

Since neither I nor the previous owner had the original Wookstock AC-adapter (the batteries were charged in an external charger) the problem cannot have occured due to overvoltage or another cause related to the charger.

May I ask the experts if this and the information in the earlier thread sheds some light on both Mark's and my problem?

Help! HP-19C printer gone mad

*Message #1 Posted by **Philippe Lasnier** on 11 Mar 2011, 5:03 p.m.*

Hi Guys,

Here I am again asking for help, but this time for an HP-19C.

I've just managed to acquire (at last!) an HP-19C.

The seller I got it from (yes, on TAS) was the original owner, but said that it hadn't been used for 30 years. The battery pack was removed then (allegedly), and everything put in a drawer. Of course, the battery pack is long dead, and it had leaked, but the calculator was apparently intact (and no trace of white dust from the battery cells inside the calculator). Using the dead battery pack's shell, I replaced the dead cells with fully charged NiMH. I inserted the battery pack, making sure the connections to the terminals were ok (voltmeter in hand), and turned on the calculator.

That's where things go wrong. The printer head just travels across and comes back, and the paper advances, a small pause, and this repeats itself. There's no way to stop it. Nothing gets printed. It doesn't matter that the printer switch is on MAN/TRACE or NORM. It doesn't matter that the power switch is on PRGM or RUN. For the short moments that the printer head is not moving between cycles, the display lights up seemingly properly. If I am fast enough (in RUN mode) I can enter some digits, but no function works.

I opened up the calculator, and didn't find much wrong that I could see. There is what looks like spots of green corrosion here and there on some tracks of the power supply/printer PCB (from battery's degassing?), and the power circuit's large resistor has made the PCB black, but that's all.

Looking around I found this, but the battery *is* working fine and full of juice, so it may be the same symptoms but doesn't look like the same cause.

The HP-19C is in otherwise excellent physical condition. It would be an utter shame if it cannot be made to work again. I sent an e-mail to fixthatcal, but Randy hasn't replied yet.

Should I clean all the contacts etc. (DeoxIT, slight vinegar wash for green spots, Isopropanol, etc.) before I cry for help?

Any idea or suggestion? (no, I haven't got an oscilloscope :-(

Hopeful regards,

Philippe

Re: Help! HP-19C printer gone mad

*Message #2 Posted by **Donald Williams** on 11 Mar 2011, 5:39 p.m.,*
in response to message #1 by Philippe Lasnier

It is most likely a power supply problem. Either the Vgg or Vss side of the supply is failing. I have 2 of them

on the bench right now trying to troubleshoot the same problem. So far I have replaced one open NPN transistor. I hate to work on this model. I have great difficulty trying to marry the logic board back to the stakes on the power supply board. If you are not very careful the stakes can easily get bent when you try to close the two halves back together, and I have not found a source for stake replacements. I won't even get into the flaky contacts on the flex wire circuit between the keyboard and the logic board. An intermittent contact here can drive you crazy. Good luck with your repair.

Re: Help! HP-19C printer gone mad

*Message #3 Posted by **Katie Wasserman** on 11 Mar 2011, 9:41 p.m.,*
in response to message #2 by Donald Williams

I agree that it's some sort of power supply issue, but may not be the internal supply. Before you start digging around in there (these are a pain to work on) try using an external 5 or 6 volt power supply in place of the batteries, one that can supply at least couple of amps. It might be that your current cells just can deliver enough current for this calculator.

-Katie

Re: Help! HP-19C printer gone mad

*Message #4 Posted by **Philippe Lasnier** on 12 Mar 2011, 12:03 p.m.,*
in response to message #3 by Katie Wasserman

Hi Katie, Donald,

Thanks for replying. The fact that you both think that it's still a power supply problem is reassuring, in a way, however I find myself very ill-equipped to proceed; I'd like to have an oscilloscope to be able to monitor various points, and a bench power supply so that I can feed whatever I need - I have neither.

On the power front, the NiMH cells I used are of good quality and were fully charged. At 2200mAh, I would have expected them to feed enough current for the motor. Of course, there could also be a problem at the PCB contacts with the battery I suppose, however I monitored the voltage on the points' solder and that looked fine, although there was some voltage drop during "printing".

I will try to re-tin the PCB contacts with some solder, and also try to rig up 4xAA new alkaline batteries straight to the PCB tracks. I'll let you know how I get on.

Donald, you mentioned that you replaced one open NPN transitor. Had it failed? Why would that be? Do you have the schematics?

Many thanks,

Philippe

Re: Help! HP-19C printer gone mad

*Message #8 Posted by **Philippe Lasnier** on 13 Mar 2011, 10:51 a.m.,*
in response to message #7 by Katie Wasserman

I have had some success last night.

I soldered leads directly to the battery contacts on the PCB, reconnected the PCB to the keyboard/CPU PCB, and connected my leads to four fresh AA alkaline cells outside the calculator. Effectively I have an HP-19C without its back, and I have to be careful with the printer (it's not held by anything) and its head's flex connector.

As soon as I switched on, I knew there was progress, as the printer stopped its merry dance.

Printing itself doesn't work. There are just a few pixel columns getting printed (from the right). At one point last night, after wiggling the various contacts between the PCBs, I got the printer to work properly (printing the stack, printing statistic registers, TRACE operating as normal), but since then it hasn't worked anymore.

I am not sure that it was the "wiggling" that made printing work, and I hope that I haven't damaged any electronics. It feels as if the data to print isn't making it to the printer's electronics.

That short period of normal operation at least proved that there is no burnt filaments in the print head. It also proved that the printing *could* work, at least with the assumption that I haven't caused any damage.

The calculator itself (i.e. with printing on MAN) seems to be working fine, STO/RCL works, various operations +-/* Log Ln etc. work, I was able to write program steps and run them.

Of interest: according to my meter, the calculator draws between 100mA and 140mA

when 'on' (depending on the number of lit digits). When printing a line, this jumps to 160mA to 180mA. Considering that I'm feeding it 6V or slightly over, this is just about 1W being used, as stated. At one point I had the printer flex connector impaired, and the current jumped to 220mA or so. All this seems reasonable.

Would the concensus be now that I have got a connectivity problem between the PCBs? Surely it cannot be a power problem anymore?

Philippe

Re: Help! HP-19C printer gone mad

*Message #9 Posted by **Philippe Lasnier** on 13 Mar 2011, 10:57 a.m.,*
in response to message #7 by Katie Wasserman

Forgot to mention: I also cleaned the various spots of green corrosion that I could find on the power/printer PCB.

Re: Help! HP-19C printer gone mad

*Message #10 Posted by **Katie Wasserman** on 13 Mar 2011, 12:48 p.m.,*
in response to message #9 by Philippe Lasnier

The contacts between the PCB's are all gold plated so they're not likely to be a problem, but since you mention the "green corrosion" I'm betting on that being the problem. You've likely got one or more bad solder joints due to this corrosion. Clean off all the corrosion and re-solder all the nearby joints and I'll bet that your 19C is back to 100%.

Re: Help! HP-19C printer gone mad

*Message #11 Posted by **Philippe Lasnier** on 13 Mar 2011, 1:19 p.m.,*
in response to message #10 by Katie Wasserman

> Quote:
>
> [...] and I'll bet that your 19C is back to 100%

That would be nice ;-)

I haven't got time to spend on it anymore right now, but I'll carry on cleaning corrosion and checking tracks and solder joints.

On another tack, I have been trying to get in touch with Randy at fixthatcalc, but he is not replying. Is he a member of the forum, so that I could try to reach him another way? Ultimately I haven't got the adequate equipment to fully repair these things.

Regards,

Philippe

Re: Help! HP-19C printer gone mad

*Message #12 Posted by **Philippe Lasnier** on 13 Mar 2011, 5:17 p.m.,*

in response to message #10 by Katie Wasserman

I just spent an hour scrapping off any trace of green oxidation that I could find, checking that tracks and solder joints were ok around each, and soldered a wire that fell off. I dusted off everything, and reconnected the power PCB with the keyboard.

Again, for a few seconds, things seemed to be slightly better; I was getting a few characters printed out. For instance the whole of "PRST" appeared as I asked to print the stack...but not the stack values. Quickly, the printing went back to as bad as it was before.

But I noticed something else (I had vaguely noticed yesterday, but hadn't paid much attention): every "bad" printing zaps Y Z and T, and the motor's pitch changes. So for instance if I am in TRACE mode, with 5 in X, and I press 4 and then +, then 4 stays in the display after the printer flounders. The printer only runs once, instead of twice (as it should to print "4 +" and then "9 ***"), and going to MAN and cycling the stack with R« I notice that Y has been set to zero. The addition operation obvioulsy didn't happen either. A similar observation goes for stack printing. If (in MAN mode) I load the stack with 1, 2, 3, and 4, then do PRST, then the printer runs twice (as if to print "PRST" and the subsequent blank line) then stops, instead of printing the stack. Examining the stack, only X remains at 4, with T, Z, and Y, having been reset to zero.

Considering that storage registers 16-29 and the stack registers Y, Z & T are not in permanent memory and are zeroed when the power is turned off, this looks like a power cut (maybe from overload) is effected somehow when the printer runs.

So here is my conclusion: the printing starts, and some pixel columns get printed. Most often though , a power "cut" occurs, which stops everything. The power comes back on effectively immediately, and because the printer's end-stop switch is open, the printer is driven all the way until the switch gets closed again (starting position). There's no printing that would happen during that "run back to start" stage, and that's actually audible - the pitch of the motor is different and the printhead speed is faster.

Now, as to what is causing this power glitch, I don't know. Sometimes it doesn't happen. If it's a bad solder joint somewhere, I haven't found it (it might help to know where in the circuit it's most likely to happen, but I don't know). If it's a bad connector, I don't know where it is; and considering that the power circuit and the printer are on the same PCB, a bad connector is less likely.

Could it be an (intermittently) faulty component? And if so, which one? It could still be the power supply, but I'm pretty sure mine is ok at the moment.

Re: Help! HP-19C printer gone mad

*Message #13 Posted by **Philippe Lasnier** on 12 Mar 2011, 12:08 p.m.,*
in response to message #3 by Katie Wasserman

Before you point out that the battery's capacity of 2200mAh has nothing to do with current delivered, yes, sorry, I realise that; I expressed myself incorrectly. What I meant was that such batteries should be able to output a couple of Amps easily.

"Dispute" oder HP-48GX SN

*Message #1 Posted by **Timo** on 10 Mar 2011, 8:34 a.m.*

Hi there,

a colleague of mine and I got into a discussion over a serial number on his black LCD HP-48GX. It bears the SN ID3XX... and according to the information given on hpcalc.org the unit should have been manufactured in 1993. However, I doubted this and seem to recall, that the new serial numbers were introduced in 1997 an that therefore his 48GX should have been manufactured in 2003. At least the black LCD would be a strong indication for this later year of production. Can anyone of the HP-48 experts clearify this for us?

Thanks in advance, Timo

Re: "Dispute" oder HP-48GX SN

*Message #2 Posted by **Martin Pinckney** on 10 Mar 2011, 9:46 a.m.,*
in response to message #1 by Timo

The hpcalc.org article you linked clearly states that the new SN system started in 1997, as you said you recalled. So 2003 is the answer.

Re: "Dispute" oder HP-48GX SN

*Message #3 Posted by **Mike Morrow** on 10 Mar 2011, 11:43 a.m.,*
in response to message #1 by Timo

I don't remember when the HP 48GX was officially discontinued. My latest one was made in 1997 in Singapore (S/N SG724xxxxx). IIRC, the HP 49G successor appeared in 1998 or 1999.

Regardless of all that, stocks of replacement calculators were made for years after the models were officially discontinued. Most HP calculators since the Pioneers are officially non-repairable and must be replaced to fulfill warranty. Units were made after discontinuance in order to fulfill this HP obligation to "repair" (replace) units that were still under warranty after the specific model was discontinued. For example, I've seen 1997 ID7xxxxxxx HP 42S units, a model discontinued in 1995.

It is likely the unit in question was made as a post-discontinuance warranty-fulfillment unit. Some of these warranty stocks seem to have been released for general sales after the obligation expired. AFAIK, these units did not come with manuals or case. They show up on ebay sometimes.

Edited: 10 Mar 2011, 11:57 a.m.

Mike, you are correct on HP's behavior up to about year 2000. They did in fact support the 42S for five years past the point of discontinuance. It was dropped in 1995 and they continued to build units in Indonesia until year 2000. Sometime in 2002, IIRC, they sold off the remaining service spares for $92 each. Some of us here were lucky enough to grab one or more.

Coming back to the GX, the unit in question was not a service spare as they were actively sold until 2003 when it died a quick death along with the remaining models (including the 32Sii) when they ceased all calculator production internally. The interesting note here is that they had only a small inventory of spares when they did this. I believe they did not make it to the end of the one year warranty period before running out of replacements for the GX and 32Sii. In some cases, I heard they offered cash refunds. So much for the five year service window. Gone. Forget about it. Carly is in the house...

As for the remaining service spares, they did have a bunch of 12C and 48G+'s spares which they sold at auction when they converted just about every thing that wasn't nailed down to generate cash to buy Compaq.

Re: "Dispute" oder HP-48GX SN

*Message #5 Posted by **Mike Morrow** on 10 Mar 2011, 9:12 p.m.,*
in response to message #4 by Randy

Thanks much for the clarifying historical details, Randy. I incorrectly assumed there was a consistent program for repair spares for all the "non-repairable" Pioneers and HP 48-series machines after discontinuance, and I thought the 48GX was discontinued before 2003. I seem to recall vaguely that this was announced in late 2002, but I'm probably wrong.

With the recent HP 30b, at least it *appears* that HP is returning to a case design that is designed to be opened. (But...I haven't tried to open mine.) It may be that some things are getting better.

Did those "repair spare" HP 42S units that were sold for $92 come with manuals? I suppose all were firmware version C.

> Quote:
>
> They certainly did not come with manuals - I got one... ...tell me how to check the firmware version, I will do so.

That's what I'd heard...no manuals. It makes sense, and for the price, it was a great value even without a manual. Does it have an S/N starting with ID7xxxxxx?

Here's how to determine firmware revision on some Pioneers:
(For models that don't have keys labeled the same as the HP 42S, use that machine's keys which are in the same physical location.)
0. Turn calculator ON. :-)
1. Push EXIT and LOG at same time.
--Starts step-wise self-tests.
2. Push <- (left arrow).
--Displays HEX firmware debugger.
--Example Pioneer displays show 16 nybbles of memory beginning at location:
-----Nybble 023F1 on HP 42S Rev. A
-----Nybble 023F5 on HP 42S Rev. C
-----Nybble 021E8 on HP 17BII Rev. B
3. Push . (period).
--Executes firmware at location shown.
--Letter that then momentarily appears on LCD at left is the firmware revision.
--Display reverts back to HEX display after a few seconds.
4. Repeat step 3 to see revision again, if desired.
5. Push EXIT and SQRT at same time to exit test/debug mode.
--Harmless "Machine Reset" message appears (no memory loss).

The HP 32SII does not have a similar debugger.
The HP 48SX has a similar debugger, while the HP 48GX does not.

RAM locations can be modified with the debugger. Example: On the HP 42S, changing contents of nybble 40300 from 7 (default) to F will (temporarily) double CPU speed. Value resets to 7 after next machine reset.

Re: "Dispute" oder HP-48GX SN

*Message #9 Posted by **Mike Morrow** on 11 Mar 2011, 12:20 p.m.,*
in response to message #8 by Thomas Chrapkiewicz

Many here are more knowledgeable than I, but to find the 48SX firmware version the method is similar to that described above:

0. Turn calculator ON.
1. Push ON and D at same time.
--Starts step-wise self-tests.
2. Push <- (left arrow).
--Displays HEX firmware debugger.
--Example: HP 48SX Rev. E displays 16 nybbles of memory beginning at nybble 705D9.
3. Push EVAL.
--Executes firmware at location shown.
--Display momentarily shows (for Rev. E example):
----Version HP48-E
----Copyright HP 1989
--Display reverts back to HEX display after a few seconds.
4. Repeat step 3 to see revision again, if desired.
5. Push ON and C at same time to exit test/debug mode.

For the 48GX and most later, type VERSION to get the same info:
-------Version HP48-R
----Copyright HP 1993

I've opened my 20b in order to fit a JTAG connector. The calculator cannot be repaired beyond the point of replacing it. Behind the back of the case there is just a heat staked sandwich of board, keys and display.

in response to message #1 by Timo

Hi Timo,

it's 2003 in this case;-)

I bought my HP-48G+ Turbo new in late November 2003 at Dynatech, and up to then, the HP-48G+/GX units were regular stock at Dynatech, not service replacements. They also said they had several in stock.
However at the beginning of 2004, I wanted to buy another new HP-48GX,
but sales seemed to have been very good that stocks were empty then...I should have bought two in the first place.

Regards

Raymond

Equation library w/ units

*Message #1 Posted by **Eric Smith** on 9 Mar 2011, 8:05 p.m.*

Dumb question time: When I'm using the equation library, and in the process of entering a value go to the units menu, how do I get back to where I was in the equation library?

Thanks!

Re: Equation library w/ units

*Message #2 Posted by **Michael de Estrada** on 9 Mar 2011, 8:45 p.m.,*
in response to message #1 by Eric Smith

Well, I don't know which specific calculator model you are using, but if for example it is an HP-48SX you would type ATTN (below ON key), followed by <right shift> LAST MENU, which will return you to the previous menu.

Edited: 9 Mar 2011, 8:50 p.m.

Re: Equation library w/ units

*Message #3 Posted by **David Hayden** on 9 Mar 2011, 9:10 p.m.,*
in response to message #1 by Eric Smith

On a 50g, does left-shift [hold] PREV do it? That normally takes you back to the previous menu.

Dave

Re: Equation library w/ units

*Message #4 Posted by **Michael de Estrada** on 9 Mar 2011, 9:55 p.m.,*
in response to message #3 by David Hayden

Yes it does. Also the sequence 0 ENTER MENU ENTER will do this.

Edited: 9 Mar 2011, 10:05 p.m.

Re: Equation library w/ units

*Message #5 Posted by **Eric Smith** on 9 Mar 2011, 10:15 p.m.,*
in response to message #3 by David Hayden

That did the trick, thanks!

I suppose that might be in the manual somewhere, but I wasn't able to find it.

Re: Equation library w/ units

*Message #6 Posted by **Michael de Estrada** on 9 Mar 2011, 10:56 p.m.,*
in response to message #5 by Eric Smith

Don't feel bad, Eric, I also have a HP-50g, and there's tons of stuff that isn't documented, even in the Advanced User's Reference Manual. I figured out a lot of things from the excellent documentation that came with my HP-48SX.

Re: Equation library w/ units

*Message #7 Posted by **Jim Yohe** on 10 Mar 2011, 2:11 a.m.,*
in response to message #6 by Michael de Estrada

Maybe the thing to do is get a hold of a HP-48SX manual to use for the extra information that the 50g manual is missing, apparently.

Re: Equation library w/ units

*Message #8 Posted by **David Hayden** on 10 Mar 2011, 11:55 a.m.,*
in response to message #7 by Jim Yohe

My favorite poorly documented feature on the 50g: right-arrow for SWAP. This is an essential function in RPN mode but its existence is buried deep in the documentation.

Dave

Re: Equation library w/ units

*Message #9 Posted by **Michael de Estrada** on 10 Mar 2011, 1:02 p.m.,*
in response to message #8 by David Hayden

Well, at least it is documented somewhere (page 3-179 of the Advanced User's Reference Manual, which you have to download from HP). The HP-48SX printed manual documents this on page 63, and the right arrow on that calc performs this operation as well, however, there is also a SWAP command above that key accessible via the left shift key. On the HP-50g, it is buried in a sub menu (left shift PRG STACK SWAP). You can also access this on either machine by typing in the SWAP command (alpha S W A P ENTER), but this is really only useful for programming). Basically, virtually all the features of the HP-48SX are carried forward to the HP-50g, however, access is either not as convenient or poorly documented / not documented. The printed User's Manual that comes with the HP-50g is very poor and rife with errors. It's truly a shame that such a powerful device is so poorly supported by useful documentation, such that most users never experience it's full capabilities. Were it not for my HP-48SX and this forum, I certainly would not be able to do so.

Re: Equation library w/ units

*Message #10 Posted by **Ángel Martin** on 10 Mar 2011, 2:52 p.m.,*
in response to message #9 by Michael de Estrada

I find increasingly unnerving that a "Museum" site needs to double roles to supply the lack of information in modern-day HP calculators. Of course it's great to share and helpful people abound on this forum, but on the other hand should the documentation live up to the system it's documenting, wouldn't the subject of this sharing be about more productive things?

Just a thought... I Suppose.

Re: Equation library w/ units

*Message #11 Posted by **Martin Pinckney** on 10 Mar 2011, 4:25 p.m.,*
in response to message #10 by Ángel Martin

The heading for the Forum states: "This forum is for discussion of HP calculators including usage, repairs, sources of replacement parts, general information etc."

So, at least as far as this forum is concerned, the term "Museum" is not really applicable.

I understand your feelings, however, about the lack of good information from the manufacturer.

Re: Equation library w/ units

*Message #12 Posted by **Mark Storkamp** on 10 Mar 2011, 3:45 p.m.,*
in response to message #9 by Michael de Estrada

When I first went to work in the '80s we had both Technical Writers and Drafters. I wonder if there's a company left today with either. (and document control departments too)

We see quite often in this forum the effect that loosing competent writers can have.

Every day I deal with the crap that engineers sketch out and call their drawings. All that has done is forced manufacturing to make the engineering decisions, since they often don't have direct access to the engineer, whereas the drafter would have worked with the engineer to iron out the problems of manufacturability.

And the bean counters are happy because they've "reduced redundancy".

We get keyboards that don't work, but that doesn't really matter after all since there's no documentation on how to use it anyway.

(you can guess the kind of day I've been having)

Re: Equation library w/ units

*Message #13 Posted by **Chris Randle (UK)** on 10 Mar 2011, 2:49 p.m.,*
in response to message #8 by David Hayden

In my copies of the HP 50g's documentation, I find reference to this SWAP shortcut here:

On page 2-5 (and 10-12) of the User's Guide in the chapter "Introducing the calculator".

On page 7 of the newer Quick Start Guide in the section "Using RPN".

On page 3-244 of the Advanced User's Reference Manual in the "Full Command and Function Reference" entry for SWAP and also in Appendix G-2 "Keyboard Shortcuts".

Re: Equation library w/ units

*Message #14 Posted by **Michael de Estrada** on 10 Mar 2011, 3:57 p.m.,*

in response to message #13 by Chris Randle (UK)

As I mentioned above, it can be found in the Advanced User's Reference Manual. I prefer the older version of the manual, where you can click on a page number in the table of contents and jump directly to the location. I do see on page 2-5 and 10-12 of the User's Guide where this is mentioned as part of examples, but there is no lead in to this information and no mention of it in the Index (Appendix N), so basically you have to read the whole book just to stumble on things like this. I can't comment on the Quick Start Guide, since I don't have one. By stark contrast, HP-48SX has a very comprensive Index, which covers this and all other items for quick referral.

Re: Equation library w/ units

*Message #15 Posted by **Ronald Williams** on 10 Mar 2011, 5:07 p.m.,*
in response to message #8 by David Hayden

FYI - Look on page 7 of HP 50g Quick Start Guide Edition 2 (item 18 will tell you how to SWAP between level 1 and 2). I think you can thank Tim for bringing RPL/RPN back as the primary operating mode of the HP 50g.

Re: Equation library w/ units

*Message #16 Posted by **Michael de Estrada** on 10 Mar 2011, 6:02 p.m.,*
in response to message #15 by Ronald Williams

I'm curious as to where you found the Quick Start Guide. I didn't get one with my HP-50g and I don't see it on the HP website. I don't need one, really, but just wondered since you mentioned it.

Re: Equation library w/ units

*Message #17 Posted by **Ronald Williams** on 10 Mar 2011, 7:11 p.m.,*
in response to message #16 by Michael de Estrada

Recently I changed from hp 49g+ to a 50g and it was packaged with the calculator. You can check this post:

"Re: Is there something going on out there? (or Getting Back to My Roots...) Message #4 Posted by Tim Wessman on 27 Apr 2010, 12:27 a.m., in response to message #3 by David Hayden"

Re: Equation library w/ units

*Message #18 Posted by **Chris Randle (UK)** on 11 Mar 2011, 5:12 a.m.,*
in response to message #16 by Michael de Estrada

The FTP link to the Quick Start Guide in the post that Ronald Williams gave no longer works ("530 Login incorrect.") - Tim Wessman warned that it was temporary - but a Google search of:

```
50g quick start guide site:hp.com
```

gave me a link to a PDF download from HP's IT Resource Center Forums (forums11.itrc.hp.com) as the first hit.

I think it's well worth getting a copy - it's a very readable manual and not too long;

the introduction suggests that you can work through it in about an hour.

I downloaded one when Tim Wessman first posted his FTP link, but my second 50g, purchased a few days ago, came with a paper copy of it.

I'm in the UK, so for my countrymen I ought to add that I *think* that my newer calculator might be US stock (it had a red "North America" tag on the blister packer, whereas my older one from a year ago had a blug "EMEA" tag). So I don't know for certain whether UK ones are currently shipping with the Quick Start Guide or the original User's Manual.

48sx Numerical Integration Question

*Message #1 Posted by **svisvanatha** on 9 Mar 2011, 4:05 p.m.*

I am performing a numerical integration of a function f(x)=g(x)*h(x) over an interval [a,b]. In other words, "integral (f(x)*dx)". I am also interested in plotting the integral's result as a function of the distance along the interval [a,b].

The algorithm that the calculator uses to perform the integration must calculate the integral at a fixed number of intermediate points along [a,b].

So, my question is whether that information is available to the user when using the built-in numerical integration routine?

I can do what I want by performing a summation of the integral's value over a fixed number of divisions over the interval [a,b]. However, I thought that these intermediate values may be available and accessible.

Any thoughts?

Edited: 9 Mar 2011, 4:08 p.m.

Re: 48sx Numerical Integration Question

*Message #2 Posted by **Namir** on 9 Mar 2011, 4:55 p.m.,*
in response to message #1 by svisvanatha

If I am reading you correctly, you want to plot the the area from a to b, varying the value of b from a until you hit bmax:

```
For b = a to bmax
  area = area under f(x) curve between [a,b]
  plot value for area on a graph showing area vs b
Next
```

Yes? No?

Namir

Edited: 9 Mar 2011, 4:58 p.m.

Re: 48sx Numerical Integration Question

*Message #3 Posted by **svisvanatha** on 9 Mar 2011, 6:19 p.m.,*
in response to message #2 by Namir

Yes, that is correct.

The issue becomes one of speed, since the built-in numerical integration function divides the interval into a finite number of strips, calculates the area of that strip for a given ordinate, and adds that to the total sum. With your method, there is alot of computational overlap between successive iterations. I came up with a

similar method, but it basically mimics the built-in routine. I was hoping that the intermediate values for iterations of the numerical solver are available in some manner, but seems like wishful thinking.

Thanks!

Re: 48sx Numerical Integration Question

*Message #4 Posted by **Crawl** on 9 Mar 2011, 7:00 p.m.,*
in response to message #3 by svisvanatha

It seems like it would be easier to do with a program.

Supposing that the distance between pixels is dx, you'd want to integrate f(x) between x and dx for each coordinate x, and add the result to variable that keeps the total.

Since the limits are so close, for most functions I'd imagine the integral would converge quickly.

Re: 48sx Numerical Integration Question

*Message #5 Posted by **svisvanatha** on 10 Mar 2011, 6:38 a.m.,*
in response to message #4 by Crawl

OK, so I divided the interval into a number of sub-intervals. For each sub-interval, I used the built-in numerical integration routine. I increment an area variable by that amount, and also store the total area and upper limit of the current interval as a 2 column row within a matrix.

At the end, I have the total area as well as the area as a function of the distance along the interval (a,b).

Thanks for the replies!

How many versions of the HP-35 are there?

*Message #1 Posted by **Michael de Estrada** on 9 Mar 2011, 12:05 p.m.*

According to this museum and many other sources there are 4 production versions of the HP-35, to wit:

1) Version 1, aka Red Dot 2) Version 2, no red dot 3) Version 3, front label with 35 4) Version 4, wider top keys with legends and raised OFF/ON legends

However, there appear to be two variations of the Version 2:

Version 2a - very similar to Version 1 with s/n label outside case, OFF/ON switch nearly flush with case, same bridge contact etc.

Version 2b - very similar to Version 3 with s/n inside battery compartment, tall OFF/ON switch, still has bump on 5 key and buggy ROM, but otherwise same as Version 3.

It's the Version 2a that has been used to create fake Red Dots in the past, although it has been stated that there are significant internal differences in construction between a true Version 1 Red Dot and any subsequent versions.

I offer this for academic discussion and otherwise no particular purpose.

Re: How many versions of the HP-35 are there?

*Message #2 Posted by **Thomas Chrapkiewicz** on 9 Mar 2011, 8:54 p.m.,*
in response to message #1 by Michael de Estrada

It would be interesting for us to track the serial numbers and versions (sort of like megarat has done here for the HP48 series). It would be interesting to provide pictures also.

I would be willing to collect and publish this if others are interested.

TomC

red dot/early V2

*Message #3 Posted by **Frank Boehm (Germany)** on 10 Mar 2011, 4:32 a.m.,*
in response to message #1 by Michael de Estrada

Much easier to check are differences between the ser#-labels - but I'm not going to disclose them, sorry. (If you are in doubt, supply a highres-pic to the forum and those knowing will do their judgement...)
The internal parts are different too (and not exchangeable), but one rarely gets pictures of those.

Re: red dot/early V2

*Message #4 Posted by **Michael de Estrada** on 10 Mar 2011, 9:01 a.m.,*
in response to message #3 by Frank Boehm (Germany)

I am well aware of the differences between the serial number label on a Version 1 Red Dot and an early Version 2, and will also not reveal the differences ;). I was merely pointing out that it's the early Version 2, Version 2A if you will, that has been the basis for attempted fakes. My discussion is more oriented towards the variations on the Version 2, and suggestion that perhaps they should be considered two different versions. This would mean that there were five production versions of the HP-35, rather than 4, although the significance of this conclusion is about as important as the position now taken by astronomers that Pluto should no longer be considered a planet.

A beautiful HP-70

*Message #1 Posted by **Michael de Estrada** on 8 Mar 2011, 10:55 a.m.*

Late last year this complete HP-70 set in mint condition sold on TAS for only $676.66 to a domestic buyer. The seller had restricted shipping to the USA, otherwise I think the final sale price would have been much higher, perhaps over $1K. Previously, a HP-70 w/o accessories and in not nearly as good condition had sold for nearly $1K to a buyer outside the USA, probably Europe. This is the only HP-70 I've seen with the original cardboard box and Demonstration Book. This is truly one of the nicest rare collectable vintage HP calc sets I've ever seen.

Re: A beautiful HP-70

*Message #2 Posted by **Juergen Keller** on 8 Mar 2011, 1:11 p.m.,*
in response to message #1 by Michael de Estrada

Very nice, never seen such a complete HP-70 set. But compared to, e.g., the 29C box, this box looks quite shabby. Why did HP not provide a nice box in the early days?

Re: A beautiful HP-70

*Message #3 Posted by **Michael de Estrada** on 8 Mar 2011, 2:31 p.m.,*
in response to message #2 by Juergen Keller

HP wanted this model to be a much less expensive economy financial calculator that cost a lot less than the HP-80. So they replaced the fancy metal clamshell jewel case with a cardboard box and the nice black soft leather calculator case with a plastic zipper case to lower costs. Another advantage of the cardboard box is that it could also be used for shipping, since in the early days HP calcs were not sold over the counter, except at HP outlets. HP also eliminated the separate Quick Reference Guide, although they improved the Owner's Handbook by making it spiral bound. When HP introduced the HP-80 in 1973 the price was $395, whereas when they introduced the HP-70 in 1974 the price was reduced to $275. The problem is that it was still not cheap, and when the more powerful HP-22 was introduced in 1975 for $165, that sealed its fate, and very few were sold, which is why they are so rare and fetch such a high price today.

*Message #2 Posted by **Jim Yohe** on 8 Mar 2011, 12:45 p.m.,*
in response to message #1 by Gerson W. Barbosa

But you said that you enter the angle in radians so an angle of 89.999999 should yield you -1.99520539304 which still isn't close to "your" implied 62,500,000.00. ;-)

Re: Mardi Gras Basic Trigs (HP-12C)

*Message #3 Posted by **Gerson W. Barbosa** on 8 Mar 2011, 3:09 p.m.,*
in response to message #2 by Jim Yohe

I should have written tan(89.999999 degrees), sorry! Angles in degrees have to be converted to radians, like in the second table examples, which have been multiplied by 1.745329252e-02, that is, pi/180. I forgot to mention the running time, less than five seconds (ordinary HP-12C). Also, the program gives at least eight digits of accuracy most of the times.

Regards,

Gerson.

The HP-12c Platinum should give more accurate results, but I don't have one to check this out.

Gerson, can you give some background on the formulas used?

Re: Mardi Gras Basic Trigs (HP-12C)

*Message #5 Posted by **Gerson W. Barbosa** on 8 Mar 2011, 6:46 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Hi Marcus,

Sorry for the lack of documentation. I hope the following is clear. Basically, I combined cos(x) and cosh(x) and used my HP-28S to obtain the required Taylor series.

Regards,

Gerson.

```
3:          'COS(X)'
2:               'X'
1:                 8

TAYLR =>  '1-.5*X^2+
4.16666666667E-2*X^4
-1.38888888889E-3*X^
6+2.48015873016E-5*X
^8'

3:         'COSH(X)'
2:               'X'
1:                 8

TAYLR =>  '1+.5*X^2+
4.16666666667E-2*X^4
+1.38888888889E-3*X^
6+2.48015873016E-5*X
^8'

  +   =>  '1-.5*X^2+
4.16666666667E-2*X^4
-1.38888888889E-3*X^
6+2.48015873016E-5*X
^8+
        (1+.5*X^2+
4.16666666667E-2*X^4
+1.38888888889E-3*X^
6+2.48015873016E-5*X
^8)'

COLCT =>  '2+8.33333333334E-2*
X^4+4.96031746032E-5
*X^8'
```

That is,

cos(x) ~ 2 + x^4/12 + x^8/20160 - cosh(x),

which has been rewritten as

cos(x) ~ 2 + x^4/12(1 + x^4/12/140) - (e^x + 1/e^x)/2

This provides 9 digits of accuracy or so for |x|<=pi/4. So, the argument is first divided by 2
then a trigonometric identity is used:

cos(x) = 2*(cos(x/2))^2 -1

Finally, sin(x) is computed as

sin(x) = sqrt(1 - cos(x)^2)

The tables below give an idea of the overall accuracy.

An HP-32S-II has been used to simulate the hp-12c platinum results in the table below, so they may differ a little.

```

*Message #7 Posted by **Gerson W. Barbosa** on 9 Mar 2011, 9:02 a.m.,*
in response to message #6 by Marcus von Cube, Germany

Marcus,

I certainly knew the Taylor series for sin(x) and cos(x) are similar to those for sinh(x) and cosh(x), except the former ones are alternating series and the latter ones are not. However, it never had occured to me to combine them to approximate the trigonometric functions... not until yesterday morning when playing with my 28S I added the first few terms of the sin(x) and sinh(x) series together and realized this might work. Then I tried cos(x) and cosh(x) and the resulting series appeared to require less steps on the 12C. Anyway, other than rewriting the series, I haven't tried to optimize the program, so I think there is still room for

improvement. I think the program runs fast even on the older HP-38, I'll try it on Nonpareil later.

Regards,

Gerson.

Re: Mardi Gras Basic Trigs (HP-12C)

*Message #8 Posted by **Stuart Sprott** on 9 Mar 2011, 6:11 a.m.,*
in response to message #5 by Gerson W. Barbosa

I can remember using a sharp 167p (at least I think it was a 167p)back in the early 1970s, before the HP35 took the world by storm.

It had 100 program steps, basic arithmetic functions, square root and 10 memory registers. Note no trig functions.

It was possible to program accurate trig functions. The only problem was that once the function was generated their was little room left for anything else. All the same we managed to write some basic Surveying programs that at time seemed out of this world. Prior to this you had to use trig tables and curta calculators.

We used infinite series for the trig functions. See below.

Sin x = x - x3/3! + x5/5! - x7/7! + ...

where x is in radians and in the above context x3 means x cubed.

I spent hours programming this machine. It was my introduction to programming. I was totally hooked.

The machine was about the size of a present day lap top and about double the thickness. The program was lost the minute you switched off the calculator. However you could store the program on a punch card. The card had to be manually punched as you wrote the program. Editing was an interesting exercise. You seemed to go through a stack of cards before you got it right.

*Message #9 Posted by **Gerson W. Barbosa** on 9 Mar 2011, 9:47 a.m.,*
in response to message #8 by Stuart Sprott

Stuart,

I know what you mean. Once I knew a retired municipal surveyor who had a small surveying office at home and spent more time there doing calculations than at the field. He had no computer, only one 11C loaded with of couple of simple programs and one sharp scientific calculator to help him. He showed me a printed spread sheet as an example of the calculations he did. I told him it was nonsense to do that kind of work without a computer and advised him to get at least a pocket computer. He purchased a CASIO PB 700 for about 100 dollars (4 kB RAM, later upgraded to whopping 16 kB!) and I wrote him a BASIC program which did in seconds the work it previously took him a whole day or two. He had a small museum of old mechanical and electronic calculators he had purchased during his career. He told me he had used trigonometric tables in the beginning. He showed me a Curta

Type II, shining in its case, complete with manuals and offered me for about 20 dollars... which I refused to buy because I was not interested in mechanical devices. I remember one of the manuals described a procedure to approximate the sine function on it. Those were the (hard) days!

Cheers,

Gerson.

in response to message #7 by Marcus von Cube, Germany

57295779.5130823151 on the Canon and

57295779.5132 on the TI-36X

Joerg

Re: Mike Sebastian's Calculator Forensics

*Message #9 Posted by **Marcus von Cube, Germany** on 8 Mar 2011, 5:32 p.m.,*
in response to message #8 by Joerg Woerner

The Canon is extremely accurate. The result is correctly rounded to the last digit. (The last digit should be a 0 and the following a 5. Taking rounding into account, the result is perfect.)

Re: Mike Sebastian's Calculator Forensics

*Message #10 Posted by **Paul Dale** on 9 Mar 2011, 1:10 a.m.,*
in response to message #1 by Joerg Woerner

The 34s only gets 10 zeros after the decimal:

```
9.000000000029361
```

This is, however, the correctly rounded result for devices with sixteen digits. I.e. each operation correctly rounded its answer.

Pauli

Re: Mike Sebastian's Calculator Forensics

*Message #11 Posted by **Marcus von Cube, Germany** on 9 Mar 2011, 2:03 a.m.,*
in response to message #10 by Paul Dale

Pauli, that's the point. The forensics is not meant to highlight the accuracy of a certain calculator but to identify identical algorithms and/or calculator chips.

Re: Mike Sebastian's Calculator Forensics

*Message #12 Posted by **Walter B** on 9 Mar 2011, 2:56 a.m.,*
in response to message #11 by Marcus von Cube, Germany

> Quote:
>
> The forensics is not meant to highlight the accuracy of a certain calculator but to identify identical algorithms and/or calculator chips.

True for this level of precision we're talking about here. In general, however, the forensics sheds some light on the reliability of calculation results. Think of error propagation in iterative computations ...

Re: Mike Sebastian's Calculator Forensics

*Message #13 Posted by **Gerson W. Barbosa** on 9 Mar 2011, 8:21 a.m.,*
in response to message #10 by Paul Dale

Paul,

The WP-34s displays 9.00000000003, that is, the internal result is rounded to the number of digits of the display. HP used to round the result and truncate it to the number of digits in the display at the end of each operation. Thus, the HP-42S displays 8.99999864267. HP's method makes sense because the results of the operations are coherent to the actual figures of the operands the user has access to (by examining their mantissas, for instance).

I assume the 34s is a 16-digit device, but the calculations are carried out with extra guard digits, otherwise it wouldn't achieve the correct rounded 16-digit result we see. Another reason to get the WP-34s as soon it's available :-)

Correct result for various numbers of digits in this old thread.

Regards,

Gerson.

in response to message #13 by Gerson W. Barbosa

Gerson, wp34s *is* on the agenda. :)

Re: Mike Sebastian's Calculator Forensics

*Message #15 Posted by **Paul Dale** on 10 Mar 2011, 1:33 a.m.,*
in response to message #13 by Gerson W. Barbosa

Try subtracting 9 from that result :-)

Yes, the 34s is a 16 digit device. Registers are IEEE 854 64 bit packed decimals. As you guessed, internal calculations are in higher precision using unpacked decimal numbers.

I could round to the display size (12 digits) easily enough. For a variety of reason I didn't.

- Pauli

HP 42s -- "TOP.FCN"

*Message #1 Posted by **Anthony (USA)** on 8 Mar 2011, 3:05 a.m.*

Hi, everyone, I'm doing a school research about several calculators (I chose the HP Pioneer series calculators), and I came across an interesting aspect concerning HP 42s. I don't own one myself, and since I don't have access to a manual, I am not really sure; but my question is what is the purpose of the "TOP.FCN" menu accessed above the zero key? I found out that by activating that menu, one would simply get a menu with items corresponding to the functions on the top row of the calculator: sigma plus, reciprocal, square root, logarithm, natural logarithm, and execute. Isn't it kind of weird? One could just press the physical square root key, for instance, to find the square root of a number; it would be a waste of two keystrokes to access the TOP.FCN menu just to accomplish what could easily be done with one key press. Please help me out, I'm not too knowledgeable (yet) and it's just killing me not knowing the exact purpose of the TOP.FCN menu of the HP 42s, because right now to me, it seems redundant and a waste of menu/function/space. Thank you. :)

Re: HP 42s -- "TOP.FCN"

*Message #2 Posted by **Nigel J Dowrick** on 8 Mar 2011, 3:46 a.m.,*
in response to message #1 by Anthony (USA)

If you have another menu currently in use, and you want to use one of the normal top row functions (e.g., 1/x) the TOP.FCN key temporarily brings up their functionality. Once the button has been pressed, the menu returns to the previously displayed menu.

This is from memory - am I right?

Nigel (UK)

Re: HP 42s -- "TOP.FCN"

*Message #3 Posted by **Stuart Sprott** on 8 Mar 2011, 6:44 a.m.,*
in response to message #2 by Nigel J Dowrick

Nigel,

I have just tried what you mentioned. It does not seem to work.

I used the HP42 regularly back in the early 90s, but I cannot remember ever using TOP.FCN.

The manual clearly backs you up. A possible bug?

Re: HP 42s -- "TOP.FCN"

*Message #4 Posted by **svisvanatha** on 8 Mar 2011, 8:01 a.m.,*
in response to message #3 by Stuart Sprott

I don't have a physical 42s anymore, but I do recall this is the correct use and behaviour of the TOP.FCN key. Also, Free42 on my N900 works like this as well.

Re: HP 42s -- "TOP.FCN"

*Message #5 Posted by **Walter B** on 8 Mar 2011, 9:56 a.m.,*
in response to message #4 by svisvanatha

I concur with Stuart. Neither my 42S nor Free42 returns to the menu displayed before TOP.FCN. For reproducibility tests, what I did is:

```
gold FLAGS    displays the flags menu
gold TOP.FCN  displays the menu of unshifted top functions
SQRT          3rd menu key executes the square root
              and returns to 2-line display of x and y
```

No manual at hand right now.

Re: HP 42s -- "TOP.FCN"

*Message #6 Posted by **Walter B** on 8 Mar 2011, 10:22 a.m.,*
in response to message #5 by Walter B

OK, found it on pp. 22 and 23 of the manual:

*Pressing TOP.FCN (top-row functions) displays a menu containing the functions (shifted and unshifted) on the six top-row keys: ... Use the TOP.FCN menu when you want to use one of these functions without exiting from the current **application** menu.*

Emphasis added. In the 42S, there are two kinds of menus. You have to know by heart which's which, you can't see it on the calc :(

Re: HP 42s -- "TOP.FCN"

*Message #7 Posted by **Glen Sanft** on 8 Mar 2011, 2:43 p.m.,*
in response to message #6 by Walter B

Some of the menus are "passive" and would normally disappear after one of the choices is taken. Even when you temporarily "lock those in" by "double-clutching" into them, they disappear after a completed TOP.FCN.

However, the "active" menus (SOLVER, BASE, etc.) which "stick around" until explicitly "EXITed-out-of" will resume where you left off after a TOP.FCN task.

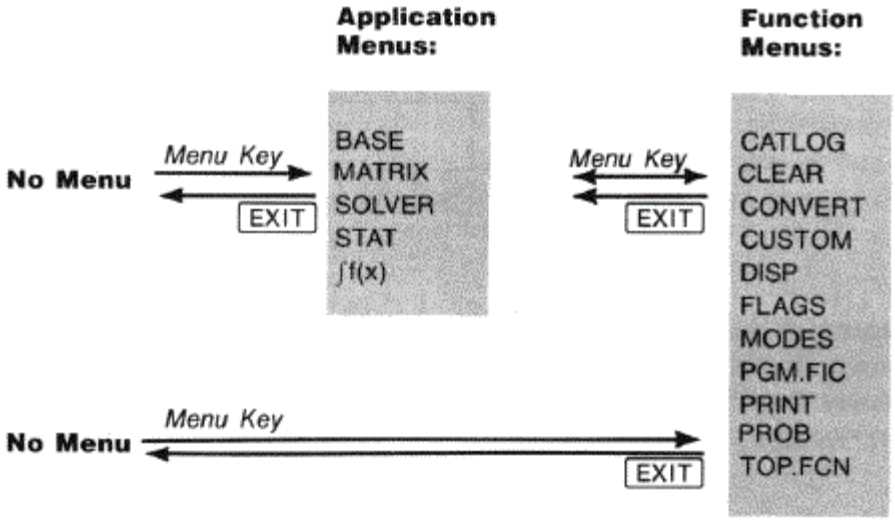
I didn't try anything with a programmed set of menu variables in action, so am not sure which side of the ditch that tree would fall.

Re: HP 42s -- "TOP.FCN"

*Message #8 Posted by **Walter B** on 8 Mar 2011, 4:11 p.m.,*
in response to message #7 by Glen Sanft

Maybe I should have been more precise. For sake of unambiguity, here's what they wrote on top of p.22 about it:

If you select a function menu while in an application, the calculator remembers the application menu and displays it again when you exit the function menu.



Nothing about "active" or "passive" ... but you have to learn the five "application menus" :-(And please don't ask me why it was structured this way - it's the way it is :-/

Edited: 8 Mar 2011, 4:14 p.m.

Re: HP 42s -- "TOP.FCN"

*Message #9 Posted by **Thomas Okken** on 8 Mar 2011, 7:13 p.m.,*
in response to message #8 by Walter B

The general idea is that "application" menus are menus that you'll spend a lot of time with, and will want to return to after using some other menus for some quick calculations.

The application menus on the keyboard are SOLVER, the integrator, MATRIX, STAT, and BASE. The variables menu (VARMENU) also acts like an application menu.

So, you can go to MATRIX and then EDIT or EDITN, and while editing a matrix element, use menus like PROB or PRINT without losing your place in the matrix editor. The TOP.FCN menu lets you access the normal functions on the top row of the keyboard, again without having to back all the way out of the MATRIX menu (the MATRIX "application", per the manual).

The HP-42S menu system is quite clever; it's designed to minimize the number of times you have to deliberately tell it to switch menus. The HP-42S manual explains it all quite well... If only HP had released that manual into the public domain! *sigh*

Re: HP 42s -- "TOP.FCN"

While you're there and since you don't have a manual you can download the "Alternative HP-42S/Free42 Manual", written by José Lauro Strapasson and Russ Jones from Thomas's site as well.

Re: HP 42s -- "TOP.FCN"

*Message #12 Posted by **Anthony (USA)** on 8 Mar 2011, 1:21 p.m.,*
in response to message #10 by Johnny Bjoern Rasmussen

Thank you all for your responses. :) Thank you Mr. Rasmussen for the link to the Free 42s, that is pretty neat! I'll download it later when I get a chance today. And thank you Mr. Walter B. for the manual excerpt, really helps. Though I still wonder because, let's say that we have the CATALOG menu activated, then let's say we want to take the square root of a number. We could do two things: (a) activate the TOP.FCN menu by pressing the SHIFT key then the zero key, for a total of two key presses, or we could (b) just press EXIT, for a total of one key press. And wouldn't one not return back to the CATALOG menu after taking the square root of a number using method (a), hypothetically in our example, but return instead to the regular X-Y display (not back to the screen with the CATALOG menu still activated)? I may be being a little too discerning, but I'm just wondering. :)

12c+ vs 12cp

*Message #1 Posted by **Erturk Kocalar** on 6 Mar 2011, 6:38 p.m.*

Hi all,

Are the guts between 12c+ and 12cp same, if both of them have the wide battery door?

I bought a 12cp recently for repurposing, but I don't see the test points for programming. The holes were covered with a thin plastic tape.

It makes me think either 12cp is different hw design or hp changed 12c plastics to prevent repurposing.

I am thinking of buying the 12c+ , but I want to make sure I can reprogram it.

Thanks,

Re: 12c+ vs 12cp

*Message #2 Posted by **Martin Pinckney** on 6 Mar 2011, 7:52 p.m.,*
in response to message #1 by Erturk Kocalar

They're different. See this thread for more information.

12cp speed differences (was Re: 12c+ vs 12cp)

*Message #4 Posted by **Cristian Arezzini** on 8 Mar 2011, 12:08 a.m.,*
in response to message #1 by Erturk Kocalar

This may be a bit off-topic, but I'm wondering... I too have one of the new, 2-battery 12Cs. I've read about the loop speed tests, specifically this one:

01 + 02 GTO 01

and I've seen results (after 60 seconds of the loop) of about 30,000 and about 45,000, in this post.

My 12C, after 60 seconds of the same test, shows 76,000. Why all this difference? Is HP constantly changing chips/frequencies??

Cristian

*Message #5 Posted by **Katie Wasserman** on 8 Mar 2011, 2:12 a.m.,*
in response to message #4 by Cristian Arezzini

The latest firmware in the 12c+ has more efficient emulator code in it that runs 2.5 times faster than the first version of the firmware. It's 150 times faster than the original 12C.

Read more about this here.

Re: 12cp speed differences (was Re: 12c+ vs 12cp)

*Message #7 Posted by **Katie Wasserman** on 8 Mar 2011, 9:53 a.m.,*
in response to message #6 by Cristian Arezzini

I don't know how you did your searching but the best way is to use google. In this case something like: "site:hpmuseum.org 12c+ speed" returns a lot about it.

I sometimes remember the person who posted what I'm looking for and add this to my search criteria, this really narrows things down. Of course this requires that you read this forum regularly and are familiar with individual's areas of interest and expertise.

On the other hand.... I don't think that most of the people here at all mind responding to questions that have come up before. It's a very friendly group and we all need help finding information on occasion.

-Katie

New -21 and -25 apps for iPhone

*Message #1 Posted by **Eric Smith** on 5 Mar 2011, 6:53 p.m.*

Maciej Bartosiak has ported my simulation code for the -21 and -25 calculators to iOS, so they may be used on the iPhone, iPod Touch, and iPad. The apps are RPN-21 and RPN-25. I hope no one objects to my posting this announcement; I thought some of the regulars here might be interested in these apps.

Re: New -21 and -25 apps for iPhone

*Message #10 Posted by **Walter B** on 6 Mar 2011, 8:46 a.m.,*
in response to message #1 by Eric Smith

Nice looking for sure. BTW, please note all shifted functions are located below of the primary operations :-)

For edition 1.1 I'd suggest an improved exponent format - e.g. sin^-1 looks a bit primitive spelled this way IMHO. And a capital Pi is used ... :-/

Re: New -21 and -25 apps for iPhone

*Message #11 Posted by **Vincent Weber** on 6 Mar 2011, 10:32 a.m.,*
in response to message #10 by Walter B

Great app ! A couple of comments:

1/This is obviously not a HP-25C: killing the app resets memory; on Iphone 4 this is not much of a problem, you can use multitasking to keep the memory state, but still - is there any plan to upgrade it to a HP-25C in future ?

2/I think there is a bug: I never owned a HP-25 but I think it is supposed to display the next instruction to

be excuted if "SST" is held down (and then, to excute the instruction). Here, nothing of this kind. Is this a bug or an intended behaviour ?

Would be awsome to have the 34C (and of course, the 65 and 67, if ever their card reader behaviour is reversed-engineered...).

Cheers,

Vincent

You're right about SST on the 25. I'll talk to Maciej about that and continuous memory.

Thanks! Eric

Re: New -21 and -25 apps for iPhone

*Message #13 Posted by **Vincent Weber** on 17 Mar 2011, 6:22 a.m.,*
in response to message #12 by Eric Smith

Hi Eric, Thanks, the new version is on the Appstore and corrects the 'SST' bug ! It does not implement continuous memory, though. Could you maybe tell us what is scheduled for Nonpareil for Iphone ? Especially: -If the calculators that are already in Nonpareil, especially the 34C and 33C, could be soon on the Appstore ? would be great ! -If the calculators that are not yet in Nonpareil, but that you have been mentionning in 2008 as almost-ready (especially, the 67 and the 29C) could come soon as well ? -and if other calcls (especially the 65, would be great) could come and when ?

Would love of these beauties on my Iphone :)

Thanks and cheers,

Vincent

[OT] TAS selling fee shock

*Message #1 Posted by **Michael de Estrada** on 5 Mar 2011, 6:14 p.m.*

It's been awhile since I sold anything on TAS, so when I recently got the bill for the sale price on two calc auctions, I was shocked to see that the sale fees have gone up dramatically. They are now a flat 9% of the sale price, regardless of the amount, with a maximum limit of $50. So, unless the final price exceeds $555.56, the sale fee as a percentage of the sale price will be 9%. Add to that the listing fees and PayPal service charge, and the total fees will exceed 12% of the sale price. It makes me wonder if it's even worth the hassle to list items on TAS, unless they will fetch more than $1000, which is not the case with any but the rarest vintage calculators. My first calc did not get much, since I made the mistake of listing it at too high a starting price and having it finish early Friday evening, when people were on their way home from work. The buyer is also a seller, so maybe we'll see it re-listed at a high BIN price! Well, at least it wasn't the infamous Mr. C, who put in a lowball bid on my second auction.

Edited: 5 Mar 2011, 6:16 p.m.

Re: [OT] TAS selling fee shock

*Message #2 Posted by **Keith Midson** on 6 Mar 2011, 1:18 a.m.,*
in response to message #1 by Michael de Estrada

I know the feeling. I downsized a part of my collection just over a month ago and then had to sell another HP to fund the seller fees! I mean at 29C kind of fee! What did you sell? Cheers, Keith

Re: [OT] TAS selling fee shock

*Message #3 Posted by **Michael de Estrada** on 6 Mar 2011, 9:16 a.m.,*
in response to message #2 by Keith Midson

I sold 2 HP-45 complete sets, both in perfect working condition. The first went for a disappointingly low amount, much less than originaly paid, and the second went for about the original cost. In the past I've seen the hard case or AC adapter alone sell for nearly what the first auction fetched. I think part of the problem is that the HP-45 is probably the least rare of HP-45 calcs, so they will never be in such low supply that they will be worth very much. Of course, that's also the reason why I ended up with so many of them, 10 in fact, and am now trying to reduce the number to a saner level.

Re: [OT] TAS selling fee shock

*Message #4 Posted by **Randy** on 6 Mar 2011, 9:34 a.m.,*
in response to message #1 by Michael de Estrada

I think you've given birth to a new eBay-ism: sellers remorse

Re: [OT] TAS selling fee shock

*Message #5 Posted by **Thomas Radtke** on 6 Mar 2011, 10:08 a.m.,*
in response to message #1 by Michael de Estrada

Fees will rise just below a level where (1) different auction sites would have a chance to get any sellers except those using them to sell at fixed prices w/o paying fees and (2) TAS' earnings will decrease due to sellers simply keep their stuff or find completely different distribution ways ;-). That's the nice thing about capitalism: The rules are very easy to understand and everyone with a good idea can join in :-).

But ... you will always find someone blaming the car industry for selling cars getting thirsty when driving 200 Mph.

Re: [OT] TAS selling fee shock

*Message #6 Posted by **robert rozee** on 6 Mar 2011, 3:01 p.m.,*
in response to message #1 by Michael de Estrada

wow, 12% fees - that is just awful! normal bricks-and-mortar auction houses charge but a fraction of that level :-(

perhaps you should start adding a "buyers premium" onto your auctions, where the buyer has to pay an additional 12% on top of the selling price to cover the horrendous fees that the online auction site dares to charge?

cheers, rob

Re: [OT] TAS selling fee shock

HP12C with a "funny" ENTER key

*Message #1 Posted by **Cristian Arezzini** on 5 Mar 2011, 2:10 p.m.*

One of the calculators I bought to replace my stolen ones, is a 12C. It's made in USA, serial no. 2906A05016. It's in near mint condition, when I acquired it it had a leaky battery, but I managed to clean everything before any damage was made. It works very well, the display is clear, and all the keys behave as expected *except* for the ENTER key. This key works, but its "action" is weird. All the other keys, when pressed, move down about 3mm before reaching the bottom; and only after about 2mm of travel you feel the dome collapsing. They feel quite "soft" at first, then they feel "firmer" just before the dome collapses. This ENTER key instead, only goes down about 1mm. It doesn't feel "sloppy", and when at rest it's at the same height than the other keys (or possibly a fraction of mm higher). But it feels "firm" from the beginning of the movement; you need more force to get it moving than the other keys. And as soon as it moves, the dome immediately clicks. It almost feels like the dome is already "almost-collapsed" when at rest. As if there's something wedged between the dome and the pin pushing on it. I tried "wiggling" the key around to try dislodging any extraneous material, but nothing happened.

Now, the question: does this description tell something to anyone? What might have happened? And, what should I do, considering that opening a 12C isn't trivial? Should I keep it as it is, or open it to get it to work as intended (if I can)? I intend to use this machine, do you think that using it as it is now could lead to premature failure of that key (though at that age, it might not be defined "premature" anyway)?

Cristian

Re: HP12C with a "funny" ENTER key

*Message #2 Posted by **Walter B** on 5 Mar 2011, 3:39 p.m.,*
in response to message #1 by Cristian Arezzini

Ciao Christian,

compared to the HP-48G you mentioned earlier, opening an old HP-12C *is* trivial. As easy as unfastening four screws ... d8-)

Well, not really... The four screws don't get you to the keyboard mechanism, to get there you also have to remove 40 heat-stakes! :) And what worries me isn't removing them, but finding a way to put everything back together solidly enough...

Cristian

Re: HP12C with a "funny" ENTER key

*Message #4 Posted by **Randy** on 5 Mar 2011, 5:18 p.m.,*
in response to message #1 by Cristian Arezzini

Sounds like a perfectly normal Voyager keyboard to me.

The Enter key behavior is different because the dimension from the hinge point to the point of contact is approximately three times longer than all other keys. It will not have the same "feel" and "click" as the others due to it having:

1. A longer lever
2. A larger area of finger contact when pressed
3. A larger contact area under the key that presses on the dome

This photo shows the differences from the back of the keys view:

in response to message #4 by Randy

> Quote:
>
> Sounds like a perfectly normal Voyager keyboard to me.

Randy, I don't know, I also have a new (the VERY fast model) 12C, and it doesn't show this behaviour. Of course you can feel that the ENTER key is a bit different, but it still moves down the same distance as the others when pressed. And the "click" comes after a couple of millimetres of travel, while on the "old" 12C it comes immediately. And you don't get a good tactile feedback at all. Can you confirm that the new and the old 12Cs present a substantially different behaviour? Of course I don't want to open it if that's how it's supposed to be! :)

Re: HP12C with a "funny" ENTER key

*Message #6 Posted by **Randy** on 5 Mar 2011, 5:54 p.m.,*
in response to message #5 by Cristian Arezzini

This is a topic that comes up at least twice a year - that is someone buys an older Voyager and thinks there is something wrong with the Enter key. What you've described is exactly how it should be as there is nothing wrong with the unit.

The later models made in China use different domes and materials between the keys. They might look the same from the outside but that's where the similarities end. Comparisons should be cosmetic only because the only thing in common between the units from a hardware standpoint are physical dimensions.

Edited: 5 Mar 2011, 5:54 p.m.

Re: HP12C with a "funny" ENTER key

*Message #7 Posted by **Cristian Arezzini** on 5 Mar 2011, 6:15 p.m.,*
in response to message #6 by Randy

> Quote:
>
> What you've described is exactly how it should be as there is nothing wrong with the unit.

Well, that's great then... if that's how it's supposed to be, I'll stop worrying! This is my first and only "old" Voyager, so I didn't know a thing like that was to be expected.

On a "side", partly off-topic, track: I seem to have problems with the search function. If I enter some words in the search field, selecting "Last several eons" as time frame, and then click on the "view message index" button at the bottom... it only shows me results from the last few days. I'm surely missing something obvious, but I just can't find a way to make a search including old messages...

Cristian

*Message #8 Posted by **Mike Morrow** on 5 Mar 2011, 11:55 p.m.,*
in response to message #7 by Cristian Arezzini

Not that Randy's info needs any external support, but all my 1980s vintage Voyagers behave *exactly* as he describes.

Re: HP12C with a "funny" ENTER key

*Message #9 Posted by **bill platt** on 9 Mar 2011, 10:40 a.m.,*
in response to message #7 by Cristian Arezzini

When using the ENTER key, push it near the upper end. It works much better that way.

As Randy described, the geometry makes it feel very different from the other keys, especially if you push it at the bottom.

Edited: 9 Mar 2011, 11:40 a.m.

Re: HP12C with a "funny" ENTER key

*Message #10 Posted by **uhmgawa** on 10 Mar 2011, 12:50 a.m.,*
in response to message #4 by Randy

> Quote:
>
> The Enter key behavior is different because the dimension from the hinge point to the point of contact is approximately three times longer than all other keys.

While there is limited mechanical real estate to balance out the top and bottom actuation force of the voyager enter key, it is somewhat perplexing why the bottom matrix dome couldn't have been used as an identical parallel key. Some fudging of the hinge stabilizer would be needed but the numbness associated with the enter key bottom seems a little strange.

As it is the lower dome position is stuffed with a snap dome and generates its own unique keycode if you can find a way to actuate it. While the upper dome "enter" generates an 8:4, the phantom lower dome is 8:5. Even more interesting is an 8:5 key code maps to an inverse sin operation by at least the 15c firmware.

Re: HP12C with a "funny" ENTER key

*Message #11 Posted by **John B. Smitherman** on 5 Mar 2011, 7:44 p.m.,*
in response to message #1 by Cristian Arezzini

Christian, I've got a "Made in USA" 15c that has an Enter with a feel similar to what you are describing. I'm the original owner and actually sent it to HP after buying it in 1987 and asked them if the Enter key was normal and would they repair or replace it. They replied and basically said that it was within HP's specifications and enjoy your 15c. It has performed flawlessly for 23+ years. I hope that this helps.

Regards,

John

Re: HP12C with a "funny" ENTER key

in response to message #1 by Cristian Arezzini

Thanks everybody for the replies. Much appreciated. I feel reassured now and I'm looking at my old 12C with different eyes, knowing that it's behaving as intended! :) Now I won't fear that if I use it I will break something inside...

Cristian

More on Voyager keys

*Message #13 Posted by **Palmer O. Hanson, Jr.** on 8 Mar 2011, 10:17 p.m.,*
in response to message #1 by Cristian Arezzini

I was intrigued by the discussion of the different feel of the ENTER key on the 12C. I have ten Voyagers: three 11C's, six 12C's (all made in the USA), and one 16C, but sadly no 15C. I verified the different feel on all of the devices and that the feel can vary somewhat depending where I press on the key. Then I encountered some really bad news. My 11C S/N 2217A03623 which has the bug also has a problem with the ENTER key

such that pressing the key near the bottom of the keyboard causes the ENTER operation to take place but without any tactile feel.

While I was playing with the keyboards I eventually noticed that the top of the ON key on each unit is somewhat lower than all of the other keys even though the feel is the same. I wondered what that was about, so, following the old adage, I looked in the manuals. I found the following footnote on page 16 of the 12C manual

> Quote:
>
> Note that the ON key is lower than the other keys to help prevent its being pressed inadvertently.

A similar note appears on page 16 of the 16C manual. If there is a similar note in the 11C manual I couldn't find it.

The same feature is on my 10B's,17BII, 32S and 48S. Interesting!

While I am on the subject of the ENTER key I have one question, namely, why is the ENTER key a different size on most HP machines? \

Re: More on Voyager keys

*Message #14 Posted by **Martin Pinckney** on 9 Mar 2011, 12:00 a.m.,*
in response to message #13 by Palmer O. Hanson, Jr.

> Quote:
>
> ...why is the ENTER key a different size on most HP machines?

It's what HP users had come to expect, ever since the HP-35. Biggest gripe about the otherwise stellar 50g is no big Enter key.

Re: More on Voyager keys

*Message #15 Posted by **Jim Yohe** on 9 Mar 2011, 1:40 a.m.,*
in response to message #14 by Martin Pinckney

At least you don't have to hunt for it with it being the lower right most key though ... I'm kind of use to that being the + key.

Re: More on Voyager keys

*Message #16 Posted by **Mike Morrow** on 9 Mar 2011, 10:28 a.m.,*
in response to message #13 by Palmer O. Hanson, Jr.

> Quote:
>
> ...why is the ENTER key a different size on most HP machines?

A good reason for ENTER being the largest key is because it is activated for any general set of calculations more any other key, including any of the / * - + keys.

A related question is why the ENTER key is not positioned in the same column of keys as the / * - + keys on most HPs made in the past 30 years, as it always was on pre-Voyager HPs. Also, these keys were

always on the left side of the keyboard.

The Voyager layout required upsetting the classic pattern, with / * - + keys moved to the right, no longer aligned below the ENTER key. For unknown reasons HP has continued placing for most post-Voyager models the / * - + keys on the right, while returning the ENTER to its traditional place on the left. Having the ENTER key on the side opposite the / * - + keys creates the worst possible arrangement, and it surprises me to see it continued on the otherwise excellent recent HP 30b.

Most users are right-handed. A logical arrangement for such users is (1) having the ENTER and / * - + keys all on the *right* side of the keyboard, and (2) having a large ENTER key ABOVE the / * - + keys. The HP 49/50 series violates all of criterion (2), but at least it represents a shift in the right direction. :-)

HP41 MLDL2000 V2 demo

*Message #1 Posted by **Meindert Kuipers** on 5 Mar 2011, 11:48 a.m.*

For those interested in the MLDL2000 for the HP41, I uploaded a video to youtube with a demonstration of the various possibilities of the MLDL2000V2, using the mbed module for adavnced I/O (networking, USB media etc). The project is currently still in the breadboard phase, but with the basic mbed functions done I can now start on completing the schematics and layout.

Many thanks go to Marcus von Cube for his support with some of the network functionality and creating the Java applet showing the HP41 stack.

Meindert

Re: HP41 MLDL2000 V2 demo

*Message #2 Posted by **Marcus von Cube, Germany** on 5 Mar 2011, 3:28 p.m.,*
in response to message #1 by Meindert Kuipers

Thanks for the credits. The video is well done.

Re: HP41 MLDL2000 V2 demo

*Message #3 Posted by **Ángel Martin** on 7 Mar 2011, 1:28 a.m.,*
in response to message #1 by Meindert Kuipers

Hi Meindert, looks like you're on a roll again - superb advances, I look forward to the MLDL_V2 with all that functionality built-in... there's no end in sight for the 41!

Re: HP41 MLDL2000 V2 demo

*Message #4 Posted by **Marcus von Cube, Germany** on 7 Mar 2011, 1:56 a.m.,*
in response to message #3 by Ángel Martin

There is still some work to do. If the mbed becomes part of the MLDL design, the power consumption will rise significantly. Either, the MLDL becomes a stationary device or it gets big enough to carry its own power source.

Creating something around the low power ARM designs (see HP 20b) might help but the mbed is not just hardware. It lives from the software environment and ease of development.

Re: HP41 MLDL2000 V2 demo

*Message #5 Posted by **Meindert Kuipers** on 7 Mar 2011, 2:08 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Power consumption has always been a concern, and that is the reason why the mbed module is optional. Apart from that, power to the mbed can be switched on or off under HP41 control. Basically I

do not see much mobile use for the HP41 with MLDL2000 (I prefer to use my iPod with i41CX when on the road). I case where low power mass storage is needed, there is the option of using the GHI uALFAT module for micro SD cards. The pinout of the MLDL2000 will allow either module.

The mbed exapnsion was done to show it is possible, and the fact that it allows very easy adaption by the user thanks to its ecosystem and endless possibilities. Please do not regard the MLDL2000 as a finished and closed system. It is intended to be used and modified in ways that I have not thought of ...

Meindert

in response to message #6 by Paul Dale

> Quote:
>
> brings the 41 series up to date.

I guess you're technically right Pauli, but for some of us (i.e. old enough) the 41 has always been "up-to-date" :-)

If not, consider:

- MLDL itself
- Clonix, NoVRAM
- PIL-Box..
- and last but not least, all the "new generation" software!

Oh well, as I said before... dream on!

Re: HP41 MLDL2000 V2 demo

*Message #8 Posted by **Paul Dale** on 8 Mar 2011, 1:43 a.m.,*
in response to message #7 by Ángel Martin

I guess I didn't express myself well. I've been using a 41 as my day to day calculator for a while now (replacing a 15c) and it isn't lacking much.

However, for those of us without any peripherals, this will be a godsend. IO and mass storage are what I'm lacking and HP-IL isn't really modern.

HP 50G eating batteries

*Message #1 Posted by **Iqbal** on 5 Mar 2011, 11:21 a.m.*

I have an HP50G and I have changed new batteries three times in three weeks. Both set of batteries. It works fine from the USB cable. Not much into electronics, but I know how to open the 50G. I have already had it replaced by HP but they didnt collect the faulty one. SO I can experiment on this. Any ideas?

Re: HP 50G eating batteries

*Message #2 Posted by **Han** on 5 Mar 2011, 11:25 a.m.,*
in response to message #1 by Iqbal

Have you checked to see if your firmware is up to date?

Re: HP 50G eating batteries

*Message #3 Posted by **Crawl** on 5 Mar 2011, 5:10 p.m.,*
in response to message #1 by Iqbal

If you carry around the 50g in a book bag, be careful it's not getting turned on in there by accident. (I put mine in a different case because of that issue)

Re: HP 50G eating batteries

*Message #4 Posted by **Iqbal** on 5 Mar 2011, 10:37 p.m.,*
in response to message #3 by Crawl

Have the latest firmware. I bought 15 of the blue ones from Spain. And the first one I tried eats batteries. Luckily the others are fine. I even did what HP said and leave batteries off for two days and then inserted new ones... same thing, the batteries were dead and even though it was hardly used.

Introducing myself... and a question on a weird 48G

*Message #1 Posted by **Cristian Arezzini** on 5 Mar 2011, 7:04 a.m.*

Hello all, This is my first post after many years of lurking here... I just registered yesterday (it's been quite hard for me to find an email provider that was accepted by the system!). I live in Italy, and of course I have a passion for HP calculators (and some other brands too, but mostly HP). My first HP was a 48G that I bought new in college... It's still working, even though it's REALLY battered - it has seen a LOT of use, and I had to open it many years ago, before I even knew what Internet was, so I had no instructions, and pretty much destroyed the face plate.

Anyway, in the years I built up a small collection (nothing comparable to the pro's!) but a few weeks ago, thieves broke into my office and opened the cabinet where I kept most of my collection (the wife doesn't understand the need to keep "old junk" at home...) so I lost almost everything. They only left a 41CV, maybe because it looked too old to be of value? And they left a 48gii, which is the one I loved (and used) the least. There were also a 12C and my original 48G safe at home.

Anyway, I've started buying some calcs to replace the ones I used most... mainly of the 48 series. And I bought a really nice 48G. It came from England, but I think it's originally from Germany because the manual is in German. It's made in Indonesia, and I was disappointed to find that it has painted keys (I thought all 48's had molded keys). And the font in the logo on the top right of the face plate, is a little different from all the other 48's I've seen. Anyway, it works, great, and it has the "blue on green" display that I love for sentimental reasons.

Now the weird thing... On the box (it came fully boxed) there is a very "official-looking" 512KB sticker; and indeed, the calculator has 512KB of RAM, one in each port from 0 to 3. The calculator shows absolutely no sign of opening; the face plate is like new, and there are no cuts where the rivets are. I don't think it was an "after-sale" mod, because in that case there would be no sticker on the box. I think it was sold already upgraded. But I've never heard of a 48G being sold that way, and my searches yelded no result. Does anybody know anything about this? Who upgraded it, and where (and for how long) was this setup sold?

Thank you in advance, Cristian

Re: Introducing myself... and a question on a weird 48G

*Message #2 Posted by **Raymond Del Tondo** on 5 Mar 2011, 9:07 a.m.,*
in response to message #1 by Cristian Arezzini

Hello and welcome:-)

There were some retailers in Germany (and maybe in other countries, too) who upgraded HP-48G (and other variants of the HP-48) units.
I had an 48G with 2.3MB RAM, and I still have an 48G+ with 1.2MB RAM. On neither unit were visible opening marks.
There ways to open the HP-48 without visible destruction. The articles section of MoHPC should contain some info about this.

HTH

Ray

BTW: Since you use an upgraded 48G, I'd like to suggest to try SpeedUI, the real software turbo for the HP-48G series.

Welcome!... and a question on a weird 48G

*Message #3 Posted by **Massimo Gnerucci (Italy)** on 5 Mar 2011, 9:18 a.m.,*
in response to message #1 by Cristian Arezzini

Hi Cristian!
Germany was the home of speedups and internal memory upgrades for the 48 series, dynatech sold them for years.
I, for one, have a 1280KB HP48G with double speed upgrade. No external sign shows that it was ever opened.

Welcome and greetings from Milan,
Massimo

Re: Introducing myself... and a question on a weird 48G

*Message #4 Posted by **Han** on 5 Mar 2011, 11:24 a.m.,*
in response to message #1 by Cristian Arezzini

Here's one method of opening the HP48 without leaving much of a trace behind:

http://www.math.uiuc.edu/~handuong/hp48/open/

This is not the only way to do it. You could also open it via the faceplate and just stick on a new faceplate afterward. There are members here who have created various backplates on the 12C (?) so it's not too hard to imagine them entering via the faceplate and then affixing a new one later on.

Re: Introducing myself... and a question on a weird 48G

*Message #5 Posted by **Cristian Arezzini** on 5 Mar 2011, 1:56 p.m.,*
in response to message #1 by Cristian Arezzini

Thank you for the replies and for the welcome! :) I didn't know about the method that Han posted... I only knew how to open it from the back (cutting through plastic behind the battery door and the IR screen). I opened several 48s that way before, and they all look OK from the outside, but show obvious opening signs if you look behind those doors. They all also feel a little more "squeaky" when twisted, while this 512K specimen is rock-hard. The faceplate of this modified 48, as I said, is perfect but has some almost unnoticeable differences; first, the "G" in the 48G logo top right, is a different font; then, it all looks a little "shinier", and it looks like it lacks the protective transparent layer that my other 48s have. I don't know if all Indonesian 48s look like that or if it really was opened from the front, and the faceplate was replaced. Anyway... I wonder how many such modifications were made, and how many still exist! And also, I wonder how professionally the job was done - i.e. will it last, or not? :)

Does a 48G with 512KB eat substantially more batteries than a regular one?

I also read somewhere that a 48 with more memory is supposed to be slower than a regular one, due to bank switching; but after some tests, I can say that the 512K one is about 5-10% faster than a 32K one. Did they modify something else, or is it due to individual tolerances in the quartz frequencies?

I'm going to try the SpeedUI... Does it erase the memory or can I keep what I already have in there?

I also have a question on a 12C but I'll write another post for that!

Thanks again, Cristian

Re: Introducing myself... and a question on a weird 48G

*Message #6 Posted by **Marcus von Cube, Germany** on 5 Mar 2011, 2:28 p.m.,*
in response to message #5 by Cristian Arezzini

The speed increase for your memory enhanced 48G may be due to the garbage collection which occurs less often then on a memory constraint system.

Re: Introducing myself... and a question on a weird 48G

*Message #7 Posted by **Raymond Del Tondo** on 5 Mar 2011, 11:19 p.m.,*
in response to message #5 by Cristian Arezzini

SpeedUI is non-destructive, of course;-)
However you'll need to free enough memory in port 0 or 1 to store the main components CF.LIB, UI.LIB, and my special UFL.LIB level F which contains all 4 SpeedUI fonts.

Ray

Re: Introducing myself... and a question on a weird 48G

*Message #8 Posted by **db (martinez, ca.)** on 6 Mar 2011, 12:03 a.m.,*
in response to message #1 by Cristian Arezzini

Cristian; Welcome. Sorry to hear you were ripped off. May the thieves get what i think they deserve. The saddest thing is that the worthless sons-of-bitches probably threw them away when they found they couldn't change the TV channel with them.

Re: the 512KB sticker. That, and the responses were interesting.
Anyway - i put an "Intel Inside" sticker on the back of my 41cx. That really messes with the people who notice.

Re: Introducing myself... and a question on a weird 48G

*Message #9 Posted by **Cristian Arezzini** on 6 Mar 2011, 5:37 a.m.,*
in response to message #8 by db (martinez, ca.)

I know what you mean... We have an idea who might be the thieves (we can't prove anything of course) and they're definitely not the type interested in HP calculators (or math) at all. They probably took all my stuff to some flea market, to cash it quickly, where it will sit until someone buys them for a few Euros and then tosses them when they can't find the = key. That's what makes me saddest - old, rare calculators going like that.

The sticker... it's not on the calculator! It's on the box. The calculator itself looks like a perfectly normal 48G, if you don't check the internal memory. And there was a receipt inside the "messages booklet", written in German, but I can tell it refers to the memory upgrade. It seems to refer to a "Cynox" brand...

Re: Introducing myself... and a question on a weird 48G

*Message #10 Posted by **Han** on 7 Mar 2011, 11:21 a.m.,*
in response to message #9 by Cristian Arezzini

There were several such companies. Cynox also made RAM cards as well as upgraded calculators.

Re: Introducing myself... and a question on a weird 48G

in response to message #9 by Cristian Arezzini

> Quote:
>
> where it will sit until someone buys them for a few Euros and then tosses them when they can't find the = key

Or reports here their fabulous flea market find!

Do you have serial numbers?

A question: what would be the "right" thing to do if you made a fabulous flea market purchase, and then were informed that you had somebody's hot calcuator (due to a serial number match, say)?

Re: Introducing myself... and a question on a weird 48G

*Message #12 Posted by **Paul Gaster** on 7 Mar 2011, 2:45 p.m.,*
in response to message #11 by Dave Shaffer (Arizona)

I would want to get the calculator, or calculators, back to the rightful owner. I would just feel bad keeping items that really belonged to someone else. If was a great flea market type purchase then I wouldn't be out much money either, so no big loss.

I say watch ebay and craigslist for your calculators. They may show up.

Re: Introducing myself... and a question on a weird 48G

*Message #13 Posted by **Cristian Arezzini** on 7 Mar 2011, 11:51 p.m.,*
in response to message #12 by Paul Gaster

I agree, I would want to give them back. Or, being the original owner, I would be more than willing to pay back what the "new buyer" paid to get them, so that he doesn't loose the money (I would assume he bought in good faith).

Re. Serial numbers: I had them, but they all were on a spreadsheet file... which was on the laptop they stole. I also had a backup on an external hard drive... Guess who has that hard drive, too, now. :(Talk about putting all your eggs in one basket! But I was backing up for possible HD failures, not thefts! Now I have to find a way to backup "off-site" all my photos and other important documents at home, in case someone breaks in and steals my computer AND backups!!!

I will be monitoring eBay, but I really don't think they're the type of people who'd list stuff there. We think they were after the money in the office (there is money here, but they couldn't open the safe), and failing to get the money they blindly ransacked our cabinets.

Interesting book

*Message #1 Posted by **Don Shepherd** on 5 Mar 2011, 3:35 a.m.*

I was looking at the obituary of John Backus, IBM employee who was the principal inventor of FORTRAN. He died in 2007, and his obituary mentioned the "Selective Sequence Electronic Calculator (SSEC)". I google'd that and came across this scanned interesting book about the IBM Watson Laboratory. It provides a general description of this machine, which was programmed to display "see Thomas" upon a certain condition occurring.

Lots of pictures.

A very interesting look at computing's early years.

Edited: 5 Mar 2011, 4:49 a.m.

Re: Interesting book

*Message #2 Posted by **Bill (Smithville, NJ)** on 5 Mar 2011, 7:04 a.m.,*
in response to message #1 by Don Shepherd

Don,

Great find. I'm always interested in the early computing days. There another book on the same site:

Computer - Bit Slices From a Life by Herbert R. J. Grosch

It's too bad these are only in HTML format and not in one of the mobile e-readers formats. They would get a lot larger audience. I just got a Kindle and have loaded it up with many early computing/personal computing books. Currently reading "What the Dormouse Said: How the Sities Counterculture Shaped the Personal Computer History".

I'll have to spend a little more time on the site to see what other books/articles they have on history of computing.

Thanks,

Bill

Pioneer series: scratched display

*Message #1 Posted by **Jim Yohe** on 4 Mar 2011, 8:08 p.m.*

I just received my "first" HP-42S from an eBay seller who, as far as I can tell, photoshopped out all of the scratches in the display from the 10 or so photos displayed in the ad. Clearly buyers were purposely deceived from doctored photos. Fortunately she's agreed to the return plus to pay for all shipping charges.

Now my question ... are scratches on the display something I should be overly concerned about ... from a collecting point of view? Since the scratch appears to be in a thin plastic film (maybe?) over glass is it this something that could be repaired? Or perhaps these displays are not covered by an plastic at all and so my scratches are embedded in the glass.

Re: Pioneer series: scratched display

*Message #2 Posted by **Martin Pinckney** on 4 Mar 2011, 8:36 p.m.,*
in response to message #1 by Jim Yohe

I don't think any Pioneers had glass. AFAIK the early mid- and high-end models had a separate plastic cover with a small gap in between it and the plastic LCD screen, while the low-end and later high-end models had the LCD screen directly exposed to touch.

Edited: 5 Mar 2011, 10:23 a.m. after one or more responses were posted

That auct5ion site taAkes very seriously any deceit. It isn't rare or valuable, demand a refund. Sam

Re: Pioneer series: scratched display

*Message #4 Posted by **Allen** on 4 Mar 2011, 11:17 p.m.,*
in response to message #1 by Jim Yohe

I can clearly see the scratches in photo 8 and a little in photo 5. Since that 42S model is anti-reflective, it's likely that the other perspectives do not show it clearly. (The aluminum bezel scratches are a good guide for where to look on the display.) I agree the seller could have added a few words about the screen scratches, but I see no evidence to suggest the seller photoshoped or culled photos to hide the scratches.

The lower price you paid relative to other 42S from the same seller recently suggest she had already accounted for either the bezel damage/screen damage or both.

I (Ebay ID: hudendai) have no connection the completed sale discussed above or the seller thereof.

Re: Pioneer series: scratched display

*Message #5 Posted by **Randy** on 6 Mar 2011, 10:39 a.m.,*
in response to message #1 by Jim Yohe

FWIW from a what can be done standpoint - it depends on the version of Pioneer.

The original "flat" bezel (my terminology) has a window in front of the LCD and is the same arrangement as the Voyagers that preceded them. The window has a metalized coating, again, same as the Voyagers. The LCD is a glossy, reflective finish. Scratches would obviously be in the outer window only and there is little you could do without damaging the metalization. Replacement of the window is from the back of the faceplate so it would require that the keyboard backing plate be removed which requires removal of all the heat stakes or that the faceplate is peeled off from the front. IMO, I consider neither a viable option so scratches on a flat bezel unit are there for life.

The later "stepped" bezel design exposes the LCD to the user. Any scratches here are on the LCD polarizer directly. These LCD's can swapped out to be rid of the scratches.

FWIW, early 1990 date code Pioneers, soon after the change in mechanical design, had glossy polarizers, I guess they were using up existing stock. Some time in 1990 or 91, they changed to a matte finish LCD to reduce glare. While in theory, you could polish scratches out of a matte LCD, you'll end up with a glossy polarizer. Overall, I've had minimal luck in polishing out scratches in LCD's so in general, while expensive, I recommend outright replacement of the LCD.

in response to message #1 by Eric Smith

Actually, Cricket (the HP-01) had two successors which were the HP-02 and HP-03. The HP-02 had more functions; the HP-03 had a liquid crystal display. Unfortunately, the lack of success of the HP-01 caused the cancellation of the other two before they reached production. Sigh.

Now if only I could remember the latter two code names! Firefly comes to mind for the '03 but I could be very wrong there.

Jim (Still enjoy my '01)

Apparently it is called *meta*-watch.

Re: Finally an HP-02?

*Message #5 Posted by **Howard Owen** on 6 Mar 2011, 10:52 a.m.,*
in response to message #4 by BruceH

I think this is dubious. They want the "integration point" of all your gadgets to live on your wrist. Naturally they are dreaming of displacing smart phones or pads in that role. But the "integration point" is the cloud. All your data is aggregated there, accessible from any device you choose to employ. If Google and others

have their way, that's where apps will live too. The point is, a wristwatch is a horrible platform for running apps, whether web based or local. the display is too small for even something as simple as a phone book, let alone a web browser or a game.

Re: Finally an HP-02?

*Message #6 Posted by **Eric Smith** on 6 Mar 2011, 4:37 p.m.,*
in response to message #5 by Howard Owen

The watch is definitely not suitable for normal apps, but there are some specialized ones I'd like to run on a watch. There have been a few choices for that:

- Seiko RC-20 etc.
- Timex Datalink
- Fossil/Abacus WristPDA (runs PalmOS)
- PCOnHand
- uWatch
- inPulse

I have a 6th gen iPod Nano (multitouch) in a LunaTik watchband, and this would be a great platform for small apps, but Apple doesn't offer an SDK for it. :-(

The inPulse comes closest to what I want, though the display size and resolution are not anywhere near as close to the iPod Nano.

However, I suspect that what HP is trying to push here isn't so much running apps on the watch, as storing data in it for use with all of your other computing devices, as opposed to storing data in the cloud, or on memory cards/sticks. If you wear your watch all the time, it seems like that would be very convenient.

Re: Finally an HP-02?

*Message #7 Posted by **Dave Shaffer (Arizona)** on 7 Mar 2011, 1:17 p.m.,*
in response to message #6 by Eric Smith

> Quote:

> If you wear your watch all the time, it seems like that would be very convenient.

I get the impression that the younger generation no longer wears watches - they've already switched to their cell phone for the time.

Re: Finally an HP-02?

*Message #8 Posted by **Ren** on 16 Mar 2011, 1:50 p.m.,*
in response to message #6 by Eric Smith

I have a Timex Ironman Datalink, I put it in the drawer after 8 or more years, the main plastic button has broken off along with most of the plastic bezel. It was less accurate than my previous Timex and probably my "current" Timex (Expedition w/flux gate compass) as well. The Datalink might only work with CRT's I never tried it with an LCD screen. The data space on the Datalink was under whelming.

Which Calculators Should I Keep?

*Message #1 Posted by **Dave Shaffer (Arizona)** on 3 Mar 2011, 11:16 p.m.*

I recently visited my parents - my Dad is 92 and my Mom will be 90 tomorrow.

We had a nice visit, but I come away appalled at the amount of "stuff" they have, nearly filling their house. There is scarcely room to sit on their couch, the dining room table is unusable, the floor is covered with books and magazines, and the "guest bedroom" is overwhelmed with my Dad's art equipment and materials. There are even some HP calculators in there, too: at least a 32S and a 97S in pretty good condition, and maybe even an original 35 somewhere. (My Dad is a retired mechanical engineer, which explains the calculators.)

Now that I am home, amidst my own stuff, I am verging on being appalled at how much of it I have, too. Therefore, I am contemplating a de-acquisitioning mode.

This brings up the question of which HP calculators I should keep. Although getting rid of a few would not really help the volume-of-junk problem, they would be among the easiest and most lucrative items to auction off. I could use the money gained thereby to buy another camera lens or two (hmmm, this may not be converging!).

What do I have? Well, the list includes a 35, an 11C, a 41C and a 41CX, a 32S, a 42S, a 48GX, a 33S, and a 35s. The 35, 11C, and 41CX have to stay for sentimental reasons. The 33S sits by the bed, for those last-minute-of-the-day brainstorms, and the 35s is my current everyday calc and lives on my desktop. I don't really have any need for the 32S, the 42S, or the 48GX (and, I can borrow a 32S from my wife if necessary). All are in very good condition, except the 35 and 11C, which work fine, but show signs of lots of use.

What are your thoughts on getting rid of some of these? Will I regret it later? I doubt it. I am retired and unlikely to ever need them for any kind of work. Unlike some here, I don’t feel any particular compulsion to have one of every calc that HP has ever made.

I know there are many here who would like to have some of these, so you may soon get your chance.

Dave,

My son Joey whom you met will be in Flagstaff next week for a visit. Maybe he should stop by and you can give him the machines that you think you can live without. Hang on to the 41CX because this model is a beauty. The rest ... give it to Joey!

:-)

Namir

PS: Things happen for a reason ... and Joey's visit to Flagstaff has a reason too! <grin>

Well, obviously you are not a collector, just a practical user. I too am a retired engineer, however, I am also a collector of some of the older more vintage HP models as well as many non-HP calcs, so I don't have a desire to de-acquire, except in certain cases of excessive redundancy. I recently sold two of my HP-45 sets, but still have 8, including 7 complete sets, so I can't say that I've really de-acquired that much. I am also a pack rat like your parents, but I don't regard that as any great sin. One of my spare bedrooms is called the DOS Room, because it's home to 6 bulky DOS PC's that have no practical purpose, and I usually fire up periodically to play old DOS based games. I guess if I were in your position I'd get rid of some of the newer models like the HP-33s, which is functionally identical to the HP-35s. Also, and HP-41C is redundant if you have an HP-41CX, which is far more capable. As far as regretting it later, well, I think you'll always be able to re-acquire, buy maybe the cost will be higher.

Dave,

I think you have answered your own question :-) Keep the 35, 11C, 41CX for sentimental/collector reasons, and the 33s/35s for daily use. Ditch the rest I say !!

I had a cull a couple of years ago, I ditched all non-cardreader LED calcs, all 71b stuff I had, and even most of the HP-IL peripherals (a PIL box is a good replacement). I certainly have not regretted any of that !!

What that left me with are several 65/67 units (just for fun), numerous 41c/cv/cx units (for sentimental reasons and daily use, and cool new stuff like PIL box and Clonix) and voyagers 11, 15, 16 and even the 12 (because they are just so darn rugged), although being an engineer, I am not sure why I have the 12 as well. I do still have a 32s and a 42s, but I have no idea why !! And lastly, a 35s, which I keep at work, just in case it gets stolen, I'd rather that get stolen than a 41 or a voyager.

Cheers, John

I concur, though that won't be my personal selection (I'd ditch the 33s and 35s and keep the 32S and 42s - but its your choice). And - as you mentioned yourself - it isn't really a big step towards a clean home if balanced by some additional lenses ;-)

Hi Dave,

I think you answered your own question.

32S, the 42S, or the 48GX . I am starting to think that I was stupid not to ditch my 48 series machines back in the 49G+ days, when the 48gx was worth a lot more...now that the 50G exists, the value has fallen a lot on all except the survey cards (which are worth far more than the calculator).

Conservatively, that is $70, $175, $90. Of course the 42S might fetch a lot more given the right accessories (box etc) description and timing.

Clutter is our natural state of being. Our ancestors figured out long ago that barring circumstances requiring movement (e.g. Toureg)we hunted and gathered....

Best regards,

Bill

I share your thinking. I'm only 43, my wife and I (and kid off to college) share a large home with large rooms more optimized for stuff than people; and we have a lot of stuff. Too much stuff. Fortunately, it is mostly organized and it doesn't appear that we have a lot of stuff. But at our young age, we could double our stuff.

We started downsizing last summer. It's a slow, ongoing process, to reduce.

I've started asking myself if I have extracted enough joy out of my calculator collection. And I think I have. I do not program them anymore for fun, or write much about them. It is a lot of work and I have other interests too. And it does take up space. If I lost them all to fire or theft, would I replace them? No, except one, a 15C. My original 15C is still going strong. It would be the one that I could not part with. With some fresh batteries and a few good textbooks I can rebuild civilization after it collapses at the end of 2012. :-)

Dave, interesting post that's got me thinking about my own situation.

If you decide to keep the 33s or 35s then you keep either the 32s or 42s so that you can use the latter to check the results of the former. :-(

Good luck,

John

Sad, but true. Some years ago, when checking the HP-12C Platinum with my trigonometric functions program upon the 33s, I found discrepancies in the tangent function near 90 degrees. I thought my program was flawed... until I decided to test it against the good old HP-32SII...

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103065#103065 (messages #8 through #28)

Later Karl Schneider made an analysis of this bug and presented other findings:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103989

Sadly the HP-35s has inherited the bugs and they are still there after all these years.

Regards,

Gerson.

I calculated Tan (89.999999999) on both my HP 35s and HP 32SII and got the same result of 57,295,779,513.1 even though they do differ with fewer decimal digits. For example Tan (89.999999):

HP 35s = 57,295,787.7856

HP 32SII = 57,295,779.5131

HP 15C = 57,295,779.51

HP 41CV = 57,295,779.51

HP 50g = 57,295,779.5131

HP 32E = 57,295,779.51

Curious.

Edited: 4 Mar 2011, 10:50 p.m.

89,999999 TAN

*Message #15 Posted by **Walter B** on 5 Mar 2011, 5:50 a.m.,*
in response to message #14 by Michael de Estrada

And the HP 42S and 20b return 57.295.779,5131 as well.

So does WP-34s :-)

```
57,295,787.7856                                                    [hp 33s]
57,295,779.5131                                                    [HP-42S]
57,295,779.51308232          (57,295,779.5131 on the display)  [WP-34s]
57,295,779.513082315299140 91  (57,295,779.5131 on the display)  [Free42 Decimal 1.4.62]
57,295,779.513082315059033981499673                                [Windows calculator]
57,295,779.513082315059033981499673129107282150664783050 6       [WolframAlpha, input line: tan(89.999999
degrees)]
```

Re: 89,999999 TAN

*Message #17 Posted by **Michael de Estrada** on 5 Mar 2011, 12:00 p.m.,*
in response to message #16 by Gerson W. Barbosa

Also:

HP 27 - Tan(89.999999) = 57,295,779.51

HP 29C - Tan(89.999999) = 57,295,779.51

However:

HP 25 - Tan(89.999999) = 58,363,500.16

HP 21 - Tan(89.999999) = 58,363,500.16

So the Woodstocks used different algorithms in different models.

Then:

HP 67 - Tan(89.999999) = 57,295,779.51

HP 91 - Tan(89.999999) = 57,295,779.51

So fairly early on HP had proper algorithms.

Re: 89,999999 TAN

*Message #18 Posted by **Eric Smith** on 5 Mar 2011, 3:13 p.m.,*
in response to message #17 by Michael de Estrada

HP-21/22/25/25C used algorithms closer to the classic series. HP-27/19C/29C/67/97 used improved algorithms; part of that was carrying intermediate results to 13 digits. See the HP Journal article "The New Accuracy: Making 2^3=8" by Dennis Harms, November 1976.

Re: 89,999999 TAN

*Message #19 Posted by **Michael de Estrada** on 5 Mar 2011, 5:48 p.m.,*
in response to message #18 by Eric Smith

Well, the HP-22 does not have trig functions, but I assume you are referring to other functions such as logarithms. Anyways, the problem here is not so much with the digits used, but with the algorithm used when a function approaches a discontinuity.

Re: 89,999999 TAN

*Message #20 Posted by **Eric Smith** on 5 Mar 2011, 6:55 p.m.,*
in response to message #19 by Michael de Estrada

I'm pretty sure the problem here **IS** a result of not enough digits used in the intermediate calculations; that's exactly what you need more of as you approach the discontinuity.

*Message #23 Posted by **Marcus von Cube, Germany** on 5 Mar 2011, 12:22 p.m.,*
in response to message #16 by Gerson W. Barbosa

The best I could get so far is Derive. I can't tell if the digits are all correct but they agree to what Alpha has returned:

If I set the precision to 100 digits and enter tan(89.999999°) I get:

5.729577951308231505903398149967312910728215066478305068762520082189827157958993840731226709890277654·10^7

(Underlining by me. In fact I have to use the "approximate" button, otherwise, just the expression is returned.)

As a comparison, Alpha returns: 57,295,779.513082315059033981499673129107282150664783050 6

Quite good are the double precision Sharp BASIC computers. My PC-1280 returns 12 significant digits after the decimal point which are all correct:

57295779.513082315059

Most of my Casios and TIs return 4 to 5 correct digits after the decimal point. The worst I could find is the ClassPad 300 with OS 3: 57295754.96 is way off (even the integer part has only 6 correct digits!)

Edited: 5 Mar 2011, 12:52 p.m.

Re: 89,999999 TAN

*Message #24 Posted by **Gerson W. Barbosa** on 5 Mar 2011, 1:05 p.m.,*
in response to message #23 by Marcus von Cube, Germany

Ask WolframAlpha for more digits twice to get

```
5.729577951308231505903398149967312910728215066478305068762520082189827157958993840731226709890277654711972391762398275578625656376921104805563273741214034175570805889095630942752778232728701844110860750074115361494293916630014... × 10^7
```

The underlined digits agree with what you got with Derive. I think I'll stop here lest WolframAlpha crashes :-)

The HP-35 result matches the ones reported by Michael for the HP-21 and HP-25.

> Honestly, I never understood what this hunt for obscure „bugs“ (who ever needed the tangent of 89,999999 in real life anyway?) was all about.

Actually, this bug was never hunted for. It simply popped out, not in a lifelike situation, I recognize, but when using the 33s to test a program.

> Quote:
>
> If I wanted to send out a space probe to rendez-vous with a comet 6 or 7 years after launch, I would hardly use a pocket calculator to do the maths, would I?

C++ won't do any better, at least the version I've been using:

```
#include <stdio.h>
#include <stdlib.h>
#include <math.h>

int main(int argc, char *argv[])
{
  double x;
  x = tan(89.999999*M_PI/180);
  printf(" x =  %.9f\n\n",x);
  system("PAUSE");
  return 0;
}
```

returns

```
 x =  57295779.814456776

Pressione qualquer tecla para continuar. . .
```

Also, Excel 2007 [=TAN(89.999999*PI()/180)] returns 57295779.8143678. Perhaps because 89.999999 has not an exact representation in binary float point. If greater accuracy is important, I would suggest TurboBCD and these functions, which give 17-digit accuracy (57295779.5130823149 for this example).

Regards,

Gerson.

*Message #30 Posted by **Eric Smith** on 5 Mar 2011, 3:19 p.m.,*
in response to message #26 by Maximilian Hohmann

If a transcendental function on a calculator only gives five significant digits correct for some arguments, what confidence will you have that it gives any better results for other arguments?

What this shows is that the TI-59 didn't use a good algorithm for range reduction on trig functions. In particular, they apparently used a poor approximation of pi.

Range reduction is very tricky to do well. There's an entire chapter of Muller's "Elementary Functions: Algorithms and Implementation" devoted to an overview of range reduction algorithms.

There is a strong case to be made that when it is known that the range reduction cannot be done accurately for arguments outside a particular range, the function should return an error instead of a value with few or no significant digits. This is obviously appropriate for sin/cos/tan for arguments of magnitude >10^10 on a ten-digit calculator, because you effectively have no significant digits. It is less obvious where the cutoff should be for tangents of angles near 90 degrees.

*Message #31 Posted by **Dave Shaffer (Arizona)** on 6 Mar 2011, 11:58 p.m.,*
in response to message #26 by Maximilian Hohmann

> Quote:
>
> And this is really the only application I can imagine where this kind of precisuion is required.

The NASA program I used to help support is now shooting for sub-mm accuracy for whole Earth geodesy. For an Earth radius of around 6370 km, that requires better than parts in 1e10 accuracy and precision. I don't know what computers or compilers they use now, but in the "olden" days (i.e. 15 years ago), it was all quadruple-precision Fortran (on HP minicomputers!). There are oodles of trig calculations involved, so once in a while one might wind up needing a tangent in the vicinity of 89.99999.... (although, of course, it's all done in radians).

PS - thanks to all for the various suggestions on which calcs to use/keep/sell. I am firmer in my intent to unload my

42S and 48GX. I will play with the 32S (it's actually a 32SII) for a while, to see how it compares with the 33S and 35s. I know, that may be blasphemy to imply that the two newer ones are better, but I certainly am more used to them.

Re: 89,999999 TAN

*Message #32 Posted by **Michael de Estrada** on 7 Mar 2011, 12:46 a.m.,*
in response to message #31 by Dave Shaffer (Arizona)

Once you start using your HP-32SII, you'll get rid of the HP-33s and HP-35s. It's much more solid with much better keys and display. It has basically the same capabilities, except for the 1-line display, which I actually prefer. The number digits are much bigger and bolder, and I really don't need to see the y-stack value all the time when I can just hit x<>y as needed to view two-variable results. And its not buggy to boot.

This is why I hang on to my 32sii, 22s, and 14b. Because someday my eyes will be too weak for my 42s, 27s, 17b.

Most of the modern HP scientific calcs are lousy

*Message #34 Posted by **Michael de Estrada** on 7 Mar 2011, 10:59 a.m.,*
in response to message #33 by Martin Pinckney

The current line of HP scientific calcs is very unimpressive in comparison with the older now discontinued models. In fact, the only current model that I use with regularity is my HP-50g, which has very good keys and display and is very solid feeling. Also, it is based on the old RPL line of calcs that were designed by HP. Sure, the HP-48gII is also a good calc, but it is obsoleted by the HP-50g, so I'd keep it if I already owned one, but wouldn't buy one today. Otherwise, I would not keep or purchase any of the other models currently offered. In fact, I have removed the batteries from my HP-33s and will stop using my HP-35s when its batteries expire, although I hardly ever use it anyways, preferring my HP-15c and HP-32SII instead. Being an RPNer, I have no interest in the algebraic entry models anyway, which comprise half of the current scientific line.

Dave, having read about eBay fees recently and taking into account the fellowship of the 42s here, I'd suggest you offer your surplus HP stuff to the forum members first (in the classified section.)

Re: 89,999999 TAN (Sub Millimeter?)
*Message #37 Posted by **Stuart Sprott** on 7 Mar 2011, 5:32 a.m.,*
in response to message #31 by Dave Shaffer (Arizona)

Dave,

Are sure about the sub millimeter precision for Earth Geodesy?

I am a Surveyor and I find that hard to believe. With contential drift and earth tides involved it is hard to see the accuracy getting much better than +- 10 cm.

Re: 89,999999 TAN (Sub Millimeter?)
*Message #38 Posted by **robert rozee** on 7 Mar 2011, 6:49 a.m.,*
in response to message #37 by Stuart Sprott

when i worked for trimble navigation, our "holy grail" was sub-centimetre accuracy, which is only an order of 10 different. achieving sub-millimetre would certainly throw up an interesting set of new issues - you might end up having to factor in current moon location and a load of continental drift data into the mapping info!

Re: 89,999999 TAN (Sub Millimeter?)
*Message #39 Posted by **Dave Shaffer (Arizona)** on 7 Mar 2011, 1:06 p.m.,*
in response to message #37 by Stuart Sprott

Stuart,

Oh Yes, I am serious!

See this . Look at Bill's first bullet.

Station positions are now routinely measured at sub-cm levels in single 24-hours experiments, and continental drift (properly called "plate tectonics") is measured for all of our geodetic sites, at levels better than 0.1mm/year for data series with 10 years or more.

This kind if accuracy requires and takes into account all sorts of things that you don't normally think about:

plate tectonics - actually, measuring this is one of the goals

earth orientation (the earth wobbles badly as it rotates, partially due to excitation from earthquakes),

changes in the rotation rate of the earth (the earth slows down and speeds up at the microsecond level every day; we can sometimes tell ahead of time that an El Nino is coming: the warming Paficic Ocean waters expand, changing the moment of inertia of the earth and therefore, due to conservation of angular momemtum, the rotation rate of the earth - just like a figure skater changes her spin rate when she pulls in her arms) There is also a seasonal rate effect: there is more land mass in the northern hemisphere - when it snows in the northern winter, the snow accumulates, changing the net distibution of water (moment of inertia), and the rotation rate changes systematically,

ocean loading - when the tide comes in, the weight of the water depresses the land for sites "near" (100s of km!) the ocean,

tidal motion - there are solid earth tides (as you note), just like the water tides. These are, I think, on the order of tens of centimeters, twice a day. By measuring them, you get some idea of the bulk response of the earth to gravity (of the Sun and Moon) - the Love coefficients.

There are all sorts of results that you get, too, besides the obvious ones (like tectonic rates): we are measuring the rebound of the earth in Scandinavia after the last Ice Age - the weight of the ice depressed the underlying rock, which is now slowly (! 1 mm per year-ish) springing back to its original shape. We get a fairly good handle (from the earth orientation effects) on the shape and differential rotation of the earth's inner core (it is NOT spinning at the same rate as the outer earth!).

Do a google/yahoo search on "VLBI (or satellite or GPS) geodesy" for more. (VLBI = Very Long Baseline (radio) Interferometry, which is done with hydrogen maser time standards, whose mid-term (a few minutes) time stability is good to parts in 1e14. The relative time of arrival of radio signals at multiple radio telescopes spread out all over the earth is easily determined at the picosecond level. Light (and radio waves) travel 0.3 mm in one picosecond.

Keep in mind that the 42S and 48GX in your list of potential disposables have built-in IR printer output and BEEP/TONE functions. I find that a calculator's ability to make noise (audio or printer feed) can be a very useful user input prompt that I really miss when running a program on grossly less capable machines like the HP-11C, 32SII, 33S, or 35S. The 23-year-old HP 42S is almost universally acknowledged as still the best RPN calculator that has ever been made by anyone, anywhere, anytime.

If you had in fact owned a HP 32S, rather than the very common HP 32SII, that would have been valuable to collectors as a somewhat hard-to-find machine.

*Message #44 Posted by **Thomas Okken** on 6 Mar 2011, 5:49 p.m.,*
in response to message #43 by Gerson W. Barbosa

Gerson, I appreciate that, but it looks like a design oversight in the BCD20 COS routine; the trigs and logs in that code works using Taylor series approximations with fixed maximum numbers of terms, but in the case of COS approaching zero, that maximum number of terms is insufficient. The code should either calculate additional terms, or, preferably, use trigonometric equalities to stay away from those difficult arguments.

- Thomas

You're right, the latter might be a better option. Once I had a problem with acos(x). I was advised to use another trigonometric identity, which eventually fixed the problem:

in response to message #46 by Paul Dale

Hi Pauli,

Re: decNumber: where can I find that?
I'm not in a rush to replace the BCD20 code (it performs well and seems pretty mature by now; fixing COS would probably be a lot less work than ripping all the floating point code out of Free42 and replacing it) but still, I would like to take a look at it. Are you distributing it under a GPLv2-compatible license?

Thanks,

- Thomas

Re: 89,999999 TAN

*Message #48 Posted by **Paul Dale** on 7 Mar 2011, 1:18 a.m.,*
in response to message #47 by Thomas Okken

The decNumber library is available from Mike Cowlishaw's page. This only includes basic arithmetic and a few important transcendental functions.

My additional code is on the WP34s Sourceforge page -- in the subversion repository. Look at decn.{c,h} and complex.{c,h} initially.

There are C++ bindings I believe but I've used only the C ones. Also, gcc is starting to support decimal floating point types natively.

> Slide rules were all there was!

As an undergraduate in the late 1940's we used slide rules if two to three digits were enough. We used books of log tables if we wanted five or six digits.

As a graduate student in 1959-1960 I had access to Fridens, and if I could justify it (unlikely for a lowly graduate student) to a RemRand 1103.

When I started working on inertial navigation systems in 1960 we did much of our work with Fridens. For transcendental functions we used tables or series expansions.

In 1968 I learned how to use the Honeywell Computer Network (HCN, a timeshare network) based on a sixteen bit DDP-516 which offered double precision for everything if I wanted it. Input and output was with a teletype. My slide rule and my log tables went into my desk drawer and I rarely used a Friden anymore.

By 1970 or so I had access to a Sigma 5 but rarely used it as I could only used batch processing with IBM card input.

HP 15C Water Damage?

*Message #1 Posted by **BDee** on 3 Mar 2011, 5:35 a.m.*

Hi all, I was careless and spilled some water that I was drinking onto my calculator keyboard. I didn't think anything actually got in, until I noticed that the buttons weren't responding quite right and the calculator took multiple presses to register values and power off. At this point, I removed the batteries from the back and let my machine sit for awhile.

After three days I placed the batteries back in. With batts in, the calculator powered itself on and attempted to display all of the symbols on the screen (like the self-test). However it wasn't able to display an entire "8" and the calculator did not function.

I have since removed the batteries, and I'm letting it sit for awhile more. Is my calculator junked? How should I go about fixing it?

Re: HP 15C Water Damage?

*Message #2 Posted by **aj04062** on 3 Mar 2011, 6:57 a.m.,*
in response to message #1 by BDee

I'd suggest taking the back off to allow complete drying in the sun or in front of a fan.

It's pretty simple and instructions are readily available on the web.

Re: HP 15C Water Damage?

*Message #3 Posted by **Artur-Brazil** on 3 Mar 2011, 7:04 a.m.,*
in response to message #2 by aj04062

Yes, you must open the calculator and put it in Sun light, but take care do not expose for a long time and take care of LCD display!!!

Re: HP 15C Water Damage?

*Message #4 Posted by **db (martinez, ca.)** on 3 Mar 2011, 10:36 a.m.,*
in response to message #1 by BDee

As i am sure you know: water does not damage calculator electronics. It is the conductive impurities, dust and whatnot that will bridge gaps etc. That was good instinct when you removed the batteries. Do what aj and Artur said. If there is still a problem after it is completely dry, you might disassemble it again and soak/flush/rinse it several times with distilled water. Then completely dry it again. Alcohol is a bad idea in this case because it can etch the screen.

Then try putting the calc in a container of uncooked rice to dry it out.

*Message #5 Posted by **tim m.** on 6 Mar 2011, 12:29 a.m.,*

Very impressive aucton on TAS

*Message #1 Posted by **Namir** on 2 Mar 2011, 9:45 a.m.*

The auction 260746120739 on TAS is for an HP19BII with a spiral-bound manual. The Australian seller has an impressive video (includes background music) video that shows the machine. The video is not short and has some professional video effects. I was very impressed by that auction.

in response to message #1 by Namir

Wow, that is pretty cool. Seems there is a lot to like about that model. Does it have a "demo mode" that he used in showing its capabilities, and is it preset by HP or can you make your own "demo"?

Isn't this the series with the faulty battery door?

Re: Very impressive aucton on TAS

*Message #3 Posted by **Mike Morrow** on 2 Mar 2011, 10:41 a.m.,*
in response to message #2 by Don Shepherd

> Quote:
>
> Isn't this the series with the faulty battery door?

Yes, indeed. The example shown in the auction video has the characteristic damaged battery port. You can see something wrong throughout the video, then around minute 5:00 as the calculator is rotated, the damaged corners of the battery port become very obvious. My 2830Axxxxx HP 28S has identical damage, while my (much lesser used) 2707Axxxxx HP 28C is still OK. Great HP so-called "good old days" design again!

The HP 19BII wasn't all that great as a financial calculator either, IMO. But I agree with Namir...this is the best auction presentation that I've seen in almost 15 years of ebay tracking.

HP Clamshells...hate 'em!

in response to message #14 by Keith Midson

> Quote:
>
> A great and cheap battery door donor!

Warning: Replacing a missing door on a Clamshell model doesn't solve the problem of the battery port opening itself breaking, especially at the upper corners. When that happens, the probability increases that the replacement door will soon go missing. Plus, the calculator itself is then permanently disfigured.

The whole design of the Clamshell battery holder system is very marginal. My HP 28S broke not during the act of replacing batteries, but due simply to the static pressure of the installed N-cells on the door and thus on the door retaining structure of the battery port. I looked at my 28S one day after a few months of non-use, and found the damage had taken place while the 28S was just sitting in a drawer.

Lesson learned: Never store an intact Clamshell with batteries installed.

Re: Very impressive aucton on TAS

*Message #16 Posted by **Keith Midson** on 2 Mar 2011, 8:39 p.m.,*
in response to message #15 by Mike Morrow

Yes the wonderful clamshell door design. I have a few 28S's, 28C's, 18C's, 19B's and 19Bii's in my collection. The battery door is the biggest downside to the calculator. I do have one 19Bii with the newer back door version - it's a pity they never implemented this on the 28S, which is personally one of my favourites.
I have a few interesting 28S's in my collection - a clear cased 28S (which I will post photos of sometime), a 100th anniversary edition, and one made in Indonesia in 1997 (well after the production run had finished). Fortunately I have a few that I don't put batteries in that are in 'like new' condition.
Cheers, Keith

> Lesson learned: Never store an intact Clamshell with batteries installed.

I obtained my HP-28S 100th Aniversary Model S/N 2801A04702 for two dolllars at a garage sale back in 2001. It had the damage to the case near the battery door. I have not experienced the problem you describe with this unit. The previous owner had told me of the possibility of losing memory if I fumbled a bit during battery replacement. I practiced replacing the cells and convinced myself that I could always buy some time before losing memory by touching the contacts on the battery door to the installed cells. But, when I needed to change the cells one of them became stuck partway out of the unit. No hope of touching the contacts on the door to the cells, and a complete loss of memory resulted.

I obtained my HP-19BII S/N 74300778 for five dollars at a church rummage sale in early 2010. It came with a mint condition manual, but not spiral bound. There is no damage near the battery door. I have not experienced the problem you describe with this unit either.

I am not sure how much damage we are talking about. The amount I have on my 28S doesn't seem to make cell replacement any more difficult than it is with my undamaged 19BII. But, the Rube Goldberg mechanization is difficult to work with in any case, broken case or not.

Hp 50g multi-page INFORM

*Message #1 Posted by **Erturk Kocalar** on 1 Mar 2011, 9:43 p.m.*

Hi,

I'm new to hp 50g user rpl programming.

I'm trying to make a multi-page input form similar to the mode page on 50g; ie it has other pages for cas and display settings. I want to combine all the results into one list afterwards.

Any pointers/help would be appreciated.

Thanks, Erturk

Re: Hp 50g multi-page INFORM

*Message #2 Posted by **Tim Wessman** on 1 Mar 2011, 10:23 p.m.,*
in response to message #1 by Erturk Kocalar

Those are actually separate informs. When you press the menu key, it builds a new page. When you return, it saves any changes.

You really can only do this with sysRPL and it isn't a trivial task.

TW

Re: Hp 50g multi-page INFORM

*Message #3 Posted by **Erturk Kocalar** on 2 Mar 2011, 9:58 p.m.,*

http://www.hpcalc.org/details.php?id=3258

That program will allow easy creation of inform boxes (source code needing to be compiled) on the unit itself.

To actually do the compiling, you will need to learn a lot more regarding sysRPL. The "bible" for that is here: http://www.hpcalc.org/details.php?id=5144

Chapter 35 is all about input forms.

Honestly though, if you are just starting with userRPL, I'd rethink your interface a bit to work with the tools presented there. Once you have it working, you can move into sysRPL and make more advanced interfaces if desired.

TW

*Message #5 Posted by **Erturk Kocalar** on 3 Mar 2011, 12:24 a.m.,*
in response to message #4 by Tim Wessman

Hi Tim,

I meant if it is possible to implement what the 'mode' page does using user RPL.

I agree, learning system RPL is not the right step for now.

thanks, erturk

New Crash Recovery Function for NoV-64.

*Message #1 Posted by **Diego Diaz** on 1 Mar 2011, 2:24 a.m.*

Hi all,

Notes on NoV-64 Crash Recovery Function (CRF)

Introduction:

One of the most annoying situations any user has to face when working with HP-41 systems is a crash.

Namely the calculator becomes irresposive to keystrokes and, quite often, it cannot be set back into normal operating condition by merely power cycling.

If the crash involves some "ill" M-code, and if such "illness" afects the polling points area, then the situation can be called a "severe crash".

Up to now, when the above scenario arises, user must wipe his/her memory contents to regain control of the HP-41. With subsequent loss of work and time.

Real HEPAX erases its memory as soon as it was unplugged. NoV's, due to its non-volatile memory, keep their data even when disconnected. To help erasing the whole memory contents, some specific programs were built in order to help in case of "severe crash". The programs are called CLR_RAMx.HEX; being x: 1, 2 or 4 depending on the device they're intended for: 1 for NoVRAM, 2 for NoV-32 and 4 for NoV-64.

A compromise "solution", certainly effective but not very elegant. And it requires reprogramming the NoV module twice.

New CRF for NoV-64:

Considering the amount of time required to write a 4K ROM, the idea of developing a method to recover from a severe crash without the need of erasing the whole memory was certainly quite appealing.

The CRF method takes advantage of the "Reset" feature of the HP-41.

With calculator OFF and NoV-64 inserted, hold down ENTER key while pressing ON twice in quick sucession.

Your calculator will turn ON, HEPAX will be re-allocated into page #C temporarily. All HEPAX functions will be accessible. RAM will be read-disabled, (thus avoiding any polling-point conflicts), but write-enabled, so you can HEXEDIT, and erase any/all xFF4-xFFA contents, while keeping the rest of your work safe.

Note that the control word at H'4100 allows you to select the RAM chip you're gonna work with. Just keep in mind that since HEPAX is temporarily allocated into page #C, you should only select control words H'000, H'001, H'002 and H'003.

Once you've cleaned the offending areas, you can power cycle your HP-41 normally, the system will get back to life and you can get back to work on your favourite program(s).

The link to download the new code for NoV-64 including the CRF functionality is here.

Replace the NoV-64-H.asm file in your working directory. (Keep the previous file in a safe place since this utility should be considered preliminary)

RAM shadowing feature:

Along with the CRF, this new release of NoV-64-H.asm includes the RAM shadowing in a CY-fashion. So when you plug a physical module into your HP-41, RAM pages (if any) at the module's addressing space will become hidden until the module is removed.

Note that the RAM contents will be preserved but, as usual, HEPAX file system may be affected (broken chain) if the module is inserted without removing its addresses from the HEPAX file system's chain.

Enjoy your HP-41's

Best wishes from the Canary Islands.

Diego.

PS. Regarding the RAM shadowing, I've tested almost every single module without any problem, except for the PLOTTER, which seems to also attempts to shadow itself, therefore creating a conflict. Will someone please confirm PLOTTER module behavior on a real HP-41CY?.

*Message #6 Posted by **Ángel Martin** on 2 Mar 2011, 8:57 a.m.,*
in response to message #1 by Diego Diaz

Hola Diego,

This is good news indeed, thanks for making all this possible.

I was wondering whether the "RAM shadowing" functionality will be available for other modules besides the NoV64. Is there any technical reason that stops it from working on, say a NoVRAM?

Saludos, Ángel

Re: New Crash Recovery Function for NoV-64.

*Message #7 Posted by **Diego Diaz** on 2 Mar 2011, 12:43 p.m.,*
in response to message #6 by Ángel Martin

Hi Ángel,

And thanks for your kind words.

To your question, I'm working to add these new features (CRF and RAM shadow) to the NoVRAM and NoV-32 code.

It will take a while though, because the ROM available area for internal code in these previous modules is just one half of the available space in NoV-64.

This is the "technical reason" why it has been 'easier' to implement in the NoV-64.

Will post here as soon as the updates become available.

Best from Spain.

Diego.

HP-41CV Display

*Message #1 Posted by **aj04062** on 28 Feb 2011, 10:41 p.m.*

I just got a CV that seems to be acting funny.

When I first put the batteries in, it didn't seem to come on unless I would reset [on] <=.

Then after repeatedly pressing on it now seems to be alive.

What would cause the display to light up 1/2 a second after pressing on? Is this normal? The CX I have doesn't seem to have this lag.

Also, as I ever so slightly press the on-user-prgm-alpha buttons, the LCD will fade in and out.

Re: HP-41CV Display

*Message #2 Posted by **Diego Diaz** on 1 Mar 2011, 9:29 a.m.,*
in response to message #1 by aj04062

Hi there,

I'll assume this is a Coconut, as the symptoms are quite likely to come from a bad CPU to keyboard connection: contact strip failure or broken post are common sources for this sort of (somehow) weird behaviors.

Hope this helps.

Diego.

HP Line is Getting Kind of Stale

*Message #1 Posted by **Jeff** on 28 Feb 2011, 1:07 p.m.*

It was couple of years ago that HP announced a new financial calculator and some ugly home office units.

Not much has happened since.

Doesn't anyone know if they plan of releasing some new products soon? I'd say it's about time.

Re: HP Line is Getting Kind of Stale

>
> Not much has happened since.

Are you familiar with the HP 30b?

Last year's 30b is, IMO, one of the most exciting HP calculators to appear in a very long time. Sure, it's a "financial" calculator, but it has more scientific functions than earlier HP financial calculators and is ten times faster than the HP 50G. It has the best mechanical presentation (again, IMO) for a handheld unit since the Woodstocks. I have little use for financial functions, but the 30b is worth carrying even for purely scientific or engineering use.

I do agree that HP seems to have over-played the financial calculator market sphere. Many here agree that a good "scientific" programable that breaks out of the 32SII/33S/35S paradigm of pure mediocrity would be most welcome.

Re: HP Line is Getting Kind of Stale

*Message #27 Posted by **Marcus von Cube, Germany** on 2 Mar 2011, 11:46 a.m.,*
in response to message #26 by Mike Morrow

You know there is some work on it going on? Not directly by HP but since the 20b/30b are open platforms, it's mostly a matter of software.

Re: HP Line is Getting Kind of Stale

*Message #28 Posted by **Mike Morrow** on 2 Mar 2011, 1:39 p.m.,*
in response to message #27 by Marcus von Cube, Germany

I praise the intellectual and technical challenge of "re-firmwaring" items like the 30b, but the hardware limitations of the associated ARM, especially its RAM and display control, make it impossible to make a very capable scientific programmable calculator from the 30b. Plus, maybe it's just me, but I would not want a scientific calculator whose keys are all labeled for financial functions.

Re: HP Line is Getting Kind of Stale

*Message #29 Posted by **Martin Pinckney** on 2 Mar 2011, 4:13 p.m.,*
in response to message #28 by Mike Morrow

Agreed, key labeling would be an issue for me.

Re: HP Line is Getting Kind of Stale

*Message #30 Posted by **Walter B** on 2 Mar 2011, 4:52 p.m.,*
in response to message #28 by Mike Morrow

Mike,

> Quote:

We all know - and it was discussed here at length - the display of the 20/30b being far from what we'd wish, but that's the hardware we've got. Though I agree on your statement, we are working on making at least a capable scientific programmable RPN calculator from the 30b. If and when we succeed doing so, I'll lean back for some hours and will watch what else will come d:-)

> Quote:
>
> ... I would not want a scientific calculator whose keys are all labeled for financial functions.

Nor do I - and we'll find a solution.

34s challenge...

*Message #31 Posted by **gene wright** on 2 Mar 2011, 5:42 p.m.,*
in response to message #30 by Walter B

Walter, et al.

How about setting a challenge date of the HHC 2011 conference in late september to get this running on real hardware?

Be a great push and celebration to go along with many other great things happening this year... the 41CL, the update to the MLDL, etc.

I could try to come up with a prize to the member of the 34s team who makes it happen who happens to be at HHC 2011!

Re: 34s challenge...

*Message #32 Posted by **Walter B** on 3 Mar 2011, 9:22 a.m.,*
in response to message #31 by gene wright

Gene,

very nice idea :-) but IMHO you did neglect two points:

1. The progress in this matter is not determined by a lack of motivation but by the lack

of appropriate resources. This crucial point was mentioned here and on last HHC more than once.
2. Almost any prize I can imagine will not cover the travel expenses one of us will need going to San Diego (very nice city, BTW) just for the HHC.

Please remember also this is a project we pursue in our spare time.

All this is well known (or could be at least by mere reading and a tiny bit of thinking). Seems, however, there's a big gap between wishing good luck and doing something helpful in a sustainable way. Luckily, we have succeeded gaining another temporary freelancer (increasing our headcount by 50%) recently, willing to help and contributing the necessary expertise. There's a good chance for progress in this matter now - may there be a prize or not.

As soon as we have a wp34s prototype and we may need some marketing support, we'll most probably turn to the international experts in this matter - we know where the best marketeers live ;-)

Disclaimer (necessary as I know the audience): The above is just my humble opinion based on my individual experience so far. No personal offense intended. And of course only the German original text is binding ;-)

Re: 34s challenge...

My lack of progress on the 20B and 12C hacking is not due to toolchain and/or hardware issues. It's more a matter of being lazy. (Well, newlib's monster sprintf() isn't encouraging, either...)

Re: 34s challenge...

*Message #34 Posted by **Paul Dale** on 4 Mar 2011, 1:05 a.m.,*
in response to message #33 by Scott Newell

There are smaller options available. Grab uClibc, it has a fairly complete but small implementation. uClinux includes an even small version in lib/libc from memory. There are others....

41c repair

*Message #1 Posted by **Paul Dale** on 27 Feb 2011, 1:45 a.m.*

I've got a 41C (2051 serial) which doesn't operate if the battery pack is fully inserted but seems to work fine if it is only half inserted. Does anyone here have any idea what the cause of this will likely be? I'm guessing the battery contact/port block isn't making good contact with the board below and the added pressure of full insertion is causing problems but I'd prefer to confirm before I open it up.

- Pauli

Re: 41c repair

*Message #2 Posted by **aj04062** on 27 Feb 2011, 8:38 a.m.,*
in response to message #1 by Paul Dale

Is there a piece of corrosion right on the forward, leading edge?

Your analysis seems plausible to me.

Re: 41c repair

*Message #3 Posted by **Allen** on 27 Feb 2011, 9:46 a.m.,*
in response to message #1 by Paul Dale

you might be able to confirm this by placing the calculator on a table and gently pressing the front face (on the top left- and right corners) while trying to turn on the calculator. It sounds like it may be a broken post to me, though.

Re: 41c repair

*Message #4 Posted by **Randy** on 27 Feb 2011, 2:30 p.m.,*
in response to message #1 by Paul Dale

My guess would be that the front pair of the four port block locating pins are sheared off along with damage to the bosses for the long case screws.

Edited: 27 Feb 2011, 2:33 p.m.

Re: 41c repair

*Message #5 Posted by **John Robinson** on 27 Feb 2011, 5:49 p.m.,*

Thanks for the idea. I feared a broken post, I'll know for sure when I disassemble. Sad really, the calculator is in great cosmetic condition.

- Pauli

Re: 41c repair

*Message #8 Posted by **Paul Dale** on 28 Feb 2011, 4:25 a.m.,*
in response to message #7 by Paul Dale

No split or broken posts!

The two posts holding the CPU board in place have nuts on them to hold the PCB onto the connector.

- Pauli

Re: 41c repair

*Message #9 Posted by **Paul Dale** on 28 Feb 2011, 5:30 a.m.,*
in response to message #1 by Paul Dale

I think I've figured this out. The battery / module connector had slightly flattened foam/felt which is stopping the electrical connection.

I took the connector out and put it into my 41cv and the problem appeared on that calculator. Swap back its original connector and it comes good. At this stage I've not tried swapping the cv's connector into the 41c.

My question now is what is the best way to fix this? The padding is only very slightly squashed.

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Feb 2011, 7:41 a.m.,*
in response to message #9 by Paul Dale

This worked for me many years ago, but is up to you to see if it fits your case: Take a piece of thin two-conductor cable (the kind used for small headphones, or two lines of flat ribbon cable), and slip it from one side of the connecting block, setting it between the foam and the flexible circuit film. When in place, looking from a side, you would find (bottom to top): the main circuit board, the flex circuit film, the cable, the foam and the plastic block. The extra thickness will ensure good contact between the main circuit and the flex circuit. Of course, the cable serves no electrical function, and care should be taken to avoid any conductive thread protruding at the ends.

Re: 41c repair

*Message #12 Posted by **John Robinson** on 28 Feb 2011, 6:54 p.m.,*
in response to message #9 by Paul Dale

Hi Pauli,

Good find. Unfortunately it's virtually impossible to replace the foam piece without wrecking the flex circuit. Newer 41 calcs had that packing made of silicon type rubber instead of foam. I'd try something along the lines of the others are suggesting and slip something non-conductive between the foam and the flex PCB.

Good luck John

[OT]TI-Nspire CX

*Message #1 Posted by **Manolo Sobrino** on 26 Feb 2011, 3:00 p.m.*

After quite a bit of speculation it is official now

http://education.ti.com/educationportal/sites/US/productDetail/us_nspire_cx_cas.html

Shall we wait for a HP answer to this?

Re: [OT]TI-Nspire CX

*Message #3 Posted by **Don Shepherd** on 26 Feb 2011, 3:32 p.m.,*
in response to message #2 by Namir

Apparently that is coming later, probably not developed in time for this release. Just my thoughts. I'm going to see if I can trade my touchpad CAS in on a color one, as a teacher.

*Message #4 Posted by **Katie Wasserman** on 26 Feb 2011, 5:16 p.m.,*
in response to message #3 by Don Shepherd

I'm sure that WiFi will be available soon based on this.

What really caught my eye was that it will have 64Mbytes of operating RAM (twice what the previous version had), 1000 times what the Casio 9860 series (and Prizm) have and many times more than any other calculator available. This is going to allow for some pretty powerful applications, serious programming environments and/or alternative operating systems.

Re: [OT]TI-Nspire CX

*Message #9 Posted by **Eric Smith** on 27 Feb 2011, 6:40 p.m.,*
in response to message #8 by Namir

I don't know whether they've done it, but if TI has responded to the brute-force cracking of the 512-bit signing keys used in their older calculators by going to larger keys such as 2048-bit or more, then it will take people a lot more than an extra 15 minutes. Barring the availability of quantum computing or breakthroughs in factoring, a brute force attack against a 2048-bit RSA key is not expected to be computationally feasible until 2030.

The downside to using long keys is that it takes much longer for the calculator to verify the signature. This is particularly a problem on calculators with relatively slow processors.

Re: [OT]TI-Nspire CX

*Message #10 Posted by **Katie Wasserman** on 27 Feb 2011, 12:14 a.m.,*
in response to message #5 by Tim Wessman

Is this Nspire CX more encrypted than the older ones? There's plenty of stuff out there on how to hack an Nspire.

Re: [OT]TI-Nspire CX

*Message #11 Posted by **Eric Smith** on 27 Feb 2011, 6:44 p.m.,*
in response to message #10 by Katie Wasserman

Quote:

> There's plenty of stuff out there on how to hack an Nspire.

AFAICT, not to the extent of installing a modified or non-TI operating system on it. They're just injecting code via bugs they've found in the TI code, which may be fixed in later firmware releases.

Re: [OT]TI-Nspire CX

*Message #12 Posted by **Walter B** on 26 Feb 2011, 3:30 p.m.,*
in response to message #1 by Manolo Sobrino

Now even TI features a big ENTER ;)

Don't hold your breath for HP's answer - I guess it will take some time if they'll answer at all. IMHO, the new TI is a great toy but I doubt it will be a great tool for the advancement of science or engineering. Just my personal view, of course.

Re: [OT]TI-Nspire CX

*Message #13 Posted by **John B. Smitherman** on 26 Feb 2011, 3:43 p.m.,*
in response to message #1 by Manolo Sobrino

I'll bet the HP calculator marketing department has been sweating this and therefore has been working overtime to develop new products.

One possibility is to sell a retro 30bii Heathkit style where the buyer has to assemble the pieces and then program the calculator. The new product will open up another 256 bytes of RAM and sells for only 10% more than a standard 30b. :-(

John

*Message #14 Posted by **BruceH** on 26 Feb 2011, 3:59 p.m.,*
in response to message #1 by Manolo Sobrino

I can't possibly take that seriously - it doesn't have [hyp] [sin] [cos] [tan] keys!!

Re: [OT]TI-Nspire CX

*Message #15 Posted by **Don Shepherd** on 26 Feb 2011, 4:10 p.m.,*
in response to message #14 by BruceH

Bruce, I'm not an engineer so I'm unfamiliar with HYP functions, but a press of the TRIG key brings up: sin, cos, tan, csc, sec, cot, $\sin^{-1}$, $\cos^{-1}$, $\tan^{-1}$, $\csc^{-1}$, $\sec^{-1}$, and $\cot^{-1}$.

The NSpire is not a scientist or engineer's calculator, it is for students only.

Re: [OT]TI-Nspire CX

*Message #16 Posted by **BruceH** on 27 Feb 2011, 1:51 p.m.,*
in response to message #15 by Don Shepherd

Sorry Don - just me being silly. So many calcs for so many years have had [hyp][sin][cos][tan] on

prominent, dedicated keys that it has become a joke that you can't sell a calculator without them any more.

Re: [OT]TI-Nspire CX

*Message #17 Posted by **Don Shepherd** on 27 Feb 2011, 3:41 p.m.,*
in response to message #16 by BruceH

Thanks Bruce. I think that sin/cos/tan had their own keys on the first NSpires, but TI decided to add a trig key to free up space for gosh-knows-what.

I'll probably eventually get one of these because, from the beginning, the worst characteristic of the NSpire was it's unreadable screen, especially in low-light situations. I would imagine this screen will be excellent, if it is anything like the Prizm's.

The release notes don't mention anything about additional program commands (in BASIC) to take advantage of this new color screen (the Prizm's programming language did include new commands).

Frankly, I rarely use my NSpire in teaching.

Don

Re: [OT]TI-Nspire CX

*Message #18 Posted by **Hal Bitton in Boise** on 26 Feb 2011, 4:26 p.m.,*
in response to message #1 by Manolo Sobrino

Looks as though it's still shackled with the lumbering AOS, as evidenced by the prominent placement of the beloved parenthesis keys. Hopefully, expressions will assemble in "pretty print" while they are being entered. Maybe the current N-spires do this already...I know the 89 only gives you "pretty print in hindsight".

Re: [OT]TI-Nspire CX

*Message #19 Posted by **Marcus von Cube, Germany** on 26 Feb 2011, 4:44 p.m.,*
in response to message #18 by Hal Bitton in Boise

Math input is standard for all Nspires. There are templates for common constructs like integrals. Hyperbolics seem to be missing but they can be easily implemented as user functions.

Re: [OT]TI-Nspire CX

*Message #20 Posted by **Mauritz Blomqvist** on 27 Feb 2011, 4:26 p.m.,*
in response to message #19 by Marcus von Cube, Germany

The Hyp-functions are there. All available functions are under the key with the open book symbol. Both alphabetically and under categories, like trig, hyp, list, string etc.

Re: [OT]TI-Nspire CX

*Message #21 Posted by **Marcus von Cube, Germany** on 28 Feb 2011, 2:56 a.m.,*
in response to message #20 by Mauritz Blomqvist

I stand corrected. I was searching under the letter "h" looking for something like "hypsin" but it's "sinh" instead. My fault.

The previous Nspire's programming commands are less than the TI-89. The TI-89 was too difficult for the students. :(

Re: Is it still a calculator?

*Message #27 Posted by **Mauritz Blomqvist** on 27 Feb 2011, 4:30 p.m.,*
in response to message #26 by George Litauszky

I have written quite many "programs" using the possibility to link variables and graphical objects, like the differential equation plotter in the previous Nspire, where the plotting is done by creating tables in a spreadsheet, and then doing a scatter plot of that. The same with drawing 3D graphs.

Re: Is it still a calculator?

High-quality color displays are generally either backlit TFT, or OLED. Either uses substantially more power than monochrome transflective LCDs, and battery life is substantially reduced. Passive color displays with no backlight look very washed out and are difficult to read except when there is bright external illumination.

Unless you don't mind buying a lot of disposable batteries, for a calculator with a high-quality color display you're really going to want to use rechargeable ones.

There are also no commonly available disposable batteries that have high capacity and are thin enough for a slim calculator. (An *actual* slim calculator, not the Casio "Slim" which is anything but.) Lithium-polymer cells are just about the only option when you want both a high-power display and a slim package.

In the 1990s it seemed like few people wanted devices (including calculators) that needed to be recharged frequently. Cell phones have changed that; now most people are accustomed to recharging consumer electronic devices frequently.

There will likely be a market for calculators with monochrome displays and long battery life for the forseeable future, but I expect that many future high-end calculators will use rechargeable lithium polymer cells.

Re: [OT]TI-Nspire CX

*Message #37 Posted by **robert rozee** on 27 Feb 2011, 9:13 p.m.,*
in response to message #36 by Eric Smith

if the probability of the batteries in a schoolkids rechargable-battery-powered calculator going flat in

any 1-hour long class is 3%, and the average class size is 30 pupils, then the overall probability of no calculators suffering flat batteries during said class is (0.97)^30, which equals 40%. the chances of no flat batteries will diminish rapidly after the first 2 years of service, as the LiIon (or similar) batteries start to reach the end of their relatively short service life.

this will mean that a mathematics teacher, teaching say four 1-hour classes each day, will almost certainly have to face the prospect of at least one student each day unable to complete the lessons. back in the 1970's this issue didn't arise, as calculators were not an _essential_ part of the teaching/learning process. students could use slide rules, tables, or even (god forbid) their brains as backup.

this is why both laptops AND rechargeable high-end calculators will present a major disruptive force within schools. the ONLY workable solution is if the tools (both computers and rechargeable-battery-powered calculators) are provided by the school within the classroom - either as class sets, or as a computer bolted down to each student's desk.

it is my view that more powerful calculators DO NOT result in smarter, more capable students. all they do is result in RICHER calculator manufacturers.

*Message #39 Posted by **Eric Smith** on 28 Feb 2011, 3:10 a.m.,*
in response to message #37 by robert rozee

This also happens with graphing calculators using disposable batteries. I've seen it in classes. I carry a set of spare alkalines for my HP 50g.

The college classes I've taken between 2006 and the present that required calculators have been:

General Chemistry I: basic scientific, not allowed to be programmable - I used an HP-32E

Linear Algebra: TI 85 or 86 required (though not allowed on tests) - I used an HP-49G instead

Engineering (Calculus-based) Physics I, II, III: basic scientific required - I used an HP-50g

In Chemistry and Physics, the calculator is mainly needed for logs, exponentials, and trig functions; the rest can be done by hand. All of it could be done with a good slide rule.

In Linear Algebra, we were expected to use the calculator to do Gaussian Elimination and find determinants, only after we had learned to do those by hand.

Although the Discrete Math class I took did not require a calculator, I found the HP-49G to be useful.

and those batteries are good for, what, 50 or so hours of operation?

out of curiosity (remembering, i left school 1/4 of a century ago) do schools have stationary shops on-campus where students can pop between classes to buy pencils, paper, and BATTERIES? when i was at school we had said shops, where you mostly went to buy ink for your fountain pen!

with a rechargeable calculator and laptop computer the student will need to carry two chargers in their bag - when the batteries go flat they will just plug said charger(s) into the mains outlet(s) that every student desk has... hmmm, i can see a problem...

Re: [OT]TI-Nspire CX

*Message #41 Posted by **Eric Smith** on 28 Feb 2011, 1:44 p.m.,*
in response to message #40 by robert rozee

Somehow those students always manage to have a charged phone.

If students can't be bothered to charge their calculator, it's a safe bet that there are bigger problems at hand.

There is a bookstore on campus, which does sell batteries, but which is closed at most time when I would need it, such as right before my early morning class and right before my evening class.

Ha! You are very fortunate. My wife teaches high school English. The major disruptive forces are discipline problems, lack of motivation, lack of sleep, failure to do assigned work, disrespect, no parental involvement, texting or worse with those rechargeable cell phones that are supposed to be put away, etc.

Re: [OT]TI-Nspire CX

*Message #45 Posted by **Eric Smith** on 28 Feb 2011, 1:55 p.m.,*
in response to message #44 by Martin Pinckney

One of my instructors has written on the course syllabus (which is legally binding) that she reserves the right to answer any cell phone that rings during class. I haven't yet seen it occur.

I was mortified a few weeks ago when my iPhone started making noise in Physics class, despite the switch being set to vibrate. It turns out that if you set an alarm, it will make noise even in silent mode. Somehow I had accidentally set an alarm for 10 AM. I apologized to the instructor after class, and he said it was OK since I turned it off quickly. I guess now I can't take the moral high ground and complain about other student's phones.

in response to message #36 by Eric Smith

There's one more display technology, which I think is just perfect for a calculator: electronic ink. Easy to read and sipping power, enabling the device to need a recharge only about once a month.

The principal disadvantage of these displays, slow update speed, doesn't really hurt for calculator use.

A typical e-book reader has a great resolution for an ultimate graphing calculator. And it's lighter and thinner than any of the TI or HP graphing calcs.

Re: [OT]TI-Nspire CX

*Message #47 Posted by **Tim Wessman** on 28 Feb 2011, 9:34 a.m.,*
in response to message #46 by Oliver Unter Ecker

At first glance, it does appear that way.

However, have you actually used any e-ink readers? There is 1 fairly important issue that immediately is noticeable - the update the entire display any time you make a change.

Imagine trying to enter a number, with or without a cursor, and the entire screen fades and reappears every button you press. We're not talking about a Voyager like flicker, but a fairly long

delay. I don't know about you, but this would drive me nuts!

TW

Re: [OT]TI-Nspire CX

*Message #48 Posted by **Oliver Unter Ecker** on 28 Feb 2011, 7:07 p.m.,*
in response to message #47 by Tim Wessman

Tim, look at them again. The current generation allows updates of any rectangular sub-region without affecting the rest of the display. Typing text is just fine and there's no flicker. There's even a blinking cursor these days.

I bought my Kindle 3 after my iPad. I develop calculator apps for both. They'll be used in different ways, and both devices have their strengths. A tablet is "loud" and great for interactive exploration. An e-reader is "silent". Ideal to be clutched in your hand while pacing the room and staring at your math, code, words, etc., while the device is, essentially, off!

My calc on the Kindle has a huge stack. When it changes there is a sub-second refresh of the changed area. Not everyone will see it this way, but, to me, it works very nicely, and I really have no issue with the present-generation lag. For a calculator application, that is. (I do not enjoy web-browsing on this device.)

E-ink displays are very rugged and need no glass for protection. This allows for a low weight of the overall device. (Light enough to be held effortlessly in one hand over an extended period. About as heavy as my iPhone.)

In the education context, the energy savings aspect alone should make this technology appealing. I'd say the "silent" aspect helps, too. (Giving every student an iPad, conversely, may not be a good idea...)

*Message #50 Posted by **Eric Smith** on 28 Feb 2011, 1:39 p.m.,*
in response to message #46 by Oliver Unter Ecker

E-ink displays are great for reading in bright sunlight, unlike most graphic displays. Unfortunately they suck for reading in other situations, as they are *not* black on whie, but rather dark grey on medium grey. The contrast ratio is abysmal. People claim it is just like reading an actual book, but it's like reading a very badly printed book. If you compare it side by side with a cheap paperback, you'll be amazed at how much better the cheap paperback looks.

Amazon brags about how their latest Kindle has "50% better contrast ratio" compared to the earlier model. That's not much to be proud of, as it means they are now at 10:1. The worst TFT LCD displays have 300:1 contrast, and most have 1000:1 or better.

The technology is slowly improving, but between the contrast ratio, and the slow update rate Tim points out, I wouldn't want it in a calculator.

I'm writing this post on a tablet with a backlit TFT display, and it is much easier on the eyes than E-ink.

Re: [OT]TI-Nspire CX

*Message #51 Posted by **Oliver Unter Ecker** on 28 Feb 2011, 7:32 p.m.,*
in response to message #50 by Eric Smith

I did not intend to become an ambassador for e-ink on this forum, but I do feel a little counter-balance to your post is needed:

There're many metrics under which to quantify a display's performance.

I'm writing this on a top-of-the-line MacBook Pro and if I move my head a fraction of an inch sideways, I see the brightness of the entire screen change with me, as the angle-dependency on this notebook screen, and all others, sucks.

Do you know that sunlight is a million times lighter than indoors illumination? Do you condemn indoor illumination for being "too dark"? The low e-ink contrast ratio is being made up in large parts by your amazing human visual system.

I enjoy tremendously to look at a reflective screen. I find it unoffensive and very pleasing. It works great for me indoors and I would not (and did not) consider curling up with son at night for a goodnight story with a tablet. Too much spewing of light and bulk.

Surely the contrast ratio is better than the typical LCD calculator?

Re: [OT]TI-Nspire CX

*Message #53 Posted by **Eric Smith** on 1 Mar 2011, 9:46 a.m.,*
in response to message #52 by Martin Pinckney

No, the e-ink contrast is far worse than most monochrome LCDs. E-Ink is only around 10:1, while typical passive matrix LCDs are at least 50:1 (usually much more), and segmented LCDs are at least 500:1 (usually much more).

I don't know if TI will ever get the message, but many teachers (at the moment) simply DO NOT CARE for the Inspire. As powerful and feature rich as it may be, its increasing resemblance to a computer equipped with a computer algebra system makes it more of a hassle and LESS appealing as a tool that would be useful in the class. All our faculty members have one, and they are simply collecting dust in our desks. The best use of the Inspire would be for teaching, and not so much for students who want to do calculations. Yet, TI is a long way from creating an easy method for teachers to actually use their Inspire in the classroom.

For those not familiar with the Inspire, it is quite cumbersome to create a "project" on the Inspire. If you want to actually create something to be used in class, you are better off using their software (on the PC), and then downloading it onto the calculator. And the software requires registration as opposed to just being freely available with the unit itself.

Now, if I am already going to have to use a PC to create a project, I would rather just use whatever I already have and am familiar with as opposed to having to learn about yet another piece of software. Secondly, the software TI provides is essentially an emulator -- which raises the question: If I can just show my students what their calculator will do with the software TI has provided, why bother using the calculator? Secondly, every student would need to have such a calculator to see the project; otherwise you would need an additional projection unit should you not want to show them the emulation. It is much more likely that classrooms today are equipped with computers. Not too many classrooms have sets of calculators -- they just are not worth the money.

And the switch to "documents" is actually a pain in the rear. It makes programming the Inspire also a pain (and last I checked, their "language" is rather limited as far as input/output is concerned).

Both TI and HP are so out of touch with the educational sector -- and the funny thing is that TI already invests quite a bit into their calculator line in terms of support (eg conferences and workshops for teachers). Yet most people I talk to in academia have simply tossed the Inspire aside. Too complicated to be a calculator, and yet not powerful enough to be a computer. No one cares for these hybrid units when you have smartphones that are much more powerful.

Re: [OT]TI-Nspire CX

*Message #56 Posted by **Don Shepherd** on 28 Feb 2011, 2:59 p.m.,*
in response to message #55 by Han

> Quote:
>
> It makes programming the Inspire also a pain (and last I checked, their "language" is rather limited as far as input/output is concerned).

The BASIC-like programming language of the NSpire started out severely crippled; there were no input commands to get data once the program began, and the only output command was the simple "Disp" to display things on a calculator page. A year or so ago TI answered that complaint with commands to input numbers or strings, and a "msgbox" type command to display data in a text box. Those commands should have been there on day one, but at least TI responded to user complaints.

Like many handheld devices, programming on the device itself is generally a pain. The teacher PC software (or student software) lets you write code on the PC, test it, and download it to the handheld without too much trouble. One of the better features was the introduction of "libraries" which lets you define functions or programs and store them in a library where they are accessible to any NSpire app, including the spreadsheet. So you could write a function to return the nth prime number and include it in a spreadsheet cell as =nprime(155), for example. So there are some good things about the NSpire programming language, but it is not as powerful and robust as many other programming languages.

There are some high schools in the US that have embraced the NSPire, but very few I think.

in response to message #57 by Thomas Klemm

Of course it can! I'll pull up the benchmark BASIC version tonight and give it a run. I currently have the touchpad CAS; it will be interesting to compare the timing of this versus the new color CAS to see if the new OS is faster or slower (the Prizm executed programs significantly slower than the 9860-g slim, and Katie thinks that is due to the new OS).

Don

Re: [OT]TI-Nspire CX

*Message #59 Posted by **Don Shepherd** on 28 Feb 2011, 7:19 p.m.,*
in response to message #57 by Thomas Klemm

The current benchmark file contains NSpire CAS timings for OS version 1.2 (8.3 seconds) and 1.3 (4 seconds). OS version 2.0, which came out about a year ago, runs it in about 4 seconds too.

If I get OS 3 (coming with the new color one) and/or the new color one, it will be interesting to see if it is at least that fast.

Hey,

Can they really call this a "CX" it if doesn't have the 4 built-in RAM modules, Time and Extended Functions modules as well as the lower portion of extended memory?

:-) :-)

Jake

Re: [OT]TI-Nspire CX

*Message #61 Posted by **Don Shepherd** on 2 Mar 2011, 4:35 p.m.,*
in response to message #60 by Jake Schwartz

Hi Jake! I guess you are alluding to the 41CX? Unless HP has "CX" copyrighted, I guess TI is free to use it.

TI is not allowing teachers to trade-in their old NSpires on this new color unit, which they have done previously. They are offering a $50 discount coupon, but you can only get one by attending one of the education trade shows coming up this year, which I never attend.

I don't want one bad enough to spend $130.

Repairing an HP33E with springs

*Message #1 Posted by **Alberto Fenini** on 26 Feb 2011, 9:44 a.m.*

Dear all,
I have had this 33E in a drawer for a while, with the usual corrosion problem.
It also had some keyboard problems, and it was purchased mainly to use the battery cover.
However, I wanted to give a try to an old idea.
I'll not write too much text, but I'm posting the sequence of images that led me to be able to use a battery pack again.
I hope is going to be of help for anyone that has a similar problem.
Any suggestion, any comment,always welcomed !!
Enjoy the weekend, Alberto

Picture 1 - insertion of the springs, after the corroded parts have been removed

Picture 2 - view from behind, also a trace is missing, so that the cable will be soldered very close to the point where the external power supply goes

Picture 3 - springs soldered, and cutted on the back side

Picture 4 and 5 - pcb in place from diffeten views

Picture 6 - it works, in reality not all the keys are working, and since the power pcb is a slightly different version, there is no way to turn the unit off

Picture 7 and 8 - unit closed, it looks nice

et voila, with the battery in place
Credits must be given to a on old post that was showing how to connect the power supply pcb to the pcb holding the battery terminals.

it's nice, it works, but what it is ?

*Message #1 Posted by **Alberto Fenini** on 25 Feb 2011, 3:52 p.m.*

Dear all,
just received today, it works and it looks like just any HP75C
however it has a nice keypad overlay and an additional memory module,
has anyone ever seen it before and knows how it works ??

any hint, will be appreciated as always,
enjoy the weekend, Alberto

Re: it's nice, it works, but what it is ?

*Message #2 Posted by **Martin Pinckney** on 25 Feb 2011, 5:05 p.m.,*
in response to message #1 by Alberto Fenini

I don't *know*, but based on the evidence, I can hazard a *guess*.

In it's day, the 75 was considered a portable computer, rather than a calculator. The overlay bears the word "terminal," so it was probably used as such on a LAN. The labels on the overlay suggest some sort of database. I know from experience that before the internet there were lots of proprietary database systems used with "in house" LANs for various municipal departments. "Fireman" suggests it might have been used as a terminal for some sort of database in a large city fire department, possibly connected to a CRT. No clue about "CE," but I don't think it means Windows.

*Message #3 Posted by **Paul Gaster** on 25 Feb 2011, 8:16 p.m.,*
in response to message #2 by Martin Pinckney

Google found this HP page: http://h20338.www2.hp.com/PublicSector/cache/96688-0-0-75-135.html

HP teamed with ESRI to provide a sophisticated solution for Wilson's "Fire Department of the Future" GIS initiative. The project relies on HP business-critical servers, high-performance workstations and networking equipment. HP technology provides a powerful, reliable infrastructure for running ESRI's advanced GIS mapping applications.

Looks like HP has a history of working with fire departments.

Re: it's nice, it works, but what it is ?

*Message #4 Posted by **BruceH** on 26 Feb 2011, 4:30 p.m.,*
in response to message #2 by Martin Pinckney

In those days, 'CE' probably meant 'Computerised Entry' and *everybody* was suitably impressed.

I'd go along with your guess except for the LAN bit - too early for that. I would say this was carried along in the fire truck and a database record filled in at the scene of the fire - a straight replacement for a paper form on a clipboard. Back at the fire house it would be connected by serial port to a modem and thence to a mini-computer located centrally, to upload the details of the call outs for that day.

The overlay labels are quite interesting from a historic computing point of view: it was seen as quite natural at the time to press a button labelled with the data item that you wanted to enter and then type the value. Imagine producing an equivalent iPhone app today, with multiple buttons on the first screen corresponding to the labels on this overlay? Somehow, I can't see it wowing the client.

Anyway, a good find from the OP. I wonder how many other custom versions like this are out there waiting to be unearthed and how many have been lost forever?

Free42 extended "SHOW" fun

*Message #1 Posted by **Glen Sanft** on 24 Feb 2011, 12:27 a.m.*

I recently picked up a copy of Free42 and it made me dig out the real thing to play with again. I'd forgotten many of the joys of using it, as well as the painful aspects, but they're all fresh in my mind again now. :)

At any rate, this program evolved over time, as they all do, and I guess it might be useful in some way to some of you, so I offer it for your consideration.

There might be enough comments within the listing. If not, ask. I normally wouldn't use "@" for comments, but I seem to recall that was the convention for this sort of stuff.

Also, I don't presently have access to a web server to put a 39KB zip file on, so cannot include the .raw file and several formatted versions of the text listing. Sorry. I'll see what I can do if there's any interest.

Here it is:

Re: Free42 extended "SHOW" fun

*Message #2 Posted by **Dwight Sturrock** on 24 Feb 2011, 1:33 a.m.,*
in response to message #1 by Glen Sanft

Glen,

What does it do?

Dwight

Re: Free42 extended "SHOW" fun

*Message #3 Posted by **Glen Sanft** on 24 Feb 2011, 5:09 p.m.,*
in response to message #2 by Dwight Sturrock

Perhaps familiarity with it has clouded my judgement. I'd guessed there was enough information in the thread title, what little I'd posted about it, and the notes in the code listing itself.

The Free42 program comes in two versions (.bin and .dec) using different math libraries. One is faster, one is more accurate. I'm pretty sure all that's in the program's documentation. In either case, there are more digits in use than just the (up to) 12 shown in the display.

I was curious about those digits and wished to compare them to results from other "calculator" programs I have at my disposal.

What I put together will (should) non-destructively (except for the ALPHA register) "SHOW" the full numerical value in the X register. It does so according to a couple formatting variables you can set to taste very early in the program, as indicated by the notes in my listing above.

Re: Free42 extended "SHOW" fun

*Message #4 Posted by **Jim Yohe** on 24 Feb 2011, 3:07 p.m.,*
in response to message #1 by Glen Sanft

What editor did you write this in so you could save it off in a .raw format for importing into Free42? (Sorry if this sounds like a dumb question.)

Re: Free42 extended "SHOW" fun

*Message #5 Posted by **Jim Yohe** on 24 Feb 2011, 3:31 p.m.,*
in response to message #4 by Jim Yohe

Never mind. I just received this link of a translator from Thomas Okken that will do the trick: http://thomasokken.com/free42/txt2raw/txt2raw.html

Re: Free42 extended "SHOW" fun

*Message #6 Posted by **Glen Sanft** on 24 Feb 2011, 4:54 p.m.,*
in response to message #5 by Jim Yohe

I just tried that, and it didn't work too well for me, even after editing out my comments &c.

Go to http://www.webutils.pl/UUencode and paste *this* uuencoded version into the textarea, then click "Decode". It'll decode into the binary format and prompt you to save the file. It didn't know what to do with my previous "base64" version, but the following works perfectly there. Cut/paste everything below from "begin" to "end", *inclusive*, into that web page's textarea.

```
begin 644 FWIW.raw
MP`#U`$9725>R``$3`/2!+DTN$P#T@2Y'+H4"HF6S`+P``V>\`/2!+E@N=?2!
M+EDN=?2!+EHN=?2!+E0N=O2!+DPNA^```/2!+DDN$A0`](N2B[TD2Y8+GKT
M@2Y3+G9A@U:#HE^T`&EGM`!U:!$`08,$=6CT@2Y%+O21+DTN2_2#+D4N=?21
M+D4N5V>Z`$/TE"Y3+J8Q])0N4RZL'/)_+JT<\G\L:041$`!"IC%I])<N2BYG
MN`#TERY)+K4`])$N1R[T@2Y)+G6F01(2`$:W`!$`009X\G\*EW/TERY)+K8`
M])$N1R[T@2Y)+G4'\G\@D'&U``BF01(2`$:Y`!$0`*9<9O)_"@GS?R`8])$N
M12ZF,;L`"OM796YT(&]U="!O9OQ_(')A;F=E(2`@.B@+?H?TD2Y,+I%T])$N
M5"[TD2Y:+O21+EDN])$N6"[TL"Y-+O2P+D<N]+`N22[TL"Y*+O2P+E,N]+`N
?12[TL"Y,+O2P+E0N]+`N6B[TL"Y9+O2P+E@N#,``#0``
`
end
```

Otherwise, you could just take the time to key in the program, hahaha!

(Note: I just performed the operation outlined above using the link and text from the preview version of this post to obtain a bit-for-bit version of FWIW.raw)

Re: Free42 extended "SHOW" fun

*Message #7 Posted by **Mike Morrow** on 24 Feb 2011, 8:34 p.m.,*
in response to message #6 by Glen Sanft

So...I'll repeat Dwight's question: What does it do? Why should someone wade through comments in a long listing to determine a program's purpose?

Re: Free42 extended "SHOW" fun

*Message #8 Posted by **Martin Pinckney** on 24 Feb 2011, 8:47 p.m.,*
in response to message #7 by Mike Morrow

I only had to read the comment on the first program line... {:-)

Re: Free42 extended "SHOW" fun

*Message #9 Posted by **Glen Sanft** on 24 Feb 2011, 8:52 p.m.,*
in response to message #7 by Mike Morrow

How about the first two lines of the listing?

Or my post above in response to his question?

Re: Free42 extended "SHOW" fun

*Message #10 Posted by **Thomas Okken** on 25 Feb 2011, 8:10 p.m.,*
in response to message #6 by Glen Sanft

Hi Glen,

txt2raw.pl will convert your listing as shown in your initial post; you just have to delete all the non-program lines (including line 00; I think txt2raw.pl may not like how you edited that line but I admit I haven't checked that), and get rid of all the comments (for vi users, **:%s/^\([^@]*\)@.*/\1/** does the job; everyone else, do whatever you have to do to get rid of any '@' signs and whatever follows them on the same line).

Having cleaned up the listing like that, txt2raw.pl converts it to a *.raw file that is identical to your uuencoded version, except for one byte, namely, offset 0x10a, which is a regular 'E' in the listing and an HP-42S small-caps exponent 'E' in the uuencoded raw file -- a cosmetic issue only since this is in a text string.

I like this program and I'll add it to my collection. :-) Being able to see the full precision is useful sometimes, and it's something that the Free42 implementation of SHOW doesn't do, because it tries to mimic the HP-42S by displaying no more than 12 digits.

For Free42 Binary, you could improve the code a bit by having it display 16 digits instead of 25 -- given the 53-bit mantissa of IEEE-754, those last 9 digits are basically just noise.

- Thomas

Re: Free42 extended "SHOW" fun

*Message #11 Posted by **Glen Sanft** on 26 Feb 2011, 10:26 a.m.,*
in response to message #10 by Thomas Okken

Hi Thomas.

Pleased to meet you and thank you very much for Free42! (I swear that with the realistic "skin" I can almost feel the keypad button move with just the right sensation under my finger when I click the mouse)

I'd tried the txt2raw script a couple times before posting earlier about it. The first time I ended

up with only the "E" difference but I recall that when I reverted

```
 >LBL 08      @and here it comes...
- |-" "
- 24
- XTOA
+ |-" E"      @this is the "exponent" (little big) "E"
  RCL ".E."
```

then my luck wasn't so good. Probably I'd just mis-compared something the second time.

I had to add the ".J." stuff to use this with free42bin. Note my notes at lines 28ff and 74f.

Don't forget to play around with the two values at lines 4 and 6. I put their declarations up as near the top as I could so they can be altered with little fuss. It's quite easy to then just up-arrow a few times before exiting the program-entry mode and be ready for an immediate R/S.

I'd placed tabs before the @s (they should still be there even after a cut-paste from this thread) so what I'd do in vi is

```
:%s,\t.*,,
ggdd
```

or probably just

```
sed 's,\t.*,,; 1d' | ./txt2raw.pl -
```

I threw the (Free42) into the program header line hoping to help prevent some poor soul going to all the trouble of entering the program into their native hardware. However, if one has the notion to do so, throw an AVIEW in after line 72 (AIP) which will make it funner to watch while waiting, and waiting.

Feel free to freely include this with your Free42 website stuff if you have half a notion.

Re: Free42 extended "SHOW" fun

*Message #12 Posted by **Glen Sanft** on 10 Mar 2011, 6:00 p.m.,*
in response to message #10 by Thomas Okken

Even though I'd considered it a finished product when originally posted here, I went ahead and made a few changes:

- All three "user options" are now available near the head of the program for ease of manipulation and are each preceded by a line of reference text.

- The routine which determines whether a linefeed should be inserted was changed from a loop scheme to (up to) three simple X--Y tests.

- A couple of variables were replaced with judicious stack use.

Here are some performance numbers obtained by looping 10 iterations "showing" PI on native hardware, timed manually using X48:

as originally posted = 50.95 seconds (running the program singly the "busy" annunciator flashes a very brief 6th time)

with un-looped "line-feeder" = 44.08 seconds (running singly the "busy" annunciator flashes a 5th time seemingly about half its normal duration)

fully(?) optimized (current version) = 37.47 seconds (running singly the "busy" annunciator flashes a 4th time for what "feels" like an almost-full duty cycle)

There is a 13kB zip file containing the .raw file, a .gif image of the program listing "printout", and some text files at http://www.box.net/shared/20plsp89n1.

Enjoy!

*Message #14 Posted by **Dwight Sturrock** on 24 Feb 2011, 11:30 p.m.,*
in response to message #13 by Lyuka

I get it. I use the real 42S most of the time. What you are saying is that the program will show the extra digits of precision that the Free42 maintains internally.

Re: Free42 extended "SHOW" fun

in response to message #13 by Lyuka

Hi Lyuka,

> Quote:
>
> I found it's very useful.

So did I. Glen's program is a keeper!

```
9 SIN COS TAN Shft ATAN Shft ACOS Shft ASIN FWIW
```

returns

```
8.999 999 999 999 999
 999 931 316 E0
```

Instead of FWIW above, previously I had done

```
9 - E 24 * E 5 +
```

and gotten

```
31,316
```

(Free42 Decimal 1.4.62)

Regards,

Gerson.

Hp-42s display problem

*Message #1 Posted by **aj04062** on 23 Feb 2011, 10:29 p.m.*

I'm looking for confirmation on the root cause on a display failure on a 42 I just acquired.

Half of pixels in one ROW are out. Does it make sense that this would be a bad Zebra connection? Unless more drop out I think it might be foolish to open this up to repair.

Agree?

Thanks for the feedback!

Re: Hp-42s display problem

*Message #2 Posted by **Randy** on 24 Feb 2011, 12:30 p.m.,*
in response to message #1 by aj04062

Twisting the case slightly should prove/disprove the theory.

I have seen cracked LCD's along one corner, typically the top left or right that exhibit that behavior. The crack is not visible from the front, only from the back when the zebra is removed.

The missing row - which side and which row? From that I can figure out where that element terminates on the LCD.

Re: Hp-42s display problem

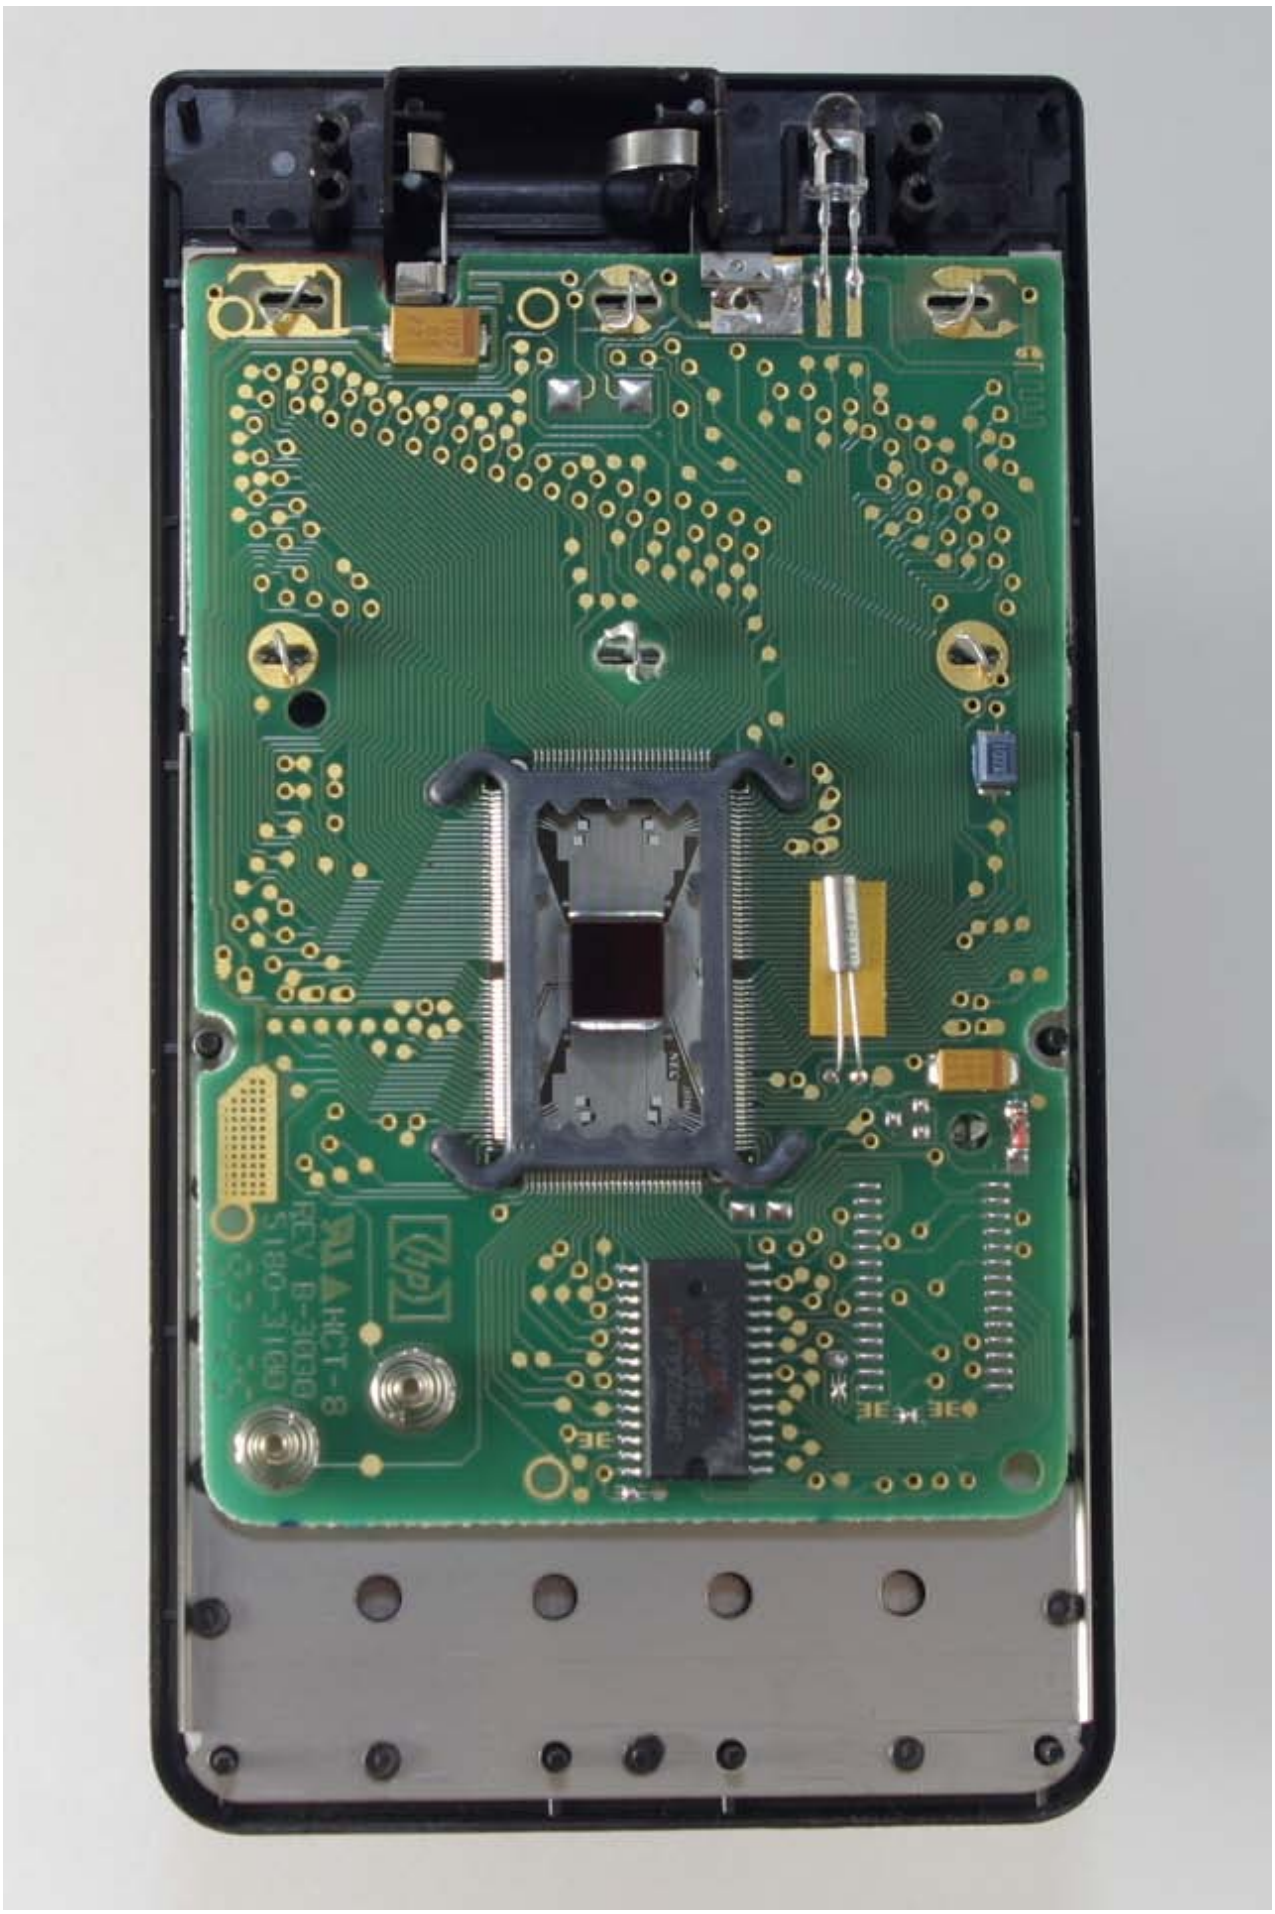
in response to message #5 by aj04062

Please look at this:



IMHO there's not much on the pcb you can swap.

Re: Hp-42s display problem

*Message #7 Posted by **Randy** on 25 Feb 2011, 11:42 a.m.,*
in response to message #3 by aj04062

All 16 rows on the left side terminate along the top left edge of the LCD. The row in question would be right below the top right twist tab as seen from the back.

If it isn't a contact issue, it is either a failed driver row on the IC or a failed lead frame bond on the die. FWIW, I've found that mechanical failures of the lead frame out-number electrical die failures about ten to one. That said, that element lands pretty much dead center on the right edge of the die so I'd be inclined to think it is electrical, not mechanical.

Re: Hp-42s display problem

*Message #8 Posted by **aj04062** on 26 Feb 2011, 10:03 p.m.,*
in response to message #7 by Randy

Well, I pulled the calculator apart because as I twisted, another half row blinked on and off. I deduced, it was probably a bad connection in need of repair.

Well, I do believe it is. When I got it apart I immediately noticed green corrosion in areas near the zebra.

Well I cleaned as delicate as I could with warm water, vinegar and a q-tip. I think there are 2-3 traces that need repair. YES the corrosion is this bad, It reminds me of a 65 I repaired that had a completely exploded battery.

Anyone have a good source of VERY FINE trace repair? I think the conductive trace pen is the only way to go here, agreed?

Re: Hp-42s display problem

*Message #9 Posted by **Wanderley Navarro** on 27 Feb 2011, 12:06 a.m.,*
in response to message #8 by aj04062

Maybe this will solve.

But an advise from Randy would be highly appreciated.

Re: Hp-42s display problem

*Message #10 Posted by **aj04062** on 27 Feb 2011, 8:36 a.m.,*
in response to message #9 by Wanderley Navarro

I Purchased a Micro Tip Silver Trace Pen last night from Cicuitworks. My only concern is that the tip may be too large to work with (.8mm)

The traces are about half that width I think.

I'll give it a try. I want to use it on the 65 with the exploded battery anyways.

LIF Utilities for linux

*Message #1 Posted by **Christoph Giesselink** on 23 Feb 2011, 6:18 p.m.*

Does anyboby managed it to port the programs inside the "LIF Utilities for linux" sources mentioned in Tony Duell's article liffile - HP9114 LIF disk image file into a Windows console program?

I tried to compile them with MinGW and with Cygwin, but in both packages the include files /Linux/fd.h and /Linux/fdreg.h are missing. Maybe that there are some more files missing.

Christoph

Re: LIF Utilities for linux

*Message #2 Posted by **Egan Ford** on 23 Feb 2011, 7:02 p.m.,*
in response to message #1 by Christoph Giesselink

I tried as well a long time ago. I think it's more than just missing files, but its really a different way of accessing the floppy. I think you are going to have to breakdown and figure out how to write a Windows driver for this.

I am trying to remember if I had any luck with using lif images. The utilities can operate on /dev/fd0 as well as lif images. I think I got that to work, but I do not recall. However, JFG's tools for lif image manipulation to support the PIL-Box would be a better source to start with.

I just check my backups and I cannot find my build directory for the lif utils under Windows. I abandon Windows 3 years ago, I just couldn't take it any longer.

Re: LIF Utilities for linux

*Message #3 Posted by **Christoph Giesselink** on 24 Feb 2011, 3:19 p.m.,*
in response to message #2 by Egan Ford

Hi Egan,

> Quote:

in response to message #3 by Christoph Giesselink

ILPer from http://www.jeffcalc.hp41.eu/hpil/index.html.

It can read/write lif images but not lif disks in A:.

Re: LIF Utilities for linux

*Message #5 Posted by **Glen Sanft** on 23 Feb 2011, 8:27 p.m.,*
in response to message #1 by Christoph Giesselink

The tarball for those utilities is currently located at http://www.hpcc.org/datafile/hpil/lifutils.tar.gz (the link in your linked-to page above is not valid anymore)

The "Readme" file in the archive file says:

> Quote:
>
> These programs should build on a standard linux system by simply unpacking the archive and typing 'make'. Porting to other unix-like OSes will be difficult owing to the direct access to the floppy disk controller. At least lif_phy.c will need major changes.

I'd venture to guess that the code in the current Linux sources might be different-enough to require some patching to get this stuff to work. It certainly wouldn't work under Windows, at least directly, even if you fetched pertinent linux headers to make the compiler happy.

Maybe fetch an historic version of Slackware from back when this package was put together, and install it into a virtual machine (i.e. VirtualBox) under your Windows. "Boot" the machine, compile the code, and run it from the command-line in a terminal window. Maybe?

Whenever I have to use Windows I get done what I need in a virtual machine under GNU/Linux. Then go take a shower...

No matter how you tackle this you'll have to roll up your sleeves a bit.

Re: LIF Utilities for linux

*Message #6 Posted by **Marcus von Cube, Germany** on 24 Feb 2011, 2:52 a.m.,*
in response to message #1 by Christoph Giesselink

Christoph, my CASsette I/O Utilities contain a module to access a Casio MD-100 floppy directly from windows. I'm using the windows package LibDisk by John Elliot. Here is my win32/readme.txt file with some links and explanations:

> Quote:
>
> The program md100 in this package makes use of LibDsk by John Eliott.
>
> Please visit his site at http://www.seasip.demon.co.uk/Unix/LibDsk
>
> For Windows NT and above, an auxiliary driver, written by Simon Owen, is needed by LibDsk:
>
> http://simonowen.com/fdrawcmd/
>
> The install subdirectory of this folder contains the driver. Install it by starting FdInstall.exe

> On Windows 9x/ME, you should start the program LDSERVER.EXE before you access the disk. This server is a 16 bit program which can do some tricks with the floppy controller that a 32 bit program can't. The program and its dll can be found in the win95 subdirectory of this folder.
>
> Marcus von Cube

You should be able to adapt the respective module in my project (libdisk.c) for LIF disk access under Windows.

Re: LIF Utilities for linux

*Message #7 Posted by **Christoph Giesselink** on 24 Feb 2011, 3:21 p.m.,*
in response to message #1 by Christoph Giesselink

Sorry, I should be more precise next time.

I'm especially looking for a tool to manipulate files in the "HP9114 LIF disk image file format". In my main focus are HP-71B related files inside LIF images handled by ILPer.

Interesting features would be:

```
dir     : print a directory of a LIF image
create  : create an empty LIF image
put     : put a file to a LIF image
get     : extract a file from a LIF image
purge   : purge a file in a LIF image
```

So I thought that the "LIF Utilities for linux" would be a good entry.

Christoph

Re: LIF Utilities for linux

*Message #8 Posted by **Juergen Keller** on 24 Feb 2011, 3:46 p.m.,*
in response to message #7 by Christoph Giesselink

Perhaps these two articles are helpful (if you not already read them):

HP-IL Files: Where, What, Why, How, etc.

liffile - HP9114 LIF disk image file

The LIF utilities ARE a good starting point. You may also be interested in the HPDir tool from hp9845.net, there is some documentation about LIF file format, too:

Background: The LIF File System

Hope this helps,
Juergen

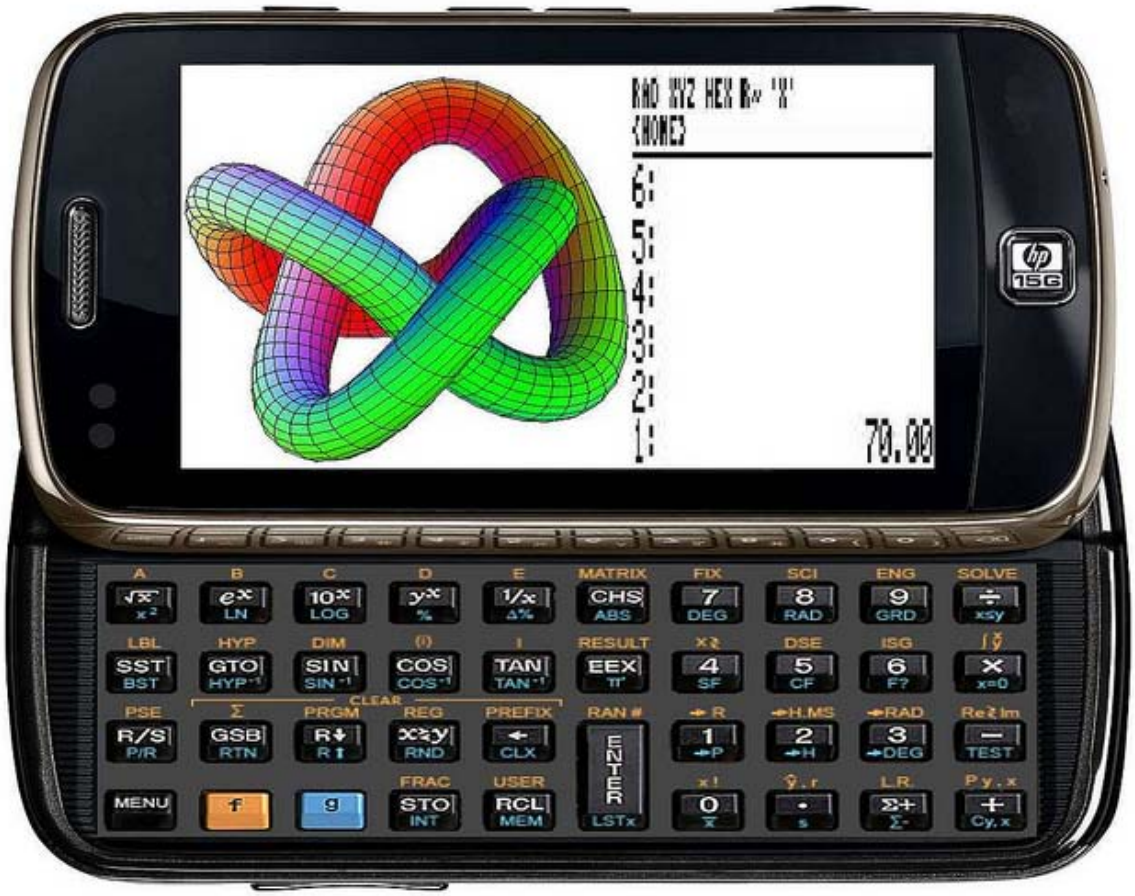
Voyager Platform for the 21st Century

*Message #1 Posted by **Norman Dziedzic** on 23 Feb 2011, 6:03 p.m.*

I realized that some of the slider phones have the same number of keys as a the voyager calculators. So, this type of hardware exists with keyboard and graphical touch screen (and camera and data storage/transfer) already!

Perhaps this is possible :-)



Edited: 24 Feb 2011, 8:19 a.m.

Re: Voyager Platform for the 21st Century

*Message #2 Posted by **Eric Smith** on 24 Feb 2011, 10:51 a.m.,*
in response to message #1 by Norman Dziedzic

When you buy a smartphone for $200, you're really paying $600, of which $400 comes from your 2 year service commitment. Given that when you buy a calculator, you're not commmitting to a monthly service, are you going to be willing to pay $500 for a calculator?

In the 1970s, programmable calculators sold for more than the equivalent of $500 in 2011 dollars, but I think few people would be willing to do that now.

Re: Voyager Platform for the 21st Century

*Message #5 Posted by **Norman Dziedzic** on 24 Feb 2011, 3:49 p.m.,*
in response to message #4 by svisvanatha

I use Free42 and i41CX+ and M48 and i48 and HP15C on my iPhone but without real keys they all fall short for me.

I just thought with the 15C seeming to be the most requested bring back and all the other requests for I/O connectivity and color and storage and real keys that hacking a slider phone could be a very neat way to realize many of the wants / desires expressed online.

Seeing as how kids are so into phones, it might also pique some interest amongst the youngin's to have the "cool calculator" instead of the big TI brick.

Hey, doesn't HP own a smart phone company????? Can you say synnergy (apparently I can say it but I can't spell it)

Re: Voyager Platform for the 21st Century

in response to message #5 by Norman Dziedzic

> Quote:
>
> I just thought with the 15C seeming to be the most requested bring back...

Among most of those familiar with both the HP 42S and the HP-15C, it is likely that the 42S is the most desired for resurrection, especially in view of HP's decision to never again produce such a capable model for fear that it would adversely impact their top-scale calculator sales.

The 42S doesn't require as many keys either.

But both the 42S and the 15C grossly fail the logical requirement that the ENTER key be in the same column as the /*-+ keys (preferably above them). The Voyager is the HP model that first broke this rule. In some arbitrary exercise of style over substance, without any technical justification, all subsequent HPs except the 49/50 series continue to violate it thirty years later. (Sadly, the 49/50 series puts it below the /*-+ keys).

The Voyager model is really a very poor design for the "21st Century". Let it sleep, except amongst non-technical finance types who can't be educated that HP has an excellent product (HP 30b) for much less money that has tremendously more advanced capabilities.

Re: Voyager Platform for the 21st Century

*Message #8 Posted by **Norman Dziedzic** on 24 Feb 2011, 10:11 p.m.,*
in response to message #7 by Mike Morrow

I figured that 15c comment would open up a can of worms (or at least your can ;/\})

I would never want just a 15C ported to a graphical color device. I would like to have a regular 15C because now I collect but I don't think I could ever use it for everyday work. I'll spend my money on a 41CX before I'll spend it on a 15C.

My point is that there are many many possibilities with modern hardware that bear looking at for the people that think about new calculator designs. And there are platforms where these things could be prototyped and tested available today.

Would it be useful/useable? I don't know but I'd like to give something like that a spin for a few weeks.

Re: Voyager Platform for the 21st Century

*Message #9 Posted by **sylvandb** on 27 Feb 2011, 2:10 a.m.,*
in response to message #7 by Mike Morrow

> Quote:
>
> Among most of those familiar with both the HP 42S and the HP-15C, it is likely that the 42S is the most desired for resurrection,

why? Neither one had I/O to store and load programs or data. That's why I didn't buy a 42s then and probably wouldn't buy a new issue. (I bought my 15c in 1982.) Today the capabilities of both the 42s could easily be implemented along with those of the 15c in a single new calculator in either portrait or landscape, and personally I'd strongly prefer more keys, and slightly prefer landscape.

> Quote:
>
> The Voyager model is really a very poor design for the "21st Century".

Because of the layout? Or because the ancient display or custom processor is so limited?

The 7segment display was the only problem I ever had with my 15c. I'd accept a speedup like the new 12c even at the cost of battery life, but faster isn't important to me. I would insist on a more capable display, and that is the _only_ reason I'd rather have a 42s.

If for the layout, I very much disagree. Further, the limited keys on the 42s is a problem. The only reason I'd give up keys is to get more area for a display. The horizontal form factor works great with the centered ENTER, and it enables a wider display for longer-length lines than would be practical in a portrait layout. Longer lines aren't needed for numbers, but they are really handy for text!

And the final criteria is price. A new 15c functionally equivalent to the old one should sell for a 20b-like price, or less. At that price I'd buy at least 3, probably 6+, and have them everywhere. (I'm not going to carry a calculator.)

Slightly more expensive to get a better display might enable much sophisticated software. But much more expensive, even with more features, I wouldn't buy as many... Would more features and/or a different layout appeal to enough more people to make more sales overall? Don't know. And it appears at least thus far, HP doesn't believe it would be sufficient.

Is IoHS "inclusion of hazardous substances"? We live just a few miles from a dump that's nearly full. It has many decades of electronics waste in it. We also get the ground water report every year, and the lead content is around an eighth of the action level, and yet the dump is not one of the suspected sources, but errosion of natural deposits *is*. Even before RoHS, the electronics industry used very little lead compared to the vehicle-battery industry, yet the latter is RoHS-exempt. Politics as usual, not helping anyone except those who've found a way to make a lot of money pushing through a new law. Our company is still using lead in our soldering. We say the European market isn't worth converting.

I should have added that I grew up in another country where we drank water from lead pipes, and yet of the kids that went to the same boarding school with me, an unusually high percentage became doctors, engineers, and scientists. Brain damaged from lead? I don't think so.

Re: Voyager Platform for the 21st Century

*Message #19 Posted by **Marcus von Cube, Germany** on 1 Mar 2011, 4:17 a.m.,*
in response to message #18 by Garth Wilson

Garth, it depends on whether the lead goes into the water or not. If the interior of the pipes is covered with limescale, the lead is sealed and stays in the pipe. If you have acidic water, things are different.

Hazardous substances in consumer goods tend do end up in a land fill, despite all recycling efforts. Many people either don't care or don't know. Many dumpsites aren't properly sealed against the ground and thus, over the years, a significant amount of these substances end up in the air or in rivers, lakes or ground water. If this can be avoided, it should be avoided.

I agree that it's not a good idea to design consumer goods in a way that they fail or become obsolete only after a few years of service just to avoid saturating the market. This results in more questionable waste being produced over time as if the devices were to stay alive much longer. So a device working for decades and being properly recycled thereafter is advantageous, even if it contains heavy metal in its solder or toxic but durable plastic in the housing.

No, actually they sold for the equivalent of $500 in *1970s* dollars! (HP-65/67).

Pretty weird how the actual keys are calculator keys, but the reflection in the case is of the top row of a QWERTY keyboard =P

in response to message #1 by Norman Dziedzic

here is one option for your hardware:

link to Ben NanoNote website

i believe these units cost something like us$99, and run linux with a 300mhz or thereabouts processor. more than enough for free42, which could then be extended as folks desired to include '48 style functionality in future. and i am quite sure that a customized set of keyboard labelling could be provided for.

i agree with other posters in that lead-free (RoHS) compliant construction dooms any modern electronics items to an early demise. i work in the R&D field, and can confirm it is an absolute nightmare for anything other than consumer-level products that a manufacturer WANTS to fail after a few years. however, there is no reason why silver-based solder should not be considered as an option.

Re: Voyager Platform for the 21st Century

*Message #25 Posted by **Marcus von Cube, Germany** on 3 Mar 2011, 12:34 p.m.,*

in response to message #24 by robert rozee

I've got one of these, thanks to Christoph Pulster!

After an update of the firmware (OpenWrt, a special Linux distro) and some tweaking of the setup, the NanoNote runs. But it is of limited use, yet: No wireless ports, only a device USB port. No touchscreen or other pointing device. I couldn't find a suspend mode, the power button seems to turn the device off. Power on causes a cold boot. The application software features kind of a PDA (all in beta). OTOH, it's not meant as a ready to use consumer device, it's an open development platform with complete "copyleft".

With 32MB of RAM and 2 GB NAND flash, the unit has enough horsepower for interesting applications. A powerful calculator might be one. But there is a caveat: The keyboard is a little "special": It's fully alphabetic but uses several shift keys to access special characters and digits. For a calc, the keyboard has to be redesigned not only concerning the legends, but probably mechanically, too, as it is relatively stiff and keys are very narrowly spaced. Without a touchscreen, free42 is not an option, either.

Despite all odds, it's fun to play around with the little beast. Connected to my Mac, it acts like a network device. SSH works out of the box. Editing config files from my mac keyboard is a real timesaver, compared to the tiny local keyboard. I'll investigate further.

In Homage to Peter Henrici

*Message #1 Posted by **Namir** on 22 Feb 2011, 5:39 p.m.*

Hi All,

A few months ago I started reading Peter Henrici's book "Computational Analysis with the HP-25 Pocket Calculator". The book contains very interesting programs that implement interesting algorithms. I am impressed how, the late Swiss mathematician, Henrici was able to push the HP-25 to the very limit. I have been translating some of his programs to HP-67 and HP-41C, allowing me more breathing space and the ability to generalize Henrici's program. The code does a lot and without the advantage of using subroutines. I guess Henrici wanted to target the lower-cost HP-25 calculator--perhaps barely affordable to students. I wish he did a version for the more expensive (especially for students) HP-67 or HP-41C--a project that needed much selling to the conservative publishers.

Henrici's wife has also written a similar book for the HP-33C (which I also have) and this book is a companion of "Essentials of Numerical Analysis", also by Henrici. The HP-33C version uses subroutines and is able to explore more interesting algorithms.

Among the books written for programmable calculators, Henrici's books for the HP-25 and HP-33C stand tall. If you have spare time to fiddle with old code (and even run it on the HP-25 emulator available on this site) then I encourage you to do so. It is also an interesting journey into cool computational algorithms.

Namir

Sandmath Mod Question

*Message #1 Posted by **mbrethen** on 22 Feb 2011, 2:14 p.m.*

This is directed toward Angel Martin:

I'm trying to use the Sandmath Module on i41CX and the EV3X3 function in particular. I input "XEQ ALPHA EV3X3 ALPHA" with the output "Nonexistent". Not sure why the function can't be found.

Note: the Advantage and I41CX-MATH modules are installed as well.

Re: Sandmath Mod Question

*Message #2 Posted by **mbrethen** on 22 Feb 2011, 2:25 p.m.,*
in response to message #1 by mbrethen

If this helps:

Port1 = I41CX-MATH Port2 = Advantage Port3 = Sandmath Port4 = No Module

Re: Sandmath Mod Question

*Message #3 Posted by **Ángel Martin** on 22 Feb 2011, 4:48 p.m.,*
in response to message #2 by mbrethen

The only dependency is for the Advantage module, and a SIZE large enough to hold the matrix data if not in XMEM.

Also make sure you have FLAG 6 CLEAR in order to use a new matrix.

Re: Sandmath Mod Question

*Message #4 Posted by **mbrethen** on 22 Feb 2011, 7:35 p.m.,*
in response to message #3 by Ángel Martin

I'm not sure what size is required to run (didn't find this info in the docs) but I set it to 28. Also checked flag 6 was clear. Still no luck.

Re: Sandmath Mod Question

*Message #5 Posted by **mbrethen** on 22 Feb 2011, 9:55 p.m.,*
in response to message #4 by mbrethen

I looked at the Matrix ROM in Sandmath 7A 3.pdf, and although the header is EV3X3, the function name is VP3X3. I tried executing that and it works.

One observation: It doesn't appear to print the results in normal or trace mode.

Re: Sandmath Mod Question

*Message #6 Posted by **Ángel Martin** on 23 Feb 2011, 1:18 a.m.,*
in response to message #5 by mbrethen

VP3X3 was the previous name for that program, so it's likely you're running a rather old version of the Module. The current one is version 8.

I'm not sure how often they get updated at TOS for download on i41CX though. I checked on my i41CX and it already has version 7, which has the new name so you could also update it.

Edited: 23 Feb 2011, 1:18 a.m.

Re: Sandmath Mod Question

*Message #7 Posted by **mbrethen** on 23 Feb 2011, 10:03 a.m.,*
in response to message #6 by Ángel Martin

i41CX only came with the i41CX-Math module, and I had to download Sandmath from TOS. There are 3 different modules; can you explain the differences?

Sandmath (currently loaded in Port 3) Older version?

Sandmath 8k

Sandmath 12k

Re: Sandmath Mod Question

*Message #8 Posted by **Ángel Martin** on 24 Feb 2011, 1:37 a.m.,*
in response to message #7 by mbrethen

This is probably what caused the issue. The "sandmath" rom is an older version, for all that matter you can delete it as it has old revisions of the programs, superceded by the "SandMath_8k" , or the "SandMath_12k" - which is a superset of the 8k version, plus another 4k containing the "Algebra" section (i.e. matrix, vectors and polynomial programs).

In summary:

Sandmath - old and superceded.

SandMath_8k = Main Module, does not need Advantage
SandMath_12k = SandMath_8k + Algebra ROM.

Only the programs in the Algebra part require the Advantage ROM.

Hope this clarifies.

Re: Sandmath Mod Question

*Message #9 Posted by **mbrethen** on 24 Feb 2011, 9:27 a.m.,*
in response to message #8 by Ángel Martin

Yes it does, Thanks.

Is it my imagination, or does there seem to be a (calculation) speed gain in the newer module?

Edited: 24 Feb 2011, 9:49 a.m.

Re: Sandmath Mod Question

*Message #10 Posted by **Ángel Martin** on 24 Feb 2011, 3:59 p.m.,*
in response to message #9 by mbrethen

> Quote:
>
> Is it my imagination, or does there seem to be a (calculation) speed gain in the newer module?

Well, yes! I optimized things a bit between both revisions, like I wrote a couple of functions to simplify the code and expedite things - so that may be what you're noticing.

It really is a much improved version - not perfect quite yet but I'm working on it :-)

Re: Sandmath Mod Question

*Message #11 Posted by **mbrethen** on 25 Feb 2011, 11:02 a.m.,*
in response to message #10 by Ángel Martin

Can the output be sent to the printer? I haven't found a way to do that.

Edited: 25 Feb 2011, 11:35 a.m.

Re: Sandmath Mod Question

*Message #12 Posted by **Ángel Martin** on 25 Feb 2011, 3:24 p.m.,*
in response to message #11 by mbrethen

Have you tried setting the printer in NORM mode?

Re: Sandmath Mod Question

*Message #13 Posted by **mbrethen** on 25 Feb 2011, 11:39 p.m.,*
in response to message #12 by Ángel Martin

I tried both trace and norm. The matrix inputs are printed, and after that a series of "RUN" statements, and a single "RUNNING..." statement. However, output results are not printed for some reason.

Another non-HP RPN calculator in my collection

*Message #1 Posted by **Michael de Estrada** on 22 Feb 2011, 12:38 p.m.*

I just won a TAS auction for an apparently NOS Garrett 2002 There was one other serious bidder, perhaps someone who frequents this forum? The listing made no mention of RPN, otherwise there might have been more bidders. This is the second Garrett I've found, the first being a model 2000, which differs only in that it lacks the alarm clock & timer functions. I find it interesting that the instructions for the Garrett 2000 make no mention of RPN, even though the calc has an Enter key and clearly uses RPN data entry. Anyways, lately my collecting has been focused on non-HP RPN calcs.

Re: Another non-HP RPN calculator in my collection

*Message #2 Posted by **Keith Midson** on 22 Feb 2011, 9:48 p.m.,*
in response to message #1 by Michael de Estrada

Interesting - I didn't bid on this item, but the first (non-serious) bidder for your Garrett is currently going hard on an auction that i'm trying to win (and it's not an HP, which is unusual for me). Cheers, Keith

Re: Another non-HP RPN calculator in my collection

*Message #3 Posted by **Michael de Estrada** on 22 Feb 2011, 10:09 p.m.,*
in response to message #2 by Keith Midson

Were you aware that the Garrett uses RPN ? Is the calc you are currently bidding on RPN ? My focus is mainly RPN, although I do own non-RPN calcs as well, about 25% of the total. The majority of all my calcs, about 60%, are HP.

Anyways, good luck on the auction, and let us know what it is after it's over.

Michael

Re: Another non-HP RPN calculator in my collection

*Message #4 Posted by **Keith Midson** on 22 Feb 2011, 11:56 p.m.,*
in response to message #3 by Michael de Estrada

No it's an obscure 1970's non-RPN scientific calculator - I have an interest in the particular brand of this one, but for no rational reason (other than my 5 year old son shares the same name and he now has one in 'his' collection - scary what i've started!!).
I hadn't heard of Garrett before this post. There aren't too many non-HP RPN calcs out there.
I think 75% of my collection is HP, 15% would be Sharp pocket computers and the balance are other 'obscure' general interest calculators (like a TI SR-10, Casio FX-702P with ABCDEF keyboard layout, etc). I actually don't have any RPN calculators that aren't HP. Cheers, Keith

Actually, there are quite a few, although most are no longer made.

non-HP RPN calculators

Re: Another non-HP RPN calculator in my collection

*Message #6 Posted by **Keith Midson** on 23 Feb 2011, 5:17 a.m.,*
in response to message #5 by Michael de Estrada

Haha - maybe I should have said "There aren't too many non-HP RPN calcs out there that I know of". That's quite an impressive collection. Mind you, does anything else RPN quite compare to a HP? Keith

Re: Another non-HP RPN calculator in my collection

*Message #7 Posted by **Michael de Estrada** on 23 Feb 2011, 9:20 a.m.,*
in response to message #6 by Keith Midson

I hope I didn't give the impression that the collection is mine; I could only dream that it were. It belongs to db (his initials), who is a frequent contributor to this forum, and very much a calculator insider. Indeed, were it not for db, I would not be aware of many of these non-HP calculators, which are largely original designs. As to your question regarding HP .vs. others in regards to RPN, mostly HP is king, but there are others that compare favorably or even surpass HP at the time they were produced. For example, the Corvus 500 introduced hyperbolic functions in the late 1970's before the HP-32E, and the quality was much higher than the HP Spice series.

Re: Another non-HP RPN calculator in my collection

*Message #8 Posted by **Mike Morrow** on 23 Feb 2011, 6:40 p.m.,*
in response to message #7 by Michael de Estrada

> Quote:
>
> ...the Corvus 500 introduced hyperbolic functions in the late 1970's before the HP-32E...

Is that a milestone for RPN calcs only? The TI SR-51 has hyperbolic functions, and it came out in very early 1975.

speaking of the Corvus

*Message #9 Posted by **db (martinez, ca.)** on 24 Feb 2011, 9:24 p.m.,*
in response to message #8 by Mike Morrow

There's a Corvus 500 for sale at the evil auction site right now. - Not by me! I have nothing to do with it.
It's a BIN with a high price but the seller is honest and the cost is what i paid for mine with shipping from England in 2003.
It's one of my three or four favorite non-hp RPNs, really well implemented.

Re: speaking of the Corvus

*Message #10 Posted by **Michael de Estrada** on 24 Feb 2011, 9:59 p.m.,*
in response to message #9 by db (martinez, ca.)

The BIN was lowered from a higher price. It's now a bit lower than I paid for mine, however, mine is in mint condition, whereas the one in the auction has a lot of wear of the gold printed legends above the keys, and several are missing completely. If anyone on this forum buys it, I can send you a pdf of the owner's manual. There was also an APF mark 55, but I don't see it anymore.

Re: Another non-HP RPN calculator in my collection

I believe my dad had a Garrett 2000 when I was growing up. On the back, does it have a sticker that says something to the effect of:

"This calculator will take you to the year 2000 and beyond"?

Dave

Re: Another non-HP RPN calculator in my collection

*Message #17 Posted by **Michael de Estrada** on 24 Feb 2011, 12:15 p.m.,*
in response to message #16 by DavidShenk

There are several stickers on the back, but none with such a statement. The instruction pamphlet states "THE CLASSIC 2000....A Calculator for the year 2000....available in the 1970's." It then promotes the advantages of RPN entry, without ever actually using the word RPN, "The CLASSIC 2000 is easier to operate than any other calculator. Once the original figure is entered, all further additions, substractions, multiplications or divisions can be performed with *one* key depression for each step; this process can continue indefinitely."

Re: Another non-HP RPN calculator in my collection

*Message #18 Posted by **Allen** on 24 Feb 2011, 7:50 p.m.,*
in response to message #17 by Michael de Estrada

Wonder how they did it with an infinite stack in 1970??

Re: Another non-HP RPN calculator in my collection

*Message #19 Posted by **Michael de Estrada** on 24 Feb 2011, 8:16 p.m.,*
in response to message #18 by Allen

Well, I'm sure you are being facetious, but it's just a 2-level stack that cannot be pushed up past the second level, since only the initial depression of the Enter key raises the stack. After that it acts as the + operator. Repeated consecutive operations without further number entry has no effect. Also the - key acts as Enter initially, only it enters the number as a negative value, which is equivalent to Enter and Chs (+/-). Still, they are correct that a calculation such as (3+5)*4 will require fewer keystrokes than on an algebraic entry calculator.

Hello Walter,

Could you please repeat in English?

Regards.

Re: Another non-HP RPN calculator in my collection

*Message #24 Posted by **Martin Pinckney** on 27 Feb 2011, 11:43 a.m.,*
in response to message #21 by Wanderley Navarro

Wanderley,

Many people take pride in things made in their native land. Americans (which is how residents of the USA refer to themselves, w/o intending any offense to Canadians, Mexicans Central or S. Americans) in particular are proud of our manufacturing heritage. At one time, we made the best of everything (or so we thought).

That is, except for cars (Germany), cameras (once Germany, then Japan), fine china (England), consumer electronics (Japan), fine leather goods (Italy), fine wines (France), ...

Anyway, having lost most manufacturing to Japan, Korea, Mexico, and China, Americans nowadays particularity appreciate stuff "Made in USA."

Re: Another non-HP RPN calculator in my collection

*Message #25 Posted by **Walter B** on 27 Feb 2011, 1:01 p.m.,*
in response to message #24 by Martin Pinckney

... which has an historic parallel in the British Empire some 100 years ago. Great Britain, having been the mother of industrialisation in the 19th century, introduced the "Made in ..." tag (with the intention of highlighting other country's producers making lower quality, so proud British won't buy from them) at the very time it was losing its leadership in the industrial world.

Lesson learned: The value of "Made in X" is based on the quality produced in a particular industry in this country X at a particular time, not vice versa. Note this statement is time and industry dependent.

Corrolary 1: The absolute, constant pride in "Made in X" for an arbitrary country X, without checking the necessary boundary conditions (was quality really as good in this industry there at that time, and is it still?), is just hollow words.

Corrolary 2: The disqualification of particular countries as producers of "cheap ... crap" was often nothing more than the sound going along with the rise of these countries (think of Japan, Taiwan some years ago, maybe China now).

HTH

Quite true. Although, there was, as in most cases of bias such as you have described, a kernel of truth.

For instance, the "cheap crap from Japan" moniker came about in the 1950s at a time when Japan was indeed exporting huge quantities of cheap consumer products to the U.S., as a conscious decision. This was considered the best way to crack into the U.S. market, given post-war bias. All the while, Japan was producing cameras and electronics of unsurpassed quality, known only to the lucky few.

The same has been true of China, only in a different time period and with a slightly different story. Aside from the early years of copying German cameras, Japan has been an innovator. China, OTOH, typically still produces under western specifications, IMO.

A bit of nationalism. I think it was justifiable in this case. While there have been some truly great RPN calculators made in Russia, Germany, Argentina, Great Britain & Hong Kong --- HP, Garrett, Friden and Heathkit made their stuff here on the left coast of the U.S.

Would it have been been more palatable if i had said "8) Made in California"? That actually sounds more cool to me, but the east coast contingent here may not agree. -yea i'm takin a you Katie!

Re: Another non-HP RPN calculator in my collection

in response to message #27 by db (martinez, ca.)

Great!!

I was perfectly aware of everything was said and my goal was to provoque the

debate.

I'm pretty sure db didn't had the "intention" to disqualify any country but since this is an international place of excellent & high level discussions and exchange of ideas with lots of comradeship between members, one should keep in mind that his distracted words can hurt someone proud even without having the intention.

Is not my case however... I know Brazil is not THAT tech country (but we made very good HP-97s, 41CVs and Voyagers among others here at the time).

I'm a quality lover so personally like almost everything made in the USA, Germany or Japan.

Thanks all.

I suspected as much, but decided to take you literally and explain, not what db meant, but what I take the appeal of "Made in USA" to be.

> Quote:
>

I fail to see how any such expression is hurtful. I would not take offense at a Brazilian being proud of something excellent made there.

Women, for instance. {:-)

May be a bit tricky to see indeed...

Although I do not have the intention to polemize too much, perhaps the point

becomes clearer when one realizes the difference between proud and vainglorious (boastful) about his country's excellence.

There is on the later a proactive attitude that makes the talker discourteous (inelegant) and unsympathetic (obnoxious) when addressing to an international audience.

Unless of course the audience is from buddies and the statement intentionally said for fun... but in this case the intention must be perfectly clear...

I suspected you wanted to provoke, especially after you asked for an English translation d;-) Since the story of the British inventing "Made in Germany" may not be common knowledge, however, I decided to explain this once more. Everything else in this matter is written above already.

Anyway, the majority of forumers come from one country inhabited by many people with unbroken self-confidence (or call it nationalism), so challenges like this are fun sometimes.

I close concurring with Martin: Enjoy the quality of Brazilian products! d:-)

Some years ago I dedided to bought an HP-12C to celebrate the 20th anniversaire. I found on TAS a buyer from Corvallis selling a NOS. I thought it was the right one. When it arrived I confirmed it was perfect. But even coming from Corvallis it was Made in Brazil.

Got the Garrett 2002, but it doesn't work :<(

*Message #35 Posted by **Michael de Estrada** on 27 Feb 2011, 12:34 a.m.,*
in response to message #1 by Michael de Estrada

Well, I got the Garrett 2002 that I won in the TAS auction today and it's doa. It was working before it shipped, and there's no evidence of shipping damage, but it's totally dead now. No display whatsoever when I switch it on, but power is getting to the circuit board, because I read 120 vac where the wall cord connects to the circuit board and there's this big transformer that gets hot. I don't see any evidence of fried components, circuit traces all look good, soldered connections look good, etc. Maybe a capacitor is bad? Well, anyways, hopefully it's something that can be fixed, otherwise it's just a large paperweight. Bummer!

adding time segmetns (HMS+)?? with 41CX?

*Message #1 Posted by **Sam Samaha** on 22 Feb 2011, 9:10 a.m.*

Hi members, sorry if this has been addressed before, I did a search and was unable to find it. I came into possession of a rather nice HP41CX that I am told can do time computations. My question is.. is there a simply way to add time segments together maintaining the HH:MM or HH:MM:SS format? For example, I'd like to be able to add :23 min to :50 min and get an answer in the format 1:13 etc... thanks all..

Sam

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Feb 2011, 9:30 a.m.,*
in response to message #1 by Sam Samaha

```
Type the first value (0.50) and press ENTER
Type the second value (0.23) and press XEQ [Alpha] HMS+ [Alpha]
That's it

The HMS+ function works as follows (internal steps):

Take value #1
Convert to HOURS format (same as HR function)
Take value #2
Convert to HOURS format (same as HR function)
Add both values
Convert the result to HH.MMSS (same as HMS function)

On older calculators which had no HMS+ function, you needed to go step by step. But the
HP41 does.
```

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #3 Posted by **Sam Samaha** on 22 Feb 2011, 9:45 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Thanks, and just to be clear on that.... if the two segments were 1min23sec and 2min50sec then it would be 1.23 <enter> and 2.50 <enter> ?

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #4 Posted by **Garth Wilson** on 22 Feb 2011, 10:41 p.m.,*

> Quote:
>
> and just to be clear on that.... if the two segments were 1min23sec and 2min50sec then it would be 1.23 <enter> and 2.50 <enter> ?

No, the hour has the integer part, so 1min23 sec is .0123.

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #5 Posted by **Marcus von Cube, Germany** on 23 Feb 2011, 2:14 a.m.,*
in response to message #4 by Garth Wilson

Sam's version should still work (except that the second <enter> has to be replaced by HMS+ in any case). It doesn't matter whether you add minutes or seconds. Both units overflow at 60. It's just a matter of interpreting the results correctly.

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #6 Posted by **Sam Samaha** on 24 Feb 2011, 5:55 p.m.,*

that makes sense... This will be an invaluable tool for flying internationally ... we have to add up (sometimes) 100+ segments on our flight plan, and if you make one mistake, it usually means starting all over..

again, thanks for the help all.

*Message #7 Posted by **Garth Wilson** on 24 Feb 2011, 7:31 p.m.,*
in response to message #5 by Marcus von Cube, Germany

If you have fractions of seconds you'll get wrong answers though.

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #8 Posted by **Marcus von Cube, Germany** on 25 Feb 2011, 2:15 a.m.,*
in response to message #7 by Garth Wilson

I agree, if you are talking about 100th of seconds. Has anybody ever seen 60th of seconds as a measure?

Re: adding time segments (HMS+)?? with 41CX?

*Message #9 Posted by **Walter B** on 25 Feb 2011, 4:36 a.m.,*
in response to message #8 by Marcus von Cube, Germany

> Quote:
>
> Has anybody ever seen 60th of seconds as a measure?

I didn't. Smaller time intervals were beyond scope in the times the second (hora minuta secunda) was invented. And many years later, when fractions of seconds became

measurable, people attacked this problem in a handier way, inventing the millisecond.

Re: adding time segments (HMS+)?? with 41CX?

*Message #10 Posted by **db (martinez, ca.)** on 25 Feb 2011, 11:06 a.m.,*
in response to message #9 by Walter B

> Quote:
>
> Has anybody ever seen 60th of seconds as a measure?

I haven't either. Whole seconds have been good enough for most uses, for most of human history. After all: there are 1.3 million of them in a circle! And as Walter said, when the need and ability to measure smaller divisions came up then there were decimal computers to calculate them. When it's railroading time, you get railroads.

Still; time and angle sexicecimal measurements are beautiful pieces of tradition, and if they weren't more useful than decimal for their purposes they would have disappeared into history.

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #11 Posted by **Frido Bohn** on 22 Feb 2011, 9:49 a.m.,*
in response to message #1 by Sam Samaha

Hi Sam!
in addition to the response of Andrés who was a few minutes ahead of me, consider that the time format is HH.MMSSss with ss being 10th and 100th of a second. Thus, choose FIX 6 to display the entire value.
HMS- substracts the time value in the x-register from the value in the y-register. So, you may be able now to calculate how much time Andrés was actually faster than me :-)
(DATE+ and DDAYS do the respective with dates).
HR serves to convert the "classical" time format into a decimal format with fractions of an hour. HMS does the reverse.
For reference see Section 6 (p. 65) of Volume I of the HP-41 CX Owner's Manual or Section 6 (p. 90) of the HP-41C/CV Owner's Handbook and Programming Guide.
Both, if not at hand, available at this wonderful site.

Frido

Re: adding time segmetns (HMS+)?? with 41CX?

*Message #12 Posted by **db (martinez, ca.)** on 22 Feb 2011, 11:27 a.m.,*
in response to message #1 by Sam Samaha

Most surveyors assigned the HMS+ to the shifted + key, the HMS- to the shifted - key, and the HMS & HR to the shifted x & / keys. I met one guy that spun a lot of repeated angles. He wrote tiny "HMS times" and "HMS divided by" functions and assigned them to the respective shifted spots.
That is easier nowadays of course. The robotic gun turns the angles automatically, the pre-programmed windows CE data collector calculates the mean, and the nephew or drinking buddy of the boss drives the info back to the office to be downloaded by an office tech.
That the old manual sighting/calculate on the 41 method gives from five to 25 times the precision - and discovers any error in the field - is lost on todays middle managers.

In case you don't have the manuals for your new treasure; they are available here from Dave at the museum.

The DVD comes with not only the 41CX manual but the 41C manual too, which is easier to get into for a beginner. It also contains lots of info on the various 41 systems and more than you will ever want to know about all things RPN.

Re: Windows 7 and HP 48GX

*Message #10 Posted by **Ed Look** on 28 Feb 2011, 4:59 p.m.,*
in response to message #3 by bill platt

Bill, my 48G and 48G+ both used to be able to communicate to my PC, the same PC. That was over a year or so ago. A couple of days ago, I wanted to transfer some files to both of these calcs and no connectivity program seems to recognize either 48G. I do not believe anything in the PC has radically changed, but hp48 Explorer, which did work then did not work a couple of days ago.

I wonder if the incessant MS updating of Windows has changed it beyond being able to detect the old 48 series calcs.

Re: Windows 7 and HP 48GX

*Message #11 Posted by **Thomas Okken** on 28 Feb 2011, 7:09 p.m.,*
in response to message #10 by Ed Look

For what it's worth: Just yesterday I wanted to transfer some stuff between my PC and my HP-48G. The PC in question is a laptop I got a couple of years ago and installed Windows XP on, and which I keep up to date religiously, but never used with my 48G yet.

I downloaded HPComm 3.04 from hpcalc.org, and downloaded the latest driver for my Sitecom USB/Serial interface. Everything worked like a charm.

If you're using Windows 7 (or Vista), and if you're using the Sitecom USB/Serial interface, you'll probably have to get the latest driver from Sitecom. They do have one specifically for Vista; it's a beta, apparently, but it may work where the older driver did not.

Re: Windows 7 and HP 48GX

*Message #12 Posted by **Ed Look** on 28 Feb 2011, 11:03 p.m.,*
in response to message #11 by Thomas Okken

Thomas, no, I'm still on WinXP. And I am using a serial-to-USB interface, but it's, I believe, a "no-name" brand cable, which I do not believe came with any software.

What is different about the Sitecom interface?

Re: Windows 7 and HP 48GX

*Message #13 Posted by **Marcus von Cube, Germany** on 1 Mar 2011, 4:02 a.m.,*
in response to message #12 by Ed Look

Ed, Device Manager will tell you about the USB ids (manufacturer and device) of your USB/RS232 converter. From that ID you can start a Google search for the manufacturer and look for an updated driver.

in response to message #1 by gene wright

Now, Gerson has been challenged. I'm sure he'll have Doom running on a 12c+ within a week! ;-)

John

Re: TI-NSPIRE calculator plays DOOM

*Message #9 Posted by **Gerson W. Barbosa** on 21 Feb 2011, 11:33 a.m.,*
in response to message #8 by John B. Smitherman

Hi John,

Didn't you mean Gene?

I woudn't be able to have Tic-Tac-Toe running on a 15C even within a month...

By the way, there are some Doom versions for the HP-48/49G at hpcalc.org:

http://www.hpcalc.org/search.php?query=Doom

I guess they don't compare to the nSpire version, though.

Regards,

Gerson.

Re: TI-NSPIRE calculator plays DOOM

*Message #10 Posted by **Walter B** on 21 Feb 2011, 1:48 p.m.,*
in response to message #9 by Gerson W. Barbosa

So now we know what graphic calcs are needed for - finally ;)

For those who don't need playing DOOM on mobile, instant on devices the screen may be considerably smaller. And weight and power consumption, too. When I need a wrench I need a good, solid wrench and don't care about bells and whistles ... YMMV

Re: TI-NSPIRE calculator plays DOOM, and other TI hacks...

*Message #11 Posted by **Egan Ford** on 22 Feb 2011, 10:26 a.m.,*
in response to message #1 by gene wright

83/84 to not only get online, but play multiplayer games: http://www.cemetech.net/forum/viewtopic.php?t=5754

Old news, but an 84 was used to jailbreak a PS3: http://www.engadget.com/2010/09/11/ps3-jailbroken-with-a-ti-84-plus-calculator/

While I think playing Doom, multiplayer calc games, and other clever TI hacks are useless, I still have to admire the hacks and applaud them. Especially, when they involving connecting things.

My useless HP hacks that involve connecting things:

41CX home automation: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=763

71B navigation: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=746

50g serial keys: http://sense.net/~egan/skb/

I think I'll find a way to control my TV with my 41CX next. :-)

It's all relative. A calculator fan who buys a $42 a case for his collection might think $116 for a bicycle handle bar is too much, right?

Re: Why not?

*Message #5 Posted by **Michael de Estrada** on 20 Feb 2011, 10:43 p.m.,*
in response to message #4 by Allen

Haha. You are comparing a cheap plastic zipper case to a carbon fibre handlebar? Now, if it were an alligator case with a mink lining, I might agree.

Re: Why not?

*Message #6 Posted by **Garth Wilson** on 20 Feb 2011, 11:55 p.m.,*
in response to message #5 by Michael de Estrada

Yep. A carbon-fiber time-trial bike aerobar set can retail for up to about a thousand dollars. My own aluminum clamp-on aerobars are about $130.

Re: Why not? [OT]

*Message #7 Posted by **Mike T.** on 22 Feb 2011, 8:12 a.m.,*
in response to message #4 by Allen

How about $110 CDN - just for the handle bar tape to wrap around your new handle bars. That was the price I was given for Brooks handle bar tape in Vancouver last September.

I actually managed to buy the same thing for £42 in Woking (Evans Cycles) on my way home from the airport, which just goes to show that the increase in price that occurs when something crosses the Atlantic isn't just one way.

Mike T.

PS - Yes it was worth it They were a complete nightmare to fit as the leather doesn't stretch easily but they are very grippy and look fantastic...

Re: Why not? [OT]

*Message #8 Posted by **Michael de Estrada** on 22 Feb 2011, 9:04 a.m.,*
in response to message #7 by Mike T.

Yes, Brooks is pricey, but it'll last a lifetime. I have two Brooks Team Pro saddles, and one of them will be 32 years old in a couple of weeks. It has seen many long camp touring rides, and there is nothing more comfortable once it is broken in. Where comfort is involved, you can't pay too much.

Re: Why not? [OT]

*Message #9 Posted by **bill platt** on 22 Feb 2011, 11:24 a.m.,*
in response to message #8 by Michael de Estrada

I wore out my Brooks in less than 4 years back when I was a teenager. I rode, and rode, and rode, and rode some more, in the rain, the snow, etc. It got so soft and swaybacked that it was useless. My concor lasted longer...

Re: Why not? [OT]

*Message #10 Posted by **Thomas Okken** on 23 Feb 2011, 2:36 p.m.,*
in response to message #9 by bill platt

I have a Brooks that I've had for about 25 years now. I never gave it any care, other than putting a plastic bag over it when the bike was parked outside and I expected rain. The leather feels hard and after I ride for the first time after a long absence, I feel like I've been kicked in the butt repeatedly, but once I'm broken in again (takes a couple of days), it's the greatest thing. I can ride on it all day till I collapse from fatigue, and no gluteal discomfort whatsoever.

Re: Why not? [OT]

*Message #11 Posted by **Mike T.** on 22 Feb 2011, 3:02 p.m.,*
in response to message #8 by Michael de Estrada

I'm still using my 'original' B21 on my touring bike (Dave Russell - 1985)

Why?

Repairing a 82022B charger (with P.S. to Geoff Quickfall)

*Message #1 Posted by **Karl-Ludwig Butte** on 20 Feb 2011, 3:45 p.m.*

Dear all,

one of my 82022B chargers broke some days ago. A first investigation showed that the fuse was melted. But after replacing it, the same thing happened again immedeately. A further search for the root cause showed that transistor Q3 shortcircuited. It's a NPN power type with a "M726" printed on it. Alas I couldn't find any datasheet at the Internet. Does anyone know with which transistor available today I can replace it ?

Any hint will be very much appreciated - thank you very much in advance.

Kind regards

Karl

P.S.: By the way, Geoff, if you're reading this, may I ask how about your book ? Will it be ready for ordering soon ?

Karl

Re: Repairing a 82022B charger (with P.S. to Geoff Quickfall)

*Message #4 Posted by **Karl-Ludwig Butte** on 23 Feb 2011, 11:44 a.m.,*
in response to message #1 by Karl-Ludwig Butte

Dear All,

thanks again for the link Ignazio and thanks Jacques for the excellent technical content.

I succeded to repair the charger by replacing the defective Q3 with a BD128 which should be available at any electronic shop. A bit more difficult was to find a supplier for the fuse, a so called pico-fuse, which also was defect. For people living in Germany I found it at Reichelt Elektronik.

Best wishes and kind regards

Karl

restoring an HP71 (old post)

*Message #1 Posted by **Alberto Fenini** on 20 Feb 2011, 1:11 p.m.*

ciao a tutti,
someone may remember that I was trying to restore an HP71,
it was basically in nice condition, but the display had some problems.
It came out that was a bad driver, and desoldering/resoldering an SMD component it is not in my DNA.
However, I had a chance to buy a working unit in very bad cosmetic conditions
although working and of the same revision (2CDCC).
Cleaning (which was my first idea) was almost impossible,
I don't know what may have been spilled on the unit, but I was not able to remove it with whatsover solvent or soap.
As you can see from the END/LINE key, I have gone pretty far in trying to clean.
The idea was then to swap the keyboard faceplates.
I'm posting this, because I have developed a technique of soldering the keyboard that may be of interest.
Using a dremel, I have "consumed" all the plastic rivets trying not to go too deep and set free the keyboard/pcb.

Then, using a plastic glue (I don't want to make any advertising, nor I'm related to this company but I use Five star adhesive medium gap filling from the UK)
and a soft cotton tip, I have let a drop of glue fall in any hole.

The keyboard and the keyboard pcb are kept together by some paper clips
You can see how it looks when it dries here :

and then this is the final result :

Of course, while the keyboard pcb is removed you can clean and polish everything.
Hope is going to be of help for someone,
take care Alberto

*Message #2 Posted by **Michael Meyer** on 20 Feb 2011, 3:05 p.m.,*
in response to message #1 by Alberto Fenini

Beautiful! When I was in medical school, I lived on $4000 USD per year- food, clothing, shelter, etc. Buying a 71B was a huge stretch. But when I turned it on for the first time and saw the blinking cursor and realized the power I had, even in the command line, it was worth every penny. I can't quite describe that awesome feeling, and have never had that feeling again, even with all the new gadgets on the market.

Enjoy!!

HP-15C, an interesting question

*Message #1 Posted by **robert rozee** on 20 Feb 2011, 9:19 a.m.*

without encouraging all the naysayers to jump in, has anyone out there ever tried taking a "parts-only" 15C apart and extracting the code from the ROMs? assuming here that one of the three chips contains all (or most of) the ROM code, and that there is some information available about the pin-outs.

cheers, rob :-)

Re: HP-15C, an interesting question

*Message #2 Posted by **Katie Wasserman** on 20 Feb 2011, 9:29 a.m.,*
in response to message #1 by robert rozee

See Eric Smith's work. The ROM dump of the original 12C is what's running inside the 12C+ using an ARM-based Voyager emulator. This is also the basis for all the speculation discussed here on a potential 15C+.

Re: HP-15C, an interesting question

*Message #3 Posted by **robert rozee** on 20 Feb 2011, 9:47 a.m.,*
in response to message #2 by Katie Wasserman

yes, just after writing the first post i found eric's work! but nowhere to download a rom image of a 15C :-(i'm thinking around the cunning idea of an emulator running on an arduino board to re-implement the 15C, perhaps even with the extra ram discussed many years back.

Re: HP-15C, an interesting question

*Message #4 Posted by **Marcus von Cube, Germany** on 20 Feb 2011, 10:24 a.m.,*
in response to message #3 by robert rozee

As far as I know, HP has claimed copyright on the Voyager ROM images so they are no longer part of Eric's distribution.

Re: HP-15C, an interesting question

*Message #5 Posted by **Martin Pinckney** on 20 Feb 2011, 8:26 p.m.,*
in response to message #4 by Marcus von Cube, Germany

> Quote:
>
> As far as I know, HP has claimed copyright on the Voyager ROM images so they are no longer part of Eric's distribution.

Implying that they once were?

So let me get this straight:

1. HP at one time released the 15c ROM images, or at least allowed someone (Eric?) to extract them.

2. HP later enforced the copyright claim so the ROM images were withdrawn from Eric's site.

3. Now HP (through Tim) says they no longer have the 15c ROM images, and would like to get them from anyone who might have them.~5th msg.

4. Meantime, Tim states that the ROM images don't contain a copyright message, implying that the copyright is unenforceable.~45th msg.

Obviously I am missing something.

Re: HP-15C, an interesting question

*Message #9 Posted by **Michael de Estrada** on 20 Feb 2011, 9:51 p.m.,*
in response to message #6 by Tim Wessman

Tim,

Is the source code written in assembly language for the processor? Would it have to be re-compiled for a different processor? I'm just asking out of idle curiosity, as my only computer programming experience is with main frames and pc's.

Michael

Re: HP-15C, an interesting question

*Message #10 Posted by **Tim Wessman** on 20 Feb 2011, 10:49 p.m.,*
in response to message #9 by Michael de Estrada

Yes, it would definitely need to be essentially rewritten, but the difference is that you are no longer guessing about the logic and algorithms so it is much easier to make something that is very similar. The 12cp was an attempt to "recreate" the 12c, but they essentially had to guess at how it worked. We all know how perfectly *that* worked out for the first few versions. . .

As an example (if I am remembering everything correctly), the 10bII had the math library from the 17bII and 48 converted into C (essentially a assembly->C converter program). This gave you C code, but really it was just assembly with tons of goto and so on like you'd use in assembly. As you can guess, that isn't very easy to edit/modify.

Thus later cyrille spent a long time remaking the math libraries in platform independent C by going back to the original assembly, using the documentation and source to redo it it, and that math library has now been used in several software versions (like the 12cp on iphone and the calcpad PC software), in the 20/30b and will be in future calculators/software.

The 15c source definitely wouldn't allow a simple recompile or anything, but it would make it possible to much more easily make a version of the 15c that could be easily expanded to allow more memory, operations, connectivity or whatever.

TW

*Message #11 Posted by **Martin Pinckney** on 21 Feb 2011, 12:10 p.m.,*
in response to message #10 by Tim Wessman

So then is "source code" for HP calculators usually a high-level language, or assembly language?

Just trying to understand.

Re: HP-15C, an interesting question

*Message #12 Posted by **bill platt** on 21 Feb 2011, 12:35 p.m.,*
in response to message #11 by Martin Pinckney

We know who designed the space program and the engineers who designed the Apollo. We know who developed the 48 series (Wickes). Do we know who

designed the 15c?

Re: HP-15C, an interesting question

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Feb 2011, 4:37 p.m.,*
in response to message #11 by Martin Pinckney

From partial (very short) listings appearing in HP Journal, I would assume that Assembly was certainly used in the first models, and possibly up to HP41 or Voyagers (Nut processors, around 1980). That would also be consistent with the need to optimize ROM space, and with statements about usage of ROM capacity at that time. When Saturn-family processors appeared in Pioneers (1987), some more evolved software development tools were possibly in use. Please take these ideas as "educated guesses", as I have no documentation to confirm them, apart from the HP Journal articles.

Re: HP-15C, an interesting question

*Message #14 Posted by **Tim Wessman** on 21 Feb 2011, 7:32 p.m.,*
in response to message #11 by Martin Pinckney

Depends.

The 20/30b are platform independent C. There are some ARM ASM routines for some of the low level addition/subtraction type things, but there are also platform independent C routines of the same thing.

The 12cp is C, but has a lot of specific thing to the processor that made moving it to the iphone more difficult.

The 48s were developed in Saturn Assembly, and sysRPL. Then the later models had C for the OS that emulates the old saturn processor.

I have no clue what things like the 300s are developed with, but I'd guess C.

TW

Re: HP-15C, an interesting question

*Message #15 Posted by **Marcus von Cube, Germany** on 22 Feb 2011, 7:14 a.m.,*
in response to message #14 by Tim Wessman

Tim, when you're talking "C" is it pure C or C++? I assume that dynamic memory management - almost inevitable with C++ - poses problems with memory constrained devices like the 20b/30b.

Re: HP-15C, an interesting question

*Message #16 Posted by **Tim Wessman** on 22 Feb 2011, 10:03 a.m.,*
in response to message #15 by Marcus von Cube, Germany

The math library is pure C, as are the 20/30b.

You are correct that C++ does tend to need more memory and be less memory efficient and is thus not as good for very low memory devices.

TW

Re: HP-15C, an interesting question

*Message #17 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Feb 2011, 8:58 a.m.,*
in response to message #5 by Martin Pinckney

Of course, Eric can comment on his own work as his convenience, but I would like just to mention that, as far as I know, HP didn't released the HP-15 (or other calculator) ROM images at any time. However, with lots of work and some specific data-capture hardware he developed, Eric was able to recover the binary ROM content of many old calculators. Older models had no copyright claims, so he was able to publish such contents; and he took care not to publish images of newer, copyrighted models. However, after such research, it seems that HP claimed copyright of some of the older models, which caused Eric to remove those images from his Nonpareil site.

Re: HP-15C, an interesting question

*Message #18 Posted by **Thomas Klemm** on 20 Feb 2011, 11:19 a.m.,*
in response to message #3 by robert rozee

Searching within forum archives

*Message #1 Posted by **Jim Yohe** on 19 Feb 2011, 10:39 p.m.*

Let me start out asking whether what I'm asking below has been asked before and if so where? So, I'm sorry to ask this but ...

1) Is it possible to search across more than one archive at a time?

[I don't see an obvious way to do this so I've been entering each archive and repeating my search.]

2) Is it possible to search for a phrase surrounded by quotations or perhaps another character?

[When I've tried this using quotations it will return the words I've used within my phrase but they are each word is separated by comma under the heading, "Containing Any of the Keywords:". Should I use "All" instead of "Any" within the option, "Only messages containing * of the following keywords:", if often won't return any results.]

3) Can I perform a search using boolean expressions?

[I'm probably pushing my luck even asking this. ;-)]

Re: Searching within forum archives

*Message #2 Posted by **NateB** on 19 Feb 2011, 11:07 p.m.,*
in response to message #1 by Jim Yohe

You can use Google's advanced search feature. Enter "hpmuseum.org" in the "Search within a site or domain" box.

Re: Searching within forum archives

*Message #3 Posted by **Jim Yohe** on 20 Feb 2011, 3:37 a.m.,*
in response to message #2 by NateB

Good idea. Thanks.

Re: Searching within forum archives

*Message #4 Posted by **Dieter** on 20 Feb 2011, 1:30 p.m.,*
in response to message #3 by Jim Yohe

The idea gets even better since it does not require Google's "Advanced Search" page. All you need is an additional "site:hpmuseum.org" in the usual search window. This limits the search to the specified site. So, searching for HP67-related topcis is as simple as entering **HP-67 site:hpmuseum org**. Try it by clicking here

There are lots of other useful options like this. Some of them can be found at the Google support site and much even more interesting stuff at the Google helpcenter.

Dieter

Re: Searching within forum archives

*Message #5 Posted by **Raymond Del Tondo** on 19 Feb 2011, 11:41 p.m.,*
in response to message #1 by Jim Yohe

IIRC correctly this topic comes up sometimes;-)
The search function is somewhat limited, but you could try google,
which also finds archived articles.

in response to message #1 by Jim Yohe

My favorite: Buy a copy of the Museum DVD , copy it to your computer's hard drive and use Google Desktop to search the archives.

Since many of the PDF files are (thankfully) OCR'd now, you will get both the Archives and Manual hits in the search returns.

For a nominal cost There are three benefits to this approach: 1) You get the manuals on PDF (thousands of dollars of printed manuals) 2) You support this site 3) You can search other files on your machine in parallel.

Re: Searching within forum archives

*Message #7 Posted by **Jim Yohe** on 20 Feb 2011, 3:35 a.m.,*
in response to message #6 by Allen

Very good idea. Been thinking of doing that anyways.

Re: Searching within forum archives

*Message #8 Posted by **Walter B** on 20 Feb 2011, 4:54 a.m.,*
in response to message #7 by Jim Yohe

The DVD is worth the $$ for sure. If you're thinking of installing Google Desktop, read their data privacy statements first. They may change your mind ...

Re: Searching within forum archives

*Message #9 Posted by **Jim Yohe** on 20 Feb 2011, 1:00 p.m.,*
in response to message #8 by Walter B

Thanks for the advise. I would never install that desktop nor any other desktop utility. No, I just meant about meaning to purchase the DVD set. ;-)

HP-35S hung in "Memory Clear" loop?

*Message #1 Posted by **Scott Newell** on 18 Feb 2011, 11:04 a.m.*

Using my 35S this morning, it missed a keystroke, then started flashing "MEMORY CLEAR". I've yanked the coin cells (which measure about 2.8V each) and left them out 30 minutes or so: no help. I tried some self test key combinations: no help. I've shorted out the coin cell terminals: no help.

Is there anything else I can try?

Re: HP-35S hung in "Memory Clear" loop?

*Message #2 Posted by **Paul Gaster** on 18 Feb 2011, 11:56 a.m.,*
in response to message #1 by Scott Newell

I think you have to use a paper clip to hit the reset button on the back of the calculator. You will lose all programs and equations you entered, but you really don't have much of a choice.

Re: HP-35S hung in "Memory Clear" loop?

*Message #3 Posted by **Scott Newell** on 18 Feb 2011, 12:34 p.m.,*

HP Classic Models Battery Pack Rebuild

*Message #1 Posted by **ben ong** on 18 Feb 2011, 9:07 a.m.*

I hope someone will have the knowledge and experience to assist me regarding HP-35/45/55/65/67/70/80 rebuid battery pack:- (1) I used the recovered battery pack holder and metal strips and rebuid 2 battery packs using the same type of batteries (NiMh). (2) After the rebuit, I tested both with digital multimeter and confirm that current are in fact flowing through each pack's metal strips because each pack registered approximate 4.0 volt (freshly charged). (3) However, and this is the strange thing, one of the pack is working perfectly when I put it into the calculator and the other just failed to light-up the display of the same calculator. I've checked many times and confirm that the metal strips are in fact touching the calculator's contacts, but yet nothing happen! 4) Can someone throw me some light as to how to go about diagnose this? Your valuable comment is very much appreciated.

Re: HP Classic Models Battery Pack Rebuild

*Message #2 Posted by **Kees van der Sanden** on 18 Feb 2011, 12:38 p.m.,*
in response to message #1 by ben ong

I assume the failing battery pack contains a bad cell. Please measure the voltage across both battery packs unloaded and loaded with a resistor of about 100 Ohm. If one or more cells are broken, the voltage will drop significant compared to the unloaded value.

Re: HP Classic Models Battery Pack Rebuild

*Message #3 Posted by **Ignazio Cara (Italy)** on 18 Feb 2011, 12:42 p.m.,*
in response to message #1 by ben ong

Clear very well the metal strips on the battery packs.

*Message #4 Posted by **Jim Horn** on 18 Feb 2011, 12:57 p.m.,*
in response to message #3 by Ignazio Cara (Italy)

A couple of unlikely possibilities:

When you probe the battery pack, could the pressure of the probes be making the metal strips contact the cells in a way that isn't the case when the pack is tried in a calculator?

Are the cells installed with the right polarity?

Re: HP Classic Models Battery Pack Rebuild

SpeedUI 11.02 released

*Message #1 Posted by **Raymond Del Tondo** on 17 Feb 2011, 7:12 p.m.*

Hello all,

the new version 11.03 includes a minor display bug fix, and switches from the original VV GROB viewer to the fast GROB scroller from Java. This saves nearly half a kilobyte;-)

Please see SpeedUI.pdf for details on how to invoke and use the fast GROB scroller.

Additionally, the documentation is in a process of getting streamlined, and moving from txt to PDF.

The new version is available here:
Walkthrough PDF

SpeedUI 11.03 zip archive
but _not_ on www.hpcalc.org (since the site has not been updated for 3 months now)

Have fun:-)

Raymond

Re: SpeedUI 11.02 released

*Message #2 Posted by **Timo** on 21 Feb 2011, 11:44 a.m.,*
in response to message #1 by Raymond Del Tondo

Hi Raymond!

Thanks for your continued contribution to the HP-48G/GX software inventory. I actually have a question concerning the update from release 11.01 to 11.02. I've read the available documentation but I wasn't able to retrieve an answer from it.

I use a HP-48GX with SpeedUI 11.01 installed. I have all of the 11.01 libraries installed except the Input Form Builder.

My question is: Which specific libraries do I have to replace on my HP-48 and what would be the sequence to do it?

Thanks for your help in advance and best regrards, Timo

Re: SpeedUI 11.02 released

*Message #3 Posted by **Raymond Del Tondo** on 21 Feb 2011, 5:11 p.m.,*
in response to message #2 by Timo

Hi Timo,

generally I'd suggest to update all libraries to the newest revision.

However, I have just uploaded the SpeedUI 11.03 archive.

In this case only the files CF.LIB and UI.LIB have been changed, so these are the mandatory files to update.
I strongly suggest this important update, since the old 11.01 and first batch 11.02 contained a serious bug, which is fixed in 11.03 .

http://www.hpmuseum.org/guest/deltondo/sui_1103.zip

I have added a StartHere.pdf to the archive, which also contains an uninstallation paragraph.

Best Regards

Raymond

When you have it hooked up, with the cursor flashing, execute PRX on the HP-41.

in response to message #1 by dinamarco

Is this the "monitor" that you can drive with the 41CX?

Re: HP IL video interface

*Message #7 Posted by **Garth Wilson** on 17 Feb 2011, 11:08 p.m.,*
in response to message #6 by bill platt

There were a couple of HPIL video interfaces which put text out on a composite video signal. A separate modulator was required if you wanted to use them with a TV. I have the 80-column 24-line HP92198 made by Mountain Computer for HP. There was a smaller 40-column one that was in the same case as the HP 82169A HPIL-to-HPIB interface converter, 82164A HPIL-to-RS232, and 82165A HPIL-to-parallel. I don't know the model number but I saw one on eBay several months back.

The monitor is nice especially for seeing a program listing as you develop the program, without having to keep printing and printing. With the 41's ACA function, you can make lines as long as you want though, not being limited to 24 characters, so there's lots more you can do with it-- just not graphics.

*Message #8 Posted by **dinamarco** on 19 Feb 2011, 10:36 p.m.,*
in response to message #7 by Garth Wilson

The system I bought on these site was the HP 82163A. And only flashing blank blocks.... nothing more... I have the HP 82164A (RS 232) Is it possible to turn into a monitor????????????? sorry about the question. Regards.

Re: HP IL video interface

*Message #9 Posted by **Garth Wilson** on 20 Feb 2011, 12:25 a.m.,*
in response to message #8 by dinamarco

The flashing blank block sounds like the cursor waiting for data. Did you select the device and send it data?

The 164 shares only the case type. It cannot be turned directly into a video interface, but it could be connected to an RS-232 terminal.

Re: HP IL video interface

*Message #10 Posted by **dinamarco** on 19 Feb 2011, 10:30 p.m.,*
in response to message #6 by bill platt

The system, when turned into a monitor, flashs a blank block, If turned on or off the calculator, no difference could be seen. I changed the calc for another, and changed the HP82160A for a new one... No difference.

Re: HP IL video interface

*Message #11 Posted by **J-F Garnier** on 20 Feb 2011, 8:57 a.m.,*
in response to message #10 by dinamarco

... I changed the calc for another, and changed the HP82160A for a new one

So I assume you tried to use it with a HP-41. The video interface needs explicit commands from the HP-41 to display something. Maybe your interface was working correctly, but you didn't know how to use it. Should you have ask to this forum before sending it back to the seller?

Re: HP IL video interface

in response to message #11 by J-F Garnier

I see the negative feedback logged for coburlin. I wouldn't feel bad about returning it at all. At the Fixed Prices that he sells things at, you should be able to expect some service with the sale. From comments when coburlin relisted it, it appears he doesn't have any clue about what he is selling either.

I own and have used an HP-IL video interface. It works just like an HP-IL printer. When you connect a printer to the HP-IL loop, it does not do anything until you send it print commands. Same thing with this video interface. A blinking block cursor is its way of telling you it is ready to receive data from the controller on the loop (HP-41).

> Quote:
>
> [..]At the Fixed Prices that he sells things at, you should be able to expect some service with the sale.

Yes, of course. But at the high price the buyer paid for this item, one could also expect that the buyer knew what he bought. Obviously he didn't know. However the buyer could have asked the seller about the functionality issue before sending the obviously functional unit back, so that seems to have been a communication problem;-)

About ten years ago I sold a NOS HP-21S for a fixed price (100 bucks), and after receiving the calc the buyer complained about the calc beeing ten years old! Pfffff...I mean, someone paying that much for a relatively simple yet rare calc should know beforehand what he's doing.

*Message #16 Posted by **Raymond Del Tondo** on 9 Mar 2011, 3:58 a.m.,*
in response to message #15 by dinamarco

After rereading the 82163 manual I have to admit that the 82163A manual is not really suited for the end user. It describes how to connect the devices, but it implies that the user

knows how to get data sent to the interface. The "Operation" section mentions in one sentence that the interface responds to many printer commands sent to it. Unfortunately there are no examples given. Section "Controlling the Video Interface" mentions that at startup the interface is in an inactive mode, w/o telling what that means. Appendix C mentions the HP-41 as controller, and that's the only section where the user can get an idea to use OUTA, or printer commands to actually get some reaction from the interface.

So, sorry for my harsh words and ingnorance. Actually it wasn't your fault. Instead, it's the fault of the lousy manual.

Re: HP IL video interface

The reason the 82163A manual doesn't explain how to print to it is that it may be used with many different controllers, and it is assumed that the manual for the HP-IL interface for the controller will describe how to select a device and send output to it. In the case of the HP-41, that would be the 82160A manual.

Other controllers that can talk to the 82163A include

- HP-71B with HP 82401A,
- HP-75C/D
- Series 80 or HP 9915A with HP 82938A
- HP-110 or Portable Plus
- HP 150 with HP 45643A
- HP-1630/1631 series logic analyzers (depending on firmware version)
- HP 9807A (Integral) with HP 82924A
- PC compatibles with HP 82973A
- a small number of third-party controllers.

All of these have substantial differences in how one talks to HP-IL devices. It would not have been practical for the 82163A manual to explain printing from each of them; that would have been like expecting the manual for a printer with a Centronics interface to have had instructions for how to print from a wide variety of different computers. (Back then the PC and Windows had not yet cornered the market.)

I/O subsystem not working on HP-41CV?

*Message #1 Posted by **Philippe Lasnier** on 17 Feb 2011, 9:17 a.m.*

Hi all,

I've just received a very good looking HP-41CV from 1983 (Singapore). I have been told it was well looked after, and it looks it, but unfortunately it doesn't work very well.

My diagnosis (possibly flawed) is that the I/O subsystem is faulty. I deduced that from the following observations:

- Start from fresh. Batteries have been in for a while, but the calculator hasn't been turned on for hours.

- Turn on. The calc on its own (no module, no card reader, nothing inserted in the ports) works fine. I haven't found any problem with it.

- Plug in a card reader (81104A), and a CAT 2 doesn't report anything. Nothing happens if you try to insert a card in the reader (the reader works fine in any of my other HP-41's).

- Plug in a TIME module (with or without the card reader still plugged in), and the calculator goes mad, with random characters (including lots of "@" for some reason) flashing on an off, and no real keyboard control. The calculator usually cannot be turned off except by taking the batteries out.

- After a while of on/off/batteries out and messing around with the keyboard, the calc slowly "stabilises", and eventually things start to work. A CAT 2 correctly reports the TIME module and the card reader. Things look peachy. The stopwatch works, and the card reader reads cards properly.

- Turn off the calculator (and go to bed in my case).

- Turn on the calculator some time later (as short as 1/2 hour) - mayhem again...

A layman's speculation is that something needs to "warm up". I thought maybe a faulty capacitor would be the cause?

In the absence of Geoff's repair book (I'm signed up for when it comes out), I am reduced to asking for your help (and Geoff's, if he is reading this).

Any precise idea what this could be? Is that repairable?

Of course, if it's not repairable I could just "sacrifice" it to become the shell of a HP-41CL :-)

Regards,

Philippe

Re: I/O subsystem not working on HP-41CV?

*Message #2 Posted by **John Robinson** on 18 Feb 2011, 2:40 a.m.,*

in response to message #1 by Philippe Lasnier

Hi Philippe,

From the date, 1983 I am pretty sure you have a "fullnut" type of CV. It sounds like the contact between the I/O block flex circuit board and the display/keyboard is not good. This could be due to one of two problems. The contact is just dirty, or even slightly corroded, or that one or both of the top two screw posts is cracked or broken. When this happens, the screws are not tight enough to make good contact.

You will need to disassemble the calculator regardless. Hopefully it's just dirty contact, and not broken screw posts. If the screw posts are not cracked or broken, clean the I/O block flex circuit board connector and the contacts on the display keyboard, and hopefully all will be good. If the screw posts are broken, there are one or two forums postings/articles on this documenting repairs, or contact me offline about repairing it.

Cheers, John

Re: I/O subsystem not working on HP-41CV?

*Message #3 Posted by **Philippe Lasnier** on 18 Feb 2011, 8:41 a.m.,*
in response to message #2 by John Robinson

Hi John,

Thanks for your reply and help.

Yes, the HP-41CV is a fullnut, and I am familiar with the flex connector, and posts, problem. I should have mentioned that I had thought about that. I didn't think it was a possible cause because the calc is tight all around, and there is no indication of any weakness in that area (no squeek, no play). There is no indication either that the calculator had even been dismantled (if it had, it would have been a professional job). I even put pressure at various points while testing just in case, but that didn't change anything.

Ultimately what convinced me that it probably wasn't a contact problem was the fact that *after a while* the calculator starts to behave properly. Since it's sitting on a desk the whole time, it didn't look like an environment issue (e.g. change of temperature forcing the connector to make a better contact); so I was left with the possibility of an electronic problem. I will probably open up the calculator anyway, to check.

I vaguely remember that there are two "large" electrolytic capacitors on the main board that can go bad, but I thought that these were part of the power supply control. If that were affecting the power enough to bother the card reader, I wouldn't however have thought that it would affect the TIME module.

Thanks again,

Philippe

Re: I/O subsystem not working on HP-41CV?

*Message #4 Posted by **John Robinson** on 20 Feb 2011, 6:24 a.m.,*
in response to message #3 by Philippe Lasnier

Hi Philippe,

You can't really tell if a 41 has been opened or not, as the screws are under the four rubber feet. The feet can certainly be reused after re-assembly.

You could well be right about the 41 logic board and even the capacitors, but I still think a good clean of the connectors, both the I/O flex board connection and the connectors between the logic board and

keyboard etc. It's worth a shot.

You may need to test the logic board in another calc. I could help you with that if need be, and I may even have a spare CV board to match yours.

Cheers, John

Re: I/O subsystem not working on HP-41CV?

*Message #5 Posted by **Philippe Lasnier** on 20 Feb 2011, 12:43 p.m.,*
in response to message #4 by John Robinson

Hi John,

> Quote:
>
> You can't really tell if a 41 has been opened or not, as the screws are under the four rubber feet. The feet can certainly be reused after re-assembly.

Yes, I know. I have opened 41s before, and carefully saved the feet myself.

> Quote:
>
> You could well be right about the 41 logic board and even the capacitors, but I still think a good clean of the connectors, both the I/O flex board connection and the connectors between the logic board and keyboard etc. It's worth a shot.

Indeed, so I took the plunge this afternoon and took the calculator apart.

The first thing I noticed is that it had *quite possibly* already been opened before. That's because one of the four feet has its backing adhesive tape missing (probable indication that the foot had been removed). Also, two of the four feet recesses had a slight but unmistakable notch; the type you could get by trying to pry up the foot using a small screwdriver. Of course, removal of the feet is no proof that the screws were taken out and the calculator opened...

All four posts were intact and solid. A minor amount of gunk was around the two halves and the spacer "U" strip - cleaned that. Some dust under the display glass - flushed it with compressed air.

The I/O block was in good condition overall. However, the narrow and long foam block that forces the connector stripe onto the PCB looked out of shape; that's not surprising really (29 years). The contact areas for that locked a bit lacklustred, especially on the I/O block. The 4 connectors to the modules looked good, but you could easily see where contact springs from modules had been - all that could go with a good clean.

I unfortunately don't have a good contact cleaner (for now), so I simply used a solvent and cotton buds and cleaned the PCB and I/O block connection areas as best I could.

I then reassembled the 41CV temporarily.

That brought **some** measure of success: the calculator immediately recognised the card reader this time, and I was able to feed a card; so it's working.

The TIME module also worked, but only in position #4 (that of the card reader). In position #2 it appears to work (CAT 2 is fine), but execute CLOCK and the calculator turns off. In position #3 the

calculator goes mental (crazy display and piezo whining). In position #1 it "works" but you can hear a faint whine from the piezo.

In summary, I think this confirms that you were perfectly correct: it's the I/O block (contacts and connectors) that appears to be the culprit.

Once I get a proper contact cleaner (I was thinking DeoxIT D100S-2 - any comment?) I should be able to fix it properly.

NB: I left the contact strip between the keyboard PCB and the CPU PCB well alone; that worked, no need to rock the boat.

> Quote:
>
> You may need to test the logic board in another calc. I could help you with that if need be, and I may even have a spare CV board to match yours.

Thanks for the offer :-) I guess that could come in handy if a full and proper clean doesn't fix the problem entirely.

Thanks again.

Regards,

Philippe

Re: I/O subsystem not working on HP-41CV?

*Message #6 Posted by **John Robinson** on 20 Feb 2011, 7:06 p.m.,*
in response to message #5 by Philippe Lasnier

Hi Philippe,

I am glad to hear you have had some success with the CV. I think you're correct about leaving the log board/keyboard connector strips alone, they are easy to damage.

As for the cleaner, the products available to me in Australia are probably different to what's available to you, but in general I use Electrolube (U.K. made) products.

You could just use to isopropanol, often available from supermarkets, the purer the better. The one I use is 70% isopropanol, which is sold as "rubbing alcohol".

Good luck

Cheers, John

1st Gen HP-35

*Message #1 Posted by **aj04062** on 16 Feb 2011, 11:34 p.m.*

Can anyone enlighten me on the following?

I just picked up a S/N 1143 calculator. Thought it might have "the bug", but it doesn't. I have a S/N 1249 calculator with the bug.

Both have raised dot on the 5.

The back label on the earlier calculator matches one I have starting at 1302. These labels state on the top HEWLETT-PACKARD HP-35 INSTRUCTIONS whereas the '72 unit only has HP-35 INSTRUCTIONS. Does this indicate the unit was sent back for repairs and the different label was applied?

I do notice the battery compartment is two piece and can see the board through the slight crack.

Re: 1st Gen HP-35

*Message #2 Posted by **Michael de Estrada** on 17 Feb 2011, 12:53 a.m.,*
in response to message #1 by aj04062

Hard to say. I have a s/n 1249 version 2 with the bug and the label has HEWLETT-PACKARD.... on the top. So, I'm not sure if a s/n 1143 version 2 should not have this version of the label as well. I've also seen labels w/o the Hewlett-Packard name on other HP models of various vintages, so it is inconclusive. Maybe it was returned to HP for repair or maybe someone mixed parts. It's also possible that it never had the bug in the first place. As to the battery compartment; I believe thay are all two piece, but some have a noticeable gap, whereas others are flush so you can hardly see it.

Re: 1st Gen HP-35

*Message #3 Posted by **Frank Boehm (Germany)** on 17 Feb 2011, 4:28 p.m.,*
in response to message #1 by aj04062

Very likely (like in close to 100%) this one has been sent to HP to replace the bugged ROMs - the "old" backlabels probably were no longer in stock, so they just stickerd current ones onto the calculator.

Re: 1st Gen HP-35

*Message #4 Posted by **Michael de Estrada** on 17 Feb 2011, 11:08 p.m.,*
in response to message #3 by Frank Boehm (Germany)

See this current TAS auction and look at the photos. This is a s/n 1143 HP-35 version 2 calc with the bug and a rear label with "HEWLETT-PACKARD MODEL 35 INSTRUCTIONS" on it. Notice that the serial number is inside the battery compartment and not outside as on some earlier production. So, like I said, the type of label is inconsequential. Yes, the calc was probably sent to HP for replacement of the ROM, but the label is not the determining indicator of this. The only way to know for sure is to open the calc and look for stickers on the pcb and ROM numbers.

in response to message #1 by svisvanatha

Very nice! Now take the next step ...

Re: HP-30B Fun (HP-45 Simulator...)

*Message #3 Posted by **svisvanatha** on 17 Feb 2011, 9:39 a.m.,*
in response to message #1 by svisvanatha

My next step will be to locally compile my own binary of the HP-45, and successfully load that.
The demo I showed was with the pre-built binary from the 20B wiki.
Once that is done, then I will take the leap with the wp-34s.
I saw in another post it was mentioned that it was not ready for deploying to the hardware - is that still the case?

Edited: 17 Feb 2011, 10:15 a.m.

Re: HP-30B Fun (HP-45 Simulator...)

*Message #4 Posted by **svisvanatha** on 20 Feb 2011, 11:25 a.m.,*
in response to message #3 by svisvanatha

Have spent some time trying to build the hp-45 demo in Ubuntu. I can successfully compile the binary with CodeSourcery, but it does not flash into the device with sam-ba (from WinXP).

Incidentally, I cannot get one environment to work with both CodeSourcery and Sam-ba. In Ubuntu, I cannot get sam-ba to show the dialog that you use to select the BIN image. And in WinXP, Sam-ba works fine, but I am not sure how to compile with CodeSourcery!

I should perhaps stick to Aircraft Engineering ! Any tips on either getting sam-ba to work in Ubuntu, or what to do with CodeSourcery in WinXP? Many thanks.

> And in WinXP, Sam-ba works fine, but I am not sure how to compile with CodeSourcery!

I did most of the dev work with the CS (or was it the RTEMS?) tools under win2k. I did check the build with a scratch built gcc cross compiler under openbsd/sparc64, so it should be fairly portable. I've got a x86 VPS running Debian, which should be close enough to your Ubuntu--I'll try and test it out today if I get a chance.

in response to message #4 by svisvanatha

Thank you for the reply. Some further information.

I have now managed to use both CodeSourcery and Sam-ba from within WinXP. I was missing the fact you had to use 'cs-make' to make the project.

1. I compiled demo_45 from source using cs-make from within WinXP. This gives a bin file of size 16772 bytes.
That does not match the size of the bin file (i.e. 16896 bytes) from the demo_45 tar.gz archive .
2. There was one warning in the compile process, in line 533.
3. The 30B does not turn on after following the usual flashing procedure with this bin file.

41CL

*Message #1 Posted by **Monte Dalrymple** on 16 Feb 2011, 2:23 p.m.*

If the following people are still interested in a 41CL,
could they send me an email so that I can contact them
directly?

Diego Diaz
Paul Dale
Bill Zimmerly
"db"
Luiz Vieira
Massimo Gerucci
Raymond Del Tondo

If you're not interested, please let me know so that I can
offer one to somebody else?

email me at monted@systemyde.com

You can check the status at 41CL page

Thanks, Monte

So this is why we have not seen a 15c+ yet.

Re: HP policy on source files

*Message #7 Posted by **Namir** on 15 Feb 2011, 11:25 p.m.,*
in response to message #6 by Martin Pinckney

Same reason you will not see the 15D, 15E, 15F an so on ... because HP will not make these models. Same reason you will not see a TI59+ from TI. With limited resources, HP is most likely focusing on combining new (reads hip and exciting) and practical (that is stuff that sells well) technology. If HP will revive any vintage machine, I'd say it's the HP41CX because the 41C/CV/CX sold very well (check the number of these auctions in TAS).

As for me, I want my HP41C+ .. and I want it now ... with at least one or two USB ports to support USB printers and USB external drives!!! I hope Tim is listening!

Re: HP policy on source files

*Message #14 Posted by **Mike Morrow** on 18 Feb 2011, 2:46 p.m.,*
in response to message #12 by Eric Smith

Who wrote the firmware for the HP 30b? That's a very nicely done recent product that does *not* rely on an ARM emulating HP firmware from some ancient HP of two or three decades earlier.

My dream would be a small "scientific" machine with completely original new firmware native to some version of an ARM with good LCD controller capability and the ability to use lots of RAM. The implementation of HP 42S capabilities in an HP 30b-sized and -styled package would be an exciting product, especially if the firmware were optimized to the new machine's processor. The HP 30b is 100 times faster than the HP 42S for the types of non-finance problems that are not limited by the 30b's characterisitcs, and ten times faster for the same problems done on the ARM-based but Saturn-emulated HP 50g. Native code makes a big difference.

So...for new calculator development, the existence of legacy firmware from an old project should be of only historical (not production) value, IMO.

In theory, yes. However, as we have seen in the case of the 33s and 35s, for whatever reason HP did not start from scratch, but apparently used the 32sii firmware as a starting point. Ideally, write new firmware implementing the functionality of both 42s and 27s, but if that is not possible, then start with 42s code and modify it.

Re: HP policy on source files

*Message #17 Posted by **bill platt** on 18 Feb 2011, 11:15 p.m.,*
in response to message #16 by Martin Pinckney

The 33s / 35s used the 32sii starting point for some obvious reasons.

Top of the list was the pretty solid market for the PE exams. Along that same list was to match the functionality of the 32sii which is probably the most popular model ever made.

I(can't fault them for that approach. Too bad they didn't put more rigor into testing or being involved more directly or something so as to avoid the bug problems that had to be sorted, and the hardware (keyboard) issues that cropped up. They sorted it but got some bruises around the eyes.

I wasn't involved, but I don't think the 33s and 35s used ANY of the 32SII code. The 33s code appears to have been a from-scratch effort, most likely written in C, and intended to have functionality similar to the 32SII. Why? Because it sells!

> Quote:
>
> implementing the functionality of both 42s and 27s

Obviously a bunch of us here in the forum would buy that, but it's far from clear that the world at large would. HP has to invest their resources into designing what they think the market will actually buy.

> Quote:
>
> then start with 42s code and modify it.

I very much doubt that you'll see any calculators with code derived from any Pioneer series models, as those were all written in Saturn assembly and/or RPL. Any new models (other than 38/39/40/48/49/50 series) are likely to be derived from 20b/30b code base.

I don't work at HP, so this is all just my opinion.

Not being a software guy, I did not use the correct terminology. Obviously, "code" was the wrong word. What is the proper term, a flow chart? What I'm trying to say, is HP, or whoever they source it to, used the 32sii functionality as a starting point.

> Quote:
>
> Why? Because it sells!

It sold because that's all HP offered at the time! It has been demonstrated here that the 42s was far superior as an RPN machine, and the 27s has a far superior Solver than any other pocketable calculator.

But even given that 42s sales faltered before it was canned, nonetheless if indeed written from scratch, the 33s/35s functionality could have been vastly improved over the 32sii.

Rather, I think Bill Platt hit on the real reason, passing muster with the NCEES folks with the least amount of effort.

Re: HP policy on source files

in response to message #19 by Martin Pinckney

> Quote:
>
> What is the proper term, a flow chart?

I doubt that they even had a flow chart to work from. I suspect that the 33s code was developed entirely from scratch. (Well, probably with some code from the 10bii or something.)

> Quote:
>
> It [32SII] sold because that's all HP offered at the time!

No, that's not the reason. The 32SII sold far better than the 42S even when both were available.

> Quote:
>
> the 42s was far superior as an RPN machine, and the 27s has a far superior Solver than any other pocketable calculator.

That has nothing to do with it. Adding more features to a product does NOT necessarily make it sell better.

Not *more*, a *better* feature set. Both 33s and 35s have received mixed reviews, even on consumer websites, let alone this one. I don't think

you mean what customers say has no bearing on sales.

> That has nothing to do with it. Adding more features to a product does NOT necessarily make it sell better.

In any event, not when the marketing is so incompetently prosecuted or purposefully self-defeating as it was with the HP 42S.

I'd used my favorite, an HP-15C, for three years before and eight years after the HP 42S appeared. Had I known the tremendous advance that the HP 42S represented over the HP-15C, I'd have purchased a 42S many years earlier.

When I finally retired my HP-15C, the HP 32SII was the only thing still in the RPN product line that seemed to offer similar capability. I found out after buying a 32SII that it wasn't even *remotely* as capable. Other than having the advantageous portrait layout, a limited alpha capability, and Saturn processor (for greater speed and accuracy), it was incredibly inferior to the old HP-15C. I tossed it in the clunker box (with other junk like the 28C and 38G) and found a source for the HP 42S. (In retrospective fairness, the 32SII is not a bad machine...unless one is comparing it to a 15C or 42S.)

Those of us who had used HP machines for decades made the mistake of assuming that the best models of one year would be replaced by even better models in later years. Sadly, HP broke this tradition in 1995. We're still waiting for a worthy 42S successor today, 23 years after introduction and 16 years after discontinuance.

The reason that the HP 42S did not sell as well as it might have is HP's piss-poor, shoddy, self-defeating marketing. I saw many HP advertisements in US engineering trade magazines such as the IEEE Spectrum for the HP 48SX. I recall none for the HP 42S, even though it is an electrical engineer's dream machine (and still is, even in 2011).

The reasons that the HP 32S/32SII sold adequately before the HP 42S was discontinued was penny-wise-dollar-foolish buyer attitudes (the 42S was 70 percent higher in cost than the 32SII), ignorance of 42S capabilities (due to HP's poor marketing of the 42S), and lack of buyer sophistication (who could imagine no value to 42S capabilities). After the discontinuance of the 42S in 1995, the 32sii sold well simply because it was the *only* small RPN machine available, as Martin points out. This was aggravated by the prices of yet available HP 42S stock rising very sharply after 1995 as HP's strategy was recognized: HP deliberately killed the grossly superior (to 32SII) 42S in order to kill competition to 48-series machines. There would be no successor.

Ever.

Re: HP policy on source files

*Message #23 Posted by **Walter B** on 20 Feb 2011, 12:27 a.m.,*
in response to message #22 by Mike Morrow

I concur with almost everything you wrote. The habitat of the 42S was given up deliberately to promote the more powerful but clunky RPL machines. Their margin must have been significantly better.

Now we have the toys at the low end (up to the 300s), the 35s for US tests (and as a basic scientific calculator with some well known shortcomings), and the 50g for the nerds at the universities etc. That's it. A powerful compact RPN tool is missing since 1995.

One more reason for pushing community projects ... d8-)

It would be interesting to know the number of downloads for Free42 and other 42s implementations to be able to judge the interest in such a product.

John

Re: HP policy on source files

*Message #25 Posted by **Eric Smith** on 20 Feb 2011, 4:27 p.m.,*
in response to message #24 by John B. Smitherman

While the number of downloads of Free42 would certainly be interesting, it would tell almost nothing about how a physical calculator would sell.

Re: HP policy on source files

*Message #26 Posted by **John B. Smitherman** on 20 Feb 2011, 5:36 p.m.,*
in response to message #25 by Eric Smith

Eric, I don't follow your logic. Let's say that Free42 and 42s have less than 100 downloads from iTunes then I wouldn't be interested in further investigation. However, if those products have had 10,000 or more downloads then I would be interested in looking into the potential for a market for a hardware calculator.

It really doesn't matter. HP is going to continue to build financial calculators and do very little with scientific / graphing calculators. With only 2E0 programmers on a planet with 7E9 people it's my opinion that they aren't interested any more.

Regards,

John

Re: HP policy on source files

*Message #27 Posted by **Eric Smith** on 20 Feb 2011, 8:20 p.m.,*
in response to message #26 by John B. Smitherman

What I'm saying is that if Free42 has 10,000 downloads, that does NOT mean that a large number of people would buy a physical calculator, and conversely, that if Free42 has 100 downloads, it doesn't mean that a physical calculator would sell poorly. The markets for samrtphone calculator apps and physical calculators are MUCH different. It's certainly true that there is a non-zero intersection, but the size of one set tells you almost nothing about the size of the other.

I don't have numbers for Free42 downloads, but it is definitely the case that far more than 10,000 people have purchased various scientific calculator apps for the iPhone. If that makes you "interested in looking into the potential for a market for a hardware calculator", more power to you, as I'm all in favor of that and would love to see it happen. Heck, I've been working on that myself for years, as anyone who has attended HHC conferences is undoubtedly aware.

Re: HP policy on source files

*Message #28 Posted by **John B. Smitherman** on 21 Feb 2011, 9:16 a.m.,*
in response to message #27 by Eric Smith

I'm guessing here but I believe that Free42 users are either 42s owners or are those that are RPN calculator users that want to be 42s owners. There should be significant overlap between the two sets.

John

What about the 34s??? A bit light on RAM but otherwise very well featured.

We've got the option to take out many inbuilt functions and replace them with user code alternatives. Less accurate but way smaller leaving plenty of space for other things. I've toyed with a matrix library in the xrom space :-) Likewise, I'm considering TVM support.

Then again, a 32k RAM upgrade for the 42s makes it extremely impressive.

> Quote:
>
> Oh well, the 41CL is around the corner (fingers crossed), rejoice!

Most definitely! I've got a pair of broken 41c's to make whole and convert into a CL. Failing that, I'll happily sacrifice a 41cv for the same purpose.

Here is a recipe to get your favourite Series 10 model with a + on tail.

Since all the Series 10 models are based on the same hardware, and the HP12C+ is a Series 10 hardware emulator

Then :

```
1) put your hand on an HP12C+.
2) find an image of the HP16C ROM (my choice)
3) go to Fort Collins, break into Tim's office and thief the tools and the ROM image
of the actual 12C+ (since this image is not publicly available, as far as I know)
4) swap the 16C image with the one of the 12C inside the 12C+ image
5) load the new image the the 12C+
6) do some painting
```

and tada... you have a magnificent HP16C+ on your desk.

Just a dream :(

In my experience, many computer programmers "accidentally" leave copies of their work on paper tape, mag tape, floppy drive, CD ROM, DVD or thumb drive (depending on the era) at home. These copies have a curious way of remaining intact.

So the best way to find lost source code is to track down the original developers. For the cost of a release of liability and maybe a free plane ticket, you might get the lost source code.

Dave

Re: HP policy on source files

*Message #38 Posted by **Eric Smith** on 16 Feb 2011, 12:41 a.m.,*
in response to message #1 by Raymund Heuvel

HP published the source code for the HP-71B mainframe ROM and the ROM of the related HP 82401A HP-IL interface as volumes of the Internal Design Specifications which were available for purchase by customers. These were the first Corvallis Division products for which internals documentation was made officially publicly available.

I would guess that this official relese of HP-71 internals documentation was done at least partly in response to the amazing amount of third-party development of microcoded ROM code and peripheral hardware for the HP-41 family. That third-party support came about as a result partially of informal release of technical information on HP-41 internals to the user community via the PPC club, and partially of a great deal of reverse-engineering effort by members of the user community. HP likely believed based on the experience with the HP-41 that providing formal support to third parties would result in even more community and commercial support for the HP-71B.

It seems evident that there was a significant expense incurred by HP in preparing the 71 IDS documents for public release. While HP normally did prepare internal documentation for computing platforms, the HP-71B IDS appears to have been prepared in a much more formal and comprehensive manner.

It would be interesting to hear from the individuals involved in the HP-71 IDS as to how successful the program was perceived to be.

In the case of the HP-41, the "VASM" source listings of the mainframe ROM and several plug-in ROMS were made available to the PPC club to be distributed to it's members as Non-Manufacturer Supported ("NOMAS"). I have heard an interesting story about how that came to pass, but not having been party to it, I'll leave it up to others to tell the story or not.

The HP-75 mainframe ROM listing was also provided as NOMAS.

In some cases HP provided other source code and internal documentation to third parties, but under NDA and thus those documents are not publicly available.

Unfortunately, in the handoffs of responsibility for calculator products to a series of other HP divisions after Corvallis Division, much (perhaps most) of the engineering data and documentation for many calculator models was destroyed. This actually included the source code for at least one product still in production at the time! While this sounds inconceivable to people who have not been involved in engineering departments at large companies, I can state from personal experiences at multiple companies (other than HP) that this is actually not uncommon.

in response to message #40 by Martin Pinckney

I should have put the FROM HP in the foreground.
Creating source files should not be such a problem (reverse engineering, OCR scanning of IDS docs and so on).
With the "FROM HP", I mean: usage without any limitation ....

The HP71B IDS docs have clear (c) marks on it,
prohibiting above techniques to convert them into "legal" copies of source files, ROM images and so on.
A lot of countries have a copyright by default even when nothing is claimed by the author and in these countries an explicit waiver is required.

A (legally binding) statement from HP concerning "ancient" calculator engineering work, e.g. putting it under GPL, would be of great help.

Re: HP policy on source files

*Message #42 Posted by **Joel Setton (France)** on 16 Feb 2011, 11:57 a.m.,*
in response to message #41 by Raymund Heuvel

Did HP put any source-code listing in their handheld calculator patents?

From my limited knowledge of legal matters, I understand that anything that is written in a patent automatically moves to the public domain when the patent expires. Thus, any source code which was patented before, say, 1990 is no longer protected.

Could anyone in this forum confirm -- or not?

Joel

Re: HP policy on source files

*Message #43 Posted by **Raymund Heuvel** on 16 Feb 2011, 12:46 p.m.,*
in response to message #42 by Joel Setton (France)

AFAIK
(I am NOT a legal advisor!!)
US: roughly for work created since 1978 the copyright protection is based on the lifetime of the author+ x? years, with multiple authors the longest living author with a maximum of 120 years

Germany / Netherlands (Europe ??)
Like US up to 70 years after death (inheritable).

Rights on Patents is something completely different!

Since most employers write in the contracts with their employees something like: "all rights concerning inventions, patents, copyrights and so on shall be deemed to be transferred to the employer at the time of creation of it", I assume that HP holds all the rights.
HP can check this and act if they want ... :)

Re: HP policy on source files

*Message #44 Posted by **Tim Wessman** on 16 Feb 2011, 4:48 p.m.,*
in response to message #43 by Raymund Heuvel

Berne convention.

US was not a signatory back then, so anything prior to that in the US had to include "copywrite" somewhere within that or it is not protected. Thus there are plenty of 12c software versions around that HP can't do anything about. The ROM didn't include any sort of copywrite notice within it.

So to use this logic, I could "extract" the pages from a book (the physical kind), leaving copyright pages in the cover, then proceed to do what I want with the "extracted" portion? I certainly don't claim any special knowledge of copyright law, but this makes no sense. Then what was the purpose of molding the copyright notice on the back of the device to begin with?

Creating useful source code by reverse engineering is surprisingly difficult.

- You can't just disassemble the entire ROM because some bytes are code and some bytes are data. Figuring out which is which requires finding and analyzing the code.
- Even if you manage to get a disassembly, the lack of labels or comemnts means that it's hard to figure out what is doing what.
- Within the disassembly, you'll find numbers being used, but what do the numbers represent? Addresses? Offsets from addresses? Binary numbers? The distance between two addresses?

*Message #51 Posted by **Jim Horn** on 17 Feb 2011, 12:20 p.m.,*
in response to message #50 by Håkan Thörngren

About 1985 HP made a pile of used HP-110 Portable computers from their sales force available to employees at an auction for $250 each. Sam Chau, a young HP PPC / CHHU / etc. enthusiast and I bought one each. Sam then figured out how and modified his to have 512k of RAM instead of the stock 288k. The natural next step was to modify the firmware ("PAM", the Personal Application Manager) to allow use of the added 224k.

Being HP employees, we contacted Corvallis and asked if the source was available NOMAS (No Manufacture Support - i.e. once we get it we wouldn't bother them with questions) and sent them the details of how it was done. They enthusiastically agreed to provide us the source as many there had Portables and wanted the same capability for theirs.

A month later we were called back. An extensive search in Corvallis had revealed that the source hadn't been backed up and the 8 inch floppies with it had been accidentally reused for the Portable Plus. So

they were shipping computers without having the source code for what they were shipping.

Disassembling PAM revealed that the RAM size was hard coded into it in many places. Sam finally just wrote a driver to treat the extra 224k as a second RAM disk. Still works fine...

The one benefit of this is that Corvallis promptly backed up what they had then and put it away. Whether those backups survived to this day is altogether another story!

Re: WP34s

*Message #3 Posted by **Marcus von Cube, Germany** on 15 Feb 2011, 8:50 a.m.,*
in response to message #2 by Paul Dale

Paul, on which platform is your Windows port based? I'm currently working on the HP20b SDK and I'm willing to port WP34s to Cyrille's emulator. I still have to check, if the application follows the same rules as the emulator (or SDK) force, like having an application.cpp file as the central point for the user interface.

Edit: I just had a short look at your sources. I'm not yet sure where to snap in Cyrille's code. I think, a graphical emulation would be very helpful. BTW, it compiles fine under VC++ Express 2010.

Edited: 15 Feb 2011, 9:35 a.m.

Re: WP34s

*Message #4 Posted by **Marcus von Cube, Germany** on 15 Feb 2011, 3:43 p.m.,*
in response to message #3 by Marcus von Cube, Germany

I've spent some more time with the sources. A standard main() in keys.c which is acting as a key press dispatcher works fine in a single thread environment, but this is not the proper way to interface to an event driven platform. Both the base code in the SDK for the platform and the Windows MFC emulation need callback functions for the handling of events.

Re: WP34s

*Message #5 Posted by **hugh steers** on 15 Feb 2011, 6:14 p.m.,*
in response to message #4 by Marcus von Cube, Germany

for a windows GUI, you'll need to write a new "main" replacing the main loop in keys.c

you'll need to translate any visual buttons into wp34s key events (along with real keys) and call process_keycode. after that signal a display repaint. all other windows events dispatched as normal.

again the display code will need reworking if you plan to render this graphically.

Re: WP34s

*Message #6 Posted by **Paul Dale** on 16 Feb 2011, 1:17 a.m.,*
in response to message #4 by Marcus von Cube, Germany

I don't know the version of Windows used to compile this sorry.

Yes, my main() in keys.c is a keystroke dispatcher. To do an event driving GUI interface, just call the guts of my main() on a key press.

There is no way, you'd want to go multi-threaded on the 30b hardware. Single thread take a key press and dispatch is definitely the way to go. HP's code does it this way as does mine.

- Pauli

Re: WP34s

*Message #7 Posted by **Marcus von Cube, Germany** on 16 Feb 2011, 2:30 a.m.,*
in response to message #6 by Paul Dale

At least the Windows version in the SDK **is** multithreaded. On the real hardware, there must be some background processing and interrupt driven actions, too. Think of automatic power down, processor off/on while the display is visible, and the like. I'll check the sources in the SDK to be sure.

For the rest of February, Meindert's Project has priority. So wp34s is on hold from my side.

Re: WP34s

*Message #8 Posted by **Paul Dale** on 16 Feb 2011, 2:44 a.m.,*
in response to message #7 by Marcus von Cube, Germany

HP's 30b development firmware is pretty much single threaded. There are interrupt handlers and timers of course but in reality they really don't do much of anything. Everything hinges around the key press.

- Pauli

PS: What's Meindert's Project???

*Message #9 Posted by **Marcus von Cube, Germany** on 16 Feb 2011, 11:15 a.m.,*
in response to message #8 by Paul Dale

Meindert is working on the MLDL again. He has added an mbed controller and now needs some demo software for networking.

Re: WP34s

*Message #10 Posted by **Paul Dale** on 16 Feb 2011, 1:19 a.m.,*
in response to message #3 by Marcus von Cube, Germany

My code isn't immediately compatible with HP's SDK. I started merging the two but never finished. The source as distributed includes this partial merge. I'd figured I was going about it incorrectly and what I had done needed to be removed and my code modified to integrate with HP's to take direct advantage of their low level support. Then life got in the way, not to mention having no access to the development environment HP's sources require.

First WP 34S mini-challenge (Was: Re: WP34s)

*Message #20 Posted by **Gerson W. Barbosa** on 16 Feb 2011, 3:17 p.m.,*
in response to message #17 by Paul Dale

Hello Paul,

> Quote:
>
> So this display looks legitimate to me.

It IS legitimate. Here is a link to an UNEDITED copy of my HP notebook screen, as of yesterday:

link

Now, to the mini-challenge. In order to get the number on the wp34s screen, trivially 13 keystrokes are required:

```
1 4 1 . 4 2 6 5 6 4 7 6 9
```

The challenge is to get this done using at most 11 keystrokes (not programming steps). My 11-keystroke solution will not work on the HP-42s because it will give an answer in excess of 1 ulp.

Likewise on 10-digit calculators it will be needed no more than 11 keystrokes to get 141.4265648. So far I have been able do it using only 10 keystrokes on the HP-35 (1972), but not on the HP-15C (I think this gives a hint to at least one keystroke). If it can be of any help, the 16-digit result is 141.4265647689814 (The meaning of this is part of the challenge, otherwise the WP 34S solution would be somewhat easier :-)

Cheers,

Gerson.

Re: First WP 34S mini-challenge (Was: Re: WP34s)

*Message #21 Posted by **Paul Dale** on 17 Feb 2011, 12:35 a.m.,*
in response to message #20 by Gerson W. Barbosa

Not a solution to the specified problem, but I stumbled upon this which qualifies as an elegant near miss I feel:

```
  command      34s keys              15c keys
    9          9                     9
    e^x        f XEQ                 e^x
    ->HR       -> f RCL              g 2
    ->RAD      -> RCL                f 3

answer:        141.4265468089978     141.4265468
keystrokes:    8                     6
```

- Pauli

Re: First WP 34S mini-challenge (Was: Re: WP34s)

*Message #22 Posted by **Gerson W. Barbosa** on 17 Feb 2011, 2:19 p.m.,*
in response to message #21 by Paul Dale

Paul,

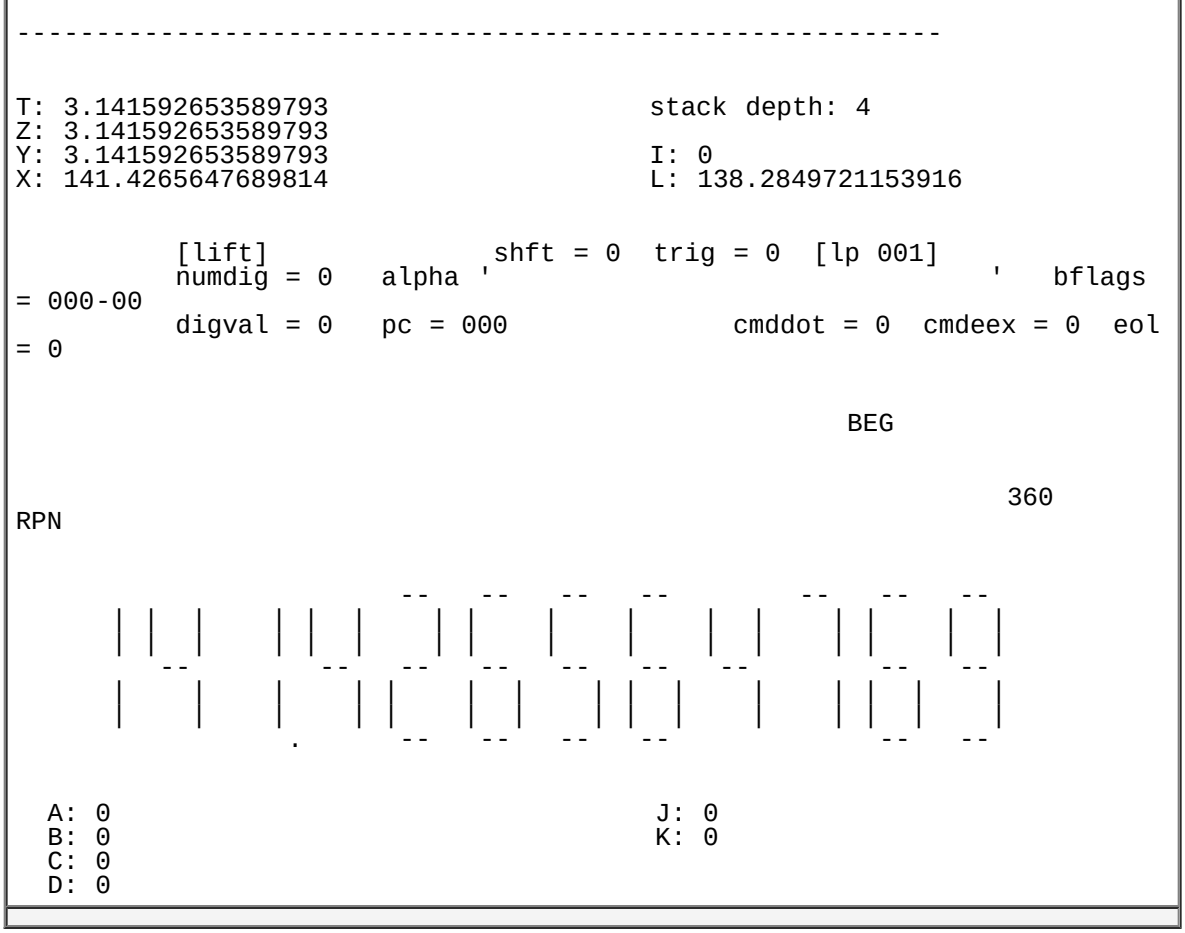
That's only four programming steps for eight correct digits which would be great in calculators with reduced number of steps (if such a number is ever needed in a program).

I submitted 141.4265647689814 to WoframAlpha but it wasn't able to find the correct closed form, neither did other inverse calculators I tried. So, there's at least one thing I know WolframAlpha does not :)

A tip to the 10-keystroke HP-35 solution: Divide 141.4265648 squared by pi then multiply the result by 3. Though this looks like an integer on the HP-35, it's actually an almost integer. The backwards operations yield an approximation to the real closed form solution, which I hope the WP 34S screen below is a hint to.

Regards,

Gerson.



Re: First WP 34S mini-challenge (Was: Re: WP34s)

*Message #23 Posted by **Gerson W. Barbosa** on 18 Feb 2011, 10:36 a.m.,*
in response to message #22 by Gerson W. Barbosa

Ok, here it is:

```
 141.4265647689814.. = pi + pi^2 + pi^3 + pi^4

                     ~ sqrt(19100*pi/3)
```

Alternative closed forms:

```
(pi^5 - 1)/(pi - 1) - 1

 pi*(pi + 1)*(pi^2 + 1)
```

WP 34S keystrokes:

```
h 3 ENTER ENTER ENTER * + * + * +
```

HP-35 keystrokes:

```
1 9 1 0 0 pi * 3 / sqrt
```

*Message #24 Posted by **Walter B** on 18 Feb 2011, 2:40 p.m.,*
in response to message #23 by Gerson W. Barbosa

Olá Gerson,

you could have saved one stroke by using FILL on the wp34:

h 3 g ENTER * + * + * +

while on the hp-35 you have to repeat ENTER:

pi ENTER ENTER ENTER * + * + * +

The approximate HP-35 solution you posted deviates from the truth by 1.9e-8.

Cumprimentos,
Walter

*Message #28 Posted by **Gerson W. Barbosa** on 18 Feb 2011, 9:30 p.m.,*
in response to message #27 by Paul Dale

Paul & Walter,

looks like I should have read the manual :-)

What I think it is interesting in the sum of these powers of pi is

```
pi + pi^2 + pi^3 + pi^4 ~ 100*sqrt(2) + 1/(2^6 + 2^7) (off by
~2e-7
```

Also interesting is pi^17 (the first five significant digits match those of sqrt(8)).

Combining these and adding a term involving sqrt(2) yields a round near integer:

```
pi^16/((pi + 1)*(pi^2 + 1)) + 2*sqrt(2)*(20 + sqrt(2)) =
2000000.000349779
```

Notice the equivalent RPN expression involves mostly 2, sqrt(2) and pi:

```
pi x² x² x² x² pi 1 + / pi x² 1 + / 2 sqrt(2) 2 * 2 sqrt(x) 20 +
* +
```

Or, in terms of WP 34S keystrokes:

```
h 3
g * g * g * g *
h 3 1 + /
h 3 g * 1 + /
2 f * 2 *
2 f * 20 +
* +
```

Regards,

Gerson.

*Message #37 Posted by **Marcus von Cube, Germany** on 28 Feb 2011, 6:09 a.m.,*
in response to message #35 by Marcus von Cube, Germany

After having helped Meindert out, I'm back on the wp34s track.

Here is my (clumsy) artwork: http://www.mvcsys.de/temp/wp34s/wp34s_skins.zip

You can unpack the file in the emulator Debug/Release directories and get the modified skins on Cyrille's original number guessing game.

Some work still ahead...

*Message #38 Posted by **robert rozee** on 28 Feb 2011, 6:43 a.m.,*
in response to message #37 by Marcus von Cube, Germany

a couple of silly questions:

why are 'fix', 'sci', and 'eng' brought out on their own key labels? most folks would surely tend to set the display format to their own personal preference and hardly ever touch it again. that is certainly what i do, in which case these could be put down in a menu.

what are the 'B', 'C', and 'D' keys for? given that these three labels exist exactly the same below the keys. the white functions above (1/x, etc), it would seem, would be better placed on the keys themselves.

cheers, rob :-)

Hi Robert,

there are no silly questions - only silly answers, though I hope getting around them ;)

> Quote:
>
> what are the 'B', 'C', and 'D' keys for? given that these three labels exist exactly the same below the keys. the white functions above (1/x, etc), it would seem, would be better placed on the keys themselves.

These are three programmable hotkeys. Compare HP-65, 67, 34C etc. For full information, please take a look to the documentation published (v1.13).

> Quote:
>
> why are 'fix', 'sci', and 'eng' brought out on their own key labels? most folks would surely tend to set the display format to their own personal preference and hardly ever touch it again. that is certainly what i do, in which case these could be put down in a menu.

I concur. One could put the command DISP (this is not a menu, see v1.13) on one shifted location there and gain two shifted locations for whatever you like being placed there - feel free to propose something. Nevertheless there are dissenting votes, too, and in this case I had no better offer than what you see so far.

Added: Personally, I switch between FIX and ENG modes quite a lot, sometimes use SCI instead and hardly ever use ALL. YMMV.

Don't hesitate to ask more.

*Message #40 Posted by **Paul Dale** on 1 Mar 2011, 1:33 a.m.,*
in response to message #38 by robert rozee

Nice work Marcus. I toyed with the idea of doing a graphical version using SDL but it

never progressed for similar reasons to the real hardware port :-(

We did have FIX, SCI and ENG in a catalogue for a while with DISP on the keyboard but, as Walter pointed out, there really wasn't anything else worthy of and suited to be in those keyboard locations.

Personally, I switch between FIX and ALL modes quite a lot, occasionally use SCI and pretty much never use ENG. Of course, everyone is different.

in response to message #40 by Paul Dale

Paul, Walter, you've mail on your sourcefourge mail addresses.

I've just opened my 20b in order to fit a JTAG connector (the USB/JTAG hardware has been ordered.) I plan to start more or less from scratch, using the SDK modules when it seems useful (keyboard, display) but having more control over what the hardware does. This is partly motivated by pure curiosity. On the other hand, it will ease in fitting in the wp34s software.

>
> if life doesn't get in the way, I'm willing to aid in porting wp34s
> to Windows and the real thing. (Life *will* get in the way, but...)

First of all, I'd like to know your "normal" e-mail addresses for easy collaboration. As an alternative, we can move the discussion to the sourcefourge infrastructure (blog, forum, what is available?). Can you add me as a developer? Talking about technical details in the museum forum might not be the right place.

I have a first point to discuss: memory.

As you should be aware of, the RAM is divided in a battery backed part of 2 KB at address 0x300000 and a volatile part of 4KB @ 0x200000. I don't know yet at which point the volatile memory looses its contents but it should only be used for scratch memory (processor stack, scratch registers for internal processing) while the persistent RAM should be used for all user data.

Your code simply defines global variables while Cyrille's implementation assumes a structure MyApplication which is manually allocated to the correct address (0x300000). From my past experience with embedded systems, the linker should be capable of putting variable data in designated segments at designated lcations. This would make us dependent on the tools but that's more or less always the case. It's just necessary to identify which data goes where and mark it in the code with the proper qualifiers. I'll have to check how to do it in IAR and/or GCC.

The Windows emulation can be done without but for state saving, some seperation is nonetheless necessary. Putting everything in MyApplication might be the straightest path to success.

32SII-FAIL 8

*Message #1 Posted by **Jim Yohe** on 14 Feb 2011, 2:59 p.m.*

I seem to be generating a FAIL 8 message in the self test if I don't do the key press sequence in the correct order. Is this the standard message for "only" that situation or does it show up for other conditions? Are there other messages that can show up when a failure mode exists? Where are these failure mode messages documented?

Re: 32SII-FAIL 8

*Message #2 Posted by **Don Shepherd** on 14 Feb 2011, 7:18 p.m.,*
in response to message #1 by Jim Yohe

Jim, I think that you have to press the keys in the correct order to avoid the fail message. If you did press them in the right order and still got the fail message, then I think you have a problem, otherwise you don't.

Re: 32SII-FAIL 8

*Message #3 Posted by **Jim Yohe** on 14 Feb 2011, 7:55 p.m.,*
in response to message #2 by Don Shepherd

True. When I press the keys in the correct order I have no problem. This wasn't a situation of me trying analyze what real failure was going on with my HP 32sii but more trying to find out if there are failure messages and what their meanings might be.

The manual says, "The calculator displays 32SII-FAIL followed by a one-digit number, if it failed the self-test", which to me suggests that there may be a series of numbers that might be displayed other than "8" to represent different failures modes.

Re: 32SII-FAIL 8

*Message #4 Posted by **Don Shepherd** on 14 Feb 2011, 8:39 p.m.,*
in response to message #3 by Jim Yohe

You're probably right, but since the codes are not listed in the manual I guess they don't want you to know them. The question would become, I suppose, if you had a real problem and called HP customer support would THEY know what the code numbers mean?

Re: 32SII-FAIL 8

*Message #5 Posted by **Thomas Radtke** on 15 Feb 2011, 3:04 a.m.,*
in response to message #4 by Don Shepherd

> Quote:
>
> The question would become, I suppose, if you had a real problem and called HP customer support would THEY know what the code numbers mean?

Of course. Since the 32SII isn't serviceable, any code means the same: Exchange the calculator ;-).

The statement that a 32SII is nor serviceable surprised me. May I have an explanation? Sam

Re: 32SII-FAIL 8

*Message #8 Posted by **Jeff O.** on 15 Feb 2011, 1:08 p.m.,*
in response to message #7 by designnut

Sam,
These two articles by Paul Brogger describe the procedure required to open any of the Pioneer series. Although Paul states that he "found the Pioneers relatively easy to open, repair, and put back together", my impression upon reading his articles is that one must conclude that they were not meant to be disassembled and repaired. Especially take note of what it takes to get at the keyboard "contacts", which are really just patches of carbon on the underside of plastic domes. Even if doable, it was certainly not worth the time and effort to hire, train and maintain a staff of technicians to repair a <$100 calculator.

...

Re: 32SII-FAIL 8

*Message #9 Posted by **Walter B** on 15 Feb 2011, 1:09 p.m.,*
in response to message #7 by designnut

Sam, no Pioneer has any provisions to be easily opened for service. Compare with the Classics etc. up to the Voyagers all being closed by screws. This does not mean a Pioneer can't be opened - you can open almost everything ;) but it's a brute force attack and will require some repair thereafter. Hope this explains what was meant by "not serviceable" - ummh, what I guess what the author meant ;-)

Re: 32SII-FAIL 8

*Message #10 Posted by **Thomas Radtke** on 15 Feb 2011, 1:26 p.m.,*

*Message #11 Posted by **bill platt** on 15 Feb 2011, 2:41 p.m.,*
in response to message #9 by Walter B

It is a funny thing, that. HP kept up the appearance, during the voyagers as well as pioneers, of being serviceable. Test codes etc were followed up by sending in the machine for "service." I did this twice with my 11c. Once, it came back having had "logic and LCD replaced." But it felt brand-new to me...

Re: 32SII-FAIL 8

*Message #12 Posted by **Randy** on 15 Feb 2011, 5:21 p.m.,*
in response to message #11 by bill platt

What I think HP did with calculators, based on evidence I've collected:

- Classic: repair
- Woodstock: repair
- Spice: repair and later replace internals once the keyboard was redesigned
- 41 fullnut: repair, until the early to mid-nineties when they replaced the top half with halfnuts
- 41 halfnut: replace
- Voyager 2 piece: repair or replace, depending upon problem
- Voyager 1 piece: replace
- Pioneer: replace
- 48 series: replace

Re: 32SII-FAIL 8

*Message #15 Posted by **Martin Pinckney** on 16 Feb 2011, 9:35 a.m.,*
in response to message #14 by Walter B

> Quote:
>
> Think!

Well, if I had your brains, Walter, I would have thought that I needed to specify that it was not unexpected.

However, straining my brain a bit, I can surmise that the trend to lower prices was driven by several factors, including lower cost of

IC's, expansion of market, greater production numbers, etc., Seen this way, the switch to less repairable design may have been a conscious decision made to complement the other trends, not necessarily the reason for them.

Re: 32SII-FAIL 8

*Message #16 Posted by **Paul Dale** on 16 Feb 2011, 3:52 a.m.,*
in response to message #12 by Randy

Doesn't quite match my experience with my unsoldered 34c. Several years of returning it for service due to display elements not lighting up properly didn't result in a soldered replacement :-(

I gave up trying in the end which is surprising given the effort and hardship I put into buying it in the first place....

Are calculators held in the hand?

*Message #1 Posted by **designnut** on 14 Feb 2011, 1:04 p.m.*

I see many write about how a calculator feels in the hand, the straight sided one less favored than the contour shaped ones. The 33S even puts rubber grips on the sides. So I pose the question, do users hold the calculator or place it on a surface? I always used mine on a desk. Comments requested. Sam

Re: Are calculators held in the hand?

*Message #2 Posted by **Walter B** on 14 Feb 2011, 1:24 p.m.,*
in response to message #1 by designnut

Sam, usually I hold mine in my left hand when calculating. So a compact, smooth shape is appreciated. That's what I loved at my 25C d:-)

Re: Are calculators held in the hand?

*Message #3 Posted by **Jim Yohe** on 14 Feb 2011, 3:11 p.m.,*
in response to message #1 by designnut

About half the time I use mine in my hand (or even both hands).

Re: Are calculators held in the hand?

*Message #4 Posted by **Bill Wiese** on 14 Feb 2011, 3:38 p.m.,*
in response to message #1 by designnut

I generally use mine in my hand)s).

I often hold (or rather, rest) an HP25 to Hp41-sized calc in my fingers and I then run the keyboard with my two thumbs - sounds klutzy, works well.

Bill Wiese San Jose CA

Re: Are calculators held in the hand?

*Message #5 Posted by **Martin Pinckney** on 14 Feb 2011, 3:37 p.m.,*
in response to message #1 by designnut

Most of the time my 27s or 48sx flat on the desk. Some exceptions:

1. I'm leaning back in my chair musing on some numbers with a 17b.

2. I'm using my 20s in my truck.

3. I'm sitting next to an employee's desk answering her question and I borrow her 32sii.

Re: Are calculators held in the hand?

*Message #6 Posted by **Michael de Estrada** on 14 Feb 2011, 4:06 p.m.,*
in response to message #1 by designnut

Prior to my retirement 2 years ago, I worked as an engineer at a company that did a lot of equipment testing, and spent much of my time in test areas where there was no place to set my calculator down. My favorite hand held calculator was my trusty HP-25, which had a rebuilt battery pack with 2500mAh NiMH battery cells that could easily last a full work week. I have very small hands, but could still both hold and operate this calc with my left hand, whilst using my right for other important tasks, such as giving a technician the cutoff signal.

Same here. I always use on a desk, and have been since I got my 15C in the early '80s. However, I often pickup to get a better read of the display because of the angle. The angle varies based on the desk, chair, and position of the calculator on the desk (and that depends on the volume and placement of clutter). If an eye tracking calculator with auto-positional LCD existed, then it'd be 100% desk.

BTW, this is not a problem with LED or backlit LCD (e.g. emulators on phones). The angle does not matter (unless glare is a factor--rare).

> Quote:
>
> BTW, this is not a problem with LED or backlit LCD (e.g. emulators on phones). The

> angle does not matter (unless glare is a factor--rare).

LEDs in calculators normally had little magnifiers over the LEDs, making the viewing angle very narrow. You couldn't read them unless you were at just the right angle. Non-multiplexed LCDs have a pretty wide viewing angle. Just looking at my 41 right now, I can read it from a very wide range of angles. That changes with LCDs with a low duty cycle, typically dot-matrix ones with lots of lines.

I use mine in two ways, on the desk or workbench, and holding in the left hand while pressing keys with the right. I never hold my 71 in my hand though. It always sits on a surface and I touch-type on it.

Re: Are calculators held in the hand?

*Message #11 Posted by **Martin Pinckney** on 15 Feb 2011, 9:18 p.m.,*
in response to message #9 by Egan Ford

> Quote:
>
> ... I often pickup to get a better read of the display because of the angle.

I use Pioneers, mostly. I find that the optimum viewing angle, and the behavior of the display when it is not held at this angle, varies from model to model, but in no case is it 90º. Seems to be intentional design, because normally in use you would not be positioned 90º above the keyboard.

Right now, I have a 21s, 22s, and 17b in front of me, a pretty good sampling of the various Pioneer displays.

Surprise! The low end one has the display with the best response. I get the widest viewing angle with the 21s, with nearly zero ghosting of inactive segments or annunciators.

The 22s (mid-range) has a narrow viewing angle, and when tilted out of its optimum angle, shows a lot of ghosting of annunciators.

The 17b (high end) also has a narrow viewing angle, and when tilted out of its optimum angle, shows no of ghosting of annunciators, but then the screen becomes all black.

Nearly always on my (or someone else's) desk

Re: Are calculators held in the hand?

*Message #13 Posted by **Thomas Okken** on 14 Feb 2011, 10:14 p.m.,*
in response to message #1 by designnut

It varies...

Back when working meant using pen and paper, I'd usually have the calculator sitting on my desk and operate it with one hand while holding my pen in the other. (Back then it used to be a huge annoyance to me that the otherwise wonderful HP-25, HP-19C, and HP-41C often weren't perfectly straight so that not all four of their feet would rest on the desktop. !@#$%^)

Nowadays, working usually means using a computer, and I use Free42, not a physical calculator. The simulator lets me copy and paste numbers between the calculator and whatever I may be working on, and that's a big plus.

Using a calculator when I'm not working at a desk or computer, I hold the calculator in one hand and use the thumb on that same hand to push the keys. If I had to use an actual calculator, I'd prefer the portrait layout because it enables this one-handed operation, and since my hands aren't very large, I prefer the Woodstocks and the HP-41 over the Pioneers and HP-48/49/50 series, in terms of ergonomics... But honestly, that's all moot since I just use Free42 on my iPod touch nowadays. I still prefer the feel of a real calculator, but since I use the iPod's PDA functionality every day, also running a calculator emulator on it means one less device to carry around. I do miss the plastic calculator bodies; the iPod's slick metal back is too slippery for my taste, and the textured plastic used on the old HPs felt much more secure in my hand. Whether the cases' edges are straight or slightly curved doesn't matter, in my experience.

Re: Are calculators held in the hand?

in response to message #16 by Timo

I am a Surveyor and when I am in the field the calculator is hand held. In the office it stays on the desk. I am also finding that I use Excell or freeHP42 most of the time in the office.

Sad to but I think that the days of the hand held calculator are numbered. I have been using HP calcs since the early HP35, back in the 1970s

Re: Are calculators held in the hand?

*Message #18 Posted by **David Hayden** on 15 Feb 2011, 1:50 p.m.,*
in response to message #1 by designnut

About half-and half between the desktop and the hand. I haven't paid attention to whether I favor one over the other based on the model I'm using - I'll try to pay attention to that.

Re: Are calculators held in the hand?

*Message #19 Posted by **Raymond Del Tondo** on 15 Feb 2011, 6:00 p.m.,*
in response to message #1 by designnut

When using my HP-48GX, I usually hold it in my right hand, or let it sit on the table.
I always use the left hand for typing in numbers, although I'm right-handed (or more precisely both-handed)

Re: Are calculators held in the hand?

*Message #20 Posted by **bill platt** on 15 Feb 2011, 6:42 p.m.,*
in response to message #19 by Raymond Del Tondo

come to think of it, I might use the right hand more, even though I am a leftie. Maybe because the pencil and paper are to the left. Or because the extended keyboard is to the right (on a PC XT) or maybe because of using the telephone with receiver in left hand (my tendency from very young)....

Funny, makes me think of handedness and the arbitrary nature of some of it. Like whether you play hockey or baseball first determining which way you will swing a golf club (that is one of my pet theories)

Re: Are calculators held in the hand?

*Message #21 Posted by **Julián Miranda (Spain)** on 16 Feb 2011, 12:52 p.m.,*
in response to message #1 by designnut

I will be 50-50 for me. It depends more on the kind of calculation. If I'm entering numbers from a paper it's on the desk. If I'm trying to solve something or tuning an already done calculation, usually handheld.

HP-48GX RAM Cards - Better with or without built-in battery?

*Message #1 Posted by **Timo** on 13 Feb 2011, 9:51 a.m.*

Dear Forum members,

I've only recently installed Raymonds Speed UI on my HP-48GX (brilliant piece(s) of software by the way, Raymond!). However, since it blocks my 128k RAM card in Port 1 almost completely, I'm considering to go looking for a new RAM card maybe with 512k or even 1MB.

Apart from the fact that they are quite expensive I'm a bit cautios about the TDS and SMI cards with the built in battery, especially when they were stored for longer periods without power supply (as will mostly be the case for the cards sold on TAS I guess). I fear tht the NiCd battery in the cards might be at the end of its useful life after a long time without a single charge.

What is, in your opinion, the better choice: 1.) Buy a TDS/SMI card with built in battery and "risking" it dies early or,

2.) buy a smaller (and somewhat slightly cheaper) 128k card with exchangeble battery?

I'd really appreciate your feedback on this.

Thanks a lot in advance and best regards, Timo

in response to message #1 by Timo

I'd definitely go with one that has a replaceable battery. There's no telling what kind of shape those old rechargeable ones would be in, and replacing the cells probably isn't easy.

I'm pretty sure you can find cards larger than 128KB that use replaceable coin cells. Of course, like any large

cards, you won't be able to MERGE them, and the cost of obtaining them will be about equivalent to several arms and legs.

Re: HP-48GX RAM Cards - Better with or without built-in battery?

*Message #4 Posted by **Nicholas Winterer** on 14 Feb 2011, 1:03 a.m.,*
in response to message #1 by Timo

I have a related question. Is there a spec available for the RAM slots on the 48GX? Would it be possible to build myself a RAM card?

I'm looking to put to a CAS on my 48GX but the 128kb of internal RAM doesn't leave me with enough free space for other purposes. I'm not willing to pay $300 for that though (I could buy 3 50G's for that price -- two to replace the others when the keys start sticking).

in response to message #4 by Nicholas Winterer

I've wondered this as well. Has anyone ever researched if a SRAM card could be modified to fit in the slot of the HP48?

I think you would need the earlier (type 1 or 2) card.

in response to message #5 by aj04062

way back people were using memory cards for smith-carona typewriters. however, it was marginal if a given card would work or not - as far as i can recall the smith-corona cards were designed to operate at a slightly higher voltage than the HP ones, and could latch up due to input protection circuitry.

my recollection is that the cards are essentially just an sram chip (62256 or similar) with some glue logic. these days (with surface mount device readily available) it should be quite simple to produce a card with one _large_ sram chip, no glue logic needed, and a switch on the top edge of the card to select from a number of banks. alternative, a cpld could be used to implement calculator-controlled bank switching.

the input protection on the original cards is largely superfluous, especially if a large card is left permanently in the calculator.

addendum: CY62177EV30LL-55ZXI-ND from digikey, us$36.00 in quantities of one. "TSOP I Configurable as 2M x 16 or as 4M x 8 SRAM". this is a package that is hand-solderable, about 2mm high profile, with all the needed address and data lines brought out. 2.2-3.7v operation. with a bit of luck just this device, a soldered battery, 2 diodes and a suitable connector would do the trick, all assembled onto a small pcb. battery drain in standby is 3uA - technology has come a _long_ way in 20 years since the 48 was designed!!

cheers, rob :-)

*Message #7 Posted by **Jorge Castellanos** on 18 Feb 2011, 1:45 p.m.,*
in response to message #6 by robert rozee

Hello everyone, I actually bought in Germany a handmade RAM card from an undergraduate student of electronics 10 years ago. I don't want to write one of those emails I really hate to read but... here we go. I have to look for the card (I pretty much know where it is) in my parent's house so I can get it in two weeks. If anybody is interested, I can make pictures of the PCB, write down the component's part number and from there make your own RAM card. I used the card for many years on my HP48GX until I placed in a drawer on my parent's house. So it should be there. Please advice if you are interested on it, it is a double sided PCB with batery backup. Regards

Jorge

I found a web page to build 128kb RAM CARD. I think the one I have is the same. The link is below:

Home made 128k Ram Card

Hello,

Yes, please can you post images of the custom made RAM CARD that you used for years. HD images will provide a look at how the RAM CARD was built.

Let us know if you find it.

Thank you, -Steve

Backing up several HP48G/G+/GX via HP50

*Message #1 Posted by **Thomas Chrapkiewicz** on 12 Feb 2011, 4:27 p.m.*

I have a number of HP48 family machines that I need to backup to a PC/text files. All of the code is user RPL.

Connecting each of these HP48s to a PC and running Connectivity software has proven to be very tedious, error prone and downloading the xserver to each 48 (again) is tedious and timeconsuming.

I was thinking of using my HP50G to capture the IR output of each of the HP48 machines and storing it in a unique dir/folder on the SD card on the HP50. This would then allow the folders to be easily copied to a PC.

Any comments? Is this practical/possible? I have little experience with the IR on the HP50. Has anyone experience with something like this?

Thanks in advance, TomC

Re: Backing up several HP48G/G+/GX via HP50

*Message #2 Posted by **Tim Wessman** on 12 Feb 2011, 4:29 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

IR is not IrDA. You have to go through the PC using a serial.

Re: Backing up several HP48G/G+/GX via HP50

*Message #4 Posted by **Matti Övermark** on 14 Feb 2011, 7:19 a.m.,*
in response to message #3 by Thomas Chrapkiewicz

You could of course use a standard 48-serial cable (4 to 9 pin) and then purchase the rs 232 cable for the 50g (Eric Rehlin at hpcalc.org -> his commerce site). Connect the two calculators,transfer and save

it to the SD card.

I do not remember all the details, but I was able to do all of above in december 2009.

HTH Matti

Re: Backing up several HP48G/G+/GX via HP50

*Message #5 Posted by **Tim Wessman** on 14 Feb 2011, 11:39 a.m.,*
in response to message #4 by Matti Övermark

You don't actually need to use serial to go to the 50g. The standard USB works fine.

Bascially, once you get the useRPL programs onto the PC in ASC format, it is pretty easy to get to the 50 at that point.

HP-33S

*Message #1 Posted by **Michael Mulé** on 11 Feb 2011, 8:56 p.m.*

Hi All:

I just inherited an HP-33S at work. I don't see any references to the 33S on the site. Does anyone know anything about it? It is older than my 32sII but very similar in the key layout. It has a 2-line display,and its styling is kind of art-deco: angled, satin chrome. Has a contoured shape like my old 25 but larger, which I like better than my 32sII which is very straight-sided.

Cheers, Michael

Re: HP-33S

*Message #2 Posted by **Eric Smith** on 11 Feb 2011, 9:34 p.m.,*
in response to message #1 by Michael Mulé

The 33s is **newer** than the 32SII.

Re: HP-33S

*Message #3 Posted by **Martin Pinckney** on 11 Feb 2011, 10:44 p.m.,*
in response to message #1 by Michael Mulé

The reason you did not see any references to the 33S on main pages of the site is because it's buried. There is a small mention of it under "Some Interesting Later Models (1986)", then "Other Hewlett Packard Calculators and computers."

Maybe the curator eventually got tired and stopped updating the site with complete descriptions of later models. Or maybe he just doesn't think the later models are that worthy of note in a "museum."

But if you search the Forum archives, you will find **lots** about the 33s.

Is it really brushed chrome, or just silver-colored plastic?

Re: HP-33S

*Message #4 Posted by **Crawl** on 11 Feb 2011, 11:05 p.m.,*
in response to message #3 by Martin Pinckney

It's really metal, not plastic, but I thought (guessed) it was aluminum.

Dave's museum is one of the greatest things ever written to be read as HTML and it is a *museum*. I leave it at that and defer to whatever he wants:-)

Re: HP-33S

*Message #14 Posted by **Thomas Klemm** on 13 Feb 2011, 7:54 a.m.,*
in response to message #13 by bill platt

> Quote:
>
> Dave's museum is one of the greatest things ever written to be read as HTML

I agree with you completely but it could be *valid* HTML. It's easy to validate this page. Just for the demonstration I made a valid copy.

What are the necessary changes?

1. Add **DOCTYPE** and **content-type**:

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
   "http://www.w3.org/TR/html4/loose.dtd">
<HTML><HEAD>
<meta http-equiv="content-type" content="text/html; charset=ISO-8859-1">
```

2. Use **alt**-tag for images:

```
<img src="http://www.hpmuseum.org/mohpc.gif" alt="MoHPC" border="0"
width="136" height="16">
```

3. end tag for element "P" which is not open

```
</EM></P>
```

   Removed end tag for element "P":

```
</EM>
```

Then what's the benefit because both are displayed identically? With a declared *charset* it's not up to the settings of your browser how to display special characters. This may lead to funny characters in names for instance.

I suggest to go one step further and allow the use of *html*-tags for special characters. A simple solution would be to support something like [«] or [√] in posts.

With the hope Victor is not offended I morphed a part of his HP-48G page into a museum post.

Posting this program would then be possible:

```
[pre]
[&laquo;]
  -> fX x x0
  [&laquo;]
    fX x [&part;] DUP -> dfX
    [&laquo;]
      dfX x [&part;]
    [&raquo;]
    SWAP 2 ^ 1 + 3 ^ [&radic;] SWAP / -> fR
    [&laquo;]
      fR x x0 2 ->LIST |
    [&raquo;]
  [&raquo;]
[&raquo;]
[/pre]
```

My guess is that these changes shouldn't generate too much effort to implement but they would be a great benefit.

Best regards
Thomas

*Message #15 Posted by **Gerardo Rincon** on 13 Feb 2011, 9:32 a.m.,*
in response to message #1 by Michael Mulé

Eventhough 33S had all the functions I needed, the keyboard layout was just so hard for me to get used to it. The Keys in and a V angle layout made the shift functions hard to find. The location and size of the <enter> key was also hard for me to get used to. I just disliked the layout so much. The size and grip feel was good. The 35S was such a positive comeback to what an HP calculator layout should be. Now we just need a smaller Scientific Calculator and without menus :)

Jim, to save you time, I can summarize the previous discussions for you with two points:

1a. HP could produce an emulated 15c on the existing 12c+ platform at low development/tooling costs.

1b. HP could not produce an emulated 15c on the existing 12c+ platform at costs low enough to justify it.

2a. HP will do it because the market for either the utility of it or the retro appeal of it is huge.

2b. HP won't do it because the market for it is too small.

Choose a or b.

*Message #20 Posted by **robert rozee** on 14 Feb 2011, 8:52 a.m.,*
in response to message #15 by Gerardo Rincon

here's an interesting question:

if HP took the internals of an hp-33s (without change) and placed it into the case of an hp-42 (ok, allowing for the extra keys), how good a calculator would this be? how many people would be happy?

i ask this as someone who has never used and knows next to nothing about the 33s.

cheers, rob :-)

Using a 42S-style two-line display requires a HUGE internal change, not "took the internals of an hp-33s (without change)" as you stated before.

AFAICT, the reason that HP isn't introducing newly designed models with a two-line dot matrix display is that the chip they have chosen for new midrange designs, the Atmel AT91SAM7L128, only can drive 400 segments. That isn't enough for a full dot matrix graphics display; the 17B/17BII/27S/42S display is 131x16, which is five times as many display elements as the SAM7L can drive. They would have to use a separate display controller, which drives up the cost.

There are starting to be some other ARM microcontrollers with similar power dissipation to the SAM7L, such as the Gecko families from Energy Micro. ST has announced an STM32L low-power family, but I haven't studied the specs yet. However, there don't seem to yet be any with more LCD drive capability than the SAM7L.

> 14 characters * 2 lines * 7x5 = 980

Also the 35s. I think Eric was referring to the 20b/30b. Anyway, the 42s has fully-addressable graphics, which 33s/35s don't.

Re: HP-33S - Why I couldn't use it

*Message #27 Posted by **Eric Smith** on 15 Feb 2011, 1:31 a.m.,*
in response to message #26 by Martin Pinckney

You're right, I was confused about the 33s/35s display. Still, it's not very comparable to the 42S display.

It is my understanding that the 33s and 35s use a part from GeneralPlus (formerly SunPlus) with a 6502-compatible core and masked ROM. I'm guessing that it's most likely a part from the GPLB3X series or GLP12/19 series.

Re: HP-33S - Why I couldn't use it

*Message #28 Posted by **bill platt** on 14 Feb 2011, 9:04 a.m.,*
in response to message #15 by Gerardo Rincon

The angled keys are strange. But they are no more difficult to get used to than a change in button configuration (which you get used to every time you get a new model). That's my experience.

While the 35S looks nicer, I find that its direct functions and built-in functions are inferior to the 33s. The only advantage I see is in the solver, where it allows editing rather than overtype. However, the solver works differently enough from the legacy machines that it can get you in trouble. The 33s has some of these differences, too (perhaps the worst case of this is the 17bii+ which has a solver totally incapable of running some of the great stuff that was written for the originally 17b/17bii and unfortunately I don't think the new version is documented well enough to get to the same level of utility).

The 33s had some really stupid bugs in its first release--these have been repaired. However the 35s has some not good design ideas--specifically the BASE function is almost useless and it doesn't have the classic rectangular to polar conversion.

The ideas in the 35S include some interesting ones, but it feels like a product which was never completed. Unlike the 48G, where that lack of completion was only at the final UI level (but robust internally, allowing further development) the 35S is a "closed" system and you get what you got.

Yes, incapable of running some original solver equations unless the user makes changes to them. A few years ago I identified changes required to make the prime factor and lcm/gcd equations (listed in the Technical Applications Manual for the HP-27s and 19b) work on the 17bii+.

> Quote:
>
> unfortunately I don't think the new version (the 17bii+ solver) is documented well enough to get to the same level of utility

I agree. The 17bii+ solver works differently than the original 17b and 17bii solver. It does an extra "pre-evaluation" pass to identify things that can be pre-calculated and, unfortunately, this extra pass executes equations twice which sometimes results in variables having unintended values. The new solver always uses the iterative solver for the sigma function, never the direct solver. The new solver is significantly slower than the original solver. And the new solver works in ways that current HP personnel cannot adequately explain. None of these facts are documented in the 17bii+ manual.

> Quote:
>
> And the new solver works in ways that current HP personnel cannot adequately explain. None of these facts are documented in the 17bii+ manual.

That is the deal-killer for me. That is what keeps me squarely away from using the 35s, 17bii+, or even the 33s solvers for anything important. I just don't trust them.

I would rather use my 27s--especially on computer since I have the original physical machine, I can run an emulator--and that way, I have the original well-documented hp solver, and I can back it up so that it doesn't go "memory lost" on me! For ad-hoc, the real machine is great. (Or I use the 48G. It is sort of a toss-up--both are on my desktop.)

This is the biggest problem with HP's current (meaning new products, rather than the 50G which is just a new HW for the 48G). They don't have the rigorous professional standing support veracity documentation that we demand as professional users.

I wonder what financial types think of with the 17bii+ Do they trust it?

What about the 20b and 30b? Has HP put in the real work to make rigorous, thoroughly documented products? (I haven't even bought one yet let alone had one in my hand).

The solver in the 20/30 (I say 20 because this is used to solve for one of the finance calculations) is essentially identical to the 48 solver, just in C. The results between them are identical.

Don, this statement puzzles me. Do you mean the help desk folks don't understand the Solver? Or the R&D guys (Tim and Cyrille?) don't know why it works as it does? Makes one wonder, who programmed it, are they still around, did they not pass knowledge down through the corporate structure?

Re: HP-33S - Why I couldn't use it

*Message #34 Posted by **Don Shepherd** on 14 Feb 2011, 12:30 p.m.,*
in response to message #33 by Martin Pinckney

No, not the Help Desk people, I wouldn't expect them to know the technical details of how the solver works in certain situations. A few years ago I was puzzled by the solver's behavior and I asked Cyrille if he could tell me why it behaved the way it did, and he couldn't. He said he did not have a debugger for the 17bii+ (like he had for the 50g) so he couldn't answer my questions. That's what I was referring to, and I still have all the emails we exchanged during that time. And the HP support staff in San Diego also did not understand how it worked; they are the ones who referred to one of my valid equations as "meaningless".

I understand Cyrille has returned to France. I don't know if he is the person who actually implemented the 17bii+ solver or not (I got the impression he was from some emails he sent me), but since he is no longer around I wouldn't even know who to ask these days. I don't think there is anyone.

I will point out that the 17bii+ solver handles simple equations fine, so a typical user would proabably not run into the difficulties I experienced. Nonetheless, certain equations that worked fine on the original 17b and 17bii won't work on the 17bii+ solver without some modifications.

*Message #35 Posted by **Tim Wessman** on 14 Feb 2011, 1:31 p.m.,*
in response to message #34 by Don Shepherd

Cyrille is now back living in France, but he still works on calculators. Nothing really changed since he was remotely working previously as well. HP just gets a larger phone bill. :-)

I believe all of the 17bII+ was implemented by Kinpo's software team. That probably explains why cyrille didn't know exactly what was going on in there.

It is "funny", because when calcs were in Corvallis and they did it all by themselves, they obviously experienced all the slings and arrows of getting keyboards to work consistently, and to engineer a good user interface, etc. etc. When a new model would be started, and those same people worked on it, all the features "baked into" HP machines were already understood and probably didn't even have to be committed to paper. As soon as the decision was made to have

others create the hardware and/or firmware, the only way to assure that the outcome would be "HP like", would be to first physically itemize all that gives their calcs "HP-ness" and then communicate that to the other company. Since the outsourcing began well after the Corvallis people were no longer in the picture, I'd bet that the complete picture of "HP-ness" was lost and couldn't even have been communcated if it had been tried. This would obviously be before Tim's time at HP, but I just wonder if just after Fred Valdez took over (in 2002?) and jump-started the current HP-calc activity, whether a serious effort was made to itemize exactly what it takes to make a handheld box into an HP machine. Boy, have we tried to characterize that list as "outsiders/enthusiasts" at HP conferences for several years now, and it is difficult. It would be cool if somehow HP could engage users by soliciting (via the HP Solve Newsletter, perhaps?) inputs like this and publish them all back to the readers as the list grew. "What gives a calculator HP-ness?"

Jake

What is the CCD Plus module?

*Message #1 Posted by **gene wright** on 11 Feb 2011, 3:08 p.m.*

I know about the CCD/OSX and the CCD module 1B image, but I have seen references to the CCD Plus rom for the HP 41.

Anyone have any details of what's in it? What makes it a "plus" ?

Re: What is the CCD Plus module?

*Message #2 Posted by **Raymond Del Tondo** on 11 Feb 2011, 10:39 p.m.,*
in response to message #1 by gene wright

It's a modified CCD module from Angel. The "Plus" is somewhat irritating, as it's a CCD 8K image with matrix functions removed, or replaced by alpha register functions, IIRC. Maybe overlapping with the Alpha ROM?

Angel could better comment on this.

Re: What is the CCD Plus module?

*Message #3 Posted by **Ángel Martin** on 13 Feb 2011, 3:35 p.m.,*
in response to message #1 by gene wright

The CCD module was a superb achievement, possibly the better of the custom modules of its time. Yet the Advantage ROM implemented a superior version of the Matrix functions (I think HP purchased them from W&W, which speaks of their quality!) - making the CCD Array FNS set somewhat superfluous.

Which lead to the question: would it be possible to remove them from the CCD, replacing them (i.e. use the available space) with something else?

That's a PLUS in my opinion. Of course everyone would choose a different set, back then I chose ALPHA and Buffer/KA. Just one of many.

Cheers, 'AM

Woodstock HP-22 calculators for repair

*Message #1 Posted by **Xavier A. (Brazil)** on 11 Feb 2011, 12:59 p.m.*

Hello everybody,

I just acquired 2 Woodstock financial HP-22 calcs.

The oldest one, most probably because of an heavy corroded circuitry, did not work very well even after a 50/50 alcohol vinagre/water bath of a few hours and a good brushing job. Probably due to the PCB itself, corroded inside, it will be very difficult to make this one alive again, unless I open the PCB itself, which seems hazardous.

Before having washed the other one (a most recent model whom components are quite different, corroded as well, or so), I had tested the first one with this other and recent PCB.

In this case, everything is working on the older calc, unless the registers R0 to R9 (and associated functions like 'FV', 'SIGMA+', etc. that require the use of the registers 5 to 9, and that return '0.00'). Number entry "seems" correct since '123' is returned as '123.00', but there is no mean to recall (RCL) another number than '0.00'.

I shall post some pictures next week end.

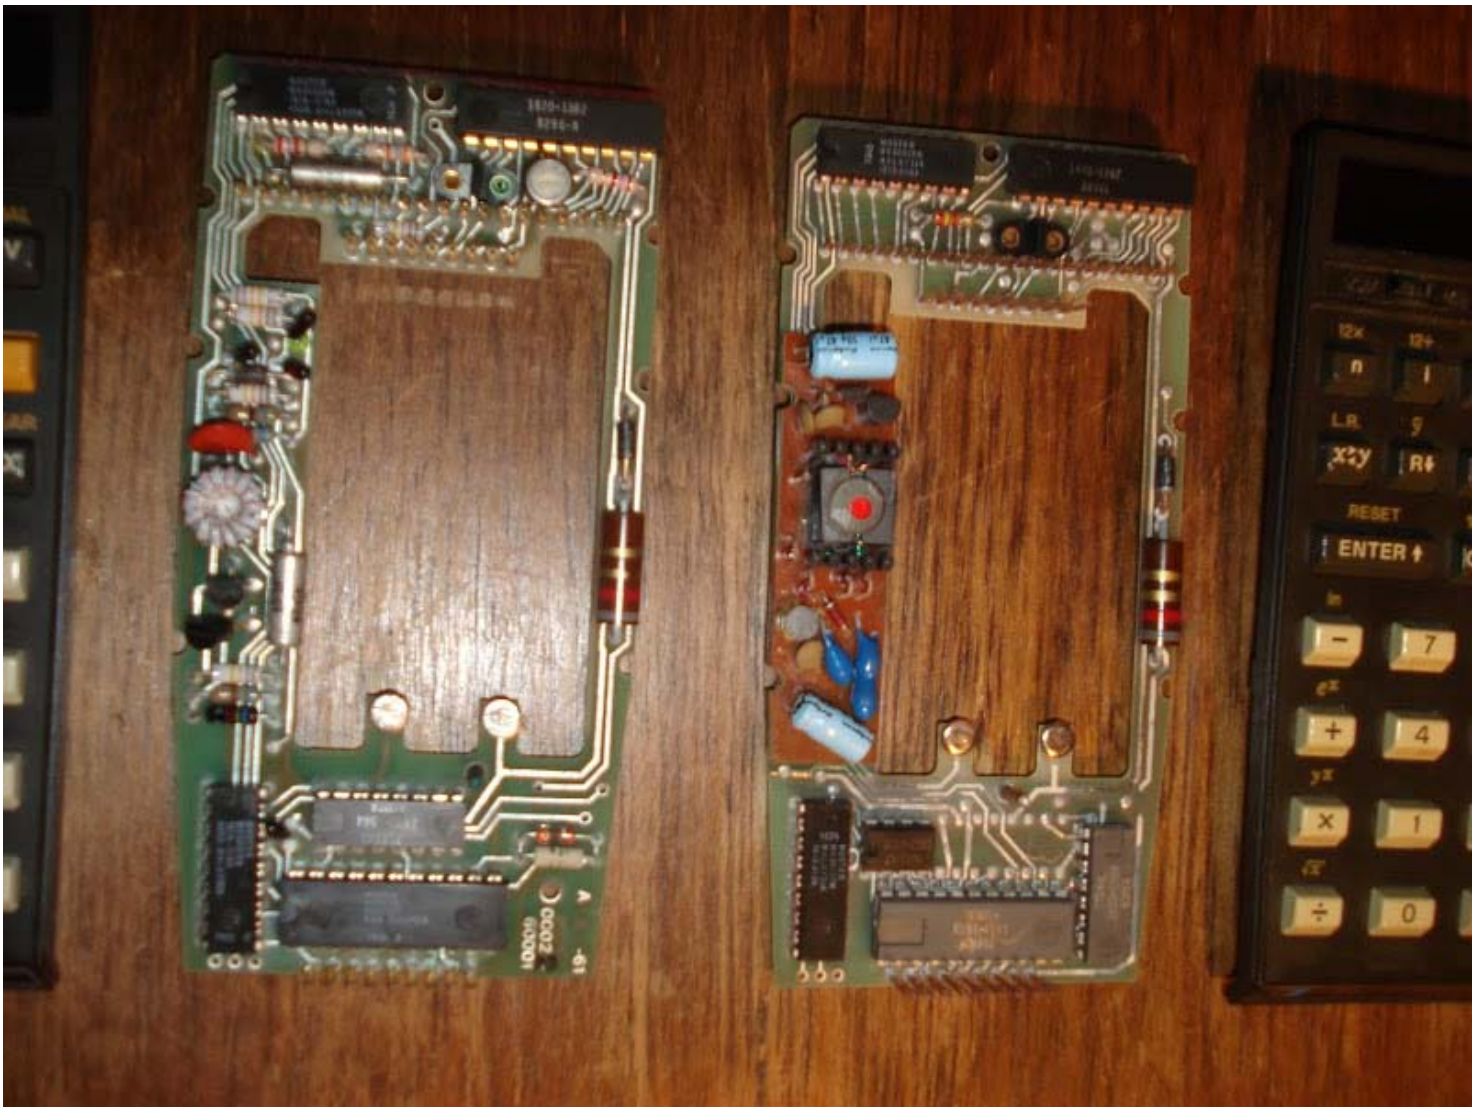
Does anyone know which component failed? Is there a way to fix this?

Many thanks in advance!

Edited: 11 Feb 2011, 1:12 p.m.

Re: Woodstock HP-22 calculators for repair

*Message #2 Posted by **Xavier A. (Brazil)** on 13 Feb 2011, 8:35 a.m.,*
in response to message #1 by Xavier A. (Brazil)



Two HP-22 calcs; the older one is at left. One can see that not only components are differents, but boards too.

I just tested the recent one after having brushed it yesterday, it works perfectly. IMO it would be a shame to dismantle it.

So I am only searching for another old HP-22 to make some replacement on the older one. But which one?

Regards

(sorry for picture's quality: flash on my camera behaves curiously, not really at the same time than the snapshot itself).

Capture the flag - HP-12C programming contest

*Message #1 Posted by **x34** on 11 Feb 2011, 12:01 p.m.*

There are at least two flags on HP-12C: BEG/END and D.MY/M.DY. What the fastest ways to get these flags values? (and shortest also).

Re: Capture the flag - HP-12C programming contest

*Message #2 Posted by **gene wright** on 11 Feb 2011, 12:59 p.m.,*
in response to message #1 by x34

1)

10 second idea. Destroys values in financial registers.

0 FV 1 N 1 i 1 PV PMT 1 + X=0?

If condition true then it was in BEG mode, otherwise END mode.

2)

1.022 ENTER 1 CHS DATE INT 1 - x=0

will be true if mode was M.DY and will not if D.MY

I make no claims that these are anywhere near optimal, but they work.

Re: Capture the flag - HP-12C programming contest

*Message #3 Posted by **x34** on 11 Feb 2011, 3:06 p.m.,*
in response to message #2 by gene wright

1) Being not acquainted with finance, is N "n" or "Nj"? 2) 14 steps, <5s in both modes. Wonderful! And unexpected (for me) VIEW/PSE effect.

Re: Capture the flag - HP-12C programming contest

*Message #4 Posted by **gene wright** on 11 Feb 2011, 3:09 p.m.,*
in response to message #3 by x34

Oops. N should be lowercase n.

and an edit to the second set of instructions. Saves a step:

1.022 ENTER 1 CHS DATE LSTx - x=0

Edited: 11 Feb 2011, 3:11 p.m.

Re: Capture the flag - HP-12C programming contest

*Message #5 Posted by **x34** on 11 Feb 2011, 3:17 p.m.,*
in response to message #4 by gene wright

1) 11 steps. Less then 4 seconds!!! Das ist Fantastisch! My best was 15s with finance and three times in length (while destroying finance regs too). If finance regs (i use them only for polynomials) are destroyed, it could be used in the finishing part of any program to select output.

Re: Capture the flag - HP-12C programming contest

*Message #6 Posted by **gene wright** on 11 Feb 2011, 3:20 p.m.,*
in response to message #5 by x34

1) May not be faster, but shorter:

0 FV 1 n 1 i 1 PV PMT FRC X=0?

Re: Capture the flag - HP-12C programming contest

*Message #7 Posted by **x34** on 11 Feb 2011, 3:34 p.m.,*
in response to message #6 by gene wright

Gene, my HP12C says new program is actually a bit FASTER too :) Having read your articles on HP calcs for many years, I understand you are very experienced in programming them. Please, tell me if there are any more flags in HP-12C which could be used?

Re: Capture the flag - HP-12C programming contest

*Message #8 Posted by **Gerson W. Barbosa** on 11 Feb 2011, 9:45 p.m.,*
in response to message #4 by gene wright

> Quote:
>
> 1.022 ENTER 1 CHS DATE LSTx - x=0

Have I misunderstood something here? This returns 2.012 in M.DY mode and 32.012 in D.MY mode. That is, false for both modes.

1.012 ENTER 1 DATE INTG 1 - x=0 will return 0 and 1, respectively. Same number of steps though.

Re: Capture the flag - HP-12C programming contest

*Message #9 Posted by **gene wright** on 12 Feb 2011, 1:14 p.m.,*
in response to message #8 by Gerson W. Barbosa

Oops. Shoudl have been:

1.022 ENTER 1 CHS DATE LSTx + x=0

Fewer steps

*Message #10 Posted by **gene wright** on 13 Feb 2011, 5:36 p.m.,*
in response to message #9 by gene wright

0 FV 1 STO n STO i STO PV PMT 1 + X=0?

Re: Fewer steps

*Message #11 Posted by **Allen** on 13 Feb 2011, 6:59 p.m.,*
in response to message #10 by gene wright

A very concise test! Well done, sir!

HP-12C erase program steps

*Message #1 Posted by **x34** on 11 Feb 2011, 1:20 a.m.*

Is there any way to erase program steps in HP-12C to free memory besides CLEAR PRGM?

Could not find info in the manual.

Re: HP-12C erase program steps

*Message #2 Posted by **Katie Wasserman** on 11 Feb 2011, 1:34 a.m.,*
in response to message #1 by x34

No. You overwrite program steps when editing programs on the 12C. If you're looking to free up only some memory that was used in a program so that you can have more cash flow registers, you're out of luck. You have to erase all program steps.

Re: HP-12C erase program steps

*Message #3 Posted by **x34** on 11 Feb 2011, 8:08 a.m.,*
in response to message #2 by Katie Wasserman

It's a pity. Katie, do you know simple way to read HP-12C flags programmatically (i mean BEGIN/END and DAY format).

Re: HP-12C erase program steps

*Message #4 Posted by **Michael de Estrada** on 11 Feb 2011, 9:18 a.m.,*
in response to message #2 by Katie Wasserman

Wow. That's a major deficiency in this calc's programming capabilities. I've never given it any thought, since I've never programmed my HP-12C. I simply assumed it worked the same as my HP-15C, which I programmed a lot, but now I can see the difference, since the HP-12C lacks the back arrow (<--) keys that the HP-15C uses to delete displayed entries. It also means that if you make a mistake when keying in an entry, you cannot backspace over the incorrect digit to correct it, and must clear the entire entry and enter the entire line again.

Re: HP-12C erase program steps

*Message #5 Posted by **x34** on 11 Feb 2011, 10:17 a.m.,*
in response to message #4 by Michael de Estrada

> Quote:
>
> It also means that if you make a mistake when keying in an entry, you cannot backspace over the incorrect digit to correct it, and must clear the entire entry and enter the entire line again.

Michael, it s much worse. You can't clear entry. Only overwrite it. If you skipped one program line during programming, you should start with the line and enter all lines following. I think it is the last RPN HP calculator (may be shares this feature with HP-10C) without insertion/deletion. HP-20S and HP-21S have this annoying feature too, but they are not RPN.

Re: HP-12C erase program steps

*Message #6 Posted by **Katie Wasserman** on 11 Feb 2011, 11:32 a.m.,*
in response to message #5 by x34

The 20s and 21s have insert/delete editing I think.

I've concluded that the reason why the 12C (10C, 25, 38e/c, others?) don't have insert/delete editing is becasue there are no labels. You can branch to any program line number. To make for a easy to use programming environment insert/delete would have to re-assign all the goto/gosub targets each time you deleted or inserted a step. This would likely create an unacceptable delay on the original 12C (and the others) and it also would require the programmer to keep looking around for the new target location if it were needed for further entries/edits.

Personally, I think that they should have allowed insert/delete editing and let the user reassign branches as needed. That's not more difficult than the suggested method of adding branches out of the code stream then back in, when you want to insert additional code.

-Katie

Re: HP-12C erase program steps

*Message #8 Posted by **Bart (UK)** on 13 Feb 2011, 3:52 p.m.,*
in response to message #7 by x34

For interest:

Now that I have had opportunity to take out my 20S, it has Label and line Insert/Delete (with auto renumber) functionality. Unlike the Voyager calculators, the 20S has fixed 99 line (merged keystroke) program memory that is not shared with its 10 registers.

HP-22

*Message #1 Posted by **brummybird** on 10 Feb 2011, 2:40 p.m.*

Hi to everyone, i've recently been given a HP-22 (which i'd like to sell) but i don't know if it's working ok. Could anyone tell me if there's a self test for this model? So far i've only found one for the HP-22S and i can't see it in the "notes" as mentioned on this website.

Re: HP-22

*Message #2 Posted by **Nigel J Dowrick** on 10 Feb 2011, 3:27 p.m.,*
in response to message #1 by brummybird

Before it's too late: if you have the mains adapter, **don't use it!** You will almost certainly destroy the calculator if the battery pack is not present, not well connected, or no longer functioning.

Sorry: I have no more specific advice to give. So far as I am aware machines in this series don't have a built-in self test. To see if it's working you'll have to power it on or sell it as untested.

What sort of state is the battery pack in?

Nigel (UK)

Re: HP-22

*Message #3 Posted by **brummybird** on 13 Feb 2011, 1:41 p.m.,*
in response to message #2 by Nigel J Dowrick

Hi,

The batteries are slightly corroded but everything seems to work fine. My only problem is i can't find the equivalent to = and "enter" didn't seem to work. Thanks, Sue

Please look here.

Re: HP-22

*Message #5 Posted by **bill platt** on 10 Feb 2011, 3:31 p.m.,*
in response to message #1 by brummybird

The best thing to do to test it is to get one of those little battery holders from Radio Smack, load it with the appropriate number of batteries to reach the design voltage, and then connect to the battery terminals. This is the safest way to test it.

Testing with the original battery is not safe enough, because it could be shorted out at this point.

Re: HP-22

*Message #6 Posted by **Mike Morrow** on 10 Feb 2011, 4:14 p.m.,*
in response to message #5 by bill platt

A shorted pack would be good (THAT at least would protect the calculator electronics). But typically, old battery packs act essentially like an open circuit, which equates to operation on the charger without a pack installed.

HP, mythical champion of "quality" design, surely did have many examples of poor design in its calculator products history.

Re: HP-22

*Message #7 Posted by **Walter B** on 10 Feb 2011, 3:34 p.m.,*
in response to message #1 by brummybird

There's definitively no self-test for this model. I just checked the manual.

Re: HP-22

*Message #8 Posted by **Mike Morrow** on 10 Feb 2011, 4:09 p.m.,*
in response to message #7 by Walter B

IIRC, the Spice models (like HP-34C) were the first HPs with built-in self test. I always thought of that as a defect in the HP-41C-series design. Few had the test modules.

Re: HP-22

*Message #9 Posted by **brummybird** on 11 Feb 2011, 1:10 p.m.,*
in response to message #7 by Walter B

Hi, Many thanks for a definitive answer to that, i've already spent an evening searching the net for it. I was seriously surprised at the huge amount of information about calculators out there and found out this was made in august 1978. I think that was the year i first saw one in my maths class; i think i miss the red displays! Sue

Re: HP-22

*Message #10 Posted by **db (martinez, ca.)** on 10 Feb 2011, 10:07 p.m.,*
in response to message #1 by brummybird

Everything they told you is right.
Now: the calculator really wants about 2.5 volts, as in 2 rechargeable AA cells. It can usually take 3 volts (2 alkaline AA cells) but it's safer to use the nicads or NIMHs ---- or test it with some used, not new, AA alkalines.

I didn't notice anyone telling you about the polarity. Hold the calc like you are going to use it. Turn it over. The contact that is on your right is positive, the left is neg. Or you can look at it as: they are off-center so the contact that is closest to the edge is the neg one and the one nearest the middle is positive.

Don't screw this up.

POLL: Who killed the beast?

*Message #1 Posted by **Joerg Woerner** on 10 Feb 2011, 1:19 p.m.*

While scanning the PPX newsletters for my DARKSIDE CALCULATOR MUSEUM I stumbeled over this document dated May 1982:

LINK TO THE BEAST

Who killed the beast?

1) ESD (Engineers)?

2) HP-41C (Management)?

Your opinion?

Thanks and Regards, Joerg

Re: POLL: Who killed the beast?

*Message #2 Posted by **Namir** on 10 Feb 2011, 2:25 p.m.,*
in response to message #1 by Joerg Woerner

I'd say the HP-41C AND the HP-28C (ushering RPL) killed the TI-88. It's a shame since the TI-88 is very good machine.

Namir

Re: POLL: Who killed the beast?

*Message #3 Posted by **Martin Pinckney** on 10 Feb 2011, 4:23 p.m.,*
in response to message #2 by Namir

A pretty good answer is given on Viktor Toth's T-88 page. Perhaps by the time the 88 was canceled, TI had already decided to cede the professional market to HP and the 41, because they were already in R&D and market research for the educational graphing models. Which turned out to be much more lucrative.

Re: POLL: Who killed the beast?

*Message #4 Posted by **bill platt** on 10 Feb 2011, 4:25 p.m.,*
in response to message #2 by Namir

The hardware sucked. Ti-itis.

Re: POLL: Who killed the beast?

*Message #5 Posted by **x34** on 10 Feb 2011, 2:41 p.m.,*

in response to message #1 by Joerg Woerner

3) TI (Management)

Like many other interesting projects of yesterday, today and tomorrow (mis)management is the primary problem. Number of MBAs and D.M.s skyrocketed in the past 20-30 years, but quality of management dropped. http://nces.ed.gov/programs/digest/

IF TI88 has been canceled in 1982, then HP-28 could not be the reason.

Re: POLL: Who killed the beast?

*Message #6 Posted by **Nigel J Dowrick** on 10 Feb 2011, 3:08 p.m.,*
in response to message #1 by Joerg Woerner

I wonder what its intended price was? Here in the UK at that time the wonderful Casio FX-602P was available (I had one!). Although not as powerful as this TI machine it was affordable, well-built, and very usable. It could also interface to a cassette recorder.

Although I'd love to have a TI-88 now, at the time I would have gone for the Casio unless the TI was going to be cheaper. The extra power of the TI wouldn't have been useful to me (and HP was way out of any price range I could have considered.)

I would imagine that TI felt it had spent too much on development to recover on expected sales. At a price that would return a profit, they judged that the machine wouldn't sell - high-end users would go for a HP, and low-end users would get excellent machines like the Casio for less money.

So the beast might have been slain by too much time spent in development? By the time it was ready it was too late! I don't know whose fault that would have been.

Nigel (UK)

That year (1982) at the Summer CES show in McCormick Place in Chicago, Richard Nelson and I fondly remember playing with the TI-88s at the Texas Instruments booth all four days of the show. It looked like interesting HP41 competition and we were surprised when the thing never actually saw the light of day. For the HHC2007 conference, Gene Wright and I posted a bunch of "vintage" HP and TI calc brochures on the conference website, including that of the TI88 which I had obtained at that CES show. It's still there at http://holyjoe.net/hhc2007/TI_brochures.html . I think Richard has a more extensive version of the promotional material in his collection.

Would you mind to borrow me the TI brochures and promotional material for a few weeks?

I started to scan, photoshop and PDF them for free download on my darkside.org Museum.

Get an impression here:

Hi,

The vast majority of that TI material belongs to Gene Wright, who originally scanned it to pdf and I hosted it on my site in time for HHC2007. The TI-88 brochure was mine, however. I have the whole "press kit" for the TI-88; now I just have to find it again. It's been a while since I looked at it. If I find the thing, I would be glad to lend it to you. I'll let you know when I locate it.

Jake

Possibly, the effort by TI to push the TI-99/4A personal computer had some adverse effect on the TI-88. The TI-99/4 had come out and failed in the late 1970s, but the TI-99/4A system was a considerable improvement. It has a very interesting, almost bizarre, architecture. It was one of the first personal computers with a 16-bit processor (TMS-9900, with hardware multiply and divide). But...also a failure by 1983.

OT: TI99/4A Re: POLL: Who killed the beast?

*Message #12 Posted by **Norman Dziedzic** on 10 Feb 2011, 4:38 p.m.,*
in response to message #11 by Mike Morrow

Whoa what memories! I had a TI99/4A. That's where I learned my first programming language. About the coolest thing I did with it was to create a title sequence for play the neighborhood kids put on.

My friend across the street had a father that had the first video camera in the area. He was into theater and got the neighborhood to put on a production of "The Odd Couple". Since the monitor for the TI99/4A was the TV we were able to send the output of that to his video recorder and make custom titles including bitmap animations of cigar smoke and falling ashes.

Thanks for triggering an impromptu stroll down memory lane !!

Can anyone say PCjr? I loved that thing, eventually had four, one for me and one for each child. Mine sported a total of five or six "sidecars."

The architecture allowed plug-in cartridges to modify or even totally change the character of the machine. As in replace the on-board BIOS completely.

It developed an almost cult following for years after IBM abruptly discontinued it, with companies and individuals creating all sorts of new peripherals.

Hmmm... Sound like a calculator we all know?

My undestanding has been that it was keyboard problems that killed the beast. I have never had one in hand but I was told that the keyboard mechannism was the same at that used in the TI-55II, TI-57LCD and BA-55. I had all three of those and each had the problem where a single keystroke would yield multiple entries into the display register. The TI-55II was so bad that TI eventually allowed an owner to simply send one in and get a TI-55III in return. The TI-55III had a much better keyboard.

TI-itis is what got me to switch to HP when a freshman in college (1980). I'd gotten one too many 8th roots or triple zero/triple 2 entries when punching a button one time with my TI calc. I got a my parents to buy me a HP-41C (they choked at first when they saw the price) but it was well worth the money and was a trusty companion until 1998. I dropped it one too many times and the posts holding the case together broke.

A guy on my dorm room floor got so frustrated with his TI calc he said he "introduced it to the wall at Mach 2" (he was an aerospace eng. major :-)).

Re: POLL: Who killed the beast?

*Message #17 Posted by **Thomas Okken** on 12 Feb 2011, 1:21 p.m.,*
in response to message #16 by Tom Mathes

TI-itis was a big factor in making me prefer the HP calculators back in the '70s and early '80s, even though the TI calculators offered a lot more functionality for the price (e.g. TI-59 vs. HP-67, no contest).

With the HP-41C, HP reached the point where its flagship calculator could beat the flagship TI not just on quality, but also on functionality... but that was also about the time when computers started to become affordable.

Look at the calculator marketplace today: it's dominated by financial calculators. Scientific calculators are targeted at the educational market, and at the smallish market of people who specifically need something portable/small/lightweight to use in the field. Everyone else uses computers now... What really killed the scientific calculator was cheap computers, not calculator quality issues.

Re: POLL: Who killed the beast?

*Message #18 Posted by **Martin Pinckney** on 12 Feb 2011, 3:30 p.m.,*
in response to message #17 by Thomas Okken

Thomas,

Your analysis is basically sound. The size of the market for scientifics was permanently reduced by the advent of relatively cheap computers. I know in my case, when I got my first PC, engineering software was either very expensive, or just was not available for the specific problems I had to solve. So I wrote my own. Why continue to program a calculator when you were spending time writing programs for a more powerful platform? Now, of course, engineering software proliferates.

But decades later, there still exists a continuing demand, although much smaller, for quality scientific calculators.

HP has only partly met that demand since the end of the Pioneer and 48gx era. After floundering with the 49's, they seem to have got a winner in the 50g. But for a smaller form factor, they've not yet got it right. The 33s was not well received. Great hopes were placed in the 35s, only to become a disappointment when they actually were in hand.

HP seems to be serving the business/financial market well with the 12c+, 17bii+ silver and 30b; why can't they do the same for the scientific/engineering market? I still think they will soon.

Re: POLL: Who killed the beast?

*Message #19 Posted by **bill platt** on 12 Feb 2011, 3:54 p.m.,*
in response to message #18 by Martin Pinckney

This will only hap[pen if HP comes to realize or proves that a large segment of potential buyers of the "43s" scientific small form I/O machine would not/do not buy or have any interest in buying a 50G.

I think the basic position now, inferring from marketed products is, "If they want the full power, they buy the 50g. If they want portability, they are happy with the 35s."

Because the small programs are easier to write for the calculator, and, if you have them assigned to keys, definitely easier to access. The calculator is instant-on and more stable too. I have had some programs I commonly use in my 41cx for *decades* without having to reload, re-write, or transfer.

Is there such a thing as HP-itis? I would say yes -- the nearly unbroken line of power supply problems from the very beginning to the present. I am not sure why that should be. Could it be because design at HP has historically been dominated by the twidgets?

Re: Is there an HP-itis?

*Message #23 Posted by **Walter B** on 15 Feb 2011, 2:27 a.m.,*
in response to message #22 by Palmer O. Hanson, Jr.

Hi Palmer,

> Quote:
>
> Could it be because design at HP has historically been dominated by the twidgets?

I had to google and found: a) *A twidget was anybody who wasn't an engineer, and therefore, according to the snipes, not a real man.* At the time HP's worst charging circuit design was launched, those folks didn't play a major role there yet. So we can't blame them for this - a pity, I

admit d;-)

OTOH, b) *twidget n. a soldier or other military individual whose job primarily involves using or maintaining electronics.* But why should electronic people make such design flaws?

So it boils down to the question: What did you want to tell us? Language should be a tool for transmitting clear messages, the less ambiguous the better (most times).

That is the probably the basis for my use of the word. I think that I picked it up from veterans at the University of Minnesota in the late 1940's. Engineering students who weren't in the EE program tended to use EE and "twidget" interchangeably. We (I was in AeroE) really believed that the EE's were a different breed of cat. I later used the term "twidget" as a shorthand for "digital designer" in the 1970's and 1980's.

> Quote:
>
> But why should electronic people make such design flaws?

In the 1970's and 1980's I saw that there was a tendency for "twidgets" to see analog design and power supply design as less demanding than digital design. That typically translated into limitations on funding for power supply design during a development because power supply design just wasn't considered to be very difficult. I made a leap from that observation to the idea that the same sort of thing may have been at the core of the power supply problems in the HP calculator product line.

Re: Is there an HP-itis?

*Message #25 Posted by **bill platt** on 15 Feb 2011, 6:38 p.m.,*
in response to message #22 by Palmer O. Hanson, Jr.

I ain't never heard of a twidget. What I do know is that the power supply problem was not as big a problem as the key-wear problem. You could always buy a new battery, and HP users all read their manual and so even though the power supply/battery issue was stupid, it was nevertheless manageable---but the keyboard thing on Ti was totally unacceptable.

My first exposure to calculators was on two different SR series Tis--my father's. Both developed Ti-itis. That is the reason he bought me an HP when it came time for me to have my own machine...

By the way, it was my mentor in school who coined the term "Ti-itis." He had a little Sharp if I remember correctly. His comment when he saw me, the young whipper-snapper, with an HP was to the effect, "expensive, but the buttons are good. None of that Ti-itis." Off topic, he wrote a lot of

good programs in BASIC which ran on everything from Timex Sinclairs to TRS 80 and Commodores etc. I still have some of them--printed out with a Daisy wheel printer...

in response to message #26 by db (martinez, ca.)

I thought Robert Noyce (Fairchild/Intel) invented the integrated circuit. U.S. pat #2,981,877.

TI's Kilby patent is later: 3,138,743 for miniaturized circuitry.

After the death of the TI-88

*Message #28 Posted by **Palmer O. Hanson, Jr.** on 12 Feb 2011, 9:34 p.m.,*
in response to message #1 by Joerg Woerner

The advance marketing effort for the TI-88 included a picture of the device with the question "MAY I HELP YOU?" in the display. An example appears on page 5 of *The Portable Computer and Calculator Catalog 1982/1983.* Among other things that was intended to demonstrate that the device had an alphanumeric capability in the display, a capability that was a selliing point for the existing HP-41.

Shortly after the demise of the TI-88 was announced in late 1982 one disgruntled potential buyer circulated a picture of the TI-88 with the "MAY I HELP YOU" message replaced with "I DO NOT EXIST."

On the front page of the V7yN10 issue of *TI PPC Notes"* editor Maurice Swinnen wrote:

> Quote:
>
> *Electronic News*, September 27, 1982, page 57, carries an article with the title "TI Portable CPU Line May Dump Top Calculator". Then it goes on saying "Texas Instruments has decided to withhold its top of the line TI-88 hand-held keystroke programmable calculator, and will scrap it altogether as it shifts priorities to a fammily of hand-held computers it will unveil shortly." The article is far too long to be reproduced here in its entirety. But I learned from it that TI has opened up eight new facilities for the production of the TI-99/4A home computer or for making its components and their total output is now 30,000 units per week.

In early 1983 I received an engineering model of the TI CC-40. The device became available at retailers in mid 1983. Its internal mechanization was simiklar to that of the TI-99/4A with base 100 arithmetic.

The LIMA 99/4A Users Group's newsletter *Bits, Bytes and Pixels* provided support for users of the TI-994A and some support for the CC-40 as late as April 1996.

Yeah, that sort of bugged me when I first saw it. My 41cx is set such that upon turn-on it immediately tells me if there's something I'm supposed to be reminded of that day (like a daytimer, with the info coming from a DAYTMR file), and if there's nothing there it tells how long until the next alarm comes due, and if there are none, it displays the current time and date. (The usual case is the latter.) For it to say, MAY I HELP YOU?" would be a step down.

My HP-41CX doesn't do any of those things, at least so far as I know. Is that because I don't know how to use it as it came from the box, because I haven't studied the manual, or because I haven't programmed it to do those things?

I never had a TI-88. I did have some of the pre-release documentation. But what I sort of recall is that the user could program in any turn-on response that he wanted to. Many years ago I sent most of my pre-release documentation to Gene Wright. Maybe he can help.

It can do them. Flag 11 has to be set when you turn it off. I have program label TOFF assigned to the summation key, and I use that to turn it off, not the ON key. TOFF just sets flag 11 and does some super-short synthetic-programming beeps and then has the OFF instruction. When you turn it on with the ON key (as opposed to an alarm coming due), program execution picks up there and goes into the portion that checks the DAYTMR file and the alarm catalog and finally displays time and date if there's nothing else that needs displaying. It takes two seconds to be ready for keystrokes. It also sets the continuous-on flag to prevent timing out and turning off at the worst times. Since it only goes off when I've told it to (either with the summation key or in a program), it always begins executing something upon turn-on. My program is not in the manuals, but all the how-to is there.

Thank you for the response. I have to admit that I probably won't implement that feature as I rarely use my cadre of HP-41's.

I found some more TI-88 material. The insert which was delivered with the Volume 6 Number 3 (May/June 1982) issue of *PPX Exchange* said in part

> Quote:
>
> > ... By selecting the system prompting option, the TI-88 can greet you with the message "MAY I HELP YOU?" Responding by pressing the [YES] key leads to a series of alphanumeric prompts designed to assist you in running *Solid State Software* programs and in setting the calculator's time, date and alarm options. ...

That sounds a little like some of the stuff you do at turn-on with the HP-41CX.

> ....putting the 83 in a+bi ***mode***...

Modes, modes. Why does it have to be modes? This "modes" thing is what got me to get rid of my fx-850p 25 years ago (I had a 28C before that and a 28S after). I don't change modes when I need to work in complex, why should the calculator? When complex is required, it must just do it. I know when I am expecting complex answers and when not. I know to "rephrase the question" if the calculator gives a real answer when I'm looking for a complex one & vice versa. Although I am more into RPL machines, I respect the 42S and for the life of me can't understand why HP didn't continue that line of calculator (instead of the 33s & 35s which are based on the 32s).

Just my 2 pence worth. :)

*Message #6 Posted by **Marcus von Cube, Germany** on 11 Feb 2011, 2:28 p.m.,*
in response to message #5 by Don Shepherd

If you look at the many RPL system flags you know that there are modes, too.

Casio has made significant changes to their graphing calculators concerning modes. In the early days (I own a fx-8000G) it was modes everywhere. The main key for influencing the behavior of the calculator or selecting an application (editor, base-n, stats) is even labeled "mode". With some later models (fx-7700GE to CFX-9800G), they switched to an icon menu and relabeled the mode key "menu". Internally, it was not too much of a difference but at least switching from degrees to radians became a menu selection. OK, the setup screen is now shift+menu which is not really far from its former "mode" selection. With the most recent line (including the Prizm) the menu selections behave much more like seperate applications and all internal behavior switching has been delegated to menu selections.

Back to complex numbers: The cube root of a negative value returns different results on RPL machines depending on complex mode or real mode. I just tried on my Nspire and got a similar result. You need a way to tell the function which result you desire (cube root has three). So to avoid modes, you need to supply additional functions or parameters. Modes act like global variables with all their pros and cons.

Apparently most of the engineers on here can't understand that.

The business types say, it's simple: The 42s quit selling. And the 48 series was selling, and has continued to in the later incarnations, including today's flagship, 50g.

Re: j operators

Good point, Bart. Indeed, Casio has long been enamored of operating modes, and still makes extensive use of them in the cheap but capable fx-115 series.

Flag 8 on the HP-15C and CRES/RRES on the HP-42S are "modes" of a sort, as are many of the flags on the HP-41, HP-42S, and HP-48,-49,-50 models. The real issue is whether functionality is cohesive and complementary.

On Casio models, this is often not the case. To use one kind of functionality requires that a particular mode to be entered, which then disables the functionality that is accessed by another mode. It is as though the calc is intended to be used to help the user learn the scholastic *'topic du jour'*.

By contrast, on the HP-15C -- to use one example -- all functionality is always available, as long as sufficient memory is allocated. Statistical functions, integration, rootfinding, complex-number calculations, and matrix calculations can all be programmed and used cohesively.

-- Karl

Karl, you have hit the nail on the head there. That was basically my issue. I found that the HPs of the time did it the best.

HP82164A HP-IL/RS-232C interface

*Message #1 Posted by **dinamarco** on 9 Feb 2011, 8:22 p.m.*

I'm trying to connect a printer like EPSON LX80 or FX80 on my HP-41CX using these PAC, is possible? How about the cable?

Re: HP82164A HP-IL/RS-232C interface

*Message #2 Posted by **Eric Smith** on 9 Feb 2011, 8:55 p.m.,*
in response to message #1 by dinamarco

If you have the serial version of the printer (relatively uncommon), that should work. You'll also need the HP 82160A HP-IL interface for the 41, two HP-IL cables, and a serial cable.

Most LX80 and FX80 printers have a Centronics-style parallel interface using a 36-pin connector.

41C programs expecting to work with an 82143A or 82162A printer may not work correctly with the FX80 or LX80, depending on what printer features they use.

Re: HP82164A HP-IL/RS-232C interface

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 10 Feb 2011, 7:57 a.m.,*
in response to message #2 by Eric Smith

IIRC, Epson used to sell a (rather expensive) "serial interface board" as an user installable option. It presented a DB-25 RS-232 connector to the outside, and plugged as a daughterboard in the printer's logic board. The funny thing was that the board did little more than translation of the +/-12 V signals from the RS-232 interface into 0-5V TTL-compatible levels. The serial functionality was already on the logic board of every printer!

In 1986, I managed a project related to this feature, and we developed a very simple interface (using TTL levels) to connect such printers to a 8088-controlled graphics terminal (NAPLPS). The hardware was little more than connectors and pull-up resistors; the fun went into developing the graphics screen-dump software!

[I apologize in advance for idiomatic mistakes and possible minutia, since this comment is based just in my memories of that time, without any documentation at hand to check for details.]

Re: HP82164A HP-IL/RS-232C interface

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 10 Feb 2011, 11:53 a.m.,*
in response to message #4 by dinamarco

My little contribution is just to suggest that, even if you have the typical, paralell-interface model; explore on the inside to see if serial functionality is there, almost for free. If you need to translate RS-232 levels, a Maxim integrated circuit does it easily in current times, avoiding the 1488/1489 or 75150/75154 old-time buffers (old and also failure prone). I cannot help on the HP-IL side, I have no experience with it. Best regards.

Re: HP82164A HP-IL/RS-232C interface

*Message #6 Posted by **Tony Duell** on 11 Feb 2011, 4:29 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

From what I remember, Epson made at least 3 diffferent RS232 interfaces for the MX/RX/etc printers. As you said, the standard printer firmware included a (bit-banged, IIRC) serial interface, and the simplest RS232 board enabled this (IIRC by grounding a pin on the conenctor for the interface PCB) and converted between RS232 levels and TTL. Configuration (baud rate, etc) was done by DIP switches on the board, read via the (redundant) parallel input port.

The other 2 RS232 boards had microcontrollers and buffer RAM on them and did a full serial-parallel conversion. The printer was left as a normal parallel device.

Epson also made an HPIB/GPIB/IEEE488 interface. It does the address comparison, handshake, etc and just feeds the data to the printer as a parallel device.

Those are not easy to find, but much harder to find still is the HP HPIL interface board. It was part of the HP82905 printer, but it will work in many older Epsons. IIRC, it's a microcontroller and a 1LB3, basically.

GolfScript versus RPL

*Message #1 Posted by **Allen** on 9 Feb 2011, 8:00 p.m.*

I've been reading up on a fairly new programming language called Golf Script Since it's stack based, it reads very much like RPL.

Curious if anyone here has experience in this language??

For example, the coercion behaviors from the tutorial are nearly identical to the way the HP48/49/50 treat similar inputs.

```
GOLFSCRIPT
 1[2]+ -> [1 2]
 1'2'+ -> "12"
 1{2}+ -> {1 2}
```

And the first example in the tutorial, is notably post-fix

```
Example:

1 1+

Has 3 items, "1", "1", "+". The ones push the number 1 onto the
 stack. The + is a built-in block defined to take the top two stack
 items, add them together, and push the result on the stack.
```

HP-41 internal construction

*Message #1 Posted by **Monte Dalrymple** on 9 Feb 2011, 1:23 p.m.*

Can anyone give me some pointers on how to determine what type of logic connector was used, perhaps based on serial number? I understand that early models used a connector material is difficult to reuse, and I don't want to pull apart a calculator that I can't re-assemble.

Monte

Re: HP-41 internal construction

*Message #2 Posted by **Randy** on 9 Feb 2011, 5:01 p.m.,*
in response to message #1 by Monte Dalrymple

The problem connectors where typically on early CV's only. Rather than trying to identify by serial, it is much easier to identify by sight.

Remove the case bottom and look between the logic board and keyboard at the bottom edge. Problem connectors have flat edges and are pink in color. They are elastomeric material only. With the pink parts, the logic board will be firmly stuck to the keyboard and it will require a bit of force to pop it off.

Good parts are gold in color and use small wires rather than carbon to make the interconnects. Gold connectors may be one or two pieces, depending upon the age.

FWIW: If there are any white labels inside the calculator with coded numbers and a date, it was serviced by HP and the problem connectors would have been replaced with reusable parts.

Re: HP-41 internal construction

HP-12C ARM Repurposing Project - Status?

*Message #1 Posted by **Malcolm** on 9 Feb 2011, 10:10 a.m.*

I have heard rumors and musing about the possibility of repurposing the HP-12C ARM calculator.

I have seen leaps and bounds with the HP20B/30B project and the wiki for it has a 12C section

(http://www.wiki4hp.com/doku.php?id=12c:repurposing_project)

But I haven't seen any updates in the last year and a half. Is anyone working on a 10C/11C/15C/16C port? I know the SDK comes with a 4 function integer calculator, but is it possible to use this calc to run the firmware of one of the other Voyager Series calculators that is not in production?

If someone is working on something to this effect I would love to help.

Malcolm

Hands on the 20b SDK

*Message #1 Posted by **Marcus von Cube, Germany** on 9 Feb 2011, 10:06 a.m.*

I'm willing to help bring forward the 20b/30b repurposing efforts and am taking the first few steps in this direction.

Firstly, my cable has arrived and works fine. (I have a spare, which I can offer to someone here in Germany for free.) After downloading SAM-BA from atmel.com, I was able to erase the flash of my 20b and reprogram it with the image provided in the SDK. The little machine is up and running its original software again. So technically, I'm able to put any software on it.

The following step was getting the sample application in the simulator to compile and run. My old MSC compiler does not support the *long long* data type (it's there but differently named). Some changes to the sources helped me out. One function is missing from the MFC libraries coming with my compiler. I've got the software running but without support for multiple skins.

To overcome these problems, I decided to upgrade to Visual Studio C++ Express which you can download from Microsoft for free. You'll need some spare space on your hard disk though. The install has just finished. I'll report back, if the SDK example application will compile with this version.

The next step would be to compile WP-34s for the simulator. If I can get this to work, a big step is taken towards a "real" port. On SourceFourge.net I can only find the documentation for download. What do I need to get to the sources? I guess an SVN client is necessary.

I had asked IAR for a price quote for the full development environment from them. In short, I'm **not** willing to pay over 2000 € for a hobbyist project. I'll be getting the kickstart edition to play around with the SDK but I plan to make GCC an alternative. OK, no debugging in the foreseeable future...

EDIT: The IAR compiler was able to create a **working** flash image of the number guessing game. I did some code changes to get rid of any compiler warnings and I had to change the project settings: The kickstart version does not allow assembly listings being generated from C/C++ code and the library options were set to "none" which lead to linker errors (missing symbols.)

Edited: 9 Feb 2011, 12:45 p.m. after one or more responses were posted

Re: Hands on the 20b SDK

*Message #2 Posted by **Walter B** on 9 Feb 2011, 11:09 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Hallo Marcus,

you'll get the necessary most recent files (or access to them) from Pauli, plus optimum advice what to do with them. Please note the layout has changed a bit compared with v1.12. I'm working on v1.13 but it's not ready to be published yet.

Walter

Re: Hands on the 20b SDK

*Message #3 Posted by **Marcus von Cube, Germany** on 9 Feb 2011, 11:30 a.m.,*
in response to message #2 by Walter B

Thanks Walter!

I'll have to streamline the SDK files a bit first before I want to do work on the simulator or GCC.

I had some sucess with the IAR compiler (see first posting). :)

Edited: 9 Feb 2011, 12:46 p.m.

Re: Hands on the 20b SDK

*Message #4 Posted by **Erturk Kocalar** on 9 Feb 2011, 1:06 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Hi Marcus,

I'm willing to help with compiling SDK.

I got my cables yesterday and tried to compile the SDK emulator on my PC, but had issues. I tested Visual C++ 2003. It is compiling about some missing files, but Tim recommended we can take them out. so I'm going to try again.

Does Visual C++ Express have the MFC libraries?

Thanks, erturk

Re: Hands on the 20b SDK

*Message #5 Posted by **Marcus von Cube, Germany** on 9 Feb 2011, 1:18 p.m.,*
in response to message #4 by Erturk Kocalar

I have yet to check the latter. Be patient.

Re: Hands on the 20b SDK

*Message #6 Posted by **Marcus von Cube, Germany** on 10 Feb 2011, 11:40 a.m.,*
in response to message #4 by Erturk Kocalar

> Quote:
>
> Does Visual C++ Express have the MFC libraries?

I fear not. :(

I will have to hunt for a replacement. My VC6 setup is just lacking a single function...

Edit: I'm just downloading the Professional Edition of Visual Studio 10.0.

Edited: 10 Feb 2011, 12:50 p.m.

Re: Hands on the 20b SDK

*Message #7 Posted by **Paul Dale** on 10 Feb 2011, 1:22 a.m.,*
in response to message #1 by Marcus von Cube, Germany

The sources and latest documentation are available via subversion from the site. The command is mentioned on the sourceforge page but it is buried a bit:

```
svn co https://wp34s.svn.sourceforge.net/svnroot/wp34s wp34s
```

- Pauli

Re: Hands on the 20b SDK

*Message #8 Posted by **Marcus von Cube, Germany** on 10 Feb 2011, 7:15 a.m.,*
in response to message #7 by Paul Dale

Thanks Pauli,

I'm going to do some work on the SDK before I turn to your sources. It will take its time.

I need a recent version of the keyboard, in case it is different from what is outlined in the PDF, in order to create an emulator skin. The result should be a working executable for windows with your software in it.

Re: Hands on the 20b SDK

*Message #9 Posted by **Walter B** on 10 Feb 2011, 4:02 p.m.,*
in response to message #8 by Marcus von Cube, Germany

The most recent version of the keyboard looks like this:

I'm pretty confident that's it now, but I've been so several times before d:-)

Re: Hands on the 20b SDK

*Message #10 Posted by **Dieter** on 11 Feb 2011, 7:13 a.m.,*
in response to message #9 by Walter B

Looks very nice and useable to me.
However, here are some ideas that might even improve it.

Here's a quote from the WP-34s manual:

> Quote:
>
> We baptized it 34S in honour of one of the most powerful LED pocket calculators, the HP-34C

The 34C was my first HP back in 1980. One of the features I liked most was the MANT function, displaying the full 10-digit mantissa. On today's calculators this function is called SHOW, and it's

also present on the 34s. But where did you hide it? In the lower left corner! Walter! Remember the 34C! This function MUST be placed on the big ENTER key! That's where it belongs. Even the 35S designers knew that! ;-)

Second, wouldn't it be nice if if VIEW was not on Shift-STO but Shift-RCL?

Finally, here are two suggestions for the function set:

1. I really like the idea of four different logarithms, including a base-2 log (although I would have chosen ld instead of lb) and a general log function with variable base. Currently this function is implemented as base-y log of x. I would definitely prefer it the other way round, i.e. the base-x log of y. It's simply more intuitive and faster to use: In real life you usually first calculate a value and then you take the base-x log of it, where x often is a constant. For a base-8 log you'd simply type [8] [$\log_x$Y].

   For the same reason other calculators have a function for the x-th root of y, and not the other way round.

2. I also like a suggestion in the last HP Solve issue concerning the delta-% function. What if it returned not just one, but two results? In other words: both delta%(x,y) and delta%(y,x), so that the user can see both results with a simple X<>Y.

Dieter

Re: Hands on the 20b SDK

*Message #11 Posted by **x34** on 11 Feb 2011, 8:02 a.m.,*
in response to message #10 by Dieter

LBL & RTN would be better bound to XEQ. I think binary logarithm/antilog could go to menu, if calc runs in BCD mode.

Re: Hands on the 20b SDK

*Message #12 Posted by **Walter B** on 11 Feb 2011, 3:29 p.m.,*
in response to message #11 by x34

> Quote:
>
> LBL & RTN would be better bound to XEQ.

Sorry, I disagree. Neither LBL nor RTN have anything to do with XEQ. LBL is used exclusively in programming, where's the habitat of RTN as well. This was the reason for placing them next to other commands for this mode.

Though used in programming as well, XEQ is mainly employed for calling routines from the keyboard or for picking items from the catalogs. Thus, XEQ, arrow up and down, and EXIT are placed in one column next to each other.

Please see the doc file.

Re: Hands on the 20b SDK

*Message #13 Posted by **Walter B** on 11 Feb 2011, 4:41 p.m.,*
in response to message #10 by Dieter

Hallo Dieter,

> Quote:
>
> The 34C was my first HP back in 1980. One of the features I liked most was the MANT function, displaying the full 10-digit mantissa. On today's calculators this function is called SHOW, and it's also present on the 34s. But where did you hide it? In the lower left corner! Walter! Remember the 34C! This function MUST be placed on the big ENTER key! That's where it belongs. Even the 35S designers knew that! ;-)

I admit I was influenced by the layout of the 42S, where SHOW lives in bottom row. And CONST needs more space than SHOW. And you can ENTER a CONSTant and EXIT a SHOW, but not the other way d;-)

> Quote:
>
> Second, wouldn't it be nice if if VIEW was not on Shift-STO but Shift-RCL?

Sure. But STO TIME would have been misleading. Since most people know what VIEW does, I decided to give the place below of RCL to TIME. YMMV.

> Quote:
>
> Currently this function is implemented as base-y log of x. I would definitely prefer it the other way round, i.e. the base-x log of y.

The inverse of y^x is log[base y](x). And the x'th root of y is another cup of tea - it's simply y^(1/x).

About Delta%: I tried to keep existing calculator commands as they are known, for sake of consistency. We have a small number of deviations from this principle. You find them highlighted in the documentation. 90% of these deviations are due to a more flexible addressing paradigm. Please see the documentation.

Re: Hands on the 20b SDK

*Message #14 Posted by **Marcus von Cube, Germany** on 10 Feb 2011, 9:00 a.m.,*
in response to message #7 by Paul Dale

Your svn command has worked perfectly. Do you think, I can compile it on Mac OS?

Edited: 10 Feb 2011, 12:58 p.m.

Re: Hands on the 20b SDK

*Message #15 Posted by **Paul Dale** on 11 Feb 2011, 1:15 a.m.,*
in response to message #14 by Marcus von Cube, Germany

I've been building on MacOS X for ages. You'll need to do it in a terminal window and you'll have to have the ncurses library installed too.

- Pauli

Re: Hands on the 20b SDK

*Message #16 Posted by **Marcus von Cube, Germany** on 11 Feb 2011, 2:42 a.m.,*
in response to message #15 by Paul Dale

OK, now I've several options:

Setup Visual Studio C++ Professional and build a windows emulator version.

Build the terminal (ncurses) version on my Mac.

Port it to gcc-arm...

My next step will be the VC++ way because I've just shelled out a few hundred bucks for the compiler. :)

For those who are not willing to pay for the Professional VC++ (because of the MFC libraries), I'm planning to put the GUI part in a separate precompiled module that may be added to a VC++ Express project.

Please stand by...

Re: Hands on the 20b SDK

*Message #17 Posted by **Marcus von Cube, Germany** on 15 Feb 2011, 8:42 a.m.,*
in response to message #16 by Marcus von Cube, Germany

I've had some success with compiling the emulator with VC++ Express. :)

You'll find an updated copy of the SDK files here. I've split the application in a Windows/MFC part which I've put in a library together with all its dependencies, and an application part which does not include any Windows specific stuff that might miss from VC++ Express. Use HP20b_Express.sln or HP20b_Full.sln as your starting point, depending on the compiler you're using. You can even debug with Express but you need to set a breakpoint in application.cpp in advance. Don't mind the linker warnings about missing PDB symbol files for the library, they need to be ignored.

Happy emulating.

I'll probably start porting wp34s to the emulator soon.

*Message #3 Posted by **Israel Otero** on 9 Feb 2011, 2:47 p.m.,*
in response to message #1 by Olivier De Smet

Hi folks,

Recently I was wondering if there is a such thing as a HP9100 emulator. After searching for a while, the result was a pleasant surprise because I did find it and able to install it on my Linux machine.

Quite a nice implementation.

It is made for Debian Linux and was tailor made for me.

The link:

http://hp9100a.sourceforge.net/

Have a nice evening to all of you.

Re: OT: new emulator

*Message #4 Posted by **Jerry Raia** on 10 Feb 2011, 1:16 p.m.,*
in response to message #1 by Olivier De Smet

There are some issues with this but it is a great start.

Re: OT: new emulator

*Message #5 Posted by **Olivier De Smet** on 10 Feb 2011, 3:17 p.m.,*
in response to message #4 by Jerry Raia

Could you give some details about the issues ?

Btw I put a new version today ...

Olivier

Re: OT: new emulator

*Message #6 Posted by **Steve Perkins** on 10 Feb 2011, 3:58 p.m.,*
in response to message #5 by Olivier De Smet

This looks like an exciting product!

The update was helpful. I need a bit more time to explore the possibilities. I'm not familiar with the system emulated (yet).

You've done a great job as far as I can tell.

One suggestion would be to include an example of what disk images to use with what disk type to get started with something.

It's great to have so many powerful options, but it can be a bit confusing to have so many choices for the beginner like me.

Thanks for sharing this great work with us!

Re: OT: new emulator

*Message #7 Posted by **Jerry Raia** on 10 Feb 2011, 5:12 p.m.,*
in response to message #5 by Olivier De Smet

Happy to :)

I did get the new version. So far the main thing is the save function. If I do a save to .E98x6 file nothing is really saved. For example the processor speed reverts to slow and the emulator boots looking for a system even though I have saved it with a system and the MAX processor speed.

Then if I delete the .E98x6 file everytime I restart the emulator I get an error that the file is missing. So now it wont start in its original clean state without an error. I cannot find a way to clear that error.

I'm running the emulator on Windows 7.

Re: OT: new emulator

*Message #8 Posted by **Olivier De Smet** on 11 Feb 2011, 3:38 a.m.,*
in response to message #7 by Jerry Raia

My fault,

Only save for disc is working. I'll try for the system soon.

To revert to a clean install you need to delete all registry entry under

\HKEY_CURRENT_USER\Software\HP98x6

with regedit

I don't activate system save (& load) because each time I change some stuff in the code, it can lead to change of the save system format, sorry

Olivier

Re: OT: new emulator

*Message #9 Posted by **Jerry Raia** on 11 Feb 2011, 12:56 p.m.,*
in response to message #8 by Olivier De Smet

Thanks for the info :)

Your work has brought a great old machine back to life on my desktop. Keep us updated on your progress :)

Re: OT: new emulator

*Message #10 Posted by **Olivier De Smet** on 12 Feb 2011, 5:32 p.m.,*
in response to message #9 by Jerry Raia

New release with more robust internal and amigo disc. Save and load of system now activated

happy rmb and pascal ...

Olivier

Re: OT: new emulator

*Message #11 Posted by **Jerry Raia** on 12 Feb 2011, 7:01 p.m.,*
in response to message #10 by Olivier De Smet

Just got the latest. Keep it up!

The save does work now but for some reason the debug window starts up even though I deselected the the check box in settings, as if that is not being saved.

Nice work though :)

Re: OT: new emulator

*Message #12 Posted by **Steve Perkins** on 14 Feb 2011, 6:55 p.m.,*
in response to message #10 by Olivier De Smet

I've had a bit more time to try this. It's really cool!

I choose a memory size of 1024k and a KML file. I used the 9122 disk type on 700.0.x, then after starting I loaded the bas5boot.bin file in the 700,0 drive. Like magic the system booted to basic.

It's been fun experimenting with simple programs.

Thanks for all your had work. You've done (and are doing) a great job!

Re: OT: new emulator

*Message #16 Posted by **Torsten** on 27 Feb 2011, 3:46 a.m.,*
in response to message #13 by Olivier De Smet

The new version still uses 100% of my (single core) CPU. On a multi-core system at work it runs at full usage (100%) of one (virtual) core.

Re: OT: new emulator

*Message #17 Posted by **Olivier De Smet** on 27 Feb 2011, 1:56 p.m.,*
in response to message #16 by Torsten

It uses 100% of one core only at max speed. At x1, it uses around 5% for a 2.4 GHz core 2 Duo. At max, it takes 100% and is equivalent as a x7 speed up.

Edited: 27 Feb 2011, 1:56 p.m.

Why not repurpose HP-50G?

*Message #1 Posted by **x34** on 9 Feb 2011, 9:33 a.m.*

It's heavy and big, and lacks normal ENTRY key. But

It is rather cheap and easy to find. It is fast. easily upgradeable. easy to restore default OS. It has lot of RAM and FLASH, it has USB and SD card. Many of us prefer RPN over RPL. So, why not?

Re: Why not repurpose HP-50G?

*Message #2 Posted by **Malcolm** on 9 Feb 2011, 10:01 a.m.,*
in response to message #1 by x34

For me, the reason I wouldn't put work into it would be the keys.

Malcolm

Re: Why not repurpose HP-50G?

*Message #3 Posted by **x34** on 9 Feb 2011, 10:46 a.m.,*
in response to message #2 by Malcolm

Why not leave the keys? Overlay could be enough.

Re: Why not repurpose HP-50G?

*Message #4 Posted by **Malcolm** on 9 Feb 2011, 11:33 a.m.,*
in response to message #3 by x34

Should have been more clear, I meant the lack of the "feel" with the keys. I am too used to my Voyager series keys.

Re: Why not repurpose HP-50G?

*Message #5 Posted by **Norman Dziedzic** on 9 Feb 2011, 12:41 p.m.,*
in response to message #1 by x34

I've often thought it would be good to have a 42s mode on my 48gii. The font would change to something **huge** with just the 4 lines of stack showing on the screen, big and useful for my aging eyes.

Re: Why not repurpose HP-50G?

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 10 Feb 2011, 8:05 a.m.,*
in response to message #5 by Norman Dziedzic

Look at emulators from HrastProgrammer, there you will find a 42S emulator that runs on a 48GX. I'm not sure about 48GII or newer models, but you may research the available options.

(BTW, these emulators are not for free)

Re: Why not repurpose HP-50G?

*Message #7 Posted by **x34** on 10 Feb 2011, 8:32 a.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

HP-42S emulator by HrastProgrammer, while being a splendid work, has inherent drawbacks:

```
a) Not Open-Source
b) Is HP-48 program utilizing POL, so base OS is needed
c) Is not easy to use (uneven keys mapping) and uses Saturn code instead of ARM
d) Does not add any functionality to HP-42S besides memory
e) There are much better open-source projects more well-suited for the task, as HP-
34S for HP-30B repurposing.
```

I think clone of Paul and Walter HP-34S, adding graphics and I/O, would be ideal.

Re: Why not repurpose HP-50G?

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Feb 2011, 9:53 a.m.,*
in response to message #7 by x34

I fully agree. Even more, I don't like the HP-48/49/50 physical format nor RPL native modes. That's why I use Free42 on my iPod Touch as my main calculator (also testing Free42 beta on my Android phone), and I'm also very interested about 34S effort. My real HP42S rests at home in pristine condition.

Re: Why not repurpose HP-50G?

*Message #9 Posted by **Håkan Thörngren** on 9 Feb 2011, 4:16 p.m.,*
in response to message #1 by x34

Funny, I was thinking the same earlier today. The SD, USB, proper alpha screen and alpha keys makes it appealing.

While I do not own one, I have hold it in my hands and my impression was not positive. Big, fat, ugly and plastic in the negative sense.

Size is the worst I think. I hold my hopes for something less bulky, with proper alpha keys and LCD. A real time clock and USB would be nice as well. A voyager style or HP-41 sized calculator would be nice.

Having said that, I would prefer the hp50g over the other existing alternatives thanks to the alpha capability.

Are there any available hardware programming documentation of the hp50g in case you want to throw that RPL thing out of it?

HP 48GX Squeaky

*Message #1 Posted by **Anthony (USA)** on 8 Feb 2011, 11:16 p.m.*

Hi, my HP 48GX is somewhat loose and squeaky at the left-side seam between the top and bottom halves. I'm wondering where the screws are located so I could tighten them. My guts tell me that the screws are located under the metal plate with all the characters printed on it. If that's the case, then I probably won't be able to access the screws and fix the problem. :'(What do y'all think?

Re: HP 48GX Squeaky

*Message #2 Posted by **Jeff O.** on 9 Feb 2011, 7:50 a.m.,*
in response to message #1 by Anthony (USA)

There are no screws. The HP48 is held together with plastic latches and heat rivets. Han Duong prepared a really nice set of instructions on how to open, but I cannot find them or a link at the moment. Try this as a start.

edit - found link: http://www.math.uiuc.edu/~handuong/hp48/open/

Edited: 9 Feb 2011, 8:30 a.m.

Re: HP 48GX Squeaky

*Message #3 Posted by **Randy** on 9 Feb 2011, 8:52 a.m.,*
in response to message #1 by Anthony (USA)

Very common on older made in Singapore units. It has to do with the plate under the keyboard. Unless you disassemble it and then glue it back together with LOTS of glue in the outside edge seams, you'll accomplish nothing. Honestly, it is one 48 attribute that is best left as-is.

Re: HP 48GX Squeaky

*Message #4 Posted by **Anthony (USA)** on 9 Feb 2011, 1:15 p.m.,*
in response to message #1 by Anthony (USA)

Oh my, those are some disturbing images, shivers literally went down my spine. Thank you, Jeff O., for the link, I appreciate it, that's really helpful and eye-opening. And I agree with you, Randy, I think I'll just leave my calculator as it is; I love it too much to commit anything that would scratch or indent it in any way. Thank y'all for the responses.

*Message #2 Posted by **bill platt** on 8 Feb 2011, 8:34 p.m.,*
in response to message #1 by Michael de Estrada

As dumb as these people are, HP was "dumb" to design a piece of equipment this way.

Re: Reading this makes me weep.

*Message #3 Posted by **Eric Smith** on 8 Feb 2011, 8:36 p.m.,*
in response to message #1 by Michael de Estrada

Well, the "buffoonery" it's really HP's fault for doing such a shoddy power supply design. It would have only taken two additional components (under $0.15 cost in volume production) to have a better power supply that wouldn't fry the electronics if the battery was dead or missing.

Fortunately HP didn't design any more calculators or accessories with that kind of power supply after 1979, but it definitely is sad that probably a lot of the old ones get destroyed by people who are unaware of the problem.

Re: Reading this makes me weep.

*Message #4 Posted by **Randy** on 8 Feb 2011, 9:20 p.m.,*
in response to message #3 by Eric Smith

Eric, I agree the design is poor at best. But, given the constraint of keeping electronics out of the wall wort, what are the two fifteen cent parts that would protect the calculator from over-voltage?

I'm asking because even if it costs several dollars at today's prices, I'd install them in all my Woodstocks and any that I repaired.

Re: Reading this makes me weep.

*Message #5 Posted by **Eric Smith** on 8 Feb 2011, 10:11 p.m.,*
in response to message #4 by Randy

A zener diode and a series resistor. The only trick is getting the right zener voltage such that it protects

the circuitry while not interfering with charging. The required zener voltage is not a common one; the minimum order quantity to get it is more than 5000 pieces. This would have been no problem for HP, but makes it less likely for us to install it ourselves.

Without using the uncommon-valued zener, it can be done with more circuitry using commonly available components. Then it becomes more difficult to pack the added circuitry into the calculator.

Re: Reading this makes me weep.

*Message #6 Posted by **robert rozee** on 9 Feb 2011, 7:53 a.m.,*
in response to message #5 by Eric Smith

given (i assume) the calculator runs on a pair of AA ni-cads assembled into a battery pack, the solution is a chunky 3.3 volt zener diode connected directly across the battery contacts. a 1 watt suitable component is the 1N4728A, listed from farnell (their p/n 1467572) for the princely sum of 20.4 cents(nz) each in quantities of 1. no additional series resistor is needed - see below.

now, the ni-cad cells would have had a capacity of perhaps 700mA/h back then, and the charging technology of the day would dictate a maximum safe charging current of 1/10th of that for a 10 hour rate, or 70mA. 70mA x 3.3 volts = 0.23 watts dissipation by the zener (worst case), well within the power rating. even charging at a 3 hour rate, it is still only 230mA x 3.3 volts = 0.76 watts.

note that the zener would ONLY have any effect if the batteries were NOT plugged in. with a battery pack present it would dissipate nothing, with the maximum voltage across a pair of fully charged ni-cads falling well below the 3.3 volt clipping voltage (ni-cads top out at about 1.5 volts at the peak of their charge cycle).

cheers, rob :-)

Hi Rob, looks like a nice and cost-effective solution.

> Quote:
>
> now, the ni-cad cells would have had a capacity of perhaps 700mA/h back then,

For sake of not confusing our friends, such capacities are measured in mAh (or mA*h if you like).

in response to message #6 by robert rozee

> Quote:
>
> note that the zener would ONLY have any effect if the batteries were NOT plugged in. with a battery pack present it would dissipate nothing

That's the theory but it's not reality.

With a 3.3 volt part, you'll have at least 5 ma of leakage at 2.8 to 2.9 volts, the point at which the cells are at full charge. So, you end up with a fair amount of self-discharge making the scheme impracticable. Been there, tried that.

Re: Reading this makes me weep.

*Message #11 Posted by **robert rozee** on 9 Feb 2011, 10:14 a.m.,*
in response to message #10 by Randy

and at 2.6 volts? this would be close enough to full charge as to not matter for the loss.

if leakage were a problem, there are two solutions that come to mind immediately: 1. place the zener the other side of the power switch, or, 2. put an NPN transistor in series with the zener (at the ground end), with the base tied (via a 10k resistor) to the calculator's Vcc line. the transistor could be quite small.

addendum - a quick check reveals: 3.3 volt zener (BZX79C3v3), two ni-mh batteries freshly charged giving 2.7 volts, produces a measured leakage current of 800uA. this would (assuming the voltage didn't drop) give a battery life of 36 days. i believe practice would be much better, well exceeding the self-discharge of 1970's technology ni-cads.

You can't subtract apples from pears, as people say here, so your "unit" doesn't work. Two, and counting d;-)

Re: Reading this makes me weep.

*Message #14 Posted by **Mike Morrow** on 9 Feb 2011, 11:12 a.m.,*
in response to message #13 by Walter B

I know. I once operated nuclear submarine batteries for a living.

The traditional term for battery capacity in many English texts has been "Ampere-hour" rather than the awkard scanning "Amperehour". The "-" is there as a delineation between the two words in the compound term, and not as a mathematical function. It causes no ambiguity in unit world because there are no additive or subtractive unit combinations that make sense.

But you are correct...the best unit would be "Ah". I should have used that. :-)

Edited: 9 Feb 2011, 11:17 a.m.

Re: Reading this makes me weep.

*Message #15 Posted by **Walter B** on 9 Feb 2011, 12:01 p.m.,*
in response to message #14 by Mike Morrow

Mike, I didn't complain about the Ampere-hours in the plain text of your posting above (we have them in one word here: Amperestunden). But as you've acknowledged, as soon as you abbreviate them, universal math rules apply. Science and engineering have some easy sides, too 8)

Orthodox writing of units

*Message #16 Posted by **Karl Schneider** on 9 Feb 2011, 11:50 p.m.,*
in response to message #15 by Walter B

> Quote:
>
> Mike, I didn't complain about the Ampere-hours in the plain text of your posting above...

Ah, *(pun intended)* but you could have: When written out, the first letter of the unit should not be capitalized, except for other reasons (e.g., beginning a sentence, or if in all caps). I was mildly chastised for such a mistake years ago.

I don't know if accepted practice differs around the world, but that's ours.

-- Karl

Edited: 9 Feb 2011, 11:51 p.m.

Re: Orthodox writing of units

*Message #17 Posted by **x34** on 10 Feb 2011, 4:00 a.m.,*
in response to message #16 by Karl Schneider

SI rules says some units (derived from names) should be ALWAYS capitalized in short form, including Ampere and Kelvin. So, "Ah" is correct, while "ah" is not.

http://physics.nist.gov/cuu/Units/units.html

In countries using different standard and numerical systems there could be another rules :)

SI prefixes should be always properly used either in capitalized or string form.

There are some crazy units, like Siemens, which denoted resistance until WWII and conductivity after it. If you read some books from the first half of XX and see "Siemens", sometimes it is hard to understand either it is resistance or inverse.

http://en.wikipedia.org/wiki/Siemens_%28unit%29

Re: Reading this makes me weep.

*Message #18 Posted by **Ernst Fueloep** on 9 Feb 2011, 9:38 a.m.,*
in response to message #1 by Michael de Estrada

Is this HP-29C repairable? I mean would it work with a good battery pack installed?

Or have the actions from the seller destroyed it beyond hope?

Re: Reading this makes me weep.

*Message #19 Posted by **Walter B** on 9 Feb 2011, 10:37 a.m.,*
in response to message #18 by Ernst Fueloep

Usually the famous ACT-Chip has been fried. It can only be repaired by finding another one in another 29C (maybe also 25C) - but you won't disassemble a (usually working) donor for repairing a nonworking patient, will you? BTW, this topic was covered in this forum extensively several times, so you'll certainly find more about it in the archives.

Edited: 9 Feb 2011, 10:38 a.m.

Re: Reading this makes me weep.

*Message #20 Posted by **Dave Shaffer (Arizona)** on 9 Feb 2011, 11:49 a.m.,*
in response to message #1 by Michael de Estrada

> Quote:
>
> buffoonery happens so often with ignorant sellers.

I don't know who the seller is, but unless he frequents this forum, I don't think it is fair to call him "ignorant."

Most modern electronics with batteries operate just fine with a charger, with or without the batteries - my most recent knowledge concerns my digital cameras. If his knowledge base is similar, he was doing what he is used to doing.

I consider myself fairly intelligent, and if I didn't know anything about this particular series of calculators and the likely problems that result if the charger is plugged in without the batteries (making good contact; another point one may not be used to thinking about), I would happily plug it in.

Re: Reading this makes me weep.

*Message #21 Posted by **Walter B** on 9 Feb 2011, 12:09 p.m.,*
in response to message #20 by Dave Shaffer (Arizona)

"ignorant" comes from Latin "ignorare" = "not (to) know". So an ignorant seller is a seller who doesn't know (here: the bad design of the charging circuit of HP's Woodstocks). Since I've fried a 25C the same way once, I'd call me ignorant as well until then. No problem with that word.

Re: Reading this makes me weep.

*Message #22 Posted by **Mark Harman** on 9 Feb 2011, 12:52 p.m.,*
in response to message #21 by Walter B

I understand what you are saying. However, in the U.S. the usage of the word "ignorant" has an extremely negative connotation and is usually considered to be an insult. It means to have a lack of knowledge in general - being uneducated, unsophisticated, and/or foolish.

Better words to use might be uninformed or unaware.

Regards,

Mark

Re: Reading this makes me weep.

*Message #29 Posted by **Michael de Estrada** on 9 Feb 2011, 1:02 p.m.,*
in response to message #21 by Walter B

Walter, thanks for clarifying my comment. I was not criticizing the seller for his unfortunate actions that were the result of his ignorance, but simply lamenting the sad fact that so many Woodstocks are being destroyed this way. I too am guilty of ignorant acts, although fortunately none have not resulted in the destruction of a vintage calculator. When I acquired my first HP 65 it did not have a battery or Owner's Handbook, and I was unaware of the unique circuitry in this Classic model, which requires the presence of a battery to prevent damage to the card reader components. In fact, at the bottom of page 87 of the HP 65 Owner's Handbook there is a cautionary note that damage may occur if the calculator is operated from the AC adapter without the presence of a battery pack. I briefly operated the calc from the AC line before obtaining a battery, and fortunately no damage was done. As to my collection of Woodstocks, I now charge all the NiCad battery packs externally, and never connect the AC adapter to

any of them.

Re: Reading this makes me weep.

*Message #30 Posted by **Thomas Okken** on 9 Feb 2011, 5:09 p.m.,*
in response to message #21 by Walter B

I believe "ignorare" means "to ignore". "Not to know" would be "nescire". Looked at it that way, the original meaning of "ignorant" translates to something more like "wilfully ingorant" in modern usage, and that is just a euphemism for "dumb", which is pejorative. In other words, never a good choice of words if what you really mean to convey is "unknowning". :-)

HP 17B ==> 17BII

*Message #1 Posted by **Martin Pinckney** on 7 Feb 2011, 4:11 p.m.*

Too bad HP didn't make the INPUT key double as ENTER, instead of the = key. Then the 17BII would be interface-compatible with the other Pioneer RPN calculators.

I guess I am a few years late on this comment.

Re: HP 17B ==> 17BII

*Message #2 Posted by **Mark Harman** on 7 Feb 2011, 4:18 p.m.,*
in response to message #1 by Martin Pinckney

Are you sure? I know that on the 17bII+, the input key does act as an enter key. It won't do it in certain menus and functions, however... In those particular cases - yes, you do have to use the = key.

Mark

Re: HP 17B ==> 17BII

*Message #3 Posted by **bill platt** on 7 Feb 2011, 4:21 p.m.,*
in response to message #2 by Mark Harman

From my understanding and experience, when you are in menus and functions, there is no difference between modes.

Re: HP 17B ==> 17BII

*Message #4 Posted by **Mark Harman** on 7 Feb 2011, 4:27 p.m.,*
in response to message #3 by bill platt

Yeah, there are a few cases, like when inputting numbers into lists that you need to use the = key as a substitute for Enter to do calculations. In the list mode, the input key actually inputs the number into the list. The 30b works the same exact way.

Mark

Re: HP 17B ==> 17BII

*Message #5 Posted by **Martin Pinckney** on 7 Feb 2011, 4:22 p.m.,*
in response to message #2 by Mark Harman

I don't have a 17bii. I just surmised by looking at the photo which shows Enter under =. I would love to be told that the Input key will work exactly like an Enter key.

Re: HP 17B ==> 17BII

*Message #6 Posted by **Mark Harman** on 7 Feb 2011, 4:29 p.m.,*
in response to message #5 by Martin Pinckney

The Input key will work exactly like an Enter key.

ULAM Bizarre #2 - The power of HP 42S STO/RCL arithmetic

*Message #1 Posted by **Allen** on 5 Feb 2011, 10:48 p.m.*

I was doodling yesterday in meeting, and found a closed-form solution to the 2008 Ulam Spiral mini-challenge that has been haunting me for three years from: this thread.

Usage: Enter a Number (N) and execute the program. It will return the non-trivial solutions for adjacent numbers in Ulam's spiral. For example:

```
         17 yields 36, 38
         16 yields 05, 35
         14 yields 03, 33
         13 yields 30, 32

example spiral:

         37 36 35 34 33 32 31
         38 17 16 15 14 13 30
          . 18 05 04 03 12 29
          . 19 06 01 02 11 28
          . 20 07 08 09 10 27
          . 21 22 23 24 25 26
          .  .  .  .  . etc..
```

If you're interested, I've made a Stack Diagram describing how the STAT registers and careful stack discipline can be combined to accumulate terms without local variables, and only using two numbers in the program. (integers 3 and 5)

This program has a very concise check to see if $2\lfloor\sqrt{4N-6}\rfloor < 2\lfloor\sqrt{4N-2}\rfloor$. It returns $N+2\lfloor\sqrt{4N-2}\rfloor+3$ and $N+2\lfloor\sqrt{4N-2}\rfloor+5$ for corner numbers such as 31,37,43.

Otherwise it returns $N-2\lfloor\sqrt{4N-2}\rfloor+3$ and $N+2\lfloor\sqrt{4N-2}\rfloor+5$

This closed form approach allows a 30% reduction in program space, AND an order of magnitude reduction in runtime. The new program is O(1) constant runtime, 37 bytes (28 steps max for all values with no looping)- The previous version from 2008 was O(N) and 54 bytes and 43 program lines with some considerable sized loops.

```
' 37-byte HP 42S ULAM spiral solution Allen T. 2/5/2011
00 { 37-Byte Prgm }
01 LBL 00
02 CL\Sigma    @ Clear Stat registers
03 ENTER
04 ENTER       @ Fill the stack up with input
05 3
06 5
07 \Sigma+     @ add 3 and 5 to Stat regs
08 +           @ add the 3 and 1 to get four
09 STO× ST T   @ Put 4*N on level T
10 Rv          @ ROLLDN
11 \Sigma+     @ Add N to each of the Stat regs
12 STO- ST Z   @ Put 4N-2 on Stack level Z
13 R^          @ ROLLUP
14 +/-         @ NEG
15 RCL+ ST T   @ Put 4N-6 on Stack Level T
```

```
16 SQRT
17 IP
18 STO+ ST X   @ find 2*floor(sqrt(4N-2))  < doubles the number in X without loosing STACK(T) 3
bytes same cost as "2 *"
19 R^
20 SQRT
21 IP
22 STO+ ST X   @ find 2*floor(sqrt(4N-6))
23 X=Y?        @ if the numbers are the same, then it's a SIDE
24 +/-         @ Need to subtract 2* the Side number
25 ENTER
26 ABS
27 \Sigma+     @ Otherwise add 2*Side number to both stat regs
28 RCL 13      @ Recall SUM(Y) register
29 RCL 11      @ Recall SUM(X) Register
30 .END.
```

Thanks to Thomas for his tutorial on using formulas. I did not follow the teacher exactly, but managed to get the formulas here anyway.

* NOTE - I do not believe this program is compatible with the HP41C due to the specific use of the linear stat register and the STO/RCL arithmetic (line 15). Caveat Emptor.

Five Reasons I think this is a nice demonstration program for the 42S and RPN flexibility:

```
1) Lines 04 and 09 allow use of STACK(T) copies as the lower stack items are consumed in
operations
2) It's one of the very few RPN programs I've seen use both ROLLUP and ROLLDN
3) Byte-saving tricks like "STO+ ST X" to double a number without disturbing the stack. (Is
there a better RPN way?)
4) Uses 3 stat registers rather than local variables
5) Wherever possible uses output from the STAT accumulator instead of entering numbers (byte
conservation)
```

Re: ULAM Bizarre #2 - The power of HP 42S STO/RCL arithmetic

*Message #2 Posted by **Don Shepherd** on 6 Feb 2011, 3:06 a.m.,*
in response to message #1 by Allen

Amazing work, Allen, congratulations.

I was thinking about entering this code on my 32sii but I notice several references to things like STO * STO T and STO - STO Z. I assume these are 42s commands to put values directly on the stack, correct? And I don't believe these commands exist on the 32sii, is that correct?

Many thanks for this great work in algorithm development.

Re: ULAM Bizarre #2 - The power of HP 42S STO/RCL arithmetic

*Message #3 Posted by **Dieter** on 6 Feb 2011, 7:21 a.m.,*
in response to message #2 by Don Shepherd

> Quote:
>
> I was thinking about entering this code on my 32sii but I notice several references to things like STO * STO T and STO - STO Z.

The HP41-series offers direct access to the stack registers - they can be used in the same way as the usual numbered registers. So STO Z directly stores X in stack register Z, or ST+ T adds X to register T. This allows very effective programming and elegant solutions like ST+ X for doubling a number (even without affecting LastX).

The 42s adds two more features: Since it can also use named storage registers a simple "STO T" might be confusing because it may refer to stack register T as well as a variable named T. That's why there's an additional "ST" for "stack" in commands referring to stack registers: STO T stores a value in variable T, while STO ST T stores it in the top stack tegister T. On the other hand, the 42s can also do all this with recall-arithmetics as well: RC+ ST Z adds the content of stack register Z to the value in X without affecting the stack otherwise.

No, all this can't be done on the 32s and similar calculators.

Dieter

Re: ULAM Bizarre #2 - The power of HP 42S STO/RCL arithmetic

*Message #4 Posted by **Thomas Klemm** on 6 Feb 2011, 5:00 a.m.,*
in response to message #1 by Allen

Hi Allen

You could reverse clearing the statistic registers and filling the stack thus saving one precious byte:

```
02 ENTER       @ Fill the stack up with input
03 CL\Sigma    @ Clear Stat registers
```

Clearing the statistic registers enables the stack lift. Since 3 and 5 follow only one **ENTER** is needed. Furthermore you could replace the two last statements with **SUM**. This instruction uses two bytes as well, so no gain with that change, but this makes the program independent of the setting of **\GSREG**. However this instruction is missing in the HP-41C.

> Quote:
>
> Thanks to Thomas for his tutorial on using formulas. I did not follow the teacher exactly, but managed to get the formulas here anyway.

Did you just save the images or did you find another ingenious way? In the latter case I could add it to the article. Which reminds me to add Egan's method he once posted as well.

It's a clever idea to use the statistic functions for some kind of parallel processing.

Kind regards
Thomas

Re: ULAM Bizarre #2 - The power of HP 42S STO/RCL arithmetic

*Message #5 Posted by **Allen** on 6 Feb 2011, 8:25 a.m.,*
in response to message #4 by Thomas Klemm

Thomas, This is fantastic, Thanks! I made the change- yes even to save 1 byte. I also did not realize about the SUM function- I've always been concerned until now about making it independent of the REG settings- now I know how!!

Don noted ULAM shows a correlation between meeting doodles and math.. perhaps I should go to more meetings!

Re: ULAM Bizarre #2 - The power of HP 42S STO/RCL arithmetic

*Message #6 Posted by **Mark Storkamp** on 6 Feb 2011, 1:22 p.m.,*
in response to message #1 by Allen

I made it work with the 41C by changing line 15 from

```
15 RCL+ ST T
```

to

```
15 R^
16 STO+ ST Y
17 Rv
```

Re: ULAM Bizarre #2 - down to 32 bytes

*Message #7 Posted by **Allen** on 7 Feb 2011, 12:26 a.m.,*
in response to message #6 by Mark Storkamp

Mark, Thanks for your 41C Fix!! I made the output from FREE42 and used HP41UC to create a 41C barcode, then scanned it in using my wand- sure it may have been faster just to type the thing in, but I'm not sure how to type R^ in the 41c.

Thomas, I incorporated your Stack lift saving 1 byte and SUM features, I also found a way to save 4 more bytes by getting rid of some of the 2-Byte STO+ instructions from above. Now it's down to 32 Bytes- Not sure I can do much better than that.

```
00 { 32-Byte Prgm }
01▶LBL 00
02 ENTER
03 CLΣ
04 3
05 5
06 Σ+
07 +
08 R↓
09 Σ+
10 1/X
11 -
12 R↑
13 ×
14 ENTER
15 R↑
16 -
17 SQRT
18 IP
19 X<>Y
20 SQRT
21 IP
22 X=Y?
23 +/-
24 STO+ ST X
25 ENTER
26 ABS
27 Σ+
28 SUM
29 .END.
```

Re: ULAM Bizarre #2 - down to 32 bytes

*Message #8 Posted by **Thomas Klemm** on 7 Feb 2011, 8:03 a.m.,*
in response to message #7 by Allen

> Quote:
>
> but I'm not sure how to type R^ in the 41c

Special characters are listed on the back of the calculator:

So the keystrokes would be:

- XEQ
- ALPHA
- 7
- Shift
- ENTER^
- ALPHA

HTH

HP-15C Sticky Keys

*Message #1 Posted by **aj04062** on 5 Feb 2011, 10:12 p.m.*

I tried the alcohol drop with homemade brush technique to clean up about 7-8 stick keys. Technique While the alcohol was liquid, the keys didn't stick. When it evaporated, they started again.

I do not have access to an ultrasonic cleaner. Would anyone suggest soaking the calculator in heated (not boiling) deionized water below the LCD? I could then heat/dry with a hair drier.

Other suggestions?

Hmm, maybe my dentist would let me borrow his water pick :)

Re: HP-15C Sticky Keys

*Message #2 Posted by **Ernst Fueloep** on 6 Feb 2011, 9:23 a.m.,*
in response to message #1 by aj04062

I have no idea to solve your problem except maybe opening the HP-15C and cleaning the key contacts.

But I would like to know if the idea to use an ultrasonic cleaner would be appropriate to clean the keyboard of a woodstock calculator? Of course, only the keyboard not the entire machine. I would open my woodstock which has some keys which needs to be pressed very strong to be recognized and put only the keyboard into the ultrasonic cleaner. Would this work? Is there no danger in damaging the keyboard?

Thanks.

Regards, Ernst

Re: HP-15C Sticky Keys

*Message #3 Posted by **Etienne Victoria** on 6 Feb 2011, 9:49 a.m.,*
in response to message #2 by Ernst Fueloep

Do NOT use a ultrasonic cleaner on a Woodstock keyboard as this will fragilize/erase the keyboard markings.

A procedure that works (I use isopropyl alcohol) can be found here.

Etienne

Edited: 6 Feb 2011, 9:49 a.m.

in response to message #1 by aj04062

Adam,

To disassemble a Voyager: I use the excellent procedure from Luiz: here.

To clean the keyboard: I use Randy's steps: here.

Etienne

Re: HP-15C Sticky Keys

*Message #5 Posted by **aj04062** on 6 Feb 2011, 10:23 a.m.,*
in response to message #4 by Etienne Victoria

Thanks Etienne,

I guess I will "dive in" to the distilled water solution. I don't know what foreign substance is causing the stick. (I just purchased the unit). Hopefully it is water soluble.

Re: HP-15C Sticky Keys

*Message #6 Posted by **Mike Morrow** on 6 Feb 2011, 11:48 a.m.,*
in response to message #4 by Etienne Victoria

The disassembly procedure in the thread referenced just above applies to the early models of the Voyagers in which the logic and LCD assemblies may be separated from the keyboard assembly.

The later models (after 1984???) utilize a much less complex configuration in which the logic and display and keyboard are all constructed on one large PCB.

This difference makes some display or keyboard repairs that are possible on one version impossible or very challenging on the other.

Most descriptions of Voyager disassembly assume that the early internal configuration is what will be found. Even this site's museum shows, AFAIK, no photos of what is likely the more common later internal configuration.

Randy's (of Fix That Calc) recommendations would carry the most authority and promise for success.

Edited: 6 Feb 2011, 11:50 a.m.

Re: HP-15C Sticky Keys

*Message #7 Posted by **aj04062** on 7 Feb 2011, 6:48 a.m.,*
in response to message #6 by Mike Morrow

I've done the distilled water cleaning and alcohol dropped into problem keys. No success. Is the cause of sticky keys ALWAYS caused by some foreign substance or do they start to get this way with age?

I'll do it again if consensus is substance as they are somewhat annoying (but work fine)

Thanks

Re: HP-15C Sticky Keys

*Message #8 Posted by **Artur-Brazil** on 7 Feb 2011, 7:15 a.m.,*
in response to message #1 by aj04062

Hi, For openning your calculator, you must cut off all the plastic seals on the main print circuit board. Use a good knife for this and let the plastic pins behing them intacts. So, remove the rubber sheet and proceed with a good cleaning, using alchool. To put back the pcb, you will need to make a support with many plastic plastic pins that goes bethween keys and use some fast Epoxi (10min cure) and some very heavy pieces to keep all togheter. It's is not so difficult and I have done this for a number of calculators, including 41C? models. Artur

Re: HP-15C Sticky Keys

*Message #9 Posted by **aj04062** on 7 Feb 2011, 9:14 p.m.,*
in response to message #8 by Artur-Brazil

Perhaps I am not describing the issue well.

It seems that the keypad membrane snaps or clicks after depressing. the feel correct, but there is snap just as the key returns. There is no sticking of contact (as in multiple digits)

Would this still be foreign matter?

SpeedUI 11.01 released

*Message #1 Posted by **Raymond Del Tondo** on 5 Feb 2011, 8:45 p.m.*

Hello all,

the new version 11.01 includes, amongst other nice things, a four way stack font size switcher.
So it should be suitable for the eagle-eyed and the nearly blind;-)

This is a major upgrade from the version 9.12 , so please uninstall all older components before installing SpeedUI 11.01 .

The new version is available here:

SpeedUI Walkthrough

SpeedUI zip archive

and on www.hpcalc.org (once the site is updated)

Have fun:-)

Raymond

HP-41C/CV/CX Eigenvalues/Vectors help

*Message #1 Posted by **mbrethen** on 5 Feb 2011, 7:55 a.m.*

I'm trying to use the "Eigenvalues/Vectors of 3rd-Order for the HP-41C/CV/CX" program but get a "divide by zero" error. It looks like the program called “A” sets up matrix "A" so I enter each element, followed with R/S. How is vector "V" entered? Anyone have experience using this program?

Thanks.

Re: HP-41C/CV/CX Eigenvalues/Vectors help

*Message #2 Posted by **mbrethen** on 5 Feb 2011, 4:52 p.m.,*
in response to message #1 by mbrethen

Tony Duell sent me this explanation via mail:

> Quote:
>
> It's actually a translation (by HP) of an HP67 program in that machine's High Level Math Solution Book. And that explains a few things...
>
> You start by storing the 9 values of the matrix in column order in register 01 to 09. You do this by hand, the program doesn't store them. When I say 'column order; I mean that registers 01-03 are the first column of the matrix, 04-06 are the second column, and 07-09 are the third column.
>
> Executing from label A (which can be done by pressing the Sigma+ key in USER mode if you have nothing else assigned there, of course) will display the 9 values in the matrix so you can check they are correct.
>
> You then store you initial guess for the eigenvector in registers 20-22. You may wonder why those. Well, on the HP67, those are called A-C. Again, you have to do this by hand.
>
> Then XEQ "EVV". The program should then display the first eigenvalue followed by the first eigenvector, then the second eigenvalue, second eigenvector, third eigenvalue, thrid eigenvector, a total of 12 numbers. Since it came from the (numeric-only) HP67, there's no labelling of these values....

Re: HP-41C/CV/CX Eigenvalues/Vectors help

*Message #3 Posted by **Ángel Martin** on 6 Feb 2011, 2:41 a.m.,*
in response to message #1 by mbrethen

Alternatives to that program are available in the SandMath Module:

EV3X3 - for 3x3 matrices, and

CHRPOL - for nxn case, and
EIGEN - using the Advantage's SOLVE

Data entry is assisted by the program, no issues there.

See also the articles section of this museum site if you're interested.

HP97 troubleshooting

*Message #1 Posted by **Prabhu Bhooplapur** on 5 Feb 2011, 2:39 a.m.*

Hi, My HP97 is having problems. It turns on with the correct display '0.00'. After this if I try to use the keyboard then say press the key '1' then the display changes to'-1000000000. 00' (the last two zeros are in the exponent position). This is same with any of the numeric keys except that the first digit is the key pressed. If I press say key '1' the display will be '-1000000000. 00', press ENTER, if I then press say key '2' the display will be '-2000000000. 00' and press '+' the answer is displayed correctly '3.00'. If I perform operations like X2 or SQRT X the result is computed correctly.

I tried using the HP97 diagnostic card. I read in both the sides of the card and the display changes to '0. 00'. On pressing key A to run the diagnostic program results first in the display showing '5. -07'(instead of the usual 57 on the display) followed by '-8. 00'.

Any clues to what could be the problem and any suggestions to solve the problem? Thanks, Prabhu Bhooplapur

Re: HP97 troubleshooting

*Message #2 Posted by **Randy** on 5 Feb 2011, 9:04 a.m.,*
in response to message #1 by Prabhu Bhooplapur

Realistically, you'll need good 97 to troubleshoot, first at the board level and then down to the component as the problem is most likely a bad ROM 6 (1818-0230). You can troubleshoot using the instructions in the 97 service manual on page 4-2.

Note: The service manual only shows the component locations for first generation logic board layout, the second one, done for the 97S, is not documented. Further, the rom locations shown in figure 4-9 are not correct. The order from left to right is ROM 1,2,6,5 and 3 and not 1,2,3,4,5 as shown.

HTH...

HP 12C Platinum Screen

*Message #1 Posted by **Anthony (USA)** on 4 Feb 2011, 8:37 p.m.*

Hi everyone,

I just bought an HP 12c Platinum and I notice that whenever I touch the screen (even with a slight pressure) that lines and clumps of pixels appear. Whether the calculator is on or off, when I touch the screen clumps of pixels appear. They disappear after a while, but I'm wondering about what's wrong with this. I have other HP scientific and graphing calculators and this sort of thing seem to only happen to the HP 12c Platinum. My fingers aren't magnetic, I don't think. What's causing this? I mean, I sure I'm not the only one who finds this somewhat disconcerting...

Re: HP 12C Platinum Screen

*Message #2 Posted by **Martin Pinckney** on 4 Feb 2011, 10:22 p.m.,*
in response to message #1 by Anthony (USA)

I've never seen an LCD that *did not* exhibit similar behavior. Even my color wide-screen display that I am looking at right now will show distortion if I touch it.

in response to message #1 by Anthony (USA)

> Quote:
>
> My fingers aren't magnetic, I don't think. What's causing this?

LCDs are not magnetic. They function on electric field changes. Your touch is disturbing or inducing electric fields through the crystals.

This should not disturb you. It's common in all LCDs if the protective window over the LCD allows fingers to get too close to the display surface.

Is the HP-50g bug free now?

*Message #1 Posted by **Jim Yohe** on 4 Feb 2011, 2:47 p.m.*

Did the release of ROM update version 2.15 eliminate all of the bugs in the HP-50g's bugs?

Re: Is the HP-50g bug free now?

*Message #2 Posted by **Crawl** on 4 Feb 2011, 3:02 p.m.,*
in response to message #1 by Jim Yohe

What do you mean? I haven't had problems with 50g bugs for as far back as I can remember.

Re: Is the HP-50g bug free now?

*Message #3 Posted by **Jim Yohe** on 4 Feb 2011, 3:43 p.m.,*
in response to message #2 by Crawl

I assume that the "bugs" found in the initial release of the HP-50g must have necessitated the firmware release to correct them otherwise there'd be no need to issue that release.

I'm sorry but I don't own this calculator so wasn't making claims about its failings but was curious and wanted to ask ... just in case I ever do purchase one. I know that there were discussions in the forum archives about "bugs" along with a couple different firmware update releases.

Re: Is the HP-50g bug free now?

*Message #4 Posted by **Crawl** on 4 Feb 2011, 4:41 p.m.,*
in response to message #3 by Jim Yohe

> Quote:
>
> otherwise there'd be no need to issue that release.

That's a faulty assumption. One ROM upgraded added an equation library, another added a periodic table function. It's not all about fixing bugs.

Re: Is the HP-50g bug free now?

*Message #5 Posted by **Tim Wessman** on 4 Feb 2011, 5:42 p.m.,*
in response to message #3 by Jim Yohe

In a system as convoluted and complicated as that, there will always be bugs. However, the vast majority of issues that have ever been known have been long fixed.

2.15 added support for the streamsmart 400. That is its main "feature".

TW

Re: Is the HP-50g bug free now?

*Message #6 Posted by **Glenn Shields** on 4 Feb 2011, 10:19 p.m.,*
in response to message #3 by Jim Yohe

I just got a new one, since the one from about a year ago had a faulty up-arrow key, requiring a hard press to get it to work.The new one has a great feel and display. And with ver 2.15 LINSOLVE actually works, and is fun to use. But the real bug I wanted to test is the alarm bug, and alas, it is still there. It seems that the alarm gets fouled up after the time passes midnight, then it will not wake up the calculator. I even tried to set an alarm for the early am which sets a NEW alarm later in the morning, but that one didn't go off either. Is the alarm such a "lowly" function in such a machine as the 50g that we are expected to just live with it?? cheers, Glenn

Re: Is the HP-50g bug free now?

*Message #7 Posted by **Paul Gaster** on 4 Feb 2011, 11:28 p.m.,*
in response to message #6 by Glenn Shields

No, one should not just live with it. The HP-41 series were programmed and used as alarms on the shuttle decades ago to remind astronauts to do certain tasks at certain times. How have calculators regressed so much since then?

Re: Is the HP-50g bug free now?

*Message #8 Posted by **Mike Morrow** on 5 Feb 2011, 12:49 a.m.,*
in response to message #6 by Glenn Shields

I use the following program in an ALARM to automatically add a few seconds each day to the slow clock on my HP 50G, version 2.15:

<24300 CLKADJ DROP>

It works, so it can't be said that the ARM-based 49g+ and 50G machines have inoperable alarm functions. But...they are quirky and not as consistent in behavior as the same functions on the HP 48 series.

It's definitely a bug, but it's been reported to be in the Saturn-to-ARM emulation.

Re: Is the HP-50g bug free now?

*Message #9 Posted by **Nicholas Winterer** on 5 Feb 2011, 8:38 p.m.,*
in response to message #1 by Jim Yohe

How about the keyboard? Mine has a couple of keys that have lost their spring (they just stick down).

Has anyone else had this problem? I am considering buying a new one because symbolic matrix operations would be handy for my linear algebra class, but if the keys are just going to break in two more years I might just try to put a CAS on my 48gx.

Re: Is the HP-50g bug free now?

*Message #10 Posted by **Jim Yohe** on 6 Feb 2011, 4:03 p.m.,*
in response to message #9 by Nicholas Winterer

> You're right. A ROM update won't fix a "sticky" or "stuck" keyboard problem.

Self tests in the HP12C Platinum+

*Message #1 Posted by **jose ernesto** on 4 Feb 2011, 11:16 a.m.*

I've been exploring my new HP12C Platinum +, the one with 2 batteries and found that the self test menu that we reach when we press <ON> + <g> + <ENTER> now display 4 alternatives. I'm trying to include the photos here but I was unable so far.

The alternative 1 turns all elements in disply on; any will make the calculator return to the 4 alternatives menu. Number 2 will start the self test that runs for some 10 seconds and then display "ChE--564Ah" string. Apparently there is no way out of this and I had to turn the device off. Alternative 3 will turn everything on again, but will require that we press all keys in column sequence to turn everything off. Any other key wiil bring tha calculator back to test menu. Number 4 will display "4059760 h2".

Other other selftests are documented in the User guide: <ON> + </>, <ON> + <x>, <on> + <-> and <ON> + <+>. The test for the HP12C+ <ON> + <g> will n ot operate with new machine.

There is not a sign of a connector near the bottom of the batteries as we had in the new HP12c+.

I will try to include the images I made as soon as I learn how to do it.

José

*Message #2 Posted by **Marcus von Cube, Germany** on 4 Feb 2011, 11:58 a.m.,*
in response to message #1 by jose ernesto

José, you need to put your images somewhere on the net (google for "image hoster"). Than you can include an [image] tag to display them here.

Including photos in Forum posts

*Message #3 Posted by **Karl Schneider** on 5 Feb 2011, 3:57 a.m.,*
in response to message #1 by jose ernesto

José --

Detailed formatting guidance is found by clicking the hypertext "more" found below the box in which a post is composed. Another host must be used for the images, as Marcus stated.

I'd like to ask that you provide links to your images (which are presumably large and high-resolution), rather than simply using the "img" code, which I believe is intended for small graphics. Otherwise, the images are automatically downloaded when readers click on the thread containing your post. This annoys readers who did not want large images to displace text in the thread, or who might be experiencing slow download speeds. The extra downloads also might incur added costs to you.

-- Karl

Jose, can you please edit your post so the the address cannot be easily picked up by a spam bot? It's bad practice to make other people's e-mail publicly visible.

Re: To jose

*Message #4 Posted by **Iqbal** on 4 Feb 2011, 2:21 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Thanks Jose. I guess you can probably delete the email now. I got it.

Re: To jose

*Message #5 Posted by **Eric Rechlin** on 5 Feb 2011, 11:28 a.m.,*
in response to message #3 by Marcus von Cube, Germany

That's not really true anymore. I get as much spam on my email addresses that have never been posted publicly as I get on ones that have been posted publicly many times.

It seems to me that the biggest source of email addresses for spammers is viruses. All you have to do is email somebody, and if they have a virus, that virus captures your email address from their inbox and sends it to spammers.

There's really little point in protecting email addresses now, because the spammers have gotten so good. Just find a good spam filter (Gmail works great for me).

Re: To jose

*Message #6 Posted by **Iqbal** on 5 Feb 2011, 4:22 p.m.,*

in response to message #5 by Eric Rechlin

That's very correct Eric. My Provider has also partnered with Gmail, and I hardly ever see any spam in my inbox.

HPIL-Devel BUFFER Question

*Message #1 Posted by **Ángel Martin** on 4 Feb 2011, 5:14 a.m.*

While doing some reseach on the BUFFER types I wanted to look at the one created by the HPIL Develoment module (id#=12).

This is quite an interesting buffer in a few ways, with a pointer structure - so it's quite close to a data file in XM, but of course without the "normalization" issue.

Anyway the issue I'm having is that the module image would not work on V41 - it freezes until you unload the rom image.

Furthermore, I loaded the said image on my MLDL and if works ok, albeit on startup it throws the criptic message "RD? 0 IND".

Linked to the MONITOR mode perhaps? I guess not, since such is disabled everytime the calculator is swithed off. Needless to say that the behavior is completele normal when using the REAL module on the same machine.

Any ideas as to what's that and how can it be disabled?

Re: HPIL-Devel BUFFER Question

*Message #2 Posted by **Meindert Kuipers** on 5 Feb 2011, 12:47 p.m.,*
in response to message #1 by Ángel Martin

Ángel,

Loaded the said module in my MLDL, had no problems with lockups or statup with starte messages. XROM number is 22 though. I did not ry any of the functions though ...

Meindert

Re: HPIL-Devel BUFFER Question

*Message #3 Posted by **Ángel Martin** on 7 Feb 2011, 6:55 a.m.,*
in response to message #2 by Meindert Kuipers

Thanks Meindert for looking into this - your assistance is always helpul.

Somehow the issue has gone away as it now works fine on the M2k. I have no idea why, no master clear or anything.

BTW I modified my BFCAT function to make it compatible with the AIP/MIP marker on the buffer header (stored in the XS digit). The BFCAT execution allows for forward and backward listing of the buffers. While the forwards way is easy using the buffer size info stored in the header, the backards run isn't possible unless the size of the "previous" buffer is known - similar to the FOCAL CHAIN in main memory.

Cheers, ÁM

Re: HPIL-Devel BUFFER Question

*Message #5 Posted by **Mike (Stgt)** on 7 Feb 2011, 4:21 a.m.,*
in response to message #1 by Ángel Martin

V41 loops (but BTW how do you predetermine the port number?). With my NutEm no problem so far, alas I do not simulate HPIL traffic yet. Did you try the trace JFG's Emu41 offers?

Ciao.....Mike

Re: HPIL-Devel BUFFER Question

*Message #6 Posted by **Ángel Martin** on 7 Feb 2011, 6:58 a.m.,*
in response to message #5 by Mike (Stgt)

V41 has a "Console" that allows you to see the MCODE steps as they're being run. It hangs in the same instruction, and there's nothing I can do to get it passed - looks like a real problem with this ROM image.

Re: HPIL-Devel BUFFER Question

*Message #7 Posted by **Mike (Stgt)** on 8 Feb 2011, 11:42 a.m.,*
in response to message #6 by Ángel Martin

Up to now I regarded Emu41 from JF Garnier as reference eumulating the Nut CPU. Tonite I'll have a look if I can compare the trace output of V41 and Emu41 (and NutEm if neccesary). BTW, if you assume a problem with the ROM image, did you CHKSM it?

Ciao.....Mike

Re: HPIL-Devel BUFFER Question

*Message #8 Posted by **Mike (Stgt)** on 9 Feb 2011, 4:35 a.m.,*
in response to message #6 by Ángel Martin

Just a short excerpt of the trace log, first from my NutEm:

```
27FB: 1E0 GOTOC
EFF8: 32B JNC    -1B EFDD
EFDD: 22B JNC    -3B EFA2
EFA2: 070 N=C
EFA3: 130 LDI
EFA4: 030 CON      48
EFA5: 106 A=C    X
EFA6: 024 PERTCT 1
EFA7: 03A RPREG 1
EFA8: 003 ?XF   1
```

And here from V41 (I left out all but the first output of CPU registers):

```
  A=000000000F0408 B=F00018AC029000 C=000018ADFF832B Stack=00F0 0000 0000 0000
  M=00000080000000 N=000018ACFF8070 Cr=0 >P=6  Q=D G=07 F0=00 ST=001010 00000000
  CLK_A=00000000000000 ALM_A=00000000000000 SCR_A=00000000000000
  CLK_B=00000000000000 ALM_B=09999999999000 SCR_B=00000000000000
  INT_A=00000  INT_B=00000 TMR_S=0040 ACC_F=0000 Timer=B FI=00000000000000
  RAM Addr=00E  Perph Addr=00  Base=16
27FB  1E0                      GOTOC
DFF8  32B                      GONC    -27     DFDD
DFDD  22B                      GONC    -59     DFA2
DFA2  070                      N=C
```

```
DFA3  130030                    LDI     030
DFA5  106                       A=C     X
DFA6  024                       SELPF   0
DFA7  03A                       B=0     M
DFA8  003                       GONC    +0      DFA8
DFA8  003                       GONC    +0      DFA8
DFA8  003                       GONC    +0      DFA8
```

And there it loops. Reminds me the test of a multitasking system, it was tanked by such a GO +0 instruction.

Hope this helps. Ciao.....Mike

HP 41CX

*Message #1 Posted by **Forrest Butler** on 3 Feb 2011, 3:54 p.m.*

I've had the referenced HP since 1980 (or so) and still use it daily in my work - RPN is far more efficient in my view. Recently, my HP replaced the decimal point with a comma, and no longer utilizes commas to separate thousands. I removed the battery for four hours hoping it would reboot to the original default position, but that hasn't helped. Does anyone on this forum have an idea how to correct this "problem"?

Re: HP 41CX

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 3 Feb 2011, 4:07 p.m.,*
in response to message #1 by Forrest Butler

The "radix mark" (comma or dot) is the symbol which separates integer and fraction part of numbers. The selection of radix mark and enabling or disabling the digits-grouping (separating thousands groups using dot or comma) are controlled by flags 28 and 29. You use the SET FLAG (SF) and CLEAR FLAG (CF) functions to set these features to suit your preferences.

To SET FLAG use the yellow SHIFT key and the "7" key, to CLEAR FLAG, use the yellow SHIFT key and the "8" key.

For instance, to use a dot as radix mark, and to enable the digits grouping feature, you should SF 28 and SF 29.

HTH

Re: HP 41CX

*Message #3 Posted by **Gerson W. Barbosa** on 3 Feb 2011, 4:10 p.m.,*
in response to message #1 by Forrest Butler

> Quote:
>
> Recently, my HP replaced the decimal point with a comma, and no longer utilizes commas to separate thousands.

Like this? I would leave it this way :-)

Now seriously, from the HP-41CX Quick Reference Guide:

```
 Flag        Flag Name               Status at Reset,
Number                                  Turn ON

28           Radix Mark                    1
29           Digit Separator Mark          1
```

So, try SF 28 and SF 29.

Regards,

Gerson.

Edited per Andrés's correction below.

Edited: 3 Feb 2011, 4:53 p.m. after one or more responses were posted

Re: HP 41CX

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 3 Feb 2011, 4:40 p.m.,*
in response to message #3 by Gerson W. Barbosa

Well, these functions are not postfix (perhaps on RPL machines they are so). On the HP 41 you do SF (or CF) and then type the appropriate flag number as prompted on the display.

So it is SF xx or CF xx.

Regards,

Gerson.

Re: HP 41CX

*Message #6 Posted by **Karl-Ludwig Butte** on 3 Feb 2011, 4:16 p.m.,*
in response to message #1 by Forrest Butler

Hello Forrest,

there are two display control flags in the HP-41: - Decimal Point Flag = Flag 28 - Digit Grouping Flag = Flag 29

If flag 28 is set, the decimal point is the radix and the comma is the seperator. If flag 28 is cleared, the comma is the radix and the decimal point is the seperator.

If flag 29 is set, seperators will be displayed.

Hope this helps.

Regards

Karl

82240B IR Printer Runs Sluggishly, then Doesn't

*Message #1 Posted by **Les Wright** on 2 Feb 2011, 11:48 p.m.*

Hi all, I haven't been around for awhile as I got enticed for a bit by shinier handheld things.

Anyhow, I recently fired up my previously flawlessly working IR printer after I don't know how long. At first, even with adequate power (from AC Adapter or fresh batteries) the printing operation was "sticky". The printer seemed to work haltingly at light print intensities, and usually would abort printing and become stuck if I set the intensity slider above the half way point.

Well, after running I don't know how many metres of paper through the thing by repeated runnings of the self-test or long jobs such as long program listings, it looks like things are back to normal. The only bit of maintenance I dared was to brush the tiniest bit of oil onto the twisty little bar that scoots the head back and forth, and to use a photographer's bulb to blow some air inside in the belief that dust and debris was bunging up some little drive belt or gear. However, these interventions didn't seem to help at first--only running the thing for some time seemed to "unstuck" the operation.

I admit to storing the thing in a room cursed with dust and cats, so that is the only culprit I can think of. But I have read here of people using these printers in very unclean environments, like carpentry shops, without difficulty.

Any thoughts? Is this basically debris and dust that had to dislodge in time, or am I facing something worse?

Heating, Ventilating and Air Conditioning Users Solutions

*Message #1 Posted by **Jeff Davis** on 2 Feb 2011, 6:42 p.m.*

Does anyone have the pdf for this users manual?

Re: Heating, Ventilating and Air Conditioning Users Solutions

*Message #2 Posted by **David Hayden** on 2 Feb 2011, 9:38 p.m.,*
in response to message #1 by Jeff Davis

Jeff, can you give some more details about this? Which calculator is it for? When was it written? By whom?

Re: Heating, Ventilating and Air Conditioning Users Solutions

*Message #3 Posted by **Les Wright** on 3 Feb 2011, 12:00 a.m.,*
in response to message #2 by David Hayden

It is in the series of HP41 User Solutions manuals.

Re: Heating, Ventilating and Air Conditioning Users Solutions

*Message #4 Posted by **Les Wright** on 2 Feb 2011, 11:59 p.m.,*
in response to message #1 by Jeff Davis

I am right now looking at the menu of the 80 individual pages at TOS. I won't post the link as I believe there are still some issues regarding that site and this upon which I care not to encroach.

The format is very inconvenient, but the manual seems to be all there.

Unfortunately, according to the listing of contents of the most recent MoHPC DVD set, the manual you seek doesn't seem to be there.

Les

35s Quadratic Regression

*Message #1 Posted by **J Noël** on 2 Feb 2011, 11:32 a.m.*

I am new to HP programming and recently acquired a 35s. I was surprised to see it cannot do Quadratic Regression, so I wrote a basic program that will develop the twelve inputs necessary to use the built in 3*3 lin. solve equation.

Q001 LBL Q

Q002 CLVARS

Q003 CLSTK

Q004 SF 10

Q005 (eqn) QUADREG

Q006 (eqn) TOTAL SETS

Q007 PSE

Q008 INPUT N

Q009 STO N

Q010 1

Q011 STO M

Q012 (eqn) X

Q013 PSE

Q014 INPUT X

Q015 STO X

Q016 (eqn) Y

Q017 PSE

Q018 INPUT Y

Q019 STO Y

Q020 STO +D

Q021 RCL X

Q022 *

Q023 STO +H

Q024 RCL Y

Q025 RCL X

Q026 (X SQUARED)

Q027 *

Q028 STO +L

Q029 RCL X

Q030 STO +B

Q031 STO +E

Q032 (X SQUARED)

Q033 STO +C

Q034 STO +F

Q035 STO +I

Q036 RCL X

Q037 3

Q038 (Y to the X)

Q039 STO +G

Q040 STO +J

Q041 RCL X

Q042 4

Q043 (Y to the X)

Q044 STO +K

Q045 RCL M

Q046 STO +A

Q047 RCL N

Q048 RCL A

Q049 X<Y

Q050 GTO Q012

Q051 RTN

When it is finished, there will be values stored in memory locations A through L. Launch and Solve the 3*3 lin. solve built-in EQN and R/S your way through the already-saved values. It will return the X, Y, and Z results of the Quadratically Regressed X,Y inputs from the program.

If anyone knows a better way to do this, please share!

JN

Re: 35s Quadratic Regression

*Message #3 Posted by **J Noël** on 2 Feb 2011, 12:47 p.m.,*
in response to message #2 by Namir

So if I may ask a newbie question, how do I use the solver to solve for various values of Y (or x) in the equation y=ax^2+bx+c?

Re: 35s Quadratic Regression

*Message #4 Posted by **Chris Randle (UK)** on 2 Feb 2011, 3:39 p.m.,*
in response to message #3 by J Noël

Press [EQN]
Type "Y=A*X^2+B*X+C" [ENTER], pressing [RCL] before each letter.
Press (right-shift) [SOLVE]
Type the letter of the unknown - no [RCL] needed this time
Provide a value for each prompted unknown followed by [R/S]
After the final [R/S] the value of the unknown will be calculated and displayed.

This is covered in the user's guide, chapter 7. Pay special attention to the bit about initial guesses in 7-8 as that is of particular importance with a quadratic.

Re: 35s Quadratic Regression

*Message #5 Posted by **J Noël** on 2 Feb 2011, 4:55 p.m.,*
in response to message #4 by Chris Randle (UK)

Boy, I feel dumb. I did not put the * symbols between the A and X.

Thank you for the help!

Re: 35s Quadratic Regression

*Message #7 Posted by **Norman Dziedzic** on 3 Feb 2011, 2:55 p.m.,*
in response to message #6 by Csaba Tizedes (Hungary)

I just noticed the 30b has this built in. Another + for the 30b.

From the linked post:

```
   Excel       HP32SII
A  -2.133E-3   -2.139E-3
B  +6.956E-2   +7.017E-2
C  +9.000E+1   +9.000E+1
```

for the 30b

```
A -2.1329E-3
B +6.9560E-2
C +9.0000E+1
```

Re: 35s Quadratic Regression

*Message #8 Posted by **Katie Wasserman** on 3 Feb 2011, 3:58 p.m.,*
in response to message #7 by Norman Dziedzic

The 20b has this as well.

Re: 35s Quadratic Regression

*Message #9 Posted by **Mark Harman** on 3 Feb 2011, 5:22 p.m.,*
in response to message #8 by Katie Wasserman

I thought that quadratic regressions were only limited to the 30b. The manual confirms this.

Mark

Edited: 3 Feb 2011, 5:30 p.m.

Re: 35s Quadratic Regression

Yes, that's a quite clever approach - though not exactly a strict least-square regression. ;-)

Hmm... since some calculators seem to offer a preprogrammed quadratic regression your idea might be used to fit a cubic function on these models...?

48sx repair help

*Message #1 Posted by **svisvanatha** on 2 Feb 2011, 7:02 a.m.*

Hello,

I used the instructions created by Han to open the 48sx so that I could fix a non-working keyboard row.

I used a thin piece of rubber between the existing keyboard rubber strip and the keyboard connector as a shim.
My thoughts were that this would help provide the missing contact for the keyboard row.

I accidently disturbed the lower rubber 'zebra strip?' that provides contact for the LCD.
The unit is back together (right side does not snap back well enough).
It does not power on unless I press down on the right side of the bezel below the LCD.
And even then, the LCD is missing many columns after powering on.

Q's:

1. What is the proper way to clean and reinsert the rubber strip for the LCD.

2. Is there a better way to provide 'gap reduction' for the keyboard contact than what I did?
A whole new rubber piece, or can it be shimmed in the manner in which I attempted.

3. What is causing the power-on problem?

4. What would cause the right side to not snap back together as well as the left?
I know this side was more difficult to pry apart.

Obviously, I am open to suggestions and criticism. The unit was working fine except the keyboard row not working prior to my repair attempt. The unit is at home at the moment.

Edited: 2 Feb 2011, 7:21 a.m.

Re: 48sx repair help

*Message #2 Posted by **aj04062** on 2 Feb 2011, 1:38 p.m.,*
in response to message #1 by svisvanatha

I have used trimmed foam from a Dr Scholls insole to replace the old foam and repair the contact.

I have wiped down the zebra strips with alcohol and been very careful to not contaminate when re-assembling. Dust from the PCB can interfere with the contact. I have had the same problem with dropped lines too and found that keeping the zebras clean and making sure you apply enough pressure on the board before you twist the metal tabs are key to a successful repair.

Re: 48sx repair help

Dust from the PCB can interfere with the contact. **I have had the same problem with dropped lines too and found that keeping the zebras clean and making sure you apply enough pressure on the board before you twist the metal tabs are key to a successful repair.**

I just wanted to add so emphasis to this response. Keep in mind that your problems are usually because of a loose connection between the printed circuit board and the connectors themselves. So your problems even after your attempted fix is either:

1) the insert you added was too thick or unevenly inserted so that part of the contacts touch the circuit board and other parts do not (and this would also cause gaps between the LCD connector and the circuit board)

2) you did not fasten the circuit board tight enough.

When I fasten the board back on, I make sure to apply lots of (even) pressure to ensure that the connection is tight, and then fasten the twist tabs.

Re: 48sx repair help

*Message #4 Posted by **svisvanatha** on 3 Feb 2011, 8:14 a.m.,*
in response to message #1 by svisvanatha

Thank you for the responses. I opened it back up last night, and used a foam piece from a mouse pad to replace the keyboard foam strip.
This seems to have fixed the keyboard contact issue. However, the LCD dropped rows/columns still exists.
I did clean the zebra strips using alcohol, and it is better than before. I would estimate that 50% of the LCD does not light up.
When pressure is applied above the A and F keys, the entire LCD does light up.
I did apply pressure to the PCB before turning the tabs, but fear that my initial tightening was not the greatest and has caused the connection to loosen.
Are replacement zebra strips available with larger thickness? That would certainly help in this case. Many thanks!

My only suggestion is to apply more pressure to the points of contact as twist the 6 tabs. The other thing that I do is prior to affixing the circuit board, I straighten out the tabs so that their prongs. Lastly, keep the number of times you twist these tabs to a minimum -- they will break if you are overzealous.

Also, you may want to look from the side to see if there is a lack of contact. Using just your fingers to press the circuit board back into place, can you notice any air gap near where the LCD connectors are? It sounds to me that your foam may be a bit too thick and not as spongy as is needed to allow for enough compression so that the LCD connectors make contact with the circuit board.

Re: 48sx repair help

*Message #6 Posted by **svisvanatha** on 3 Feb 2011, 6:58 p.m.,*
in response to message #5 by Han

Yes, there is a gap at the same location that I disturbed the zebra strip.
It is on the right side of the LCD (when looking at the assembled unit).
The other parts of the PCB do not show a gap. The tabs are still twisted at the moment.
I tried yesterday to reinsert that side of the zebra strip, but it does not seat fully in its track.
Is there a trick to get it in there? Also, I also noticed the metal frame is bent so that the keyboard side is bent up slightly.
I will fix that once I disassemble again. But before I untwist the tabs, I wuuld like to get your experience on seating the zebra strip.
Many thanks!

Re: 48sx repair help

*Message #7 Posted by **svisvanatha** on 3 Feb 2011, 11:32 p.m.,*
in response to message #6 by svisvanatha

> Quote:
>
> Also, I also noticed the metal frame is bent so that the keyboard side is bent up slightly.

Success!! The metal frame was bent at the 'F' key location. This caused 2 things: the zebra strip had some wiggle room between the lcd and the frame, and since the frame was bent upwards, the zebra was not making proper contact with the lcd and pcb. My keys are restored, and the lcd is working 100%. The case is not as tight as before, but I am an amateur ;)

Storage and recall arithmetic with the HP35s

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 2 Feb 2011, 4:02 a.m.*

How do I do it in algebraic mode?

Re: Storage and recall arithmetic with the HP35s

*Message #2 Posted by **x34** on 2 Feb 2011, 4:53 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hmm. RCL A + RCL B STO B, is displayed A+B>B

Re: Storage and recall arithmetic with the HP35s

*Message #3 Posted by **David Hayden** on 2 Feb 2011, 6:55 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

See page 3-6 of the user's manual. STO + A will add the value in X to A. RCL + A will add the value in A to X.

Re: Storage and recall arithmetic with the HP35s

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 2 Feb 2011, 4:39 p.m.,*
in response to message #3 by David Hayden

> Quote:
>
> See page 3-6 of the user's manual. STO + A will add the value in X to A. RCL + A will add the value in A to X.

But, not in ALG mode.

Using the procedures on pages 3-6 through 3-8 of the HP35s User's Guide and operating from the keyboard:

In RPN Mode the sequence:

2 STO A 3 STO+ A RCL A

yields 5 in the display.

In ALG Mode the sequence

2 STO A ENTER 3 STO+ A ENTER RCL A ENTER

yields 3 in the display and, looking at what happens as the sequence is keyed in, nothing happens in response to the entry of the + after the second STO of the sequence.

However, *there are blue check marks* by each section heading on pages 3-6 and 3-7, and if one has read the manual from the beginning one will know from page 1-1 of the manual that a blue check mark "... identifies examples or keystrokes that are shown in RPN mode and must be performed differently in ALG mode."

Is it that "storage arithmetic" and "recall arithmetic" are not available in ALG mode, or is it simply that I don't know how to do it? I do understand that one can recall the contents of a register, add something to it and return the result to the original register, but that is not what is commonly known as "Arithmetic with Stored Variables".

The HP33s provides "Arithmetic with Stored Variables" in both RPN and ALG modes. The text and examples on pages 3-4 to 3-6 of the HP33s User's Guide are nearly identical to that on pages 3-6 to 3-8 of the HP35s User's Guide, but there are no blue check marks on those pages of the HP33s User's Guide.

Re: Storage and recall arithmetic with the HP35s

*Message #5 Posted by **bill platt** on 3 Feb 2011, 12:30 a.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

I actually like the 33s way way better than the 35s. At least now.

Re: Storage and recall arithmetic with the HP35s

*Message #6 Posted by **Marcus von Cube, Germany** on 3 Feb 2011, 7:53 a.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

The Alg mode of the 33s and 35s are quite different in that the 33s executes all operations when it can, according to their priority. The 35s evaluates the expression as a whole. This can have side effects if you do storage arithmetic and recall the same variable in the same expression because the final result depends on the order of evaluation which is not necessarily left to right:

2 STO A
(1+1 STO+ A)*A

The result depends on when the second A is fetched, before or after the STO+ operation. On the 33s, the closing parenthesis will execute the addition before you can even type in the multiplication sign, but on the 35s you cannot be sure.

Re: Storage and recall arithmetic with the HP35s

*Message #7 Posted by **Silvio A. Bensi** on 3 Feb 2011, 7:13 p.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

You can program the sequence STO + A in RPN. The program will run in algebraic. It is not the best, but it is a solution.

Re: Storage and recall arithmetic with the HP35s

*Message #8 Posted by **Palmer O. Hanson, Jr.** on 6 Feb 2011, 3:22 p.m.,*
in response to message #7 by Silvio A. Bensi

> Quote:
>
> You can program the sequence STO + A in RPN. The program will run in algebraic. It is not the best, but it is a solution.

The "Selecting a Mode " section on page 12-3 of the HP33s User's Guide states "Programs created and saved in RPN mode *can only* be edited and executed in RPN mode, and programs created and saved in ALG mode *can only* be edited and executed in ALG mode. You can ensure that your program executes in the correct mode by making RPN or ALG the first instruction on the program "

The "Selecting a Mode" section on page 13-3 of the HP35s User's Guide states "Programs created and saved in RPN mode *should be* edited and executed in RPN mode, and programs or steps created and saved in ALG mode *should be* edited and executed in ALG mode. If not, the result may be incorrect."

I added the italics in the quotes to emphasize the change from "... can only ..." in the HP33s User's Guide to "... should be ..." in the HP35s User's Guide, whatever that implies, if anything.

My experience is that if I restrict my program to doing arithmetic with storage and recall arithmetic then a program written in RPN will run satisfactorily in ALG.

I am working with a little program where I was intending to follow those rules but inadvertently used a plain old divide in an RPN orogram and it still ran satisfactorily in ALG on an HP35s, but would not run satisfactorily in ALG on an HP33s. I will publish something on this when I figure it out, OR maybe when I give up on figuring it out and ask for help.

And what ought to have been written for the HP-33s...

*Message #9 Posted by **Karl Schneider** on 6 Feb 2011, 8:48 p.m.,*
in response to message #8 by Palmer O. Hanson, Jr.

> Quote:
>
> *The "Selecting a Mode" section on page 12-3 of the HP33s User's Guide states, 'Programs created and saved in RPN mode can only be edited and executed in RPN mode, and programs created and saved in ALG mode can only be edited and executed in ALG mode.'*

So the opposite mode must be selected before the program can be deleted? I suspect that this verbiage for the HP-33s ought to have read as follows:

'Programs created and saved in RPN mode can be edited or *executed* only *in RPN mode, and programs created and saved in ALG mode can be edited* or *executed* only *in ALG mode.'*

Correct placement of "only" is one of the most-common errors of usage in English -- one which would be far less likely to appear in the great HP manuals of the 1980's.

Also, "or" is more correct than "and".

-- Karl

Re: And what ought to have been written for the HP-33s...

*Message #10 Posted by **Martin Pinckney** on 7 Feb 2011, 11:27 a.m.,*
in response to message #9 by Karl Schneider

Quote:

This is one of the most-common errors of usage in English --

Karl,

There must be a generic name for this class of usage errors. I have to be on the watch for them in technical documents that our company produces, even when I am the author!

For instance:

"Responsibility for XXXX is the sole responsibility of the Contractor" should read "Responsibility for XXXX is solely the responsibility of the Contractor."

An obvious example, perhaps, but this kind of error appears all too often.

A little help from my friends ...

*Message #1 Posted by **Meindert Kuipers** on 31 Jan 2011, 3:29 p.m.*

I am looking for a little bit of help for a small HP41 experiment from someone on the forum who is a bit experienced with web programming (java?).

As you may know I have been working on the MLDL2000 for some time, and late last year I became aware of a design challenge (see here). I wanted to add an external SD controller module to the new MLDL2000, instead I have decided to use the MBED module for that purpose. I have been working hard to get a breadboard prototype up and running, and it now works quite well. The HP41 can now access files on an SD card and a USB stick, and I can load and save ROM images and user code programs (.RAW files).

One of the last items remaining to be implemented is networking functionality. I have done some tests with the MBED module on a network, and I can easily download a file (of course that will be a ROM image or focal program in .RAW format soon). For demonstration of some of the other networking capabilities I kindly ask some help.

I can program a bit in C/C++, Delphi, VHDL, Focal and mcode, but I have never done anything with web-based applications. I therefore would like to get in touch with someone who can create a web-based application to send and receive data to my network enabled HP41. For example to display on a webpage an HP41 display that I can send data to, and a few buttons or sliders that I can read data from.

The MBED libraries support an HTTP client and server (see here) and many other features. I have successfully used the HTTP Client to stream the contents of a ROM image to the MBED module but I want to demonstrate something else as well.

Honestly, I have no idea even where to start with building a web application or script for these. The Twitter example on the MBED website is nice, but I want something new for this.

Please contact me by email if you have a bit of time to help me here or want some more info.

See here for a picture of my breadboard setup

Thanks,

Meindert

Re: A little help from my friends ...

*Message #2 Posted by **Håkan Thörngren** on 31 Jan 2011, 5:29 p.m.,*
in response to message #1 by Meindert Kuipers

I am not sure I follow, but maybe you could try something simpler?

There are many tcp/udp services that may already be running on a computer. Though these days many may be default off for security reasons.

Default tcp ports (see /etc/services) contains some stuff that might be helpful, like echo (port 7) and daytime (port 13). Daytime will send current time (see RFC 867), it could be used for an RPN program to set the time of the time module?

Sending a mail using smtp may also be an idea.

Re: A little help from my friends ...

"I have no way to test it" = It doesn't work.

Re: Do the Ebay sellers check the merchandise?

*Message #3 Posted by **Namir** on 31 Jan 2011, 4:26 p.m.,*
in response to message #2 by Martin Pinckney

Indeed .... sellers try to hide behind clever wording. The most common is .. I don't have a way to power it up so I did not test it. In many case it is not hard to put batteries and see what happens. The ones that really make me shake my head is the seller HAS A POWER SUPPLY .. but will not bother to use it!!!

I had a case or two like that. I left the seller a negative feedback and refused to alter it when TAS asked me to.

*Message #4 Posted by **bill platt** on 3 Feb 2011, 4:53 p.m.,*
in response to message #3 by Namir

Are you saying that Ebay itself approached you regarding feedback, and requested that you rescind it?!

Re: Do the Ebay sellers check the merchandise?

*Message #5 Posted by **Jeff Kearns** on 31 Jan 2011, 4:59 p.m.,*
in response to message #1 by Gonzalo Fernandez

PLUS... he guaranteed the unit to be in working condition. Buyer claims he/she sent it back but did not get a refund. Negative feedback on TAS is not something to be envied. If you're gonna play the game you gotta learn to play it right.

I have tried unsuccessfully to purchase a few choice models of late (HP 45, HP 67, HP 25C) only to be outbid

- by an unknown bidder - in the last 3 seconds of the auction. The prices paid for some of these units are, in my opinion, exhorbitant and I am increasingly disillusioned by TAS.

You said, "The prices paid for some of these units are, in my opinion, exhorbitant and I am increasingly disillusioned by TAS", and I have to wholeheartedly agree!

Re: Do the Ebay sellers check the merchandise?

*Message #7 Posted by **David Hayden** on 2 Feb 2011, 7:05 a.m.,*
in response to message #5 by Jeff Kearns

The prices paid may be bad for the buyer, but I'm sure they make the sellers very happy. :)

I don't understand why ebay keeps a hard deadline on the end of an auction. If it was up to me, I'd extend the end time by perhaps 3-5 minutes after a last-minute bid to give other bidders a chance to counter. New bids would continue to extend the end-time. It would get rid of snipers, give buys a chance to get items they really want, and increase the sale price for sells. Since the minimum bid increment goes up geometrically, it wouldn't be possible to extend the bidding forever without going broke.

Re: Do the Ebay sellers check the merchandise?

*Message #8 Posted by **Allen** on 2 Feb 2011, 10:35 p.m.,*
in response to message #7 by David Hayden

> Quote:
>
> ... It would get rid of snipers...

Not really, it would just change how the sniping services operate.

For buyers who wanted to win without staying up until 2AM Friday morning, could still put a loop in the snipe program like this:

```
Initial Bid: $100
Bid Increment: $5
Max price: $125
```

The above settings would not extend the auction more than 5 times or past $125, which ever came first. It still gives an advantage over the human buyer who must carefully time a page reload, and be on a computer through the end of an auction. I suggest it would arguably not change the ending dynamics or the trading price in the long run, since the MAX Price will likely stay around "Fair Market Value", while snipers lower the initial bid, hoping for a deal. More bids does not always equal higher price.

Not that I have much experience buying or selling online or keep track of tens of thousands of historic HP calculator prices. ;-)

Re: Do the Ebay sellers check the merchandise?

*Message #9 Posted by **Jim Yohe** on 2 Feb 2011, 11:21 p.m.,*

in response to message #8 by Allen

FYI, from eBay's online customer support site (http://contact.ebay.com/ws/eBayISAPI.dll?CustomerSupport) I get from a search for "I want information about the automatic bidding system":

When you place a bid, enter the maximum amount you're willing to pay for the item. No one will see this amount. We'll place a bid that is just high enough to make you the high bidder or meet the reserve price if there is one. This means you could win the item for less than your maximum bid amount.

We'll continue to bid on your behalf to keep you the high bidder until the bidding reaches your maximum amount, and we'll send you an email each time we bid. If you're outbid, we'll send you an email so you can bid again if you want. The winner of the item is the one with the highest bid.

I agree it would not get rid of snipers, but it would prevent the sniper from winning the auction strictly on the basis of timing (which is the goal of sniping).

In other words, if the incremental bidder is not paying attention to the auction near closing time, the sniper still wins. But if he is paying attention, then he has another chance to submit an incremental bid. The same would hold true for additional snipes near the end of each time extension. If you really want to foil snipers, then have the duration of time extension vary randomly. The time extension would be posted on the auction page, but the ending time would not be made available electronically to the sniping service.

As an aside, I can't see why some people are so opposed to sniping. Some say it's "unfair." I disagree. If all bids were required to be submitted as a snipe, then it would be analogous to sealed bids. Everyone gives it their best shot, and the high bidder wins. What could be fairer than that?

But the auction sites like incremental bidding, because it keeps bidders coming back and looking, so they might see something else to bid on.

You can easily prove that sniping is NOT about timing by placing a higher bid at any time. If you are willing to pay a dollar or a cent more than everyone else is (subject to minimum bid increments), you win- it does not matter when the bid was placed.

On any given auction, you have no way of knowing how many snipe bids were placed for that item and later annulled because the bidding passed the snipers max threshold- independent of time.

I agree with you that universal sniping would be as close as possible to the unbiased, sealed bid.

True about higher amounts winning, but what I meant is that the goal of sniping is to get a bid in at the next allowable increase level before the incremental bidder has time to react before the auction closes. That *is* about timing.

By "incremental bidder," I mean the guy who sits at his computer watching the bids rise, then each time he gets outbid, offering another slightly higher bid of his own. In the end he is beat by a sniper because he does not have time to get in one more bid.

Re: Do the Ebay sellers check the merchandise?

*Message #15 Posted by **Don Shepherd** on 3 Feb 2011, 9:40 a.m.,*
in response to message #14 by Martin Pinckney

My strategy is to enter the absolute top amount I am willing to pay and then not worry about it. If I lose, it means somebody was willing to pay more. Easy peasy lemon squeezy.

Re: Do the Ebay sellers check the merchandise?

I don't feel sorry for this "incremental bidder". If he wants to pay more anyway then why does he not bid a larger amount at once?

It is really strange because of such "incremental bidders" I usually bid only during the last seconds of an auction. If I would bid earlier such an "incremental bidder" ruins the price bidding a little bit more and more until he reaches my maximum price. If he wants to buy the item why does he not bid the amount he is willing to pay at once?

Re: Do the Ebay sellers check the merchandise?

*Message #17 Posted by **David Hayden** on 3 Feb 2011, 3:25 p.m.,*
in response to message #16 by Ernst Fueloep

> Quote:
>
> I don't feel sorry for this "incremental bidder". If he wants to pay more anyway then why does he not bid a larger amount at once?

Because he is already be the high bidder. There's nothing worse than being the high bidder, having a maximum bid that is higher than your current bid, and then being outbid in the last 3 seconds of the auction.

The whole "bid the maximum that you're willing to pay" concept assumes that you know ahead of time what that maximum is. This is funny since one of the purposes of a live auction is to get people caught up in the bidding - fundamentally to get them to change their mind about what they're willing to pay for an item.

> Quote:
>
> ... The whole "bid the maximum that you're willing to pay" concept assumes that you know ahead of time what that maximum is. ...

Yes, normally you don't know what the maximum is. But you should know what the maximum is you are willing to pay for the item. If you have bid less and somebody bids in the last 3 seconds a higher price but still lower than what you would have been willing to pay than why do you blame the last second bidder? You could have bidden the maximum you were willing to pay and the last second bidder would probably not have outbid you.

Re: Do the Ebay sellers check the merchandise?

*Message #19 Posted by **Walter B** on 3 Feb 2011, 4:41 p.m.,*
in response to message #18 by Ernst Fueloep

That's the rational way of bidding. And the other is the emotional way. The latter is more fun for the participants, but you've to take care not paying more than you (later) want having paid. So it's the classical conflict between ratio and emotion, known for millenia.

Re: Do the Ebay sellers check the merchandise?

...and that is why good deals are very rare on ebay. Good deals for the buyer, that is!

Re: Do the Ebay sellers check the merchandise?

*Message #21 Posted by **BruceH** on 3 Feb 2011, 6:12 p.m.,*
in response to message #20 by bill platt

Irrespective of the pros and cons of sniping and time limited auctions I find it a total mystery that eBay has not at least experimented with traditional auctions i.e. ones that end only when there have been no more bids within a defined time limit.

I can't believe that it would cost eBay any more to hosts such auctions and it would surely bring in more revenue as sniped bargains would be a thing of the past?

Re: Do the Ebay sellers check the merchandise?

*Message #22 Posted by **bill platt** on 3 Feb 2011, 6:31 p.m.,*
in response to message #21 by BruceH

Maybe the logistics is against their model?

If you are going to have an auction--say, 10 minutes between bids = final bid, then you have to first publicize the auction, then run the auction. Ebay would have to have a "future auctions" page where each one would have a scheduled start time. Separately, you could go to the "active" auctions page to participate with ongoings, and a "closed" auctions page.

I suppose the seller would pay premiums for "prime" auction times and get a "discount" for auctions in the "middle of the

night" (that depends on market, doesn't it!)

It is an interesting idea!

Re: Do the Ebay sellers check the merchandise?

*Message #23 Posted by **robert rozee** on 4 Feb 2011, 6:57 a.m.,*
in response to message #21 by BruceH

here in new zealand we have TradeMe, www.trademe.co.nz which is the local equivalent of ebay. if a bid is placed within the last 2 minutes of an auction, the ending time is extended to be two minutes beyond the time of that bid - so an auction will only end after there has been no further bidding activity for 2 clear minutes.

incidentally, we also almost universally make payment for TradeMe by direct credit; you send the winning bidder your bank account number and name, and they deposit payment online by direct credit from their bank account into yours. all our banks in new zealand talk to each other (electronically) across a system that is transparent to the customer.

oh, and we have eftpos (electronic funds transfer at point of sale), whereby you can use an eftpos card issued by any bank to purchase goods at almost any retailer. a bit like a visa debit card, only not involving visa and usable by even children.

and we have a ban on nuclear weapons!!

cheers, rob ;-)

Hum.

(One of those frogs diplomatically said.)

By the way, entrance in NZ is very difficult due to very strict ecologic protective laws. If you ran a jogging in your country in the morning and packed in your shoes without having washed them, your arrival in this country would be more than complicated.

Nevertheless I do agree: it's a beautiful one.

Re: Do the Ebay sellers check the merchandise?

*Message #28 Posted by **bill platt** on 5 Feb 2011, 5:17 p.m.,*
in response to message #27 by Xavier A. (Brazil)

Hi Xavier,

Of course I am rather snarkily jesting. The friction between NZ an FR relates to two issues: 1, Underwater nuclear testing in the pacific, which France continued to carry out until shockingly recently and 2. The sinking of the Greenpeace RAINBOW WARRIOR including the murder of two crewmembers.

Obviously the countries are linked by a web of alliances anyway...and France would never threaten

NZ in our lifetimes...

Re: Do the Ebay sellers check the merchandise?

So the ban is a practical one, not philosophical. I.e., as long as we have Uncle Sam to provide *his* nuclear umbrella, we need not bother with the costs/risks of having our own.

> Quote:

> PLUS... he guaranteed the unit to be in working condition. Buyer claims he/she sent it back but did not get a refund. Negative feedback on TAS is not something to be envied. If you're gonna play the game you gotta learn to play it right.

There's an old saying, "There's three sides to every story, yours, mine and the truth." We've just heard the buyer's side, and cannot take it to necessarily be the unvarnished truth. The seller claims that the item was in perfect working condition when shipped and also stated clearly that there are "no returns." So, any guarantee is essentially worthless, given that it can't be enforced. Can we say for sure that the item was not damaged in shipping? After all, it was shipped to Brazil, and possibly opened at customs. Can we say for sure that the buyer did not damage it through accident, abuse or misuse? Did the buyer contact the seller to request return of the item? Did the buyer even return the item? We only have the buyer's word on this. I'm not siding with the seller here, and would never be stupid enough to buy anything from him, given his attitude and absurd pricing. However, I have little sympathy for people who deal with people like this and then complain when they get burned.

N-queens benchmark and the HP-17BII

*Message #1 Posted by **Thomas Klemm** on 31 Jan 2011, 3:23 a.m.*

We're not obliged to use a backtracking algorithm. We can use brute force and cycle through all the combinations. Let's assume we have variables *a, b, c, d ...* representing the position of the queens then the condition to come true would be something like:

```
a#b & a#c & a#d & ...
      b#c & b#d & ...
            c#d & ...
...
|a-b|#1 & |a-c|#2 & |a-d|#3 & ...
         |b-c|#1 & |b-d|#2 & ...
                   |c-d|#1 & ...
...
```

There are several ways to cycle through all the possible positions. One would be to have a counter *i* from where the positions *a, b, c, d ...* can be calculated. This is basically representing the counter *i* in base *N*.

Given the limitation of ~2,400 cycles I'm afraid we can only solve $N = 4$ as $4^4 = 256$ and $5^5 = 3{,}125$. But maybe this idea can be improved.

I'm sure Katie had a reason to use INV(A) on both sides of the equation. My guess is it tricks the solver into solving the equation numerically. The disadvantage is that we need the same conditional on both sides. So finding another equation that can't be solved algebraically by the solver would refrain us from typing the same stuff twice.

Of course using an error condition to stop the program would be another solution.

Cheers
Thomas

HTH
Thomas

Re: N-queens benchmark and the HP-17BII

*Message #4 Posted by **Thomas Klemm** on 31 Jan 2011, 8:56 a.m.,*
in response to message #1 by Thomas Klemm

Here's the solution for the 4-queens problem:

```
QUEENS:
Z=P+Q+R+S+
\GS(A:1:4:1:
\GS(B:1:4:1:
IF(A<>B:
IF(SQ(A-B)<>1:
\GS(C:1:4:1:
IF(A<>C:
IF(SQ(A-C)<>4:
IF(B<>C:
IF(SQ(B-C)<>1:
\GS(D:1:4:1:
IF(A<>D:
IF(SQ(A-D)<>9:
IF(B<>D:
IF(SQ(B-D)<>4:
IF(C<>D:
IF(SQ(C-D)<>1:
L(P:A)xL(Q:B)xL(R:C)xL(S:D)/0
:0):0):0):0):0):0))
:0):0):0):0))
:0):0)))
```

After entering the equation which is quiet a pain you get the following menu:

```
[  Z  ][  P  ][  Q  ][  R  ][  S  ]
```

Enter 0 to P, Q, R and S and solve for Z. After a while you get an error message:

```
SOLUTION NOT FOUND
```

Now you can recall the solution:

```
P = 2
Q = 4
R = 1
S = 3
```

This corresponds to the following configuration:

```
┌     ┐┌     ┐┌  #  ┐┌     ┐
│  #  ┘└     ┘└     ┘└     ┘
└     ┐┌     ┐┌     ┐┌  #  ┐
┌     ┘└  #  ┘└     ┘└     ┘
```

Please don't make me type this for the 8-queens problem. I had to type this on an iPhone.

Cheers
Thomas

> Quote:
>
> I'm not familiar enough with this problem to know whether your work can be enhanced to do the 8-queens problem. Can it?

I assume so. Just counted the amount of characters and got something very close to 1,000. So the memory shouldn't be an issue. But who wants to enter all these? I've expanded the equation to solve the 5-queens problem and I got {1, 3, 5, 2, 4}.

The algorithm isn't very complicated. It's basically what you would do on a physical board: put the 1st queen at the first possible position, then the 2nd to the next possible position and so on. Whenever you can't proceed go one step backwards and try the next possible position. So we have 4 (or 8) nested for-loops but since some are enclosed within if-statements we don't really execute them all. I'd say it's pretty much the same algorithm as used in the other programs. When a legal position is reached the program stops due to an error condition (division by zero). It turned out to be much easier than using Katie's trick.

How do we you want to proceed? Any volunteers to enter that beast into a HP-17BII? I could provide the listing but not before the end of the week. But I think it should be possible to extrapolate the listing for the case of 8-queens.

As I'm not very familiar with the solver I still have the following question: Am I right that the variable of a summation is only visible within this scope? I circumvented this by assigning this value to a global variable. Are there better ways to do it?

Cheers
Thomas

Thomas, can you explain what you mean here? Thanks.

Re: N-queens benchmark and the HP-17BII

*Message #8 Posted by **Thomas Klemm** on 31 Jan 2011, 3:02 p.m.,*
in response to message #7 by Martin Pinckney

Let's assume we have a simple equation:

```
A=B+C
```

Now all of these three variables will be displayed in the solver menu. Compare that to a summation:

```
A=\GS(I:1:4:1:SQ(I))
```

Now only the variable *A* is displayed in the menu which makes perfectly sense: the variable *I* is a local variable to the summation. But I need to get exactly that value out and all I could think of was to use another global variable *P* and copy the local variable *I* to it. So my question was whether there's a better solution to that problem.

Thanks in advance
Thomas

It seems the solver knows that the index to a sigma function is probably something that the user does not want to see in the menu, because your menu does not include your loop indexes A, B, C, and D. So, yeah, the way you did it is probably the best way.

That's great work, Thomas, as is usual for you. I don't think I have the patience to extend it to the 8-queens myself, but I am curious as to how long that execution would take. Perhaps Mark will pickup the ball and try his hand at "extreme HP17bii+ programming"!

Don

Re: N-queens benchmark and the HP-17BII

*Message #11 Posted by **Thomas Klemm** on 1 Feb 2011, 4:57 a.m.,*
in response to message #5 by Don Shepherd

It took 6'24.1" to solve the 8-queens problem with my HP-17BII. Don't ask me how long it took me to enter the equation. Here's the solution:

```
{ 1, 5, 8, 6, 3, 7, 2, 4 }
```

Cheers
Thomas

Re: N-queens benchmark and the HP-17BII

*Message #12 Posted by **Don Shepherd** on 1 Feb 2011, 7:35 a.m.,*
in response to message #11 by Thomas Klemm

Is that 6 hours and 24 minutes or 6 minutes and 24 seconds? I'm guessing the former.

in response to message #11 by Thomas Klemm

Thomas, many thanks for your supreme effort here in proving that the 17bii is truly a "programmable" calculator. It may not be fast, certainly not like the 30b is fast, and it may be cumbersome to write programs in the solver, but you have proven that it does have the basic functions to support programming.

Did you contact Xerxes to add this to the n-queens benchmark timing list?

Mark, now you can see that the 17bii+ can support programmable functions like this. Personally, I like the challenge of seeing how much all of these programmable calculators can do. My favorite in this regards is probably the HP-65 I got a few years ago, with its limited registers and programming space and conditionals and no indirect addressing. But I am amazed at what it can do sometimes, with crafty programming. Same with the 12c. Same with the 17bii.

Don

*Message #15 Posted by **Mark Harman** on 1 Feb 2011, 12:34 p.m.,*
in response to message #14 by Don Shepherd

Yes, indeed I can. Quite honestly, I wanted the 17bII+ to be able to do this, too. I think it is absolutely fantastic that Thomas pulled it off.

Mark

Re: N-queens benchmark and the HP-17BII

*Message #16 Posted by **Xerxes** on 1 Feb 2011, 8:17 a.m.,*
in response to message #11 by Thomas Klemm

Thank you Thomas, I'm really impressed. I see that I've underestimated the capabilities of the solver. I've updated the benchmark list with your result and the 4-queens-equation as example.

Re: N-queens benchmark and the HP-17BII

*Message #17 Posted by **Thomas Klemm** on 1 Feb 2011, 2:33 p.m.,*
in response to message #16 by Xerxes

Equation for the 8-queens problem

```
QUEENS:
Z=A+B+C+D+E+F+G+H+
\GS(I:1:8:1:
\GS(J:1:8:1:
IF(I<>J:IF(SQ(I-J)<>1:
\GS(K:1:8:1:
IF(I<>K:IF(SQ(I-K)<>4:
IF(J<>K:IF(SQ(J-K)<>1:
\GS(L:1:8:1:
IF(I<>L:IF(SQ(I-L)<>9:
IF(J<>L:IF(SQ(J-L)<>4:
IF(K<>L:IF(SQ(K-L)<>1:
\GS(M:1:8:1:
IF(I<>M:IF(SQ(I-M)<>16:
IF(J<>M:IF(SQ(J-M)<>9:
IF(K<>M:IF(SQ(K-M)<>4:
IF(L<>M:IF(SQ(L-M)<>1:
\GS(N:1:8:1:
IF(I<>N:IF(SQ(I-N)<>25:
IF(J<>N:IF(SQ(J-N)<>16:
IF(K<>N:IF(SQ(K-N)<>9:
IF(L<>N:IF(SQ(L-N)<>4:
IF(M<>N:IF(SQ(M-N)<>1:
\GS(O:1:8:1:
IF(I<>O:IF(SQ(I-O)<>36:
IF(J<>O:IF(SQ(J-O)<>25:
IF(K<>O:IF(SQ(K-O)<>16:
IF(L<>O:IF(SQ(L-O)<>9:
IF(M<>O:IF(SQ(M-O)<>4:
IF(N<>O:IF(SQ(N-O)<>1:
\GS(P:1:8:1:
IF(I<>P:IF(SQ(I-P)<>49:
IF(J<>P:IF(SQ(J-P)<>36:
IF(K<>P:IF(SQ(K-P)<>25:
IF(L<>P:IF(SQ(L-P)<>16:
IF(M<>P:IF(SQ(M-P)<>9:
IF(N<>P:IF(SQ(N-P)<>4:
IF(O<>P:IF(SQ(O-P)<>1:
L(A:I)xL(B:J)xL(C:K)xL(D:L)xL(E:M)xL(F:N)xL(G:O)xL(H:P)/0
:0):0):0):0):0):0):0):0):0):0):0):0):0))
:0):0):0):0):0):0):0):0):0):0):0):0):0))
:0):0):0):0):0):0):0):0):0):0):0))
:0):0):0):0):0):0):0):0))
:0):0):0):0):0):0))
```

```
:0):0):0):0))
:0):0)))
```

The names of the variables have been changed: now you get the result in *A*-*H* whereas the local variables *I*-*P* are used in the summations. The result *{ 1, 5, 8, 6, 3, 7, 2, 4 }* corresponds to the following configuration:

```
    A   B   C   D   E   F   G   H
  +---+---+---+---+---+---+---+---+
1 | # |   |   |   |   |   |   |   |
  +---+---+---+---+---+---+---+---+
2 |   |   |   |   |   |   | # |   |
  +---+---+---+---+---+---+---+---+
3 |   |   |   |   | # |   |   |   |
  +---+---+---+---+---+---+---+---+
4 |   |   |   |   |   |   |   | # |
  +---+---+---+---+---+---+---+---+
5 |   | # |   |   |   |   |   |   |
  +---+---+---+---+---+---+---+---+
6 |   |   |   | # |   |   |   |   |
  +---+---+---+---+---+---+---+---+
7 |   |   |   |   |   | # |   |   |
  +---+---+---+---+---+---+---+---+
8 |   |   | # |   |   |   |   |   |
  +---+---+---+---+---+---+---+---+
```

I think this example shows both the capabilities and limitations of this nice calculator. Of course you'd prefer decent subroutines to what is named "call by editor". On the other hand you're able to solve some hard problems.

Using the solver is a little like using Excel and that's probably something business people are more familiar with than procedural programming. On the other hand it reminds me also of a functional programming language like Haskell.

As for the handling of such a huge equation I was surprised of the good support. The characters I needed most (:<>) were easy to access. Of course I made some typos but these could easily be fixed as the "debugger" just stopped at the right position. It took nearly 2 minutes for VERIFYING the EQUATION though. But I think the speed of the solver is quiet okay considering what we really do here. I was afraid to fry the batteries running the calculator for hours.

As for the timing: **00:06:23.5** is my 2nd measurement. I suppose my reaction was a little better as I expected the solver to finish at that time.

Kind regards and thanks for the interesting challenge
Thomas

*Message #20 Posted by **Thomas Klemm** on 2 Feb 2011, 4:19 p.m.,*
in response to message #17 by Thomas Klemm

Today I realized that I could use AND instead of nested IF-statements. With this change it takes only **00:03:28.8** to solve the 8-queens problem. The listing is here:

```
QUEENS:
Z=A+B+C+D+E+F+G+H+
\GS(I:1:8:1:
\GS(J:1:8:1:
IF(I<>J AND SQ(I-J)<>1:
\GS(K:1:8:1:
IF(I<>K AND SQ(I-K)<>4
AND J<>K AND SQ(J-K)<>1:
\GS(L:1:8:1:
IF(I<>L AND SQ(I-L)<>9
AND J<>L AND SQ(J-L)<>4
AND K<>L AND SQ(K-L)<>1:
\GS(M:1:8:1:
IF(I<>M AND SQ(I-M)<>16
AND J<>M AND SQ(J-M)<>9
AND K<>M AND SQ(K-M)<>4
AND L<>M AND SQ(L-M)<>1:
\GS(N:1:8:1:
IF(I<>N AND SQ(I-N)<>25
AND J<>N AND SQ(J-N)<>16
AND K<>N AND SQ(K-N)<>9
AND L<>N AND SQ(L-N)<>4
AND M<>N AND SQ(M-N)<>1:
\GS(O:1:8:1:
IF(I<>O AND SQ(I-O)<>36
AND J<>O AND SQ(J-O)<>25
AND K<>O AND SQ(K-O)<>16
AND L<>O AND SQ(L-O)<>9
AND M<>O AND SQ(M-O)<>4
AND N<>O AND SQ(N-O)<>1:
\GS(P:1:8:1:
IF(I<>P AND SQ(I-P)<>49
AND J<>P AND SQ(J-P)<>36
AND K<>P AND SQ(K-P)<>25
AND L<>P AND SQ(L-P)<>16
AND M<>P AND SQ(M-P)<>9
AND N<>P AND SQ(N-P)<>4
AND O<>P AND SQ(O-P)<>1:
L(A:I)xL(B:J)xL(C:K)xL(D:L)xL(E:M)xL(F:N)xL(G:O)xL(H:P)/0
:0)):0)):0)):0)):0)):0)):0)))
```

Cheers
Thomas

> Wow, lots fewer IF's and, therefore, parentheses.

I was quiet surprised that this change reduced the time so much. It seems that jumps are expensive in the solver. Does anybody know the internal operating principles of this solver? What's happening during VERIFYING EQUATION... ? My speculation is that the equation is translated into some byte code. Or is it also RPL as in the HP-48? Christoph Gießelink might have an emulator and thus the ROM of this calculator. I remember a screen-shot of his desktop with pretty much every pioneer. So he could know. Or maybe someone at HP? Tim or Cyrill?

Just curious
Thomas

in response to message #25 by Thomas Klemm

Thomas, I suspect you are right about what happens during Verifying Equation. Something interesting I found was the difference between the original 17b and 17bii and the plusses regarding this behavior. The 17b (and bii) take much longer during the "verifying equation" phase, but are much quicker to actually solve the same equation than the plusses. Personally, I'd rather have the fast response during the execution phase rather than the "compile" phase, so I prefer the originals.

*Message #27 Posted by **Martin Pinckney** on 3 Feb 2011, 1:46 p.m.,*
in response to message #26 by Don Shepherd

Don,

I own only the original 17b. Besides the RPN option (and different color scheme), are there other significant difference in the 17bii? (Not +).

As an aside, too bad HP never made a 27sii (with RPN option). Might have made even 42s fans take a look.

Which is why I advocate a new scientific that incorporates the best features of both 42s and 27s.

*Message #40 Posted by **Martin Pinckney** on 31 Jan 2011, 9:44 p.m.,*
in response to message #39 by Raymond Del Tondo

Raymond,

My question was somewhat tongue-in-cheek because of an earlier discussion in another thread. Not sure if you saw that one. It included the following comment by Mark Harman:

> Quote:
>
> I remain unconvinced of the extent of programmability of the 17b series. They're great calculators and the menu-based Solve is awesome, but I think by its nature it is more limited than other programmable machines. Perhaps this is where creativity comes in and a good programmer can really shine in this regard.
>
> Still, if you want to really impress me and, at the same time, make me a true believer of the 17's programming capability, write a version of the N-queens benchmark program for the 17bII+, execute it, and submit the time. ;^) As of yet, nobody has done this. Personally, I think this is a golden opportunity to prove all the naysayers wrong - if possible.

I have always maintained that the "Solver only" HP's are indeed programmable.

Re: N-queens benchmark and the HP-17BII

*Message #41 Posted by **x34** on 1 Feb 2011, 10:28 a.m.,*
in response to message #38 by Martin Pinckney

Yes. Any calculator which is Turing-complete is 100% programmable one. And solver of HP-17BII is definetely Turing complete.

I'm trying now to prove turing-completeness of HP-35S' solver.

However, not EVERY HP Solver is Turing complete. e.g. solvers of HP-32SII and HP-33S are NOT

Turing complete. There is no known way to alter registers in Solver of these calcs. (Calcs themselves are complete, only Solver is not).

Re: N-queens benchmark and the HP-17BII

*Message #42 Posted by **Martin Pinckney** on 1 Feb 2011, 11:11 a.m.,*
in response to message #41 by x34

Well, I guess that settles it. So it was not necessary after all to develop a N-Queens routine to prove programmability.

Re: N-queens benchmark and the HP-17BII

*Message #43 Posted by **x34** on 1 Feb 2011, 12:11 p.m.,*
in response to message #42 by Martin Pinckney

I think the purpose of solving N-queen problem was different.

a. To measure the speed, so HP-17B could be added to famous Xerxes' list-o-fame.

b. The main one, i guess. To prove thyself thou CAN do it, and thou DID it. It's the most amazing thing with calcs to do - they are just means, not purpose - to make amazing things.

And. there is one more. If computer is not Turing-complete, it does not imply it could solve no problems. It just says it could solve not ALL problems, the other are capable of.

But, of course, if you have a problem and you know the computer is turing-complete, it gives you idea it could be solved.

Re: N-queens benchmark and the HP-17BII

*Message #44 Posted by **Mark Harman** on 1 Feb 2011, 12:50 p.m.,*
in response to message #42 by Martin Pinckney

I was actually already convinced of programmability after given a good definition of what being programmable meant and being told that it could run a prime factor solver. At the point I asked about the N-queens benchmark, I just wanted to know to what it extent the machine was programmable. I thought that it would be limited since the n-queens problem, I feel, tests very well the robustness of a computer's level of programmability. With Thomas's feat, I am now convinced that creativity and patience can allow for a lot of complexity and variety in 17b series Solver programs.

It may not be a speed demon, but the fact that it can do N-queens is a heck of a lot more than what many calculators out there can do. I think it is awesome that it can be done. I will probably still not buy one of these machines, but I have a lot more respect for what its Solver can do now.

Also, I wasn't aware that the 17b series Solver was Turing Complete. Knowing this now helps me see better why Thomas was able to accomplish such an impressive display of programming.

Regards,

Mark

Re: N-queens benchmark and the HP-17BII

*Message #45 Posted by **Don Shepherd** on 1 Feb 2011, 1:48 p.m.,*
in response to message #44 by Mark Harman

This was all documented years ago on this forum, and I learned it through a painful experience, but there are differences between the solver in the 17b and 17bii and the solver in the 17bii+ (both brown and silver). Essentially, the solver in the 17b and bii operates like a programmer thinks it would; the solver in the plusses does not always do that.

This can be illustrated by a simple equation to get the sum of digits from input N:

```
a=sigma(i:0:log(n):1:mod(n:10)+0*l(n:idiv(n:10)))
```

Solve for A. Works like a trooper on the 17b and 17bii, but on the 17bii+ it results in "solution not found" because the solver on the plusses does a pre-evaluation pass of the equation to calculate items that can be precalculated (per Cyrille), but to do this it actually executes the equation twice, and the first pass (which the 17b does not do) reduces n to 0 so when you try to do log(n) when n is 0 in the second pass you get the error message. Now, there are workarounds, but anyone who intends to write "programs" for the plusses needs to be aware of this. When I got my 17bii+ years ago and tried that equation and it didn't work, I wrote HP and they told me the equation was "meaningless." That offended me greatly.

Don

*Message #50 Posted by **x34** on 1 Feb 2011, 3:02 p.m.,*
in response to message #49 by Thomas Klemm

Thomas, my proof attempt is vulgar, and so we should settle on rules first.

```
1. Ability to read/write memory register.
2. Ability to change value before writing. i.e. read A, store A+1
3. Ability to execute conditional statement (IF A THEN B), a-la
   X<=Y?:STO+3 B
4. Ability to make conditional jump (X>Y?: GOTO A)- this is a hard nut on HP-
35S.
```

Something not mentioned here? These are all from my memory.

*Message #51 Posted by **Thomas Klemm** on 1 Feb 2011, 3:55 p.m.,*
in response to message #50 by x34

> Quote:
>
> 4. Ability to make conditional jump (X>Y?: GOTO A)- this is a hard nut on HP-35S.

This is the point where I have my doubts concerning the HP-17BII. My equation uses an error to exit the nested loop but that terminates the program as well. Big problem when you need to continue the calculation because this is only an intermediate result. The same problem arisies with Katie's trick. We can start the solver only once. So I can imagine that there might be relatively easy problems that can't be solved with this calculator.

But I must confess that I dont understand yet what "Turing complete" exactly means.

Kind regards
Thomas

Re: N-queens benchmark and the HP-17BII

*Message #52 Posted by **x34** on 1 Feb 2011, 4:14 p.m.,*

in response to message #51 by Thomas Klemm

Wiki says http://en.wikipedia.org/wiki/Turing_complete

"This requires, at a minimum, conditional branching (an "if" and "goto" statement) and the ability to change arbitrary memory locations."

Basicaly, i remember the same.

more can be find here:

http://en.wikipedia.org/wiki/Turing_machine_equivalents#Register_machine_models

So, we need only JUMP IF EQUAL (e.g. simulate jump) to meet conditions.

Considering HP-17 - am i correct that you can:

```
a) Use multiple sigmas in one equation?
b) Change ending value of Sigma in it's expression?
c) Store values inside Sigma'e expression? (Is it possible to write
smth like (A+X^I>B) in expression? It is not clear in the manual.
```

Sure, look at Thomas' program above, IF's are all over the place inside the sigmas. That's fine.

> Quote:
>
> only RCL of loop parameter allowed inside it.

Not sure what you mean by this. RCL is not something that can be in an equation, but you can use the loop index however you want, you just can't change it.

> Quote:
>
> by A+X^I>B i mean A+X^I STO B to be precise

No, you can't use STO inside an equation either, which means you can't use the registers R0-R9 in an equation, but you can use variables, so this is not a huge limitation, IMO.

Exactly! This is one of the great features in the 17b - 27s Solvers. Not only can you have an "unlimited" number of variables, but they can have descriptive names. You can even STO and RCL them (from the keyboard), at least while the equation in which they occur is active.

It was a huge blunder for HP to use the antiquated 32sii Solver in the 35s instead. Or at least a missed opportunity.

*Message #57 Posted by **Don Shepherd** on 1 Feb 2011, 8:30 p.m.,*
in response to message #54 by x34

The absolute best resource regarding the solver in the 17bii is the Technical Applications Manual for the HP-27S and HP-19B. It has whole sections on Get(), Let(), intermediate variables, multiplication by 0 method, using the sigma function, and simulating an indefinite loop (which essentially "does nothing" after a certain point in the loop is reached, but it doesn't really exit the loop so it will still do all of the iterations you originally told it to do), and the manual lists about 9 solver routines to accomplish various tasks, including finding prime factors and determining the GCD and LCM.

This manual is on the museum DVD set (2719tech.pdf).

Re: N-queens benchmark and the HP-17BII

*Message #58 Posted by **x34** on 2 Feb 2011, 5:49 a.m.,*
in response to message #53 by Don Shepherd

http://www.palmtoppaper.com/ptphtml/7/ptp7005c.htm

It describes HP-95LX Solver. May be it is equivalent to HP-17BII?

@The expression "0*L(initial:initial+10)" adds nothing to the value of "initial^2" because it is multiplied by zero. However, it does increase the value of initial by 10 each time you solve for "answer." @

So, it says *you can* change some of the FOR LOOP parameters. Is it true? If so, it makes pure BREAK possible.

Re: N-queens benchmark and the HP-17BII

*Message #59 Posted by **Don Shepherd** on 2 Feb 2011, 8:46 a.m.,*
in response to message #58 by x34

I'm not sure if the solvers in these two machines are the same, but the Applications Manual I referenced above (for the 27s and 19b and I believe the 17b) says:

> Quote:
>
> When the sigma function is first encountered in an equation, the solver stores the step size s and the counter variable's initial and final values c1 and c2 in a special location in memory not accessible to the user. Any attempt to alter the values of s, cv, c1, or c2 using the LET function causes the solver to create separate variables of the same name. Since the value of these variables (referring to the original s, cv, c1, and c2 I believe) cannot be changed, a loop cannot be prematurely exited. This is precisely what makes construction of a true indefinite loop impossible.

So once you start a loop, it will complete all its specified iterations. About the only thing you can do to terminate a loop early, and what Thomas did, is do an illegal instruction (divide by 0 always works nicely, as does log(0)) within the loop when a certain condition occurs and after storing a value of interest in a global variable. This stops the loop--and unfortunately stops evaluation of the equation--but you can RCL the variable where you stored something of interest to see it.

Re: N-queens benchmark and the HP-17BII

*Message #60 Posted by **x34** on 2 Feb 2011, 5:34 a.m.,*
in response to message #52 by x34

Since my understanding of HP-17BII Solver is adequate now (with the big help of forum members), here is vulgar proof of it's Turing completeness. Our goal is SUFFICIENT completeness, with finite number of steps and memory locations.

```
a) Solver can read/write/modify variables. (Proved by forum)
b) Solver has conditional statement (IF). (Proved by manual and forum)
c) You can use multiple assignments and IFs inside Sigma loop

We need to prove we can use jumps (branches)

Sigma is essentialy equivalent to FOR LOOP.

BREAK could be emulated easily using IF inside FOR (with finite N):

FOR I IN [1..N] DO
  IF (X>0) THEN BREAK; END IF;
  EXPRESSION LIST;
END FOR;

is equivalent to

FOR I IN [1..N] DO
IF (X<=0) THEN
   EXPRESSION LIST;
END IF;
END FOR;

Sure, there would be empty cycles, but it would do the same

Any BREAK position inside FOR could be rewritten using IF.

(We could emulate any loop iterator with FOR)

Having FOR with BREAK is equivalent to GOTO.

backward label:

LBL L:
    EXPR1;
    EXPR2;
    IF A>B THEN GOTO L; END IF

is equivalent to

L:=TRUE;
FOR I IN [1..N] DO
    IF L THEN
      EXPR1;
      EXPR2;
    END IF;
    L:=(A>B);
END FOR;

Forward label is trivial:

   EXPR1;
   IF A>B THEN GOTO L; END IF;
   EXPR2;
LBL L:   EXPR3;

   EXPR1;
   IF A<=B THEN
     EXPR2;
```

```
   END IF;
   EXPR3;

Nested IFs (if they are not supported bu HP-17) could be
unrolled, e.g.

IF A>B THEN
  IF C<D THEN
     EXPR1;
  END IF;
  EXPR2;
END IF;

IF (A>B) AND (C<D) THEN EXPR1; END IF;
IF (A>B) THEN EXPR2; END IF;
```

So, we have all turing critera met. Please, tell me where i am wrong.

Regards, x34

>
> ```
> FOR I IN [1..N] DO
> IF (X<=0) THEN
>    EXPRESSION LIST;
> END IF;
> END FOR;
> ```

What happens if the EXPRESSION LIST has side effects? Let's assume it just increments a counter. In the upper FOR-loop it counts the passes until the break-condition is met for the 1st time while in the lower it counts how many passes don't meet the break condition which is not the same.

However this can be fixed with an additional variable DONE. What we really want to have are expressions before and after the break:

```
FOR I IN [1..N] DO
  EXPRESSION LIST A;
  IF (X>0) THEN BREAK; END IF;
  EXPRESSION LIST B;
END FOR;
```

This is equivalent to:

```
DONE=0
FOR I IN [1..N] DO
  IF (DONE==0) THEN
    EXPRESSION LIST A;
    IF (X>0) THEN
```

```
      DONE=1
    ELSE
      EXPRESSION LIST B;
    END IF;
  END IF;
END FOR;
```

I'm still not 100% convinced that an endless-loop and a for-loop are equivalent. But you might say that there isn't something as an endless-loop in a finite machine. Or how would you argue?

Best regards and thanks for your interesting contribution
Thomas

This could be rewritten to avoid side effects, as you illustrate:

> ```

Absolutely!

> [quote[I'm still not 100% convinced that an endless-loop and a for-loop are equivalent. But you might say that there isn't something as an endless-loop in a finite machine. Or how would you argue?

No. i will not argue. You are right, they are not equivalent in general. But I think it simply does not matter here, because Endloss loop is not a request for Turing-Completeness,so i don't count it as an objection.

BTW, finite machine CAN have an endloss-loop if it is one of the states. Many of them actually have, like a telephone answering machine.

In our case (calculator) if you can make a 1E12 iterations cycle, it would be practically infinite. But actually TWO types of loops should be used - the one with simulated BREAKs would be impractical if near infinite. "Cray is so fast, it can do infinite loop in two seconds!" - it was popular saying in the 80's :)

And your solution of Queens is much faster than could be done with "emulated" constructions.

> Quote:
>
> Best regards and thanks for your interesting contribition
> Thomas

Thanks to you! [pre] Actually, i have a problem with HP-35S Solver.

What we have on HP-35S is:

a) One external loop, designed by Katie b) Unlimited IFs

IFs are emulated with 0*((BOOLEAN RESULT) EXPRESSION).

X=0? is equivalent to 1-SGN(ABS(X)) or NOT(SGN(X))

X<Y?==NOT(SGN(Y-X)-1)

X>=Y?==NOT(SGN(X-Y)-1)+NOT(SGN(ABS(X-Y))

and so on.

I could not yet understand, if a lot of "IFs" within eternal loop could be considered equivalent to GOTO and/or recursion.

I personaly think they are NOT equivalent, however could be used for small tasks.

In any case, there would be EXTREMELY difficult to write 8 queens in the HP-35S Solver, however possible, even if it is not turing-complete. I will try to write simple compiler or macros to do it, but not soon.

May be someone will find a way to make any kind of iteration (loop) besides

the outer one in HP-35S Solver? I hope so. [pre/]

in response to message #5 by Gerry Schultz

Will it blow your mind to hear that you can also have an essentially unlimited "stack" of stacks? :-P

This is what allows you to do things like evaluate expressions and programs for inputs in inform boxes. You couldn't do that on the 48. Essentially, these virtual stacks allow you to save the entire content of a stack very quickly and easily, allow anything to go on in the new stack, and then restore it just as easily.

*Message #13 Posted by **David Hayden** on 2 Feb 2011, 7:16 a.m.,*
in response to message #5 by Gerry Schultz

It looks like the original post was indeed referring to the data stack, but for any readers who are curious, the subroutine stack (also known as the "return stack") depth is also infinite on the 50g - which really means it's limited by memory.

If I recall correctly, objects are stored on one side of a memory pool, and the data stack is stored at the other. They grow towards the center, where the return stack is stored. If the data stack or object store bumps into the return stack, then the return stack is re-centered. This can result in a significant slowdown in processing if you have a VERY deep return stack but in practice, I think that's very rare.

Dave

HP-35S ROM ?

*Message #1 Posted by **x34** on 30 Jan 2011, 5:19 p.m.*

I wonder if file 35s.sml, which is a part of freely downloadable (but not free - license required to run) HP-35s emulator is a HP-35s ROM?

http://www.hp.com/sbso/product/calculators-emulators/graphic-calculator-emulators.html

http://www.hp.com/sbso/product/calculators-emulators/scientific-calculator-emulator.html

http://www.hp.com/sbso/product/calculators-emulators/finance-calculator-emulators.html

It happens to contain all HP-35S commands, plus a mysterious X1 X2 X3 X4, CB, YZZY and CBRT entries.

CB and CBRT i am sure are Cube and Cube root. But i failed to execute them on real calc (tried both EQN and ALG).

Edited: 30 Jan 2011, 6:03 p.m. after one or more responses were posted

Re: HP-35S ROM ?

*Message #2 Posted by **Tim Wessman** on 30 Jan 2011, 5:59 p.m.,*
in response to message #1 by x34

I am not certain if that is the exact file that is uploaded to the calculator, but yes that does contain ROM code of some variant or another.

TW

Re: HP-35S ROM ?

*Message #3 Posted by **Glenn Shields** on 2 Feb 2011, 7:40 p.m.,*
in response to message #1 by x34

I did try them, and they don't work. Finding undocumented code for the 35s is like finding the Holy Grail. It has been mentioned here before that there isn't any such thing, but it sure would be fun to find something. Those codes (CB, CBRT, YZZY) yield "syntax error", along with ver or version. Is there really nothing?? :-(Glenn

I have. CB and CBRT give Syntax Error.

I think the emulator has the same ROM image as the actual calculator, as it even has all the bugs.

CB and CBRT appear only once in the .sml file, other functions at least twice. Perhaps they are just left over tags from functions not implemented or from the 33s that the ROM was based on?

To HP: even if it couldn't fit on the keyboard, it would have been nice if it had been left in for programming.

Re: HP-35S ROM ?

While I'd surely purchase an emulator that would run on a portable device I fail to understand why one running only on Windows costs that much. Is there an advantage in using this on the computer? TIA.

> Quote:

Most likely the latter.

Quote:

42S reincarnation is possible?

*Message #1 Posted by **Csaba Tizedes (Hungary)** on 30 Jan 2011, 3:07 p.m.*

I'm just wondering: is it possible to uploading 42S ROM into a HP17BII? Or 17BII ROM is replacable with 42S ROM if we changing their ROM-chip or uses a burned EPROM?

Edited: 31 Jan 2011, 9:22 a.m. after one or more responses were posted

Re: 42S reincarnation is possible?

*Message #2 Posted by **Mark Harman** on 30 Jan 2011, 4:26 p.m.,*
in response to message #1 by Csaba Tizedes (Hungary)

It is not possible. The 17bII and 17bII+ do not have a flashable ROM or even a means of transferring data electronically into the unit. There is no I/O except for an infrared transmitter that only transmits data to an HP 82240B Printer.

Regards,

Mark

Yes. This too...

Re: 42S reincarnation is possible?

*Message #5 Posted by **Csaba Tizedes (Hungary)** on 31 Jan 2011, 4:09 a.m.,*
in response to message #3 by Tim Wessman

I have no data about types of CPU in the two unit, but on the finseth data base the two model seems to me same, with different ROM (the LCD, CPU (Lewis chip), memory, ... same).

I found an article here about the 42S:

I never opened a HP-42S, but from was I read in some posts, I think that there is a place for a second ROM. ***It's true for the HP17BII which have the same hardware****, and it is how HP managed the two HP17BII versions (english and international with multiple languages): one common ROM and a second optionnal ROM.*

I'm not a guru, but it's seems to me possible...

Message #6 Posted by ***Nacho*** *on 31 Jan 2011, 4:34 a.m.,*
in response to message #5 by Csaba Tizedes (Hungary)

Dear,

You are confused with two hardware types.

HP 17BII (Pioneer) = HP42S and ROM's can be swaped physically.

HP 17BII+ the golden or grey new series have nothing to do with the HP 42S as hardware is different and significantly worst.

in response to message #6 by Nacho

I'm talking about HP42S and HP17BII.

About this:

And this:

Re: 42S reincarnation is possible?

Message #8 Posted by ***Csaba Tizedes (Hungary)*** *on 31 Jan 2011, 6:40 a.m.,*
in response to message #6 by Nacho

...but, you're said, this is possible? Anothers said this is not possible! I *feel*, because this two machine is SO similar.

```
1.) 42S ROM is available (many emulators uses this files)
2.) Which type of ROM in this machines?
3.) Burn an EPROM
4.) Solder that EPROM
5.) Enjoy your 42S with 17BII skin
```

Life is simple :) :P - as I think... :P

*Message #9 Posted by **Martin Pinckney** on 31 Jan 2011, 8:58 a.m.,*
in response to message #6 by Nacho

It's not Csaba that's confused. He stated from the beginning that he is talking about the 17bii. Others have assumed he meant 17bii+. However, he unfortunately used the word *uploading*, which caused some confusion on what he meant, I think. Now it seems clear he meant physically installing a new ROM chip after burning the 42s ROM onto it.

Never forget: Your English is orders of magnitude better than our Hungarian! Anyway, I'm curious as well what will be the answer to your question.

Re: 42S reincarnation is possible?

*Message #13 Posted by **Mark Harman** on 31 Jan 2011, 1:12 p.m.,*
in response to message #9 by Martin Pinckney

I never assumed he was talking about the 17bII+. I just mentioned both so I could cover both bases.

Using a the traditional method of flashing the ROM via any method is not possible. The ROM is hard coded. This is the only situation my answer covered. I really didn't know that a replacement ROM could be installed in the 17BII. If it can, then a change is within the realm of possibility.

Unfortunately, you will have to either find a a 42S ROM laying around or you have to manufacture one. I don't know any individual who is capable of manufacturing ROMs. I am under the impression that it requires a lot of resources, which would be within the realm of a chip manufacturer.

Regards,

Mark

*Message #14 Posted by **Martin Pinckney** on 31 Jan 2011, 1:46 p.m.,*
in response to message #13 by Mark Harman

I am out of school here, but nevertheless I am sure Csaba was talking about using an E(rasable)P(rogrammable)ROM, which is supposed to be DIY with a simple kit. So it would seem one would only need an EPROM of the right form factor, compatible energy demands, speed, etc., plus the 42s ROM code. Is this what you meant, Csaba?

Re: 42S reincarnation is possible?

*Message #15 Posted by **Mark Harman** on 31 Jan 2011, 1:51 p.m.,*

Re: 42S reincarnation is possible?

*Message #16 Posted by **Randy** on 31 Jan 2011, 3:18 p.m.,*
in response to message #15 by Mark Harman

1. The 42S operating system code is part of the processor die in the form of masked ROM.
2. 42S OS ROM is 64 kb in size.
3. The external ROM port is 8kb in size.
4. The external rom is in a different address space than the OS.

If you need more reasons why it will not work, I might be able to think of some...

Speaking of the devil, I'm preparing to resurrect OpenRPN. I believe I finally have the necessary facilities to bring the project to fruition. However, this time I'm planning to take baby steps that lead to some dream calculators.

Re: 42S reincarnation is possible?

*Message #22 Posted by **robert rozee** on 4 Feb 2011, 11:43 a.m.,*
in response to message #21 by Hugh Evans

please do start a new thread outlining your plans?

i'd be keen to see an atmel ATMEGA1284P processor used: 128k flash, 16k ram, 4k eeprom, four 8-bit i/o ports. oh, and in a DIP package, meaning 0.1" pin spacing solderable onto veroboard by just about anyone.

quite literally, a complete hardware solution could be built onto veroboard, requiring just the 1284, a matrix of switches, a 16x2 off-the-shelf LCD module and a battery pack.

Re: 42S reincarnation is possible?

*Message #23 Posted by **Hugh Evans** on 4 Feb 2011, 1:03 p.m.,*
in response to message #22 by robert rozee

Walter is already on the right track. My current concept is to use existing hardware, such as the 35s, and replace the PCB. At the very least we end up with complete control and customization with the lowest possible overhead costs.

Re: 42S reincarnation is possible?

*Message #24 Posted by **Thomas Radtke** on 4 Feb 2011, 1:20 p.m.,*
in response to message #23 by Hugh Evans

> Quote:

> My current concept is to use existing hardware, such as the 35s, and replace the PCB.

Last time it was about taking a given PCB and put it into a new case, right? ;-)

However, if you manage to write a bugfree 35s-like firmware, you'd probably have some customers. If it's about changing keyboard lables, I personally would stay away from it. That's probably more difficult than just to have some cases produced in China - inluding paint job.

HP-35S solver questions - extremum

*Message #1 Posted by **x34** on 30 Jan 2011, 11:23 a.m.*

HP-35S Solver differs from the one of HP-33S at least in two aspects:

a) It permits user to STOre the values in registers.

b) It is much prone not to find/show extremums of function solved. (if HP-33s while failed to find a root. usually makes it possible to see closest values, HP-35S does not show them, i dunno why).

Regarding STOrage: if you store subexpression (like X>C*Y+3, where ">" designates "STO") or whole expression (X*Y+3>C), it's ok but of little use (sometimes you can get argument and/or function estimates after NO ROOT FND). But if you RCL it, solve would ask for it's value, effectively blocking usage of it for temporary data storage.

May be, the creators of HP-35s wanted to make Solver more advanced (hence the ability to use STO in EQN), but had no resources to implement reasonable additional functionality.

Well, the EQN and STO are very interesting, and should be examined more closely. Especially, using indirect registers, there may be possibility to break into calc internals here (i hope so).

Interesting thing, that usage of X>X is allowed in the EQN. I do not understand the logic yet, however.

I am now trying to write some kind of equation permitting to use Solver for extremum search. The simplest way seems to compute derivative function and find it's roots.

Re: HP-35S solver questions - extremum

*Message #2 Posted by **Glenn Shields** on 30 Jan 2011, 2:24 p.m.,*
in response to message #1 by x34

You may be interested in a previous thread by Katie (IIRC, which is not that often) in which she wrote a function for solver which counts iterations, like a loop. This thread has been very, very difficult for me to find, can anyone help with this? It does provide a way of "probing" into the workings of the solver. Cheers, Glenn

Re: HP-35S solver questions - extremum

*Message #3 Posted by **x34** on 30 Jan 2011, 3:56 p.m.,*
in response to message #2 by Glenn Shields

Thanks Glenn! I suppose you speak about http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=121288

Found it in Google.

Very interesting!

While continuing to learn solver, I've found one new interesting thing: when you solve for indirect, (I) or

{J), and modify I or J, solver "precompiles" (I) or (J) used in eqn. May be it is too clumsy, so here is the sample:

```
EQN: (I)>I*2+3
-26
STO I
EQN
SOLVE (I)
```

Solver would solve for Z (-26), not for (I) with changing value of I.

> Reading this thread again I suddenly realized that Katie's trick could be used with the HP-17BII to solve the N-queens problem.

Thomas, please elaborate on this. I looked at the sample programs for the n-queens benchmark recently and came to the conclusion that, since there seemed to be one or two indefinite loops in that algorithm, the 17bii solver would not be able to handle that since it does not support indefinite loops. I'm curious, what did you have in mind?

thx, Don

in response to message #5 by Don Shepherd

From message #3 Posted by Katie Wasserman on 13 Aug 2007, 10:45 a.m., in response to message #2 by Don Shepherd

> Quote:
>
> If you tell it to solve: INV(A) = -INV(A)+ 0x(I+1 STO I), solve for A and give it a starting value of I=0 and A=1, it will run for about 2400 iterations on the 35s. after that point the solver will end up solving the equation by coming up with A ~= 1E499. 2400 is pretty much all the iterations you'd ever want to do on this calculator -- it ain't that fast -- I'll call it a near-infinite number of iterations for our purpose.

(...)

> Quote:
>
> I don't have a 17BII+ but on the 17BII you can do the same thing in the solver: INV(A)=-INV(A)+0xL(I:I+1). Start with I=0 and A=1, solver for A and RCL I when it finishes and you'll find that I has a value of about 2400, showing that this many iterations have been done. Unfortunately you can't 'STO (I)' on the 17BII because it has no way to write to an array (although you can read the items in a list from within the solver). Of course you would never really do this on the 17BII you'd use: X=Sigma(I:1:N:1,whatever you want to do). Note that 'Sigma' is the summation sign and 'whatever you want to do' will be evaluated N times and the results will be summed and returned in X.

Of course we really want to do this because we need a means to exit a loop on a specific condition. I'm not sure at all whether all this would work to write a solver program for the N-queens problem. But at least it seems the solver isn't limited to a for-loop.

Re: HP-35S solver questions - extremum

*Message #7 Posted by **Don Shepherd** on 31 Jan 2011, 2:45 a.m.,*
in response to message #6 by Thomas Klemm

Thanks Thomas, I remember that thread from 2007 and Katies work then. Fascinating stuff.

When I looked at the BASIC program (thinking it would be easier to understand than the RPN and RPL solutions) for the n-queens problem here, there seemed to be about 4

overlapping indefinite loops: lines 40-100, 70-150, 90-130, and 140-170. I didn't know exactly what these loops were doing, but since they weren't definite loops I didn't think the 17bii solver could handle them.

I did learn of a way to actually exit a loop early on the 17bii solver from user Mike Ingle about 4 years ago, but you exited early by halting the program with a programmed divide by 0 after you stored some value of interest in one of the menu variables, which you could RCL after the program stopped. That might work for one indefinite loop, but not 4!

I would present a "steely-eyed missle man" award to the person who could implement the n-queens problem on the 17bii solver.

Don

in response to message #3 by x34

I wrote: "But if you RCL it, solve would ask for it's value, effectively blocking usage of it for temporary data storage."

Katie wrote (http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=121288):

"The get, G(), function I was referring to is a special function in the 17bii solver (and several other HP calculators going back to the 27S) that recalls the value of a variable each time it's encountered. When used in combination with the let, L(), function it allows for side-effects in the solver. The 35s solver apparently has the L() function (in the form of STO) but not the G() function, or so it seems."

I think it is wrong. G() (RCL) works. The only problem is you should enter first value of it (seed) at the launch of solver.

Strangely, Katie make use of it in her examples. Something i do not understand. Or G() is not equivalent to RCL?

More: solver uses local (to it) copy of variable solved.

so it is possible to use it in expression.

0 STO A A/A+0x(777>A) SOLVE RCL A 777

min(a,b) and max(a,b) equation for HP-33S/HP-35S

*Message #1 Posted by **x34** on 30 Jan 2011, 10:48 a.m.*

HP-33s and HP-35s lack min and max functions. Yes, they could be easily programmed, but.. a) Label would be consumed on HP-33S (not a problem for HP-35S, thou) b) You can't use conditionals in the Equation Writer

So, here is simple (but awkward) brute force implementation of MIN & MAX using Signum function, present on these calculators.

MIN(a,b)=((b-a)*SGN(a-b)+b+a)/2

MAX(a,b)=((a-b)*SGN(a-b)+b+a)/2

If used in program, they could be simplified by isolating (a-b).

Re: min(a,b) and max(a,b) equation for HP-33S/HP-35S

*Message #2 Posted by **Dieter** on 30 Jan 2011, 12:10 p.m.,*
in response to message #1 by x34

If I need a min() or max() function in a program I simply do it this way - without any labels and with minimal memory usage:

```
MIN-function:          MAX-function:
   X>Y?                   X<Y?
   x<>y                   x<>y
```

Okay, this doesn't work for the solver. :-)

Looking at your equations for a while I found a somewhat simplified version. Since (a-b)*sign(a-b) is simply abs(a-b) the two equations may be written even shorter this way:

```
MIN(a,b) = (a+b-ABS(a-b))/2
MAX(a,b) = (a+b+ABS(a-b))/2
```

By the way thanks for your suggestion - it's always nice to re-think some basics and find solutions one would otherwise not have thought of. :-)

Dieter

I sure do. It's quite a nice scientific calculator for the time. I especially like the 2-digit raised exponent on the LED display.

Nice site! Do you still have a working ZX81, that was a fun machine to play with.

Thanks! The ZX81 PCB on the site is mine. Last time I opened it the keyboard flex cable broke, so it's inop right now. I recently got a Sinclair Cambridge Programmable calculator. As with the ZX81, they cleverly squeezed a lot of functionality into a small package. Perhaps they squeezed too hard, as accuracy does suffer.

And thank you for scanning and posting the Bowmar manual. Mine did not come with one.

I'm not a Bomar collector, but my first calculator was a Bomar 901B (four-function) purchased new in October

1972 for a 2010 equivalent of about $750. I've still got it.

Re: My New Geeksite (including Bowmar)

Powered it up today, got good news and bad news. Keyboard and logic work, some LED segments do not. High power inspection revealed crystal growth inside the LED stick. Lot more work ahead to restore this one.

Decimal point before an operation

*Message #1 Posted by **Jim Yohe** on 29 Jan 2011, 2:10 p.m.*

Looking at the HP 50g User's Guide on page 1-14 it shows that you can input an expression directly without using the equation writer. While in the algebraic operating mode, with every entry of a whole number they also show a key-press of a decimal point before an operation (ie, "x" "+" etc..). When in the equation writer they didn't do this and so it's foreign to me, as I've never had to do that with other HP and TI calculators I've owned.

Why was it necessary to add a decimal point before an operation?

Re: Decimal point before an operation

*Message #2 Posted by **Chris Randle (UK)** on 29 Jan 2011, 3:49 p.m.,*
in response to message #1 by Jim Yohe

Hi Jim,

It's not a decimal point before the operator, it's a decimal point *after* the number. It's a way of overriding the current exact/approximate mode and explicitly stating that you want an approximate result (a numeric answer) rather than an exact result with integers.

You can toggle implicit exact/approximate mode by holding down right-shift and pressing enter.

If you're in algebraic mode (ALG displayed in the header) and in exact mode (= displayed in the header), try these:

```
1 / 2 [ENTER] -> '1/2'
1. / 2. [ENTER] -> '.5'
```

In the last example, you could have left the decimal point off either the 1 or the 2 and you'd have got the same result.

If you had tried the example from page 1-14 without the trailing decimal points, the calculator would have produced a non-approximate result, but the EXP() function must produce an approximate result, so the calculate instead asks you to confirm a switch to approximate mode.

If the calculator is in exact mode and you want an approximate answer, you can use (right-shift) ->NUM

```
1 / 3 [ENTER] -> '1/3' [->NUM] -> '.333333333333'
```

in response to message #2 by Chris Randle (UK)

Thank you Chris. I am just reading the PDF of the manual and wasn't aware of approximate vs. exact modes. At least not yet. Still it's a bit confusing since this is a new concept to me with respect to how this calculator has been programmed to work.

Re: Decimal point before an operation

*Message #4 Posted by **Chris Randle (UK)** on 29 Jan 2011, 5:33 p.m.,*
in response to message #3 by Jim Yohe

It's a great feature of the calculator, and well-implemented, IMO. In case you're not familiar with HP tri-glyphs, "\v/" represents the square root symbol, "\->" a right-arrow, and "\pi" the symbol for pi.

In exact mode,

```
\v/4 -> 2
```

because there's an exact decimal representation of the square root of four. But, because the square roots of two and 20 are irrational,

```
\v/2 -> \v/2
\v/20 -> 2*\v/5
```

Keeping the square roots there in case a later squaring operation is used. If you knew in advance that you wanted an approximate decimal fraction for the square root of two, you could type:

```
\v/2. -> 1.41421356237
```

to convert back,

```
\->Q\pi(ANS(1)) -> \v/2
```

\->Q\pi is available from the catalog menu (CAT)

The example on page 1-14 and the examples I've used assume the calculator is in algebraic mode. I prefer RPN mode, and Tim Wessman has produced an additional guide: "HP 50g Graphic Calculator Quick Start Guide" with all examples in RPN mode. If you haven't seen it, you can download a copy here:

HP 50g Graphing Calculator Quick Start Guide

Also, if you haven't seen a copy of the Advanced User's Reference Manual, which is definitely worth a look, you can get yourself a copy from here:

HP 50g/49g+/48gII graphing calculator advanced user's reference manual

Why was the HP-15C dicontinued and not the HP-12C

*Message #1 Posted by **Gerardo Rincon** on 29 Jan 2011, 11:08 a.m.*

I have always wondered the reason why HP discontinued the HP-15C and decided to keep in production the HP-12C? Both the HP-12C and HP-15C calculators are what I would consider near perfect in calculator design and functionality.

Re: Why was the HP-15C dicontinued and not the HP-12C

*Message #2 Posted by **Michael de Estrada** on 29 Jan 2011, 11:44 a.m.,*
in response to message #1 by Gerardo Rincon

Totally different markets. The Hp-15c, as well as the HP-10c and HP-11c appealed to scientists and engineers who wanted to do programming, whereas the HP-12c was used by business and financial types who for the most part do not write programs. The programming capabilities if the HP-15c were severely limited and subsequent models with better programming capacity and features replaced it.

Re: Why was the HP-15C discontinued and not the HP-12C

*Message #4 Posted by **Mike Morrow** on 29 Jan 2011, 1:39 p.m.,*
in response to message #1 by Gerardo Rincon

Bill beat me to the answer...the HP 42S. But I'll add some detail. The HP 42S is very marginally longer than the 15C but is otherwise the same size. It has an order of magnitude more functionality which due to great alphanumeric support is much easier to use. It's five times faster and has much greater accuracy and precision in its numerical results. It has tone and beep audio output and IR printer output. It has about 16 times more RAM.

I can't help but remark once again that the HP-15C's awkward and pointless landscape layout (for which no one cites an advantage other than attributes best summed up by "cuteness") alone is valid reason for HP not preserving that mistake in subsequent products other than endless primitive HP-12C re-treads.

The HP-15C does, however, get consolation prize as the second best RPN calculator ever made. And, its color style is more attractive. (IMHO)

The real question that should be asked is: "Why has a replacement as or more capable in the same size package as the HP 42S *not* been produced in the 23 years since the HP 42S was first introduced?"

Edited: 29 Jan 2011, 2:05 p.m.

Mike you are so correct in your statement: "The real question that should be asked is: "Why has a replacement as or more capable in the same size package as the HP 42S *not* been produced in the 23 years since the HP 42S was first introduced?"

Also, Size does matter, and I don't like menus. One of the things I really like about the HP-15C is the size/portability and access to so many functions direct from the keyboard, without having to use Menus.

Menus is the single reason I don't use my HP-30b at work (so many key strokes are needed just to execute a % change burried somewhere in a menu is an example).

If the HP-35S were smaller, pocket size, it would be a wonderful calculator to use around the office.

I'm beginning to dislike my 30b for that same reason of having to enter too many key strokes to get to functions deep down in menus.

Re: Why was the HP-15C discontinued and not the HP-12C

*Message #7 Posted by **Don Shepherd** on 29 Jan 2011, 3:58 p.m.,*
in response to message #6 by Jim Yohe

Guys, remember the 30b can bring any embedded function to a key of your choice with a simple program. If you are of a scientific-bent, immediately assign 6 desired functions to the TVM keys and AMORT on the top line and put a thin little sticky above them to note how you redefined them.

Gene suggested this many times and it's a great idea.

Don

*Message #8 Posted by **Mark Harman** on 29 Jan 2011, 4:39 p.m.,*
in response to message #7 by Don Shepherd

Since I don't like the primary and shifted functions to be replaced, I will assign the nested and new functions as Shift-Hold functions. Thereby, acting as a second shift. I have a number of custom programs that I created that are assigned as shift-hold functions.

For example, I have a program that will calculate combinations with repeating. Where did I put it? The logical spot - as a shift-hold function on the decimal key, thereby sharing the key with the shifted combinatorial function. I also added a Mod function that I placed as a shift-hold function on my multiplication key, amongst other things...

Regards,

Mark

*Message #9 Posted by **Mark Harman** on 29 Jan 2011, 4:30 p.m.,*
in response to message #5 by Gerardo Rincon

I can understand the frustration regarding the menu system. However, there is no menu on this machine that is more than two levels deep. I can't say that about other menu-based calcs that HP has made (I mean, heck, the 17bII+ has one menu that is buried seven levels deep!).

That being said, the percentage change function is not that hard to get to. Just shift % and arrow up and you're there. One thing that I think many users might neglect to learn is that the menus roll around, so one can start at the bottom of the menu if they want to save keystrokes.

Still, if you really want to avoid that function altogether, just remember the percentage change formula.

(New - Old)/ Old * 100

For example, if you want to know the change from 90 to 100, do the following: 100 enter 90 - 90 / 100* You should get 11.111

Now, of course, if any changes over multiple periods, that will require a few extra steps that I don't want to explain at this time. In this situation, the %Change menu function is very handy and more efficient than going through the steps.

Regards,

Mark

*Message #10 Posted by **Mark Harman** on 30 Jan 2011, 4:57 p.m.,*
in response to message #5 by Gerardo Rincon

Here is a program I whipped up really quick to add a straight %Change function to the 30b.

I have it assigned as a Shift-hold to the percentage key. Use a high-numbered program space so you can keep the low numbered ones for processor-intensive programs.

When programming it, scroll up to start at line zero so you can assign the key. Press Shift-hold %

SH%
Swap
-
Ans (this is the same as Lastx)
/
1
0
0
*
You can enter a message on line 9 so your function is represented. I entered in [delta symbol] %

It takes 13 bytes and your checksum should be 050

To get it to work. Just enter in your old number first and the number it is changing to second, then hit shift-hold % to execute this function.

For example, what is the percentage change from 80 to 200?

80 Input 200 shift-hold %

Nine lines is all it takes - and now you can bring your 30b with you to work!

Cheers,

Mark

Agreed -- sort of.

I love the HP50g, menus and all. But I usually carry two calculators with me, a CAS graphing calculator, and a scientific with few / no menus for more basic number crunching.

I think a 50g / 15c combination would work well with this mindset, but a 50g / 42 not so much.

Hmmm... you have something here.

I carry and use exactly a combination of a 50g and a 33s (35s when teaching) at work and a 49g+ and 33s (or trusty ol' 32SII) at home. It seems that there is most often the need for quick calculations or simple programs that can be handled with a 33s or 35s (maybe not a 32SII) with minimum fuss. And then not always, but often enough, you need more programming power or maybe the storage and display and program running capability of the (50/49)g(+). The only issue with the graphing models is that it does take more time and trouble to program them as opposed to that taken with the scientifics.

in response to message #4 by Mike Morrow

I would not say the Voyager series landscape being pointless. Granted, if you hold it in your hand it is really awkward, but the size is very attractive, and I tend to put the calculator on the table anyway.

I find it easier to get closer to view the LCD on a Voyager when being busy with lots of things on the table. The vertical machines sometimes feel a bit tall, with the LCD getting a bit far away, this from my school memories.

I think the vertical ENTER key was the biggest mistake, it is really pointless.

The HP-41CX would be third best, if one doesn't need its magnetic card, time, bar-code, and HP-IL capabilities. I suspect that the vast majority of 41C users never had any need for bar-code and HP-IL, and if they need magnetic card features, then they'll have to have repaired the gummy wheel problem by now. The most outstanding feature of the HP-41C series over all *later* models is the excellent "best-in-class" keyboard quality. Otherwise, the HP-41C is more of a slightly faster, alpha-capable HP-15C with tone and printer output, but without the 15C's native solver, integrator, and complex number facilities. Even the Advantage Module doesn't do a good job of giving the 41C those capabilities of the 15C. I have the HP-41CX that I bought new 26 years ago, with most common accessories. It's nice, but I value my HP 42S units more. Much much more.

Thanks for asking.

Well to me and I guess to all surveyors of the time "native solver, integrator, and complex number facilities" are things we can't care less, and alpha-capabilities, the BEST EVER MADE keyboard plus reasonable amount of memory and IO made it THE BEST. The HP-42s is crippled in a way of professional use in my area. So I guess it's all a matter of a point of view. I wander how many calculators from each models are sold. Thanks for the answer and best regards, Reth

Wow. I believe I've heard such an assessment before which equally mystified me. Personally the landscape configuration of the voyager series was the initial ergonomic attraction for myself to that model series.

IMO any handheld calculator used as such requires two hands to pilot. With a landscape configuration digits of both hands are readily available for keypad duty where in a profile orientation the non-dominant hand holds the device and the other has at the keypad. In my experience tactile feedback and control is much greater when a key is actuated within the clutch of a hand vs. hand-to-hand in the case of a profile format. While a conventional vertical profile unit may be operated similarly with both hands, the natural coverage of both user "thumbs" falls into a wide horizontal vs. vertical area.

Measured by marketing presence I see my preference is in the minority. However I can't imagine why a landscape configuration isn't the default for *every* handheld calculator.

The 12C became an established standard for finance types. It became the de facto standard in classes, text books, real estate classes, etc...

HP didn't discontinue the 12C because the demand after 30 years still exists. The TI-83 in high school enjoys the same success.

The HP scientific line had to evolve to compete. The 15C was dropped for more capable and less expensive models. That evolution gave us the 42S--the peak of RPN scientific calculators. I'll never understand why things went downhill after that.

*Message #23 Posted by **Karl Schneider** on 29 Jan 2011, 2:37 p.m.,*
in response to message #1 by Gerardo Rincon

Gerardo --

HP introduced Pioneer-series replacements for both the Voyager-series HP-11C, HP-15C and the HP-12C -- the HP-32S, HP-42S and HP-17B -- but the HP-17B apparently did not achieve acceptance in the larger financial market as a replacement. Appearance and the lack of familiarity and compatibility may have played a role. The Voyager-series landscape layout that Mike Morrow continually criticizes is actually well-suited for desktop use, as financial people likely prefer.

Thus, the HP-12C was continued, as demand still exists.

I disagree with Michael de Estrada that the programming capabilities of the HP-15C were ostensibly "severely limited". That term might apply to those of the HP-10C and HP-12C, which lacked insert/delete editing as well as most of the programming features, and also offered far less RAM for the user.

The HP-15C offered broad, cohesive functionality, along with ample programming features and sufficient resources to accomplish practically any task appropriate for that particular tool. However, its non-alphanumeric 7-segment display and limited program-management capabilities made the use and maintenance of permanent-residence programs rather inconvenient.

Yes, that's a major part of the "lack of ... compatibility" I had mentioned, although I'm not convinced that financial types would be tied to RPN. Even though the HP-17BII provided RPN and a dressier

appearance to equal that of the HP-12C, the application programs written and published for the HP-12C remained incompatible with the HP-17B/BII, which did offer the fine algebraic solver.

The HP-10B and HP-14B were not programmable in any fashion, although I'd prefer to use them over the HP-12C for standard finanacial calculations.

although I'm not convinced that financial types would be tied to RPN.

A fairly large number of them ARE tied to RPN. They learned how to solve problems on the 12C don't want to relearn it differently, if they can avoid it. They'd rather just buy another 12C.

It doesn't matter if a 17BII, 20B, or 30B might in some sense be easier to use than a 12C. It's easier yet to stick with what you already know.

Having more features on a newer financial calculator will get some users to switch, but many are perfectly happy with the 12C and don't need the additional features.

A lot of bean counter types enter that one-strange-function as a program on their 12c too, along with the fine trig routines that have been posted here.

This is my favorite though.

I'll take a stab at guessing. I think he is referring to the Black-Scholes function.

Mark

that one missing function

*Message #30 Posted by **db (martinez, ca.)** on 31 Jan 2011, 12:54 a.m.,*
in response to message #29 by Mark Harman

Mark & Don;

I should have said that one *missing function*. I've noticed that there's usually at least one thing that everyones favorite calculator (whichever) doesn't do and it's of course always something different. That's why we program, or set up the solver. That was especially true in the calcs with smaller memories and the 41 where more programs meant less data storage.

I bet everyone here could name *that one thing* that should have been in ROM instead of xxxx. To which everyone else would reply "that's minor - the real omission is...."

Re: that one missing function

*Message #31 Posted by **Mark Harman** on 31 Jan 2011, 1:30 a.m.,*
in response to message #30 by db (martinez, ca.)

db,

I get what you are saying now.

Honestly, before I got my 30b, I used a TI BA II Plus Professional. It is a very nice device and served me well for a long time with its fairly robust function set and fair speed. However, there were functions that I always wanted to have that I could not add. It isn't a programmable device, so I got the functions it came with.

When I did get my 30b, I was thrilled because, first, it had RPN and, second, it could be programmed. I have since added a number of functions to the calculator that I really enjoy having. I am at the point right now where I am considering starting a blog based on this device by posting some of my "programs" that I have thus far written...

I also agree with your last sentence. It always seems like one user's specific request is less important than the one that another feels is important. Unfortunately, we can't get everything we want and, like I mentioned in another post, designers are always going to make a decision or compromise that will make one group of users happy while alienating another.

Regards,

Mark

*Message #32 Posted by **Don Shepherd** on 31 Jan 2011, 2:21 a.m.,*
in response to message #30 by db (martinez, ca.)

Thanks, db, I see what you mean and I would agree. I once had a discussion with Katie, who consults for the financial types, about whether they typically use any programs on their 12c's. She said a lot of them actually do, but typically not programs they wrote themselves, rather programs written by someone else (frequently her) for the "one function they often need but isn't there". Given the 12c's program execution method and 99 line capacity, I would imagine they would be limited to a single function since otherwise they would have to GOTO a certain line number first for additional functions. They wouldn't have that restriction on the 30b since any key can activate whatever programmable function they want, but there is still the 290 byte limit on that machine.

And you're certainly right about what that missing function would actually be. Like Mark said, it might be Black Scholes for the bean counters, but for me it would be something related to number theory.

Thanks for clarifying.

Don

Karl, that is not much of a distinction. The exact same thing can be said for every HP calculator ever made (well...maybe not the HP 6S, et al), even that HP 9820 in my storage shed.

But just as the 9820 is not a good handheld device, unfortunately neither is a Voyager. The HP 50g is easier to use as a *hand held* machine than the much smaller Voyager. That surprising disadvantage stems *solely* from the Voyager's landscape layout. I have large hands, still I find it impractical to hold a Voyager for use in one hand. The Voyager can not accurately be termed a "handheld" calculator if such use is impractical. Perhaps a Voyager should be called a "two-hands-held" or "mini-tabletop" calculator.

Landscape works well only when the total width of the calculator is easily cupped in a typical-size palm. If the HP-15C could be scaled down until its width is about the same as a Pioneer's, I'd readily and enthusiastically buy several such machines. Such an item would be exciting on a number of levels! An HP 15CM (Mini) anyone? (I'm not holding my breath.)

When it comes down to it, the best handheld HP calcs were the Woodstocks. They were by far the narrowest of HP's pocket RPN calcs and weighed only 1.6 oz more than a Pioneer. Despite having very small hands, I can both hold and operate my Woodstocks with one hand, something I cannot do with any other of my HP calcs. When placed in a shirt pocket, they were no taller than a Voyager, and least likely to fall out if you bent over. And their battery pack design made it a snap to swap batteries.

I agree about the Woodstock's great characteristic as a handheld device. The mechanically sturdy arrangement of the Woodstock is re-assuring. I'd love to have an HP-34C (very flimsy mechanically) in a Woodstock body (same number of keys...30). But I could also fall for an HP-15C (or an HP 42S) in a Woodstock body as well. But the HP-15C has 39 keys, and the HP 42S has 37, which are significant increases above the Woodstock's 30 keys.

*Message #42 Posted by **Martin Pinckney** on 30 Jan 2011, 1:12 a.m.,*
in response to message #39 by Mike Morrow

Mike, I think the first point is that most people do not use their calculator hand-held most of the time, so the LS format of the Voyagers becomes moot. That being the case, the other things about Voyagers that are appealing (compactness and style) come to the forefront.

Yes, you are correct about the 42s being so great, but the second point is many have stated they do not like a menu-driven interface. This accounts for the continuing popularity of both the 15c and the 32sii, which you also don't like.

Different strokes...

the whole battle over landscape versus portrait format is starting to wear a little thin methinks. i have a 20s and an 11c, and like both.

as far as i am aware they are all called POCKET calculators, which makes no reference as to how one should use said calculator once you have removed it from your pocket at the "location of calculation". the term 'handheld' only really came into use much later with the advent of small handheld computers like the sharp PC-1211, most of which happened to be portrait format!

Your threshold for perceiving a "battle" is too low.

> Quote:
>
> as far as i am aware they are all called POCKET calculators

As far as I an aware they are all not. Quod gratis asseritur gratis negatur.

In any event, that completely misses the point of the discussions. The Voyagers could have been designed with portrait layout and been otherwise exactly the same size, shape, weight, style, and function...plus sit just as well on a table top. What rationale justified choosing the layout that makes the unit inarguably impractical to use in hand, yet provides no advantages to justify that choice? History shows that HP did not repeat the mistake again in a new design during the 30 years following Voyager introduction. It appears that HP came to the obvious conclusion.

There are a *lot* of good reasons to like the Voyagers, especially the HP-15C. I like them...I've got two, and a couple of HP-12C units as well. I believe that most Voyager fans have

recognized the many great characteristics and unconsciously or uncritically included the unique layout as an integral part of what makes the machine great. But no one has ever been able to coherently explain any *advantage* that stems from the landscape layout. "Cute" and "different" and "I just like it" are subjective artistic-type considerations that do not provide a real answer to the question. But maybe it *is* just like the tail fins on some 1959 Buick automobiles! :-)

None of us can change the Voyager design, so it could be termed of little value to discuss. But...this is a forum. Perhaps some day someone who helped make such decisions will contribute. Or maybe not. Perhaps someone will present information that will reshape a concept for myself or others. Or maybe not. Such discussions take place on all forums for all subjects. That's why forums exist!

The rationale of "landscape" layout, in detail

*Message #45 Posted by **Karl Schneider** on 30 Jan 2011, 3:31 p.m.,*
in response to message #44 by Mike Morrow

> Quote:
>
> But no one has ever been able to coherently explain any *advantage* that stems from the landscape layout. "Cute" and "different" and "I just like it" are subjective artistic-type considerations that do not provide a real answer to the question.

Mike --

Those insinuations are far from the truth. Many people here have plainly and coherently explained the advantages, appeal, and rationale for this and other things you seem to despise, yet you continually ignore it and then re-hash your predictable "talking points" a few months later, or even subsequently in the same thread (for example, after Håkan Thörngren posted in this one).

Certainly for actual handheld use, the portrait layout is ideal. I suspect that many users of the HP-35 and successors took them to construction sites and other "field" locations. However, many or most users in the early 1980's -- such as office workers and students -- would place the calculator near the front of a tabletop or desktop, using it to calculate numbers to write on their papers. In that era, few people had a PC or computer terminal on their desks. Thus, no pull-out keyboard trays to move the user away from the desk or table. 90% of people are also right-handed, and would press the keys with that hand.

With all of that in mind, the Voyager-series portrait layout made perfect sense. These calc's also have the display window offset to the left, shift keys in the lower-left corner, and data-entry keys on the right side, but just to the left of the arithmetic keys. With the calc placed to the user's right near the edge of the desk, the following ergonomic advantages were achieved:

- The display window is moved a few inches closer to the user than with portrait layout.
- The user's right hand is moved in a natural side-to-side motion to reach keys, instead of a back-and-forth ("to and fro") motion that involves the user's upper arm.
- The shift keys can be pressed with the right thumb, if desired.
- Most "operation" and transcedental-function keys (other than arithmetic) are not obstructed by the user's hand while entering data.

Yes, HP thought this through quite well. Portable computers of the era, such as the HP-71B and the models by Sharp also used this layout for similar reasons. Please note that "cuteness", "different", and "artisan" had nothing to do with them. (The HP-71B and HP-75 were too large to reasonably use as handhelds, anyway.)

Also remember that HP was selling the HP-41 as a calculator well-suited for handheld field use, with its expandability, advanced programmability, and limited data-storage capability. The HP-34C was also available as a handheld alternative, up until 1983. The Voyager-series models, however, were not really intended for field use.

By the latter 1980's, the *modus operandi* of office work was evolving. Most white-collar workers began to get PC's for their desks, along with pull-out keyboard trays for entering numbers into documents, e-mails, or even spreadsheets in some cases. The user was no longer sitting next to the calculator placed on the edge of the desk surface, and would no longer write the calculated result onto paper placed nearby on the desktop. Hand-held use was becoming the norm, dictating a portrait layout for the Pioneer series.

Students, meanwhile, continued to use desks without PC's, as Håkan and others could attest. The landscape layout worked great for that.

One final point: HP's landscape layout isn't optimal for those who want to operate the calculator with their *left* hand, but is still workable. It should be noted that telephones have long been optimally configured for right-handed operation and left-handed listening -- even more so with rotary dialing. Predominant right-handedness of people is why the dials were turned clockwise, and why the handset is plugged into the left side of the phone. The objective was to optimize ergonomics for the most-typical method of usage -- something that, unfortunately, is often not achieved in modern consumer produtcts.

Alles klar? Coherent enough?

Karl,

Coherent and well thought-out explanation of the evolution of the calculator form factor. It brought to mind scenes I had not thought of for a few years. When I started working in Florida in 1986, the company supplied calculators to anyone who needed one. The model they supplied - because the company President thought it was the best - was the 11c. I remember him remarking that the 15c was overkill. I remember people using them just the way you said, on the corner of a desk or drawing board, where the LS format worked perfectly.

Mike,

You are right about this being a forum for the free exchange of ideas and opinions. What's annoying sometimes is when you present your opinions as incontrovertible fact, even in the face of others giving reasons why they prefer something different. For example **uhmgawa**'s explanation of how, for him, the LS format actually works better as

a handheld.

> What's annoying sometimes is when you present your opinions as incontrovertible fact...

Hi Martin,

It's a common forum technique, designed to provoke a counter response and discussion. All assertions (including...even especially...mine own) expressed on a forum are, without necessity of labeling, made with an implied "in my opinion" caveat. Concrete facts and details obviously represent an exception.

My outlooks come from 39 years of calculator use, 35 years of HP ownership in particular, during which time I have owned every model about which I've expressed opinion and developed not just a few comments on each. If I were not interested in other viewpoints, I'd refrain from bringing any of my views to the fore on the forum.

I've had my run on this issue. I thank every one who voiced contrary positions and stated the basis.

Karl,

Thanks for taking the time to produce the canonical list of the advantages of the Voyager being made in landscape rather than portrait layout:

> Quote:
>
> ...the Voyager-series portrait layout made perfect sense...the following ergonomic advantages were achieved:
>
> - The display window is moved a few inches closer to the user than with portrait layout.
> - The user's right hand is moved in a natural side-to-side motion to reach keys, instead of a back-and-forth ("to and fro") motion that involves the user's upper arm.
> - The shift keys can be pressed with the right thumb, if desired.
> - Most "operation" and transcedental-function keys (other than arithmetic) are not obstructed by the user's hand while entering data.

I have some remarks/questions on that list:

- I agree that this advantage exists. Is it likely that a significant number of users found the advantage to having a calculator's display at most two inches (46 mm) closer was worth a keyboard layout that precluded effective use as a handheld calculator?

I agree that this advantage exists. Is it likely that a significant number of users found enough advantage to having a calculator keyboard layout that encouraged right-left rather than down-up hand motion, three inches (72 mm) maximum, was worth a keyboard layout that precluded effective use as a handheld calculator?

- I disagree with your premise. The shift-key-on-left quality has NOTHING to do with landscape vs. portrait advantages. The Pioneers *also* have the shift key on the left side allowing right thumb use just as effectively as you suggest the Voyager allows. IIRC, all HP calculators since the HP-41C have placed the shift key(s) on the left side. Further, were this in fact to be considered an advantage for either layout, it would be one for RIGHT hand users only.
- I disagree with your premise. The quality that you cite of the Voyager layout placing the various function keys on the left where the keys are not obscured illustrates a problem or advantage that occurs BECAUSE of the landscape layout. You describe the arrangement as an advantage, but it is only that for RIGHT handed users. It's a problem for LEFT handed users. In contrast, the portrait layout is a decided advantage in this area because these function keys are not obscured regardless of the user being LEFT or RIGHT handed. Frankly, I had never considered that, and I thank you for noting yet another advantage to the portrait layout.

> Quote:
>
> The Voyager-series models, however, were not really intended for field use.

I doubt that limiting the theater of use was in HP's design objectives ("intent") for the Voyager. Any citation of such a concession at HP would be of interest.

> Quote:
>
> HP's landscape layout isn't optimal for those who want to operate the calculator with their *left* hand, but is still workable.

Still, you're talking about two-handed use. However, it is use in-hand, with that hand, which is the acid test. Most portrait layout models may be used with varying degrees of ease completely one-handed while hand held. Even the HP 50G. The small Voyagers do not possess that characteristic.

I don't have any objection to landscape layout that doesn't stem simply from the fact that, as implemented in the Voyagers, it makes hand held operation inefficient. Any perceived advantages, as have been recently presented, do not compensate for that. However, a mini-Voyager that was scaled down to be about the same width of HP portrait models would completely overcome the objections that I have to the design.

Mike --

A few comments:

1. Thank you for using ALL CAPS to emphasize the words, "NOTHING", "BECAUSE", "LEFT" (twice), and "RIGHT" (thrice). Else, I (we?) might not have grasped their full significance...

> Quote:
>
> "The shift-key-on-left quality has NOTHING to do with landscape vs. portrait advantages...

2. Thank you for the revelation. Indeed -- that, along with arithmetic keys to the right of data-entry (number) keys -- had more to do with optimization for right-handed use, as with the Pioneer series. While quoting me, you omitted a sentence that mentioned certain attributes distinct from landscape layout: *"These calc's also have the display window offset to the left, shift keys in the lower-left corner, and data-entry keys on the right side, but just to the left of the arithmetic keys.*

3. Notwithstanding your statement that included all the capitalized LEFT's and RIGHT's, an HP-15C placed on a desktop/tabletop to the left of the user can be operated adroitly with the left hand. It's not absolutely optimal in all aspects, but it's certainly not a "problem", either.

> Quote:
>
> Still, you're talking about two-handed use. Most portrait layout models may be used with varying degrees of ease completely one-handed while hand held. Even the HP 50G.

4. No I wasn't; I was talking about *desktop* use. As for one-handed hand-held use, those "degrees of ease" might range from 'effortless' for those with hands like baseball gloves to 'unworkable' for the rest of us when using a larger model.

> Quote:
>
> However, a mini-Voyager that was scaled down to be about the same width of HP portrait models...

... would be a credit-card-sized uCalc. I wouldn't want to try cramming an HP-15C's functionality onto it.

> Quote:
>
> My outlooks come from 39 years of calculator use, 35 years of HP ownership in particular, during which time I have owned every model about which I've expressed opinion...

5. Is this intended to convince us that you have special insight? Most of us have used

HP's for 20+ years, not that it takes that long to form assessments. Many of us have fairly-complete collections, too.

My basic point: HP did not, shall we say, 'blunder' with the landscape layout of the Voyager series, as you have repeatedly opined. The engineers knew what they were doing, and likely had solid reasons for the decisions they made at the time. My own well-documented observations suggest that every detail of the HP-15C was carefully considered. The apparent objective of the Voyager-series design was to optimize ergonomics for routine *desktop-placed* use by students and office workers who dominated the market, with a modest bias in favor of the 90% of people who are right-handed. The HP-15C is the only calc I owned through most of the 1980's and 1990's, and that's how I used it then -- placed on the desktop.

This is no longer the case for myself and countless others, who use PC keyboards on pull-out trays that all but necessitate hand-held use of calculators. The portrait layout is much better for that purpose, and HP probably recognized that as well in the latter half of the 1980's.

Karl,

Thanks (seriously!) for the time and effort you've taken to explain your position. It's all been well worth reading.

BTW, I am guilty of using a capitalized individual word at times for emphasis on that word. It seems to me to lend a voice-type conversational characteristic. IMO, a phrase in caps is shouting, not a single word, though there's no internet forum standard that supports my position. I had no other purpose beyond that with my use of a capitalized word. I apologize for causing offense.

Re: The rationale of "landscape" layout, in detail

*Message #56 Posted by **Walter B** on 2 Feb 2011, 3:27 p.m.,*
in response to message #55 by Mike Morrow

FYI, there's an opportunity to underline, what shall be emphasized. Capitalizing takes less effort though.

Re: The rationale of "landscape" layout, in detail

Quote:

> - The display window is moved a few inches closer to the user than with portrait layout.

A practical consequence of this is that when you are a stock exchange trader on a narrow cramped desk with several screens and keyboards and precious little spare space, it is easy to slide your computer keyboard back a couple of inches in order to put the 12C on the edge of the desk, in front of it. A landscape calculator means you have to move your keyboard much further back which might not be possible.

I think you mean in portrait layout you'd have to push your keyboard further back. Landscape layout would give you a little more room to pull your keyboard closer to you.

in response to message #45 by Karl Schneider

To me, the important thing for HP to recognize is that different people have different preferences. I think it's important for them to produce calculators in a variety of form factors.

I also think it's crucial on the high end machines to allow assignable keys and way for the user to know which functions are assigned to which keys. The 50g has thousands of functions but I suspect that each user has a small number that they use frequently. Ideally, they would assign these functions to less used keys. I really liked the 41C series with its removable keyboard overlay and the fact that holding down the key showed the name of the function it would invoke.

Again, my point here isn't that form factor X is "better" than factor Y, or that A should be on the keyboard rather than function B. My point is that these factors vary from person to person and the manufacturer should design with this in mind. Thus a scientific calculator in the landscape format would be a nice addition, as would a physical change to allow keyboard overlays on all models that support assignable keys.

Dave

in response to message #74 by Etienne Victoria

If they stopped making the 15c because of the 42s then why did they stop making the 42s? There is no replacement, they simply stopped making it.

People always say that there is a market for the 12c but not for a 15c or a 42s. In my view that's bullshit. Students, engineers and scientists need calculators with "scientific" capabilities. It is just normal that nowadays they use Casios and TIs because there no longer is an alternative from HP, readily available.

Re: Why was the HP-15C dicontinued and not the HP-12C

*Message #76 Posted by **Eric Smith** on 4 Feb 2011, 4:24 a.m.,*
in response to message #75 by Patrick Rendulic

HP makes the 35s for those people. We could debate the merits of the 35s vs. the 15C and 42S, but the reality is that most students, engineers, and scientists that need a scientific calculator don't want or need more than a fairly basic one. The 35s is actually overkill for them.

I don't think they stopped making the 15C because of the 42S. I think they stopped making the 15C because sales of the 15C tapered off. Richard Nelson has related the story of the 42S discontinuation,

which was that Educalc was selling a moderate number of them, but that NO OTHER HP DEALER was selling any significant number. In other words, the sales of the 42S had tapered off also.

Some people seem to think there are big conspiracies or extreme stupidity going on in product discontinuation, but the reality is that HP, like almost any other company, discontinues products when they stop bringing in revenue. There are only rare exceptions to that.

[I don't work for HP; these are just my personal opinions.]

Re: Why was the HP-15C dicontinued and not the HP-12C

*Message #77 Posted by **Ron Ross** on 4 Feb 2011, 1:20 p.m.,*
in response to message #75 by Patrick Rendulic

Also, if I remember correctly, the Hp48S and then the Hp48G were made available for only a few dollars more. In fact the Hp48g was selling for $100 on the street when the Hp42s was still selling for $120. While a professional would still buy an Hp42s, that likely professional ALREADY had an Hp42s. A student who wanted a graphing calculator, more memory, ability to share programs would buy the Hp48G (or better).

And Hp realized that for every Hp42s sold, they probably lost the sale of an Hp48G (which was a two tiered sale, ie a student who buys an Hp48G, might then upgrade to an HP48GX!!! KA Ching!! Two sales).

Under such market conditions, it is no wonder the Hp42s was discontinued. Had Hp sold the Hp42s for $70-80, it would have sold much better, but then it would have definitely robbed sales from the Hp48G line and still would have been dropped.

*Message #78 Posted by **Mike Morrow** on 4 Feb 2011, 5:40 p.m.,*
in response to message #77 by Ron Ross

Ron, I believe you have identified all the key aspects for why the HP 42S was discontinued.

I had used an HP-15C almost daily in my job as a nuclear plant control room engineer and supervisor. In 1997, after eleven years of 15C use, I decided to retire the beloved 15C and get the current equivalent model in HP's line. That happened to be the HP 32SII, because the HP 42S had been discontinued in 1995. I very quickly found the 32SII to be woefully inadequate as replacement for the 15C. And...two years after the 42S had been discontinued, typical prices on the used market were at least double the pre-1995 price. (IIRC, Edu-Calc sold the 42S for $95 before discontinuance.)

(Momentary tangent follows: The college bookstore at U. of Alabama at Huntsville did not believe in discounting old stock to encourage sales. There I found (still in 1997) two **new** HP 42S units that had been on the shelf for more than **four** years...so long that the batteries were dead! I bought both for $114 each. The last 42S that I bought I found in the box, open but unused, at a ham radio flea market last year. The last 15C I bought was also at a ham radio flea market (used, with manual...$10!). Places like that can gold mines for old calculators.)

The thing that aggravates me is that the HP scientific calculators (33S, 35S) that followed copied the inadequacies and limitations of the 32SII. How much would it have cost to put most 42S capabilities in the 33S and 35S during the development phase? I suspect the answer is that HP still thought that they'd be creating competition with their top-end HP 49G+/50G model. I suspect that the same fear exists today, which makes it unlikely that we'll ever again see a small HP calculator

with 42S capability.

Decimal Key is Loose

*Message #1 Posted by **Anthony (USA)** on 28 Jan 2011, 1:28 a.m.*

During a math competition back in high school I let a friend of mine borrow my HP 33s. Well, I don't really know what happened because I didn't pursue it, but the decimal key is loose. It's not falling off the calculator, it's still in there. But you know when you touch any key in an HP calculator it doesn't move around, well the decimal key is somehow loose inside, it moves around freely. I don't know the architecture of the keys of HP calculators, so I don't know how (and if) this could be fixed. This is the main reason why I stopped using my HP 33s several years ago, because it just got unpredictable when working with the key. This is the only HP scientific (of high standard) still being manufactured today that allows the entering of a fraction by simply pressing the decimal key twice in a row (I really dislike how they took that away from the HP 35s, now we have to type ". 2 . 3" instead of "2 . . 3" to enter the fraction 2/3). I really wish I have an HP 32sII for this regard (HP 32sII is the calculator that my school let us borrow when we go to math competitions, it's my first encounter with the wonders of RPN).

I unscrewed my HP 33s open but I couldn't get to the keys because the circuit/electronic board is in there really good because of several plastic columns melted to prevent the board from being taken out. I'm just wondering what I should do to fix my decimal key, that is, if it's salvageable.

Re: Decimal Key is Loose

*Message #2 Posted by **designnut** on 29 Jan 2011, 9:51 a.m.,*
in response to message #1 by Anthony (USA)

The decimal is the lowest key on the keyboard. I suspect physical abuse out of the case. Dropped? Stepped on?

HP30B/20B Repurposing Project - Status?

*Message #1 Posted by **svisvanatha** on 27 Jan 2011, 10:23 p.m.*

Hello,

I am fairly new to MoHPC, but have been using HP calculators for over 2 decades.

I came across the HP30B/20B repurposing project, and was wondering if it was close to being made available to testers. I see that it now has an entry as of Jan 2011 on sourceforge (http://sourceforge.net/projects/wp34s/).

Thanks!

Re: HP30B/20B Repurposing Project - Status?

*Message #2 Posted by **Walter B** on 28 Jan 2011, 5:30 a.m.,*
in response to message #1 by svisvanatha

Hi Svisvanatha,

things are about ready to be ported on the real 30b, as you may have seen in previous threads at the turn of the year. This porting is a task Thomas Chrapkiewicz wanted to attack since Pauli doesn't have access to the necessary equipment anymore. I didn't hear or read anything about Thomas' progress recently, however - intercontinental projects have their intrinsic challenges.

Preliminary documentation is found at the sourgeforge address you mentioned. It is (and will be) changing without notice for the time being until we've got the feedback our modifications are up and running smoothly on the 30b.

In any case, we appreciate whoever wants to join us in our quest to get this job done properly. The site at sourceforge was installed and is maintained for sharing information and data.

Best regards,
Walter

Re: HP30B/20B Repurposing Project - Status?

*Message #9 Posted by **Paul Dale** on 28 Jan 2011, 8:36 p.m.,*
in response to message #8 by svisvanatha

The build process should have created a libconsts.a in the truck directory. That is what isn't being found. Try a "make clean" and then "make" to rebuild everything. If that doesn't work, there is something screwy going on. "make consts.h" should build the library alone. It does require "ar" and "ranlib" but you should have those two commands already but still worth checking that they are there.

- Pauli

Re: HP30B/20B Repurposing Project - Status?

*Message #10 Posted by **svisvanatha** on 28 Jan 2011, 8:48 p.m.,*
in response to message #9 by Paul Dale

OK, thank you! Fantastic work, and very exciting.

./calc now brings up an emulator for the wp34s. I can do some basic functions using the keymap in /doc. Some questions:

```
1. Is there a more complete keymap, for instance, for shifted keys,
```

```
etc?
2. What is the best way to help test?  Using the sourceforge bug
tracker and forum, or posting here?
3. What is the remaining process to get this onto the 30B?  (sorry
for the naive question, but my forte does not lie in electrical or
computer engineering)
```

Re: HP30B/20B Repurposing Project - Status?

*Message #11 Posted by **Paul Dale** on 28 Jan 2011, 8:59 p.m.,*
in response to message #10 by svisvanatha

1/ The complete keyboard map is in the documentation PDF file either in the doc directory or available as a download.

2/ Just send me and/or Walter a message on this forum. We're not really advanced enough to justify proper bug tracking yet. Plus, I'm not checking the source forge site often.

3/ To get this on the hardware required merging HP's development sources with what we've done. The basic methodologies of the two are the same & I did start doing it but decided I was going about it incorrectly and would need to start that bit again. Then life got in the way.

There isn't a huge amount to do to finish the port but it will take some programming ability/knowledge and some hardware.

Promising? If this calculator comes true it's nothing short of sensational! It has all the nice things and functions I would like to have added to my beloved HP-41. Simply great!

And, finally, there's a decent function set for statistical distributions and their inverses. I simply don't know why these absolutely basic functions are missing in most calculators that claim to be "scientific" - they are basics in mathematics as well as in most social sciences! Walter, can you say something about the implementation of, say, the inverse Normal and Student distribution? Did you use a set of rational approximations? An iterative approach? Or something else?

There are just two things:
First, it's a shame that such a great calculator (*if* it eventually comes true) doesn't provide any external storage. No memory card, no PC-transfer, no anything. Or did I miss something?
And finally - what about the keyboard and new key labels? In the HP41-days there was a way - the 82200A. ;-)

Dieter

I am pretty reserved usually :) As for the keyboard, I would prefer an adhesive mat and key labels. I am sure that can be custom made for a reasonable price if there is enough quantity.

Re: HP30B/20B Repurposing Project - Status?

Hallo Dieter,

thank you for your kind words. With respect to the two points you raised:

> Quote:
>
> ... it's a shame that such a great calculator (*if* it eventually comes true) doesn't provide any external storage. No memory card, no PC-transfer, no anything. Or did I miss something?

You only missed we cannot perform magic. We have to take the 30b hardware as is.

> Quote:
>
> ... what about the keyboard and new key labels? In the HP41-days there was a way - the 82200A. ;-)

We tried finding a way getting the keys relabeled. Pauli did some experiments, and they looked promising. An adhesive keyboard overlay (it has to be adhesive due to the design of the 30b, no other ways for attaching like e.g. in HP-41) may be an alternative, but so far we didn't investigate - it's way down on our agenda and looks viable so far. I assume the prototypes will get some sticky paper labels.

Walter, can you say something about the implementation of, say, the inverse Normal and Student distribution? Did you use a set of rational approximations? An iterative approach? Or something else?

The Normal uses the error function which in turn uses gamma. The inverse normal uses the built in solver so it will be slow but should be reasonably accurate. I couldn't find a series approximation I liked & using the solver (which has to be there anyway) is much more space efficient.

Student's T is a special case of the incomplete beta function which comes down to a series approximation. The inverse is the solver again.

> Quote:
>
> And finally - what about the keyboard and new key labels?

I experimented with a 20b and clearing the labels off the keys is quite easy with a Dremel and a fine sanding & a polishing disc. Engraving and painting new labels would be straightforward but I never got to that stage since Walter keeps improving the keyboard.

Now I'm back home I'll give a more detailed response.

For those distributions where there are explicit formulas for the cumulative distribution (CDF) or its inverse (the quantile function or QF), I've used that. This is the case for the Weibull distribution, the exponential distribution and the geometric distribution's CDF. I don't take a possibly huge summation as an explicit formula so the binomial and Poisson distributions aren't calculated that way.

For the others, I've used generalised functions (the incomplete gamma and beta functions) calculated by convergent series. Functions using the incomplete gamma function as their basis are both Normal distributions, the Chi squared and the Poisson distribution. Functions using the incomplete beta are: Student's T, Snedecor's F and the binomial distribution. In all these cases and

the geometric's QF, the solver is used to evaluate the QF.

Even though the solver is used to calculate these inverses, these functions can be used inside user code solver routines (although user routines cannot nest SOLVE).

Re: HP30B/20B Repurposing Project - Status?

*Message #23 Posted by **Dieter** on 30 Jan 2011, 12:20 p.m.,*
in response to message #22 by Paul Dale

Pauli, thank you very much for this information. Let me add a few more thoughts.

Using the solver for the quantile functions is an option if (and only if) the whole calculation is done with the internal 15-digit precision. Otherwise this method is not accurate since the quantile may change by several ULPs and still provide the same probability returned by the solver.

Example:

```
Probability      p  =  0,18
Normal quantile  z  =  0,9153 6508 7842 8140 4978 ...

12-digit result  z  =  0,9153 6508 7843

  Value for z       Normal CDF (12 digits)
-----------------------------------------
0,9153 6808 7840       0,1800 0000 0001
0,9153 6508 7841       0,1800 0000 0000
0,9153 6508 7842       0,1800 0000 0000
0,9153 6508 7843       0,1800 0000 0000
0,9153 6508 7844       0,1800 0000 0000
0,9153 6508 7845       0,1799 9999 9999
-----------------------------------------
```

But I think you will have access to the full internal 15-digit precision, so the solver should be okay.

Both for the Normal CDF as well as its inverse there are rational approximations, leading to fast execution and very accurate results (full double precision, i.e. 15-16 sign. digits). For instance, take a look at the well-known AS241 algorithm. It uses three (7;7) rational approximations with 45 numeric constants. As long as these constants are given with 20 significant digits the relative error is less than 10^{-16} over the whole double-precision range, i.e. down to $p = 10^{-308}$. At the working limit of our HPs (10^{-499}) the error still is less than 0,2 ULP.

Of course you can also find your own rational approximation optimized for your specific working range and with exactly the precision you need. In many cases usual spreadsheet software like Excel is all you need. ;-)

Another possible way is a much simpler approximation, giving 7 significant digits, followed by one single Newton-Halley iteration, which should provide the desired 12-digit result.

If you're interested in series approximations, in any case take a look at the papers by Shaw and Steinbrecher where several possible solutions can be found. For instance, the Normal Quantile can be evaluated to full 12 significant digits (+/- 1 ULP) for values below approx. 10^{-90} with a simple series evaluated to just three terms.

Yes, it's an interesting topic, this quantile thing... :-)

Actually, we don't have 15 digit precision. Our basic reals are 16 digits and internal computations are carried out with 39 digits. To the best of my knowledge, most of the internal functions are correct to all 16 digits (although achieving this over their entire range & proving such is pretty much impossible). The statistical distributions aren't fully accurate unfortunately, however they are good enough for most applied statistical work.

In your example Q^-1(1 - 0.18) displays 9.15365087843E-1 and the actual value in X is 0.9153650878432420. So reasonably accurate but not perfect.

I'm aware of several rational approximations. My problem here is a trade off of accuracy vs time vs space. I'm not terribly concerned about the time at the moment but accuracy and space are important. Unfortunately, we've pretty much completely filled flash memory so space efficient algorithms are important. Using the solver is very space efficient. Storing 40 constants and having extra code to calculate the approximation isn't :-(I'm getting better value for the space by having the incomplete beta and gamma functions and the solver.

I do agree that this is an interesting topic.

I've used the free GNU tools (GCC etc.) for lots of ARM development, though not specifically on the 20b/30b. To get the HP SDK sample code working with GCC would require a little bit of work. Regrettably I do not presently have any spare time to assist in such an effort.

The easiest way to get the GNU tools working, on Windows or Linux, is to use the CodeSourcery G++ Lite for ARM EABI distribution: http://www.codesourcery.com/sgpp/lite/arm/portal/release1592.

I'm not sure how the code size optimization with GCC compares with IAR, but they don't have the size limit of the IAR Kickstart edition.

This is a simple recipe for cheerfulness all around, because...

'Happiness = Reality/Expectations', which admittedly assumes that the expectations were positive.

Another form is 'Happiness = Reality - Expectations', but this allows for no glee if high expectations are actually achieved.

Suggestions for a more mathematically-robust formula?

Hi all,

I'm a recent convert to HP RPN (thanks to a good engineer at work).

I received my 30b today. It looks and feels great. I'm excited about the 34s project. Let me know how I can test. (I am checking out the source now.).

Does the original 30b image exist somewhere? So I can go back if needed.

Last, I also have the 12CP with the arm processor. It looks like the serial connector pads are covered with black tape. Can it be removed easily? (I just got it from Fry's so dont' want to mess it up if I wanted to return it.)

Ok, one more thing. I also received my 49g. I like it.

Ok, this is seriously last. my 48gx also works great :)

thanks, erturk

> I'm planning to use my 20b for the experiments. Can it be "upgraded" to a 30b?

From the user's point of view, the main advantage of the 30b hardware is a significantly improved keyboard (see "rotate and click"). You won't get this with any 20b so far.

Re: HP30B/20B Repurposing Project - Status?

*Message #38 Posted by **Tim Wessman** on 4 Feb 2011, 10:28 a.m.,*
in response to message #37 by Walter B

Nope. We built the 30b software to make sure it won't run on a 20b.

Well, I guess it will run, but before it moves into any 30b functionality it validates you are running on the 30b. I guess you could probably hack it to force it to work. . . but isn't a good keyboard and a better screen worth the bit extra? :-)

Seems I missed something: What do you mean by "better screen"? AFAIK the displays in both 20b and 30b are identical. TIA for enlightenment d:-)

Re: HP30B/20B Repurposing Project - Status?

*Message #45 Posted by **Mark Harman** on 8 Feb 2011, 2:02 p.m.,*
in response to message #44 by Walter B

The displays are similar. I think the one in the 30b has a higher resolution. The biggest difference though, is the fact that the 30b's screen is below the surface plastic, which is flush with the body of the calculator. Therefore, there is no gap between the body and the display for dust to get into. On the other hand, the 20b's screen has the plastic set right against it and there is a lip where the body meets it, similar to other calculators.

I think there are other differences that people should acknowledge that aren't physical. For example, the 30b has a many more functions than the 20b - or any other financial calculator, for that matter.

Mark

in response to message #46 by Walter B

I have a 30B, but no 20B near to compare. I would say, from available information, that both displays have the same size, number of segments (the restrictions were commented by Cyrille some time ago), and hence resolution. Possibly the 30B has better looks, mounting method or contrast; but all information suggests they are functionally the same.

The ATMEL CPU supports exactly 400 LCD segments. The display is a 100% implementation of this constraint. On both machines.

Re: HP30B/20B Repurposing Project - Status?

*Message #49 Posted by **Mark Harman** on 8 Feb 2011, 5:05 p.m.,*
in response to message #46 by Walter B

Okay, I can see how what I said was confusing...

Resolution isn't the best word. The 20b and 30b have visually similar displays. Meaning, that the way their screens are arranged are identical. One line is dot matrix. One line is segmented. The annunciators are in the upper right side of the screen. This is how they are similar. However, I think the plastic above the display affects the way the 30b displays information in a positive way. It has the effect of making the lcd segments appear darker with better contrast than the 20b. Also, it completely protects the display from dust contamination.

Here are some images that you can look at to see the differences (keep in mind that these aren't the best images around) The darkness of the characters on the 30b compared to the 20b doesn't show well in these pictures. However, I have seen both head on and the difference is quite real.

*Message #50 Posted by **Martin Pinckney** on 8 Feb 2011, 9:16 p.m.,*
in response to message #49 by Mark Harman

I have not seen either in real life. But in your pictures, the 20b screen looks more contrasty to me!

I also don't understand your dust comment. With the Pioneers, it's the screen cover that causes the dust problem. No cover, no space between to collect dust.

Similarly, with the Pioneers, the screens w/o the dust cover have higher contrast.

I am not trying to be argumentative, just trying to understand.

Re: HP30B/20B Repurposing Project - Status?

*Message #51 Posted by **Mark Harman** on 9 Feb 2011, 1:30 a.m.,*
in response to message #50 by Martin Pinckney

These pics are not mine. They were two of the best angled shots I could find from the web. Also the 30b shot was at a different angle than the 20b, so it isn't exactly comparable. I did mention that the shots do not show the difference well. However, I have seen them both head-on and the 30b has a much darker look to the screen. To

me, the 30b is more pleasing on my eyes.

Regarding the dust issue, there is a crack in between the upper casing and the screen on the 20b. This is illustrated in the pics where you can see the ledge. On the 30b, the upper casing and the plastic over the screen are one and the same. It is seamless with no crack. Therefore, there is no place for dust to get in.

Speaking of pioneers, I have my 20S in front of me and it also has the upper cover and a recess where the display meets the cover. This has a crack where the screen and the cover meet. The 20b is similar.

*Message #52 Posted by **Tim Wessman** on 10 Feb 2011, 1:25 a.m.,*
in response to message #51 by Mark Harman

The screen on the 30b is a much higher quality LCD display. It isn't just the fact that it is recessed.

I think what you are trying to convey is that the pixel coloartion is consistent across the entire screen. On the 20b some pixel areas sometimes seem slightly lighter than others. The 30b doesn't have that issue and so is much easier to read.

Thank you for the responses! The 20B documentation clearly indicates that a serial-usb adapter will not work for this purpose, and that a hardware serial port is required. Is this indeed the case? My machine does not appear to have a plain jane serial port.

Re: HP30B/20B Repurposing Project - Status?

*Message #59 Posted by **Mark Harman** on 10 Feb 2011, 3:47 p.m.,*
in response to message #58 by svisvanatha

There are two ways to interface the calculator:

1. Serial pogo connection below the batteries.

2. Optional JTAG connection, which you will have to go through the trouble of installing. Personally I don't like this option as it will result in defacing the device.

If you want to back up the software or want to debug, you will need the JTAG. However, Tim is offering you the backup of the 30b software on a zip file, so it really is unnecessary to install the JTAG (unless you want to do more technical stuff).

The cable that works with the pogo connection will plug into a USB port with a serial adapter. You should then be able to flash the device and push the new software to it or push a backup of the old software. Since you can get a backup from Tim, you won't need to back it up yourself.

How about a pen that calculates...

*Message #1 Posted by **Egan Ford** on 27 Jan 2011, 4:47 p.m.*

With all this talk about pocket calcs, new sci calcs, etc..., why not something completely different?

Watch the video below.

http://www.youtube.com/watch?feature=player_embedded&v=Bf0XAf8_mLI

If this pen can play Tic-Tac-Toe and Zork, I have to believe that some here could make it a very compelling and very capable calculator.

Re: How about a pen that calculates...

in response to message #1 by Egan Ford

I thought about a smart pen decades ago. Only I thought it needed a 2 axis rotary encoder to follow the movement of the ball point. The Livescribe uses a built in camera and special paper. Do others use accellerometers?

Of course, decades ago neither the technology nor my level of knowledge were sufficiently advanced. Nowadays the technology is there...

Egan,

I had one of the Live Scribe pens and it was pretty amazing - just a lttle bit too fat. It comes with a couple of cards that have a calculator printed on it (4 banger calculator & a scientific calculator) which you could tap out the keys with the pen and get the calculated results. Worked okay - but a real calculator is easier/quicker to use.

Bill

*Message #4 Posted by **Egan Ford** on 28 Jan 2011, 12:18 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

I was thinking along the lines of a more natural calculator, e.g. draw matrices, equations, etc... If TTT can be done, so can a matrix.

Re: How about a pen that calculates...

*Message #5 Posted by **Bill (Smithville, NJ)** on 28 Jan 2011, 12:45 p.m.,*
in response to message #4 by Egan Ford

I seem to remember that I could write a simple equation out such as

4 + 5 =

and it would give the answer.

I know you can draw the piano keys out and then play the piano. They do have some sort of applaction development kit that will let you create what they call PenApps. So it should be possible to do something similar for a calculator.

How about a pocket / hand held RPL calc?

*Message #1 Posted by **Michael de Estrada** on 27 Jan 2011, 1:28 p.m.*

Lately we've been lamenting the lack of innovation at HP and the demise of some great calcs like the HP-42s. I've been mulling this over and thought that the one thing that would would really get my interest would be an RPL programmable calculator like my HP-48SX and HP-50g with its full alpha variables and unlimited stack, but with the hand held / pocketeable size and convenience of an HP-42s. It would have an SD card slot to provide portability as well as added memory, but could dispense with the IRD and USB ports. It would have a color dot matrix 4 line display and customizable hot keys / menu line. Oh, and it would be strictly RPN to simplify key assignments and menus. It would spare no expense to provide the best possible key button action, which is one of the traditional hallmarks of this brand. Finally, it would provide comprehensive documentation in spiral bound printed manuals, written by literate technical writers.

Yes, I know, I shouldn't drink so much.

Michael

I want my cake and eat it too, which is easy because one can have both RPN and RPL, such as in the case of the HP 48SX. RPL just extends the capabilities of RPN.

RPL

RPN

in response to message #3 by Michael de Estrada

I did an honest, real attempt at RPL for more than 6 month flat out. Eagerly programming lots in RPL. I found it RePuLsive. It's clunky, cumbersome and counter-intuitive - whereas RPN is simple, elegant and nice. Me awaits the 41CL.

Re: How about a pocket / hand held RPL calc?

*Message #5 Posted by **Reth** on 31 Jan 2011, 10:52 p.m.,*
in response to message #2 by Walter B

RPL is not that hard to learn at all. Many years ago I lost my beloved HP41CV and had to replace it with the then available HP-28S with manuals in German language of which I have no clue whatsoever. Only by reading the examples in the book in less than a week time I rewrote all my surveying programs in RPL. I find programing in RPL is heaps a lot easier and quicker than in RPN. I still do RPN for fun (I got a few HP-41's latter), but it's not for more serious tasks. BTW the brilliant 42S emulator on iPhone gives me more pleasure to do RPN programming. Cheers

I would consider as minimum a BlueTooth interface for voice commands and result output.
Would be nice having a chat with a RPN calculator.
As a collateral feature, amongst others, files can be exchanged also with it.
A mesh network of RPL/RPN calculators is also on my wish list.

Talking to an RPN calculator (I suspect) would be a bit like talking to Yoda.

"Want you, I do, number ENTER into stack, number another likewise you must, number first, number second, divide by, wence thou knowest quotient, displayeth said quotient to thine eyes."

I think it would be fun to do an RPL calculator on the 30b hardware. This would be a 32-bit native ARM RPL interpretter.

Re: How about a pocket / hand held RPL calc?

*Message #12 Posted by **Katie Wasserman** on 27 Jan 2011, 4:16 p.m.,*
in response to message #11 by David Hayden

It's straightforward to re-purpose a 30b, you just need the special cable and the free IAR software. The problem is that it will end up like a fast 28C because there's only 2K on non-volatile RAM to use. The 28C was such a huge disappointment becasue the tiny amount of memory made it almost useless for anything but simple calculations and a few programs.

It would be nicer if someone would find a way to reprogram the silver 17bII+ on the firmware side,
as this machine has a much better hardware than the 30b in nearly every respect.

However, for my daily tasks, even the 17bII+ is overfeatured.
I have no need for Sine or Cosine since more than eight years,
and the logs, inverses and PI are there.

Ray

in response to message #13 by Raymond Del Tondo

The 17bII+ has much *worse* hardware, in that is uses a masked-ROM microprocessor and there is no possibility of changing the firmware short of building an entire replacement board to go in it.

Re: How about a pocket / hand held RPL calc?

*Message #15 Posted by **Mark Harman** on 27 Jan 2011, 7:08 p.m.,*
in response to message #13 by Raymond Del Tondo

Raymond,

I'm with Eric. Just because you found the 30b uncomfortable (I've read your previous posts), doesn't mean that it is worse from a hardware side. Comfort and aesthetics are a highly subjective area of evaluation whereas hardware and features can be a highly objective area of evaluation. Personally, I think the 30b is more comfortable and more attractive than the 17bII+. Again, this is highly subjective. However, I think the keyboard and build quality are on par.

The only thing that the 17bII+ has in terms of a distinct advantage over the 30b from a features standpoint is its menu-driven Solve and the built-in clock features. Some people might also like its menu-driven interface; however, this is a subjective area.

The 30b is by leaps and bounds a much faster and more powerful machine than the 17bII+. I don't know of any other pocket calculator that is as fast on executing certain programs and benchmarks. The processor in the 17bII+ is decent, but compared to the 30b it is a slow, old, three-legged dog that can't be repurposed, updated, etc...

I will hand that the built-in menu-driven Solve can extend the 17bII+'s feature set tremendously. However, it doesn't have anywhere near the built-in functionality that the 30b has.

Plain and simple, the 30b is a much better calculator for half the price.

Let's run over things that the 30b can do that the 17bII+ can't do, shall we?

Programming Functions:
The 17bII+ is not programmable!
Programs can be assigned to keys, even as Shift-hold functions!

Mathematical Functions:
Negative and non-integer factorials
Gamma function
Trigonometric functions
Integer Part
Fractional Part
Absolute Value
Random Number Generator

Financial functions:
Instantaneous calculation of complex IRR. On the 17bII+, it can take a while to solve for complex IRRs.
MIRR
FMRR
Solve for C/YR on interest conversion
Black-Scholes
DBXover depreciation
French Straight Line depreciation
French DB depreciation
Built-in partial year depreciation
Settable C/YR
Payback
Discounted Payback
Modified Duration
Macaulay Duration
Breakeven Analysis

Statistics and Probability:

7 regression models
5 probability distributions and 4 of their inverses
Standard Error
Covariance
Population Standard Deviation
Frequency Statistics
Quartiles
Permutations
Combinations

Really, the 17bII+ is better than the 30b in "nearly every respect?" I'm pretty sure this isn't the case, especially based on what I have shown above. That doesn't mean that I don't think the 17bII+ is a nice calculator. I like it very much, but compared to the 30b, it is quite short on functionality. Also, because my background is in accounting and finance, I find all the 30b's additional features to be quite useful. It is, after all, a financial calculator, right? Plus, I am heavy into statistics and probability, so the 30b's features in this regard make it much more attractive than the 17bII+.

Now, I am aware that there are features that the 17bII+ has that the 30b doesn't, but I consider most of them to be rather antiquated.

Regards,

Mark

Mark, I agree with everything you said about comparing the HP-17bii+ with the HP-30b except this. While technically the 17b has never been advertised as a programmable calculator, its solver does provide some degree of limited "programming." When I taught introduction to computer programming at the community college a few years ago, the text said that any programming system had to support three structures: sequence, decision, and iteration. The 17bii solver does that with the IF command and the sigma command. And variables are possible using the get() and let() functions. Now, I admit that this is tedious work, but a few years ago I wrote a dozen or so "programs" on the 17bii and 17bii+, so they are programmable at some level.

Here is a 17bii+ solver equation that determines whether a given starting configuration of tiles in the famous 15 puzzle is, in fact, a solvable configuration (meaning you can start with this arrangement and eventually get to 1-2-3-4 etc.).

Speed-wise, of course, the 17bii+ cannot compete with the 30b.

And as a proud owner of the 128k Macintosh, I concur with your comments.

Don

Re: How about a pocket / hand held RPL calc?

*Message #17 Posted by **Mark Harman** on 27 Jan 2011, 9:32 p.m.,*
in response to message #16 by Don Shepherd

Don,

Fair enough. I was aware of this, too. However, I don't consider the 17bII+ anywhere as programmable as the 30b. Still, so I don't sound too ignorant, can it be programmed to do any of the benchmark programs that other programmable calculators can execute? It would be interesting if it could do an N-queens benchmark or a Prime Factor finder. If so, I would love to know the speed of execution. My guess is that it would have nothing on the 30b.

I actually do like the paradigm of the 17bII+ Solver function, in that one could add some really cool menu-based features to the calculator this way. However, I have added really cool features to my 30b with its built in programming and Solve. So, to me, my needs for function-set expandability is more than met. A little more memory on the 30b, of course, would be nice - but my needs with this device are very well-met.

Also, thanks for acknowledging my remarks about the 128k Mac. I have always thought it was a fantastic machine, even when it came out when I was 9 and a half years old. :) I am a very happy Mac user, even though I am very comfortable using all flavors of Windows, as well as Linux and other operating systems. I just prefer the Mac.

Regards,

Mark

I don't know about the N-queens benchmark, but here is a prime factor finder that works on the 17bii+ with the two mods I annotated. Without the mods, that solver equation works fine on the 17b and 17bii, but it won't work on the + because the solver on the + works differently than the original solver. It took me a long time to figure out how to get it to work, but I perservered. As you can imagine, it is slow, about a billion times slower than the 30b (I'm exaggerating a bit). But, yeah, the 17bii+ can actually do a lot of things with its solver.

in response to message #18 by Don Shepherd

That is cool that it can be done. However, I would love to have a basis of comparison.

The 30b can determine the primality of 9,999,999,967 in 40 seconds, which is REALLY fast for such a large number. What length of time would it take the 17bII+ to achieve the same result? I am really curious.

Regards,

Mark

Re: How about a pocket / hand held RPL calc?

*Message #20 Posted by **Don Shepherd** on 28 Jan 2011, 5:19 a.m.,*
in response to message #19 by Mark Harman

> Quote:
>
> What length of time would it take the 17bII+ to achieve the same result?

Perhaps 40 years!

There really is no similarity regarding the speed of the two machines. The program listing in my link above is from the Technical Applications Manual for the 27s and 19b, and the page after the page I show says "you should expect long execution times for very large integers" and it's true. Now, 40 years is an exaggeration, but certainly a number that large would require several sets of batteries on the 17bii or bii+, I would imagine.

It's been a few years since I wrote solver equations for the 17bii, and looking through some of them now I don't see that I recorded their execution times, although I do see my comment on one routine that "this version takes a long time to execute".

> Also, thanks for acknowledging my remarks about the 128k Mac. I have always thought it was a fantastic machine, even when it came out when I was 9 and a half years old.

Mark,

Great write up on the feature differential between the 17BII+ and the 30b! Also, I like my HP 42S units, but I'd love it if they were in as nice a body as that of the HP 30b. The 30b is just a fabulous all-round outstanding package.

With respect to the era of the 128K Macs, during that time I was working to produce System Description Manuals at a nuclear power plant. No one had access to computers if they didn't provide their own. Otherwise, a secretarial pool turned handwritten notes into typed hard copy.

One of my computer geek co-workers bought the new 128K Mac. It was so limited that it was all but unusable. I had a 48K-byte Radio Shack TRS-80 Model III (4 MHz Z-80 uP!) running primitive Scripsit word processor software that ran circles around what that advanced GUI-Mac could do in terms of text document size. Later during the contract, we needed to do crude simulations of reactor and containment response to drill scenario situations. The Mac didn't even have a mathematical programming language bundled with it, for all its high cost! My Model III's Basic interpreter once again came to the rescue. As a demostration of GUI principles, I guess that Mac had some points. But as a practical machine to be used in "for pay" goal-oriented projects, it had the value of an expensive toy.

I learned to think of the Mac as being programmable by the normal user the same way that an electric typewriter was programmable. If the typewriter user was happy with what the maker thought the user should be able to do with that typewriter, so the Mac user would be happy if what Apple-hype condescended to permit was all the user wanted to do. It was absolutely inconceivable that Apple-hype would supply to the unwashed and unblessed users something as simple and powerful as, say, MS-DOS's DEBUG utility, much less a bundled Basic interpreter! All machine and OS features were to be well-hidden behind the Apple-hype iconostasis, and this attitude by both Apple-hype and its users still survives very strongly today.

I always thought a better name for the MacIntosh would have been the "GUI-Duck."

Re: How about a pocket / hand held RPL calc?

*Message #22 Posted by **Mark Harman** on 27 Jan 2011, 11:37 p.m.,*
in response to message #21 by Mike Morrow

Mike,

Well, I did acknowledge that the original Mac had its limitations... LOL

It seems like your original experiences with Macintoshes have certainly forever tainted your view of Apple products. It's a real shame since they make great stuff and the Mac has come a REALLY long way since the original 128k.

Still, and not to be mean, the truth of the matter is that your coworker was kind of foolish and really did not do his homework before buying. He bought a computer that was intentionally designed for and marketed to "the rest of us." The whole point of the Mac was to make it as useable and friendly as possible for **non-techie types**. It was for people who wanted to get work done with applications specifically catered to their required task with as little hassle as possible and not for people who wanted to write custom apps, tweak their OS, and so forth. If he, or you, thought that the latter was ever Apple's original intent, then you both completely missed the entire point of the original machine. Not everyone is able to be a programmer or engineer. Surely it isn't a sin to provide that segment of the market something that they can use with ease.

Granted, the original memory size was abysmal for creating sizeable WP documents (due to the memory requirements of the OS). However, Apple addressed these memory issues in a relatively short period of time with integrating the most taxing OS features into the ROM, introducing HFS, and adding memory to machines shortly thereafter. By the time the Mac Plus came out, the machine was very worthy for the non-tinkers and serious developers who were given developer kits from Apple.

In the present time, Mac OS X is certainly much easier to develop for than the original Mac operating system and Apple supplies a lot of great resources for developers and potential developers with every machine. Now, I am not much of a programmer, but I know a few people who develop for OS X and find it to have a great development environment with Xcode and so forth. They can make custom programs in very short periods of time. There are other features that techie types would absolutely love, but I won't bore you with that. :)

Regards,

Mark

Don, I don't quite understand this statement. As I see it, you can have any number of variables (with very descriptive names) w/o using get() and let() at all. That's one of the beauties of the Solver.

> Quote:
>
> Now, I admit that this is tedious work, but a few years ago I wrote a dozen or so "programs" on the 17bii and 17bii+, so they are programmable at some level.

Again, I don't understand what is "tedious" about it. Writing Solver routines is extremely easy, to me. And if the 17b series is not programmable, then in IMO we have too narrow a definition of "programmable." I'm not wanting to get in the 17b vs. 30b debate, but as a matter of fact, some have cautioned the 30b isn't really "programmable", but merely records macros. Again, too narrow a definition.

Re: How about a pocket / hand held RPL calc?

*Message #24 Posted by **Mark Harman** on 28 Jan 2011, 12:38 a.m.,*
in response to message #23 by Martin Pinckney

I agree with you on the fact that too narrow a definition has applied to the 30b's programmability and so many people dismiss it as "macro recording."

You probably know many of the things I am about to say, but I am going to say them anyway.

I think the fact that the 30b can perform the N-queens benchmark and do it faster than any other pocket handheld attests to its speed and programmability. I mean, they do everything that programmable calculators should do, including conditional testing, looping, branching, and subroutines.

To me, all the other "keystroke programmable" calculators are nothing more than the same

thing. The only difference is that the the others I've seen like the 12c, 20s, and so forth have a set of numbers on the display representing the keystrokes and the 30b has the actual name of the key or function being pressed or utilized on the display (Also, it has some little things borrowed from RPL). Really, though, it is all semantics. So, maybe we should just use the definition being attached to the 30b, and attach that same "it just records macros" or "macro recording" moniker to the other "keystroke programmable" units going back to the 65 since that is **exactly** what they do!

I remain unconvinced of the extent of programmability of the 17b series. They're great calculators and the menu-based Solve is awesome, but I think by its nature it is more limited than other programmable machines. Perhaps this is where creativity comes in and a good programmer can really shine in this regard.

Still, if you want to really impress me and, at the same time, make me a true believer of the 17's programming capability, write a version of the N-queens benchmark program for the 17bII+, execute it, and submit the time. ;^) As of yet, nobody has done this. Personally, I think this is a golden opportunity to prove all the naysayers wrong - if possible.

Regards,

Mark

To me this is beside the point. My calculators are tools to help me in my work. I can pick up a 27s of 17b and write a Solver routine in a few minutes, a lot quicker than writing a program on anything else. It may be a routine I keep, or just an ad hoc quickie.

I have also written one fairly complex Solver program with conditionals.

>
> I have also written one fairly complex Solver program with conditionals.

I understand that these things are tools. I use mine as a tool also. Nevertheless, the 17b series (or and other calculators with the sole menu-based Solve, for that matter) are not represented in the N-queens benchmarks. I understand the value you place on utility. However, since you seem to represent yourself as fairly adept at Solve programming, I felt that such a challenge would be within your ability. Additionally, I think this should be done for three reasons. First, to show that it can be done. Second, to give a calculator with such a paradigm representation on the N-queens benchmarks page. Third, to test the speed, effectiveness, and efficiency of execution of such a program by the calculator running it.

Also, I don't see this as being "beside the point." If it can be done, it can be done. If it can't, it can't. I sincerely want it to be doable, but I also sincerely believe it can't be done. If it could be done, it would have by now. I remain waiting to be impressed. :)

As for the 30b, I can rattle off programs for it in a few minutes, myself (not much different than you writing programs in a few minutes for the menu-based Solve). It is a pretty easy platform to program for. I haven't gotten into any advanced stuff yet. However, I have added a few functions to my 30b that have made it much more useful to me - even with its myriad already-useful functions that are built-in. Also, I am working on something fairly complex right now that will use the 30b's built-in Solve function. It is challenging my fairly limited programming ability (I'm an accountant, not a programmer, Jim!). Other programs using Solve on the 30b that I have written have taken only a few minutes or so to write. However, I am trying to figure out the best algorithm to solve the actual problem in the first place. Once that is done, it will be easy to write the program according to that algorithm.

Regards,

Mark

*Message #27 Posted by **Martin Pinckney** on 28 Jan 2011, 1:42 p.m.,*
in response to message #26 by Mark Harman

Mark,

I have no idea what "N-queens benchmark" is. I have no particular interest in the hairsplitting comparisons of which calculator is faster on this or that algorithm. I own several Pioneers and a couple 48sx. They are all plenty fast enough for me, except the 48sx is excruciatingly slow with anything using

graphics.

I haven't claimed to be adept at anything, but I do find Solver routines fairly easy to write and use, which makes the 17b and 27s extremely useful to me. I use the 27s for the straightforward problems I encounter in practicing cimple engineering, and the 17b for similar problems running my engineering business.

I really enjoy reading the posts on this site, and posting as well. It's an interesting intellectual exercise for me, much like I suppose trying to show that something can or cannot be done is for you.

N-queens benchmark info, for your edification:

http://groups.csail.mit.edu/cag/raw/benchmark/suites/nqueens/README.html

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=700
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=119357

That is fine if you have no interest in pursuing it. I just thought it would be neat if you could take a stab at it. Many people who visit and comment on this site have an interest in this benchmark. It is a good one for testing the limits and capabilities of the devices they use. More than anything else, I think it is just for fun. I find it rather fascinating.

I know you haven't claimed to be adept. I only surmised this based on the level of comfort you expressed with being able to write for Solver. I haven't ever written a Solver routine, so you are way ahead of the curve on this aspect compared to me.

I only have one Pioneer - a 20S that my Statistics instructor in college recommended that we had for the class. I still have it and it is a very nice calculator. It still is using its original batteries (even though it came packaged with a spare set!). The only drawback, in my opinion, is its lack of RPN. Otherwise, it is a fantastic device.

I have a lot of interests and things I pursue to challenge and exercise my intellect (not just trying to show that something can or cannot be done). I also enjoy reading this site. I have learned many interesting things and it is nice to see so many people that are passionate about calculators and the things they use them for.

Regards,

Mark

> I only have one Pioneer - a 20S that my Statistics instructor in college recommended that we had for the class.

The 20s was my first HP, purchased in early 90's after my second TI failed. It was lot of calculator for the money at the time. I still have mine too, but eclipsed by the 27s now.

But for statistics your instructor should have recommended the 21s!

Yeah, I see that Thomas Klemm has made a lot of progress on this. I am impressed with what he has shown thus far.

> Quote:
>
> But for statistics your instructor should have recommended the 21s!

She would have, but by the point I was in her class it was no longer being manufactured or available. She had one herself and bragged about all the things it could do. Honestly, I was quite impressed and myself and a few others in the class kind of drooled over its awesomeness. Because the 21s wasn't available, she wanted us to have something that was as close as possible within a reasonable price range - mostly due to the fact that she liked the fast entry of statistical data. I got an A in the class, so it seemed to work out well for me.

With the exception of hypothesis testing, the 30b has all of the statistical functions of the 21s and then some. I am pretty sure that I could eventually write a program for it that will do a hypothesis test. Maybe that will be my next challenge.

Mark

They're great calculators and the menu-based Solve is awesome, but I think by its nature it is more limited than other programmable machines. Perhaps this is where creativity comes in and a good programmer can really shine in this regard.
>
> Still, if you want to really impress me and, at the same time, make me a true believer of the 17's programming capability, write a version of the N-queens benchmark program for the 17bII+, execute it, and submit the time. ;^) As of yet, nobody has done this. Personally, I think this is a golden opportunity to prove all the naysayers wrong - if possible.

Mark, there are many programming-type things that the 17bii+ cannot do, such as subroutines, goto, loops other than the simple "do as i goes from 1 to 1000 by 2". The lack of an indefinite loop capability, or do while, means you can't really implement something like the N-queens problem (as I understand it, in any event) because it seems to require an indefinite loop or two.

So, yes, there are pretty substantial limitations on what the 17bii+ can do, programming-wise. Now, an expert programmer MAY be able to overcome some of these limitations, but expert programmers typically don't flock to the 17bii+ as a programming platform.

The bottom line is this. Since the 17bii solver provides IF, Sigma (definite loop), and variables, it can do some programming-type things that would not be possible in solvers without such features. There are many things you can do with it, programming-wise, and many you can't, N-queens among them I believe.

Very few 17bii+ users consider it a "programmable" machine, or even have a need for it to be a programmable machine. That's fine. But some of us who know what it can (and can't) do find it interesting. Who would have thought that you could write a prime factor finder for it?

Don

Re: How about a pocket / hand held RPL calc?

> Quote:
>
> you can have any number of variables (with very descriptive names) w/o using get() and let() at all

That's true, but if you don't want them to appear as a menu item when the user runs the program in the solver, you must use the g() and l() functions. That prime factor finder, for example, uses several "intermediate" variables that are necessary for the program to run,

but you don't want them to appear on the menu to confuse the user. If you reference a variable without the g() and l() commands, the variable appears in the menu for the user to see.

> Quote:
>
> I don't understand what is "tedious" about it. Writing Solver routines is extremely easy

I agree, implementing simple equations like the Pythagorean Theorem or the quadratic formula (which is how most people use the solver) is straightforward. But implementing "programs" usually requires lots of parentheses and text, and the 17bii method for text entry is cumbersome (as is the 30b's method also, BTW) and matching all your opening parens with closing parens takes a lot of work when your program gets a bit complex. And dealing with the solver on the 17bii+ always requires more work due to the way it differs from the original 17bii solver. So those kinds of things make writing program on the 17b rather tedious.

> Quote:
>
> the 30b isn't really "programmable"

It is programmable. I know Gene sometime says it was originally designed as a "macro" system to capture and playback keystrokes, but the final product is as programmable as any programmable HP calculator. It does have some maddening differences from pure RPN, but once you start working with it and get used to those it's a fine platform for programming. And, yes, more program memory would be great, but what's there is usable.

*Message #34 Posted by **Raymond Del Tondo** on 28 Jan 2011, 4:13 a.m.,*
in response to message #15 by Mark Harman

Hi,

ok, maybe I used the wrong word. With firmware I did _not_ mean the CPU firmware, but the surrounding OS of the machine (if there is one at all).

From that point the 17bII+ may be a dead end, since it doesn't have an option to replace or extend the OS. However I also consider the 30b as a dead-end, since it has very limited display capabilities, and very little RAM for these days. 2K was ok in 1980, but even in 1987 (28C) it was not enough anymore, and nowadays I wouldn't spend too much effort on a recently developed calc with that small amount of RAM.

It's still fun to squeeze as much as possible into HP-41 ROM blocks, but the 30b is from 2010...

Apart from that, how many people will actually dive into modifying it?

And with hardware I mainly meant the parts which the normal user has access to, namely the housing. The 17bII+ has a non-glare high-contrast dot matrix display with menus, 32K of RAM, and is well designed and comfortable to hold.

The 30b is the first HP-branded calc which I returned to the dealer because of the housing, and it's the first calc of which I heard from other users that they modified the upper edges due to the "sharply shape". The latter should be enough reason for the designers to take a look at it.

<OT> From that perspective, the clamshell calcs (28C/S) are badly designed, too, since they are very uncomfortable to hold in a hand. If the left side is flipped back, you have the sharply shaped edges (front and back), if not, you have still have the edges (front), but also a calc which swings around the ankle. In my experience a clamshell calc could only be used seriously when it was sitting on a table. </OT>

It's all subjective, of course, but it should also be a reason for the designers to think it over.

Maybe a successor of the 30b will have a more defensively shaped housing, a non-glare display, much more RAM, an easier way for data exchange, and maybe some easier way to update the OS.

Regards

Raymond

Re: How about a pocket / hand held RPL calc?

*Message #35 Posted by **Mark Harman** on 28 Jan 2011, 1:12 p.m.,*
in response to message #34 by Raymond Del Tondo

Raymond,

First of all, I agree with you regarding the amount of memory for the 30b. However, if you even try to extend the function set on the 17bII+ using the Solve function so that it is in parity with the 30b, I think you will find that you will that either 32k will be insufficient or that it will use up most of the memory since Solve programs are memory intensive. I believe It takes 2.5k just to input the 17bII+ function for Black-Scholes into Solve.

I think the fact that the 290 bytes remaining for programming on the 30b can make for extremely useful programs that are in addition to the already huge function set says much of the economy of the 30b.

One of the things that I want you to understand though, is that the memory of the 30b is based on the properties of the Atmel Arm 7 processor, which is a full system on a chip. The memory, ROM, RAM, processor, and display controller are all in one place. I believe HP made a conscious decision to use this chip to reduce the number of parts thereby reducing the chances for something to go wrong. I think it was a good design decision, albeit short on RAM.

Also, of course the 30b has an OS. How else would it operate?

Housing and display are subjective. Glare hasn't been too much of a problem for me with the 30b. Maybe it will bother someone else. The same debate rages on in notebook computer land. I happen to like the level of contrast on the 30b. Plus, I like the way the menus within the 30b function. I've used the 17bII+ and the 42s. The paradigm is nice, but the 30b works well and is easy to use, also. The case has never bothered me. I find it to be rather comfortable. Everyone I know who has handled my 30b has really liked the design and feel of it.

Notice how all these points are highly subjective? You make changes to any of these things and there will be a group of consumers that will disapprove. In designing something, one can't satisfy 100% of the market in every way possible 100% of the time. Not everyone can be pleased. Hard decisions have to be made and the designers have to live with the consequences of their design choices, for better or worse. In my case, it was for better and in your case it was for worse.

Regarding your "redesign" idea at the end:

"Defensively Shaped" housing: Okay, I suppose rounded edges wouldn't be a bad thing. But I don't mind the current design. In fact, I really, really, like the current design. I find it rather comfortable and I made no modifications to it make it such, either.

Non-glare display: The current display doesn't bother me - but, sure, a non-glare one wouldn't be too bad. The display window on the current model, however, prevents the display from being easily damaged and with no gap between the window and the body, there is less chance of dust getting into the display. The window is too far from the display itself to make it matte. It would look too fuzzy since it is above the display. It has to be right against the display itself for any clarity. Therefore, for your idea to be implemented, the display would have to be similar to the 20b. I think HP was trying to move away from that design intentionally.

More RAM: Agree completely. However, that would require off-die ram and additional programming to access the RAM - this adds complexities, possible complications, more need for bug testing, et cetera ...

An easier way for data exchange: Maybe. I really can't see the need. If I need transmittable output, I certainly am more apt to use Excel than a financial calculator. Still, perhaps you can elaborate on the different uses for such a feature.

Easier way to update the OS: Really, it isn't that hard. There is a 6-pin serial Pogo jack in the back right below the 2 CR2032 batteries. You just need a special serial cable with a reset button and an erase button and the software to send the updates to the calculator. For anyone who wants this stuff, it can be had.

Regards,

Mark

Agreed. Programming-wise, the 17bii+ takes 29 seconds to figure out that 12,841 is prime. The 30b would figure that out before your finger left the execute key.

Don

Re: How about a pocket / hand held RPL calc?

*Message #37 Posted by **Thomas Klemm** on 28 Jan 2011, 6:13 p.m.,*
in response to message #36 by Don Shepherd

Did you ever consider using the Miller–Rabin primality test? According to Wikipedia all we have to do is verify that:

- $2^{12,840}_{12,840} = 1 \ (12,841)$

- 3 = 1 (12,841)

I just entered this simple program into my HP-42S to calculate MOD 12,841:

```
12,841 [STO] 00

00 { 2-Byte Prgm }
01 RCL 00
02 MOD
03 .END.
```

We need the binary representation of 12,841 - 1 = 12,840 which is 11001000101000.

Write the binary digits downwards. The 1s indicate when to push additionally the [x] key:

```
3
[ENTER]
[ENTER]
[ENTER]

1:                      3
1:  [x²]  [x]  [R/S]    27
0:  [x²]       [R/S]    729
0:  [x²]       [R/S]    4,960
1:  [x²]  [x]  [R/S]    7,573
0:  [x²]       [R/S]    2,423
0:  [x²]       [R/S]    2,592
0:  [x²]       [R/S]    2,621
1:  [x²]  [x]  [R/S]    11,959
0:  [x²]       [R/S]    7,464
1:  [x²]  [x]  [R/S]    8,273
0:  [x²]       [R/S]    12,840
0:  [x²]       [R/S]    1
0:
```

Of course we can stop as soon as we get 1. Using 2 as a witness gives a similar result.
I'm pretty sure that this algorithm could be implemented in the solver of the 17bii+ and that it will use less than 29 seconds to complete.

Kind regards
Thomas

Re: How about a pocket / hand held RPL calc?

Re: How about a pocket / hand held RPL calc?

*Message #39 Posted by **Thomas Klemm** on 31 Jan 2011, 3:48 p.m.,*
in response to message #38 by Don Shepherd

As always with these kind of problems Jean-Marc Baillard provides a program for the HP-41: Primes & Number Theoretic Functions for the HP-41 .

Just as a sidenote: the important thing in the example I've given is that the value before it gets 1 is -1 (or 12,840 in this example). This is not the case for a=2 and n=561 and will detect this number as composite though $2^{560}=1 \pmod{561}$. I must admit I didn't understand that completely when I wrote that previous post.

Cheers
Thomas

I was one of those who bought the first HP 28C that I could find in 1987. Just as you state, it turned out to be good only as a "concept" machine. It definitely was not ready for prime time.

It reminded me of those first GUI-wonderful MacIntosh computers from Apple-hype. With all of 128K RAM, one could process documents *almost* two pages long before memory ran out. Of course, Apple-hype didn't point that out in its sales propaganda.

This was remedied with the HP-28s, which has 32 Kb of ram. I sold my HP-28c, but still have my HP-28s. I always found the clamshell design very awkward and it's use of 3 N cell batteries annoying.

Re: How about a pocket / hand held RPL calc?

*Message #42 Posted by **Mark Harman** on 27 Jan 2011, 7:59 p.m.,*
in response to message #40 by Mike Morrow

While I agree that 128k was severely limited, I think that the Mac was no less a revolutionary machine and paved the way for the future of computing. Plus, Apple learned really quickly from this with the 512k "Fat" Mac less than a year later and the 1MB Macintosh Plus a year after that. Also the 512k and the Plus coded the HFS and other aspects of the OS into the ROM, to save room for applications. To Apple's credit, they did provide a reasonably-priced upgrade kit to bring the 128k and 512k Macs up-to-par with the Mac Plus.

Seriously, memory prices in 1984 were quite prohibitive and Apple wanted to be at a much lower price point than they were with the Lisa, which was a great machine (released one year prior) but could not compete in the marketplace on price - so it failed. The Lisa had 1MB of RAM, which drove the price up to $9,995. The 128k Mac was only $2,495. RAM prices sharply declined over the next two years so much that they could offer the greatly-improved Plus for less than $100 more than the original 128k Mac.

HP-28C was not "useless" or "good only as a 'concept' machine"

*Message #43 Posted by **Eric Smith** on 28 Jan 2011, 2:10 a.m.,*
in response to message #40 by Mike Morrow

I'm not sure what you all expected out of the HP-28C that has led to so much disappointment. It wasn't intended to replace the HP-41, for example.

In 1976 I used an HP-25 and thought it was awesome. It had a whopping 112 bytes of RAM and 1280 bytes of ROM. It was incredibly useful for math and engineering. The price was $195, which is $768 in modern dollars.

In 1987 I bought an HP-28C for $235. Yes, it only had 2048 bytes of RAM, but it had 128K of ROM, was vastly superior in capabilities to the HP-25, and far more useful for math and engineering. Adjusted for inflation, it cost $437.

Everyone praises the HP-25, and bitches and moans about the HP-28C, yet the HP-28C had 60% more RAM, 100 times as much ROM packed with useful features, and cost 43% less!

Sure, the later HP-28S was better, but I don't think that the HP-28C was "almost useless" or "good only as a 'concept' machine". I feel like I fully got my money's worth when I purchased the HP-28C.

For those that think the HP-28C was such a bad deal in 1987, I'd challenge you to find another handheld calculator available at that time that had anywhere near the capabilities. (I'm not talking about handheld BASIC machines and such, though they generally didn't have math capabilities to match the HP-28C.)

Which shows you, that comparing naked figures can be meaningless. And the price of a calculator is not connected to it's usefulness in any way. The 28C/S (and later the 48 series) were advertised and sold as **programmable** calculators. But nobody told you, that several degrees in engineering and ten years programming experience on a variety of machines, ranging von calculators to mainframes (as in my case), would not be a sufficient pre-requisite to actually write even the simplest program for this thing. You had to to work your way through 1000 (or was it only 800?) pages of manual first. A '25 or '41 could be programmed by anybody in less than ten minutes on the other hand. And that's what makes the difference between a useless and a useful tool.

Regards, max

I have NO degrees in engineering, but I did have eight years of programming experience on a few machines, and I managed to do useful things with the 28C after skimming the first couple of chapters of the manual. Programming it was certainly different than a traditional RPN calc, but it's hard to believe that it was an insurmountable challenge.

In any case, HP didn't intend the 28C to replace all their traditional calculators. They offered a range of calculators from simple to very sophisticated. It is almost inevitable that a sophisticated calculator is going to take more effort to learn to use.

*Message #46 Posted by **Walter B** on 28 Jan 2011, 5:01 a.m.,*
in response to message #45 by Eric Smith

At the bottom line, RP**L** is observed being a very polarizing programming paradigm - some love it, many have given up on said steep and high learning curve, even very capable math gurus (think of e.g. Valentin). OTOH, almost all people here agree on RP**N** being far easier to gain first benefits from. Seems that's it, and we won't gain anything by discussing this ad nauseam.

Just my 20 m€, of course. Ceterum censeo: HP, launch a 43S (or 42SX, whatever you prefer).

I think what we tend to forget is that regardless of whether you like or hate RPL, RPL calcs have an open stack with it's level limited only by memory, whereas all the other RPN calcs are limited to a 4 level stack. So, even if you are not programming, and simply manually evaluating a very long expression with many levels of pending operations (parentheses), you can simply work through it left to right without having to worry about losing a portion of the calculation out the top of the stack. Often with a 4 level stack you have to store partial results in registers and then recall them later to complete the calculation. If you use several registers you have to keep track of which portion of the calculation is stored where. Not only is this more complicated, but also more likely to result in mistakes. A modern algebraic scientific calculator typically has about 10 levels of parentheses, but a 4 level RPN stack effectively only has 3. The fixed 4 level stack IMO is the biggest shortcoming of a conventional RPN calculator.

Re: HP-28C was not "useless" or "good only as a 'concept' machine"

*Message #50 Posted by **Walter B** on 28 Jan 2011, 4:10 p.m.,*
in response to message #49 by Michael de Estrada

That's one of the reasons why we have an optional 8-level stack in the 34S d:-)

The lack of memory really hurt the 28c, which is why the 28s came so quickly thereafter, ISTM

*Message #51 Posted by **gene wright** on 28 Jan 2011, 9:45 a.m.,*
in response to message #45 by Eric Smith

As I recall, the 28c would choke if given the problem:

derivative of sin(x)/x

with an out of memory error or such.

Even Bill Wickes' review of the 28c in CHHU lamented the lack of memory which he said made the machine more of a scratchpad than a real workhorse.

But...of course, without the 28c and those who purchased one, the 28s would never have appeared, the 48SX would not have appeared, etc.

Sadly, the 49g appeared, so my logic is somewhat faulty here. :-)

Indeed, that was my point in saying that other than simple programming much of its advanced functionality was useless. The TAYLOR expansion for example, didn't have enough memory to work at all. There were other functions like that.

I had given a talk at an HP financial conference and was given one of the first production 28C's as compensation. I was really excited about this at the time and loved learning RPL. But I ran out of memory just for my playing around functions in no time, so even for this it was a disappointment. Of course I bought myself a 28S when that came out too and was very pleased with all I could do on it and the new hierarchical memory structure.

Re: HP-28C was not "useless" or "good only as a 'concept' machine"

*Message #53 Posted by **Mike Morrow** on 28 Jan 2011, 12:07 p.m.,*
in response to message #43 by Eric Smith

I bought the HP 28C in early 1987 and found it not particularly useful due to RAM limitations. But it was promising. When the HP 28S cam out a year later, I bought one of those too. I remember thinking at that time it would have been far better for HP to have held off putting the 28C on the market until the memory capacity of the 28C was practical.

I never cared much for any of the HP clamshells. Today, what really gripes me is the poorly designed battery compartment door of the series. My 28S is has suffered the very common clamshell door damage. The 28C is still OK, oddly.

The 28 series doesn't cause much excitement in the used calculator market today, for these good reasons.

*Message #54 Posted by **Keith Midson** on 29 Jan 2011, 4:03 a.m.,*
in response to message #53 by Mike Morrow

My very first HP was the 28s. I LOVED this calculator. At the time it was the 28C or 28S - there was a big difference in price, but a friend talked me into buying the 28s. It was an amazing machine! I spent far too much time programming it at uni (I did Engineering). I had a Sharp pocket computer as well, but I found RPL MUCH better than Basic once I'd learned it well enough. Now I have a big collection of HP's and I have a special place for the 28C because it was released for a short time - the introduction of the 28s is HP's acknowledgment that this amazing machine (the 28C) needed more memory. It was a first in so many ways for HP (graphing, symbolic, etc). A piece of history really. There was nothing like it out there by any other manufacturer. My 2c. Keith

in response to message #1 by William Maidment

HP 42S

Take a look a the HP SOLVE June issue by clicking the above link. Then scroll down to Calculator Restorations. The second article explains one method of entry into the Pioneers. Not as difficult as it appears.

Cheers, Geoff

Emails on there way to those that have lent me calculators for restorations (with explanations on the delays), bear with me!

Cheers, again, Geoff

An email would be good

*Message #3 Posted by **db (martinez, ca.)** on 31 Jan 2011, 10:53 p.m.,*
in response to message #2 by geoff quickfall

You can use the address from one of the emails i have sent you, my home address, or you can use Dave's contact system through the forum.

10 months have passed since i loaned you my hp10 to disassemble and photograph for your book, and since i last got a reply. An email would be nice.

Re: HP42s sticking key

*Message #4 Posted by **Randy** on 27 Jan 2011, 4:56 p.m.,*
in response to message #1 by William Maidment

Does the key have the normal travel and click or is it flat with no tactile feedback? If it clicks okay and doesn't register correctly, it is most likely bad contact between the keyboard and logic board.

I find this to be a perfectly acceptable method to open Pioneers: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=5

Personally, I have never seen a faceplate that has been peeled off without some form of distortion or damage. Peeling faceplates to open Pioneers isn't necessary, it puts the keys at risk and is in my opinion, a really bad idea. I've opened *many* Pioneers using the Brogger method and find it the best solution by far.

Re: HP42s sticking key

*Message #5 Posted by **Diego Diaz** on 2 Feb 2011, 12:16 p.m.,*
in response to message #4 by Randy

Hi,

Just to make sure: Sticky key? or Non-responsive key?

The first symptom is more likely related to the key contacts themselves than to the Keyboard/PCB connection.

Some of the carbon-made contacts turns into dust, creating a weak "contact" between the two conductive foils of the keyboard layers, this weak contact is recognized by the CPU as a permanently pressed key.

Regrettably the only way to fix it is by removing the dozens of plastic rivets which hold the steel frame in place (this is the easy part), then taking the key layers apart, cleaning them and (the *very* difficult part) re-assembly the whole thing keeping a high grade of tightness between the steel frame and the top half.

Sorry for the bad news... I sincerely hope you *only* have a non-responsive key, which in most cases just need the replacement of the sponge beneath the KB contact strip; far more simpler as described by Geoff's article.

Diego.

PS: I agree: removing the faceplate is not required in most cases.

Is there any need for just another HP calculator (JAHPC)?

*Message #1 Posted by **Frido Bohn** on 27 Jan 2011, 9:18 a.m.*

This contribution was inspired by the thread 'No new scientific calculators from HP?' As I felt that my insights were

somewhat OT, I simply started a new thread - I am sorry for this ;-)

Looking back to the history of handheld calcs, it was HP that made the big step
- to scientific calculators (HP-35A).
- to programmable calculators (HP-65).
- to alphanumeric, expandable (aka computer-like) calculators (HP-41).
Also some of the minor steps in the development of pocket calculators were pivotal and should have the merit to be termed as
big steps too (e.g. solver and numeric integration first in the HP-34C).

The HP-35s is a decent scientific calculator. Well, I dislike those flabby arrow keys and the delicate display (don't press to hard while cleaning). Not to tell about all those bugs which provoke a mild horror in the light of the experience HP should be able to draw from. However, I like its ergonomic form factor, the well engineered keys (with
exception of arrow keys / I never experienced the 'missing keystroke problem' in my sample), the color design and its
overall delightful functionality. But to be honest, what surplus does the HP-35s add to the overall performance of recent
scientific calcs? The HP-35s is just what it was advertised for: a reminiscence of his ancestor, the great HP35A which
now has its firm place in the hall of fame of electrical engineering devices.

What should be the scope of another device, maybe a successor of the HP-35s or even HP-50g? If we observe the current
development, it would be nothing more than a recapitulation of an endless loop of quite similar devices with minimal
changes from generation to generation. Sometimes with questionable advances which barely compensate for their bugs.

What should a new calculator be like, at least with a breeze of revolution in it? Nowadays we have superb mathematical
software, we have this neat 'whole-display' devices with virtual keys, and we have a lot of connectivity or networking.
Let us simply merge this all! Of course, there are those *iDevices* with those 'apps' that can emulate our beloved gadgets. Why suggesting HP to build something like an *iCalc*? The answer is: why not!

HP was not first in the production of graphing calculators, but they were not shy of to adopt the concept, and they were
leading in the production of decent graphing calculators (HP-48 and successors). So let them shamelessly copy the concepts of other manufacturers and build two hardware devices, one in the form factor of a handheld scientific, and the

other one with the form factor of a graphing calc. (Don't tell me it's the iPod - iPad duality, it is!) Let the devices have all the known features: GPS, multiple sensors (accelerator, temperature etc.), cameras, sound, telephony etc. Let
the CPU and memory count in GHz and GB. Let the calculator software be something scalable starting with fine scientific
or business options up to heavy duty functionality (comparable to Mathematica or Maple). And finally, let it have all the
connectivity we would like to have to use those devices for calculations as well as for interchange. Imagine the use of
the input of the sensors, GPS, camera, microphone etc. for mathematical transformations, the use of publicly available or
community generated data for similar purposes. Yes, imagine threads of this forum (e.g. 'Five-minute challenge') being
calculated, presented and discussed on these devices!

HP shall sell these devices as basic equipment (scientific or graphing calc). If you want more you would pay more (app/cloud concept). The appearance may be changed to the user's delight: redefinable keys would be the simplest you were
suposed to do! Bugs would be easily exterminable due to upgradable versions. If such devices were available with the
upcoming of the HP-41 you would still be able to run it and all its expansions, otherwise you would be able to load a
HP-32sii or HP-50g or the like. And finally, HP would approach to that they already dreamed of in 1979.

Regards
Frido

in response to message #4 by Martin Pinckney

Responding to thee original post, I am disturbed by the present trend away from the neat rectangular calculators of the past to the "stylish" calculators on Hp store site. It seems the direction of calculator futures is in the hands of salesmen who have their own vision of what is needed. I am appalled at the loss of integrity for want of a better word. Is HP to be in the business of making trinkets and curios? Yes I pity the poor corporate climber that has to lug a notebook computer, a cell phone, a watch, a calculator, camera around. Clearly what is needed is a calculator worn like a watch? I cherish my 32SII with its thin slip case when I look at the clunky case of the 33S "handheld", but I notice they put feet on it, a hybrid? HP calculators have forfeited their heritage to their detriment. Sam

*Message #6 Posted by **Mike Morrow** on 27 Jan 2011, 1:07 p.m.,*
in response to message #5 by designnut

I'm having a little trouble following the stream-of-consciousness with this one.

But with respect to scientific calculator watches, the Casio CFX-200 and -400 watches were available from about 1983 to 1988. I've still got mine. But they must not have sold well because that's the last time such devices were marketed. The small number made, with the small survival rate after 25 years, result in these watches in good condition commanding prices that rival or exceed any old esteemed rare HP machine.

Re: Is there any need for just another HP calculator (JAHPC)?

*Message #7 Posted by **David Hayden** on 27 Jan 2011, 1:54 p.m.,*
in response to message #1 by Frido Bohn

Here's my take on the subject.

First, you have to think about the market for hand-held calculators. I believe there are three, in order of size:

1. Education for 12-22 year-old students (middle school through college in the USA.
2. Special-purpose applications like construction trades, oil/gas rigs, and a million other places where you already see hand-held computers. Note that I'd put the financial calculators in this class.
3. The general purpose quick calculating device that is its historical use.

All three of these are susceptible to the more general purpose hand-held devices that we're seeing now (Droid/iPhone, iPad/Nook/Kindle, notebook/netbook). The advantage of a calculator is its instant-on ability, long battery life and reduced expense.

Market #1 is a tough nut to crack, at least in the US where TI has it sewn up, especially because the textbooks are geared towards their machines. A cost effective way to break into this market is to produce companion booklets for the popular textbooks that describe how to work the calculator problems with HP models. The user community could be tapped for this.

Market #2 is a little easier. Notice that a lot of effort went here recently with the 20b, 30b and 12C+. In particular, the 20b and 30b are running modern software on a modern CPU and the speed really shows it. There's an SDK for the these machines which I believe is an attempt to support 3rd party re-purposing projects. I don't think this has been very successful so far, mostly due to a lack of available resources on HP's side. Still, I give them credit for trying.

That leaves market #3. It's small and neglected unfortunately. I would love to see something like the 35s, with I/O and the speed of the 30b, but I'm not holding my breath.

On the other hand, I like to imagine that HP is being VERY smart about the path that their taking. Imagine that you're a tiny group within HP with a severely limited budget and big plans for the future. The only way to achieve your plans is to build a revenue stream. How do you do that?

I'd start with the low-hanging fruit. A hardware refresh of the best-selling product I have (and indeed the best selling one in the class) the 12C. Just emulate the old code on a new processor and poof, it runs 100x faster. I'd get this machine out and advertise it. This is exactly what HP did (minus the advertising, which is so conspicuously missing that I feel certain there's some good reason why they couldn't say they had a new product, even though it basically is new).

Once some money comes in from the 12C, I'd make a clear break with the past - dump the Saturn, dump RPL, build a modern machine, write the software in a modern language. Again, the financial calculators are a good candidate for this and poof! Now we have the 20b and 30b - blazing fast.

As the revenue stream grows, it funds longer-term projects. At this point, I'd go for a 50g replacement. Here the software base is so big that I don't think you could rewrite it from scratch. Instead, I'd do a 32-bit RPL engine on the ARM processor and go back to the 48 series code (because I believe it's mostly in RPL, not assembly). The goal would be to drop a calculator on the market that has the same functionality as the TI 89, but is so much faster that people can't ignore it.

The 39gs/40gs are, I suspect, basically the 50g with different user interface glued on. So once I had the RPL engine for the 50g replacement, I'd port the 39gs and 40gs.

Finally, I'd refresh the lower end models, maybe a 35s replacement as I mentioned earlier, probably with crippled versions that would be acceptable to in the standard tests. Call me a heartless capitalist, but my goal would be to make people buy two - the one that the test organizations will allow and the compatible one with the "must have" features like I/O that you can't live without.

Anyway, if I was King of HP, that's what I'd do. If anyone from HP is listening, I'm available for coronation next weekend.... :).

Dave

*Message #8 Posted by **designnut** on 27 Jan 2011, 2:32 p.m.,*
in response to message #7 by David Hayden

I do believe there is an untapped market for small customized calculators for field use by estimators and sales force. There was one machine shop owner that was collecting 41S so he could supply his staff with estimating software. RPL may be very powerful but the learning is too much for the small user. This leaves room for 3rd party programmers like the surveying solutions available. But not useful for the small shop owner with special needs. sam

*Message #9 Posted by **Ren** on 27 Jan 2011, 8:50 p.m.,*
in response to message #8 by designnut

(Theoretical HP tablet described)

Games!

If it has games it will increase its saleability!

Open Source

If the operating system was open source, many people would be willing to write new software for it.

But there is the rub. I believe HP, like $ony, wants total intellectual property control over their products and they can't stand the thought that someone else could make a buck or deprive them a buck using one of their products.

Re: Is there any need for just another HP calculator (JAHPC)?

Then why release info on how to re-purpose the 30b, or how to access System RPL, for that matter. And what about all the third-party providers for the 48s?

Re: Is there any need for just another HP calculator (JAHPC)?

*Message #11 Posted by **Frido Bohn** on 28 Jan 2011, 5:04 a.m.,*
in response to message #7 by David Hayden

Hello David,

instead of cultivating a plethora of different hardware devices which address different sectors of the market, the main message of my contribution was to offer only few hardware devices - may be an HP-12C, an HP-35s and an HP-50g form factor.

Let these devices run different types of calculator software and you can address every customer you want. HP is offering the HP-12C, HP-20b, HP-35s and HP-15C as software variants. Why not offer a hardware platform to run this software?

The hardware platform should offer something special that customers would expect from HP. As a minimum requirement, it should include those features we know from currently available smart phones and tablet PCs.

About HP calc serial numbers

*Message #1 Posted by **Ernst Fueloep** on 27 Jan 2011, 4:29 a.m.*

Hi,

This page: http://www.finseth.com/hpdata/serial.php explains that the week number in HP calculator serial numbers starts from Nov 1st (HP's fiscal year start).

So, then if I have a calculator with the serial number of 2205Axxxx this would mean it was manufactured in 1981 December, right?

Or have I misunderstood something?

Thanks.

Regards, Ernst

Can only be partly right.

*Message #2 Posted by **Frank Boehm (Germany)** on 27 Jan 2011, 6:48 a.m.,*
in response to message #1 by Ernst Fueloep

I'm not sure if this is an "urban legend" or correct at all. Maybe someone can prove or disprove this quoting a reliable source.
But: The earlier machines had something that I would rather call a "batch date" or maybe "revision" date. The 35 started with a "1143" datecode, next in line was, AFAIR, "7230".
So the given explanation of serial# is, at least, partly wrong.

Re: Can only be partly right.

*Message #3 Posted by **Eric Smith** on 27 Jan 2011, 6:17 p.m.,*
in response to message #2 by Frank Boehm (Germany)

Traditionally HP used the first four digits for the year and date of the start of production of a specific revision level of a product. They might make products with a particular code for a long time, not even just one "batch", if there were no design changes. Those first four digits were what you looked up in the service manual for "back-dating".

Calculators started out that way, but quickly became the highest-volume HP product, such that the standard HP serial numbering scheme was not practical. For calculators, they decided to change the code every week, even if no design change had been made.

There were occasional errors or anomalies in the serial numbering. The serial number of the calculator was not particularly intended to be interpreted by anyone other than HP.

Re: About HP calc serial numbers

*Message #4 Posted by **Mike Morrow** on 27 Jan 2011, 10:34 a.m.,*
in response to message #1 by Ernst Fueloep

I purchased a new HP-15C in December 1985 from a large-volume dealer. The serial number on it is 2605A02499.

I've owned HPs since the mid-1970s, so I was familiar with the significance of the first five characters of HP serial numbers of that era. I was surprised at that time to see an early 1986 serial number on a device purchased in late 1985.

This one example supports the statement that the serial number year began late in the previous calendar year.

HP 48GX Interface Cable Dilemma

*Message #1 Posted by **Anthony (USA)** on 26 Jan 2011, 7:50 p.m.*

Hi, I'm just beginning to expand my calculator collection. I recently purchased an HP 48GX Expandable Graphing Calculator and I need advice. I want to be able to connect my HP 48GX to my computer (so I can download games and applications), and I found the appropriate Serial Interface Cable online. After looking at pictures of the cable, I noticed that the end of the cable that connects to the computer is that 9-hole end thing (I don't really know the correct terminologies so forgive me). The port-thing in my computer that comes close to resembling it has 15 holes. What should I do? Is there an intermediary adapter thing that would connect the 9-hole end of the Serial Interface Cable to the 15-hole port-thing in my computer? Any help would be appreciated. Thank you.

Re: HP 48GX Interface Cable Dilemma

*Message #2 Posted by **Martin Pinckney** on 26 Jan 2011, 9:32 p.m.,*
in response to message #1 by Anthony (USA)

Anthony,

The 15-pin connector on your computer is analog video, no relation to serial port. Latest computers do not have a legacy type serial port.

What you need is a USB-to serial adapter. You can find one anywhere computer peripherals are sold. May take some tweaking to get the 48gx and the computer to "talk" to each other, but it can be done.

The name for the "9-hole end thing" is a 9-pin D-sub connector. They are of course male and female. You want a male 9-pin D-sub to USB adapter. Take your cable with you to avoid confusion on the gender.

Edited: 26 Jan 2011, 9:36 p.m.

in response to message #2 by Martin Pinckney

Oh, thank you, thank you, sir. Your response is beyond helpful! I'll order the Serial Interface Cable right now online and when it arrives I'll immediately buy the male 9-pin D-sub to USB adapter. Thank you, again, Mr. Pinckney, I really appreciate it.

Re: HP 48GX Interface Cable Dilemma

*Message #4 Posted by **Martin Pinckney** on 27 Jan 2011, 12:12 a.m.,*
in response to message #3 by Anthony (USA)

You're welcome.

You probably know that you will need Windows software to transfer files back and forth between the computer and calculator. Some vendors for the cables include the software with it, but if not a couple

of different programs are available for free download.

You will probably want to come back here for help once you get all the components for the connection.

Well, I can't say for sure. I successfully used HP48 Explorer with XP. I have since upgraded to 7, but I don't have my 48 or my USB-Serial adapter with me right now, so I will have to check later. Unless somebody else chimes in.

30b Dead 5 Key

*Message #1 Posted by **Norman Dziedzic** on 26 Jan 2011, 7:37 p.m.*

My 30b Christmas Present (S/N: 4CY02405153) has a dead 5 key. All the other keys are as expected with crisp feel but the 5 is like a wet fish. If I press it hard it will register but something is definitely not right in there.

Anyone know the best channel at HP to go through for getting this fixed?

Thanks

Re: 30b Dead 5 Key

*Message #2 Posted by **Don Shepherd** on 26 Jan 2011, 7:43 p.m.,*
in response to message #1 by Norman Dziedzic

I'd look in the quick reference guide and see what it says.

in response to message #2 by Don Shepherd

Or you could download the full manual which has been uploaded for a month or two now.

Anyway, that sounds like a collapsed metal dome. Contact support and ask them about it. If you have any trouble, send me an email.

*Message #7 Posted by **Mike Morrow** on 27 Jan 2011, 11:00 a.m.,*
in response to message #6 by Tim Wessman

I wish there was a source for replacement programming keyboard overlays. Mine looks terrible, since the overlay characters are printed on the the upper surface of the overlay and wear off extremely easily and readily. The characters begin to wear off even in the process of initially applying the overlay! I know others have experienced the same problem.

Better would be overlays that had the ink protected from exposure. I'm not an industrial design expert, but I'd suggest that having the ink UNDER the overlay plastic would be helpful.

Best would be to have the overlay actually a permanent part of the HP 30b keyboard at time of manufacture. The overlay info is very valuable for programming, but the overlay as made is very unsatisfactory.

Regardless of this gripe, I have been very happy with the HP 30b. An excellent and exciting design, I think. I love the calculator body design. (I've experienced no keyboard problems on mine as yet.)

Re: 30b Dead 5 Key

*Message #8 Posted by **Mark Harman** on 27 Jan 2011, 2:46 p.m.,*
in response to message #7 by Mike Morrow

I'm with you, Mike. The overlays are terrible in terms of ink quality. There are some printing processes that won't wear off that HP could use. It seems like these were printed on a laser printer or something. I think they need to use dye sublimation.

I have, at the time being, given up on using the overlay (after going through a replacement one) and have memorized the layout of the programming function set. I actually like the clean look without the overlay even though I agree with you that the programming nomenclature should be printed on the base of the keyboard, as the Black Scholes function is. However, HP wanted to keep things clean and non-confusing as possible for the majority of users who won't program. I was told this decision was based on input from marketing studies and financial educators.

I also agree with you regarding the overall design of the 30b. It really is a great calculator and I haven't had any problems with my keyboard, either. My opinion is that it the finest financial calculator on the market today. I think it is even better than a 12c or 17bII+ and it is certainly far beyond anything competitors offer.

Regards,

Mark

I was told this decision was based on input from marketing studies and financial educators.

That's one major difference between financial and technical calculators known for years: financial people prefer such "non-confusing" designs while sci/tech people even accept and like a 32sii. Financial calcs are advertized being problem solvers while sci/tech calcs are tools. I won't speculate about root-causes here ...

Re: HP 17BII Dropped!

*Message #1 Posted by **Csaba Tizedes (Hungary)** on 26 Jan 2011, 3:13 p.m.*

Hi Mike!

My 17BII was similar (without dropping). Ask "Számológép" Google Group member 'Dexter' at this topic: Calculator Hardware Malfunctions. He is a great hungarian calc-guru, he repaired my 17BII for free of charge. Maybe he will help to you via email or something similar way!

("Számológép" in English means "Calculator" - This is a very busy Google Group about calcs with 6-8-10 active members. (Számológép == Számoló gép == "A machine which is can calculate" ("Szám" == "Number", "gép" == "machine"))

Greets from Hungary!

Csaba (ZilogR)

Re: HP 17BII Dropped!

*Message #1 Posted by **Mike D** on 26 Jan 2011, 1:44 p.m.*

The main reason I wanted to know if someone had completed this repair was that it personally irritates me and I want to fix it. So if anyone reads this who has done it, please respond.

It is sound advice to find a cheap one on ebay, which I will look for.

I have tried pressing on the bezel and that does help but isn't a long term solution.

Thanks,

Mike D

Re: HP 17BII Dropped!

*Message #2 Posted by **Martin Pinckney** on 28 Jan 2011, 12:03 a.m.,*
in response to message #1 by Mike D

Mike,

I think pressing on the bezel was suggested as a diagnostic method to help isolate the cause of the problem, not as a solution.

No new scientific calculators from HP?

*Message #1 Posted by **Ivan Latorre** on 25 Jan 2011, 5:23 p.m.*

Is the 35s the latest RPN scientific calculator from HP? I bought it in summer 2007! No new scientific calculators from HP since then?

Re: No new scientific calculators from HP?

*Message #2 Posted by **Martin Pinckney** on 25 Jan 2011, 5:37 p.m.,*
in response to message #1 by Ivan Latorre

Correct. Two new business models with some scientific features (20b and 30b), and an upgraded 12c, but no scientifics. Unless you count the SmartCalc 300s, which is not HP-developed, but just a re-badged something-or-other.

People on here have been clamoring for a new HP scientific ever since 35s, the main reason being the real or perceived deficiencies of said model.

It's a popular topic.

Re: No new scientific calculators from HP?

*Message #3 Posted by **Michael de Estrada** on 25 Jan 2011, 7:42 p.m.,*
in response to message #2 by Martin Pinckney

I was in a Home Depot today to buy some tax software and compressed air dusters, and checked out the calculator rack. There were several HP business calculators, but not a single HP scientific calc. Meanwhile, there were 6 or so TI high end graphing calcs, and dozens of other lesser scientific calcs from other brands. It used to be that you'd find at least one or two HP scientific calcs there, but I guess the market has been lost to TI and others.

Correction: I meant Office Depot

For me, that depends. I could live with ergonomic problems like the glare on the display, the odd (to me) display font, combined parenthesis key, and shifted STO function.

The bugs would presumably be fixed in any "better" 35s.

But the antiquated Solver I could not abide, even if everything else was improved.

Only two bugs? Incredible.

Re: No new scientific calculators from HP?

*Message #19 Posted by **Fred Lusk** on 26 Jan 2011, 12:18 a.m.,*
in response to message #18 by Martin Pinckney

Actually there are a couple more. When I bought my HP-42S in 1989, it came with a "Manual Update" page that described two stat bugs (I am using # in place of the Greek letter sigma):

[1] "If you have selected LIN# mode and execute LASTX after #+ or #-, you will get an incorrect result....This update describes a method to correct mistakes in statistical-data entry. This problem applies to executing LASTX after #+ or #- only in LIN# mode. The default is ALL# mode (see page 234)."

[2] "If you try to use the HP-42S power curve-fitting model to forcast a x-value as described on page 240, you will get an incorrect solution. This manual update provides a method you can use to get a correct solution. This problem applies only to the method for focasting an x-value within the power curve-fitting model. All other methodes for the curve-fitting and forcasting models (including forcasting y-values within the power model) are correct as described in the manual."

BTW, the solution for problem #2 was a little 7-step program.

The Update Identification for this page is as follows: Update Number: 1; Part Number: 00042=90042; Date: December 1988

If anyone needs a copy, drop me a line and I will email it to you. I vaguely recall sending a copy to Dave Hicks to post on the site, but haven't checked to see if it's there.

Fred

in response to message #19 by Fred Lusk

Hi, Fred.

Good to hear from you again. Like hoping for a new scientific from HP, I am still hoping for a 42s revision to your Feet-Inches-Fractions program. {:-)

Re: No new scientific calculators from HP?

*Message #21 Posted by **Fred Lusk** on 28 Jan 2011, 8:47 p.m.,*
in response to message #20 by Martin Pinckney

Martin…

It's STILL on my To Do List. I have had very little time for programming the last several years. I actually have the update for the 41CX version of the program about 95% done--just need to resolve one issue where the physical machine and my emulators differ (IIRC one or the other, but not both, doesn't like the depth of my subroutine calls). After that, the 42S version requires only buiding the menus. I should have it done sometime before get men back on the moon, but hopefully sooner.

Fred

*Message #23 Posted by **Mike Morrow** on 26 Jan 2011, 1:58 p.m.,*
in response to message #19 by Fred Lusk

My HP 42S with Rev. A firmware (2934Sxxxxx) has this Update 1 sheet with the manual.

Apparently the problems were corrected by Rev. C firmware on my two later HP 42S units (3328Sxxxxxx). The Edition 7 manual (January 1992) contains no caveats about these two issues.

I've never personally come across an HP 42S with the Rev. B firmware, but I'd bet that it was corrected also.

It is amazing that such capable and complex firmware as is found in the HP 42S has so few imperfections. What a great job by the HP team that was responsible for HP 42S issues two decades ago!

Re: No new scientific calculators from HP?

*Message #24 Posted by **Rav Walia** on 25 Jan 2011, 9:54 p.m.,*
in response to message #1 by Ivan Latorre

There hasn't been any new scientific calculators from HP and I'm fast beginning to think that we wont see any.

It's unfortunate, but I'm going to go and start looking at non HP scientific calculators and start to learn how to use a non RPN calculator.

My feeling is that if you want a scientific calculator it might be better to start looking at other companies, at least they 'appear' to be more active in producing new scientific calculators.

> ... I'm fast beginning to think that we wont see any... other companies, at least they 'appear' to be more active in producing new scientific calculators.

Hold on, there. Let's see, the 35s came out in 2007, right? The 33s in 2004? So after the demise of the Pioneers, we've had two about fours years apart. Meanwhile the progression of the larger 48/49/50 series has continued.

In the same time period HP has updated the 10b once, 17bii twice, the 12c, what, three times? But these are largely cosmetic changes, except increasing speed of 12c. But no real change in functionality, unless you allow for adding ALG to Platinum.

Granted, this is arguably more activity than for scientific, but the only *new* business calcs are 20b and 30b.

So I, for one, believe HP *is* working on a new scientific, and we are about due for one, perhaps as early as this summer.

Re: No new scientific calculators from HP?

*Message #27 Posted by **Paul Gaster** on 26 Jan 2011, 11:33 a.m.,*
in response to message #26 by Jim Yohe

I hope for some new things too, but I'm not going to hold my breath. The 35s made sense for

multiple reasons. People complained loudly about the 33s, and with the 35th anniversary of the HP-35 the timing was right for the 35S.

I could see HP making a revision to the 35S to fix bugs, but to invest time and money for a new model...well, I just don't see it right now. Everyone wants a new 42s, but there is no anniversary coming up for that as far as I know. On the graphing side of things the 48GII was changed once already to add a USB port and equation library. I don't know how anyone could add more to the 50G, so that will probably be left alone too.

The 12C really needed the speed upgrade to make it competitive with the TI offerings, so that makes sense to me. Everyone seems to like the 30b so it should be stable, and the newest 10bII seems decent for a lower end financial calculator, so I don't see any changes there either.

TI calculators own the high school and college math class market, so maybe HP will focus on that for a while. Most of us here wouldn't want an algebraic calculator, we like our RPN, but that is a huge market. If HP could just get a better foothold it could mean a lot of extra cash for them.

Re: No new scientific calculators from HP?

*Message #28 Posted by **Don Shepherd** on 26 Jan 2011, 11:53 a.m.,*
in response to message #27 by Paul Gaster

Paul, don't look for HP to attempt to enter the education market. TI has a lock on that. TI calculators are the standard in the US education market, from elementary school through college. The textbook manufacturers write lessons specifically for TI graphing calculators. TI has a nationwide network of support and training people who offer training classes to teachers and special deals to school systems. The TI Nspire will eventually become the standard calculator in high schools and colleges (Casio Prizm notwithstanding). It would be economically foolish for TI to try to insert itself in that market at this point.

Not to mention, the TI-8x series of graphing calculators are fundamentally good products.

Re: No new scientific calculators from HP?

*Message #29 Posted by **Eric Smith** on 26 Jan 2011, 12:53 p.m.,*
in response to message #27 by Paul Gaster

Everyone wants a new 42s, but there is no anniversary coming up for that as far as I know.

HP usually does not time calculator introductions based on anniversaries. Although there have been "anniversary editions" before the 35s, they simply consisted of putting a special label on an existing calculator.

Whether a new 42s is introduced has nothing to do with anniversaries, and everything to do with how much engineering it would take and how well it would be projected to sell.

Not being an HP employee, this is of course only my opinion. As with most discussion of future products, those that speak don't know, and those that know don't speak.

I'm only a financial person by accident I was suppose to be a scientific person then later a computer person, but fell off the wagon, twice! :(

I think that financial calculations should be done in logarithmic space. It used to be that a million <insert your preferred currency here> was a lot of money, not that long ago it was a billion, now it's trillion.

Re: No new scientific calculators from HP?

in response to message #36 by Katie Wasserman

Being an engineer, I have little need for a financial calculator. However, I really love my old HP-12c, because in so many ways it works like a scientific calculator and has so many of the basic features and capabilities. Not only is it RPN and does it have EEX, but it also has all the power and log functions as well. It even has linear regression, which is universally used by engineers, scientists and financiers. That's all that is needed for many engineering calculations.

*Message #38 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Jan 2011, 3:30 p.m.,*
in response to message #36 by Katie Wasserman

For my country economy, logarithmic is not enough, but complex currency may do. Our brazilian neighbors name REAL their currency, sometimes argentinian currency works like an imaginary number; so our incipient common market (Mercosur) need a currency with REAL and IM parts for sure.

*Message #39 Posted by **db (martinez, ca.)** on 27 Jan 2011, 10:25 p.m.,*
in response to message #38 by Andrés C. Rodríguez (Argentina)

Andres; So since it's not REAL, and not not an imaginary number, what is the Chilean Unidad de Fomento? Maybe a complex number? Carrying this on we could define the Boliviano as a random number and the Sucre as "funny money". BTW: I understand the concept of the UF. It's very Chilean: let's vote our way to equality, act our way to decency, and now calculate our way to fairness. It might work there. It's never been tried on a national scale in North America. - db

Reading all that's been posted in the past asking for a new 42s or new 15c's and multiple threads like this that have been posted here and on other forums, I'm going to have to look elsewhere for my next scientific calculator.

I had to use an algebraic calculator last week and after too many years using rpn, it was painful. However, the sooner I start the sooner I'll become used to it.

The way the situation is now, I couldn't in good faith recommend to any students/colleagues that learning RPN would be a good way to go.

Even if four years is the time between scientific calculators, which I don't think it is, I don't think that's a good strategy in the modern market.

New HP12C that uses 2 batteries, and is blazing fast.

*Message #1 Posted by **jwhowa** on 24 Jan 2011, 9:54 p.m.*

I was in my local Staples tonight, and ran across an HP12C that had a rather large battery door, so I was curious. I opened it, and found that it took TWO CR2032 batteries, not one, so I then did a standard 30year mortgage TI calculation and to my great surprise, there was no Running, Running, Running... Just an instant answer.

This thing is WAY faster than my 1990 era 12c, and even faster than my Platinum edition from a few years ago.

Staples was out of stock on the calculator or I would have bought one on the spot.

I called HP to see if I buy one from their store will I get this one, and the guy on the support call basically told me I was an idiot, that no such thing existed. BUT I HAVE PICTURES! :)

So here is my question...

Has anyone else seen one of these, and do you know where I can get one?

Other than the batteries and the blazing speed, this thing looks exactly like my 1990's era 12c. It doesn't have the paren keys on the sto/rcl buttons that the Platinum calc does.

Any ideas?

Thanks! -Jim

in response to message #1 by jwhowa

You saw what is informally known as the 12c+, based on the ARM processor. It's been around for the last two years and is identified by its large battery door, as you noted. Search the forum for "12c+" and you will find a bunch of info about it.

Re: New HP12C that uses 2 batteries, and is blazing fast.

*Message #3 Posted by **Eric Smith** on 24 Jan 2011, 9:59 p.m.,*
in response to message #2 by Don Shepherd

And note that if you find a 12C Platinum with two coin cells, it is apparently not based on the ARM platform, and does not run faster than the single-cell 12C Platinum.

Re: New HP12C that uses 2 batteries, and is blazing fast.

*Message #4 Posted by **jwhowa** on 24 Jan 2011, 10:11 p.m.,*
in response to message #2 by Don Shepherd

Any idea where to get ahold of one? Buying online, of course, tons of people sell the 12C but I can't find any seller marketing a 12C+. And of course, I can't see the battery door when I buy online. :)

To Tim, who said it might be a fake, I will be happy to post pictures I took of it if you like, I have the serial number and battery compartment of the demo unit on the shelf at Staples.

Tim, I'm curious. Other than the user's postings at hpmuseum where is the new 12c documented?

John

Re: New HP12C that uses 2 batteries, and is blazing fast.

*Message #7 Posted by **Tim Wessman** on 25 Jan 2011, 1:12 a.m.,*
in response to message #6 by John B. Smitherman

Nowhere really. The are identical part numbers as the old one (same product - transparent to the end user. . .) so according to HP it is still the same 12C.

The new manual has the testing information about the old test system removed from it since the old test system menu isn't there, but according to the marketing/ordering system, it is still the same 12c.

The 12c+ is an emulated version of the original 12c code. Provided nobody finds any more emulation issues, there is no difference between them except battery life being shorter. I think most people are ok with that since your calculations are 100-150 times faster.

in response to message #1 by jwhowa

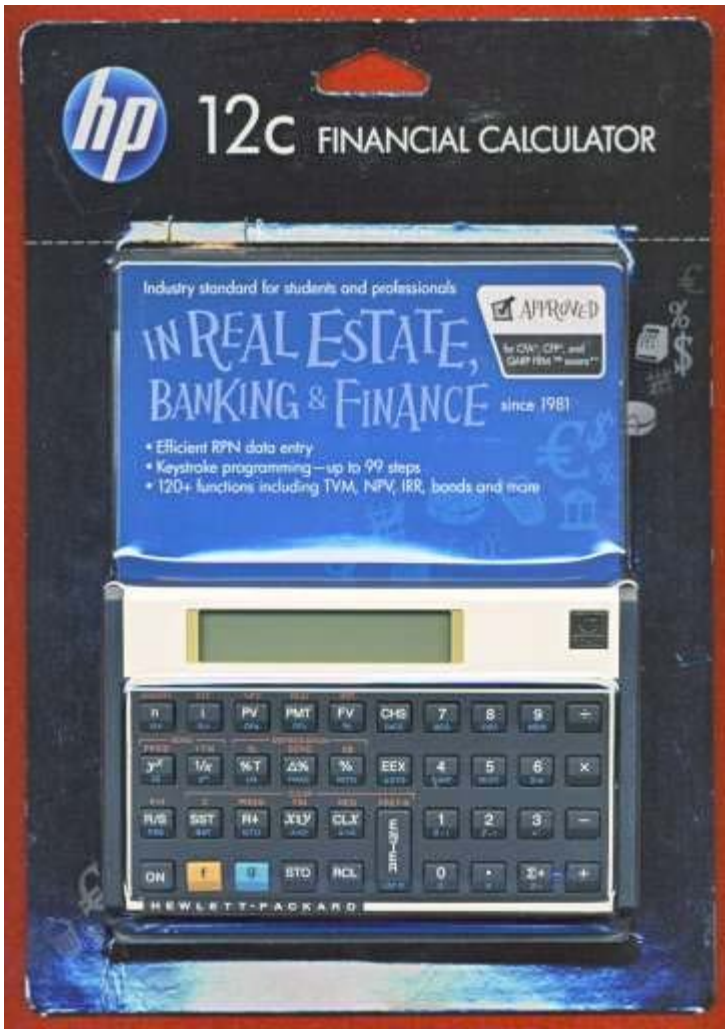
I agree.. I LOVE the new 12c.. It's quality and speed match any other Financial Calc HP has ever made- IMHO.

If you're looking for a dual battery model, avoid the big-box online stores like Amazon, Tiger Direct, etc, unless you can buy one you can actually put your hands on. Auction sites might be an option. Regretably, few of the sellers know the difference- especially if HP does not, and HP has the nasty habit lately of issuing several completely different calculators under the same ABA part number.

Watch for one packaged thusly with the blue book behind the calculator in a black package:



Re: New HP12C that uses 2 batteries, and is blazing fast.

> Quote:
>
> I LOVE the new 12c.. It's quality and speed match any other Financial Calc HP has ever made- IMHO.

I doubt that.

The recent HP 30b is the speed king of *all* handhelds...ever. It is a financial machine, but with far better scientific support than any of these never-ending re-issues of the tired old HP-12C. In that respect, the HP 30b performs the Savage Benchmark ten times faster than even the HP 50G. It also does NOT have the pointlessly awkward landscape layout of the HP-12C series, a great plus in and of itself alone. It's also a lot less expensive for a lot more features.

(Yes...I own several HP-12C varieties, my first I purchased back when it was still being made in the USA, more than 25 years ago.)

I agree with Allen completely.

The 12C+ is in fact faster than the 30b at some things, using the cash-flow memory in particular is about twice as fast. For simple loops the 30b is the faster machine by about the same margin. (Look around this forum for more comments and testing on this.)

Re: New HP12C that uses 2 batteries, and is blazing fast.

*Message #15 Posted by **Mike Morrow** on 27 Jan 2011, 12:32 p.m.,*
in response to message #14 by Katie Wasserman

But how fast does the HP 12C+ do the old 2500-loop Savage Benchmark?

Whoops...that's right...the HP-12 series isn't very good at things requiring trignonometric calculations. :-)

My serious question is really one that, due to my not being especially oriented to financial calculations, I'm not skilled well enough to know the answer even though I have some HP-12Cs and one HP 30b:

What number-processing advantage does the HP 12C have over the HP 30b, even when the discussion is limited to areas that are strictly financial? In other words, what things financial can the HP 12C handle that the HP 30b can't? It appears to me that the features of the HP 30b exceed those of the HP-12C, include much better scientific function support, added to the HP 30b being much less expensive ($50 vs. $95 at Office Depot stores). In short, why would one choose any HP 12C now that the HP 30b is available?

in response to message #16 by Tim Wessman

Yes, there are still some CFA, actuary, etc tests that only allow certain calculators.

Re: New HP12C that uses 2 batteries, and is blazing fast.

*Message #18 Posted by **Martin Pinckney** on 27 Jan 2011, 2:47 p.m.,*
in response to message #15 by Mike Morrow

This is indeed a good question. Tim's answer implies that the reason is either reputation, recognition, tradition, or a combination thereof. The HP website has changed, but if I remember correctly, the 12c used to be touted as more "advanced" than the 30b. At least they do charge more for the 12c.

Interestingly, the 20b seems to have been dropped.

Re: New HP12C that uses 2 batteries, and is blazing fast.

> Quote:
>
> What number-processing advantage does the HP 12C have over the HP 30b, even when the discussion is limited to areas that are strictly financial?

Some of the TVM function are faster on the 12C+ but they are unlikely to be used in a program loop. More to the point, you'll find almost any program that needs arrays is faster on the 12C+ than on the 30b. In both machines arrays are only possible using the cash flow registers (or data registers on the 30b which are just another name for the shared memory structure).

Try writing some programs and you'll discover why this is so.

Are there two (or more?) versions of the HP-30B too? Like the HP-12C?

Or is every HP-30B a very fast one with two batteries?

Regards, Ernst

Re: New HP12C that uses 2 batteries, and is blazing fast.

*Message #21 Posted by **Katie Wasserman** on 27 Jan 2011, 10:46 a.m.,*
in response to message #20 by Ernst Fueloep

There's only one version of the HP-30b, at least from a hardware perspective. I don't know if different firmware versions are out there or not. Even so, they are all likely to run at the same, very

fast speed (unless some optimizations are added to a later firmware version).

*Message #23 Posted by **Keith Midson** on 25 Jan 2011, 1:15 a.m.,*
in response to message #1 by jwhowa

Whoohooo! I just checked all my 12C's and i've got one too! I didn't even know. I have a collection of pretty much every 12C version (9 total: oldest 1982, newest 2011) and recently purchased a 12C Platinum from TAS without even noticing the dual batteries. I had assumed it was just a newer version of the 12C-platinum anniversary edition that I already had (which only has one battery).
I checked the speed against the older (and also the much older) 12C's and yes it's quick.
Cheers, Keith

Re: New HP12C that uses 2 batteries, and is blazing fast.

in response to message #23 by Keith Midson

Keith,
Do you have a 12C with two 2032 batteries, or a 12C Platinum with two 2032 batteries? As Eric mentioned in this thread, the 12C Platinum with dual batteries does not have the arm processor and is no faster than the earlier 12C Platinum Anniversary Edition. It is faster than the old 12C.

That's selling virtual calcs for virtual dollars only :-/
As mentioned in another thread, AFAIK HP (whoever in particular) doesn't think the tech/scientific community will pay the effort. Throughput in business/finance is obviously higher - though it may contain lots of virtual dollars, but they seem to materialize in HP's pockets at least. Real tech/sci dollars can't do that trick :-(

*Message #2 Posted by **Ignazio Cara (Italy)** on 25 Jan 2011, 3:35 a.m.,*
in response to message #1 by Christophe Dubreuil

Hi Christophe, if the paper is the same and you haven't take apart the printer or swap the printer PCB with another one, it's very strange. If my eyes are still good, you are loosing one resistor of the thermal printer head, the third from the bottom. You should measure each resistor from the edge of the flat cable that is connected to the printer's PCB. The value of each resistor should be about 11 ohms. If you have one spare printer PCB, try to swap it on the printer. Let me know after you have done this series of checks.

Regards

Ignazio

I don't know why this changed but there's and easy and documented fix for this in the service manual.

> Quote:
>
> 2-31. The remaining comparators in U4, along with the resistor network in U5, produce the variable duty-cycle signal STB, which is nominally 10 kHz. The STD signal will change its duty-cycle to keep its rms value constant and thus print intensity constant. By changing the value of R8, the nominal duty-cycle of STD can be changed to adjust print intensity.

There's no way to tell what the current value of R8 is without looking. Each HP-97 was shipped from the factory with a selected value, they list values from 34.8K to 196K in the service manual, but they've all 1% resistors.

-Katie

Re: Printing quality on HP-97

*Message #5 Posted by **Christophe Dubreuil** on 31 Jan 2011, 3:14 a.m.,*
in response to message #4 by Katie Wasserman

I finally went thru the service manual ... i checked the various things i could (resistances and voltages) and all seems OK , i guess it may be one of the transistors that is weak (explaining meybe the light line).

I should get an oscilloscope ro further investigate.

But as i pointed out ... it happened after i opened it for fixing the magnetic card reader ... it was perfectly working before ...i should have inadvertably modified something.

I am a bit reluctant to change R8 and modify it. I guess i will use it as it is, and if it get worst i then will proceed further.

Thanks to the community.

in response to message #1 by Martin Pinckney

There was only one serious bidder. It takes at least two to get the price up. For all we know, the winning bidder offered much more. Last year there was a very clean an complete HP 81 up for auction on TAS. They are very rare and it's one of the very few vintage calcs missing in my collection. Still, I am not willing to pay a lot for a business model and already own an HP 46, so my bid was modest, as were all the competing bids. Late in the auction with only seconds to go a bid came in from Europe, and it sold for a little over $300. No doubt the actual bid was much higher, but we'll never know. OTOH, the next time a complete non-fake HP 35 Red Dot shows up on TAS, I think we'll see a lot higher price, becasue there are more people willing to pay for such an item.

transistor equivalence

*Message #1 Posted by **Alberto Fenini** on 23 Jan 2011, 5:45 p.m.*

Dear All,
I have recently opened two topics, one was for the classic power supply and the other was for the restoration of an HP67.
In both cases, I need to replace some of the transistors present on the boards.
Jaques, but I guess is not the only one, was able to find a cross reference from the classic power supply's transitors, into some ECG-XXX models.
For example : the 0393-338 can be replaced with a ECG-189
which has several equivalents that can be found for example here :
Semiconductor Cross Reference Search
or even better here :
Semiconductor Cross Reference
Does anyone know how it can be done for the rest of the transistors ?
On the HP67 I'm working on, there are :
0413-393 which is the one between the cathode and anode driver
0414-668 (qty two) on the back side of the same pcb
0124-094 on the same side, right corner.

Thank you very much for any help provided, take care Alberto

Re: transistor equivalence

*Message #2 Posted by **Katie Wasserman** on 23 Jan 2011, 6:13 p.m.,*
in response to message #1 by Alberto Fenini

Take a look here.

I have the vague recollection of reading how HP codes some of their transistors: add a leading zero on the last 3 digits and ignore the leading 4 digits.

So a 0413-393 would translate to: XXXX-0393 and you'd find that this is is equivalent to a 2N3330

However it's more than possible that I'm totally wrong about this, so perhaps someone else can jump in here.

Re: transistor equivalence

*Message #3 Posted by **Alberto Fenini** on 23 Jan 2011, 7:18 p.m.,*
in response to message #2 by Katie Wasserman

ciao Katie,
thank you very much for the pdf document, it is very very nice,
if the original HP part number is known it works like a charm.
But I did some tries adding the leading zero to the second part of the item read from the transistor and it doens't always work.

For instance, if you take 0414-668, and search for 0668 you will find :
1853-0668 01698 TIPP115
1855-0668 02883 BS170
1820-0668 * TTL IC
the third is obviuosly wrong, since it's an IC and we are looking for a transistor.
So that the question could also be, does anyone has a complete list of the HP part numbers including the used transitors for a given model ??

thanks again, Alberto

Re: transistor equivalence

*Message #4 Posted by **Tony Duell** on 24 Jan 2011, 4:16 a.m.,*
in response to message #3 by Alberto Fenini

Some general information on HP part numbers :

HP assembly part numbers (like PCBs, etc) have part numbers consisting of 2 5-digit groups, the first groups seems to be the model number of the instrument that first used that assembly, with leading zeros added. So the CPU Control PCB in an HP98x0 is a 09810-66513 (it was first used in the HP9810 calculator).

HP component part numbers consist of 2 4-digit groups. The first group gives the type of component. There are tables in a few HP instrument manuals, but not all.... Anyway, for transistors :

1850-xxxx = Germanium PNP

1851-xxxx = Germanium NPN

1853-xxxx = Silicon PNP

1854-xxxx = Silicon NPN

1855-xxxx = FET

1858-xxxx = Transistor array

To save space on small transistor packages, sometimes only the last digit of the first group and the 'significant digits' of the second group are printed on the package. So if you find one marked 4-471, that's an 1854-0471 silicon NPN transistor.

I wonder if one of the groups of digits on the OP's transsitors is actually a date code.

Re: transistor equivalence

*Message #5 Posted by **Joel Setton (France)** on 24 Jan 2011, 12:39 p.m.,*
in response to message #1 by Alberto Fenini

Folks,

Here's my best shot at it:

0413-393 would be an 1853-0393, and 041 is the date code

0414-668 would be 1854-0668, date code 041

0124-094 would be 1854-0094, date code 012.

I haven't found any of them in the various cross-reference listings I have, maybe someone else has some information on these part-numbers?

I hope this helps!

Joel Setton

Re: transistor equivalence

*Message #6 Posted by **Ignazio Cara (Italy)** on 24 Jan 2011, 2:09 p.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto, I can give you only this little help. From the very good pages of Jack Laporte I can report:

1854-0094 NPN Silicon ---> PN3646

1854-0550 NPN Silicon ---> 2N3904

1853-0020 PNP Silicon ---> 2N3702

Nothing to do for the other (HP 67/97):

1854-0668 switcher

1854-0071 regulation

1853-0395 ??

Take a look at this link

Good evening.

Ignazio

Happy National Pie Day

*Message #1 Posted by **Mark Hardman** on 23 Jan 2011, 1:31 p.m.*

Flipping through radio stations this morning I caught a brief sound bite on NPR about today being National Pi Day. After a few minutes of background processing, my brain raised an exception that Pi <> 1.23.

A quick Google search cleared up my confusion. Today is actually National Pie Day.

http://wftv.zipscene.com/events/view/2835597-american-pie-council-national-pie-day-2011-orlando

Lest Walter acuse me of being jingoistic, I must point out that this is National Pie Day in the United States. I'm sure other principalities celebrate pie on their own appropriate schedules.

Let the Pie Are Squared jokes begin.

Font for HP-25 "Continuous Memory" logo

*Message #1 Posted by **Steve Lidie** on 23 Jan 2011, 10:02 a.m.*

I'm putting the finishing touches on my iPhone HP-25 simulator. The App preserves state so it's really a "continuous memory" variant. On the face of the real device the words Continuos Memory are written in some script font, which I cannot determine / duplicate .. the closest I have come up with is Snell Roundhand. Does anyone know of the actual font HP used, or maybe a better approximation?

Many thanks, Steve

Re: Font for HP-25 "Continuous Memory" logo

*Message #2 Posted by **Dave Shaffer (Arizona)** on 23 Jan 2011, 12:17 p.m.,*
in response to message #1 by Steve Lidie

There are web sites that purport to identify fonts. (I say "purport" because on one or two tries, they haven't been very succesful for me.)

That said, do a google/yahoo search on font identification. Some, like this one work from an image example. If you can get an image to submit, you might try it.

Re: Font for HP-25 "Continuous Memory" logo

*Message #3 Posted by **steve lidie** on 23 Jan 2011, 1:30 p.m.,*
in response to message #2 by Dave Shaffer (Arizona)

What will they think of next? It never occurred to me that a web site might identify the font, thank you for the idea and link. So far no luck with machine identification, mostly because - I assume - it's a script font and not separate characters. I'll keep trying, though, thanks.

Re: Font for HP-25 "Continuous Memory" logo

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 23 Jan 2011, 4:23 p.m.,*
in response to message #1 by Steve Lidie

This may sound weird and unrespectful for the venerable HP-25C but, just as a humble opinion, I suggest to avoid that fancy calligraphic "Continuous Memory" badge; or at least make an option to display it or not. It is reasonable that, at those old times, HP needed to stress this new feature that much, and to so devise that exaggerated statement. I would had preferred that they just put the 25C mark in the traditional, sober label, and let the knowing people tell the difference.

By the way, I would also prefer that HP doesn't use faceplate space on the current calculators with labels as "Scientific Calculator", "Business Calculator", and so. I understand the need to put such legends on the box or blister; but I cannot think of a valid reason to have it all the time on the device face.

Just an opinion, and I know it goes against historic accuracy. See you soon at the App Store, my iPod Touch 4G already has a lot of HP calc simulators, but there is always room for one more; and the HP-25 was my

first, unforgettable, HP calculator.

Best regards

HP-25 displays "Error" when trying to input numbers

*Message #1 Posted by **Harald** on 22 Jan 2011, 5:44 p.m.*

After several years of continuous use my HP 25 seems to have died today. I've used it on a daily basis and since it was connected to the power cord I very rarely turned it off in the last couple of years. But today it had a surprise in store for me. Everything seems to work fine. The stack works fine, I can add, multiply, divide,subtract and probably lots more. The only problem is, entering numbers is quite tricky :) As soon as I press any of the number keys it displays "Error". The shifted functions on those keys do the same. But I can input numbers by pressing "Sigma +" for example. And after entering them most calculations appear to work fine to. When I switch to programing mode, it looks like there is something in the program memory that doesn't belong there.

I have tried swapping the keyboard, but that didn't change anything. Any ideas on what happened here?

Regards, Harald

Re: HP-25 displays "Error" when trying to input numbers

*Message #2 Posted by **Michael de Estrada** on 22 Jan 2011, 9:14 p.m.,*
in response to message #1 by Harald

The Woodstock series calculators have very fragile charging systems, and can be seriously damaged if operated with the AC charger without a good battery installed. If the batteries were worn out or not making good electrical contact with the calculator terminals, ICs can be damaged or ruined. In any event, the AC charger should only be used to charge batteries, preferably with the calculator turned off. Frankly, I'm surprised your calc has lasted this long turned on continuously with the AC adapter connected to it.

Re: HP-25 displays "Error" when trying to input numbers

*Message #3 Posted by **Harald** on 23 Jan 2011, 6:30 a.m.,*
in response to message #2 by Michael de Estrada

Well, I never connected it to the charger without a battery installed. Also I disconnected the calculator from the cord and carried it around when I needed to, and therefore replaced the battery every now and then when it was getting weak. I have tested the battery in my 29C now and it lasted for two hours. I am well aware of the woodstocks not being able to operate without a battery and I don't think in my case this is the problem. Nevertheless it most likely is on of the ICs that has been damaged, but the question is which one and why? Thanks for your answer!

OT - Adding Roll & pitch to sat dish pointing

*Message #1 Posted by **Giuseppe Marullo** on 22 Jan 2011, 6:34 p.m.*

Hi all, I don't know where to look so I am asking for some assistance here.

A friend of mine asked help to develop a automagic satellite dish tracker (stationary).

Basically, we put togheter compass and GPS data to move a dish automatically to receive HotBird.

We have tested the basic formulas and they seems okay against the tables provided for latitude and longitude.

Now I would like to add pitch and roll of the truck in the equations to account for small angles that could lead to errors.

I have roll&pitch from 2 accelerometers in degrees resolution -+1 degrees increment (or I could access raw accelerometer data).

These are the formulas we are using:

PosLat = (2*M_PI*PosLat) / 360.0; // truck latitude to radians PosLong = (2*M_PI*PosLong) / 360.0; // truck longitude to radians SatLong = (2*M_PI*SatLong) / 360.0; // sat longitude to radians

v1 = 6.612 * cos(PosLat)*cos(PosLong-SatLong)-1;

v2 = 6.612 * sqrt(1-(pow(cos(PosLat),2)) * pow((cos(PosLong- SatLong)),2));

SatElevation = atan(v1/v2); SatAzimuth = M_PI + atan(tan(PosLong-SatLong) / sin(PosLat)); SatPolarization = -atan(sin(PosLong-SatLong) /tan(PosLat));

clear();

SatElevation = (SatElevation * 360.0) / (2*M_PI); // sat elevation in deg SatAzimuth = (SatAzimuth * 360.0) / (2*M_PI); // sat azimuth in deg

How could I modify the formulas to account for pitch & roll of the truck? Could you eventually point me to any site that could explain to me easily how to achieve this?

TIA.

41 MCODE: PANAME ROM Bugs

*Message #1 Posted by **Ángel Martin** on 22 Jan 2011, 6:49 a.m.*

While looking at the PANAME source code (in search of exportable functions, I confess it) I noticed a few weird-looking code lines that may well be plain bugs.

They're on Port_Dependent calls within the same quad, which in theory should read like:

379
03C
addr

but they read like:

375
03C
addr

Did they have something else in mind or it's just an error? (if so, it's quite repetitive!)

This occurs in the following addresses:

Lower ROM: E16, E20
Upper ROM: 0A6, 0AF, 768, 783, 980, B53, B5E.

Edited: 22 Jan 2011, 6:49 a.m.

Re: 41 MCODE: PANAME ROM Bugs

*Message #2 Posted by **J-F Garnier** on 22 Jan 2011, 12:37 p.m.,*
in response to message #1 by Ángel Martin

My Emu41 shows the code as :

```
8E16  375 03C       GSUBNC =GOSUBH
```

GOSUBH is a variant of the GOSUB entry point:

```
=GOSUBH
0FDD  260           SETHEX
=GOSUB
0FDE  1B0           C=STK
0FDF  330           CXISA
etc...
```

J-F

Re: 41 MCODE: PANAME ROM Bugs

*Message #3 Posted by **Ángel Martin** on 22 Jan 2011, 2:51 p.m.,*

in response to message #2 by J-F Garnier

Thanks J-F. Pointing to the SETHEX line may not be of any help, as the address won't be properly calculated with the CPU in DEC mode!

So perhaps a superfluous step, or at worst an error (if SETHEX is not done prior to the call).

Re: 41 MCODE: PANAME ROM Bugs

*Message #4 Posted by **Håkan Thörngren** on 22 Jan 2011, 3:43 p.m.,*
in response to message #3 by Ángel Martin

The two word GOSUB instruction (not label) does not care if the mode is in hex or dec, it works fine. The GOSUB routine (which picks up the third word) needs to be in hex mode so the alternative entry point ensures hex mode in case it was in dec.

> Quote:
>
> Thanks J-F. Pointing to the SETHEX line may not be of any help, as the address won't be properly calculated with the CPU in DEC mode!
>
> So perhaps a superfluous step, or at worst an error (if SETHEX is not done prior to the call).

Re: 41 MCODE: PANAME ROM Bugs

*Message #5 Posted by **Ángel Martin** on 22 Jan 2011, 4:19 p.m.,*
in response to message #4 by Håkan Thörngren

So effectively calling GOSUBH saves one code line, as there's no need to call SETHEX before it (as it happens with GOSUB). Nice trick...

*Message #7 Posted by **J-F Garnier** on 22 Jan 2011, 5:28 p.m.,*
in response to message #1 by Ángel Martin

Just wondering, do you have the *original* Paname source files, possibly with symbols and comments? It could be very interesting.

And BTW, there are bugs in the Paname module, related to the RGXTR and RGORD functions...

J-F

Re: 41 MCODE: PANAME ROM Bugs

*Message #8 Posted by **Ángel Martin** on 23 Jan 2011, 7:50 a.m.,*

in response to message #7 by J-F Garnier

No, I don't have any original source code for any module, or the OS either - I wish! Imagine, all the dark corners documented and explained in plain light... mmm.

What I have is "blueprints", result of disassembling plus uncountable hours of code-smithing going over the listing. Some are posted at TOS (basically my own modules), and others are still being worked on. I did the CCD and the AECROM, the PANAME is next.

These are EXCEL documents, with hyperlinks to navigate between calls and subroutines. It's quite friendly in my opinion, albeit not everybody's cup of tea.

If you're interested I'll send you a copy once it's "done".

Cheers, 'AM

HP's best scientific calculator?

*Message #1 Posted by **Jim Yohe** on 21 Jan 2011, 10:54 p.m.*

What would have been HP's best scientific calculator that can easily be carried around in ones shirt pocket? I'm kind of liking what I see in the 42s.

Re: HP's best scientific calculator?

*Message #2 Posted by **Eric Smith** on 21 Jan 2011, 11:49 p.m.,*
in response to message #1 by Jim Yohe

The 48/49/50 series (and the 38/39/40 series) are too big for a shirt pocket, so the contenders are arguably the 41C series, 15C, 32S/32SII/33s/35s, the 42S, and the 28C/28S.

If you need a way to save and load programs, the 41C series is your only choice, though it verges on being too big for a shirt pocket. The 42S is compatible with the 41C series, and better in some ways, but does not have any means of external input other then the keyboard.

The 28C/28S are the only compact RPL scientifics. They also lack external input, but have more powerful symbolic capabilities than any of the other listed models. They may be too wide for some shirt pockets.

For compact size, the 15C, 42S, and 32S/32SII/33s/35s are the best choices. I personally prefer the 15C, as it mostly avoids menus and such. You do have to remember the codes for matrix operations and conditionals, or look at the reference printed on the back of the calculator. However, the 15C also has the least available memory.

Re: HP's best scientific calculator?

*Message #3 Posted by **Michael de Estrada** on 22 Jan 2011, 2:57 p.m.,*
in response to message #2 by Eric Smith

My HP-15c is my all-time favorite. I used it steadily for 25 years as my carry-around calc, leaving other bigger calcs like my HP-48SX sitting stationary on my desk. A modern version with a faster processor and more storage memory would be awesome, but I think that's a pipe dream and is hard to justify given iPhone apps.

Re: HP's best scientific calculator?

*Message #4 Posted by **bill platt** on 22 Jan 2011, 5:38 p.m.,*
in response to message #2 by Eric Smith

I never thought about it that way but wow! To think that the last machine HP made, which is pocket sized and I/O, dates to 78 and out of production in 90. Crazy!

I think the sharps were way better from a pocketable I/O standpoint. I wish I had realized that they existed, back in the 80s. Then I might never have been so HP though...

Re: HP's best scientific calculator?

*Message #5 Posted by **Daniel Oliva** on 22 Jan 2011, 12:44 a.m.,*
in response to message #1 by Jim Yohe

Buy a large pocket shirt, put a 50g inside. I know many distingish between graphic and scientific, but in the end graphic calculators are also scientific. Hence the best HP scientific is the 50g in a large pocket shirt.

Re: HP's best scientific calculator?

*Message #6 Posted by **bill platt** on 22 Jan 2011, 5:39 p.m.,*
in response to message #5 by Daniel Oliva

That's like carrying a boat anchor around. That's a much stronger statement than a pocket protector for sure;-)

Re: HP's best scientific calculator?

*Message #7 Posted by **db (martinez, ca.)** on 22 Jan 2011, 12:45 a.m.,*
in response to message #1 by Jim Yohe

i agree with eric, and would add that if you're going to use several programs , and/or use them infrequently; get a 41 or 42. those have the ability to prompt and label output. otherwise, the 15 is the smallest, the 33 is usually the cheapest and the 35s is the best combination of easy to get into and cheap.
on the other hand; eric has *made* some pretty good RPN calcs.

Re: HP's best scientific calculator?

*Message #8 Posted by **Eric Smith** on 22 Jan 2011, 2:59 a.m.,*

I share your feelings for the 42S. In addition to the points the previous posters made: If you want to get the 42's function set plus data & program I/O plus real speed, load Free42 on your PDA or iPhone. It may even be worthwhile getting a cheap PDA for this. The only drawback is the lack of real keys.

BTW, carrying a 50g in your shirt pocket may turn you asymmetric d;-)

And FYI: Pauli & me are working on a 30b repurposing project to convert that speedy banker's gadget into a real scientific. Thomas C. joined us for porting the code on the 30b.

in response to message #20 by Monte Dalrymple

So, it's vaporware, then? Not to belittle anything as cool as a project to resurrect the HP-41, but since we were talking about "the best scientific HP calculator", I figured we'd at least be talking about calculators that, well, exist. :-)

Re: HP's best scientific calculator?

*Message #23 Posted by **Monte Dalrymple** on 24 Jan 2011, 10:01 p.m.,*
in response to message #22 by Thomas Okken

Well, _one_ exists. It's on the desk in front of me. Then there's the testbed one in the other room.

Re: HP's best scientific calculator?

*Message #24 Posted by **Thomas Okken** on 24 Jan 2011, 10:51 p.m.,*
in response to message #23 by Monte Dalrymple

So, it's like the Mercedes-Benz C111 then. It's cool, one or two of them exist, but you can't buy one. Still sounds like a prototype, i.e. something that has no place in a discussion of "best X product". In a discussion of "coolest X prototype", sure.

Mind you, I don't mean to complain. Just wanted to make sure what's what.

Re: HP's best scientific calculator?

*Message #25 Posted by **Mike Morrow** on 24 Jan 2011, 11:03 p.m.,*
in response to message #23 by Monte Dalrymple

I want my vintage calculators to be 100 percent vintage and with the original guts inside the box. What's the point otherwie?

The only thing unique about the several HP-41 units I've owned since 1980 (including the perfect condition HP-41CX a few feet away from me now) is that they all had the best keyboard "feel" of any calculator that I've ever used. But the display is, compared to anything available for the past quarter century, very terribly limited.

I wouldn't change a thing on the originals.

*Message #26 Posted by **db (martinez, ca.)** on 25 Jan 2011, 1:22 a.m.,*
in response to message #25 by Mike Morrow

Hi Mike;
I know very little about the NEWT, but i did sit next to Monte a few years ago at an HHC conference in San Jose where i got some early info. He also gave a presentation about it. One of it's minor positive points (major to me) is that this will resuscitate a lot of "brain dead" 41s that have no problems other than a zapped or otherwise damaged processor. Add that to giving buyers access to 100 4k ROMs who's manuals are available on the Museum DVD (as Diego's work has done) and you have a real users tool. Of

course, i don't have one yet but i believe that we will be able to re-write the ROMs, which will be a major win in the surveyors rom for instance. A couple of missing global labels there (local labels only) made it impossible to access key points in the programs to store data by point number and to enter horizontal curve data as it is usually found. We'll see about that. I don't care one way or the other about the speed enhancement.

The NEWT may give us capabilities we needed 30 years ago, and do that on calcs that are dead anyway. I know you program, for real uses. Keep an open mind on this, You may like it. - db

BTW: I do see the limitations in the 14/17 segment screen in that one can't display most lower case characters, but they are just sooooo pretty.

Re: HP-41CL manual

*Message #27 Posted by **Marcus von Cube, Germany** on 25 Jan 2011, 3:42 a.m.,*
in response to message #23 by Monte Dalrymple

I opt for one of the first production units if the price is right.

BTW, I checked the manual and found a few typos:

> Quote:
>
> This project never could have succeeded **with** Warren Furlow’s excellent Web site

The setup of Hepax RAM pointers seems to be buggy (too much copy&paste):

> Quote:
>
> ```
> ALPHA 808FE8-000D ALPHA
> XEQ ALPHA YPOKE ALPHA
> ALPHA 809FE7-000C ALPHA
> XEQ ALPHA YPOKE ALPHA
> ALPHA 809FE8-000E ALPHA
> XEQ ALPHA YPOKE ALPHA
> ALPHA 80AFE8-000D ALPHA
> XEQ ALPHA YPOKE ALPHA
> ALPHA 80AFE8-000F ALPHA
> XEQ ALPHA YPOKE ALPHA
> ALPHA 80BFE8-000E ALPHA
> XEQ ALPHA YPOKE ALPHA
> ```

The **8** should read **7** in both cases.

I'm missing a chapter about or even some ready to use code for "standard configurations" like Hepax development or HP-IL setup with all the necessary modules in place. A feature to save and restore named configurations would be very handy, too. I guess, most users will create focal code to accomplish this but a standardized method seems to be more appropriate.

Greetings from Germany
Marcus

in response to message #1 by Jim Yohe

The 50g is the most comprehensive and complex scientific/graphing calculator on the market. With it comes a very steep learning curve and so because of this I'm not sure it's the best.

Of the current HP scientific offerings the 33s/35s have a fairly complete set of function for most users. Both are easier to learn to use than the 50g.

Using an old analogy of the longbow and crossbow - both have their uses and skills required for mastery but when used properly both are very effective.

Regards,

John

*Message #38 Posted by **Walter B** on 22 Jan 2011, 4:39 p.m.,*
in response to message #37 by Eric Smith

A steep learning curve is a good thing to get to an achievable next level fast. If said level is too high, however, without any intermediate steps before, you may fail reaching it on said steep curve at all. Compare to mountaineering, mountain biking, etc. It all depends on the level gap in relation to the learner's energy. IIRC we had this topic recently already.

> Quote:
>
> A steep learning curve is a **good** thing. If the learning curve was shallow, it would take a very long time to learn to use it.

That's only true if you assume you have guaranteed forward motion. :-)

In the real world as I know it, steep learning curves are a **bad** thing, where people just get stuck and end up suffering a lot of needless frustration, usually caused by poor documentation. My favorite example is **vi**, which is an excellent text editor, but which also causes untold frustration... not because it is badly designed, but because most tutorials don't bother to **explain** its design. I suspect that the HP-50g suffers from the same problem. Apple's products also have a bad history in this regard (speaking from a programmer's perspective, not a user's...)

Re: HP's best scientific calculator?

*Message #43 Posted by **Eric Smith** on 24 Jan 2011, 10:01 p.m.,*
in response to message #42 by Thomas Okken

Are you using something other than time as the X axis of the learning curve, then?

Re: HP's best scientific calculator?

*Message #44 Posted by **Thomas Okken** on 24 Jan 2011, 10:33 p.m.,*
in response to message #43 by Eric Smith

I am thinking of the "learning curve" as a mountain you have to climb. As long as the grade is shallow enough, everyone can scale it, and some will do so more quickly than others. As you make it steeper, getting up becomes harder, and some people will not be able to make any progress at all once the grade gets too steep.

As long as it is possible to keep the grade shallow, we should do so. Civilization is not about bragging rights about who makes it up to the top, it is about making it possible for as many people to make it up there as we can.

What's *your* idea of the X axis of the learning curve?

EDIT: Referring to my previous post, "documentation" is "making the grade shallower". Note that I'm not advocating "dumbing down"; the mountain of knowledge will be as tall as it is regardless of what anyone will do, but that doesn't mean we can't do anything to make it easier to get up there. It is possible to understand the wheel without being forced to reinvent it.

Re: HP's best scientific calculator?

*Message #45 Posted by **Garth Wilson** on 25 Jan 2011, 12:08 a.m.,*
in response to message #44 by Thomas Okken

I guess the learning curve was not steep at all on my 41cx and 71. When they arrived (the 41cx a year or two ahead of the 71), I just started at the beginning of each manual and read through to the end, and when I was done, I felt like I knew the machine quite well, and yet I never got to the "hard part." OTOH, the manual that came with my 50g was just about worthless, so the 50g sits in a drawer, unused.

Re: HP's best scientific calculator?

*Message #46 Posted by **Eric Smith** on 25 Jan 2011, 1:09 a.m.,*
in response to message #44 by Thomas Okken

Knowledge on the Y axis, and time on the X axis. At some point the curve will approach a horizontal asymptote, which hopefully will be at a Y coordinate corresponding to the level of knowledge you want.

Re: HP's best scientific calculator?

*Message #47 Posted by **Thomas Okken** on 27 Jan 2011, 1:51 a.m.,*
in response to message #46 by Eric Smith

Hmmm, well... that's what I was afraid you meant, but with that interpretation, the learning curve might as well be vertical, that way we'd all learn everything instantly. Which, in the real world, would translate to not having any form of education, instruction, manuals, textbooks, etc., at all -- either you spontaneously "get it", or you lose.

Re: HP's best scientific calculator?

*Message #48 Posted by **Eric Smith** on 27 Jan 2011, 3:05 a.m.,*
in response to message #47 by Thomas Okken

No, that would be a nearly flat learning curve, because no matter how long you flail away at it, you never learn enough to be productive. As t approaches infinity, y stays near zero.

Re: HP's best scientific calculator?

A virtual one. Consider a fine emulator for your phone. I use Free42 mostly. But have just about every other virtual HP as well, including the very capable 49g.

If you really need to crunch a lot of numbers periodically throughout the day and a virtual HP just doesn't cut it then I'd have to throw in my vote for the 15C (followed by the 42S). The 15C is the only HP I've actually put in my shirt pocket (on the very rare occasions I actually have a shirt pocket).

I see some votes for the 50g. You are going to need a holster for that. One of the HHCers is always sporting one. Along with a backup 50g, camera, phone, PDA, tool-set, soldering iron, slide-rule (just in case), a pocket ref, a fork, etc... in other holsters. Kinda looks like Nerd Vader's utility belt. :-)

I have and been using Free42. Most definitely an amazing simulator and very customizable though I, without a doubt, prefer the "realistic" skin over any other.

No doubt the 50g would be a wonderful scientific if it weren't for the (HUGE) learning curve and also the inconvenience of so many functions embedded in layers of menus. Of course, how else could they include so many functions (quote: "over 2300") without using nested menus? A holster is the only way one could realistically carry one around unless you wore farmer's overalls. ;-)

Re: HP's best scientific calculator?

*Message #54 Posted by **Martin Pinckney** on 22 Jan 2011, 4:10 p.m.,*
in response to message #1 by Jim Yohe

"Best" is too subjective. You'll never get agreement on one (or even two or three). Eric Smith gave the best synopsis of the contenders and why.

IMO, since (besides scientific) pocketabilty was the only stated criterium, the choice is limited to a Voyager, Pioneer, or 33s/35s, and the last two are "stretching it" a little (pun intended).

And since the responses are (not surprisingly) all about RPN, I will throw in my choice from The Dark Side, the 27s. Two-line alpha-numeric display, amount of memory, included "business" functions, and that wonderful Solver are the reasons.

*Message #55 Posted by **Jim Yohe** on 23 Jan 2011, 2:34 p.m.,*
in response to message #54 by Martin Pinckney

Well, notice that I "qualified" my question about what the "best" one as one that could be carried in a shirt pocket. I know it doesn't narrow it down too much but pretty much does disqualify the larger ones with large displays (ie, 39gs, 40gs, 48gii, 50g).

I prefer the pioneer series form factor. Have always loved the size, look, and layout of my 32sii, for instance.

The 10c/11c/15c/16c/12c family is the smallest. None have digital I/O. 15c was top dog of that group.

The 20s/22s/273/32s/42s are a bit longer but just as thin. They are just a bit too tall to hide in a shirt pocket.

I hate putting calculators in shirt pockets. They fall out when you lean over to pick up the blackwing 602 you happened to have dropped.

I don't really consider any of my HP collection "pocektable" (mostly LED models) so for that duty I have several quite good emulators loaded on my iPhone 4, which defintiely IS pocketable. i41CX+ is just an incredible 41C emulator, highly recommended. And there are 15C, 42S, etc. etc. emulators on the App Store, too. Also VintageRPN which has HP-35/45/55/80 (quite good, not perfect), and GO-21 which is a really nice HP21.

Enjoy

*Message #61 Posted by **Mike Morrow** on 22 Jan 2011, 11:00 p.m.,*
in response to message #1 by Jim Yohe

Without any question or ambiguity, it's the HP 42S. It leaves its closest pocket-sized competitor, the HP-15C, in the dirt in every respect except color scheme and display clarity. It makes up for those two items by not having the abominally stupid landscape layout, an error that HP never repeated outside all those recurring HP-12C re-issues.

Most knowledgeable people evaluate the HP 42S, even today, as the best RPN calculator that has ever been made. This is astonishing for a calculator introduced in 1988. It actually says that HP hasn't given a crap about maintaining more recent similar-sized releases (32SII, 33S, 35S) with capabilities that can equal what was available 23 years ago.

If you simply wanted to know the best calculator made by anyone, without regard to size, there's nothing to compete with the HP 50G. But it's about three times the size and weight of the HP 42S, and programs in RPL, not RPN. HP can be proud of their HP 50G. But...you can get several of them new for the price you're likely to pay for a used HP 42S.

The proof is in ebay prices. These are prices being paid by users, not collectors.

Mike, I agree the portrait format makes more sense. But apparently a lot of folks either like or tolerate well the landscape format of the Voyagers. I'm not a 15c advocate; I don't even own a 12c, but since you mention eB** prices, remember the 15c also does very well in this regard.

Re: HP's best scientific calculator?

*Message #63 Posted by **Mike Morrow** on 23 Jan 2011, 12:47 p.m.,*
in response to message #62 by Martin Pinckney

Hi Martin. If I sound like I'm down on the HP-15C, that's not what I intend. I own two, one of which I used every day for eleven years even though I also owned a HP-41CX, HP 28S, HP 48SX, HP 48GX, and HP 32SII during that interval. Were it not for the stunning capabilities of the HP 42S, the 1982 HP-15C even with its adverse and pointless landscape layout would still be the finest RPN calculator ever made. But since the HP 42S appeared 23 years ago, the HP-15C has been the second best. A distant second best for sure, but still very very good.

Landscape-arranged pocket-sized calculators have a "cute and different" appeal, but are much more awkward to *actually use* as a handheld calculator. That is a very bad quality for a handheld calculator to have. Landscape scientific calculators have good purpose only when the width is small, like those "credit-card" size scientific calculators from 27 to 33 years ago. Like the Casio fx-48 (1978) and fx-98 (1984), and (best of the bunch) the Radio Shack EC-4009 (1984, made by Casio...an improved fx-98 with permutation and combination functions). BTW, now these usually bring prices approaching or exceeding those of the HP-15C or HP 42S. They are far far more difficult to find on the used market than nearly any HP calculator.

I have great hopes for the possibilities in the future if HP developes more machines along the same lines as the recent and excellent HP 30b. A calculator that had the best features of the HP 42S and the HP 30b would be the greatest scientific pocket size calculator ever. Include all HP 30b financial capabilities and HP 17BII clock/calendar functions and one would have absolute Nirvana...a calculator that literally was "one with everything"!

in response to message #64 by Keith Midson

What's wrong with the HP 42S in your collection?

Re: HP's best scientific calculator?

*Message #66 Posted by **Keith Midson** on 24 Jan 2011, 4:29 p.m.,*
in response to message #65 by Mike Morrow

I've got more 42S's in my collection than 15c's, so you have a point Mike. I think I was really just responding to the 'shirt pocket' question - I will take my 42S with me more often to a meeting or on site, but if I had to put something in my shirt pocket then i'd go for something smaller - hence the 15C. I do love both calculators though.
Interesting too - I just got the book "A Guide to HP Handheld Calculators and Computers" by Mier-Jedrzejowicz - it says that HP considered having the 15C (and all the 10 series) in portrait format before moving it to landscape. Cheers, Keith

Re: Power management and deep sleep

*Message #1 Posted by **uhmgawa** on 21 Jan 2011, 7:55 a.m.*

> Quote:
>
> Yeah, I'm familiar with what can and can't be done with the current ARMs. I am just feeling more interested from a historical/technical/personal interest.

Aside from the CMOS implementation the effective cpu cycle time is quite slow which contributes to the reduced power consumption.

In normal running mode the cpu LC oscillator is enabled, ISA bus clocks, control, and data are active, and the cpu is continuously executing instructions. The LC tank oscillates at ~880KHz for a voyager with an internal 4x divide to produce the base ~220KHz clock and the resulting 56bit 3.9KHz ISA bus cycle time. Pretty sluggish but given the application specific architecture the actual processing throughput is equivalent to what a contemporary general purpose processor can perform at 1-2MIPS in emulation.

The voyager firmware as an example doesn't spend too much time polling for user input before it times out and powers off the CPU, halts the LC oscillator, an idles all bus signals. In this mode the LCD controller is still driving the display clocked by an internal RC oscillator. Seemed a bit unconventional to find this timeout pushed into the display controller but it is quite sensible as it allows the cpu to be fully quiesced. And the 10m sleep timeout can then be clocked by the display RC oscillator at a far more power conserving ~500Hz.

Contemporary SoCs have sophisticated power management schemes and support power down of functional subsystems independently. But I find the NUT cpu design quite interesting, particular considering the relative infancy of VLSI design in 1978.

HP Solve Newsletter Jan 2011: Article about LOGs

*Message #1 Posted by **Frido Bohn** on 21 Jan 2011, 4:52 a.m.*

The article about logarithms was very inspiring (HP Solve #22, 42-50). It summarized some basic truths in a very concise
manner and gave a historic overview starting with logarithmic tables, over slide rules up to calculators - especially HP-calculators of course!
The concept of logarithms appears not easy to be approached in our linear cognition of quantities. Thus, it is not trivial
to estimate the log10 of, let's say 600 without any aids. We know, that it must be something with a "2" as the integer part,
as the number can be expressed as 6*10^2. But what about the fraction? Will it be closer to "1" or to "9"?
If we look at a linear representation of a graph of log(x) we see that the curve starts with a steep slope which decreases
as x progresses. The consequence of this is that the fractional part of log10 is higher at the beginning of the first decade
such that log10(2)= 0.30xx, whereas log10(5) = 0.69xx and log10(9) = 0.95xx.
The result is that the first fraction of log10(x) is always higher than the integer part of the respective number. So, the
estimation of log10(600) would result in a fraction somewhat higher than "6", maybe "2.7" or "2.8". As a matter of the
nature of log10, the fractional part will be identical in each order of magnitude such that log10(6 000 000)=6.7782 and
log10(600)=2.7782. In order to manage log10 one would have to learn by heart the logarithms within one order of magnitude, and that's all. But how about log2 or ln (on the basis of e)? I believe that the approach to the logarithm of
other bases than 10 is very hard in our decimal world.

Related to the concept and perception of logarithms, I found it very interesting to read an article about the Mundurucu,
an indigene culture in the Western Amazonas. A French-American group of researchers investigated the mapping of numbers
onto space in this culture and compared it to the American. The Mundurucu have no nouns for numbers beyond five.
Thereafter, they use relative quantities as "few", "more" or "many". The mapping of quantities on a line (without labels) followed a logarithmic pattern whereas the Americans made it the "linear way". The researchers concluded that our intuitive approach to quantities is rather logarithmic than linear but that we learn that the space between, for example "4" and "5" must be the same as for "8" and "9", and thus we get implanted to think in linear patterns as school kids. Indeed, experiments with children between 4 and 6 years of age show that the logarithmic mapping of quantities is also common in this period of human development.

From an evolutionary point of view, the logarithmic approach of quantities appears to be more intuitive. For our ancestors, it was important to distinguish between 2, 3 or 4 lions but it was less important to keep apart 84 from 85 or 86
gnus. In higher quantities, the distinction between 100, 200 or 300 have been of more relevance. Our perception of sound and shades, for example, follows also a logarithmic mapping and is described in Webers's law - "larger

numbers [or a
more intense sensation of sound or light] require a proportional larger difference in order to remain equally discriminable".

In conclusion, logarithms always existed. They were not just invented by John Napier. He discovered them and made them
accessible to logical reasoning. Just as Newton did not invent gravity, but he was the one who put its concept into physical laws.

Regards
Frido

Very interesting post. Let me add this:

> Quote:
>
> The result is that the first fraction of log10(x) is always higher than the integer part of the respective number.

This is true for x > 1,371. Below that point 10 lg(x) is less than x.

> Quote:
>
> ...estimation of log10(600) would result in a fraction somewhat higher than "6", maybe "2.7" or "2.8".

I'd like to add another method for estimating common logarithms - a very simple method if you're familiar with the world of photography. Due to the logarithmic property of light (our eyes see the same brightness difference if the light intensity changes by the same factor (!)) the usual aperture scale is a geometric sequence where each value is sqrt(2) times its predecessor. In other words: the common logs of the aperture values change in 0,15-steps. Which means that logs can be determined easily by simple couting:

aperture value	1	1,4	2	2,8	4	5,6	8	11
common log	0,00	0,15	0,30	0,45	0,60	0,75	0,90	1,05

In this case lg 600 is easily estimated to be a bit more than 2,75.

It gets even more precise if you're familiar with intermediate values, for instance 1/3-steps, leading to nice 0,05 logarithmic steps. So, knowing that the next 1/3 aperture step after f/5,6 is f/6,3 the unknown lg 600 has to be quite exactly in the center between 2,75 and 2,80 - and in fact it is (2,778).

Okay, this is a method specially designed for photo nerds. But I'm sure there're some of us around here... :-)

> Quote:
>
> In order to manage log10 one would have to learn by heart the logarithms within one order of magnitude

That's what most photographers have learned from the start - maybe without realizing it. They use geometric

sequences like apertures, shutter speeds and ISO-settings and at the same time they think in logarithmic exposure stops (EV).

Dieter

Dieter,

Indeed, I am one of those photo nerds. As I read Frido's post, I was thinking about this same subject, so thank you for spelling it out so well.

Logs and Photo nerds

*Message #4 Posted by **Dave Shaffer (Arizona)** on 21 Jan 2011, 5:18 p.m.,*
in response to message #2 by Dieter

Thanks for the tip on relating f-stops to logs.

I suppose that photo nerds (love the term!) have as many cameras and/or lenses as they do calculators!

The digital age has caused an explosion in my number of cameras, at least. For almost 40 years, I got by with my Pentax ME film camera and 3 lenses (28, 50, and 135 mm). (Reminds me of the durability of my HP 35 from the same era!)

In the last 5 years or so, my digital cameras included HP210, HP318, Canon XT, Canon XTi, Kodak 915, Kodak 981, Pentax K100D, Pentax K10D, and Pentax K20D. Since old Pentax lenses work on the new Pentax DSLRs, I have also acquired some 15-20 lenses (on the shopping site which must not be named).

I imagine there are a lot of other photo nerds here. Tell us what you have.

Related question: what (perhaps high-priced) item do you own whose operating lifetime is measured at a few hundred seconds?

The CCD on your digital camera?

Re: Logs and Photo nerds

*Message #7 Posted by **Dave Shaffer (Arizona)** on 21 Jan 2011, 9:35 p.m.,*
in response to message #6 by Martin Pinckney

I am thinking of Martin's answer (include the entire camera, though), although I also like Chris's answer - but he must drink his Chateau D'Yqeum fairly rapidly!! (I am looking forward to savoring my Chateau Lafitte-Rothschild 1996, that my wife bought for me back when it was affordable, for my 65th birthday in a few weeks! I think I will spend more than a few hundred seconds at that.)

Consider your camera: average exposure is perhaps 1/100 second; multiply by 20000 or 30000 pictures, and the operating life is several hundred seconds (although shutters on high-end DSLRs are typically rated for 100K or more exposures - so you gain a few more hundred seconds). If you are into time exposures, you gain a lot of "lifetime."

Re: Logs and Photo nerds

*Message #8 Posted by **Eric Smith** on 21 Jan 2011, 11:56 p.m.,*
in response to message #6 by Martin Pinckney

CCD sensors on almost all DSLRs now potentially have a much longer operating life, given that they now are used for "live preview" mode as well as for video capture.

Even on DSLRs that don't have those features, the short operating life you describe is only due to the way the device is conventionally used, and not due to any limitation of the sensor. The MTBF of the sensor is in the hundreds of thousands of hours. Some photographers use cameras for very long timed exposures.

Re: a challenge related to the 15 puzzle

*Message #1 Posted by **Don Shepherd** on 20 Jan 2011, 11:06 p.m.*

I figured out that, rather than have two loops to calculate the inversion count (which takes about 40 seoonds on the 32sii), you can actually do it while you are entering the numbers if you keep track of the numbers you have previously entered. Then, when you enter the last number, you can see the inversion count immediately. This 32sii program implements that algorithm.

```
This version of the 15 puzzle solvability program is for the 32sii and not the 32s
because it uses the exchange x with a register command which is not on the 32s.
Since I got the 32sii I've been looking for a reason to use this command
and this is it!

This version calculates the cumulative inversion count as the 16 numbers are entered, so
once you enter the last number it tells you the inversions instantly, with no waiting.

Usage:

XEQ A
enter first number
R/S
enter second number
R/S
.
.
.
enter 16th number
R/S

it then displays the inversion count; even number means the puzzle can be solved.

Registers:

A-O - set to 1 when the corresponding number is entered
P   - inversion count (even means solvable)
Q   - main loop index
i   - indirect addressing and second loop index

Code:

lbl a      entry point
clrvars
1.016      initialize loop to enter 16 numbers
sto q      main loop index
lbl b      begin main loop
r/s        enter the next number (0 for empty space)
x=/=0      if empty space, calc row number and update P
goto c     for 1-15
3
rcl+q
4
/
ip
sto+p      update inversion count with row # of empty cell
goto x     iterate main loop
lbl c      handle 1-15
```

```
x<->i       move # to i
1
sto (i)     put a 1 in A-O when number is found
x<->i       get number back in x
1           add x-1 to p, max possible inversions
-
sto+p
x=0         if 0 this is number 1, so nothing can be to it's left
goto x      so iterate main loop
1000        otherwise loop from 1 to (x-1) and subtract what
/           you find there from p
1
+
sto i       so input number 7 would cause loop from 1 to 6
lbl d       begin loop
rcl(i)      will be 0 or 1
sto-p       subtract from inversion count
isg i       iterate loop
goto d
lbl x       iterate main loop now
isg q
goto b      continue main loop to enter next number
rcl p       display inversion count
rtn         all done
```

Five-minute challenge

*Message #1 Posted by **David Hayden** on 20 Jan 2011, 2:00 p.m.*

A friend at work posed this math problem to me the other day. It isn't realistic, but it's still interesting - particularly because answer is surprising.

A steel company has developed an experimental railroad rail. They can make very long rails without joints so they fabricate one that is 1 mile long (5280 feet). They lay it out straight and fix the endpoints to the ground. A few hours later, the rail had expanded in the midday heat. This expansion has added 1 foot of length to the rail, so now it is 5281 feet long. The end points are still attached to the ground, so the rail has warped and is no longer straight.

Assume that the rail bends in a circular arc. The question is "how much has the rail warped at the mid point?" In other words, after adding 1 ft of length, the whole rail has bent. How far is the mid point of bent rail from it's original position?

Without doing any calculations, guess the answer.
Can you come up with a rough approximation that can be computed on a 4-banger?
Can you find the exact (within 2 decimal places) answer?

Re: Five-minute challenge

*Message #2 Posted by **Don Shepherd** on 20 Jan 2011, 3:31 p.m.,*
in response to message #1 by David Hayden

Very interesting problem. Before doing any math, I guessed maybe .1 inch. So I played with the math, circles, circumference, diameter, radius, and calculated the answer of 3.84 inches, but I have no idea if my assumptions are correct so I wouldn't bet any money on that answer.

I'm looking forward to some answers from those engineers who know much more than I.

Thanks for the challenge on a snowy day in Louisville.

Don

Re: Five-minute challenge

*Message #3 Posted by **Katie Wasserman** on 20 Jan 2011, 4:43 p.m.,*
in response to message #2 by Don Shepherd

Off the top of my head, I think that this is like the "string around the earth" problem. My guess is that it's going to be really high in the middle.....

While not at all accurate: figure this is approximately a right triangle with the hypotenuse being 1/2 of the new length (2640.5) and the long side being 1/2 of the original length (2640). That makes the height 51+ feet.

Re: Five-minute challenge

*Message #4 Posted by **Walter B** on 20 Jan 2011, 5:15 p.m.,*
in response to message #3 by Katie Wasserman

I did guess less than a foot. Calculating with good ol' Pythagoras I get 51.4 feet. Surprise!

Re: Five-minute challenge

*Message #5 Posted by **Walter B** on 20 Jan 2011, 5:26 p.m.,*
in response to message #4 by Walter B

First order approximation according to good ol' Taylor results in SQRT(2640) = 51.4 as well.

Re: Five-minute challenge

*Message #6 Posted by **Martin Pinckney** on 20 Jan 2011, 4:46 p.m.,*
in response to message #1 by David Hayden

> Quote:
>
> Can you find the exact (within 2 decimal places) answer?

44.52 feet.

Yes, I was surprised at how much.

Katie's estimate wasn't too bad.

Re: Five-minute challenge

*Message #7 Posted by **David Hayden** on 20 Jan 2011, 10:09 p.m.,*
in response to message #6 by Martin Pinckney

Martin, I get 44.4985 on my 50g. I get 78,335.0805ft for the radius of the circle. One of us is probably having a rounding error.

I'll wait a day or two before posting details of the solution. I too was surprised at how big the deflection is. I was also surprised at how far off the "assume a right triangle" approximation is.

Dave

Re: Five-minute challenge

*Message #8 Posted by **Gerson W. Barbosa** on 20 Jan 2011, 10:44 p.m.,*
in response to message #7 by David Hayden

I've found similar results using the HP-33s Solver:

```
R*SIN(2640.5/R)=2640                    ->     R=
                                                78,335.0803155

ENTER ENTER 2640 x<>y / ASIN COS * -      ->   44.4984551
```

Gerson.

Re: Five-minute challenge

*Message #9 Posted by **Werner** on 25 Jan 2011, 5:49 a.m.,*
in response to message #8 by Gerson W. Barbosa

```
For those with a 42S, a general inverter:

00 { 42-Byte Prgm }
01*LBL "INV"
02 FC? 45
03 GTO 00
04 RCL "X"
05 XEQ IND "A"
06 RCL- "Y"
07 RTN
08*LBL 00
09 ASTO "A"
10 PGMSLV "INV"
11 STO "Y"
12 CLX
13 STO "X"
14 1
15 SOLVE "X"
16 END

The fact that it's 42 bytes is a coincidence ;-)

usage:
ALPHA: name of function to invert (F)
X: value Y for which F(X) = Y
XEQ "INV" -> X

eg. to find the value of X for which SINC(X) = 5280/5281, do:

1. define the function SINC(x) = SIN(x)/x for x#0, = 1 for x=0

01*LBL "SINC"
02 X=0?
03 GTO 00
04 SIN
05 LASTX
06 /
07 RTN
08*LBL 00
09 SIGN
10 END

2.A: "SINC"
  X: 5280 5281 /
  XEQ "INV" -> 3.37077587945e-2
```

Re: Five-minute challenge

*Message #10 Posted by **Dave Shaffer (Arizona)** on 20 Jan 2011, 10:10 p.m.,*
in response to message #6 by Martin Pinckney

I get 44.50 feet (pretty close to Martin's answer).

This is why you need expansion joints in concrete sidewalks and roads. Otherwise, a bit of thermal expansion will cause considerable heaving.

Re: Five-minute challenge

*Message #11 Posted by **Thomas Okken** on 20 Jan 2011, 11:56 p.m.,*
in response to message #10 by Dave Shaffer (Arizona)

> Quote:
>
> This is why you need expansion joints in concrete sidewalks and roads. Otherwise, a bit of thermal expansion will cause considerable heaving.

It is my understanding that those extremely long railway rails basically aren't allowed to expand, i.e. they are anchored firmly enough to prevent them from buckling, and when they heat up or cool down, away from their "nominal" temperature, they just become compressed or stretched, respectively, but they don't move. Anyone who actually knows modern railway engineering firsthand, please correct me. :-)

Edited: 21 Jan 2011, 12:01 a.m.

Re: Five-minute challenge

*Message #12 Posted by **Paul Gaster** on 21 Jan 2011, 12:35 a.m.,*
in response to message #11 by Thomas Okken

Sounds like some rails designs have gaps and others are just restrained from moving like you said. See here:

http://en.wikipedia.org/wiki/Track_(rail_transport)

Re: Five-minute challenge

*Message #13 Posted by **Karl Schneider** on 20 Jan 2011, 11:13 p.m.,*
in response to message #6 by Martin Pinckney

(While I was busily writing, David Hayden, Gerson, and Dave Shaffer were posting identical results using what appears to be the same approach...)

I'd say that Martin's answer is correct, or very nearly so. I got 44.4984551 feet on my HP-32SII.

At a family gathering in the 1970's, I remember my *(non-railroad)* engineer grandfather reading this problem and giving the answer for a straight expanded track. He, too, found the height of about 50 feet to be greater than expected. It really illustrates the importance of expansion joints in bridges, lest severe buckling occur during heat waves.

The trigonometric solution for the straight expanded track is simple:

$0.5 * \mathrm{sqrt}(5281^2 - 5280^2) = 51.3833630665$

Solving for the circular-arc expanded track proved to be more complicated. I got the answer from iterative solution of the well-known sinc function *[sin(x) / x]*.

(For a graphical illustration, please refer to Thomas Klemm's post deeper in this thread. Notational conversion: A/2 = x; h = e; d = L-1)

```
Define the following:

L is the total length of the arc of expanded track
d is the original length of straight track
r is the radius of the circular arc of track
A is the angle of the full arc [radians]
y is the vertical distance from the center of the arc circle to the track surface
```

Then,

1. L/2 = r * A/2
2. d/2 = r * sin (A/2)
3. d/2 = y * tan (A/2)

Some algebra using equations 1 and 2 yields

$$\frac{\sin (A/2)}{(A/2)} = \frac{d}{L}$$

With d = 5280 ft and L = 5281 ft,

SOLVE on the HP-32SII and HP-42S yields

A/2 = 0.0337077587945 rad

The rise of the track (h) = r - y

From equations 1 and 3,

$$h = \frac{L/2}{A/2} - \frac{d/2}{\tan (A/2)}$$

h = 44.4984551

Alternatively from equations 2 and 3,

$$h = d/2 * \left[\frac{1}{\sin (A/2)} - \frac{1}{\tan (A/2)} \right]$$

h = 44.49845532

The HP-15C, HP-34C, and HP-41/Advantage produce the following results:

A/2 = 0.03370777144 rad

h = 44.49846

Gerson stated below that the answer correct to 12 digits is

h = 44.4984550191

which is a bit lower than either of my results.
The differences are explained by last-digit roundoff error.

Addendum

WolframAlpha can be utilized to solve many digits of an equation.

Formula:

```
sinc(x) = 5280/5281

==>  x  = 0.033707758809879429348218 4983
```

This value can be used in Windows calculator to calculate the rise (h) to 24 digits or so:

```
    2640.5    2640
h = ------ - -------
      x      tan(x)

h =  44.4984550191007992545541 6...
```

Another place where expansion has to be taken into account is piping systems. We do hot/chilled water piping design and are very careful to allow for the expasion/contraction that can take place in the system. In underground piping systems, concrete thrust blocks are added at bends to ensure that the expansion takes place in the expansion joints and not have the pipe move at the direction change. It's not uncommon to have miles of underground piping on a large campus environment.

But I have to admit, I was somewhat supprised at the 50 feet expansion over one mile.

Bill

> But I have to admit, I was somewhat surprised at the 50 feet expansion over one mile.

To be technically precise, the *lateral displacement* was (roughly) 50 ft. The expansion was 1 ft. Incidentally, this corresponds to about 23 degrees F temperature rise.

Thanks, Martin, I was just going to check this out. Here in my area (southern Brazil), 40 °F temperature rise or greater is not uncommon.

You're right - Expansion is only 1 foot.

Thanks,

Bill

> *(While I was busily writing, David Hayden, Gerson, Dave Shaffer were posting identical results using what appears to be the same approach...)*

I don't remember the word you used in your first version of this text in place of busily. It was not diligently, but it had a close meaning and expressed better what you did. Congratulations for the nice work and your detailed and didactic explanations, as always. It takes time to provide a complete solution as you have done. Most here just don't have time to, anyway it is a good thing they occasionally take the time to solve problems and post the results so we can compare them to our own. As of me, I am just kind of lazy.

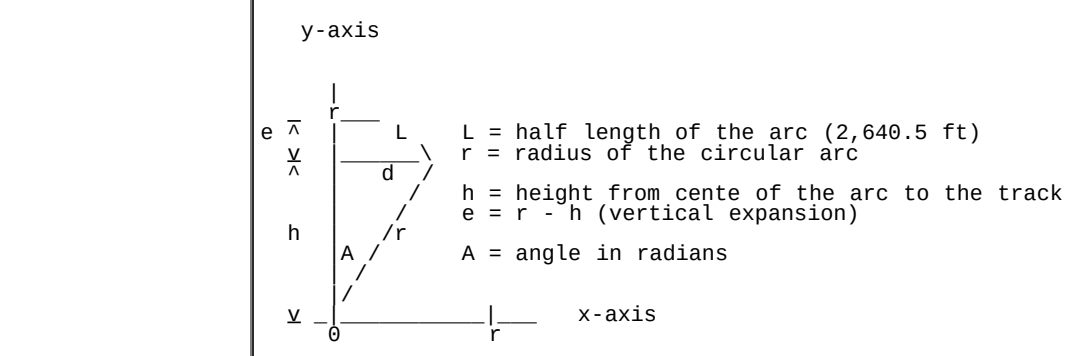
> Quote:
>
> I'd say that Martin's answer is correct, or very nearly so. I got 44.4984551 feet on my HP-32SII.

I do agree. Martin is a Civil Engineer, if I am not wrong, so his two-digit answer is good enough for practical purposes. I remember myself solving transmission lines problems (involving grossbeak aluminum cables and other birds names) and the answers to six decimal places during examinations, when two would have sufficed. My professor found that strange but would never say anything :-)

> Quote:
>
> Solving for the circular-arc expanded track proved to be more complicated.

I am glad you have said this. So, I am not the only one :-)

Here is my solution, using a similar approach. Yesterday, at first I had used an expression involving the ASIN function at first, then switched to SIN. I have decided to use ASIN again, only because it's similar to the answer I got through Calculus. Anyway, both are equivalent:



Using

$$2L = r*2A \text{ (length of arc subtended by central arc)}$$

and

$$\sin(A) = \frac{d}{r}$$

We get $$A = \frac{L}{r}$$

and $$A = \arcsin\left|\frac{d}{r}\right|$$

which implies

$$L = r*\arcsin\left|\frac{d}{r}\right|$$

Replacing L and d with their known values, 2640.5 and 2640, respectively, we get

$$r*\arcsin(2640/r) = 2640.5$$

when solved for r (initial estimate r = 50,000) on the HP-32SII in radians mode yieds

$$r = 78{,}335.0808851 \text{ ft}$$

We are now able to compute the vertical expansion e:

From the drawing (well, sort of),

$$h = \sqrt{r^2 - d^2}$$

```
           h = sqrt(78,335.0808851^2 - 2640^2)

           h = 78,290.5824303 ft

           e = r - h

           e = 78,335.0808851 ft  - 78,290.5824303 ft
```

e = 44.4984548 ft

This morning, hoping to avoid the solver, I tried Calculus. It turns out I got the same equation:

From the Length of an Arc Formula:

```
    L = Integrate(x=a, b, sqrt(1+[f'(x)]^2)dx)
    (SCHWARTZ Abraham, Calculus and Analytic Geometry. Holt, Rinehart and Winston, 3rd edition)

    f(x) = sqrt(r^2 - x^2)

    f'(x) = x*sqrt(r^2 - x^2)/(x^2 - r^2)

    [f'(x)]^2 = -x^2/(x^2-r^2)

    L = Integrate(x=O, 2640, sqrt(1 - x^2/(x^2 - r^2)))

    L = r*arcsin(2640/r)
```

or r*arcsin(2640/r) = 2640.5

On the HP-50g:

```
    'sqrt(R^2-X^2' DERVX x^2 1 + sqrt   -->  'ABS(R)/ABS(R^2-X^2)*SQRT(R^2-X^2)'

                                INTVX   -->  'ASIN(X/R)*(R*SIGN(R)/SIGN(R^2-X^2))'
```

Since R > 0 and X=2640 > 0, this simplifies to

```
    'R*ASIN(X/R)')
```

Regards,

Gerson.

in response to message #18 by Gerson W. Barbosa

Gerson --

Thank you for the compliments. My only objective was to solve the problem with minimal effort in a straightforward fashion using the 'favored' tools we have at our disposal, and to show the procedure clearly. I believe that I'd examined a problem like this one before, but could not readlity deduce any apparent trigonometric formula to solve it.

The mathematical work done by you and Thomas Klemm in particular was more impressive, and Thomas also prepared a nice diagram to accompany his symbolic algebra.

Of course, the algebraic methods of estimation worked only because the angle was very small. In the days before calculators and computers, I suppose that an engineer or architect would refer to pre-calculated tables of the 'sinc' function to solve it. The function is used in signal processing.

-- Karl

Re: Five-minute challenge

*Message #21 Posted by **Gerson W. Barbosa** on 22 Jan 2011, 9:04 p.m.,*
in response to message #20 by Karl Schneider

Thanks, Karl, for your comments. As of the sinc function, I thought of finding an approximation for it to make the solution not dependant of the solver. Sinc(x) ~ cos(x*sqrt(3)/3) might be an option and would have yielded 3 correct decimal places in your method (44.49827). The constant has no mathematical meaning, but works for small angles. That's cheating, however...

Gerson.

Re: Five-minute challenge

*Message #23 Posted by **Gerson W. Barbosa** on 22 Jan 2011, 10:49 p.m.,*
in response to message #22 by Paul Dale

That was found when solving SIN(A)/A-COS(A*X)=0 for X, A=3.37077587945e-2 (that's A/2 in Karl's post above). I got X=5.7734397696e-1 which is very close to sqrt(3)/3 (off by 7.29e-6). For X=0.5 up to X=1 the difference ranges from 1.e-5 to 6.6e-3. I tried a correction term but I discarded it because it was not suitable for the problem (y ~ cos(x*sqrt(3)/3)+(2+sqrt(3))/1000*x^4).

> The constant has no mathematical meaning,

I should have said "the constant has no mathematical meaning I am aware of". Sqrt(3)/3 appears to be the exact value for k in y = sinc(x) - cos(k*x) that yields maximum accuracy. A little more or a little less will degenerate the approximation and make the function either change sign or oscillate around zero. The Wolfram Alpha's graph can show y(x) is always positive until the range is narrowed down to [-1e-3, 1e-3], when the machine precision limit is reached.

By the way, an exact equivalence is

```
sinc(x) = 1/(Gamma(1 + x/pi)*Gamma(1 - x/pi))
```

(See MathWorld Sinc Function page, formula #10)

in response to message #1 by David Hayden

Yeah, as someone mentioned, this problem is similar to the "rope around the world" problem, which was mentioned here.

There, an extra meter in the length of the rope caused it to be raised up ~120 meters over the surface of the earth.

Re: Five-minute challenge

*Message #28 Posted by **Crawl** on 21 Jan 2011, 6:38 p.m.,*
in response to message #27 by Crawl

This problem has been solved a lot, but not a lot has been said about why the answer is so huge for a such a small input, so I want to talk about that.

The reason is that the answer function does not have a Taylor series -- at least not at x=0 (if x is the slack in the rope around the world, or the expansion of the railroad).

For the "rope around the world" problem, the first step (in my solution) was to solve

-y + 2 tan(y/2) = x/r

taking the taylor series of the left side, that's

y^3/12=x/r

or

y = cuberoot(12*x/r)

Then you plug y into

r*(cos(y/2)+sin(y/2)*tan(y/2)-1)

The lowest taylor series there is

r*y^2/8.

So finally, the height is

2^(1/3)*r/4*(3*x/r)^(2/3)

So, the height goes as x^(2/3) power. This has infinite slope at x=0, explaining why the answer grows so rapidly even for very small x.

I also should point out that that first order approximation is accurate enough to agree to all 5 digits of my originally quoted answer.

For the railroad problem, not showing my work (there was way more work, at least for me, than the rope problem), but the final answer to first approximation is

sqrt(6*m*x)/4

with m=5280, and x=1, this gives 44.497

Note: In form, this is very similar to the trigonometric solution, but is much more accurate! The trigonometric solution to first approximation is sqrt(2*m*x)/2 ~ 51.38 for the given values.

Before going through the work myself, I might have thought the first approximation formulas (trigonometric versus circular) would be the same, but they're not.

But again, the answer goes as squareroot of x, which has infinite slope at x=0.

Sort of interesting that the basic idea of the problems is so similar, as well as the large increase in the answer for small values of x, but the power dependency on x for the two problems is different.

Re: Five-minute challenge

*Message #29 Posted by **Crawl** on 21 Jan 2011, 7:08 p.m.,*
in response to message #28 by Crawl

But doesn't it seem like there should be a simple explanation for the factor of sqr(3)/2 difference between the two methods?

If so, that with the trigonometric approach would seem to be the simplest method to solve the problem.

Re: Five-minute challenge

*Message #30 Posted by **Crawl** on 24 Jan 2011, 1:53 p.m.,*
in response to message #29 by Crawl

I think I figured that out, and in the process came up with a slightly different way to solve the problem.

Imagine that we have the normal "small angle" slice of a circle.

Let's just set r=1. The green line is sin(t), the blue line (after a bit of geometry) is sqrt(2(1-cos(t))), and the black arc is of course t.

What we want to find out is how the blue line and the black arc compare to the green line when t is small.

The taylor series of sqrt(2(1-cos(t)))/sin(t) = 1+t^2/8

The taylor series of t/sin(t)= 1 + t^2/6

So, if the green line is normalized to 1, the blue line (trigonometric solution) is normalized to 1+t^2/8, and the circle is a little bit larger (naturally), 1+t^2/6.

t^2/6 IS the added length (or half of it, but it doesn't really matter since we're normalizing everything)

Since the green line is normalized to 1, that basically means we're dividing by m. The extra length is then x/m.

This means t = sqrt(6x/m)

plugging that into t^2/8 (the extra for the trigonometric case), we get 3x/(4m).

In other words, if we replace the extra length x/m with the "adjusted" extra length 3x/(4m), we can use the trigonometric solution and get the same answer.

The trigonometric solution was m*sqrt(2(x/m))/2.

So the real correct solution is m*sqrt(2 (3x/4m))/2 = sqrt(6xm)/4.

By the way, I see some people elsewhere in the thread concerned about accuracy for the sinc function. It's probably not worth worrying about. Even this first order solution agrees with the actual solution to within 1% for as much as a 350 foot expansion!!

Re: Five-minute challenge

*Message #31 Posted by **Thomas Klemm** on 24 Jan 2011, 10:05 p.m.,*
in response to message #30 by Crawl

Very nice!

But I think we can do without the indirection of the "trigonometric solution", once we realize that the small angle in the green-red-blue triangle is in fact *t/2*.

$$\frac{t}{\sin t} = \frac{m+x}{m}$$

$$1 + \frac{t^2}{6} + \cdots = 1 + \frac{x}{m}$$

$$t \doteq \sqrt{\frac{6x}{m}}$$

Now we can use *t* to calculate the lateral displacement *e*:

$$e = \frac{m}{2} \cdot \tan \frac{t}{2}$$

$$\tan \frac{t}{2} = \frac{t}{2} + \cdots$$

$$e \doteq \frac{m}{2} \cdot \frac{t}{2} = \frac{\sqrt{6xm}}{4}$$

Cheers
Thomas

Re: Five-minute challenge

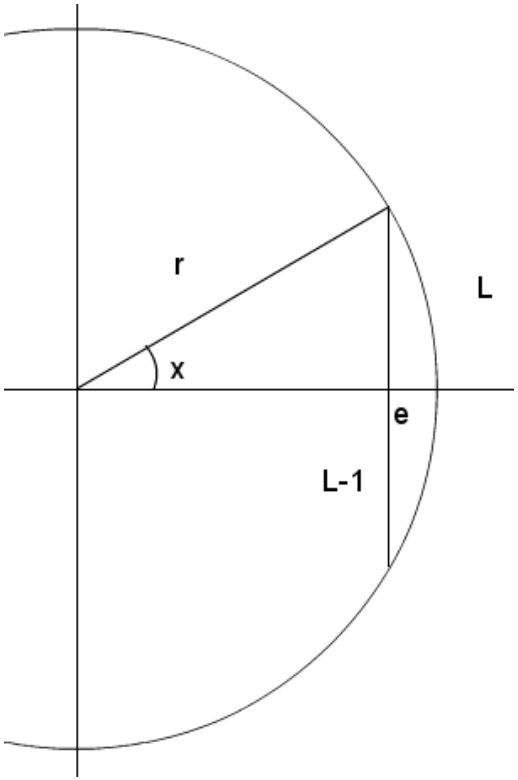
in response to message #1 by David Hayden

Quote:

Can you come up with a rough approximation that can be computed on a 4-banger?



Just using the Taylor expansion of the trigonometric functions I got:

$$\frac{\sin x}{x} \doteq 1 - \frac{x^2}{6} = \frac{L-1}{L} = 1 - \frac{1}{L}$$

$$\frac{x^2}{6} = \frac{1}{L} \Rightarrow x = \sqrt{\frac{6}{L}}$$

$$L = 2x \cdot r \Rightarrow r = \frac{L}{2x} = L \cdot \sqrt{\frac{L}{24}}$$

$$\cos x \doteq 1 - \frac{x^2}{2}$$

$$1 - \cos x \doteq \frac{x^2}{2} = \frac{3}{L}$$

$$e = r \cdot (1 - \cos x) = L \cdot \sqrt{\frac{L}{24}} \cdot \frac{3}{L} = \sqrt{\frac{3L}{8}}$$

$$L = 5281 \Rightarrow e = \sqrt{1980.375} \doteq 44.5014$$

> Quote:
>
> I was also surprised at how far off the "assume a right triangle" approximation is.

This shows you can do better even without a fancy solver.

Cheers
Thomas

Re: Five-minute challenge

*Message #33 Posted by **Crawl** on 22 Jan 2011, 8:09 a.m.,*
in response to message #32 by Thomas Klemm

Okay, so your formula looked like my formula. So why did mine give a slightly better result?

They're not actually the same. Mine was

sqr(3*m*x/8)

while yours was (effectively, since you substituted in x=1)

sqr(3*(m+x)*x)/8)

That's actually not a first order formula, since it has an x^2 term. If m is large compared to x, you drop x in m+x.

You might think going to second order would improve the accuracy, not decrease it, but that might not be the correct second order approx., if second order terms were dropped earlier.

Honestly I must admit that I didn't realize that you provided a solution to this problem but was thinking you were only dealing with the rope problem. I'd be interested to see your approach and might not be the only one.

Best regards
Thomas

Re: Five-minute challenge
*Message #35 Posted by **Crawl** on 22 Jan 2011, 11:16 a.m.,*
in response to message #34 by Thomas Klemm

The approach is exactly the same in terms of setting up the problem. You just have to be careful when selecting the number of terms to retain.

I went ahead and got the second order solution. It is

y = sqrt(6mx + 9/5 x^2)/4

That gives an answer that agrees with the "exact" answer to at least 8 places.

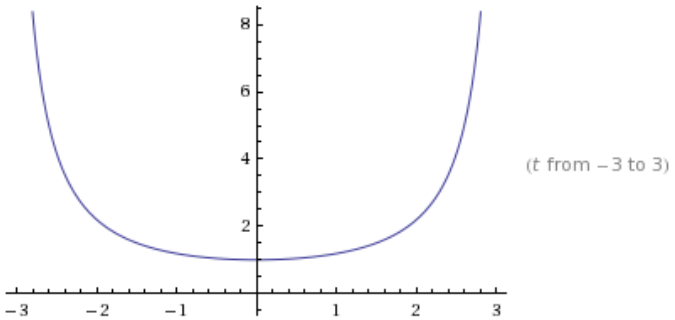
Re: Five-minute challenge
*Message #36 Posted by **Thomas Klemm** on 26 Jan 2011, 10:30 a.m.,*
in response to message #35 by Crawl

Power Series of Equation

Instead of solving the following equation for *t* I tried to calculate the inverse of the Taylor expansion using WolframAlpha.

$$\frac{t}{\sin t} = \frac{m+d}{m} = 1 + \frac{d}{m} = 1 + y$$

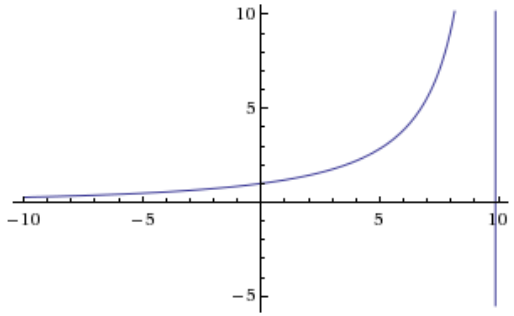
As can be seen by the graph there's a minimum at the point *(0, 1)*.



This makes the inversion difficult since the first derivative of the inverse function is infinite. Thus I use the following substitution:

$$x = t^2 => t = \sqrt{x}$$

Now the graph has a positive derivative:



(*x* from −10 to 10)

This leads to the following equation:

$$\frac{\sqrt{x}}{\sin\sqrt{x}} = 1 + y$$

Let's try to find the Taylor series expansion:

```
Series[Sqrt[x]/Sin[Sqrt[x]], {x, 0, 4}]
```

$$1 + \frac{x}{6} + \frac{7\,x^2}{360} + \frac{31\,x^3}{15\,120} + \frac{127\,x^4}{604\,800} + O\left(x^5\right)$$

Thus we end up with:

$$y(x) = \frac{x}{6} + \frac{7x^2}{360} + \frac{31x^3}{15120} + \frac{127x^4}{604800} + \cdots$$

Inversion of Power Series

Starting with the equation *f(y(x)) = x* I calculated little by little the derivations:

```
D[x=f[y[x]],{x,1}]
```

$$\frac{d}{dx}(x = f(y(x))) = (y'(x)\,f'(y(x)) = 1)$$

```
D[x=f[y[x]],{x,2}]
```

$$\frac{d^2}{dx^2}(x = f(y(x))) = \left(y'(x)^2\,f''(y(x)) + y''(x)\,f'(y(x)) = 0\right)$$

```
D[x=f[y[x]],{x,3}]
```

$$\frac{d^3}{dx^3}(x = f(y(x))) =$$
$$\left(f^{(3)}(y(x))\,y'(x)^3 + 3\,y'(x)\,y''(x)\,f''(y(x)) + y^{(3)}(x)\,f'(y(x)) = 0\right)$$

```
D[x=f[y[x]],{x,4}]
```

$$\frac{d^4}{dx^4}(x = f(y(x))) = \left(f^{(4)}(y(x))\, y'(x)^4 + 6\, f^{(3)}(y(x))\, y'(x)^2\, y''(x) + f''(y(x))\left(3\, y''(x)^2 + 4\, y^{(3)}(x)\, y'(x)\right) + y^{(4)}(x)\, f'(y(x)) = 0\right)$$

From the coefficients of the power series we can easily calculate the derivation at x = 0:

```
y'[x] = 1/6
y''[x] = 7/180
y'''[x] = 31/2520
y''''[x] = 127/25200
```

If we put these values into the equations below we get a system of linear equations:

```
f'[y[x]] y'[x] == 1
y'[x]^2 f''[y[x]] + f'[y[x]] y''[x] == 0
3 y'[x] f''[y[x]] y''[x] + y'[x]^3 f'''[y[x]] + f'[y[x]] y'''[x] == 0
6 y'[x]^2 y''[x] f'''[y[x]] + f''[y[x]] (3 y''[x]^2 + 4 y'[x] y'''[x]) + y'[x]^4 f''''[y[x]] + f'[y[x]] y''''[x] == 0
```

solve	$\begin{pmatrix} \frac{1}{6} & 0 & 0 & 0 \\ \frac{7}{180} & \frac{1}{36} & 0 & 0 \\ \frac{31}{2520} & 3\times\frac{1}{6}\times\frac{7}{180} & \frac{1}{216} & 0 \\ \frac{127}{25200} & \frac{49}{10800}+4\times\frac{1}{6}\times\frac{31}{2520} & 6\left(\frac{1}{6}\right)^2\times\frac{7}{180} & \frac{1}{1296} \end{pmatrix}$.{f1, f2, f3, f4} = {1, 0, 0, 0}	for	f1, f2, f3, f4

```
Solve[{
{1/6, 0, 0, 0},
{7/180, (1/6)^2, 0, 0},
{31/2520, 3*1/6*7/180, (1/6)^3, 0},
{127/25200, 3*(7/180)^2+4*1/6*31/2520, 6*(1/6)^2*7/180, (1/6)^4}
}.{f1,f2,f3,f4}=={1,0,0,0},{f1,f2,f3,f4}]
```

Here's the solution:

$$f1 = 6 \text{ and } f2 = -\frac{42}{5} \text{ and } f3 = \frac{3384}{175} \approx 19.3371 \text{ and } f4 = -\frac{11016}{175} \approx -62.9486$$

From these values we can finally calculate the coefficients of the inverse power series:

$$x(y) = 6y - \frac{21y^2}{5} + \frac{564y^3}{175} - \frac{459y^4}{175} + \cdots$$

Calculation of the lateral displacement

We use the same formula as before:

$$e = \frac{m}{2} \cdot \tan\frac{t}{2}$$

Now we plug the expression for *t* into $4\ tan^2(t/2)$ and calculate the power series of that:

```
Series[4 Tan[Sqrt[6y-21y^2/5+564y^3/175-459y^4/175]/2]^2,{y,0,4}]
```

$$6\,y + \frac{9\,y^2}{5} - \frac{27\,y^3}{350} + \frac{27\,y^4}{700} + O(y^5)$$

After a last substitution *y=d/m* we finally get:

$$e \doteq \frac{\sqrt{6md + \frac{9d^2}{5} - \frac{27d^3}{350m} + \frac{27d^4}{700m^2}}}{4}$$

Using only the first three terms I get the same value to 12 places as Gerson stated in message #36:

> Quote:
>
> e = 44.4984550191

Cheers
Thomas

PS: *InverseSeries* and *ComposeSeries* don't seem to work with WolframAlpha. That would have made this much easier.

Re: Five-minute challenge

*Message #37 Posted by **Gerson W. Barbosa** on 26 Jan 2011, 8:44 p.m.,*

Impressive work! You and Crawl have derived an elegant and compact formula for a non-trivial problem.

Here are the numeric results the formula gives gives out, from 1st through 4th order:

```
1st: 44.497190922573977692
2nd: 44.498455029360289016
3rd: 44.498455019099827724
4rd: 44.49845501910079 9359

actual: 44.498455019100799255
```

The latter agrees with the actual result to 17 significant digits!

In order to get all those digits, I had to ask WolframAlpha for a numeric solution (the limit of my skills). First "solve r*arcsin(5280/(2*r))=5281/2 for r", then using the numeric value for r thus obtained: "78335.08050455416533561551559 - sqrt(78335.080504554165335615515592 - 5280^2/4)".

Regards,

Gerson.

Re: Five-minute challenge

*Message #38 Posted by **Thomas Klemm** on 27 Jan 2011, 9:16 a.m.,*
in response to message #37 by Gerson W. Barbosa

Meanwhile I had access to Mathematica where the whole thing is **much** easier:

```
4 Tan[Sqrt[InverseSeries[Series[Sqrt[x]/Sin[Sqrt[x]] - 1, {x, 0, 6}]]]/2]^2
```

$$6x+\frac{9x^2}{5}-\frac{27x^3}{350}+\frac{27x^4}{700}-\frac{58887x^5}{2695000}+4\left(\sqrt{6}\left(\frac{9590497281\sqrt{\frac{3}{2}}}{44844800000}+\frac{1}{6}\left(-\frac{991213011\sqrt{\frac{3}{2}}}{1379840000}-\frac{93447\sqrt{6}}{336875}\right)\right)-\frac{3147579}{1971200000}\right)x^6+O\left(x^{13/2}\right)$$

Funny to see how the coefficients start to become very complicated.

Just out of curiosity: Is it possible to do something like this with the CAS of the HP-50g?

Cheers
Thomas

I fear the HP-50g lacks InverseSeries, otherwise I think it would handle that.

By the way, I've just found someone else's attempt:

http://www.moderatenerd.com/2009/12/15/the-expanding-rail-problem/

Cheers,

Gerson.

Thanks for both the answer and the link. Looks promising. It seems there's nothing new under the sun and Google has an answer to every question.

Cheers

Thomas

Re: Five-minute challenge

*Message #41 Posted by **Gerson W. Barbosa** on 31 Jan 2011, 1:53 p.m.,*
in response to message #38 by Thomas Klemm

> Quote:
>
> Funny to see how the coefficients start to become very complicated.

Thomas,

The sixth term simplifies to 683073/50050000*x^6:

http://www.wolframalpha.com/input/?i=4*%28sqrt%286%29*%289590497281*sqrt%283%2F2%29%2F44844800000%2B1%2F6*%28-991213011*sqrt%283%2F2%29%2F1379840000-93447*sqrt%286%29%2F336875%29%29-3147579%2F1971200000%29

It would be interesting if there was a way to force the first terms to be left unsimplified, to see how they generalize (if they do at all).

Cheers,

Gerson.

Actually, your solution meets David Hayden's second question (*"Can you find the exact (within 2 decimal places) answer?"*) while being able to do it on a 4-banger. Well done!

> Quote:
>
> > Quote:
> >
> > I was also surprised at how far off the "assume a right triangle" approximation is.
>
> This shows you can do better even without a fancy solver.

By resorting to Pythagoras instead to the Taylor's series for cosine, the approximation is improved:

$e = r$ - sqrt(r^2 - ((L-1)/2)^2)

$e = L*sqrt(L/24)$ - sqrt(L^3/24 - (L-1)^2/4)

e = 44.4971906

That's very close to Crawl's approximation but, unlike his or yours, far from concise.

Adding another term to the first series would require solving a quartic equation in order to find the radius. Fortunately, it is reducible to a quadratic equation and can be done by hand. Eventually I got, following your steps:

$r = L$/(2*sqrt(10*(1-sqrt(1-6/(5*L)))))

which, when plugged into the first equation above, yields

e = 44.498455 (44.49845 on the HP-12C and probably even less accurate on an ordinary 4-banger)

As a comparison, the actual result to 12 significant digits is

e = 44.4984550191

Regards,

Gerson.

Re: Five-minute challenge

*Message #43 Posted by **Stuart Sprott** on 24 Jan 2011, 7:34 a.m.,*
in response to message #32 by Thomas Klemm

Your method is more accurate than you realise. If you solve for the radius as you suggest, the radius is 78315.056. Next solve directly for the angle 2x, by arc/radius. ie 5280/78315.056. This is .067420 radians and equivalent to 3.862881 degrees. Therefore x = 1.931441 degrees. And (1- Cosx) = .000568

And finally defelection = .000568*78315.056 = 44.492977

This answer is only 0.005 different to the correct result. If you work backwards from the above the chord length is 5279.00051. So for all practical purposes the above is correct.

in response to message #1 by David Hayden

Through a coincidence worthy of a Hollywood movie, I actually had a somewhat practical application of this very problem today.

We have some chairs on our porch. The seats are supported by an elastic webbing similar to this. The original webbing stretched out over the years so I cut it, but it just stretched out more and I decided to replace it.

A little hunting on the internet led me to elastbelt webbing which stretches about 7%-10%.

When you install the webbing, you pull it tight, so say it can only stretch an additional 5% once installed. If the seat is 20" wide and the webbing stretches 5%, how much will it sag when I sit in it? Will I be able to get out of the chair to say hello to the neighbors when they walk by? Will it sag enough to be comfortable?

I may have done the calculations wrong, but I figured it should sag about 2.7590" - Perfect! :)

HP Solve article on thousands separators

*Message #1 Posted by **Martin Pinckney** on 20 Jan 2011, 9:21 a.m.*

Reading the "Commas in the HP Calculator Display" article by Richard Nelson, I was surprised to learn that "The HP48/49/50 series of machines will ... display the thousands separators in the FIX mode."

Surprised, because this has been a topic of discussion here, and I came away from said discussions with the belief that RPL machines *could not* display the thousands separators at all, because said RPL machines have to be able to process multiple kinds of objects, not just numerical ones. Now, I suppose that only applies to the command line.

Anyway, I have been a fan of the delimited display, but previously had resigned myself to not having it on my 48sx. My curiosity was piqued, however, because I almost always use FIX mode, but could not remember seeing the separators! So I turned on my main 48sx, and, I was right, no separators. I also have a beat-up 48gx that I never use, so I tried that, and saw the separators. Was this feature absent from the SX? No, I have Java installed on my main SX, so I tried a plain vanilla SX, and viola! Separators! So either this feature is not implemented in Java, or there is a setting to turn it on that I don't know about.

To further extend this rambling, while playing with the GX, I noticed that the display for mode setting looks just like the 38g not at all like the 48sx. Again curious, I dug out a 38g and tried it in FIX mode, and NO separators. Interesting.

Re: HP Solve article on thousands separators

*Message #2 Posted by **Walter B** on 20 Jan 2011, 11:12 a.m.,*
in response to message #1 by Martin Pinckney

Thanks for pointing to this article, though commas in the display are very common here (shall I claim that's the reason why commas are called commas? No, I won't, though it would have been fun to watch the resulting discussion ;). What caused me laughing out loud, however, was Table 1. The case must be pretty desperate if it's necessary to list Interlingua and Esperanto to make that row looking bigger than the following one. Very ... ummh ... interesting selection of countries, too. Reminds me of the famous poster published by The New Yorker decades ago, but still available AFAIK.

Nice article nevertheless, Richard. Keep going!

Re: HP Solve article on thousands separators

*Message #3 Posted by **Martin Pinckney** on 20 Jan 2011, 11:43 a.m.,*
in response to message #2 by Walter B

One thing was curious to me about the way the article was presented. That is, the row of tiny Voyager photos near the bottom of the 1st page. We are encouraged to "look closely." One wonders how.

In Acrobat Reader, when I magnify the images on that page up to 300%, the LCDs become somewhat readable and the separators are visible, albeit a bit pixellated.

Jake

Never fear, Walter, Germany has to be included in "(most of mainland Europe)." [:-)

Re: HP Solve article on thousands separators

*Message #7 Posted by **Walter B** on 20 Jan 2011, 4:50 p.m.,*
in response to message #6 by Martin Pinckney

Martin, FYI I'd have made the same remark if Richard had written "Denmark, Germany, (most of mainland Europe), ..." instead - you didn't get the point. A similar case were e.g. "Peru, Ecuador, (most of South America), ...".

Re: HP Solve article on thousands separators

*Message #8 Posted by **Kiyoshi Akima** on 20 Jan 2011, 1:10 p.m.,*
in response to message #1 by Martin Pinckney

There are also times when the presence of the digit separator every three digits actually hinders entering/reading numbers. Some languages and cultures split in groups of four digits, not three. There have been times when I've wished my HP had an option to put the separator every four digits.

Of course, I can just imagine the tech support nightmare that would ensue. On one tech support forum I frequent (tech support for everything, not just calculators), THE most common question I see about HP calculators is some variant of "My HP-12C is showing a comma instead of a period. How do I fix it?"

Re: HP Solve article on thousands separators

*Message #9 Posted by **Walter B** on 20 Jan 2011, 5:00 p.m.,*
in response to message #8 by Kiyoshi Akima

> Quote:
>
> THE most common question I see about HP calculators is some variant of "My HP-12C is showing a comma instead of a period. How do I fix it?"

If it couldn't be misunderstood, I'd ask why the reverse is asked far less. But since it can, I won't ... ([;-)

Re: HP Solve article on thousands separators

*Message #10 Posted by **Martin Pinckney** on 20 Jan 2011, 5:16 p.m.,*
in response to message #9 by Walter B

Can you not change the radix on the 12c? (Unless I'm not getting the point). The online manual states:

> Quote:
>
> **Digit Separators**
>
> As a number is keyed in, each group of three digits to the left of the decimal point is automatically separated in the display. When the calculator is first turned on after coming from the factory — or after Continuous Memory is reset — the decimal point in displayed numbers is a dot, and the separator between each group of three digits is a comma. If you wish, you can set the calculator to display a comma for the decimal point and a dot for the three-digit separator. To do so, turn the calculator off, then press and hold down the . key while you press ;. Doing so again sets the calculator to use the original digit separators in the display.

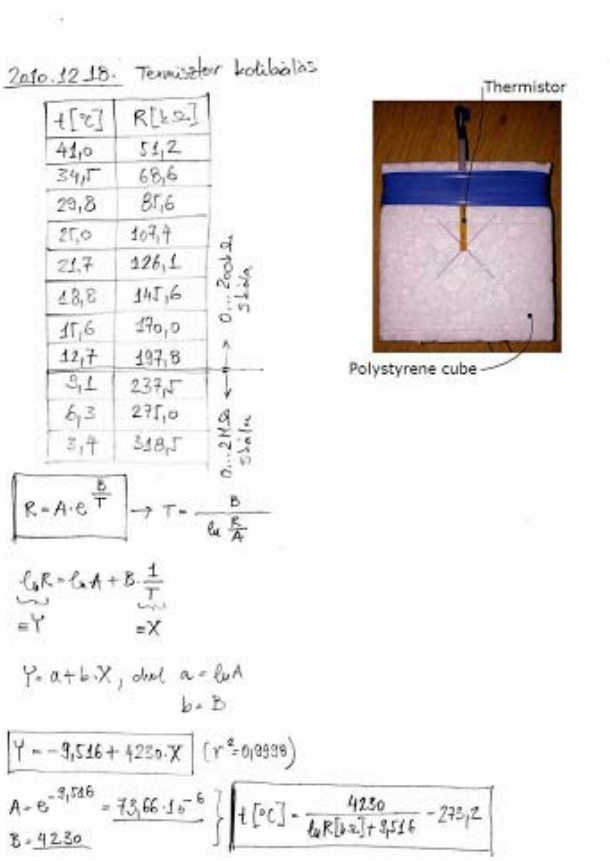
Re: The lost formula

*Message #1 Posted by **Csaba Tizedes (Hungary)** on 20 Jan 2011, 4:40 a.m.*

In last December I used an equation and works very well. I want to made a house-wall-temperature-meter to calculate heat loss of my house. This was a very simple polystirene cube (bad thermal conductivity for more precise measure) and a little PSION Revo thermistor. This "device" works very simple: Push the thermistor to the wall, wait for 15-20 seconds, measure the resistance then calculate temperature.

A pic about it and a calibration calculation:



Re: The lost formula

*Message #2 Posted by **designnut** on 20 Jan 2011, 10:41 p.m.,*
in response to message #1 by Csaba Tizedes (Hungary)

That seems precise. What method of regression analysis did you use? What calculator?,Sam

Re: The lost formula

*Message #3 Posted by **John B. Smitherman** on 22 Jan 2011, 6:15 p.m.,*
in response to message #2 by designnut

Hi Sam. I used a 35s to work through Csaba's example and of course it only does linear regression. I had to remember to

take the ln of resistance and 1/Temp in degrees K before entering them as y and x.

Regards,

John

Re: The lost formula

*Message #4 Posted by **Csaba Tizedes (Hungary)** on 26 Jan 2011, 5:25 a.m.,*
in response to message #2 by designnut

Hi Sam,

I usually use Excel to fit functions, because it's simple and compatible with everything. Sometimes I grab my old 48SX and feed them with data.

This regression a simple least-squares method. The temperature need to calculate from Celsius to Kelvins!

Re: The lost formula

*Message #5 Posted by **John B. Smitherman** on 20 Jan 2011, 10:55 p.m.,*
in response to message #1 by Csaba Tizedes (Hungary)

Good work Csaba and thanks for sharing. Where did you get the temperature data used to develop the correlation?

By the way, what did you learn about your house's heat loss?

Regards,

John

Re: The lost formula

*Message #6 Posted by **Csaba Tizedes (Hungary)** on 26 Jan 2011, 5:59 a.m.,*
in response to message #5 by John B. Smitherman

I have a good mercury-filled thermometer (scale divided into 0.5C from 0C-100C, and approximate the temperature +-0.1C). I used a simple plasticware, filled with ~half liter water then I was cooled slowly with snow. If temperature not changed I was read a measuring point data.

Some approximately data about my house wall's heat loss:

1.) I assume that the wall have four layer (see the table: 2nd is the brick layer, 3rd is the heat-isolation layer and 1st and 4th the inner and outer mortar/grout (I dont know how to say it in English)).

2.) I want to know the inner heat transfer coefficient (alpha_i [W/(m2*K)]), so I wrote a heat flux from dining-room wall "inner" side to "outer" (ambient) , then I wrote some equation from "inner" side to inner wall surface. In this points the temperatures measurable (Ti, Tiw, To), and then I solved this equation (1) to alpha_i.

3.) With this coefficient the heat flux calculated: q'A [W/m2]=alpha_i*(Ti-Tiw)

4.) Then I plot this heat flux as function of temperature difference.

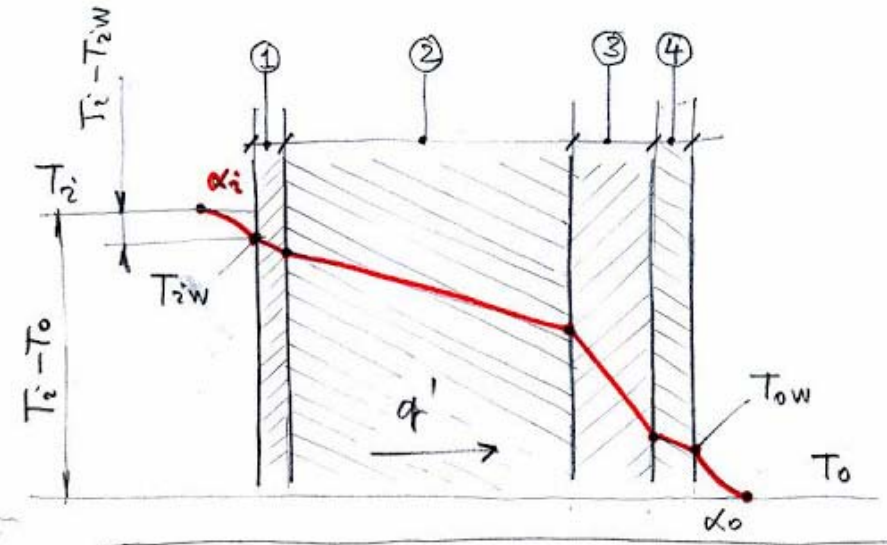
Unfortunately I have not measuring points yet at dT=22...24C.

Scans about it:

α_i – belső hőátadási tényező becslése

Házfal rétegei:

Sz. i	Vastagság e_i [mm]	Hővezetési tény. λ_i [W/(m·K)]	Anyag
①	15	0,35	Habarcs/Vakolat
②	240	0,32	Tégla
③	50	0,04	Hőszigetelés
④	20	0,87	Külső habarcs



$$\left.\begin{aligned} q' &= k \cdot (T_i - T_0) \\ q' &= \alpha_i \cdot (T_i - T_{iw}) \end{aligned}\right\} \quad (1)$$

$$k = \frac{1}{\frac{1}{\alpha_i} + \sum_{j=1}^{4} \frac{s_j}{\lambda_j} + \frac{1}{\alpha_0}}$$

$$(1): \quad \frac{1}{\frac{1}{\alpha_i} + \frac{s_1}{\lambda_1} + \frac{s_2}{\lambda_2} + \frac{s_3}{\lambda_3} + \frac{s_4}{\lambda_4} + \frac{1}{\alpha_0}} \cdot (T_i - T_0) = \alpha_i \cdot (T_i - T_{iw}) \rightarrow \alpha_i = \dots$$

Sor.	T_i [°C]	T_{iW} [°C]	T_o [°C]	α_{iA} [W/m²K]	α_{iB} [W/m²K]	ΔT_{io} [°C]	q'_A [W/m²]
1	19,7	18,2	-0,5	5,50	5,85	20,2	8,25
2	19,9	18,4	-0,5	5,56	5,91	20,4	8,34

New HP Solve issue now posted at HP site

*Message #1 Posted by **gene wright** on 19 Jan 2011, 5:19 p.m.*

New HP Solve issue is out

Re: New HP Solve issue now posted at HP site

*Message #2 Posted by **Mark Harman** on 19 Jan 2011, 7:30 p.m.,*
in response to message #1 by gene wright

Thanks for the link, Gene.

I read Palmer Hanson's interesting article on algebraic, with its comparison and contrast to RPN. He made the point at the end of the article:

> Quote:
>
> Here's a possible solution for calculators which offer both RPN and algebraic: RPNers frequently use RollDown and x<>y. Algebraic users rarely, if ever, do. Why not share the RollDown function with the left parenthesis function and the x<>y function with the right parenthesis function with the software deciding which option to use depending on which mode the calculator is in.

I actually think HP has gone in the right direction with having already done this on both the 20b and 30b.

Mark

Re: New HP Solve issue now posted at HP site

*Message #3 Posted by **Katie Wasserman** on 19 Jan 2011, 10:44 p.m.,*
in response to message #2 by Mark Harman

Isn't this exactly what HP did in 1990 on the 17bii?

Re: New HP Solve issue now posted at HP site

*Message #4 Posted by **Mark Harman** on 19 Jan 2011, 10:54 p.m.,*
in response to message #3 by Katie Wasserman

Actually, on the 17bII and 17bII+, the roll down and x<>y functions are shifted. Even with the most recent versions, this is the case. On the 20b and 30b, the roll down and x<>y functions share the keys with the parentheses and are engaged based upon the mode that is selected. This functionality is what Palmer is suggesting as a solution.

Mark

Re: New HP Solve issue now posted at HP site

*Message #5 Posted by **Bruce Bergman** on 19 Jan 2011, 11:03 p.m.,*
in response to message #4 by Mark Harman

Um, no I don't think that's right. I don't have my 17bii+ around right now, but when it is in RPN mode, the parenthesis function as the swap and drop keys. I distinctly remember that being the case.

Can anyone confirm or deny?

thanks,

Bruce

Re: New HP Solve issue now posted at HP site

*Message #6 Posted by **Mark Harman** on 19 Jan 2011, 11:20 p.m.,*
in response to message #5 by Bruce Bergman

I guess I could be wrong as I have never used the 17bII+ in RPN - just algebraic when it was on a store display a number of years ago. What I have seen in pics, and in person, have suggested to me that they are shifted functions. However, I can concede to the idea that the key cap labeling is idiosyncratic.

Regards,

Mark

Ah, it's definitely a shifted function in algebraic, yes.

(I've been searching through piles for the last hour trying to find my 17bii+ now... lol)

Thanks,

Bruce

Re: New HP Solve issue now posted at HP site

*Message #8 Posted by **Katie Wasserman** on 20 Jan 2011, 2:14 a.m.,*
in response to message #7 by Bruce Bergman

I've got a 17bii (not a 17bii+) in front of me:

In ALG mode parens are available without shifting, while in RPN mode the unshifted-paren keys are roll-down and swap. You can shift for these if you'd like to but the shift is not needed.

Additionally, in ALG mode you can use the roll-down and swap functions if you shift first.

I, too enjoyed this article, and I like Palmer's categorization of the three main types of "algebraic" calculators.

Nitpicking, Palmer, I wish you had included reference to the "almost algebraic" HP's that operate similar to the TI's you mentioned, such as 20s, 21s, 22s and 27s.

Except I would further break them down into those that do or don't actually display the parentheses. I.E., some are more "almost" than others!

iDOS Lives! Get it while you can (IOW, EMU71/EMU41 on iPad/iPhone)!

*Message #1 Posted by **Egan Ford** on 19 Jan 2011, 9:37 a.m.*

iDOS is back up on the App store and it's free. The catch is that you cannot use iTunes to place your files in iDOS, so no EMU*.*.

However, there is a work around. Install iPhone Explorer for Windows or Mac. Then you can browse the file system of your i* device and then drag and drop files to your iDOS Doc folder.

BTW iPhone Explorer is easier to use than iTunes for file xfers, so its really no loss. iPhone Explorer is free.

Hurry, before its gone again.

Requirements seem to suggest a jailbroken iPhone to put Mini vMac on one.

Mini vMac on iPhone

However, I wonder if you can achieve the same results by using something like iPhone Explorer to make all the changes required to get Mini vMac running?

I should have been clearer on this, I have an iPod Touch 3rd gen. You have to have an iPhone, iPad or iPod Tocuh for iDOS. It will work on any generation device as long a iOS 4.0 or later is running.

Like Gene said, you have to Jailbreak to run it. It is out of date and has no direct support for iPad or Retina Display (iPhone 4).

If you have a $99/year Apple dev lic you could build it yourself, however the tool chain used is not Apples, so it may be a bit more cumbersome.

> Quote:
>
> Is this iDOS for iPod too?

Yes, it should work on all 4.0 iOS or later devices.

*Message #9 Posted by **gene wright** on 19 Jan 2011, 9:56 p.m.,*
in response to message #8 by gene wright

How do you QUIT a DOS app in iDOS?

I got the 71b running and could do a CAT ALL, etc. But how do I exit the EMU71 app in the iPhone environment?

Re: Egan... when running Emu71 on the iphone...

*Message #10 Posted by **Raymond Del Tondo** on 20 Jan 2011, 12:22 a.m.,*
in response to message #9 by gene wright

Many DOS Programs could be exited via either Q , ESC, F10, or alike. What does the Emu71 doc tell about this?

In any case, keying in OFF should exit the emulator...

Edited: 20 Jan 2011, 12:24 a.m.

Very cool. Okay, so I have a couple of questions.

First, how do you get those different views? When I run iDos, I don't see the computer-looking screen and so on. I just get a window with a see-thru keyboard. Am I missing some way to change settings or configuration

options?

Second, when I go to the generic dos prompt, how do I get back? If I try the traditional "exit", the app locks up until I soft rest my iPad. That can't be the way to get back out...

Next, I have emu71 running, along with a couple of games, and they're great. iPhone Explorer works fine, if a bit clunky. ;-) Where are some good references on how to use EMU71 to actually do things?

Finally, I would love to get cpack200 or any of the 200LX Connectivity Pack stuff running, however I realized last night that although I have the 3.5" floppies, I no longer have a computer with floppy disk drives! Ugh! Any idea of where to get a copy of the connectivity pack online? Or am I going to have to resurrect one of my old desktops just to transfer it.

Thanks !!

Bruce

Try rotating the screen. On the iPhone/landscape view press the top of the screen. iPhone/portrait view press the keyboard icon on the bottom of the screen. Config options are under the sprocket icon.

> Quote:
>

Don't type exit. Press the top-left corner of the screen to get back to the GUI. If you type exit again, press the sleep button until you get the "slide to power off", then release the sleep button and press the home button. That will kill any iPhone hung app without a restart.

> Quote:
>
> Next, I have emu71 running, along with a couple of games, and they're great. iPhone Explorer works fine, if a bit clunky. ;-) Where are some good references on how to use EMU71 to actually do things?

EMU71 is the same as 71B, I'd read the 71B docs and the EMU71 docs on the extra features (e.g. HP-IL emulation, configuration, etc...)

> Quote:

The point is: I can't find that "iDos" folder in the folder tree.
I tried hard but I didn't find it in the folder system as offered by the iExplorer.

Re: iDOS Lives! Get it while you can (IOW, EMU71/EMU41 on iPad/iPhone)!

*Message #20 Posted by **Katie Wasserman** on 21 Jan 2011, 11:22 a.m.,*
in response to message #19 by Frido Bohn

On my iPod Touch the correct folder is:

/Apps/8HLDK844H7.net.litchie.idos/Documents

Re: iDOS Lives! Get it while you can (IOW, EMU71/EMU41 on iPad/iPhone)!

*Message #21 Posted by **Gerry Schultz** on 21 Jan 2011, 6:57 p.m.,*
in response to message #20 by Katie Wasserman

I too am having issues with the iDOS/iPhone Explorer combonation. In the left column of the iPhone Explorer, it sees the 8HLDK844H7.net.litchie.idos subdirectory within the Apps subdirectory of the iPad but when I click on it, iPhone Explorer says 'file not found.' As a matter of fact, trying to open any of the subdirectories listed report 'file not found.'

But in the white bar just below the pull down menus, that shows the iPad ID name and path and at the bottom, iPhone Explorer accurately reports how much RAM is in use. I am trying to use the iPhone Explorer as a standard app (in Windows XP) to browse through the file structure in the iPad but perhaps that's a misconception on my part.

What am I doing wrong?

Thanks for the help, Gerry

Thanks. Reboot fixed mine also.

To make things more interesting, I loaded a CPM emulator and now have cpm programs running on a iTouch. Can't hardly read the screen, but still fun. Next to try a TRS-80 emulator.

Too bad iDOS has been pulled again. It could be a lot of fun to play with on a iPad (if I ever get one).

Bill

Re: iDOS Lives! Get it while you can (IOW, EMU71/EMU41 on iPad/iPhone)!

*Message #25 Posted by **Vladan Dugaric** on 22 Jan 2011, 11:44 a.m.,*
in response to message #24 by Bill (Smithville, NJ)

Well, if you get an iPad, all apps that you have in your iTunes account can be installed on it too. There is no limit to the number of iDevices that you can use on an iTunes account, and all apps can be installed on all devices (no need to repurchase and Apple won't remove it from your iTunes library).

So, when you get your iPad (presumably iPad 2, it's just around the corner and it is rumoured to have a much better spec), just sync it to your computer and all the apps from your iTunes library will be loaded onto it. Even if an app has been withdrawn in the meantime (though if the authors remove the root file system access, I am guessing that Apple will approve of the app again).

Vladan

iDos removed... perhaps because ...?

*Message #28 Posted by **gene wright** on 21 Jan 2011, 1:27 p.m.,*
in response to message #27 by Bruce Bergman

Someone on engadget posted a way to get to the iPhone / iPad / iPod touch root/ file system from within iDOS!

Probably considered a BAD Thing by Apple. Just guessing.

Do a google search and you'll find out how to do it. Why? Not sure.

Re: iDos removed... perhaps because ...?

*Message #29 Posted by **Eric Smith** on 21 Jan 2011, 11:59 p.m.,*
in response to message #28 by gene wright

Knew that wouldn't last. They're facing an uphill battle as every time Apple removes it, and the developer modifies it to make Apple happy, people will discovering more things it can do that Apple doesn't like.

The problem with the iPhone is that it is a computer, but (despite your purchase) it is not **your** computer, it is **Apple's** computer.

If you want a smart phone you actually own, without having to depend on clever people to jailbreak it and fight an arms race with the vendor, buy an Android based phone instead.

The only DOS emulator I can find on the Android Market (by searching for "DOS") is a DosBox port called "PLAY PC GAMES ON YOUR DROID." (No kidding, that's the app name.) They don't provide source, and mention a whole lot of bugs in the implementation. They also say it's pointless to use it without a hard keyboard. I was wondering if anyone had tried this? Alternatively, are there other DOS emulators on the Market that I am missing?

Missed iDOS for my iPod this time around too. I should read this forum more frequently.

*Message #31 Posted by **Eric Smith** on 22 Jan 2011, 8:35 p.m.,*
in response to message #30 by Howard Owen

I'm certainly not claiming that there's a Android equivalent for every iPhone app. However, since Android is an open platform, over time it becomes more likely that you will find an app that does what you want for Android, especially since Apple wants to limit what you can do with the iPhone and iPad, while Google wants you to be able to do whatever you want.

Many people have pointed out the irony of Apple advertising in 1984 that their products would help you seize control from Big Brother, but that now Apple is trying to BE Big Brother.

*Message #33 Posted by **Howard Owen** on 22 Jan 2011, 11:30 p.m.,*
in response to message #31 by Eric Smith

I'm an Android user for that very reason, Eric. You still have to deal with the carrier's shenanigans, but at least the phone OS isn't an opaque padlock. Even without "rooting" an Android phone, you have the capability of installing your own software on the device, for example. You can also get around most of the carrier silliness without blowing up the phone.

> So I'm not slamming Android when I ask about a DOS emulator. I'm just wondering if anyone knows of one. :)

Re: a challenge related to the 15 puzzle

*Message #1 Posted by **Don Shepherd** on 19 Jan 2011, 4:53 a.m.*

Well, the HP-32sii version takes a while to run because it has to decode registers A-D in which 4 numbers are stored in each register. I did that to avoid using so many registers. This version stores a single cell value in each register A-P. While it uses many more registers than the other version, it runs much quicker (about 7 seconds versus 40 seconds).

Life (and programming) is all about trade-offs!

```
Program to determine solvability of 15 puzzle for 32s.
This one is faster than the one that stores 4 numbers in each register A-D.

Register usage:

A-P - 16 cell values, entered after XEQ A
Q   - number of inversions, including row number of empty cell
R   - current outer loop cell value
i   - indirect addressing and inner loop index
T   - outer loop index

Usage:
XEQ A
enter 16 cell values (0 for empty cell) R/S after each
program displays number of inversions; if even, puzzle is solvable

Code:

lbl a    entry point
1.016    loop to get cell values
sto i
lbl b
r/s      enter each of 16 values
sto (i)  stores in A-P
x<>0     if 0 calc row#
goto c
3
rcl+i
4
/
ip
sto q    inversion count starts with row# of empty cell
lbl c
isg i
goto b
1.015    outer loop goes from 1 to 15
sto t    outer loop index
lbl d
rcl t    get current outer loop cell value
sto i    and store in R
rcl (i)
sto r
rcl t
ip
1.016
+        inner loop goes from t+1 to 16
sto i    inner loop index
lbl e
```

```
rcl (i)
x=0       if inner loop cell value is 0, ignore
goto f
rcl r     current outer loop cell value
x<y
goto f
1
sto + q   increment inversion counter
lbl f
isg i
goto e    iterate inner loop
isg t
goto d    iterate outer loop
rcl q     display inversion counter, even means puzzle is solvable
rtn
```

Re: a challenge related to the 15 puzzle

*Message #1 Posted by **Don Shepherd** on 18 Jan 2011, 10:20 p.m.*

Here is a BASIC version for the HP-71b, one of my favorite calculators. It is much faster than the 32sii version, probably because it doesn't have to decode multiple numbers stored in a register.

```
HP 71b program to determine 15 puzzle solvability

10 destroy all
20 integer a(16)
30 data 11,5,14,7,15,2,9,4,6,0,1,13,10,3,12,8
40 for i=1 to 16
50 read a(i)
60 if a(i)=0 then let b=ip((i+3)/4)
70 next i
80 for i=1 to 15
90 for j=i+1 to 16
100 if a(j)<>0 and a(j)<a(i) then let b=b+1
110 next j
120 next i
130 if mod(b,2)=0 then disp "solvable" else disp "unsolvable"
140 disp "inversions = ";b
```

41 MCODE: Alice in Bufferland

*Message #1 Posted by **Ángel Martin** on 18 Jan 2011, 5:51 p.m.*

We have not Lewis Carroll but other few people to thank for this new 41 MCODE collection (to mention a few names: David Yerka, Håkan Thörngren, David van Leeuwen, and the wonderful anonymous CCD Module programmers - BTW does anyone know their names?)

So building upon their work, here's to let you know about the release of the BUFFERLAND module, absolutely free of charge (don't look for it on TAS = at least the price is right :) compiling a collection of your favorite Buffer-related functions, plus adding a few new ones from my own harvest, like:

- creation, deletion, and clearing of buffers
- buffer header, size and other vital signs
- exchange (STO/RCL) with "normal" data registers
- transfering to/from XMEM
- re-issuing the buffer id# - a hacker delight
- BFCAT, a buffer catalog featuring SST and BST- interactive operation (and certainly not an easy one to crack!)
- and the proverbial "much more"... did I say Key Assignments are also part of the pack?

All in all, the right toolset to make this seemingly obscure part of the 41 OS/Memory as transparent as main data registers or program memory can be.

And the better news is: just in time to be included in Monte's 41CL image file! and of course the usual submission to TOS will follow for those of you curious enough and/or interested in the subject...

Hope you enjoy it as much as I did programming it (never mind the sleepless hours trying to get it all work!_

Cheers, 'AM

> what is a "buffer" in terms of the HP41?

Buffers are reserved memory areas used by diverse application packs for internal housekeeping or calculations. Notorious buffers are the Advantage's for SOLVE/INTEG, the HP-Devel for MONITOR/SCOPE, and (of course) the 41Z for the complex stack.

Probably best to look at the comprehensive section in the book "Extend your HP-41", by Wlodeck - or just google for "41C buffers" :-)

Buffer table taken from the ICEBOX manual.-

```
Buffer id# Module/Eprom Reason
1          David Assembler MCODE Labels already existing
2          David Assembler MCODE Labels referred to
3          Eramco RSU-1B ASCII file pointers
4          Eramco RSU-1A Data File Pointers
5          CCD Module, Seed, Word Size, Matrix Name
6          Extended IL (Skwid) Accessory ID of current device
7          Extended IL (Skwid) Print Cols, number & width
8          41Z, Complex Stack, POLAR/REC settings
10         Time Module Alarms information
11         Plotter Module Data and barcode parameters
12         IL Development, CMT-200 IL buffer and monitoring
13         CMT-300 Status Info
14         Advantage INTEG & SOLVE scratch
15*        Mainframe Key Assignments
*) KA area isn't really a buffer.
>
```

Nowhere could I find any instruction as to which file is "appropriate" for me. But I am sure most anyone else on here would know immediately.

I use Windows 7 32 bit. Does that mean I use the x86 and not x64 version?

in response to message #1 by Egan Ford

Actually, it is pretty capable. You can use complex matrices, input complex numbers for the functions (hyperbolics too, lacks inverses of these though who needs that). Some symbolics, integrals and derivatives, and the graphs look nice. For free it's a corker and makes unnecessary to purchase a graphic calculator. I wouldn't overlook it, I think it's great for school, and maybe a little more too. I wish it had some programmability... Good for you Microsoft! (never thought I would say that).

Re: Power management and deep sleep

*Message #1 Posted by **Monte Dalrymple** on 17 Jan 2011, 6:57 p.m.*

Tim,

For the 41CL I had to mimic the power-down modes of the original 41C series as best I could. I think I ended up with something quite similar to what was used. Basically there are three states: Deep Sleep, Light Sleep, and Running.

In Deep Sleep power (Vdd) is shut off to the majority of the logic, which in the 41CL is a Flash-based FPGA. The program storage, also being FLash, is powered down, and the main voltage regulator is shut off (it still passes the unregulated battery voltage), along with the master oscillator. So the only things drawing power are: the static RAM (data storage), the CPLD (which has the wake-up logic), the RS232 chip (just in case in the future I add serial wake-up functionality), the micro-power regulators for the RAM and CPLD, and two resistive dividers in the main power supply (one for the low-level detect, and one for the voltage-level feedback).

Light Sleep is the state where the calulator is "on" but not actually doing anything. Everything is powered, but static. The oscillator is still running, but the clocks are stopped inside the FPGA. Because of the way the keyboard scanner works, all of the column drivers have to be Low in this state (to detect any keypress), but that is a slight problem, because the column signals are really open-drain drivers with resistive pull-ups. So the pull-ups have to be as large as possible. But this conflicts with the timing for the keyboard scanner. What I ended up doing was during the actual keyboard scan, precharging all of the column lines before actually driving one of them. This allowed me to use megohm pullups instead of the 75K that would have been required to meet timing. That saved 370uA during light sleep.

I guess the bottom line is that when going for low-power, try everything possible, because it all adds up in the end. The 41CL current drain isn't as low as it could be because the programmable logic vendors haven't really cared about power. I mean, the wake-up logic required to remain powered is perhaps a dozen gates, but the CPLD draws alomst 100uA. If I were doing this in a custom chip that number would be less than 5uA. Even the resistive dividers in the power supply is a trade-off. I live with 3-4% accuracy on the voltages, because that lets me use higher-value resistors, saving another 10uA or more per divider.

Monte

Re: a challenge related to the 15 puzzle

*Message #1 Posted by **Allen** on 17 Jan 2011, 6:03 p.m.*

Here's a quick RPL program based on the article you posted above. It uses a flag for parity tracking, and indrect addressing from the stack to scroll through the loops. Here are the program 41c barcodes (including 2 programs to input 2 test matrices.)

Credit Note: Program was written using Free42, output to RAW and converted to barcodes using HP41UC program.

```
Inputs:
  Register 00 - 1  (a pointer to first cell)
  Register 01 - First number of grid
  ...
  Register 15 - Last number of grid
  Register 16 - 00 (assumes the space is in location 16)
Outputs:
  Clear stack except for 1 in ST X if solution exists, 0 otherwise

00 { 53-Byte Prgm }
01>LBL "AQ"
02 CF 01              ' clears the parity flag
03 CLST               ' clear stack
04 RCL 00             '
05>LBL 01             ' Loop for checking results
06 RCL IND ST X
07 X<0?               ' Check the pointer to see if it's neg
08 GTO 02             ' if so, go to next loop
09 -1
10 STO× IND ST Z      ' Otherwise negate and recall next value
11 RCL IND ST Z
12 +/-
13 GTO 01             ' repeat loop
14>LBL 02             ' Flip the parity flag- (starts even)
15 FS? 01
16 FC?C 01
17 SF 01
18>LBL 03             ' begin counting through the values
19 RCL IND 00
20 X=0?               ' until you find a positive one to loop on
21 GTO 04             ' 00 value indicates end of matrix
22 X>0?
23 GTO 01             ' new loop found, go to main loop
24 ISG 00             ' increment reg 00 counter
25 CLX                ' NOP
26 GTO 03             ' counter to check for the first pos. number
27>LBL 04             ' end program
28 CLST               ' cleanup the stack
29 FS? 01
30 1                  ' return parity based on Flag 1
31 END
```

Note: edited to add inputs/outputs section

Edited: 18 Jan 2011, 9:16 a.m.

Dead HP-31E, where do I start?

*Message #1 Posted by **Paul Gaster** on 17 Jan 2011, 4:00 p.m.*

I have a HP-31E that is dead and I am not sure where to start. It is in the box with original case, manuals, and AC adapter. Serial number is 1920A92944, Made in USA. It does not turn on when plugged in, and when I checked the battery pack I noticed that one contact is broken. The extra piece was under the batteries. Where do I start with this? I know this was a lower end model, but I would like to be careful and want to avoid any further damage.

Re: Dead HP-31E, where do I start?

*Message #2 Posted by **db (martinez, ca.)** on 17 Jan 2011, 5:15 p.m.,*
in response to message #1 by Paul Gaster

first, do not plug it into that charger. never. if it is dead; that is probably what killed it.

second, you might clean the contacts with vinegar and rinse with alcohol or distilled water if they have blue stuff on them. then note from the battery (it will only go in one way) which is the + and which is the - contact and mark them both as a reference. you probably have some AA rechargables (they are the correct 1.25v). turn the switch to the off position. with some aluminum foil to temporarily make up for the broken contact and to bridge the batteries, you might find that when you switch it on, or after wiggling the batteries, you have a calculator.
if not, and if there was blue corrosion, then you might have to take it apart to clean off or paint on new traces. popping off the back is difficult the first time if you only have three hands but there is a very good set of instructions with photos in the articles section of this site.

there are lots of other things to try, but the're down the list.

Edited: 17 Jan 2011, 5:19 p.m.

*Message #3 Posted by **Paul Gaster** on 17 Jan 2011, 7:47 p.m.,*
in response to message #2 by db (martinez, ca.)

Thank you, that did the trick and I now have a calculator that comes on and seems to work in general, but it has a new problem. The lowest row on the display doesn't come on. Is there any way it can be fixed?

Re: Dead HP-31E, where do I start?

*Message #4 Posted by **Norman Dziedzic** on 17 Jan 2011, 9:20 p.m.,*
in response to message #3 by Paul Gaster

I second that request :-)

I have a 31E with some missing segments. The lower left segments are out for all digits on my 31E.

Re: Dead HP-31E, where do I start?

*Message #5 Posted by **db (martinez, ca.)** on 17 Jan 2011, 9:46 p.m.,*
in response to message #4 by Norman Dziedzic

it might be the pressed-on chip problem. maybe.

if you post the serial numbers, someone here will know if yours are from before hp started soldering stuff onto the pcb, without having to pop it apart. like i said; taking the back off is not difficult. however; each time you spring it open you run the chance of cracking something. but putting them together is like falling off a log.

Re: a challenge related to the 15 puzzle

*Message #1 Posted by **Allen** on 17 Jan 2011, 10:10 a.m.*

Don, That's an interesting article. It reminds me very much of a Turing state machine, whereby the numbers in each grid become a GOTO instruction. It basically counts the number of closed GOTO loops in the grid- really interesting approach!

With one register in each variable, this would be interesting to do using indirect registers. Pseudo code for 41cv/42s:

```
0. Enter matrix in registers 1-15
1. Format Stack, clear parity flag
2. recall register 1
3. use  -1 STO* IND ST Y to mark the register "visited"
4. indirectly recall next memory location
5. If greater than 0 goto 3,
6. starting from beginning of matrix find first number > 0
   if == 00 (register 16) goto 9
7. Toggle parity flag
8. goto 3
9. recall parity flag (done)
```

Classic Chargers

*Message #1 Posted by **Alberto Fenini** on 17 Jan 2011, 9:15 a.m.*

ciao a tutti,
I have few chargers that need the transformator replaced,
I digged a while on the forum and on some more sites, like Jacque's one but I'm a little confused
what the specs exactly are ? primary 220 V, secondary 16 V and VA ???
thanks for help, Alberto

Re: Classic Chargers

*Message #2 Posted by **Kees van der Sanden** on 18 Jan 2011, 3:13 p.m.,*
in response to message #1 by Alberto Fenini

Hi Alberto,

The secondary voltage of the transformer must be between 6V and 9 V. The 16 V given on the site of Jacque is too high. I expect this is a typo. A secondary voltage of 16 Volt will destroy the 400uF/15V capacitor. A 6 or 8 VA transformer will do the job.

Regards,

Kees

Re: Classic Chargers

*Message #3 Posted by **Alberto Fenini** on 18 Jan 2011, 4:42 p.m.,*
in response to message #2 by Kees van der Sanden

ciao Kees
thanks for the information, I'll give it a tr.
I have purchased two transformers that will perfectly fit into the case but the specs are 6V 2.4VA
In a way the 16 V made sense, it would be slightly dropped by the four diodes and will properly charge the condenser,
I'm afraid that a lower secondary will not work, but since I have two of them I'll try soon.
Thanks again, I'll let everybody know if it will work
take care Alberto

Re: Classic Chargers

*Message #4 Posted by **sylvandb** on 18 Jan 2011, 10:04 p.m.,*
in response to message #3 by Alberto Fenini

> Quote:
>
> In a way the 16 V made sense, it would be slightly dropped by the four diodes and will properly charge the condenser,

The condenser will charge to the peak voltage (RMS * sqrt(2)). Yes, the diodes will drop the voltage about 0.7v each. (If using a full-wave bridge rectifier, about 1.4v.)

Your 220v:6v transformer might be close enough. 6v would be about 8.4v before the diode drop. So a full-wave bridge would provide about 7vdc. If you supply it with 240v on the primary you would get about 0.5v more on the secondary. Or if you use a half-wave rectifier you could get another 0.7vdc but might need more capacitance.

Re: Classic Chargers

*Message #5 Posted by **Alberto Fenini** on 19 Jan 2011, 3:52 a.m.,*
in response to message #4 by sylvandb

I think I will desolder a transformer from a good working classic power supply and see how much is the secondary value
thanks again Alberto

Re: Classic Chargers

*Message #6 Posted by **Jacques Laporte** on 21 Jan 2011, 4:40 a.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto,

Yes, in the past (2007 i think) I have done measures on the Classics transformer 82002A. I wrote on my site that the output voltage of the constant current circuit is @ 15V DC (unloaded).

You can easily confirm that with a multimeter. See photo below. With the calc attached (the load) the voltage drops.

That's it !

I will open a working adapter this WE **for you** and measure the voltage at the Xformer's secondary.

That said, my HP calc site has become too huge (too much data) : errors are certain.

Thank you all to help me correct them!

Edited: 21 Jan 2011, 9:21 a.m. after one or more responses were posted

Re: Classic Chargers

*Message #7 Posted by **Jacques Laporte** on 21 Jan 2011, 9:17 a.m.,*
in response to message #6 by Jacques Laporte

Alberto, I have done (at the risk of my life ....) a video of the measure.

Took a 82011A which is safer : I have only 2 hands (with the 82002A, it's not easy to keep the 110-220 slider in place !!)

Result is : 12,5 V AC at the secondary (unloaded).

See : checking a 82011 battery charger

Edited: 21 Jan 2011, 9:27 a.m.

Re: Classic Chargers

*Message #8 Posted by **Alberto Fenini** on 21 Jan 2011, 11:26 a.m.,*
in response to message #7 by Jacques Laporte

Thank you very much !!!!
Boy this was cool, even my name on the video,
I'll stop by the shop tomorrow morning and see what they have
Take care and thanks again, Alberto

Re: Classic Chargers

*Message #9 Posted by **Bart (UK)** on 21 Jan 2011, 9:02 a.m.,*
in response to message #1 by Alberto Fenini

In Tony Duell's article on classic chargers he shows the *rectified* output to be 16V (I think this is open circuit voltage, as the cap is rated 15V). Therefore I would guess a transformer with a secondary voltage of ~10V AC would suffice. HOWEVER, in another thread Tony warns *"The output voltage of this transformer is designed to fall under load, in a specified way"* (I would hazard a guess that this is to reduce the stress on the power transistors as the load increases). So a standard transformer may not be the best solution.

Re: HP-67 advice needed

*Message #1 Posted by **Alberto Fenini** on 17 Jan 2011, 9:13 a.m.*

Thanks Randy,
I have printed out everything, and I'll do some more tests
I'll keep posted the results here
again, thank you very much, Alberto

Re: HP-67 advice needed

*Message #2 Posted by **Alejandro Paz (Germany)** on 18 Jan 2011, 1:47 a.m.,*
in response to message #1 by Alberto Fenini

You may consider re-drawing the board and getting it made. You went to the trouble of removing all the components. You can even get it gold-plated like in the old days :)

Re: HP-67 advice needed

*Message #3 Posted by **Alberto Fenini** on 18 Jan 2011, 4:53 p.m.,*
in response to message #2 by Alejandro Paz (Germany)

It's not a bad idea, actually I'm in touch with someone for making
a replica of an HP65 card reader pcb, but it's more complicated that we can imagine.
Not because of the complexity of the layout, but because of the thickness
which is a not a common format nowadays.
The price is about 45 € for the master, and 10/15 € each unit produced.
Price could slightly increase for the master since the shape is not a regular rectangle.
Should this work (the guy is based in Sicily and I live in Milano, so logistic is slow and complex) it could be worth doing this for an HP67 logic PCB.
Thanks for suggestion, take care Alberto

Re: HP-67 advice needed

*Message #4 Posted by **Alejandro Paz (Germany)** on 26 Jan 2011, 3:23 p.m.,*
in response to message #3 by Alberto Fenini

Alberto:

The people at bilex-lp.com (I'm not affiliated with them) make also 0.5 mm pcbs and 0.8 mm too. The prices are very similar.

If anyone understands the meaning of this thread, I would like to know.

Re: The lost formula

*Message #3 Posted by **Norman Dziedzic** on 17 Jan 2011, 11:17 a.m.,*
in response to message #2 by Martin Pinckney

Seems to me like just a question of curve fitting.

A thermistor is an electronic device whose resistance changes with temperature in a predictable, albeit nonlinear, way.

See:http://www.vishay.com/doc?29053

I'm guessing the OP used to have a simple equation to approximate a particular thermistor response at one time and lost it.

Re: The lost formula

*Message #4 Posted by **Martin Pinckney** on 17 Jan 2011, 1:21 p.m.,*
in response to message #3 by Norman Dziedzic

Thanks for responding, Norman.

The rest not so much.

Re: The lost formula - lost in translation

*Message #5 Posted by **Norman Dziedzic** on 17 Jan 2011, 3:05 p.m.,*
in response to message #4 by Martin Pinckney

I think I had my high pass filter on and didn't absorb that part of the thread ;-/

Re: The lost formula

*Message #6 Posted by **Walter B** on 17 Jan 2011, 4:49 p.m.,*
in response to message #4 by Martin Pinckney

Martin,

let me explain. As far as I understood the OP, he

- had found a simple method decades ago describing the electrical behaviour of a thermistor
- had used something like experimental math (or call it trial and error) for his finding since he had known no other way then
- can't find it again but doesn't want this knowledge getting lost
- keeps pointing us to this therefore.

I admit I don't know for sure what the OP wants us doing. So my answer could have been like John's, but I didn't want to leave an old man out in the rain. Thus I thought a bit and guess:

If that behaviour is of practical relevance, it was solved in the time between - or it can be modeled easily by some brute force fitting algorithm using the tools available today, which where beyond imagination decades ago. So the OP's problem is most probably solved now either way by the

advancement of science ... dona eo pacem!

HTH. I'm most willing, however, to delete my two postings in this thread if they will cause any trouble whatsoever ...

Re: The lost formula

*Message #7 Posted by **Martin Pinckney** on 17 Jan 2011, 6:04 p.m.,*
in response to message #6 by Walter B

Walter, I think I've got it now. Thanks for your help.

No need to delete anything.

Re: The lost formula

*Message #8 Posted by **designnut** on 18 Jan 2011, 1:27 a.m.,*
in response to message #7 by Martin Pinckney

I think I probably started adding 273 to the C temperature and found that was not quite the right slope and adjusted from there. I'll give it a try through programming and see what happens. I know it was dirt simple, probably a temp add-on and a normalizing factor to suit the particular resistance thermistor. Sam

Re: The lost formula

42.

Re: The lost formula

*Message #10 Posted by **Martin Pinckney** on 18 Jan 2011, 8:33 a.m.,*
in response to message #9 by Pal G.

Now *that* explains it!

Re: The lost formula

*Message #11 Posted by **Walter B** on 18 Jan 2011, 9:54 a.m.,*
in response to message #10 by Martin Pinckney

Don't lose your towel, ask Douglas Adams instead ;)

Re: The lost formula

*Message #12 Posted by **Dan W** on 18 Jan 2011, 8:47 p.m.,*
in response to message #11 by Walter B

When I first discovered WolframAlpha, I had to ask it the question of life, the universe, and

everything.

It came up with the correct answer. ;)

OLD HP Forum

Welcome back!
Your last visit began on 30 Oct 2014, 2:36 a.m.
Since then, no new messages have been posted.

This is the OLD HP forum. For newer discussions, please visit the New HP Forums.

How to register at the new forum:
Even if you had an account on the old forum, you'll need to create one for the new forum. In the upper left near "Hello There, Guest" you should see a register link.

Using the same name (or close) as as you used on the old forum is preferred. The new forum does not allow commas in names. If you had a comma before, please omit it from your new account name.
