Your example above will be solved **exactly** - well, at least if you enter all coefficients with full precision, but that's not possible e.g. for 1.234^20. But with integer coefficients it works.

The Laguerre method automatically solves all polynomials of the form (x-x0)^n correctly, and all other multiplicities within a polynomial should be solved by my special routine for multiple roots - usually exact for integer roots (and even not too 'long' rational numbers) and with about 12 or more digits precision for all other (irrational) roots.

You can try the examples that Valentin has posted about a month ago (the thread is in the archive and has also a name like "polynomial roots solver").
He has given the examples (x+1)^30 and (x^2+x+1)^10 and both are solved exactly by my program. Also the example from the HP-71B paper (x+1)^20 gives absolutely correct roots, whereas the HP-71B program returns very inaccurate (I would call it even wrong) solutions.

Franz

Hi again, Namir!

I've now written a small routine which created your above polynomial and then let my program solve it, and although of course the coefficients couldn't be stored with full precision (i.e. all digits) my PRS solver returns all 20 solutions absolutely exact as -1.234!

I think that tells all about the quality of this polynomial rootsolver ... :-)

Franz

Oops, of course you're right!
My short program just created (x+1.234)^20 instead of (x-1.234)^20.
So everything is fine at the end ... :-)

HP50g Advertisement

*Message #1 Posted by **NateB** on 24 Dec 2011, 9:17 p.m.*

This is the first HP calculator advertisement I've ever seen in print. It is being run in the Dec 2011 issue of ASCE's *Civil Engineering* magazine.

Re: HP50g Advertisement

*Message #2 Posted by **bill platt** on 24 Dec 2011, 9:49 p.m.,*
in response to message #1 by NateB

That's pretty funny.

Why would someone think to use a calculator instead of a laptop? I am curious how they came to that decision. I'm not saying it was the wrong decision--inquiring minds want to know!

Re: HP50g Advertisement

*Message #3 Posted by **NateB** on 24 Dec 2011, 10:07 p.m.,*

Same here. Battery life? Durability?

Re: HP50g Advertisement

*Message #4 Posted by **Raymond Del Tondo** on 24 Dec 2011, 10:14 p.m.,*

in response to message #2 by bill platt

Maybe because a 50g together with a StreamSmart is cheaper than most laptops, or maybe because it's sufficient for the task.

On a laptop one may have to install some suitable analysis software. Maybe the 50g built-in analysis features are either well suited for the task, or easily customized to do it right;-)

And don't forget mobility: The 50g eats batts within a few weeks, but a laptop only runs 2 to 7 hours on a charge.

Apart from that, HP sponsored the ad, and maybe more, so there are reasons beyond the above...

Re: HP50g Advertisement

*Message #5 Posted by **bill platt** on 25 Dec 2011, 12:29 a.m.,*
in response to message #4 by Raymond Del Tondo

Very plausible ideas.

I think it is interesting and perhaps heartening to know that people doing this sort of project have the 50g "on the radar" as it were.

Re: HP50g Advertisement

Given the relative cost of the project as a whole the cost of a laptop vs. calculator would be a rounding error. I'd also wager for every 50g there is probably a dozen or so laptops.

My guess, personal choice. The 50g isn't going to outclass a laptop in capabilities, but rather in simplicity. If any of us were on the crew we would probably do the same, not because we should, but because we could.

They make just a little bit more from the laptops too.

This is the marketing team targeting a particular product. Someone higher up has invested some marketing budget into sponsoring this particular effort. A pretty smart buy, I'd say. Flying a jet on the ground at supersonic speeds has appeal from applied math to the NASCAR crowd. I'm sure they are using this affiliation to push laptops too, but the 50g is an obvious niche product that can benefit from the jet afterglow.

None of which speaks to why you might use a 50g for something like this. Perhaps weight on board a grounded jet is at a premium? Maybe the 50g performs better than a laptop when confronted with extremes of temperature, vibration and dust? A laptop designed to survive those conditions would cost a lot more than a 50g. Just because a project will take a lot of money to complete doesn't mean money isn't tight. Quite the opposite, in fact.

It's all speculation. But one thing doesn't seem speculative to me. That jet is cooooool! :)

*Message #10 Posted by **Vince (Italy)** on 25 Dec 2011, 4:51 a.m.,*
in response to message #2 by bill platt

It would be an unreasonable choice if it were real. Such a complex and difficult task cannot be accomplished using a (sophisticated as it is) calculator. They mainly use a CFD system from FARO Technologies Inc. running on PC platform supplied by Lenovo. The Hp 50g is used in the context of some "educational" activities that are a by-product of the main project; so the advertisement is a sort of publicity gimmick: http://www.landspeed.com/jetcar/classroom.html

Re: HP50g Advertisement

When I got my 41cx in the 80's, others would say that for the price, you might as well get a PC, as if the only reason to get a 41 was if you couldn't afford a PC. I did get a PC later of course, but I'm glad I got the 41cx first. There's little overlap in the purposes of the two types of computers, and I did a lot with the 41cx that I could not have done with a PC, because of issues of size, portability, durability, ease of personal programming and interfacing to several pieces of lab equipment at once, etc.. For some purposes, GHz speeds and 64-bit buses are irrelevant to the value of a computer.

Making all of your acquaintances this year has been an un-expected blessing this year. It is always refreshing to interact with such talented, passionate and giving people.

And in this day and age of companies that are so closed and secretive (a certain fruit-based computer company

comes to mind) it's good to know there are still companies like HP that will create a really cool tool then publish the schematic and an SDK and give away free cables so we can have fun and create an even cooler tool!

HP-41CL & TIME module (extending time keeping)

*Message #1 Posted by **Diego Diaz** on 23 Dec 2011, 9:28 p.m.*

Hi all,

Some of the CL users out there that want to have the TIME functions handy (I know of a number of them), will have eventually noticed that the TIME module is prone to loose its contents a few secon after the CL has been disconnected from a power source.

A standard HP-41 can keep the time for some 2'30" or 3 minutes just using its internal capacitor (470 uF).

Due to its internal design, CL's cannot hold charge enough in its caps to keep the TIME module running more than 15 or 20 seconds, which is a very tight gap if you need to replace a set of alkalines.

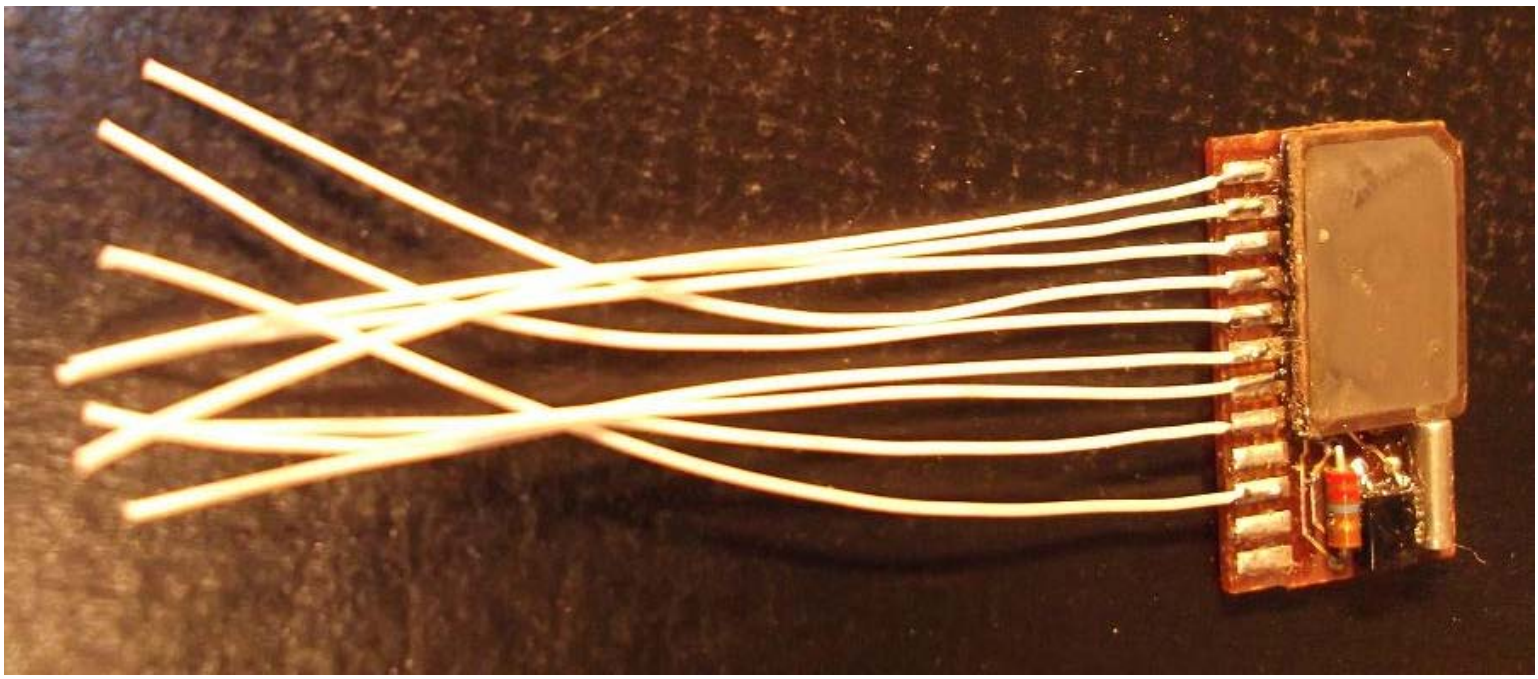
I'm not a SW guy, but like to have my clocks on time, so when it comes to fit a TIME module into my CL I included a small capacitor (220 uF 6.3v) PC CON type.

To avoid the capacitor being discharged thru the NEWT board, a diode is inserted in the module's power line.

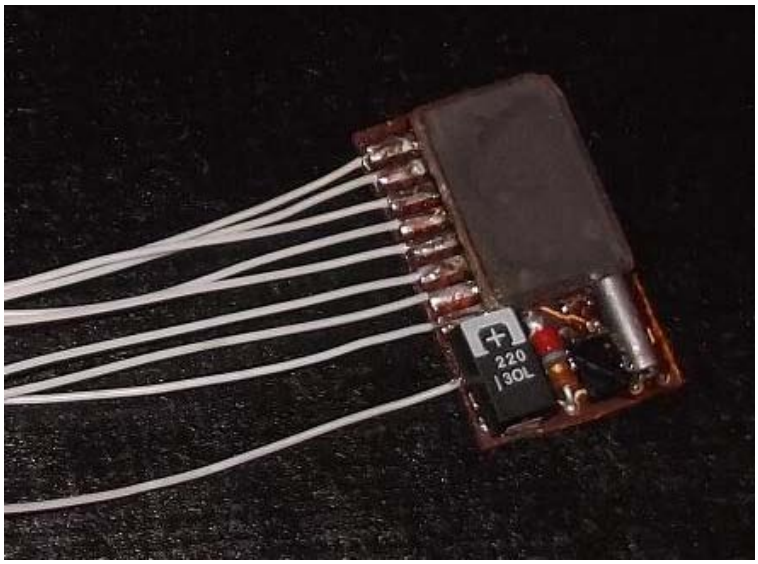
As a result, the time is kept for about 1'45", good enough to replace batteries or find any other suitable power source.

Some pics my help with the details:

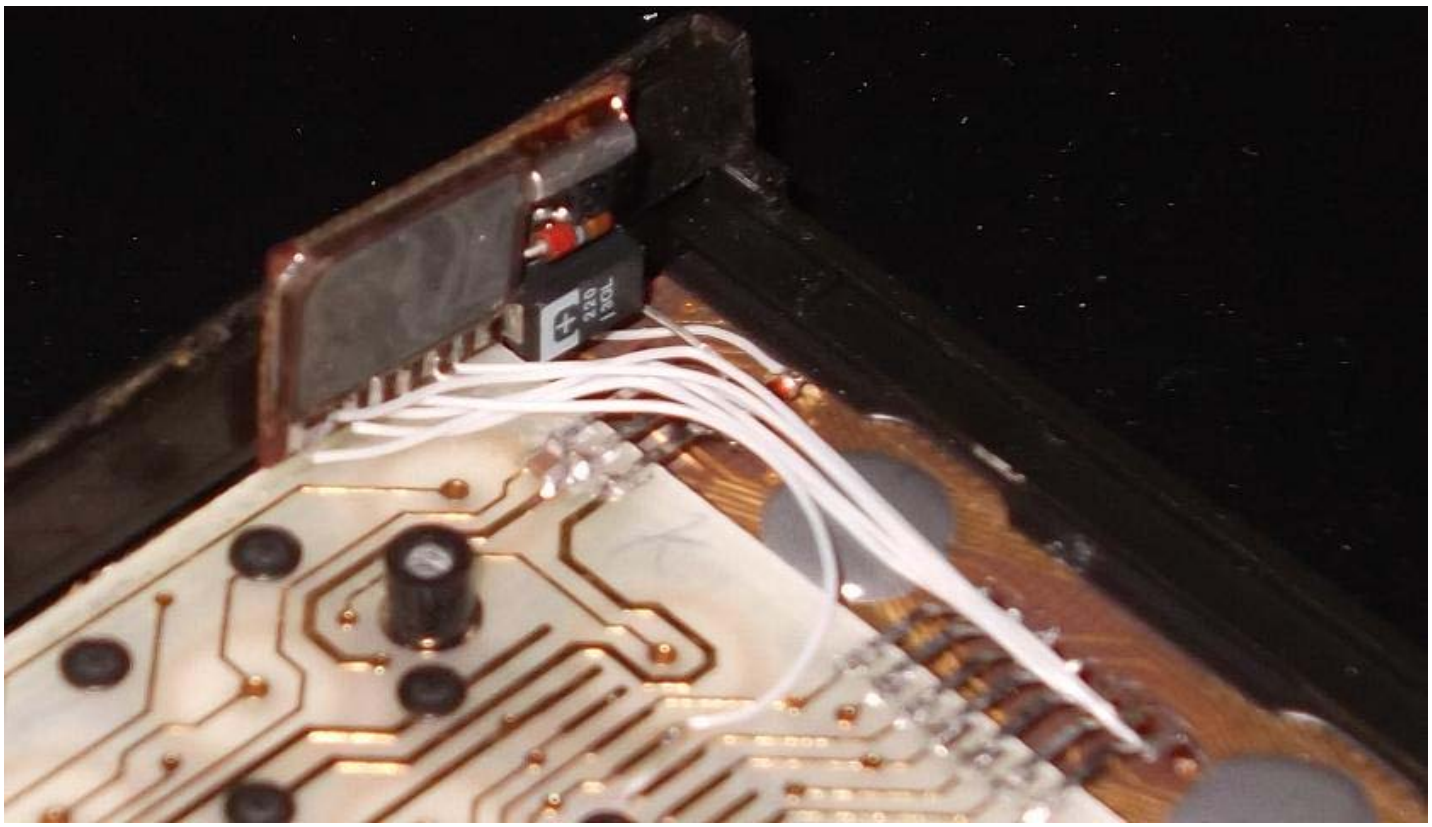
The TIME module disassembled and pre-wired.



The added capacitor.



And the TIME module in its new place.



Hope this can be useful for someone.

Merry Christmas!!

Diego

41CL Flash Update Question

*Message #1 Posted by **Howard Owen** on 23 Dec 2011, 5:47 p.m.*

I have Ángel's new CLUTILS 2E loaded in RAM on my 41CL. I want to update the image in flash, and I'd like to confirm my understanding of how that works before I plunge ahead. I understand that flash must be erased in 64k chunks. So that means you have to save off 7 pages (8 if you want to keep a backup of the original ROM) somewhere and write them back after the erase.

Assuming my understanding is correct, I'm then left with a question about the mnemonics for the standard ROMs. Where is that mnemonic kept? If write the new CLUTILS 2E on top of the existing CLUTILS, will the new ROM inherit the 'CLUT' mnemonic for mapping it into port memory? Can I add my own mnemonics to the table, wherever it is located?

Sorry if I missed this in the documentation, and thanks in advance for any help you can offer.

Merry Christmas
Howard

Re: 41CL Flash Update Question

*Message #2 Posted by **Gerry Schultz** on 23 Dec 2011, 6:29 p.m.,*
in response to message #1 by Howard Owen

Howard, I don't know about you, but I'm nervous about writing back to flash on my 41CL until I thoroughly understand how this works. I've already seen one post where a new 41CL owner accidentally over-wrote some of his flash memory. Given my conservative mind-set when it comes to storage, the very first thing I want to do is COMPLETELY back up all of my flash to a PC so if I accidentally screw up, I can restore it to factory specs. Then I want to back up all my RAM just for the heck of it. Geoff has talked about this in some of his posts and I want to do that too before I start tinkering around. Also, in the new production version of the 41CL, some of the user flash (the XXXA 4K section I think) has solution books located there so if you're not careful, they could be over written if you didn't see that in the user notes that were sent with the 41CL circuit board.

So, for us 41CL Newbies, how do I backup both RAM and flash to a Win7 PC? Please write this as simply as possible because I'm an idiot and if there is a way to screw this up, my fingers will find it!

Thank you,

Gerry

P.S. I do have the 41CL serial port option installed and a good cable to a PC serial port.

Edited: 23 Dec 2011, 6:42 p.m.

Re: 41CL Flash Update Question

in response to message #2 by Gerry Schultz

> Quote:
>
> I've already seen one post where a new 41CL owner accidentally over-wrote some of his flash memory.

I saw that too. I think that happened because he wasn't aware that an erase would take out 8 pages of flash at a time. Hence the need to back up the 64K block that contains the ROM you want to update.

> Quote:
>
> Given my conservative mind-set when it comes to storage, the very first thing I want to do is COMPLETELY back up all of my flash to a PC so if I accidentally screw up, I can restore it to factory specs.

This would be nice too. I have the PIL-Box, which connects HP-IL to USB, and the ILPer software that will serve up a virtual LIF disk. One way to do it would be to map blocks of 7 pages into port memory (8 minus one for the HEPAX) and write them out to LIF. The HEPAX WRTROM will do contiguous pages. So you'd set up the mnemonics in extended memory or normal registers, and step through them seven at a time.

> Quote:
>
> Then I want to back up all my RAM just for the heck of it. Geoff has talked about this in some of his posts and I want to do that too before I start tinkering around.

I've done this using Geoff's procedure. You write the state of the calculator to flash. It involves erasing a section of user flash, which to me less hair raising than overwriting pieces of the library.

> Quote:
>
> P.S. I do have the 41CL serial port option installed and a good cable to a PC serial port.

I haven't installed mine yet. As far as I know, there's no software to drive the calculator end of things.

Re: 41CL Flash Update Question

*Message #4 Posted by **Monte Dalrymple** on 23 Dec 2011, 10:28 p.m.,*
in response to message #3 by Howard Owen

Look at the description of the serial functions in the 41CL manual. There are also programs for linux and windows on the website.

If you aren't aware, there is also a 41CL wiki located at

http://www.wiki4hp.com/doku.php?id=41cl:replacement_cpu_board

with information generated by the Beta testers. All users are encouraged to contribute there themselves.

Re: 41CL Flash Update Question

*Message #5 Posted by **Monte Dalrymple** on 23 Dec 2011, 10:22 p.m.,*

in response to message #1 by Howard Owen

The image mnemonics are hard-coded in YFNZ. Each mnemonic points to a specific physical address and "knows" the size of the image stored at that location.

All of the production boards contain an Image Database at address 0x0DF000, and I want to update YFNZ at some point to use this database. But I don't have a schedule for that yet. I also hope to add functions that will allow users to add mnemonics to the table.

Re: 41CL Flash Update Question

in response to message #5 by Monte Dalrymple

> Quote:
>
> Each mnemonic points to a specific physical address and "knows" the size of the image stored at that location.

But it would be OK to store back an updated ROM as long as the page count didn't change? (i.e. the "known" sizes are multiples of 4096.)

> Quote:
>
> All of the production boards contain an Image Database at address 0x0DF000, and I want to update YFNZ at some point to use this database. But I don't have a schedule for that yet. I also hope to add functions that will allow users to add mnemonics to the table.

That would be very cool. :)

I'm looking at Geoff's QRG for the beta. I assume that patching YFNS using the procedure there would be a bad idea? The version being patched is YFNS 1A, whereas YFNZ in the production board shows YFNS 2B in cat 2. (The table in the manual still has "yfnsX 1a for both ROMS.)

Re: 41CL Flash Update Question

*Message #7 Posted by **Monte Dalrymple** on 24 Dec 2011, 9:24 a.m.,*
in response to message #6 by Howard Owen

Yes, you can store an updated (or different) image to Flash as long as the image type (size) doesn't change.

There is no need to patch -2B. All of those patches to the Beta versions are already applied to the release version.

The only reason you might want to mess with the -2B version would be to modify one of the polling points to select the 50x Turbo mode every time the calc is turned on. The instructions for doing this are available on the 41CL website. I don't recommend attempting to do this until you are familiar with working with the Flash.

Re: 41CL Flash Update Question

*Message #8 Posted by **Ángel Martin** on 24 Dec 2011, 10:47 a.m.,*
in response to message #1 by Howard Owen

Yes, Flash is ERASED in sectors of 32k, that is 8x blocks of 4k each. So if you want to update CLUTLS (or any other ROM) you´ll have to have all the 8x blocks in RAM and do a YFWRT eight times.

That´s why typically the Flash update routines first copy to RAM those blocks that won't be updated as well before doing YERASE, since otherwise there'll be gone.

For instance, see the following script to re-flash sector 0x0F6. This assumes new versions of the 41Z, CLUTLS, and YFNS are already loaded in RAM, at locations 0x807, 0x80C, 0x80D, and 0x80E. Thus it first copies the other four in safe locations prior to YFERASEing the sector,and then proceeds to re-write all blocks back to the same locations.

You will have to modify the program below unless the exact same conditions apply.

Hope this helps, just make sure you're 150% sure that it all is safe to proceed and use a fresh set of batteries.

And one more things: CLUTLS 2F is ready - corrects a few glitches and changes the YFWALL/YFRALL destination to preserve the sector where the Solution Books roms are stored. You may want to use this version instead - let me know and I can send you the image file.

Re: 41CL Flash Update Question

*Message #9 Posted by **Howard Owen** on 24 Dec 2011, 12:56 p.m.,*
in response to message #8 by Ángel Martin

Well, I went ahead and bit the bullet. I patched YFNS to XROM 15, and updated CLUT to CLUTILS 2E. The first part of the process is described in this document on the Wiki. However I refrained from patching anything other than the XROM number because it looked to me like the rest of the patch applied to an

older version of YFNS. Monte's post confirmed this for me.

I had a bit of an adventure getting your newest CLUTILS onto my calculator though. I've mislaid the burner for my NoV64, which would have been the easiest way to get the bits onboard. What I resorted to was HEPAX + HPIL + PIL-Box. I converted the CLUTLS 2E ROM image to a packed 10 bit format using CLBIN41.EXE (part of JF's EMU41.) I then loaded it in EMU41 and wrote it to LIF using HEPAX's WRTROM. Over on the real calc, I read the image in with HEPAX's READROM. At this point I got a checksum error.

The ROM checksum isn't checked by the 41C's operating system, but the HEPAX complained, rightly or wrongly, that it was invalid. This is ironic since the first page of the HEPAX 1D module has an invalid checksum itself. But I was left wondering whether I had corrupted the image at some point during the transfer or if the checksum didn't actually match, or if HEPAX was crazy.

To resolve this, I decided to dump a disassembly of the ROM to my virtual IL console. I could then compare it to your source listing. Well, it turns out that the HEPAX DISASSEM command doesn't work on the CL for some reason. So I loaded the ZENROM and used MCED's disassembler. The process took a while, but I was left with a usable listing of the code. I grabbed the source code out of your "Blueprint" PDF and set about massaging the two so I could compare them.

Because the two listings used different mnemonics and were formatted very differently overall, I wrote a Perl script that found address offsets and the associated data in each. (I looked for patterns matching the page specific addresses plus 3 hex digits.) I produced two lists of these, one for each source listing. I then tried to compare the two. This was an adventure in chasing down subtle format differences and rationalizing other glitches. I finally decided that my image on the calculator contained the same bits that your listing contained.

Finally, back on the calculator, I followed the procedure you outlined above to update CLUTLS and a patched YFNS. I didn't know there was a new 41Z module, so here we go again. :) It should go much better with most of the wrinkles ironed out. I would very much like your updated CLUTLS. You can email me on gmail. I'm egbokalaka.

Thank you, and Merry Christmas!

Howard

You´ve got mail

*Message #10 Posted by **Ángel Martin** on 25 Dec 2011, 1:30 p.m.,*
in response to message #9 by Howard Owen

sorry you had to go through all that hassle! Truth is I never worry about the checksum byte, so… it´s never ¨correct¨.

Re: You´ve got mail

*Message #11 Posted by **Howard Owen** on 25 Dec 2011, 9:37 p.m.,*
in response to message #10 by Ángel Martin

Nothing I do in pursuit of this hobby is ever a hassle! (I actually like writing text parsers in Perl, for example. :) Even if it were a hassle, the pleasure you have given me with your work over the years would far outweigh any trouble.

Thanks for the updated module!

Regards,
Howard

15C LE just arrived

*Message #1 Posted by **Keith Beyer** on 23 Dec 2011, 12:44 p.m.*

Just got it. Nice. Lighter than the original 15C. Has wiggly f and g keys like the first run. What did they supposedly fix from the first run?

Re: 15C LE just arrived

*Message #2 Posted by **Thomas Radtke** on 23 Dec 2011, 1:04 p.m.,*
in response to message #1 by Keith Beyer

Some keys won't register on some calculators (probably due to dirt).

The wiggly shift keys cannot be fixed easily, and I think the only problem about this is that they are the only keys outside the matrix. If all keys were 'loose', nobody would have complained about that, imo ;-).

Several problems remain, unfortunately.

Re: 15C LE just arrived

*Message #3 Posted by **David Griffith** on 24 Dec 2011, 12:17 a.m.,*
in response to message #2 by Thomas Radtke

Is this from the lot that most recently showed up on buy.com? I haven't been able to get to mine yet and I'm thinking "uh oh".

Re: 15C LE just arrived

*Message #4 Posted by **Keith Beyer** on 24 Dec 2011, 9:31 a.m.,*
in response to message #3 by David Griffith

No, I bought this on the HP website on 12/21/11. The standard shipping was super fast. I assume this is the second run of calculators, but I thought one issue they would fix was the wobbly f and g keys. It's weird because all the other keys are fine. Everything works well as far as I can tell.

Re: 15C LE just arrived

*Message #5 Posted by **Ethan Conner** on 24 Dec 2011, 10:59 a.m.,*
in response to message #4 by Keith Beyer

The f and g are wobbly on every LE because they are stand alone where the rest of the keypad is tied together. If you are waiting for a "fix" on that you better get comfortable. lol

Re: 15C LE just arrived

*Message #9 Posted by **David Griffith** on 24 Dec 2011, 5:52 p.m.,*
in response to message #8 by Neil Hamilton (Ottawa)

Does anyone know of a teardown with photos on the 12c? Perhaps that could be used as a reference on how to fix the wobbly 15cle keys.

Re: 15C LE just arrived

*Message #10 Posted by **NateB** on 24 Dec 2011, 7:46 p.m.,*
in response to message #9 by David Griffith

The problem is also related to the molds used for those keys. As the molds wear, the keys will have a greater tendency to wiggle. There is more info on the f and g keys

in an earlier thread. Basically, the wiggle varies, is within the expected tolerance for the keys, and is not something that HP will be correcting.

Re: 15C LE just arrived

*Message #11 Posted by **David Griffith** on 25 Dec 2011, 1:55 a.m.,*
in response to message #10 by NateB

I thought I saw some posts here and elsewhere from people who had the jiggly key problem and HP fixed it.

Re: 15C LE just arrived

*Message #12 Posted by **Jeff O.** on 25 Dec 2011, 7:05 p.m.,*
in response to message #11 by David Griffith

HP "fixed" (i.e. replaced) units which had keys that did not register when pressed or required excessive pressure to cause to register.

Re: 15C LE just arrived

*Message #13 Posted by **David Griffith** on 26 Dec 2011, 8:48 p.m.,*
in response to message #12 by Jeff O.

I opened up my new 15c LE yesterday. The shift keys jiggle a little, but no more than on some other calculators I've had and I wasn't bothered then. I still need to fiddle with it to get the hang of using it. I think I'll stick with the 32sii for everyday use, but this purchase was a good one.

Re: 15C LE just arrived

*Message #14 Posted by **Keith Beyer** on 30 Dec 2011, 11:55 a.m.,*
in response to message #13 by David Griffith

My complaint with the wobbly f and g keys is this: They have been making the 12C for about 30 years WITHOUT wobbly f and g keys, so why do something different with the 15C? I bought a 12C new about 10 years ago and all keys were solid then and still are. I can only guess they are using a different manufacturer for the 15C, and somehow the production of those two keys is different??

I'll be ok using the calculator, and I'm not saying it is a fatal flaw. My concern is those keys will fail eventually.

in response to message #24 by Michael de Estrada

Hay uno que dice que sus 15Cs LE pesan 121 gramos. Como dice, en traducción literal, "mis varias 15Cs" (my several 15C) se entiende que se refiere al *conjunto*.

Así que, necesariamente, cada una pesará una fracción de esos 121 gramos.

Una bromilla por una confusión escribiendo, vamos ;)

Re: 15C LE just arrived

*Message #26 Posted by **Michael de Estrada** on 25 Dec 2011, 3:38 p.m.,*
in response to message #25 by Borja

Yo entiendo perfectamente la bromita. Cuando undo dice que mis 15Cs pesan 121 gramos, se entiende que yo estoy diciendo "cada una". Sin decir que es la cantidad, no es lógico inferir que ese número es el total de los objetos. Por ejemplo, yo podría haber dicho "mis tres 15Cs pesan 121 gramos," y con esto entender que cada uno pesa 40.3 gramos.

Y con esto, le deseo feliz navidad y un próspero año nuevo. :)

*Message #29 Posted by **Michael de Estrada** on 25 Dec 2011, 10:18 p.m.,*
in response to message #28 by Frank Knight

I'm curious how you were able to order more than one, since they have a limit of one. Did they change that since the time when you ordered ? Just for fun I tried to put two in my cart and it wouldn't allow it. I've already ordered all I want, so this was just idle curiosity.

Edit: I see they have them on ebaby again, so I assume you bought them there with no limit on quantity.

Anyway, I like to see them undercut the price gougers. Looks like SC has only managed to sell two out of 100 to just one buyer so far at $250.

Edited: 25 Dec 2011, 10:37 p.m.

Correct, did an Internet search which brought me to their Ebay page, Buy.com. Ordered and they processed 2, wanted for personal use. I did see later the Buy.com order page with limit 1 and all the scalpers everywhere else with the $149 and $199 prices.

Re: 15C LE just arrived

*Message #31 Posted by **Keith Beyer** on 26 Dec 2011, 10:23 a.m.,*
in response to message #30 by Frank Knight

They appear to be out of stock now, but if you order on the HP website and enter the coupon save15hp, you get $15 off. So, with free standard shipping, that's $85 for the calculator plus sales tax, which is what I paid.

Re: 15C LE just arrived

*Message #32 Posted by **Frank Knight** on 26 Dec 2011, 12:49 p.m.,*
in response to message #31 by Keith Beyer

Yes, checked there first and were out of stock, but said check back soon, so maybe HP will get more. Before I found the Buy.Com units I emailed HP Customer service to see when they might have more. 2 is my limit though for this model so I am set. I think I have 3 or 4 35S and still have a few HP classics left and newer such as 20S, 48GX, 49, 50 and business models though sold most classics out on ebay from 2003-2005. Have a pile of non-HP left. Since HP charges state tax not much difference for me on price.

Re: 15C LE just arrived

*Message #33 Posted by **Michael de Estrada** on 26 Dec 2011, 1:22 p.m.,*
in response to message #32 by Frank Knight

Last time HP said "check back soon," it took 3 months for them to restock. It's like us hispanics when we say mañana (tomorrow), it really means someday in our lifetime.

[WP34s/QtGui] What is qextserialport?

*Message #1 Posted by **Nobby K.** on 23 Dec 2011, 8:50 a.m.*

Hi all.

I tried to build QtGui on linux platform. But it faild because of link error relayted on libqextserialport.a.

In QtGui/SerialPort.txt, it is discribed that libqextserialport.a is external library.

On Ubuntu 11.10, build is succeeded, but on my linux box(vine linux 5.1), the binary which comes with 'svn update' does not link.

What is the purpose for linking serial library? And how to configure without linking the serial port functions?

I'm making Japanese page, how to build wp34s. Please see, if interested.
http://park11.wakwak.com/~nkon/homepc/hpcalc/

Re: [WP34s/QtGui] What is qextserialport?

*Message #2 Posted by **Marcus von Cube, Germany** on 23 Dec 2011, 1:34 p.m.,*
in response to message #1 by Nobby K.

The calculator has serial communications built in and so has the emulator. The emulator serves as the link to the calculator to send programs and data to the device.

Re: [WP34s/QtGui] What is qextserialport?

*Message #3 Posted by **Nobby K.** on 23 Dec 2011, 11:50 p.m.,*
in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> The calculator has serial communications built in and so has the emulator. The emulator serves as the link to the calculator to send programs and data to the device.

Thanks response.

I succeeded to build local version of libqtextserialport.a and QtGui. The trunk(2702) works good.

I think that it is better to be selectable serial port function. Because the cost of building the library does not balance the frequency to be used. To use serial port, hardware hack is needed, such as soldering ADM3202.

Re: [WP34s/QtGui] What is qextserialport?

*Message #4 Posted by **Marcus von Cube, Germany** on 24 Dec 2011, 3:07 p.m.,*
in response to message #3 by Nobby K.

No hardware modification is necessary if you use the programming cable that is used to flash an HP 30b to become a 34S.

Polynomial roots again ...

*Message #1 Posted by **fhub** on 23 Dec 2011, 4:57 a.m.*

I've now finally finished my Polynomial RootSolver for the WP34s, and I think it's a quite good piece of software. :-)

Unlike almost every other such program (at least for calculators) it also calculates multiple roots with full precision, where the usual programs fail miserably and give completely wrong roots.

Although I've tested my program with MANY example polynomials I've found in the dozens of sources (about polynomial root solving) that I've read (and so I far I get excellent results!), but before releasing my program I would like to make a few more tests.

So does anyone know a special collection of 'hard to solve' polynomials, especially with multiple roots?
But please no polynomials with multiplicity=degree, i.e. P(x)=(x-x0)^n, because this is too easy and is automatically solved exactly by the used Laguerre method. ;-)

Franz

Thanks Werner, but I was rather expecting a ready-to-use list of polynomials known to be a hard task for rootsolvers (like Valentin's matrix examples).

It's already enough work to enter lots of (usually quite long) coefficients into the WP34s, but I'm absolutely not keen on studying a long abstract mathematical paper just to be able to build such polynomials by myself - for this task I could just use a CAS.

Franz

Re: Polynomial roots again ...

*Message #4 Posted by **Werner** on 27 Dec 2011, 2:11 a.m.,*
in response to message #3 by fhub

There's no need to study anything.. if you cared to scan the document for 5 minutes, you would see that the polynomial

```
x^d - 2*(a*x - 1)^2 = 0
```

has two roots separated by a distance less than a^(-(d+2)/2) If you take a to be a convenient 10, and d=30, for instance, this means that

```
x^30 - 200*x^2 + 40*x - 2 = 0
```

has two roots that agree to 16 digits, yet are distinct:

```
0.09999999999999992929
0.10000000000000007071
```

By making the order of the first term larger, you can get the roots arbitrarily close, but still distinct. This means that your routine to eliminate multiplicity in roots will not apply here, but numerically they will be treated as multiple roots, resulting in slower convergence and loss of accuracy. The HP48, working with 15 internal digits, returns

```
.0999999635205
.100000036479
```

losing *nine* digits.

Cheers, Werner

>
> losing *nine* digits.

Hi Werner,

I've now played a bit with your polynomial above, and of course 'distinct' roots which agree to 16 digits are just beyond the calculation accuracy of PRS (or should I say WP34s?).

In line 402 of PRS there's my 'multiple root threshold' (SDL 10) which I've chosen after many tests with and without multiple roots. If I change that line to "SDL 08" then I get in fact 2 distinct roots for your polynomial, but (like the HP48) with much less significant digits - a 'multiple' root of 0.1 (which PRS returns with its default SDL 10) is definitely much more accurate than the 2 roots given by the HP48 (or if I change SDL to 08).

So I would indeed say that my program returns a much better result for this example. But as I already mentioned - if you construct polynomials with distinct roots (or root clusters) only in the 16th (or higher) digit, then you shouldn't wonder that you don't get absolutely exact results.

After your example I'm thinking about making this 'threshold' value for multiple roots (SDL 10) an option that can be changed by the user (like the accuracy 1e-15 in R99)!? OTOH this would make the usage of the program more complicated - and which user would really know when (and to which value) change this parameter for multiplicity testing ... :-(

Franz

Re: Polynomial roots again ...

*Message #6 Posted by **Werner** on 27 Dec 2011, 4:29 a.m.,*
in response to message #3 by fhub

A bit further on, you see the more general formula

```
x^d - 2*(a*x-1)^(d-1) = 0
```

that has d-1 roots very close together. For a=d=10, that amounts to

```
x^10 - 2*(10*x - 1)^9 = 0
x^10 - 2000000000*x^9 + 1800000000*x^8 - 720000000*x^7
+ 168000000*x^6 - 25200000*x^5 + 2520000*x^4 - 168000*x^3
+ 7200*x^2 - 180*x + 2 = 0
```

Here, the WolframAlpha and the HP-48 results differ in the third digit already.

in response to message #1 by fhub

With the most recent emulator you can test the double precision functionality. In DBLON mode you loose some registers, of course. With the full setup, 50 double precision registers are available. The set of lettered registers is reduced to X, Y, Z, T, L and I.

There are most probably some rough edges. I'd like to here from you.

Well Marcus, I'm not yet very impressed with the latest improvements (I'm still using SVN 2030 before the new flash handling has been introduced).

After my program had reached the 510 step limit I tried loading and running it in the newer versions, just to see that this reduces the number of available registers, and I definitely need many/all of them. Since I want to solve also very high-degree polynomials (my program limit is now 39), I'm using all registers R80-R99 for my calculations, so reducing the registers for more program steps is not acceptable for my program. So I finally decided to switch back to the older version again and to remove an (almost never used) feature of my program again, and now my final version is 504 steps, which is enough for polynomials upto degree 39 (and runs even in version 2 of WP34s).

I also don't know yet what I should think about this new DBL precision mode - is this really necessary (i.e. does it really give any better results)???
At least for my polynomial solver I don't think so, because also without DBL precision I already get results accurate to all displayed 12 digits, and I can't imagine that this new mode would do it any better. And with even more register reducement it's definitely a no-go for me.

And finally I'm absolutely not happy with this new library management - it was so much easier with single wp34s-n.dat files for each program!

Franz

Re: Polynomial roots again ...

*Message #9 Posted by **Marcus von Cube, Germany** on 23 Dec 2011, 2:55 p.m.,*
in response to message #8 by fhub

I have to disagree. The new library management is way better in getting the most out of the rare flash memory.

Many registers and long programs work well together if you let the program run off library or backup space and use RAM exclusively for data with a combination of global and local registers. Local registers are very handy for internal variables while global registers should be used for user data.

The reason to introduce double precision mode was an idea to implement more functions in user code which will save space, hopefully more than the new feature costs. Double precision comes in handy when an algorithm is susceptible to cancellation. The more digits the better. The internal precision is already at 39 digits and we won't loose too much of the potential when we start implementing stuff in user code with the help of double precision registers.

Re: Polynomial roots again ...

*Message #10 Posted by **fhub** on 23 Dec 2011, 3:31 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Yes, if the reason for double precision is turning built-in functions into external user code, you're right of course. But for usual programs I see not need for it.

And my problem with the new library is that I can't get the libmanager working here (with my TinyPerl), and so I still prefer separated dat-files created by the perfectly working assembler. But of course it's just a matter of taste, and maybe I'll like it more when I become familiar with it anytime in the future ...

> Quote:
>
> I've now finally finished my Polynomial RootSolver for the WP34s, and I think it's a quite good piece of software. :-) [...] So does anyone know a special collection of 'hard to solve' polynomials, especially with multiple roots?

Last time I heard of your *"Polynomial RootSolver for the WP34s"* was about a month ago, in this post of yours (the highlighting is mine):

> "Message #24 Posted by fhub on 20 Nov 2011, 3:57 p.m.,
> in response to message #23 by Dieter
>
> Quote:
>
> > So it's about time for you to show your latest Laguerre solver. ;-)
>
> **No Dieter, not after these attacks a week ago!**
>
> **Since this time my programs are only private.**"

So I take it that now you're asking for people to share their knowledge and materials with you *("a special collection of 'hard to solve' polynomials")* while publicly stating that you won't share a thing with anyone because of some bruised ego you've got or something ?

Or have you (silently) changed your mind since that post of yours ?

Not that a change of mind on your part would be unheard of, actually ...

Best regards from V.

*Message #12 Posted by **fhub** on 23 Dec 2011, 5:48 p.m.,*
in response to message #11 by Valentin Albillo

Would you really say that posting a few polynomials (or a link to them) is "share their knowledge and materials" with me?
Well, then I've also "shared my knowledge" more than a dozen of times in the past month when I reported bugs in the latest WP34s development. ;-)

And if you had read my posting a bit more mindfully then your reply won't have been necessary at all - I quote myself:
"..., but **before releasing my program** I would like to make a few more tests."

Re: Polynomial roots again ...

LOL, of course not, I'm not a salesman or a company. ;-)
I'm also not a native English speaker, and maybe 'publish' would have been a better word than 'release'.

My program is already out (free of course) - see this thread:

Calculator from a smoking environment: What is to be done?

*Message #1 Posted by **Peter Murphy (Livermore)** on 22 Dec 2011, 10:37 p.m.*

I've got two calculators that I can smell at a distance. Does anyone have a recipe for reducing that odor? The cases stink, too.

(My New Year's resolution: ASK eBay sellers about the environment in which their calculators have lived.)

>
> (My New Year's resolution: ASK eBay sellers about the environment in which their calculators have lived.)

My condolences as I have one of those too. Smells like someone left the device in a desk drawer on top of a box of cheap incense for a decade or so. I've tried dismantling the unit, washing 4-5 times in a dishwasher, soaking in vinegar, packing it disassembled in baking soda for weeks. No dice whatsoever, the stench refuses to leave.

In the process of the above nonsense I'd peeled the serial number sticker off the case to preserve it, stuck it elsewhere and forgot about it. Weeks later I was unknowing working in the area where I'd stashed the serial number and thought I was having flash backs of that rancid smell. Then I noticed the sticker. Unbelievable.

Sorry I have no advise other than digging a hole in the backyard. My casualty is a sam7 12c+ so at least I'm not going to worry too much about hitting the flash wearout on this particular unit.

*Message #3 Posted by **Katie Wasserman** on 22 Dec 2011, 11:36 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

Open it up and clean everything as best you can with 99% isopropyl alcohol inside and Novus #1 outside. Then leave it open to the air, preferably outside and in the sun if you can, for a long time. It will eventually be smell free but may take a month or longer.

Please do not use Acetone on ABS plastic as it will immediately soften and destroy the finish. In fact it dissolves ABS so readily it makes a superb ABS glue. IIRC there can be variation in the distillate composition of Naphtha so you might want to test that sparingly on the inside of the housing before going too far.

*Message #14 Posted by **Duane Hess** on 23 Dec 2011, 8:54 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

Something I used (probably not a good idea for circuitry) on plastic parts was a degreaser. Specifically I used Super Clean Tough Task Cleaner Degreaser from Casey's (think 7-11, Gas 'n Stop, etc.). (my brother smokes like a damn chimney)

When I've used it on plastic, glass, non-porous surfaces that damn nicotine comes right off. Your paper towel will be a disguisting yellowy-brown. It smells exactly like 409 cleaner, feels like 409, looks like 409, makes you choke like 409, etc. So 409 might work just as well.

Never checked for smell beforehand but afterwards there wasn't any. Just be sure to RINSE, RINSE, RINSE. I don't use it on anything I can't hold under warm running water and rub with a clean rag/paper towel. It takes quite a lot to rinse the degreaser off. (which may mean there is more left to clean)

** must warn you, I've only once used the degreaser on an ink surface. i.e. the keyboard back-plate on a HP-91/97, for example, where the yellow nomenclature is. The yellow lettering looked very solid and I only sprayed and immediately rinsed. I have used similar cleaners (Mean Green?) on keys of a HP-46 (removed & washed each key cap) and in a few light rubs the cleaner started taking the colored lettering right off. So I make a point to never rub on ink-printed nomenclature. Use a q-tip & go around it. Spray on the lettering and then immediately hold under water. Then PAT the lettered area dry.

Maybe the colored lettering on a 46 versus newer items is different, but never trusted the cleaner subsequently. i.e. the coloring on the 46 appeared to hold, then in about 1/2 a wipe most of it was suddenly gone.

But never had any problem using the degreaser on a case and rubbing on it with a rag.

Re: Calculator from a smoking environment: What is to be done?

*Message #15 Posted by **Hugh Evans** on 26 Dec 2011, 11:02 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

Extended soaking in isopropyl alcohol sounds very reasonable, but I don't have a tobacconated calculator to test this on. After all of the surface cleaning, this is ultimately a question of solubility... Which gives me an idea, based off of a concept I encountered for cleaning old records: PVA adhesive.

The idea would be to disassemble as much as possible, and apply a thick layer of PVA adhesive. Elevated temperatures will accelerate the process of light organics molecules being absorbed into the adhesive layer. After several weeks, peel off the adhesive (should clean the textured parts very nicely) and see if it improves.

If anyone wishes to give this a shot of has a calculator scrap they would like to try this on, let me know. I do technical work in the adhesives/sealants/polymer industry, so providing material samples is easy enough from my end.

i use a product call De-Solv-It to clean most things, it is a citrus oil based solvent intended for removing stains. works like a treat on dirt and ink marks, and leaves behind a faint orangish odour.

it also softens/dissolves adhesives, and is marvellous for removing unwanted labels and stickers. just apply to the top of the sticker, leave for 10 minutes or so to soak through, then the sticker will peel off cleanly. once the De-Solv-It has fully evaporated away, the adhesive on most labels will become sticky again.

applied lightly and rubbed off with a cloth, it will restore most items to a new-looking finish with remarkably little effort.

i believe eucalyptus oil works similarly well.

Coburlin Is No More!

*Message #1 Posted by **Dan Grelinger** on 22 Dec 2011, 8:29 p.m.*

After discussions on this forum a few months ago about forum posters blocking him from bidding on their items, he no longer has any items for sale on eBay (TAS)!

But, wait! Who is this 'garbaco'? A new ebay member (11/1/11) already has 65 vintage HP calculating instruments and accessories, all at ridiculous Buy-It-Now prices and $5.95 or $9.95 shipping charges. And this seller is also from California! Perhaps this is a relation, one who shares the same genetic material with the 'big C'? Tricky, tricky, tricky!

So, for those who have blocked coburlin from bidding on their ebay items, you may wish to block his evil twin, garbaco, for the same reasons.

Re: Coburlin Is No More!

*Message #2 Posted by **Michael de Estrada** on 22 Dec 2011, 9:01 p.m.,*
in response to message #1 by Dan Grelinger

Yes, it's him. Same listings, word for word. Same photos. And of course same prices. As to his bidding on auctions, his bids were always totally lowball, so there was never any risk he'd win, unless you did a really bad job in the listing and nobody else noticed it. I don't sell on ebaby anymore, so it's a moot point.

Re: Coburlin Is No More!

Calculator Market

*Message #1 Posted by **Benoit Maag** on 22 Dec 2011, 3:45 a.m.*

I was wondering about the size of the scientific calculator market, and the shares of hp, ti, Casio... is there any reference on that? The only datapoint I have is Casio celebrating the 1 billion mark a few years ago (all calculator types included).

Re: Calculator Market

*Message #2 Posted by **Ethan Conner** on 22 Dec 2011, 8:06 a.m.,*
in response to message #1 by Benoit Maag

I found a Wall Street Journal article from 2009 that was about the TI N-spire that lists market share for the U.S. concerning graphing calculators. The article uses NPD (national purchase diary) as the data source. The article states that TI has 80% and HP 5% but doesn't give a percentage for Casio. However it says Casio is second in market share so i infer that means 15%. I'm sure that there are forum members that will be able to shed more light on the subject.

YFNS vs YFNZ

*Message #1 Posted by **Howard Owen** on 21 Dec 2011, 9:38 p.m.*

THe 41CL ROM library contains two versions of the CL extra functions ROM. They differ only in their ROM labels and in their XROM numbers. The YFNZ ROM has XROM 15, and is the default version. (i.e. it is loaded when the MMU is disabled, hardwired into port 7.) The"alternate" version is called YFNS. It has an XROM number of 31.

In order to play with flash memory on the 41CL, it is necessary to map one or the other of these ROMs into RAM. For some reason, people writing code like that tend to map the YFNS version at ROM address 0x062000 into RAM, rather than the default YFNZ version at ROM address 0x070000. They often also "restore" the port mapping of the YFNS version when they are through. This has caused me some confusion, because code I wrote using the YFNZ version fails to work if the YFNS version is loaded.

Is there an XROM collision that leads people to prefer YFNS over YFNZ? Or perhaps this is a legacy of the beta test era?

Re: YFNS vs YFNZ

*Message #2 Posted by **Monte Dalrymple** on 21 Dec 2011, 9:50 p.m.,*
in response to message #1 by Howard Owen

I think that this is probably an artifact of the Beta testing.
The 41CL hardware does not allow the first sector of Flash memory to be written, to protect the operating system. The YFNZ version is located in this sector. So, when patching is required the YFNS version was used, because it can be written back to the Flash.

Re: YFNS vs YFNZ

*Message #3 Posted by **Geoff Quickfall** on 21 Dec 2011, 10:08 p.m.,*
in response to message #2 by Monte Dalrymple

To that end we were also patching the YFNS to read ROM id #15 using a ypoke command.

Cheers, Geoff

p.s. I encourage all CL users to sign into Bruce Bergmans wiki in which is a dedicated CL forum including PDFs and etc:

HP 41CL wiki

Also there are some beta pdf's created which are available with an email to me.

geoffqf@xxxtelus.net (remove the xxx of course.)

Re: YFNS vs YFNZ

*Message #4 Posted by **Ángel Martin** on 22 Dec 2011, 3:45 a.m.,*
in response to message #2 by Monte Dalrymple

One reason to use the XROM#15 one is CLUTILS - the function launchers expect that id# to work.

The drawback is HEPAX RAM tends to use the same id# in 16k configurations, so a manual adjustment is required.

I have re-flashed my YFNS#31 with a patched version of the YFNZ#15, so I'm totally commited to that id number.

Return of the 15C with Bad Zebra?

*Message #1 Posted by **aj04062** on 21 Dec 2011, 9:24 p.m.*

I pulled an old 15C out of the box today to see if it was still malfunctioning after a brief time of normal function. When I tried to use it, the same malfunction occurred.

Reference this old THREAD

Here is a picture of what happens.

Any key that is pressed results in this display. If you press a key twice, it will "stick". I have left the batteries out to try again in a few weeks. Last time I did this, it worked normally when I installed batteries.

Thoughts?

The voyager lcd controller will mindlessly render whatever display data has been sent to it long after the NUT cpu has gone off into the weeds. It is autonomous in the sense it generates its own scan clock and as long as it hasn't been disabled it will persistently render the last captured display data. The dropout voltage for the display registers is spectacularly low and your best bet to determine weather the cpu is repeatedly writing that display data is to remove the button cells and short the corresponding terminals to discharge the internal bypass capacitors.

> Quote:
>
> If you press a key twice, it will "stick".

Not sure I quite follow what you mean by "stick"?

> Quote:
>
> I have left the batteries out to try again in a few weeks. Last time I did this, it worked normally when I installed batteries.

Waiting for weeks isn't necessary to dropout the voltage rail, try the above.

You may also have an intermittent related to temperature or handling of the unit. If you are comfortable to open the unit, further debug is possible particularly if you have access to an oscilloscope.

Re: Return of the 15C with Bad Zebra?

*Message #3 Posted by **aj04062** on 22 Dec 2011, 7:59 p.m.,*
in response to message #2 by uhmgawa

If I press any key once you will see the displayed "text". After you release the key, the screen goes blank. If I press quickly press any key, the display with remain as shown. If I press any key again, it will go blank.

I tried shorting the terminals. Nothing changed. I have no problem pulling the the unit apart and do have a scope.

I know 4.5V would be an appropriate voltage setting on a bench power supply, what should the max current be?

What do I need to look at with the scope?

Is the 15c to your knowledge actually in its "on" mode when you see the above behavior? Or is it "off" and pressing any key causes the above?

Other than being illegible text, are the driven lcd segments solidly polarized or do you see any indication of weak partial drive? The latter would point a finger at the lcd controller or contamination of the interconnect between it and the lcd glass.

> Quote:
>
> I tried shorting the terminals. Nothing changed. I have no problem pulling the the unit apart and do have a scope.

In the event you haven't opened one up before, do so in something like a deep tray to capture the esd bonding springs which are carefully designed to disappear as soon as being exposed to light.

Concerning springs, once you have it open do a quick check of the button cell positive spring terminal to verify the pcb end is solidly under tension between the pcb and the cell stack well -- the spring tension is divided in two parts due to the cell well. I've seen a loose spring cause all sorts of trouble and it could also frustrate the attempt to discharge the power rail as above.

> Quote:

> I know 4.5V would be an appropriate voltage setting on a bench power supply, what should the max current be?

When the cpu is active and the LC tank is driven, somewhere around 1ma is typical. Note you'll need to hold a key down to keep the cpu active as it will enter poweroff in under 100ms when it is idle and no keys are down.

> Quote:
>
> What do I need to look at with the scope?

Take a look at the LC tank and verify it reliably becomes active (~880KHz) upon key press and becomes inactive when the key is released. IIRC the inductor is situated horizontally just under the cell well on that vintage voyager.

Before that I'd get a jeweler's loupe and have a look at the solder joints of all package leads checking for fillet stress fractures, and shorts due to whiskers or contamination. You can also try poking at the leads with a toothpick to see whether that alters the behavior. Mild flexing/torque of the case/pcb (back removed) may also be useful. At least this is what I'd hope is the source of the trouble, and (if I follow correctly) the intermittent nature of the problem would seem to indicate some type of dependency on temperature, humidity, or stress.

Unfortunately except for the cpu, the only source of replacement ram/rom/display devices are another 15c. And the only conclusive approach to debug a suspect device is to sniff the ISA bus to capture the transactions which is somewhat involved electrically and mechanically. FWIW I've disassembled dozens of voyagers and every problem I've encountered has been due to an interconnect of some sort.

15C back in stock at hp.com

*Message #1 Posted by **sjthomas** on 21 Dec 2011, 1:11 p.m.*

Here

Get 'em while they're hot!

Re: 15C back in stock at hp.com

*Message #2 Posted by **Jeff Johnson** on 21 Dec 2011, 1:25 p.m.,*
in response to message #1 by sjthomas

Wow, yeah. And BUY.COM has them again, but now they are $256.66 + shipping. Just got mine last week from BUY.COM for $94.95 with free shipping. What is up with this market?

Re: 15C back in stock at hp.com

*Message #3 Posted by **NateB** on 21 Dec 2011, 1:50 p.m.,*
in response to message #2 by Jeff Johnson

Buy.com is out of stock. The ones selling for $256.66 (why such a random amount?) are being sold by Samson cable.

The resellers are buying all the available stock from Buy.com and HP and then listing them at a 300% markup. Hopefully HP gets the supply issue worked out and all the speculators get hosed.

Re: 15C back in stock at hp.com

Good old law of Supply and Demand. Demand is high and apparently supply is *limited*...

Re: 15C back in stock at hp.com

*Message #5 Posted by **Bill Smith** on 21 Dec 2011, 2:01 p.m.,*
in response to message #1 by sjthomas

Got one! Almost didn't notice they were in stock, but have been checking their site daily for the last month or so.

Re: 15C back in stock at hp.com

*Message #6 Posted by **Jeff Johnson** on 21 Dec 2011, 2:35 p.m.,*
in response to message #5 by Bill Smith

Glad you snagged one, Bill. Seems like "daily" checking isn't good enough with this crazy situation. To catch it, you probably need to either be lucky, or hit "refresh" on a web browser hourly, for days on end. Worth the effort, though, in my opinion.

Re: 15C back in stock at hp.com

*Message #7 Posted by **Michael de Estrada** on 21 Dec 2011, 2:26 p.m.,*
in response to message #1 by sjthomas

Also, use coupon code SAVE15HP to get $15 off. Effective price will then be $84.99. Also, don't bother paying for expedited shipping, because standard free shipping is plenty quick IME. You will have to pay your state sales tax, however.

Re: 15C back in stock at hp.com (+ name-dropping)

*Message #8 Posted by **Paul Brogger** on 21 Dec 2011, 7:05 p.m.,*
in response to message #1 by sjthomas

I just ordered one -- Merry Christmas to me!

Also, having notified him of the fact, no less a techie than Steve Gibson (creator of of "SpinRite", among other things, at Gibson Research Corporation) celebrates the 15C's renewed availability via a Tweet and at the end of his most recent Security Now podcast.

He says his own favorite is the 11C, and from listening to earlier episodes of the show I understand he's got a half-dozen (!) of them in his refrigerator for long-term backup. (Smart guy!)

Edited: 21 Dec 2011, 9:03 p.m.

Re: 15C back in stock at hp.com

*Message #9 Posted by **Dan Grelinger** on 22 Dec 2011, 10:32 a.m.,*
in response to message #1 by sjthomas

And they are back in stock at Buy.com as well, for $99.99 with Free Shipping. This ordering limit is now 1.

Thimet index for 15C LE

*Message #1 Posted by **Jeff Johnson** on 21 Dec 2011, 9:42 a.m.*

Has anyone run the Thimet speed index on the new HP 15C LE? I'm curious as to how it compares to the "100 times faster" metric. The Thimet index should be a little more representative, since it includes some floating point math and transcendental functions. The original 15C clocked in with an index of 2.7, the new 35s with a 9.5, and the 50g with a 260.

Re: Thimet index for 15C LE

*Message #2 Posted by **Gerson W. Barbosa** on 21 Dec 2011, 10:40 a.m.,*
in response to message #1 by Jeff Johnson

60 iterations in 10.06 seconds (performance index = 202.8). That's about 75 times faster than the HP-15C in his table (2.7). That's a double-speed unit, however:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=77430

150 appears to be the right factor.

Re: Thimet index for 15C LE

*Message #3 Posted by **Jeff Johnson** on 21 Dec 2011, 11:27 a.m.,*
in response to message #2 by Gerson W. Barbosa

Good info. Thanks! I was curious how it stacked up with the others. Also didn't know about the "double speed" unit. That's interesting too.

SpeedUI 11.11 available

*Message #1 Posted by **Raymond Del Tondo** on 20 Dec 2011, 7:28 p.m.*

Hello all,

here's an important update for SpeedUI.

SpeedUI 11.11 fixes some serious bugs
and adds some new features.
See RelNotes.txt for details.

For installation/uninstallation, please take a look into
StartHere.pdf supplied with the latest SpeedUI archive.

The new version is available here:
http://www.hpmuseum.org/guest/deltondo/speedui.pdf (Walkthrough PDF)

http://www.hpmuseum.org/guest/deltondo/sui_1111.zip (SpeedUI zip archive)

and on www.hpcalc.org once the site will be updated.

Have fun:-)

Raymond

HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #1 Posted by **Diego Diaz** on 20 Dec 2011, 6:43 p.m.*

Hi all,

After some diving into NoVRAM and NoV-32 code, I've fixed the issues that prevented them to properly work on HP-41CL machines.

Details on previous thread: here.

The updated code is here, just replace the enclosed files in your working directory and reprogram your NoV's as usual.

Now the whole range of Clonix and NoV's modules are compatible with HP-41CL.

As a "collateral effect" I've also added the RAM shadowing feature to the NoVRAM and NoV-32 modules... ;-)

Please let me know of any issue you may find.

Hope this helps.

Enjoy your 41's and best wishes for the upcoming Xmas season.

Diego.

Re: HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #2 Posted by **Meindert Kuipers** on 21 Dec 2011, 3:12 a.m.,*
in response to message #1 by Diego Diaz

Could you shed a light on what the issue was? I expect my CL soon and could run into the same type of problem when it needs to work with the MLDL2000,

Meindert

[Meindert] Re: HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #3 Posted by **robertoataulfo** on 21 Dec 2011, 6:19 a.m.,*
in response to message #2 by Meindert Kuipers

```
Meindert I did not understand what would be the use of MLDL2000 with 41CL?
I have both but on different machines.
I do not see what use to use the two simultaneously.
Can you help me this question?
```

Edited: 21 Dec 2011, 6:20 a.m.

Re: [Meindert] Re: HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #4 Posted by **Meindert Kuipers** on 21 Dec 2011, 12:35 p.m.,*
in response to message #3 by robertoataulfo

Obviously this type of knowledge may be interesting just for fun. And there may be several use cases for the MLDL2000, if only for easy transfer of ROM images from the PC to MLDL2000 to the 41CL.

Meindert

*Message #5 Posted by **Massimo Gnerucci (Italy)** on 21 Dec 2011, 3:44 a.m.,*
in response to message #1 by Diego Diaz

Thank you Diego! (as usual...)

Season's Greetings,
Massimo

Re: HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #6 Posted by **Ángel Martin** on 21 Dec 2011, 4:38 a.m.,*
in response to message #1 by Diego Diaz

Hola Diego, I tried my NoVRAM with the new configuration files quickly this morning and sure enough the start sequence works great, and the HEPAX relocates itself to page#6. I believe you said that page #8 must be free during the start-up process, but I might be wrong. Just in case the MMU configuration is YFNS on page#E and CLUTILS on page#F - nothing else so no conflcits.

There is however a (new) problem: the two non-hepax ROM images burned (the "back-seat passengers" so to speak) are not there!, Seemingly not on the VRAM at all, as they don't show up on the standard CX either.

I'm using pages #C and #D for the "passangers". I tried it twice, starting the burning from the scratch. Same result, and the disconcerting part is that those images are not shown in the non-CL machine either. Is it possible that the upgraded files have caused this?

I'll try this evening with other pages to see if the same issue occurs - it may be me making some mistake, who knows.

Saludos, Ángel

Re: HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #7 Posted by **Diego Diaz** on 21 Dec 2011, 12:10 p.m.,*
in response to message #6 by Ángel Martin

Hi there,

Meindert, it was a clock phase missing issue. Since the code in the NoVRAM is so tight (just 2Kbytes) I have to run some "tricky" code in order to keep NoV "in time".

At some point it seems that the Phi pulse witdh on the CL is slightly narrower than the original 41 and the NoV lost its pace.

After moving a few instructions up and down a bit, (namely 166.66nS in two different Phases) NoV can now stay in sync as it should.

Due to the very different concept in your MLDL2000 (HW interfaced) I doubt this trouble could arise in your case, but it is always a pleasure to find someone who can listen to these "old techie tales"... ;-)

Thanks for your (as usual) kind words Massimo, and Merry Xmas to Italy!

Ángel, you're right (sorry) I switch the "back seats" OFF, to ease the testing procedure, and forgot to turn them back ON once the timing issue was fixed.

I've already uploaded the "fixed" update, it may take a few hours until my ISP will actually "update" it on-line.

In the meanwhile, you can use the NoV-32 files to configure your NoVRAM, it will work as expected (of course just one 16K RAM block)

Enjoy your toys!!

Diego.

Re: HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #8 Posted by **Eric Smith** on 21 Dec 2011, 4:54 p.m.,*
in response to message #1 by Diego Diaz

Does this apply to Nov64 also?

Re: HP-41CL & NoVRAM/NoV-32 issue fixed... ;-)

*Message #9 Posted by **Diego Diaz** on 21 Dec 2011, 6:25 p.m.,*
in response to message #8 by Eric Smith

Hi Eric,

To your question, NoV-64 has a different microcontroller, different code, and duoble program space, so it works with HP-41CL.

Update is applicable only to NoVRAM and NoV-32 modules.

Cheers.

Diego.

14b is not calculating PMT correctly

*Message #1 Posted by **Eric Peltier** on 20 Dec 2011, 4:51 p.m.*

14b is not calculating PMT correctly. I have a 14B 50th Aniv Edition. I am a mortgage professional, so, I calculate PMT quite a bit. It has suddenly started calculating PMT incorrectly. I have checked it against several sources. Any ideas why? Is there a setting that got messed up? Thanks in advance!

Re: 14b is not calculating PMT correctly

*Message #2 Posted by **Raymond Del Tondo** on 20 Dec 2011, 5:05 p.m.,*
in response to message #1 by Eric Peltier

Did you try again after a reset of the calc?

Re: 14b is not calculating PMT correctly

*Message #3 Posted by **Eric Peltier** on 20 Dec 2011, 5:26 p.m.,*
in response to message #2 by Raymond Del Tondo

I'm not sure how to reset it. I took the batteries out for 10 minutes and that did not fix it.

Re: 14b is not calculating PMT correctly

*Message #4 Posted by **Eric Peltier** on 20 Dec 2011, 5:38 p.m.,*
in response to message #3 by Eric Peltier

I found instructions online on how to reset it. It did not help.

Re: 14b is not calculating PMT correctly

*Message #5 Posted by **geoff quickfall** on 20 Dec 2011, 5:10 p.m.,*
in response to message #1 by Eric Peltier

Not a finance guy, but doesn't the PMT depend on the payment schedule.

That is, is there a flag that toggles Canadian to American style, another that calculates end of payment period or beginning?

In other words, if it worked correctly out of the box, then try the reset suggested as this would reset all the applicable states.

Geoff

Re: 14b is not calculating PMT correctly

*Message #6 Posted by **Eric Peltier** on 20 Dec 2011, 5:39 p.m.,*
in response to message #5 by geoff quickfall

I agree, this may be part of the problem. But I do not have the instructions....

Give us the exact keystrokes you are keying in and the results please

*Message #7 Posted by **gene wright** on 20 Dec 2011, 8:18 p.m.,*
in response to message #6 by Eric Peltier

and that will help us see if the 14b is giving wrong answers. If so, it is always possible it has bit the dust.

But easier to tell if you give very complete examples. :-)

Re: 14b is not calculating PMT correctly

*Message #8 Posted by **jose gonzalez divasson** on 20 Dec 2011, 5:45 p.m.,*
in response to message #5 by geoff quickfall

I was desperate with the same problem with my 12c - I wasn't able to reproduce my mortgage numbers froim the bank. At the end it was all about being in BEG mode instead of END!

In other models it may have to do with the number of oeriods per year.

Re: 14b is not calculating PMT correctly

*Message #9 Posted by **Don Shepherd** on 20 Dec 2011, 6:21 p.m.,*
in response to message #8 by jose gonzalez divasson

Yeah, for loans you want to be in END mode. You will get the wrong payment amount if you are in BEGIN mode.

Re: 14b is not calculating PMT correctly

*Message #10 Posted by **Allen** on 20 Dec 2011, 8:42 p.m.,*
in response to message #1 by Eric Peltier

Almost all the problems I've had like this ended up being the P/YR setting was off.

This happens on the HP10b as well.

Press RCL SHIFT PMT and you should get P/YR=12.00 You can change to 26 Payments per yr by typing 26 STO SHIFT PMT

If you hold ON+N+SIGMA at the same time, The P/YR will get reset to 12.

If this does not work, type here your 5 FIN variables so we can recreate the issue.

E.g. (I=4%, PMT=360, PV=1000, FV=0 ----> PMT= -4.77)

Re: 14b is not calculating PMT correctly

*Message #11 Posted by **Eric Peltier** on 21 Dec 2011, 10:42 a.m.,*
in response to message #10 by Allen

Allen

The ON+N+SIGMA worked! Somehow, the darn thing got set to 10 payments a year. I'm not sure how,

since it just sits on my desk, not banged around a bag or anything. Thanks!!!!

Re: 14b is not calculating PMT correctly

*Message #12 Posted by **Neil Hamilton (Ottawa)** on 21 Dec 2011, 11:04 a.m.,*
in response to message #11 by Eric Peltier

I don't have a 14B but on my ancient 10B, when you clear the TVM registers using the [SHIFT] CLEAR_ALL sequence, it briefly displays the P_Yr value.

Do you never clear your TVM registers?

(It could be that this clears EVERYTHING on this machine. I am not sure. I bought it as a red-shirted "expendable crew member" so I could learn how to dismantle Pioneer calculators. Don't use it very much -- **much** prefer my (several) 17Bii's running in RPN mode!)

15CLE disassembly / reassembly recommendations?

*Message #1 Posted by **Thomas Chrapkiewicz** on 20 Dec 2011, 11:53 a.m.*

Has anyone disassembled a 15CLE?

Removing the back is simple - only the 6 screws.

I've noticed that the PCB is retained with heat stakes.

If and when I remove these I would like some ideas on the proper screws to re-retain the PCB.

Thanks in advance,

TomC

Re: 15CLE disassembly / reassembly recommendations?

*Message #2 Posted by **Jeff O.** on 20 Dec 2011, 1:46 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

Check out this thread which described disassembly and repair of a bad key.

Here is a direct link to the pictures.

Re: 15CLE disassembly / reassembly recommendations?

*Message #3 Posted by **Thomas Chrapkiewicz** on 20 Dec 2011, 2:16 p.m.,*
in response to message #2 by Jeff O.

Thanks! I thought I had seen this before.

...and thanks djj for posting this.

15CLE disassembly / reassembly recommendations?

41CL - Shut Off that Auto-Turn Off

*Message #1 Posted by **Frido Bohn** on 20 Dec 2011, 5:27 a.m.*

Annoyed about the 41CL turning off automatically after about 30 seconds being idle?
Then simply set Flag 44. This flag forces the HP41 to continuous on.
Unfortunately this is not feasible by standard means. Executing FS 44 renders a mere NONEXISTENT because system flags are not in reach of the (standard) user.
One solution would be the use of synthetic code. The PPC ROM offers the command "IF" to invert every kind of flag, regardless whether it is a user or system flag.

For the sole purpose to activate Flag 44, here some MCODE:

```
08E     N
00F     O
013     S
003     C               ; Name of the routine: "CSON" (ContinuouS ON)
3B8     READ 14 (d)     ; Reads RAM register 14 (d) where the flag configuration resides into
CPU register C
10E     A=C ALL         ; Transfers the flag settings to CPU register A
04E     C=0 ALL         ; Fills CPU register C with zeros
21C     R=2             ; Sets the pointer to Nybble 2
210     LD @R 8         ; Puts "8" at Nybble 2 resulting in CPU register C containing a mask
where only Flag 44 is set
370     C=C OR A        ; An "or" statement cares about the original flag setting being
preserved while Flag 44 is set
3A8     WRIT 14(d)      ; The modified flag setting is written back to RAM register 14
3E0     RTN
```

Now Flag 44 is set and the calculator does not turn off automatically. To get back to the original status simply turn off the HP41 manually: Flag 44 will be not set at the next turn on.

Now some remarks to disclaim any kind of liability here: While the 41CL is on battery power it makes of course sense that the machine is turned off automatically while being idle because the power consumption would eat the charge pretty fast. If you have an external power solution or if you don't care about battery life then the continuous power on is not that critical.

Quote:

> Isn't this what the ON command does?

Oh, sh..!

I was thinking hard about some way to overcome the auto-turn off and wondered if there was a simple way.
And of course, you are completely right! The "ON" command!
To get kind out off this and regain back a minimum of reputation I would like to state that the code may serve as an example how to manipulate flags in MCODE.
Sorry about this! I made a fool of myself.

Re: 41CL - Shut Off that Auto-Turn Off

*Message #4 Posted by **Ángel Martin** on 20 Dec 2011, 7:24 a.m.,*
in response to message #3 by Frido Bohn

Not at all, the more people getting into MCODE the better - it's all an opportunity to learn.

There are several available functions to set/clear/toggle the status of any of the 55 flags: SFX, CFX, TOGF.... have a look at the CCD, CCD_OS/X, AMC_OS/X, etc.

Re: 41CL - Shut Off that Auto-Turn Off

*Message #5 Posted by **Håkan Thörngren** on 21 Dec 2011, 9:01 a.m.,*
in response to message #4 by Ángel Martin

I agree, the more people who try MCODE the better!

One has to start somewhere, and simple routines are a great stating point. Your example has the advantage over 'ON' of being programmable.

Re: 41CL - Shut Off that Auto-Turn Off

*Message #6 Posted by **Gerson W. Barbosa** on 21 Dec 2011, 9:22 a.m.,*
in response to message #5 by Håkan Thörngren

I don't have a 41 anymore, but on my 42 'ON' is a programmable command. I assume it is on the 41 also.

*Message #10 Posted by **Massimo Gnerucci (Italy)** on 21 Dec 2011, 3:02 p.m.,*
in response to message #9 by M. Joury

You're right Marwan! It's the ON key that is not assignable.
Sorry,
Massimo

Re: 41CL - Shut Off that Auto-Turn Off

*Message #11 Posted by **M. Joury** on 21 Dec 2011, 3:07 p.m.,*
in response to message #10 by Massimo Gnerucci (Italy)

Yes. Unlike the HP48 series where you can assign to any key you cannot assign to the top 4 keys (ON, USER, PRGM, and ALPHA) on the 41.

Cheers,

-Marwan

Re: 41CL - Shut Off that Auto-Turn Off

*Message #12 Posted by **geoff quickfall** on 21 Dec 2011, 4:01 p.m.,*
in response to message #11 by M. Joury

probably apparent from the above postings but two separate "ON" definitions are discussed:

```
The "ON/USER" key which under normal circumstances is not
 assignable.  However on the CX this toggle key and the
PRGM/ALPHA
 key are reassigned in ED mode.  I think I remember that
synthetics
 may be able to access those key locations.

The "ON" function whose sole purpose is to overide the timed
out
 "OFF" function by toggling flag 44. This flag, when not set,
turns
 the calculator 'off' after 10 minutes.  When set, the
calculator
 stays 'on' indefinitely (battery dependent) until selected off
 with the toggle switch.  I cannot remember if it is set
 to 'off' at each toggle 'off' cycle.
```

Cheers, Geoff

*Message #14 Posted by **Craig Ruff** on 20 Dec 2011, 7:03 p.m.,*
in response to message #13 by Massimo Gnerucci (Italy)

Nor does mine after I finally finished the lower screw post repair by waiting long enough (23 hours) for the epoxy to cure fully! I followed aj04062's procedure described in his HP-41 Permanent broken Post Fix posting. Because drilling out the 41CL's mounting holes would cause damage, I used an 11/64" square nose end mill bit to remove the plastic posts, then sized two 2-56 threaded standoffs to a bit below 11/64" outside diameter and cut to length. Two 2-56 binding head screws completed the repair.

*Message #15 Posted by **Frido Bohn** on 21 Dec 2011, 4:13 a.m.,*
in response to message #13 by Massimo Gnerucci (Italy)

This really astounds me. I thought it is a feature of the 41CL but instead it evolves to be a bug although insignificant?
With my 41CL specimen, the shut-off time appears to be independend from the TURBO state and is well below 1 minute. A usual HP41 would shut-off after 10 minutes.
Is there any entry point where this time can be manipulated?

Re: 41CL - Shut Off that Auto-Turn Off

*Message #16 Posted by **Massimo Gnerucci (Italy)** on 21 Dec 2011, 6:44 a.m.,*

Re: 41CL - Shut Off that Auto-Turn Off

*Message #17 Posted by **Monte Dalrymple** on 21 Dec 2011, 11:22 a.m.,*
in response to message #15 by Frido Bohn

This may be due to the early display driver chips. Take a look at this thread to determine the display driver type and the solution if in fact this is the source of the problem:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=186130#186130

If the display drivers are covered with little caps like show in this example, rather than epoxy blobs, then you'll need to add the capacitor as shown here.

Edited: 21 Dec 2011, 11:24 a.m.

Re: 41CL - Shut Off that Auto-Turn Off

*Message #18 Posted by **Frido Bohn** on 22 Dec 2011, 3:39 a.m.,*

> Quote:
>
> If the display drivers are covered with little caps like show in this example, rather than epoxy blobs, then you'll need to add the capacitor as shown here.

By adding a capacitor the issue with the auto-power off within 1 minute in idle state has been resolved.
Thank you, Monte!

Buy.com has 15c-le again

*Message #1 Posted by **David Griffith** on 19 Dec 2011, 8:31 p.m.*

I just ordered a 15c LE from buy.com. They just got a bunch in.

Re: Buy.com has 15c-le again

*Message #2 Posted by **Michael de Estrada** on 19 Dec 2011, 8:53 p.m.,*
in response to message #1 by David Griffith

Interesting. They've again raised the price by $5 and now it's $99.99, same as MSRP at HP H&HO. Also, they now show a limit of 1, presumably to kill the profiteering. I like these guys.

So far, they've not relisted on TAS, where the prices have come down a bunch lately. I just saw a new listing with a 1 cent start price and a $135 BIN price. Quite a few have sold for under $200, and I'm glad to see the price gougers being ignored.

Edited: 19 Dec 2011, 8:59 p.m.

-Marwan

Edited: 21 Dec 2011, 11:42 a.m.

Re: SC trying to cash in on the madness

*Message #15 Posted by **Gordon Strickland** on 22 Dec 2011, 3:29 p.m.,*
in response to message #14 by M. Joury

You seem to be ignoring the fact that they are offering the additional benefit of being able to buy an extended, three-year warranty for only $34.99!

Re: SC trying to cash in on the madness

*Message #16 Posted by **M. Joury** on 22 Dec 2011, 3:44 p.m.,*
in response to message #15 by Gordon Strickland

Ha! So I can buy one unit for $301.13 with warranty and shipping or I could buy... Let's see... Three units from somewhere else for less money. I was one of the first to buy my three from buy.com at the original selling price. Was that $79.99 or $84.99--can't remember exactly.

I do realize that you are being facetious :-).

Cheers,

-Marwan

Re: SC trying to cash in on the madness

*Message #17 Posted by **Nick R** on 21 Dec 2011, 11:20 a.m.,*
in response to message #13 by Michael de Estrada

"...has undergone additional quality control by HP."

That's assuming HP did much in the way of quality control in the first place. Expecting quality from Chinese electronics manufacturers these days is a bit of a crap game - with the emphasis on crap.

Re: SC trying to cash in on the madness

*Message #18 Posted by **Nick_S** on 22 Dec 2011, 1:37 a.m.,*
in response to message #13 by Michael de Estrada

Well, the HP15C LE is listed at their old SC price of $149.99 and they are in stock on the main SC Website. So why bother with the auction site?

Re: SC trying to cash in on the madness

*Message #19 Posted by **Dan Grelinger** on 22 Dec 2011, 10:36 a.m.,*
in response to message #18 by Nick_S

Buy.com is selling them again. $99.99 and Free Shipping. Limit of 1. 9:30am CST.

Re: SC trying to cash in on the madness

*Message #20 Posted by **Michael de Estrada** on 22 Dec 2011, 11:18 a.m.,*
in response to message #19 by Dan Grelinger

Yeah, the party's pretty much over for Samson and the other price gougers. Samson hasn't made a single sale in 1 1/2 days since they've listed at $249.99 + $14.35 shipping. Interestingly, if you look at the Buy.com store listing, they also link to the Samson listing at $256.66. Hmmm, should I pay $99.99 or $256.66 ? Difficult decision there.

Re: SC trying to cash in on the madness

*Message #21 Posted by **Michael de Estrada** on 22 Dec 2011, 12:17 p.m.,*
in response to message #20 by Michael de Estrada

Oops. Buy.com is sold out again, but at least HP Home still has them for $99.99.

in response to message #22 by Howard Owen

> Quote:
>
> Can you say "artificial scarcity?"

Articel in Scare-City?

How would the 15C LE be perceived w/o all those ado? No hoarders, and probably a virtually unlimited supply for those actually using it. Even more since there are still problems.

While at it ... Michael was right, keys do bounce. Noticed a mysterious double entry when debugging a program and actually saw it live on pressing 'RCL 2', where I had the register entry on key down, and '2' on key up on the display. Hard to enforce, seem to happen only if you don't expect it ;-(.

HP, [re]invent [the wheel]. And repair your products.

Re: SC trying to cash in on the madness

*Message #24 Posted by **Howard Owen** on 22 Dec 2011, 9:17 p.m.,*
in response to message #23 by Thomas Radtke

I meant that letting the supply of a "limited edition" calculator dwindle close to zero, then opening the spigot sporadically so your resellers periodically run out of stock could be seen as a way to maximize profits.

I see two possible problems with that. First, the profits mainly accrue to the resellers. Second, it's a bit of a conspiracy theory. I'm not sure the marketeers at HP are capable of that level of thinking. On the other hand, nobody has said what "limited" actually means.

Re: SC trying to cash in on the madness

Serial port communciations on the CL?

*Message #1 Posted by **Geoff Quickfall** on 19 Dec 2011, 4:26 p.m.*

Just a question,

I use CLONIX for updating the CL so I have not been playing with the serial port.

Has anyone got a step by step procedure for Windows and Mac users that they can send me.

I will PDF it and edit along with trying it out. The idea is to get this to the WIKI:

HP 41CL Wiki (Bruce Bergman)

Ultimately the WIKI would be a great place to go to source everyones contributions in one stop. Maybe create a single PDF manual with different sections:

```
-THE CL BY MONTE! (all current manuals)
-INSTALLATION tips and information including screw post fixes and etc.
-CLONIX transfers to CL
-MDLD2 via serial
-SERIAL for the MAC AND WINDOWS
-CLUTILS (the ultimate utilities rom)
```

Cheers, Geoff

we could also create a ROM manual database as the CL has them all (almost?).

Edited: 19 Dec 2011, 4:27 p.m.

Re: Serial port communciations on the CL?

*Message #2 Posted by **Ángel Martin** on 19 Dec 2011, 4:40 p.m.,*
in response to message #1 by Geoff Quickfall

Geoff you'll no doubt remember that Raymond Wiker wrote the CS source code for CLWRITER - and also shared the procedure with the CL beta users. Do you still have that? I can re-send if not.

Fact is it works like a charm - so there's two grand ways to transfer ROMS to/from the CL, CLONIX and Serial Transfer.

I use them indistinctly, CLONIX are easier when multiple blocks are to be tranferred at once, and also once burned it removes the PC dependency. On the other hand Serial is unbeatable for quick-drop ROM updates - remember that I make many changes to the code... a godsend.

Re: Serial port communciations on the CL?

*Message #3 Posted by **Geir Isene** on 19 Dec 2011, 8:08 p.m.,*
in response to message #2 by Ángel Martin

There is also the third way that I use: HP-IL/PIL-BOX/PC w/EMU41 in Dosbox under Linux

Also works like a charm :)

Unabashed CL user promotion or why the 41CL?

*Message #1 Posted by **Geoff Quickfall** on 19 Dec 2011, 2:44 p.m.*

Hello all;

This is directed to anyone that knows the 41C family (CX) capabilities and draw backs.

I have a CL (actually 2 now). On the way to Sydney, Australia (a 15 hour leg) on Thursday last week the display faded to non existance on the CL. No big deal as it was a cold solder joint on one of the LCD contacts and easily fixed today.

As a result I could not use the following routines:

```
Great Circle routine
- data base solutions
- coordinate solutions
Intermediate Latitude
Break scheduler with print functions (very important!)
World time clock
Alarm setting
Stopwatch setting
Temperature corrections
Assorted conversions
Fuel in Tank
Airport door codes (security encrypted)
Phone numbers (PDA)
Metric altitude conversion (data based)
```

I pulled out my 42S (32K version) and had to plod through with it ;-) It does contain the majority of programs listed but does not contain the convenient data bases which allow for Airport code prompts. I can only say, I could not wait to get home and fix the solder joint on the LCD as the 41CL was sorely missed, especially its ability to do dynamic time functions. The 42S is great but once bitten by the 41 and now the 41CL, I cannot go back

So now to the crux of this story. Basically, why the 41CL?

```
-the 41CL is fast, very fast, at least, for my programs,
 faster then the 42S.
-the display on the 41CL is clear due to the dedicated LCD segments
 as opposed to the 42S dot matrix.  Much easier to see at night in
 low light.
-My CL routines use the dynamic time functions (with module) and
 the 42S does not.

AND NOW THE BIG REASON

-Its ability to be fully 'backup and restore' capable is the big
 seller for me.
```

I removed the batteries today, disassembled the calculator, and repaired the solder joint on the LCD panel. Of course this resulted in Memory Lost but who cares. I did not have to use the tape deck, card reader, HPIL or any other mass storage device.

I simply copied the current HP41CL state back into the Memory from its flash protected storage registers. It took

15 seconds. The memory transfer included all alarms, extended memory data bases and memory registers. Bang, 15 seconds and all of it back.

Tomorrow over to the Simon Fraser University and in 15 seconds I have my Palynology memory swapped from its on board flash location and then back to work on Friday, 15 seconds later and the calculator is configured for the B777 flight.

THANKS MONTE.

I urge anyone using the 41C still to consider the CL upgrade. Unbelievable!!!

Geoff

Bravo, Geoff! ;)

Massimo

Re: Unabashed CL user promotion or why the 41CL?

*Message #3 Posted by **Meindert Kuipers** on 19 Dec 2011, 3:35 p.m.,*

in response to message #1 by Geoff Quickfall

I am eagerly awaiting my 41CL. According to tracking info it is now in customs, so I am keeping my fingers crossed, though Dutch customs is usuall pretty efficient. Hope to have it before Christmas!

One of my goals is to see how and if I can modify my MLDL2000 software tools to make the functionality work with the 41CL.

Re: Unabashed CL user promotion or why the 41CL?

*Message #4 Posted by **Gerry Schultz** on 19 Dec 2011, 3:48 p.m.,*
in response to message #3 by Meindert Kuipers

Geoff and Meindert, I have had my 41CL for a while and it's a truly amazing machine. I haven't done a lot with it yet as we are in the holiday season, but it is so fast and has so much built into it, I am blown away! I have been reading and re-reading Monte's manual as there is a lot of power built into the Cl-Utils so I am being careful and taking my time. I just printed out the CL-Utils ROM manual and will start reading it too. It will hopefully answer some questions I'm putting together about the 41CL. If not, I will post them here.

I can't stop thanking Monte for such an outstanding upgrade to the HP-41C. Also, a heartfelt thanks to Geoff for his work on my donor 41C. Finally, thanks to you Angel for the manual. I can't wait to start reading it.

So much fun!

Gerry

Re: Unabashed CL user promotion or why the 41CL?

*Message #5 Posted by **Ángel Martin** on 19 Dec 2011, 4:17 p.m.,*
in response to message #3 by Meindert Kuipers

Meindert, the MLDL2k works great on the CL - just need to respect the physical addresses so there's no conflicts. Rest assured that both seem to be perfectly compatible.

BTW, the MLDL2k (w/ HEPAX) is the *best* practical method to exchange information between V41 and the real world - all throughout the HEPAX RAM blocks, being "shareable" between both wordls.

Would it be a wild pipe dream to have a future intelligent USB connection that would have a hot-link between both, the real machine and the Windows emulator??

Imagine...

Re: Unabashed CL user promotion or why the 41CL?

*Message #6 Posted by **Howard Owen** on 19 Dec 2011, 4:37 p.m.,*
in response to message #5 by Ángel Martin

Maybe you could hack it together using PIL-box and a virtual LIF disk? I seem to recall that IL-Per allows concurrent access, but it actually doesn't work.

Re: Unabashed CL user promotion or why the 41CL?

*Message #7 Posted by **Geir Isene** on 19 Dec 2011, 8:16 p.m.,*
in response to message #6 by Howard Owen

PIL-BOX & virtual LIF file works great - I did a full sync program between my calendar program on the 41 and Google Calendar/my Android device using the PIL-BOX/EMU41 w/virtual LIF file.

Re: Unabashed CL user promotion or why the 41CL?

*Message #8 Posted by **Howard Owen** on 19 Dec 2011, 10:15 p.m.,*
in response to message #7 by Geir Isene

Could you do concurrent access from real and emulated calcs? If you can do that, then you could do development on emu41 (or v41, suitably modified) and automatically download images to the real 41.

Actually, I don't know v41 very well. Perhaps you can write to a LIF image from within it?

Re: Unabashed CL user promotion or why the 41CL?

*Message #9 Posted by **Geir Isene** on 20 Dec 2011, 6:22 a.m.,*
in response to message #8 by Howard Owen

Yes, you can do this with EMU41 :)

CL-UTILS Manual now available

*Message #1 Posted by **Ángel Martin** on 19 Dec 2011, 1:53 p.m.*

Hi folks, finally I got around writing the User's Manual for the CL-UTILS module. It's revision 2E, with functions covering the production run of the CL board - so will hopefully be useful to all CL owners.

Also more documentation is available: blueprint, QRG, etc. Make sure you check TOS in a couple of days or so and download your Xmas parcel :-)

Best, 'AM

How about more info for plugging into Pages 6 and 7 ?

*Message #6 Posted by **gene wright** on 19 Dec 2011, 3:38 p.m.,*
in response to message #5 by Ángel Martin

Great document.

Suggestion for some?

What roms can be plugged into pages 6 and 7? What problems can / does that create?

Can someone simply plug the CCD/OSX into page 7 (no HP IL) and be ok? What about page 6?

Re: How about more info for plugging into Pages 6 and 7 ?

*Message #7 Posted by **Ángel Martin** on 19 Dec 2011, 4:08 p.m.,*
in response to message #6 by gene wright

Gene, this is a manual for the CL Utils module - not a compendium of the collective knowledge on the 41 system.

I've had the AOSX plugged in page 7 since day-1, only remove it when using the HPIL.

Page 6 is trickier - as it has more scanning entry points than the others - because of the printer stuff. The only module I know to be 100% compatible with page#6 location is the HEPAX - but unfortunately that won't work on the CL because page#6 doesn't support bank-switching.

Re: How about more info for plugging into Pages 6 and 7 ?

*Message #8 Posted by **gene wright** on 19 Dec 2011, 5:24 p.m.,*
in response to message #7 by Ángel Martin

Oh, but you are one of THE 41CL experts. :-)

The knowledge that the CCD-OSX and AOSX modules should work there helps. I had wanted to put the YFNS there, but for various reasons it is in page 8. But I can save 4K by moving the CCDX there.

Thanks for all you do.

Re: Hey Angel... don't make us wait!

*Message #9 Posted by **Howard Owen** on 19 Dec 2011, 4:42 p.m.,*
in response to message #5 by Ángel Martin

Quote:

```
#       Function        Description
.
35      HEPINI          HEPAX FileSys Init
.
```

Cool! I made it on to one of your modules :)

Edit: Wow! I'm onboard the 41CL! I had no idea. I wrote a FOCAL program to do the initialization on mine LOL.

Edited: 19 Dec 2011, 4:53 p.m.

Re: Hey Angel... don't make us wait!

*Message #10 Posted by **Ángel Martin** on 19 Dec 2011, 4:54 p.m.,*
in response to message #9 by Howard Owen

Howard you sure did, as it´s duly credited to you in the manual :-) In fact HEPINI is used in the other three HEPAX Config functions, saving over 100 bytes over the older versions.

BTW I wrestled with the HEPINI M-code for a while trying to "optimize" it (or at least reduce its length) but apart from the first three lines (strictly speaking unneeded but good practice nevertheless) I couldn't make any improvement! [picture-perfect:-)

I did find an issue with one instruction in the main loop where you increase A[S&X] for the page# - but I could have created it during the optimization attempts. So the code is pretty much the same as the function you wrote for the MLDL2k - thanks!

Re: Hey Angel... don't make us wait!

*Message #11 Posted by **Howard Owen** on 19 Dec 2011, 5:16 p.m.,*
in response to message #10 by Ángel Martin

Thank you, Ángel! It's an honor and a thrill to be included!

Could you send me your source? I'd like to check that possible bug.

I don't seem to have the HPXNN functions in my production release of the 41CL CLUT module. This is what I ended up with for initializing my HEPAX configuration.

```
01 LBL 'HEP
02 TURBO50
03 'HEPX
04 PLUG2U
05 'CLUT
06 PLUG2L
07 '0B9>808
08 AVIEW
09 YMCPY
10 '0B9>809
11 AVIEW
12 YMCPY
13 '0B9>80A
14 AVIEW
15 YMCPY
16 '0B9>80B
17 AVIEW
18 YMCPY
19 'PLUG RAM
20 AVIEW
21 '808-RAM
22 PLUG3L
23 '809-RAM
24 PLUG3U
25 '80A-RAM
26 PLUG4L
27 '80B-RAM
28 PLUG4U
29 4
30 12
31 HEPINI
32 HEPROOM
33 TURBOX
34 VIEW X
```

Edit: The HPXNN functions would radically reduce the size of this FOCAL. :)

I already wondered where the commands would be explained.

WARNING: WARNING: WARNING

*Message #17 Posted by **Ángel Martin** on 20 Dec 2011, 2:39 a.m.,*
in response to message #1 by Ángel Martin

In the current version (2E) the Backup to Flash uses sector at address 0x0C8, thus if used it will DELETE the Solution Books ROMS.

To prevent this you need to PATCH the code at the following locations in the CLUTILS ROM: (x: = page number).

x0EE, change current value "043" to new value "044"
x0FB, change current value "043" to new value "044"
x105, change current value "043" to new value "044"

This will use sector at address 0x0D8 instead.

You can patch it using YPOKE or HEPAX' HEXEDIT function. CLUTILS needs to be loaded in RAM for this to work.

I'll make this change permanent in version 2F, but in the mean time you'll need to have CLUTILS in RAM to make the changes stated above.

0D8 and beyond

*Message #18 Posted by **Etienne Victoria** on 20 Dec 2011, 6:14 a.m.,*
in response to message #17 by Ángel Martin

Hello Angel,

Great work, both CLUTILS and the manual - very handy and thorough explanations..thank you!!

I never use my CL without YINPT.

My 0D8 is full with TIMER SLN, Blood glucose, Monopoly 1 & 2, Sudoku so I'll patch my CLUTILS to a more remote place :-)

Thanks again !

Etienne

Edited for typo

Re: 0D8 and beyond

*Message #19 Posted by **Ángel Martin** on 20 Dec 2011, 7:33 a.m.,*
in response to message #18 by Etienne Victoria

Hi Etienne, absolutely right but what's more remote than that?

Addresses beyond 0xE7 are already taken with other modules, so it's getting tight - imagine!

Practically there's two sectors available, assuming the first USER FLASH sector is taken by the Solution Books modules.

Best, ÁM

Re: 0D8 and beyond

*Message #20 Posted by **Etienne Victoria** on 20 Dec 2011, 11:37 a.m.,*
in response to message #19 by Ángel Martin

Well..I agree...more remote is actually E00-->E7F for me :-(

I was also looking at 00F and wondering if it's empty or hosting another page of the Multiprecision ROM...

But yes...it's getting tight...

Cheers

Etienne

Edited for typo E7F

RAM instead of flash?

*Message #21 Posted by **Frido Bohn** on 21 Dec 2011, 4:32 a.m.,*
in response to message #19 by Ángel Martin

> Quote:
>
> Addresses beyond 0xE7 are already taken with other modules, so it's getting tight - imagine!

For the more or less uninitiated in profound knowledge about flash and RAM: What would be the main disadvantage of saving stuff into user RAM?
I am thinking of the address space 0x806000 - 0x83FFFF (which is about 232kB).
The RAM content would not survive a MEMORY LOST condition. Is this right?
But anyway, as long as you don't push the 41CL to its extremes such condition is not a standard occurence, and hence the user RAM would
appear to be a handy storage space if the free room in flash is at its limits.

Re: RAM instead of flash?

*Message #22 Posted by **Ángel Martin** on 21 Dec 2011, 4:46 a.m.,*
in response to message #21 by Frido Bohn

Using CL-SRAM for backup is a perfectly valid approach. It WILL survive a Memory Lost - so even better than you thought - but will fade away like your "dayddy's best jeans" if the batteries are removed from the machine for a (undetermined) while.

Re: Message to Katie Wasserman: thanks!

*Message #3 Posted by **Ignazio Cara (Italy)** on 20 Dec 2011, 5:04 a.m.,*
in response to message #2 by hpnut

Of course, hpnut. I was trying to repair the hp-27 of my dear friend. No display but good tensions from the DC-DC inverter and a current drain of 110 mA. How you can read in the article of Katie about the issues of Woodstock's series calculator, I have cut the SYNC trace from the ACT to the rest of the calculator and insert one resistor (32KOhm, 1/4W, 5%) that has resurrected the little beauty, so far. My first attempt has been with a 20 KOhm resistor but with value of resistor the 27 needed 3 or 4 minuts to warm up properly. It's all, I'll be available for any further information.

Regards from Italy.

Ignazio

[WP34s] About the Perl tools

*Message #1 Posted by **fhub** on 19 Dec 2011, 7:52 a.m.*

After the latest wp34s_asm.pl suddenly stopped working with my TinyPerl, I've done some trial-and-error changes to this Perl script, because I have no clue about the Perl language at all.

With this latest asm.pl I got an error message about "POSIX", so I looked for this name in the source and found a line "use POSIX;". Now after removing (or commenting out) this line, the assembler is working again with TinyPerl. :-)

Ok, after this experience I also tried to fix the preprocessor pp.pl, because this one has never worked for me. Here the problem is not "POSIX" but after a few compares I found that the line "use strict;" is the reason for the failure with TinyPerl, and after removing this line now also the preprocessor is finally working here for me.

Now the only remaining problem is the new library manager lib.pl:
After having also removed the "use POSIX" and "use strict" lines to avoid the first error messages, I still get an error when I try to run it: "ERROR: lib::split_END: Likely the assembler run failed. Halting lib."

Ok, looking at the source I saw that it calls the assembler script as subprocess (in the line 'my $DEFAULT_ASM = "wp34s_asm.pl";), and this can't work of course for me because I don't have a full Perl installed. So I tried to call TinyPerl instead by changing the line above to "my $DEFAULT_ASM = "tinyperl.exe wp34s_asm.pl";", but that didn't work but gave a new error message:
"ERROR: lib::run_prog: Cannot locate daughter script 'tinyperl.exe wp34s_asm.pl' in current directory or '.\'."

Well, I could imagine that my trial won't work, because certainly the Perl script lib.pl can only call a Perl script as daughter, but not an EXE file like TinyPerl.

But now I've no idea how I could solve this last problem, so that also the new libmanager would work here with my TinyPerl. Does any Perl expert here have any suggestions for me? ;-)

Franz

Re: [WP34s] About the Perl tools

*Message #2 Posted by **Marcus von Cube, Germany** on 19 Dec 2011, 8:55 a.m.,*
in response to message #1 by fhub

Sorry, I'm of not much help here because my Perl knowledge is as bad as yours. Congratulations that you got it working at all for you.

For the time being, the lib manager is far from working the way I'd like to see it. You can simply throw all your sources at the assembler and let it output a large file named wp34s-lib.dat. If it complains about maxsteps being exceeded you can patch the value in the op-code file. The maximum is then the same as maxlibsteps. I tried to do this in the asm script (the name of the variable is near the top of the script) as an intermediate measure until all is neatly working.

My latest commit fixes some serious issues with the software, so please update!

Re: [WP34s] About the Perl tools

*Message #3 Posted by **fhub** on 19 Dec 2011, 9:10 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks, that seems to be a good intermediate solution! :-)

The main problem without having a full Perl installation is currently calling a Perl sub-script from within another Perl script, and this is now even done twice: the assembler calls the preprocessor (if used with -pp), and now also the libmanager calls the assembler.

That's all quite a bit complicated IMO, and I hope this will be simplified in the future - I would really appreciate a single Perl script which can do ALL of these tasks: preprocess, assemble and put it together into a library file!

> If you mean ActivePerl then I have already answered your question

I found ActivePerl became way too fat and was non-standard in too many ways. Years ago I switched to strawberry perl -- strawberry is nothing more and nothing less than the normal perl sources compiled for windows. However I don't currently use windows very much so haven't tried it for 2-3 years now.

http://strawberryperl.com/

Looks like the current download is 40mb, previous version 34mb. Don't know how big it is installed.

Edit: Strawberry Perl and ActiveState Perl are the two windows builds linked on perl.org

Edited: 19 Dec 2011, 7:21 p.m.

Re: [WP34s] About the Perl tools

*Message #7 Posted by **Neil Hamilton (Ottawa)** on 19 Dec 2011, 11:23 a.m.,*
in response to message #1 by fhub

I will quibble with the word "fix" in this post. As has been pointed out previously the "fix" is required in tinyperl as its parser -- and now apparently library/module set as well -- is broken and/or deficient. These scripts are designed for a compliant Perl v5.8+ environment -- which tinyperl is most definitely not.

In this specific case, the "use POSIX" allows use of the "ceil" function. Unless tinyperl already has knowledge of this function, your patched version will not be able to calculate some values. I am surprised that it doesn't crash with POSIX commented out except, knowing your history, you probably have not asked ASM to fire up the PP script (ie: did not use the "-pp" switch). If you are not running the PP from within the ASM, it is just possible that the line with the ceil function is never called and you might just survive. (Speculation)

Turning off "use strict" might be OK here because the ASM and PP scripts were already vetted under "strict" mode so there should be no issues. Turning it off in a normal/functional Perl environment is not usually a very good idea as it usually indicates that there are some latent issues you are trying to avoid. (LIB might still have it turned off because I am still tracking some issues.)

The "split_END" error is saying that the spawned assembler run from the LIB tool did not actually succeed. In your case, since you don't usually use the PP, you might be able to add the "-no_pp" switch to the LIB tool invocation to prevent it from running PP. No promises though. PP is on by default in the LIB tool.

The ASM script detects whether it is run from an EXE or Perl script and assumes that the daughter programs are of the same variety. You might be able to adjust what is called by the ASM by using the "-pp_script" switch to change it. I think in your case, it is not "path-aware" and cannot locate "tinyperl.exe" in the current directory. Try adding the complete path to the tinyperl.exe executable to the switch (or edit the default as you did) and see what happens. The equivalent switch does not (yet) exist in LIB so this trick will not work there. LIB is too new and has not really been released to the general public yet. It is in SVN but only showed up there last night for a look-see by the development team. It might go through some wicked gyrations before we are done.

A word of warning: The latest SVN assembler might not build correct images for the current V3 calculator -- at least until the calculator catches up to changes in the binary image specification. Marcus may have more to say on that shortly. Again, you might be in the middle of a development change.

Neil

Re: [WP34s] About the Perl tools

*Message #8 Posted by **Marcus von Cube, Germany** on 19 Dec 2011, 11:38 a.m.,*
in response to message #7 by Neil Hamilton (Ottawa)

No need to worry, the executables are up to date and collaborate with the modified format. (The emulator works with both old and new formats but since there are recent op-code changes, reassembly is

mandatory.)

The one in my collection is also only a clear back case - i've only ever seen one like this on ebay once before (about 3 years ago) and it went for over $600 from memory. I also haven't seen a clear cased front 71B - if such a beast exists i'd love to see photos! Cheers, Keith

OT: planimeters for sale

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 18 Dec 2011, 11:58 p.m.*

A local thrift store has two K&E planimeters for sale. One has a 620000 logo and appears to be complete and in near mint condition. The second does not have an identifying logo but the hardware is very similar to the first. There may be some missing accessories. It is also in near mint condition. Each device has an asking price of $125 which seems to be a little steep to me but it may be negotiable..

I am personally not interested as I already have an Aristo No. 1130L for my collection.

Re: OT: planimeters for sale

*Message #2 Posted by **Nick R** on 19 Dec 2011, 1:38 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

The asking price does seem to be on the high side, particularly if they're later model compensating polar planimeters that don't come in a wooden case.

Wikipedia on the 15C LE

Message #1 Posted by ***Peter Murphy (Livermore)*** *on 18 Dec 2011, 9:36 p.m.*

The HP-15C Limited Edition is a reproduction of the 15C based on the modern ARM powered 12C hardware, released at the same time as the 30th Anniversary Edition HP-12C. This model is powered by 2 CR2032 batteries, and can easily be differentiated from original production run (1982-1989) 15Cs by the "Limited Edition" script below the HP 15C logo, and the black text on brushed metal back label, as opposed to the white text on black of the original.

Impressive TI NSpire CX CAS Multiple Integration

*Message #1 Posted by **Namir** on 18 Dec 2011, 1:59 p.m.*

I have been playing with double and tripLE integration using the Monte Carlo method and with nested Simpson 1/3 rules using Excel VBA. The Monte Carlo method is very easy to program. Both methods work well, with the nested Simpson method performing better than the Monte Carlo for the same number of function calls.

Out of curiosity, I powered up my TI Nspire CX CAS (the newest version) and tried to perform double and triple integrations. To my surprised, the machine gave me the correct answer in both cases, instead of complaining that it could only do single integration! Very impressive TI! Sorry 15C, you no can do!!!

Namir

in response to message #1 by Namir

Pretty sure the TI89 and HP50g can do multiple integration out of the box, too.

No idea what the point of your last line was. Obviously the HP15C can't do any symbolic integrals, and while it might not be able to do triple integrals numerically out of the box, I'm sure such abilities can be programmed.

in response to message #2 by Crawl

I certainly would like to see an HP-15C program that uses the built-in Integrate feature to perform multiple integration.

The **HP-34C Solution Book "Advanced Math"** features a program of mine which does exactly that to implement double integrals on the HP-34C, using 3-point Gauss for the outer integral and the built-in integration capability for the inner one.

Though specifically written for the HP-34C it can be ported to the **HP-15C** with little or no change. Come to that, the same applies to all programs featured in the book, but if you're interested just in the particular one which computes double integrals and you can't find the Solutions Book, it's also featured here:

You're welcome. If you're interested in testing out some particular methods against hard multiple integrals you may want to check **problems 6, 7, and 10** in this interesting paper:

http://crd.lbl.gov/~dhbailey/dhbpapers/tenproblems.pdf

Problem 7 in particular, I included in this ancient post where I gave both the **HP-71B MATH ROM** implementation as well as a simple **Monte-Carlo** BASIC implementation:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=53268

*Message #8 Posted by **Ángel Martin** on 19 Dec 2011, 2:55 p.m.,*
in response to message #4 by Valentin Albillo

Here´s the listing for the 41 version - in case you wonder:- It uses R10 istead of "I", so the usage is simple

1. store number of intervals in R10, set FIX for precision
2. type the function program name in Alpha
3. enter integration limits in T,Z,Y,X
4. XEQ "2DITG"

Enjoy, 'AM

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #9 Posted by **Valentin Albillo** on 19 Dec 2011, 4:24 p.m.,*
in response to message #8 by Ángel Martin

Hi, Ángel:

Thanks for your interest and for the translation.

Matter of fact this simple program translates with minimal effort to run in many other RPN models (HP-34C, HP-15C, HP-41** + Advantage ROM, etc) and an HP-71B version would be equally straightforward but moot as the **INTEGRATE** keyword (a funny function) allows for up to 5-dimensional integrals *per se*.

A useful template to compute multiple integrals with the HP-71B plus examples can be found at point 10 in one of my articles, namely:

http://membres.multimania.fr/albillo/calc/pdf/DatafileVA012.pdf

By the way, I don't remember whether I've already ranted about this here but I think that the HP programmer (or team) who decided to name the keywords INTEGRATE instead of **INTEG**, FNROOT instead of **SOLVE**, FVAR instead of **FV**, and IVAR instead of **IV** had *absolutely no idea of what "ergonomic" and "economic" mean*, as the shorter keywords are faster to type and most importantly you can fit more complex expressions in the command line for immediate execution without the hassle of having to write a program just because your expression doesn't fit in a line (which is easily the case with multiple integrals).

Best regards from V.

Multiple Integration - WP 34S

*Message #10 Posted by **Marcus von Cube, Germany** on 19 Dec 2011, 5:05 p.m.,*
in response to message #9 by Valentin Albillo

With the recent addition of local registers and recursive programming, WP 34S has the ability to do multiple integration with the built-in integrator (a non adaptive Gauss-Kronrod quadrature). I've not done it, but it should be straight forward to write a subroutine for the function to integrate and another which calls the integrator for the defined function. This subroutine can than be used as the argument for the integrator. Not as comfortable as just typing in a formula but still easier than creating your own integrator in RPN.

Re: Multiple Integration - WP 34S

*Message #11 Posted by **Marcus von Cube, Germany** on 20 Dec 2011, 12:31 p.m.,*
in response to message #10 by Marcus von Cube, Germany

Here is a short example of a recursive call to the WP 34S integrator. It computes S(0,1,S(0,1 X*Y,Y),X). The result is 0.25. No global registers are used, the outer subroutine at LBL 00 creates a local register .00 which is visible to the inner subroutine at LBL 01.

```
LBL A
  0
  ENTER[^]
  1
  [integral] 00
  RTN

LBL 00
  LocR 00
  STO .00
  0
  ENTER[^]
  1
  [integral] 01
  RTN

LBL 01
  RCL[times] .00
  RTN

END
```

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #12 Posted by **Oliver Unter Ecker** on 19 Dec 2011, 5:32 a.m.,*
in response to message #1 by Namir

Hi Namir,

Can you show us the examples you tried? I'm interested to see how the syntax looks for multiple integration.

Does it work for both definite and indefinite integrals?

Have you been seeing it fail for some other examples? (Would like to see those, too.)

Thanks!

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #13 Posted by **Namir** on 19 Dec 2011, 8:13 a.m.,*
in response to message #12 by Oliver Unter Ecker

I tried the simple integrals:

```
      / \ 1   / \ 1
     /       /
    /       /    X*Y dX dY = 0.25
  \/ 0    \/ 0
```

```
     /\1    / \ 1   / \ 1
    /      /       /
```

```
  /     /     /
 \/ 0  \/ 0  \/ 0   X*Y*Z dX dY dZ = 0.125
```

Syntax on the 50g

*Message #14 Posted by **Oliver Unter Ecker** on 19 Dec 2011, 11:55 a.m.,*
in response to message #13 by Namir

Thanks. (I was secretly hoping for something a bit more exciting...)

How about the syntax on the TI?

On the 50g, I notice that 'S(11,14,X^2+4*Y,X)' EVAL works, whereas 'S(7,10,S(11,14,X^2+4*Y,X),Y)' does *not* enter. ("Invalid syntax" is reported.)

In an RPL program, one could feed the (symbolic) output of the inner integral into the outer integral. So, yes, as per Crawl, there is out-of-box capability for multiple integration on the 50g.

(On ND2, in development, S(7,10,S(11,14,X^2+4*Y,X),Y) works and returns 1719.)

["S" is my poor man's integral symbol.]

Re: Syntax on the 50g

*Message #15 Posted by **Crawl** on 19 Dec 2011, 1:45 p.m.,*
in response to message #14 by Oliver Unter Ecker

It should work.

My tip for figuring out the syntax on the HP50g is to enter an expression in the equation editor (which is usually intuitive), but if you don't like that and want the "code", turn off "textbook" in display.

That gave me

'S(7,10,S(11,14,(x^2)+(4*y),x),y)'

which evaluates to 1719

I'm not able to duplicate your error. It enters fine (on the stack) even if I enter what you have (which is identical to what I have, minus the extra parenthesis)

Maybe you just made a typo on the calculator?

Or maybe there's a mode difference, but I don't know which mode should make a difference, or why.

Re: Syntax on the 50g

*Message #16 Posted by **Crawl** on 19 Dec 2011, 1:49 p.m.,*
in response to message #15 by Crawl

> Quote:
>
> I'm not able to duplicate your error. It enters fine (on the stack) even if I enter what you have (which is identical to what I have, minus the extra parenthesis)

And, actually, that's only because I had the "show all parens" flag checked. Without it, it looks absolutely identical to what you had.

Re: Syntax on the 50g

*Message #17 Posted by **Oliver Unter Ecker** on 19 Dec 2011, 2:24 p.m.,*
in response to message #15 by Crawl

Thanks, Crawl.

You're right. It's all good.
I had entered

```
'S(7,10,S(11,14,X^2+4*Y,X),Y
```

and expected auto-completion to provide the closing chars for me, but, that, apparently, doesn't work in this instance and caused the syntax error.

(Yes, I'm that lazy/trusting of auto-completion...)

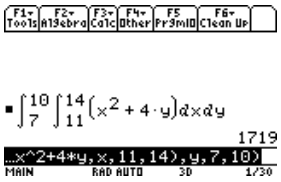
Edited: 19 Dec 2011, 2:32 p.m.

Re: Syntax on the 50g

*Message #18 Posted by **Crawl** on 19 Dec 2011, 10:01 p.m.,*
in response to message #14 by Oliver Unter Ecker

> Quote:
>
> How about the syntax on the TI?

It's pretty intuitive on the TI89. Just nest the integrals like on the HP50g (except that the limits come at the end rather than the beginning of the syntax)



Re: Syntax on the 50g

*Message #19 Posted by **Oliver Unter Ecker** on 20 Dec 2011, 4:33 a.m.,*
in response to message #18 by Crawl

Thanks for that, Crawl.

Makes sense. I had wondered if there might be, perhaps, a special "SS" syntax.

Re: Syntax on the 50g

*Message #20 Posted by **Crawl** on 20 Dec 2011, 9:38 a.m.,*
in response to message #19 by Oliver Unter Ecker

The problem with that approach is that you then wouldn't be able to do quadruple, quintuple, etc., integrals.

The great thing about the CAS in these modern calculators is that they're fully integrated, so you can (for example) combine complex numbers with symbolic expressions in matrices, or (as in this case) combine integrals with integrals to do multiple integration, etc.

There's probably no limit to the number of integrals you can nest, other than calculator memory and the increasing amount of time it would take to evaluate them.

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #21 Posted by **Crawl** on 19 Dec 2011, 8:35 a.m.,*
in response to message #1 by Namir

> Quote:
>
> Both methods work well, with the nested Simpson method performing better than the Monte Carlo for the same number of function calls.

Monte Carlo eventually wins, because the error goes as 1 over the square root of the number of function evaluations, [i]regardless of the dimension of the integral[i].

On the other hand, with nested Simpsons, error goes as 1 over the number of function evaluations raised to the (4/dimension) power.

So when you have 8 dimension integrals, Monte Carlo and Simpsons are equally good. For 9 or more dimension integrals, Monte Carlo is better.

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #22 Posted by **Crawl** on 20 Dec 2011, 3:47 p.m.,*
in response to message #21 by Crawl

I tried the 6-dimensional integral of tan(x*y*z*t*a*b) over x,y,z,t,a,b, all variables ranging between 0 and 1.

In maybe about a minute I set up an Excel spreadsheet that calculated it with Monte Carlo simulation (30K points), getting 0.015.

Anyway care to try to do better?

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #23 Posted by **Valentin Albillo** on 20 Dec 2011, 6:30 p.m.,*

>
> In maybe about a minute I set up an Excel spreadsheet that calculated it with Monte Carlo simulation (30K points), getting 0.015.
>
> Anyway care to try to do better?

Well, this extremely simple **HP-71B** Monte Carlo code (80+ bytes):

```
10  DESTROY ALL @ RANDOMIZE 1 @ RADIANS
20  FOR K=1 TO 6 @ M=10^K @ S=0 @ DISP K;M, @ FOR I=1 TO M
30  S=S+TAN(RND*RND*RND*RND*RND*RND) @ NEXT I @ DISP S/M @ NEXT K
```

repeatably runs to give:

```
>RUN

1  10          6.5740257498E-3
2  100         1.64187909582E-2
3  1000        1.67187076886E-2
4  10000       1.51787016672E-2
5  100000      1.56906185411E-2
6  1000000     1.57093573935E-2
```

which agrees with your result. The final value should have about Log10(Sqrt(1000000)) = **3** correct digits so **0.0157** should be accurate to all the digits shown.

Curiously enough, the final value (**0.015709**) closely resembles **Pi/200 = 0.015708** ... I'll let you figure out whether that's a coincidence or not ... :D

Best regards from V.

`

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #24 Posted by **Thomas Klemm** on 21 Dec 2011, 12:49 a.m.,*
in response to message #23 by Valentin Albillo

> Quote:

> I'll let you figure out whether that's a coincidence or not ... :D

I used the Taylor expansion of *tan(x)* (up to the term of x^{19}) and got:

```
1.57094692997E-2
```

Compared to Pi/200 I'd say: coincidence.

Kind regards
Thomas

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #25 Posted by **Crawl** on 22 Dec 2011, 4:53 p.m.,*
in response to message #24 by Thomas Klemm

Thomas Klemm probably has the winning technique.

I'll post some solutions one at a time since it'll take a while to get it all together.

This is Simpsons's Rule on an HP50g.

First you need this program

```
%%HP: T(3)A(R)F(.);
\<< \-> N F T
  \<< N 2 / DUP IP == N 0 \=/ AND N T \=/ AND
    IF
    THEN F 2 *
    ELSE N 2 / DUP IP \=/
      IF
      THEN 4 F *
      ELSE F
      END
    END
  \>>
\>>
```

which I named SIMPCO.

Then this is the program you run:

```
%%HP: T(3)A(R)F(.);
\<< 0 0 0 0 0 0 0 0 0 0 0 0 \-> T A B C D E F S P1 P2 P3 P4 P5 P6
  \<< 0 T
    FOR A A 1 T SIMPCO 'P1' STO 0 T
      FOR B B P1 T SIMPCO 'P2' STO 0 T
        FOR C C P2 T SIMPCO 'P3' STO 0 T
          FOR D D P3 T SIMPCO 'P4' STO 0 T
            FOR E E P4 T SIMPCO 'P5' STO 0 T
              FOR F F P5 T SIMPCO 'P6' STO A B C D E F * * * * * T 6 ^ / TAN T 3 * 6 ^ / P6 * S
+ 'S' STO
              NEXT
            NEXT
          NEXT
        NEXT
      NEXT
    NEXT S
  \>>
\>>
```

I named it SIMP6, but it doesn't really matter what you name it.

You give as an argument an even number (t). It will do (t/2) applications of Simpsons rule in each dimension, which works out to (t+1)^6 function evaluations.

Results:

```
t     Calculation Result   Time on Calculator Time on Emulator
2     1.57143781232e-2     2min22sec          4sec
4     1.57096718319e-2      x                 1min18sec
6     1.57095084843e-2      x                 9min48sec
```

You probably could do the t=6 case on an actual calculator, provided you were willing to let it run for 6 or 7 hours. Better use USB power.

Edited: 22 Dec 2011, 4:54 p.m.

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #26 Posted by **Crawl** on 22 Dec 2011, 6:04 p.m.,*
in response to message #25 by Crawl

Here's the Taylor series solution.

```
%%HP: T(3)A(R)F(.);
\<< X TAN X ROT TAYLR X A B C D E F * * * * * = SUBST A RISCH B
RISCH C RISCH D RISCH E RISCH F RISCH A 1 = SUBST B 1 = SUBST
C 1 = SUBST D 1 = SUBST E 1 = SUBST F 1 = SUBST \->NUM
\>>
```

The argument is the number of terms to take in the Taylor series.

And results:

```
t       Result                  Calculator Time  Emulator Time
1       1.5625e-2               9sec
3       1.57063802083e-2        20sec
5       1.57092380044e-2        32sec
7       1.5709443877e-2         44sec
9       1.57094657465e-2        1min
...
15      1.57094692786e-2                         5sec
17      1.57094692959e-2                         6sec
19      1.57094692997e-2        3min             7sec
21      1.57094693005e-2                         9sec
...
29      1.57094693006e-2        3min34sec        9sec
```

Also, I'm getting slight differences between the physical and the emulator. The emulator gives a result 1ulp less for the t=19 and 29 cases I checked on both.

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #27 Posted by **Thomas Klemm** on 23 Dec 2011, 12:24 a.m.,*
in response to message #26 by Crawl

Is it possible to just calculate the coefficients of the Taylor series using the HP-50G? I was trying to do that using the HP-48G without success. So I let WolframAlpha do this and entered them into the HP-42S which was quite a pain, you may believe me. Once I have stored them into the registers 01, 02, ... I used the following program:

```
00 { 33-Byte Prgm }
01 LBL "ITAN"
02 STO "n"
03 10
04 STO 00
05 CLX
06 LBL 00
07 RCL IND 00
08 RCL 00
09 2
10 *
11 RCL "n"
12 Y^X
13 /
14 +
15 DSE 00
16 GTO 00
17 END
```

To run the program you just enter the dimension, in this case $n = 6$.

With minor changes this program could be used with the HP-15C and most other models as well. So yes, with only a little cheating (i.e. using W|A for the coefficients) we can do multiple integration. Purists would first write a program to calculate the Bernoulli-numbers to get the coefficients without that ugly hack. Now I'm curious how the TI NSpire CX handles this problem.

This Taylor expansion converges only slowly for the upper bound $x = 1$. Therefore I tried to find a substitution that might transform that to something like $1/2$ but to no avail. Maybe somebody else has an idea?

Since the quotient of succeding coefficents a_i/a_{i+1} converges to $(Pi/2)^2$ some kind of convergence acceleration could be helpful but I didn't try that.

Here we're just lucky because $n = 6$: the harder you're trying to make it by adding more dimensions, the faster it converges.

Kind regards
Thomas

> Purists would first write a program to calculate the Bernoulli-numbers to get the coefficients without that ugly hack.

For those too lazy to enter those numbers manually but still willing to enter a program into the calculator:

```
00 { 49-Byte Prgm }
01 LBL "INIT"
02 ENTER
03 +
04 LASTX
05 1E3
06 /
07 1
08 +
09 STO 00
10 RDN
11 LASTX
12 RCL+ ST Y
13 N!
14 1/X
15 LBL 00
16 RCL IND 00
17 RCL ST Z
18 N!
19 /
20 X<>Y
21 -
22 X<>Y
23 2
24 -
25 X<>Y
26 ISG 00
27 GTO 00
28 STO IND 00
29 RCL 00
30 IP
31 END
```

Now you enter the following:

```
1
STO 01
XEQ "INIT"
R/S
R/S
R/S
R/S
R/S
(...)
```

Just keep on pressing [R/S] until you feel like it's enough, let's assume stop with 20. Now replace line 03 in the other program ("ITAN") with this number.

BTW: In the end I didn't use the Bernoulli-numbers but simply the fact that: $sin(x) = cos(x)\ tan(x)$. This gives a system of equations for the unknown coefficients of $tan(x)$.

So I hope the purists are happy now.

Cheers

Thomas

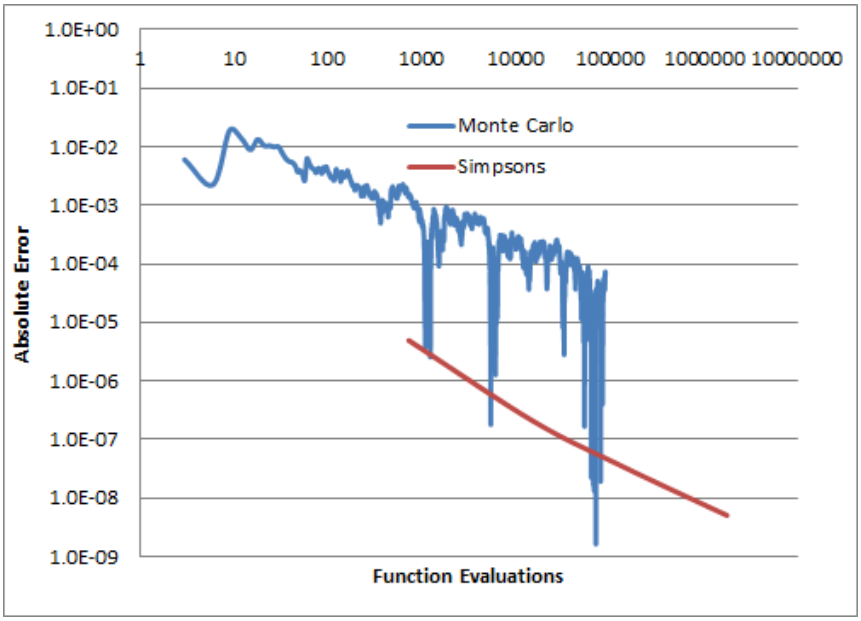
And this compares the absolute error between using the Monte Carlo method versus Simpson's Rule.



Even for this problem, Simpson's Rule is more efficient than Monte Carlo.

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #31 Posted by **Crawl** on 23 Dec 2011, 6:21 p.m.,*
in response to message #30 by Crawl

Another thing you could try would be to just enter the integral as-is and try to let the built-in integral routines try to deal with it.

$$\int_0^1\int_0^1\int_0^1\int_0^1\int_0^1 \tan(A\cdot B\cdot C\cdot D\cdot E\cdot F)\,dA\ d$$

I think we have evidence here that you should be able to get at least a few digits of accuracy this way, and by adjusting the FIX setting you can only ask for a few.

You don't really need a program for this, but this lets the calculator time itself, and I can also just let it run and do something else and have the calculator alert me when it's finished.

```
Fix  Returned  Full               Time (with Emulator)
0    2.e-2     1.57089974862e-2   2min26sec
1    1.6e-2    1.57089974862e-2   2min30sec
2    0.02      1.57089974862e-2   2min32sec
3    0.016     1.57090853677e-2   3min46sec
4    0.0157    1.57094436066e-2   43min45sec
5    ?                            Over 6 hours!
```

I didn't even bother trying this with a physical calculator.

The FIX5 case finally stopped running.

The clock says it took 25 hours, 13 minutes, but that's very approximate, since the computer was in sleep mode several times over that period.

The result is

1.57094677879e-2

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #33 Posted by **Thomas Klemm** on 25 Dec 2011, 3:18 p.m.,*
in response to message #32 by Crawl

> Quote:
>
> 25 hours, 13 minutes

That's amazing! Just for comparison: it takes ~60ms for Free42 on my iPhone to calculate this integral to 16 correct places (both "INIT" and "ITAN") when I use 20 terms to get:

```
1.570946930078026084759965e-2
```

However with 40 terms it takes ~240ms to produce 24 correct places[1]:

```
1.570946930078026389931 57e-2
```

Just imagine how long it would take to do that with your method.

Cheers
Thomas

---

1. Of course I can't be sure whether all places are correct, but it's the case for $n = 1$ compared to $-\log(\cos(1))$ and $n = 2$ compared to Valentin's result when I use 100 terms. Therefore I assume the coefficients of the Taylor series are correct. And with $n = 6$ fewer terms are needed to get the same result.

*Message #34 Posted by **Oliver Unter Ecker** on 23 Dec 2011, 6:04 p.m.,*
in response to message #25 by Crawl

Nice job, Crawl.

I tried your code, unchanged, on my calcs.
Results:

```
t     Calculation Result   Time on ND1       Time on CalcPad/Mac
2     0.0157143781230784   12sec             0.7sec
4     0.0157096718412068   x                 12.6sec
6     0.0157095084875193   x                 88sec
```

Then I gave it a quick speed treatment.
I used what's called "natural math entry" on ND1 for SIMPCO and changed it to this:

```
f(N,F,T)=F * (N%2 ? 4 : (N && N != T ? 2 : 1))
```

Then I changed some RPL instructions into RPL+ for SIMP6:

```
\<< 0 \-> T S
  \<< 0 T
    FOR A A 1 T simpco =P1 0 T
      FOR B B P1 T simpco =P2 0 T
        FOR C C P2 T simpco =P3 0 T
          FOR D D P3 T simpco =P4 0 T
            FOR E E P4 T simpco =P5 0 T
              FOR F F P5 T simpco =P6 A B C D E F * * * * * T 6 ^ / TAN T 3 * 6 ^ / P6 * =+S
              NEXT
            NEXT
          NEXT
        NEXT
      NEXT
    NEXT S
  \>>
\>>
```

New timings:

```
t     Calculation Result   Time on ND1       Time on CalcPad/Mac
2     0.0157143781230784   0.8sec            0.052sec
4     0.0157096718412068   17s               0.9sec
6     0.0157095084875193   2min6sec          6.9sec
8     0.0157094817061892   x                 32sec
```

Edited: 23 Dec 2011, 7:12 p.m.

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #35 Posted by **Oliver Unter Ecker** on 23 Dec 2011, 7:37 p.m.,*
in response to message #34 by Oliver Unter Ecker

A further 3x speed improvement is obtained by changing this RPL code

```
A B C D E F * * * * * T 6 ^ / TAN T 3 * 6 ^ / P6 *
```

into this RPL+ code

```
P6*TAN((A*B*C*D*E*F)/T^6)/(T*3)^6
```

Another 10% is squeezed out by writing SIMPSO in JavaScript, like so:

```
function (N, F, T) { /*as is*/
    return F * (N%2 ? 4 : (N && N != T ? 2 : 1));
}
```

The improved timings:

```
t     Calculation Result   Time on ND1       Time on CalcPad/Mac
2     0.0157143781230784   0.3sec            0.022sec
4     0.0157096718412068   4.7sec            0.3sec
6     0.0157095084875193   33sec             2.2sec
8     0.0157094817061892   x                 9.6sec
10    0.0157094743918417   x                 31sec
12    0.0157094717597684   x                 1min23sec
```

That's ~500x faster than a 50g for this task, on <10x faster HW (iPhone vs. 50g HW).

Edited: 23 Dec 2011, 7:45 p.m.

Re: Impressive TI NSpire CX CAS Multiple Integration

*Message #36 Posted by **Oliver Unter Ecker** on 20 Dec 2011, 7:00 p.m.,*
in response to message #22 by Crawl

I had W|A try better.

```
integrate (integrate (integrate (integrate (integrate (integrate (tan(x*y*z*t*a*b))
dx from 0 to 1) dy from 0 to 1) dz from 0 to 1) dt from 0 to 1) da from 0 to 1) db from 0 to 1)
```

First it wanted more time, then it volunteered another server, as the first decided to quit. (Again! It's pretty easy to get into that condition with W|A. I wonder if it really, physically, brings down a server. The icon of a server farm suggests as much to me.)

Maybe there's a better question to ask W|A that will return a result.

Anyway. See, that's where "SSSSSS" syntax may be useful: for higher dimensions, switch to an altogether different algorithm. Here: Monte Carlo.
The nested syntax doesn't easily allow for that.

Here's home-baked Monte-Carlo in RPL+:

```
\<< 5 =l
   0 =sum
   1 l START 1 l START 1 l START
   1 l START 1 l START 1 l START
      random =x random =y random =z
      random =t random =a random =b
      tan(x*y*z*a*b*t) =+sum
   NEXT NEXT NEXT
   NEXT NEXT NEXT
   sum/l^6
\>>
```

Returns 0.015xxx, with latter digits varying by run, in ~7s on my iPhone.
That's for 5^6 (~16K) samples. Even with 7^6 (~118K) samples, it's still showing variability past the 5.

[Crawl: Off-topic, but since you had responded to my question about modular exponentation of a non-integer and the thread is archived: Here's how that played out: As suspected, this was not about any non-integer. The polynomial was special, and so were its roots. The secret sauce knowledge to have was about Pisot numbers, and Newton's Identities. Took me *weeks* to figure out, even with hints... but ultimately a great problem to solve. And running on an app calc in 1s/root.]

[EDIT: Added RPL+ code.]

> 0 to 1)
> ```

It will understand the following syntax:

```
integrate tan(x*y*z*t*a*b) dx dy dz dt da db, x=0..1, y=0..1, z=0..1, t=0..1, a=0..1, b=0..1
```

However, this is all it gives out:

Computation timed out. No more results available.

which might mean

Buy Mathematica, buy Mathematica... :-)

Surely it does. W/A, while being an outstanding piece of software and a very useful one at that, also fails miserably in many surprisingly simple computational tasks with the added puzzlement that sometimes it will work alright for a very slight variation of the computation that's giving it the bends.

I initially submitted a lot of reports but never received a reply or noticed any action at all being taken on them so I don't bother anymore.

Best regards from V.

> b=0..1
> ```

Trying that syntax out in W/A with the 2-dimensional version, namely:

```
integrate tan(x*y) dx dy, x=0..1, y=0..1
```

produces **0.275687** after a while and refuses to compute any more digits (*"Computation timed out"*) which is pretty useless for identification purposes.

On the other hand, the **HP-71B** produces with the help of just a little code (and my constant recognition program):

```
> CAT
```

```
    workfile   BASIC    54 07/18/04 12:38

> LIST

    10 DEF FNF(X)=INTEGRAL(0,1,0,TAN(X*IVAR))
    20 DISP INTEGRAL(0,1,0,FNF(IVAR))

> CALL @ CALL IDENTIFY(RES,S$) @ S$

  .2756872738  ("identified as")  5/179*Pi^2
```

which seems quite a reasonable agreement as the alleged symbolic identification evaluates to **.275687273774**, i.e., *a 10-digit agreement* with the numerically computed value for the double integral.

Whether the symbolic identification is absolutely correct would require many more digits and that would only serve as empirical reassuring, never proof, that would demand symbolics.

Oh, and by the way, a Monte-Carlo run with 10^7 samples produces **.27571**6754735, which is good to nearly 5 digits, not bad for a dumb probabilistic method.

Best regards from V.

I had tried that on W|A but I failed to notice any connection to pi. I had divided 0.275687 by pi on the HP-32SII and obtained 8.77538976e-2. Had I divided it again by pi I would have gotten 2.79329332e-2. Finally FDISP would have returned 0 5/179.

Best regards,

Gerson.

P.S.: By the way, one of these days I observed e^(e*pi) = 5113.98499978, which multiplied by 200 equals 1022796.99996. A coincidence?

W|A returns "integral tan(x y) dx = -(log(cos(x y)))/y+constant" for "integrate tan(x*y) dx". We can use the HP-15C

```
f LBL A
  COS
g LN
  x<>y
  /
g RTN
```

and get

```
0 ENTER 1 Integrate A CHS   ->   0.2756872439
```

We can also try this online integrator and obtain

```
Numerical Integration of -(log(cos(x)))/x in the interval [0,1]
Method          Value                    Estimated Error
-------------------------------------------------------------------------
Romberg         0.2756872738004371       2e-16

Gauss-Legendre  0.2756872738004297       9e-15

Double Exp      0.2756872738004369       9e-16
```

which is remarkably close to 5/179*pi^2:

```
                0.2756872737734458
```

Best regards,

Gerson.

>
>
> Double Exp      0.2756872738004369       9e-16
> ```

Hehe, no need for a lousy online integrator, my very own integrator produces:

```
        Integral[-log(cos(x))/x] in [0,1] =
0.27568727380043716388975206142159327295557988379607996904909339414027953447558064939638505676331764634919
```

which, as I stated, is remarkably close to:

```
                                  5*pi^2/179 =
0.27568727377344577147582377094626120489703070969946342531880864179385600062623478332407188278543441988335
```

so both values aren't identical though in this case I don't think their similarity is coincidental. Thanks for your interest and

Best regards from V.

HP won't fix PSE bug on 15CLE?

*Message #1 Posted by **MK-52** on 18 Dec 2011, 10:24 a.m.*

July Inc., a HP calculators distributor in Japan, announced HP won't fix PSE bug because "the behaviour is by design". :-(

Edited: 18 Dec 2011, 10:28 a.m.

Re: HP won't fix PSE bug on 15CLE?

*Message #2 Posted by **Lincoln R.** on 18 Dec 2011, 11:37 a.m.,*
in response to message #1 by MK-52

I don't believe that. HP themselves admits that it is a bug, this sounds like loudmouthing on the part of a distributor.

Sorry for my poor translation. I am not sure this is an HP official announcement. At least HP told them that they won't fix bugs.

Thank you very much for your finding and the translation! I'm sure *someone* told July so. However, I'm not sure if one hand of HP knows what the other does ;-). No really, there where so many things messed up around the 15C LE, I wouldn't wonder if that 'announcement' means nothing.

This is the smallest and most inconsequential of the bugs. For the time&energy cost of using a run-stop command instead and pressing r/s, one gets to have time to write down or store the intermediate answer. The only loss is to the pride of the programmer and i'm not sure how many programmers have any pride in their work any more, or shame for that matter.

There are some, the designers of this piece of software being among them, for sure!

I assume that there will be no official return policy but a new image will eventually appear for those having the means to upgrade the firmware in their devices.

Absolutely. He writes good code. Before this, Tim and his partner John Evers wrote what i think is the best fully integrated surveying program on the market. And it's for an hp too. I have three of those 15Cs and have no regrets at all but i will update the software when it comes available. I think it's great that that is possible.

The trinity of the wp34s are no slouches either.

Re: HP won't fix PSE bug on 15CLE?

*Message #14 Posted by **Katie Wasserman** on 18 Dec 2011, 2:18 p.m.,*
in response to message #7 by db (martinez, ca.)

I agree. While it would be nice to have the PSE bug fixed, I think that the power consumption problem and low-battery memory loss issues are much more important.

It would be nice if PSE works as it should, even though I prefer to R/S to PSE.

Hack a 15C-le into a 16C?

*Message #1 Posted by **David Griffith** on 18 Dec 2011, 5:54 a.m.*

Have any of you involved in the development of the WP34s given any thought to the concept of hacking a 15C-le into an emulation of the 16C?

Re: Hack a 15C-le into a 16C?

*Message #2 Posted by **Marcus von Cube, Germany** on 18 Dec 2011, 9:31 a.m.,*
in response to message #1 by David Griffith

Maybe a 12C+ is the better choice because it is easier to get.

You'll need a firmware image to patch the 16C ROM in. This is not (yet) available for the 15C.

Re: Hack a 15C-le into a 16C?

I've been thinking to do a KEMU port to the sam7 voyagers for some time now. But my impasse is really wanting to displace the segment display with a graphic matrix.

It is quite possible to do so as the lcd segment controller drive is multiplexed as gpio. However a custom module of either COG or COB topology is realistically required. COG provides minimal vertical elevation but has problematic active area asymmetry, has interconnect routing issues, and needs off-glass charge pump capacitors (which could be located on a flex pc interconnect). COB can address routing and charge pump components allowing use of a less expensive FFC interconnect. But a conventional COB unit is problematic due to available z-axis consumed via pcb, zebras, and compression frame residing in tandem to the glass. The frame and zebras can be displaced by heat seal tape and in doing so we don't need a particularly ridgid pcb. It might be possible to reduce it to 0.4mm -- however the COB encapsulant projection could double that. Even dismissing all the above, it is still a custom glass prospect to optimally fill the existing window and fit within the existing glass enclosure void. I think the quote I had for a near ideal 192x32 unit was somewhere in the US$7-8K ballpark which included one-time tooling and delivery of the first 1K units.

That's a tall order and travelling this path may not make much sense unless leveraging it as an opportunity to provide some sorely missing features. Eg, at a minimum: external communication, high endurance NV memory, additional RWM, perhaps external power.. Basically what I would have hoped for in an encore voyager 30 years later, particularly a 15c.

Anyway this is all very much possible and straightforward with with a new pcb layout. Doing so also allows

the major simplification of freeing us from the need to shoehorn these enhancements into the existing design. However at this point we get to question whether the aged sam7 is worth the effort of bringing forward given more cost effective and higher performance SoCs currently available.

The one consideration which (at least to me) prevents the above tirade from being wholesale dismissed is the fact such a prospective board+display swap on an encore voyager is mechanically a fairly minor undertaking. But I suppose from my POV I don't find a clear delineation in the slippery slope continuum corresponding to a meaningful partial feature set. At least that's my excuse for not having pursued a physical prototype thus far.

Re: Hack a 15C-le into a 16C?

*Message #4 Posted by **Paul Dale** on 18 Dec 2011, 4:33 p.m.,*
in response to message #1 by David Griffith

Walter and I did discuss the possibility of re-purposing the 12c and decided it wasn't worth our efforts -- the segmented screen is too limiting being far worse than the 30b's which has always been quite an impediment.

If anyone's thinking about it, a couple of comments:

1) the 16C's maximum wordsize of 56 bits was huge for the time, but 64-bit processors are common now. I'm not sure how much of a practical limitation this is, but getting around it would be a huge job given the architectural platform;

2) the 16C uses the HP floating-point implementation of that era, rather than the now-ubiquitous IEEE 754(?) format (although the manual did provide conversion routines). An implementation of the IEEE format would be much more useful.

I'd say that an upgraded rewrite, rather than a straight port, would probably be easier, as well as more useful.

Best,

Yes - you're right. I've no idea why I'd got the idea the max was 56 bits. I've never used any WSIZE larger than 32 bits anyway, and the display made even *that* quite painful.

Best,

--- Les

*Message #9 Posted by **Marcus von Cube, Germany** on 19 Dec 2011, 2:28 a.m.,*
in response to message #8 by Paul Dale

The register size of the 16C varies with the configured word size and so does the number of available registers. In float mode, the word size is set to 56 bits but in integer mode, almost any word size up to 64 is legal. I haven't tried 1 though. It should be possible to configure the 16C to a single bit machine in unsigned mode (with a register size of 8, I assume.)

Re: Hack a 15C-le into a 16C?

*Message #10 Posted by **Paul Dale** on 19 Dec 2011, 2:57 a.m.,*
in response to message #9 by Marcus von Cube, Germany

The internal CPU registers are 56 bits wide.

The calculator can be configured with any integer size from 1 to 64 bits. 1 bit works in signed modes too -- you get zero and something negative depending on the mode. In unsigned you get 0 and 1.

The actual memory used by registers is the next multiple of 4 up from the word size. Thus, 1 bit registers use 4 bits of memory.

- Pauli

Re: Hack a 15C-le into a 16C?

*Message #11 Posted by **Les Bell** on 19 Dec 2011, 3:56 a.m.,*

in response to message #10 by Paul Dale

> Quote:
>
> The actual memory used by registers is the next multiple of 4 up from the word size. Thus, 1 bit registers use 4 bits of memory.

Yep. Setting mine to 1-bit word size gives me 406 registers, equivalent to the 203 bytes available.

As to why I remembered 56-bit rather than 64-bit maximum word size, it beats me. Probably a recollection of the CPU register size.

Best,

--- Les

You probably got that idea becasue a 56-bit word size is the value set when switching back from floating point mode to integer mode.

Speaking of which, does anyone have the details of the LCD and keyboard port mappings for the 12C+/15C LE?

A while ago there were rumours of a 12C+ SDK but I can find no further references.

Thanks...

Voyager 1xC emulation in the same unit?

*Message #14 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 20 Dec 2011, 11:47 p.m.,*
in response to message #1 by David Griffith

Hi David,

Have you seen this (if you haven't you will be amazed): HP 1xC Voyager

Great way to combine 1xC Voyager series into one! I wonder if this would be possible using the new HP-12C+ ATMEL CPU with emulations instead of the KINOMI custom CPU.

Any thoughs? Regards, Kerem

> Quote:
>
> I wonder if this would be possible using the new HP-12C+ ATMEL CPU with emulations instead of the KINOMI custom CPU.

The NUT cpu and Voyager system emulator in use (KEMU) isn't tied to the KINOMI module in any way and the first prototype was actually cobbled together around a Hitachi SH1. The version of the KINOMI module shown in the demonstration used an Atmel AVR atmega1284p SoC. This was largely due to the extreme size restrictions imposed by the 14.0mm x 14.6mm footprint of the original NUT cpu lqfp package. Otherwise *far* more hospitable SoC choices exist.

Porting KEMU to the HP-12C+ or 15c le is relatively straightforward. But I'd be more interested to do so as part of a larger functional upgrade to the encore voyager which frees us from the 7-segment display, adds some form of external i/o to the device, and perhaps extends available user memory (ideally as non-volatile).

What LCD module are you using?

Re: Voyager 1xC emulation in the same unit?

*Message #18 Posted by **uhmgawa** on 23 Dec 2011, 12:00 a.m.,*
in response to message #17 by Eric Smith

> Quote:
>
> What LCD module are you using?

I haven't found anything as standard product which I'd call even remotely usable relative to either a NUT or sam7 voyager's available display area. Given space constraints about the only configuration option is a zebra or TAB-style interconnect, as the asymmetry (or rather the glass extension for ITO/bump interconnect) of COG rule it out. There are also other unique requirements such as a straight reflective polarizer and an aspect ratio in the range of 5:1 to 6:1 which pretty much leave the empty set as far as COTS graphic devices. Just satisfying the desired resolution, aspect ratio, and polarizer pushes the problem to at least a semi-custom display.

Frankly concerning a graphic display upgrade, I'm undecided whether a voyager retrofit is really the best use of time, funds, and effort relative a new modified mechanical design.

BTW on a semi-related subject, I didn't intend come across as dismissing the openRPN effort in this regard. However my personal experience with the above sends me screaming into my pillow to witness a clean slate effort painting itself into a corner, flirting with the headache of shoehorning a display into an already defined enclosure footprint.

Re: Voyager 1xC emulation in the same unit?

*Message #19 Posted by **Eric Smith** on 23 Dec 2011, 4:47 p.m.,*

That is a laudible goal which would be greatly appreciated, but I'm sure a lot of people would be very, very happy with a straightforward port, if you should ever be so inclined.

Re: Voyager 1xC emulation in the same unit?

*Message #21 Posted by **robert rozee** on 23 Dec 2011, 7:00 a.m.,*
in response to message #20 by Jeff O.

it seems a good enough reason for the project would be to produce a bug-free set of firmware that can be reprogrammed into an unmodified 15C-LE set of hardware. and the 15C-LE already has a 'licence' (of sorts) to use the original 15C firmware image.

i'm quite sure if you could produce a firmware for the 15C-LE that was (say) 10x faster than an original 15C, drew just a couple of mA from the 2032 cells, and was 100% functional, then you would collect a great many new friends!!

*Message #7 Posted by **Jim Yohe** on 19 Dec 2011, 1:11 a.m.,*
in response to message #1 by Egan Ford

That keypad has "nothing" over the Nixie watch, IMHO.

Re: OT: Number Pad Watch Nerdier Than Calculator Watch?

*Message #8 Posted by **Howard Owen** on 19 Dec 2011, 4:42 a.m.,*
in response to message #7 by Jim Yohe

Can't argue with that. :)

Re: OT: Number Pad Watch Nerdier Than Calculator Watch?

*Message #9 Posted by **megarat** on 20 Dec 2011, 4:27 p.m.,*
in response to message #1 by Egan Ford

> Quote:
>
> Well nerds, it is?

Hardly. I argue that true nerdiness prioritizes function over fashion, and as this thing stands, it's all fashion, zero function.

(When I first saw the subject line and the images, I got the impression that it would be an actual wrist-mounted numeric keypad, and actually got excited. As a user of 10-keyless keyboards (to minimize the distance between the keys and the mouse) I really like the idea of plugging that thing into my computer and swinging over my dominant hand whenever I need to 10-key in some numbers. Geeky, yes, but geeky-cool in a curiously useful kind of way.)

New Year's resolutions ?

*Message #1 Posted by **Michael de Estrada** on 17 Dec 2011, 10:05 p.m.*

Do you have any New Year's resolutions vis a vis calculators ? Mine is very simple - no more calculators. It's not that I can't afford them, because I can. It's simply a matter of having every make and model, past and present, that interests me. In many cases I have more than one sample of a given model, and they all are in working condition. In some cases I'm missing accessories such as an HP-70 printed manual, but in most cases they're complete. I have insufficient room to store them. Some are stored in shoe boxes, piled up in a closet. Some are piled up in a display case. Some just sit on the floor in the middle of my home office (aka guest bedroom). Enough is enough.

Re: New Year's resolutions ?

*Message #2 Posted by **Egan Ford** on 17 Dec 2011, 10:17 p.m.,*
in response to message #1 by Michael de Estrada

I'd like to complete another HP-IL project and write about it in 2012.

Re: New Year's resolutions ?

*Message #3 Posted by **Eric Smith** on 18 Dec 2011, 1:09 a.m.,*
in response to message #1 by Michael de Estrada

Some years back I made a New Year's resolution that I wouldn't make any New Year's resolutions. Thus far I'm doing a pretty good job of sticking to that one.

Re: New Year's resolutions ?

*Message #4 Posted by **Hans Brueggemann** on 18 Dec 2011, 3:31 a.m.,*
in response to message #1 by Michael de Estrada

That's an easy one: Get my first batch of FRAM71 modules into production ;o)
hans

Re: New Year's resolutions ?

*Message #5 Posted by **Namir** on 18 Dec 2011, 10:51 a.m.,*
in response to message #4 by Hans Brueggemann

What is a New Year's resolution???? Is it a piece of software or hardware?

Edited: 18 Dec 2011, 10:52 a.m.

Re: New Year's resolutions ?

*Message #6 Posted by **David Ramsey** on 18 Dec 2011, 11:05 a.m.,*
in response to message #1 by Michael de Estrada

I'm making the same resolution: no more calculators or related items in 2012, mainly because of the insane spending spree I went on this year re desktop machines. Not only did I spend a lot of money, but I have no place else to put anything! Desktop machines are big!

Exceptions for previous commitments: a 41CL board, paper and parts for a 9100 printer, and that's it! No, really...

Re: New Year's resolutions ?

*Message #7 Posted by **Eddie W. Shore** on 18 Dec 2011, 3:53 p.m.,*
in response to message #1 by Michael de Estrada

I think I am the opposite, I will probably collect additional calculators, both old and new during 2012. But then again, I won't need a resolution to do that.

Re: New Year's resolutions ?

*Message #8 Posted by **David Hayden** on 19 Dec 2011, 11:19 p.m.,*

Calculator Clear Case

*Message #1 Posted by **Joerg Woerner** on 17 Dec 2011, 9:23 p.m.*

Collectors,

I just received my first two Texas Instruments Clear Case calculators and like to understand why they were manufactured.

Is it about the missing 3D modeling in the 1970's or about the injection molding optimization? Any ideas?

Thanks and Regards,

Joerg

Re: Calculator Clear Case

*Message #2 Posted by **Eric Smith** on 18 Dec 2011, 1:14 a.m.,*
in response to message #1 by Joerg Woerner

Yes, that's exactly why it is done. It's not as important now do the sophisticated 3D CAD, but it's sometimes still done since it is still a useful verification.

After the clear cases are made and it is verified that the design meets the requirements, the texturing is added to the mold. It is then not possible to make good clear cases again because:

1. With the textured mold, the resulting case would not really be optically clear
2. After non-transparent material has been molded, trying to mold transparent material will usually result in the molded part having residue of the non-transparent material, unless you mold and discard a large number of items to flush it all out.

Re: Calculator Clear Case

in response to message #1 by Joerg Woerner

Joerg, I'm sending you images of a clear SR-10 case containing SR-11 innards.

Re: Calculator Clear Case

*Message #5 Posted by **David Ramsey** on 18 Dec 2011, 11:07 a.m.,*
in response to message #1 by Joerg Woerner

I have a clear case Newton 110. The engineer at Apple I asked about it said it was to help check component fitment inside the case.

Clear Newton 110

*Message #6 Posted by **Frank Boehm (Germany)** on 18 Dec 2011, 2:19 p.m.,*
in response to message #5 by David Ramsey

That's fortunately/unfornately not the whole truth. I just read about it this week - a larger batch of clear 110s has been manufactured and were available for purchase by employees, good customers and I think as well on a developer conference. They were manufactured for the looks, the development has long been finished before the production run.
Nice to have, but not too rare (guesstimates are talking about a four-digit number of clear 110s).

Re: Calculator Clear Case

*Message #7 Posted by **Alberto Fenini** on 19 Dec 2011, 10:55 a.m.,*
in response to message #1 by Joerg Woerner

Congratulation !!
So you were between the ones looking at that auction ?
It went from 43 US$ to over 700 US$ in the last hour ....
nice items, congratulation again !
Alberto

HP 9826A HPL ROM board part number

*Message #1 Posted by **David Ramsey** on 17 Dec 2011, 7:21 p.m.*

Can someone here confirm that 98261-66541 is the correct part number for an HPL ROM board for a 9826A?

It seems to be (and the part number "looks like" the part numbers for the BASIC boards), but the HP Computer Museum lists the part number for an HPL ROM board as "98604A"...

Re: HP 9826A HPL ROM board part number

*Message #2 Posted by **Eric Smith** on 17 Dec 2011, 7:29 p.m.,*
in response to message #1 by David Ramsey

It is common for there to be two different numbers, a nnnnA number (four digits, one letter) for something ordered as a "product", and nnnnn-nnnnn (two groups of 5 digits, called a 5x5 part number), for something ordered as a service replacement part. It's entirely possible that both numbers you gave are for the same thing.

Re: HP 9826A HPL ROM board part number

*Message #3 Posted by **David Ramsey** on 17 Dec 2011, 10:12 p.m.,*
in response to message #2 by Eric Smith

Thanks, Eric. The photo of the item seems to visually match the computer museum's photo, so that's probably the case.

in response to message #8 by bill platt

There's a couple of model numbers listed. Maybe he only killed one of them?

Re: Really pocketable 15C clone

*Message #10 Posted by **Mike Morrow** on 17 Dec 2011, 9:59 p.m.,*
in response to message #9 by Jim Yohe

The outstanding and exceptional aspect of the unit shown is, IMHO, its size. The fact that it's an HP 15C clone, at a time when HP has produced its own full-sized (and thus less desirable) HP 15C clone, is irrelevant.

The unit shown would be a tremendous competitor in high demand, based on small size and large capability that has never been matched in the whole electronic calculator era.

Re: Really pocketable 15C clone

*Message #11 Posted by **Howard Owen** on 17 Dec 2011, 9:53 p.m.,*
in response to message #8 by bill platt

Looks like the credit card sized clone emerged from the ashes. That's a very clever way to keep what must have been a very large investment in time and effort alive. It's a brilliant novelty. I wonder if he's aware how many of those he could sell to members of this site alone?

in response to message #1 by Massimo Gnerucci (Italy)

I've got enough 15Cs. What I need is more 16Cs.

Re: Really pocketable 15C clone

*Message #16 Posted by **htom trites jr** on 18 Dec 2011, 1:22 p.m.,*
in response to message #15 by Egan Ford

It's an emulator, so reprogramming might be possible. Business card size, 3.5" x 2", you *could* put ten keytops across, but there would be little space between them. A keytop 1/8" on a side might work much better.

Re: Really pocketable 15C clone

*Message #17 Posted by **Palmer O. Hanson, Jr.** on 18 Dec 2011, 11:41 p.m.,*

Are 16C's really that hard to find? If so, I suspect that I need to sell mine since I purchased it in 1998 and haven't used it for more than an hour since. The previous owner obviously didn't use it very much. The spine on the manual doesn't show any evidence of use.

in response to message #1 by Massimo Gnerucci (Italy)

Just ordered one and was told "you are on the list for Jan of 2012".

Had to order it, next version will fit on the wrist (just hoping).

Geoff

Re: Really pocketable 15C clone

*Message #19 Posted by **Walter B** on 19 Dec 2011, 1:57 p.m.,*
in response to message #18 by Geoff Quickfall

It's looking very nice and nerdy, but I think the keys are just too packed. Did you watch him operating the calculator? Doesn't look very relaxed. So here pocketability was driven over the limit IMHO. A 30b or 15C in their original size fit my shirt pocket quite well. And I don't need anything smaller, not even on my wrist.

Just my 20m€ as usual.

Re: Really pocketable 15C clone

*Message #20 Posted by **Geoff Quickfall** on 19 Dec 2011, 2:14 p.m.,*
in response to message #19 by Walter B

I agree about the size, but still, it's like having a book on the head of a pin, don't need it but it looks good!

Although, the U-watch works for me, don't wear it as the strap attachments combined with my ability to use epoxy causes lug failure.

I think part of the problem is the nervousness factor on pressing the keys. My attempts at youtube took a few takes as my brain and my fingers did not work in unison (sp?) and the intitial attempts looked "nervous".

In anycase, if the it does work with my fingers, well then, slick! More of a novelty but I will take it to work with about 280 lines of programming covering the basics:

```
Great Circle
Intermediate Longitude
Conversions
Temperature Altitude corrections
Wind chill (only in the winter!)
Fuel SG check
```

Cheers, GEoff

Re: Really pocketable 15C clone

*Message #21 Posted by **Mike Morrow** on 19 Dec 2011, 2:09 p.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

Judging from statements at the DM-15CC website:

1. **"based on the original microcode of the HP-15C"** and **"runs on a battery saving LPC1114 ARM processor emulating the NUT processor"**
Is there no danger that HP will assert ownership of the firmware?

2. **"uses one CR2032 battery"**
That's a much better approach than paralleling two cells as the HP models do. That's just bad engineering by

HP!

3. **"runs up to 60 times faster than the original calculator"**
This would be about half the speed of the new HP 15C-LE. That's good, especially if it means that that energy consumption from the single CR2032 is half or less than that of the 15C-LE.

The thing that's somewhat disappointing about this exciting product is its use of emulation of the old firmware rather than using all new native LPC1114 firmware coding.

A comparison of benchmark run times on the emulated HP 15C-LE versus the non-emulated HP 30b shows that identical tasks take about eight times longer on the HP 15C-LE compared to the HP 30b, even though *both use the same SAM7L SoC and clock frequency*. That shows that a task performed on the 15C-LE will use eight times the energy of the same task on the 30b.

Such gross inefficiency means that *emulation is a really really bad idea* for programmable calculators operating from a very small battery. In terms of reasonable battery life, emulation works for the HP 12C+ because user programming on the 12C+ is typically negligible. It remains to be seen if it will be practical in the 15C-LE, which is much more likely to be employed for user programming.

Regardless, the DM-15CC is irresistible! Here's a very interesting and more detailed demo video of the DM-15CC prototype. Fantastic work.

Edited: 19 Dec 2011, 3:09 p.m.

Re: Really pocketable 15C clone

*Message #22 Posted by **Walter B** on 19 Dec 2011, 5:27 p.m.,*
in response to message #21 by Mike Morrow

As with the HP-15C LE itself, I don't want to spoil the party. The 15CC is a cute little toy, and I appreciate the great work to create it. All who want a programming model being 30 years old feel free to buy either one (or both). Enjoy decoding key codes.

But all who want readable programs beware. The 15C programming paradigm is simply outdated. Most Pioneers show a better UI already, and even the WP 34S v1.x was more advanced than the 15CC. V2.2 runs circles around it. So if you want a tool to do serious work ...

HP41CV faulty

*Message #1 Posted by **Steve Hunt** on 17 Dec 2011, 11:34 a.m.*

Hi folks - new to the forum so please go easy with a "newbie".

I have an HP41CV (Fullnut I think you call it) which has seen better days - badly corroded battery terminals, and intermittent contact between the logic board and keyboard. Rather than scrap it, I pulled it to pieces and hard-wired the logic board to the keyboard. Temporarily I've connected a 6v supply directly across the appropriate keyboard traces.

It doesn't work! Here are the symptoms:

At power-up the display shows the "flying duck" in the leftmost display position and the PGRM annunciator is on. None of the keys has any effect except:

* Pressing the ON key causes the display to briefly show "MEMORY LOST" and the beep to sound before going back to the original display.

* Pressing R/S changes the display to "0," at the left and "00" at the right. Pressing R/S again puts it back to the original display.

Before throwing it in the bin I wondered if those symptoms give any pointers to what the fault might be.

I've very carefully check my hard-wiring of the logic board to the keyboard - everything looks correct with no shorts.

Grateful for any help, Steve

Re: HP41CV faulty

*Message #2 Posted by **Randy** on 17 Dec 2011, 12:16 p.m.,*
in response to message #1 by Steve Hunt

Anytime a 41 displays MEMORY LOST at power on (other than after a complete reset of memory) is usually a sign of a bad rom or ram.

Realistically, the only way to troubleshoot is with the HP 41 service rom.

Re: HP41CV faulty

*Message #3 Posted by **Steve Hunt** on 17 Dec 2011, 1:56 p.m.,*
in response to message #2 by Randy

Thanks Randy - looks like it's on its way to the bin!

Steve

Re: HP41CV faulty

*Message #4 Posted by **Håkan Thörngren** on 17 Dec 2011, 2:06 p.m.,*
in response to message #3 by Steve Hunt

Do NOT throw it!

If it has a good keyboard and LCD, it can probably be salvaged and converted to a 41CL by replacing the logic board.

At worst, it will most likely have some use for spare parts!

Re: HP41CV faulty

*Message #5 Posted by **Steve Hunt** on 17 Dec 2011, 5:35 p.m.,*
in response to message #4 by Håkan Thörngren

Yes - the "bin" in question is the spare parts bin ;) I have 3 other HP41s, so it might come in useful at some stage.

Next job is to replace the "crumbling" drive wheel on my card reader!

Thanks for the advice, Steve

[WP34s] New flash handling?

*Message #1 Posted by **fhub** on 17 Dec 2011, 7:45 a.m.*

Marcus, could we please get a short description of the new flash structure and handling?

In the current SVN I can't even load any of my programs with "PRCL n" because PRCL now doesn't accept a parameter anymore. :-(

Franz

Re: [WP34s] New flash handling?

*Message #2 Posted by **Marcus von Cube, Germany** on 17 Dec 2011, 8:55 a.m.,*
in response to message #1 by fhub

Here is a short description:

There are no longer any regions (copies of the RAM program structure) which can be individually accessed by number. There are just four program areas:

RAM
User library
User backup
ROM

Each area (except ROM) can be divided into individual programs delimited by END. To make any program (in any area except ROM) the current program you can use CAT and navigate to a label within the program. ENTER will just position the PC while R/S or XEQ will run the program. P/R lets you inspect the program.

The following commands act on a single program only:

CLP - removes current program from RAM or library. CLP can be directly accessed from the CAT browser.

PSTO - stores the current program in the library. The program must start with a LBL'xyz' instruction which serves as kind of a file name. Programs are always appended to the end of the flash area. If a program with the same name exists, it will be deleted first. PSTO is mapped to STO in the CAT browser.

PRCL - Creates a copy of the current program at the end of RAM. The source may even be RAM so you can make a duplicate of your code on the device. No automatic removal of duplicate labels is attempted. XROM cannot be copied, all other programs are available to PRCL. Single program size is bound by some 900 steps. If needed, room in RAM is increased by clearing the statistical sums and reducing the number of registers before PRCL is performed. PRCL is mapped to RCL in the CAT browser.

LOAD and SAVE have not changed. SAVE is the only way to store something in the backup (PSTO 0 is no longer available).

In case of trouble do a manual RTN to force the PC to location zero in RAM. There may still be situations

where the internal pointers get a bit mixed up.

Re: [WP34s] New flash handling?

*Message #3 Posted by **fhub** on 17 Dec 2011, 9:32 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks for the explanation, Marcus!

That's now indeed a completely different flash handling, and I still don't fully understand it.

Ok, let's begin with my usual daily work on my PolynomSolver (everything for the emulator of course):
I guess now I have to compile my source to wp34s-lib.dat instead of wp34s-n.dat (with n=1..9), right?

And what if I already have e.g. 10 separate programs? Do I need to have them all in one single source file to compile them to wp34s-lib.dat?
So I would always have to compile all of them again and again, even if I only change something in the source of one program?
And what's the size limit for this wp34s-lib.dat? What if I have hundred programs which would compile together to e.g. 10kB?

> Quote:
>
> If needed, room in RAM is increased by clearing the statistical sums and reducing the number of registers before PRCL is performed.

What if my program is too big to load (and PRCL reduces the stat registers), but these registers are used in my program (as it is the case in my PolySolver)?

Re: [WP34s] New flash handling?

*Message #4 Posted by **Marcus von Cube, Germany** on 17 Dec 2011, 11:50 a.m.,*
in response to message #3 by fhub

The assembler is being updated to support updating the library so you can just recompile any sources and they are automatically updated in the library.

Until then, it's better to compile into wp34s-backup.dat or wps3s.dat and run (and test) from there. Use PSTO to add the program to the library.

The automatic measures to increase the available space to load a program are only carried out if there isn't enough room beforehand. Just use REGS to decrease the number of registers before you attempt the PRCL. If you need a very long program and a lot of memory for data, run the program from the backup or from the library.

Re: [WP34s] New flash handling?

*Message #5 Posted by **fhub** on 17 Dec 2011, 12:14 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Oh my god, after having worked almost every day in the last months with the WP34s I'm quite familiar with these 'n' flash files and this new stuff sounds rather complicated to me - I'm not sure if I'll like it!?

But at least the increase in possible program steps in RAM is a great advantage - my Laguerre PolySolver has now (with more than 500 steps) already reached the current size limit, and I was already thinking about removing some of its features ...

Re: [WP34s] New flash handling?

*Message #6 Posted by **Marcus von Cube, Germany** on 17 Dec 2011, 12:29 p.m.,*
in response to message #5 by fhub

Even within the limits of 510 steps you could separate parts of it and create routines with global labels which do part of the work and are called by the main program. These routines may well be stored in a program region.

I think you will be comfortable with the new features if you work with them. The main reason for the change was a better exploitation of the available flash space which is now organized in pages of 256 bytes (no longer 1 KB chunks). There is no slack, all programs in the library are contiguously aligned in the available space. Being able to have larger single programs (even in RAM for editing) is an additional benefit.

Re: [WP34s] New flash handling?

You'll like it :-)

The best part you no longer have to organize the programs you want into 1kb pages. Just throw everything into the wp34s-lib.dat Also less problems with multiple programs wanting to use the hotkey labels A-D or internal LBL 0-9 etc..

Well, maybe I would if I could! :-(

Unfortunately now not even the new assembler (not to speak of the library manager) is working with my TinyPerl.

So I guess I'll stop updating to new WP34s versions and stay with SVN 2030 (the last version before this new flash handling) ...

Franz

Tiny Perl is just too tiny I'm afraid. Any hopes to upgrade your PC to a more recent

model that supports ActivePerl? With the new Qt based emulators being developed you may even switch to Linux (where Perl is standard). Linux will most certainly get more juice out of the same hardware than Windows does.

It's not that bad. It's more like switching from People's Party (Windows - don't ask questions, you _will_ like what we give you) to Social Democrat (Linux - have what you like, but you have to do it yourself) :-)

Why don't you use ActivePerl? I remember it was very simple to install - though the full thing does suck > 120MB of disk because it include almost 40M of documentation and 80 Mb of libraries - it should be possible to delete most of them.

Well, you've already written the reason yourself: 90% of all my work I'm doing on my VERY old internet notebook, and this notebook has VERY limited resources. So I definitely can't (and don't want to) install 120MB just for running one single Perl script!

But if anyone would show me a small (maybe upto 10MB) ready-to-use (no need to install dozens MBs useless libraries) Perl package, I would certainly download and use it. ;-)

Emmanuel Compes

*Message #1 Posted by **Matthias Wehrli** on 17 Dec 2011, 4:53 a.m.*

Emmanuel (3e0_rtn) sells through ebay in these days... Take care: I still did not get the EPROMS I paid for 3 years ago (certainly all provable by emails, sorry)

Re: Emmanuel Compes

*Message #2 Posted by **Jean-Pierre Fouques** on 17 Dec 2011, 11:27 a.m.,*
in response to message #1 by Matthias Wehrli

Thanks. However I had some deals with him. He was reliable and helpful. I know that he only ship to UE. In the past he got problems with guys. They refused to pay customs taxes and/or to recover registered mails. FYI he was also selling in july and august. Why waiting 3 years? Did you ask for ebay protection? Did you pay him through paypal? Did you contact him? If you want, I can tell him. Yours.

Re: Emmanuel Compes

*Message #4 Posted by **Dan Grelinger** on 18 Dec 2011, 9:55 a.m.,*
in response to message #1 by Matthias Wehrli

I had a bad experience with Emmanuel, and doubt his integrity. A few years ago I was selling a rare HP-41C 3rd-party item (ZEPROM) on ebay. A previous bidder had put in a bid well above any previous bids, and his highest bid was therefore not yet 'disclosed' by ebay. Very near to the auction's end, Emmanuel placed about a dozen successive bids on my item, each $5 to $10 more than the last, until he exposed the other bidder's maximum bid, and then he immediately retracted ALL of his bids, claiming he had entered the wrong amount! I challenged him on it, fearing claims of bid manipulation from the original high bidder, and he claimed that his son was bidding for him on ebay and made a mistake!

At best, this person is dishonest and unreliable. Using Google to search this site for his name turns up many hits, most of them warnings and descriptions of bad experienes, few of them endorsements.

Unable to start and run EMU41 on new 64-bit Processor Laptop running with Windows 7

*Message #1 Posted by **Antoine M. Couëtte** on 17 Dec 2011, 2:37 a.m.*

Hello to all,

This post I am sending to our Forum further to a suggestion just e-mailed to me by Jean-François Garnier, our well known and highly regarded developer and "father" of EMU41.

For the past years and up until one week ago, I had been able to run EMU41 (a MS-DOS program as I understand it to be) on all my previous laptops using WINDOWS VISTA, WINDOWS XP, WINDOWS 2000 and maybe also some previous versions of WINDOWS. My EMU41 setting up and running procedure had always been quite simple and consistently the exact same one : I just stored all EMU41 files in one same dedicated EMU41 Folder, then left clicked on the "EMU41" icon and it worked perfectly well.

As an example, my last laptop was a SAMSUNG Q45 32-bit processor running with VISTA. It ran at about 600/700 times the speed of a conventional HP41, which is absolutely wonderful and quite highly appreciated - *if not a must in some cases* - for running some of my self-developed ASTRONAV Software which will usually take up to more than one hour for Lunars on a conventional HP41.

Congratulations and Thanks again for EMU41 to you Jean-François !

****

My brand new laptop is a LENOVO "THINKPAD" T420 with a 62-bit processor running with WINDOWS 7. Any time I attempt running EMU41 through the very same settings as indicated here-above, I am getting the following message :

"**The version of this file is not compatible with the version of Windows you are running. Check you Computer System information to see whether you need an x86 (32-bit) or x64 (64-bit) version of the program, and then contact your software publisher.**"

Such Warning Message seems pointing out towards 2 directions :

- Windows Version, and

- Processor type.

Actually, when compared to my former SAMSUNG Q45 32-bit processor running with VISTA, my new laptop :

- is running with a different and more recent Windows Version, i.e. WINDOWS 7, and

- is also running with a different Processor, namely a 62-bit Processor.

****

Is my EMU41 current problem then due to the new WINDOWS 7 Version, and/or to the new 64-bit Processor I am using ? or to any other reason ?

Just for the case where it might be simply a WINDOWS version problem not related any way to the Processor type (be it a 32-bit or a 64-bit Processor) is it still possible to run "modern" laptops directly in MS-DOS mode instead of in WINDOWS mode ? If so, what is the applicable (laptop starting ?) procedure ?

****

Thanking you for Your Kind Attention, and thanking you in advance for any help to solve this unexpected and new problem, I am remaining

Most Sincerely Yours

Merry X-Mas and Happy New Year 2012 to you all !

Antoine M. "Kermit" Couëtte

PS : A last personal note now : after having been laid off from my previous BOEING B757 Company which went bankrupt, I am now quite happy flying the AIRBUS A340 from MAURITIUS ISLAND to Europe, Africa, China, South East Asia and Australia. *Somebody has got to do it, anyway !*

in response to message #1 by Antoine M. Couëtte

Hello Antoine!
In order to execute DOS mode 16 bit programs under Windows 64bit OS you may try to use DOSBox
If I am not wrong there were reports of EMU41 running smoothly under DOSBox...

Season's Greetings,
Massimo

in response to message #2 by Massimo Gnerucci (Italy)

Hello Massimo,

Nice to read from you in Milano !

Thank you very much for your reply.

I will have to wait for about 10 days before I have sufficient time to implement and try the DOSBOX on my laptop.

Meanwhile, if anybody in this forum has got some ideas as to why EMU41 does not seem to run on 64-bit WINDOWS 7 computers, please feel free to contribute.

Meanwhile also I will be flying twice from Mauritius to Europe, starting with ... Milan MXP where I am

scheduled to land to-morrow afternoon Dec 19, 2011 at 16:50 Local Time (MK30 flight from MRU to MXP, then at the Melia Milano hotel, downtown Milano). ***That's a small world, isn't it ?***

Have a Great Day,

Merry Christmas, and

Happy New Year 2012

Antoine

Well, the answer is quite simple:
Microsoft has completely removed the support of any 16-bit programs (DOS and Windows) in their 64-bit Windows versions, so there's no chance for running them (unless you use an emulator like DosBox).

Franz

That was really driving me crazy for awhile, since I had a lot of old Turbo Pascal programs that wouldn't run. Then someone here put me onto Free Pascal and I recompiled and all is well again.

I'm wondering if the source to EMU41 is available and if it can be recompiled into 32 bit code?

Bill

Yes Bill, I've moved to Borland Delphi for my TurboPascal programs. ;-)

> Quote:
>

Well, the source is available here:
http://www.jeffcalc.hp41.eu/emu41/index.html
It's written in C so it should be possible to port it to 32-bit, but this would be quite a lot of work I'm afraid.

Franz

Re: IT WAS AN ACCIDENT!

*Message #6 Posted by **Joerg Woerner** on 16 Dec 2011, 12:30 p.m.,*
in response to message #4 by Frank Boehm (Germany)

...and an accident!

I (the guy with the feedback of 6179) was trying to win this auction for a collector friend in Germany.

He (the guy with 134 feedback) did not expect my bid and overlooked my earlier bids...

He placed a sniper bid with a "I want it badly" value and I placed one with "I want it for a friend" -

well s**t happens.

The interesting part of the equation is number three in the game with a feedback of 2476! He placed immediately after that accident an auction with a Concept III and a Buy-It-Now of $127.50 out on eBay (120830113245), accepting a best offer of $100.

Maybe I see my share ;-))

Cheers,

Joerg

The best way to order a 15C LE in German

*Message #1 Posted by **Timo** on 16 Dec 2011, 3:43 a.m.*

Dear forum memebers!

After having been informed that the 15C LE is on offer again on buy.com I decided to give myself a christmas present and would therefore like to order two 15C LE. However, buy.com does state in its shipment conditions that international shipping is not possible, which rules out placing a direct order there. Amazon.com would be another option which has the 15C LE on offer as well - but for 199$...

So what would be the best option for me to order the two LEs on my 'wishlist'? Would anybody here on the forum living in the US be willing to order two and send them to Germany by private shipping? I'm sure we can figure out a way to transfer the necessary money (PayPal, bank transfer,...).

Thanks for the help in advance and best regards, Timo

Re: The best way to order a 15C LE in German

*Message #2 Posted by **Bart (UK)** on 16 Dec 2011, 4:30 a.m.,*
in response to message #1 by Timo

From Eric Rechlin at www.hpcalc.org at $95 + shipping (go to his commerce site). Not in time for Christmas, but states back order to mid-January.

Another option is Samson Cables, but they're selling at $150 + shipping, stating new shipment due to arrive on 20 Dec.

Re: The best way to order a 15C LE in German

*Message #3 Posted by **Timo** on 16 Dec 2011, 6:06 a.m.,*
in response to message #2 by Bart (UK)

Thanks a lot for the quick response, Bart!

I've ordered my 2 15Cs and will be patiently (more or less) awaiting delivery.

I knew right away that the calcs would not make it to Garmany in time to land under the christmas tree - but my birthday is in late January, so it would be a bit of a late christmas and birthday present... ;)

Kind regards, Timo

9100Bs obtained

*Message #1 Posted by **David Ramsey** on 16 Dec 2011, 12:45 a.m.*

I spent several hours today with Larry Atherton going over the two 9100Bs he's spent the last couple of months restoring for me.

Both are, of course, functionally and cosmetically perfect. The later unit-- the one that uses a standard power cord rather than the unique power cord the earlier model uses-- has a better CRT, as the display for the earlier unit is slightly dim in the center of the screen. With their rebuilt keyboards, card readers, and electronics, everything else about these machines is as perfect as it's possible to make it.

Sadly, the lowest wire in the flex cable for the 9100's printer failed *as Larry was demonstrating how to use it.* We verified this fault with a continuity test. Of course the only possible fix is a printhead salvaged from another printer, so if anybody has a dead 9100 printer laying around, let me know. The fault is in the black plastic block that the tungsten printhead wires protrude from, and there's visible, very light corrosion on the wires entering the block. We decided that it's probably better to leave things as they are, since opening the block might well result in a showing of disintegrated flex cable wiring and a totally nonfunctional printer rather than one that simply can't print the last line of pixels.

I shall post pictures soon...

It can get quite cold here in February. Earlier this week the low was 16 degrees; Feb will be similar.

Re: 9100Bs obtained

*Message #10 Posted by **Namir** on 17 Dec 2011, 8:20 a.m.,*
in response to message #9 by David Ramsey

Ouch! Do you get snow?

Re: 9100Bs obtained

*Message #11 Posted by **David Ramsey** on 17 Dec 2011, 11:31 a.m.,*
in response to message #10 by Namir

Yes, we get snow. We're right by Lake Tahoe, one of the biggest ski areas in the nation. However, down on the valley floor, it's relatively rare for snow (on the roads, at least) to last too long. The very low humidity and brilliant sun can get rid of it very quickly. Many times I've woken up to a winter wonderland at 7AM and found no trace of snow left by 2PM.

Besides, you want to come play with this stuff. I'll have ready for you:

9100B 9810A 9815A 9820A 9825A 9830A 9835A HP-85 HP-87

You know you want to...maybe if you take me to lunch I'll let you touch the SR-60.

*Message #16 Posted by **David Ramsey** on 17 Dec 2011, 11:40 a.m.,*
in response to message #1 by David Ramsey

As promised, photos. First, the two machines together:

The newer unit is on the left, the older on the right. The older unit uses a unique power cord and has a slightly dimmer area in the middle of its CRT. The newer unit has a standard power cord and a perfect CRT. It's interesting to see the subtle changes HP made between the early and late units: thicker power cables internally, improvements to the circuitry for the ROM and core memory...

The newer unit, if not the bestest nicest 9100B in existence, would certainly be in the running:

Some might argue the rather glossy finish of the epoxy paint isn't how the machine looked from the factory. True enough. Perhaps I'll hit it with some matte spray.

The tags from each machine: Purdue from the new machine and Barrett-Cravens from the old one.

HP41CL Backup of Flash Contents

*Message #1 Posted by **Frido Bohn** on 15 Dec 2011, 2:07 p.m.*

Spontaneously that notorious song came to my mind: Oops, I did it again.
In my case, I managed accidentaly to erase the flash contents of the sectors following the address 0x0C9. I realized that YFERASE works sector wise and not by page much too late.
Now my question: is there any archive from which I can backup those "last-minute" ROMs (ISENE to IMDB)?

Re: HP41CL Backup of Flash Contents

*Message #2 Posted by **Monte Dalrymple** on 15 Dec 2011, 5:54 p.m.,*
in response to message #1 by Frido Bohn

Those late-addition images are available at

http://www.isene.com/isene.cgi?hp-41

The imdb image isn't posted yet, but there is no software
yet that can use it, so that shouldn't be a problem. If I
(or someone else) gets around to writing something that takes
advantage if it, I'll post it on the 41CL pages.

Problems activating HP15C LE emulator

*Message #1 Posted by **Nick_S** on 15 Dec 2011, 3:25 a.m.*

Hi

I have been trying to activate the installed HP15c emulator program which came with my LE calculator, but with no success.

Typing in the serial number of the CD-Rom directly into the HP Calculator Licence Activation popup dialogue just keeps returning a new blank dialogue box each time after it has said "connecting to activation server"

I tried the cut-and-paste method by choosing the offline option and pasting in the <PRODUCT DATA> ... </PRODUCT DATA>

into the http://activate.hpcalculating.com/ web page which then gave instructions to "Paste text from the Activation Dialog starting with <LICENSE> and ending with <\LICENSE>"

So I pasted the <LICENSE> ... <\LICENSE> in the HP Calculator Licence Activation popup dialogue and it still returned a new blank dialogue box.

Having tried this several times I now get the message "Exceeded maximum activations."

Any ideas on how to proceed? HP really needs to reconsider this on-line activation method. Surely entering the licence key from the CD-Rom as part of the initial software installation should be sufficient.

Nick

*Message #2 Posted by **Bill (Smithville, NJ)** on 15 Dec 2011, 11:10 a.m.,*
in response to message #1 by Nick_S

I never really understood WHY hp even requires you to activate it. Are they afraid that they will sell fewer of the actual hardware calculator? Didn't they already sell all that they chose to produce?

Are they afraid you might share your copy with other people - thus exposing it to more people who might buy the actual harware (assumming that HP decided to produce more of them).

I know - they are afraid that their competion will get it and then .. what? I would think the competion would have just bought a real calculator which came with the emulator.

I would think having the emulator out there would increase sales of the actual hardware. But then I'm not a marketing person.

It reminds me of Canon and Nikon manuals for their digital cameras. Canon will let you download a PDF, but

it has a watermark that says COPY in large letters slanted across the page. Even the PDF that ships on the CDROM that comes with the camera has the watermark. Of course they protect the document, so it's very difficult to remove the watermark. Nikon will let you download a PDF but it has the NOPRINT turned on. When you purchase the camera, they will let you download a printable PDF only upon registeration.

Okay, now that that's off my chest, I feel better...

Bill

in response to message #2 by Bill (Smithville, NJ)

I never have that problem with cameras since I shoot Olympus (OM-1N, OM-4T, E-1, E-5, and ST-6020) and all of their manuals are freely available in PDF format with no watermark, no printing restrictions, and no registration required. Shooting Olympus, plus being an engineer, using RPN, and once having owned a rotary engine Mazda (RX-2), makes me one of society's outcasts. :-)

> since I shoot Olympus

Good to see another Olympus fan. I've been an Olympus Film fan for years - OM-1N and OM-2. But my favorite is the Pen F. I have a complete set of lenes and accessories for the Pen F. It was great - 72 photos per roll of film. And the size was fantastic. If and when work comes back, I'd love to have the digital version of the Pen. A freiend of mine uses the digital Pen will all his old film lenses and the results are great.

For some reason, when I went digital, I went all Canon.

Bill

Re: Problems activating HP15C LE emulator

*Message #5 Posted by **M. Joury** on 15 Dec 2011, 6:49 p.m.,*
in response to message #4 by Bill (Smithville, NJ)

If you went digital back around 2003/2004/2005 Canon was the way to go. Now there are lots more options. I am actually very happy with my Canon cameras (been shooting Canon from way back when the F1 was new) but I have often wished I had the money to go out and splurge on a different system just for fun. Problem is that once you have a few lenses (including a quite pricey 70-200 F2.8 IS) switching brands is not so easy.

Cheers,

-Marwan

We are all a bunch of non-conformists here, so: Anybody else who is a Pentax DSLR user? I like it that I can use my Pentax lenses from 1975 on my new (2011) K5D!!

Marwan is right, too - once you have a few pricey lenses from one of the camera brands, you are more or less stuck on that one.

By the way, us Pentax / Olympus / Sony users have image stabilization built-in to the camera body, which works with ANY lens. Saves a few bucks on lenses - don't need that fancy IS / VR!!

Re: Problems activating HP15C LE emulator

*Message #9 Posted by **kc** on 16 Dec 2011, 12:02 a.m.,*
in response to message #8 by Dave Shaffer (Arizona)

I am a Pentax fan, and I own a K20d and now the K5. I always think that I am quite special. Asuume that 1 out of 100 use HP RPN calculators; and assume that 1 out of 100 use Pentax cameras, then I am 1 out of 10000...

Re: Problems activating HP15C LE emulator

*Message #10 Posted by **Lincoln R.** on 16 Dec 2011, 3:18 a.m.,*
in response to message #8 by Dave Shaffer (Arizona)

I'm also a Pentax user. My first SLR was a K1000 SE I rescued from the trash bin at a thrift store I volunteered at in high school (they had a 'pitch all film cameras' policy since most of what they got was 80s fixed-focus point & shoot crap) and that was the camera that got me involved in photo again. I accumulated more gear (some more that the thrift was tossing, some from a used camera shop) and took the stuff with me when I went to college. I later bought a dSLR and went for the K200d for the same reason as you. This all worked out to my favor when I decided to minor in photography, I've ran many a roll of Ilford HP5 through that old Pentax K1000.

Re: Problems activating HP15C LE emulator

*Message #11 Posted by **Dominic Richens** on 18 Dec 2011, 10:14 p.m.,*
in response to message #8 by Dave Shaffer (Arizona)

Non-conformist? I have a Nikon DSLR and I can use any F-mount lens from 1959 onwards. Not that I want to - the coatings that appear in the 1970's make all the AI-S lenses better.

Do you know these 2 functions ?

*Message #1 Posted by **PGILLET** on 15 Dec 2011, 2:23 a.m.*

Hello,

What's the purpose of these 2 functions (for x>0) ?

y1=(90*x+100*int(x)+int(60*x))/250
y2=(250*x-60*int(x)-int(100*x))/90

It's easy ... :)

Re: Do you know these 2 functions ?

*Message #2 Posted by **Marcus von Cube, Germany** on 15 Dec 2011, 3:26 a.m.,*
in response to message #1 by PGILLET

Easy? I can't make anything out of it by looking at the Wolfram Alpha plots.

Re: Do you know these 2 functions ?

Two-directional unit conversion

Re: Do you know these 2 functions ?

*Message #4 Posted by **PGILLET** on 15 Dec 2011, 9:01 a.m.,*
in response to message #1 by PGILLET

It was easy :)

y1 = Decimal Degrees -> Degrees/Minutes/Seconds

y2 = Degrees/Minutes/Seconds -> Decimal Degrees

I don't think it's widely used ...

Re: Do you know these 2 functions ?

*Message #5 Posted by **Oliver Unter Ecker** on 16 Dec 2011, 6:04 p.m.,*
in response to message #4 by PGILLET

These are really sweet. Thank you for sharing!
Did you develop them yourself?

I think I'm going to use them in a calculator I know...

One should note that int() needs to do more than truncate to an int. It needs to round to internal precision as well, or you get something like 2.5111111111 for y2(2.3) (using IEEE-754 doubles).

Re: Do you know these 2 functions ?

*Message #6 Posted by **Paul Dale** on 16 Dec 2011, 6:15 p.m.,*
in response to message #5 by Oliver Unter Ecker

Correctly dealing with rounding is by far the most difficult part of properly implementing these functions.

More so with binary floating point numbers than decimal ones.

- Pauli

Re: Do you know these 2 functions ?

*Message #7 Posted by **Werner** on 17 Dec 2011, 5:56 p.m.,*
in response to message #6 by Paul Dale

Many of the H.MMSS numbers cannot be represented correctly in binary floating point... I've looked at Free42 Binary, it does a good job.

Some errors of the HMS arithmetic functions on the 41C:

```
 1.20 0.20 HMS-          0.5959999999
 1.0 0.5959999999 HMS-   1.080000e-10
```

and, even one on the venerable 42S (where the equivalents of the above problems do get the correct results!)

```
 1.0 5.95999999999e-1 HMS+ -> 1.6000
```

The 5.959..e-1 kludge is the only way to enter a 12-digit number between 1 and 0.1, btw.

These 41/42-style programs do get it right, well, as far as I've been able to tell:

```
*LBL"HR"
 XEQ 02
 3600
 /
 RTN

*LBL"HMS-"
 CHS
*LBL"HMS+"
 XEQ 02
 X<>Y
 XEQ 02
 +
*LBL"S-H"
 3600
 /
*LBL"HMS"
 ENTER
 FRC
 .4
 *
 -
  E4
 %
 FRC
 .004
 *
 -
 RTN

*LBL"H-S"
*LBL 02
 XEQ 00
*LBL 00
 ENTER
 INT
 .4
 *
 -
  E2
 *
 END
```

Cheers, Werner

Hello,

Yes, I discovered these 2 formulas years ago.

Are they known elsewhere ?

You're right about rounding to internal precision:

That's what I do now in my implementation of the dd->dms formula on the TI-86 as a built-in function

The TI-86 computes 14 digits and displays 12 => Rounding is done to 12 digits **before and after** the formula:

(It's good old Z80 programming)

ld hl,_OP1 ; hl = OP1 address (Floating point register number 1)

ld a,(hl) ; Get OP1 flag byte

ld (mem1),a ; save OP1 flag byte

and $7F ; Clear sign bit => positive

ld (hl),a ; OP1=abs(x)

call _RNDGUARD ; OP1=OP1 rounded to 12 digits (abs(x) rounded, I call it x')

call _op1toop4 ; OP4=OP1 (x')

ld hl,n90

call _mov10toop2 ; OP2=90

call _FPMULT ; OP1=OP1*OP2 (90*x')

call _op1toop5 ; OP5=OP1 (90*x')

call _op4toop1 ; OP1=OP4 (x')

call _INTGR ; OP1=int(OP1) (int(x'))

ld hl,n100

call _mov10toop2 ; OP2=100

call _FPMULT ; OP1=OP1*OP2 (100*int(x'))

call _op5toop2 ; OP2=OP5 (90*x')

call _FPADD ; OP1=OP1+OP2 (90*x'+100*int(x'))

call _op1toop5 ; oP5=OP1 (90*x'+100*int(x'))

call _op4toop1 ; OP1=OP4 (x')

ld hl,n60

call _mov10toop2 ; OP2=60

call _FPMULT ; OP1=OP1*OP2 (60*x')

call _INTGR ; OP1=int(OP1) (int(60*x'))

call _op5toop2 ; OP2=OP5 (90*x'+100*int(x'))

call _FPADD ; OP1=OP1+OP2 (90*x'+100*int(x')+int(60*x'))

ld hl,n250

call _mov10toop2 ; OP2=250

call _FPDIV ; OP1=OP1/OP2 ((90*x'+100*int(x')+int (60*x'))/250)

call _RNDGUARD ; OP1=OP1 rounded to 12 digits

ld a,(mem1)

and $80 ; Keep sign bit only

ld hl,_OP1

or (hl)

ld (hl),a ; Restore sign bit

ret

Re: Do you know these 2 functions ?

*Message #9 Posted by **Oliver Unter Ecker** on 21 Dec 2011, 12:14 p.m.,*
in response to message #8 by PGILLET

I have not seen them before and find them quite remarkable. Wonder how you found them.

Here's my implementation of your formula (in MorphEngine):

```
        "toHMS": function(x) { return
this.toPrecision((90*x+100*this["int"](this.toPrecision(x))+this["int"](this.toPrecision(60*x)))/250);
},
```

"this" points to the function collection for the "Number" (=Reals) data type.

Cheers.

Re: Do you know these 2 functions ?

*Message #10 Posted by **J-F Garnier** on 21 Dec 2011, 2:46 p.m.,*
in response to message #8 by PGILLET

Hello,

I didn't know these formulae either. Interesting.

However, here is case with abnormal result:

```
7.5 1/x XEQ "HMS1"
Result is 0.0760
The HP-41C HMS function correctly returns 0.0800 .
The HP32SII ->HMS function returns 0.0759999999999 .

Here is my test program:
 01*LBL "HMS1"
 02 ENTER^
 03 ENTER^
 04 ENTER^
 05 90
 06 *
 07 X<>Y
```

```
08 INT
09 100
10 *
11 +
12 X<>Y
13 60
14 *
15 INT
16 +
17 250
18 /
19 END
```

Edited: 21 Dec 2011, 2:48 p.m.

Re: Do you know these 2 functions ?

*Message #11 Posted by **Werner** on 21 Dec 2011, 3:29 p.m.,*
in response to message #10 by J-F Garnier

While the 0.0760 is wrong, I'm afraid it's the 41C that returns the abnormal result in this case... no doubt there's some 'cosmetic rounding' taking place that doesn't always work.
The correct result is delivered by the 32SII (and also by the 42S). My formulas used in the programs above return the correct result as well. (for HMS that would be:

```
x := 3600*HR;
x := x/100 + int(x/60)*0.4;
x := x/100 + int(x/60)*0.4;
```

Cheers, Werner

Re: Do you know these 2 functions ?

*Message #12 Posted by **Gerson W. Barbosa** on 21 Dec 2011, 3:36 p.m.,*
in response to message #10 by J-F Garnier

> Quote:
>
> The HP-41C HMS function correctly returns 0.0800 .

So does the HP-15C :-)

> Quote:
>
> The HP32SII ->HMS function returns 0.0759999999999 .

So does the HP-42S :-(

The BASIC sub-routines below (from the QBASIC program in this thread convert D.MMSS to D.D (line 310) and D.D to D.MMSS (lines 320-328).

```
310 M = INT(100 * FNFRAC(AN)): S = 100 * FNFRAC(100 * FNFRAC(AN)): AN = INT(AN) + M / 60 + S /
3600: RETURN
320 T = FNFRAC(AN): M = INT(60 * T): S = FNFRAC(((3600 * T) / 60)) * 60
323 IF INT(S + .5) = 60 THEN S = 0: M = M + 1
325 IF M = 60 THEN M = 0: AN = AN + 1
328 RETURN
```

This morning I had W|A simplify the first line. The result appears to be correct (at least for positive arguments -- I haven't tested it with negative arguments), despite being longer than PGILLET's original function:

```
y2 = (180*IP[x] + 3*IP[100*FP[x]] + 5*FP[100*FP[x]])/180
```

I didn't try to simplify the other function. When converting my original CASIO PB-700 program to QBASIC, I remember the function would not work correctly unless lines 323 and 325 were added. Perhaps both the HP-32SII and the HP-42S are using a similar simplified formula.

Edited: 21 Dec 2011, 3:48 p.m.

Re: Do you know these 2 functions ?

*Message #13 Posted by **Werner** on 22 Dec 2011, 12:01 p.m.,*

in response to message #12 by Gerson W. Barbosa

But 0.0759999... *is* the correct value for an input of 0.1333.. The 42S and 32SII have it right.
It's a bit like complaining (1/3)*3 does not equal 1.

And, on a decimal machine, using

```
x := HR - FRC(HR)*0.4;
HMS := x - FRC(x*100)*0.004;
```

does not need any rounding.

Cheers, Werner

As in Dr. Randall's talk above... I found that ridiculous when I watched it, yet I did the same...

Cheers,

Gerson.

Re: Do you know these 2 functions ?

*Message #15 Posted by **Dieter** on 22 Dec 2011, 2:58 p.m.,*
in response to message #12 by Gerson W. Barbosa

Gerson, I think you used the wrong smilies. ;-) In fact, the 41C and 15C are wrong. They return an incorrect result due to rounding. I see Werner already said it, but anyway, let's take a closer look at this:

There is one basic thing we have to consider: the argument for the H.MS function is *not* 1/7,5 hours. In fact, it's the *10-digit-rounded value* of this, i.e. all we can do is apply the H.MS function to x = 0,1333333333 hours. The correct H.MS representation of this is as follows:

```
   0,13333 33333  hours
 x 3600 seconds/hour
 = 479,99 99998 8 seconds
```

In other words: The exact result of H.MS(0,13333 33333) is exactly

```
   7 minutes and 59,99999988 seconds
```

In h.ms notation this result would be displayed as

```
   0,075999 99998 8
```

This full-precision result requires 11 significant digits. But there are just 10 of them on the 41C and 15C. So the last digit gets rounded and the correct 10-digit result should be

```
   0,075999 99999
```

But that's not what these machines return. They return exactly 8 minutes. Which is plain wrong. Or "inexact", if you prefer. ;-)

Now let's take a look at the same problem on a 12-digit machine. Here, the input value is

```
   0,13333 33333 33 hours
 x 3600 seconds/hour
 = 479,99 99999 988 seconds
 = 7 minutes, 59,999 99999 88 seconds
```

In h.ms notation this result would be displayed as

```
   0,075999 99999 988
```

This exact result has 13 significant digits. So again, the last digit has to be rounded and the final, correct 12-digit result is

```
0,075999 99999 99
```

And that's exactly what the 32s returns.

So actually both the 41C and 15C are wrong :-(
While on the other hand the 32s is right :-)

Dieter

Preview of the 'Full Command and Function Reference' inside your HP 50g / HELP for *all* commands.

*Message #1 Posted by **Software49g** on 14 Dec 2011, 7:09 a.m.*

Hello everybody,

I have coded the "Full Command and Function Reference" section of the Advanced User's Reference Manual (AUR) as an integrated help for the HP 50g including all text and graphics, stack diagrams, related commands and the access to each command.

A first glimpse about this new product is available here:
http://www.software49g.gmxhome.de/FullCommandAndFunctionReference.htm

Currently I am debugging it but an initial release should be available soon.

Feedback is appreciated.

Regards,
Andreas

OT: Casio FX-720P

*Message #1 Posted by **robertoataulfo** on 14 Dec 2011, 7:03 a.m.*

I got an fx-720p disassembled.
I have a question in which order the metal mask is placed right after the keys or on top of the plastic mask.

FX-720P Photo

in response to message #1 by robertoataulfo

I don't plan to disassemble mine but I would suggest to put the rubber between the metal sheet and the board.

Dr Z Beat the Racetrack module document pages

*Message #1 Posted by **Mark** on 13 Dec 2011, 5:38 p.m.*

Hello I am searching for the first 2 pages of the Dr Z Beat the Racetrack program for the HP41c, module 82500a - a24. It was published and sold in the mid-1980's. Any idea where I might find an archive of Hp manuals? Is anyone familiar with the program? I have the module working and prompting me, but I don't know what keys to press to enter data. Thanks, Mark

OT - Length of day question

*Message #1 Posted by **Cristian Arezzini** on 13 Dec 2011, 1:18 p.m.*

Ok, this has nothing to do with calculators, even less with HP, but it has to do with math and physics and this forum has a bunch of very knowledgeable people, so I thought I might ask... The shortest day of the year (meaning, the day with least sun illumination) is the day of the winter solstice, which is around December 21st. And I always thought that approaching that date, the sunrise would get always later and later, and the sunset always sooner. But I found out that the sunrise has its "latest" peak after the end of December, while the sunset has its "soonest" around December 13th. I always thought they would be "symmetrical". I can't understand why the sunset stops getting earlier while the sunrise is still getting later. Does this question make sense at all? :) Anyone here knows the answer?

Cristian

*Message #2 Posted by **Thomas Chrapkiewicz** on 13 Dec 2011, 1:43 p.m.,*
in response to message #1 by Cristian Arezzini

The rotational axis of the earth is not perpindicular to its orbital plane.

NOAA has (had?) a sunrise/sunset table calculator which one can easily plot to see the assymmetry.

TomC

in response to message #1 by Cristian Arezzini

Look up "Analemma" to learn more about this.

Essentially, the location of Local Apparent Noon -- the zenith of the sun--is not in the same place all year--and it is not symmetrical with the seasons.

Note that in addition to the tilting of our axis relative to the orbital plane, we also have a non-circular orbit. The northern hemisphere winter is actually when we are *closer* to the sun!

Obviously not only the tilt angle of our axis, but also where it points relative to the orbital apogee and perigee affect how our days get aligned.

For fun, see this:

http://www.analemma.com/Pages/framesPage.html

Re: OT - Length of day question

*Message #4 Posted by **Dave Shaffer (Arizona)** on 13 Dec 2011, 2:58 p.m.,*
in response to message #3 by bill platt

As Bill notes, the Earth's orbit is not circular.

As Kepler deduced about 400 years ago, all orbits are ellipses, with the Sun at one of the foci - hence the Earth's distance from the Sun varies throughout the year. He also realized that the speed of a planet in its orbit is not constant, but when the planet is closer to the sun, it moves faster and vice-versa.

However, the spin rate of the Earth - i.e. the length of the day - is basically constant. (I say basically, because at the millisecond level, the length of the day does vary.) This is the length of the day that you measure with respect to the stars or something far, far away from the Earth.

A "day" as most of us think of it, however, is tied to the Sun. i.e. It's a "day" from one noon to the next, say.

But, since where the Sun is in the sky depends on both the rotational (daily spin) position AND orbital location of the Earth, the time of local solar noon changes systematically throughout the year - the curvature of the Earth's orbit has to be taken into account and added to (or subtracted from, if we are getting behind) the Earth's rotational position.

This effect shifts the daylight part of the day ahead or behind. This results in the analemma effect (the figure 8 often drawn on a globe) which notes how far behind or ahead the sun is. The amount of behindedness or aheadedness is with respect to a fictitious Sun that would be observed if the Earth was in a circular orbit.

To a small extent, the shift is fast enough that part of it occurs during the day, shifting sunrise and sunset by slightly different amounts. As also noted, the tilt of the Earth's axis, which affects where the Sun appears to rise and set, also comes into play.

See here for some more details.

*Message #5 Posted by **Miguel Toro** on 13 Dec 2011, 3:43 p.m.,*
in response to message #3 by bill platt

Hi Bill,

Is there any RPN program (I suppose someone already did it) calculating the equation of time? Since I cannot afford a watch with such "complication", at least I could find consolation programming this on my 34s :-)

Miguel

*Message #6 Posted by **Jim Horn** on 13 Dec 2011, 4:37 p.m.,*
in response to message #5 by Miguel Toro

Oh yes - the HP-65 Navigation Pack had such a program which had to run in 99 steps and less than 10 registers so almost any more recent machine should be up to it. The algorithm was a sum-of-harmonics approximation as I recall. It's been a long time since I read my copy of that 1975 era book...

Re: OT - Length of day question

*Message #7 Posted by **Dale Reed** on 13 Dec 2011, 4:44 p.m.,*
in response to message #5 by Miguel Toro

Miguel,

I don't have an RPN program, but it should be pretty straightforward to go from the NOAA equations to an RPN program. The equations will get you from local Lat/Lon and time (with UTC offset) to solar azimuth and elevation and sunrise/sunset times.

For those of you using industrial Programmable Controllers, I have a version in IEC-61131-3 structured text language available as well.

There are about a dozen program constants, and lots of sin/cos/tan and asin/acos/atan. Probably too many steps for an HP-25, but I think an 11C could handle it.

Dale

> I always thought they would be "symmetrical". I can't understand why the sunset stops getting earlier while the sunrise is still getting later.

Good remark!

A lot of people actually have understood that sunset and sunrise changes would be symmetrical. The main reason is that a lot of us have been teach like that, since 'length of day' have only been explain through season inclination of the Earth’s axe of rotation. If we only take into account this only explanation, then the sunset cannot stop getting earlier while the sunrise is still getting later. Something important is missing.

The important fact is missing!

Re: OT - Length of day question

*Message #12 Posted by **bill platt** on 13 Dec 2011, 2:48 p.m.,*
in response to message #11 by C.Ret

C.

The shift has nothing to do per se with the sun being a disk nor with our definitions of sunrise and sunset. I am not saying that these do not have an effect on what we consider a "day" but the shift exists regardless of the size of the sun's disk...

By the way, when you see the sun just kissing the horizon, it is actually pretty much all the way below the horizon--because the rays are bent, we see the sun over the horizon. In other words, there is essentially a superior mirage at every sunrise and sunset...but this can vary dramatically with weather conditions. Timing the sunset can be quite off from the theoretical point.

Re: OT - Length of day question

*Message #13 Posted by **C.Ret** on 13 Dec 2011, 3:49 p.m.,*
in response to message #12 by bill platt

You right, I miss samething in my explanation.

And only realise now that analemma have effect on sunrise and sunset. Up to now, I only consider analemma to have impact on position of the Sun in the sky and only care of it for navigation application.

I like this forum. Every day something to discover and misskownlege to correct.

Thank you very much.

Re: OT - Length of day question

*Message #18 Posted by **Bernard Rochlin** on 13 Dec 2011, 5:05 p.m.,*
in response to message #1 by Cristian Arezzini

Here in the southern hemisphere 32 degrees South the pattern of the above is reversed. The earliest sunrise is December 4 and the latest snset is January 5 in the southern summer. in winter the earliest sunset is on June 5 and the latest rise is on July 6.

Re: OT - Length of day question

*Message #20 Posted by **Vince (Italy)** on 14 Dec 2011, 12:43 a.m.,*
in response to message #19 by Cristian Arezzini

I'll try to add some more information. Since the Earth orbit is an ellipse, according to the second Kepler law, the Earth angular velocity is greater when the Earth is closer to the Sun in its orbit (perihelion), and lesser when it's around the aphelion, because its surface velocity has to keep constant along the whole orbit.

The duration of the day is the time interval between two consecutive culmination of the Sun. Since the distance between the Earth and the Sun is not infinite, that interval consists of the time lenght of a whole Earth rotation plus an additional angle that is equivalent to the apparent motion of the Sun along the ecliptic. The angular velocity of the Earth along its orbit is greatest at the end of December, then the time lenght between two consecutive culminations is extended.

Hope it helps

Vince

HP SMB 15C LE ship date

*Message #1 Posted by **Scott Newell** on 12 Dec 2011, 7:56 p.m.*

Just got a notice from HP SMB: calcs should ship by December 22nd!

Hopefully the 3 month delay was productive.

Re: HP SMB 15C LE ship date

*Message #2 Posted by **jimi** on 12 Dec 2011, 8:07 p.m.,*
in response to message #1 by Scott Newell

I guessed I missed something... So the limited edition calculator is getting another run? I guess it's really not that limited?

Re: HP SMB 15C LE ship date

*Message #3 Posted by **Brandon Poindexter** on 12 Dec 2011, 8:25 p.m.,*
in response to message #2 by jimi

I think its more of a "lets-try-this-again" attempt by HP, as i think initially they silently recalled it. That's just my take though and i could be completely wrong.

Re: HP SMB 15C LE ship date

*Message #4 Posted by **jimi** on 12 Dec 2011, 9:13 p.m.,*
in response to message #3 by Brandon Poindexter

Recalled? I hadn't heard that anywhere. I got one from the initial batch, but I've never gotten around to opening it. All my calcs have been packed up since I moved.

Re: HP SMB 15C LE ship date

*Message #5 Posted by **Michael de Estrada** on 12 Dec 2011, 9:20 p.m.,*
in response to message #4 by jimi

I'd recommend that you run the keyboard self-test on it to make sure you don't have a defective keyboard. You should be able to get it replaced under warranty if you have a defective unit.

Re: HP SMB 15C LE ship date

*Message #6 Posted by **Namir** on 12 Dec 2011, 8:55 p.m.,*
in response to message #1 by Scott Newell

I think this is the boat shipment we have all been waiting for. My own guess is that these machines will have the same firmware as the ones flown, a few months ago, to the US.

Namir

Re: HP SMB 15C LE ship date

*Message #7 Posted by **Allen** on 12 Dec 2011, 11:31 p.m.,*
in response to message #6 by Namir

Namir, I think you are right. If that's true, the keyboard issue will still be resident in some 11% or so of the units. I have not had a faulty one yet, but I didn't buy very many.

Re: HP SMB 15C LE ship date

*Message #8 Posted by **Eric Rechlin** on 12 Dec 2011, 11:38 p.m.,*
in response to message #7 by Allen

It only takes a few weeks for boats to get here from China, at the absolute most (giving time for slow dock workers to sit on the containers for a while), so I would think that this wasn't simply the shipment that was sent back in September.

Eric

Re: HP SMB 15C LE ship date

*Message #9 Posted by **Michael de Estrada** on 13 Dec 2011, 12:05 a.m.,*
in response to message #8 by Eric Rechlin

I bet you're right. Also, I bet the LE numbers will begin with "1" and the serial / batch numbers will indicate manufacture date in October.

Re: HP SMB 15C LE ship date

*Message #10 Posted by **Scott Newell** on 17 Dec 2011, 11:25 p.m.,*
in response to message #1 by Scott Newell

And they're here! CNA132094S (#00446) and CNA132094H (#00296). Both have 2011-04-15 firmware. No printed self test addendum to the manual and no tape seal on the clear outer box. Keys feel fine. The f and g keys show the slight misalignment.

These are from an HP SMB order placed around 9/26.

HP15C-LE available at Buy.com

*Message #1 Posted by **Dave Mabry** on 12 Dec 2011, 2:07 p.m.*

Just got a message from Buy.com that the HP15C-LE is again in stock. I placed an order, so it's probably true.

Click here to go to the page where it's available. $90 and free shipping. Probably won't last long.

Re: HP15C-LE available at Buy.com

*Message #2 Posted by **NateB** on 12 Dec 2011, 2:54 p.m.,*
in response to message #1 by Dave Mabry

Looks like it is a popular item.

The reluctance to reissue the 15c reminds me of the underestimated demand for the HP-35.

Re: HP15C-LE available at Buy.com

*Message #3 Posted by **Dan Grelinger** on 12 Dec 2011, 8:25 p.m.,*
in response to message #1 by Dave Mabry

It will be interesting to see how long they last. The are now up to a Rank for today of '3', up 30767% from yesterday's rank of 926, so orders appear strong.
I got a kick out of the limit that buy.com is placing on orders. You may only order 25 of these at a time!

Re: HP15C-LE available at Buy.com

*Message #4 Posted by **jimi** on 12 Dec 2011, 9:17 p.m.,*
in response to message #3 by Dan Grelinger

Well, given that it seems to be a no brainer to buy a stack of them, since they initially seemed to have tripled in value on TAS. If HP continues to pump them out, I don't know how long that will last.

If it did, that's a quick several thousand dollar profit though.

Re: HP15C-LE available at Buy.com

*Message #5 Posted by **hpnut** on 13 Dec 2011, 5:16 a.m.,*
in response to message #1 by Dave Mabry

Hahaha. Samsons still selling them at $149.99 plus shipping. let the market forces determine the "right" price

for consumers.

http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=434&Sku=HP15C

hpnut in Malaysia (I got mine from Samsons at $99 early on)

Edited: 13 Dec 2011, 5:27 a.m.

Re: HP15C-LE available at Buy.com

*Message #6 Posted by **Steve Fennell** on 13 Dec 2011, 1:06 p.m.,*
in response to message #1 by Dave Mabry

Now the price is $94.99. Get them while they are hot.

People are paying $300+ for these on TAS. Nice profit margin if you're so inclined.

Re: HP15C-LE available at Buy.com

*Message #7 Posted by **Howard Owen** on 13 Dec 2011, 1:18 p.m.,*
in response to message #6 by Steve Fennell

Or, resell one for $110.00, and point everyone to buy.com.

"Nice Price!! (But you can get it cheaper at retail.)"

Re: HP15C-LE available at Buy.com

*Message #8 Posted by **Lincoln R.** on 13 Dec 2011, 3:43 p.m.,*
in response to message #7 by Howard Owen

I seriously considered buying 4 or 5 when they first came out and selling them on TAS for what I paid for them + TAS fees and shipping to try to force down the prices of the scalpers, but then decided that they would probably just get bought by the scalpers.

Re: HP15C-LE available at Buy.com

*Message #9 Posted by **Steve Fennell** on 13 Dec 2011, 4:32 p.m.,*
in response to message #8 by Lincoln R.

Even the auctions are getting bid up. It's not just the BIN prices that are high.

Buy.com is also selling them on TAS

*Message #10 Posted by **Michael de Estrada** on 13 Dec 2011, 5:26 p.m.,*
in response to message #9 by Steve Fennell

Here

So far they've sold over 60 today and early on someone bought 25. It will be interesting to see how many they have for sale this time. Last time when they sold them on TAS they only had 50, but they've already exceeded that number. They're still being sold for only $89.99 with free shipping.

Edit: They show 259 still available with 64 sold so far.

Edited: 13 Dec 2011, 6:19 p.m.

Re: HP15C-LE available at Buy.com

*Message #11 Posted by **NateB** on 13 Dec 2011, 8:42 p.m.,*
in response to message #6 by Steve Fennell

I see they've also dropped the purchase limit from 25 to 2... The eBay listing has been removed "because the item is no longer available."

Edited: 13 Dec 2011, 8:45 p.m.

Re: HP15C-LE available at Buy.com

*Message #12 Posted by **Michael de Estrada** on 13 Dec 2011, 9:18 p.m.,*
in response to message #11 by NateB

Yeah, it's deja vu all over again.

Re: HP15C-LE available at Buy.com

*Message #13 Posted by **Michael de Estrada** on 13 Dec 2011, 11:53 p.m.,*
in response to message #11 by NateB

They've relisted it for the same $94.99 price as their online store. No mention of quantity limits. I'm going to bed now. It will be interesting to see if it's still there in the morning.

Edited: 14 Dec 2011, 12:17 a.m.

Re: HP15C-LE available at Buy.com

*Message #14 Posted by **Dan Grelinger** on 14 Dec 2011, 11:18 a.m.,*
in response to message #13 by Michael de Estrada

I ordered my first unit the first time they were on buy.com, and ordered a second on Monday at $89.99. It is scheduled for delivery tomorrow (12/15/11). They are still available just now at the higher ($94.99) price and lower limit per order (2).

I wonder if all you have to do is place 10 separate orders to buy 20 units?

Re: HP15C-LE available at Buy.com

*Message #15 Posted by **Michael de Estrada** on 14 Dec 2011, 11:33 a.m.,*
in response to message #14 by Dan Grelinger

Somehow I think they won't accept repeat orders from the same buyer. Just like they won't honor repeated use of coupons meant only for first time buyers. It's a moot point, since I've got all the ones I want, and am not interested in selling them.

Re: HP15C-LE available at Buy.com

*Message #16 Posted by **Dan Grelinger** on 15 Dec 2011, 8:34 a.m.,*
in response to message #15 by Michael de Estrada

The maximum order quantity on buy.com has changed again, now it is 10. The sales rank was 9 yesterday, and now it is 5, so these are still selling popularly.

Re: HP15C-LE available at Buy.com

*Message #17 Posted by **Dan Grelinger** on 15 Dec 2011, 3:35 p.m.,*
in response to message #1 by Dave Mabry

I received my unit today. Limited Edition Number 09368, Serial Number CNA1320HT8 (when was it made?) ROM date is 2011-04-15. I tested the keyboard several times and found no issues (my first unit a few months ago had two keys with problems).

There is an "Errata Sheet to Self Tests (p261)" included with the documentation now. It corrects the text concerning the correct way to execute the self tests.

My replacement unit from HP for the first defective one is Limited Edition Number 13520 and CNA14400SG.

Re: HP15C-LE available at Buy.com

*Message #18 Posted by **Michael de Estrada** on 15 Dec 2011, 5:11 p.m.,*
in response to message #17 by Dan Grelinger

The serial number suggests that it was part of the original production in mid-August. My guess is that they inspected all of them, and discarded the bad ones. They also took the opportunity to add the errata sheet.

Re: HP15C-LE available at Buy.com

*Message #19 Posted by **Allen** on 15 Dec 2011, 8:49 p.m.,*
in response to message #18 by Michael de Estrada

The way Dec 2011 units were sealed using a clear sticker on the top of the box, suggests they went through some quality control stage as Michael Suggests.

I also observe the black plastic tray is un-evenly replaced in a few units, suggesting they were quickly taking the black trays out (e.g. to include the errata sheet below). The clearance between the manual, the edges of the black tray holding the 15C, and the edges of the box is quite small.

Re: HP15C-LE available at Buy.com

*Message #20 Posted by **Jeff O.** on 16 Dec 2011, 8:08 a.m.,*

Does it warn against performing the original self tests?

I presume there is not an "Errata Sheet to PSE Instruction (p68, 270)" which states that it does not work more than once in a program?

The Errata Sheet to Self Tests is only the replacement text for the Self Test section of the handbook. There is no warning concerning the original self tests, and nothing on the PSE instruction.

Got my unit last night, LE # 06457. Does look like its part of the original run.

The packing included the Errata sheet. Tested all the keys, all felt good.

Haven't had chance to really use it yet - annoying thing called work is taking up my time.

Is the serial number of the form CNA132xxxx (first production run) or CNA144xxxx (postulated second production run after the keyboard issues were sorted out.)

Re: HP15C-LE available at Buy.com

*Message #24 Posted by **Mike Phillips** on 16 Dec 2011, 12:28 p.m.,*
in response to message #23 by Jeff O.

Its a CNA132xxxx serial number.

Re: HP15C-LE available at Buy.com

*Message #25 Posted by **Jeff Johnson** on 16 Dec 2011, 4:12 p.m.,*
in response to message #23 by Jeff O.

Ordered mine from buy.com on 12/14/11 and received today (2 days). Keys feel good. CNA1320J6D. Limited Edition #06037. Doesn't bother me if the "Limited" is unlimited. Just glad it's available again for all those who want one. Worth the wait, and didn't have to get gigged on eB** or other places trying to resell at 100% mark-up.

Re: HP15C-LE available at Buy.com

*Message #26 Posted by **Thomas Radtke** on 16 Dec 2011, 12:01 p.m.,*
in response to message #1 by Dave Mabry

If the LEs listed here are all US models, it *seems* this market alone covers about 10,000 calculators (given continuous LE-numbers for each contry specific 'model'). If this is true, how limited is this limited edition, actually?

Re: HP15C-LE available at Buy.com

*Message #27 Posted by **Paul Taylor (junkmine)** on 16 Dec 2011, 1:55 p.m.,*
in response to message #26 by Thomas Radtke

I just received two of these from buy.com today, that makes 5 total, 4 from buy.com 1 from HP plus my original one I purchased new in 1982 still works great but I keep in a little shrine above my desk! The new ones are serial numbers 05953 and 06449. Look the same as the ones from the original run (sub 01000 serial numbers). Ran the self test and keyboard test and did some of my own basic math test, all good.

From the time I put them in my buy.com cart to when I checked out the price went from $89.99 to $94.99, they know a sucker when they see one.

They are sold out again

*Message #28 Posted by **Michael de Estrada** on 16 Dec 2011, 9:38 p.m.,*
in response to message #1 by Dave Mabry

Just checked and they are sold out in the online store and have ended the eB** listing. So, I guess it's wait until HP's store has them again or pay higher prices to gougers. Anyway, I hope none of you procrastinated, and got your orders in on time.

Any DIY5 pics out there?

*Message #1 Posted by **Ángel Martin** on 12 Dec 2011, 11:17 a.m.*

I was wondering whether some DIY5 pics have been posted already - for all of us who didnt't go the the last HC meeting? Thanks.

Re: Any DIY5 pics out there?

*Message #2 Posted by **Eric Smith** on 12 Dec 2011, 3:14 p.m.,*
in response to message #1 by Ángel Martin

There isn't a DIY5 yet. At HHC 2011 I showed a DIY4 calculator modified to use a graphic display. I refer to that as the DIY4X. The short answer to your question is that I don't have any good photos or video at the moment. We got the graphic display in August, and were in quite a hurry to get it working, so our current display adapter board is somewhat of a kludge, and not very robust. At the moment it is broken, or I'd take some photos and post them.

Longer answer:

When we first got the display this past August, we weren't sure that it would be satisfactory, so rather than actually modifying the calculator, we kludged the display, which uses a SPI (synchronous serial) interface, to plug into the SD card slot.

When we saw how amazing the display is, Richard Ottosen designed an adapter board to plug into the 14-pin connector for the DIY4 character display module. This allowed us to put the calculator into a reasonable package, rather than having the kludge hanging out the SD slot. This is the model I showed at HHC 2011. I don't remember whether I showed the SD slot kludge.

Richard etched the adapter board himself, and there were some problems with the etch, which resulted in the adapter board not being as robust as we would like. Richard warned me that it might not survive being mailed to me, or being taken to the conference. As it turned out, it worked just fine until I took it back to the hotel room after the Sunday conference session was over. whereupon it stopped working.

Rather than fix it or make any more manually etched boards, Richard is going to design a better adapter board and send it out to a PCB fab house. We will use that to update all three existing DIY4 boards. We are considering making a few more DIY4X calculators with the new adapter, but the longer-term plan is to redesign the main board to include the graphic LCD support, as well as some other design changes including USB support. That will be the DIY5.

When we make more units of the DIY4X with the new display adapter, or we make some DIY5s, we intend to make a small number of units available to outside firmware developers. I've already got HP-41 firmware running on it, but we want to support newly-created calculator firmware as well. That development can take place in parallel with our efforts to develop a production-quality industrial design.

in response to message #4 by Eric Smith

Eric,

Really great development! Especially the display looks like running circles around everything else I know in the calculator market. Do you plan to allow for softkeys in the DIY5? What are your plans for the function set?

Re: Any DIY5 pics out there?

*Message #6 Posted by **Eric Smith** on 14 Dec 2011, 6:56 p.m.,*
in response to message #5 by Walter B

The DIY5 is intended to be available with at least two different keyboard layouts.

One layout will be an -41 style layout, the same as we currently have on the DIY4X, and is not intended for soft keys, although there is nothing in the hardware that would prevent the firmware from offering them. There are only five keys in the top row. The function set of the provided firmware would be similar to the 41CX with some extensions to support the SD card and such. It could support alternate firmware if someone wanted to write some.

The other planned layout is the Pioneer/42s/20b/30b layout, which is intended for soft keys. I believe we can package the DIY5 with this keyboard layout in a package of comparable size to the Pioneer. While it is expected to have a MicroUSB connector (device only, for connection to a PC or Mac), we have not yet decided whether to include a MicroSD card slot. The issue is that SD cards (including Micro) can draw up to 100mA, which is too much for lithium coin cells to reliably provide.[*] We're looking at three possibilities:

1. No MicroSD card, lithium coin cells, slim packaging comparable to Pioneer
2. With MicroSD card, two AAA alkaline cells, more wedge-shaped packaging to accomodate the AAAs at the display end
3. With MicroSD card, color OLED display[**] instead of B&W, lithium polymer rechargeable battery, slim packaging

This model is intended as a firmware development platform, so the early units would be provided to firmware developers with only a hardware test program in the flash memory. It would be up to the firmware developers to decide what functions they want to implement.

If you have a desire for a keyboard layout that doesn't match either the 41 or Pioneer, we'd be

interested in trying to accommodate it.

Eric

[*] CR2032 coin cells are only intended to provide a peak current drain (pulsed) of about 6.8 mA. When they are fresh, they can do this with only about 0.3V drop. We've found that they actually can supply enough current for an SD card, but at a higher voltage drop. However, near end of life, when you would most desperately need the SD card to work, so as to save the calculator memory to the SD card before the batteries fail, is exactly when it won't work. Near end of life, the internal resistance of the coin cell is very high, so a current spike from the SD card will drive the already low battery voltage below the level that can keep the processor operating. In other words, you'll lose the data in memory that you were trying to write to the SD card.

[**] Oddly enough, the color OLED display is significantly *less* expensive than the black-and-white display. However, it sucks a lot of power, so I don't think it's practical without a rechargeable lithium polymer battery. Personally, I don't want to have to recharge my calculator frequently, so I prefer the black-and-white display and prefer to focus my development efforts on that.

Edited: 14 Dec 2011, 7:03 p.m.

Re: Any DIY5 pics out there?

*Message #7 Posted by **Cristian Arezzini** on 14 Dec 2011, 11:52 p.m.,*
in response to message #6 by Eric Smith

Me wantsss!!! :) FWIW, I'd strongly prefer option 2 above - not 1 because I like the SD, and not 3 because I strongly dislike rechargeables and am all for standard, easy-to-find batteries. And I don't really need color screens on calculators.

Cristian

Re: Any DIY5 pics out there?

*Message #8 Posted by **Eric Smith** on 15 Dec 2011, 3:07 a.m.,*
in response to message #7 by Cristian Arezzini

The point of option 3, with the OLED display, isn't to make people that want a color display and rechargeable batteries happy. The point is that it costs a *lot* less than the high-quality monochrome LCD. And I really do mean a **lot**. The monochrome LCD costs over $45 each in quantity one, and not much less than that in quantity 1000.

Guess what a calculator has to sell for if has a $45 display. Hint: increasing the component cost of a product by $X usually increases the retail price by at least $3X, and more commonly by $4X.

This means that if the rest of the components in the calculator cost only $1, the retail price would still have to be over $135. Unfortunately, I can't get the rest of the components for $1, or anywhere close to that.

The OLED display, on the other hand, costs under $14 in quantity one.

If cost was not a concern, there is no question that I'd want the monochrome display. It looks absolutely beautiful. At the conference, people thought it was a static mockup until they saw the display change as I pressed the buttons.

In fact, the display looks even better in reality than it does in Richard's photo of the oblique view of the assembled DIY4X, because in that photo there was glare from the mylar covering the display. With a real production case, there won't be mylar over it. The top view with no overlay is closer to reality, if you mentally edit out the diagonal yellow stripes of the protective film. It's too bad that photo doesn't show the four-level stack or annunciators.

Note that this is a graphic display, 400x240 (about 173 dpi or 68 dpcm), showing an open-source font, Liberation Sans, which is derived from Bitstream Vera. This font was used because it was readily available and I was in quite a hurry to get it working in time for the conference, not because I think it is an ideal calculator font. The real -41 uses slashed zeros rather than dotted, and I would prefer that. Since it is a graphic display, you will be able to use any font you like, subject to only a few limitations.

in response to message #6 by Eric Smith

Eric,

Thanks a lot for your elaborate explanation. As Christian, I vote for option 2, for the same reasons. I look forward to see this baby progressing. Wish you all the best. If there's any support I can supply, don't hesitate to contact me.

Questions about need for MicroSD card

*Message #10 Posted by **Eric Smith** on 15 Dec 2011, 3:22 a.m.,*
in response to message #9 by Walter B

How strongly do you guys feel about needing the MicroSD slot, given that there will be a MicroUSB (device only) interface, allowing transferring your programs and data to/from a computer?

Would you feel that you needed the MicroSD slot if you had both the USB port, and some hardwired internal flash memory for program and data storage?

Re: Questions about need for MicroSD card

*Message #11 Posted by **Marcus von Cube, Germany** on 15 Dec 2011, 3:28 a.m.,*
in response to message #10 by Eric Smith

I don't like swapping cards much. What about Bluetooth or USB on the Go?

USB, Bluetooth

*Message #12 Posted by **Eric Smith** on 15 Dec 2011, 3:53 a.m.,*
in response to message #11 by Marcus von Cube, Germany

We can support USB device (for connection to a host PC), but the calculator cannot be a USB host because it cannot provide 5V at 100mA. To do OTG with "limited power sourcing" still requires at least 4.4V at 8mA, and even that is difficult and expensive for us to provide. Also, the OTG protocol introduced a whole lot of added complexity beyond the already absurd complexity of normal USB, and I don't have time to develop

firmware for that.

What is your proposed usage model for OTG? In other words, what other OTG device would you use with the calculator, and for what purpose?

I've considered Bluetooth as an optional module that could be inserted in the battery compartment, but I'm not convinced that it would be cost-effective. The new "Low-Energy Bluetooth" is appealing, but normal Bluetooth devices such as your existing laptop or cell phone do not support "Low-Energy Bluetooth", so there's a chicken-and-egg problem.

Re: USB, Bluetooth

*Message #13 Posted by **Marcus von Cube, Germany** on 15 Dec 2011, 9:46 a.m.,*
in response to message #12 by Eric Smith

I was thinking of connecting two calculators for data transfer via BT or USB. The same can be achieved with IrDA but modern devices lack the technology in favor of BT.

Re: Questions about need for MicroSD card

*Message #14 Posted by **Paul Dale** on 15 Dec 2011, 3:37 a.m.,*
in response to message #10 by Eric Smith

To me it will be a question of the available internal memory.

The user will want some of course. The firmware will need lots. With a MicroSD the space becomes effectively unlimited without it things are more constrained.

I'd expect a firmware image for a device like this to be much larger than for e.g. the 34S -- not so much for the actual mathematical support which needn't be a lot larger. Rather, all the other extras will consume space.

Fonts e.g. aren't small especially when they are a bit map on a high resolution display. I'd expect a couple of fonts will be required at least or a scalable font.

- Pauli

Re: Questions about need for MicroSD card

*Message #15 Posted by **Eric Smith** on 15 Dec 2011, 4:18 a.m.,*
in response to message #14 by Paul Dale

There will be one megabyte of flash in the microcontroller chip. Presumably any that isn't taken up by firmware (including fonts) can be used for user storage. The erase page size is 4KB and that endurance is 20,000 erase cycles per page. The programming current is 7mA in low-power mode.

What I'm proposing is that we could include some additional nonvolatile memory accessible over an SPI port. In the current DIY4 we have a 128KB FRAM, which is byte-writeable and has effectively no endurance limit. We could instead use a normal SPI flash part, or an SPI PCM (Phase Change Memory).

SPI flash memory costs about $1.40 for a 2MB part with 4K sectors and endurance of

10,000 cycles.

SPI PCM costs about $5 for 16MB, is written in 32-byte pages, and has an endurance of 1,000,000 writes per 32-byte page.

Flash uses up to 30mA, and PCM uses up to 50mA, so either is still enough to be a problem for coin cells, and would require the AAA battery option.

What I was trying to avoid was the need for AAA cells, but since internal flash or PCM would need AAA cells anyhow, it seems like having the MicroSD slot is probably the best option. I was really hoping to find an option that was workable with CR2032 coin cells, in order to have a very slim calculator, but after looking at the data sheets for representative nonvolatile memory chips it seems unlikely.

Re: Questions about need for MicroSD card

*Message #16 Posted by **Paul Dale** on 15 Dec 2011, 4:54 a.m.,*
in response to message #15 by Eric Smith

One megabyte of flash seems adequate but not copious. Assuming 128kb of available non-volatile RAM and 1Mb of flash, the flash disappears quickly:

- 128kb RAM backup -- this seems useful on the 34S with its 2kb of non-volatile RAM and would only be more useful with more RAM.
- 128kb fonts -- guessing here but a small vector font is in realm.
- 128kb or 256kb of user flash -- how much would people want? Don't answer all of it :-)

That's half and we've not started the firmware proper. The 34S firmware has had a lot of size optimisations made many of which really ought to be avoided in future and there are quite a few things I'd do differently a second time around. At a very minimum 256kb and likely more -- people always want more functions which use more space: integrated complex numbers, proper matrix support, units, real fractions, unlimited length integers, interval arithmetic, formulas, ...

Anyway, a built-in flash device seems unnecessary for user storage.

The ability to access a read-only flash device might still be useful. Firmware updates via SD card or even firmware on SD card freeing almost all the CPU's flash for the user. Just random ideas here now.

Is there a reason for not including a FRAM part for user storage? Is the current draw too high or the cost? Being able to drop down to a zero power standby state would be amazing.

This would also free up all the CPU's internal RAM to be volatile if desired. An amount of volatile RAM is really useful too -- the 34S makes very extensive use of this 4kb. A device with plenty of non-volatile RAM wouldn't need it but quite an amount could end up wasted for housekeeping tasks.

- Pauli

Re: Questions about need for MicroSD card

in response to message #16 by Paul Dale

> Quote:
>
> One megabyte of flash seems adequate but not copious.

It is *eight* times what you have now, and you're already complaining! :-)

> Quote:
>
> how much would people want? Don't answer all of it

Of course people don't want 100% of it. They want **300%** of it!

> Quote:
>
> Is there a reason for not including a FRAM part for user storage?

The density of FRAM is really low compared to other memory technologies, and the price is high. The current DIY4X has a 128KB FRAM which costs about $10. That same $10 can buy 16MB of flash or 32MB of PCM.

On the other hand, the FRAM does have a few advantages. It doesn't need to be erased in sectors like flash, it has effectively unlimited endurance, and it only requires 2.5 mA, so it can be used from coin cells.

The question is whether having 1MB of internal flash, 128KB of FRAM, and a USB port, would make it satisfactory to not have a MicroSD.

Re: Questions about need for MicroSD card

*Message #18 Posted by **Paul Dale** on 15 Dec 2011, 6:06 a.m.,*
in response to message #17 by Eric Smith

> Quote:
>
> It is *eight* times what you have now, and you're already complaining! :-)

Complaints are cheap and easy ;-)

With a pile more flash, we'd (the 34S triad) would give the user a lot more space, we'd not spend the huge amounts of effort trimming the code, we'd add more functions, ... It would be easy to double or quadruple the size of the current firmware -- still only half of the 1MB suggested which is lots of headroom for anything I can imagine a calculator being asked to do by its users.

> Quote:
>
> The question is whether having 1MB of internal flash, 128KB of FRAM, and a USB port, would make it satisfactory to not have a MicroSD.

A USB port is essential -- backups and upgrades demand this. Could a slave port be put to other use? No idea. But this one is easy to get out of the way. I/O is a must. Without USB, you have to have the SD or serial.

128KB of user (F)RAM is more than a 100x100 matrix or many tens of thousands of programming steps. Without a large library of routines like the 41CL can call on, I don't see this running out quickly. Then add flash backups and storage to further increase the capabilities. Thus, to my mind at least, 1MB/128kB has to be enough to avoid requiring any SD card, allowing the smaller form factor case.

More interesting, to me at least, would be 128KB of FRAM (almost all for the user) + 128KB of (sometimes battery backed) internal RAM (firmware) + 1MB of internal flash (user + firmware). There are housekeeping operations that will require extra storage. The 34S's main ones are some of the matrix operations and some of the statistical functions. We don't have compacting garbage collection which is a must on an always-on device. The 34S has twice as much volatile as non-volatile RAM and we're using it all or close enough to all of it.

- Pauli

Re: Questions about need for MicroSD card

*Message #19 Posted by **Eric Smith** on 15 Dec 2011, 6:26 a.m.,*
in response to message #18 by Paul Dale

The current plan definitely has USB (device only). No decision has been made on the serial port; the development units will have it but production might not.

The three main options under consideration are:

1. high quality monochrome LCD, USB device, no MicroSD, 128KB FRAM, two CR2032 coin cells, slim, hideously expensive
2. high quality monochrome LCD, USB device, MicroSD, two AAA cells, wedge shaped, hideously expensive
3. color OLED, USB device, MicroSD, lithium polymer rechargeable battery, slim, only moderately expensive

I can predict the response. Everyone wants "high quality monochrome LCD" and "only moderately expensive". Sorry, those two features are mutually exclusive due to the cost of the display.

Edited: 15 Dec 2011, 6:28 a.m.

Re: Questions about need for MicroSD card

*Message #20 Posted by **Paul Dale** on 15 Dec 2011, 6:38 a.m.,*
in response to message #19 by Eric Smith

I'd be happy with option 1, with this level of hardware the 42S can finally be topped as the best RPN keystroke programmable. As I mentioned, I feel that MicroSD is something that can be lived without.

I also quite like slim calculators :-)

Or option 4 (you knew it was coming):

colour OLED, USB device, no MicroSD, 128KB FRAM, lithium polymer rechargeable battery, slim, only moderately expensive.

Something must be impossible here :-)

- Pauli

Re: Questions about need for MicroSD card

*Message #21 Posted by **Eric Smith** on 15 Dec 2011, 6:53 a.m.,*
in response to message #20 by Paul Dale

I don't seen any technical or cost problem with your proposed option 4. I just question having expensive FRAM built-in when there's enough power to use cheap MicroSD cards.

Re: Questions about need for MicroSD card

Thanks for the clarification, of course you are right -- I'm not thinking entirely straight tonight.

- Pauli

RAM

*Message #23 Posted by **Eric Smith** on 15 Dec 2011, 6:30 a.m.,*
in response to message #18 by Paul Dale

The current DIY4X has 16KB of RAM, all of which is battery-backed (vs. 6KB with only 2KB battery-backed in the Atmel AT91SAM7L128).

The new ones (and any we retrofit) will have 128KB of RAM, all of which is battery-backed.

With either chip it is possible to turn off some of the RAM to save power, but the savings is so small that I haven't bothered to try it.

font memory

*Message #24 Posted by **Eric Smith** on 15 Dec 2011, 4:36 a.m.,*
in response to message #14 by Paul Dale

Right now the DIY4X has only 16KB of RAM, though the next ones we build (or the current ones if we retrofit them) will have 128KB of RAM.

Due to the 16KB RAM limit of the current calculator, I do NOT use a frame buffer in RAM for the display, as that would take about 12KB. The display contains its own internal memory, which cannot be read back. The display can only be written in increments of one full horizontal scan line (400 pixels).

The way my firmware works now is that any update to the display loops over the individual scan lines of the update area, render one line, and sends it to the display. An optimization would be to use DMA for the transfer to the display, and to start composing the next scanline while the current one is being transferred.

With the 128KB RAM, it would be possible to have a full display bitmap kept in RAM, but I don't think it's a good utilization of the memory, unless it is needed for graphing functions.

The current DIY4X firmware contains three sizes of the Deja Vu Sans Mono font. The large one used for the stack and alpha-mode displays contains a superset of the 41 character set, with a total of 116 glyphs. There is no compression, in order to keep display updates fast, so it uses 19KB of flash.

The tiny font used for the annunciators does not have the full set of glyphs, and occupies 1084 bytes of flash.

The third font in an intermediate size used only for showing debug messages, and occupies 2032 bytes of flash.

I don't think it is desirable to render a scalable font in the calculator due to both memory and performance constraints.

Re: font memory

*Message #25 Posted by **Paul Dale** on 15 Dec 2011, 5:02 a.m.,*
in response to message #24 by Eric Smith

Those font sizes are much better than I'd figured. Very easy to work withing those limits at least. The 34S's fonts are 122 bytes for the 7 segment characters and 2152 bytes for the two fonts. This represents a fair potion of available flash and the bitmaps are densely packed.

The 34S doesn't use a frame buffer either, in fact we use the LCD RAM as extra semi-volatile storage between keystrokes. The screen is regenerated after every user action and some commands. Given the space cost of a frame buffer, this seems like a sensible thing to continue.

Anyway, 1Mb of flash seems more than adequate.

- Pauli

Re: Questions about need for MicroSD card

*Message #26 Posted by **Bart (UK)** on 15 Dec 2011, 7:06 a.m.,*
in response to message #10 by Eric Smith

Personally I'd say dump the USB (it was not a Microsoft invention and therefore *even now* the support in MS operating systems is flaky).

Transferring/backup/upgrades via MicroSD is good. (SD is all I use on the 50G). These days PCs and laptops have SD slots as standard (Most take MicroSD, but SD converter cards are still relatively easy to come by).

Re: Any DIY5 pics out there?

*Message #27 Posted by **David Griffith** on 15 Dec 2011, 1:38 a.m.,*
in response to message #6 by Eric Smith

I like Option 2. Standard cells are much preferable to lithium ion packs and the problems they pose for replacement. A colour display might be nice for graphs, but for a calculator it's just not warranted. I'm definitely going to like the alternate 32s/20b/30b/32sii layout.

Battery size and life questions

in response to message #27 by David Griffith

How do you feel about AAA alkaline vs. CR2032 lithium coin cells?

In particular, ignoring the SD card issue, and all other things being equal, do you prefer a slimmer calculator with coin cells, or one with a more pronounced wedge shape with AAA cells?

How much does battery life enter into your preferences? Bearing in mind that more or larger cells result in a larger calculator, which would you prefer out of the following choices:

1. one CR2032 lithium coin cell, six month battery life
2. two CR2032 lithium coin cells, one year battery life
3. two AAA alkaline cells, two year battery life
4. three AAA alkaline cells, three year battery life
5. four AAA alkaline cells, four year battery life

[Note that the battery life figures listed are purely hypothetical, as battery life depends on how much you use the calculator. However, the ratios of battery life in the choices are a reasonable approximation, since a AAA alkaline cell stores roughly twice the energy of a CR2032 lithium coin cell.]

in response to message #28 by Eric Smith

Two 2032 cells with a replacement interval of one year is good. I wouldn't be bothered by the additional thickness required to accomodate AAA cells. Two AAA cells and two years of life is sufficient. More AAA cells would edge over into the realm of "too big". I carried around a big old TI85 since it came out. It would be good to have a powerhouse calculator in a smaller package.

Something else that may need consideration is what sort of non-volatile memory to use. It seems to me that programs are to be stored in flash memory. I think that's not prudent given the limited rewrite cycles of flash cells. I believe supercapacitors are small enough to provide enough juice to keep RAM alive while you change the batteries. This segues to the SD card issue. I'd prefer to keep my programs there instead of in a flash soldered to the calculator's PCB. That way I can pop in a new SD card if things get dodgy. I'm already dealing with this sort of problem with digital cameras. It should be very clear to all of us that we have a tendency like something and stick with it for a very long time. Otherwise we'd be posting at ticalc.org. Projects like this should be planned with this tendency in mind.

Option 2. CR2032 just doesn't have grunt to exploit high processor speeds for lengthly programmes.

Actually AAAA would be an option. I have heard they can be difficult to find, but for me they are available in my local Tesco store. Not only are they cheaper than CR2032, but still have longer life (~3x Ah, 1.5x Wh) and higher instant current drain capability (less than 1/30th internal resistance).

Another option is two N cells, giving 3V in the space of about one AAA cell, but probably still better performance than two CR2032.

Re: Battery size and life questions

*Message #31 Posted by **Eric Smith** on 15 Dec 2011, 10:48 a.m.,*
in response to message #30 by Bart (UK)

We're avoiding both AAAA and N because they are a lot more expensive at retail than AAA. By the time other industrial design considerations are taken into account, AAAA and N don't actually allow me to make the case much slimmer than with AAA.

Your Tesco store either has much lower prices on AAAA, or much higher prices on CR2032, than anything around here. We have CR2032 for less than the price of a AAA, but AAAA for much more than a AAA.

*Message #32 Posted by **Bart (UK)** on 15 Dec 2011, 12:12 p.m.,*
in response to message #31 by Eric Smith

AAA: pack of 4 for £2.00 (cheaper/cell in bigger packs)
AAAA: pack of 2 for £4.00 (haven't seen them in bigger packs)
N: pack of 2 for £4.00 (haven't seen them in bigger packs)
CR2032: pack of 2 for £4.00 (bigger packs only available on the internet)

On the face of it the N and AAAA cells are the same as the 2032's, but in reality two N or AAAA cells in series will still beat the pants off two 2032's in parallel (especially w.r.t. internal resistance, but also more capacity. In reality I think you will get more than double the life because of the significant lower drop in voltage at peak currents).

Addendum: Of course buying on the internet is much cheaper (but AAAA remain indeed reasonably expensive).

*Message #33 Posted by **Katie Wasserman** on 15 Dec 2011, 10:10 a.m.,*
in response to message #28 by Eric Smith

If you really want this to be DIY, a good compromise battery option exists. Power it from 2

or 3 AAAA sized cells that users obtain at low cost by opening up a 9 volt alkaline battery. The cells inside are not quite AAAA size but close enough to be interchangeable with store bought AAAA cells. They are around 600mAh and are under 8 mm in diameter. The advantage that these have over CR2032 is a much higher discharge rate without damage to the cell and will easily be able to power a microSD card. The advantage they have over AAA cells is that they are about 2.5mm less diameter.

There are 6 of them inside a 9 volt battery. Amazon sells Energizer 9 Volt industrial batteries for $0.83 each, that's under $0.14 per AAAA cell which makes them about the least expensive option. All you need is a needle nose pliers and 30 seconds of time to get at the cells.

DIY has just been the "code name". Don't read too much into it.

8.3mm max dia still requires more of a wedge shape than the 3.2mm max thickness coin cell, especially since the battery compartment design effectively requires two thicknesses of case plastic for cylindrical cells, while the coin cell only requires one.

*Message #36 Posted by **M. Joury** on 15 Dec 2011, 11:27 a.m.,*
in response to message #28 by Eric Smith

My personal preference would be option 3 or 4. It is more than just a matter of battery life for me. There is also the issue of having the correct cells available. I always have some AAA cells lying around but generally have to go out to buy CR2032's. I know that someone is going to say: "Well what's the bug deal if you only have to do it once a year"? There is some validity to that argument and I agree that it is not a big hardship, but personally I would still prefer the AAA cells. The added size and wedge shape don't concern me too much.

Cheers,

*Message #37 Posted by **David Hayden** on 15 Dec 2011, 4:50 p.m.,*
in response to message #28 by Eric Smith

Any of those options would be okay by me. In other words, if you can get 6 months of battery life out of it, I'd be happy.

I'd be more concerned with the affect on form factor of the different battery choices. Consider things like the balance and whether it can be comfortably held in one hand too.

Re: Battery size and life questions

*Message #38 Posted by **Eric Smith** on 15 Dec 2011, 8:47 p.m.,*
in response to message #37 by David Hayden

I was initially concerned about balance with two AAAs at the display end of the calculator. Two alkaline AAA cells together are about 23g, for a weight of less than an ounce. I did a very unscientific experiment of putting two AAAs in the display end of a calculator mockup, and didn't find it to be much of a problem. The HP-41 card reader was fairly heavy, and I don't recall much complaint about that. (But lots of complaints about how quickly it drained batteries.)

*Message #40 Posted by **Håkan Thörngren** on 15 Dec 2011, 7:42 a.m.,*
in response to message #6 by Eric Smith

Frequent recharging is highly undesirable. Standard rechargeables, like AAAs is what I would prefer. If it works one month or more with moderate use on 2 rechargeable AAAs I would be extremely pleased. One week between charges and heavy use would also be acceptable to me.

Some wedge shape is a small price to pay for standard batteries. If it also gives MicroSD, the better.

I vote for (2).

Put simply, I do not want to recharge often, and I do not want to go out to hunt for new batteries several times per year either.

I'm going to recommend against rechargeable AAA, for the same reason that most calculator vendors do, which is that you won't get much (if any) warning of battery low before it dies. We can set a reasonable battery low threshold voltage detection for alkaline, but not for NiMH or NiCd.

Re: Any DIY5 pics out there?

*Message #42 Posted by **M. Joury** on 15 Dec 2011, 11:33 a.m.,*

Option 2. For same reasons as I noted above plus I really like the convenience of a Micro SD card for backup and transferring data.

I am not as strongly anti-color/anti-rechargeable as some others. My one concern with that approach would be an easy way to replace the LiPo cell/battery when it gives out which is bound to happen eventually. I hate gadgets that make it hard or impossible to replace a warn out battery.

Cheers,

I agree with you completely. Unfortunately, there are good reasons why this is done.

If we did use a lithium polymer cell in the DIY5, we would state that it was not user-serviceable, and we would definitely not encourage end user replacement. However, for improved factory serviceability it would use a connector rather than being soldered in place. The case would use "security screws".

Having given an appropriate warning that the calculator is not user-serviceable, I'm certain that everyone would respect that warning, not buy themselves a set of security bits, not open their calculator, and not replace the lithium polymer cell.

Quote:

- With MicroSD card, two AAA alkaline cells, more wedge-shaped packaging to accomodate the AAAs at the display end
- With MicroSD card, color OLED display[**] instead of B&W, lithium polymer rechargeable battery, slim packaging [/ol]

I've grappled with this issue routinely as well. Having demountable storage seems really convenient. However one question to consider is whether demountable media really fits into a typical user's workflow. Demountable in the event of near-wearout may be all that is needed and in the case of 1e6 cycle endurance devices you may not even need to provide for this assuming a write to NV memory is a power-off event.

Accommodating the current draw of an SD card starts to push the device outside of a grab/use/drop/forget-till-next-time use model if that is your primary target. From personal experience I have more high power, high performance devices which require daily electron feeding than I really care to own. If demountable media is a must-have, SIM cards might be an alternative or even a similar custom design approach using chip scale EEPROM, etc.. assuming you can live within about 128KB capacity.

Concerning power source, if the footprint is extended to house common AAA cells, I don't think anyone will miss losing problematic CR2032s. But the impact to the form factor may be objectionable to some as they will likely contend for z-axis space with the display.

Quote:

[**] Oddly enough, the color OLED display is significantly *less* expensive than the black-and-white display.However, it sucks a lot of power, so I don't think it's practical without a rechargeable lithium polymer battery. Personally, I don't want to have to recharge my calculator frequently, so I prefer the black-and-white display and prefer to focus my development efforts on that.

As long as you're selecting from the cell/media handheld component supply pipe, everything is unnaturally cheap. But an illuminated display may be functional overkill for a calculator as whatever task you're using it to assist, itself normally requires illumination.

We've actually considered putting the MicroSD card slot in the battery compartment rather than exposed on the outside of the calculator. That would have the advantage of making it less likely for contamination to enter the calculator through the card slot, and less likely for the card to fall out unexpectedly and become lost. (I've had that happen with the 49g+ and 50g.)

On the other hand, it's less convenient if the user wants to routinely swap memory cards. I don't get the impression that many calculator users expect to swap cards frequently.

> Quote:
>

Although I briefly considered it, I don't think we want to use any kind of proprietary or uncommon removable media.

If we were to include a small (e.g., 128KB) built-in nonvolatile memory, it would almost certainly be FRAM, both to avoid endurance limitations and because FRAM requires very little energy to write compared to other nonvolatile memory technologies.

However, from a cost perspective, it is very difficult to justify including both a MicroSD slot and an internal FRAM. Similarly, although we'd like to include both USB and a serial port, we can't justify the cost, and we expect the majority of users to take advantage of USB, with only a small minority having any use for a serial port.

> Quote:
>
> Concerning power source, if the footprint is extended to house common AAA cells, I don't think anyone will miss losing problematic CR2032s. But the impact to the form factor may be objectionable to some as they will likely contend for z-axis space with the display.

I'm not sure which axis you're calling "z", but the plan is to put the AAA cells behind the display, as you look at the calculator from the front. Based on feedback received from questions asked months ago, and some of the comments in this thread, it seems that most people are willing to accept a wedge-shaped calculator to accommodate the batteries, but don't want a calculator that is significantly longer than the 42S/20b/30b case.

The current DIY4X with a 41-style keyboard is nearly as long as the 41 with a card reader. The only way to make it shorter is to ditch the graphic display, or tighten the keyboard row spacing. The 42S/20b/30b case has two fewer rows of keys, so it will be about the same length as the 42S.

What I personally don't like about the 42S/20b/30b case design is that it is too wide to comfortably operate one-handed, which is how I often use my 41. This is due to the keyboard having six columns rather than five, and there's no way to fix it other than reducing the keyboard column spacing. However, I haven't heard a single complaint about the width from anyone other than Richard and myself, so apparently this is a non-issue for the majority of potential customers.

According to Wikipedia, FRAM does indeed have cycle limitations. Maybe have a look at MRAM or PRAM?

Re: Any DIY5 pics out there?

*Message #50 Posted by **Eric Smith** on 16 Dec 2011, 11:30 a.m.,*
in response to message #49 by David Griffith

I would rely on the information in the manufacturer's data sheet on the part, rather than on Wikipedia. Wikipedia is correct that there are limits on the endurance, but that isn't the whole story.

The endurance specification for the part in question is 10^14 cycles, and you only access the FRAM when the user pokes the buttons on the calculator to tell it to do a read or write operation, the endurance is effectively unlimited.

Even if the user writes a user-code program that just beats on the FRAM mercilessly, 10^14 cycles is going to last a **very** long time. Just how long is left as an exercise for the reader.

MRAM in great. It's available in slightly higher density than FRAM, but also is more expensive. It uses a lot more energy to write, so it is less desirable for memory for a calculator.

Couldn't resist :-)...

Well, using my trusty HP-41CV...

At 10,000 writes per second the memory would last 317.09 years (if I did the math right). I'd say that for all intents and purposes that is unlimited.

Cheers,

-Marwan

With disposable batteries (vs. echargeable), it would require a significant change to the calculator power supply to be able to do that. Richard designed the power supply for very high efficiency in the normal mode of operation, which is going from battery voltage of 2.0-3.0V (or slightly higher with fresh alkaline cells) to 3.1V. We'd have to add a buck regulator to the board to deal with input voltage from USB, which is at least 4.4V, because we'd have to step that down. I'm reluctant to add the cost of another

regulator and associated components, but that's probably worthwhile enough to justify it.

There are combined buck-boost regulators, but the boost-mode efficiency isn't as good as our dedicated boost regulator.

I think that would be a given, as some return for piercing a hole in the enclosure to the outside world. I'm not particularly in love with USB, but it is so commonplace and inexpensive there really isn't any better choice for simple wired external power + communications in this class of device.

Unfortunately it is somewhat of a weak link in terms of reliability for device lifetimes expected here as the connectors are typically rated for a maximum 5K mating cycles assuming ideal conditions, considerably less otherwise. Perhaps a moulded silicone plug shield would be a reasonable option to consider.

On a different train of thought, I've kicked around the feasibility of avoiding external connections altogether, approaching an environmentally sealed enclosure. IR will get bits in/out however a simple ISM RF link will put less of a dent into the energy budget, have essentially no orientation issues, and avoid the need for IR window logistics in the enclosure.

Charging current can be induced by magnetic flux. PV cells are another possibility -- perhaps remote due to the logistics involved. However the concept of a calc sitting idle on the desk harvesting waste energy for later appeals to me. But even using primary cells is reasonable. Eg, in the case of cylindrical AAA cells it is relatively straightforward to create a battery well closed by a round plug/o-ring.

Re: Any DIY5 pics out there?

*Message #58 Posted by **Eric Smith** on 17 Dec 2011, 4:10 a.m.,*
in response to message #57 by uhmgawa

Powering the DIY5 from USB is most definitely NOT a given. It's a feature we'd like to have, but it's not as easy as one might imagine. We would have to either add a buck regulator and two schottky diodes, in addition to the boost regulator we use from the two AAA cells, or switch to using only a buck regulator with four AAA cells.

If we stick with the two AAA cells and add a buck regulator for USB, we introduce a schottky diode drop in the battery path, which takes away from the usable battery life.

The problem with using four AAA cells and only a buck regulator is that the buck regulator has to be on all of the time, even when the calculator is "off", because it

has to supply at least 1.85V to the processor to maintain memory and timekeeping. While some buck regulators have a "burst mode" for dealing with low-load conditions, the quiescent current is usually far too high. This afternoon we found a buck regulator that might do the job, but we'll have to evaluate it.

Now I've started to wonder what power supply chip(s) the 49g+ and 50g power supplies use, and why they switched from three AAAs to four.

in response to message #58 by Eric Smith

If you're expecting to get at least a year of calculation from two AAA cells, then powering the DIY5 externally doesn't sound very useful. Think about how often you need to change the batteries in a TV remote and recall that they typically don't have recharge jacks. USB should be for communication only. It would be nice to make the jack easily replacable if the need arises. Recessed and under a rubber plug sounds good.

Concealing the SD card in the battery compartment also sounds like a good idea. I don't anticipate swapping it around a lot. Maybe occasionally when loading a bunch of new programs. In any case, it should be removable without having to first remove the cells.

Re: Any DIY5 pics out there?

*Message #60 Posted by **Eric Smith** on 17 Dec 2011, 12:04 p.m.,*
in response to message #59 by David Griffith

A year from two AAA cells is based on assumptions that are not likely to be valid for all users. In particular, not for "power users". As I wrote when explaining the options, really only the relative lives of the different options were approximately accurate, and not the absolute times indicated.

The original plan with two AAA cells and USB was that the power from the USB would power the USB transceiver, but nothing else in the calculator, such as the processor. As I've described, the reason for that plan was the lack of suitably buck-boost regulators. However, there is a problem with that plan, which is that as long as the calculator is plugged into USB the main oscillator has to run at 48 MHz, so the power consumption is higher than usual. This means that using USB would significantly reduce the battery life.

I've described some of the alternatives previously, and we're now considering how to proceed.

I don't think we can make the USB receptacle "easily replaceable". It's soldered in, after all. The only products I can think of that have "easily replaceable" USB receptacles are USB host adapters (e.g., for PCI, CardBus, PCI Express, or ExpressCard), where they are replaced by replacing the entire host adapter.

We probably can't have the receptacle recessed or under a rubber plug, even though I agree that it's a good idea, because it complicates the industrial design too much. If we were experts at industrial design, or could afford to

hire people that were...

I wanted to put the SD card in the battery compartment, and would certainly prefer that it be replaceable without removing the AAA cells, but doing that requires an extra PCB, two connectors, and a flex jumper, which increase cost, decreases reliability, and makes it harder to do the industrial design.

Unless you have a need for efficient conversion off the usb power rail, a linear regulator can be used to drop the usb voltage. And rather than suffering the diode drop, a high side p-channel switch on the internal cell gated from the usb rail would disconnect the internal cell when usb power is present.

I suppose if you wanted to get fancy you could add an inductor (and free-wheeling diode to ground) between the p-channel switch and internal rechargeable cell(s), then PWM the gate to charge the internal cells via buck conversion. When usb power isn't present the inductor DC saturates and effectively won't cause a voltage drop.

> Quote:

This afternoon we found a buck regulator that might do the job, but we'll have to evaluate it.

I faced a similar issue with the prospect of 3V cores powered from the legacy voyager 4V5 button stack. The current draw of smps control circuitry is going to exceed that of a linear regulator at these current budgets. Using a low quiescent current linear regulator in tandem with a buck converter would have addressed the issue of data retention power. The SoC can perform the switch between linear and smps as needed for power on/off. The problem I had particular to my scenario was finding a linear regulator with a quiescent current comparable to a NUT in a powoff state in order to approximate the fabled decade+ shelf life a NUT leveraged from SR44s. No regulators really come close but TI has some IIRC with about a 1uA Iq. I believe since then I found a linear regulator from

Analog Devices which can best that.

When looking for a reliable USB connector, check female micro-usb (NOT mini-USB). With the female micro-USB being adopted as a standard charge input, high-reliability connectors are available. IIRC, the baseline is 15K cycles, and the 'springs' are on the male part (cable end) which is easily replaceable.

The plan is to use a Micro-B receptacle.

If we were going to support USB OTG, we'd use a Micro-AB receptacle. However, OTG presents too many challenges for our power management design, and for firmware development.

Power management for OTG would be easy if we used a rechargeable lithium-polymer cell, because there are single-chip solutions for that. Implementing OTG using primary cells is much more difficult, especially because we need very high efficiency.

Re: Any DIY5 pics out there?

If power is the only/major reason not to do OTG, leave power out but do the rest. In other words, you cannot call it OTG, but all functionality is present except for power. Then it is easy to use a special cable which activates OTG and supplies power to the USB device, or a special powered USB hub which activates OTG and does not need power from the host.

(I've seen reference to several devices which do this, but the only one I own is the HP TouchPad.)

in response to message #48 by Eric Smith

A quick check on the calc's in my desk drawer (HP, TI, Casio, Canon) shows that most have five columns of keys on the numeric keypad and six columns on the function keys above them. Almost all (including HP35s and WP34s ex HP20b) are between 76mm and 82mm wide, the exception being the very petite Casio FX-82 Solar (FX-260 in US) at 70mm without its slide-on case.
I've sometimes wondered if there is merit in having a slim calculator with coin cells for memory retention and hand-held use, with an AA-battery desk cradle giving a better viewing angle for desktop use. However AFAIK such an item has never been available, so maybe it's not so good an idea....

Defective HP-41CV for 41CL?

*Message #1 Posted by **Ernst Fueloep** on 12 Dec 2011, 8:59 a.m.*

I have a defective HP-41CV which is cosmetically in an excellent condition. But I have no idea why it is not working. When I insert new batteries the calculator immediately shows the following display and doesn't react on any key press:

Any ideas what may be wrong with this HP-41CV? Would this be a suitable unit for the HP-41CL upgrade? The S/N is 2236xxxxxxx.

Re: Defective HP-41CV for 41CL?

*Message #2 Posted by **Eric Smith** on 12 Dec 2011, 3:18 p.m.,*
in response to message #1 by Ernst Fueloep

Try executing the BEEP function. If it beeps, the logic board is probably fine, the problem is most likely with the flex circuit or zebra strip. If it doesn't BEEP, the problem could still be with the flex circuit, zebra strip, or logic board.

If only the logic board has failed, then it is a great candidate for the 41CL upgrade.

If the flex circuit or zebra strip has failed, they would have to be repaired or replaced before the 41CL would work.

Re: Defective HP-41CV for 41CL?

*Message #3 Posted by **db (martinez, ca.)** on 12 Dec 2011, 9:50 p.m.,*
in response to message #1 by Ernst Fueloep

41s sometimes make a screen full of crazy characters if you wiggle an IL cable when it's in the process of transferring info (this probably includes interrupting any I/O, such as a memory chip or dedicated printer). Letting it set for a half a year with no power will sometimes fix it, but: you NEED a donor and this looks like one. besides, the loco characters i'm talking about usually look more like japanese kangi.

Re: Defective HP-41CV for 41CL?

*Message #4 Posted by **Juergen Keller** on 13 Dec 2011, 12:57 a.m.,*
in response to message #1 by Ernst Fueloep

As it does not work properly, it makes sense to open and inspect it anyway. I haven't seen many 41s where the logic board was defective, my first guess is some kind of contact problem. Check for broken screw posts and check the zebra strip. Probably, the fix will be easy, and then the question is obsolete :-) Good luck!

OT: Cosine curio

*Message #1 Posted by **Bob Patton** on 11 Dec 2011, 5:17 p.m.*

```
     Laguerre cosine approximation
        Math history fun fact
I came across this some 50 years ago,
before calculators had trig keys.

It's good to about 4 significant digits for first quadrant,
and exact at 0, 45, 60, 90 degrees.

m = angle/90 for degrees or angle/pi/2 for radians

                  -m^2
 ( ---------------------------------- - 1)
   sqrt((-m^3 + 4m^2 -5m + 2)/3) + m

This can be expressed in linear form as:

-(((((((4-m)m-5)m+2)/3)^(1/2)+m)^(-1)mm)-1)

which can be keyed in directly on a simple chain-logic memory
calculator with a square root key and the ability to find the
reciprocal using some combination of / and = keys. Handle the
leading minus at the end, just mentally if necessary.

To test it, on a 12C, for angles in degrees:

90 / ENTER ENTER ENTER
4 x<>y - X 5 - X 2 + 3 / g-sqrt + 1/x  X X 1 - CHS
```

<*** End of File ***>

Re: OT: Cosine curio

*Message #2 Posted by **Crawl** on 11 Dec 2011, 9:23 p.m.,*
in response to message #1 by Bob Patton

It seems like the final 1 should be positive, not negative.

Re: OT: Cosine curio

*Message #3 Posted by **Namir** on 12 Dec 2011, 6:49 p.m.,*
in response to message #1 by Bob Patton

Interesting approximation! Can we enhance it now that we have tools like Matlab and Excel?

Crawl it right in pointing out that the trailing -1 in the first two equations should be +1.

Namir

Re: OT: Cosine curio

*Message #4 Posted by **C.Ret** on 13 Dec 2011, 5:45 a.m.,*
in response to message #1 by Bob Patton

Really interesting approximation.

As **Namir** and **Crawl** have already point out, there is a typo in the developed formulae only.

$$1-\frac{m^2}{m+\sqrt{\frac{2-5.m+4.m^2-m^3}{3}}}$$

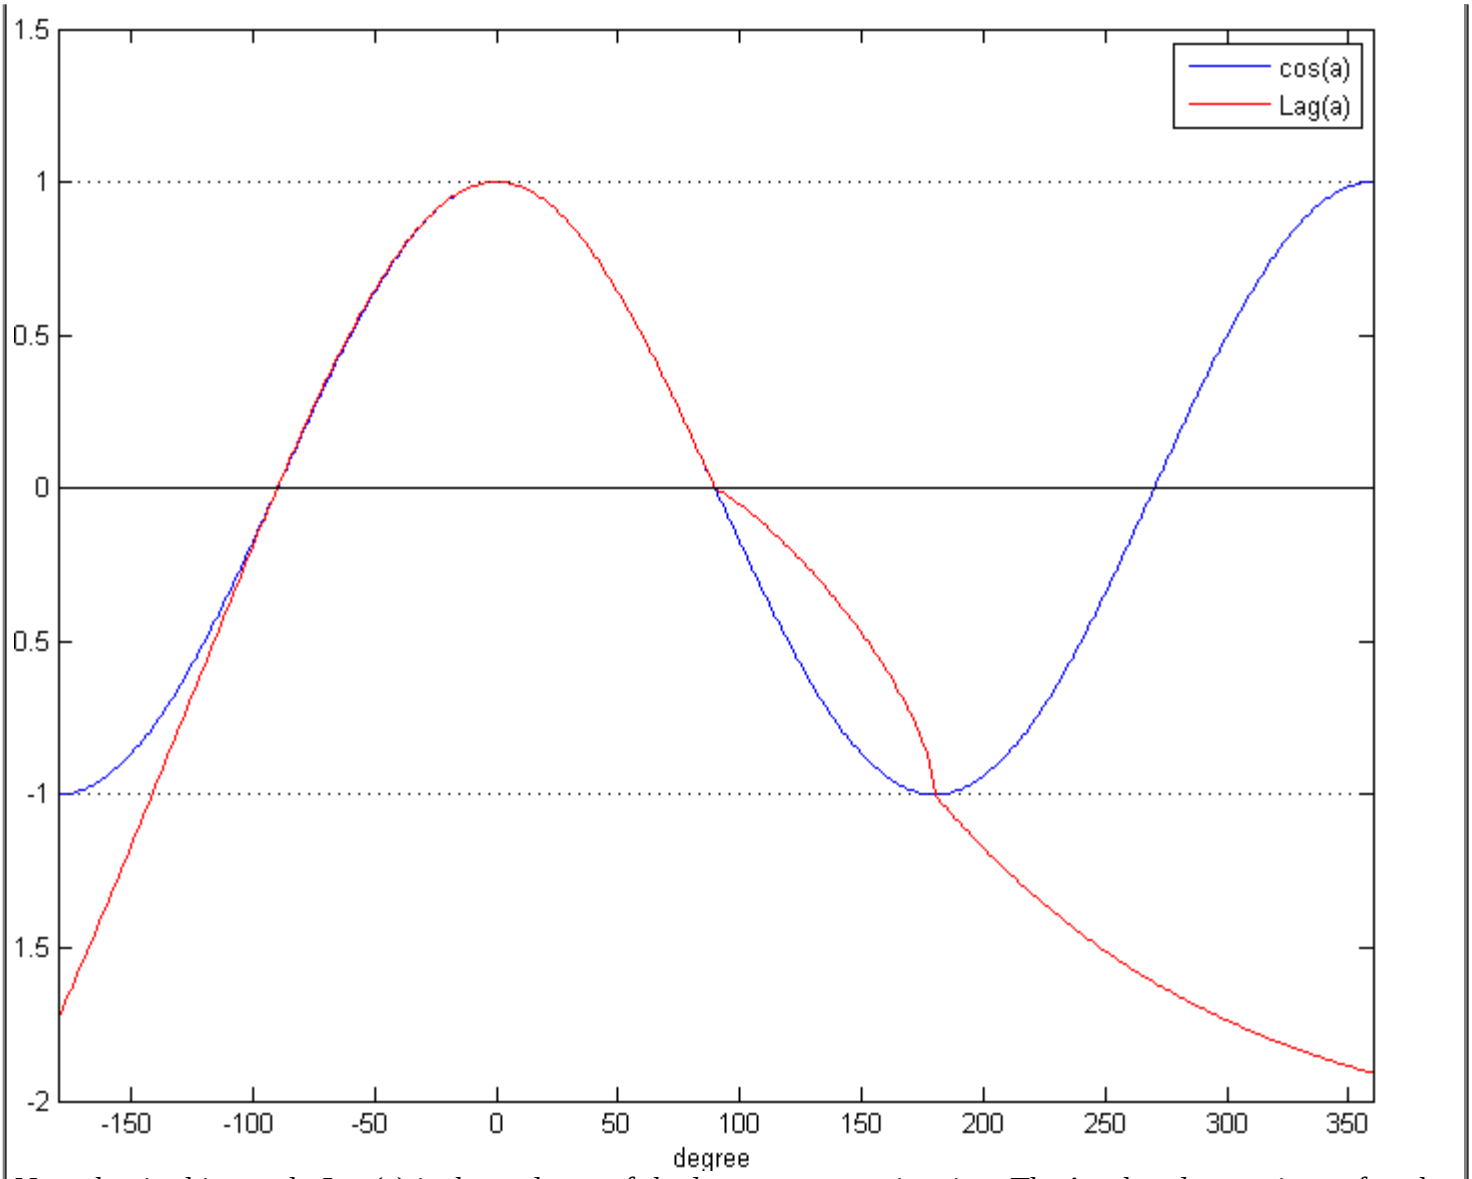
The linear formulea and the RPN instructions are all correct.

Using my HP-41C, I just test a few points to observe error between cosine and the Laguerre approximation (express in the following table as ppm

Angle(°)	m=a/90°	Laguerre(m)	Cos(a)	Error(ppm)	
-90	-1	0.0000000	0.0000000	0	
-45	-0.5	0.7124144	0.7071068	7506	
0	0	1.0000000	1.0000000	0	
10	1/9	0.9848786	0.9848078	72	
20	2/9	0.9398473	0.9396926	165	
30	1/3	0.8661695	0.8660254	166	
40	4/9	0.7660945	0.7660444	65	
45	0.5	0.7071068	0.7071068	0	
50	5/9	0.6427550	0.6427876	-50	
60	2/3	0.5000000	0.5000000	0	
70	7/9	0.3421859	0.3420201	484	
80	8/9	0.1739508	0.1736482	1742	
90	1	0.0000000	0.0000000	0	
120	4/3	-0.1927647	-0.5000000	-614471	!!!!!
135	1.5	-0.3203263	-0.7071068	-546	
145	1.6111	-0.4175237	-0.8191520	-490	
180	2	-1.0000000	-1.0000000	0	
225	2.5	n.a.r.v.	-0.7071068	nan	

As explain, in first quadrant, few error and exact value for same remarkable values are obtained.
No more approximation can be obtained after 180° due to the sign of the polynôme under the square root.

The following figure better illustrate accuracy and region of interest for this cosine approximation:



Note that in this graph, Lag(a) is the real part of the laguerre approximation. That's why plot continue after the 180° limit.

As **Namir** point it out, we can enhance this approximation, but not only in accuracy, other way may be to make it usable on a larger domain.

Look for a website which name is based on your calculator (two letters and two numbers) and with the top-level domain used for organizations. Google may help. Due to complex (legal) issues, it's not possible to post more detailed information here.

HP 15C Programming Tutorial Posted

*Message #1 Posted by **Eddie W. Shore** on 11 Dec 2011, 1:30 p.m.*

The latest installment: Part 14 (Complex Numbers)

Eddie's Calculator Blog

Re: HP 15C Programming Tutorial Posted

*Message #2 Posted by **Geir Isene** on 11 Dec 2011, 4:16 p.m.,*
in response to message #1 by Eddie W. Shore

Now that's a good and useful blog right there. Thanks.

Re: HP 15C Programming Tutorial Posted

*Message #3 Posted by **Thomas Klemm** on 14 Dec 2011, 12:40 p.m.,*
in response to message #1 by Eddie W. Shore

The comparison of the two methods to enter complex numbers confused me slightly because in the first example you start with a stack *[x y z t]*, enter *a* and *b* and end up with *[a+ib x y y]*, while in the second example you start with *[y z t ?]*. Why? I'd start with *[x y z t]* as well and end up with *[a+ib x y z]* instead.

As I always considered the stack as the interface to communicate with the calculator I don't esteem your solution to solve the quadratic equation much. You can do it without storing any numbers into registers. See message 2 in: Short quadratic solver (HP-15C)

To solve your first example you'd just enter the three coefficients of the quadratic equation and run the program:

```
2
ENTER
3
I
3
CHS
ENTER
4
CHS
I
2
Re<>Im
E
```

Both solutions are now on the stack. You can use *x<>y* and *(i)* to display them. Bonus: the same program can also be used for real coefficients.

Kind regards
Thomas

*Message #2 Posted by **robertoataulfo** on 11 Dec 2011, 10:51 a.m.,*
in response to message #1 by Don Shepherd

He did not show documentation (manuals)

Re: a bunch of brand new 71b's on Ebay

*Message #3 Posted by **Don Shepherd** on 11 Dec 2011, 11:03 a.m.,*
in response to message #2 by robertoataulfo

Yeah, you're right. From the size and appearance of the boxes, it appears to be like a shipment to a business who is buying a lot of these, rather than a retail package to be sold in a store, so maybe the manuals weren't part of the package. He says it only includes the calculator and the zipper case. Buyer beware.

Re: a bunch of brand new 71b's on Ebay

*Message #4 Posted by **Howard Owen** on 11 Dec 2011, 12:00 p.m.,*
in response to message #3 by Don Shepherd

The main photos show a bare bones 71B, but the photo below shows one with a card reader. Given the disclaimer, I'm betting the first photos are correct. Given that, and IMHO, these aren't worth $599.00, NIB or not.

Re: a bunch of brand new 71b's on Ebay

*Message #5 Posted by **Don Shepherd** on 11 Dec 2011, 12:58 p.m.,*
in response to message #4 by Howard Owen

Yeah, the photo below was obviously stolen from this site, the seller didn't even airbrush MoHPC out. What a jerk. I agree, I wouldn't pay that price for a NIB unit.

Re: a bunch of brand new 71b's on Ebay

*Message #6 Posted by **robertoataulfo** on 12 Dec 2011, 10:06 a.m.,*
in response to message #1 by Don Shepherd

71b with the documentation :-)

Re: a bunch of brand new 71b's on Ebay

*Message #7 Posted by **Howard Owen** on 12 Dec 2011, 1:41 p.m.,*
in response to message #6 by robertoataulfo

The translation Google comes up with contains a description that sounds like he's listing the things you can add to a 71B, particularly a Forth module and an HP-IL interface, but that those aren't actually included. If that's the case, then this is another outrageously priced machine. Even if those items were included, the price is still too high.

Re: a bunch of brand new 71b's on Ebay

*Message #8 Posted by **Thomas Radtke** on 12 Dec 2011, 2:01 p.m.,*
in response to message #7 by Howard Owen

The sentence where he mentions the Forth module isn't correct german. It makes no sense as it is.

The sentence where he mentions the HP-IL leaves it open if he lists something this machine could do (by adding something) or if this particular machine can do it. I think it's deliberately misleading.

I don't trust him.

41CL Usage Notes: Clock Mode and Turbo Interaction

*Message #1 Posted by **Craig Ruff** on 10 Dec 2011, 11:08 p.m.*

I noticed that the turbo mode is cleared if you enter clock mode with shift-ON, but not by executing CLOCK. The owner's manual states that shift-ON actually turns the calculator off briefly, but CLOCK does not. Displaying the CLOCK obviously doesn't need turbo mode, but if you don't remember this behavior you might wonder why things are running slowly after exiting the clock display mode.

Re: 41CL Usage Notes: Clock Mode and Turbo Interaction

*Message #2 Posted by **Ángel Martin** on 11 Dec 2011, 5:27 a.m.,*
in response to message #1 by Craig Ruff

Yes, that´s because turning the clock on involves a CALC_OFF event and it´s likely that the TURBO mode resets to default.

This is very easy to go around just by patching YFNS in the CALC_ON event to re-set TURBO50, as per Monte´s instructions in the CL manual.

HP70 - cosmetic side

*Message #1 Posted by **Alberto Fenini** on 10 Dec 2011, 8:09 a.m.*

DearAll,
I have had my first experience with the Tamiya TS-80 and I wanted to share the results.
At first I wanted to swap the keyboard plate with an old HP45. However, as it had been impossible toremove the lettering as opposite to when you DON'T want to remove the lettering and they fade away by simply cleaning the keyboardplate, I gave up and decided to keep the original plate.
This had been sand paper treated becuase of some badscratches that I wanted to remove, so the original appearance was a little changed.
With a flow of hot air (150 °C) I have removed the plate from the original shell.
This way I can restore the silver trim easier than with the plate installed and also, using the tamiya will require less protection.
I'm wondering is someone else has used the spray before, and if they are using the original can, a micro airbrush or just a brush.
Since I don't have a microairbrush, I have used botha brush (forget it ...) and the orginal can, on some old keyboard plates and plastic pieces.
It must be said it is not very easy, but I think there are two secrets : 1 stay at least at 40 cm away from the object you want to paint and 2 use VERY little spary i.e. push the cap very gently.
It may be obviuos, but to me it was not ....
I', attaching the results and any comment or suggestion to improve the tecnique will be very welcome
anejoy the weekend!!

OT: WebOS

*Message #1 Posted by **Katie Wasserman** on 9 Dec 2011, 10:44 p.m.*

HP plans to turn WebOS into an open-source project

I wonder if this signals a change in heart at HP and the way they will deal with software in the future. I don't know if this would ever affect the calculator group, but there are several computer systems where this policy would be appropriate. I'm thinking mainly of abandoned MPE/iX and some of the 9000 series systems.

Edited: 10 Dec 2011, 12:03 a.m. after one or more responses were posted

Re: OT: WebOS

*Message #2 Posted by **M. Joury** on 9 Dec 2011, 10:58 p.m.,*
in response to message #1 by Katie Wasserman

Thanks Katie,

I have been waiting to see what HP decided to do with WebOS. This might breathe new life into what could be a great OS with just a little bit of polishing.

Cheers,

-Marwan

anyone recognize these pics from old HP manuals?

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 9 Dec 2011, 9:10 p.m.*

Don Shepherd introduced this thread back in November. The pictures of attractive young women in high heels working with computers reminded me of the advertisements which appeared for the Osbornes. Those portable machines weighed about as much as a typical concrete block. The advertisements showed the women walking comfortably in high heels while carrying the Osborne in one hand. I always suspected that the pictures were posed with a carrying case with the computer innards removed.

Re: anyone recognize these pics from old HP manuals?

*Message #2 Posted by **Don Shepherd** on 10 Dec 2011, 1:28 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I don't think anyone actually identified which two HP manuals these pictures came from. Hint: they weren't calculator brochures.

Re: anyone recognize these pics from old HP manuals?

*Message #3 Posted by **Eric Smith** on 10 Dec 2011, 3:06 a.m.,*
in response to message #2 by Don Shepherd

I don't know which specific manuals, but I've definitely seen the photos in documentation regarding the 21xx family minicomputers (2114/2115/2116, or 2100, or somewhat less likely, the 21MX M/E/F series). I'm guessing that they're from some of the paperback handbooks.

*Message #4 Posted by **Matthias Wehrli** on 12 Dec 2011, 5:11 p.m.,*
in response to message #1 by Keith Midson

Also for me, 2-3 very nice units are in your collection. Keep them save or let me know ;)

Re: On-line collection updated

*Message #5 Posted by **Keith Midson** on 13 Dec 2011, 4:13 a.m.,*
in response to message #4 by Matthias Wehrli

Thank you Johnny, Jose and Matthias. I have two HP rarities on their way to me (thanks Juergen and Bruce!) as well as one unusual HP - so the collection is always expanding and will be continuously updated.
I am also trying to find the right glass display cabinets so that I can display them at the office. At the moment they are mostly hidden in a cabinet (apart from a few items in my glass bookshelf behind my desk

and my favorite HP's that stay on my desk and get daily use).
Cheers, Keith

Keith,

If you find a nice display case avaiable generally (through Internet or retail purchase and not just a one-off from some store closing), please post here. I'm looking for one as well.

What I'd REALLY like to find is a low-profile wall-mount one (like a picture frame, maybe a tad deeper) that's suitable for, say, a dozen Voyagers and a couple Woodstocks.

Yeah, I know, I should just go buy some Plexiglas and glue and get busy sawing and gluing. But I want it to look good... I've seen pictures of what some of you have built -- and I KNOW my fabrication skills are nowhere near what's needed to do the same!

Dale

Most framing shops should be able to fabricate something like that for you.

Do a google/yahoo search on "acrylic (wall) display cases"

I found this . Prices are around $200 for 5 to 7 shelves.

*Message #9 Posted by **Keith Midson** on 13 Dec 2011, 7:05 p.m.,*
in response to message #6 by Dale Reed

Hi Dale,
Yes I will let everyone know when I find something. I've thought about IKEA display cabinets - but i'm really after something solid with some wood. I remember a similar thread a year or so ago - Katie Wasserman showed her collection in some excellent cabinets (and I can't find the thread). I

was after something similar to that.
I do like the acrylic display cabinets in Dave's post - that might be an easier and cheaper solution for now.
Cheers, Keith

*Message #10 Posted by **Katie Wasserman** on 13 Dec 2011, 10:43 p.m.,*
in response to message #9 by Keith Midson

Here's a really old thread on this topic.

I should probably post some more up-to-date pictures of my collection but the cases are still the same: 2 small ones and two large ones, two sets of drawers containing manuals and accessories. I use some IKEA shelving for the large desktop machines I have (HP-9810, HP-9815, HP-46, HP-81 and a bunch of non-HP machines.)

15c LEs Replaced

*Message #1 Posted by **Gerry Schultz** on 9 Dec 2011, 1:53 p.m.*

I just received my replacement 15C LEs for the two I had given to HP to evaluate at the last HHC. The original units had bad keys. These new units are S/N 13841 and S/N 13802. Their firmware version is 2011-04-15 which is still current I believe but I'll check with my other units.

Merry Christmas,

Gerry

in response to message #1 by Gerry Schultz

It's the same firmware.

Re: 15c LEs Replaced

*Message #3 Posted by **Michael de Estrada** on 9 Dec 2011, 4:56 p.m.,*
in response to message #1 by Gerry Schultz

Glad to hear it. It looks like they scrapped the original production past LE number 03000, and started a new production run with 13000. What are your serial numbers ? That will give an indication of when they were produced. Do the keys feel any different on the new ones ? Are the f (yellow) and g (blue) shift keys loose or do they rattle ?

Re: 15c LEs Replaced

*Message #4 Posted by **Gerry Schultz** on 9 Dec 2011, 6:18 p.m.,*
in response to message #3 by Michael de Estrada

The serial numbers are 13802 and 13841. There's also a second tag on each unit, CNA1410BK0 and CNA1410BK3 in the upper right of the back of the units. If they are part numbers, I would think they should be the same, but they're not. The two units look and act identical. What do these numbers mean?

Gerry

P.S. I forgot to mention that the keys feel the same as the first batch of 15C LEs including the f and g keys which wobble a bit, but that doesn't bother me.

Edited: 9 Dec 2011, 8:56 p.m. after one or more responses were posted

Re: 15c LEs Replaced

*Message #5 Posted by **Michael de Estrada** on 9 Dec 2011, 6:54 p.m.,*

in response to message #4 by Gerry Schultz

Those are the true serial numbers. The CNA is the factory code, the first number is the last digit of the year (2011), the next two digits is the week number (41) in which they were manufactured. So, they were bother manufactued in the 41st week of 2011, which would be mid October. The last four digits are lot codes. The Limited Edition numbers are not serial numbers.

The serial numbers for the original production units that I bought all indicated manufacturing dates in the 31st or 32nd week of 2011, which was in August.

Edited: 9 Dec 2011, 7:08 p.m.

Re: 15c LEs Replaced

*Message #6 Posted by **Jeff Kearns** on 9 Dec 2011, 8:04 p.m.,*
in response to message #5 by Michael de Estrada

My LE Number is 02720 with Manufacturing Part Number (actual serial number...?) of CNA 1310L1B. Therefore, it was made in the 31st week of 2011.

The unit, with the exception of the slightly wonky shift keys, seems fine. What are the chances that it has as yet undiscovered faulty keys or some other problem, being part of the original batch? Would the firmware version of all LE units released to date - old and new - be 2011-04-15? How can I tell? Where is the Checksum indicated? I take it replacement units have the PSE bug also.

My very first HP calculator was a 15C S/N 2237AXXXXX. This new one is very fast - e.g. Valentin's third double integral example in his "Long Live the HP-34C !" article (a must have like all of his other articles), takes some 17 minutes on the 34C and not much faster on an original 15C, but computes to at least 6 significant digits in a mere 6 seconds on the 15C LE.

The HP 15C is, in my humble opinion, the best pure RPN calculator, with all functions readily accessible from the keyboard, ever made.

Re: 15c LEs Replaced

*Message #7 Posted by **Michael de Estrada** on 9 Dec 2011, 8:18 p.m.,*
in response to message #6 by Jeff Kearns

The firmware date and checksum are indicated by running the second self-test, i.e. calc off g ENTER ON then release ON g ENTER, then press 2 followed by any key repeatedly until you return to the main menu, then ON to exit and turn the calc OFF. You can also test the keyboard by pressing 3 in the main menu, and then pressing every key in any order at least once to turn off all segments on the display. If your keyboard works properly, then it's unlikely you'll have any problems. Mine has worked perfectly for 3 months now, and I've used it nearly daily.

in response to message #4 by Ignazio Cara (Italy)

(pictures are large enough, when using the galery view), so everything seems to be fine :)

Re: Another Red Dot for sale

*Message #6 Posted by **Michael de Estrada** on 9 Dec 2011, 9:00 a.m.,*
in response to message #4 by Ignazio Cara (Italy)

Hi Ignazio,

Hate to be picky, but the original ac adapter is a 03502A, not 35002A. Looking at the enlarged photo in the listing, the model number on the ac adapter appears to be 82002A, which was a later model for the ac adapter. In fact, when I bought my HP 35 Version 3 in mid 1973, it came with that charger that looks the same as the earlier model and was made in the USA. I agree that the calculator looks authentic, as do the other accessories including the hard travel case.

Regards,

Michael

HP-15C Zebra

*Message #1 Posted by **aj04062** on 8 Dec 2011, 7:19 p.m.*

I have a 1982 HP15C that seems to have a problematic zebra strip. I think I diagnosed this as the problem after powering up the display/cpu module disconnected from the keyboard. The symptoms are the same as when it is assembled in the unit.

I thought I had it solved when I substituted a strip from a similar vintage 12C I have. The 15C came to life, passed the keyboard test, etc. However, after sitting a bit, the same symptoms came back.
Does anyone else have experience curing issues like this? If it helps, I can post pictures.

Edited: 8 Dec 2011, 7:19 p.m.

in response to message #1 by aj04062

Did you also clean the contacts on both the circuit board and LCD with a good quality circuit board cleaner ?. It could also come down to pressure, maybe you need a little more pressure to squish the zebra a little more - just a thought!!

Cheers, John

> Does anyone else have experience curing issues like this?

One of the problems with the legacy voyager lcd glass design is the lack of a vertical zebra retainer/stabilizer which makes (re)assembly a bit of a challenge. Unless the zebras are located near normal to the pcb before compression, they tend to distort and potentially buckle to varying extents which will lead to intermittent or even failed connections. This is aggravated by the fact the stainless compression frame fingers need to be sprung apart to seat into the pcb mounting holes. In the process of doing so the display tends to move around and the zebras along with it.

Eyeball the glass from either extreme side, sighting under the glass along the zebra length. If the zebra is flexed outward where it mates with the pcb, you can push it back normal by carefully pushing under the stainless frame along the length of the zebra, where and as needed. If it flexes inward that is much less fun, but you

could try to pull it outward into alignment with a taut music wire or preferably a thin metallic strip which will have far greater rigidity in the needed direction.

If you need to fish under the display to coax the zebras into position, you'll also need to navigate around the two alignment studs which pass through the pcb.

Re: HP-15C Zebra

*Message #4 Posted by **aj04062** on 9 Dec 2011, 12:53 p.m.,*
in response to message #3 by uhmgawa

When I initially fixed this unit, it was the little short zebra from the keyboard the LCD unit that seemed to be the problem.

I did clean with alcohol, but will look for other contact/pcb cleaner. Do you think a pencil eraser is good enough or should I use something else?

I'll look to see if I can insert something between the flex pcb and the zebra to get better contact.

Edited: 9 Dec 2011, 12:55 p.m.

Ah, I see. I thought you were referring to the lcd zebras.

You can try buzzing out continuity between the key matrix and the CPU. I haven't done so but I'd expect somewhere in the few k-ohm range for a zebra contact pad-to-pad. The zebra resistance needs to be low enough to overcome the parasitic key matrix capacitance seen by the ~55KHz scan with enough noise margin for reliable operation. A scope on a row input of a pressed key position would confirm this.

It has been a while since I had an early voyager apart but IIRC the flex zebra contacts were gold plated. I'm not sure what type of foreign contamination may exist in your case but I'd avoid losing any of the gold plating as that will remove the copper pad oxidation barrier.

I was always a bit mystified by the construction of the early voyagers given a separate pcb for display and silicon requiring yet another zebra connect to the key matrix pcb. I usually cringe when the cost reduction madmen arrive with hacksaws. But in this case it is an absolute improvement by any measure.

Completely unresponsive calculator. It will display "c eef c".

Interestingly, I left the batteries out since I started this thread. I just installed to take a picture and it is working fine again. I ran keyboard and self test and they both pass.

I tried shorting the terminals before and that didn't cure it in the past, if you are thinking to discharge the capacitor.

> Quote:
>
> Completely unresponsive calculator. It will display "c eef c".

Hopefully it wont, but if it does get into that state again you might leave it be to determine if the ~10 minute display timeout occurs as that doesn't require CPU/program intervention.

Yet I'd suspect an intermittent joint on the display/cpu board as a cause of that symptom. Although admittedly I've never actually seen an early vintage 15c of that construction, but only a 16c and 12c. In those cases neither the board nor surrounding frame had provisions for a 15c's additional r2d2.

A picture would be interesting if you have reason to open it up again.

+1 - as I have seen several flex circuit units with fractured soldering, the most recent, a 15C.

OT: Nasa's Voyager 1 in 'cosmic purgatory' on verge of entering Milky Way

*Message #1 Posted by **Egan Ford** on 8 Dec 2011, 5:08 p.m.*

http://www.telegraph.co.uk/science/space/8940350/Nasas-Voyager-1-in-cosmic-purgatory-on-verge-of-entering-Milky-Way.html

At HHC we were told that the Saturn processor was named as such because Voyager was on it's was to Saturn.

> Quote:
>
> The Voyagers have enough power and fuel to operate until at least 2020.

I'll wager that all my Voyagers (10C-16C, sans 11C) will still be going strong by 2020.

It'll be interesting to see which Voyager line lasts longer. The original or the 12C.

Re: OT: Nasa's Voyager 1 in 'cosmic purgatory' on verge of entering Milky Way

*Message #2 Posted by **Valentin Albillo** on 9 Dec 2011, 5:00 a.m.,*
in response to message #1 by Egan Ford

> Quote:

> http://www.telegraph.co.uk/science/space/8940350/Nasas-Voyager-1-in-cosmic-purgatory-on-verge-of-entering-Milky-Way.html

About *"entering the Milky Way"*, a couple' observations:

1. Both Voyagers, as well as our whole planet, inhabitants,and machines, already *are* in the Milky Way, i.e., our very own galaxy, so they can hardly be *"entering"* it. As for *"exiting"* it, that would be indeed groundbreaking news.

2. Much has been said about the Voyagers being on the verge of *"leaving the solar system"* and such, and while that's technically correct for a certain definition of the limits of the solar system let's not forget that once they do they will still be about 15 or 20 light-*hours* from the Sun but about 4 light-*years* from the nearest star or solar system, i.e., not that far from home at all. Plotted to scale on a regular sheet of paper their locations would still fall right on top of the Sun's.

Best regards from V.

Just a reporter's attempt at a catchy headline ;-)

NASA's Voyager site puts it better: heading for "interstellar space", which I assume translates to "that area of space outside any noticeable influence[1] of stars (e.g. our own sun)"

[1] However "noticeable influence" may be defined ;-).

Re: OT: Nasa's Voyager 1 in 'cosmic purgatory' on verge of entering Milky Way

> [1] However "noticeable influence" may be defined ;-).

Hehe, true.

I wonder if we'll ever retrieve them in the future, to be displayed at the Smithsonian's or some other museum.

That would preclude they eventually being found and examined by aliens, which would actually be positive if only to avoid embarrasment at aliens writhing their gonopods in stupor when finding a large *analog* record which must be physically made to slowly rotate while scratching its surface with a needle (!!) in order to retrieve meager amounts of info stored there, instead of a small non-mechanical chip stuffed with large amounts of electronically-retrievable *digital* data.

How uncannily primitive civilization ! ... XD

Best regards from V.

Re: OT: Nasa's Voyager 1 in 'cosmic purgatory' on verge of entering Milky Way

*Message #5 Posted by **Cristian Arezzini** on 9 Dec 2011, 6:56 a.m.,*
in response to message #4 by Valentin Albillo

> Quote:
>
> How uncannily primitive civilization ! ... XD

Well... I know this is all "tongue-in-cheek" but, there are a few points:
- I would suppose that even the most advanced (for us) digital chip would still be considered way primitive by the aliens;
- Digital would be much more difficult to "extract information" from - though I suppose they would figure out the pinouts and communications protocol of the chip;
- The analog record is MUCH more durable! Ad damage-resistant. What if a the aliens' idea of a

safe, low-voltage battery, is 5000 VDC?
- The more primitive the technology, the more durable and easy to fix it is - consider: an abacus, a Curta, an HP-35, an iPod. Which would last more? Which would be easiest to figure out and eventually to fix?

:)

Cristian

*Message #6 Posted by **Howard Owen** on 9 Dec 2011, 11:46 a.m.,*
in response to message #5 by Cristian Arezzini

Assuming aliens knew about propagation of sound through a medium, they would probably recognize the grooves in a "vinyl" (It's actually titanium or something) disk as being an analog of said propagation. Once that was understood, "reading" the information wouldn't necessarily have to involve needles or scratching of any sort. Figuring out the function of a digital memory might take them a couple of, um, heartbeats longer.

41CX-MCODE: Digit Sum function

*Message #1 Posted by **Ángel Martin** on 8 Dec 2011, 5:05 p.m.*

So who said the 41 was an outdated platform? Here's a tidbit that may make you think it twice:-

Since I didn´t find any routine to calculate the digit sum I took upon writing one myself - here's the deceptively simple code for a CX environment - may you enjoy it as much as I do !

```
087     "G"
009     "I"
004     "D"
04E     "Sigma"
0F8     READ 3(X)
00E     A=0 ALL
39C     PT= 0
33C     RCR 1
3C6     RSHFC S&X
3C6     RSHFC S&X
146     A=A+C S&X       value to convert in A[S&X]
3DC     PT=PT+1
0D4     ?PT= 10
3D3     JNC -06 [NEXTD]
17D     ?NC GO  CX-only!!
0C6     ->315F  [ATOX20]
```

Best, 'AM

Hi Angel, I have been a FOCAL programmer for a long time; however your solutions and challenges on HP-41 MCODE as well as being a proud owner of a HP-41CL and a NoVRAM-64 got me very interested in getting into HP-41 MCODE, and explore the further potentials of the HP-41 beyond FOCAL. How can I write this code you provided into a HP-41? I would appreciate. Thanks, Kerem

Easiest way is to buy an HP 41CL ! :-)

Re: 41CX-MCODE: Digit Sum function

*Message #4 Posted by **Juergen Keller** on 8 Dec 2011, 5:32 p.m.,*
in response to message #3 by gene wright

He already got one. And a NoVRAM-64, too, which can emulate HEPAX and thus is perfect for getting into MCODE.

Re: 41CX-MCODE: Digit Sum function

*Message #5 Posted by **Juergen Keller** on 8 Dec 2011, 5:30 p.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

There are many ways to do that. I would recommend to have a look at the famous and exciting HEPAX module. The manuals are available on TOS; the second part contains information about MCODE.

If you don't know what TOS means google for 'HP-41 archive'. Why TOS is used in this forum is another story ...

Re: 41CX-MCODE: Digit Sum function

*Message #6 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 8 Dec 2011, 5:56 p.m.,*
in response to message #5 by Juergen Keller

Thanks for the pointers, and yes I do have a 41CL (thanks to Monte!) and NoVRAM-64(receving soon, thanks to Diego!). I will read the HEPAX module documentation on MCODE and try it first on my HP41 emulator (i41CX) which has the HEPAX module capability, see what will it take to enter Angel's code in my HP-41. I never though I would be going into MCODE, but now with all the available hardware, software and the knowledge base, seems like a great way to explore HP-41 beyond FOCAL and Syntetic.

41CL and NoVRAM...

*Message #7 Posted by **gene wright** on 8 Dec 2011, 6:20 p.m.,*
in response to message #6 by Kerem Kapkin (Silicon Valley, CA)

I believe there are some issues with the NoVRAM 64 and the 41CL.

certain NoVRAMs do not work properly?

Re: 41CL and NoVRAM...

*Message #8 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 8 Dec 2011, 6:40 p.m.,*
in response to message #7 by gene wright

I received heads up that NoVRAM-64 may not work properly on the 41CL which is OK, because I was able to replace the dead CPU board on my HP-41C with the CL to give it a new and improved life while my 41CV will be receiving the NoVRAM-64 module (awaiting delivery). 41CL provides everything I need, memory, speed, modules and much more, while NoVRAM gives me HEPAX and MEMORY and module/program transferability on my HP-41CV. I don’t see the need to use CL and NoVRAM together, except the idea of using NoVRAM with USB programmer to download programs and modules and later transfer them to the 41CL (didn’t get the serial port with this one).

My first try to plug in a Nov64 into the 41CL rendered pure chaos. I had "YFNZ" in Page 8 because I wanted to use the HPIL. But somehow the HEPAX system of the Nov64 doesn't like Page 8 to be occupied by somewhat else because it expects to get HEPAX RAM into there. Well, this may be also true for the real HEPAX module, but I have no chance to check this. To make things work in the 41CL, I accommodated YFNZ into Page E (PLUG4L). In the Nov64 Pages E and F have to be free so that there is no conflict with YFNZ of the 41 CL and the HEPAX OS (HEPAX 1D) of the Nov64 gets the chance to instal itself into Page F.

in response to message #9 by Frido Bohn

The Real HEPAX module re-allocates itself to the lowest available port upon each CALC_ON event. This includes pages 5,6 and 8, - as well of course as the "outside" ports.

Here is the mail I sent to "Monte's 20" after I get back home (a few of weeks ago) and tested with my own 41CL:

Hi there,

I just get back home a couple of days ago. Yesterday night finally get my 41CL comfortably installed into a donor CV housing and start some Clonix/NoV's compatibility test.

Good to know that Clonix has been proven useful to move pages to/from 41CL's. Sorry about the serial programmer issue Geoff (they're known not to work with laptops.)

I've tested, Clonix-41 and Clonix-D and they both work as expected. Tested NoV-64 -ver.08r- and it also works as it should. I remember some users reported NoV-64 issues when plugged into 41CL's, please contact me to diagnose the trouble.

Also tested NoVRAM and NoV-32, and they DOES NOT work. Occasionaly, when using an older NoVRAM software version it turns up and seemed to work, but it is not a stable situation whatsoever and trends to crash.

Of course, I'll check the NoVRAM and NoV-32 code in order to find a suitable solution as soon as I can.

Tests have been performed with 41CL "out-of-the-box" (-YFSN 1A) no mods or upgrades.

All the best from the Canary Islands.

When using NoV it assumes port 1 or 2, therefore page 8 *must* be free for proper operation.

I've also tested Real Adv. HEPAX placed into port 2 and another ROM into port 1 and the 41 doesn't turn on or crashes.

As stated above, NoVRAM and NoV-32 are not compatible with CL at the moment, and I'm seeking the causes for this issue.

My best wishes for the upcoming Xmas season.

Diego.

I recommend to check for Section 12 in Vol. 2 of the HEPAX Module manuals. There, the development of an own ROM is explained step by step. Especially the sub-section "Example of a user-developed ROM" was very helpful for me. If you want to dive deeper into MCODE an ultimate must is Ken Emery's "MCODE for Beginners"!

Re: 41CX-MCODE: Digit Sum function

*Message #13 Posted by **Ángel Martin** on 9 Dec 2011, 2:20 a.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

I´d say the HEPAX is the only thing you need. Its image is available on the CL so you´re all set - can use the NoVO on your other machine if you want, that's what I also do.

Using HEXEDIT it´s just a few keystrokes away, directly on the HEPAX RAM - also available in the CL library.

The CLUTILS ROM (also included) has HEPCL, a function to setup the HEPAX in the CL, it will PLUG the ROM in page B and 4 HEPAX RAM blocks in pages C-F.

For the new revision of CLUTILS I have prepared two versions of HEPCL, one setting up 16k of HRAM, the other only 8k. Also have a mini-HPX routine that sets up only 4k, perfect for testing and quick checking of things. Let me know if you'd need any of these as well.

Make sure your batteries are fresh!

Re: 41CX-MCODE: Digit Sum function

*Message #14 Posted by **Ángel Martin** on 9 Dec 2011, 2:30 a.m.,*
in response to message #13 by Ángel Martin

Here's the mini-HPX routine - it plugs the HPX ROM in page A and the HRAM in page B so the layout takes up port 2, a minimal footprint.

```
Mini-HEPAX:
port #2, id#="C"
```

```
1       LBL "HPX4"
2       TURBO50
3       "0B9>808"
4       AVIEW
5       YMCPY
6       "808000-000C"
7       YPOKE
8       "808-RAM"
9       PLUG2U
10      "HEPX"
11      PLUG2L
12      HEPDIR
13      END
```

Unfortunately neither page 6 or 7 support bank-switching - so the HEPAX ROM must be in the "upper space" - I use page 7 for the AMC/OSX module (my tweak of the CCD/OSX, itself a CCD derivative), an absolute must.

By calculating "the digit sum", did you mean computing the sum of all the digits of a decimal number?

For instance, are you expecting that 123.509 return twenty?

> Quote:
>
> here's the deceptively simple code for a CX environment - may you enjoy it as much as I do !

I only own an HP-41C with two memory modules, but no other exotic modules that are in question here. I have no clue at all about what your code is doing and how it is doing it !! But, I really enjoy if I may learn it!

"forces you to slow down"?? My high-school typing teacher typed 80-90wpm on a manual typewriter in the 1970's! I'm hardly over half that much on the PC keyboard. There's some validity however to the part about not just writing the first thing that comes to mind; because I don't think in a good order to communicate, so it's nice to be able to keep move things around and insert and delete sentences, phrases, and paragraphs.

slowing down

*Message #3 Posted by **Frank Boehm (Germany)** on 8 Dec 2011, 8:16 a.m.,*
in response to message #2 by Garth Wilson

We had to use "vintage" teletyping machines at the army which had a "lockup" function when typing more than 50(?) characters per minute. That was really annoying, as you just couldn't type as fast as you could, instead it was a good idea to just only use one finger to slow you down. (Funny sidenote: We had to do a typing exam to reach at least 100 characters per minute. I made a bet with our instructor, that I'd pass with over 200 characters using only 2 fingers. I came out with 215...<g>)

> "forces you to slow down"?? My high-school typing teacher typed 80-90wpm on a manual typewriter in the 1970's! I'm hardly over half that much on the PC keyboard.

I took a year of typing in high school in 1944. The best that I could manage was about fifty wpm, but that was after subtracting five wpm for each error that I made. The girls who were in the secretarial sequence typicaally managed eighty wpm. In typing class we had to touch type as the typewriters did not have letters on the keys.

I still have the Smith Corona portable that I purchased in 1947 at the University of Minnesota. I haven't used it in years. I also have a Coronamatic 2200 that I purchased in about 1980. It's advantages over the older mechanical machine were (1) because it was electric each character appeared with the same intensity (2) it had four keys which cooulod be replaced to provide a limited capability to do scientific symbols.

Others in this thread have addressed longevity. I still have the Simpson Midgettester that was provided by Honeywell to field engineers in the late 1950's. It still works but I have replaced the test leads many times. The test leads screwed into the tester. Thatt was a real advanttage when working on aircraft on the flight line. If you dropped the tester you could rescue it by holding onto the test leads.

in response to message #1 by Egan Ford

I've not followed the link yet (I can't from this computer) but it's an interesting coicidence as my 10-yo daughter just asked for a mechanical typewriter for her birthday.

I've written a couple of letters with this and it certainly leads to a more considered style of writing. My analogy would be like going back to a film camera from digital. The resulting output isn't necessarily any better or worse but you have to think about it a bit more which may be a good thing.

Hello, vintage technology lovers,

It's not only a personal kind of living or working. It's a kind of society changement. New technologies allow a lot of people doing things, which they were unable to do in former times. It's a kind of going on more democracy. But it seems although become true, the quality of the products become lower and lower.

For example a lot of people can publish with the help of the internet. But the quality of enormous bunch of written articles...

I can remember working for a large engineering firm that had a floor devoted to a typing pool. For reports and proposals we would hand write a draft and then "submit" it to the typing pool where it would be entered into the typing schedule. Since it might take several days before being typed, we spent a lot of time making sure our first draft was as close to final as possible. There never was enough time to allow for more

than two passes through the typing pool. The result was a very well thought out first draft and final report.

Later on when we switched to local word processing, we saw a lot of sloppy reports due to the fact that the thinking was "just put something on paper - it can always be cleaned up". Of course it's hard to clean something up if the original thought process was bad.

*Message #9 Posted by **Don Shepherd** on 8 Dec 2011, 10:21 a.m.,*
in response to message #8 by Bill (Smithville, NJ)

I think it is worth noting that the motto of one of the most successful computer companies in the world, IBM, is "Think".

The original manual on the programming language BASIC, at Dartmouth College in 1964, contains this sentence: "Typing is no substitute for thinking."

As a teacher, "thinking" is what I teach. I introduce principles and concepts and want my students to use their brains to understand these things, and experiment. It is through experimenting and thinking that learning really occurs.

I've been called a Luddite (I wear that badge proudly) regarding programmers who let the compiler catch their errors, and I cringe a bit every time I notice a programmer writing code but not testing it. In my mind, the programmer's job is not done until he or she thoroughly tests their code, and I don't necessarily mean by using an automated testing system either, although I do support those if used in support of other testing.

> I think it is worth noting that the motto of one of the most successful computer companies in the world, IBM, is "Think".

Exactly!

During my first summer of college, I worked for the radio shop of the Jefferson Proving Grounds in Madison, IN. This was a army amunition testing base but staffed mainly by civilians. Barney (my Boss) was a great believer in thinking before doing. We had to install radios in various army trucks, cars, jeeps, and tanks. He would have us spend many hours (sometimes days) reviewing how we were going to mount the radio, run the wiring, etc, before we ever started the work. The result was always a beautiful installation with no errors or rework being required.

Barney's work method of thinking it all out first has stayed with me. His favorite expression has also stuck with me: "I cut it off twice, but it's still too short."

Hi Martin,

It was a very interesting place to work. We'd be working on a transceiver, doing a little bit of soldering, and the warning whistle would sound. We would freeze, wait for the big gun to go off, wait for the lights to stop swinging, and then go back to soldering. This would happen several times a day. Great fun.

Was it from the AN/VRC-12 (-43 to -49) series (RT-246/VRC, RT-524/VRC, R-442/VRC)? That is a vehicular tactical low-band VHF-FM set (30 to 76 MHz).

The U.S. AN/VRC-12 series is an amazing and likely the best example of extremely long service life for a complex and very widely deployed (with U.S. and allied military forces) set of electronics. It was first issued in 1961, and was not retired in U.S. service until 2008. That's a service life of **47 years**! The only major life-span alteration was introduction in the mid-1960s of silicon transistors in the A-models in place of germanium transistors in the original models. Never was an IC or uP to be found anywhere in it.

I know of nothing electronic anywhere, military or civilian, that equals this record. None of our favorite HP calculators come close.

in response to message #14 by Mike Morrow

Hi Mike,

We used standard police VHF radios, Motorola Motrac with the remote control head. The tanks were the most fun to try to fit them into.

A funny sidenote: Barney wanted to have air conditioning; so he went on a campagn shutting down the repeaters, wait for the complaints to roll in, and then tell them that the excessive heat was causing them to shutdown. After about three weeks of this, a crew showed up, partitioned off the transmitters from the work space and installed a massive air conditioning unit on the transnmitter side of the partition. It ran full blast - no controls - and could keep the space, with the transmitters running full time, in the 60-65 deg F range. Barney quickly brought in some lawn chairs and we took our work breaks in comfort.

That mini-documentary was shot by Jason Scott on his new equipment that he will be using to film three feature-length documentaries: Arcade, Tape, and 6502. I am most excited about 6502 followed by Tape (as in tape backup). You may want to checkout his other two completed documentaries: BBS and Get Lamp. The former needs no introduction. The later is a documentary about interactive fiction and text adventures. Both are very well done and have great interviews.

Very interesting. For me, there was a subtext of how change is understood differently by those who lived through it compared to those who simply see it in retrospect.

And the mechanical device. No batteries or circuits to corrode. Still working fine after 50 years.

They actually do. Best politics within Europe is swiss made.

Unfortunately, you'll have similar prices all over the continent.

Doing beta tests for HP?

Joking. Of course, even including postage and custom fees, HPs are much cheaper to come by this way. My last three HP calculators were all from the U.S. I wonder when or if european dealers will do a reality check.

Re: HP-15C LE available in Switzerland

*Message #5 Posted by **Christoph Giesselink** on 8 Dec 2011, 2:00 p.m.,*
in response to message #4 by Thomas Radtke

Sorry, I could not confirm that self importing of a HP-15C LE is cheaper than the

149.00 SFR -> ~ 122 EUR

Price at hpcalc.org

HP15C $95 + Shipping per Priority Mail $34 = $129 -> ~ 98 EUR

For the German import you have to pay 19% import sales/purchases tax ->

98 EUR * 1.19 tax = 116.40 EUR

The last time, when got a caluctor from the US over FedEx I had to pay additional 7 EUR fee for the import sales/purchases tax handling.

So total 116.40 EUR + 7.00 EUR = 123.40 EUR !

That's no option, especially not for the case of a warranty problem (all keyboard problems already solved?) here in Germany. A warranty case is IMHO equal to a total financial loss.

Of course you could not compare, but in Germany a HP-50G costs

HP-50G 113.95 EUR + shipping 4.95 EUR = 118.90 EUR !

with no probems in a warranty case.

So I'm glad that I bought a new 15C in 1987 for 250 DM.

Christoph

*Message #6 Posted by **Juergen Keller** on 8 Dec 2011, 2:13 p.m.,*
in response to message #5 by Christoph Giesselink

I bought 5 HP-15C LE calculators from the US, one for me and 4 for colleagues. Price including shipping and custom taxes was around EUR 120.-; not really cheaper than buying it now in Switzerland. However, the reason was that I didn't wanted to wait. Furthermore, I wasn't even sure if the 15C LE find its way to Switzerland.

I also noticed this when a coworker got his 50g, and it's quite tempting to get one. However, the 35s in 2007 and later the 20b with help of a kind forum member were also cheaper to get in the U.S., allthough I don't remember the exact figures.

Re: HP-15C LE available in Switzerland

*Message #9 Posted by **Christoph Giesselink** on 8 Dec 2011, 5:29 p.m.,*
in response to message #8 by Thomas Radtke

Sorry for another disagreeing. It may be cheaper when you buy more than one calculator to save money for shipping.

Here's the 35S example:

hpcalc.org:

HP-35S $56 + Priority Mail shipping $31 = $87 -> ~66 EUR

With import sales/purchaches tax 66 EUR * 1.19 = ~79 EUR

In Germany at www.dynatech.de:

HP-35S 44.40 EUR + shipping 4.95 EUR = 49.35 EUR

Next let us compare the calculator price only:

hpcalc.org: $56 -> ~42.50 EUR * 1.19 tax = 50.60 EUR

vs.

www.dynatech.de 44.40 EUR

The calculator only example for the 20B:

hpcalc.org: $35 -> 26.60 EUR * 1.19 tax = 31.60 EUR

vs.

www.dynatech.de 33.30 EUR

The only reason IMHO for buying the 15C LE in the US is: you can get the 15C LE in the US only.

Regards

Christoph

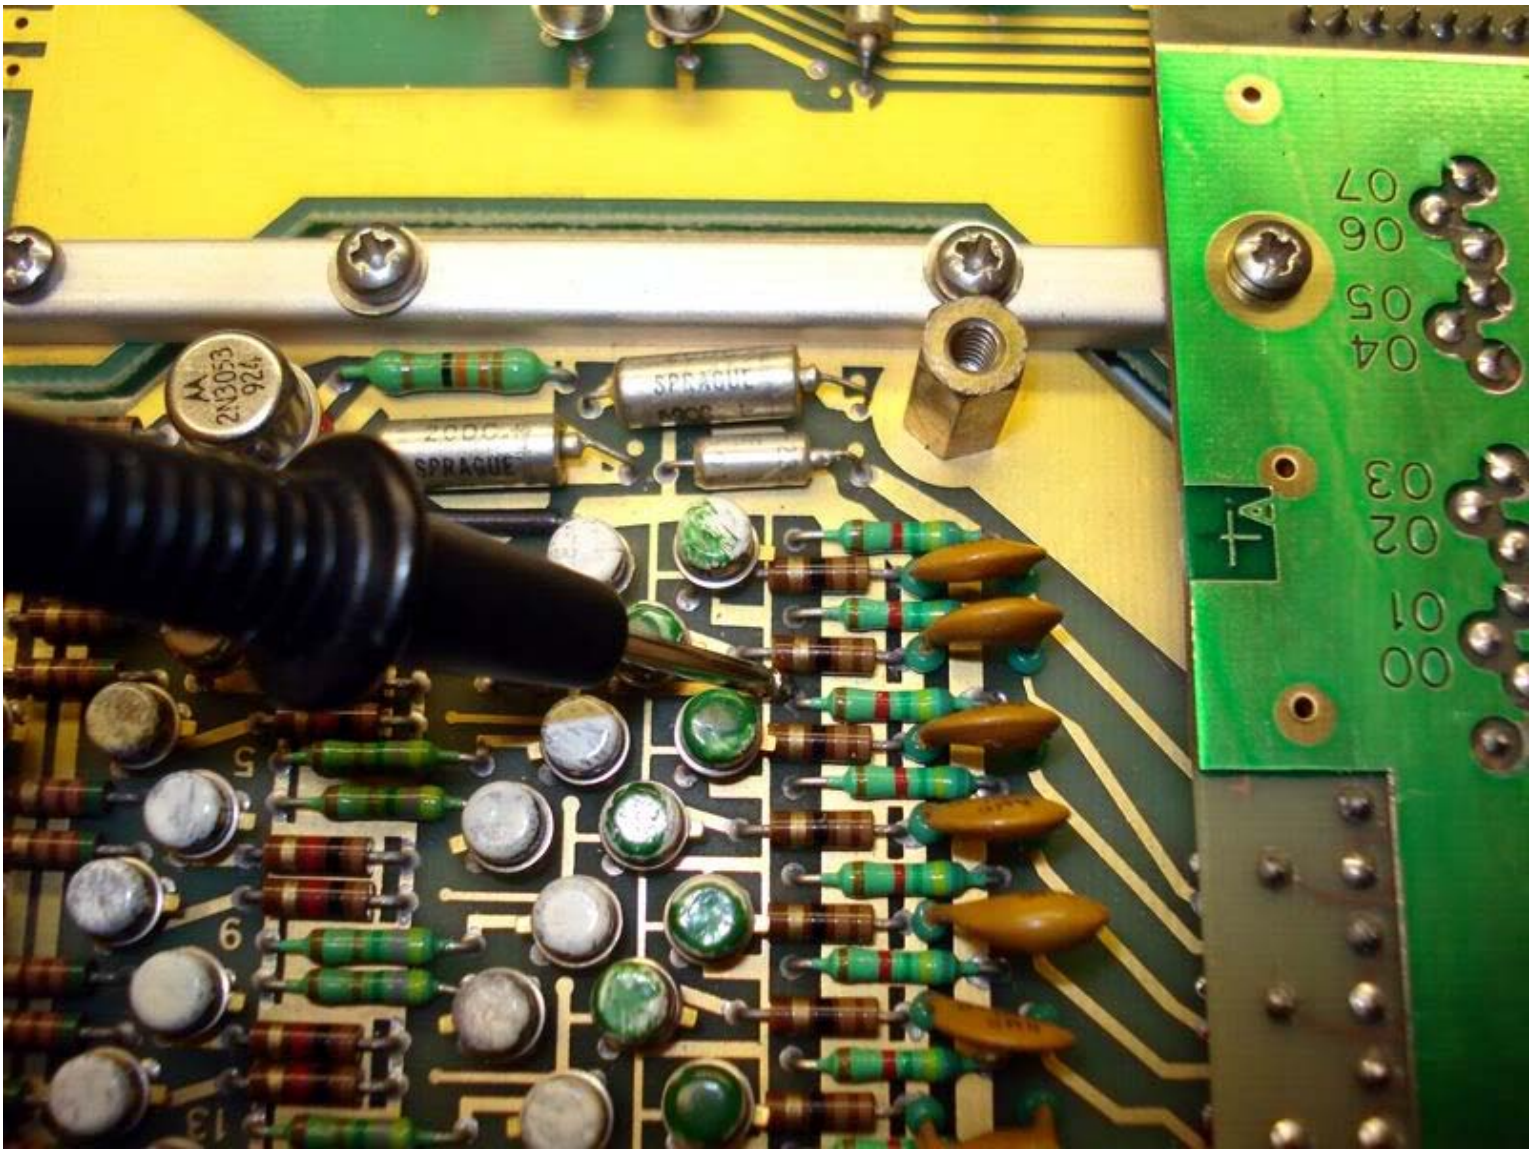
9100A with no display now working!

*Message #1 Posted by **Richard Wilder** on 7 Dec 2011, 12:29 a.m.*

This is the 9100A I posted about about a year ago. It was DOA at the time and I've been working on it on and off ever since. (Katie this is the one my son bought from Aristotle.) To make a long story short I replaced some generic transistors that the previous owner had installed with NOS correct HP parts and eventually traced the problem down to two open resistors in two ROM sense amp circuits - one on the odd side and one on the even side. It would have been impossible to locate the problem without Tony's incredible schematics! Thanks Tony!



The card reader had no issues and reads & writes without error.

The plotter platen surface had de-laminated and stretched. I peeled it off and cleaned off the old adhesive. I was able to find a perfect (imho) replacement piece of material at a car custom graphics shop. After cleaning the contact rails and linear potentiometers with some DeoxIt the plotter is back to 100% functional. The 43 year old pens are dried up but the plotter went through the steps of plotting a sine wave.

My son will be posting these on eBay on Thursday (12/8.)

in response to message #4 by David Ramsey

> Quote:
>
> And where in the world would one find NOS correct HP transistors?

Hi Dave, I got the 1854-0354 transistors that were the output transistors on the braided core board from http://www.etestparts.com/. I've also ordered NOS parts from http://www.sphere.bc.ca/test/hpparts.html. BTW Sphere has a nice cross reference list on that link of hundreds of HP transistors & diodes. Turns out there was no x-ref listed for the 1854-0354 parts I needed. Keep in mind the abreviated marking HP used on these parts: These transistors are marked "4-354" which is really part number "1854-0354"

Not a good idea IMO to remove CLalpha from the keyboard and replace it by CLP. :-(
How often will you need a CLP compared with a CLalpha?

But if you really keep this 'improvement' (?), then it would be a good idea if CLalpha would still be

available as [h]CLx at least when being in alpha-mode!

> Not a good idea IMO to remove CLalpha from the keyboard and replace it by CLP. :-(How often will you need a CLP compared with a CLalpha?

Yeah, I was a bit puzzled by that too. I have to use CLalpha before pretty much every alpha command when programming. CLP is something that can be in a catalog somewhere.

Re: WP 34S keyboard update

*Message #10 Posted by **Marcus von Cube, Germany** on 8 Dec 2011, 9:24 a.m.,*
in response to message #8 by fhub

In alpha mode you get CLalpha from the same key.

Oh, very nice! Good idea.

Re: WP 34S keyboard update

*Message #12 Posted by **Marcus von Cube, Germany** on 8 Dec 2011, 10:38 a.m.,*
in response to message #11 by Dominic Richens

I mean "You get CLalpha from the CLx key" of course.

Re: WP 34S keyboard update

*Message #13 Posted by **Jeff O.** on 8 Dec 2011, 10:49 a.m.,*
in response to message #12 by Marcus von Cube, Germany

What about in program mode? In my mind, that is where CLalpha gets repeated use as mentioned by Dominic previously. Must you first enter alpha mode (by pressing f ENTER) before entering CLalpha by pressing h <-? My guess is yes, since Clx is also needed frequently. Four keystrokes to enter this command may prove to be an inconvenience to some users.

Re: WP 34S keyboard update

*Message #14 Posted by **Marcus von Cube, Germany** on 8 Dec 2011, 11:02 a.m.,*
in response to message #13 by Jeff O.

Jeff, you will typically do CLalpha just prior to entering some alpha text, so you need to go to alpha mode only once. All the alpha commands are only available from within alpha mode, so this is consistent behavior.

Re: WP 34S keyboard update

*Message #15 Posted by **Jeff O.** on 8 Dec 2011, 12:59 p.m.,*
in response to message #14 by Marcus von Cube, Germany

Yes, I suppose that the majority of the time, a CLalpha will be followed by alpha entry. If not, well, it's just two extra keystrokes. Wait, I think it will be three extra, since you must press ENTER to end alpha mode, but no matter, it will probably not wear out my fingers.

Re: WP 34S keyboard update

*Message #16 Posted by **Dominic Richens** on 8 Dec 2011, 1:38 p.m.,*
in response to message #15 by Jeff O.

Unless I'm mistaken, CLalpha is only really needed in program mode.

It's the same number of keystrokes - you just go into alpha mode to do CLalpha rather than immediately after. When you go to enter your alpha, you are already in alpha mode.

Try it out rev 2000 of wp34sgui.exe

Re: WP 34S keyboard update

All alpha commands are really only useful in program mode.

- Pauli

Re: WP 34S keyboard update

*Message #18 Posted by **Jeff O.** on 10 Dec 2011, 1:17 p.m.,*
in response to message #17 by Paul Dale

I agree that CLalpha is primarily useful in program mode, and that most of the time, it will be executed immediately prior to entering alpha data, so there will not be any extra keystrokes needed. My point is that on the occasion (see below for example) that a CLalpha is used in a program and not immediately followed by alpha entry, it will take

three extra keystrokes as compared to v2.2 build 1950.

```

I see the <(and)> for scrolling binary numbers are still on the same key (with different modifiers). Would you please consider having them on separate keys? It would be a lot easier to use. I would be willing to sacrifice the base 8 function (which I think is not that much used these days)

I remember having seen this request already many times in the past, but I really don't understand what's the problem with these keys!?

If you have a long binary number you usually scroll in **one** direction to see all digits, and not back and forward all the time. And if you want indeed scroll back in the other direction, then why would it be 'easier' (?) to do it with the same prefix [f] and an other key instead of an other prefix [g] and the same key?
Sorry but I don't get it ...

And BTW I think it's quite logical to put together (on one key) what belongs together.

Edited: 8 Dec 2011, 5:47 a.m.

When it comes to keys for navigation, I think it's not very logical to put these on the same key. I think the only reason they are on the same key is because of a lack of available keys, which is fair enough I guess.

I also think it is common to scroll back and forth when you're looking at a long binary number, at least I do that when I'm looking at some kind of binary protocol that I want to understand. The advantage with having them on different keys is that you can keep the modifier key pressed while you scroll back and forth with the arrow keys.

Another related wish that I think I mentioned before, is to only display 8 bits at a time in base 2 mode to make it easier to know which byte within the whole number you are looking at.

Re: WP 34S keyboard update

in response to message #26 by Paul Dale

I vote for 8 digits at a time which is two thirds of our display. So you always see half of the previous information. If we add fixed delimiters to give the eyes something to rest on, things improve further.

I've done this just for binary mode to play around with and see if it is helpful or not.

Re: WP 34S keyboard update

Something like a decimal point at every byte delimiter? Or some extra character using the 7-segment?

Re: WP 34S keyboard update

*Message #29 Posted by **Marcus von Cube, Germany** on 9 Dec 2011, 7:14 a.m.,*
in response to message #28 by Cristian Arezzini

We are discussing (and implementing) options. Currently, the display of separators follows the decimal mode settings. Windowing is dependent on this mode setting (12 without separators, 8 or 9 depending on base with separators displayed.)

You can use h dot to toggle the separator display in integer mode. The changed setting carries over to decimal mode which might be a bit unexpected because you need to go to MODE to change it again. I might update the behavior to use a separate setting in integer mode.

EDIT: The two flags are now being kept apart. The command names have changed from E3ON/OFF to SEPON/OFF because the digit grouping is no longer fixed at 3.

ON+dot to change the radix mark is gone for good. It was redundant anyway.

Edited: 9 Dec 2011, 7:47 a.m.

in response to message #30 by Walter B

Nice! I love "live update" menus!

Really liking the new layout and catalog organization. I don't need matrix functionality but I'm already thinking of sourcing an HP-30b to be ready for when I can get a V3.0 overlay.

Have you guys thought about moving BestF, LinF, ExpF, etc.. to the MODE menu since they modify a setting? Or maybe resurrect the CFIT and replace ./, with it?

Re: WP 34S keyboard update (2)

HP-41 Card reader 82104A

*Message #1 Posted by **aj04062** on 6 Dec 2011, 6:55 p.m.*

Can anyone elaborate on the technique to get the I/O cover off the case? The Service Manual on TOS leaves me wondering how to exactly do this.

I am trying to troubleshoot two card readers I have, one does not read cards (Checksum and Card Error messages) and the other appears to have a bad ROM as it is not even recognized with CAT 2.

I hope I can make 1 good from both or does anyone have parts?

Re: HP-41 Card reader 82104A

*Message #2 Posted by **Raymond Wiker** on 7 Dec 2011, 12:52 a.m.,*
in response to message #1 by aj04062

When I repaired my card reader a few months back, I used three different "recipes" for the work:

http://www.hpmuseum.org/guest/hoskins/41crfix.pdf

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=57

http://www.pmgeiser.ch/calc/index.php?id=HP82104A

Re: HP-41 Card reader 82104A

*Message #3 Posted by **aj04062** on 7 Dec 2011, 12:40 p.m.,*
in response to message #2 by Raymond Wiker

Thanks, but none of these demonstrate how to get the I/O Port Cover off.

I need to take all the boards out as there is either a bad ROM or other component that is preventing the card reader from getting power.

Re: HP-41 Card reader 82104A

*Message #4 Posted by **Ignazio Cara (Italy)** on 7 Dec 2011, 1:43 p.m.,*
in response to message #3 by aj04062

Hi Adam, if I have understood well, you need to take apart the cover of the I/O contact in a 82104A card reader. Take a look at these image:

Hope this can help you.

Regards

Ignazio

Re: HP-41 Card reader 82104A

*Message #5 Posted by **aj04062** on 7 Dec 2011, 9:51 p.m.,*
in response to message #4 by Ignazio Cara (Italy)

YES,

That's what I was wondering, where was it attached??

Thanks Ignazio!

Re: HP-41 Card reader 82104A

*Message #6 Posted by **Ignazio Cara (Italy)** on 8 Dec 2011, 4:59 a.m.,*
in response to message #5 by aj04062

Sorry Adam, but I've not understood your question. Can you reformulate the answer? The I/O cover must slide on and off the bottom case until it's locked in its site.

Let me know if my answer is clear enought.

Ignazio

Anyone have ideas for batteries for these type of calculators? Edmund Scientific?
*Message #1 Posted by **gene wright** on 6 Dec 2011, 12:58 p.m.*

Edmund Scientific small calculators

These used a small battery pack that plugged directly into the wall to recharge. Anyone have an idea of refurbishing these? I plan to take it apart since the link above suggests it ran off coin cells. Perhaps I can simply use some alkalines...?

Ideas?

FYI. The one I have is the Edmund Scientific actual Scientific version that is missing keys in the picture. The one I now have is in great shape, but won't turn on. Batteries? perhaps...

Re: Anyone have ideas for batteries for these type of calculators? Edmund Scientific?
*Message #2 Posted by **Bill (Smithville, NJ)** on 6 Dec 2011, 1:17 p.m.,*
in response to message #1 by gene wright

Hi Gene,

I would think that standard button rechagable cells could be used to recreate the battery pack. Some of the Fujitsu Stylist tablet computers used a strip of 4 button rechargable batteries to maintain the clock and other settings while switching the main batteries. Not sure if Fujitsu directly sells replacement, but I would think they could be obtained from a battery distributer.

The harder part would be re-assembling the battery pack so that it could still be plugged into an outlet without risk of shocking yourself.

Bill

Re: Edmund Scientific? (pictures)
*Message #6 Posted by **robert rozee** on 6 Dec 2011, 11:15 p.m.,*
in response to message #5 by gene wright

to be honest, i'd seriously consider using three AAA or AAAA sized cells (whichever will fit), along with an external charger - or just make a holder that will take non-rechargables.

i'm afraid the current system employed, just series resistors and a diode, is inherently unsafe and sub-optimal in terms of battery health.

Re: Edmund Scientific? (pictures)
*Message #7 Posted by **Thomas Chrapkiewicz** on 6 Dec 2011, 11:19 p.m.,*
in response to message #5 by gene wright

Gene:

Given the vintage of the machine and the I.C. inside (I believe I saw a TI part in one of the pics), it likely operates on about 5v. It appears that the silver contact is the positive (+), and the gold contact is the negative (-).

The pictures of the batteries (3 button cells in series) and circuitry appears to be some sort of half-wave rectified charging system. I would certainly NOT connect this to the 110VAC under any circumstances!!!!!!!!!

Assuming that it will ultimately operate, it would be interesting to measure the current consumption, then figure out if more modern button cells (LR44 - NOT rechargeable) would be a viable replacement.

Hp-41 time module options

*Message #1 Posted by **Raymond Wiker** on 5 Dec 2011, 3:01 p.m.*

My HP-41CX has been upgraded with an HP-41CL board, which is absolutely great - the combination of ~50x speed and (for all practical purposes) unlimited flash and RAM is a real vitamin injection :-)

The only problem is that the 41CL does not have anything equivalent to the time module - it has the code, but not the actual timer chip. The obvious solution to this would be to add a time module, but these appear to be scarce. I have the timer chip on the old CPU board from my HP-41CX, but I'd rather keep that intact.

I'm wondering if it might be possible to program the Clonix-41 to emulate the timer chip. If so, then that might be a solution for those of us that have a Clonix (or one of the later designs). Alternatively, it might be possible to use a chip from the TI MSP430 series - these seem quite cheap (you can get development kits for $4.30!), and have been used in watches, so one might assume that they have low power requirements and a means of keeping track of the time.

Any thoughts on this?

Geoff Quickfall - Physical Ports

Edited: 5 Dec 2011, 3:26 p.m.

Re: Hp-41 time module options

*Message #3 Posted by **Ángel Martin** on 5 Dec 2011, 4:56 p.m.,*
in response to message #1 by Raymond Wiker

I´m hoping Diego reads this and shares his thoughts on this intriguing idea, which I agree would be cool.

Another thing could be using the real Time Module (assuming you've got one) as physical frame for the serial connector, so as to kill two stones with the same bird (sic.) - but I guess there isn't enough room inside for such a hack.

Edited: 5 Dec 2011, 4:57 p.m.

Re: Hp-41 time module options

*Message #4 Posted by **geoff quickfall** on 5 Dec 2011, 5:43 p.m.,*
in response to message #3 by Ángel Martin

Got to agree, if someone could come up with a time module crystal assembly which can be plugged into a donor ROM module, Fantastic.

Time modules are rare so far.

Don't see the need to free up physical ports though, other then finesse. For example, I am using the:

```
-IR ROM, which is swap when using HPIL to avoid printer/HPIL conflicts
-time module
-serial port connector.
-on occasion I will insert the CLONIX when updating the CLUTILS,
 other ROMS not built in or YFNS.
```

So I have always got one free port or two if I remove the IR module. As far as other modules, my automated UPLUG/PLUG routines with various subroutines will add any number or combo of the built in ROMS.

Cheers, Geoff

Re: Hp-41 time module options

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 5 Dec 2011, 5:59 p.m.,*
in response to message #4 by geoff quickfall

How does the time signal send to the main HP-41 board over the flex PCB, is it digital or analog.

Since serial ports on the 41CL remains attached and If the clock signal is an analog signal, perhaps a time module circuit (Crystal, IC, cap, etc) could fit into the 41CL serial port cover, power from the flex PCB (battery) and send clock the signals via some wire either to the flex PCB or directly to the 41CL core.

Re: Hp-41 time module options

*Message #6 Posted by **Eric Smith** on 5 Dec 2011, 7:21 p.m.,*
in response to message #5 by Kerem Kapkin (Silicon Valley, CA)

It is digital, using the normal HP-41 serial bus signals.

Re: Hp-41 time module options

*Message #7 Posted by **Didier Lachieze** on 6 Dec 2011, 9:33 a.m.,*
in response to message #3 by Ángel Martin

> Quote:
>
> I´m hoping Diego reads this and shares his thoughts on this intriguing idea, which I agree would be cool.

This is something I've already thought about: adding a RTC clock such as the DS1340 into a Clonix module to provide an HP Time Module emulation, but I've not checked in details the specs of both the Time module chip and the RTC to see what would be the effort required to emulate the first one.

Re: Hp-41 time module options

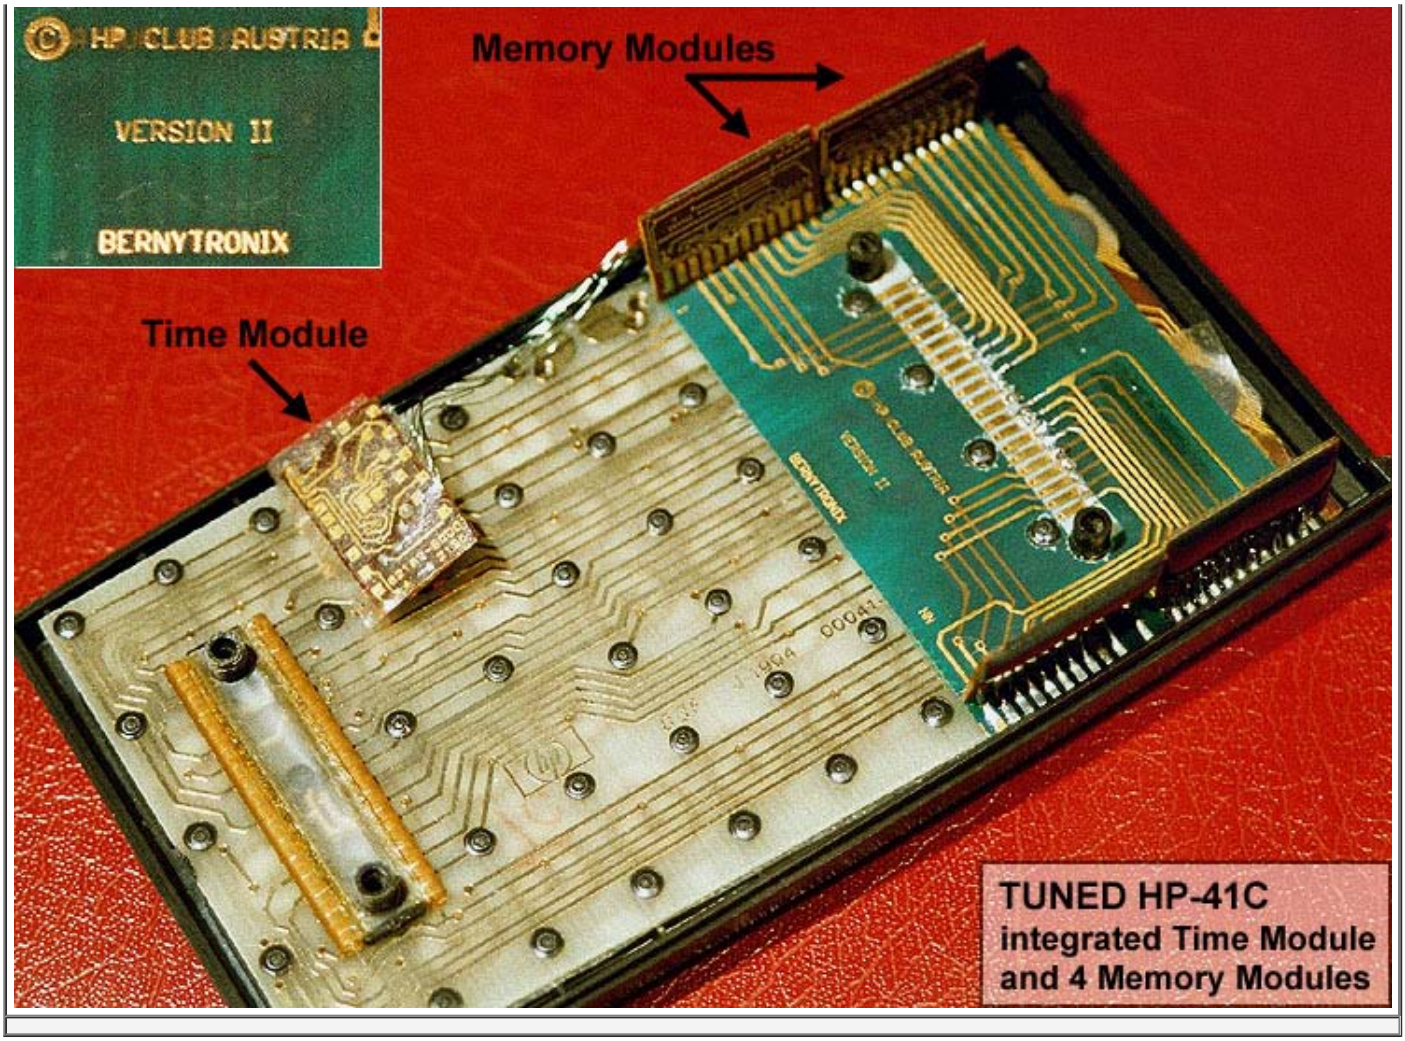
*Message #8 Posted by **Juergen Keller** on 6 Dec 2011, 11:37 a.m.,*
in response to message #3 by Ángel Martin

The serial connector that comes with the 41CL board does not fit into an empty module housing. There might be another place for a serial interface as indicated on the picture below but you would need a connector similar to the ones used in 48 models, and this solution might have other drawbacks ...

Re: Hp-41 time module options

*Message #9 Posted by **Juergen Keller** on 6 Dec 2011, 11:44 a.m.,*
in response to message #8 by Juergen Keller

And as you can see here, you can even have a built-in time module:



Re: Hp-41 time module options

*Message #10 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 6 Dec 2011, 12:35 p.m.,*
in response to message #9 by Juergen Keller

Thanks for sharing, very nicely made! Do you have the schematics on this time module and how it is connected to the HP-41? Regards, Kerem

Re: Hp-41 time module options

*Message #11 Posted by **Geoff Quickfall** on 6 Dec 2011, 12:47 p.m.,*
in response to message #10 by Kerem Kapkin (Silicon Valley, CA)

Unfortunately, that is a TIME MODULE ROM chip, just moved inside to free up a port.

As stated, it is not the physical ports that require freeing as 99% of the ROM modules for the 41C reside in the CL. It is the rarity of a TIME ROM module itself.

The question is, can one be made from scratch and added to the board. With a spare TIME MODULE as an example, I don't see why a time module kluge would not work and attached as in Juergens picture. Just costing it with the limited production run of CLs might preclude its production unless someone comes up with a DIY kit.

Geoff

Re: Hp-41 time module options

*Message #12 Posted by **Gerry Schultz** on 6 Dec 2011, 1:28 p.m.,*

in response to message #11 by Geoff Quickfall

How is the time module built into a 41CX? Is it a separate module or is it a part of a larger sub-board that includes Extended functions and memory?

Gerry

Re: Hp-41 time module options

*Message #13 Posted by **Raymond Wiker** on 6 Dec 2011, 2:02 p.m.,*
in response to message #12 by Gerry Schultz

The time module chip is included on the HP-41CX CPU board.

Re: Hp-41 time module options

*Message #14 Posted by **Juergen Keller** on 6 Dec 2011, 1:55 p.m.,*
in response to message #11 by Geoff Quickfall

> Quote:
>
> Unfortunately, that is a TIME MODULE ROM chip, just moved inside to free up a port.

Exactly. Of course it would be nice to have a replacement solution but I fear there are not enough interested parties to bring back the development cost so it's even harder to find someone who jumps in this project.

> Quote:
>
> It is the rarity of a TIME ROM module itself.

Well, it's not that rare but prices definitely have raised in the last months.

Re: Hp-41 time module options

*Message #15 Posted by **Monte Dalrymple** on 7 Dec 2011, 8:40 p.m.,*
in response to message #14 by Juergen Keller

I always wanted to include the timer function, but it just
isn't practical using programmable logic.

Just the registers in the timer chip require 382 flip-flops,
which immediately dictates the use of the largest available
Xilinx Coolrunner-II CPLD, which is a $40 device. To make
matters worse, that part is most readily available in a 208
PQFP package, which won't even fit on the 41CL circuit board.
The other available packages are all chip-scale, which means
higher assembly costs. These package options also have minimum
order quantities of several hundred.

I am about half done with the reverse-engineering of the chip
in case things change in the future.

Re: Hp-41 time module options

*Message #16 Posted by **Garth Wilson** on 8 Dec 2011, 3:06 a.m.,*
in response to message #15 by Monte Dalrymple

Would a fleapower microcontroller be able to do it? I'm envisioning a crystal oscillator with CMOS logic to divide it down, to interrupt the microcontroller 100 times per second and wake it up for just a few instructions' time to update the registers, see if they match the next alarm time, etc., then go back to sleep. The microcontroller's own clock would be RC type so it doesn't take a lot of cycles to stabilize and be ready to run, assuming it needs to run faster than the time reference crystal when the calculator is talking to it. If the calculator is turned on, then the microcontroller would probably have to be alert enough to perk up its ears when the calculator talks to it.

Re: Hp-41 time module options

*Message #17 Posted by **Monte Dalrymple** on 8 Dec 2011, 10:23 a.m.,*
in response to message #16 by Garth Wilson

Should be able to do it. Keeping the time is only a small part of what is required though. The bigger task is interfacing to the 41C bus, accepting commands, etc. in a compatible fashion.

Perhaps some combination of a small cpld to do the interface stuff and a uC to do the timekeeping/registers would be the best option.

Edited: 8 Dec 2011, 1:25 p.m. after one or more responses were posted

Re: Hp-41 time module options

*Message #18 Posted by **Raymond Wiker** on 8 Dec 2011, 11:56 a.m.,*
in response to message #17 by Monte Dalrymple

This is the reason I mentioned Clonix as a possible host for this functionality - it already has the code for communicating on the bus, and the processor used appears to have timer/counters that could be used to keep track of time.

Re: Hp-41 time module options

*Message #19 Posted by **Diego Diaz** on 10 Dec 2011, 8:21 a.m.,*
in response to message #18 by Raymond Wiker

Hi all,

And again sorry to join this thread so late.

Most of Monte's reasons to discard TIME module into CL logic are applicable for the Clonix approach.

TIME module is *not* a simple ROM pac but a very complex peripheral device wich has a whole set of dedicated commands and can both "request" CPU attention and make its own "decisions" according to events requirements like alarms.

Current Clonix family only handles a few "commands" (or pseudo commands) that is some codes that 41CPU cosiders as NOP's.

Only exception is the emulation of the double X-MEM memory for the Clonix-D or NoV-64 which decodes a few "real" intructions.

All of the above does not means that the project itself is not appealing... on the contrary, it certainly is!! :-)

However, it may well be a little too much for the limited processing abilities of the microcontrollers used into Clonix or NoV; and one thing is for sure: HW desing *must* be very different.

So, the other point would be: are not enough TIME modules out there to fulfill the HP-41CL's users needs?

Cheers!

Re: Hp-41 time module options

*Message #20 Posted by **Raymond Wiker** on 10 Dec 2011, 12:53 p.m.,*
in response to message #19 by Diego Diaz

Ok, I guess that's the definitive answer as regards the suitability of the Clonix for this purpose :-)

I don't know if there's actually a lack of time modules in the marketplace - all I know is that I don't often see them available on eBay, and in general, they seem to be priced quite high (compared to, for example, a complete Hp-41CX, or a 41CL board).

Re: Hp-41 time module options

*Message #21 Posted by **Geir Isene** on 13 Dec 2011, 4:32 p.m.,*
in response to message #20 by Raymond Wiker

Pitching in very late here - but I believe I have a couple of spare Time modules if anyone are interested. I am not interested in money in return, but rather some HP calc stuff.

You shared my grief...

*Message #1 Posted by **cbuhmann** on 5 Dec 2011, 1:53 p.m.*

...and on Friday my three HP15C LE I ordered in September arrived in Hamburg at the customs (s/n no. 017XX, 018XX).

Wow, this was really a feeling like being a child before christmas.

Played with them on the weekend, and I am really happy about the machines. This is exactly what I was waiting for since my studies (started with an HP48G, then a Sharp PC E500, a TI-82, back to the HP48, HP48G-II (crappy thing), HP49G (7 replacements, then I gave up), HP35S (too big for the pocket) and now.... finally I am there.

Impressed an old collegue who will be retired soon and who is working with a *very* used 11C with my new machine.

The only thing are the loose 'f' and 'g' keys, but ok, as long as they are working I will not complain.

Cheers Christian

Re: You shared my grief...

I have 2 on backorder from HP Small Business. I received another email from someone at HP today and here is a cut and paste of part of it:

"The factory has updated the ETS to December due to back log reasons. I will make sure to have you informed through all whole process regarding this unfortunate delay."

Makes no sense to me considering we are almost a week into December already, unless they mean 2012...

Re: You shared my grief...

*Message #4 Posted by **Ángel Martin** on 5 Dec 2011, 5:04 p.m.,*
in response to message #1 by cbuhmann

Just as well you got the calcs, but four months wait!! That's too much even for the notoriously thick bureaucratic red tape going on in customs.

I mean no disrespect to anyone but wouldn't it be great if instead of spending all that money in protectionistic barriers goverments actually invested it in research, technology, promotion of entrepreneurial spirit, etc, etc.... ??

who knows, maybe the same people would be designing the 41 CL++ instead of issuing and filling out forms to clear customs and pay the import duties. That's a nicer (not to mention way much more clever in the long run) scheme in my book.

Dream on grasshopper...

Re: You shared my grief...

*Message #5 Posted by **Eddie W. Shore** on 5 Dec 2011, 9:44 p.m.,*

My HP 15c is already there.

Re: What advantage does Wp34s have ove the HP50g?

*Message #8 Posted by **Walter B** on 5 Dec 2011, 1:34 p.m.,*
in response to message #7 by bluesun08

Seems both the HP-15C and the WP 34S are fermions, and the shirtpocket is a rectangular potential well. Both calculators can't live in ground state of said well simultaneously - one will occupy an metastable excited level tending to leave the well quite soon. Ground state energy of the HP-50G even exceeds the well walls, so it tends to leave said well quasi-instantaneously ;-)

[wp34s] Incomplete Gamma on the wp34s

*Message #1 Posted by **Les Wright** on 5 Dec 2011, 2:48 a.m.*

Thought there would be some interest in this article:

Incomplete Gamma for wp34s

For reasons given at the end of the article, this routine may not be terribly useful to most, but I must say it is a programming job I have been pretty pleased with over the years and I really enjoyed porting it to the wp34s.

Les

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #2 Posted by **Paul Dale** on 5 Dec 2011, 4:06 a.m.,*
in response to message #1 by Les Wright

The 34S already includes a regularised incomplete gamma functions for real arguments. The difference between this and the incomplete gamma function is a scaling by a normal gamma function evaluation.

- Pauli

*Message #4 Posted by **Les Wright** on 5 Dec 2011, 5:21 a.m.,*
in response to message #2 by Paul Dale

I should point out that the documentation of the I-Gamma function is actually incorrect. It returns I-Gamma(y,x). The arguments are are reversed.

Les

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #5 Posted by **Paul Dale** on 5 Dec 2011, 5:39 a.m.,*
in response to message #4 by Les Wright

The documentation will be updated in due course I suspect :-) I must admit, I never really tested this

function in isolation. It is used by some of the probability distributions and was tested as part of them.

We've also got a regularised incomplete beta function, again for real arguments only. And again, in support of the statistical functions.

- Pauli

Re: [wp34s] Incomplete Gamma on the wp34s

Likewise with the incomplete beta function. It actually returns I-Beta(x,z,y).

Les

Maybe Not Completely Redundant

*Message #7 Posted by **Les Wright** on 5 Dec 2011, 8:47 a.m.,*
in response to message #2 by Paul Dale

Actually, the wp34s provides only the lower regularized incomplete gamma and cdf's (lower -tail) for phi and chi-square.

But what if one wants high precision in the upper tail of the regularized incomplete gamma or its specific relatives? For phi it's easy, since the symmetry of the standard normal distribution means that 1 - phi(x) = phi(-x), so if I want the upper-tail probability associated with the normal statistic x = 3 I would compute phi(-3) instead.

But there is no such reflection relation for chi-square. A high-value of the statistic will give a probability close to one, and digits (and precision) will be lost due to subtraction from 1 to get the complementary upper-tail probability. It is probably better to compute the upper-tail chi-square probability by way of the underlying continued fraction expansion for the right-sided incomplete gamma--IGL in my program. Of course, this only matters if one really cares about the lost digits. In practical applications, most likely wouldn't.

I notice the built-in erfc function gives all or almost all 16 digits accurate for higher values of the argument in cases where subtracting erf from 1 would give zero. I am surmising that erfc has it's own routine and is not derived from the built-in regularized incomplete gamma.

Re: Maybe Not Completely Redundant

*Message #8 Posted by **Walter B** on 5 Dec 2011, 9:46 a.m.,*
in response to message #7 by Les Wright

Anybody doing statistics with more than a few significant digits shall check whether his mathematical model describes the reality observed to this precision - and if true then please check whether it's necessary. Mathematical statistics provides tools for better estimations, nothing more. I've written this earlier already, presumably.

Re: Maybe Not Completely Redundant

*Message #9 Posted by **Les Wright** on 5 Dec 2011, 12:50 p.m.,*
in response to message #8 by Walter B

True dat, as the young people like to say today.

Obviously, my interest in computing the upper-tail functions to high precision has no practical indication at all. It is more of an aesthetic thing :)

That said, the 48-series (48G(X), 49g+, 50g) do return the upper-tail probabilities to full displayed precision--UTPN, UTPC, UTPT, and UTPF.

Les

Re: Maybe Not Completely Redundant

*Message #10 Posted by **Paul Dale** on 5 Dec 2011, 4:35 p.m.,*
in response to message #7 by Les Wright

Rather than guessing you could look at the source code ;-)

Yes, the upper tail probabilities will suffer from cancellation -- we ran out of space to implement both properly.

- Pauli

Re: Maybe Not Completely Redundant

*Message #11 Posted by **Les Wright** on 5 Dec 2011, 6:03 p.m.,*
in response to message #10 by Paul Dale

Still working my way around the files. I must admit I can comprehend much of the code, but the special number types and functions acting on them make for some slow going.

Les

Re: Maybe Not Completely Redundant

*Message #12 Posted by **Paul Dale** on 6 Dec 2011, 3:32 a.m.,*
in response to message #11 by Les Wright

These functions are all implemented in decn.c and stats.c. The code there mostly uses the decNumber type which is a real. The function calls should be self explanatory -> fn(a, b, c) means a = fn(b, c). I've reused variables a lot for stack space reasons which does confuse things a bit.

- Pauli

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #13 Posted by **Namir** on 5 Dec 2011, 11:55 a.m.,*
in response to message #1 by Les Wright

Les,

Can you please provide a link to the algorithms you used to calculate the two versions of the incomplete gamma functions?

Namir

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #14 Posted by **Les Wright** on 5 Dec 2011, 12:55 p.m.,*
in response to message #13 by Namir

Sure, Namir.

I just ported the routines from an older version of Numerical Recipes. The authors of those books have put older versions online for free perusal, and the relevant section can be found here starting at page 216:

Numerical Recipes in C, Second Edition

In my code, the first few steps compute the series, the next several (the bulky middle) compute the continued fraction, and the last few steps where both routines end up compute and multiply in factors common to both.

Les

Edited: 5 Dec 2011, 12:56 p.m.

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #15 Posted by **Paul Dale** on 5 Dec 2011, 4:38 p.m.,*
in response to message #14 by Les Wright

The Numerical Recipes books don't seem to be very well respected in numerical mathematics circles. The code I've used from them had issues which needed to be addressed.

They are easy for a layman to read however. Far more so than any of the other numeric texts I've got.

- Pauli

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #16 Posted by **Ángel Martin** on 6 Dec 2011, 2:14 a.m.,*
in response to message #13 by Namir

I guess you've already seen Jean-Marc Baillard's page:

http://hp41programs.yolasite.com/gamma.php

section 4 within that document.

He uses two approaches, one with continued fractions and another with the Kummer function (a particular form of the Generalized Hypergeometric Function, HGF+) as an accessory to calculate the Incomplete Gamma - and many others BTW. I found that a very clever and efficient scheme, once the HGF+ function is tackeld down in MCODE that provides a slew of many others for the same price of admission.

FWIW, these functions are included in Jean-Marc's own JMB_MATH and in the SandMath modules.

/AM

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #17 Posted by **Namir** on 6 Dec 2011, 10:16 a.m.,*
in response to message #16 by Ángel Martin

The HP Museum HP-41C Software library pages also has an upper incomplete gamma function program ported by Tony Duell from the *HP-67 High Level Math Solution Book*. The code is standalone and is still relatively short.

I am a bit puzzled, because Duell **only** worked with the code for the upper incomplete gamma (whose definition is an integral between one of the function's arguments x and infinity) which seems, to me, to be harder to code than the lower incomplete function (whose definition is an integral from 0 to x) which should be easier to code.

Namir

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #18 Posted by **Les Wright** on 6 Dec 2011, 10:32 a.m.,*
in response to message #17 by Namir

Namir, I am familiar with that code you are noting, and I believe it computes the continued fraction in a very old fashioned way that is costly for steps and prone to overflow. I have always liked the NR routine for its brevity and its use of a more modern algorithm. I am particularly proud of a SysRPL port I did of it for my HP49g+

Angel, I am very familiar with JMB's work, and particularly his approach to the problem with the hypergeometric and Kummer routines. Mine is just one more way to skin that cat :)

Re: [wp34s] Incomplete Gamma on the wp34s

*Message #19 Posted by **Namir** on 6 Dec 2011, 11:07 a.m.,*
in response to message #18 by Les Wright

Thanks for letting know about the vulnerability of the HP-67 program ported to the HP-41C. Nobody likes bad surprises when computing .... especially if you are in a space capsule going to the Moon, or worse yet, to Mars!

Does Baillard implement routines for both the lower AND upper incomplete gamma functions?

PS: I can see a cartoon where two astronauts are traveling to Mars and the display calculating the incomplete gamma function gives a mission critical error message! One astronaut turns to the other one and says, "I told you fifty million times use the Baillard code ... but nooooooooo .. you had to use the code translated from the HP-67 library. We are so dead now!!"

HP-15C - useless today?

*Message #1 Posted by **Reth** on 5 Dec 2011, 2:08 a.m.*

After playing a bit with the HP-15C LE (keyboard fixed) I'm under the impression, that apart of nostalgic reasons it is no worth getting it at all. Its low internal accuracy makes it hopeless and also makes HP-35S look acceptable. Both can't compare with the BRILLIANT Free 42S by Thomas Okken and more so with Byron Foster's implementation for iPhone. I wander who would use it today for real work?

Re: HP-15C - useless today?

*Message #2 Posted by **Les Wright** on 5 Dec 2011, 3:16 a.m.,*
in response to message #1 by Reth

I am glad I have one as a collector, and I use it more than the near-mint 1985 version I paid too much for and am afraid to look at funny. But since I discovered wp34s and how easy it is to flash a calc and assemble and disassemble programs, I just don't pay much attention to it these days. Indeed, Samson has its back-ordered HP15C LEs marked up 50 %, but the 30b is priced to clear at 30 bucks. I just ordered another of the latter to perpetuate my wp34s fascination :D.

It depends on where you use it. I think only rocket science needs a higher internal accuracy. In such case, you might need a sophisticated computer rather than a calculator.

Re: HP-15C - useless today?

in response to message #3 by From Hong Kong

> Quote:
>
> ... only rocket science needs a higher internal accuracy...

Not at all.

In the case of a rope looped around the Earth, what clearance would provide 1m extension if the rope were lifted? Try to solve this on 15c or 35s. Piece of cake for the 42s.

Re: HP-15C - useless today?

About 15cm ;-).

Re: HP-15C - useless today?

*Message #6 Posted by **Paul Dale** on 5 Dec 2011, 5:49 a.m.,*
in response to message #4 by Reth

Simplicity itself even on a four banger.

The answer doesn't depend on the radius of the circle the loop forms so the big numbers completely disappear. A tiny bit of algebra before hand makes easy work of this :-)

I think he's asking this question, not if the rope was hovering uniformly in space over the entire earth.

Re: HP-15C - useless today?

*Message #8 Posted by **Crawl** on 5 Dec 2011, 9:36 a.m.,*
in response to message #7 by Crawl

Not that that's something that should be impossible for the HP15c, either.

Taking the Taylor series, you get the answer is

R/8*(12x/R)^(2/3)

This gives 121.6440...

whereas solving the equations exactly (which you can almost certainly also do with the HP15C, though I don't have mine with me now) gives

121.6447...

Re: HP-15C - useless today?

*Message #9 Posted by **Jeff Kearns** on 5 Dec 2011, 1:59 p.m.,*
in response to message #8 by Crawl

Valentin's 'original' answer is as follows.

Quote:

"A little geometry will duly solve this. Let's call the Earth's radius r, the subtended angle between the point of maximum height and the point of tangency we'll call x, and let's say the length of the cable not in contact with the Earth is 2a. The corresponding circular arc length is 2rx. Let d be the extra length added to the cable. Then 2a = 2rx + d. Hence a = rx + d/2, and so a/r = x + d/2r.

We also have, tan(x) = a/r. Therefore the equation to solve for the angle x is:

tan(x) = x + d/2r

Once we've got the angle x by solving it, we then have that the required height h over the ground is:

h = r(sec(x) - 1)

For our particular problem d = 1, r = 6,400,000, so we must solve:

tan(x) = x + d/2r = x + 1/12,800,000

which gives:

x = 0.00616549902401 radians

and from this, the height h is:

```
h = r(sec(x) - 1) = 6,400,000*(sec(0.00616549902401) - 1)
  = 121.644736 m
```

If the man can stretch his arm to a height in excess of 120 m (360 feet) while comfortably sitting at ground level, he must be Mr. Reed Richards, alias "Mr. Fantastic", so his brother-in-law's name should be Johnny Storm, alias "The Human Torch", both members of the well-known Fantastic Four superhero team.

This is my 20-step program for the HP-15C which will return the height for any given extra length. First store the constant 12,800,000 (2r) in R0 and set RAD mode:

```
01 LBL A
02 STO1
03  0
04 SOLVE B
05 COS
06 1/X
07  1
08  -
09 RCL*0
10  2
11  /
12 RTN
13 LBL B
14 TAN
15 LASTX
16  -
17 RCL 1
18 RCL/0
19  -
20 RTN
```

Running it, we can get for instance:

```
For d =   1 m:    1 GSB A  ->  121.6448 m  (h)
    d = 0.1 m:  0.1 GSB A  ->   26.2080 m
    d =  10 m:   10 GSB A  ->  564.6400 m
```

As you may see, even a mere 0.1 meter (some 4 inches) of extra length can raise the highest point to a height of more than 26 meters (nearly 80 feet). Mr Fantastic would still be needed."

The 15C is more than up to the task and is neither useless nor obsolete. It was my 'main' calculation tool in a mechanical engineering program in the 1980s and would still serve as such today.

And does the 42 take into account thermal expansion and contraction for the sides in sun or shade? What about tension and elasticity? The 15C is just fine for REAL problems, maybe not so much for the made up variety.

Re: HP-15C - useless today?

*Message #13 Posted by **Frido Bohn** on 5 Dec 2011, 4:03 a.m.,*
in response to message #1 by Reth

For real work I would use a computer.
For doing maths I would use then either a CAS software, program routines myself or even take a spreadsheet application.
As long as I have a computer within reach I would prefer it over any calculator.

There may arise situations where the use of a computer is impractical. May be then somewhere in the field or somewhere without electricity.
In such cases a device would be advisable with an optimum between versatility and battery life. This would be not a smartphone, I guess.

For me, the main impulse to be engaged with the nostalgia calculators is that there is easily accessible expert knowledge about them. Nowadays, dozens of years after they were

introduced, there is countless material about them so one can gather in-depth knowledge about their innards on hardware and software basis. A crucial point for me is that those old calculators have a history: they have an accomplished biography documented in countless periodicals or newsletters. A whole generation was deeply involved with them - and of course, still is.
The impact these calculators had on their lives will be barely seen with modern devices which are too transient and interchangeable, although their capacity may be more advanced in some orders of magnitude. I simply can't imagine that we will have such a huge community who cares about TI-Nspire or HP-50g in 30 years.

Interesting. In SpaceTime 3 and 4, calculating Eigenvalues fail using built in numerical routines on certain PDAs (s. discussion in the respective ST forum). The pure CAS solution works, however. Trust no one except really proven systems like..? The 15C? ;-)

This calculator is not useless and not obsolete. But there are people who have no use for it or *find* it obsolete. There's a difference.

I'm using it, so it's useful (to me). I went back from more 'modern' solutions to the 15C, so it's hardly obsolete (to me).

Re: HP-15C - useless today?

*Message #17 Posted by **Dave** on 5 Dec 2011, 4:02 p.m.,*
in response to message #15 by Reth

The reason why the 15C is neither useless nor obsolete is that in the 30 years it was out of production, HP failed to make any model equal to it in terms of functionality, form factor and price. Like an idiot, I sold my 15C years ago thinking HP's next model would be better. Well, it wasn't, and neither was the next model or the next. So I'm ecstatic to have a brand new 15C which is just as elegant and useful as it was 30 years ago. Because I have no reason to believe HP will ever make another model as good as the 15C, I bought enough spares to last the rest of my life.

Nonsense! I've got two 15C and two 15C-LE units, and I've used this model since 1985. However, it does **not** compare favorably to the 1988 HP 42S in any detail except that the 15C is visually much more attractive. But visual beauty, IMHO, is not enough to trump all the many other aspects in which the 15C is grossly inferior to the *later* 42S.

Apples and oranges. The 42S did not replace the 15C. It replaced the 41. The 32S replaced the 15C, and it was less functional, as was the 32Sii, 33S and 35S. There are plenty of HP calcs that do a lot more than the 15C and 42S, but none have the trifecta I posted.

*Message #24 Posted by **Bill Platt** on 5 Dec 2011, 10:09 p.m.,*
in response to message #23 by Dave

I disagree with you (on this sort of absurd academic point).

I feel that the 32s replaced the 11c, the 42s replaced the 15c with the ability to use 41 programs.

With no I/O, there was never even the slightest possibility that the 42s could be seen as a replacement for the 41 system. That had to wait for the 28 and then 48 series. In some ways even they didn't do it. Who have you ever heard of using a 48 to do data gathering of multiple HPIL inputs? (Maybe the PC simply came to replace by then...and so I didn't notice?)

> The 42S did not replace the 15C. It replaced the 41. The 32S replaced the 15C, and it was less functional, as was the 32Sii, 33S and 35S.

One should not just "make up" the history and the development of HP calculators. Those familiar with HP calculators can cite real facts to show that the above statements are baseless in every particular.

In absolutely NO informed appraisal can the HP 42S be considered a replacement for the HP 41C series. It was designed to be program semi-compatible, *but that is all* and that does not the 42S a "replacement" for the 41C make.

Many might consider it a somewhat important detail to recall that the HP-41C is, er, expandable, while the 42S is, er, NOT expandable. It is nonsense to claim the keyboard/LCD/printer-only I/O 42S is "the replacement" for a device that can control multiple diverse devices on an HPIL loop, use input from a bar code reader, use a magnetic card reader, employ various other I/O and time modules, and utilize RAM and ROM memory of very many sorts. Exactly how does that "replacement" HP 42S "replace" any of such capabilities, or is that just some small and negligible and inconvenient detail?

Additionally, the 42S itself has many advantages never found in any configuration of the 41C. Its Saturn processor is faster and produces results that have several orders of magnitude better accuracy and precision. The scope of the 42S mathematical function set is far greater than that of the 41C, including exhaustive complex domain support, matrix manipulation, a numerical solver, and a numerical integrator. The 42S is smaller and lighter than the 41C, and operates almost forever on its three 357 cells.

Compare the 41C to the 15C. The scope of the 15C mathematical function set is far greater than that of the 41C, including exhaustive complex domain support, matrix manipulation, a numerical solver, and a numerical integrator. The 15C is smaller and lighter than the 41C, and operates almost forever on its three 357 cells.

Hmmm...one might just conclude that the 42S was the replacement for the 15C, and not the replacement for the 41C. Or someone like me who has been buying HP calculators for 35 years could tell you that no one, neither HP nor customer, ever considered the HP 42S as the replacement for the HP 41C.

With respect to the 32S and the 15C, the 32S/SII isn't *close* to being a functional replacement for the 15C. Like all Pioneers, there are several improvements over earlier models, such as (1) limited alpha display, (2) greater speed, (3) better accuracy/precision, and (4) portrait rather than landscape keyboard. But anyone who replaced his 15C with the 32S/SII was likely very disappointed after finding that his new calc lacked many of the features and functions of the 15C, not the least being competently-executed complex domain support. I bought a 32SII to replace a 15C in 1997, when the 42S was no longer available from HP. I immediately retired that new but painfully inadequate grade-schooler's calc to storage. Happily, I was shortly thereafter able to obtain three HP 42S units. All of them together are physically incapable of replacing my one 1984 HP-41CX. *But I didn't buy the 42S as a replacement for the 41CX. Nobody did*.

> In absolutely NO informed appraisal can the HP 42S be considered a replacement for the HP 41C series. It was designed to be program semi-compatible, *but that is all* and that does not the 42S a "replacement" for the 41C make...

You make an interesting argument, but that doesn't make it true. You are the one making up history (HP42S Wiki). I guess Jake Schwartz makes up HP history too when he writes HERE that "Toward the end of 1988, HP introduced the non-expandable HP42S Pioneer model as a successor to the HP41 series." While it's true the 42S wasn't a very good replacement for the 41, it was indeed released as a replacement nonetheless. The 32S wasn't a very good replacement for the 15C either, but that doesn't change the fact that it was. The 15C and 42S have never been in the same class, so it is unfair to compare them.

The 42S belongs in a museum because it has been far surpassed by later models. The 15C has not, and currently fills a niche no other calculator can fill. Its ultimate successor the 33S, or arguably the 35S, can't do matrices and has very limited complex number support.

So history is on my side. And the 15C still has no equal.

Not that this will stop World War III about to play out on these very pages, but according to Wlodek's book the 42s was, in many ways, a Pioneer replacement of the HP-41 series, but at some stage it was repositioned as a 15c replacement instead.

So maybe you both are right.....and, remember, it's the season of peace.

Huh? I am not going to argue whether the 42S replaced the 15C or the 41C (although I personally always thought if it as a 15C replacement since it filled that niche for me but never replaced my 41) but I really don't understand the above argument.

Are you saying that the 42S is outdated because it has been superseded by newer more powerful calculators and at the same time claiming that the less powerful 15C has not been? What niche does the 15C fill that can't be filled by the 42S (setting aside UI preference for menus vs. overloaded keys). And what exactly has replaced the "far surpassed" 42S as a pure scientific programmable calculator? Sorry, maybe I am misunderstanding what you are trying to say.

Cheers,

-Marwan

The successors to the 42S far surpassed it with the addition of RPL, CAS, I/O, Display, etc.

But none of the successors of the 15C have as much functionality, i.e., matrices and complex numbers, as I said before.

If you want to argue that the 42S is the successor to the 15C, then fine, it's a far better calculator in every way, as are the 28, 48, 49 and 50. But it's not the successor by any stretch of the imagination. If the 42S did replace the 15C, then where does the 32S and it's successors fit in?

Regardless of your opinion of the family tree, what other model has the same combination of simplicity, pocketability and low price as the 15C? The 42S certainly doesn't, and neither does any other model.

Dave,

The 32s is the successor to the 11c. Have you ever used an 11c?

If you put the two side by side, if you compare memory, features, etc as well as market position and also what the salespeople were saying in the early 90s, the 32s and 32sii are the 11c replacement--not the 15c.

Also as I said before, the 33s and 35s were developed directly freom the 32sii.

Also as I said before, the feature set in the 42s contains every single feature in the 15c and then some.

Also look at the introduction of the 42s relative to the retirement of the 15c.

If you want to do a detailed look, you can use the museums feature comparison tool (very cool!) and I also recommend perusing Craig's site:

http://www.finseth.com/hpdata/hp42s.php

http://www.finseth.com/hpdata/hp15c.php

http://www.hpmuseum.org/cgi-bin/compare.cgi?calc1=HP-15C&calc2=none&calc3=none&calc4=none&calc5=HP-42S&calc6=none&calc7=none&calc8=none&shade=ON

http://www.hpmuseum.org/cgi-bin/compare.cgi?calc1=HP-11C&calc2=none&calc3=none&calc4=none&calc5=HP-32S&calc6=none&calc7=none&calc8=none&shade=ON

and finally:

http://www.hpmuseum.org/cgi-bin/compare.cgi?calc1=HP-32S&calc2=none&calc3=none&calc4=none&calc5=HP-42S&calc6=none&calc7=none&calc8=none&shade=ON

*Message #31 Posted by **M. Joury** on 8 Dec 2011, 1:29 p.m.,*
in response to message #29 by Dave

I see what you are saying but it doesn't fly with me. Even if one accepts that the 42S was not a replacement for the 15C (and I am not arguing that point one way or the other--I do make the opposite case below) the argument that the 42S is obsolete because there are newer machines that were specifically designed to replace it that do more while the 15C is not obsolete because the machine specifically designed to replace it did not do a good job of that (your argument is that the 32S was supposed to replace the 15C) is somewhat disingenuous.

Basically the 42S is a far more capable machine than the 15C. Sure, it is a little bigger and uses menus but it is still a much more capable RPN machine than the 15C is. If the 15C has a place in today's world than the 42S does as well.

Anyhow, what exactly replaced the 42S? You claim that the 42S replacement(s) are the RPL line. Well even if one can make an argument for that (I always saw the RPL line as replacing the 41) it (the 42) still has advantages. it is a small, easily pocketable, scientific calculator using straight RPN (favored over RPL by many). Also, if you look at the dates of production according to the HP Museum web site you will note that the 42S was still being produced after the 28C/S and 48S/X were both discontinued. Sort of shoots down the argument that the 28 and 48 were replacements for the 42. Also note that the 48SX came out in 1990 while production of the 41 ended in 1990 (halfway through the production run of the 28S BTW). So timeline-wise the 48SX was the replacement for the 41.

Here are some of the dates:

```
HP-41C/V/X:  1979-1990
HP-15C:      1982-1989
HP-42S:      1988-1995
HP-28C:      1987-1988
HP-28S:      1988-1992
HP-48SX:     1990-1993
```

Given the above dates and the functionality offered by each of these models the 28C/S are really just a detour they don't replace anything. The 48SX replaces the 41C. And the 42S replaces the 15C. One could read this differently except that no one can realistically make the argument that the 42S was replace by either the 28 or the 48.

And the argument that the 15C was "low price"? Well the 42S was actually introduced at a lower price point. I don't know what the 15C was selling for at that point in time but my guess is that it was pretty close.

And don't forget that HP even offered a 41 emulation or something for the 48SX--if I remember correctly it was an expansion card that had some sort of routine for running the 41 programs? I can't remember but someone here will :-)

Re: HP-15C - useless today?

*Message #33 Posted by **M. Joury** on 8 Dec 2011, 3:58 p.m.,*
in response to message #32 by bill platt

Yes, indeed. I have one :-). What more can one ask for proof?

It is an expansion card that emulates the HP-41. It can run programs and keyboard calculations, has full support for all HP-41 built-in functions (such as keyboard assignment/user mode) and can also be expanded by calling out to an RPL program (for example you can emulate the time and date functions of the 41 by using the time and date functions of the 48). You do this by writing an RPL routine that gets called in a special manner and assign it to an XROM number. I can't remember the details right now (it has been a while) but I created routines to support a number of the time module functions.

Cheers,

-Marwan

Here is the issue that I have with your argument. The following two statements appear to be mutually exclusive:

> Quote:
>
> The 42S belongs in a museum because it has been far surpassed by later models. The 15C has not, and currently fills a niche no other calculator can fill.
>
> Quote:
>
> If you want to argue that the 42S is the successor to the 15C, then fine, it's a far better calculator in every way,

Who cares what was supposed to replace what. If it is a "far better calculator in every way" than how can you in the first quote say that it "belongs in a museum". If it is a batter machine it is a better machine and it does not much matter what came before or after it--it is ***still*** a better machine.

This is exactly the argument I was making with my first response. Why are we bothering to argue about what came first and what replaced what--if the 42S is better than the 15C it remains better than the 15C whether it was meant as a replacement for it or as a replacement for the 41.

You really can't have it both ways--claim that the 42S belongs in a museum while the 15C is still a usable machine and in the very next breath state that the 42S is a "far better calculator in every way".

You are confusing my exasperation with logic. I'm letting you have it both ways because I'm tired of arguing these silly semantics. The bottom line is the 42S is ugly and complicated. The 15C is elegant, simple and has no equal (literally).

I can't read HP executives' minds, but it was pretty clear to me as a consumer at the time that the 42S was intended to replace the 41, and that the only model anywhere close to the defunct 15C at the time was the 32S. The 42S was in a completely different class. I accept argument that the 15C was actually never replaced, which is why it's so great to have it back now.

If the 42S was such a perfect replacement, then why is there a much bigger demand for the 15C than the 42S? I think it comes down to styling and a perfect, though much more limited, function set for a pocket calculator.

*Message #38 Posted by **M. Joury** on 8 Dec 2011, 6:56 p.m.,*
in response to message #37 by Dave

Excuse me? It was not me that asked to have it both ways. All I said was that the 42S should not be relegated to a museum because if the 15C was such a great calculator than the 42S still has a place in the world.

The 42S is ugly? Personal opinion--don't try to tell me what I should like and that the 42S is (basically what you are saying) worthless because you find it ugly.

I don't care which calculator was meant to replace which. I have repeated that multiple times. Stop trying to fabricate an issue out of what came first and what came next. Simply put the 42S is more powerful than the 15C. That is a fact. Whether you prefer the looks of the 15C (which I like BTW) or not, whether you like the menu system of the 42S or not, etc. the 42 is simply a more powerful calculator.

Actually I would say that the 15C WAS replaced but that the 42S was never replaced.

Complicated? As far as menus go perhaps. As far as coding goes? The 42S is FAR easier to program simply because it has mnemonics and you don't have to rely on key codes. You can separate programs into their own logical entities so that numeric labels can be reused. It is much faster. And a whole slew of other improvements over the 15C (don't bother to tell me again that it wasn't meant as a replacement for the 15C--that does not justify the claim that it is a museum piece).

No one wants the 42S back? Try that one again! There are a LOT of people on this forum that would fall over themselves to buy a new 42S. Why do you think that the WP34S firmware was developed? Because people wanted a replacement for the 42S. If the 42S is a museum piece than so is the WP34S--so why are so many people on this forum interested in it? Maybe you are referring to sales on eBay? I have not tracked it recently but 12 years ago I sold a new-in-box HP-42S for $200+. I wonder what a NIB 42S would fetch now?

I really don't care which machine you like more. I personally think that the 15C is a great little calculator. What I had a problem with is that based on your personal opinion (you have given me no real data other than to argue about which calculator replaced which and to tell me that the 42S is ugly and complicated--I find it to be neither) you relegated the 42S (which I use far more often than my 15C) to an also ran, outdated, museum piece while holding up the 15C (you personal choice) as the only logical choice. That is not logic, that is personal preference which you have every right to. I have shared my opinions often enough on this forum to know that each and every one of us here have our favorites and when I state a preference I always add that "for me" or "for what I use it for" such and such works best. I like RPN, others like Algebraic, they are no more right or wrong than I am. These are all personal choices and all valid. I am very, VERY, careful not to say that such a calculator is better and that this other model is junk because that may not be true for someone else.

I can't remember who that HP R&D guy was who attended a meeting of a local PPC chapter in the Corvallis area, but supposedly he showed to a few folks a prototype of a 42S with I/O. (Wlodek, you probably know who that is - was it Chris Bunsen, by any chance?) Apparently there were two simultaneous internal "camps" working on RPN and RPL and HP chose to go with RPL for the flagship position, relegating the 42S to having "O" without "I" and elevating the work toward the HP48SX, to be released on 3/6/90 (although without anything close to HP-IL).

> Quote:
>
> The 42S belongs in a museum because it has been far surpassed by later models.

If we were to restrict ourselves to RPN programmabbles, I'd say that the 42S was easily the pinnacle, with absolutely nothing more powerful. For those who prefer RPN programming to RPL, it is a shame that the 42S language never was ported to or further improved in a successor to this day.

Jake

Having bought an 11c the first year they came out, I can assure you, with absolutely no equivocation whatsoever, that the 32s was never marketed as a replacement for the 15c--it was marketed as an 11c replacement. The 33s and the 35s are 32sii clone/mods.

The 41/42 relationship is interesting, and perhaps Jake and Wlodek can fill us in with behind the scenes stories. But what I remember when I went to replace my lost 11c was that the 32sii was presented as its replacement...

Re: HP-15C - useless today?

*Message #43 Posted by **Mike Morrow** on 9 Dec 2011, 11:08 p.m.,*

in response to message #26 by Dave

I see that you are unable to respond to my statement:

> Quote:
>
> It is nonsense to claim the keyboard/LCD/printer-only I/O 42S is "the replacement" for a device that can control multiple diverse devices on an HPIL loop, use input from a bar code reader, use a magnetic card reader, employ various other I/O and time modules, and utilize RAM and ROM memory of very many sorts. Exactly how does that "replacement" HP 42S "replace" any of such capabilities, or is that just some small and negligible and inconvenient detail?

There are no knowledgeable people who consider the HP 42S the replacement for the HP-41C series, for very obvious reasons...not today, not 23 years ago. Your argument that in the early design phase it was intended to be implemented as a replacement is gratuitous and specious *in toto*. The *only* thing that counts is what appeared on the market that customers could buy.

You obviously are not adequately familiar with the HP 42S and the HP-15C to be able to competently evaluate the relationship of the HP 42S to the HP-15C. Additionally, your statement that many more prefer the HP 15C rather than the HP 42S is demonstrably false, and, once again, completely gratuitous. A substantial part of your argument seems to be based simply on the Pioneer design being uglier than the Voyager design. I agree with that assessment, but within that ugly Pioneer design is a calculator that is orders of magnitude better than the HP-15C or HP 15C-LE. Beauty does not trump capability.

And...to return for the moment to the original thread, I agree that there is no real reason for the existence of the HP 15C-LE, except that it allows a lot of people to spend a fair amount of money on something they can pretend is an HP-15C. It is most definitely *not* the equivalent of the original HP-15C. It has many deficiencies in comparison to the original, and *one and only one* advantage...speed! But a very limited device like the HP-15C was seldom if ever used for calculations for which speed was of any real value. The inferior mechanical design and the significant errors in implementation of the HP-15C design (PSE bug, power management, self-tests, emulation rather than native uP code that wastes 90 percent of battery energy) ensure that the 15C (not LE) remains the machine to own, if its grossly superior HP 42S replacement is out of reach!

Emotionally, I (and I'm sure others) would like to argue with your assessment above. Unfortunately you speak the truth as thus far it primarily is a nostalgic collectable item.

I'm still mystified what HP's motivation was in this effort as I don't see how a return on the development investment would have produced a meaningful profit. So if it was a bow to their loyal following I really hope none of this discussion is received as an attempt to punish a good deed.

> Quote:
>
> emulation rather than native uP code that wastes 90 percent of battery energy)..

I don't think this is a valid claim. In any case we'd need to emulate the decimal ALU operations of the legacy 14 digit NUT processor via a functional reimplementation on the host processor. The fact we're feeding from a legacy voyager rom image vs. a rewrite of such has significant benefit. It is much easier to verify you've produced accurate NUT ALU emulation than verify a complete functional rewrite of the entire firmware. And a functional rewrite of 15c firmware isn't going to fit in 15KB of rom without substantial encoding of the ALU operations. We get that for free by running the native firmware with nearly each operation being encoded into 10 bits. So emulation is arguably the most efficient way to get the job done.

The problem with battery life lies simply with the chosen ARM core clock rate. A legacy NUT voyager draws approximately 1.1ma (15c) 730ua (11c/12c/16c) executing instructions at a target rate of 3947/s. An at91sam7l128 in the configuration used for an encore voyager is capable of a 36Mhz clock rate at a current consumption of ~20ma. Current draw parity with a legacy nut voyager occurs at about a 2Mhz clock rate. Assuming a 100x aggregate performance differential for the sam7 at 36Mhz, running at 2MHz would provide a ~6.7x improvement at the legacy current draw. Add to this the power source has changed from 3x SR44 to 2x CR2032, the latter of which provides over double the mAH capacity of the former. Running at 2Mhz with 2x CR2032 cells we're well in the recommended continuous current draw range for a CR2032 with a worst case continuous user program execution runtime ballpark of 400 hours. Or we could increase current consumption to the system equivalent of a legacy 15c while still remaining in the recommended load range for CR2032 cells, and achieve a throughput of ~14x.

Aside from core clock rate overkill, it is regrettable some firmware-external functionality wasn't provided in the emulator such as a facility to get code in/out of the device -- even if only as a means for wholesale backup of user programs. A bare-bones ubiquitous usb serial interface shouldn't have added more than US$3 manufacturing cost, if that.

The current HP-12C models share the identical loss of mechanical quality of the HP 15C-LE, so that's just what the market will bear. My assessment does not mention an important ameliorating characteristic of the HP 15C-LE: *It's far less expensive than the original HP-15C.* I bought my first HP-15C new in 1985 for $100, which equates to $210 dollars in 2011. I suspect that if sufficient sales volume could be assured at that price, HP could produce a version that was equal in mechanical quality to the original, while using non-emulated firmware written from scratch for a fast SoC, just as was done recently by HP for the HP 30b and is being done independently for the WP 34S. But, for the $80 I paid for each of my HP 15C-LE units the quality-to-price ratio is still reasonably good, *if one is an HP RPN nut*.

> Quote:

> I'm still mystified what HP's motivation was in this effort as I don't see how a return on the development investment would have produced a meaningful profit. So if it was a bow to their loyal following I really hope none of this discussion is received as an attempt to punish a good deed.

I agree...I don't wish to be too critical of this little HP 15C-LE experiment. In a perfect world, the HP 17bii would have survived in the HP product catalog rather than the HP 12C clones. Perhaps then an HP 42S-LE would nave been issued, filling the very huge gap that has existed in RPN programmables since the HP 42S was discontinued 17 years ago. The HP 15C-LE fills no similar gap.

I think it's a valid claim. However, I agree that non-emulated firmware was *never a reasonable expectation*.

Emulations can waste an astonishing percentage (about 90 percent) of the battery's energy to accomplish a specific task, compared to a non-emulated machine. For example, here is data from a specific benchmark (2500-iteration Savage, see message 68 in this thread.):

On the 15C, it takes 5840 seconds. (original)
On the 15C-LE, it takes 48 seconds. (emulated SAM7 firmware)
On the 30b, it takes 6 seconds. (non-emulated SAM7 firmware)

The 15C-LE and the 30b use similar hardware and clock speeds. Yet the 30b completes this specific complex task eight times faster than the 15C-LE. It produces a result that has better precision and accuracy, with the error smaller by several orders of magnitude. My conclusion that it requires about nine times more energy for the 15C-LE system to complete the same task (ignoring the loss of precision) as the 30b is likely not far wrong. Emulation is thus responsible for a gross waste of battery energy without benefit to the calculation. Whatever energy is lost due to the pointless high speed of the 15C-LE is *multiplied* by the inefficiency of the emulation process. It causes the 15C-LE to run at least eight times longer than a hypothetical non-emulated version to perform the identical task.

I agree that there could be no other process other than emulation for the introduction of the 15C-LE. Since the 15C-LE is mostly a short-term odd-ball quirky product for "real fans", this doesn't matter much. Where emulation really hurts the HP product line is the HP 50g. At least it's better (except for alarms) than the original Saturn for speed, but only by about a factor of three. In fact, the same benchmark cited above takes 65 seconds on the HP 50g, **35 percent longer than the 15C-LE!**

It causes the 15C-LE to run at least eight times longer than a hypothetical non-emulated version to perform the identical task.

Where a strict emulation approach can fall short are cases where the host processor is capable of a significantly more efficient native operation, from which the guest could benefit, but isn't easily inferred from the guest instruction stream. A good example here is the guest synthesizing a multiply operation via iterated shift/add operations, but the host cpu possesses a native multiply instruction. We really can't take advantage of the host multiply in general as we don't know when the guest is performing a multiply operation. We could decompile the guest code and patch the image, but again this isn't a general solution.

So in this sense, a functional simulator can free us from the programming model to which the emulator is bound. And in doing so if we can now leverage host resources previously unavailable, there is clearly a liability for an emulation approach -- but only necessarily in this case. Perhaps this is semantic hair-splitting but it isn't a limitation of emulation as an approach per se but a limitation of the programming model in use relative to the capability of the host cpu.

Actually I'm not a big fan of emulation either. The only justifiable case IMHO is when attempting to preserve the useful life of a precious bag of bits as in the 15c firmware. The moment we have need to modify those bits functionally (vs. administratively) the return falls off rapidly.

This discussion may soon be moot as I expect binary emulation in the context of pocket calculators will soon be significant only for technical historians.

I think of old calculators as like old cars. You can use a classic car as your "daily driver" as long as you can get parts for it, has room to transport you and your chattels and it more or less keeps up with the other traffic on the road. It just needs to be able to get you to where you want to travel and be pleasing to the eye or your personal sense of style. An old calculator must be able to do the calculations you need to do for your work or hobbies, must be reasonably reliable and be portable if that is required. I think the 15C, for

many people, will do all the calculations they require reasonably reliably and does so with style and in a small form factor. Obviously there are some applications where it's limitations make it less useful but that can be said for all calculators, old or new. To argue that it doesn't have feature x or y or is slower than a more modern model is missing the point. You wouldn't use a Model T Ford on a motorway but if you never drive on a motorway, that isn't a problem. You can use a modern car for long distance touring or a computer for problems requiring high processing power. If it does what you need, then you don't need something else. I can't see how the 15C can be obsolete.

in response to message #48 by Calum Tait

It's fun listening to this esoteric group bantering back and forth. I enjoy the energy and passion surrounding various models. While I appreciate the "purists" and their discussion of the finer points of various calculators (including "extreme" calculations, which are fun, and sometimes practical), there is indeed a group of us that use real calculators for "grunt" calculations on a daily basis. I do basic Algebra, Trig, Log type problems to calculate phase angle voltages, Line of Sight distances, microwave path losses, etc. I don't want to fire up Excel to do those calculations in the office, and it's even less practical when I'm out in the field. The scientific calculator is an EXTREMELY useful tool for my type of work. And, no, it's not just as easy to do those calculations on the soft HP calc on my Tablet PC. I'll grab a real, physical calculator every time, because it's faster to find and use. I can do my calculations equally well on my HP-45, HP-28c, HP-41c, HP-32sII, HP-25, HP-35s, or HP-50g. Until I retire, I will NEED a real calculator. Others may not, but that doesn't mean calculators are useless, including the venerable HP-15c. I will buy one when they become available at the retail price :o)

Agreed. I find the 27s (it would be 42s if I were an RPN nut) to be more useful because of the alpha capability. But I can see how the 15c has a lot of appeal because of it's simple interface, everything's right there on the keyboard. If one prefers that type of interface, it would be hard to beat the 15c for an elegant implementation of the essential scientific calculator.

I left one of my 27s machines on a KLM flight from Schipol to JFK in August :-(. Also a logitech M505 mouse.

I wonder how many great calculators are gathered up each year from the magazine pockets of airliners?

Good question. At least they are not confiscated at security - yet.

Ever check out how many Leathermans are offered on eB** per month from airport confiscations? What part of "you cannot bring a sharp object on the plane" do they not understand?

Re: HP-15C - useless today?

*Message #53 Posted by **M. Joury** on 6 Dec 2011, 2:38 p.m.,*
in response to message #52 by Martin Pinckney

Actually you can. It is legal to take a pair of scissors of up to 4 inches onto an aircraft. Or so we have been told. We discovered this when my daughter tried to do exactly this so that she could work on some arts and crafts project she had. When we saw it we figured: A. They were going to give us a hard time and B. They would confiscate it. But no, we were informed that it was perfectly legal.

Do you know that you can take a pair of figure skates onto an aircraft? I am assuming that means that you can also board with speed skates. Have you ever seen how sharp those things are? And you could always sharpen them further.

On the other hand I was in a rush one day and forgot to take a mini Swiss army knife with a tiny little blade off my key-chain. That they of course confiscated.

And of course liquids are not allowed but milk and formula are exempt and can be taken on board.

Like a lot of things, airport security does not make a whole lot of sense.

One of the "funniest" (as in illogical) experiences I have ever had...

My family flew up to Vermont from Richmond, VA a few years ago. My wife was going up there for an interview but we were scheduled to fly out separately and return together due to my work schedule. As it turned out we flew out together because a snow storm kept me from getting to work that day. At any rate that is not the point. The "funny" part occurred on the return.

We arrived at the airport together and we were going through security together. I am of pretty obvious Middle Eastern descent and my wife is an Italian blonde. At any rate we were going through security and my daughter and I passed through just fine but my wife got stopped and every item in her bags was taken out. When she asked why it was only her she was told that she was traveling alone (she was not on our itinerary since the tickets had been purchased separately) and that since I was traveling with our daughter I was obviously no threat. As it happens my daughter was at that point carrying my wife's carry on and she (my daughter) walked right through with no issues AFTER SECURITY SAW MY WIFE PLACE SOMETHING IN THE CARRY-ON! Gotta love how safe we are with the TSA taking care of us.

Cheers,

-Marwan

Hi Marwan,

Well security is a funny business. Part of my job is designing security systems for the various buildings we design. I always meet with the client and ask a variation of the following question " What do you wish to acheive or what is the purpose/goal?" Often, they don't have any clear idea. How they answer this question determines whether they are looking for real security or show security. There may be several departments from the client and they will give conflicting requirements depending on their own viewpoint.

A usual conflict is protecting the building or equipment versus the people in the building and what are you protecting against.

So much of security is for show only. After 9/11, the casino where my wife worked, increased security in the garages - they were afraid someone would sneak a bomb into the garage and then blow up the casino garage (not really sure why they thought this). So my wife goes to work, they stop the cars in front of her and check their trunks and under the cars and then politely greet my wife and wave her thru since they know her. Security is only as good as the people implementing it and following thru on it.

The funny part is that a few years later, her casino was bought, and they blew it up to make way for a new casino (which they never built).

in response to message #56 by Bill (Smithville, NJ)

Haha ironic.

Garages? Bombs? Probably from the 1st attempt at the World Trade Centers. On everyone's mind back then, including mine. I knew people on the top floor of that building who had to go to the roof to escape the smoke--which went up to the top floors and filled them.

I think anyone serious about security must read the chapter "Safecracker Meets Safecracker" in Feynman's autobiographical book.

I think the following story quite represents the idiocy of some aspects of screening. In case some don't realize, I go through security at airports around the world as part of my job (pilot).

Here is a first hand account of a brush with LHR (London Heathrow Security, flight and cabin crew bypass). I mention bypass for flight crew because you would think that these screeners would be looking for a different aspect of prohibited goods:

ME: "what in particular are you searching my flight bag for?"

SCREENER " Pardon me sir."

ME: " I would like to know, so that, if possible, I could leave it at home and preclude an invasive search of my FLIGHT BAG"

SCREENER "Oh, well, anything that will allow you to take control of the aircraft."

Now remember, I am a pilot of the flight, I am at crew bypass screening, I have uniform on, international (including HomeLand security) recognized electronic pass as well as pilot licence. So just WHAT in my flight bag were they looking for???

So now I just go to work, expect the least common denominator of common sense, then laugh about the insanity of it all.

Cheers, Geoff

p.s. the 15C rules, except for the 41CL and WP34S and 71B and 34 and 67 and 65 and 25 and ... personal choice which includes appearance, functionality (dependent on what you do or require it to do).

Cheers, again!

I wear the watch and carry the 41C in the shell through London on purpose:

VS/1220-99-978-3399
COMPUTER
MORTAR
FIRE DATA
MARK 2
CV

Just my humour is all.

In fact, for a pilot, Tel Aviv is easier to get through then London or the US. However in the US the rules may be changing for flight crew, using a bypass instead of lining up with the passengers would shave an hour off our time and not degrade security in the least.

Geoff

Pretty funny, Geoff. I work as Tech Support for the FAA's Indianapolis ARTCC. Although I haven't had anything to do with Security since our security people split off and became TSA, I have continued to be amused by the screening of pilot's belongings. Same goes for arming pilots. Can that be *more* dangerous, when you're already trusting your LIFE to that pilot? If a pilot wants to kill everybody on board, he doesn't need ANY carry-ons. Sanity and logic apparently have little say-so in security. Similar things happen at our FAA facilities. They go out of their way to screen, check, limit, train, restrict us as engineers, technicians, controllers, etc, yet I could walk into a cipher-locked room in our basement and in 10 seconds, ground traffic from LA to Boston with nothing but a set of bolt cutters. Aside from my obvious termination, there would also be delays for many, many hours and millions of dollars lost by the airlines. Where does screening stop and trust begin? Tough question.

The 42s has a Solver, but it is not as easy to use, because you first have to write a *program* to solve the equation, instead of just writing the equation. However, once you've written the program, the 42s Solver is just as easy to use.

There was one RPN model with the 27s type of Solver, the 17bii, but you are correct, it's not scientific.

That's fine, but the RPL solver, first appeared in the 18C, allows to solve for any variable. This isn't easily possible with the 42S, is it?

Re: HP-15C - useless today?

*Message #76 Posted by **Martin Pinckney** on 6 Dec 2011, 1:45 p.m.,*
in response to message #75 by Thomas Radtke

I'm not sure what you mean by "RPL Solver", but I assume it is the type that is in the 27s/17b. AFAIK the 42s Solver does allow solving for any variable once you have entered a correct program representing the equation.

For some problems you have to enter an initial guess, but this is also true on the 27s as well.

Re: HP-15C - useless today?

*Message #77 Posted by **M. Joury** on 6 Dec 2011, 2:45 p.m.,*
in response to message #75 by Thomas Radtke

Absolutely can. From a user's perspective looks just like the 17bii. Coding the problem is of course different.

Here is a simple example:

Temperature conversion:

```
01 LBL "Temp"
02 MVAR "°F"
03 MVAR "°C"
04 RCL "°C"
05 1.8
06 *
07 32
08 +
09 RCL "°F"
10 -
11 END
```

This would be the equivalent of:

```
°Cx1.8+32=°F
```

on the 17bii.

Cheers,

-Marwan

I too, missed this. but then my first HP calculator was 28C. All other HP product calculators I obtained since then had a Equation solver (HP200LX, 48G,33S,35S) where i could just enter a equation. I never thought hp42S solve (in my case free42) could do this.

That "discovery" begs a question. Is it also possible to do this with WP34S? I could not figure this out from reading the manual.

*Message #80 Posted by **M. Joury** on 7 Dec 2011, 11:10 a.m.,*
in response to message #79 by Masaki Adachi

I don't believe so.

One issue would be that the HP30b/WP34S display does not support a menu system like that of the 42S/17bii/27S etc. So another approach would have to be devised to support such functionality.

Cheers,

-Marwan

On HP33S/35S for instance,procedure is as follows.

Key 'EQN'

Scroll and select the equation that you want to solve.

Key 'Solve" then enter 'A'

then the calculator asks for 'B?' and then 'C?' (for equation A+B=C)

so interface-wise, it appears do-able with 20b/30b LCD display.

A solver could ask for a register to solve for instead of using the x-register. The user would then be required to fill in given values into the remaining registers before calling solve. Maybe a useful extension..?

With some luck, it already works this way (don't know the wp34s either :-D).

in response to message #83 by Thomas Radtke

You enter the label with SLV and the solver always searches for a zero of the program depending on X. I don't see an easy way to change its behavior.

Re: Solve for any variable

*Message #85 Posted by **Thomas Radtke** on 7 Dec 2011, 1:00 p.m.,*
in response to message #84 by Marcus von Cube, Germany

Quote:

> You enter the label with SLV and the solver always searches for a zero of the program depending on X. I don't see an easy way to change its behavior.

(1) enter initial guess into eg. register r0 (or whatever you have)
(2) call the solver
(3) enter program to solve
(4) enter register descriptor for r0

The solver would then feed the current guess into r0 instead of x.

The solver is not interactive so it has no way of querying any additional parameters beyond what's already part of the command (the label of the routine to solve).

Re: Solve for any variable

*Message #87 Posted by **Marcus von Cube, Germany** on 7 Dec 2011, 3:11 p.m.,*
in response to message #86 by Marcus von Cube, Germany

Thinking a bit further, it's not too complicated to create a routine that can be solved for any of its variables, just by using a pointer register:

```
LBL 00
STO[->]00
RCL 01
RCL 02
RCL 02
[times]
-
RTN
```

You can STO 1 or 2 in r00 and the routine will then solve for this register. STO the parameter in the other register before executing SLV 00.

Re: Solve for any variable

*Message #88 Posted by **Thomas Radtke** on 8 Dec 2011, 2:19 a.m.,*
in response to message #87 by Marcus von Cube, Germany

That's actually how I do it on the 15C, but thought it would be easier to remember a slightly different invocation of the solver. Maybe it's not worth it.

Re: HP-15C - useless today?

in response to message #77 by M. Joury

> Quote:
>
> *Cx1.8+32=*F

On the 17b, 17bii, or 17bii+, instead of * to indicate degrees, I would use the actual degree symbol ^{o} since it is available on the set of symbols and can be part of the variable name.

Re: HP-15C - useless today?

*Message #90 Posted by **M. Joury** on 6 Dec 2011, 4:35 p.m.,*
in response to message #89 by Don Shepherd

Yes. That is what I meant by '*' represents the degree symbol. I actually use the degree symbol on both the 17bii and the 42S. I just didn't bother to find the PC equivalent.

Cheers,

-Marwan

in response to message #77 by M. Joury

> Quote:

Here is a simple example:

Temperature conversion:

```
01 LBL "Temp"
02 MVAR "°F"
03 MVAR "°C"
04 RCL "°C"
05 1.8
06 *
07 32
08 +
09 RCL "°F"
10 -
11 END
```

This would be the equivalent of:

```
°Cx1.8+32=°F
```

on the 17bii.

This is an excellent example of the beauty of working with the 17b/27s Solver versus RPN solvers.

Or the power and versatility of the HP42S solver :-). Don't get me wrong, the 17bii solver is great. But, for me at least, the 42S solver is easier to work with for complex problems.

Cheers,

-Marwan

Re: HP-15C - useless today?

*Message #96 Posted by **Martin Pinckney** on 7 Dec 2011, 11:34 a.m.,*
in response to message #95 by M. Joury

We really should be comparing the 27s Solver, because it is scientific like the 42s, rather than business.

But I'm curious, how is the 42s solver easier to work with, when you first have to write a program in RPN to solve the equation, debug it, instead of just keying in the equation?

Re: HP-15C - useless today?

*Message #97 Posted by **Jim Yohe** on 7 Dec 2011, 11:40 a.m.,*
in response to message #96 by Martin Pinckney

Exactly!

... though I'll probably be sorry for agreeing so heartily. ;-)

Re: HP-15C - useless today?

*Message #98 Posted by **M. Joury** on 7 Dec 2011, 12:45 p.m.,*
in response to message #96 by Martin Pinckney

For complex problems. The problem I offered above would definitely not fall into that category and is much easier to solve with the 17bii. Remember that with the 42S you have the power of a full programming paradigm to work with. While I have seen a lot of very interesting problems solved with the 17bii there are problems that don't fall easily into the equation paradigm.

Also, I find RPN programming extremely easy so, while I agree that for simple problems the 17bii is easier to work with, for more complex problems I find the 42S easier to work with -- note that I said "for me at least" in my original post.

Cheers,

-Marwan

Re: HP-15C - useless today?

*Message #99 Posted by **Don Shepherd** on 7 Dec 2011, 1:37 p.m.,*
in response to message #98 by M. Joury

This is an interesting discussion of the types of solvers in HP calculators. I can't help but compare the solvers in the 32s and 32sii. The 32s solver requires you to write an RPN program, I guess much like the 42 (and 30b). The 32sii offers an algebraic solver, similar to the solver in the 17b and 27s but without the power of Σ and IF and menus.

Unless you want to learn some basic tenets of RPN programming, you won't be able to use the 32s solver, but anyone who can type an equation can use the 32sii algebraic solver. I would imagine that is why HP changed the solver approach between the 32s and the 32sii. Although I know RPN, I much prefer the 32sii approach.

I personally am attracted to the the power of the 17b/19b/27s solver, since it contains several features (like loops and decisions) that standard solvers do not.

Re: HP-15C - useless today?

*Message #100 Posted by **Martin Pinckney** on 7 Dec 2011, 2:01 p.m.,*

Remember that with the 42S you have the power of a full programming paradigm to work with. While I have seen a lot of very interesting problems solved with the 17bii there are problems that don't fall easily into the equation paradigm.

We are talking about solvers here, which AFAIK *implies* using equations. Granted, using straight RPN programming affords more raw problem-solving power, especially with a calculator as robust as the 42s. But you can't just write any RPN program and then solve for any variable with the Solver. You have to have a valid equation to solve first, then write a program to represent it.

So my question still begs an answer, how is the 42s solver easier to work with than the 27s Solver?

Unless I am missing something.

Re: HP-15C - useless today?

*Message #101 Posted by **M. Joury** on 7 Dec 2011, 4:50 p.m.,*
in response to message #100 by Martin Pinckney

For anything that requires branching, particularly nested branching, I prefer the 42S approach. Not that the same thing can not be achieved with the 17bii, it is just my preference.

You could of course argue that at this point (nested branching) we are no longer talking about a solver equation per your definition and I would probably have to give you that.

BTW, for most of my regular equations I do use the 17bii solver rather than that of the 42S. I rarely use the 27S simply because it is not RPN.

Cheers,

-Marwan

Re: HP-15C - useless today?

*Message #102 Posted by **Martin Pinckney** on 7 Dec 2011, 5:08 p.m.,*
in response to message #101 by M. Joury

It's not my definition, it's HP's. This portion of the thread was about what HP calls "Solver", not "solving problems by the method most preferred by the user". I understand you prefer RPN programming; I was just trying to understand your rationale for stating that using the 42s Solver was easier than the 17b/27s Solver.

Re: HP-15C - useless today?

*Message #103 Posted by **M. Joury** on 7 Dec 2011, 6:22 p.m.,*
in response to message #102 by Martin Pinckney

Maybe I was not clear. I was talking about branching within a solver routine. You asked for an example of something that both the 42S and the 27S/17bii could do within their respective solvers that I found easier to do on the 42S. For me branching is an example of such.

My statement that this maybe outside your original definition was referring to the fact that such a solution is not a straight equation. I was not switching the topic to discuss overall programming capability. Also that is what I was referring to when I originally said that I sometimes find complex solutions easier to code on the 42S--I was not limiting my definition to straight equations.

As stated earlier, for simple (in this case read no branching) solutions the 17bii and the 27s solvers are much more intuitive and easier to use. Even for an RPN fanatic like me.

Sorry for any lack of clarity.

Cheers,

-Marwan

Re: HP-15C - useless today?

*Message #104 Posted by **Martin Pinckney** on 8 Dec 2011, 9:02 a.m.,*
in response to message #103 by M. Joury

Yes, that does clarify it. Now that intrigues me to understand how I might use the 42s Solver for branching equations. I

understand how to do those on the 27s, but never tried it on 42s.

Thanks!

List 75 Files

Please could you do this for a listing for 41 and 71?

Re: Howard Owen request

*Message #2 Posted by **Howard Owen** on 4 Dec 2011, 10:04 p.m.,*
in response to message #1 by robertoataulfo

Hi, Roberto,

I made a quick list of the different sorts of file, their names and what disk they come from. I zipped them up and made it available here. I didn't include the LIF date or size. I was interested once in organizing those files for use, preservation and study. I had a database up that I called "swapdex." I thought I might get others interested helping to pull out the files and figure out what they did. Unfortunately, I was not energetic enough to get the thing rolling. (One alternative explanation might be that the idea sucks. :) The main problem is that there are nearly 4000 files in the archive.

I think it is my HP71B (TAS)

*Message #1 Posted by **Miguel Toro** on 4 Dec 2011, 4:07 p.m.*

Hello,

I well I do not know what to do. I lost my HP 71B and I think it is selling now at ebay, here. I contacted the seller to see if we can verify if it is really my calculator.

I am not sure where I lost it: maybe at the train, going home or I forgot it visible on my office. Either way, it is my bad. Also an error I made (because I have never lost one of my calculators): I did not keep track of the serial number.

There are several other details that can positively identify it but I will keep that from the seller. If was counting looking for it at the lost objects of the train station and after that report it to the police.

Hard way to learn not to take it from home. :-(

Edited: 4 Dec 2011, 7:40 p.m. after one or more responses were posted

Re: I think it is my HP71B (TAS)

*Message #2 Posted by **Lincoln R.** on 4 Dec 2011, 4:26 p.m.,*
in response to message #1 by Miguel Toro

Luckily the only time I lost one of my calculators was at my college. I left it in a lab, and while TI graphing calculators typically disappear rather fast when this happens (When I was a sophomore I inadvertently left a TI-89 Titanium unattended in a lecture hall for 5 minutes, and by the time I noticed it missing someone had already taken it), someone actually had the decency (or lack of interest in pilfering) to return my beat up 32S to the lost and found desk. I checked, not expecting to find it, asking "Hey, did anyone bring in an old and beat up looking calculator? It's a Hewlett-Packard 32S in a brown faux leather case." The lost and found guy digs around a bit, and sure enough the calculator was there.

Re: I think it is my HP71B (TAS)

*Message #3 Posted by **Miguel Toro** on 4 Dec 2011, 5:17 p.m.,*
in response to message #2 by Lincoln R.

Well,

I think I am lucky: the item has been retracted after a discussion with the seller proving that it was indeed my calculator, hopefully I will receive it this week by mail.

Regards,

Miguel

Re: I think it is my HP71B (TAS)

*Message #4 Posted by **Jeff Kearns** on 4 Dec 2011, 6:37 p.m.,*
in response to message #3 by Miguel Toro

This is an interesting post. I just checked the link and the item is still up for auction.

The seller appears to reside in Montreal... Is that where you lost the 71B?

His description and answers to questions indicate his unfamiliarity with the calculator.

Good luck in getting it back and bravo for finding it again in this fashion.

in response to message #6 by Miguel Toro

I'm curious - since you didn't have the serial number, how did you prove to him that it was indeed yours?

Did you describe a program that was stored on it... or ....

It is the holiday season and looks like you got your wish.

Bill

Re: ...And I got it back!!!

*Message #9 Posted by **Miguel Toro** on 6 Dec 2011, 3:10 p.m.,*
in response to message #8 by Bill (Smithville, NJ)

I described enough the machine, but kept for me some other characteristics in case I had to escalate, as the version of the rom, the existence of the math rom on port number 3 with its version, the fact that the card reader is installed and he was not even aware of that. So, too much customisation that was put together for it not to be my calculator.

What I told him: when and where I thought I lost it, the kind and brand of batteries installed (Energizer rechargeable batteries) and some marks he did not mention in the description that I know are there and of course the little threat to escalate, I think.

I did not want to mention any program because, they could have been erased (I had recently entered MAKELEX and RPNLEX), as that was the case.

Miguel

Edited: 6 Dec 2011, 3:13 p.m.

HP-70 erratic behaviour - first results

*Message #1 Posted by **Alberto Fenini** on 4 Dec 2011, 3:49 p.m.*

Dear All,
this is the first follow up on the topic, i had some time and I have worked on the electronic side of the problem.
I had ordered and received the Deox and at first I have cleaned all the contacts, but the erratic behaviour was sitll there.

Then I have then realized than the HP45 and the HP70 are very very close from the chipset point of view, except for a couple of ICs.
Using one of my HP45 boards and one old shell I have transplanted from the HP70 board to the HP45 board the two different chips.

this is the original HP70 board

HP45 board ready to receive the ICs

transplat done !!

weird, but it works !!!!

I have now a working HP70 in the body of an HP45, although the keyboard (keys) are those from the HP70. It's kind of weird but it works !!
Now I'll work on the cosmetic side, I have already removed the scratches from the HP70 faceplate with the sandpaper, I'll later spray it with the Tamiya Flat TS80.
If the results will not be good enough, I will remove the lettering from this faceplate (the one pictured) and I'll dissamble it from the black frame.
What do you think ??
Suggestions as always are very welcome,
take care Alberto

HP 41CL; requirements and thoughts about donor shells

*Message #1 Posted by **geoff quickfall** on 4 Dec 2011, 3:19 p.m.*

I think, with Monte's new release, that a review of appropriate donors would be helpful.

Physical characteristics:

```
* must be a fullnut; squared lcd corners; *NOT* rounded lcd corners.
 (figures 1 and 2)

* separate logic board.

* must have perfect or perfectly repaired screw posts.

* can have elastomere zebra strips but the wire wrapped are best.
  (figure 3)

* display drivers come in two types with respect to the CL design.
 - rounded square caps which require a capacitor modification.
   (figures 3, 4 and 5)
 - epoxy blobs which do not require modification.

* time module, although not required, it does activate the clock.
  the functions are avialable without the module.
```

figure 1: square LCD panel (a donor).

figure 2: rounded LCD panel (not a donor).

figure 3: wire wrapped connector.

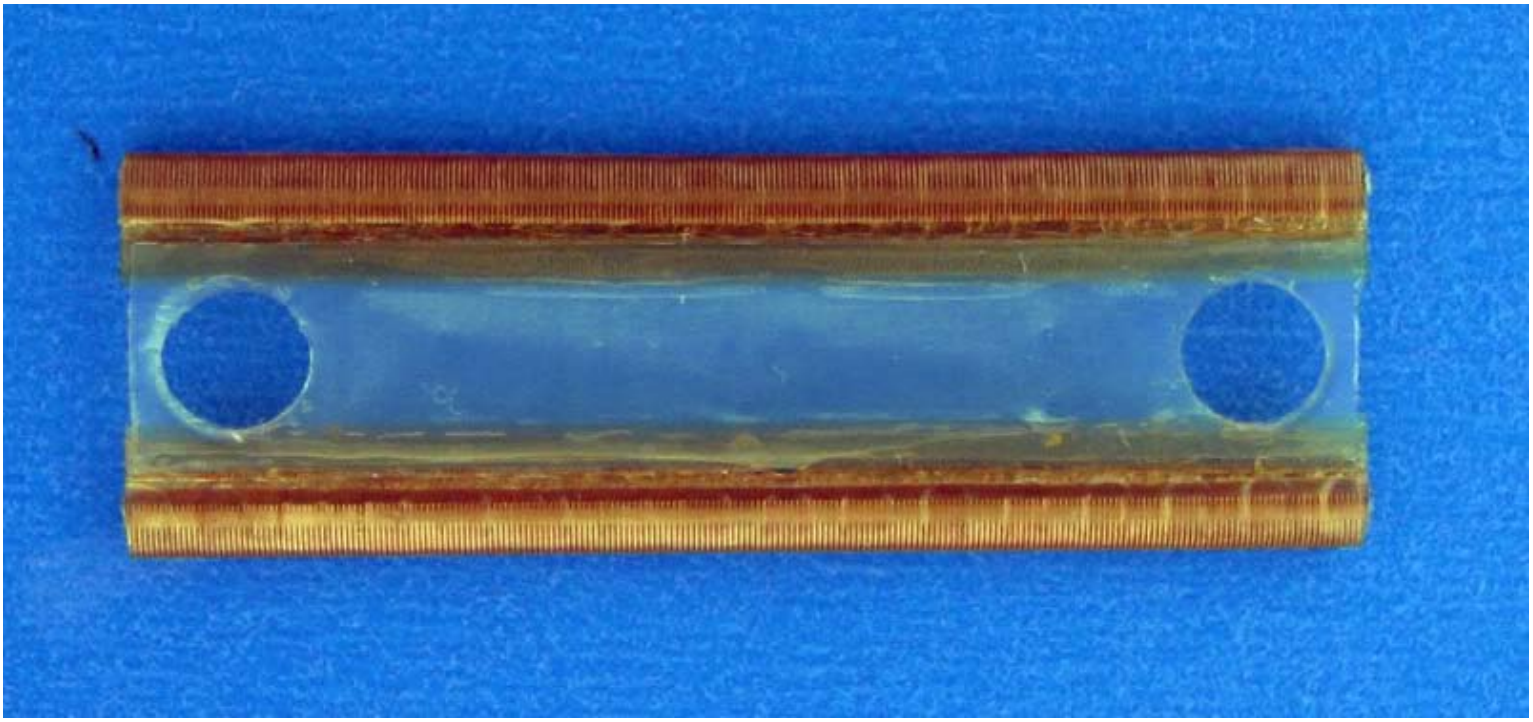

figure 4: example of square capped drivers.

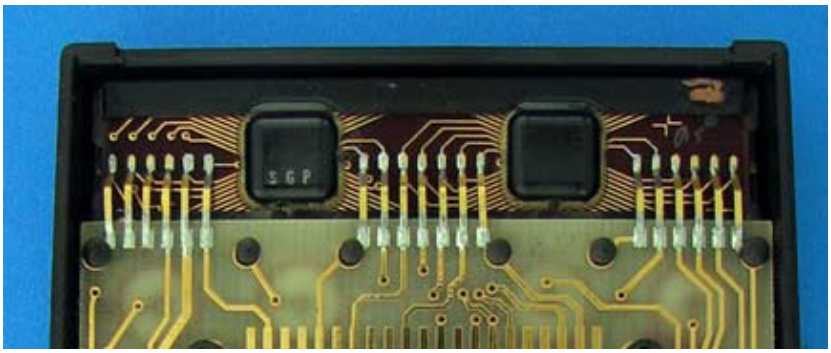

figure 5: wiring diagram for capacitor modification.

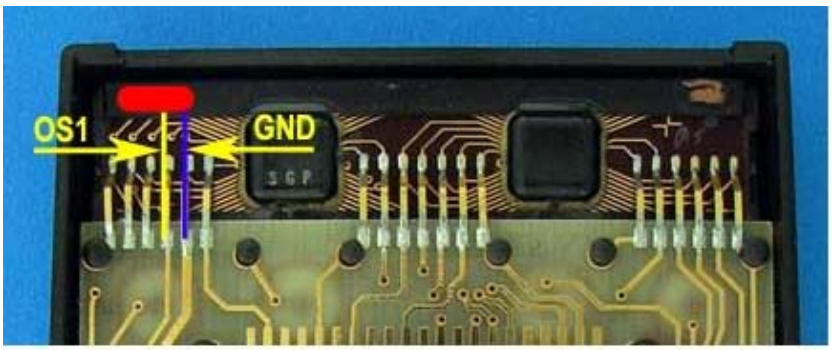

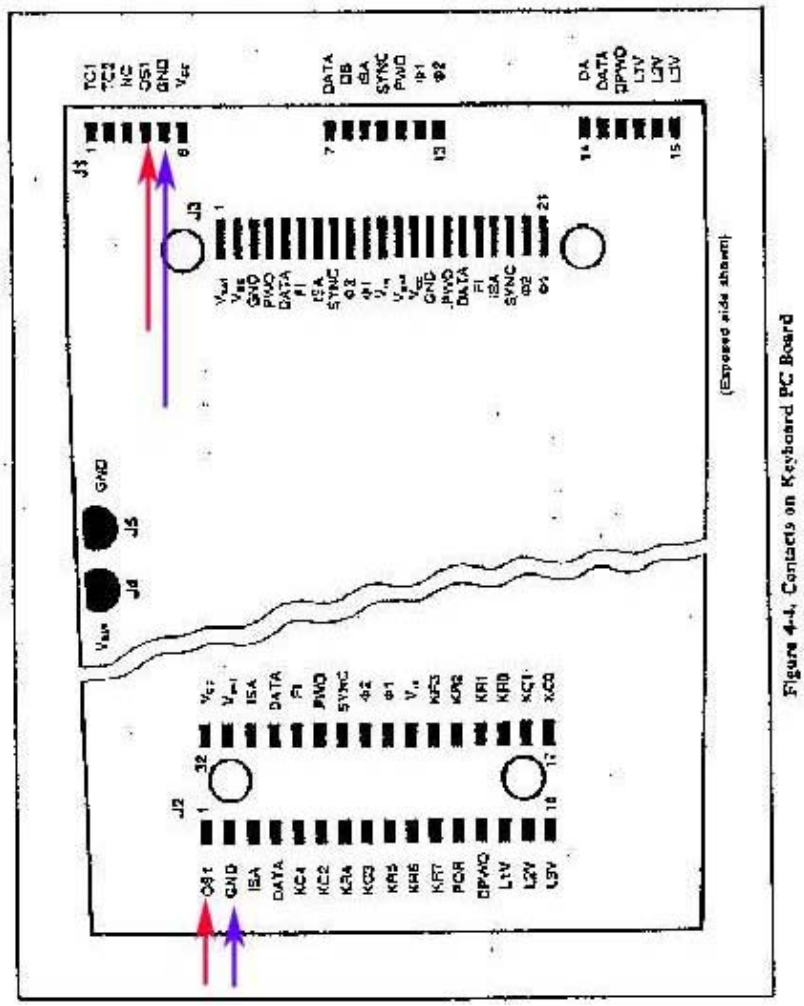

figure 6: example soldered in place.

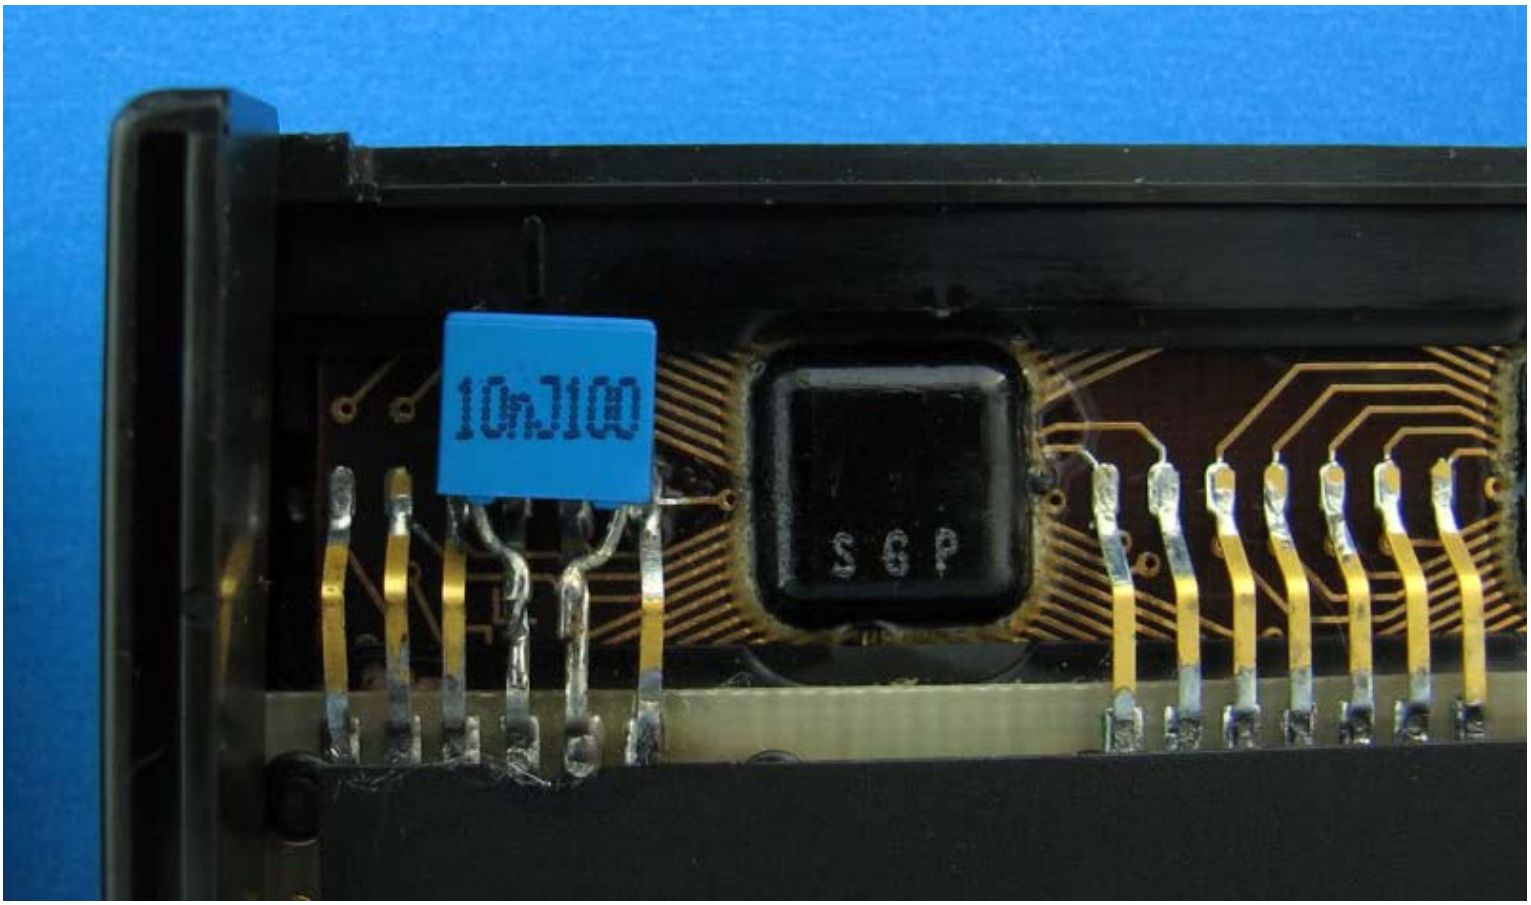

Personal preferences:

```
*CX's would be a waste of a good (albiet slow machine) although
 the entire process is reversable from a collectors viewpoint
*CV's are a perfect choice depending on condition.
*C's with slanted keys are more readable.
*C's with tall keys are fun because they are the oldest and combined
 with the newest make for a conversation piece.
```

I have a 41C from 79 with tall keys, square lcd drivers and the two gold ac connector balls. I chose the C out of sentimental reasons as it is my first HP 41C purchased way back when.

Re: HP 41CL; requirements and thoughts about donor shells

*Message #2 Posted by **Garth Wilson** on 4 Dec 2011, 4:08 p.m.,*
in response to message #1 by geoff quickfall

Quote:

* must be a halfnut; squared lcd corners; *NOT* rounded lcd corners. (figures 1 and 2)

Square corners would be the coconut. The halfnut has the rounded ones.

The "ALPHA" annunciator in the display in the picture can be gotten rid of by executing PROMPT to display the alpha register.

Now we need someone to make a time module to to build into the 41c memory modules (the ones that are useless for the cv & cx which already have the main memory capacity filled out) that are cheap on TAS. The time modules are so rare.

Edited: 4 Dec 2011, 4:14 p.m.

thanks Garth, typo fixed.

*Message #3 Posted by **geoff quickfall** on 4 Dec 2011, 7:59 p.m.,*
in response to message #2 by Garth Wilson

nt

the halfnut display is a Display test routine found in PPC ROM or made with the bytejumper.

Geoff

in response to message #1 by geoff quickfall

Geoff:

Nice work!

Is there anyway do determine the type of donor by the serial number?

Obviously, the display type is obvious, but the other characteristeics require opening the machine.

Thanks, TomC

> Is there anyway do determine the type of donor by the serial number?

Yep. Check page 6 of the HP-41CL manual for the details which you can find here

You'll have to open it up to check the connector type, though.

Cheers, Bob

Re: HP 41CL; requirements and thoughts about donor shells

*Message #8 Posted by **Geoff Quickfall** on 7 Dec 2011, 3:47 a.m.,*
in response to message #7 by BobVA

Randy is correct and I should have mentioned it.

The repair shop replaced keyboards and LCD panels then reattached the original backs.

So you get a mishmash of fullnut serial numbers with halfnut guts. The EARLY HP41Cs have a different rearshell then the later 41's. These are recognized by the hex nuts used to attach the logic PCA to the keyboard.

Later models used a modified rear shell which pressed all subsequent logic PCA's into the keyboard PCA.

On some occasions, HP did not reassemble with the hex nuts as they are very on forgiving and the screw posts stripped. I have two early HP41Cs which HP converted the hex nuts into thick plastic ringed spacers which fit over the screw posts on the logic pca as it sits on the keyboard pca. This allowed for the reuse of the original rear shell which then pressed down on the spacere which inturn, pressed the logic pca into the keyboard pca.

Wlodek's book mentions that HP actually may have repaired some HP41Cs with the halfnut board creating a halfnut hp41C. They did however make from the production line halfnut 41CV and CX's.

The moral of the story is to pick a squared LCD panel and then open up the machine to find a removable fullnut board.

Cheers, Geoff

Re: HP 41CL; requirements and thoughts about donor shells

*Message #9 Posted by **Randy** on 7 Dec 2011, 10:04 a.m.,*
in response to message #8 by Geoff Quickfall

I have repaired several 41C's that had been "converted" by HP service to halfnut electronics. They were in fact 41CV's with 319 registers.

This brings into question, at least for me, the existence of a halfnut rom that was limited to the 64 registers of the original C. I suspect HP never went to the trouble of making a special version just for service spares but cannot confirm. Really not relevant to this thread and I don't mean to take it of topic but it is one of those things that I hear about but can never confirm...

Re: HP 41CL; requirements and thoughts about donor shells

*Message #10 Posted by **Geoff Quickfall** on 7 Dec 2011, 12:17 p.m.,*
in response to message #9 by Randy

The existance of a Halfnut 41C is hearsay at best. I remember having a conversation with Wlodek that it might exist as a 319 register machine. In other words, the keyboard shell side was replaced while keeping the rear shell.

I think he said, if you find a halfnut 41C you would have a rare bird indeed.

Geoff

There are some pictures of one of these rare animals here. One interesting comment is:

> Quote:
>
> I have also pluged a quad module which has been recognized....

which may mean that prior to plugging the quad module there was only 63 registers available as on a standard 41C. But this is only speculative and would need to be confirmed.

Re: HP 41CL; requirements and thoughts about donor shells

*Message #12 Posted by **Randy** on 6 Dec 2011, 11:04 p.m.,*
in response to message #6 by Thomas Chrapkiewicz

In an ideal world, one were your 41 never went back to HP for service, the serial number could be used to determine suitability as a CL.

But, in the real world, HP41 serial numbers alone cannot and should not used to assume what hardware is inside the case. Geoff's list is far better and safer to determine suitability. The only safe way to check is to open the unit and look.

There are many early serial numbers out there that have had the top of the unit replaced with halfnut electronics, this occurred late in the service life of the 41 when HP ran out of coconut parts.

HP 25 programming issue

*Message #1 Posted by **Fouad M. Kaadou** on 4 Dec 2011, 3:07 p.m.*

Hello,

I have an HP-25 that has a programming problem. When I first received the calculator it did not have this issue.

The issue: when I go to PRGM mode any step I enter reults in a 'GTO 00' command. If I press any of the shift keys the display will show that it is in shift mode but when I click on another key it just puts GTO 00.

Any ideas?

- Fouad

Mark Hardman

Re: HP-IL ftp files

*Message #3 Posted by **Howard Owen** on 4 Dec 2011, 3:00 p.m.,*
in response to message #2 by Mark Hardman

That archive has all the files broken out of the LIF images, which is quite useful. I seem to recall the nice thing about the original repo was it had LIF images you could use directly with an emulator or a real calc. I'm looking through my files for the original archive, so far with no luck.

Re: HP-IL ftp files

*Message #4 Posted by **Howard Owen** on 4 Dec 2011, 3:29 p.m.,*
in response to message #1 by robertoataulfo

I couldn't find the original archive, but I did find the LIF images themselves. I zipped them up here . If you want individual files, then the museum archive is good. This archive works better if you want to use the images with an emulator or through the PILBox or ISA card to a real calculator.

Meindert's MLDL2000

*Message #1 Posted by **robertoataulfo** on 3 Dec 2011, 8:16 p.m.*

Meindert's MLDL2000 new version ?

Re: Meindert's MLDL2000

*Message #2 Posted by **Meindert Kuipers** on 5 Dec 2011, 7:41 a.m.,*
in response to message #1 by robertoataulfo

Currently I am struggling with available time to finish the design, and with the more than welcome 'competition' of the 41CL (looking forward to receiving my own unit). I seriously doubt if I will have enough potential users to justify a cost effective production run.

With other platforms on the horizon (I sincerely hope that Eric's ARM version of the DIY Calculator will see the light) the MLDL2000 will have very limited added value, apart from offering a nice interface to today's PC world with USB.

Of course I welcome positive feedback that could increase my motivation to finish this project.

Meindert

Re: Meindert's MLDL2000

*Message #4 Posted by **Gerry Schultz** on 5 Dec 2011, 1:13 p.m.,*
in response to message #2 by Meindert Kuipers

Meindert:

I too am interested in your MLDL2000 as I want an easy and simple interface with a PC to load and use with my 41Cs. I got my 41cl board last week and should receive my refurbished 41CV today (it was handed to me as I was writing this. Thank you Geoff!).

One area you can probably address, since you're getting your own 41cl, is the ability to add and manipulate ROM images on the cl. If your software could talk to both your hardware and a 41cl with a serial port, that would peak my interest even more. Also, I can migrate your hardware to any 41c that I own so I see that

as another advantage.

I've never looked at only one solution for my needs and when I have more than one way to do it, I consider that an advantage. Please consider continuing your development of the MLDL2000. I for one still want one.

Thank you, Gerry

*Message #5 Posted by **Ángel Martin** on 5 Dec 2011, 4:46 p.m.,*
in response to message #4 by Gerry Schultz

> Quote:
>
> the ability to add and manipulate ROM images on the cl

I for one very much appreciate the MLDL2k and sure enough will love to see a new version coming out - but the CL is already capable to manipulate the ROM images, either in RAM or Flash - without any external accessory.

What I'd love to see is a "front end" (for lack of a better word) that could connect the actual 41 to a V41-like program on the PC - on a one-to-one fashion, all through the USB bus.

So it's probably a pipe-dream thing, but wouldn't it be nice to replace the current MLDL2k Manager with an intelligent shell on the PC that actually drove the machine and would be driven by it?

Cheers, 'AM

Re: Meindert's MLDL2000

*Message #6 Posted by **Garth Wilson** on 5 Dec 2011, 2:35 p.m.,*
in response to message #2 by Meindert Kuipers

I am optimistic about these new things for the 41, but the problem of time-module availability puts quite a damper on the CL for me. I've been watching TAS for a long time and not a single time module has come up. When it does, I'm definitely not going to pay $389 like you-know-who likes to charge, trying apparently to prop up the market. I'd also have to buy another 41, since mine is a 41cx halfnut. So I'd say keep going with the MLDL2000 projects.

Re: [HP-75] Cat$ doubt

*Message #8 Posted by **Paul Berger (Canada)** on 3 Dec 2011, 8:38 p.m.,*
in response to message #3 by robertoataulfo

Ok its seems that you need an IO ROM for this. In the IO ROM there is a function TCAT$. For example my 75C with an IO ROM it auto assigns my diskette drive to be :M1 on the command line I enter F$=TCAT$(':M1',2) @ DISP F$ and it displays the file name of the second file on the diskette in the drive. This should work the same way for a tape drive, I would try it but since getting a diskette drive I don't use my tape drives anymore and have cleared all of my tapes.

If you don't have an IO ROM there may be a LEX file available that provides this function, or you could read and parse the raw directory block from the tape.

What is this?

Re: What is this?

*Message #2 Posted by **Keith Midson** on 3 Dec 2011, 2:18 p.m.,*
in response to message #1 by robertoataulfo

I think it's a Numonics Electronic Graphics Calculator, Model: 1224-113-8042 ...

Re: What is this?

*Message #3 Posted by **Katie Wasserman** on 3 Dec 2011, 2:22 p.m.,*
in response to message #2 by Keith Midson

On a more helpful note, I think it's an early graphics digitizer made by Numinics Corp who now makes white boards. They've been around for 40 years and they used to make digitizers.

Re: What is this?

*Message #4 Posted by **Bill (Smithville, NJ)** on 3 Dec 2011, 3:51 p.m.,*
in response to message #1 by robertoataulfo

From a search on the WEB, there are a lot of medical articles that mention using Numonics Electronic Graphics Calculator. From a 1982 NIH article on Nucleic Acids Research:

> Quote:
>
> The magnified image is then traced, along the top side of the viewing screen, using a digitizer. The digitizer used in this system is a NUMONICS GRAPHICS CALCULATOR which was chosen because it can be used with a back projected image, is of sufficiently high accuracy and of reasonable cost. This digitizer can resolve 0.025 cm over a working range of 59 cm x 59 cm. As the tracing head is moved along the image, a stream of X-Y coordinates is accepted by the computer at a rate of more than 100 coordinate pairs/sec via a BCD interface.

[wp34s] A Short Wish List

*Message #1 Posted by **Les Wright** on 2 Dec 2011, 5:21 p.m.*

Occurred to me I would love to see some capacity to APPEND a program to flash memory, I guess like HSAVEP in the HEPAX module. (HEPAX is a better analogy than HP41 extended memory, because in that case you can't run programs from extended memory, only archive them.)

Also, it would be neat to write up a program listing following some standard syntax in a simple text file that could be compiled to a format readable by the wp34s emulator so that the program could be manipulated back and forth by the serial commands like RECV, SENDA, etc

Just saying :D

Les

Re: [wp34s] A Short Wish List

Something like this is planned and a major driving force for the implementation of the END command.

> Quote:
>
> Also, it would be neat to write up a program listing following some standard syntax in a simple text file that could be compiled to a format readable by the wp34s emulator so that the program could be manipulated back and forth by the serial commands like RECV, SENDA, etc

Isn't this possible already?

The emulator takes the same binary image files as the calculator and things can be transferred between the emulator and the real device via the serial commands or the programming cable.

The assembler works both as an assembler and a disassembler, thus it can be used to produce a canonical text representation of programs.

- Pauli

Re: [wp34s] A Short Wish List

*Message #3 Posted by **Les Wright** on 2 Dec 2011, 6:24 p.m.,*
in response to message #2 by Paul Dale

I have never worked with the assembler!

I feel silly--should've researched that more.

I will explore that and see how I get along. It would be so neat for users to swap programs in text and binary form to get into the calc via the emulator.

Les

Re: [wp34s] A Short Wish List

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 2 Dec 2011, 11:14 p.m.,*
in response to message #3 by Les Wright

Typically text form would be prefered since the binary image will not always be compatible between calculator revisions. The opcodes can change between various revisions of the calculator. Actually this was the original impetus for the assembler/disassembler.

Additionally, the text form allows commenting, etc.

While some mnemonics have changed a occasionally, they have been pretty stable lately.

You will already find a reasonable collection of user programs in the library directory of the SVN load. More are probably welcome.

Re: [wp34s] A Short Wish List

*Message #5 Posted by **Les Wright** on 3 Dec 2011, 2:38 a.m.,*
in response to message #4 by Neil Hamilton (Ottawa)

Okay--I am apprehending this at a pretty novice level right now.

From what I see the assembler takes a text file in the appropriate syntax and spits out a *.dat file which, if given the appropriate name and dropped into the emulator home directory (or, alternately, concatenated with calc.bin via "join" and flashed to the calculator) for running, copying to and from flash on the emulator, moving over to the calc via SEND* and the cable, etc.

This is only slightly more complicated than using hp41uc to create *.raw files from text to get into HP41C and HP42S emulators and or, in my case a lot, may barcode files for laser printing, wanding into the calc, the writing to cards.

I will play with the assembler in the days to come. I broke a pin on the plug of my cable so I am awaiting the replacement from Gene, so I will have to wait to see i things move over to the real calc okay.

more HP97 card reader followup.

*Message #1 Posted by **Dave F** on 2 Dec 2011, 1:31 a.m.*

I had last posted that my newly acquired HP97 was all working, except the card reader, which was pulling cards slowly with hight current (>300 mA), and producing errors. It was looking like the tubing I had used to repair the gummy wheel was too large diameter.

I ordered the correct O-rings, and received them today. Replacing the tubing with the O-rings, there is slight improvement; the card pulls through slowly, but not as slow and jerky as before, and the current is still high (about 250 mA) regardless of the cam position. I will spend some time next trying to get this resolved, but I would be most grateful for any additional suggestions.

Thanks,

Dave

Re: more HP97 card reader followup.

*Message #2 Posted by **Jean-Michel** on 2 Dec 2011, 4:48 a.m.,*
in response to message #1 by Dave F

Hi Dave,

I have fixed the same issue on my HP-97, with O-rings too. I have currently not in mind the exact size of O-ring I choose (I tested several), but I will keep in mind to check this as soon as I will be back at home. I didn't mesure the current though, but the card reader did read and write correctly, so, no more investigations were needed to my opinion.

Kind regards.

Re: more HP97 card reader followup.

in response to message #1 by Dave F

What is the motor current with the gear removed? If it is higher than about 40ma, the screw is bent or not centered on the motor shaft.

Re: more HP97 card reader followup.

*Message #4 Posted by **Randy** on 2 Dec 2011, 10:03 a.m.,*
in response to message #3 by Randy

Duoh. Is the 250ma with or without a card present? If it is card present, is it card stalled (held back) or card moving?

Re: more HP97 card reader followup.

*Message #5 Posted by **Dave F** on 2 Dec 2011, 10:06 p.m.,*
in response to message #4 by Randy

Thanks for all the help!!!

I just checked it--about 20 mA. Interestingly, the reader is now working! I had to put the machine away so I can use my bench for work over the weekend, so I assembled the whole unit, and popped in the battery I bought (from Mark via Ebay), and just for kicks, I slid a card in and it went through smoothly this time, but gave an "ERROR". I wondered if perhaps the card contained garbage data, so I tried the Diagnostic Card from the Standard Pac, and it read both sides, then wrote both sides of that same blank card, then read the card back. I ran the program, and it gave me the -7.777777770-77 as expected, and printed out 1.+07, 10.000+06***, 1.0000+07***.

However, the manual indicates it should leave a -8.888888888-88, and instead I see 1000000.00

I am assuming the last is a display test. Why would the calc not show it?

Also, I notice that the printer paper tends to jam a bit while loading. I had to thread a piece of tape beneath the platic sheild to try to fish the leading edge of the paper up and through. Afterwards, it seems to feed along nicely, although the printer makes a bit of a whining sound.

All the keys work beautifully, and the display is excelent, except that part of the middle segment on the rightmost digit doesn't light.

Best regards,

Dave

Latest HP 12C+ F/W Version

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 1 Dec 2011, 3:17 p.m.*

I just acquired a 12C+. Very nice (and fast!) unit. S/N CNA00616171. White key font seems nicer than some of the new ones I have seen online -- a bit skinnier than my '86 era original. The blue and yellow seem identical. Key click is good -- a bit hollow, but quite acceptable.

It has F/W version 2009-07-02. I have seen references to later versions (eg: 2009-11-19).

Does anyone know the differences between the various versions? Are the newer ones available (ie: via special request)? Is it worth bumping the version from the one I have?

Thanks...

Quote symbol in Alpha mode on 41C?

*Message #1 Posted by **Mojo88** on 1 Dec 2011, 2:45 p.m.*

Hi folks, its been a long time for me since I sat down with 41C. I pulled out my old Time Module Function book and started entering the program listing for the SETALM routine. I cannot remember how to enter the quote (")symbols around the message text prompts. I've looked through the manual and cannot find any mention or sight of a quote (")or double quote (""")symbol entry in Alpha mode. Example: "TIME ?" - as a prompt to the user for an input. I can't figure out how to get the quotes in there.

I've looked on the back of the calc and the symbol isn't there. Could you help me out? Many thanks for your help!

Re: Quote symbol in Alpha mode on 41C?

*Message #2 Posted by **Eric Smith** on 1 Dec 2011, 3:45 p.m.,*
in response to message #1 by Mojo88

There's no way to enter a quotation mark symbol from the keyboard, except maybe with a special ROM module that extends the key parser. You can get a quotation mark symbol into the alpha register using functions like XTOA of the Extended Functions Module (effectively built in on the 41CX).

However, if you're looking at program listings, they are printed with quotes around all alpha string program lines. You don't enter the quotes. If you want to prompt with the string TIME ?, not including the quotes, you just press ALPHA T I M E space ? ALPHA.

Re: Quote symbol in Alpha mode on 41C?

*Message #3 Posted by **Namir** on 1 Dec 2011, 4:53 p.m.,*
in response to message #1 by Mojo88

You are over complicating a very simple issue. The double quotes are a practical abbreviation for the [ALPHA] key. When 41C listings appear, it is smoother on the eye to read "TIME?" than to read [ALPHA]TIME?[ALPHA].

Namir

Re: Quote symbol in Alpha mode on 41C?

*Message #4 Posted by **Geoff Quickfall** on 1 Dec 2011, 7:25 p.m.,*
in response to message #3 by Namir

Actually, are we talking about the Quotes in the manuals, in which case I agree with Namir and Eric.

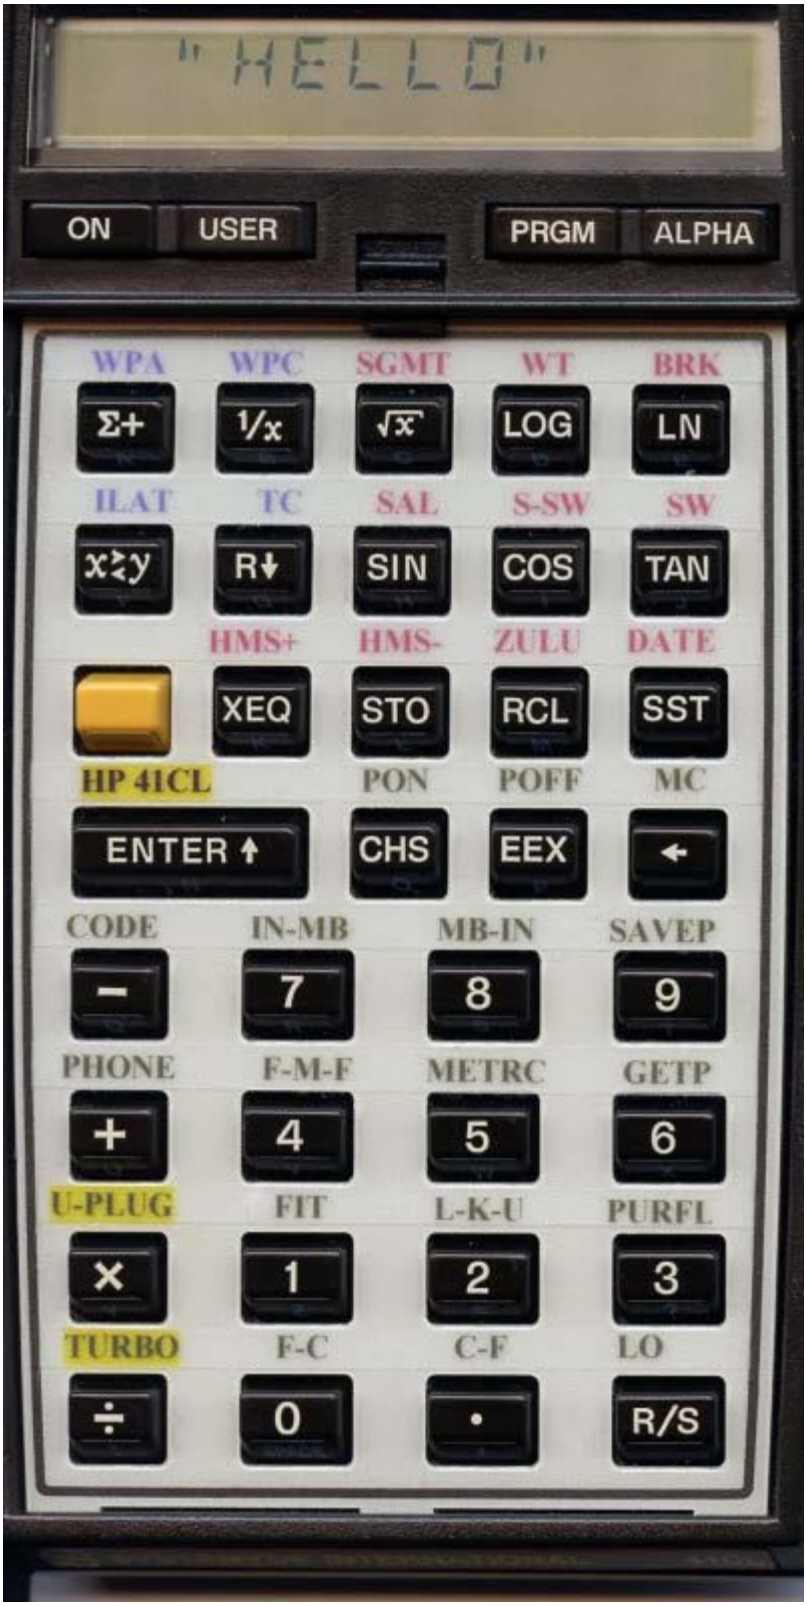
OR

are we talking about quotes on a alpha display, in which case, Synthetics are your answer. You can create it with a simple byte jumper, or CCD or equivalent module or as Eric said "XTOA".

I have labelled many alpha prompts and displays with the " (double quote).

Cheers, Geoff

I used the CCD module in my 41CL (YEHHH MONTE) to produce this display in about 3 seconds.



added later: the title confused me, I thought you wanted quotes in the alpha display. I guess the missive RTFT (read the full text) applies here.

AC Power Adapter for HP 67

*Message #1 Posted by **Phil Hochstetler (Portland, OR, USA)** on 1 Dec 2011, 11:24 a.m.*

I have a mint condition HP 67 that is missing its power supply. Does anyone know where I might find one? I looked on ebay but did not find any for sale. This calculator has not been powered up in 30 years and was only lightly used prior to that time.

Re: AC Power Adapter for HP 67

*Message #2 Posted by **Michael de Estrada** on 1 Dec 2011, 11:40 a.m.,*
in response to message #1 by Phil Hochstetler (Portland, OR, USA)

Just keep in mind that you will also need a good battery pack to operate it safely and that probably the card reader drive wheel will need to be rebuilt.

Edited: 1 Dec 2011, 11:40 a.m.

Re: AC Power Adapter for HP 67

*Message #3 Posted by **Phil Hochstetler (Portland, OR, USA)** on 1 Dec 2011, 7:06 p.m.,*
in response to message #1 by Phil Hochstetler (Portland, OR, USA)

Thanks. I did enough reading on the power supply to realize that if you try to operate it on the AC supply without a working battery, the voltage will rise high enough to damage things. Thanks for the heads up.

Re: AC Power Adapter for HP 67

*Message #4 Posted by **Dan W** on 1 Dec 2011, 7:59 p.m.,*
in response to message #3 by Phil Hochstetler (Portland, OR, USA)

The HP67 uses the same DC power supply as all the Classics. It is the 97 that uses an AC supply.

[wp34s] Using FAST and SLOW

*Message #1 Posted by **Les Wright** on 1 Dec 2011, 10:53 a.m.*

I was testing out the integration program I mentioned in an earlier thread when I noticed that things were taking almost twice as long to solve as when I began testing them. I thought I broke something in my program, but I when I reverted to an earlier version that I knew tested faster the slowing was still there.

Eventually discovered the FAST and SLOW commands in the manual. I thought FAST might override the calculator's propensity to drop into SLOW mode when battery voltage drops, but apparently not. I ran FAST, then started up the integration problem, saw the low-batt indicator flash for a bit, then go out, so I assumed the calc had adjusted and reverted to SLOW mode again.

Am I right in my observation here that it looks like SLOW can override FAST when batteries are fresh, but FAST can't override SLOW when batteries are lower? Also, where is the cut off point where the calc goes into SLOW mode. BATT told me I was running at 2.9V for a few days, but now it consistently reads 2.8V, so I am guessing that's the magic number?

TIA,

Les

Re: [wp34s] Using FAST and SLOW

*Message #2 Posted by **Walter B** on 1 Dec 2011, 5:10 p.m.,*
in response to message #1 by Les Wright

Making a long story short: Yes, SLOW can override FAST. And yes again, you can't set FAST if the battery voltage is lower than a certain limit.

Re: [wp34s] Using FAST and SLOW

*Message #3 Posted by **Les Wright** on 3 Dec 2011, 3:48 a.m.,*
in response to message #2 by Walter B

> Quote:
>
> Making a long story short: Yes, SLOW can override FAST. And yes again, you can't set FAST if the battery voltage is lower than a certain limit.

Thanks, Walter. The short answer is what I needed now. I was wondering why my program was taking almost twice as long to run. The processor is clocked to half the speed, which for simple calculations and fast programs is in itself more than enough.

Les

Re: [wp34s] Using FAST and SLOW

*Message #4 Posted by **Dominic Richens** on 3 Dec 2011, 7:27 a.m.,*
in response to message #3 by Les Wright

if you are up to making Wiki updates as you learn stuff, feel free to update WP-34s Users' Guide. I know that the FAST and SLOW are not yet documented (like most stuff).

Re: [wp34s] Using FAST and SLOW

*Message #5 Posted by **Walter B** on 3 Dec 2011, 10:25 a.m.,*
in response to message #4 by Dominic Richens

> Quote:
>
> I know that the FAST and SLOW are not yet documented (like most stuff).

Hmmh, not quite true: Both are documented in the manual (like almost all stuff) ;-)

Re: [wp34s] Using FAST and SLOW

*Message #6 Posted by **Dominic Richens** on 3 Dec 2011, 11:14 a.m.,*
in response to message #5 by Walter B

yes, quite true - the owner's manual does have everything. I guess what I should say is that it would be good to capture the examples discussed in this forum somewhere - the Owner's Manual is not the appropriate place (otherwise it would be 1000 pages in no time).

I was dry-walling a trapezoidal attic wall in my house and trimming in an arched window. The WP-34s fraction mode was very, very useful, but I had to play with the DEN* modes a bit before I understood what you meant :-)

Hence I took the time to document what I figured out in the wiki..

(OT) Heathkit and Nixie Tubes

*Message #1 Posted by **Gerry Schultz** on 30 Nov 2011, 4:47 p.m.*

Recently, we've had topic threads on both Heath kits and Nixie tube displays. In digging around the net, I found a kit from KABtronics called the Nixie-Transister Clock Assembly Kit. It uses no IC chips, only transistors, diodes, resistors, capacitors, etc. and the display uses Nixie tubes. It just arrived today and it's very cool. All the parts along with a complete instruction manual are included. Some assembly is required. :^P

Following this forum costs me way too much money...

Gerry

*Message #3 Posted by **Katie Wasserman** on 30 Nov 2011, 7:07 p.m.,*
in response to message #2 by DavidShenk

Nice big PCB with lots and lots of soldering to be done. But I don't like those Russian Nixie tubes that use an upside down '2' instead of a real '5'.

Re: (OT) Heathkit and Nixie Tubes

*Message #4 Posted by **Jim Yohe** on 1 Dec 2011, 1:01 a.m.,*
in response to message #3 by Katie Wasserman

Yeah that's what you need ... nixie tubes to keep your place warm. I just like they way they looked. ;-)

Re: (OT) Heathkit and Nixie Tubes

*Message #5 Posted by **Marc Ferrer (France)** on 1 Dec 2011, 1:01 p.m.,*
in response to message #4 by Jim Yohe

Hello to you all,

The link to KABtronics appeared in this forum for the first time, 2 or 3 weeks ago. I jumped on it and ordered the LED Transistor clock kit. It's a real joy for a (real) geek. I'm in the process of building it, by now 400 out of ~1200 components assembled, 950 solders out of ~2800 done and yesterday I saw the first digit displaying seconds from 0 to 9... what a fun.

Just my 2 cents, Marc

Edited: 1 Dec 2011, 1:02 p.m.

Re: (OT) Heathkit and Nixie Tubes

*Message #6 Posted by **Gerson W. Barbosa** on 30 Nov 2011, 6:55 p.m.,*
in response to message #1 by Gerry Schultz

Congratulations! Many hours of fun ahead :-)

Not nearly as fancy, that's kind of a poor man's digital clock kit I assembled years ago:

http://i918.photobucket.com/albums/ad30/gwbarbosa/DIY%20Digital%20Clock/DIYDC_1.jpg

http://i918.photobucket.com/albums/ad30/gwbarbosa/DIY%20Digital%20Clock/DIYDC_2.jpg

http://i918.photobucket.com/albums/ad30/gwbarbosa/DIY%20Digital%20Clock/DIYDC_3.jpg

http://i918.photobucket.com/albums/ad30/gwbarbosa/DIY%20Digital%20Clock/DIYDC_4.jpg

A co-worker gave me two printed circuit boards that had come with an electronics magazine. I gathered the required components and assembled the kit, but I was soon disappointed as there was no backup batteries to keep the correct time when AC went off. So I rebuilt the main board and added a secondary board to provide an alternative 60-Hz clock signal. One transistor switches off the LED displays when power if off, the other one triggers the 555 IC. The tiny board that holds one diode and two resistors switches off the two blinking LEDs (I'd forgotten about them). Still working! :-)

Gerson.

Edited: 30 Nov 2011, 6:59 p.m.

Re: (OT) Heathkit and Nixie Tubes

*Message #7 Posted by **David Ramsey** on 30 Nov 2011, 7:58 p.m.,*
in response to message #6 by Gerson W. Barbosa

A 555 timer! I remember those from the Apple][days...it was used for the joystick input circuit on the][...

Do they still make 555 timers?

Re: (OT) Heathkit and Nixie Tubes

*Message #8 Posted by **Gerson W. Barbosa** on 30 Nov 2011, 8:04 p.m.,*
in response to message #7 by David Ramsey

Yes, "the part is still in widespread use":

http://en.wikipedia.org/wiki/555_timer_IC

Re: (OT) Heathkit and Nixie Tubes

*Message #9 Posted by **Eric Smith** on 30 Nov 2011, 9:38 p.m.,*
in response to message #7 by David Ramsey

The joystick circuit used a 558, which was a quad timer that was vaguely similar to a 555. Some people call it a quad 555, but it isn't really.

LOVE this watch! Two digits?

Re: On Nixie tubes, HP 41 CL's and hello Gerry

*Message #15 Posted by **Geoff Quickfall** on 1 Dec 2011, 1:12 p.m.,*
in response to message #14 by Jim Yohe

Has a settable tilt setting and a 24 hour setting.

tilt the watch to view and it displays in a series of flashes:

```
- first flash hours
- second flash minutes
- third flash seconds; displaying up to 30 seconds at a time to
  save power.
```

6 volt lithium battery stepped up to 150V to drive the display with a step back to 130V (by memory, should check the site) to continue the display. Well check out the site:

*Message #21 Posted by **Gerry Schultz** on 1 Dec 2011, 1:16 p.m.,*
in response to message #10 by geoff quickfall

I like the look of Nixies as I worked with them a lot many moons ago. This clock also runs off of 60hz mains but I recently heard that the power grid is not going to maintain the strict 60hz standard as in the past so clocks dependent upon AC power will not be as accurate. I suppose with WWV and GPS clocks, it's not so critical but that bums me out.

Gerry

Re: On Nixie tubes, HP 41 CL's and hello Gerry

*Message #22 Posted by **Cristian Arezzini** on 1 Dec 2011, 2:44 p.m.,*
in response to message #21 by Gerry Schultz

They will stop the night-time "catch-up" to compensate for lost cycles during daytime. But for what I read, the inaccuracies introduced will be very small, especially considering that you would loose the time setting anyway at every power outage...

Cristian

Re: On Nixie tubes, HP 41 CL's and hello Gerry

*Message #23 Posted by **Gerry Schultz** on 1 Dec 2011, 4:01 p.m.,*

Then I'm plugging it into my PC UPS! With all the winds around here in LA today, I'm lucky to have any power.

Gerry

Re: On Nixie tubes, HP 41 CL's and hello Gerry

*Message #24 Posted by **Cristian Arezzini** on 1 Dec 2011, 5:25 p.m.,*
in response to message #23 by Gerry Schultz

Hehe... I have my power-network-synced clock on an UPS too... but my point was that the UPS's frequency isn't precise at all, surely much less stable and precise than the network, even after the recent "degradation"! :)

Re: On Nixie tubes, HP 41 CL's and hello Gerry

*Message #25 Posted by **Geoff Quickfall** on 1 Dec 2011, 7:10 p.m.,*
in response to message #23 by Gerry Schultz

Gerry,

Doing the math and assuming LA has a really crappy control of there electrical system, lets assume an accuracy factor of only 98% (58.8Hz/60Hz): that is a the system runs at 98% of 60 HZ all day! Of course, the system is described at the LA web site as

"Power Quality refers to the characteristics of the power, or specifically the current and voltage, provided to the customer. The power is to be provided in clean sinusoidal waveforms at a frequency of 60Hz that does not contain sags or spikes, which allows the customer’s equipment, including sensitive electronics, to operate reliably."

```
(1) 60min*24hours=1,440min/day

(2) .98*1,440min/day=1,411.2min/day

yikes at a whopping 30 minutes a day!
```

However, I would suggest from the little research I have done on the LA power grid, the system runs better then that, and that spikes probably serve to cancel drops in the 60Hz as the system does not consistently run 'off' 60Hz.

In anycase, here in Vancouver I am off a minute to two per month during the windy season in November.

Cheers, Geoff

Re: On Nixie tubes, HP 41 CL's and hello Gerry

*Message #26 Posted by **Gerry Schultz** on 1 Dec 2011, 8:22 p.m.,*
in response to message #25 by Geoff Quickfall

Hey Geoff;

Yes, that's my concern, accumulated error. This kit has a backing plate and I'm planning to put it on my garage wall (The garage has been finished. Sort of my mancave. My wife would never let that clock in the house!) but it will be above my desks and a little hard to reach. So it will accumulate errors over time which will require periodic tweaking. I could find an old HP Cesium standard down at the TRW swapmeet and take the 1PPS output to drive the clock. Is that overkill? :^)

At work, hi-freq harmonics on the AC main's neutral line can be an issue. All of our broadcast equipment use switching power supplies which puts lots-o-crap on the neutral line so there is a special transformer (K-factor? I don't remember.) to filter it out. When we use our Fluke analyzer to look at the AC mains there's always a lot of crap on the hots (that's after the 750 KVA APC UPS down on the first floor) but it all works.

Gerry

Re: On Nixie tubes, HP 41 CL's and hello Gerry

*Message #27 Posted by **Cristian Arezzini** on 2 Dec 2011, 6:14 a.m.,*
in response to message #26 by Gerry Schultz

> Quote:

> I could find an old HP Cesium standard down at the TRW swapmeet and take the 1PPS output to drive the clock. Is that overkill? :^)

I've looked into that kit as well... but (also since I have 50Hz here, not 60) I was planning something less dramatic: just the 1pps pulse from a cheap quartz clock would do, I think, and could be easily hidden behind the main board, and powered from the same supply or from a simple AAA battery... Then the only issue would be how to make it keep tracking time during power-outs. I haven't figured that one out yet, besides using another UPS!

Cristian

anyone recognize these pics from old HP manuals?

*Message #1 Posted by **Don Shepherd** on 30 Nov 2011, 10:57 a.m.*

The pictures came from two different HP manuals. Notice that the captions are, essentially, the same.

The good old days.

She looks like she is putting money into a coffee vending machine--you know, the kind that dates from the same period--the cup drops down, there is a whirring inside the box, and coffee flows down, then cream.

Or, more likely, the cup does NOT drop down, but the coffee still flows (down the drain), and you are left for nothing to show for your quarter!

The five-footed chairs that have become universal have only one main objective...to make it impossible to lean backward and potentially cause a fall when the legs slip out. It's just one of those office funny moments that are now gone, in the interest of safety.

Nice sophisticated ASR33 teletype I/O devices. In my early days in field service one of my customers had a little HP mini that ran some data entry terminals at a remote location and logged the data on spools of paper tape that they would then use to transfer the data to the mainframe. The console was an ASR33 which would chatter away endlessly. My employer also used them for I/O on a customer terminal system for a large hotel chain, but I never had to service any of them. I did however service lots of terminal equipment that used a modified selectric typewriter as the I/O device.

WP 34S: Beware of new builds

*Message #1 Posted by **Marcus von Cube, Germany** on 30 Nov 2011, 4:37 a.m.*

Just to be warned: The next few builds will most probably be badly broken because we are working on a proper implementation of END. The latest revision I can recommend is 1940.

Re: WP 34S: Beware of new builds

*Message #2 Posted by **Paul Dale** on 30 Nov 2011, 5:54 a.m.,*
in response to message #1 by Marcus von Cube, Germany

More than the next few I suspect. END is very invasive and requires a lot more changes before it will work suitably.

For those with a morbid fascination, there is a TODO-END file which contains things Marcus and I know we've got to do, address and fix. How often this file is updated remains to be seen :-) Also, ignore the one DONE item -- that is being reimplemented a different way.

- Pauli

Re: WP 34S: Beware of new builds

*Message #3 Posted by **Eddie W. Shore** on 30 Nov 2011, 8:38 a.m.,*
in response to message #2 by Paul Dale

OK. I am currently at 1782 - got to catch up. Thanks for the updates!

Re: WP 34S: Beware of new builds

*Message #4 Posted by **Marcus von Cube, Germany** on 30 Nov 2011, 10:25 a.m.,*
in response to message #2 by Paul Dale

It might work now, at least partially. Testers are welcome.

In program mode, the complete memory is available but as soon as a program is running or single stepped, END serves as a boundary. The detection of labels 00 to 99 and A to D is confined to the program the program counter is currently in.

Try GTO.up and GTO.down to navigate between programs.

Edited: 30 Nov 2011, 10:25 a.m.

WP 34S: Current release starts working :-)

*Message #5 Posted by **Marcus von Cube, Germany** on 2 Dec 2011, 6:58 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I've made some updates to the latest release so that END should now be working (hopefully). END statements define boundaries for local label search. This includes the hot keys A to D. The program counter needs to be in the program that defines the hot keys to make them active.

GTO.. in program mode goes to the last statement in program memory and adds an END if it isn't already there. In run mode, GTO.. simply goes to step 000. As a short cut, you don't need to press h shift. XEQ. is treated the same as GTO.

GTO.down and GTO.up take you to the next or previous program respectively. This is intended for program mode but may work in run mode, too. I tested it in also library space. All libraries are updated to contain END statements where appropriate. I have not tested this thoroughly, though.

Re: WP 34S: Current release starts working :-)

*Message #6 Posted by **Gerry Schultz** on 2 Dec 2011, 2:18 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Hi Marcus. We sat next to each other at the last HHC. In talking about GTO.. how do you handle memory when editing a program? Will GTO.. pack memory like the 41C? Just curious.

Gerry

Re: WP 34S: Current release starts working :-)

*Message #7 Posted by **Marcus von Cube, Germany** on 2 Dec 2011, 3:54 p.m.,*
in response to message #6 by Gerry Schultz

We don't have holes in program space. The 41 does some magic to improve performance in editing and running a program. We just tackle the same issues with brute (processor) force. Moving memory back and forth doesn't cause the same delays it would on a 41 Nut processor. So no packing necessary.

No need to remind me on your HHC presence. I'm still remembering almost every little bit of these few days. :-)

[WP34s] Romberg Integration

*Message #1 Posted by **Les Wright** on 30 Nov 2011, 4:19 a.m.*

Just wanted to advise all fans of the calc that I did a quick and dirty port of the PPC ROM routine IG, and it works beautifully. At this stage I have simply entered it step by step, using where necessary wp34s equivalents (e.g., the 41-series XEQ IND 10 becomes [alpha]XEQ 10). I have yet to streamline it with things like recall register arithmetic and the X~~Y command for comparing rounded interim results. However, it is crazy fast, and with the tough integral discussed by Kahan in his 1980 HP Digest paper, even in ALL 00 the algorithm converges in about a minute or two to a solution that is correct to 14 digits within 1 ULP. In the words of Borat Sagdiyev, high five!

If I am permitted, I will post the entire routine and instructions, but only after I have made enough of my modifications so that it differs enough from the original PPC routine to be openly shared.

Les

Les, write an article in this forum!

Re: [WP34s] Romberg Integration

*Message #3 Posted by **Les Wright** on 30 Nov 2011, 9:17 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I am respectfully boggled that in the months the wp34s has been around no one has mentioned this before. This is not a major task to do a straight port. The wp34s has all of the necessary HP41-style functions and then some. In an initial transfer I had to do next to nothing.

Will look at this more closely as I get to know the wp34s better. I am sure there are efficiencies and whatnot I am missing.

Les

Re: [WP34s] Romberg Integration

*Message #4 Posted by **Paul Dale** on 30 Nov 2011, 9:45 p.m.,*
in response to message #3 by Les Wright

Porting the IG routine has been on my list of things that should be done eventually -- with aim to making this the built in integration routine.

There are definitely efficiencies available and there are other things that would be nice e.g. using the v3 local registers (they can even be resized during the computation if necessary). Then there are the extra fluff required for the built in command -- proper stack on exit and handling infinite values and not

numbers.

So while a straight port is very simple, making it integral [sic] to the calculator isn't quite so easy.

- Pauli

Re: [WP34s] Romberg Integration

*Message #5 Posted by **Paul Dale** on 30 Nov 2011, 5:50 a.m.,*
in response to message #1 by Les Wright

Or better, modify it so it is suitable for XROM and we'll include it :-)

ALL nn modes all round to 12 digits. The nn is for display only not for rounding. FIX/SCI and ENG, however, do use their argument for rounding purposes.

- Pauli

Re: [WP34s] Romberg Integration

*Message #6 Posted by **Les Wright** on 30 Nov 2011, 6:23 p.m.,*
in response to message #5 by Paul Dale

Ah, that explains why SCI 11 and ALL 00 each take as long and give the exact same 16 digit final result.

Re: [WP34s] Romberg Integration

*Message #7 Posted by **Kiyoshi Akima** on 30 Nov 2011, 6:32 p.m.,*
in response to message #6 by Les Wright

Just out of curiosity, what result do you get when you integrate fractional_portion(x) from 0.0 to 6.4? The same from 0.0 to 6.5? (Sorry, I don't know if the WP34s calls it "FRAC" or "FP" or whatever.)

Re: [WP34s] Romberg Integration

*Message #8 Posted by **Les Wright** on 30 Nov 2011, 9:11 p.m.,*
in response to message #7 by Kiyoshi Akima

The integration scheme doesn't like that function at all. Gives 1.28 and 1.625 respectively. Not even close. According to Mathematica, the correct results are 3.08 and 3.125, which is easily seen by inspection (6*1/2 + .4*.4/2 in the first case, and you get the analogy in the second case).

The integral is periodic with discontinuities. The IG Romberg scheme doesn't even seem to get past the first estimate before exiting.

The August 1980 Kahan paper and the advanced integration chapters in the 42s, 15C, 34C, and 35s do at least touch on the "know thy function" theme. In this case, what it easily computed by visual inspection and by hand boggles the calculators. I am sensing that the underlying trapezoidal rule is not fooled by the initial nonlinear distribution of sample points, and the routine gets too successive identical results off the bat and exits. I should note that the algorithm gives exact results quickly within the continuous segments, but not across the discontinuities.

Les

Re: [WP34s] Romberg Integration

If this is what you need: that's easily achieved by quoting the respective texts ;-)

> Quote:
>
> In this case, what it easily computed by visual inspection and by hand boggles the calculators.

To me, this problem sounds a bit academic. As known from the vintage calculators you mentioned, discontinuities are a problem. We can't catch every strange case (I doubt any algorithm can), so maybe I have to insert a warning statement in the manual of the kind "Don't use this oven for drying pets!".

Re: [WP34s] Romberg Integration

*Message #10 Posted by **Kiyoshi Akima** on 1 Dec 2011, 3:00 p.m.,*
in response to message #8 by Les Wright

At least your results imply that you have a correct port of the IG routine. To the best of my knowledge, this particular example trips up every HP calculator with a built-in integrator. Because of the nonlinear transform, the first three estimates match and the routine refuses to go any further. In a textbook Romberg integration without the transform, the third estimate differs.

The nonlinear transform also bunches points near the endpoints of the interval. This works great when integrating something with a singularity at or near an endpoint, like sqrt(x) from 0 to 1. However, that backfires when the singularity is in the interior of the interval, like sqrt(abs(x)) from -1 to 1.

Printed copies of HP-15C Advanced Functions Handbook

*Message #1 Posted by **Eric Rechlin** on 30 Nov 2011, 1:13 a.m.*

A bunch of you expressed interest in getting a printed copy of the HP-15C Advanced Functions Handbook, based on Joe Horn's scan.

I am now ready to ship these for anyone who might be interested. They are black and white (sorry, not color) and spiral bound, just like the other manuals I sell. The price is $10 plus shipping. For the US, I will ship in a box by Media Mail for $4. International ranges, but for most countries it will be $10 for First Class Mail. Please send me a private message (or email me at eric@hpcalc.org) if you are interested and I will give payment information.

Eric

HP-15C LE listing back on Buy.com

*Message #1 Posted by **Dan Grelinger** on 29 Nov 2011, 2:59 p.m.*

I bought an HP-15C LE from Buy.com when they first came out because they had the best price ($90 with free shipping). They sold out quickly of their own stock, and for awhile had a listing from Samson Cables for $200. Eventually, they removed their HP-15C LE listing altogether.

But now, the listing has returned, including a link to be notified when the item is back in stock. I take that as a sign that they have placed another order with HP that was accepted, and that they will have stock in the future. Pure speculation on my part, but it fits my observations of past buy.com behavior.

http://www.buy.com/prod/hp-15c-scientific-calculator-limited-edition/223173356.html

Re: HP-15C LE listing back on Buy.com

*Message #2 Posted by **Nicholas Winterer** on 29 Nov 2011, 3:25 p.m.,*
in response to message #1 by Dan Grelinger

Hopefully in time for Christmas!

XEQ vs GSB - what am I missing?

*Message #1 Posted by **Thomas Radtke** on 29 Nov 2011, 1:22 p.m.*

Spices use GSB, the 41 XEQ, the Voyagers GSB, later models XEQ again. I think both lables can be justified, but why was there a change and why do Voyagers broke with the new convention introduced with the 41?

Does anyone here know?

Thanks,

Thomas

Re: XEQ vs GSB - what am I missing?

*Message #2 Posted by **M. Joury** on 29 Nov 2011, 2:00 p.m.,*
in response to message #1 by Thomas Radtke

The only difference I can see is that with the 41 (and 42) XEQ does more than just execute a subroutine. With most of the other HP calculators GSB does exactly what it says (Go SuBroutine). With the HP41 XEQ is used to execute subroutines as with GSB but it is also used to execute internal commands so GSB would not be an accurate description for what XEQ does on the 41. I can't hazard a guess as to why later models (other than the 42) go back to using XEQ when they really are using it more like a GSB.

Just my $0.02 worth.

-Marwan

Re: XEQ vs GSB - what am I missing?

Because XEQ looks totally bad-ass on the keyboard. To the uninitiated it has a certain mystique, like the big red button under the glass. The ultimate power of your calculator is unleashed via XEQ.

And sometimes you can get away with using it as a scrabble word (You know, "zeek", it's a mathematical word, do you really want to challenge a guy with more calculators than first dates?). People think twice about challenging such a powerful word. Keep a straight face and you might pull it off. YMMV. :-)

XEQ also sounds executive.

Re: XEQ vs GSB - what am I missing?

*Message #7 Posted by **Eddie W. Shore** on 30 Nov 2011, 8:43 a.m.,*
in response to message #1 by Thomas Radtke

In my experience, XEQ and GSB work in the same way. I guess they wanted something different for the Voyagers (?).

Re: XEQ vs GSB - what am I missing?

*Message #8 Posted by **M. Joury** on 30 Nov 2011, 10:05 a.m.,*
in response to message #7 by Eddie W. Shore

Yes and no. XEQ on the 41 and 42 has additional functionality in that it is also responsible for executing any non-keyboard (or for that matter keyboard) function. For example XEQ ALPHA FRC ALPHA. This is NOT a subroutine call and has a distinctly different usage from a GSB on a Voyager. Mind you, the 32S and it's derivatives do use XEQ in exactly the same manner as GSB.

Cheers,

-Marwan

Re: XEQ vs GSB - what am I missing?

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 30 Nov 2011, 9:18 a.m.,*
in response to message #1 by Thomas Radtke

It was a good thing that they don't choose "CALL" as an alternative for "GSB" or "XEQ", otherwise a lot of calculators may be taken as cell phones... :-)

MoHPC - 15C | 15C LE update?

*Message #1 Posted by **DigiGal** on 29 Nov 2011, 1:08 p.m.*

Curious, are any MoHPC curators planning to update the 15C info page to include the 15C LE?

Edited: 29 Nov 2011, 1:09 p.m.

Re: MoHPC - 15C | 15C LE update?

*Message #2 Posted by **Martin Pinckney** on 29 Nov 2011, 1:58 p.m.,*
in response to message #1 by DigiGal

AFAIK there is only one curator, he put a gargantuan effort into building this wonderful site, then for the last eight years or so he has had an actual life apart from this site.

Re: MoHPC - 15C | 15C LE update?

*Message #3 Posted by **Dave Hicks** on 30 Nov 2011, 1:22 p.m.,*
in response to message #2 by Martin Pinckney

Also, every couple of years or so, I spend 4-8 months round the clock doing a new DVD release. Then after I get that done, I want to take a break - which often does seem to last till the next DVD version. In fact, I'll probably be spinning up another DVD project this winter if people can find enough manuals that aren't already included.

I also need to do some forum updating. It seems there are too many "false positives" lately. ie: too many messages being identified as possible spam and being sent to moderators for approval. Some of these spam detectors date to times before I wrote the user account code and really aren't that necessary anymore.

Re: MoHPC - 15C | 15C LE update?

*Message #4 Posted by **Walter B** on 30 Nov 2011, 1:39 p.m.,*
in response to message #3 by Dave Hicks

Hi Dave, since you show up: Is there anything we can contribute to get that famous "Other" page updated?

OT: AA Lithium Battery Tests

*Message #1 Posted by **Bill (Smithville, NJ)** on 29 Nov 2011, 11:28 a.m.*

Would like to ask an off topic question about AA Lithium batteries.

This morning, I caught a story on the news that Consumer Reports had tested AA batteries, including the Everyready "Advanced" and "Ultimate" AA batteries. They stated that the testing showed the Advanced did 809 photos and the Ultimate only did 470 photos.

This is exactly reveresed from what I would expect. Everyready claims the Ultimate is about twice as powerful as the Advanced.

Did the News Reporter get the two batterys backwrds, or do the Advanced really out perform the Ultimate.

Unfortnuately, I do not have a subcription to CR, so I can't read the original article.

I'd appreciate if anyone here who subscribes could verify the results.

(The reason I bring this up here is I know some of us use these batteries in the HP-200LX)

Thanks

Bill

Edited: 29 Nov 2011, 11:29 a.m.

Re: OT: AA Lithium Battery Tests

*Message #2 Posted by **Katie Wasserman** on 29 Nov 2011, 12:56 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

I use scores of both of them (they are in almost all my calculators, flashlights, low-end digital camera, etc.) and find very little difference between them in just about every application. I've even done side-by-side lifetime tests with high current draw and found them to be almost identical. It's possible that the Ultimate have a longer shelf life, the expiration dates indicate this. But they haven't been around long enough for me know if this is true or not.

I buy them on TAS when I can get them cheaply and don't really care if they are the Ultimate or the Advanced.

Re: OT: AA Lithium Battery Tests

*Message #3 Posted by **Bill (Smithville, NJ)** on 30 Nov 2011, 7:37 a.m.,*
in response to message #2 by Katie Wasserman

Hi Katie,

Your results are about what I had also found. I usually buy either one depending on what the current sale

is. Not too long ago, our local food store had the ultimates on sale for about 1/3 price, so I stocked up.

I find it hard to believe that Everyread has found a way to double the Lithium capacity in the same size package. Which is what they claim - Advanced are 4X the Everyready Max batteries and the Ultimate are 8X.

As reported by the TV reporter, the Consumer Reports tests (and we can argue forever on what constitutes a valid test) indicated that the reverse is true. I was hoping someone could verify this with the actual Consumer Reports article or whether the reporter had the story wrong.

I guess I could visit my Library this weekend and see if they have the December issure of CR.

Thanks,

Bill

Might depend on type of usage?

*Message #4 Posted by **Frank Boehm (Germany)** on 30 Nov 2011, 9:43 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I think camera usage needs a battery that can supply a lot of peak current. Regular usage mostly has less peaks and depletes the battery slower and better.
So depending on the camera or gadget, one battery might be superior or inferior, even when claiming the same capacity.
That's probably the reason, why there are two types of Eneloop (IMHO the best rechargable battery on the market), one with less charging cycles but stronger peak current, for camera usage.

Re: OT: AA Lithium Battery Tests

*Message #5 Posted by **Dave Shaffer (Arizona)** on 5 Dec 2011, 10:25 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

I finally found my December copy of Consumer Reports (buried under all the other stuff on my desk) and can verify that the story as quoted by Bill accurately reported the CR findings.

Their table of results shows that the Energizer "Advanced" provided 809 camera shots, compared to the Energizer "Ultimate" at 470 shots. Alkalines ranged from 260 shots (Duracell Ultra Advanced) to 133 shots (Walgreens Supercell), with most of the others giving around 200 shots.

Their test: "We load batteries into identical digital cameras, then mimic everyday camera use (zoom, flash, shoot) until each camera quits."

They also say "use lithiums in high-drain devices such as cameras and alkalines in low-drain devices such as remote controls"

Depends on how hard you use your calc!?!?!

HP 20 series European versions

*Message #1 Posted by **Fouad M. Kaadou** on 29 Nov 2011, 11:08 a.m.*

Hello,

I read on the museum that the Woodstock series had European versions with ','s instead of '.'s. I have never seen these on eBay. Are these rare and desirable?

Rock 'n' Roll,

Fouad

Which Model HP-41C For the 41CL Transplant?

*Message #1 Posted by **Mark Hardman** on 29 Nov 2011, 10:48 a.m.*

I have nine working HP-41's to choose from. I only have a single HP-41C, so I don't want to use that one.

Of the remaining machines, one is a NIB HP-41CV that has only rarely seen the light of day. I'm tempted to use this calculator as it would likely have the longest useable life span and would be the least likely to have broken posts. However, I would have to sacrifice a port and a time module to make it fully functional as a 41CL. I also run the risk that once opened, I'll find the wrong type of zebra connector.

Would it be better to use one of my HP-41CX's? I know they all have good posts and the correct zebra connector.

Is there any advantage to using a 41CX over a 41CV?

Mark Hardman

Re: Which Model HP-41C For the 41CL Transplant?

*Message #2 Posted by **Ángel Martin** on 29 Nov 2011, 11:35 a.m.,*
in response to message #1 by Mark Hardman

This is a good struggle to find yourself in, better than not having any suitable donor :-)

Because the TIME module needs to be added to get the timer functional, I'd definitely use a CV over a CX - and if you had more then I'd use the (plain) C - my preferred choice, going from the smallest to the biggest.

In that way you'll still have 7 CX's (fully functional) plus the CL and your "token" C.

Good luck with the transplant!

Re: Which Model HP-41C For the 41CL Transplant?

*Message #3 Posted by **Mark Hardman** on 29 Nov 2011, 10:08 p.m.,*
in response to message #2 by Ángel Martin

I appreciate your answer. I had to go back and re-read the 41CL manual--and you are correct. Regardless of the model used, a time module is required. So using a 41CX gains me nothing and really would be overkill.

I just received confirmation from Monte that my board is on its way. The donor 41CV has been opened and inspected.

Christmas is coming about a month early at my house!

Mark Hardman

Re: Which Model HP-41C For the 41CL Transplant?

*Message #4 Posted by **Juergen Keller** on 30 Nov 2011, 3:41 p.m.,*
in response to message #3 by Mark Hardman

> Quote:
>
> Regardless of the model used, a time module is required.

Not true, see Time chip inside 41CL. If you use a CX it's possible to use its timer chip instead of a TIME module.

in response to message #4 by Juergen Keller

Technically I guess that's correct but I'm not inclined to get into that kind of intermediate-surgery and very much prefer using a physical TIME module.

Besides, what else do you need the ports on the CL for? :-)

Re: Which Model HP-41C For the 41CL Transplant?

*Message #6 Posted by **gene wright** on 1 Dec 2011, 12:33 p.m.,*
in response to message #5 by Ángel Martin

What do you need the ports for?

Printer, Card reader

or

HP IL module

or

Clonix to load new roms into the 41CL

One port is gone with the serial connector if installed.

Might start running out of ports!

;-)

But, I do have a physical TIME module installed in my 41CL which is soon on its way back to me.

Re: Which Model HP-41C For the 41CL Transplant?

*Message #7 Posted by **sylvandb** on 29 Nov 2011, 8:18 p.m.,*
in response to message #1 by Mark Hardman

Back in 1979-80 with silver prices soaring, many people sold all the silver they could get their hands on. Most of the silver sold was melted down, refined and poured into ingots.

Common (at the time) silver coins were one of the things sold and melted. After all, those common coins had no collector value, but at those silver prices those old coins were worth a lot just for the metal they contained.

Now coin collectors have discovered that what once was common is now rare since so many were melted, and some of what was once rare is considered common since so many were NOT melted.

(http://www.pcgs.com/Articles/Detail/496)

I wonder what HP-41's will be considered common or rare in another 20 years? Will the 41CL cause a significant loss of 41C or CV models leading to a "glut" of the 41CX?

I don't think there is any way to second guess or predict. I find it simply an interesting thought experiment.

Re: Which Model HP-41C For the 41CL Transplant?

*Message #8 Posted by **Monte Dalrymple** on 29 Nov 2011, 10:11 p.m.,*
in response to message #7 by sylvandb

If you don't attach the 41CL label to the case and keep the old cpu board (guys, PLEASE don't throw them away), it's easy to change a CL back to what it started out as.

Actually, the 41CL will always be rare, given that I'm not really expecting to make a ton of them. That, plus the FPGA and Flash memory are only guaranteed for 20 years.

Re: Which Model HP-41C For the 41CL Transplant?

you mean to say no more CL fun after 70? :-)

Edited: 2 Dec 2011, 9:22 a.m.

Re: Which Model HP-41C For the 41CL Transplant?

*Message #10 Posted by **Monte Dalrymple** on 2 Dec 2011, 12:59 p.m.,*
in response to message #9 by Ángel Martin

The 20 years is what the Flash manufacturers guarantee. Since as far as I know the failure mechanism is charge loss on the floating gates, reflashing the memory and the fpga should be sufficient to extend the life. Of course there is no guarantee that the tools will still exist or work in that timeframe. But since the design is done in Verilog HDL presumably it could be moved to whatever technology is common in the future.

Message #12 Posted by ***Mark Hardman*** *on 29 Nov 2011, 10:18 p.m.,*
in response to message #7 by sylvandb

Three paragraphs into your post, I was under the impression that you were suggesting we melt down our surplus HP-41's!

Just as an HP-41CY commands extreme high prices among collectors, I would be certain that a well cared for and operational HP-41CL would sell for a king's ransom.

One thing is certain, I will pass away before I offer any of my collection for sale. So, I've given explicit instructions in my will for the liquidation of my HP calculators.

[HP 15C LE] Prophecy on bug fix?

*Message #1 Posted by **Alexander Oestert** on 29 Nov 2011, 9:55 a.m.*

Anyone wanting to make a prophecy on when the HP 15C LE bug fix firmware will be available? Is there a list to be notified by HP as soon as it comes out?

I would love to be able to use my new and shiny 15C without the PSE bug! Really! ;-)

Nah, you'll eventually see a bug fix, only perhaps not from HP.

> Quote:
>
> HP just lost me as a potential future customer. This is bad.

That's overreacting. If I'd refrained from buying from some company or other on the grounds of a simple disappointment I wouldn't be buying much, if at all.

Best regards from V.

Yeah, for a product marketed as 'Limited Edition' in a fake leather case that is entirely a pure luxury item, for 100 bucks I'm probably expecting too much. What was I thinking...

HP even gave us a nicely printed "Advanced Functions Handbook"...wait..where did I get that one?

Re: [HP 15C LE] Prophecy on bug fix?

*Message #9 Posted by **Tim Wessman** on 29 Nov 2011, 11:33 a.m.,*
in response to message #6 by Alexander Oestert

>Meaning we will never see a bug fix.

Meaning nothing.

Seems like quite a stretch to reach that conclusion from my comment. I suppose the best thing to do is go away and completely not participate in this forum as everything I say gets taken way out of context. Whether there is or is not ever going to be a fix would never be communicated on a forum like this. Modern large companies just don't do that.

If you have displeasure with something HP has or has not done, you need to let them know through the proper channels. I am not an HP employee when I discuss and post here.

TW

Edited: 29 Nov 2011, 11:39 a.m.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #10 Posted by **Bruce Bergman** on 29 Nov 2011, 11:43 a.m.,*
in response to message #9 by Tim Wessman

Yeah, this was a total overreaction by others.

Folks, this is NOT a support forum hosted by HP! The museum forums are something completely outside of the HP domain, and shouldn't be construed as part of HP's official (or even unofficial) stance on anything.

If all you're trying to do is drive away GENEROUS and CARING employees from HP who participate here, then keep it up and I'm quite sure they'll leave.

If you want "official" HP responses, go visit their web site or call their Tech Support. I'm betting that you'd be happier with the unofficial responses you get here, than those "official" responses at the other locations.

Or, you can be content with what's here, and realize (whether you believe it or not) that this is a community of interesting and caring individuals, who just want to make things better for all HP users.

Please don't ruin it for the rest of us. If you're pissed at HP and don't want to be a customer, then fine, go away. But don't poke the eye out of those people from within HP who just happen to enjoy HP products and help WHERE THEY CAN.

My $0.02 anyhow. And no, I'm not overreacting. ;-)

Thanks,

Bruce

Re: [HP 15C LE] Prophecy on bug fix?

*Message #11 Posted by **Martin Pinckney** on 29 Nov 2011, 12:12 p.m.,*
in response to message #10 by Bruce Bergman

Some points to keep in mind:

1. Tim has stated several times he participates as an individual, not an HP employee.

2. Despite the above, all regulars here still are aware he *is* an HP employee, and not only that, but the 15c LE was his project.
3. Because of (2), It's only natural that some folks are going to assume that his comments might mean something.
4. In fact, Tim has on occasion given out some real HP information, as when he published photos of the 15c LE and 12c 30th packaging.
5. The forum is a free-form venue, and if a known HP employee makes glib comments, some are bound to be offended, given how seriously some folks are about HP's products.

And that's my $.02.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #12 Posted by **Tim Wessman** on 29 Nov 2011, 12:26 p.m.,*
in response to message #11 by Martin Pinckney

Good points. Which is why I am just going to avoid participating except for very rare occasions. Makes things simpler all around.

Tim,
I'm not sure what the best "proper channel" would be, so I just sent a message to HP Scientific Calculator Support. I described the issues and told them that I was certain that you and Cyrille could easily fix the problems, if directed to do so.

If that does not work, I guess I will have to try to contact Ms. Whitman.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #20 Posted by **Walter B** on 30 Nov 2011, 1:46 p.m.,*
in response to message #19 by Jeff O.

:-D Good luck!

Re: [HP 15C LE] Prophecy on bug fix?

*Message #21 Posted by **Jeff O.** on 30 Nov 2011, 3:46 p.m.,*
in response to message #20 by Walter B

Hey, I already got a reply back stating that "One of our Technical Support Specialists will be responding to your inquiry. It is our pleasure to be of service to you..."

Or were you referring to a potential future attempt to contact Ms. Whitman? I don't really think that would be possible, but beside Tim and Cyrille, I don't know how or who else I might try to contact to officially request a new 15c rom. It's not like there is a phone or e-mail directory of the company available so that I might try to contact someone in the calculator division who has the power to get the problems solved.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #22 Posted by **Thomas Radtke** on 1 Dec 2011, 11:38 a.m.,*
in response to message #19 by Jeff O.

> Quote:

> I described the issues and told them that I was certain that you and Cyrille could easily fix the problems, if directed to do so.

We should all do so, maybe even using the same text.

Would you mind sharing it with us?

Re: [HP 15C LE] Prophecy on bug fix?

*Message #23 Posted by **Alexander Oestert** on 1 Dec 2011, 12:08 p.m.,*
in response to message #22 by Thomas Radtke

I second that: same text to the same email address.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #24 Posted by **Jeff O.** on 1 Dec 2011, 12:35 p.m.,*
in response to message #22 by Thomas Radtke

Here is the text of the message:

> Quote:
>
> This in reference to the new HP 15c scientific calculator. The firmware for the new calculator has several bugs as follows:
> 1) PSE used more than once in a program blanks the display after the first occurrence. The display blanks out until the program finishes, subsequent PSE instructions do not properly display the interim results.
> 2) the display will flash inappropriately in a number of circumstances, for example, running Cy,x or Py,x three times in a program, or in complex mode, press f - (i) to temporarily display the imaginary component. While the temporary display is up, press a single digit key, as if you were starting to key in a number. As soon as the temporary display of the imaginary component goes away, the digit you pressed will be displayed, and the display will be flashing.
> 3) executing the ON plus x self-test described in the manual which came with the calculator corrupts program memory. This key combination, as well as the other key combinations which execute the self-tests of the original 15C should either be disabled or made to work as they did originally.
> 4) Current draw is over 20mA when holding down a key, which will lead to rapid battery depletion.
> 5) Current draw is also over 20 mA during program execution. While the high speed that such current draw allows is appreciated, this is actually well in excess of the capability of the CR2032 cells used to power the calculator. It might be advisable to implement a power management scheme which would allow high speed operation some of the time, but throttle back the speed under certain circumstances, for example after the first few seconds of a running program, or when battery voltage drops to a certain level.
> 6) The low battery indicator does not appear to work, i.e., it never indicates a low-battery condition regardless of battery voltage. More seriously, when the battery voltage gets low enough or the batteries can't supply enough current, memory is lost. Graceful low-battery detection and shut-down should be implemented in association with the power vs. speed management discussed in item 5 above.
> All in all, the new 15c is a wonderful, much appreciated device. It would make a nice Christmas present to the HP calculator enthusiast community if HP could create a new rom file and make it available in the near future.

> Thank you for your support.

Thanks and credit given to Katie Wasserman, I took much of the above from her HP-15C LE (Limted Edition) Bug Reports article.

I sent the above to HP via this contact form.

I did receive a follow-up reply:

> Quote:
>
> Thank you for contacting Hewlett-Packard.
>
> This is in response to your e-mail regarding the HP 15c Scientific Calculator.
>
> Thank you for your feedback. I will pass this message along.
>
> Sincerely,
>
> HP Email Support

HP 15c bug list article.

Edited: 10 Dec 2011, 12:54 p.m. after one or more responses were posted

Re: [HP 15C LE] Prophecy on bug fix?

*Message #25 Posted by **Thomas Radtke** on 1 Dec 2011, 1:03 p.m.,*
in response to message #24 by Jeff O.

Thanks!

Did it, and hopefully the majority of listening 15c LE users will do so also.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #26 Posted by **Lincoln R.** on 1 Dec 2011, 1:27 p.m.,*
in response to message #25 by Thomas Radtke

Yes. This is a great idea. Posting here probably isn't the right way to get results, but if enough people complain through official channels that may make HP decide that fixing the bugs is a worthwhile endeavor.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #27 Posted by **Jeff O.** on 1 Dec 2011, 3:47 p.m.,*
in response to message #25 by Thomas Radtke

Do we need a new separate "Pester HP for a new 15c rom" thread to encourage and track the campaign?

*Message #29 Posted by **Walter B** on 1 Dec 2011, 5:46 p.m.,*
in response to message #28 by Katie Wasserman

If it will take as long as the old petition to succeed ...

Re: [HP 15C LE] Prophecy on bug fix?

*Message #30 Posted by **Reth** on 2 Dec 2011, 4:31 a.m.,*
in response to message #28 by Katie Wasserman

Brilliant!

Re: [HP 15C LE] Prophecy on bug fix?

*Message #31 Posted by **Thomas Radtke** on 2 Dec 2011, 1:11 a.m.,*
in response to message #27 by Jeff O.

It wouldn't hurt. I'd call it 'Kindly pointing HP to the right direction', however ;-).

Re: [HP 15C LE] Prophecy on bug fix?

*Message #32 Posted by **Alexander Oestert** on 2 Dec 2011, 3:50 a.m.,*
in response to message #24 by Jeff O.

Did it!

Re: [HP 15C LE] Prophecy on bug fix?

*Message #33 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 2 Dec 2011, 2:42 p.m.,*
in response to message #24 by Jeff O.

This is the response I received from HP customer service for the bug fix request above.

> Quote:
>
> Thank you for contacting Hewlett-Packard.
>
> This is in response to your e-mail regarding the HP 15c Scientific Calculator.
>
> Hi,
>
> I just received 3 letters with identical wording from other people and one additional one just like this one, is this a form letter?

We are aware of the PSE issue and have it on our fix list but I do not have an ETA. I will forward your information on the other issues but to document it you would need to phone us between 9 am and 9 pm eastern at 1800 474 6836 and troubleshoot the issues with us, and we could escalate the case if necessary.

Thanks,

Saleh

Sincerely, HP Email Support

Re: [HP 15C LE] Prophecy on bug fix?

*Message #34 Posted by **Ethan Conner** on 2 Dec 2011, 3:31 p.m.,*
in response to message #33 by Kerem Kapkin (Silicon Valley, CA)

Imagine that.....they were already aware of the problem. So before Tim was driven away from the forum he notified HP of the problem. Of course some people have nothing better to do than beat a dead horse.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #35 Posted by **Alexander Oestert** on 3 Dec 2011, 5:07 a.m.,*
in response to message #34 by Ethan Conner

Quote:

Tim was driven away from the forum

Insinuating Tim was "driven away" for what was written in this thread means accusing him of a rather childish behavior. If anything, he was directed by his superiors to not participate anymore.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #36 Posted by **Jeff O.** on 2 Dec 2011, 4:14 p.m.,*
in response to message #33 by Kerem Kapkin (Silicon Valley, CA)

I guess it is good that it is on their fix list, and that they even have a fix list.

Are you going to respond and tell Saleh that it is not so much a form letter as an effort by concerned users that the message get through? How about calling and troubleshooting to get the problems escalated?

Re: [HP 15C LE] Prophecy on bug fix?

*Message #37 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 2 Dec 2011, 4:55 p.m.,*
in response to message #36 by Jeff O.

I already send a follow up message to Saleh in the same regard, also

letting him know that I and many others do appreciate HP and the HP Calculator product development team for bringing back the HP-15C.

When I can put a side 30-45 minutes from work, I will call the customer service and try to walk them through on reproducing the issues we have seen regularly. Also I will recommend that they would expedite a solution for these issues.

More people e-mail them expressing their concern and call them to demonstrate the issues to get in the fix list; perhaps customer service would have enough data points to justify to the management for requesting an expedited solution.

I hope you find time to call and get the problems escalated. They already know about the PSE bug, and it should be easy to walk them through some flashing display examples and also show them how the ON / x self test corrupts memory. Unfortunately, it won't be possible to walk them through the power management issues, which are arguably the most serious. But of course the people who can fix the problems are already well aware of them, so hopefully the escalation process is just a formality to inform HP of the problems through proper channels.

Never. If it were of any importance to HP, they would have fixed it along with the keyboard problem. Reports have shown that HP didn't do that.

Dream on, Alexander. I did so when the 35s came out, and I did it for quite a long time.

(unfortunately, I didn't catch the removed messages)

*Message #42 Posted by **Lincoln R.** on 29 Nov 2011, 5:37 p.m.,*
in response to message #41 by Thomas Radtke

The keyboard problem seems like it was probably trivial to fix, since certain forum members disassembled units and discovered foreign matter inside keyswitches and/or bad heatstaking. That's a simple matter of getting the manufacturing plant to be more careful. A software bug requires man-hours to trace the source of the bug, find a fix, and then do a lot of testing to make sure it didn't break more stuff (Like the fixes that led to this PSE bug in the first place). I'd imagine HP is working on a fix, but wants to make sure it is properly tested before sending it out because people will complain even louder if a PSE fix that results in math functions giving wrong answers or insanely bad battery life is released.

Anyhow, they replaced the units with bad keyboards on essentially a no-questions-asked basis. Making more units and then FedExing them to people wasn't cheap, so they obviously *do* care about this product. It would be easy to just say "some variation in keyboard feel is normal and is due to slight variation in the manufacturing process" and only replace units with totally dead keys, and furthermore require customers to ship them to HP at the customer's expense and pay shipping on the replacement unit too. But they didn't do that. They found out there was a problem, took in units to disassemble, corrected the manufacturing defects, and replaced people's calculators.

Tim put out a contact e-mail just for people with keyboard issues. This may have been easily missed by someone who doesn't view the forum daily. It was back when the le's were getting to people in the US and the forum was turning over fairly rapidly.

*Message #46 Posted by **Lincoln R.** on 30 Nov 2011, 7:03 a.m.,*
in response to message #44 by Ethan Conner

I'm pretty sure there were some people that called the phone number and went through the regular HP support chain of command to get their replacement. And I don't think it was entirely US-only, IIRC at least one guy from Canada was able to get his replacement, but it may have taken some extra work. The phone number to call is: (800)474-6836

Initially Tim was asking people to email him or someone else at HP because they were collecting the defective units to disassemble and analyze. Once they had enough, I believe he made a post here asking people to go through the normal HP support channels.

Alexander, the whole discussion is fruitless. I'm pretty sure the bugs and manufacturing glitches nag those who made the 15C LE a reality more than anybody else. So just be patient and hope for a fix. Or, complain to HP and they will offer you to return the faulty items. Guess what my option in this case is!

If I were based in the US I would do exactly that, but that is not an option after having paid international postage and custom fees.

Maybe some here tend to forget that HP is not making the 15C LE as a charity to make us nerds happy but to make money with it. Customers can expect their money's worth in service.

True, I'm pissed that there is no information nor even a hint as to if, how or when this will be resolved.

And yes, I know this is not an official HP support forum. But I also think you can't have both: get praised for all the good things you've done as an HP official but only be a private person when it comes to taking some heat.

I think there's no doubt Tim would do & distribute a fix if he were allowed to spend his time on it. It doesn't pay, however. Sales figures likely indicate that people buy and praise buggy calculators and that fixes do not change the situation for the better. It's our fault. Wer're the customers making the figures look like they do.

And honestly, I believe that most good things come from the dedicated HP people participating here, and most problems arise from the mechanics of a large company.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #50 Posted by **M. Joury** on 29 Nov 2011, 3:01 p.m.,*
in response to message #49 by Thomas Radtke

The problem with that logic is that if we don't buy them then the response will be: "There is no interest in these sort of machines so we'll just stop making them." And if we do buy them the response is: "They are buying them anyway so no need to fix them."

Fortunately I am not quite that cynical (second bit above), and will continue to support the HP calculator folks by buying their products. Remember that there were firmware fixes for the 12C+ and that gives me some small degree of hope.

Either way, while the HP15C LE does have a few issues I still think that it is a great little machine and that those at HP that pushed it through should be appreciated for the effort. Also note that it

would appear that HP took the keyboard issue seriously and did something about it so one can't say that they are not listening.

Cheers,

-Marwan

Get real.

HP is not some podunk little company where a $1,000,000 sales is a project considered seriously "to make money with it."

I sat in many meetings at HP where even $10,000,000 potential revenue projects were discarded without a second thought. It wasn't until potential revenues were 3-4x that amount that cost estimates entered into the "do we investigate this idea further" decision.

Now granted the calculator operation is a lot smaller than where I was. But something like the 15c has to be understand as somebody's pet project where I'm sure the discussion included something much like "development is almost free so hopefully we won't lose too much money."

> Quote:

Throwing large numbers out fails to impress. What does that have to do with product quality issues and company integrity in fixing them?

Is it possible to suck the firmware out of a pre-PSE-bug 15C+ and run that on the LE? I don't have a serial port at this time so I don't know if this is possible. From everything I've read here, the PSE bug is worse than all the bugs they may have quashed in its unintentional introduction.

I know it wouldn't be an official fix even if some kind soul with a serial port were to post such firmware. Still...

If at all (the feature can be shut off by the manufacturer) it would be through a JTAG interface, not the

serial port. Adding a JTAG connector would require serious surgery which I doubt anybody is willing to do. There may be old firmware images floating around but access would only be possible if they would either be officially released of unofficially leaked (which would violate any NDA signed.)

I would like to say that i hope Tim always feels like he can come to the forum and "be one of the guys". Even if it involves HP or our beloved 15c LE. It amazes me that they were able to convince HP to do the LE in the first place and have Tim offer here to help people with keyboard issues. In another thread someone has already offered a workaround for the PSE situation if i remember correctly. The LE was advertised as being 100 times faster and we all knew this ahead of time. Hopefully we are all capable of knowing what that means for battery consumption. Having Tim on here is an asset and i don't see what is to be gained by driving him away. To me him being here is like seeing your boss at the company picnic. Yeah we may talk a little work but good grief let the man relax and be a normal human being who can make humor and vent just like anyone else.

*Message #61 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 29 Nov 2011, 9:45 p.m.,*
in response to message #60 by Ethan Conner

Continuing the discussion completely technical:

Increased battery consumption due to the increased speed was expected. What I am referring is the "brown out" threshold settings. IMHO this is more concerning than the "PSE" bug which is just an annoyance. There were many testing done on the standby and running power drains, brown out threshold by the members of this forum and were published here.

You can find more at this link.

I think it's more a case of some folks treating Tim as a representative of an evil multinational corporation that has committed the crime of releasing a defective product, whereas many here know Tim as someone who was a member of this community before going to work for HP. Some of us have met Tim personally at the HHC conferences and know first hand that he's one of us. We know for a fact that his disappointment over the firmware bugs exceeds our own. We know that if we ever see a fix for those bugs, it will be because Tim and others will have struggled against all odds to make it happen. If he doesn't overcome those odds it won't be for lack of trying everything humanly possible for someone in his situation.

Most people haven't met Tim personally. Many people didn't sign the petition to bring back the 15C years ago. Those of us who did remember how absurd it seemed that HP would ever release a resurrected 15C, and have some appreciation of what a miracle Tim and others pulled off. If others lack that perspective and only see the flaws, it's to be expected. Tim could probably have a thicker skin in the face of that sort of criticism. But his critics could also pause and consider the other side of the coin.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #68 Posted by **Tim Wessman** on 30 Nov 2011, 9:50 a.m.,*
in response to message #67 by Howard Owen

This will be my last post on the issue and for quite a long time.

This has nothing to do with not having a "thick skin" or me over-reacting or anything. Rather, I agreed that should my participation ever cause problems on this forum I would cease to do so.

You may notice that all other employees that previously were participating are no longer doing so. There was concern expressed about this forum and the way some were reacting.

Since I am an HP employee and this forum is directly related to what I work on, it is natural that some may treat things I post as gospel. This has obviously caused at least a few people to respond negatively and so I simply can't continue to post here. HP has policies regarding participation in forums.

While true that I occasionally posted something semi-official (such as asking to collect some 15c units for examination), this was at the request of the support team since it was deemed to best way to get the information as quickly as possible.

That's quite unfortunate and I'd encourage all of you to reconsider, otherwise both sides suffer a loss. While I don't claim to know HP's strategy in this market, in absolute terms I can't imagine cultivation of this forum isn't of significant value to you all. Understood dealing with occasional irate users isn't pleasant, but it seems a trivial price to pay for sustaining the following here.

> Quote:
>

Case in point of the value to HP for expending cycles here. I'd hazard the above was available and leveragable to HP due to the presence you've personally developed in this forum.

> Quote:
>

Asking the HP employees to reconsider may not be possible. It's entirely possible that their boss told them not to post on this forum anymore. I agree it's a big loss, it was a cool thing to have their presence in the community (I can't think of too many other products where this is the case), but American businesses see everything as a lawsuit waiting to happen (understandably so in a country where you can get sued by a guy whose hand you ran over while he was stealing your hubcaps.)

The way the rom addresses ram can only allow a maximum of 224 registers with some 'minor' patches (I have them on a private HP15 emulator ...) instead of the 64 original registers.

To allow more, a rather complete rom rewriting should be necessary.

Dear Alexander,

What answer did you expect with your question ?
Even if if packed in a nice sentence, you are asking for a trade secret.
The saying "The ones how know don't talk, the ones how talk don't know" perfectly apply here. It is a trade secret and every one how know have no right to answer (at least seriously).

In France we have a saying "Question idiote, réponse idiote" which translate in something like "Dumb question, dumb answer". It is just the answer you got.

Is it impolite for ones inappropriate behavior to make a public spectacle at another's party? Obviously.

Is it impolite to escort previous derelict from said party even if it temporarily contributes to said spectacle? Obviously not.

And because it is equally obvious that subtlety of behavior is lost, you are the one who is causing said public spectacle with your inappropriate behavior and it would be better for all if you were escorted from the party.

*Message #83 Posted by **Lincoln R.** on 2 Dec 2011, 5:27 p.m.,*
in response to message #82 by Alexander Oestert

At least in my opinion, your initial post was polite and reasonable. Tim's response, while certainly not rude, was a bit sarcastic and teasing, given Tim's position within HP, however this would appear to be the norm for Tim's posts regarding official HP matters. Your response to Tim still seemed perfectly polite, essentially "Cut the jokes, do you have any real info to give us?" Unfortunately, the answer to that was no, likely due to non-disclosure agreements, a violation of which could cost Tim his job (and likely further delay/ruin hope of a 15C bugfix).

However, interpreting "You're reading too much" as "there will never be a bug fix" seems to be jumping to conclusions. Tim's response of "If you want official answers, go through official channels" is probably the *only* answer he could give you without putting his job on the line. The guy has a wife and kids, he's not going to risk his job to appease some guy on an internet forum. Neither would I, and I sincerely doubt that you would do that if you were in Tim's position.

And anyhow, the e-mail that Kerem posted indicates that HP obviously knows about this problem, and is on their "fix list," which while I don't want to do excessive speculation, would seem to indicate that a fix is forthcoming. As for distribution to us, I'm not certain. Hopefully distribution of the fix can at least be handled in the same way as the 12C+ fix, and maybe there will even be some kind of reflashing program for those who don't have access to cables and serial ports.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #92 Posted by **Lincoln R.** on 3 Dec 2011, 9:13 a.m.,*
in response to message #91 by Alexander Oestert

Your car mechanic isn't an employee of GM or Toyota or whoever who needs their proprietary information to replace a worn out brake pad. You're paying the mechanic to fix your car using parts and service procedures which are available to the public. HP is paying Tim, Cyrille, or whoever it is who is tasked with fixing this bug to fix their calculator firmware using HP intellectual property.

In the US, companies are *very* paranoid about IP, and understandably so: For many American companies, IP is the only thing of any value they have, and this is almost certainly the case with the HP calculator division. They own no manufacturing facilities, choosing to contract out all manufacturing. As such, the most valuable asset (other than people) they have is the design of their calculators, whether that be firmware code, PCB schematics, industrial design (Although the 15C's layout and look probably aren't covered under any design patents anymore if they ever were, an HP 15C looks like an HP 15C, and has HP badging on it that someone else can't just knock off), mechanical design of things like keyswitches, etc.

I agree that a timeframe would be nice to know, however if HP's employee agreements are anything like the ones I've had to sign to get a job in the past, Tim could easily be fired for sharing that information because it's a liability to a company to have anyone other than official PR types release that kind of information (For instance, if Tim said "Oh, yeah, we'll have a fix for that by January 1" and no fix came out, there's a slight chance that people could actually sue HP for making false statements.) This is the reason that nobody would admit to the existence of the 15C LE until they were actually rolling off assembly lines, because until that pint, it's entirely possible HP could have cut the project.

*Message #94 Posted by **Thomas Radtke** on 3 Dec 2011, 10:23 a.m.,*
in response to message #93 by Alexander Oestert

There's an important thing you miss: While HP admitted a fix is on their list, it is an open question if they find that their customers can claim this fix and if it is done. We always have the choice to return the 15C LE.

I still think we won't get a new firmware through official channels, but that's entirely my oberservation and experience with HP, not derived by anything an HP employee said.

Re: [HP 15C LE] Prophecy on bug fix?

*Message #95 Posted by **Walter B** on 3 Dec 2011, 10:57 a.m.,*

> worn out brake pad.

Slight difference: In Germany, the major fraction of car mechanics IS employed by the respective motor companies ;-) And indeed, if any of those won't be able to tell me when an obvious product failure will be fixed, I'll certainly not recommend this car brand anymore. Some years ago, there were examples of luxury cars showing problems in their control electronics, and the response of the company was poor (presumably not having a real solution at that time) - this supported the rise of other brands. But that's totally off topic, of course d;-)

HP-15C Turing Complete?

*Message #1 Posted by **Marcel Samek** on 29 Nov 2011, 1:28 a.m.*

Searching around the web, you can find many sites that repeat the identical quote that the 15C's "programming model is not turing complete."

However, I have not been able to find any information to back up that assertion, and I can't see why the 15C would not be considered turing complete.

Does anyone have more information?

Re: HP-15C Turing Complete?

*Message #2 Posted by **Eric Smith** on 29 Nov 2011, 1:37 a.m.,*
in response to message #1 by Marcel Samek

This is a typical case of someone adding incorrect information to Wikipedia, which then gets copied to a zillion other web sites. Even if the Wikipedia article gets fixed (which it hasn't), it's just about impossible to get any of the copies fixed.

The worst part is that once misinformation in a Wikipedia article is corrected, people "correct" it back, citing the other web pages that were copied from Wikipedia as references.

I've been through this several times, for instance, fixing the articles on the Viking and Voyager space missions, which incorrectly claimed that those spacecraft used the RCA CDP1802 "COSMAC" microprocessor.

I think Wikipedia is a great, but it is not an authoritative source, and neither are web sites that just host outdated copies of it. Wikipedia is sometimes good for finding authoritative sources, though, as many articles do contain good references.

Re: HP-15C Turing Complete?

*Message #6 Posted by **Eric Smith** on 29 Nov 2011, 1:40 a.m.,*
in response to message #1 by Marcel Samek

It appears that the Wikipedia article (as of this writing) is only claiming that the HP-10C and HP-12C are not Turing Complete, as they lack any form of indirect addressing. That does not extend to the HP-11C, 15C, and 16C, though I wouldn't be surprised if other web sites misinterpret it.

Re: HP-15C Turing Complete?

*Message #7 Posted by **pascal_meheut** on 29 Nov 2011, 2:00 a.m.,*
in response to message #6 by Eric Smith

HP-10C supports conditional branching which can be used to emulate indirect addressing as far as I know.

Can someone explain why an HP-10C (<with more memory preferably) would not be able to run the same programs as an HP-11C?

Re: HP-15C Turing Complete?

*Message #8 Posted by **Namir** on 29 Nov 2011, 7:38 a.m.,*
in response to message #7 by pascal_meheut

Can you give an example of how the HP-10C can emulate indirect addressing?

To answer your question, the HP-10C lacks subroutines, labels, and flags, to name a few features.

Namir

Re: HP-15C Turing Complete?

*Message #9 Posted by **Eric Smith** on 29 Nov 2011, 10:49 a.m.,*
in response to message #8 by Namir

Everywhere you want to do an indirect RCL, you would have to have a chain of comparisons, GTOs, and direct RCLs, to get the equivalent effect (from a limited number of possible data registers). Similarly for STO. It's obviously not going to work for any real problem-solving, due to the very limited amount of program memory available. It's only a theoretical argument for Turing Completeness, and not about any practical capability.

Re: HP-15C Turing Complete?

*Message #10 Posted by **Eric Smith** on 29 Nov 2011, 10:47 a.m.,*
in response to message #7 by pascal_meheut

Although "Turing Complete" generally disregards the amount of memory available, by the time you use conditional branching in a program to emulate even just a few registers of indirect addressing, you're out of memory. But I guess technically it probably does qualify as being Turing Complete.

Re: HP-15C Turing Complete?

*Message #11 Posted by **Howard Owen** on 29 Nov 2011, 11:53 a.m.,*
in response to message #10 by Eric Smith

I'm confused. If the ability to address over 20 registers is the problem, then my Mac is Turing incomplete too. Turing machines need infinite memory. All real machines have architectural limits on the amount of addressable memory. For the 10C, it's 20 locations. For my Mac it's 2^{64} locations. Am I missing something?

Re: HP-15C Turing Complete?

*Message #12 Posted by **pascal_meheut** on 29 Nov 2011, 12:17 p.m.,*
in response to message #11 by Howard Owen

This is not the problem. No real machine has indeed infinite memory but they (or any language) are considered Turing complete if they had so.

Another way is to look at the question is this: let's consider a problem which can be implemented by a Turing machine using N "memories" (or tape spaces). Can a give machine, given sufficient memory solves this problem for any value of N? If so, it is equivalent to a Turing machine.

Now, let's suppose an HP10C with more memory and more registers and let's check if we can implement an NxN Game Of Life.

We store the status of Cell x/y in register x*N+y obviously and then for each cell, we write the code which computes its next state (and stores it in register N*N+x*N+y). Basically, we write N*N times the same code adressing different registers.

Then we write the code to copy the new state over the old one. Once again, N*N instructions but nothing complicated.

Basically, we unroll the loops we would have written if we had indirect register adressing.

Finally, we test for a counter or a condition and we exit or go back to instruction 0.

This implements the Game of Life on a HP-10C with a lot of memory.

As the Game of Life is proved to be a Turing machine, the HP-10C is too...

Unless I'm wrong of course.

Re: HP-15C Turing Complete?

*Message #13 Posted by **Katie Wasserman** on 29 Nov 2011, 1:05 p.m.,*
in response to message #10 by Eric Smith

It's absolutely Turing Complete. Have you ever wrote programs for a hypothetical machine as described by Turing himself? There's no indirect addressing, subroutines, mathematical operations, or anything else. The only thing that there is is conditional branching --- with unlimited memory, of course!

Re: HP-15C Turing Complete?

*Message #14 Posted by **Eric Smith** on 30 Nov 2011, 2:10 a.m.,*
in response to message #13 by Katie Wasserman

Of course a Turing Machine has indirect addressing. That's the **ONLY** form of addressing it has for the data memory (tape); there is no "direct" addressing. The tape location pointed to by the head (which is equivalent to the indirect register) is the only accessible location. The only changes that can be made to that "indirect register" are to increment or decrement it.

Edited: 30 Nov 2011, 2:11 a.m.

Re: HP-15C Turing Complete?

*Message #15 Posted by **Katie Wasserman** on 30 Nov 2011, 2:49 a.m.,*
in response to message #14 by Eric Smith

I was thinking of more conventional indirect addressing. Calling a Turing machine's addressing "relative" would be a better term, however.

Going back to the 12C, it has both relative addressing (via STO/RCL CFj) and conventional indirect addressing (via STO N followed by STO/RCL CFj).

Edited: 30 Nov 2011, 2:55 a.m.

Re: HP-15C Turing Complete?

*Message #16 Posted by **pascal_meheut** on 30 Nov 2011, 3:12 a.m.,*

The only changes that can be made to that "indirect register" are to increment or decrement it.

What is the point? We are not talking about the Turing machine itself but about being "Turing complete", i.e. being able to compute the same set of functions as a Turing machine. And it can be done without "indirect adressing", i.e. RCL i/STO i for instance.

In fact, it can be done in many ways (see above about the Game of Life).

The point of describing characteristics of the Turing Machine is that it defines Turing Completeness.

Re: HP-15C Turing Complete?

*Message #18 Posted by **pascal_meheut** on 30 Nov 2011, 3:25 p.m.,*
in response to message #17 by Eric Smith

Quote:

The point of describing characteristics of the Turing Machine is that it defines Turing Completeness.

No. You repeat the same thing but you are making a confusion between the construction of the Turing machine and the set of functions it can compute.

The 2nd is a consequence of the first but the inverse is not true. Fortunately.

So indirect addressing is not necessary to be Turing complete.

Re: HP-15C Turing Complete?

*Message #19 Posted by **Eric Smith** on 30 Nov 2011, 10:17 p.m.,*
in response to message #18 by pascal_meheut

According to Wikipedia:

Quote:

In computability theory, a system of data-manipulation rules (such as an instruction set, a programming language, or a cellular automaton) is said to be Turing complete or computationally universal if and only if it can be used to simulate any single-taped Turing machine and thus in principle any computer.

It is thus relevant to discuss the characteristics of a Turing Machine. There are other Turing Complete machines that have the same computational ability as a Turing Machine, and thus these machines can, like a Turing Machine compute all partial recursive functions. If the Church-Turing Thesis holds, this is the set of all computable functions.

One way to show that a machine is Turing Complete is to show that the set of functions it can compute is identical to the set of partial recursive functions. For example, a Post tag machine with at least two tags is Turing Complete. It is in some cases easier to show that a machine can both simulate and be simulated by a Turing machine than to directly show that it can compute exactly the set of partial recursive functions.

Certainly there are machines that can be shown to be Turing Complete yet lack a

direct equivalent to the type of indirect addressing found in some HP RPN calculators.

Showing that an HP-10C is Turing Complete by the method you suggest seems to have some difficulties. There is some lower bound to the universe size required for Conway's Life cellular automata to be universal, and the HP-10C is not likely to be capable of simulating that. A more promising approach would be to show that it can simulate Wolfram's Rule 110, which is the simplest known universal CA.

Re: HP-15C Turing Complete?

*Message #20 Posted by **pascal_meheut** on 1 Dec 2011, 12:38 a.m.,*
in response to message #19 by Eric Smith

The subject is not the space required to simulate a Turing machine using a Life Game. Because if we go this way, no computer and of course no HP calculator is even close of doing so.

The point was that indirect addressing is not necessary to be Turing Complete and if your only objection to my demonstration is the memory size, then thanks for your validation.

Re: HP-15C Turing Complete?

*Message #21 Posted by **Eric Smith** on 1 Dec 2011, 11:17 a.m.,*
in response to message #20 by pascal_meheut

While memory size is not normally considered for Turing Equivalence, since no real computer has an infinite tape, it is required for Turing Equivalence that the candidate computer has to be able to simulate at least one single-tape Turing machine that uses only a finite amount of tape storage.

If I built a piece of hardware that could perform the Life CA with a 3x3 universe, no one would consider it Turing Complete, even though the Life CA is universal, because that size universe doesn't make it capable of simulating a Turing machine with even a two state program that uses only two tape locations, the smallest possible non-trivial Turing machine program.

Re: HP-15C Turing Complete?

*Message #22 Posted by **Eric Smith** on 1 Dec 2011, 3:54 p.m.,*
in response to message #20 by pascal_meheut

For another example, Wolfram's Rule 110 CA is proven to be universal. I can implement one cell of Rule 110 with seven NAND gates and one flip-flop. However, no one would claim that the circuit with seven NAND gates and one flip-flop is Turing Complete. Some larger collection of such circuits would be.

It's a matter of a lower bound. Turing Complete systems are not required to match the upper bound of what a Turing Machine can do, because that's obviously impossible, but they have to at least reach a lower bound

of doing *something* non-trivial that a Turing machine can do.

If you don't have any lower bound, then you can say that *any* system is Turing Complete, because it can simulate a trivial Turing Machine, for instance, a Turing Machine that ignores its input, writes a single bit to the tape, and halts.

Re: HP-15C Turing Complete?

*Message #23 Posted by **pascal_meheut** on 1 Dec 2011, 4:29 p.m.,*
in response to message #22 by Eric Smith

Once again, you are changing the subject which was about indirect indexing, not the amount of memory needed...

Have fun by yourself, you probably think you can be right by talking about something else...

Re: HP-15C Turing Complete?

*Message #24 Posted by **Eric Smith** on 1 Dec 2011, 5:23 p.m.,*
in response to message #23 by pascal_meheut

I didn't say indexed addressing is necessary. However, if you don't have it, you'll have to use some other mechanism that provides the equivalent. On an HP calculator like the 10C, there is no indirect addressing, and doing the equivalent as a series of tests, branches, and RCL/STO uses up so much of the limited program memory that I don't think it is possible to make a credible claim that the 10C is Turing Complete.

For example, to have programmatic RCL access to just *three* selectable memory locations requires 14 program steps out of the 80 available. A programmatic STO access would also require 14 program steps. Since there are no subroutines, those RCL and STO sequences would need to occur multiple times.

Re: HP-15C Turing Complete?

*Message #25 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 29 Nov 2011, 12:52 p.m.,*
in response to message #6 by Eric Smith

> Quote:
>
> ...HP-12C are not Turing Complete, as they lack any form of indirect addressing

Could this behaviour of HP-12c be considered as Indirect addressing? Addressing an indirect register through n and Cfj. RCL(CFj) increases "n" value by one before calling the corresponding Register.

for an example

n=-1

RCL(CFj) returns R(0)

n=4

RCL(CFj) returns R(5)

n=1

CFj stores x value in R(2)

n=2

CFj stores x value in R(3)

and so on...

Also you can use additional 21 registers besides R(x)for values that are positive, integer and less than 100: n for location (0-20) "Nj" to store x, RCL(Nj) to recall that register in to x.

Regards, Kerem

Opening a 100LX

*Message #1 Posted by **David Ramsey** on 28 Nov 2011, 7:42 p.m.*

Just received an HP-100LC from Australia. Overall nice condition except several keys don't work: the vertical row of Esc, Tab, Q, A, and Z, and, oddly, the "Memo" key.

This should be a simple fix but I cannot figure out how to take the thing apart. Removing the four T6 screws under the rubber feet was easy, and this site:

http://www.hermocom.com/knowledgebase/hplx/dismantle

...shows how to do it, but the description is unclear and the photos are small and taken from a poor angle. The "Slide the credit card until it's at the position shown below" photo is especially useless.

I'm assuming the credit card is supposed to push back a catch molded into one half of the shell, but I can't make it work, and I don't want to apply any more force for fear of breaking the unit's case. Any suggestions?

Edited: 28 Nov 2011, 7:42 p.m.

in response to message #1 by David Ramsey

look at the exploded photos, and figure out where the strip of contacts between the PCB and keyboard membrane is. basically, sitting behind and just below the menu, right shift, "0", "." keys. found that location? on each side is a plastic pin that extends between the two halves of the case (mounded into the front of the case). these pins are very fragile.

the below photo shows the PCB from a 1000lx (identical), with the keyboard contacts at the bottom of the image. the pins pass through the holes at each end of the set of contacts:

when the case is together the two pins are a friction fit into 'sockets' in the back half, and somewhat vital to the connection to the keyboard. the purpose of the credit card is to help pull the two halves of the case apart parallel to each other, without twisting or bending the two pins - if they break off, you have major problems.

does this make things clearer?

you should be able to remove the base of the case with the screen closed. the only other thing holding the two parts together are the battery connections.

*Message #3 Posted by **Ángel Martin** on 28 Nov 2011, 12:02 p.m.,*
in response to message #1 by M. Joury

A journey of fun and discovery awaits you, buckle up!!! :-)

Re: Just got my HP41CL board Too!

*Message #4 Posted by **Gerry Schultz** on 28 Nov 2011, 7:59 p.m.,*
in response to message #3 by Ángel Martin

Man, when it rains, it pours! I not only got my 41CL board today (yahoo!), but my new iPhone 4s just showed up. And Geoff is sending my 41CV donor machine back to me this week with his unique TLC ready for an upgrade to a 41CL. It will be interesting to compare the speed of the 41CL to the i41CX+ RPN Calculator app for the iPhone.

Thank you Monte and Geoff!

Gerry

[WP34S] Cheap Overlay Solution Courtesy of Kinkos

*Message #1 Posted by **Les Wright** on 28 Nov 2011, 5:02 a.m.*

I am still working with 2.2, will commit to Eric's overlays once we have a version 3 release, or at least a beta where the key-mapping is set. In the meantime, I really am enjoying this solution:

The quality of the colour laser printing is excellent so far and doesn't seem to smudge. The paper is sturdy but not too thick to adversely affect key click. Overlay secured with thin strips of double-sided cellotape around the edges and between rows 2 and 3. I could make flaps and poke the keys through, but the touch is accurate enough to I don't need to.

Kinko's did the job for just over seven bucks--8 pages with 4 overlays on each. Great temp supply.

Me likey!

Les

> urrgghhhh....it's cheap, and it shows :-(

It's an interim solution and thus it's really ok.

What I don't understand is: it is the old V2 version and you could have bought Eric's beautiful overlay for even less money. He is still offering them as far as I know.

Re: [WP34S] Throw-away Overlay Solution Courtesy of Kinkos

*Message #4 Posted by **Dominic Richens** on 28 Nov 2011, 10:57 a.m.,*
in response to message #3 by Alexander Oestert

Right, I wouldn't call it "cheap" either as Eric's overlays, with shipping, are next to nothing already. I'd call it "throw away".

I understand Les not wanting to attach one of Eric's overlays only to have to try to remove it in a few weeks time! Them things are really really sticky!!!

When I finally decide I need V3.0 I'm just going to upgrade to an HP-30b. Although I don't need the extra functions, I'm liking the new keyboard layout - it's cleaner and more logically grouped.

Re: [WP34S] Cheap Overlay Solution Courtesy of Kinkos

*Message #5 Posted by **Les Wright** on 28 Nov 2011, 1:50 p.m.,*
in response to message #3 by Alexander Oestert

hpnut, I went for function rather than form as an interim measure. I am actually amazed at how good it actually works--the printing is clear and the keys move fine under the paper. Just fine for now. I appreciate the aesthetics of a beautiful HP as much as anyone here, and I know this arrangement is not a looker.

Alexander, I do admit I went a little into overkill with the Kinko's print order. I had them print up 8 at under 90 cents a page with 4 overlay images per 8.5x11 page. I will likely not use all of them. I could've done fine with two or three pages to tide me over. But, c'est la vie--I have wasted nickels and dimes on far dumber things.

That said, Eric's overlays are not really going to be a saving for me. I understand that it can be challenging to get them on just so without mucking them up, so I plan to order three--one to use, one in case I spoil the first one, one for backup if the first gets stained or worn or whatever. That's $15, not $6. Still worth it. That's a week's coffee money for me.

As far as, the various expenditures regarding the wp34s, I have not hesitated to throw a few extra bucks at it. I got the 30b for the nicer key touch. I gave Gene 20 bucks for the cable to support the cause even though he wants only 10. I spent a little extra, 25 bucks, on the FTDI USB-serial controller recommended by Eric, since I wanted something proven to work and I didn't want to waste time on cheaper options. I haven't donated yet to the wp34s project per se, but should get on that. All told, I have spent far less on this excellent device and the accoutrement than I have on some vintage collectables that I just had to have at the time but now don't use much. In this context, a few bucks at Kinko pending Eric's release of a v. 3 overlay is peanuts in comparison.

*Message #6 Posted by **Walter B** on 28 Nov 2011, 2:38 p.m.,*
in response to message #1 by Les Wright

Hmmh, that's a very quick and easy method. Obviously workable ;-) Using double-sided tape also in the center cries for cutting flaps, however, taking half an hour of dedicated precise work now since the cutting marks are in the file. If you don't want to invest this, use single sided tape along the edges - easier and may even look better, too :-)

HP 71B : How to input RPNLEX in EMU71 for Windows?

*Message #1 Posted by **Miguel Toro** on 27 Nov 2011, 3:21 p.m.*

Hi,

I just discovered that there is a RPNLEX file allowing using RPN in a 71B. Because I cannot use EMU71/DOS in Windows 7, I wanted to use EMU71/WIN, but I do not know how to do some things that apply to the DOS version as for example, the use of emu71.ini to declare the HDRIVE2 device with the lexfl1.lif file.

Does EMU71/WIN recognizes emu71.ini? if not, how can I have access to the lexfl1.lif file?

I appreciate any help

Thanks and regards,

Miguel

Edited: 27 Nov 2011, 3:22 p.m.

Re: HP 71B : How to input RPNLEX in EMU71 for Windows?

*Message #2 Posted by **Mike (Stgt)** on 28 Nov 2011, 9:20 a.m.,*
in response to message #1 by Miguel Toro

Emu71/Win does not use the INI file of Emu71/DOS. You have to use the settings menu to add a simulated IL module to Emu71/Win. Next connect ILPer Christoph offers here to add a simulated peripheral mass storage.

Ciao.....Mike

Execution Speed of Early HP Programmables

*Message #1 Posted by **Nigel Fraser Ker** on 27 Nov 2011, 10:13 a.m.*

I tried writing a program on my HP67 which simply counts from 1 upwards. I timed this process and it runs at almost exactly half the speed I can quite easily achieve doing the equivalent thing with my Curta mechanical calculator. I timed my HP41CX and it runs at approximately the same speed as the Curta.

This is by no means meant to be a criticism but it does seem remarkably slow and I'd like to know what limits the speed. Is it because 1970s memory runs very slowly? I am using 2011 electrons ;-)

Re: Execution Speed of Early HP Programmables

*Message #2 Posted by **Dieter** on 27 Nov 2011, 10:35 a.m.,*
in response to message #1 by Nigel Fraser Ker

I don't think it's memory or "the 70s". Here are some results from various benchmarks: the first one here on hpmuseum.org and another one with much more data in the articles section.

Look at the figures and draw your own conclusions. ;-)

Dieter

Edited: 27 Nov 2011, 10:36 a.m.

Re: Execution Speed of Early HP Programmables

*Message #3 Posted by **Katie Wasserman** on 27 Nov 2011, 11:20 a.m.,*
in response to message #1 by Nigel Fraser Ker

The early calculator chips were mostly PMOS (or NMOS) not CMOS, they used a lot of current and switched slowly. To minimize the current draw and extend battery life they kept to clock rate low.

Re: Execution Speed of Early HP Programmables

*Message #4 Posted by **Nigel Fraser Ker** on 27 Nov 2011, 11:45 a.m.,*
in response to message #3 by Katie Wasserman

Ah, I see...many thanks!

Re: Execution Speed of Early HP Programmables

*Message #5 Posted by **Jim Horn** on 27 Nov 2011, 12:55 p.m.,*
in response to message #3 by Katie Wasserman

Early calculators used a bit serial architecture - i.e. the addresses and data were shuffled around only one bit at a time. That's how the '41's RAM and ROM could fit into 8 pin DIPs. So, combine a sub-megahertz clock with having to shuffle 56 bits per register around and then use a lot of internal programming opcodes

to do a simple add, combined with having to do GOTOs by searching entirely through memory on the '67, and the slow speed is no surprise.

Of course, a simple counting loop is easy on the Curta. Transcedental math is another thing!

Still, the fastest factoring program on the HP-67 found 10^10-33 prime in about 3 hours 45 minutes, as I recall. The HP-41 was blazingly 3 times faster. Glacial by current standards, but that was over 30 years ago (i.e. the answers arrived 30 years before today's machines can deliver them). And far faster than the personal calculators of 30 years before that...

(An old saying - you can tell the pioneers as they're the ones with the arrows sticking out of their backs).

Re: Execution Speed of Early HP Programmables

*Message #6 Posted by **Nigel Fraser Ker** on 27 Nov 2011, 2:26 p.m.,*
in response to message #5 by Jim Horn

Thanks, that's very interesting and certainly explains a lot.

(I don't want to sound like I'm knocking these lovely old machines - my 67 is currently my favourite calculator and I have several to choose from!)

Re: Execution Speed of Early HP Programmables

*Message #7 Posted by **db (martinez, ca.)** on 27 Nov 2011, 3:07 p.m.,*
in response to message #5 by Jim Horn

Jim; 4 things.

Yes. True. The Curta was slowed way down when you had to look up a number in your peters tables to throw into it.

So as you said; the hp 67 was faster in reality - but it couldn't grind coffee.

If there are arrows in the backs of Pioneers, what's sticking out of Voyagers?

I'll use that line of yours "the answers arrived 30 years before today's (faster) machines can deliver them" someday, but i'll take credit.

Re: Execution Speed of Early HP Programmables

*Message #8 Posted by **Jim Horn** on 27 Nov 2011, 5:26 p.m.,*
in response to message #7 by db (martinez, ca.)

I didn't consider anything here as a knock on the older machines - and certainly appreciate the tremendous changes since then!

The '67 will always have a fond place in my memories. I used mine so much I could program it by feel, and did one night in the wee hours while driving my VW Scirocco back to the SF Bay Area from LA to try out some math ideas I had. Of course, the LEDs were easy to see in the dark when I occasionally glanced at their results.

Martinez, CA? I moved up to the Columbia River Gorge from Santa Rosa - and my '67 is still in Rohnert Park with a great friend...

Re: Execution Speed of Early HP Programmables

*Message #9 Posted by **Hal Bitton in Boise** on 27 Nov 2011, 10:42 p.m.,*
in response to message #8 by Jim Horn

The LED light show while a program is running on a 67 is priceless. Next best is the flying goose on the 41's, followed by the flashing "running" on the 15c. All of the above give unambiguous indication that your program is running.
The little hourglass annunciator on current machines is very non-discript and boring by comparison...so, it's a good thing programs run faster! :)

Re: Execution Speed of Early HP Programmables

*Message #10 Posted by **Olivier De Smet** on 29 Nov 2011, 8:30 a.m.,*
in response to message #9 by Hal Bitton in Boise

Just to give some hints, classic were built with a base clock from 185 up to 235 KHz.

Which gives around 3000 instructions per second (56 cycles for an instruction)

(btw the flickering on an HP67 is around 220 Hz)

9120 printer paper

*Message #1 Posted by **Dave Brown Christchurch NZ** on 27 Nov 2011, 6:45 a.m.*

Had a direct email requesting info re this based on a post of mine here,back in 2005. I replied directly but email bounced. I DO still have some of this paper and I'm more than happy to supply it to those in need. DaveB

Re: 9120 printer paper

*Message #2 Posted by **David Ramsey** on 27 Nov 2011, 9:51 a.m.,*
in response to message #1 by Dave Brown Christchurch NZ

Ah, that would have been from me. I run my own mail server (since 2001) and after a couple of years of increasing spam I bought my own Barracuda Spam and Virus Filter, a dedicated box that filters all e-mail coming into any "neko.com" (and a few other) domains.

It blocked your message because of the "reputation" of ihug.co.nz. This is understandable since another message I see from that domain consists of the text:

"Please response to my Deal of 45.5 Million U!S!D funds transfer as i urgently need your help "

Anyway, I've whitelisted your address so further communications will get through.

Re: 9120 printer paper

*Message #3 Posted by **David Ramsey** on 28 Nov 2011, 7:32 p.m.,*
in response to message #1 by Dave Brown Christchurch NZ

I would like to buy a few rolls (or even a case; your 2005 message mentions "many cases") of paper. The zinc oxide electrosensitive paper is unique to this machine, as far as I can determine, and is quite different from the still-available aluminized paper.

(In case anyone's interested: a printer "prints" on the more common aluminized paper by actually vaporizing the thin layer of aluminum, exposing the black polyvinyl alcohol layer underneath. The 9120 printer is designed for zinc oxide paper, which has the advantage of being white(ish) rather than silver. The zinc oxide layer is not vaporized but is reduced back to zinc by the electric current, resulting in dark brown print on a white background. NOBODY makes this kind of paper any more, although there are "premium" copy papers that use zinc oxide coatings for its bright white appearance. These won't work in the 9120 since they lack a conductive layer underneath the oxide coating.)

I would be interested to buy some rolls, too, provided that you consider international shipping.

Re: 9120 printer paper

*Message #5 Posted by **Dave Brown Christchurch NZ** on 29 Nov 2011, 11:01 p.m.,*
in response to message #4 by Juergen Keller

I need to get some idea of cost to send internationally - no problems in that regard, other than the cost. The paper comes in boxes of three but can split if necessary.

Agreed - this paper is unlike any other electrosensitive paper which will explain why the correct paper is necessary in the 9120 printer.

Dave- I'm still blocked- replied to your second direct email but yet another bounce. FYI Ihug is one of the main ISPs here so no worries re that aspect- I've never had an issue with them in 12 years or so. They all have their issues at times but ihug is one of the original ones and was bought out by vodafone some years ago- fortunately we old timers have been able to keep our original email addresses.

Re: 9120 printer paper

*Message #6 Posted by **David Ramsey** on 30 Nov 2011, 1:02 a.m.,*
in response to message #5 by Dave Brown Christchurch NZ

A Barracuda spam filter uses a descending series of strategies to filter spam. One of the first things it does is check the source IP against a list maintained on Barracuda Networks' servers. This list is built (partially) from return addresses of emails other Barracuda users have reported as spam. For whatever reason ihug.co.nz is on that list, so anything from that domain is blocked due to "Barracuda reputation."

I can't unblock the entire domain, but I whitelisted your original address ("tractorb"). Unfortunately your second attempt used a different address so it got blocked again! Both addresses are whitelisted now, so please try just one more time...

[WP34S] SLV returns "Failed" when it finds a root just fine.

*Message #1 Posted by **Les Wright** on 27 Nov 2011, 6:36 a.m.*

The subject line says it all.

I have encountered a weird situation where the Solver tells me it has failed, but the root returned (once I clear the error message) is more than accurate for the precision specified via, ALL, SCI, or FIX.

I am using 2.2 and this reproducible on the emulator and on the calc.

The very simple equation I am dealing with is x^3 -36 = 0, and the routine solved is

```
LBL 55
3
y^x
3
6
-
RTN
```

The real root of this equation is about 3.3. I enter 3 ENTER 3.5 f SLV 55 and I get "Solve Failed", but underneath is a root that is more than acceptable for the precision desired.

Is this a bug? Is the underlying code much more sensitive around the desired error issue than it has to be?

If this issue has already been reported, please forgive my repetition. It is just odd to get a failure message when there has been no failure at all.

Les

Re: [WP34S] SLV returns "Failed" when it finds a root just fine.

*Message #2 Posted by **Marcus von Cube, Germany** on 27 Nov 2011, 8:47 a.m.,*
in response to message #1 by Les Wright

This is Pauli's territory, I'm afraid. There are some issues with the solver pretending not to find a root while the results are perfectly fine.

Re: [WP34S] SLV returns "Failed" when it finds a root just fine.

*Message #3 Posted by **Dieter** on 27 Nov 2011, 9:20 a.m.,*
in response to message #1 by Les Wright

There is or was a problem with the solver in that it checks whether the function result of the final approximation is close to zero, as far as I know using the x~~0 test. In SCI, ENG or ALL mode this is equivalent to a test whether x is *exactly* zero. However, in many cases even the best possible 16-digit result does not return a plain zero. And the solver will throw an error.

This is also true in this case. The correct solution is the cuberoot of 36, i.e. 3,301 9272 4889 4627 for which

the function result is 1E-14. Rounded in ALL mode, this still remains 1E-14 and not zero, making the solver think it has failed. However, the root SLV has found so far is 3,301 9272 4889 4673 in X and Y, which is not the exact 16-digit value.

Now try the same in FIX 11 mode and the solver returns a result that is correct in all 11 displayed decimals: 3,301 9272 4889. The final function result in Z is 1,51E-12 which in FIX 11 nicely rounds to zero, thus confiming that the solver has found a valid result.

As long as this has not been corrected, the well-known workaround from the olden days may be used: round small function results to zero. In this case, changing x by 1 ULP (1E-15) will change f(x) by more than 3E-14, so anything below 1E-13 may be considered zero. So simply add "EEX 4 + RCL—L" to the function routine and the solver will find a result even in ALL mode.

By the way, there is no need for "3 y^x" since there is a dedicated CUBE function, as well as CUBERT and another one for the xth root of y. These functions also provide better precision.

Dieter

Edited: 27 Nov 2011, 9:51 a.m.

Re: [WP34S] SLV returns "Failed" when it finds a root just fine.

*Message #4 Posted by **Les Wright** on 27 Nov 2011, 9:50 a.m.,*
in response to message #3 by Dieter

Yep, Dieter, that is the thing.

One needs to use FIX n so that the function result in register z rounds to zero for the purposes of the x~~0 test. This won't happen with SCI n or ALL n. For example 2.934654E-12 will round to 0 in FIX 11, but not in SCI or ALL display modes.

So, that's the thing. Thank you!

Les

What about CUTEBERT, the adorable function!

Re: [WP34S] SLV returns "Failed" when it finds a root just fine.

*Message #7 Posted by **Paul Dale** on 27 Nov 2011, 4:31 p.m.,*
in response to message #3 by Dieter

Dieter hit the nail on the head. The approximately zero test is failing and the solver thinks it hasn't solved successfully.

This errant check has been removed in the latest firmware and it is up to the user to determine if a zero or a discontinuity was found.

HP-18C User's Manual in German

*Message #1 Posted by **Karl-Ludwig Butte** on 27 Nov 2011, 6:09 a.m.*

Dear All,

I was lucky to get the German edition of an HP-18C in quite good condition. Alas, the user's manual is missing. I read in Prisma 10/1986 (the magazine of the German CCD User's Club long time ago) that the American and German editions diver significantly in some calculations due to different usages. I found the english version of the user's manual on the museum CD but not the German version.

Does anyone know, where the German user's manual can be download or has anyone a PDF version of it ?

Every hint will be very much appreciated. Thank you very much in advance.

Kind regards

Karl

serial numbers of international HP-17b's

*Message #1 Posted by **Don Shepherd** on 26 Nov 2011, 9:15 p.m.*

I have two 17-b's made in the US in consecutive weeks during 1988:

```
Serial # 2816A06305  -  no language choice in MODES, self-test OK-17B-E
Serial # 2815A91640  -  choice of languages in MODES, self-test OK-17B-I
```

So I'm thinking that if the first digit of the serial number (after the YYWWC portion) is 0, that corresponds to a unit sold in the US, and if the digit is 9, that corresponds to a unit sold outside the US (and so it has the language selections).

Can anyone confirm this?

Edited: 26 Nov 2011, 10:36 p.m. after one or more responses were posted

*Message #4 Posted by **Marcus von Cube, Germany** on 27 Nov 2011, 6:22 a.m.,*
in response to message #1 by Don Shepherd

I've an international 17bii with serial # 3112**S0**4389

Re: serial numbers of international HP-17b's

*Message #5 Posted by **Don Shepherd** on 27 Nov 2011, 10:40 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Thanks Marcus.

I've got 3 non-language-selection Singapore units that begin (the serial # part) with S3, so maybe the Singapore factory uses 3 for English-only units and 0 for international units.

Or maybe not. I guess only HP knows (or knew).

Re: serial numbers of international HP-17b's

*Message #6 Posted by **Marcus von Cube, Germany** on 27 Nov 2011, 10:51 a.m.,*
in response to message #5 by Don Shepherd

Maybe the 17Bii and the 17B are different in this respect. Does there exist an English only 17Bii?

Re: serial numbers of international HP-17b's

*Message #7 Posted by **Don Shepherd** on 27 Nov 2011, 11:33 a.m.,*
in response to message #6 by Marcus von Cube, Germany

> Quote:
>
> Does there exist an English only 17Bii?

Oh yeah. I have about 4 17bii's and they are all English-only (that is, no language selection from the MODES key). They are from Singapore and Indonesia, and the serial # (after YYWWC) starts with 0.

Re: serial numbers of international HP-17b's

*Message #8 Posted by **Ken Shaw** on 28 Nov 2011, 8:17 a.m.,*
in response to message #5 by Don Shepherd

The 17BII that I have handy is 3015**S0**1247.

Singapore, but not international, if "international" means it has the language option in the Modes menu.

Re: serial numbers of international HP-17b's

*Message #9 Posted by **Don Shepherd** on 28 Nov 2011, 12:45 p.m.,*
in response to message #8 by Ken Shaw

Thanks Ken. So yours is S0 and without language selection, and Marcus' is S0 with language selection. Marcus, can you verify that when you do the self-test, you get OK-17B-I?

Re: serial numbers of international HP-17b's

*Message #10 Posted by **Marcus von Cube, Germany** on 28 Nov 2011, 3:32 p.m.,*
in response to message #9 by Don Shepherd

I get OK-17B-II-I? The language selection pops up after a power failure (the batteries were flat so I saw it.)

Re: serial numbers of international HP-17b's

*Message #11 Posted by **Don Shepherd** on 28 Nov 2011, 4:38 p.m.,*
in response to message #10 by Marcus von Cube, Germany

Thanks Marcus. I'm thinking that the "I" at the end of the message means "international unit", as opposed to the usual "E" for English-only units. So you should have the language selection options from the MODE key, correct?

Re: serial numbers of international HP-17b's

*Message #12 Posted by **Marcus von Cube, Germany** on 29 Nov 2011, 3:45 a.m.,*
in response to message #11 by Don Shepherd

Yes, MODE offers INTL.

HP-71B Rom Stuck in Port

*Message #1 Posted by **Jeff Davis** on 26 Nov 2011, 7:00 p.m.*

I have a 64K EPROM that is stuck in the port so tight I cannot get it out. What is the best method to remove the EPROM from the 71B.

Re: HP-71B Rom Stuck in Port

*Message #2 Posted by **Raymond Del Tondo** on 26 Nov 2011, 9:14 p.m.,*
in response to message #1 by Jeff Davis

If the module sits in port 1 or 2 (near the ON key) ,
you can try to push it out from behind, by removing the IL module (or the cover).
You'll have to use a suitable tool, like an screw driver with isolated shaft.
Be CAREFUL not to damage the PCB or any electronic parts on it!

If the module sits in port 3 or 4, you may have to open the 71B,
by removing the screws under the rubber feet and in the batt and card reader compartments.

HTH

Ray

Re: HP-71B Rom Stuck in Port

*Message #3 Posted by **Patrice** on 26 Nov 2011, 10:24 p.m.,*
in response to message #1 by Jeff Davis

I have a 71B with a very tight module.
I am used to remove it by alternating moves to left and right while pulling and repeat tens of times.

*Message #4 Posted by **Marcus von Cube, Germany** on 26 Nov 2011, 3:08 p.m.,*
in response to message #3 by Matti Övermark

I thought they are (almost) the same.

Edit: A short look at casio.ledudu.com reveals they're not.

Edited: 26 Nov 2011, 3:17 p.m.

Re: OT: Manual for Casio FX-3900P needed

*Message #5 Posted by **Marcus von Cube, Germany** on 26 Nov 2011, 4:07 p.m.,*
in response to message #1 by Matti Övermark

The Casios work all in a similar fashion. A sample program can be found on rskey.org. You need to go into MODE 2 (WRT) (or 3 (PCL) to make room first). In MODE 2 you can input your program. You run it in MODE 1 (RUN). Prog N (1 to 4) will start a program. For paired statistics you go into MODE LR (divide). Data points are entered with DT (on the root key). A pair is entered with a comma if I remember correctly.

Re: OT: Manual for Casio FX-3900P needed

*Message #6 Posted by **Matti Övermark** on 27 Nov 2011, 6:10 a.m.,*

in response to message #5 by Marcus von Cube, Germany

Thanks a lot Marcus! I found the data insert key - its labelled DT. As you said the data pairs are separated by a comma.

Regards Matti

What advantages? Last time I asked I was answered that I could let my friends know when I'm out for dinner or going to the toilet. I found that this wouldn't compensate for being tracked by a company. But that's probably only me.

Re: Interesting AT&T hp-15C

*Message #7 Posted by **Ethan Conner** on 27 Nov 2011, 3:29 p.m.,*
in response to message #6 by Thomas Radtke

Now the meter is broken....sigh. For those who don't FB that is fine.

And the great thing is, if you refuse to have a Facebook account and login, Facebook will auto-assemble and post a profile page for you based on whatever it can find from wherever. Especially if a lot of people who know you have facebook accounts. :(

Re: Interesting AT&T hp-15C

*Message #13 Posted by **Dominic Richens** on 28 Nov 2011, 11:07 a.m.,*
in response to message #4 by Don Shepherd

Meh. I only login to Facebook with an incognito window (Chrome) - take care of the tracking problem.

FB gets the bad rap because it is the most popular site to do this. Almost all online retailers do this. I see ads all the time on web sites advertising stuff I was just looking at from the retailer I was just looking at! Tigerdirect, newegg, dealextreme, even the place I buy car parts from! It always seems a little ridiculous to buy a ECU for my van and then to see ads for ECU on every web site I go to! I mean how many times in ones life does one need to buy a replacement ECU!!?

Re: Interesting AT&T hp-15C

*Message #14 Posted by **Lincoln R.** on 28 Nov 2011, 11:11 a.m.,*
in response to message #13 by Dominic Richens

Yeah, it's irritating. I once bought a set of fuel injectors for my Chevrolet and started seeing ads for all kinds of random car parts. "You might be interested in: A manual transmission rebuild kit for a Honda Accord" or "500 blank Ford ignition keys." Clearly their ad-targeting software isn't that bright.

HP-15C LE in Washington?

*Message #1 Posted by **marais** on 26 Nov 2011, 8:22 a.m.*

Folks, I'll be in Washington DC next month for a few days and was wondering if anybody knew about a shop selling the 15C LE? Since it is still not available in Europe, I thought I should use that opportunity. Any help appreciated!

Re: HP-15C LE in Washington?

*Message #2 Posted by **Katie Wasserman** on 26 Nov 2011, 10:59 a.m.,*
in response to message #1 by marais

I don't think that anyone has reported seeing a 15C LE in a brick and motor store. I've only heard of people buying them online. Furthermore I don't know of any online store that has them in stock now.

Re: HP-15C LE in Washington?

*Message #3 Posted by **marais** on 26 Nov 2011, 12:59 p.m.,*
in response to message #2 by Katie Wasserman

Katie, there goes my hope of ever having a 15C LE. Now I know why it's called "limited edition".

Re: HP-15C LE in Washington?

*Message #4 Posted by **Katie Wasserman** on 26 Nov 2011, 1:05 p.m.,*
in response to message #3 by marais

Give it time. I think that there will be more available not too long from now and maybe even a "regular" 15C. It would be dumb for HP to walk away from a successful product.

Re: HP-15C LE in Washington?

*Message #5 Posted by **Namir** on 26 Nov 2011, 1:24 p.m.,*
in response to message #3 by marais

Nothing at the FNAC Montparnasse???

Re: HP-15C LE in Washington?

*Message #6 Posted by **marais** on 27 Nov 2011, 3:53 a.m.,*
in response to message #5 by Namir

Neither at Fnac Les Halles.

Re: HP-15C LE in Washington?

*Message #7 Posted by **Walter B** on 27 Nov 2011, 5:12 a.m.,*

in response to message #6 by marais

FYI in the USA: The presence of HP's scientific calculators in Europe is neglegible :-(HP, are you listening?

Re: HP-15C LE in Washington?

*Message #8 Posted by **Namir** on 27 Nov 2011, 5:32 a.m.,*
in response to message #6 by marais

In the good old days, all these FNAC stores carried the HP and TI calculators.

Re: HP-15C LE in Washington?

*Message #9 Posted by **Walter B** on 27 Nov 2011, 6:56 a.m.,*
in response to message #8 by Namir

Those were the days, my friend, we hoped would never end ...

Re: HP-15C LE in Washington?

*Message #10 Posted by **Namir** on 27 Nov 2011, 12:22 p.m.,*
in response to message #9 by Walter B

I recall when I lived in Paris in 1978, I'd visit the FNAC stores each Saturday ad marvel and the HP ad TI calculators. I had an HP-67 then, but that did not prevent me from browsing. The added taxes were high on these machines. I recall when I arrived in Michigan in December 78 and went to Ulrich's book store in Ann Arbor, I was stunned to see how cheap the TI-59 was (compared to prices in France). My reaction was asking the salesperson to buy a TI-59. A few days later I went back and bought the printer that goes with it.

Edited: 27 Nov 2011, 12:23 p.m.

Re: HP-15C LE in Washington?

*Message #11 Posted by **Michael de Estrada** on 27 Nov 2011, 12:40 p.m.,*
in response to message #10 by Namir

Where did you work in Michigan ? In 1978 I lived in Jackson, and worked at Gilbert-Commonwealth. I bought my 32E in 1978, 34C in 1979 and 15C in 1982 at the Ann Arbor Ulrich's. By 1982 I was commuting to Ann Arbor to work at Bechtel. The 32E and 34C both died after a couple of years and were scrapped, but the 15C survives in perfect working condition to this day with only one change of batteries.

Re: HP-15C LE in Washington?

*Message #12 Posted by **Dominic Richens** on 27 Nov 2011, 2:07 p.m.,*
in response to message #8 by Namir

> Quote:

Please. Don't let facts kill my dream... :-)

Re: HP-15C LE in Washington?

*Message #18 Posted by **Thomas Radtke** on 27 Nov 2011, 4:19 a.m.,*
in response to message #15 by Paulo MO

You can be sure about exactly two things in this matter:

(1) Those who know won't talk

(2) It's on sale when it's on sale

HP employees following this forum seem to not always have all information about what's going on at HP. I remember one of them insisted the 15C LE wasn't even shipped from China one or two days before they arrived in the US. Could have been a strange sense of humor also, don't know.

Re: HP-15C LE in Washington?

*Message #19 Posted by **Paulo MO** on 27 Nov 2011, 6:32 a.m.,*
in response to message #18 by Thomas Radtke

That is very Zen and very deep. Unfortunately, it is also very true. ;-)

[wp34S] PSTO Won't Write to 6 thru 9

*Message #1 Posted by **Les Wright** on 26 Nov 2011, 4:56 a.m.*

Hi guys,

In my 30b-based wp34s, I have been fiddling with flashing and internal storage, etc.

I am chagrined to note that I same to only get access to libraries 0 thru 5 with the PSTO command. On my calc, the function won't accept 6 thru 9 as a parameter for the function.

All is well with the emulator, and I can PSTO to all ten libraries, just like the manual says I should.

Do I possible have a bad calc with bummed flash memory? It would be a shame to miss out on those extra 2000 program steps.

I am still using 2.2

Les

Re: [wp34S] PSTO Won't Write to 6 thru 9

*Message #2 Posted by **pascal_meheut** on 26 Nov 2011, 5:13 a.m.,*
in response to message #1 by Les Wright

Some of the flash regions have been used to implement new functions such as matrix support. This restriction does not apply to the emulator.

Re: [wp34S] PSTO Won't Write to 6 thru 9

*Message #3 Posted by **Paul Dale** on 26 Nov 2011, 5:13 a.m.,*
in response to message #1 by Les Wright

The number of flash regions had to be reduced. The cost of the matrix functions primarily.

The emulator has no such restrictions since it isn't really limited by memory or disc space.

- Pauli

Re: [wp34S] PSTO Won't Write to 6 thru 9

*Message #4 Posted by **Les Wright** on 26 Nov 2011, 5:20 a.m.,*
in response to message #3 by Paul Dale

Whew! My 30b was a new but open box TAS sale. The price was right, but I was worried I had a hardware issue.

This issue does apply to 2.2, right? So all is normal with my calc?

Thanks,

Les

P.S. Another little glitch in this is that an askew insertion damaged a pin in my cable! Just ordered a fresh one from Gene. Dang, those little pins are delicate and I thought I was taking care. Take caution, guys!

Re: [wp34S] PSTO Won't Write to 6 thru 9

*Message #5 Posted by **Paul Dale** on 26 Nov 2011, 5:24 a.m.,*
in response to message #4 by Les Wright

Yes this applies to 2.2. Matrix functions are present -- they aren't small.

Thus far, all the 3.x functionality has been done in a flash neutral manner -- in fact we've (Marcus predominately) saved enough to regain one flash region in addition to providing the extra functionality.

- Pauli

OT - casio fx-750p manual

*Message #1 Posted by **Giancarlo** on 26 Nov 2011, 2:07 a.m.*

Hello, Sorry to use this forum for other machines. I was given a Casio fx750p with a 4k memory module. I don't really know how to use it, i missed all these products because already in love with HPs at that time.

I don't have the manual; is there an electronic source for downloading such manuals?

Thanks

Giancarlo

Re: OT - casio fx-750p manual

*Message #5 Posted by **Marcus von Cube, Germany** on 26 Nov 2011, 9:56 a.m.,*
in response to message #4 by From Hong Kong

The FX-750P is internally very close to the PB-700 and its successor PB-770. It shares the statistical functions with the latter. There is a strange caveat: If you have the cassette interfaces for both you can exchange programs but the FX-750P lacks the lower case characters. That wouldn't be a problem if they were mapped to their upper case equivalents but they simply vanish. More info about this can be found here:

http://www.mvcsys.de/doc/casioutil.html
http://www.mvcsys.de/doc/basic-compare.html

Re: OT - casio fx-750p manual

*Message #6 Posted by **From Hong Kong** on 26 Nov 2011, 10:18 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Strangely, the official manual of FX-750P does not mention these two commands.

[WP34] Poor Person's Overlay

*Message #1 Posted by **Les Wright** on 25 Nov 2011, 4:31 p.m.*

I just wanted to report my satisfaction with a temporary overlay that finally makes my newly flashed calc fully useful to me, until such time as version 3 bugs are worked thru and Eric resumes making his vinyl overlays for the new version.

Though I am still on 2.2, the version 3 manual briefly includes instructions on how to size and print the overlay provided with the Sourceforge download. I happen to be be most comfortable with Photoshop, and setting the overlay width to 68 mm provides a ppi of just under 595 without resampling the image. In Photoshop, I create a new 8.5x11 doc with that ppi, and cut and paste the resized overlay image four times onto the new document. I make sure there is a wide margin all around as when I tried to fit six overlays on one sheet forcing printing at 100% cut off the edges due to the intrinsic printable area for my printer. (In printing on my Mac, it seems the default is to shrink things slightly to fit, so I must force 100% in order to maintain the correct 68 mm width.)

I then print on pretty good quality paper, cut out, and just stick over the keypad with double-sided tape. I don't bother with flaps because the key feel is just fine through the paper. I use a monochrome laser printer and find B&W works fine for me since the correct shift key can be quickly discerned from placement on or under the key. If I like this arrangement for a more than temporary fix I may splurge a few dollars and get colour laser printing done.

This a great calculator and I love it more each day, so I just wanted to share how delighted I am that I found such a simple way to make it easy to use. It isn't cosmetically perfect, but it is functionally just great. I have a 15C LE, but it goes neglected as I become fascinated with this wonderful gizmo.

Les

Re: [WP34] Poor Person's Overlay

*Message #2 Posted by **Walter B** on 25 Nov 2011, 6:19 p.m.,*
in response to message #1 by Les Wright

Les,

Glad you like it :-)

I've read about Photoshop in this context more than once now. IMHO, the following is even easier on a PC: Just create a blank MS Word file and <insert> <graphics> <from file>, specifying the overlay file of your choice. Then format the inserted picture to the given size (in mm), and you're done. If you want to, you may copy this formatted picture as often as you like and print.

The v3 overlay gives optimal results with a height of 104mm.

Enjoy,
Walter

Hp 97 Card Reader issues

*Message #1 Posted by **Fouad M. Kaadou** on 25 Nov 2011, 1:17 p.m.*

Hello,

I have an HP97 with some card reader issues. -can not read or write on cards. -the reader pulls the cards very slowly

I have bypassed the write protect by connecting the necessary pins on the card reader chip so i will be able to write and it worked. Also when i first received the calculator i attempted to fix the gummy wheel issue (which i did) , but the ribbon cable was totally destroyed so i had to solder the card reader the main PCB myself.

Any ideas?

TIA

-Fouad

Re: Hp 97 Card Reader issues

*Message #2 Posted by **Randy** on 25 Nov 2011, 5:18 p.m.,*
in response to message #1 by Fouad M. Kaadou

Preceded by

> Quote:
>
> can not read or write on cards. -the reader pulls the cards very slowly

Frankly, your post makes no sense. First you say the reader cannot read or write then you say it writes.

If the unit does not pull the card through correctly, why not start there? Perhaps the worm screw is loose on the shaft or the wheel repair is not correct?

Re: Hp 97 Card Reader issues

*Message #3 Posted by **Fouad M. Kaadou** on 26 Nov 2011, 4:28 a.m.,*
in response to message #2 by Randy

Randy,

the card reader writes only because I have bypassed the write protect, without that the reader does not read. and it **should** be able to read without the bypass.

-Fouad

Lambert W functions on WP 34s

*Message #1 Posted by **Hans Milton** on 25 Nov 2011, 9:00 a.m.*

It is impressive to see the Lambert W functions included in WP 34s.
However, the W_{-1} function give incorrect results. Example:

x e^x = -0.2 has two solutions
-0.259171
-2.542641

On the emulator W(-0.2) correctly returns the first solution.
But W_{-1}(-0.2), which is expected to give the second solution,
instead returns -0.163746

Re: Lambert W functions on WP 34s

*Message #2 Posted by **Walter B** on 25 Nov 2011, 9:26 a.m.,*
in response to message #1 by Hans Milton

FYI, W^-1 represents the inverse of W in the WP 34S.

Re: Lambert W functions on WP 34s

*Message #3 Posted by **Hans Milton** on 25 Nov 2011, 10:10 a.m.,*
in response to message #2 by Walter B

I see. What I thought was the Lambert W_{-1} function is
actually the inverse of the Lambert W_0 function. Which
could also be easily calculated as x e^x.

W_{-1} is not so easily calculated. So would be more useful
to have on the calc.

Re: Lambert W functions on WP 34s

*Message #4 Posted by **Walter B** on 26 Nov 2011, 4:57 a.m.,*
in response to message #3 by Hans Milton

With the next software build, you'll find both branches on the WP 34S: W_p for the principal branch and W_m=W_{-1} for the lower branch. The latter is calculated by an XROM routine, so it may not be as accurate as W_p.

Re: Lambert W functions on WP 34s

*Message #5 Posted by **Hans Milton** on 26 Nov 2011, 8:14 a.m.,*

in response to message #4 by Walter B

Great!

Re: Lambert W functions on WP 34s

*Message #6 Posted by **Gerson W. Barbosa** on 25 Nov 2011, 10:15 a.m.,*
in response to message #1 by Hans Milton

Easily done on the HP-12C:

```
01 CHS
02 1/x
03 STO 0
04 STO 1
05 LN
06 RCL 0
07 *
08 RCL 1
09 x<>y
10 -
11 x=0
12 GTO 15
13 LST x
14 GTO 04
15 LST x
16 RCL 0
17 /
18 CHS
19 GTO 00

-0.2  R/S ->   -2.542641358
```

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=159032

Edited: 25 Nov 2011, 10:54 a.m.

Re: Lambert W functions on WP 34s

*Message #7 Posted by **Paul Dale** on 25 Nov 2011, 6:52 p.m.,*
in response to message #6 by Gerson W. Barbosa

It would be easy enough to include a user code programme to calculate this branch of the W function in the device -- for real arguments only. I'd guess 100 or so bytes of precious flash.

Alternatively, use this program:

```
01  LBL'W[sub-1]'
02  LocR 02
03  STO .02
04  +/-
05  1/x
06  STO .00
07  STO .01
08  LN
09  RCL[times] .00
10  RCL .01
11  x[<->] Y
12  -
13  x=0?
14  SKIP 03
15  DROP
16  RCL L
17  BACK 10
18  DROP
19  RCL L
20  RCL/ .00
```

```
21  +/-
22  x[<->] .02
23  STO L
24  x[<->] .02
25  RTN
```

Store it in one of the flash segments and you've got the W_{-1} function. It behaves like a keyboard command in that Last X is set properly and the stack is not damaged. The argument range is not correctly validated however.

- Pauli

Re: Lambert W functions on WP 34s

*Message #8 Posted by **Walter B** on 25 Nov 2011, 6:59 p.m.,*
in response to message #7 by Paul Dale

Pauli, [sub-1] ??

Re: Lambert W functions on WP 34s

*Message #9 Posted by **Paul Dale** on 25 Nov 2011, 7:30 p.m.,*
in response to message #8 by Walter B

Yeah, [sub-1] which displays as $_1$. We don't have a subscript minus or minus 1. All our codes for subscripts are [sub-X].

The other convention I've seen is W_m and W_p for w_{-1} and W_0 respectively.

- Pauli

Re: Lambert W functions on WP 34s

*Message #10 Posted by **Walter B** on 26 Nov 2011, 3:20 a.m.,*
in response to message #9 by Paul Dale

Exactly. And we feature [sub-m] and [sub-p] ... :-)

Re: Lambert W functions on WP 34s

*Message #11 Posted by **Paul Dale** on 26 Nov 2011, 3:27 a.m.,*
in response to message #10 by Walter B

I know that was why I mentioned them ;-)

- Pauli

Re: Lambert W functions on WP 34s

*Message #12 Posted by **Ángel Martin** on 25 Nov 2011, 10:49 a.m.,*
in response to message #1 by Hans Milton

Just in case it's useful, functions WL1 and WL0 are available in the SandMath-II module for the HP-41, both implemented in MCODE.

The module is available at TOS for V41 and i41CX usage - also possible to burn into Clonix, MLDL2k, etc. of course.

Cheers, ÁM

WP 34S: Keyboard Layout Change

*Message #1 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 5:52 a.m.*

We're coming closer to a final keyboard mapping. Check out the most recent emulator and tell us what you think about it! At least SF and CF are on the keyboard now. :-)

I've updated the other skins (compact and LED) and renamed everything to contain a version tag V2 or V3.

Re: WP 34S: Keyboard Layout Change

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 25 Nov 2011, 7:12 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Hi Marcus,

I updated to SVN 1917 a few minutes ago and am getting "Error while loading skin (27)" message when starting the emulator under wine. I haven't tried it under Windows (don't have one handy at the moment).

Is there a state file I need to clear?

I have tried launching it from several directories with the same result.

Cheers...

Re: WP 34S: Keyboard Layout Change

*Message #3 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 8:46 a.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

Normally this should not stop the emulator but revert to the first skin in the list. You can clear the registry entry for the program and try again. If that fails, I need to check what happens if no skin is found.

Re: WP 34S: Keyboard Layout Change

*Message #4 Posted by **Didier Lachieze** on 25 Nov 2011, 8:58 a.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

I've had the same issue until I downloaded the wp34s_V3_* skins files from the artwork directory and put them together with the .skin files and with the emulator files under the same directory.

Re: WP 34S: Keyboard Layout Change

*Message #5 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 9:49 a.m.,*
in response to message #4 by Didier Lachieze

Quote:

> I've had the same issue until I downloaded the wp34s_V3_* skins files from the artwork directory and put them together with the .skin files and with the emulator files under the same directory.

That was it. I had forgotten to add the BMPs to SVN.

I'm sorry.

Re: WP 34S: Keyboard Layout Change

*Message #6 Posted by **Neil Hamilton (Ottawa)** on 25 Nov 2011, 9:54 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Perfekt!

Thanks...

Re: WP 34S: Keyboard Layout Change

*Message #7 Posted by **gene wright** on 25 Nov 2011, 10:43 a.m.,*
in response to message #6 by Neil Hamilton (Ottawa)

The only "disappointment" (and that is too strong a word, but ...) I have with the V3 keyboard is the movement of PI off the 3 key.

I'm not sure I see a solution without moving around a couple of other things, but I do wish PI could be back at 3.

If... X.FCN moved to . and the ./, function went to a catalog (since it really won't be used all that often), then you would end up with a spare key location at EEX.

But, I know that opens up several things (again).

IMO (and that's all it is) PI on 3 is more important than ./, on ..

Re: WP 34S: Keyboard Layout Change

*Message #8 Posted by **fhub** on 25 Nov 2011, 11:02 a.m.,*
in response to message #7 by gene wright

> Quote:
>
> If... X.FCN moved to .

Not a good idea IMO:
TEST, P.FCN and X.FCN in one row is quite comfortable and logical, and all 6 digits 1-6 having a menu on it, too.

Re: WP 34S: Keyboard Layout Change

*Message #9 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 11:17 a.m.,*
in response to message #7 by gene wright

Have a look at your beloved 15C.

Re: WP 34S: Keyboard Layout Change

*Message #10 Posted by **gene wright** on 25 Nov 2011, 12:19 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Fhub, I understand. No good solution. However, it would simply form an L if they were moved. Not that bad.

Marcus, I know where PI is on the 15c :-) but Walter's "3" argument convinced me some time ago that this was "the" place for the PI function. Eh...

Just 2 cents.

The Odyssey of PI

*Message #11 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 12:58 p.m.,*
in response to message #10 by gene wright

I've checked where HP has put PI on some of its scientific calculators. It was a real odyssey.

```
Primary  : 35
0        : 41C/95C
2        : 65/67
3        : 38G/39G/...
.        : 25/27/20/33C/28C/45/55
EEX      : 15C/21/34C
CHS      : 10C/11C
Divide   : 97
y^x      : 31
1/x      : 32E
P->R     : 91
Space    : 48G/49G/50G
)        : 27S
STO      : 22S
RCL      : 32S
R-Down   : 42S
SIN      : 32SII
COS      : 33S/35S
```

TI is only slightly less inventive on this.

in response to message #11 by Marcus von Cube, Germany

That would make a great coffee table book. I love the title.

Re: WP 34S: Keyboard Layout Change

*Message #13 Posted by **Walter B** on 26 Nov 2011, 5:12 a.m.,*
in response to message #10 by gene wright

> Quote:
>
> ... but Walter's "3" argument convinced me some time ago that this was "the" place for the PI function.

When you need contiguous space even good arguments won't work ;-)

And BTW, ./, must stay where it is since it's employed in alpha mode as well.

Edited: 26 Nov 2011, 5:15 a.m.

Re: WP 34S: Keyboard Layout Change

*Message #14 Posted by **Javier Goizueta** on 25 Nov 2011, 5:39 p.m.,*
in response to message #1 by Marcus von Cube, Germany

I'm unable to update to the latest revision with subversion on Mac OSX.

```
svn: Failed to add file 'trunk/windows/bin/wp34s_V3_medium.bmp': an unversioned file of the
same name already exists
```

The problem seems to be there are two files in the same directory with names differing only in the capitalization: wp34s_v3_medium.bmp and wp34s_V3_medium.bmp

OSX doesn't allow this.

If both files are really needed, can you please alter the name of one of them a little more? (or remove it from SVN otherwise).

Edited: 25 Nov 2011, 5:40 p.m.

Re: WP 34S: Keyboard Layout Change

*Message #15 Posted by **pascal_meheut** on 25 Nov 2011, 5:45 p.m.,*
in response to message #14 by Javier Goizueta

There is indeed something wrong. Just tried a checkout under MacOS X and got the message:

svn: In directory 'trunk/windows/bin' svn: Can't open file 'trunk/windows/bin/.svn/tmp/text-base/wp34s_v3_medium.bmp.svn-base': No such file or directory

Re: WP 34S: Keyboard Layout Change

*Message #16 Posted by **Paul Dale** on 25 Nov 2011, 5:52 p.m.,*
in response to message #15 by pascal_meheut

I just ran into this too :-(

Looks like someone decided to change the case of the the file name and the case insensitive Mac filesystem is confusing subversion.

A work around is to cd to trunk/windows/bin, delete wp34s_v3_medium.bmp and then svn update wp34s_V3_medium.bmp and then do a full update from the top level. I'm still getting svn warnings about the file wp34s_v3_medium.bmp however so I don't know the long term implications of this change.

I'm sure a proper fix will come in due course.

- Pauli

Subversion is easily confused. We are using it at work too and I noticed it (too) many times :-<

HP-15C LE Bad Button >>> easy fix

*Message #1 Posted by **Reth** on 24 Nov 2011, 5:30 p.m.*

In a previous thread we saw HP-15C LE fixed, but I found that fix too complicated. So I decided to sacrifice my calculator and do it myself and I'm no good with such repairs.

I used only my Swiss army knife, a small screwdriver and two component epoxy glue.

Heat stakes are very easy to cut off flashing with the PCB - the plastic the are made of is somewhat soft, jelly like.

The offending key had a little white plastic ball - about 0.1mm diameter - stuck at the dead center of the metal dome - and I had to apply some force to remove it.

I can't tell more about the material of the "ball", it got lost somewhere in the cotton bud I used to take it off...

Reassembling was easy - PCB stood quite firmly even without heat stakes heads being glued - I tested it like that for a day. Eventually I put a little drop of the glue on top of the heat stakes and that way sealed them. I believe this is enough to keep it firmly in place.

A tricky bit is there are 3 little spiral springs abt 20mm long that are very easy to loose when opening the calculator.

It's working perfectly now - will see for how long ;)

Cheers,

*Message #2 Posted by **Raymond Del Tondo** on 24 Nov 2011, 6:21 p.m.,*
in response to message #1 by Reth

Many thank for the info:-)

did you take pictures of the work?

Could the plastic ball be a residue from manufacturing, or in other words: Is it of one of the materials used in the hardware?

Did you mail it (the info, not the piece) to Tim? This may be of interest for him;-)

Cheers

Ray

A new record price for an HP 15c LE

*Message #1 Posted by **Michael de Estrada** on 24 Nov 2011, 9:15 a.m.*

I think this must be a new record price for an HP 15c LE. IIRC, the previous record was $447. This is pretty close to high price for a mint vintage HP 15c, which I find to be mind-boggling. Note that the seller resides in the UK, not the USA, so again it appears that the big money collectors are Europeans.

Re: A new record price for an HP 15c LE

*Message #2 Posted by **Timo** on 24 Nov 2011, 9:57 a.m.,*
in response to message #1 by Michael de Estrada

Yeah, I stumbled upon this auction some day ago and even back then the highest bid was already well above 200 Euro.

About 1,5 years ago I won an auction for a completely mint HP-15C (still in its plastic wrapping, handbook untouched and almost pristine box) for approx. 250€ - and even that did hurt quite a bit.

And honestly, I'm much happier with the original in such a super state...

Re: A new record price for an HP 15c LE

*Message #3 Posted by **Derek Walker (UK)** on 24 Nov 2011, 10:39 a.m.,*
in response to message #1 by Michael de Estrada

If the buyer is also in the UK, it does mean that the trans-Atlantic shipping, and UK import taxes and charges, have already been paid. For my 15cLE these almost doubled SC's US selling price.
Still a high price in comparison, though.

Re: A new record price for an HP 15c LE

*Message #4 Posted by **Rob Willett** on 24 Nov 2011, 12:12 p.m.,*
in response to message #3 by Derek Walker (UK)

Well I have the exact same model, brought in the US, taxes paid in the UK. I forget all the details, but I recall taxes were £45, shipping was £30 or so. These all add up.

Whilst I was going to keep it, for £336 I am very happy to sell it to anybody who wishes to buy it, I am also happy to swap it for an entire set of Spice range calculators :) I only wish I had brought a thousand of them.

Whilst we may bitch at the prices people pay, supply and demand allows this to happen. If people want to pay it then fine, the only impact on me is the insurance premiums I have to pay go up as I revalue my collection.

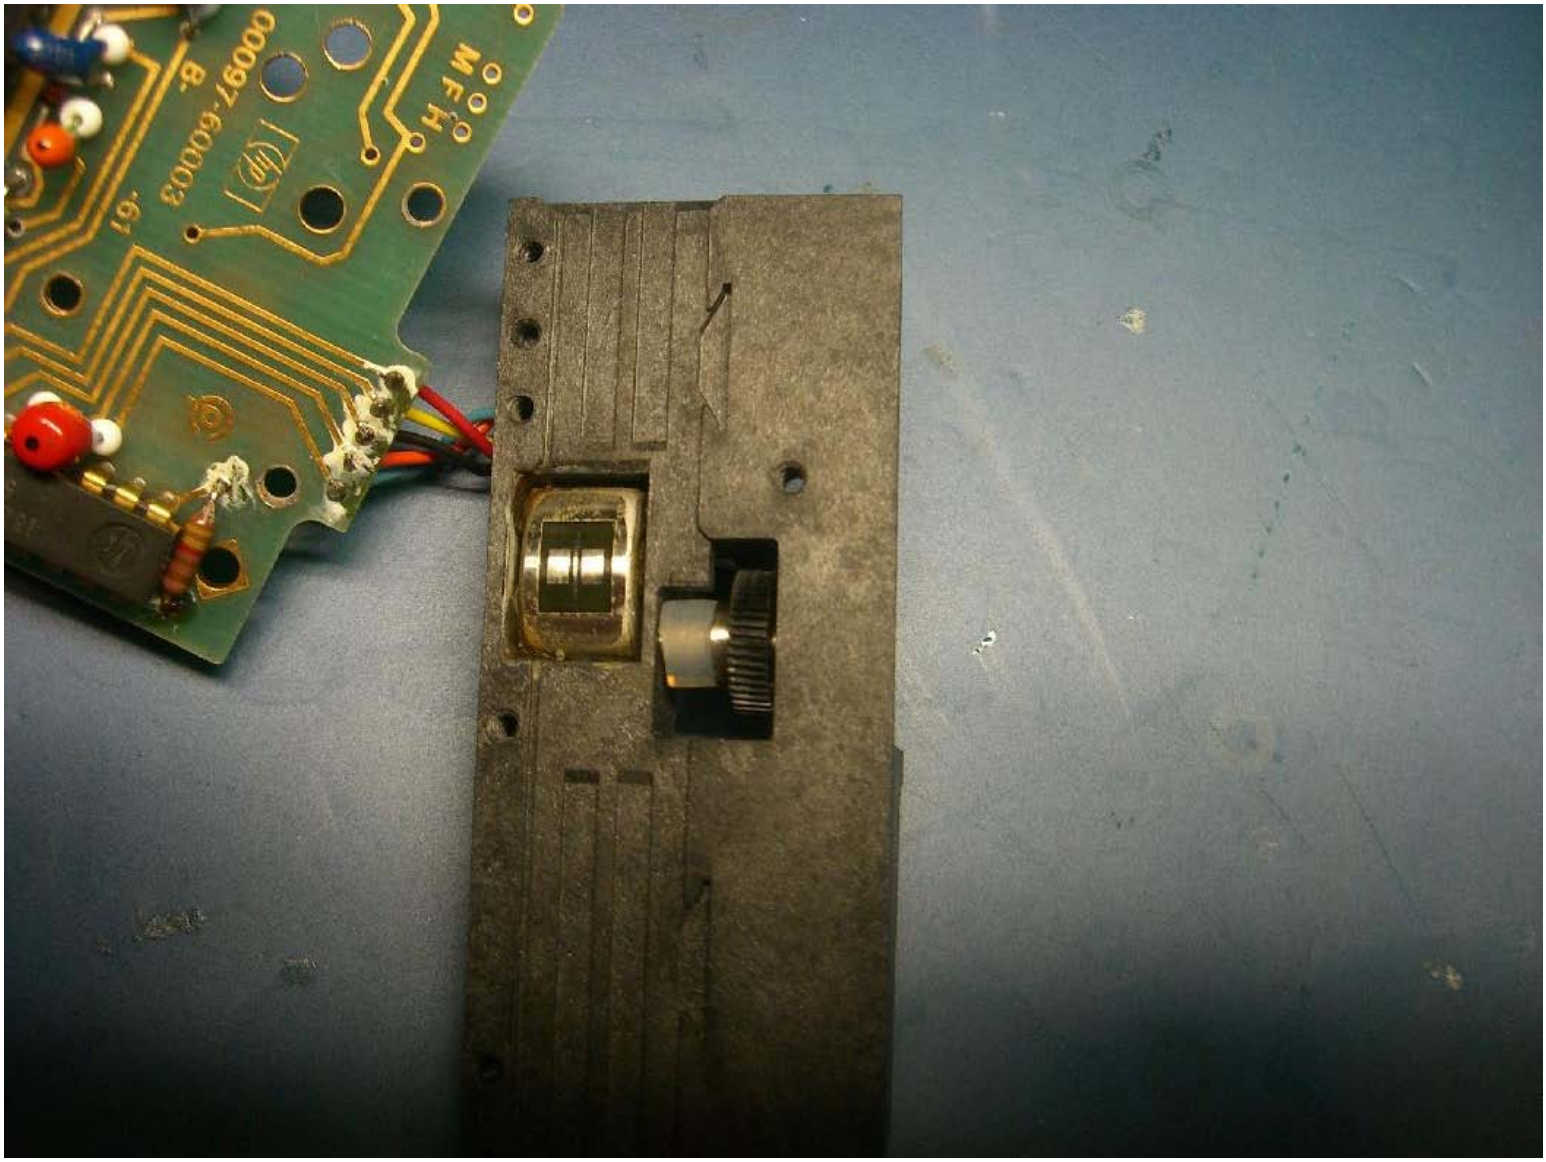
HP97 card reader followup

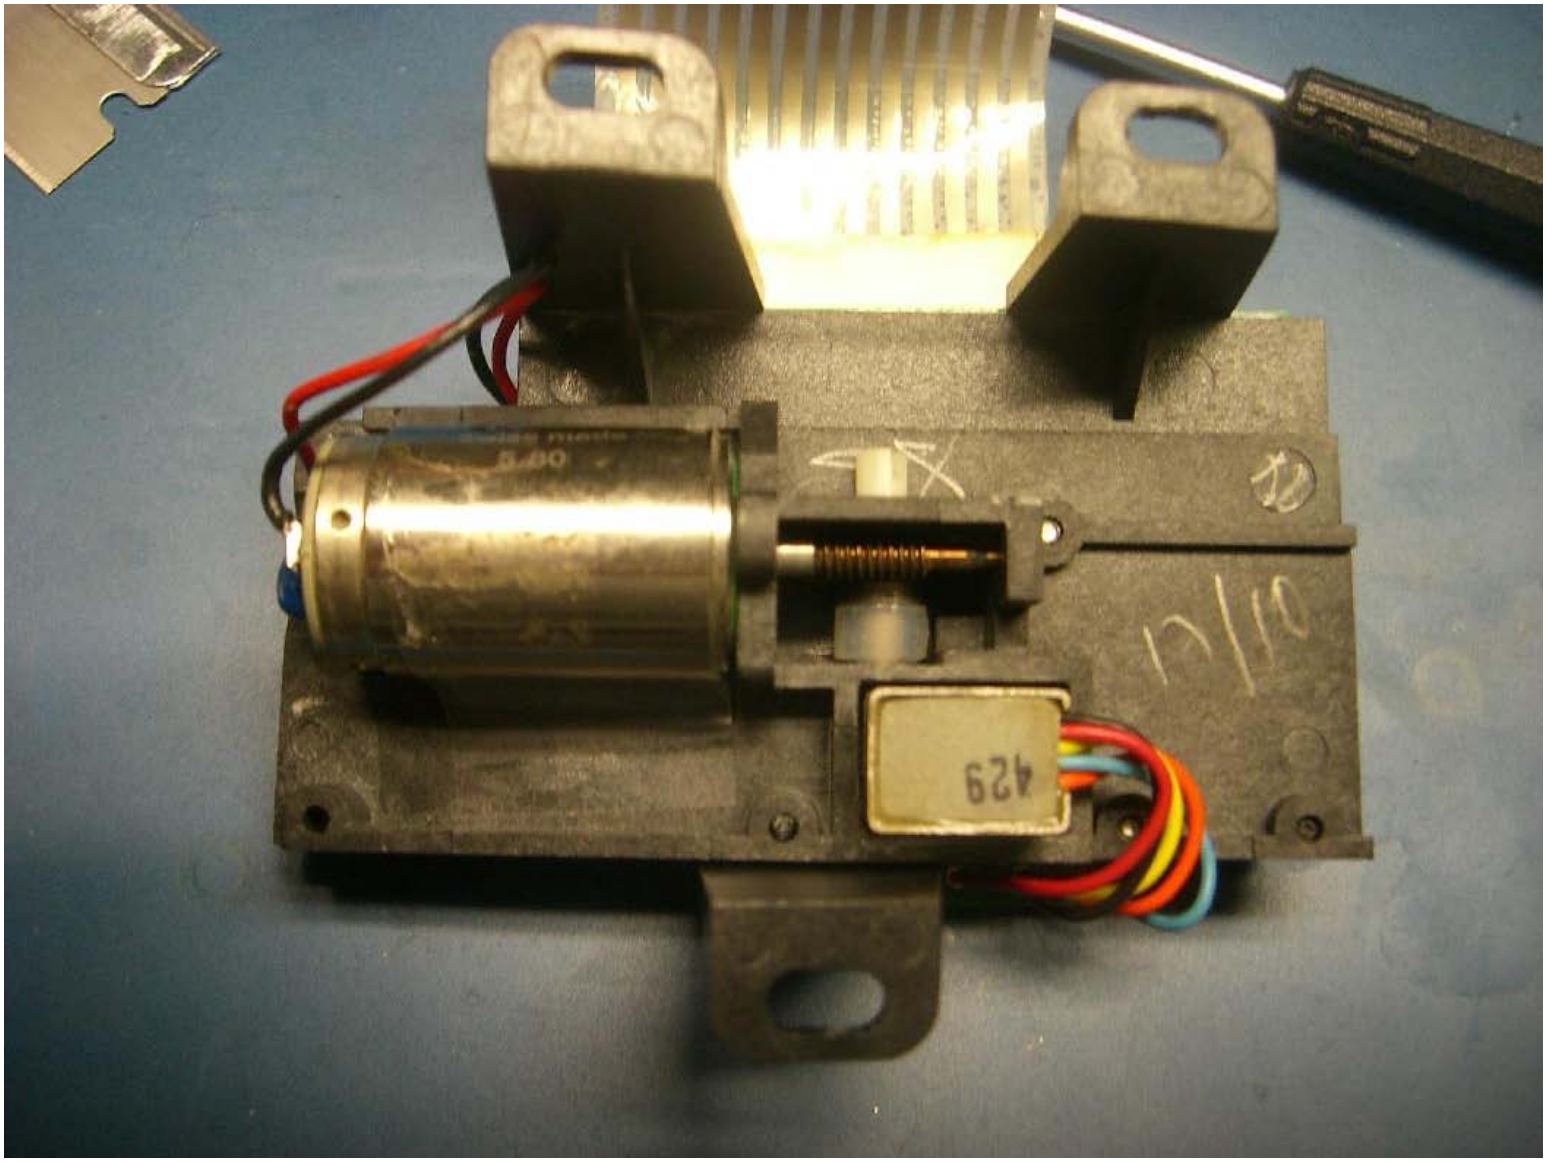
*Message #1 Posted by **Davd F** on 23 Nov 2011, 8:30 p.m.*

Some progress with the card reader.

For the non-rolling nylor roller, I carefully cut away some material circumferentially from the thicker spinel using a razor blade and magnifier glasses, until it dropped in place without difficulty, and rolled freely.

For the disintegrated coupler, I used the insulation from an 18G wire, surrounded by silicone within the aluminum tube. With this, the motor would move the card through slowly, reaching 180 mA current without any resistance, but there was lots of slippage. I ended up gluing the couple/worm gear assembly to the motor shaft with a drop of super glue. Now there's no slippage, but the motor is taking over 300 mA and moving slowly, and the calculator is detecting the error and shutting down the motor. Here are a couple of pictures, taken before re-assembling the reader:





It seems the motor control is working properly, but somehow there is too much resistance.

Does the roller look too thick? It is almost exactly flush with the metal disc base.

Thanks for any additonal suggestions.

Happy Thanksgiving!

Dave

Re: HP97 card reader followup

*Message #2 Posted by **aj04062** on 23 Nov 2011, 8:40 p.m.,*
in response to message #1 by Davd F

I'd try adjusting the eccentric shaft that supports the gear. If it is all the way "up", the resistance will be high. Backing this off (by rotating) will reduce the drag/friction.

Eccentric Cam

*Message #3 Posted by **Dave F** on 24 Nov 2011, 4:49 p.m.,*
in response to message #2 by aj04062

I've finally located my copy of the museum CD, and, as you mentioned, it suggests rotating the pin until the motor resistance is 180 +/-20 mA when trying to roll a card against resistance. However, I'm getting over 300 mA regardless of the position.

Can someone explain how this works? The manual refers to this as an eccentric cam, but it doesn't look very eccentric to me--it looks fairly symmetrical about the axis. I measure a diameter of 0.91", uniformly about the cam. Perhaps that's part of the problem. Is it supposed to be curved?

I took some pictures. Please forgive the fuzzy focus. Here is what it looks like:

If this is supposed to be able to be curved or ellipsoid, then that may explain the high resistance to the card. Can someone post (or email) a picture of the cam if it's supposed to look different?

Thanks!

Dave

Re: Eccentric Cam

*Message #4 Posted by **Michael de Estrada** on 24 Nov 2011, 5:01 p.m.,*
in response to message #3 by Dave F

Look very closely at the end of the shaft where it is reduced to fit in the frame. That smaller very short section is slightly eccentric to the long shaft that supports the roller. The shaft of the pin itself is round. Problem is that if the diameter of the roller is too large, then the drag force will be too large regardless of how you adjust the cam.

Edited: 24 Nov 2011, 5:03 p.m.

Re: HP97 card reader followup

*Message #5 Posted by **Wanderley Navarro** on 23 Nov 2011, 9:59 p.m.,*
in response to message #1 by Davd F

Quote:

Does the roller look too thick? It is almost exactly flush with the metal disc base.

The diameter of the metal disc base is 0.62mm. A roller with an outer diameter with no more than 0.65mm is ok.

Re: HP97 card reader followup

*Message #6 Posted by **Dave F** on 24 Nov 2011, 5:45 p.m.,*
in response to message #5 by Wanderley Navarro

Would that be 6.2mm?

Re: HP97 card reader followup

*Message #7 Posted by **Wanderley Navarro** on 24 Nov 2011, 9:52 p.m.,*
in response to message #6 by Dave F

Correct. Sorry my mistake.

More progress

*Message #8 Posted by **Dave F** on 24 Nov 2011, 6:55 p.m.,*
in response to message #1 by Davd F

Getting closer. I hadn't realized the peg at the end is slighly eccentric. It is almost imperceptible, but I believe it is slightly eccentric. It is possible that I didn't push the cam in far enough to engage the eccentric peg at the end.

After pushing in the cam all the way to ensure engaging the motor, the motion of the card through the reader is slow and slightly jerky, but the card goes all the way through. The calc can at least attempt to write to the card, sending it through the reader, but when I attempt to read back (for example, writing a program to the card, then switching back to run mode), the card passes through, but generates an error.

When I say the card goes all the way through, I mean that a tiny tug is required to pull the card out at the end. However, my HP65 reader appears to work this way as well. The HP97 speed is about 1/2 to 2/3 that of the 65.

When I insert the card and hold it rather than let it go freely through, the motor current is about 350 mA. I suspect that this is because I superglued the motor shaft to the coupling, so that there is truly no slippage. Can anyone who has done this coupler/"clutch" repair comment on this?

Thanks,

Dave

Re: More progress

*Message #9 Posted by **Michael de Estrada** on 24 Nov 2011, 7:38 p.m.,*
in response to message #8 by Dave F

There is not supposed to be any slippage, period. It is not a clutch. Please stop this line of reasoning lest you incur the wrath of the great Randy.

Edited: 24 Nov 2011, 10:10 p.m. after one or more responses were posted

Re: More progress

*Message #10 Posted by **Dave F** on 24 Nov 2011, 9:08 p.m.,*
in response to message #9 by Michael de Estrada

Hi Michael,

I'm glad to hear that since, as I mentioned, I super-glued the shaft of the motor into the vinyl insulation sleeve. I will say that I was not comfortable with having the shaft slip in the sleeve, since it seemed a very unreliable setup. I only repeated it because I have seen it here, but the manual (which I have now that I found my CD copy) certainly doesn't mention a clutch. However, there is an article in the articles forum that may need to be corrected.

Then, would it be correct that the roller is supposed to slip over a restrained or jammed card, at the right cam setting? That would explain how adjusting the eccentric cam could affect the motor current when holding the card so it can't roll through.

If the current is too high, and the card is going through slowly and slightly jerkily, then I am guessing there's too much friction in the system, and too much torque on the motor. Although I had believed my tubing on the roller is not too thick, perhaps I need to find a smaller caliber solution.

Does that line of reasoning sound reasonable? Does anybody have suggestion of a specific size of silicone tubing or O-ring that is known to work reliably?

Thanks,

Dave

Edited: 24 Nov 2011, 9:11 p.m.

Re: More progress

*Message #11 Posted by **Michael de Estrada** on 24 Nov 2011, 10:07 p.m.,*

in response to message #10 by Dave F

Yes, a card jam should not cause the motor to stall, which could damage it. To that extent, the slipping roller could be considered a clutch of sorts. As to the O-rings, that is the method that I've always used, and have bought them from sources like this. I've found that the best way to secure them on the wheel is to use a bit of superglue. I'm not sure what size they are nor the durometer value. I believe they are Viton. There are some people on this forun who do know and might chime in.

Re: HP97 card reader followup

*Message #12 Posted by **Randy** on 25 Nov 2011, 9:01 a.m.,*
in response to message #1 by Davd F

> Quote:
>
> Does the roller look too thick? It is almost exactly flush with the metal disc base.

Yes, it is too large and is the reason for the over-current. It should be *exactly* flush with the metal part of the wheel - which is 0.250 inches in diameter.

The correct o-ring size is 005. I have rebuilt many card readers that had high current and did not read reliably, the problem was incorrect o-rings. I know at one time, one of the eBay sellers was selling rings that were too large. Here is a link to my source: http://www.mcmaster.com/#o-rings/=f35yqm Part number is 9452K13, cost is $1.93 for 100 pieces.

Edited: 25 Nov 2011, 9:25 a.m.

Re: HP97 card reader followup

*Message #13 Posted by **Michael de Estrada** on 25 Nov 2011, 10:10 a.m.,*
in response to message #12 by Randy

What O-ring material do you recommend. I see from your source that they offer Viton with A75 durometer hardness. Also, the OD of the #005 size is 0.241", not 0.250" that you recommend. Does the O-ring expand to 0.250" when it's installed ?

Re: HP97 card reader followup

*Message #14 Posted by **Randy** on 25 Nov 2011, 11:07 a.m.,*
in response to message #13 by Michael de Estrada

In this application, I don't think you'll find a difference between A70 and A75 hardness... and yes, they expand when stretched over the hub. IIRC, they end up a few thousandths over .250 inches - but certainly not as large in diameter like the tubing shown in the OP.

IMO, while tubing *appears* to provide more surface area and is likely to last longer, rings provide a far more consistent result than tubing. If you're lucky enough to find a piece of tubing that is of the correct size and is concentric enough to work, have at it.

Re: HP97 card reader followup

*Message #15 Posted by **Dave F** on 25 Nov 2011, 2:06 p.m.,*
in response to message #12 by Randy

Thanks! I have followed the link and placed the order. I will report the result once I have placed these o-rings.

Best regards,

Dave

9100B restoration progress

*Message #1 Posted by **David Ramsey** on 23 Nov 2011, 12:31 p.m.*

Larry Atherton's work on my 9100Bs continues apace. The biggest problem we've had is that the earlier of the two units would fail to run a program (the standard diagnostic) until it had been turned on for 5-10 minutes, after which it would work perfectly.

Board-swapping with the other 9100B isolated the problem to the "left" board of the two-board "C Core set", which controls access to the core memory.

Selectively heating individual components on the board revealed two problems: first, a set of 3.01 Ohm (yes, that's correct: 3.01 Ohms!) resistors were out of spec. Second, one specific transistor would cause the problem when cooled and fix it when heated.

Since the transistors HP used in the 9100 have odd part numbers that don't correspond directly to any modern parts, the only way to find a replacement that works is to experiment. First, Larry removed the problem transistor and measured its characteristics when warm, then installed Tektronix sockets so he could swap in new parts without having to solder and unsolder each time. The image above shows the new transistor installed.

The new part reduced the "warm up time until proper operation" to about 45 seconds, but the machine would still fail if you turned it on and immediately tried to run a program in memory.

Looking at the -15V supply, Larry noticed noise on the line. Not a lot, but still. So he added the large blue filtering capacitor you can see in the first image...and the problem went away completely! You can now bring the first 9100B in from an overnight cool down in an unheated garage, turn it on, immediately press END, CONTINUE, and it works!

Now onto cosmetics. The backlights for the register labels had failed years ago, and heat from the bulbs had, over time, slightly warped and scorched the piece of photographic film that comprises the actual label. Larry cleaned the film as best he could and used LEDs for the backlights. Clear plastic tubes added act as light pipes to make the illumination more even, and a thin gold film at the bottom colors reflected light to more closely match the original orange color.

While the final appearance is not identical to the original, it's still amazingly good.

As you may recall from a previous posting, the black plastic socket at the neck of the CRT was cracking. Larry fabricated an extra support from perforated aluminum, visible here at the very back of the CRT, to support it. The front of the CRT is supported on new rubber buffers for shock protection.

OK, everything works. Now it's time to do something about the beat-up chassis. This machine was bought in 1969 by a trucking company and obviously used heavily for many years. Time to paint!

The first 9100B is now complete. The only sign of age is the slightly-dimmer-in-the-center CRT. With a fully functioning card reader, adjusted CRT, completely rebuilt keyboard, and other repairs, this represents several weeks of work on Larry's part...

Edited: 23 Nov 2011, 7:32 p.m. after one or more responses were posted

*Message #6 Posted by **Bill (Smithville, NJ)** on 23 Nov 2011, 3:21 p.m.,*
in response to message #5 by From Hong Kong

And don't forget the last of the series, PC-1600, had dual processors (the pc-1500 processor and a Z-80 processor), had two memory slots, RS-232 interface, and an analog port.

The one I have on my desk is fully fitted with a 32K and 256K memory cards giving 77K for programs and 220K ram disk file space. Pretty amazing for a handheld computer of that day.

Yes, PC-1600 is a great machine in terms of functionality and expandability. Unfortunately, it never arrived in Hong Kong. I had to buy one from TAS!

Another nice model that was once available in Hong Kong is PC-E500S. It has a lot of built-in BASIC programs categorised as "engineering software". I think it's still available somewhere (except auction sites) on earth.

Of course, machine language programming is possible on PC-E500S. You can easily find related information on the web.

in response to message #1 by gene wright

For everyone here that likes these sharp pocket computers, there is a nice emulator for a lot of the models:

POCKEMUL

The latest version 0.93 includes a Beta version of the PC-1600 plus you can emulate a lot of the accessories such as printers, tape recorders, memory modules. Please note that it's not a 1.0 product level, so be prepared for some quirks along the way. But still fun to play with.

Bill

Well, I didn't get it at the time it was released but actually a few years ago as a birthday present from a friend so I haven't used it at all, I'm just collecting it. That said, I think it's absolutely awesome for its time and further I'll state that from a purely aesthetic point of view it's one of the most beautiful calculators in history.

No pictures can make it justice no matter how good, you just have to hold it in your hands to be enthralled by its sheer beauty and luxury feel. Absolutely gorgeous !

Best regards from V.

[OT] Google's Lem doodle

*Message #1 Posted by **Valentin Albillo** on 23 Nov 2011, 8:24 a.m.*

Hi, all:

I guess many of you, if not all, have seen and tried today's Google doodle, dedicated to **Stanislaw Lem**, one the very best science-fiction writers ever and my very own personal favorite among them all.

The Lem doodle is utterly **awesome**, it must have taken lots and lots of effort and savvy to concoct !

... and I'm pretty happy and amazed that Google values Lem's work so much as to produce such a magnificent and expensive work of art to celebrate him.

Opinions ?

P.S: you can see Lem's doodle being played out in its entirety here: http://www.youtube.com/watch?v=09YagnJ1urE, though I'd recommend you don't see this video but actually play it out yourself, extremely funny and rewarding.

Best regards from V.

Edited: 23 Nov 2011, 8:34 a.m.

Re: [OT] Google's Lem doodle

*Message #2 Posted by **Randy** on 23 Nov 2011, 10:11 a.m.,*
in response to message #1 by Valentin Albillo

Thank you for posting - as his doodle does not appear in the US, it is an animated turkey for the thanksgiving holiday.

Re: [OT] Google's Lem doodle

*Message #3 Posted by **Howard Owen** on 23 Nov 2011, 11:06 a.m.,*
in response to message #2 by Randy

You can see the doodle in the US by going to google.de. I'm pretty sure other international domains would work too.

It's pretty cute. :)

Re: [OT] Google's Lem doodle

*Message #4 Posted by **Howard Owen** on 23 Nov 2011, 11:13 a.m.,*
in response to message #1 by Valentin Albillo

That is cool!, If you hadn't mentioned it was dedicated to Stanislaw Lem I never would got the connection. The only thing I've read by him is Solaris, and the alien in that novel is a bit shapeless. :) Since the Google Doodle in the US is dedicated to our Thanksgiving holiday, I never would have seen this at all if you hadn't posted. Thanks!

Re: [OT] Google's Lem doodle

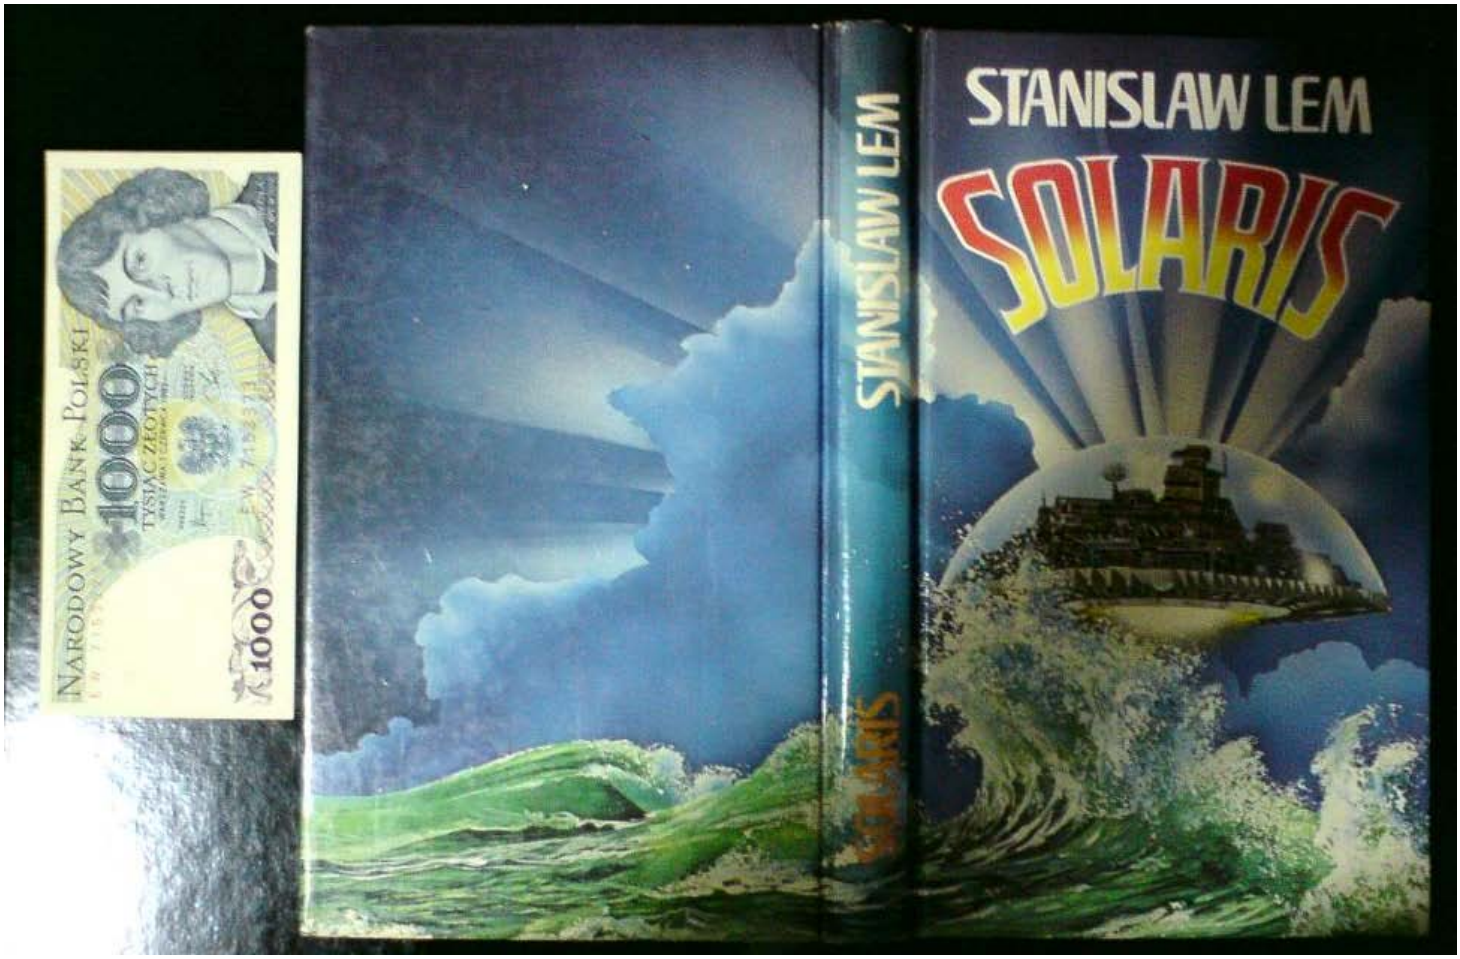
*Message #5 Posted by **db (martinez, ca.)** on 23 Nov 2011, 10:15 p.m.,*
in response to message #4 by Howard Owen

Howard; Solaris was a good strange, haunting choice. If you read another; you might try At the Futurological Congress.

Re: [OT] Google's Lem doodle

*Message #6 Posted by **Gerson W. Barbosa** on 24 Nov 2011, 1:17 a.m.,*
in response to message #4 by Howard Owen

From my bookshelf:



That's the only Lem's novel I read. Time to read more from him.

Also from Poland:

Nicolaus Copernicus

Joseph Conrad

Jan Lukasievicz

Last but not least, my great-grandparents (mother's side) :-)

Re: [OT] Google's Lem doodle

*Message #7 Posted by **George Litauszky** on 24 Nov 2011, 1:30 p.m.,*
in response to message #6 by Gerson W. Barbosa

I found the "Cyberiad" from Stanislaw Lem in English. It's a nice book too.
Lem: Cyberiad

Re: [OT] Google's Lem doodle

*Message #8 Posted by **Gerson W. Barbosa** on 24 Nov 2011, 5:08 p.m.,*
in response to message #7 by George Litauszky

Thanks! Thanks also Valentin for the post and the recommendations below. According to Portuguese Wikipedia, only Solaris was available in Brazil, which appears to be true, and only a few other Lem's works have been translated into Iberian Portuguese.

Re: [OT] Google's Lem doodle

*Message #9 Posted by **Valentin Albillo** on 24 Nov 2011, 1:24 p.m.,*
in response to message #1 by Valentin Albillo

Hi, all:

I didn't know that the Lem Google doodle wasn't visible in the US, I had mistakenly assumed that it was available worldwide ... :(

Anyway, thanks to those of you who replied, much appreciated. I love most all of Lem's books, articles, and novels, but for those of you interested in reading more of it (as Solaris, IMHO, is too much overrated and isn't neither typical nor the best of his production), may I suggest you try these:

- **Fiasco**

  Full-fledged novel, the most amazing, visionary technology and new scientific theories used throughout effortlessly, as if it were completely real and well-known to the reader. A real treat for the technologically-, scientifically-oriented mind, with an awesome final. A must.

- **More Tales Of Pirx The Pilot**

  A collection of short tales, absolutely enthralling in their uncanny mix of futuristic setups and deep philosophical themes. Another must.

- **The Star Diaries**

  The exact opposite of the previous one, this is also a collection of short tales but instead of realistic setups and philosophy what you get here is sheer humour, lots of it, of the decidedly surrealistic kind. It may seem a bit strange at first but once used to it you'll be laughing all the time, from the very first short tale to the last.

There are many, many others (**"His Master's Voice"**, the short tale **"Non Serviam"** in the short-tale collection "A perfect vacuum", etc, etc) but if you would check the above three references, which are completely varied and unlike one another, I would be more than satisfied.

Best regards from V.

[WP34S] Numeric Integrator Has Max Iterations Set?

*Message #1 Posted by **Les Wright** on 23 Nov 2011, 3:58 a.m.*

The subject-line query says it all.

I was fiddling around with numeric integration, and the first integral I usually attempt is the one discussed in Kahan's 1980 paper on the 34C integration (on the MoHPC DVD). Namely, we are talking the integral of the following between w=0 and w=1:

```
2*w^2/((w-1)*(w+1)) - w/ln(w)
```

The WP34S emulator is fast but it seems to top out at 7 accurate significant digits even if one sets the display to the max possible (i.e., ALL 11, FIX 11, or SCI 11).

My HP15C LE is pretty fast and gets more like 8 or 9 digits even if I use something as low as SCI 6 or SCI 7. My 35S is much slower but, still, does better than the best attainable with the 34s.

This is admittedly a challenging integral (Kahan presents it as a potentially pathological example in the aforementioned paper), but I was wondering if the programmers here limited the number of function computations in the Romberg Integration or whatever other algorithm was used.

I note that Thomas Okken, via Hugh Steers, uses Romberg Integration in Free42. Free42 gets all 12 displayed digits correct for this integral, and quickly at that.

I am very interested in numerical integration and wondering if anyone could tell me about the innards of the algorithm.

Les

P.S. I am working with 2.2, not the version 3 beta. Indeed, I don't know where to get the latter.

Edited: 23 Nov 2011, 4:01 a.m.

Re: [WP34S] Numeric Integrator Has Max Iterations Set?

*Message #2 Posted by **Paul Dale** on 23 Nov 2011, 5:32 a.m.,*
in response to message #1 by Les Wright

The 34S does **not** use an adaptive integration method. It doesn't deal with the *difficult* cases at all well.

There is a wrapper somewhere to provide some degree of adaption over the top and I've thought about implementing Romberg but haven't done it yet and might never get to it.

- Pauli

Edited: 23 Nov 2011, 5:33 a.m.

Re: [WP34S] Numeric Integrator Has Max Iterations Set?

*Message #3 Posted by **Les Wright** on 23 Nov 2011, 5:48 a.m.,*
in response to message #2 by Paul Dale

Well, Pauli, that explains perfectly the speed and the fact that the accuracy stays put irrespective of how many digits I choose to display. The algorithm only samples 31 points no matter what.

The 90 step Romberg Integration routine in the PPC module I am sure is easily adapted to the 34s, since it looks like 34s has all of the functions of the 41C series and then some. I could work on that eventually.

BTW, I recall that the TI-83 and TI-84 actually use Gauss-Kronrod but may sample more points according to desired accuracy? I can't remember--haven't touched my Tis forever.

Les

Re: [WP34S] Numeric Integrator Has Max Iterations Set?

*Message #4 Posted by **Paul Dale** on 23 Nov 2011, 5:57 a.m.,*
in response to message #3 by Les Wright

It only performs 21 function evaluations. Gauss/Kronrod quadratures share the points between the two methods. A major aspect of their appeal.

The PPC Romberg routine would port easily -- when I wrote the integration code several years ago, I had exactly five registers to work with. Romberg was simply not possible in so few. This is a limitation of the internal keystroke programming model. Thus, the 2.x firmware will *never* get an adaptive built in integrator. However, check out Miguel Toro's integration wrapper for a way to use the internal integration somewhat adaptively.

With the 3.x firmware, we have dynamically allocated local registers and it would be possible to use the PPC routine as the basis of the internal integration function. It will still need quite some reworking to make it behave *exactly* like the built in command must (near enough isn't acceptable for this unfortunately).

Time is my issue :-(The current integrator works okay mostly, I've better things to do at the moment than recode it. Maybe eventually.

- Pauli

> The wrapper is in the Article section.
>
> Regards,
>
> Miguel

Miguel, this is a great routine. I may tweak it a bit so that the desired accuracy can be entered directly, like we do with the 42s or Free42, rather than inferred from the number of digits in SCI, FIX, ALL, etc.

It isn't an adaptive routine like Richardson extrapolation, but it still is quite fast on what is a very fast calculator. I like it just fine. Thank you!

Les

Re: [WP34S] Numeric Integrator Has Max Iterations Set?

*Message #7 Posted by **Paul Dale** on 23 Nov 2011, 5:35 a.m.,*
in response to message #1 by Les Wright

> Quote:
>
> I am very interested in numerical integration and wondering if anyone could tell me about the innards of the algorithm.

The 34S uses a 10/21 point Gauss/Kronrod quadrature. The source code is in xrom.wp34s in trunk in the source tree.

Also see pages 99 and 100 of the 2.2 manual.

HP 67 and 97 odd behavior- HELP

*Message #1 Posted by **Fouad M. Kaadou** on 22 Nov 2011, 4:25 p.m.*

Hello,

I have a problem with both my hp67 and hp97 both bought off auction sites. They both sometimes stop responding and when I press certain* buttons (not all have this problem) one of the numeric LEDs shuts off and turns back on when unpressed. The buttons always correspond to the same LED. Does this mean that both have fried circuits?

*On the hp67 only the last column (E, SST, h, CLX, 9, 6, 3, R/S)

*On the hp97 only the right set of buttons.

Help

-Fouad

Re: HP 67 and 97 odd behavior- HELP

*Message #2 Posted by **Katie Wasserman** on 22 Nov 2011, 4:42 p.m.,*
in response to message #1 by Fouad M. Kaadou

The keys on the 67 correspond to all the keys on the one column scan line. If the problem is intermittent you likely have a poor contact going to the keyboard on that line. Open up the calculator and clean the contacts to the keyboard.

On the 97, is the problem also intermittent and are all keys on the right half of the keyboard problematic?

Edited: 22 Nov 2011, 4:42 p.m.

Re: HP 67 and 97 odd behavior- HELP

*Message #3 Posted by **Fouad M. Kaadou** on 23 Nov 2011, 9:48 a.m.,*
in response to message #2 by Katie Wasserman

Hello Katie,

Yes all the keys on the right hand side of the hp97 have this issue.

I will clean the keys on the hp67 and tell you what happens.

Thanks,

-Fouad

Re: HP 67 and 97 odd behavior- HELP

*Message #4 Posted by **Katie Wasserman** on 23 Nov 2011, 11:59 a.m.,*

in response to message #3 by Fouad M. Kaadou

Don't clean the keys on the 67, just the contacts between the keyboard and the main board.

On the 97, the only thing that distinguishes the right half of the keyboard form the left half is the contact sheet sandwich. It must be that the right half sandwich is misaligned. You need to take the keyboard apart and check the alignment. This is actually pretty easy to do, no keys need to be remove just unscrew the keyboard PCB from the keyboard and you should see the problem immediately.

Cursed Card Reader

*Message #1 Posted by **Fouad M. Kaadou** on 22 Nov 2011, 4:11 p.m.*

Hello,

I seem to have a cursed hp41c card reader...please help.

The card reader works perfectly on my hp41c but when plugged into my hp41cx the calculator would either not recognize it or would go crazy and not respond until I unplug the card reader. The port 4 of the hp41cx works properly with modules and other peripherals but somehow rejects the card reader. Could the card reader be cursed by the previous owner?

Thanks in Advance

-Fouad

Re: Cursed Card Reader

*Message #2 Posted by **Raymond Del Tondo** on 22 Nov 2011, 4:41 p.m.,*
in response to message #1 by Fouad M. Kaadou

Hello,

the first things that come into mind are contact foil/spring problems, and/or battery/energy problems.

Maybe one or more of the contact springs of your card reader has a slightly different (out of line) resting position,
which may still make good contact to the foil of your 41C, but not necessarily in other HP-41 units.

Or the energy side: Did you try with the same battery pack in both calcs when using the card reader?

HTH

Ray

Re: Cursed Card Reader

*Message #3 Posted by **Dirk Mehldau** on 23 Nov 2011, 2:00 a.m.,*
in response to message #1 by Fouad M. Kaadou

Hi Fouad,

even though port 4 works properly with modules, the card reader uses a unique address not used by modules. So there may be contact problems around port 4.

Hope this helps.

Dirk

Re: Cursed Card Reader

*Message #4 Posted by **Fouad M. Kaadou** on 23 Nov 2011, 9:58 a.m.,*
in response to message #3 by Dirk Mehldau

I have tried changing the battery pack but still to no avail. I forgot to mention that even though the calculator does not recognize the card reader but when I plug a card in the reader the display shows weird things and freezes.

I will attempt to clean the contacts inside the calculator and get back to you.

cheers,

Fouad

WP34s Development under Linux?

*Message #1 Posted by **Nobby K.** on 22 Nov 2011, 11:05 a.m.*

Hi, all.

I'm trying to modify WP34 based on V2.2 using Linux enviorment.

Q1. If based on V2.2 firmware, which SVN revision shoud be checked out?

I tried to build with CodeSourcery G++ Lite(4.5.2) on Linux and build SVN1782 source. Download the firmware to HP30b hardware. Almost of commands work correct, but [h][CONST] is hanged up.

Anyone has seen that?

Q2. Which compiler should be used on linux? Q3. Who tests the firmware with linux compiler?

regards,

Re: WP34s Development under Linux?

> Q1. If based on V2.2 firmware, which SVN revision shoud be checked out?

Build 1797 was a good v2.2 build IIRC. Generally, just read the comments submitted with each build - and a few of the following ones - and you'll get a feeling what was (and is) going on. But be aware you branch on

work in progress! We let you follow the development process closely, giving you a lot of insight and OTOH a lot of responsibility for your deeds. If you want a probably more stable package, take the latest zipped build.

For the other questions, I concur with Eric.

Re: WP34s Development under Linux?

*Message #4 Posted by **Marcus von Cube, Germany** on 22 Nov 2011, 1:34 p.m.,*
in response to message #1 by Nobby K.

As Eric already told you, CodeSourcery and WP 34S are a close mismatch. :-(

If you really want to participate in development, do it on the latest SVN revision. Pascal is just adding a Qt GUI to the project which makes it possible to run the GUI version on MacOS, Linux and whatever operating system supports Qt. Compiling this on a Linux system should be easy. In order to build the ARM binary, get a generic GCC 4.6.2 ARM cross compiler. Yagarto.de is supplying one for Windows and MacOS which I'm running both with success: They produce the same binaries.

Re: WP34s Development under Linux?

*Message #5 Posted by **pascal_meheut** on 22 Nov 2011, 2:19 p.m.,*
in response to message #4 by Marcus von Cube, Germany

The project compiles under Linux indeed. But it is better to use GCC.

I second Marcus: you should base your work on the last version. If you checkout it, you'll find a README in the QtGui subdirectory explaining how to build the whole project and the new emulator under Linux.

Then you can indeed build the calc.bin if you have a compiler. Just configure the paths in the main Makefile (search for CROSS_COMPILE) and launch "make REALBUILD=1".

If you really want to work on 2.2, it must be possible to merge the old source code with the emulator and the changes in the Makefile but you'll be on your own.

Re: WP34s Development under Linux?

*Message #6 Posted by **Nobby K.** on 23 Nov 2011, 8:29 a.m.,*
in response to message #5 by pascal_meheut

Thanks All!

I will uninstall CodeSourcery and try YAGARTO on windows or generic GCC on linux.

I only want to add sum functions to every day using stable calculator. So if V3.0 overlay is released, I will change the base revision from V2.2 to trunk. V3.0 is very interesting such as Qt emulator, new functions(including solver) and bug fix. I'm hoping and waiting new overlay.

Re: WP34s Development under Linux?

*Message #7 Posted by **Marcus von Cube, Germany** on 23 Nov 2011, 8:38 a.m.,*
in response to message #6 by Nobby K.

> Quote:

Are you sure this is a missing functionality? There are functions for time and date and calculations therewith.

Re: WP34s Development under Linux?

*Message #8 Posted by **Nobby K.** on 24 Nov 2011, 10:42 a.m.,*
in response to message #7 by Marcus von Cube, Germany

I want to add 'SETJPN' and money exchange rate convertor.

OK,OK! I will follow trunk, but now building GCC toolchain.

SETJPN

*Message #9 Posted by **Paul Dale** on 24 Nov 2011, 4:41 p.m.,*
in response to message #8 by Nobby K.

What should SETJPN do?

- Radix indicator (dot or comma) ?
- Time (12 or 24 hour) ?
- Thousands separate present or not ?
- Julian/Gregorian change over date (1582 or 1752) ?
- Date format (d.my, m.dy or y.md) ?

I think adding this command will consume 10 - 12 bytes of flash.

If you want to do it yourself, you'll need to make changes to (at least):

- xeq.c
- xeq.h
- commands.c
- compile_cats.c

- Pauli

Edited: 24 Nov 2011, 10:31 p.m.

Re: SETJPN

*Message #10 Posted by **Nobby K.** on 25 Nov 2011, 12:38 p.m.,*
in response to message #9 by Paul Dale

So, I am Japanese. Anyone is there?

Radix indicator is dot. Time is 24h Thousands separate present(comma). J -> G: 1873 Date format is y.md

> Quote:
>
> I think adding this command will consume 10 - 12 bytes of flash.

J -> G year is not important for me.

I should try that. But if you do that, it is very welcome. I'm building tool chain now.

Re: SETJPN

*Message #11 Posted by **Paul Dale** on 25 Nov 2011, 5:55 p.m.,*
in response to message #10 by Nobby K.

> Quote:

If we want to add some personalization in the firmware without consuming flash, it is relatively easy: we can simply change a value in calc.bin itself.

I've tried this to calibrate the STOPWATCH function and it works perfectly. My WP34s are now very accurate without a quartz.

I plan on implementing this kind of function, starting by calibration, in the new emulator. Editing a bitfield to select a few options from an already compiled calc.bin should be very easy too.

Re: WP34s Development under Linux?

Wow good job Pascal!

I'm posting the latest version of the emulator in a public share at work - I know there are a few RPN oriented people at my work.

Any plans to make a "compact" skin?

Re: WP34s Development under Linux?

*Message #18 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 6:59 a.m.,*
in response to message #17 by Dominic Richens

I've just updated the layout(s) again for Windows. Pascal, some work ahead! :-)

Edited: 25 Nov 2011, 7:00 a.m.

Re: WP34s Development under Linux?

*Message #19 Posted by **pascal_meheut** on 25 Nov 2011, 8:03 a.m.,*
in response to message #17 by Dominic Richens

Yes, the new emulator will support the same set of skins. It is just a matter of converting them to the new XML format which can be partially automated.

And the emulator must also be improved to detect the set of skins, create the menu, remember the last one selected...

Nothing major but I'm working on the .dat files load&save right now.

Anyway, a first "full" version of the new emulator should be ready in 2 to 4 weeks I guess. Maybe sooner if my real work stop bothering me :-)

Re: WP34s Development under Linux?

*Message #20 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 8:48 a.m.,*
in response to message #19 by pascal_meheut

> Quote:
>

The routines are all there (storage.c). What makes this difficult?

Re: WP34s Development under Linux?

*Message #21 Posted by **pascal_meheut** on 25 Nov 2011, 9:37 a.m.,*
in response to message #20 by Marcus von Cube, Germany

Nothing difficult but if we want the emulator to be a real application, packaged for several OS, it is better to use the .dat files as default values and to store the user's modifications as

"preferences", i.e as a copy in its home directory.

It allows the application to be installed for several users (in Program Files, /usr/local, /opt, /Applications...), avoids trying to write to the directory where the application is installed (which can be read-only...)

Supporting the current behavior will still be possible of course.

Re: WP34s Development under Linux?

*Message #22 Posted by **Marcus von Cube, Germany** on 25 Nov 2011, 9:52 a.m.,*
in response to message #21 by pascal_meheut

I understand. You want to look at the current directory (or a preferences directory) first for any file, then in the emulator directory. Writing shall always go to the current or user's directory.

Re: WP34s Development under Linux?

*Message #23 Posted by **pascal_meheut** on 25 Nov 2011, 10:01 a.m.,*
in response to message #22 by Marcus von Cube, Germany

Exactly.

Re: WP34s Development under Linux?

*Message #24 Posted by **Nobby K.** on 26 Nov 2011, 9:20 a.m.,*
in response to message #19 by pascal_meheut

Hi, Pascal.

I try to build QtGui, but can not. If define INCLUDE_STOPWATCH, compiler reports the following error.

QtEmulatorAdapter.c:66: undefined reference to `KeyCallback'

Sorry, I have few experience in Qt. I'd like to fix this.

Thank you.

Re: WP34s Development under Linux?

*Message #25 Posted by **pascal_meheut** on 26 Nov 2011, 10:53 a.m.,*
in response to message #24 by Nobby K.

Strange, work fine here.

Can you check that you have the last version and that QtEmulatorAdapter.c has the #include "stopwatch.h" at the beginning ?

Re: WP34s Development under Linux?

*Message #27 Posted by **pascal_meheut** on 27 Nov 2011, 1:25 a.m.,*
in response to message #26 by Nobby K.

Ok, this is a link problem, not a compilation one. And something is wrong on your link command: you are missing both the calculator libraries (-L../Darwin_qt/obj -lCalculator -ldecNum34s -lconsts) and the Qt libraries.

Are you using the provided Makefile? Because I tried under Ubuntu yesterday and everything went smoothly with gcc & Qt installed, PATH & QMAKESPEC defined. All I had to do was "make".

Re: WP34s Development under Linux?

*Message #28 Posted by **Nobby K.** on 27 Nov 2011, 8:22 a.m.,*
in response to message #27 by pascal_meheut

QtGui is builded successfully. The cause is that the linux console emulator and library does not builded correctry. I have only builded the firmware.

Thanks.

Re: WP34s Development under Linux?

*Message #29 Posted by **pascal_meheut** on 27 Nov 2011, 8:32 a.m.,*
in response to message #28 by Nobby K.

Fine. Do not hesitate to report any problem, QtGui is still a work in progress.

Rehabilitating mushy keys

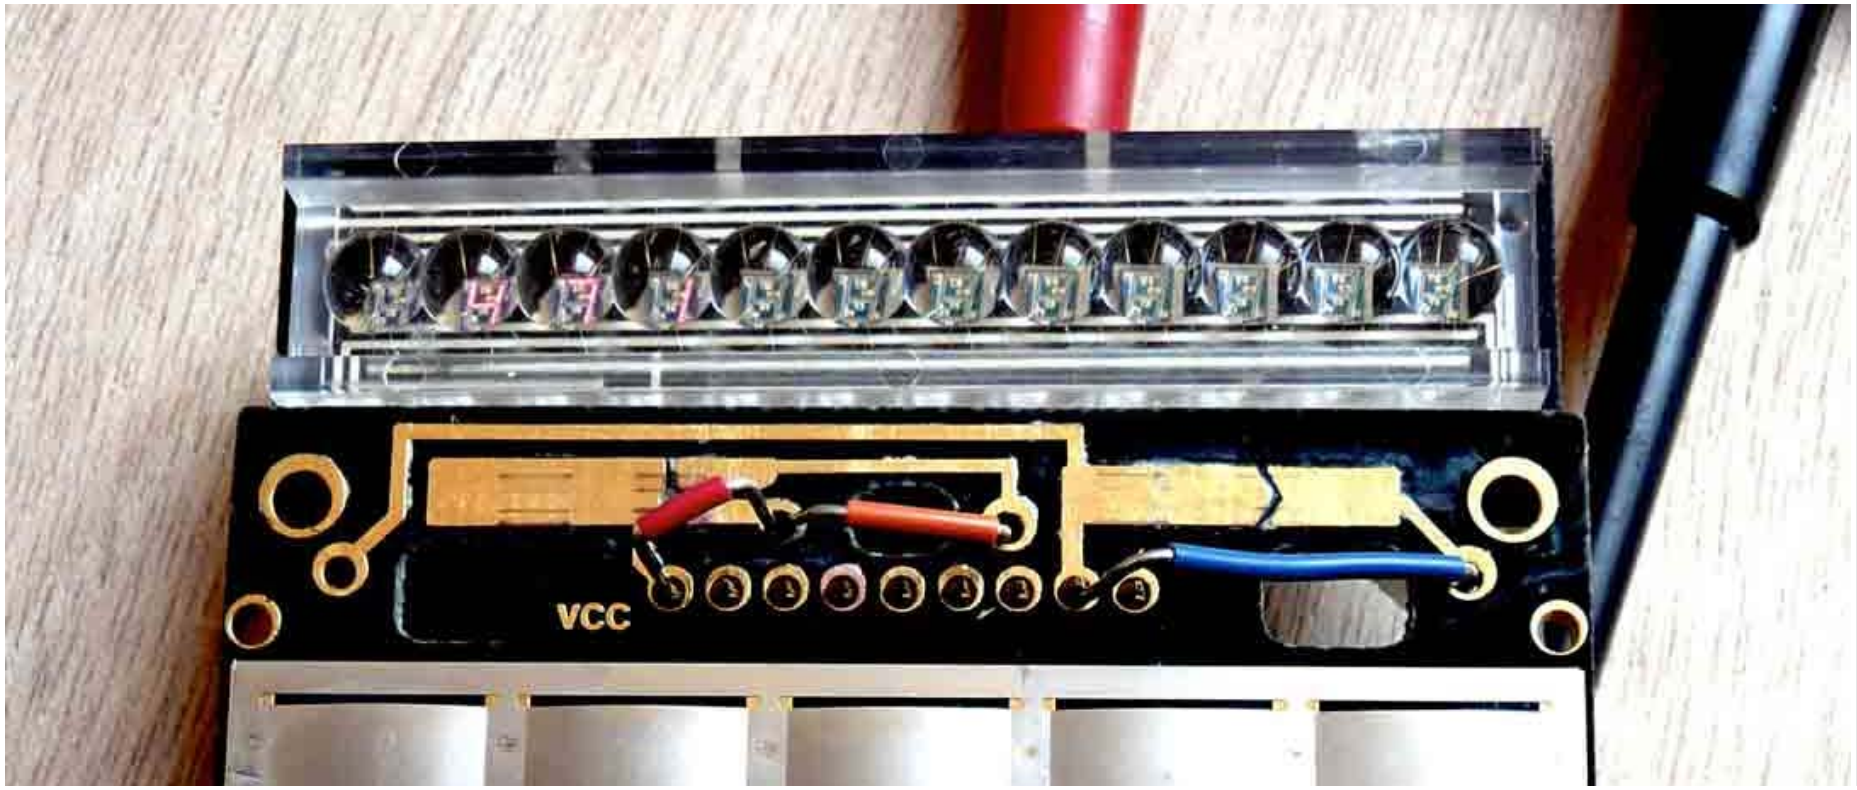
*Message #1 Posted by **David Griffith** on 22 Nov 2011, 2:10 a.m.*

According to Randy of fixthatcalc.com, mushy keys on an HP calculator are often caused by exposure to high heat for an extended period of time. What happens is that the plastic flexing part gets weak. That's why he says it's generally not possible to fix mushy keys. I don't know exactly what the keys look like underneath, but here's how I fixed mushy keys on something else, I forget what. The keyboard had tilting keys much like an HP calculator. I applied a thin layer of epoxy resin to the bar of plastic leading from the frame that held the buttons together to the button itself. This stiffened the bar enough such that it would spring back when pressed. The result was a complete rehabilitation and the keys were snappy again. Are HP calculator keys constructed such that this trick would work?

Re: Rehabilitating mushy keys

*Message #2 Posted by **David Ramsey** on 24 Nov 2011, 12:53 a.m.,*
in response to message #1 by David Griffith

I don't know what he means by "the plastic flexing part". Classic HP calculators have individual keys held in place by a plastic frame; the "key click" action is provided by arced metal "bridges" under each key position. It's hard to describe them but a photo will help (image found via Google Images):



Re: Rehabilitating mushy keys

*Message #3 Posted by **David Griffith** on 24 Nov 2011, 5:18 a.m.,*
in response to message #2 by David Ramsey

I see now that my idea would not work on HP calculators and my idea of why keys go mushy. So, just what is it that happens when a key goes mushy?

Re: Rehabilitating mushy keys

*Message #4 Posted by **David Ramsey** on 24 Nov 2011, 2:25 p.m.,*
in response to message #3 by David Griffith

> Quote:
>
> I see now that my idea would not work on HP calculators and my idea of why keys go mushy. So, just what is it that happens when a key goes mushy?

Two possibilities:

1. The metal arcs that provide the key snap feel have fatigued or cracked. The only repair possible is to replace the keyboard assembly.

2. Depending on the calculator, screws holding the keyboard assembly together have loosened, or in the case of heat-staked keyboards, the heat stakes have started to fail, although this is rare.

What calculator do you have with a mushy keyboard?

Re: Rehabilitating mushy keys

*Message #5 Posted by **David Griffith** on 24 Nov 2011, 6:22 p.m.,*
in response to message #4 by David Ramsey

I have two 32siis with mushy 8 keys. The rest of the keys are fine though one of them has keys distinctly less responsive than the other. I understand that some units were like this brand new.

WP34S Flashing Success

*Message #1 Posted by **Les Wright** on 21 Nov 2011, 4:04 p.m.*

Just wanted to report that flashing my erased 30b took 23 seconds with MySamBA under under an XP virtual machine on my Mac. I used the FTDI USB-Serial adapter sold by Eric Rechlin, which worked like a charm after the headaches with my older Prolific-based adapter. The calculator didn't turn on at first, but I recall reading someplace that removing and reinserting the batteries solved that problem, as it did here.

I wanted to thank Gene, of course, for the cable, as well as the specific direction I got from Eric, Egan, Marcus, and anyone else I am forgetting.

Now I wanted to ask what people are doing about overlays and key labels. Are folks simply printing off and cutting out their own on adhesive backed labels? What sort of label stock and printing methods would you recommend?

Thanks again,

Les

Re: WP34S Flashing Success

*Message #2 Posted by **Marcus von Cube, Germany** on 21 Nov 2011, 4:08 p.m.,*
in response to message #1 by Les Wright

Les, you can't beat the precut vinyl overlays from Eric Rechlin.

Re: WP34S Flashing Success

*Message #3 Posted by **Les Wright** on 21 Nov 2011, 4:31 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks, Marcus. I will wait until the bugs get hammered out of the most recent version before I commit to the version 3 overlays. I should mention that I flashed with the most recent of version 2 since that is the firmware I just happened to have on the computer.

Thanks for the tip about Eric. I didn't know if anyone was providing these.

Les

Re: WP34S Flashing Success

*Message #4 Posted by **Les Wright** on 22 Nov 2011, 9:22 p.m.,*
in response to message #3 by Les Wright

I think I will start off with getting several copies of the "no keys" version of the overlay colour laser printed at Kinko's to get me started. It is a little crowded, I know, and the existed key labels will be a tad distracting, but it will get me used to the calculator without having to look over at the emulator all the time. It's just a matter of getting the measurements correct to be sure that I get the ppi set correctly

for finally printing.

Les

Re: WP34S Flashing Success

*Message #5 Posted by **Walter B** on 23 Nov 2011, 1:18 a.m.,*
in response to message #4 by Les Wright

The "flap method" may be an alternative then. Uses the normal overlay file and saves you 37 exacto knife cuts :-)

Re: WP34S Flashing Success

*Message #6 Posted by **Les Wright** on 23 Nov 2011, 3:41 a.m.,*
in response to message #5 by Walter B

> Quote:
>
> The "flap method" may be an alternative then. Uses the normal overlay file and saves you 37 exacto knife cuts :-)

Yeah, Walter, that will work too. I will be sure to use either heavy paper or light card stock so that the little flaps over the keys will resist too much creasing or tearing. I think a thin laminate may help too. This is just a cheap transitional solution until Version 3 is dewormed and Eric starts selling the standard overlays again.

Les

Re: WP34S Flashing Success

*Message #7 Posted by **Eric Rechlin** on 23 Nov 2011, 9:29 a.m.,*
in response to message #6 by Les Wright

I'm still selling the standard overlays -- I have been for almost 2 months.

Eric

Re: WP34S Flashing Success

*Message #8 Posted by **Walter B** on 21 Nov 2011, 4:35 p.m.,*
in response to message #2 by Marcus von Cube, Germany

... but AFAIK you can't get them right now - and we are not definitively settled about the new layout yet. So, for the time being, use the method as described on page 97 of the most recent manual.

Re: WP34S Flashing Success

*Message #9 Posted by **Andreas Grund** on 21 Nov 2011, 8:38 p.m.,*
in response to message #8 by Walter B

I just received my (flashed by Jose of the TheCalculatorStore) WP 34s with the overlays. My question is how to attach best the overlays? First the keys, or the entire overlay without the keys? Is it wise to remove the protective sheet completely or only little by little? Any need to clean the keys first.....

I simply do not want to spoil the precious overlay.

Andreas

Re: WP34S Flashing Success

*Message #10 Posted by **Jeff O.** on 21 Nov 2011, 10:23 p.m.,*
in response to message #9 by Andreas Grund

I applied mine, with good results, as follows:

1. First do the keyboard plane overlay. Peel it entirely off of the backing sheet, making sure to leave the key labels and the thin border which surrounds each key behind. Stick the overlay down, starting above and below the row with the ENTER key. Then work your way up and down from there. You can gently pull and stretch the overlay to get it aligned properly as you go.

2. Then do the keys. I lifted each key label off of the backing sheet with a small flat blade screwdriver, by the upper left corner. Then I held it over the key and poked down the lower right corner when the reveal looked right. If necessary, I found I could remove and re-stick the stuck corner, or rotate the sticker slightly using the screwdriver before fully adhering the sticker and removing the screwdriver. I started at the top left and worked left to right and then down to the next row, but you can probably go in any order.

As far as cleaning, follow Neil's advice in the post below.

It seems a little scary at first, but just jump in and it will probably look fine.

Good luck!

Re: WP34S Flashing Success

*Message #11 Posted by **Neil Hamilton (Ottawa)** on 22 Nov 2011, 7:21 a.m.,*
in response to message #10 by Jeff O.

Having installed 4+ of these things I'll make a couple of comments: one regarding the key stickers, and another about cleaning.

Eric tries very hard to cut partially through the stackup so as to not cut all the way through the glossy backing sheet. Unfortunately, this can result in the cut through the top vinyl sheet being incomplete occasionally.

I have found that it is easier than you would image to delaminate the vinyl top layer from its sticky backing than you would image. If this happens, the key sticker is essentially destroyed.

Therefore, the trick I have adopted is to remove the concentric ring around each key sticker prior to the sticker itself. That way, if there is not a complete cut, it is the disposable ring that gets the damage, not the key sticker. I also have a razor blade or other suitably sharp knife handy to complete any cuts that are partial.

(I was lucky enough that Eric had graciously given me a dud sticker sheet at HHC2011 and I used one of these to replace the one I inadvertently destroyed by pealing the sticker away from its incompletely cut sticky substrate. **THANKS** Eric!!! :-)

As far as cleaning, I have found that if you use the calculator to any extent prior to installing

the overlay, then any residue finger oils will cause the keys to lift eventually. I have this problem with my first batch of overlays (the very first runs Eric made), and to a much lesser extent with the HHC2011 vintage. I would definitely use some kind of solvent to make sure the keyboard is pristine before installing the overlay. As to what the solvent is, someone else might have to pitch in there.

That being said, I had seen a lot of whiny complaints about overlays in the beginning but other than the aforementioned preventative steps, these are absolutely great! Eric has done a marvelous job in producing these things.

Les, I hope you like the calculator. The Triumphant Trio has done a marvelous job on this thing. The more I use it, the more I like it.

Re: WP34S Flashing Success

*Message #12 Posted by **Andreas Grund** on 23 Nov 2011, 2:34 a.m.,*
in response to message #11 by Neil Hamilton (Ottawa)

Jeff & Neil,

Thanks for sharing your experience, it helped a lot, especially the removal of the concentric rings is useful. First I cleaned the keys with a few drops of dishwasher soap in water with a soft cloth and after careful drying I attaches the overlay, beginning at the "Enter" row and the the keys, step by step.

The concentric rings I lifted with a needle in a corner and pulled them off by hand. No need to recut the labels. Now my WP-34s is fully functioning, indeed, a great calculator! Thanks to all who made it happen!

15C emulator display bug

*Message #1 Posted by **Thomas Radtke** on 21 Nov 2011, 2:59 p.m.*

When pressing 'f', I get a part of the skin copied to the display. It even persists when closing and restarting the emulator. The strange display returns to normal state when pressing another button.

Is this only me? I'm running the original HP emulator under Win7 64Bit on a recent Acer laptop, still with the original drivers (except scratchpad).

No problem with emulator display running on XP V3 32bit.

Re: 15C emulator display bug

*Message #3 Posted by **Marcus von Cube, Germany** on 21 Nov 2011, 4:06 p.m.,*
in response to message #1 by Thomas Radtke

Thomas, maybe your skin file is corrupted. If the 15C emulator works the same as the 20b SDK (the base for the WP 34S emulator GUI) then I understand well what is happening. Some "segments" of the emulated LCD are drawn as vectors while others (mainly the annunciators) are drawn by copying part of the skin graphic to the screen area. In the latter case the source area is a polygon that encircles the annunciator graphic in the underlying bitmap. Look for the display definitions in the skin file.

Re: 15C emulator display bug

Numerical Integration

*Message #1 Posted by **Namir** on 21 Nov 2011, 2:38 p.m.*

Hi All,

I posted an article (as a pdf file) on my web site. You can download it if you click here.

The article is a result of some basic investigation to enhance the Trapezoidal method by using additional points inside each integration interval. My new approach produces some improvements over the basic Trapezoidal rule using weights with points inside the interval. Interestingly, the new method does very well when these weights match those of Simpson's rule, Simpson's 3/8 rule, and other similar methods. The article explains how you can mix the Trapezoidal method with better methods when the scheme of the latter are applied to each integration interval in an isolated or compartmentalized manner. The article shows the source code for VBA functions that implement the various algorithms covered by the article.

Re: Numerical Integration

*Message #5 Posted by **Mike Morrow** on 22 Nov 2011, 7:37 p.m.,*
in response to message #1 by Namir

How does it compare to Gauss-Kronrod quadrature? The implementation of G-K quadrature on the fx-115/991ES seems to give much better and faster results than the quadrature methods of the various HP calculators, including the HP 50g and my beloved HP 42S.

Re: Numerical Integration

*Message #6 Posted by **Namir** on 22 Nov 2011, 10:59 p.m.,*
in response to message #5 by Mike Morrow

The Gauss-Kronrod quadrature is a better method.

Re: Numerical Integration

*Message #7 Posted by **Allen** on 22 Nov 2011, 9:57 p.m.,*
in response to message #1 by Namir

I wonder if you have considered using something other than the monomial basis for your objective function for your numeric integration??

For example, whether using uniform weighting or individual weights, you can use the method of undetermined coefficients to solve the abscissa locations. For example to find a three point, equal-weighted solution on the following range:

$$\int_{-1}^{1} f(x)dx = w(f(x_1) + f(x_2) + f(x_3)) = C_3(x)$$

With 4 unknowns, you can just use this equation:

$$w\begin{bmatrix} 1 & 1 & 1 \\ x_1 & x_2 & x_3 \\ x_1^2 & x_2^2 & x_3^2 \\ x_1^3 & x_2^3 & x_3^3 \end{bmatrix}\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} \int_{-1}^{1} 1dx = 2 \\ \int_{-1}^{1} xdx = 0 \\ \int_{-1}^{1} x^2dx = \frac{2}{3} \\ \int_{-1}^{1} x^3dx = 0 \end{bmatrix}$$

to find +/-inv(sqrt(2)), and 0 are the nodes, with the weight w=2/3.

Any number of weights or points can be calculated this way, but this only uses the monomial basis. With a different (perhaps higher-order?) basis function, Could it be more accurate??

Re: Numerical Integration

*Message #8 Posted by **Namir** on 23 Nov 2011, 9:14 a.m.,*
in response to message #7 by Allen

I really have not seen any numerical integration algorithm with a single weight. Being a pragmatic person, if you can find a method with a constant weight and it works well, that is fine.

Namir

Re: Numerical Integration

*Message #9 Posted by **Allen** on 23 Nov 2011, 8:37 p.m.,*
in response to message #8 by Namir

I was just reading about this method last week. The key is using the monomial basis to actually move the nodes around to compensate for the equal weight. I first heard about Chebyshev Quadrature in the book I am reading. It's simpler numerically than Simpson and a few other methods because you save n-multiplications by factoring out the weighting function from the summation. It's interesting to solve, too.

I hope you all have a Merry Thanksgiving!!

HP 97 card reader

*Message #1 Posted by **Davd F** on 21 Nov 2011, 11:07 a.m.*

Hi all,

I picked up an "untested" HP97 on Ebay, and have just finished cleaning it up. It had an "old electronics" smell, and was loaded with insect droppings and some insect parts. I disassembled it down to the last screw and thoroughly cleaned it. I am powering it via a 5V supply to the terminals (thanks Dave for including the polarity in your pics on the battery page!)

So far, The calculator works beautifully, and I can advance paper, but have to buy some calc paper to test the printer out. During the cleaning, I repaired the gummy card reader wheel, and removed all the gunk (mixed with bug parts and droppings--ugh.) Now, when I insert a card, there is no response, but when I push the card far enough, I get an ERROR message on the display. I am unfamiliar with the apparatus, but would guess it's either a motor or card sensor problem. I did remove the little foil spring contact on the reader, which I am guessing is the sensor for card progress through the slot. It has four little balls and 5 screws, three of which are accessible with the assembly cover in place. Am I right in guessing that there is a proper process for setting the tension on the foil via those screws, and that I probably messed it up when I disassembled it? Any suggestions on what might be happening?

I have read the prior posts, and understand that sometimes some of the caps on the assembly cause problems. However, I hate to just start replacing parts without knowing for sure what is wrong. I used to have the DVD with all the manuals, but can't find it anywhere. I just ordered a new set, but it looks like I won't have this before the holidays:-(So anything that might point me in the right direction would be most appreciated!

For those celebrating Thanksgiving, have a great holiday!

Dave

Re: HP 97 card reader

*Message #2 Posted by **Davd F** on 21 Nov 2011, 12:50 p.m.,*
in response to message #1 by Davd F

Also, can I work with the unit with the keyboard off? In otherwords, suppose I wanted to try adjusting the tension on the card sensor foil. Can the processor operate and respond without the keyboard attached? My idea was to start gently adjusting the tension, and see if the card gets detected at some point (hopefully the processor would activate the motor); otherwise, I will try to open up the unit, trace out the circuit, and then check the voltage at the switch, and turn the screw until the switch trips on card insertion.

Am I thinking in the right direction? These parts seem pretty delicate, and I'd hate to needlessly damage something. I'm fine with electrical stuff, but as someone who can't build a square picture frame, if I break a mechanical part, I'll be looking for another "untested" HP on Ebay. . .

Dave

Re: HP 97 card reader

*Message #3 Posted by **Michael de Estrada** on 21 Nov 2011, 1:27 p.m.,*
in response to message #2 by Davd F

First, those are leaf switches, not springs, and they are not tensioned. They work by the card depressing the balls, which press on the tips of the switches, causing them to close the circuits by pressing them against the circuit board. One of the switches causes the motor to start when it is closed. They can be adjusted, but it's tricky, and generally not necessary. According to the HP 97 service manual: "If any of the switch contacts are bent, replace the leaf switch contacts rather than attempting to bend them into position."

Second, are you sure you got all the little parts in place when you reassembled the card reader ? You mentioned the 4 nylon balls, but there should also be a nylon pinch roller and two curved brass spring guides as well.

Third, the easiest way to check out the card reader is to remove the entire assembly including the ribbon connector from the calculator, and apply power directly to its terminals. This way you can isolate the issue to the motor or switches. If the reader checks out outside the calculator, then the problem is in the calculator itself.

Edited: 21 Nov 2011, 1:37 p.m.

Re: HP 97 card reader

*Message #4 Posted by **Davd F** on 21 Nov 2011, 7:13 p.m.,*
in response to message #3 by Michael de Estrada

Thanks for the reply.

I was able to get the machine to detect a card; I can hear the motor running but the card isn't being pulled through. There's a lot of resistance.

Regarding the little parts, they are all there, but the roller did not turn particularly freely. I'm wondering if that's not part of the problem. Should that be turning pretty freely? If so, does it need to be lubed somehow?

Best regards,

Dave.

Re: HP 97 card reader

*Message #5 Posted by **Wanderley Navarro** on 21 Nov 2011, 8:05 p.m.,*
in response to message #4 by Davd F

The resistance is usually related to a larger than necessary roller tubing or O-Rings. Try to decrease the diameter a bit with the help of a Dremel tool and a nail file.

A more fearless approuch:

- cut a piece of a nail file large enough to fit freely inside the roller chamber

- connect some alkaline batteries to the motor terminals

- file the roller

- clean

If the problem remains, verify if the clutch is working good. The cause may be there...

Re: HP 97 card reader

*Message #6 Posted by **Davd F** on 21 Nov 2011, 8:34 p.m.,*
in response to message #5 by Wanderley Navarro

Thanks for the suggestions. I think the roller is OK. I had some silicone tubing that was almost the exact diameter of the metal part of the roller when placed. With power off and motor removed, I can slid a card through.

However, I had not been aware of a clutch mechanism (although I see there is an article about it.) I just looked at the clutch as you suggested, and the plastic stuff fell out, so perhaps that is a part of the problem. I will review the article about repairing the clutch, and see if that helps.

Best regards,

Dave

Re: HP 97 card reader

*Message #7 Posted by **Michael de Estrada** on 21 Nov 2011, 8:46 p.m.,*
in response to message #6 by Davd F

It's actually not a "clutch", but just a flexible connector between the motor and worm gear that is not supposed to slip. However, the "clutch" term has been used a lot, so many people call it that. Remove it and save the metal collar, then find some wire insulation that is a tight fit inside it. The ID of the insulation must be a tight fit on the motor shaft that can be secured with a drop of superglue. The other end must be bored out sufficiently to fit the end of the worm gear inside it until it bottoms out on the end of the motor shaft. I've used a heated nail to bore it by melting the insulation. So far I've succeeded with this method on 3 card readers.

Re: HP 97 card reader

*Message #8 Posted by **Michael de Estrada** on 21 Nov 2011, 8:11 p.m.,*
in response to message #4 by Davd F

One possibility is that the motor shaft is slipping in the elastomeric coupling (aka clutch) and the worm gear is not turning. The coupling is made of a material similar to the drive wheel that deteriorates over time. If that's the case, you will need to rebuild the coupling. I have succeeded in making this repair using wire insulation. Again, you can see this if you remove the reader assembly from the calculator.

Also, you may not have the drive wheel adjusted properly. The shaft is eccentric, and can be adjusted to provide more or less pressure on the card. The recommended method in the service manual is to measure motor current at 180 +/- 20 mA when it attempts to pull a card through but is not allowed to.

Re: HP 97 card reader

*Message #9 Posted by **Davd F** on 21 Nov 2011, 8:24 p.m.,*
in response to message #4 by Davd F

On further examination, one of the spindles of the pinch roller is thicker than the other. The smaller side drops easily into either slot. The thicker side needs to be pushed to fit, in either orientation. This is preventing the roller from moving. I am guessing that the spindles should be small enough on both sides to drop in and roll freely.

Any suggestions on how to fix this? I am thinking emery board, but I'm going to wait a bit, because when it comes to mechanical fixes, I always end up wishing I'd waited and gotten some advice :-)

Dave

Re: HP 97 card reader

*Message #10 Posted by **Michael de Estrada** on 21 Nov 2011, 8:29 p.m.,*
in response to message #9 by Davd F

A normal pinch roller fits easily into the slots, and is the same on both sides. You may have a home-made substitute of some kind.

Re: HP 97 card reader

*Message #11 Posted by **Davd F** on 22 Nov 2011, 12:02 a.m.,*
in response to message #10 by Michael de Estrada

It doesn't look homemade. The thicker spindle is slightly bulbous at the end, almost as if it has melted.

Examining the clutch on my unit, the aluminum sleeve is very firmly attached to the worm gear, extending in about 1/2 the length of the sleeve. There is a hole at the end of the worm gear into which the motor shaft fits without any friction, so the gear/sleeve assembly fits over the motor shaft. So this appears as if it was designed to slip above a certain torque.

So, the plan is, based on advice here, and the various articles,

1) file down that spindle until is falls easily into the slot)

2) Replace the "clutch" material, which has dried and crumbled away. Insulation for 18 Ga wire fits well over the motor shaft, so I'll dip the insulation in silicone compound, and place it in the aluminum sleeve, using an 18G wire to center the insulation relative to the worm gear. Then I'll remove the wire, cut off the excess insulation, and slip the whole gear/tube/insulation assembly on the motor.

Re: HP 97 card reader

*Message #12 Posted by **Michael de Estrada** on 22 Nov 2011, 12:11 a.m.,*
in response to message #11 by Davd F

> Quote:
>
> So this appears as if it was designed to slip above a certain torque.

That was what I thought, too, but in fact this is not the case. The motor / coupling / wormgear was supplied as an assembly by HP as p/n 00067-60904 and no slippage was intended. The remaining coupling material will continue to deteriorate and the slippage problem will return unless you remove all of it and replace it with new material.

Re: HP 97 card reader

48gii on USB???

*Message #1 Posted by **William Graves** on 20 Nov 2011, 12:32 p.m.*

I see the 48gii comes with a USB cable (HPCalc sales site). I thought the 48gii was serial only. I have 2 units and neither work with the Kenpo usb driver (Windows cannot id the device) - my 50g works fine.

The same two 48gii works fine in serial mode. Does the same connector really support USB and serial?

I worked on this thing when it first was developed and I sure don't remember the USB capability on the 48gii. Am I just getting old and forgetful?

I got into this thread because a user emailed me about Conn4x

Re: 48gii on USB???

*Message #2 Posted by **Thomas Chrapkiewicz** on 20 Nov 2011, 1:53 p.m.,*
in response to message #1 by William Graves

As I understand it, there are two versions of the 48Gii.

Older model has serial only (using a mini usb connector on the calc!) and uses 3AAA batteries.

Newer model has both serial and USB (I assume using the same connectors as the HP50G) ans uses 4AAA batteries.

I would like to know in more detail how one can distinguish between these two models if one cannot hold the physical unit (like when shopping on the auction site).

Re: 48gii on USB???

*Message #3 Posted by **Ron Ross** on 20 Nov 2011, 2:12 p.m.,*
in response to message #2 by Thomas Chrapkiewicz

The original Hp 48Gii has only a small micro? RS-232 port (not the same plug as a mini USB). The new 48Gii has both plugs on top.

The original had 128K of RAM of which 80K was available and no eq. library. The new one has 256K of RAM.

The old 48Gii came with an open slip case, the new 48Gii comes with a plastic (ti like) slide on cover.

The old 48Gii came with 3 batteries, the new one with 4 AAAs.

The old 48Gii keyboard is often comparable to the Hp 49G+ keyboard (BAD!), the new 48Gii is the same as the Hp 50G.

Re: 48gii on USB???

*Message #4 Posted by **Thomas Chrapkiewicz** on 20 Nov 2011, 2:19 p.m.,*
in response to message #3 by Ron Ross

I have a 48gii (in my hand - CNA60501...) that has a mini USB (the odd shaped type that many cell phones and bluetooth headsets use) and the cable that came with it. One end of the cable has the mating USB connector and a DB9f on the other end.

If you would like serial number info and pics, email me.

TomC

Re: 48gii on USB???

*Message #5 Posted by **Howard Owen** on 20 Nov 2011, 4:50 p.m.,*
in response to message #4 by Thomas Chrapkiewicz

How many batteries?

The second version of the 48gII was introduced concurrently with the 50g. Like the 50g, the 48gII has four batteries, a (much) better keyboard and both a serial and USB port. The USB connector is type Mini B. I believe the serial connector is a custom job, but it any event is odd looking. The cable that comes with the newer package is definitely a USB cable.

Re: 48gii on USB???

> One end of the cable has the mating USB connector and a DB9f on the other end.

I'm guessing that's the older type. The new one has two ports.

Re: 48gii on USB???

*Message #7 Posted by **David Hayden** on 21 Nov 2011, 5:01 p.m.,*
in response to message #2 by Thomas Chrapkiewicz

There are a few ways to distinguish the two versions.

If they are in the retail package, check the writing on the front of the package to see if it says it supports USB. You can also check to see if there are 3 batteries or 4 in the package.

If the unit is out of the package, just look at the top of the calculator to see if there is one connector (serial, old version) or two (serial and USB, new version).

The old versions are sometimes available new on TAS for around $60 (or they used to be several months ago). To me, it's a very inexpensive way to get a really first class calculator.

Deep Drawn Aluminum Sources

*Message #1 Posted by **Hugh Evans** on 19 Nov 2011, 7:29 p.m.*

The first physical prototype OpenRPN enclosure design is in progress, but I've hit an annoying snag. Sourcing samples of deep drawn shells, which are planned for the back of the case design, has proven difficult. It may be a simple matter of actually registering a business to be taken seriously, but some vendors fail to reply and others are sending back some ugly looking quotes. The most recent quote I received for a design that supposedly requires no tooling costs the wholesale price per unit at quantities of 500+ was nearly $20. If need be, I will have the part machined for the prototype.

Does anyone have a good source for such parts?

Most of the work right now is revolving around negotiating with component manufacturers. Realistically, what started as a crazy idea appears to turning into a business. We have definite needs for a hardware designer, potentially a few dedicated programmers, and someone familiar with production logistics. If anyone is interested in getting involved please contact me. I have a strong preference for bringing people into this small group who are truly passionate about making a new breed of high end calculators. Crowd sourcing hardware doesn't seem to be a great approach. The goal is to create a great platform, and build great calculators on to of it.

Re: Deep Drawn Aluminum Sources

in response to message #1 by Hugh Evans

One we've used with good results is Lynx in northern California, at (209)833-3400. I have here that Vance Anderson is the sales mgr, that Mike Archer is in sales also, and the foreman who also does quoting is Steve Macredy (sp?). I can't find a website for them. Another one is Omega Tool in San Bernardino, CA. Their website address is http://www.omegatool-usa.com/ . They have molds for a lot of box sizes. The depth is custom but does not require special tooling. Same goes for things like nutplates. IOW, you should be able to get very close to what you want without having to pay tooling.

Where can I see renderings of what OpenRPN hopes to produce? I can't seem to find any recent info on OpenRPN newer than a couple years ago. Help?

Re: Deep Drawn Aluminum Sources

*Message #6 Posted by **Hugh Evans** on 21 Nov 2011, 3:20 a.m.,*
in response to message #5 by David Griffith

This is not the most current design but it is more recent:

I'm focusing on a portrait layout that fits in the same 3x5 form factor. The back shell is deep drawn, and the keyboard overlay and display are being approached as a single e-ink display (dynamic overlays sound cool enough?) That will be covered with aluminosilicate glass. Finally, a rubber boot will provide a gripping surface and impart some impact resistance.

I have no plans to post further CAD renderings around here until I have a picture of a physical prototype in the palm of my hand.

Re: Deep Drawn Aluminum Sources

*Message #7 Posted by **Eric Smith** on 21 Nov 2011, 9:58 p.m.,*
in response to message #6 by Hugh Evans

Are you expecting to get a dot-matrix E-Ink display that has holes in it for the keys? I very much doubt that you're going to be able to get that.

Re: Deep Drawn Aluminum Sources

*Message #8 Posted by **uhmgawa** on 22 Nov 2011, 12:55 a.m.,*
in response to message #7 by Eric Smith

> Quote:

The interconnect/drive technology doesn't currently exist, assuming it ever will be commercially feasible or even justifiable. But I suppose if you have sufficient financial resources you can certainly try. A more available alternative might be replicated individual panels situated in the horizontal key row spacing with perhaps matrix displays, but far more likely segment icons. Still that's a rather extreme undertaking for the limited benefit.

The other consideration being the actual key-resident legends will be static. So what really is the benefit of such a partial solution?

A less glamorous but perhaps more complete approach might be mechanical where a keyboard keycap matrix along with integral legend plate can snap in/out of the switch matrix, or slide into

retainer channels adjacent to the matrix. This would allow a 100% reconfigurable keyboard but frankly the notion of carrying around "extra" key cap plates and needing to swap them is quite unappealing.

Re: Deep Drawn Aluminum Sources

*Message #9 Posted by **David Griffith** on 22 Nov 2011, 3:46 a.m.,*
in response to message #8 by uhmgawa

I would probably have one or two sets of keys, but once I got it the way I liked (like a supercharged 32sii 35s combo) I'd leave it alone. The sheer thought of having my dream calculator done right would be enough for me.

Re: Deep Drawn Aluminum Sources

*Message #10 Posted by **Howard Owen** on 22 Nov 2011, 12:54 p.m.,*
in response to message #8 by uhmgawa

The way I see it, swapping keyboards wouldn't be a normal activity. The benefit would be that new calculators could be implemented on the same hardware. An enthusiast might reconfigure the calculator in various ways, but most users would stick with the machine as shipped.

As a business proposition, that would mean you'd primarily selling software and perhaps services. Does that sound familiar?

Re: Deep Drawn Aluminum Sources

*Message #11 Posted by **uhmgawa** on 22 Nov 2011, 5:32 p.m.,*

> The way I see it, swapping keyboards wouldn't be a normal activity. The benefit would be that new calculators could be implemented on the same hardware. An enthusiast might reconfigure the calculator in various ways, but most users would stick with the machine as shipped.

That's a realistic simplification, yet it does obviate the need for dynamic reconfiguration.

However as a means to facilitate reconfiguration as a manufacturing option I'd cast my vote for the demountable, integral keypad matrix and legend plate approach. But only if the resulting ergonomics were at least equal to a legacy HP benchmark.

> Quote:
>
> As a business proposition, that would mean you'd primarily selling software and perhaps services. Does that sound familiar?

The above seems reasonable for a platform of sufficient computation power and generality. But I don't believe I see a contemporary business case for it built around an essentially non-reconfigurable calculator.

That said, in the above scenario it is possible to offer a custom keyboard manufacturing service targeted at the enthusiast or calculator firmware projects in need of a bootstrap

vehicle (perhaps to limited scale production). I'd thought about doing so a few years ago but didn't see a compelling business case. I'm doubtful one exists but OTOH a technology labor of love doesn't really need one.

*Message #12 Posted by **David Griffith** on 22 Nov 2011, 2:24 a.m.,*
in response to message #6 by Hugh Evans

A portrait layout? Do you mean the kind of raw layout that is found on the 32sii, 20b, and 30b? It shouldn't be too hard to find an appropriate LCD dot matrix in small quantities. I'm not sure about thicknesses. The only ones I've played with have been around half an inch thick. I didn't have much luck sourcing e-ink displays in small quantities. They seem to want you to buy a thousand-dollar development kit.

How hard would it be to get physical buttons?

WP34S Under WINE

*Message #1 Posted by **SteveH** on 19 Nov 2011, 11:37 a.m.*

I was trying to flash an HP 40 to WP34S today and no great success (and limited time) using a Windows PC at work. As I only have a Mac at home I was going to try again using WINE (Codeweavers version) as I've read here that this has been successful.

The problem I was having starting SAM-BA were all about communication errors. I was using both a direct COM port and a USB converter and SAM-BA 2.11.

The ATMEL SAM-BA software crashed with a runtime error whenever I stated it. Does it need any additional software to run under WINE?

I also looked at Bossa and wondered if this might work.

> Quote:
>
> The motivation behind BOSSA is to create a simple, easy-to-use, open source utility to replace Atmel's SAM-BA software

Has anyone tried this?

Re: WP34S Under WINE

*Message #2 Posted by **Marcus von Cube, Germany** on 19 Nov 2011, 12:12 p.m.,*
in response to message #1 by SteveH

Get the MySamba application from SourceForge (http://sourceforge.net/projects/wp34s/files/FlashTool/) and try again.

You certainly did not try to reflash an HP 40, did you?

Edited: 19 Nov 2011, 12:12 p.m.

Is the MySamba application in place of the ATMEL software that's referred to in the quick start guide?

Re: WP34S Under WINE

*Message #5 Posted by **Marcus von Cube, Germany** on 19 Nov 2011, 12:46 p.m.,*
in response to message #4 by SteveH

Yes, it's a replacement originally written by Cyrille from IBM and only slightly modified to make it compatible with the less than 128KB flash files for WP 34S. The software is much faster than Atmel's offering.

BTW, you will need fresh batteries because the SAMBA boot loader, once activated by erasing the flash with the cable, will have drained them already. Use a multimeter to verify this! If the batteries are still fine, chances are good that you did not successfully erase the calculator. Try to turn it on.

Re: WP34S Under WINE

*Message #6 Posted by **SteveH** on 19 Nov 2011, 2:03 p.m.,*

Careful there. You'll start a rumor. :)

Re: WP34S Under WINE

*Message #8 Posted by **SteveH** on 21 Nov 2011, 7:51 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks, that suggestion worked well and the calculator is now up and running.

Is there a self-test mode? I couldn't see a reference to it in the manual - everythings aseems to work well though.

It might be worth updating the Quick Start guide to remove the reference to the Atmal software?

Re: WP34S Under WINE

*Message #9 Posted by **Marcus von Cube, Germany** on 21 Nov 2011, 8:50 a.m.,*
in response to message #8 by SteveH

> Quote:
>
> Is there a self-test mode?

Do you really believe we implement a test to reveal the many bugs and shortcomings of our design? ;-)

No, if you want to test the hardware you'll need HP's original firmware. On the other hand, hardware failures aren't very common on this platform. So we decided to use the flash space for our own purposes.

Have fun!

Re: WP34S Under WINE

I had initially also crashes of SAM-BA under CrossOver. After I got the serial port configuration right everything worked.

Serial ports are defined in the dosdevices directory of ~/.wine or in the respective bottle of CrossOver.

Use 'com1' but not 'com1:' as the serial port name, the name with the colon does not work.

Hubert

Looks pretty good, at least the resolution of the museum CD version if not better. It may well replace that version after cropping out the edge shadows and coil binding holes.

Re: HP 15c searchable Adv Fun Handbook (link) - done by Joe Horn

*Message #4 Posted by **Valentin Albillo** on 19 Nov 2011, 3:54 p.m.,*
in response to message #1 by gene wright

Thanks for the link, Gene, it's a very nice scan and much appreciated.

Actually, I really love those old HP manuals and Owner's Handbooks of the golden age, and this particular one is really among the very best and most interesting of them all and really lives up to its title, being full to the brim with quality advanced info and examples.

However, all isn't perfect and there's the odd suboptimal programming in there as well, which is particularly rare in such a state-of-the-art handbook. One such instance is the routine found in page 119 for *"Constructing an Identity Matrix"*, which ineffciently needs 12 steps and 3 registers to do the task and it's quite slow to boot.

Actually, I asked for such a routine in one of my very first HP-15C mini-challenges posted to this forum many years ago, with my own solution being:

```
            LBL A
            CLX
            STO MATRIX A
            MATRIX 1
            X<> 0
            LBL 0
            STO+ 0
        "u" STO A
            GTO 0
            RTN
```

which is just 10 steps long (including LBL and RTN), and only takes a maximum of 3 seconds for a 7x7 matrix, which is the largest possible size the HP-15C's memory allows. You can substitute MATRIX A and STO A for whatever desired matrix, A to E.

Best regards from V.

Strange HP41CX Problem - HELP!

*Message #1 Posted by **Fouad M. Kaadou** on 19 Nov 2011, 5:41 a.m.*

Hello Hp museum,

I have recently opened up my Hp41cx to repair what I suspected was a broken screw posts problem but it was only broken posts on the back side of the calculator and by placing them correctly it is now firmly held together.

Now the real problem: After I reassembled the Hp41cx I was plugging in some modules and noticed that if I plugged any modules or card reader or printer or anything into the right ports (ports 2 and 4) the calculator will go crazy and not respond to anything unless I unplug the modules on the right side. The calculator works great if the right ports are empty. The left ports function properly.

Any Ideas? HELP!

Thanks in advance,

Fouad

Re: Strange HP41CX Problem - HELP!

*Message #2 Posted by **Randy** on 19 Nov 2011, 3:03 p.m.,*
in response to message #1 by Fouad M. Kaadou

Disassemble and check for foreign matter under/on the i/o port block connector.

Re: Strange HP41CX Problem - HELP!

*Message #3 Posted by **Fouad M. Kaadou** on 20 Nov 2011, 5:12 a.m.,*
in response to message #2 by Randy

Thanks Randy. I found the problem, but I also have another problem:

I have a card reader that works on my other HP41C but when connected to the HP41CX the calculator would not even recognize that it is plugged in when I run CAT 2. although the port used by the card reader works properly with other modules.

Any thoughts?

-Fouad

An interesting challenge

*Message #1 Posted by **Don Shepherd** on 19 Nov 2011, 2:30 a.m.*

How many 9-digit numbers containing all the digits 1,2,3,4,5,6,7,8,9 are prime numbers?

Edited: 19 Nov 2011, 2:39 a.m.

Re: An interesting challenge -- spoiler?

*Message #2 Posted by **Tony Duell** on 19 Nov 2011, 3:50 a.m.,*
in response to message #1 by Don Shepherd

Off the top of my head... Zero.

The sum of 1..9 = 45, which is a multiple of 9. Therefore any 9 digit number formed from a permuation of those 9 digits is also a multiple of 9 and thus not prime.

Re: An interesting challenge -- spoiler?

*Message #3 Posted by **Don Shepherd** on 19 Nov 2011, 7:05 a.m.,*
in response to message #2 by Tony Duell

Yes, what I had in mind actually was divisibility by 3. What a great way to teach the divisibility by 3 rule, which students can never seem to remember.

Edited: 19 Nov 2011, 7:07 a.m.

Re: An interesting challenge -- spoiler?

*Message #4 Posted by **Marcus von Cube, Germany** on 19 Nov 2011, 8:09 a.m.,*
in response to message #3 by Don Shepherd

Don, do you have an easy proof for this rule (there are two: one for 3 and one for 9 and a similar one for 11)?

Re: An interesting challenge -- spoiler?

*Message #5 Posted by **Dieter** on 19 Nov 2011, 8:38 a.m.,*
in response to message #4 by Marcus von Cube, Germany

You will easily get the idea if you look at the example of a, say, four-digit number.
This number will consist of the four digits abcd. It can be divided by 9 if abcd mod 9 = 0.

A number abcd can be written as

```
    1000 a  +  100 b +  10 c  +  d
```

We now want to evaluate

```
   (1000 a   +  100 b   +  10 c   +  d) mod 9
=  (999a + a +  99b + b +  9c + c +  d) mod 9
```

Since 999, 99, 9 etc. are all integer multiples of 9, this simplifies to

```
   (a  +  b  +  c  +  d) mod 9
```

In other words: in order to test whether a number can be divided by 9, simply check the sum of its digits. So if the remainder of the digit sum divided by 9 is zero, the number itself can be divided by 9 as well. This also means: if the remainder is 3 or 6, i.e. it can be divided by 3, the number itself is divisible by 3.

In other words:
If the digit sum is divisible by 9 resp. 3, so is the number itself.

Example:

```
  n = 12345
  sum of digits = 15
```

15 is not divisible by 9, but the remainder (6) is. Or: 15 can be divided by 3. So 12345 is divisible by 3 as well.
BTW, you can also continue with the digit sum of 15 which is 6 and judge the divisibility from this result. ;-)

Dieter

Search for 'divisibility' in Wikipedia

Patrice

Re: An interesting challenge -- spoiler?

*Message #7 Posted by **Don Shepherd** on 19 Nov 2011, 9:53 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Well, I don't have a proof, just the fact that every middle school math textbook I've seen that discusses factoring and divisibility lists the test for divisibility for selected numbers. I generally teach the easy ones: 2 (even number), 3 (sum of digits divisible by 3), 5 (ends in 0 or 5), and 10 (ends in 0). There are tests for divisibility for other numbers, as Wikipedia shows, but in middle school we usually limit it to those 4.

Re: An interesting challenge -- spoiler?

*Message #8 Posted by **Marcus von Cube, Germany** on 19 Nov 2011, 10:08 a.m.,*
in response to message #7 by Don Shepherd

4 is easy: the last two digits (read as a two digit number) need to be divisible by 4.

There is another rule for 11: It deals with the pairwise digit sum. Example 121: The pairwise sum is 01 + 21 = 22. This is divisible by 11 and hence 121 is. The proof must be similar to what

Dieter has shown.

> Quote:
>
> The proof must be similar to what Dieter has shown.

You bet. :-)

The method is based on the fact that 99, 9999, 999999 etc. are all divisible by 11 (which can be easily proven as well). The approach is basically the same as before. Here, the number consists of groups with two digits aa, bb, cc etc., so an eight-digit value can be written as aabbccdd.

```
   aabbccdd mod 11
=  (1000000 aa       + 10000 bb      + 100 cc      +  dd) mod 11
=  ( 999999 aa + aa  +  9999 bb + bb +  99 cc + cc +  dd) mod 11
```

Since 99, 9999, 999999 etc. are divisible by 11, this simplifies to

```
   (aa + bb + cc + dd) mod 11
```

q.e.d.

Dieter

I'd be stunned if this problem would make the rule easier to remember. It seems like the rule is pretty easy to remember as is.

Actually, it seems like an easier rule to help remember this (as well as the times tables for 9) is that 9 times any single digit number results in a number whose digits not only add to a multiple of 9, but 9 itself.

HP-41C PCB Repair Question.

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 19 Nov 2011, 2:00 a.m.*

My long time trusty HP-41C has begun giving MEMORY LOSS errors this morning when it was left off for more than 10 minutes. Each time became more difficult to turn it on, no response. While it was on, I was able to run the MEMTEST program to makesure everything was ok, worked fine, until I turned it off.

I had to pull the calculator aprat to check the curcuit. I was first suspecting from the C1 470uF capacitor which holds the memory when power is turned off. However all capacitors seems to be fine. I am not measuring any significant leakage. My next suspect is the Q3 Transistor (the most lower right in the photo), it is a 1854-0092 which is part of the Memory Reset circuit.

Is there anyone know where can I find 1854-0092 (NPN Transistor) or an equivelant?

Thanks in Advance. Kerem

*Message #2 Posted by **Alexander Oestert** on 19 Nov 2011, 2:20 a.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

Are the batteries ok?

Are the screw posts, especially the two lower ones, ok? If these screws aren't screwed in tight, the small PCB makes no good and permanent contact with the keyboard PCB, through which it gets its power.

I had a similar problem - if your calculator has the "zebra strip" elastomeric connector between the CPU and the keyboard PCB that may be the problem, or it might be the connections to the LCD/switch board. Having another HP41 to swap the CPU board with is pretty handy for trouble-shooting.

This link might be of use.

Re: HP-41C PCB Repair Question.

*Message #5 Posted by **Randy** on 19 Nov 2011, 3:20 p.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

To assume the transistor is the problem just because it controls mem reset is a good way to waste lots of time looking for a part you don't need.

FWIW, the problem is almost always caused by a bad D/S integrated circuit. Could be a power supply IC issue but a bad memory IC is the far more common cause. Realistically, without a HP41 service rom, you're lost in the wildness at night without a compass or torch.

Re: HP-41C PCB Repair Question.

*Message #6 Posted by **Garth Wilson** on 19 Nov 2011, 4:12 p.m.,*
in response to message #5 by Randy

+1. I'd give it nearly zero chance that it's the transistor. Silicon bipolar transistors that are run within their design parameters and aren't run hot last indefinitely. If it is bad, it's almost for sure because something else went south and took the transistor with it, meaning that if the first cause isn't fixed, you can replace the transistor and the replacement will blow right away too.

*Message #7 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 19 Nov 2011, 11:02 p.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

Thank You All for your valuable comments and suggestions! Very much appreciated.

I have taken your suggestions and comments spend several hours today, troubleshooting as much as with what I had available.

- Verified Batteries are OK, contacts are fine and clean. Cleaned all gold contacts with a pink eraser very gently, and removed the entire residue.

- Zebra strip looks ok, I think the round plastic in the zebra strips is supposed to be round, but with many years of pressure on it, it is somewhat square, however I traced the lines with PCB in place and verified the electrical connectivity.

- Another reason I was suspecting the transistor, because I found a repair sticker in the back of the calculator dating 1990. Also that transistor had relatively new solder contacts and unlike other two transistors, had a non-HP part number 53-0482-952. I had this calculator since 1992 and was working OK until recently, except every key stroke resulted in display blinking with several segments turning on across the display since I owned it. I contributed this problem to the early 41C's bugs and issues. Especially how the CAT command operated... Never had to open it until now. However I understand the argument about the transistor and how unlikely it could be the cause.

- Posts are fine, no cracks, or issues.

Final Result: It no longer turns on. No response at all.

I agree with Randy that it seems like a bad D/S circuit. I will stop wasting more time with it, perhaps I can use the original board which will become available after upgrading my 41CV to CL in the future.

Thanks and Best Regards, Kerem

That sounds like the older (and more reliable) printed wiring connector - looks like two clear tubes with a flat section between them? The zebra connector is a rectangular blob of pink elastomer with alternating black carbon conductive imbeds.

Complete shot in the dark: I have a 41C that had the same turn on problem (but not the memory loss) which was fixed by resoldering the interconnect cable between the LCD and the main board. Bear in mind this is an "Easter Egg" approach to trouble-shooting. Randy's advice above is the bottom line if you want to get to the bottom of the problem systematically.

You might want to sort this out before trying a 41CL transplant - if the problem you're having is not due to a bad CPU board you might be in for quite a confusing time.

in response to message #9 by BobVA

> Quote:
>
> That sounds like the older (and more reliable) printed wiring connector - looks like two clear tubes with a flat section between them?

It is the older type printed wiring connecter. Two clear printed wiring tubes (with an elastomeric clear tube in each)with a flat section between them. It has good contact to both board and CPU.

More I read the comments and more I think about how the problem started, It seems more to do with CPU D/S or RAM problem than connectors. Because the calculator was working fine and started giving "MEMORY LOST" errors upon turn on. It took a few presses on the ON button to get it working (getting worst each time), then it worked fine. I was able to write several MEMTEST problems to check the memory, registers, etc. If it was turned on immediately after it was turned off, no problem, came right back up. However more time it was shutdown, more difficult it got to wake up and resulted in MEMORY LOST error. Then never turned back on again... That's when I decided to open it up, began troubleshooting

Except for the MEMORY LOST (which is obviously a big difference) that's exactly what mine was doing - it would have to sit for a couple of days before it became difficult to turn on, but once it started working I could turn it on/off repeatedly with no issues.

Regards, Bob

Idler gear used in HP-97 printer

*Message #1 Posted by **Gary Robert Bosworth** on 19 Nov 2011, 1:19 a.m.*

For years I have tried to track down a source of the white plastic idler gear used in the HP-97 calculator printer. I am certain that HP did not have it fabricated special. Does anyone know who molded this polyurethane or nylon gear for HP? I have 3 HP-97 calculators, and this idler gear is stripped in all of them. The plastic reacted with the atmosphere and disintegrated. I have miked out all of the dimensional data.

Really?

Did you first consider that every other part in the 97 that was molded from plastic was molded in an HP facility in mold made by HP? Right down to the two pin power connector.

I think you seriously under-estimate the level of vertical integration that existed within HP in the seventies...

Immediate algebraic expressions in RPL+

*Message #1 Posted by **Oliver Unter Ecker** on 18 Nov 2011, 7:49 p.m.*

In RPN/RPL, you work from the "inside out" or from the "bottom up". In algebraic notation, you take a "top down" approach.

Whether you write

```
Algebraic: total(squared(divs(x)))
```

or

```
RPL+: x divs squared total (RPL: x DIVIS SQ SIGMALIST)
```

comes arguably down to preference.

Algebraic has in its favor, that it matches natural language:

```
English: "Sum of squares of the divisors of a number."
```

RPN has in its favor, that it matches recipe-style step-by-step processing:

```
English: "Compute divisors for x. Square them. Sum them up."
```

Let's suggest, that no one is better or worse than the other.

When it comes to algebraic expressions involving operators, RPL doesn't look so good, though, I'd say.

Can you comprehend

```
1 3 a * 4 b * + 5 c * +
```

or

```
1 3 a * 4 b * 5 c * + +
```

at a glance?

How about the algebraic equivalent of

```
3*a+4*b+5*c
```

?

The situation becomes worse when expressions are consumed by a function or construct that takes multiple arguments.
Consider

```
1 b 4 + x - FOR i ...
```

You can't glance where start and end value computations begin and end, without backtracking.

Consider these variations of using a comparison operator:

```
IF x SQ y == THEN
x SQ y == IF THEN
x SQ y IF == THEN
x SQ IF y == THEN
```

It's not hard to argue that, in these cases, the RP notation comes at the expense of readability.

Now. RPL calcs support algebraic expressions via a data type. You could write

```
IF 'SQ(x)==y' EVAL THEN ...
```

to increase readability.

What if you could type

```
IF SQ(x)==y THEN ...
```

?

I'm working on supporting "immediate algebraic expressions" in RPL+, which permit just that.

You may write

expr

instead of

'*expr*' EVAL

This pulls all of algebraic notation into RPL, and (gasp!) merges them.

An example:

```
1: 1 size(arr)-n FOR i
2:   arr[i-n/2] divs squared total =x
3:   IF SQ(x)==y THEN BREAK END
4: NEXT
```

This is not a particularly instructive example, but here're some notes:

Line 1: The algebraic expression *size(arr)-n* segments what comes before *FOR* into two blocks, and makes the calculation more readable
Line 2: pure RPL+ with an algebraic in the array-access operator (*=x* is equivalent to *'x' STO*)
You could write this line also entirely in algebraic notation:

```
x=total(squared(divs(arr[i-n/2])))
```

Line 3: Algebraic makes the comparison more readable

As with every other RPL+ feature, you may use it, or not.

Am I instigating a forbidden love here, that should better remain unconsummated? Your opinions are welcome.

Re: Immediate algebraic expressions in RPL+

*Message #2 Posted by **David Hayden** on 18 Nov 2011, 8:34 p.m.,*
in response to message #1 by Oliver Unter Ecker

Hi Oliver,

I'd say do it. To me, RPN is good for keying in the solution to problems, but when it comes to *reading* expressions, I'd much rather see algebraic since that's how they always appear in books. To me, the ability to read a program is just as important as the ability to have the program produce the correct answer. After all, if you can't understand the code, then bugs are highly likely. So I think algebraic expressions in the programming language are a good thing.

Dave

The comparison I made to a co-worker was that algebraic tells what you get, whereas RPN tells how you get there. That little piece of info got him interested in the HP-50g. He bought one and now he's absolutely nuts about it. He can't say enough good about it.

> Quote:
>
> Can you comprehend
>
> 1 3 a * 4 b * + 5 c * +
>
> or
>
> 1 3 a * 4 b * 5 c * + +
>
> at a glance?

Instead of separating them all with the same one space, group the parts of it, separating groups with, say, three spaces instead of one, to make it more readable. I would even use spaces to group your algebraic version of the same, again to make it more readable since the stars have to be there so you can't just say 3A+4B+5C+1. You can also put the algebraic in the comments if you want, to have both.

> Quote:
>
> What if you could type
>
> IF SQ(x)==y THEN ...

?

I speak RPN but not RPL, but I use Forth which has a lot in common with RPL. I definitely like the way it does:
<test this expression, argument, flag, whatever>
<IF true, do the following>
<ELSE do this>
<THEN, when you're done with either of those, continue on here.>

Quote:

You could write this line also entirely in algebraic notation:

x=total(squared(divs(arr[i-n/2])))

Line 3: Algebraic makes the comparison more readable

Uh, yeah, whatever. To each his own I suppose. I sure don't find that readable.

Re: Immediate algebraic expressions in RPL+

*Message #5 Posted by **Oliver Unter Ecker** on 19 Nov 2011, 4:15 a.m.,*
in response to message #4 by Garth Wilson

Thanks for your feedback, Garth.

Quote:

---

x=total(squared(divs(arr[i-n/2])))

---

was not meant to be the readable version of line 2. This is where I, too, prefer RPN. Just wanted to illustrate how far you can push this, and that it allows you to go fully algebraic, if you must.

(Except, I should add, for control structures. You cannot say "FOR(0, 100, ...)".)

Edited: 19 Nov 2011, 4:31 a.m.

Re: Immediate algebraic expressions in RPL+

*Message #6 Posted by **Crawl** on 19 Nov 2011, 12:10 a.m.,*
in response to message #1 by Oliver Unter Ecker

Quote:

You may write

expr

instead of

'expr' EVAL

The only thing I would suggest is that if you take this route, you may want to have an "unEVAL" command, so, for example, if you had

UNEVAL expr

it would work just like expr alone does now.

The reason is that sometimes you do NOT want an expression to be evaluated (eg., evaluating it might be time consuming); you just want to push it onto the stack. It would be good to retain that ability (in contrast, the TI89 does not have that ability; it tries to evaluate every entered expression)

But switching the default to automatically evaluate expressions seems fine to me.

Re: Immediate algebraic expressions in RPL+

*Message #7 Posted by **Marcus von Cube, Germany** on 19 Nov 2011, 4:15 a.m.,*
in response to message #6 by Crawl

Just leave the expression in 'quotes'. Omitting the quotes will trigger evaluation.

Re: Immediate algebraic expressions in RPL+

*Message #8 Posted by **Oliver Unter Ecker** on 19 Nov 2011, 4:16 a.m.,*
in response to message #6 by Crawl

Hi Crawl.

Yes, just as Marcus says. Everything remains the same in respect to handling of expressions when quoted.

Re: Immediate algebraic expressions in RPL+

*Message #9 Posted by **Oliver Unter Ecker** on 19 Nov 2011, 4:29 a.m.,*
in response to message #6 by Crawl

I don't really know the TI-89, but I suspect this would allow the calc to be used very similarly. (Again, except for CONTROL structures, which could be addressed, too.)

With one interesting side-effect:

Consider

```
a=4; 3+4; b=3+a;
```

in C-like languages.

The middle statement is valid. It's just "dead", inconsequential code.

In this merged world, "unconsumed" expression results, such as this one, are pushed onto a FIFO stack. And they're pulled from it when you specify a function or operator without arguments.

So, these are the two mods you need to transform an algebraic environment into a RPL environment. Not that weird sounding, perhaps.

Multivariable Interpolation

*Message #1 Posted by **Namir** on 17 Nov 2011, 2:11 p.m.*

After starting a thread with the same subject, I wrote a short article about a method to preform multi-variable interpolation that can use custom interpolation models. You can find the pdf for the article on my website here.

Namir

15c LE - Another Flashing Display Issue

*Message #1 Posted by **Jeff O.** on 17 Nov 2011, 1:09 p.m.*

As has been documented (here and here for example), the 15c LE display will flash oddly in various situations. I discovered *three* more which I do not believe have been reported:

1. in complex mode, press f - (i) to temporarily display the imaginary component. While the temporary display is up, press a single digit key, as if you were starting to key in a number. As soon as the temporary display of the imaginary component goes away, the digit you pressed will be displayed, and the display will be flashing. Pressing another digit key will continue entry of a multi-digit number beginning with the one that was already entered, and stop the flashing display. Pressing any function key will execute the function on the flashing number and stop the flashing display. If you press more than one digit key while the temporary display is up, the flashing will not occur. On my 15C Classic, key presses during the temporary display are simply ignored.

2. in any mode, press f - PREFIX to temporarily display the full mantissa. While the temporary display is up, press a single digit key, and you will get the same behavior as above.

3. in any mode, press g - MEM to temporarily display the memory allocation. While the temporary display is up, press a single digit key, and you will get the same behavior as above.

I tried to think of other temporary display modes which might exhibit the above behavior and could not think of any. You can of course execute PSE from the keyboard which is a temporary mode of sorts. On the 15C Classic, keyboard input during the pause is ignored. On the 15c LE, input will be accepted as in the above examples and displayed after the Pause ends, but the display does not flash.

I point out the above to hopefully aid in producing a new bug-free rom by documenting all inconsistencies found with the current one.

edit - found another instance, changes in italics above.

Sounds like another manifestation of the display controller winding up in buffer swap mode as was speculated here.

Quote:

Just curious if an ETA was yet mentioned for a revised Owners Handbook?

Re: 15c LE - Another Flashing Display Issue

*Message #3 Posted by **Kiyoshi Akima** on 17 Nov 2011, 4:42 p.m.,*
in response to message #1 by Jeff O.

Apparently more differences between the 15C LE and the HHC2010 15C+. My HHC 15C+ exhibits neither of these behaviors. However, an overflowing operation leaves the display blank instead of blinking.

Interesting behavior I just came across: press EEX 2 g 10^x to cause an overflow and the display blanks. Press a digit key as if entering a new number and hold the key down. The display showing the new number blinks while the key is held down. Press and hold another digit key and the two-digit entry blinks while the key is held down.

Can someone else with the HHC 15C+ verify or dispute my results?

Re: 15c LE - Another Flashing Display Issue

*Message #4 Posted by **Jeff O.** on 17 Nov 2011, 8:17 p.m.,*
in response to message #3 by Kiyoshi Akima

Kiyoshi,
I think you are describing normal behavior (i.e. behavior exhibited by the original 15C), see this post.

Update - my 15C Classic behaves the same way, so not a new bug, just successful emulation of odd original behavior.

WP34S: Valentin Albillo's Polynomial Root Finder

*Message #1 Posted by **Miguel Toro** on 17 Nov 2011, 12:56 p.m.*

Hi,

Here is a version for the WP 34s of Albillo's original program for the HP 41. I would like to thank Ángel Martin for helping me with lot of information, documentation and his own version for the 41z. Porting the program was very straightforward. The only real difference I found between commands was with the SIGN function that behaves like it does in the 3Xs family rather than it does in the 41 and 42 calculators, so I have to replace it in my code.

The program has been tested with version 2.2 rev. 1782. Just copy it in a file and assemble it to try in the emulator and the calculator

Testing the examples from the article on the calculator, I obtained the same results, with the following time:

Example 1) 5 seconds – original on HP 41: 8 minutes :

(2+8i)z^6 + (3+0i)z^5 + (-1+2i)z^4 + (0+2i)z^3 + (-3-3i)z^2 + (1+2i)z + (-2+3i) =0

Example 2) 3,5 seconds – original on HP 41: 5 minutes :

5x^6 – 4x^5 – 3x^4 + 8x^3 + 8x^2 – 2x + 7 = 0

Note: You can delete the STOP in line 34. It is there just for testing.

Enjoy!

Miguel

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #2 Posted by **Ángel Martin** on 18 Nov 2011, 2:10 a.m.,*
in response to message #1 by Miguel Toro

Bravo Miguel! This contributes to create a 34S library :-) The next should be the Bessel functions - Complex of course - sure the 41Z programs can also help!

Looking at the 34S code I can recognize a couple of tricks I used to adapt the program to the 41Z - nice to see the design similarities, which on the other hand are pretty logical choices.

I'm thinking about Valentin's examples in the other thread - would be good to test the port with those and see how it fares, sort of "turning the creature against the creator" :-)

the first one was:

```
x^20+10 x^19+55 x^18+210 x^17+615 x^16+1452 x^15+2850 x^14+
4740 x^13+6765 x^12+8350 x^11+8953 x^10+8350 x^9+6765 x^8+
4740 x^7+2850 x^6+1452 x^5+615 x^4+210 x^3+55 x^2+10 x+1 = 0
```

which Wolfram Alpha reports (Thanks Gerson!) having coincident roots at:

```
x = -1/2 - sqrt(3)/2*i
x = -1/2 + sqrt(3)/2*i
```

Not quite the same as what this program did when I tried it on V41/ w/41Z - I may have made some data entry error so I'll repeat it this week-end.

Best, 'AM

in response to message #3 by Paul Dale

The way to push the complex argument into the complex stack with independence from the real one, and also checking on the complex round as opposed to on each real and imaginary parts - as it was done in the original program.

Trivialities when seen in retrospective but it was different when you also had to write the MCODE underneath all the functions to play well in that scheme.

We don't separate the stack into a complex and real sections -- everything lives on the single stack. X + iY, Z + iT, A + iB and C + iD. The latter two being optional. I did add complex STO and RCL commands to make life easier.

Hi Angel,

either you have mistyped any coefficient(s), or Miguel's translation is not correct, or Valentin's program does indeed not solve this polynomial at all!?

I've entered this polynomial now 3 or 4 times and waited about 2 minutes (on the PC emulator of WP34s), but no solution - it just didn't stop running.

So I guess I'll stay with my own new polynomial solver (with Laguerre method), which solves all those polynomials without any problems (even the 2 'hard' ones that Valentin has posted), and is in fact much faster and gives more accurate solutions. :-)

Franz

>
> which Wolfram Alpha reports (Thanks Gerson!) having coincident roots at:
>
> x = -1/2 - sqrt(3)/2*i x = -1/2 + sqrt(3)/2*i

I tried this example with the original 41 program entered in the V41 emulator and it does not converge either. I did it several times in case I made any mistake entering the data. So I think that my translation is as faithful as it can be but one never knows...

With both versions in FIX 6, results are really similar; and putting simply FIX 11 in line 041 or the wp34s version, accuracy is very much improved for many other cases I tested, but this one in particular, seems to be really tough :-).

As disclaimed by Valentin in his article : "convergence is not guaranteed".

What I am going to do:

1.- let the program as simple and near the original as possible,

2.- include some of the improvements suggested by Dieter,

3.- add an iteration limit so the program may stop with a “no zero found” message,

4.- put it in the Article section, so there is at least a solver available until some improved version is made by one of the many knowledgeable peoples of this community (someone please give a WP 34S to Valentin! I am sure he will enjoy).

Thanks and regards,

Miguel

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #8 Posted by **Werner** on 23 Nov 2011, 2:20 a.m.,*
in response to message #7 by Miguel Toro

I'd like to see Valentin's original program. I searched through PPC Journals in vain for it. BTW since his 20-degree polynomial is simply

```
(x^2 + x + 1)^10
```

it's no wonder all polynomial solvers choke on it - well at least those that do not check for multiple

roots up front (which can only really be done when you have exact coefficients, as is the case here). For a root with multiplicity n, (n-1)/n of the digits of the result will be inaccurate.

Cheers, Werner

in response to message #9 by Ángel Martin

Can't locate it.. it's not on TOS, and not on the Museum's DVD..

Werner

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #11 Posted by **Werner** on 25 Nov 2011, 8:14 a.m.,*
in response to message #9 by Ángel Martin

Thanks for the file, Angel.
I am, however, slightly disappointed as it is a simple Newton-Rhapson scheme, not an implementation of the Laguerre method, which I had expected.

Cheers, Werner

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #12 Posted by **Dieter** on 18 Nov 2011, 7:04 a.m.,*
in response to message #1 by Miguel Toro

Looking at the code, I would like to add a few comments:

- I would prefer the input routine to prompt for the coefficients with a zero in X. This way real coefficents can be entered much easier, without the need of typing [0] [ENTER] first.
- Is there a reason why line 117-122ff do not simply contain a straightforward constant ". 0 0 2" or "2 EEX +/- 3" ?-)
  Also, line 071ff. muliplies by 1E-3. Why not simply divide by 1E3 ?
- Unlike the 41-series, the 34s can do RCL-Arithmetics. So step 150 - 154 can be replaced by a simple FS?01 RCLx 08.
- Is the complex ENTER in line 059 and 135 really required?
- The program switches between four different display formats (FIX 00, 02, 06 and 07). Why is this neccessary? I see some ROUND statements here and there. What exactly do they do? The ROUND in

step 064 has no preceding display setting so it's unclear how many digits are rounded. BTW, there also is a "X~~0" test that does not require rounding at all.
I assume the algorithm iterates as long as a certain precision is not yet achieved, and the test in step 064 checks this. In FIX 06 mode this means the absolute error is less than 5E-7. This is fine for small and moderate values, but then think of a root near 1E-6. Or another one near 1E9. So there might be a better way: a root is found if the latest and the previous value agree in 12 significant digits. Which should be fine since the 34s works with 16 digits.

- The EEX in step 044 probably is a leftover from an earlier 41-implemenation where it was a few milliseconds faster than a usual "1" (one). I don't think this is required on the 34s. ;-)

You see there is some nitpicking in these comments. Please consider this a compliment since there obviously are no major bugs. ;-)

Dieter

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #13 Posted by **Miguel Toro** on 18 Nov 2011, 10:06 a.m.,*
in response to message #12 by Dieter

Hi Dieter,

Excellent and pertinent remarks! There is a lot of heritage from the original code that is not required with the WP 34s. In this version I just made the more obvious changes and improvements, thanks to the excellent complex instruction set of the 34S, just to test how easily was to port code from the 41.

I will modify the program based on your comments.

Thanks and regards,

Miguel

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #14 Posted by **Dieter** on 18 Nov 2011, 3:19 p.m.,*
in response to message #13 by Miguel Toro

Here's a first attempt of a modified version for the 34s. I'm sure there's room for improvements, maybe there are even some errors. The algorithm is the same, basically the following details have been changed:

- The various rounding steps have been removed. Instead, a tolerance is stored in register A, here with a value of 1E-6. From this, three individual "deltas" are derived: The original test if abs(R04) < 0,005 was replaced by R04^2 < 1E-6. In the output routine, roots with imaginary parts less than 1E-12 are neglected, i.e. the root is considered real. And finally there is a more sophisticated convergence check: First, the real parts are compared. If they agree in all displayed digits (i.e. all 12, since we're in ALL mode), the imaginary parts are compared as well. If they do *not* agree the program finally tests whether both imaginary parts are smaller than approx. 1E-12. In this case the root is virtually real and no further iteration is required.
- The input routine now prompts for the coefficients with a cleared stack. So real values can be entered without pressing any additional keys.
- The output routine has been rewritten. Every root is now labelled as "Real" or "Compl". In the latter case the result is x+iy and both parts can be viewed with x<>y, as usual.
- Finally, various minor improvements have been applied.

```

Here's an example: x^4 - 4 x^3 - 3 x^2 + x + 1

```
XEQ"PRT"
              N=?
 4 [R/S]      Im^Re 4?
 1 [R/S]      Im^Re 3?
-4 [R/S]      Im^Re 2?
-3 [R/S]      Im^Re 1?
 1 [R/S]      Im^Re 0?
 1 [R/S]
              Compl 1   =
             -0,57898166378
   [x<>y]    0,22687379984
   [R/S]
              Compl 2   =
             -0,57898166378
   [x<>y]   -0,22687379984
   [R/S]
              Real 3    =
              0,56277097739
   [R/S]
              Real 4    =
              4,59519235018
   [R/S]
              0
```

Once calculated, the results can be recalled by XEQ"RES".

By the way: Walter, I miss a directly accessible "=" on the alpha keyboard. As far as I can see, common prompts like the "N=?" in line 007 cannot be entered from the keyboard. However, there are several unassigned keys on the alpha keyboard: Just as h [4] enters a question mark, h [5] could be used for the missing "=".

Dieter

*Message #15 Posted by **Walter B** on 18 Nov 2011, 5:51 p.m.,*
in response to message #14 by Dieter

Dieter, thanks for pointing this out. I'd put '=' on h-shifted ENTER in alpha mode - the location CONST lives.

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #16 Posted by **Marcus von Cube, Germany** on 18 Nov 2011, 6:30 p.m.,*
in response to message #15 by Walter B

'=' is in the test catalog of course. In multi alpha mode I've put it on the same key (no catalogs available then) in the most recent build. h ENTER^ produces an up arrow.

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #17 Posted by **Walter B** on 19 Nov 2011, 5:05 a.m.,*
in response to message #16 by Marcus von Cube, Germany

As often before, this is not finally discussed nor agreed on yet. Some procedures seem quite

difficult to teach ;-)

And a catalogue access is not a direct access 8-)

Edit: Meanwhile, we agreed on putting '=' on h-shifted R/S in alpha mode, the key it lives nearly everywhere ;-)

Hi Dieter,

it seems you have indeed changed it a bit too much - your version doesn't even solve the simple polynomial x^10+1=0.
No error messages, no wrong solution(s), just runs forever ...

Franz

Yes, the more sophisticated convergence test was a bit too ...sophisticated. ;-) It does not work if a root is very close to zero and decides that two consecutive approximations do not agree even if their real parts are 1E-24 and 1E-25. In your example the problem arises at the fifth and sixth root (i and -i). Their real part is exactly zero while the program actually has determined a value near 1E-16.

Here's an improved version. It checks whether the real and complex parts either agree in all displayed digits *or* if they both are virtually zero.

```
... ...
058 [->]POL
059 1/x
060 [cmplx]CONJ       // shorter than
061 [cmplx]STO 07     // previous code
062 STO 07
063 CF 01
064 XEQ 11
065 [cmplx]RCL 07
066 [->]REC
067 [cmplx][times]
068 [cmplx]+/-
069 [cmplx]RCL+ 03
070 [cmplx]ENTER
071 [cmplx]x[<->] 03
072 x[<->] Y
073 R[v]               // x=re_old  y=re_new  z=im_new  z=im_old
074 x[approx]? Y       // do both real parts agree?
075 SKIP 04            // then continue checking
076 [cmplx]ABS         // both real parts do not agree
077 [sqrt]             // so check whether they are both near zero
```

```
078 x>? A               // are both real parts < 1E-12?
079 GTO 01              // if not, do next iteration
080 R[v]                // real parts agree or both are near zero
081 R[v]                // now check imaginary parts
082 x[approx]? Y        // do both imaginary parts agree as well?
083 SKIP 04             // then we're done
084 [cmplx]ABS          // at this point both real parts agree
085 [sqrt]              // but the imaginary parts don't
086 x>? A               // now check if they are at least < 1E-12
087 GTO 01              // if not, do another iteration
088 SF A                // otherwise we're done, continue here
089 XEQ 11
... ...
```

Have you tried Valentin's 20-degree polynomial which Angel has re-posted above?

Let's see if your new version is now sophisticated enough for this one ... ;-)

Or you could even try the 30-degree polynomial Valentin has posted as test for my first (Bairstow) solver. It has the only solution x=-1 (but with multiplicity 30), and my new Laguerre solver gives the exact solution 30-times! :-)

Well, I've tried at least the 20-degree poly (with Miguel's translated program),but got no solution at all. So I didn't try the 30-degree one.

Franz,

> Quote:
>
> Let's see if your new version is now sophisticated enough for this one ... ;-)

there obviously is a misunderstanding here. This is not "my" solution of a polynomial root solver. Honestly, I do not plan on writing something like this - my knowledge on this topic is very limited. What you see is simply Miguel's original PRT version with some minor improvements (input/output, convergence test, special 34s features). The whole algorithm is exactly the same as before. So if the original version does not handle the 20-degree-polynomial, the modified version will not do so either.

So it's about time for you to show your latest Laguerre solver. ;-)

Franz,

Of course, it's your choice to share your knowledge with the community or not; but it's puzzling that such a decision is made upon the result of a single event or exchange with one or two persons. Many contributors, even very bright ones, received some unexpected, unfair or out-of-style feedback from time to time; I recall some cases and I'm sure there are more. And sometimes the language differences, personal styles, local/country jargon, sense of irony, and translations add up to make a supossedly friendly message look more aggressive than intended. Sometimes any of us may be on the receiving side of such messages and sometimes, even by accident, may be at the originator side. But the decision to share or not is up to each one of us.

Many people come here just to learn from others' creations and discoveries, and an implicit thank you is available for all contributors each time they post interesting and useful material.

Please see that I'm not trying to analyze, explain, or otherwise support or condemn the opinions and postings of any other member of this community.

Best regards.

(I apologize in advance if my imperfect command of the English language prevents this message to convey its friendly and positive intentions)

*Message #26 Posted by **Walter B** on 21 Nov 2011, 8:01 a.m.,*
in response to message #25 by Andrés C. Rodríguez (Argentina)

Just crossed my mind whether we need a general disclaimer all of us writing in English as a foreign language should append to our postings in this forum. This won't, however, cover the numerous spelling or even wording errors by authors with "English" as their mother tongue observed here. Anyway, since it won't take care of all cases I remember having seen here, forget it **;-)**

Re: WP34S: Valentin Albillo's Polynomial Root Finder

what about this for a disclaimer:

"get a grip"

:-)

Re: WP34S: Valentin Albillo's Polynomial Root Finder

*Message #28 Posted by **Peter Murphy (Livermore)** on 22 Nov 2011, 11:12 a.m.,*
in response to message #26 by Walter B

Walter, you are correct: there are so many Forum participants who write excellent English despite its not being their mother tongue that it is easy for native speakers of English to assume that everyone here can communicate with perfect clarity.

You are also correct that some cases seen here do not result from imperfect English: perfect clarity is sometimes the problem.

My suggestion: if we treat our communications here as if they were delivered face to face, we might be less likely to speak in ways that give offense. And in cases of seeming offense, we might do well to let a matter rest overnight before responding, if we respond at all.

In cases of offense, sincere and humble apology does wonders.

Finally, remembering our purpose in participating in the Forum, namely to increase the enjoyment and utility we and others get from HP calculators, might do a lot to reduce the number of cases arising.

How to register new HP 15C LE?

*Message #1 Posted by **hpnut** on 17 Nov 2011, 10:44 a.m.*

Hi all,

I am having difficulty registering my newly acquired HP 15C LE at hp.com

when i put HP 15C calculator in the product registration form, i get "search results - O products"

funny, I could register my HP 12C 30AE earlier.

btw my HP 15C is LE 00118. is this a record of sorts, excluding Tim (or Cyrille's?) LE 00000? :-)

Kinda like our generation's use of the adjective "sexy."

At least the male half uses it. Generally, I've found the women can't comprehend that usage.

way OT

*Message #6 Posted by **Don Shepherd** on 17 Nov 2011, 2:37 p.m.,*
in response to message #5 by Martin Pinckney

Martin, in my college English class (1969), I read the short story "Tomorrow and Tomorrow and So Forth" written by John Updike in 1955. In the story, a high school teacher intercepts a note in which a girl student says "I just love (the teacher)". I've always remembered this story because of the following excerpt, where the teacher lectures the girl after class about note passing:

> Quote:
>
> "And about love. 'Love' is one of those words that illustrate what happens to an old, overworked language. These days, with movie stars and crooners and preachers and psychiatrists all pronouncing the word, it's come to mean nothing but a vague fondness for something. In this sense, I love the rain, this blackboard, these desks, you. It means nothing, you see, whereas once the word signified a quite explicit thing--a desire to share all you own and are with someone else. It is time we coined a new word to mean that, and when you think up the word *you* want to use, I suggest that you be economical with it. Treat it as something you can spend only once--if not for your own sake, for the good of the language"

Some things you learn in college stay with you.

Re: way OT

It is time we coined a new word to mean that ... for the good of the language" [edited only for the sake of brevity]

Don, thanks for that quote.

As I am sure you know, the ancient Greeks had four words for "love", each with decidedly different connotations.

As rich a language as English is, I still don't understand how it "missed the boat" on such an important word as love.

English is a rich language because the British were given free Latin lessons and free French lessons in different moments in History. It's a pity Greek was never so widely taught in the island :-)

Re: way OT

*Message #13 Posted by **Oliver Unter Ecker** on 17 Nov 2011, 5:39 p.m.,*
in response to message #11 by Walter B

It's correct grammar. Read up on "conditional sentences" in English.
http://en.wikipedia.org/wiki/Conditional_sentence

So, for example, you wanna say "it's time we talked about WP34S" and not "it's time we talk about WP34S", to give a completely hypothetical example.

I find the given definition of "love" very weak, though. The first attribute of "that what you sink your heart into" is the sharing of material goods?! C'mon!

Interestingly, the "old world", and, for sure, many other locales, have not embraced (or succumbed, if you will) to the inflationary use of this word, and others like it ("great" comes to mind), that should (or used to) carry some weight--for better, or worse.

Re: way OT

Except perhaps in France (*j'**aime** du vin*). Here (in Brazil) the verb "amar" is not used in these situations. Well, now that MacDonald's "I'm lovin' it!" has been translated as "**Amo** muito tudo isso!" I am not so sure of that anymore...

Re: way OT

*Message #15 Posted by **Oliver Unter Ecker** on 17 Nov 2011, 6:14 p.m.,*
in response to message #14 by Gerson W. Barbosa

No. The French really *do* love their wine.
(And the Germans, sausages. The Italian, women (note, plural!). The British, probably, Marmite. Etc.)

“There is no sincerer love than the love of food.”
George Bernard Shaw

I doubt that Mr. Updike used the word "own" in the sense of owning and sharing a washing machine or a coping saw, etc. Perhaps he meant something like owning a compassionate spirit or owning a belief in helping others who are needy, things like that. At least that's how I'd interpret it.

I think John Updike died a few years ago, so we can't ask him, unfortunately.

Re: way OT

*Message #18 Posted by **Oliver Unter Ecker** on 17 Nov 2011, 7:03 p.m.,*
in response to message #17 by Don Shepherd

Ok, I'd buy that, if it weren't for what comes before and after:

"once the word signified a quite explicit thing"
This suggests that the word was once well-defined, and, to a lesser extent, universally so. I must doubt both very much, and would resent the authoritative tone.

"a desire to..."
No matter what comes after the "to", "a desire" is something that hasn't run its course, whereas more common beginnings "a feeling", "a state of mind", etc. certainly have. Love already "is"; it's not merely something anticipated, as "desire" would imply. Its weighty version is "final", too, which is certainly not something you'd associate with "desire". It feels very tentative, and reduces the complexity of that feeling (called love) unduly, I think.

"someone else"
Here the scope of love is narrowed to humans. What about causes, religions & other ideas, books, animals, and other common, non-trivialized objects of love.

But, hey, let's not forget this is a *character* of Mr. Updike's. It's not Mr. Updike's shot at explaining what love is.

Love is not limited to humans. google "shep Ft. Benton Montana dog" and you will read about a dog that waited at the railroad station for over 5 years awaiting his master [who would never return] meeting every train every day hoping his sheep herder companion would return. If you can read Shep's story without tearing up, check to see if you have a pulse, and the obituaries for your name. Learned of this first hand while in FB many years ago.

*Message #2 Posted by **Paul Dale** on 17 Nov 2011, 5:49 a.m.,*
in response to message #1 by robertoataulfo

We haven't *fixed* the layout yet, so no overlay is possible.

- Pauli

Re: [WP-34] New Overlay Version 3.0 Eric Please !

*Message #3 Posted by **Marcus von Cube, Germany** on 17 Nov 2011, 7:46 a.m.,*
in response to message #2 by Paul Dale

With a little effort you can patch your overlay to match the present layout. It can be viewed by starting the latest emulator or looking at the V3 bitmap in the trunk/windows/bin directory.

Re: [WP-34] New Overlay Version 3.0 Eric Please !

*Message #4 Posted by **pascal_meheut** on 17 Nov 2011, 10:07 a.m.,*
in response to message #1 by robertoataulfo

Eric told me a few weeks ago that he was waiting for the new keyboard to be fixed as Paul already pointed out.

*Message #5 Posted by **Walter B** on 17 Nov 2011, 1:46 p.m.,*
in response to message #1 by robertoataulfo

Please let me point you to an older answer and solution. I'll update the artwork shortly - stay tuned.

Re: [WP-34] New Overlay Version 3.0 Eric Please !

*Message #6 Posted by **Eric Rechlin** on 17 Nov 2011, 3:21 p.m.,*
in response to message #5 by Walter B

If you just need to update the artwork, I can do that myself.

I'm just waiting for confirmation that the 3.0 keyboard arrangement has been finalized, because I don't want to be printing overlays that end up being a weird 2.2/3.0 hybrid.

Eric

Re: [WP-34] New Overlay Version 3.0 Eric Please !

*Message #7 Posted by **Walter B** on 17 Nov 2011, 4:30 p.m.,*
in response to message #6 by Eric Rechlin

Eric, I'm well aware of you waiting for said confirmation. But you got me wrong. When I update the artwork, people can print it and create *temporary* paper overlays as explained in the old thread I pointed to. Those will do easily (and ease life) until we are ready for *releasing* the new layout d:-)

Hp 42s soft keys

*Message #1 Posted by **Paulo MO** on 16 Nov 2011, 8:35 p.m.*

Hi guys

Even though being a die-hard 15c fan (first love is forever), the 42s arouse my curiosity, mainly to to the better complex and matrix integration. I don't have one (a TAS solvable problem), nor do I have a manual (a forum solvable problem). But I have a question for the 42s users/fans (the user set and the fan set are a single set, from what I hear :-)): Not having dedicated soft keys is not a deal breaker? Or, put in another way: When you have a menu on screen (say the Stat menu), don't you miss the overloaded algebraic and transcendental keys? It seems to me that one will frequently need to use these while using many of the menus, and having the keys transformed into soft keys will become a major pain.

Sorry if this a stupid question. But curiosity is killing me.

Paulo

Re: Hp 42s soft keys

*Message #4 Posted by **Ron Ross** on 16 Nov 2011, 9:15 p.m.,*
in response to message #1 by Paulo MO

The soft keys can roll over or be frozen on. As Mike Morrow has often stated, once you have a 42s, you dump the Hp 15c and don't look back. But my 15c was my first Hp and it is only a bit smaller, but that bit is the critical difference that fits perfectly in my pocket and one of my two gripse about the Hp 42s. The other is the lack of I/O. The 42s still has no equal from Hp in their calculators.

I actually think Hp should abandon the Hp 50g platform and release an Hp 42s like calculator with an HDMI and USB port (with power ie NOT a Micro or mini usb port) plus a micro SD card slot, and Blutooth. Basically have a pocket calcualtor with the built in ability to function as a portable computer with an excel and word compatable software with a high end math package when hooked up to these goodies (ie an Andriod type OS in the background). On the surface a simple calculator. Thats why everyone loved the HP 41c series. Very few people added any or all the goodies,....But they could!

After all, the last RPN model with (and the only one with real) I/O was the 41C. The 42S wasn't allowed to have it for not interfering with the 48 series. But that's an old story often told here already.

> Quote:

Ooops, I knew the 41CX could do a lot, but work "as a portable computer" as described above? I must have missed something ;-/

And regarding your wishlist: two full size ports, one slot, Bluetooth, smaller footprint than a Pioneer - the only feature I missed is eternal battery life - sounds pretty much like what we call an "eierlegende Wollmilchsau" here (i.e. one animal for everything). Will be difficult to have it sitting on the table with all those ports connected ;-) Personally I'd be satisfied with a micro SD port and a proper display, as you may

know.

Ceterum censeo: HP, launch a 43S.

Walter

Re: Hp 42s soft keys

in response to message #4 by Ron Ross

Thanks, Ron.

> "...once you have a 42s, you dump the Hp 15c and don't look back."

That settles it. I will *never* buy a 42s. I wouldn't know what to do then with my two 15c's. Betrayal is not an option! ;-)

Seriously, now: if you 42s fans can survive and live happily with the TOP.FCN mitigating feature, so can I. I guess I'm now officially a 42s prospective buyer.

Cheers Paulo

> As Mike Morrow has often stated, once you have a 42s, you dump the Hp 15c and don't look back.

I disagree. I got a 42S years ago because it was hyped as the end-all-be-all RPN calculator. And in 1984, when I got my 15C, if the 42S were an option, I would have picked it, just on the specs.

But after years of using the 15C, I've come to appreciate the simplicity of the overloaded keyboard and no menus. I'll admit that I do not use the 42S enough to have mastered every sequence to get the results that I want, and perhaps that would change my mind.

I must also admit, that I cannot be completely logical about the 15C. It is beautiful.

I tried to switch from the 15C to the 34S recently, you know, try something different. My goal was to take my 15C and 16C off my desk (I still use the 16C for assembly programming) and replace with the more functional 34S, but the 34S still has to use menus because of the volume of functions. Now I have 3 calculators on my desk.

Lastly, I must admit that 42s is my default iPhone calculator. The vertical layout is better optimized for single hand, single thumb use.

Long story short. You do not have to choose, you can have both. In my entire lifetime I have logged more time on the 15C, followed by the 48GX, and I do not think that will change.

Re: Hp 42s soft keys

*Message #9 Posted by **Paulo MO** on 17 Nov 2011, 1:04 p.m.,*
in response to message #8 by Egan Ford

Hi Egan

Time spent with the 48GX doesn´t count, since most of it is either waiting time for the thing to compute an answer and/or update the screen, or in my case, eye and mind straining to try to understand what cryptic low-resolution 4letter action is that menu entry all about :-). It is a super great machine, other than that.

On behalf of the 15c: one of the things that I don´t see referred, and that I'm very thankful for, is: calculation reliability. I logged many, many hours of midterms and final exams, in the middle stages of my academic path, with the inevitable i) stress ii) not time enough to be redoing calculations iii) getting stuck if the numerical path took me to the wrong place. It was great to be able to do calculations *once*, without even looking at the screen, and still know that, with very high probability, there were no mistakes of any kind. You could (and can) rely on a 15c (RPN helped a lot, too. And so did Stokes theorem :-)).

What I could never do, was to be able to explain that feeling to my kids. They grew up on TI83s, and I could never really make them realize what they missed. :P

> Quote:
>
> As Mike Morrow has often stated, once you have a 42s, you dump the Hp 15c and don't look back.

I'm another long-time owner of both a 15C and 42S that still uses the 15C much more frequently than the 42S.

I feel like a handheld calculator is something that I turn to mostly for short, one-off calculations. I went from using a 11C to a 15C to a 28S. I ended up getting a 48GX and a 42S around the same time, but by that point I was already doing more of my `real' number crunching on a computer rather than a calculator. Nowadays, I pick up new HP calculators more or less out of curiosity, but seldom find myself using them for `real' work. And for `casual'/one-off calculations, I find that the simpler design is a plus and the reduced feature set isn't really a limitation.

Really, whenever I find myself wanting something beefier than the 15C, I find myself reaching for my 41CX more than my 42S, just because I like the keys better, and I prefer the use-assignable keys on the 41 to the menus on the 42.

And this is all apart from my preference for the landscape layout, which I've always found easier and faster to key than any of the portrait layout calculators I've tried.

41-MCODE Vector Calculator (3D)

*Message #1 Posted by **Ángel Martin** on 16 Nov 2011, 8:15 a.m.*

I've taken the opportunity to add some extensions to the ROMS containing some of the HP_Solution_Books. In particular the Geometry ROM had more than 2/3rds. of empty space, a waste that needed correction - So I added a few triangle solvers and a coordinate tranformations FOCAL programs.

As there was still more available room, I went ahead and wrote a handy set of MCODE functions to handle 3D-Vector operations - you know, the usual suspects. They use the stack for the first operand and Alpha for the second, leaving the results in the stack - so nothing fancy like a Vector-stack or similar, just plain and simple.

A couple of interesting remakrs :

- V<>, VVIEW, VRCL and VSTO are programmable prompting functions that work on three-register blocks at once
- VVIEW and VIEWV sequentially display the three vector components using the display (not Alpha obviously)
- using the new functions the "VC" program from the HP-41 Advantage module shrinks down to barely 45 lines ;-)

The functions are listed below:- you can download it from TOS, just use the usual procedure.

```
-VECTORS        Header Section
A+V             Vector Addition
A-V             Vector Subtraction
A*V             Vector Dot Product
AXV             Vector Cross Product
V<> _ _         Vector Exchange
V<>A            Vector Swap
VADST           Distance between Vectors
VANG            Angle Between Vectors
VCHS            Vector negative
VENTER^         Vector ENTER^
VIEWV           Vector View
VINV            Vector Inverse
VMOD            Vector Magnitude
VNORM           Vector Norm
VRCL _ _        RCL Vector
VSTO _ _        STO Vector
VUNIT           Unit Vector
VVIEW _ _       View Vector
```

Best, ÁM

use rpl for deriving rpl functions

*Message #1 Posted by **peacecalc** on 15 Nov 2011, 2:07 p.m.*

Hi folks,

I try something well-known in an old style. I want to give you an explanation for that little project.

I tried this in another hp-forum, but there I got there the message: Say clearly what you want or show a solution of a problem. Project with unconcrete aim or solution are not desirable.

Please, understand me right, I don't want fora-bashing, I accept that opinion about the forum-style, so I decided to try here a new attempt.

It's a forum in "old calculators", I have a hp 50g, a new one. But I think, may be it's a theme for this forum, too.

Shortly: RPL/RPN versus algebraic style.

I think a lot of members here are very fond of RPN/PRL (of course). But the CAS on the HP 50g (and former models) works with the algebraic form of mathematical terms for simplifiying or transforming these terms. Indeed even most fans of RPN/RPL think in algebraic patterns, when they do symbolic algebra (with paper and pencil or even with the hp calculators).

So my project is an effort to use only RPN (programmed in RPL), even in that symbolic algebraic calculations. By the way that is my justification to bring this theme in that forum: we old fashioned boys (and some girls of course, too) like to use RPN everywhere in mathematics (maybe it's not possible).

Please don't discuss wether it is useful or not. It is not serious, it's a game!

What is the beginning: I want to derive an rpn-function without any way through the classical algebraic patterns (which is the normal use on hp calculators, 39/40 and 50g).

What I have: I can transform every (of course not every, but a lot of) algebraic term into a RPN/RPL function.

So I found an article in the web (ten years old), which shows a very clear way to implement the derive-rules (a look-up table has to be nessary,too) in an recursive function.

Other projects can be: integration or the whole bunch of instruments (factorizing, collecting and so on...

When I (or some of you (may be) did this before) succeed in doing this, then HP has an new challenge for a new calculator for the old purists.

sincerely peacecalc

Re: use rpl for deriving rpl functions

*Message #2 Posted by **designnut** on 15 Nov 2011, 5:09 p.m.,*
in response to message #1 by peacecalc

I abandoned book formulas when I got my original HP35. I changed to keystroke routines with easy to remember "formulas" all rearranged from the book versions. I squared equations to remove the root sign and moved all terms to the left side = 1. Thus I could multiply terms and invert to find the missing term. I found relations not shown in books as I could play with numbers easily. It may not be higher math but engineering shortcuts to answers. RPL programming is too steep a hurdle for me now. Sam

Re: use rpl for deriving rpl functions

*Message #3 Posted by **Crawl** on 15 Nov 2011, 7:25 p.m.,*
in response to message #1 by peacecalc

I have no idea what you're asking for.

Re: use rpl for deriving rpl functions

*Message #4 Posted by **Martin Pinckney** on 15 Nov 2011, 8:23 p.m.,*
in response to message #3 by Crawl

It's a bit hard to follow (perhaps lost in translation), but I think Sam gets it. Maybe Peacecalc wants to re-write algebraic expressions in RPN format (as Sam says he did many years ago), but use the 50g to manipulate them in programs. He wants to know if Forum members are interested in this.

Re: use rpl for deriving rpl functions

*Message #5 Posted by **Crawl** on 15 Nov 2011, 9:38 p.m.,*
in response to message #4 by Martin Pinckney

So, for example, a physics text that lists the equation

E Enter m Enter c 2 ^ * =

I guess I don't get it, or see the point. When you see an equation written the normal way, you instantly can "translate" it to how you'd enter it in RPN (maybe the reverse isn't true). It's not a truly new way of thinking about things (which his post seems to imply); you wouldn't "derive" things any differently than you otherwise would; it's just a different notation.

Re: use rpl for deriving rpl functions

*Message #6 Posted by **David Hayden** on 15 Nov 2011, 9:24 p.m.,*
in response to message #1 by peacecalc

I"m having some trouble understanding what you're trying to do also. It looks like you aren't a native English speaker. You may want to post in your native language and then maybe someone more familiar with English can translate. Alternatively, post an example of what your input and output should be.

Are you asking about doing symbolic derivatives? The 50g already does this, but I agree it would be a fun project anyway.

By the way, internally, algebraic expressions are stored in RPN form if I recall. So '3+3*5' is stored as 3 3 5 * +, so applying the symbolic rules for derivatives is pretty easy. But I'm not sure if you could do this in User RPL because I don't know if there's a way to extract the components of the algebraic expression.

You'll find that this is a friendly and helpful group here.

Dave

Re: use rpl for deriving rpl functions

*Message #7 Posted by **Bart (UK)** on 16 Nov 2011, 5:17 a.m.,*
in response to message #1 by peacecalc

So, do I understand that you want to develop a CAS that uses formulas in RPN format?

e.g. intead of:
INTVX(X^2*LN(X)) = 1/3*X^3*LN(X)+(-1/9)*X^3
you want:
INTVX(X 2 ^ X LN *) = X 3 ^ 3 / X LN * X 3 ^ 9 / NEG +

is that correct?

Re: use rpl for deriving rpl functions

*Message #8 Posted by **peacecalc** on 16 Nov 2011, 5:42 a.m.,*
in response to message #7 by Bart (UK)

Hello folks,

thank you for your replies.

First of all: I have to observe that my english abilities are more low-grade, then I thought (that's right: I'm not a native speaker).

I've learned that the book format is the same as what I call: algebraic terms. Book format is better, because f. e.: x y z ^ * is also an algebraic term (in RPN format).

With derives i meant "symbolic derivatives".

I try it a second time to explain what I want. Maybe some observations are helpful: The HP 50g needs relativly a long time for the function SUBST on a formular in book format compared with the formular transformed in a function in RPN format and the substituting variable is the variable of the function.

For example: 2: (x + 3*y)/(x^2 - 17)

1: x = 6 SUBST

takes more time for calculating then:

A function f is defined as:

<< -> x << x y 3 * + x 2 ^ 17 - / >> >>

1: 6 f

Of course the SUBST command is more general acting like the other way (for y you have to build a new function). The conversion of a formular from book format in a rpn function is no problem: You need the little program "->RPN" in the Advanced User Reference for the HP 50g on page 2-27. Then it's easy to build a function f (with USER RPL) mentioned above.

But the point is: You always get a result in book format:

(6 + 3*y)/19

My assumption is/was that the transformation between book and RPN format is an overhead which makes the symbolic calculations slow. I also assumed that the hp 50g works internally with "trees" which represent the algebraic terms. I thought this was necessary doing symbolic algebra and showing the book format.

If you have a list of an algebraic term in RPN format you needn't such a "tree", only a stack for storing the results in between. That is a good condition for calcs with an infinit large stack. You use the serial order and the type of operators which are given in RPN format. And you can do this also for symbolic algebra directly f. e.: symbolic derivatives.

The information of David Hayden is interesting: the book format is stored in RPN format. If it is possible to get an access (with user rpl) to that storage places, than it is not necessary to make that conversion from book to RPN format.

for example: Input: { x 3 ^ 5 x 2 ^ * + } recursive function output: { 3 x 2 ^ * 5 2 x * * +}

One more assumption: some sophistcated functions, like "SERIES" could run faster (now may be, is sys rpl necessary).

Please tell me wether things become clear/clearer or not. I thank you for the time you've invested understanding my post(s).

Yes Bart that's what I want with a little correction:

1: X 2 ^ X LN * INTVX

1: X 3 ^ 3 / X LN * X 3 ^ 9 / NEG +

sincerely peacecalc

Re: use rpl for deriving rpl functions

*Message #9 Posted by **Crawl** on 16 Nov 2011, 7:03 p.m.,*
in response to message #8 by peacecalc

So, it's just about speed?

I don't think the speed issue is due to it being RPN versus textbook. When you try 6x+1, x=2, SUBST, I'm guessing what happens is the interpreter goes through each bit at a time

6? No, that's not x. x? Yup, that's x, replace it with 2. +? Not x 1? Not x, either.

And you get 6*2+1

Well, maybe you could argue that it is in fact an RPN versus textbook issue, because in RPN mode, it knows 6 automatically means "pop 6 onto the stack" and x means "pop whatever value x has onto the stack". It doesn't need to scan and compare.

However, it seems to me that in this case, you could just optimize your programs for speed; you don't need to change the way the calculator deals with every expression it's given (which is what it sounds like you want). I've dealt with that in the past. The first time I solved the general quartic equation on the 50g, I found it was fastest to deal with stack commands. That was able to solve the general quartic, symbolically (though it also worked with numerical input) in about 3 minutes, which I thought was impressive.

Even at the time, though, I knew something unintuitive: It is MUCH faster to take the squareroot of x

with squareroot(variable) variable=x SUBST, than it was to simply enter x squareroot in RPN. The reason is that taking a squareroot directly on the stack causes an EVAL, and if the squareroot is of a complicated algebraic equation, the EVAL can take some time. On the other hand, the SUBST just plugs the expression into the squareroot symbol.

I later got it down to about 10 seconds I didn't use any algebraic expressions, but I still used SUBST.

in response to message #9 by Crawl

Hello crawl,

thank you for post, I haven't ignored it, but I followed your links, and I need some time understanding them. I will implement your programs in my hp 50g, too. Thank you very much.

It's not only efficiency, but I'm interested in understanding how the things work (or if they are possible or not). Even I know now, that the hp 50g works internally in RPN format. I like to program in RPL how it works to differentiate from an RPN input to an RPN output.

The HP guys were faster again with that topic.

Sincerely peacecalc

*Message #11 Posted by **Eric Smith** on 17 Nov 2011, 12:54 p.m.,*
in response to message #8 by peacecalc

The HP RPL calculators store algebraic expressions in RPN internally. They are converted from algebraic to RPN on input, and from RPN to algebraic on output (display). All computations are done with them in RPN form internally.

Re: use rpl for deriving rpl functions

*Message #12 Posted by **peacecalc** on 17 Nov 2011, 2:17 p.m.,*
in response to message #11 by Eric Smith

Hello Eric,

if that is true what you wrote (I have no reason for disbelieving this fact), then the "internal workflow" of the hp 50g is really optimized. The overhead then is only given by transforming book to rpn format and vice versa. Is a function with a book term also stored as an rpn formula by DEF or DEFINE?

Edited: 17 Nov 2011, 2:22 p.m.

Re: use rpl for deriving rpl functions

*Message #13 Posted by **Eric Smith** on 18 Nov 2011, 4:17 a.m.,*
in response to message #12 by peacecalc

User-defined functions created by DEF or DEFINE with an algebraic store the algebraic object wrapped in a program into a variable, but the actual algebraic object is internally stored in RPN.

Re: use rpl for deriving rpl functions

*Message #14 Posted by **Bart (UK)** on 18 Nov 2011, 10:37 a.m.,*
in response to message #11 by Eric Smith

So would it be possible to bypass the algebraic->RPN conversion and call the functions (with and RPN expression as input) using SysRPL?

Re: use rpl for deriving rpl functions

*Message #15 Posted by **Eric Smith** on 18 Nov 2011, 3:16 p.m.,*
in response to message #14 by Bart (UK)

Yes, you can call a DEFINEd function from SysRPL, the same way that you would call any RPL program. A DEFINEd function *is* an RPL program.

The conversion to/from algebraic notation ONLY happens when the user is entering the algebraic expression, or it is being displayed to the user. Internally everything, including "algebraic objects", are stored in postfix (RPN) form. There's nothing special you need to do to bypass any conversion.

Interpolations for Two and Three Independent Variables

*Message #1 Posted by **Namir** on 15 Nov 2011, 12:21 p.m.*

Recently I was looking for information about multivariable interpolation. I was curious about interpolation with two and three independent variables. My first stop was Wikipedia. The algorithm presented there dealt with interpolation based on the coordinates of the independent variables forming a square. That is, the bilinear interpolation used points (x1,y1), (x1,y2), (x2,y1), and (x2,y2).

Further search on the Internet located a paper that dealt with bilinear and trilinear interpolation. The paper showed more elegant equations for square-shaped coordinates for the bilinear interpolation. The paper also included equations for the cube-shaped trilinear interpolation. Implementing these algorithms in BASIC, RPN, or RPL should be easy.

After implementing the bilinear and trilinear interpolations, I asked myself the question, “What if the anchor coordinates for the bilinear interpolation do not form a square? Likewise, what if the anchor coordinates for the trilinear interpolation do not form a cube?”

I proceeded to calculate the coefficients for the multi-variable polynomials used for the bilinear and trilinear interpolations. After a little bit of math wrangling, I realized that my best bet was to use Vandermonde types of matrices. Such matrices would allow me to calculate the coefficients of the interpolating polynomials. In addition, you need fewer anchor points than the square or cube approaches. One advantage of calculating the interpolating polynomial coefficients is that you can reuse the coefficients for additional interpolations that use the same anchor points. This is an advantage that is not available when using interpolation equations that simply yield the final answer.

Using the Vandermonde types of matrices allowed me to easily implement quadratic interpolations for two and three independent variables. If the implementation uses a language that works with matrices, then the calculations are greatly simplified! Such is the case with Matlab, RPL and the HP-71B that has the MATH ROM.

Namir, do you think the matrix support in WP 34S is strong enough to support your algorithms? Can you post some background and a solution to look at?

Re: Interpolations for Two and Three Independent Variables

*Message #3 Posted by **Namir** on 15 Nov 2011, 3:01 p.m.,*
in response to message #2 by Marcus von Cube, Germany

```
In the case of a bilinear interpolation, one can build the Vandermonde matrix A as

+-          -+
```

```
|  1  x1  y1 |
|  1  x2  y2 |
|  1  x3  y3 |
+-          -+
```

and the B vector as:

```
+-          -+
|  f(x1,y1)  |
|            |
|  f(x2,y2)  |
|            |
|  f(x3,y3)  |
+-          -+
```

The coefficients in array C as obtained by:

```
C = inverse(A) * B
```

To interpolate at point (Xint,Yint) use:

```
y = C(1) + C(2) * Xint + C(3) * Yint
```

In the case of a trilinear interpolation, one can build the Vandermonde matrix A as

```
+-               -+
|  1  x1  y1  z1  |
|  1  x2  y2  z2  |
|  1  x3  y3  z3  |
|  1  x4  y4  z4  |
+-               -+
```

and the B vector as:

```
+-            -+
|  f(x1,y1,z1)  |
|               |
|  f(x2,y2,z1)  |
|               |
|  f(x3,y3,z3)  |
|               |
|  f(x4,y4,z4)  |
+-            -+
```

The coefficients in array C as obtained by:

```
C = inverse(A) * B
```

To interpolate at point (Xint,Yint,Zint) use:

```
y = C(1) + C(2) * Xint + C(3) * Yint + C(4) * Zint
```

Re: Interpolations for Two and Three Independent Variables

*Message #4 Posted by **Marcus von Cube, Germany** on 15 Nov 2011, 4:12 p.m.,*
in response to message #3 by Namir

Namir, thanks. It doesn't look impossible to implement on the 34S. Do you have a benchmark example?

Instead of multiplying with the inverse of the matrix, a linear solve should do as well.

Re: Interpolations for Two and Three Independent Variables

*Message #5 Posted by **Namir** on 15 Nov 2011, 4:17 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Here are benchmarks for the bilinear and trilinear interpolation:

```
X         Y        FX              Interpolation Data
3         2         5                X           4
3         4        -1                Y           3
5         2         9                Z Calc      4
5         4         3                Z Act       4

X        Y        Z        FX              X       1.5
1        1        1        16              Y       1.5
1        1        2        21              Z       1.5
1        2        1        19              FX Calc 19
1        2        2        24              FX Act  19
2        1        1        14
2        1        2        19
2        2        1        17
2        2        2        22
```

Speed is not a real issue here because there are no iterations.

Re: Interpolations for Two and Three Independent Variables

*Message #6 Posted by **Namir** on 15 Nov 2011, 4:18 p.m.,*
in response to message #3 by Namir

```
In the case of a biquadratic interolation, one can build the Vandermonde matrix A as

+-                                  -+
|  1  x1  y1 x1^2  y1^2  x1*y1      |
|  1  x2  y2 x2^2  y2^2  x2*y2      |
|  1  x3  y3 x3^2  y3^2  x3*y3      |
|  1  x4  y4 x4^2  y4^2  x4*y4      |
|  1  x5  y5 x5^2  y5^2  x5*y5      |
|  1  x6  y6 x6^2  y6^2  x6*y6      |
+-                                  -+

and the B vector as:

+-          -+
|  f(x1,y1)  |
|            |
|  f(x2,y2)  |
|            |
|  f(x3,y3)  |
|            |
|  f(x4,y4)  |
|            |
```

```
|  f(x5,y5)  |
|            |
|  f(x6,y6)  |
+-          -+
```

The coefficents in array C as obtaied by:

C = inverse(A) * B

To interpolate at point (Xint,Yint) use:

y = C(1) + C(2) * Xint + C(3) * Yint + C(4)*Xint^2 + C(5) * Yint^2 + C(6) * Xint * Yint

In the case of a triquadratic interolation, one can build the Vandermonde matrix A as

```
+-                                                                                -+
|  1  x1   y1   z1   x1^2   y1^2   z1^2   x1*y1    x1*z1    y1*z1    x1*y1*z1    |
|  1  x2   y2   z2   x2^2   y2^2   z2^2   x2*y2    x2*z2    y2*z2    x2*y2*z2    |
|  1  x3   y3   z3   x3^2   y3^2   z3^2   x3*y3    x3*z3    y3*z3    x3*y3*z3    |
|  1  x4   y4   z4   x4^2   y4^2   z4^2   x4*y4    x4*z4    y4*z4    x4*y4*z4    |
|  1  x5   y5   z5   x5^2   y5^2   z5^2   x5*y5    x5*z5    y5*z5    x5*y5*z5    |
|  1  x6   y6   z6   x6^2   y6^2   z6^2   x6*y6    x6*z6    y6*z6    x6*y6*z6    |
|  1  x7   y7   z7   x7^2   y7^2   z7^2   x7*y7    x7*z7    y7*z7    x7*y7*z7    |
|  1  x8   y8   z8   x8^2   y8^2   z8^2   x8*y8    x8*z8    y8*z8    x8*y8*z8    |
|  1  x9   y9   z9   x9^2   y9^2   z9^2   x9*y9    x9*z9    y9*z9    x9*y9*z9    |
|  1  x10  y10  z10  x10^2  y10^2  z10^2  x10*y10  x10*z10  y10*z10  x10*y10*z10 |
|  1  x11  y11  z11  x11^2  y11^2  z11^2  x11*y11  x11*z11  y11*z11  x11*y11*z11 |
+-                                                                                -+
```

and the B vector as:

```
+-                -+
|  f(x1,y1,z1)     |
|                  |
|  f(x2,y2,z1)     |
|                  |
|  f(x3,y3,z3)     |
|                  |
|  f(x4,y4,z4)     |
|                  |
|  f(x5,y5,z5)     |
|                  |
|  f(x6,y6,z6)     |
|                  |
|  f(x7,y7,z7)     |
|                  |
|  f(x8,y8,z8)     |
|                  |
|  f(x9,y9,z9)     |
|                  |
|  f(x10,y10,z10)  |
|                  |
|  f(x11,y11,z11)  |
+-                -+
```

The coefficents in array C as obtaied by:

C = inverse(A) * B

```
To interpolate at point (Xint,Yint,Zint) use:

y = C(1) + C(2) * Xint + C(3) * Yint + C(4) * Zint +
           C(5) * Xint^2 + C(6) * Yint^2 + C(7) * Zint^2 +
           C(8) * Xint * Yint + C(9) * Xint * Zint + C(10) * Yint * Zint +
           C(11) * Xint + Yint + Zint
```

Re: Interpolations for Two and Three Independent Variables

*Message #7 Posted by **Namir** on 15 Nov 2011, 4:24 p.m.,*
in response to message #1 by Namir

The advantage of using the Vandermonde type of matrices is that you can use it to define your custom interpolation function. For example, if I want to interpolate using:

Z = a + b/X + c/Y + d*X*Y

Then the Vandermonde matrix will have a matrix with the following columns:

```
Column 1: is full of ones.
Column 2: column of 1/X values
Column 3: column of 1/Y values
Column 4: column of X*Y values.
```

Since we have 4 coefficients we need four rows in the Vandermonde matrix.

Another example is using the following model that involves three independent variables X, Y and T:

Z = a + b sin(X) + c sin(2*X) + d ln(Y/T) + e X*T

Then the Vandermonde matrix will have a matrix with the following columns:

```
Column 1: is full of ones.
Column 2: column of sin(X) values
Column 3: column of s(2*X) values
Column 4: column of ln(Y/T) values.
Column 5: column of X*T values
```

Since we have 5 coefficients we need five rows in the Vandermonde matrix.

Thus the Vandermonde matrix approach gives us the power to choose to work with any number of variables that suites our application and also choose from wide variety of (thousands if not millions) models for interpolation. This conclusion answer an old question of mine about pushing new limits for interpolation.

Another way to look at this approach is basically we are using Vandermonde-style matrices to do a curve fit with a minimum required number of data points (meaning R-square of the fitted model is always 1).

Best new 12C flavor?

*Message #1 Posted by **Peter Murphy (Livermore)** on 14 Nov 2011, 9:07 p.m.*

I'm thinking of getting a newer 12C to keep company with my 2614BXXXX. What new-model 12C is most favored, and why? Thanks for comments.

Re: Best new 12C flavor?

*Message #2 Posted by **M. Joury** on 14 Nov 2011, 9:23 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

I personally prefer the 12C+ over the platinum. Primarily better speed and on a personal note I prefer the more muted colors compared to those on the platinum. The drawback is of course less memory but that is not an issue in my use.

There is also a weird implementation of stack lift in conjunction with the use of CHS on the platinum. 3 ENTER CHS 4 - on any relatively modern RPN machine including the 12C and 12C+ returns -7. On the Platinum it returns -1. Some on this forum have argued that this is incorrect usage and perhaps they are right. Be that as it may, it does not return what I expect and so I avoid it.

Just a very quick $0.02 tour of the main differences as I see them.

Of course if you want algebraic support then the Platinum is your only choice. and the backspace and undo features on the Platinum are nice.

Cheers,

-Marwan

Re: Best new 12C flavor?

*Message #3 Posted by **Michael de Estrada** on 14 Nov 2011, 9:45 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

I bought 3 of these for under $15 apiece to keep my beautiful immaculate 12C 2732AXXXXX company:

As for the modern HP financial calcs, my choice was the 10bII+. It's better than any of the retro-Voyagers for a fraction of the price.

Re: Best new 12C flavor?

*Message #4 Posted by **M. Joury** on 14 Nov 2011, 10:15 p.m.,*
in response to message #3 by Michael de Estrada

I have to say that the 10bii+ us a very nice machine. Only problem for me is no RPN.

As for he Victor V12, I have been meaning to give my $0.02 tour of that machine since I have now had mine for a couple of weeks.

All in all a decent calculator. Maybe even great for the price. But therein lies the rub... For the price...

Dislikes:

```
1.  I don't like the small decimal point.
2.  I don't like the larger size.  It is not quite pocketable.
3.  I don't like the keyboard feel.
4.  Not as fast as the 12C+.
5.  No backspace or undo as on the newer 12C Platinums.
6.  No parens (just like the older 12CP's) so if you really do want to use algebraic
entry you might be a little hobbled.
```

Likes:

```
1.  I do like the large display
2.  Inexpensive
3.  It does *NOT* have the CHS behavior of the 12CP that I consider odd
4.  Inexpensive
5.  Uses 2 x AAA batteries instead of the 2032's that the 12C+ and the 12CP use
6.  Did I mention inexpensive?
7.  No keyboard issues once you get past the feel (which I really don't like).  But
then I have had no keyboard issues with any of my voyagers and that includes the 12C+'s
and 12C 30th AE's and the 15C LE's.
```

In conclusion: I *make* myself use the Victor V12 every now and then but it has not come close to replacing the 12C that sits on my desk.

As always, just my $0.02.

Cheers,

-Marwan

Re: Best new 12C flavor?

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 14 Nov 2011, 10:05 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

If you decide to go with 12C instead of Platinum, I would recommend 12C 30th AE or try to find an older type 12C with serial number starting with CNx xxxxxx instead of newer CYxxxxx.

Personally, I noticed that the newer models, (also you can tell from the character set of the keys-see photo-), seem to have the worst keyboards with more frequent non-responding keys. Photo Old/New

Re: Best new 12C flavor?

*Message #6 Posted by **Jose Gonzalez Divasson** on 15 Nov 2011, 5:42 p.m.,*
in response to message #5 by Kerem Kapkin (Silicon Valley, CA)

I concur with your appreciation - the ones starting with CN in the serial number seem to be slightly better in key feel than the ones starting with CY. Apparently, the former ones come from the Kinpo factory while the others from Invertec. The Kinpo ones sure look better. The key feel might be a little better as well, but now we're talking about the last 1-2% !! And the clicky response feels better to me than my original 1985 units (Brazil and USA)

As for reliability, none of both has ever missed a keystroke.

See pictures and discussion here

The last batches of "plain" HP12c+ received in Europe all come from Invertec - at least this was the return from the European distributors that I know.

The good thing is, the HP12c anniversary comes from the "right" source and sports the "right" keyboard!!

Re: Best new 12C flavor?

*Message #7 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 15 Nov 2011, 6:16 p.m.,*
in response to message #6 by Jose Gonzalez Divasson

Three weeks ago I was shopping at a local electronics store called Fr**s, both at Sunnyvale and San Jose. Sunnyvale had about 7 units of HP-12C in stock, San Jose 5. ALL of the 12 HP-12C's had keyboard problems, 2 of them had NO response with ENTER key at all, 2 with NO response CLx key, 1 with PV + PMT keys that didn't click and unless you pushed really hard didn't register, rest of them had one of multiple keys that didn't register and missed regularly. The store is going to return them all back to HP. All had serial numbers starting with CY xxxxxxx with the new looking type set. Luckly they had a "very old" return almost at regular price that no one wanted, all scratch up display, low battery etc, serial number CNA XXXX, keys worked perfect despite the significant cosmetic wear. So I replaced my first defective unit with that one. Also contacted TW at HP three weeks ago, who said forwarded my message to customer support, but haven't received any response from HP yet.

I'd recommend a 2615BXXXX. Keyboard is great, no known bugs or funny issues with increased speed, etc...

Re: Best new 12C flavor?

*Message #9 Posted by **Eddie W. Shore** on 15 Nov 2011, 8:05 a.m.,*
in response to message #1 by Peter Murphy (Livermore)

> Quote:

> I'm thinking of getting a newer 12C to keep company with my 2614BXXXX. What new-model 12C is most favored, and why? Thanks for comments.

Even though the Victor 12C clone is nice and inexpensive - I find myself using the 12C+ (99-step upgrade) the most. I like the 12C+ the most because it is most like the classic 12C with speed improvements.

Talking to HP

*Message #1 Posted by **David Griffith** on 14 Nov 2011, 8:20 p.m.*

Does anyone here know who to talk to at HP about what's being discussed or done regarding the HP35s bugs? I tried the "ask HP" thingy from the website and haven't received an answer.

Re: Talking to HP

*Message #2 Posted by **Howard Owen** on 14 Nov 2011, 9:03 p.m.,*
in response to message #1 by David Griffith

I don't think they'll ever fix the existing 35s machines. The only way they could do that would be to replace those units, and they have apparently sold a **lot** of them.

I don't have any idea why they haven't fixed the firmware in newer units.

Re: Talking to HP

*Message #3 Posted by **David Griffith** on 14 Nov 2011, 9:22 p.m.,*
in response to message #2 by Howard Owen

This is irritating. I'd be willing to spend twice as much as the 35s typically goes for as long as the bugs are fixed. I'm hoping that they have something like a 35sii waiting in the wings that would address the objections many of us have.

No idea who to talk to?

Re: Talking to HP

*Message #4 Posted by **Howard Owen** on 14 Nov 2011, 10:30 p.m.,*
in response to message #3 by David Griffith

HP's calculator engineers, cyrille de Brébisson and Tim Wessman, both occasionally post to this forum. It seems certain to me that neither had much say in whether the problems would be fixed or not. Tim gives some hints about how things went wrong at the beginning of this thread. Given those conditions, you might be able to make a reasonable guess as to why they haven't fixed it.

Bashing the 35s is an ever green topic here, and that's what the referenced thread devolves into. It's interesting if you haven't heard it all before. :)

Re: Talking to HP

*Message #5 Posted by **David Griffith** on 15 Nov 2011, 9:14 p.m.,*
in response to message #4 by Howard Owen

I posted to the HP Communities calculator forum and got the attention of Miguel Angel Caporalini, the guy who runs it. He replied to my post with this:

Quote:

If you have existing warranty for your HP35S, you must contact, with the HP Technical Service near, at you home. Is important see, the inform, from ... http://www.hpcc.org/datafile/V26Special/the35s.pdf

Re: Talking to HP

*Message #6 Posted by **Ron Ross** on 15 Nov 2011, 10:07 p.m.,*
in response to message #5 by David Griffith

No, Miguel Angel Caporalini does not run the site, he is just an enthusistic supporter of Hp calculators and helps as many posters as He possibly can.

I posted a response to your concerns about the Hp35s on the comp.sys site and won't bother to boar other here. Mike Morrow has consistantly given you Hp's unofficial reasons for their lack of action. Does Mike speak directly for Hp? No, but his comment is on point and I would bet, accurate.

Tim and Cryille cannot give you any official words due to legal commitments infirred due to comments ie legal BS or being subjected to a corporate whipping or other such punishment. American corporate policies are often JUST LIKE THAT, for better or worse.

I do notice you have become an avid Hp calculator user and have selected a well loved model in the Hp 32sii.

Welcome.

Re: Talking to HP

*Message #7 Posted by **David Griffith** on 16 Nov 2011, 12:31 a.m.,*
in response to message #6 by Ron Ross

I understand Tim and Cryille not being able to talk <shrug>. I'm just chomping at the bit at the thought of a new scientific calculator using the chassis of the 20b. I'm very pleased with my new (old) 32sii. In the meantime I'll keep my eye on things.

It seems to me that sometime after the 35s came out, subsequent calculators were designed internally instead of contracted out. Am I correct?

Re: Talking to HP

*Message #8 Posted by **Howard Owen** on 16 Nov 2011, 12:42 a.m.,*
in response to message #7 by David Griffith

I believe that's true. Tim said as much in the referenced thread.

Re: Talking to HP

Are you aware of wp34s? I don't see how hp could top what Walter, Pauli and Marcus have created for the 30b/20b hardware platform. (The 30b is so far superior to the 20b that the 20b should not even be considered.) Get a 30b, a cable from Gene, an overlay from Eric, and the v2.2 rev 1797 version of wp34s and have fun. If you don't want to go to the hassle of getting the cable and learning how to download the rom, I'm sure someone here would do it for you.

Re: Talking to HP

*Message #11 Posted by **David Griffith** on 16 Nov 2011, 2:43 p.m.,*
in response to message #10 by Jeff O.

I've been vaguely aware of that project. I'll carefully consider doing it. Let me clarify what I meant by using the chassis of the 20b or 30b. The keyboard is essentially identical to the 32sii. Only the legends need to be changed. The WP34s project seems to have taken care of that problem in the best way practically available. Also, I'd like to see in it the LCD from the 35s. That's something that can only be changed by a complete rework of the mainboard. I've settled into really liking the entirely dot-matrixy (save for annunciators) way of doing things presented by the 32sii and the 35s.

Some other things for my fantasy calculator, hoping HP is reading: Use screws instead of plastic rivets. Include a means for updating the firmware. USB and IR ports. Even more memory than the 35s.

I second Jeff for obvious reasons. Here's what you'll get:

from us :-) There are emulators for Windows, Linux, and Mac OS available as well :-) And you'll also get a documentation of some 100 pages.

Enjoy,
Walter

Re: Talking to HP

*Message #14 Posted by **Mike Morrow** on 14 Nov 2011, 9:25 p.m.,*
in response to message #2 by Howard Owen

Quote:

I don't have any idea why they haven't fixed the firmware in newer units.

That's probably hard to correct, so that becomes the justification. What I really don't understand is why an obsolete version of HP 12C+ firmware is being used on the most recent HP 12C 30th Anniversary Edition. That doesn't indicate much value is being attached to "attention to detail"!

Re: Talking to HP

*Message #15 Posted by **Gerry Schultz** on 14 Nov 2011, 9:40 p.m.,*
in response to message #14 by Mike Morrow

Please correct me if I'm wrong, but I thought one of the reasons the 35s doesn't have R-P or P-R is that they were deleted to make room for 'improved' functionality over the 33s. To me, that indicates the firmware ROM is full and to fix these issues would require more ROM space that what is left. So, it would require re-engineering the calculator with more space to make it work as we would like. Hmmm, what would HP do in this case?

Gerry (I must be in a bad mood today.)

Re: Talking to HP

*Message #16 Posted by **Paul Dale** on 14 Nov 2011, 10:25 p.m.,*
in response to message #15 by Gerry Schultz

I thought the 35s has the same amount of ROM as the 20b has flash. Look at the 34S for what can be done in that amount of space :-)

Okay, not a completely fair comparison since they have completely different CPUs. My suspicion would also be that the 35s's CPU is capable of having denser code...

- Pauli

Re: Talking to HP

*Message #17 Posted by **Lincoln R.** on 14 Nov 2011, 10:09 p.m.,*
in response to message #14 by Mike Morrow

I'd honestly call the firmware issue a screwup on the part of the manufacturing contractor. More recent 12Cs appear to have been made by Inventec, the 12C AE appears to have been made by Kinpo, it's entirely possible their assembly line workers just flashed the image they were used to using the last time they built 12Cs (which could also explain the poor guy who got a 15C LE with 12C+ firmware).

Re: Talking to HP

*Message #18 Posted by **Stuart Sprott** on 15 Nov 2011, 6:00 a.m.,*
in response to message #1 by David Griffith

It seems strange that the HP35s was ever brought out. I have only recently acquired a HP32Sii. It does all that a HP35s does, without any bugs, great layout, the keys have a great feel and it is easy to write simple programs. My main calculator is a HP50. I like it for its power, versatility and its ability to transfer data to USB sticks and computers.

But when I am in the office doing simple calcs (I am a Surveyor), I find that I nearly always reach for the 32sii. Its size is also a great positive. It reminds me of the HP 42s. Another great calculator.

Why did HP ditch a perfectly good calculator that was popular? I guess that this question has been asked by many before on this forum. But it is still frustrating. The bean counters have a lot to answer for.

Re: Talking to HP

*Message #19 Posted by **M. Joury** on 15 Nov 2011, 6:48 a.m.,*
in response to message #18 by Stuart Sprott

> Quote:

> HP32Sii. It does all that a HP35s does,

It doesn't.

Yes the 35S has bugs but there are at least a few improvements over the 32Sii starting with much more memory. This has been rehashed so often here that I am not going to go into details again but to say that there were no improvements is disingenuous. It might be true to say that the bugs, lack of R-P / P-R and some badly implemented features such as the binary mode ended up overshadowing the upgrades and ruined what might otherwise have been a very nice machine.

Cheers,

-Marwan

Re: Talking to HP

*Message #20 Posted by **Eddie W. Shore** on 15 Nov 2011, 8:11 a.m.,*
in response to message #19 by M. Joury

I think the biggest improvement of the 35S over the 33S (I don't have a 32Sii - yet) is the ability to branch to program lines within labels (i.e. GTO A025). I love the carrying case.

My biggest beefs with it are (1) the lack of >Polar and >Rect functions - thankfully a work around has been presented and (2) the limited complex number support (despite that it has more than most of all the current non-graphing calculators on the market today).

Re: Talking to HP

*Message #21 Posted by **M. Joury** on 15 Nov 2011, 8:56 a.m.,*
in response to message #20 by Eddie W. Shore

Agreed. That branch to line number feature is great and makes the huge memory usable (whereas the 33S with the same memory is hobbled in this regard). However, while the 32Sii does not have this feature it can be argued that it is not needed because it has much less memory and it is unlikely that you will ever need to use all the available labels to write a program that will fit in available memory. I would respond that even with a bunch of small programs it is a nice feature to have since each main label is a separate program and you don't have to figure out what goes with what. E.g. anything that has a line number starting with A... belongs to program A. Not true for either the 32Sii or the 33S.

This is one of the improvements that I was referring to above.

Cheers,

-Marwan

The 32sii has been out of production since 2003, I think. So there is no relationship between them, as far as marketing is concerned. rather the 35s was meant to supersede the 33s, as Tim seems to point out in the thread Howard Owen referenced.

The 35s is never going to be fixed, because it was entirely outsourced under independent contract; WYSIWYG.

However, note in the same referenced thread there was a tiny hint about future scientific models(s).

Why haven't bug fixes been outsourced? This other company apparently did the 33S, too (both calculators even share the same bugs where applicable), so there's some relationship. And the 33S actually underwent a bugfix.

The explanation is a different one, imo. The 35s sells, and so is bug free from the business point of view :-(.

Re: Talking to HP

*Message #29 Posted by **Paul Gaster** on 16 Nov 2011, 2:01 p.m.,*
in response to message #28 by Thomas Radtke

I wonder if the 35S being on the NCEES calculator list has something to do with the lack of changes/updates. The 33S is also on the list, so both calculators would need at least some of the same changes so that the results would be consistent between them. I was thinking about the cos bug specifically. So, HP would have to change both calculators, then try go get them both to pass NCEES testing again. I can see why HP would be hesitant to do this. It is a slippery slope with the risk of getting banned by NCEES for the short term if all doesn't go well. I think we would all like to see some of these things changed, but probably won't happen.

Also just noticed that the NCEES calculator policy page got an update today: NCEES

I think TI added a calculator, but I might be wrong on that.

HP70 project - cosmetc and electronic issues

*Message #1 Posted by **Alberto Fenini** on 13 Nov 2011, 3:47 p.m.*

Dear All,
I'm back on the calcs ...
I have been collecting watches for a while, mostly LED and LCD and kept an eye on the forum, but I had stopped working on calcs.
If anyone is interested in watches, just email me and will gladly share some of the things thst I have learned there.
By the way, working on small items like the LED and LCD modules makes our beloved calcs really HUGE stuff.
I have recently purchased this HP70, mostly because I needed the case for one onmy two units, which has a thin crack in the body.
However, as always, when the unit arrived I couldn't believe it was gone for good...
I cleaned most of the battery leakage and washed the keys and body and cleaned the battery contacts.
I have put a battery pack and plugged the AC power supply, but nothing happened.
Since the unit was without the back cover, I could giggle with the logic board and by
moving it, the unit came back to life.
However, the behaviuor is erratic, it may lights up four times in a row, or may not light up for a while.
One thing I have notices is that when is on, the two transistors in the upper left corner, the coil and
the capacitor get really hot.

There are two issues where I would liketo receive your help and your ides :
on the cosmetic issues : the are thin scratches on the keyboard frame, what could I do to erase them ?
I was thinking about using some sandpapervery thin (like 2000) but I'm afraid I will loose the typical
aspect of an HP keyboard.
On the electronic side : would it be a good idea to re-solder all the connections ?
could this behaviour due to a bad connection ?
I was also thinking about replacing the power supply components, does anyone know
a good replacement for the transistors, the capacitor and anything else that could be needed ??
I'm attaching some pics, any comment and any idea will be, as always, greatly appreciated.

One last word about this forum. Entering the watch collector's world has been a nice experience.
Looking for resources I have come across different forums. Let me tell you that no other forum
by any mean is as friendly and as rich of nice people like this one, so let's keep up the good work !!!

Re: HP70 project - cosmetc and electronic issues

*Message #2 Posted by **David Ramsey** on 13 Nov 2011, 5:45 p.m.,*
in response to message #1 by Alberto Fenini

I have disassembled and cleaned some dozens of these "Classic" HP calculators, and I don't know any refinishing technique that would eliminate the scratches without radically changing the appearance of the keyboard. Frankly given the HP-70's well deserved status as the ugliest single calculator ever made in the entire history of the world (I gave my much nicer example away as a door prize at HHC 2006. Nelson got it.), I wouldn't sweat it.

I'll leave any electronics comments for someone else. After all, I don't even know a full wave rectifier from a bridge rectifier!

Re: HP70 project - cosmetc and electronic issues

*Message #3 Posted by **John Robinson** on 13 Nov 2011, 7:38 p.m.,*
in response to message #1 by Alberto Fenini

Hi Alberto,

I think you're lucky that the 70 has no lettering on the keyboard surround. I have had some success with this kind of issue by light sanding fine emery paper, then spray painting with Tamiya flat lacquer. The good thing is that I can sand and respray multiple times without issues. Just may sure you use to appropriate lacquer type, I use the "TS" lacquer. I have done this with a 65 which does have lettering on keyboard surround.

On the electronics, I would try re-soldering, but there is always the risk they it will be worse after wards. I's start with by re-soldering all the pins on the bottom edge connector. Also make sure all the holes for the pins in the logic board are free from corrosion.

Cheers, John

Re: HP70 project - cosmetc and electronic issues

*Message #4 Posted by **Eric Smith** on 14 Nov 2011, 3:37 a.m.,*
in response to message #1 by Alberto Fenini

Tony or Randy would probably be better sources of advice on the power supply circuitry, but if the transistors are getting hot to the touch, something is definitely very wrong. I doubt that it's just a bad solder joint. If it were my calculator, I wouldn't power it up again until I had come up with a theory explaining why the components are getting hot, and had attempted to repair it.

Re: HP70 project - cosmetc and electronic issues

*Message #5 Posted by **Randy** on 14 Nov 2011, 10:08 a.m.,*
in response to message #1 by Alberto Fenini

> Quote:
>
> On the electronic side : would it be a good idea to re-solder all the connections ? could this behaviour due to a bad connection ?

I would not recommend re-soldering. You would be heat stressing almost forty year old components for no good reason. A good visual inspection should identify any possible bad solder connections and re-solder only those necessary.

> Quote:
>
> I was also thinking about replacing the power supply components, does anyone know a good

> replacement for the transistors, the capacitor and anything else that could be needed ??

If they work, why would you replace them? You achieve nothing, other than to say you replaced perfectly good components.

As for the transistor and transformer getting hot - is this when the unit is functioning or when it is on the fritz?

The intermittent behavior - Corrosion on the board or on the pins - is obviously the most common cause of trouble but if you find none:

Remove the logic board and carefully inspect the 25 gold pins on the keyboard side - insure that the smaller, lower side extends outward enough to engage and make good contact with plate-through hole of the logic board. It only takes one compressed pin to cause major grief. When the pins look good, with magnification, inspect the plate-through holes of the logic board.

FWIW, I have seen boards (especially on 65's) with missing/worn plating that caused intermittent contact. I recently had a 65 that so much wear inside the holes that I ended up rotating most of the connector pins 90 degrees so it would not go crazy when the low end was lifted up three inches off the desk and dropped. This is a good test for all HP's as it was part of final repair QC.

Re: HP70 project - cosmetic and electronic issues

*Message #6 Posted by **Alberto Fenini** on 14 Nov 2011, 2:38 p.m.,*
in response to message #5 by Randy

Thank you very much for all the replies I've got so far.
On the cosmetic side, I'll definetely try some sandpaper (the finest I have is 2000 grade and I'll go with that first).
On the electronic side, I have already fixed the obviuos, like the switch contacts and the battery contacts
PSU components may get hot because the unit was half opened and surely this is the worst way to test a unit.
Visual inspection of the gold pins revealed no corrosion but definitely not shining over there ....
I was thinking about it and I don't want to use sandpaper on the pins, neither in the corresponding holes in the logic board.
What could be a good idea to make them shine again ? Isopropolic Alcohol would do the trick ? Or should I go for the water and vinegar solution ?
Again, thanks everyone for help, take care Alberto

Re: HP70 project - cosmetic and electronic issues

in response to message #6 by Alberto Fenini

> Quote:
>
> Or should I go for the water and vinegar solution ?

Yes, that is best for corrosion/battery leakage. Caig DeoxIT is also highly recommended for clean up and protection.

> Quote:
>
> I was thinking about it and I don't want to use sandpaper on the pins, neither in the corresponding holes in the logic board.

Sandpaper? One word: *NEVER*

A clean "pink pearl" pencil eraser is most abrasive thing I'd every take to gold plated contacts. This is the best way to restore "shine" if there is any shine left to restore...

Re: HP70 project - cosmetic and electronic issues

Hello Alberto and compliments for your HP70 I read that it's not so easy to find that kind of calculator..... expecially for a human price!

I'm curious to know where have you found the Caig DeoxIT here in Italy... If I've not well understood, may you suggest another equivalent product, I'll appreciate it, thank-you

Re: HP70 project - cosmetic and electronic issues

*Message #11 Posted by **John Robinson** on 14 Nov 2011, 8:16 p.m.,*
in response to message #6 by Alberto Fenini

Alberto, I am not totally familiar with the DC-DC converter on the 70, but assuming it's the same as the 65 which I am familiar with, then the heating up of those components sounds like the calc is drawing too much current. which would indicate a short or near short on one of the three power lines, Vcc, Vss or Vgg. Unfortunately in the articles forum, Tony Duell's "inside the HPxx" doesn't cover the HP70, only the other classics, so I can't tell you where to measure Vcc, Vss and Vgg.

The only other possibility for a hot transistor would be the 2nF capacitor (large capacitor next to coil) is on the way out. If that's the case, then the oscillator might be oscillating too fast. However, that would really only apply if one transistor is hot, not both.

One transistor forms the oscillator, the other forms a kind of regulator via Vss line (I think !). On a HP65 the oscillator oscillates at around 670 Khz, do you may want to check that if you have access to an oscilloscope - try pin 1 of the "coil". The coil itself is extremely unlikely to be the problem.

Personally, I'd replace the 2nF capacitor, and both transistors, and the diode in the feedback (connected to the zener diode). All other diodes are for rectification of the three output voltages.

Cheers, John

Re: HP70 project - cosmetic and electronic issues

*Message #12 Posted by **Joel Setton (France)** on 24 Nov 2011, 3:49 p.m.,*
in response to message #11 by John Robinson

Alberto,
you may want to start by checking the two transistors and the diodes in the DC-DC converter. With the board removed from the calculator (and no power), a simple ohmmeter check will let you know if these parts are OK. Simply check for "good" junctions in the transistors and the diodes (the ones with the black-black-orange-yellow colour bands).
I hope this helps!
Joel

Public apology to Valentin Albillo

*Message #1 Posted by **fhub** on 13 Nov 2011, 2:52 p.m.*

Hi Valentin!

First to our differences about the Laguerre method:
I now have to agree that you were right, the Laguerre algorithm is indeed a very powerful method and definitely better than the Bairstow algorithm!

What changed my mind? Well, today I've slightly modified my WP34s Laguerre program, and suddenly I got an error message which I couldn't explain. Analyzing this problem I found that there was a misunderstanding between me and the WP34s about the absolute value of a complex number: I assumed that [cpx]ABS would of course return just a single real value, but the WP34s implementation returns a complex value with the ABS-value in X and 0 in Y!
Since you have to compare 2 ABS-values of complex numbers in the Laguerre method (to find the larger denominator), I simply used a x>=y? after having calculated both absolute values, and so in fact I compared the 2nd abs-value with 0 (instead of the 1st abs-value), and this caused the program to always use the wrong denominator and so the iteration was so bad.
After having now corrected this program step (x>=z? instead of x>=y? to comply with this unexpected behaviour of the WP34s [cpx]ABS function), my Laguerre program now is working excellent and - as you said - indeed better than the Bairstow program (in average it needs only 1/3 of the iterations).
So in short words: you were right with Laguerre and I was wrong (due to my misunderstanding of this [cpx]ABS function in WP34s)!

Now about the 'style' of our communication:
Usually I'm a very friendly person and never use 'bad' words, but I was really angry about your answers to my postings with those numerous "Nope, ... is your lack of relevant theoretical knowledge", "Nope, ... it's your lack of understanding", etc. etc. ...
You really treated me as if I would have "no clue about anything" (in other words, like being an idiot), and this may explain my reaction that I also answered in a quite unfriendly way.
So - although it was not only my fault - I nevertheless apology for my unfriendly and harsh words!

I hope you accept my apology,
Franz.

*Message #5 Posted by **Marcus von Cube, Germany** on 13 Nov 2011, 5:01 p.m.,*
in response to message #4 by Paul Dale

Most probably superseded by cABS and R->P. But the function may be replaced by: cABS (or R->P) x<>y DROP.

Re: Public apology to Valentin Albillo

*Message #6 Posted by **Paul Dale** on 13 Nov 2011, 5:16 p.m.,*
in response to message #5 by Marcus von Cube, Germany

"cABS +" is one step shorter :-)

Alas, DROPY went away a long time ago.

Re: HYPOT and complex ABS

*Message #7 Posted by **Dieter** on 13 Nov 2011, 5:46 p.m.,*
in response to message #4 by Paul Dale

Well, I remember some person suggesting a HYPOT command and another person saying this was not required since CPX ABS would do the same. ;-)

In fact, the complex ABS command evaluates sqrt(x^2 + y^2) exactly - it's done with 39 digits while only 32 are required. There is just one thing that looks a bit strange for me: consider a function that uses a complex argument while it always returns a real result. Do you think the result should still be returned as a complex number with a zero imaginary part? In other words: is it a good idea if the complex ABS function finishes with the C indicator set and a result in X *and* Y where Y = 0 ? I think it should simply return the (real) result in X and drop Y.

Dieter

> I think it should simply return the (real) result in X and drop Y.

I disagree, I'd rather stay in complex mode because if I was to use the result as an argument for another function, it would likely be complex too (and thus save me putting 0 in Y).

Re: Public apology to Valentin Albillo

in response to message #1 by fhub

> Quote:
>
> I assumed that [cpx]ABS would of course return just a single real value, but the WP34s implementation returns a complex value with the ABS-value in X and 0 in Y!

All complex functions of the WP 34S deal with pairs of registers in input and output. So does ^{C}ABS. Simply consistent :-)

Re: Public apology to Valentin Albillo

*Message #11 Posted by **Walter B** on 13 Nov 2011, 5:57 p.m.,*
in response to message #10 by Dieter

Well, the basic assumption is anybody calculating complex functions wants to continue this way - so we better return a complex result. If, OTOH, some complex functions would return just a single number in a single stack level, a continuation in complex realm would become quite difficult.

Re: Public apology to Valentin Albillo

*Message #12 Posted by **Ángel Martin** on 14 Nov 2011, 2:06 a.m.,*
in response to message #11 by Walter B

Excellent logic - I used the same convention in the 41Z with functions like ZABS, ZARG, etc. returning zero as imaginary part.

WP 34S complex mode

*Message #14 Posted by **Marcus von Cube, Germany** on 14 Nov 2011, 2:09 a.m.,*
in response to message #11 by Walter B

Which leads me to the conclusion that CPX should be renamed i. We have dynamic register allocation so it's time for a complex stack and a complex mode going with it. We will save a lot of flash space in the keyboard, display and catalog handlers which we can spend better on a proper complex mode. No need to recode the subroutine behind label E to use cLN instead of LN. Let's do it the same way as the 15C!

Re: WP 34S complex mode

*Message #15 Posted by **Paul Dale** on 14 Nov 2011, 2:36 a.m.,*
in response to message #14 by Marcus von Cube, Germany

> Quote:
>
> We will save a lot of flash space in the...

- keyboard: yes.
- display: where?
- catalog handlers: no?

Doing a 15C style complex stack will be very invasive. Better will be real types (including complex) for the 43S.

Static and HPs

*Message #1 Posted by **Fouad M. Kaadou** on 13 Nov 2011, 10:53 a.m.*

Hi guys,

I was just wondering if its important to take precautions against static electricity when working with the inside of the older HP calculators(HP-25,67,97,41C...)?

I heard that its not necessary to worry about static with older devices without EPROMS, Flash Drives and newer technology. Is that true?

Thanks in Advance,

-Fouad

Re: Static and HPs

*Message #2 Posted by **Lincoln R.** on 13 Nov 2011, 11:33 a.m.,*
in response to message #1 by Fouad M. Kaadou

Many older ICs are actually more susceptible to static damage. Modern ICs are typically designed with some amount of ESD protection. However, you shouldn't have to be ridiculous about it: Don't wear a wool sweater, don't go walking around carpet, etc. and it might not hurt to touch something metal before working on a calculator.

HP 34s: Three financial routines

*Message #1 Posted by **Miguel Toro** on 12 Nov 2011, 7:42 p.m.*

Hi,

I posted three financial routines for the HP 34s on the Articles section, to complement the existing TVM application :

- Cash flow analysis (corrected and improved by Dieter)

- Amortization

- Nominal / Effective interest rate conversion

As always, any suggestion is very welcome.

Regards,

Miguel

Edited: 12 Nov 2011, 7:43 p.m.

Re: HP 34s: Three financial routines

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 13 Nov 2011, 1:55 p.m.,*
in response to message #1 by Miguel Toro

Hi Miguel,

I am really glad to see you using the preprocessor extension to the WP 34S assembler! That is gratifying. Your code is an excellent example of usage of the extension.

A couple of points that will help in certain cases:

1) Most importantly, if you are using this tool (wp34s_pp or the -pp switch in wp34s_asm), it is better to let the tool assign the local label names (eg: LBL 01) and use a symbolic label for the target of your SLV or XEQ statement. (Just as a reminder, and **not** that you violated this, but the preprocessor cannot handle duplicate local labels [ie: LBL 01]. It is usually (always?!) better to let the tool choose local labels to use itself.)

2) For ease of input you can recode most of the text strings by using double quotes. The tool will parse it and figure out the most efficient coding required. Several things, like spaces, are automatically recoded as the '[space]' equivalent. In some cases, the double quote technique will produce fewer steps than you would have gotten otherwise. Regardless of whether the output steps are identical or not, it is certainly easier to code the strings using double quotes.

3) You have a few cases where your use *stretched* to the tool to places it was not intended to go :-) In at least one case, you made use of a GTO with a 'soft' label (step 16 of 'CFE', for example) where it had been my

intention that this technique designed for use with the pseudo JMP instruction. In a way I am glad that the GTO actually worked in this case but I don't think it was never tested (at least not extensively)! In this example, if you had used a JMP instead GTO, the tool would have decided that this could have been coded with a SKIP instruction. These JMP->SKIP promotions will save a few steps here and there because the tool would not be forced to inject a LBL for the soft-targetted GTO.

I have attached a 'diff' output between your code and a slightly modified version to show you what I mean. The first line of each diff pair is the original line(s) from your code and the second line(s) are how I modified it. I can send you the modified code as a whole if you'd like. Just let me know.

Not that the resulting compression make too much difference, but your code assembled to 317 words in total (228 steps) and my variation assembled to 314 words (again, in 228 steps). This is mostly the loss of the additional LBLs (I think).

Keep up the fine work!

HP-15LE: Anybody else see double key registrations?

*Message #1 Posted by **BobVA** on 12 Nov 2011, 5:43 p.m.*

Just curious. Poked around a bit and didn't see this particular failure discussed (as opposed to the "clicks but didn't register" problem).

On mine (about a month old) I'll sporadically get two "divide" inputs for one press of the divide key. Happens about one in 15 times on average.

Calling HP tomorrow to see if I can get a replacement.

(I seem to be facing down a general technology revolt - everything from my valve cover gaskets to computer RAM decided to pack up at once!)

Bob

Re: HP-15LE: Anybody else see double key registrations?

*Message #2 Posted by **Michael de Estrada** on 12 Nov 2011, 6:05 p.m.,*
in response to message #1 by BobVA

What you are describing is commonly referred to as "repeating", and yes, I've noticed this behavior sporadically on my 15C LE. On mine it seems to affect all the keys, not just a particular one. It seems to occur only when I press the keys slowly, or use my thumbs. I doubt any replacement will solve this, as it's probably a software issue with debouncing.

Edited: 12 Nov 2011, 6:06 p.m.

Re: HP-15LE: Anybody else see double key registrations?

*Message #3 Posted by **Thomas Radtke** on 12 Nov 2011, 6:47 p.m.,*
in response to message #2 by Michael de Estrada

Tried hard to provoke bouncing on my 15C LE but fortunately to no avail.

Re: HP-15LE: Anybody else see double key registrations?

*Message #4 Posted by **Paulo MO** on 12 Nov 2011, 7:16 p.m.,*
in response to message #2 by Michael de Estrada

It can not be a software debouncing problem. It must be HW related. None of my two LE's does multiple key registers. The sofware debouncing algorithm seems to be doing the job. Ergo...

*Message #5 Posted by **BobVA** on 12 Nov 2011, 10:37 p.m.,*
in response to message #2 by Michael de Estrada

> Quote:
>
> I doubt any replacement will solve this, as it's probably a software issue with debouncing.

That's what I was thinking, too. But it only seems to happen on one key (divide) and my other LE doesn't exhibit the problem. It's very repeatable on one and non-existent on the other.

Which isn't to say that perhaps it couldn't be FIXED in software. It might be a case of some keys / keyboards needing a touch longer debounce than nominal and I've got one that's on the outer edge.

Bench Power Supply

*Message #1 Posted by **aj04062** on 12 Nov 2011, 1:30 p.m.*

I just purchased a 6216A power supply to work on calculators (and other stuff).

What should I set the max current rate at? Should it be different for different series HP's given their different battery configurations? (FYI the 6216A max output is 500mA)

Edited: 12 Nov 2011, 1:31 p.m.

Re: Bench Power Supply

*Message #2 Posted by **Eric Smith** on 12 Nov 2011, 1:59 p.m.,*
in response to message #1 by aj04062

Although the 6216A has a meter with a 500 mA scale, I believe it is only rated to provide a maximum of 400 mA. It should be able to provide 500 mA as long as the line voltage isn't low, but it may not meet the specifications.

250 mA is probably enough for any of the calculators that did not have a printer or card reader.

400 or even 500 mA is not enough for the printing calculators or the ones with card readers. They draw more than an amp when printing or reading/writing cards.

HP 41: a documentation odyssey

*Message #1 Posted by **Miguel Toro** on 12 Nov 2011, 11:04 a.m.*

I have zero knowledge on the legendary HP 41 series of calculators and derivatives (C, CV, CX, CL … even Z?). From times to times I have been tempted to acquire one, but prices have always been too high to really justify the disbursement, thus I never really felt any urgency to read the extensive documentation available.

Guided by my “everything 34s” infatuation, I followed with interest but at the same time with increased distress this post about a polynomial solver for the 34s. Apart from the, IMHO, unfair treatment towards Valentín Albillo, there is what I consider the real jewel : Ángel Martin’s post of Albillo’s solver for the HP 41. Could I, even with my infinite ignorance on the subject, port this to the 34s as a programming exercise? Naively as always, I said yes and began trying to decipher the code... and this is when things became interesting :-)

So, here I am with my first obstacle: two instructions [SIZE?] and [PSIZE]. “Very well, this should be somewhere in the user handbook” - I said to myself. I decided to search on what is here called TOS... and found no reference whatsoever on the entire manual. What the heck??? I googled them and I got the same fruitless result. Is this some kind of arcane, undocumented and obscure code only accessible to the initiated? I began to wonder. Back to TOS, I found a manual written by Ángel. Ah ha! And I see a program using the dreaded codes, both of them! And also my next significant clue: XROM 25, A6:6C. So, this is an extended rom thing and I had to look for the number 25!

Back to the museum, I look for this rom on the software>xrom section, finding several rom extensions implementing these two instructions, including an extended functions module identified with number 25! But there is no description of these instructions and even if I already had a little idea of what they do, I wanted to know how they really work. The next step was to look into the HP41 section of the museum and see that this module has a product number: the 82180A, and therefore there should be a user manual. So back again to TOS and voilà, finally the Holy Grail and reward of this embarrassing quest: the 82180A extended function/memory module manual, somewhat buried in the standard peripheral section of the library with the descriptions I was longing for.

So, I can finally advance to line 11 :-)

Conclusions

- After finishing writing these lines I will buy the museum DVD. It is really a must. Until now, I was satisfied with CDs I and II which contains the majority of manuals for my collection.

- It was a really fun Saturday morning activity ...

- But, I will never post a so shameful confession again!

Have a nice weekend!

Miguel

A better place to start if you can is the 41CX Owners manual, which included those extended functions in the original documentation.

But, how were you to know? :-)

Enjoy the journey!

Re: HP 41: a documentation odyssey

*Message #3 Posted by **Ángel Martin** on 12 Nov 2011, 12:32 p.m.,*
in response to message #1 by Miguel Toro

Miguel, you're at the beginning of a wonderful ride! :-) Here's a link thak can help a lot, provides the User Manuals on-line for the main 41 and the Extended functions:

http://www.greendyk.nl/hp41c-manual/index.php

The program in question has a few functions from the 41Z - another extension to the system that I wrote to handle complex numbers in a "decent" way, no FOCAL programs pls. If you're interested in Valentin's original listing I think it's available in one of the PPC TN, I should be able to dig out the reference.

Yes I think it should be easy to port to the 34S, but that may be just my ignorance since I'm not familiar with it.

Si tienes alguna pregunta me puedes escribir a: "ovolacteoarrobaonlinepuntode"

Saludos, 'AM.

Apart from the, IMHO, unfair treatment towards Valentín Albillo, there is what I consider the real jewel : Ángel Martin’s post of Albillo’s solver for the HP 41.

Thanks for your appreciation of my effort of 30+ years past. As for the *"unfait treatment"* towards me, don't worry, I'm more than used to it by now and doesn't upset me in the least. From Wikipedia:

> *"The Dunning-Kruger effect is a cognitive bias in which unskilled people make poor decisions and reach erroneous conclusions, but their incompetence denies them the metacognitive ability to recognize their mistakes. The unskilled therefore suffer from illusory superiority, rating their ability as above average, much higher than it actually is, [...] Kruger and Dunning proposed that, for a given skill, incompetent people will:*
>
> - *tend to overestimate their own level of skill;*
> - *fail to recognize genuine skill in others;*
> - *fail to recognize the extremity of their inadequacy;*
> - *recognize and acknowledge their own previous lack of skill, if they can be trained to substantially improve."*

I'm sure you can think of a number of people who should wear this shoe, as it fits exactly, isn't it ? ... :D

Thanks again, Miguel, have a nice weekend, and

Best regards from V.

Don't worry Walter, I already did quit!

I just had to defend myself after this posting of Mr.V.A., who continued to attack me and tried to make an idiot out of me, and this only because he didn't like my statements about some mathematical issue (although I even have the proof for it).

So you won't read here anything from me anymore -
well, at least unless these offences against me continue.

Franz

Re: [finally here!] Problems with International shipping of HP15c LE

*Message #1 Posted by **Nick_S** on 12 Nov 2011, 10:02 a.m.*

My three HP15c LE calculators have arrived at long last :-)

Here is a summary of the path taken (reminds me of the travelling salesman problem):

Departure USA, Sept 26, 2011, via New Caledonia, detour to France, stay 1 week in French customs, return to USA, arrival in Greece, 3-weeks in Greek customs, delivered to me in Athens on November 10, 2011.

Chris at Samson cables was helpful in contacting USPS to find out what was happening and for informing me of contact telephone numbers once the package had arrived at Greek customs.

I still need to do a full keyboard check and self test of each unit, but the one I am using has a nice reliable keyboard somewhere between my stiffer-clicking HP48GX and the softer-clicking HP28S. The HP15c LE is a much better quality calculator than the HP20b which I purchased a few months ago. My only criticism is that the x! , y^.r and Py,x key legends could do with being printed in a heavier yellow type to increase their clarity.

Nick

Best documentation for different features?

*Message #1 Posted by **David Hayden** on 12 Nov 2011, 3:14 a.m.*

I've been reading through the 48G manual and I was really impressed with the section on Units. Double-checking with the 50G User's Guide, I found that it really does do a much more thorough job of explaining how units work.

That got me thinking about other documentation. The 15C manuals do a great job describing SOLVE. I really liked the RPN primer in the 41C manual. So here's a question:

Which documentation do you think does the best job of describing which features of HP calculators?

Also, I wonder if the documentation becomes more and more brief as a feature gets older and older. It seems like RPN is glossed over in the newer manuals.

Dave

in response to message #1 by David Hayden

The 15C and 41C manuals are hard to beat in many respects. I also like several of the older ones esp the HP67 manual, it's pretty thorough.

The 42S manual is also a very good example of a concise technical reference, though I would not put it in the same class as the manuals above. I do believe as the calculators become more feature rich, some of the discussion on theory is traded to keep the length and printing costs down.

HP-15C LE replacement shipped

*Message #1 Posted by **Dale Reed** on 11 Nov 2011, 8:52 p.m.*

I had logged a support case with HP (per instructions I read here some weeks ago) because my HP-15C LE (CNA1310KBQ, #02198) had a divide key that took extra pressure to register.

Today I received an e-mail from Paul L. at HP support stating that my replacement unit just shipped 'Priority Overnight' and I should receive it by Tuesday latest -- although he did not have a tracking number to provide.

Perhaps they've reworked some of the stock and will soon be selling and shipping again?

But the 15C LE still shows "Out of Stock" on the HP Home and Small Office shop site. And it's not listed at all on the other business and enterprise sites, at least that I can find.

I'll believe it shipped when I have it in my hands. I'll let you know if they include packing and postage to ship the defective one back. Maybe it's a good thing I hadn't gotten around to opening it up and trying to fix it myself!

Dale

in response to message #1 by Dale Reed

I also got e-mail from Paul L. in regards to this. I asked him where to send the broken 15C to and was told: "As far as the defective calculator, at this time we will not be ask you to return it to us. You may dispose of it once you receive your replacement. "

Re: HP-15C LE replacement shipped

*Message #3 Posted by **Dale Reed** on 11 Nov 2011, 10:08 p.m.,*
in response to message #2 by Lincoln R.

Ah. So, if I take my flaky-divide-key one and open it up and fix it (per recently posted procedures and pictures by others, and I don't hack it up too badly), what does that do to the "Limited Edition"? Do I just end up with two (#02198 and some other number)? They wouldn't send another marked #02198, would they? Can't have two with the same LE number, right?

Did I just hose someone else out of an otherwise available "Limited Edition" calculator? Then I absolutely have to apologize to anyone who couldn't get one. I'm sorry.

I guess I'll end up with a good one to keep and one to open up and dink with and maybe fix or otherwise experiment around with. I sure can't complain, getting another. Just hate feeling like someone missed out because of this.

But before you all ask: No, I won't give the one with the flaky divide key away ;-) (Nor will I "dispose of it", nor will I put it up on TAS for a ridiculous price. Someone will get usefulness out of it.)

Re: HP-15C LE replacement shipped

*Message #4 Posted by **Thomas Radtke** on 12 Nov 2011, 2:32 a.m.,*
in response to message #3 by Dale Reed

It seems all calculators sold were in the LE-No. range of up to 3000. With about 10% defective units, that would make just 300 units for the bin, probably a sufficiently small number to be ignored.

The remaining number of 15C LE hopefully comes from a replacement production batch or hasn't been produced before the bug were encountered and fixed.

It's great to see a generous acting HP again and hope it works out for the overseas people as well. Now one last thing remains - the firmware update.

*Message #5 Posted by **Namir** on 12 Nov 2011, 8:12 a.m.,*
in response to message #3 by Dale Reed

Dale,

I read you comment about duplicate serial numbers. I became both curious and excited about the prospect.

Sooooooooooo, I programmed by Super Cray computer (which I have secretly assembled in my basement so that my calculator-monitoring wife would not know about it). I applied combination of Markov Chain Monte Carlo Methods (I had to actually call prince Albert II of Monaco to tweak the algorithm ... the guy is a math genius) with Quasi-deterministic Bayesian algorithms, and the spherical Bessel function of the ludicrous kind used in the Fermi-model for Uranium 238 nucleus. That was not as easy as it sounds to program.

In the output, my own beloved and most cherished Super Cray told me that I was a moron and demanded I take it back to the dealer. It printed, and I quote, "I'd rather be a stupid mp3 player than work for you!!" Harsh words, I must say. I was shocked that the machine did not take my question well!!

:-)

A while back I was lambasted for pointing this out, because, if I recall, the 35s is different, because it does not have an upgradable ROM. However, my point was, and may also be yours, that HP seemingly has no interest in fixing bad ROMs, with the exceptions of the 12c+ and 50g.

Re: HP-15C LE replacement shipped

*Message #12 Posted by **Michael de Estrada** on 12 Nov 2011, 10:49 p.m.,*
in response to message #11 by Martin Pinckney

Well, I don't own a 12C+, so I don't know about updates for it, but I did reflash my 50g EPROM when an update was offered. Of course, this is easily done with either the supplied USB cable and software or an SD card. The 12C+ and 15C LE require purchase of a cable and software not offered or supported by HP. For the average user this is an unacceptable hassle.

Excellent point.

Re: HP-15C LE replacement shipped

*Message #14 Posted by **Thomas Radtke** on 14 Nov 2011, 11:47 a.m.,*
in response to message #9 by Jeff O.

Jeff,

there was an update for the 12C+ - same bug, AFAIK. It's hopefully not rocket science to correct the 15C LE firmware for the units still to be sold, and I hope it has been done already (I guess we will know soon).

Unfortunately, the 12C+ update hasn't been made available, but then, I haven't heard of any requests for it. Different story now. Someone should leak the 15C LE update firmware to the community if HP didn't do it themselfs. That might violate the law, but is ethically as clean as a newborn.

And for those w/o cable, I'm sure we can arrange to find users do this for them. I for one would be willing to update calculators for german forum members.

Thomas

I presume you mean that if the replacement units come with an updated rom, that one of those receiving such a unit should "share" the rom. From what I understand, there is no way to extract the rom from the calculator itself, so HP would have to release it to someone in electronic form.

> Quote:
>
> And for those w/o cable, I'm sure we can arrange to find users do this for them. I for one would be willing to update calculators for german forum members

I thought about suggesting that as an option HP could use to distribute a new rom. But I doubt they could actually formally support or encourage such program due to liability reasons. I.e., if they tell people to send their calculators to me to re-flash, and I decide to keep them for myself, HP would be liable. (I am not a lawyer, just applying common sense.)

Re: HP-15C LE replacement shipped

*Message #19 Posted by **Thomas Radtke** on 14 Nov 2011, 12:57 p.m.,*
in response to message #18 by Jeff O.

I wouldn't, too. Such things leak all the time out of conviction, not because they have been requested. Well, it's just a chance.

Having an update and keep it from users spending $100+ for a certain product would be an incredibly stupid thing to do, taking into account that the 15C ROM can be found easily on the net anyway. I can't see any additional value in the emulating stuff around it, so HP likely will release it.

Edit: ... as they did with the 20b firmware.

I'm waiting for the Victor V15.

Re: HP-15C LE replacement shipped

*Message #21 Posted by **Thomas Radtke** on 14 Nov 2011, 3:29 p.m.,*
in response to message #20 by Michael de Estrada

I took a chance and contacted them about exactly that. Of course, I didn't get any further than getting the usual nonsense response.

Now that the 15C LE apparently sells well, someone might notice it and produce a V15, an Aurora 1000S or something similar. But ... the 15C *is* actually back and we'll see how things develop. I see no reason why HP doesn't want to make some money from this success and does a few things unexpectedly right. It's about time.

I'm obviously biased, but IMHO the emulation implementation is precisely where the value lies for either ARM based voyager. Legacy voyager firmware images are largely an opaque bag of bits into which you can drill just enough to accurately emulate their execution. It is the emulation engine which gives the legacy rom images application beyond execution via a 30 year old 0.0039 MIPS NUT processor.

Concerning a firmware upgrade, on one hand as HP released an update for the 12c+ it would seem there is precedent for doing so. Unsure whether they will be more concerned with the prospect of letting a 15c le image loose in the wild nor does that service approach seem to scale very well in general.

> Concerning a firmware upgrade, on one hand as HP released an update for the 12c+

Well, an update was provided to a few people, but they never actually formally released it. It's not like you can go to the HP we site and download it. I think current new models are still shipping with an earlier version.

Re: HP-15C LE replacement shipped

*Message #24 Posted by **Lincoln R.** on 14 Nov 2011, 8:29 p.m.,*
in response to message #23 by Jeff O.

Would posting the update on HP's website be that useful? They would also have to set up a distribution channel for the cables, official documentation for the flash tools and/or a more user-friendly tool than SAM-BA.

I just can't see the current procedure for this (get flash cable by sending money to a guy on the internet <no offense to Gene, we all know him as a great guy but random HP customers don't know him from Adam>, fill out big form to download Atmel's programming software, hold down crazy sequence of buttons to enter programming mode, etc.) being something HP would officially post. I find it more likely that if they do anything other than quietly give the update to us like they did with the 12C+ code they would probably have people mail in their calculators to be reflashed.

Re: HP-15C LE replacement shipped

*Message #25 Posted by **Gerry Schultz** on 14 Nov 2011, 9:17 p.m.,*
in response to message #24 by Lincoln R.

I hate to say it but the only practical solution for HP is to institute a replacement program. If you've registered your 15C LE (or not) and you contact them with a complaint about it (either software or hardware), they will send you a replacement and not even bother with your old unit. They might request that you exchange your bad unit for a new one, but all they will do is dispose of it. It's just too expensive for them to do anything else and they already have customers who are angry about a brand new calculator that has problems. I own 4 of these 15c LEs and I left two of them with Tim back in September. I'm sure when new calculators are issued that have the excessive current solved, the bad keys replaced and the firmware upgraded, he will send me replacements. I should send him an email asking how it's going.

The real question here is HP going to provide a path for us die-hard owners to upgrade the firmware for the LEs we already own? They can but I would think the concern HP would have is a third-party using the firmware upgrade to build near perfect clones of the 15C LE at a 10th of the price (though I'm sure the keyboard and display will suck).

Also, remember, HP has made these programming cables available to allow us to re-program the 20b and 30b calculators with WP34s firmware, not perform firmware upgrades to existing units. There is no liability for HP to have a customer reprogram a perfectly good 20b/30b. I know the original 20b firmware is available but the 30b firmware isn't available as far as I know. If HP releases a firmware upgrade to the 15C LE and the average customer has no idea how to do this (How do I hook a D9 connector to my Win7/Mac PC? What is FTDI?), who will the customer become angry with?

I hope HP surprises me and does both, but I'm not holding my breath.

Gerry

Re: HP-15C LE replacement shipped

*Message #26 Posted by **Lincoln R.** on 14 Nov 2011, 10:07 p.m.,*
in response to message #25 by Gerry Schultz

Meh. Plugging a programming cable in isn't that expensive. Unless these things are stupidly cheap to make, which I doubt because they're being turned out in small batches, and look like an HP 15C, which means brushed metal, custom painted faceplate/backplate, a chrome 15C logo, and other things not seen on your average $15 Casio. Even compared to a 30b, I'm almost certain the 15C costs more to make.

I can understand HP telling us to pitch the ones with bad keyboards, those would be far too labor-intensive to fix (and fixing it correctly would involve either screws or replacing the front case).

As for a third party snarfing the 15C firmware, I don't know how much of a concern that really is, or how much of a deterrent the 'no firmware image' thing is. A sufficiently motivated copycat could get it out of the chip one way or another even if it took decapping the IC or something (even easier than a 12C+ since the 15Cs have plastic packaged CPUs instead of chip on board). And I just don't know if a 15C copycat would be economical. 12Cs sure, but the 15C has a very limited market, and that market wants it to say "Hewlett Packard" on the front.

Re: HP-15C LE replacement shipped

*Message #27 Posted by **Eddie W. Shore** on 15 Nov 2011, 8:15 a.m.,*
in response to message #26 by Lincoln R.

I can't imagine why someone would not want to produce a 15C clone. There are several companies that produces clones on the iPhone and Andriod market.

As far as replacement - it would make sense for HP to have a swap and replace program for updated 15C for those who purchased calculators from the first batch. Of course, there will be a at least a week's time between the shipments - which presents big time problems for those who had to wait months for their order to arrive.

Re: HP-15C LE replacement shipped

*Message #28 Posted by **Lincoln R.** on 15 Nov 2011, 11:02 a.m.,*
in response to message #1 by Dale Reed

My replacement arrived today. CNA14400SH, LE#13047. Keyboard seems perfect, firmware is the same version (Checksum FFFFh, date 2011-04-15). Came in a FedEx box shipped from Fort Collins, CO, just the calculator, no accessories/documentation (which makes sense, people getting these already have boxes and cases and manuals).

Re: HP-15C LE replacement shipped

*Message #29 Posted by **Jeff O.** on 15 Nov 2011, 1:27 p.m.,*
in response to message #28 by Lincoln R.

Although there is no new firmware, there is perhaps some good news in your report. The serial number implies that it was manufactured in week 44 of this year, which by my calculations was the last week of October. The CNA implies that it was made in the same factory as the earlier units. So hopefully this means they sorted out the manufacturing difficulties that were causing the keyboard problems and have restarted production. In other words, they have not just sorted through and tested all units produced in the first production run to find those with good keyboards to send out to replace faulty units. The LE number implies that at least 13,047 units have been made, so maybe the "10,000 unit limited production run" rumor was unfounded.

Or perhaps I read too much into the available information.

Re: HP-15C LE replacement shipped

*Message #30 Posted by **Lincoln R.** on 15 Nov 2011, 3:25 p.m.,*
in response to message #29 by Jeff O.

The LE number may not mean that, but it does mean that at least 13,047 back plates were made, since it would seem that backplate LE numbers and serial numbers have no relationship. Since the 'manufacturing difficulties' seemed to be sloppy heatstaking and/or debris getting into the keyboards, I'd imagine resolving those was simply a matter of disassembling a few 15Cs, discovering these problems, and yelling at the factory to be more careful.

So, debugging it in time for the replacement units was obviously not possible or worthwhile. That's really bad news and a first indication that it will never happen :-(.

Agree completely.

> Quote:
>
> But work culture may be different there ;-)

I'm not sure it is a work culture/ethic at the choice of an engineer but perhaps a difference of competitive business philosophy. Eg, resources are expended to the extent of producing a product which is marginally (but not excessively) superior to the competition. Doing so finite resources are conserved and redirected to another competitive front.

All else being equal this is one reason opensource development routinely produces a superior polished product as work continues to an engineer's passionate lunatic fringe vs. halting when the development budget has been deemed exhausted.

Of course old HP was an infamous exception in this respect.

New TI-PPP discovered!

*Message #1 Posted by **Joerg Woerner** on 11 Nov 2011, 6:35 p.m.*

It is not from HP but might be from interest for you, too.

Texas Instruments is in the process of moving the Educational Department and the employees started some house cleaning. One employee discovered a never released prototype - and it arrived less than 10 minutes ago here at the Datamath Calculator Museum.

It is a real triple-P:

One P for Programmable

One P for Printing

One P for Prototype

I would guess that it was developed about 20 years ago, later than e.g. the HP-41C.

It will be featured in December in the Museum - today just a small teaser:

Have a great weekend.

Regards, Joerg

HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #1 Posted by **Valentin Albillo** on 11 Nov 2011, 2:30 p.m.*

Hi all:

The recent release of the **HP-15C LE** is a momentous event which truly deserves a *great celebration* on my part, being as I am a life-long sworn fan of this wonderful model (most especially today which is the one-and-only **11-11-11** date you'll get to see for the next 100 years or so).

However, as I'm currently not in the mood for any great efforts and I'm feeling a little lazy today, methinks you'll have to make do with this *two-bit*

HP-15C (& LE!) 11-11-11 Mini-Challenge

We all know that *numerical integration* is all the rage these days in the forum with plenty of good algorithms being discussed and offered for consideration to the WP34S team and such. The best of those integration algorithms are powerful and complex, a many-byte affair.

However, on the other hand, the ugly duckling would be **numerical derivation** which, unlike integration, can usually be done by numerically evaluating a symbolically-obtained derived function y'(x) at any specified X ordinate. Regrettably, that requires some advanced symbolic manipulation which is simply unavailable in the HP-15C (&LE!) and thus numerical approximations is the only way to go.

So the challenge is:

You're asked to write a program for the **HP-15C (& LE!)** which must be as short as possible, and which can evaluate the **derivative** at a given ordinate X of a user-supplied function **y(x)**, subject to the following *mandatory* requirements.

The exact requirements your program must meet are:

1. first and foremost, it must be *as short as possible*, anything more than a dozen steps or two means back to the drawing board for you. The program must begin with **LBL A** and end with **RTN**.

2. it must accept a given real ordinate X in the display and produce the value of the *derivative* of **y(x)** at that ordinate, where **y(x)** is a user-supplied function which must be accessible under **LBL E**.

3. it must *not* depend on or require any particular setting or any particular memory allocation to be previously stablished.

4. it must *not* require any pre-stored constants in the registers or stack contents except for the ordinate X being initially in the display at runtime.

5. and last but not least, it must strive to produce *full 10-digit accuracy* (except for the usual cases of particular troublesome points or ranges, etc, of course).

Sample of use:

1. given **y(x) = e^x/Sqrt(sin(x)^3+cos(x)^3)**, find **y'(1.5)**

```
define y(x) -> LBL E, e^X, LAST X, LAST X, SIN, 3, y^x, X<>Y, COS, 3, y^x,
+, SQR, /, RTN

1.5, GOSUB A ->  4.053427894, which is the correct result to all 10 digits
```

2. given **y(x) = 7*$e^{(2.1*X)}$**, find **y'(15)**

```
define y(x) -> LBL E, 2.1, *, e^X, 7, *, RTN

15, GOSUB A -> 7.040338081 E14, which is the correct result to all 12 digits
```

3. given **y(x) = sin(x)/e^x**, find **y'(1)**

```
define y(x) -> LBL E, SIN, LAST X, e^X, /, RTN

1, GOSUB A -> -0.1107937653, whis is correct to all 10 digits
```

Within a few days I'll post my solution, which is just **11 steps** long, meets all five conditions above, and produces the sample results above correct to all digits shown. Relaxing a condition or two could shorten it even further, to just 6 steps or even just 5, but let's first keep all five requirements above and see what **YOU** can produce ... :)

Enjoy !

Best regards from V.

.

*Message #3 Posted by **peacecalc** on 12 Nov 2011, 2:44 a.m.,*
in response to message #2 by Gerson W. Barbosa

Hello Gerson,

I'm sorry but I think your code doesn't function in the way you want.

I miss the "-" operation, which is nessecary for calculating: "f(x+h)/h - f(x)/h"

But your idea is genial, **parallel computing** with the hp 15c!

sincerely peacecalc

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #4 Posted by **Thomas Radtke** on 12 Nov 2011, 6:09 a.m.,*
in response to message #3 by peacecalc

Looks like Gerson ingeniously implemented this.

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #5 Posted by **Gerson W. Barbosa** on 12 Nov 2011, 8:17 a.m.,*
in response to message #4 by Thomas Radtke

My source, actually. That's what Wikipedia and Google are for :-) Technically we should get rid of the imaginary part in the end, either by setting the complex mode off or by clearing the register X before the second Re<>Im instruction. This takes one extra step, however.

Here is an HP-42S solution:

```
00 { 27-Byte Prgm }
01 LBL "DRV"
02 1E-9
03 RCL* ST Y
04 STO 00
05 COMPLEX
06 XEQ "FN"
07 COMPLEX
08 RCL/ 00
09 END
```

Example:

```
00 { 8-Byte Program }
01 LBL "FN"
02 LN
03 RTN

1E-490 XEQ DRV -> 1.E490
       XEQ DRV -> 1.E-490
```

You might want to insert X<>Y and Rv between the steps 08 and 09. The answer will be valid only if FN returns a real result for the given X. A few more steps might handle this.

Gerson.

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #6 Posted by **Werner** on 12 Nov 2011, 10:13 a.m.,*
in response to message #5 by Gerson W. Barbosa

Or,

```
00 { 25-Byte Prgm }
01 LBL"DER"
02 1E-9
03 COMPLEX
04 ASTO L
05 XEQ IND ST L
06 COMPLEX
07 1E9
08 *
09 END
```

It does not need a predefined alpha label for the function
It does not use registers, numbered or other. Just the alpha register to pass the function name

Cheers, Werner

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #7 Posted by **Gerson W. Barbosa** on 12 Nov 2011, 10:44 a.m.,*
in response to message #6 by Werner

Thanks for the tip, Werner. It doesn't give correct results when |x| >= 1e4 for my example (LN), unless a slight modification is made:

```
00 { 27-Byte Prgm }
01 LBL "DER"
02 1E-9
03 RCL* ST Y
04 STO 00
05 COMPLEX
06 ASTO ST L
07 XEQ IND ST L
08 COMPLEX
09 RCL/ 00
10 END
```

Cheers,

Gerson.

Edited: 12 Nov 2011, 10:48 a.m.

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #8 Posted by **Dieter** on 12 Nov 2011, 12:13 p.m.,*
in response to message #7 by Gerson W. Barbosa

What about x = 0? This currently means that h = 0 as well, throwing a division by zero error. Setting h = 1E-9 in this case is not really an option. ;-)

Dieter

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #9 Posted by **Gerson W. Barbosa** on 12 Nov 2011, 12:29 p.m.,*
in response to message #8 by Dieter

Ooops!

```
00 { 28-Byte Prgm }
01 LBL "DER"
02 1E-9
03 X<Y?
04 RCL* ST Y
...
```

This should handle practical cases. Of course the result is not valid for LN(x) because LN(0) is not defined.

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #10 Posted by **Dieter** on 12 Nov 2011, 12:48 p.m.,*
in response to message #9 by Gerson W. Barbosa

Are negative values no practical cases ?-)
What about x = -1 000 000? This would set h = 1E-9 as well.

Dieter

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #11 Posted by **Gerson W. Barbosa** on 12 Nov 2011, 1:45 p.m.,*
in response to message #10 by Dieter

Back from a nap... which might explain it (don't program when you're sleepy :-)

Back to the drawing board:

```
00 { 29-Byte Prgm }
01 LBL "DER"
02 1E-9
03 RCL* ST Y
04 X=0?
05 LASTX
06 STO 00
...
```

Or on the HP-15C:

```
001- f LBL B
002-   ENTER
003-   ENTER
004-   EEX
005-   CHS
006-   9
007-   *
008- g x=0
009- g LSTx
010-   STO 0
011- f Re<>Im
012-   +
013-   GSB E
014- f Re<>Im
015-   RCL/ 0
016- g CF 8       ; leave complex mode
```

```
017- g RTN

018- f LBL E
019- g LN
020- g RTN

 keystrokes       display

EEX 90 GSB B -> 1.000000-90
       GSB B -> 1.000000 90
```

Any idea to save a step or two?

Edited: 12 Nov 2011, 7:57 p.m.

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #12 Posted by **Dieter** on 13 Nov 2011, 8:00 a.m.,*
in response to message #11 by Gerson W. Barbosa

Gerson,
I think we are discussing a problem that actually does not exist. ;-) There is no need to make sure that h is a certain fraction of x. And x=0 does not require any special handling either. The method should work for essentially any h, regardless of the magnitude of x. Consider your ln(x) example. It doesn't matter if x is 1 or 50000 or 10^9 - in all cases h = 1E-9 will do. Remember, h is *not* added to x, it's just used for its imaginary part.

Example:

```
   x = 1234567890
   h = 1E-9
   ln (1234567890 + 1E-9 i)
     = 2,9339868592 + 8,10000007371E-19 i
So
  f' = 8,10000007371E-19 / 1E-9
     = 8,10000007371E-10
     = 1/x
```

It even works down to h = x * 1E-99 resp. x * 1E-499.
Or, in other words: your very first solution was fine already. ;-)

Dieter

*Message #14 Posted by **Dieter** on 13 Nov 2011, 9:06 a.m.,*
in response to message #13 by Gerson W. Barbosa

I see, so the problem arises for values close to zero. On the other hand you previously said *"...it doesn't give correct results when |x| >= 1e4 for my example (LN)"*, so I took a closer look at *large* values. #-)

This leads to the question if there is a clever way to determine a suitable h that's small enough to ensure sufficient precision as well as large enough to prevent underflow. But I fear this cannot be done in 11 steps or less. ;-)

Dieter

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #15 Posted by **Gerson W. Barbosa** on 13 Nov 2011, 9:44 a.m.,*
in response to message #14 by Dieter

> Quote:
>
> But I fear this cannot be done in 11 steps or less. ;-)

Agreed! The steps 11 and 12 in the program above can be replaced by [f] [I] per Thomas Klemm's suggestion. Now it's only 16 steps long and decounting :-)

Gerson.

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #16 Posted by **Thomas Klemm** on 13 Nov 2011, 10:47 a.m.,*
in response to message #14 by Dieter

From The Complex-Step Derivative Approximation:

> Quote:
>
> Taking the imaginary parts of both sides of this Taylor series expansion (7) and dividing it by h yields:
>
> $$f'(x) = \frac{Im[f(x+ih)]}{h} + h^2\frac{f'''(x)}{3!} + \cdots$$
>
> Similarly, for the truncation error of the derivative estimate to vanish, we require that:
>
> $$h^2\left|\frac{f'''(x)}{3!}\right| < \varepsilon|f'(x)|$$

For this example we have:

$$f(x) = \log(x)$$

The third derivative is:

$$\frac{d^3}{dx^3}\log(x) = \frac{2}{x^3}$$

This leads us to:

$$h^2 < \varepsilon|3x^2|$$

or

$$h < \sqrt{3\varepsilon}|x|$$

So with a relative working precision of 1e-10 we should be happy with h = 1e-5 |x|. It turns out this isn't exactly enough but it seems h = 1e-6 |x| is.

> Quote:
>
> This leads to the question if there is a clever way to determine a suitable h that's small enough to ensure sufficient precision as well as large enough to prevent underflow.

I doubt that this can be achieved in general. OTOH we probably run only into problems in the neighborhood of singularities but Valentin stated in requirement 5:

> Quote:
>
> (except for the usual cases of particular troublesome points or ranges, etc, of course)

Therefore I guess we can live with h = 1e-9 in most of the cases.

Cheers
Thomas

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #17 Posted by **Werner** on 13 Nov 2011, 9:17 a.m.,*
in response to message #12 by Dieter

I thought so too, at first, but: take f(x)= LN(x) and x = 1e-10 then (with h=1e-9):

```
f(1e-10,1e-9) = (-20.7182906715,1.4711276743)
```

and the calculated derivative is 1471127674.3 instead of 1e10.
Making h smaller will work, so you might think, let's take the smallest possible h=1e-499. But then,
Taking h=1e-499 returns f'(1e499)=0, as underflow occurs in the calculation of LN(x,h).
Scaling h by x, as Gerson did, works for the whole range.

Cheers, Werner

This may help to shorten the f' function in WP 34S which is implemented in user code. Pauli?

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #20 Posted by **Paul Dale** on 13 Nov 2011, 2:01 a.m.,*
in response to message #19 by Marcus von Cube, Germany

This method isn't really suitable for the 34s. It requires a complex evaluation of the user supplied function which isn't seamless unfortunately.

The 34s differentiation routine uses 4, 6 and 10 point estimates and returns the 10 point one if

all evaluations succeed.

I've not attempted this challenge on the 34S but the code is nice and short:

```
LBL A
f'(x) D
RTN
```

Using label D instead of E. Shorter again to not bother coding this and just enter f'(x) D :-)

- Pauli

It does work. That was Valentin's idea, though. I've only figured out which it was, I think.

Regards,

Gerson.

Hello Gerson,

I beg your pardon Gerson, my lessons in complex functional analysis are 30 years left. I forgot them.

Now, it's a good reason for me repeating that stuff, because it's new for me to use result from this for numerical purposes.

sincerely peacecalc

in response to message #22 by peacecalc

Hello,

Same here. As I said, I've only implemented the formula in the Wikipedia article above. The following paper provides a detailed explanation of the method:

The Complex-Step Derivative Approximation

Regards,

Gerson.

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #24 Posted by **Thomas Klemm** on 13 Nov 2011, 8:00 a.m.,*

in response to message #23 by Gerson W. Barbosa

It appears that Valentin took the first example from this paper:

2.2 A Simple Numerical Example

Since the complex-step approximation does not involve a difference operation, we can choose extremely small step sizes with no loss of accuracy.

To illustrate this point, consider the following analytic function:

$$f(x) = \frac{e^x}{\sqrt{\sin^3 x + \cos^3 x}}. \qquad (12)$$

The exact derivative at $x = 1.5$ is computed analytically to 16 digits and then compared to the results given by the complex-step formula (6) and the forward and central finite-difference approximations.

Kind regards
Thomas

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #25 Posted by **Thomas Klemm** on 13 Nov 2011, 7:35 a.m.,*
in response to message #2 by Gerson W. Barbosa

Saved one step:

```
001 - 42,21,11   LBL A
002 -        26   EEX
003 -         9   9
004 -        16   CHS
005 -     44  0   STO 0
006 -    42  25   I
007 -    32  15   GSB E
008 -    42  30   Re<>Im
009 - 45,10,  0   RCL ÷ 0
010 -    43  32   RTN
```

Nice solution!

Cheers
Thomas

in response to message #25 by Thomas Klemm

> Quote:
>
> Saved one step

Great!

This should be closer to Valentin's original solution. I guess his solution includes

```
10- 53, 5, 8  CF 8
```

This is required to get rid of the imaginary part. Try, for instance, squaring f'(pi/6) when f(x) = sin(x).

The correct result is 3/4 not 1/2 + sqrt(3)/2*i. When I saw your listing, I imagined it would not work if the complex mode had not been previously set. I had tried a similar program, except that I included SF 8 in the beginning (I didn't remember [f] [I] activates the complex mode, like Re<>Im does).

Cheers,

Gerson.

in response to message #25 by Thomas Klemm

I learnt something today, thanks to Valentin.

For the fun, here is a solution of the last two problems for the HP32SII. At least I found a use of the HP32SII complex mode!

```
LBL A
1E-9
x<>y
XEQ E
x<>y
1E-9
/
RTN

LBL E  ( 2nd problem )
0
2.1
CMPLX*
CMPLXe^x
0
7
CMPLX*
RTN

LBL E  ( 3rd problem )
0
ENTER
CMPLX+
CMPLXSIN
Rv
Rv
CMPLXe^x
CMPLX/
RTN
```

I didn't succeed to write it on the HP35s...

Re: HP-15C (& LE!) 11-11-11 Mini-Challenge

*Message #28 Posted by **Gerson W. Barbosa** on 13 Nov 2011, 6:17 p.m.,*
in response to message #27 by J-F Garnier

The first problem is possible as well:

```
A01 LBL A
A02 1E-9
A03 STO B
A04 x<>y
A05 XEQ E
```

```
A06 x<>y
A07 RCL/ B
A08 RTN

E01 LBL E
E02 STO A
E03 RCL B
E04 x<>y
E05 CMPLXCOS
E06 RCL B
E07 RCL A
E08 CMPLXSIN
E09 CMPLX+
E10 0
E11 3
E12 CMPLX*
E13 3
E14 RCL* B
E15 3
E16 RCL* A
E17 CMPLXCOS
E18 CMPLX+
E19 3
E20 RCL* B
E21 3
E22 RCL* A
E23 CMPLXSIN
E24 CMPLX-
E25 0
E26 4
E27 CMPLX/
E28 2
E29 RCL* B
E30 2
E31 RCL* A
E32 CMPLXe^x
E33 CMPLX/
E34 CMPLX1/x
E35 0
E36 ENTER
E37 0.5
E38 CMPLXy^x
E39 RTN

1.5 XEQ A -> 4.05342789391
```

Better use the original expression and save the intermediate results to registers. Or use the HP-28S symbolic differentiator instead :-)

Regards,

Gerson.

HP-15C (& LE!) 11-11-11 Mini-Challenge ORIGINAL SOLUTION & COMMENTS

*Message #29 Posted by **Valentin Albillo** on 14 Nov 2011, 8:12 a.m.,*
in response to message #1 by Valentin Albillo

Hi, all:

Thanks for your interest in my HP-15C (&LE!) Mini-challenge, I'm glad many of you enjoyed it and produced a number of correct solutions, some of which virtually duplicated my original one, as well as producing solutions for other models. That's the spirit of these challenges and mini-challenges and I thank you for joining in.

As for my original solution, this is it:

```
01  LBL A
02  EEX
```

```
03   6
04  CHS
05  STO I
06   I
07  GSB E
08  Re<>Im
09  CF 8
10  RCL/ I
11  RTN
```

which is 11 steps and meets all 5 requirements. I prefer to use h=1E-6 instead of smaller values and I think that CF 8 must be included lest you'll leave the machine in complex mode, which would be utterly unexpected to the user as both the input and the output are assumed and expected to be real.

Partially relaxing condition (1), i.e., supressing LBL and RTN, would save two steps, while relaxing condition (4), i.e., pre-storing 1E-6 in a register, would save three additional steps, leaving the grand total at a mere 6 steps or so. An additional step could be saved by supressing CF 8 but as stated above, I think this would seriously detract from the usability.

As for the register used to store the constant, I prefer using permanent register RI instead of R0 or R1 (also permanent) though, as the constant is less than one, the best solution is using register RAN#, which frees RI for indexing purposes and R0-R1 for general use or matrix operations. However, as there's no RCL\ RAN# instruction this means an additional step to perform the division.

Finally, I knew that for X arguments near 0 accuracy would get worse and so require extra steps to cater for that case, thus this is why I included the exception at condition (5) in order to keep it short and sweet. After all, this was intended as a Mini-challenge, not a full-fledged article on numerical derivation complete with industrial-strength code ! ... :D

When I was busy concocting this mini-challenge, I first implemented it for the HP-71B, where the code is as simple as

```
IMPT(FNF((X,H)))/H
```

where FNF is the user-defined function f(x) and H is a suitably small constat (1E-7, say). I conducted some experiments to see which H would be best, for instance:

```
10 DEF FNF(X)=5*COS(10*X)+((X-2)*X-6)*X+10
20 DEF FND(X)=-50*SIN(10*X)+3*X*X-4*X-6
30 FOR I=1 TO 9 @ H=10^(-I) @ DISP I;IMPT(FNF((1,H)))/H,FND(1) @ NEXT I

>RUN

 1  24.9567129442     20.2010555444
 2  20.24631331       20.2010555444
 3  20.2015078976     20.2010555444
 4  20.201060068      20.2010555444
 5  20.2010555897     20.2010555444
 6  20.2010555449     20.2010555444
 7  20.2010555444     20.2010555444  << H=1E-7 first nails the exact derivative
 8  20.2010555444     20.2010555444
 9  20.2010555444     20.2010555444
```

and in virtually all cases H = 1E-7 was optimal (except for X near 0, of course, where a smaller H is needed). For the HP-15C, which only carries 10 (13) digits instead of 12 (15), H=1E-6 does the trick.

That's all. I've got (hopefully) interesting ideas for some dozen challenges and mini-challenges as well as for another dozen full-fledged articles but regrettably next to no or very little time to write them down & post them hera, and actually no suitable place to publish the long articles so it might be a while till I make another lengthy contribution ... :(

Thanks again for your interest and best regards from V.

My HP 33S came in yesterday

*Message #1 Posted by **Eddie W. Shore** on 11 Nov 2011, 12:58 p.m.*

I wonder if the display has been improved like it has been reported. This was to replace my broken 33S.

I think I now have almost at least one of all the calculators made since 2003 (39gs, 40gs, 50g, 49g+, 10bII, 10bII+, 35s, 33s, 12C, 12C 30th Ann, 15C LE).

Re: My HP 33S came in yesterday

*Message #2 Posted by **M. Joury** on 11 Nov 2011, 1:48 p.m.,*
in response to message #1 by Eddie W. Shore

12C Plat? Or does that not qualify? When did they start making it?

Re: My HP 33S came in yesterday

*Message #3 Posted by **Eddie W. Shore** on 12 Nov 2011, 12:58 a.m.,*
in response to message #2 by M. Joury

Forgot about that, yes, both the silver 12C Platninum (which I never use) and the 25th Ann. Edition, the latter which I gave to my dad.

Re: My HP 33S came in yesterday

*Message #4 Posted by **bill platt** on 11 Nov 2011, 6:54 p.m.,*
in response to message #1 by Eddie W. Shore

wow, that's a lot of new Kinpo stuff.

I've bought a number of 33s and one 35s the latter being lost and a number of teh former being lost or broken. At least they are chump change comapred to the friggin lpatops which get borken all the time (TG I insure tehm)...

I hear that I really aught to get a 50g but I already have 2 48gx so not so motivated

Re: My HP 33S came in yesterday

*Message #5 Posted by **Eddie W. Shore** on 12 Nov 2011, 1:00 a.m.,*
in response to message #4 by bill platt

I started collecting HP calculators around 2000.

Quick review of the 33S: it is probably the closest I'll get to the 32s/32s ii ($250+ for a 32s). IHMO the decimal point is clearer but not bigger. The keyboard is much better than the 2003 version. CNA141000C

Algorithm for fitting a logistic curve?

*Message #1 Posted by **Tim Wessman** on 11 Nov 2011, 12:05 p.m.*

Hello,

Working on the math library here, and I have had an immensely difficult time finding how to efficiently implement a logistic curve fit. Note, this isn't a full fledged binary logistic regression (which I can find lots of information on), but rather the fitting of a curve to a set of data with the form L/(1+a*^(-b*x)).

The fitting method in the math library right now linearizes the equation and it doesn't give a very good fit at all so I am trying to replace it.

Does anyone have any helpful pointers to any algorithms for this type of problem?

I have posted the Charlie Patton's code comments below from the 48 math library for those interested (he wrote this originally). I am not 100% certain if the issue is the linearization and a completely different method is needed, or just the L esitmator routine needs replacing/improvement.

```
*       Name: fitlogist
* Algorithm: The basic model is:
*              y=L/(1+A*e^(B*x))
*            which is equivalent to:
*              Ae^(B*x)=(L-y)/y
*            so that
*              ln(A)+B*x=ln(L/y-1).
*
*            Fit a linear model to the transformed data
*               ( x(i), ln(L/y(i)-1)) to obtain y=a+bx
*            then A=e^a and B=b
*
*            Note B normally would be negative
*

**       Stack:  L% (or %0 if there's a problem with zero divisors)
**
**
**       Temp. Env.
**
**Errors:
**
**
**Description/Algorithm:
**
** This utility attempts to estimate the saturation value for a logistic
** equation from sorted statistical samples.
```

```
**
** It is assuming that the data Y(X) (stored in pair form X[i],Y[i]) corresponds
** to samples from a differential equation dY(X)/dX = Y(X)*k*(L-Y(X))
**
** Note that this is an autonomous ODE with nodes at Y=0 and Y=L.
** If we plot (1/Y)*(dY(X)/dX) as a function of Y (note that it doesn't really depend
** on X) we will get a straight line with a zero at Y=L. It is this fact we will use
** to approximate L from the data. Namely, replacing dY(X)/dX by it sampled version
**      dY(X)/dX ~ Y'[i]=(Y[i+1]-Y[i])/(X[i+1]-X[i])
** we do linear regression on the pair Y[i],Z[i] with Z[i]=Y'[i]/Y[i] and
** find the zero of the corresponding line.
**

Re: Algorithm for fitting a logistic curve?

*Message #2 Posted by **Eric Smith** on 11 Nov 2011, 1:47 p.m.,*
in response to message #1 by Tim Wessman

In my experience, fitting either the logistic function or the tanh function tends to get poor results. I suspect that this is due to how rapidly they go asymptotic, but that's really only a guess on my part. Hopefully someone knowledgeable about numerical analysis can explain how to do it properly.

Linearizing the equation, followed by a simple linear regression, is a classic method that usually gives decent results. However, it does not minimize the sum of the residuals' squares. How did you determine the quality of the fit here?

> Quote:
>
> I have posted the Charlie Patton's code comments below from the 48 math library for those interested (he wrote this originally). I am not 100% certain if the issue is the linearization and a completely different method is needed, or just the L esitmator routine needs replacing/improvement.

As far as I can see the comments simply refer to the common linearization, which here leads to the transformation ln(A)+B*x = ln(L/y-1). The goal of the algorithm however seems to be a different one: implement a method to estimate the saturation parameter L: *"This utility attempts to estimate the saturation value for a logistic equation from sorted statistical samples"*.

A true least-square regression, i.e. one that exactly minimizes the sum of the residuals' squares, is not trivial. I came across the following document and think it's an interesting read on this subject:
http://home2.fvcc.edu/~dhicketh/DiffEqns/Activities/logistic.pdf

in response to message #1 by Tim Wessman

Tim, Unfortunately, if you linearize an equation to fit it to your data, you do not minimize the SSE. And, not all equations can be linearized. What is needed is a non-linear fitting routine. But this requires a calculator with a CAS system so you can compute the derivatives of the equation with respect to the parameters. I have done this for the TI-89 and the NSpire CX CAS. If you want, I can send the routines to you. My email is don.phillips@gmail.com.

in response to message #4 by MacDonald Phillips

I can't believe I'm saying this (being a big fan of CAS calculators), but you don't NEED to use a CAS. I use Excel's Solver routine all the time to do least squares fitting to arbitrary function forms.

Tim,

> Quote:
>
> Does anyone have any helpful pointers to any algorithms for this type of problem?

How critical is speed?

Perhaps you've already been down this road, but using a brute-force approach I took the equivalent equation:

```
y = L/(1+a*exp(-k*x))
```

and applied least-mean-square principles:

```
Let E = sum i=1 to n of (L/(1+A*EXP(-K*X_i)) - Y_i)^2
```

then minimized E by taking the partial derivatives of E with respect to L, a, and k and setting them to zero.

```
E 'L' DERIV 0 =
E 'A' DERIV 0 =
E 'K' DERIV 0 =
```

This gives three non-linear equations which can then be solved numerically for L, a, k.

I tried this with a few sample data points on the 50g (using the SOLVESYS lib to solve) and in Maxima (using

MNEWTON to solve) and got matching results which also matched the FitLogistic command in the computer software GeoGebra. I don't know if you're allowed to use GPL code for your project, but GeoGebra is a GPL program with source code available from http://www.geogebra.org/source/program/. Perhaps you could look and see how they handle it.

You don't need the CAS since the derivatives can be hard coded, but numerically solving the equations is of course the bottleneck. It might even be faster to use the linearized results as the initial values in the iterative solving process.

9100B progress

*Message #1 Posted by **David Ramsey** on 11 Nov 2011, 11:37 a.m.*

Since both units are now completely functional, it's time to rip 'em apart, rebuild the power supplies, clean, and paint...

But opening things this old up always reveals more work to be done that you didn't plan on. For example, the plastic socket at the neck of this CRT was (very) loose and starting to crack. We can't source a new socket, so liberal use of High Tech Adhesive™ will fix it in place permanently.

The underside of the main board has even more components on it. They all look OK.

Here are the (burned out) incandescent display stack label backlights. Decades of heat from these bulbs has warped the plastic film with the actual labels on it, and burned away or faded some of the black backing. This has been repaired and replacing these bulbs with LEDs will remove the heat issue. Care has been taken to preserve the original bulb sockets so that future collectors could replace the LEDs with bulbs again, although it's likely that even micro-incandescents like this will be illegal in our dystopian future.

The power supply has what appears to be a half-wave rectifier with capacitor-smoothed output. These two dinky diodes tested OK, but you know? They just look weeny and unsuitable for a Real Man's Calculator, which the 9100 definitely is. (And what? Couldn't HP afford two more diodes for full wave rectification? But so much of the 9100's operation seems to depend on electrical things we'd call "side effects" these days that it's probably unwise to functionally revise anything...)

There! Much better. To those who might complain that this was *completely unnecessary*, I simply retort that Art is always misunderstood by the hoi-polloi...

Re: 9100B progress

*Message #2 Posted by **Bart (UK)** on 11 Nov 2011, 11:58 a.m.,*
in response to message #1 by David Ramsey

My motto: "if it ain't broke don't fix it"

So except for the fix of the register names backlight, I would just leave the rest alone.

Did you measure the Vf of the original diodes? For all we know you may have replaced low Vf grmanium diodes with higher Vf silicon parts. (OK, just pure speculation. But again, why replace something that works.)

Each to his own, hope it still works when you put it all back together

And... have fun :-)

I suppose the rest of the world has eventually caught up with the electronic manufacturing finesse of HP (and to be fair perhaps others such as Tektronics, etc..). Yet it did take several decades to close that gap.

I recall on the occasions I've needed to prod internals of HP equipment in the mid 80s, I simply didn't want to close it back up. It was by any measure manufacturing elevated to an art form far more worthy for display as a wall hanging rather than suffocating in ABS.

Looks like a fun project BTW. ;)

200LX Ram cards compatible with 48GX?

*Message #1 Posted by **mr-scorpio** on 11 Nov 2011, 8:03 a.m.*

Does anyone know whether the Ram cards that go in the 200LX (palmtop) are compatible with 48GX ? They appear to be similar?

Hope someone has the answer Best Al

Re: 200LX Ram cards compatible with 48GX?

*Message #2 Posted by **Bart (UK)** on 11 Nov 2011, 8:11 a.m.,*
in response to message #1 by mr-scorpio

No, the 200LX uses PCMCIA cards and the 48GX uses cards that are specifically designed.

Re: 200LX Ram cards compatible with 48GX?

*Message #3 Posted by **mr-scorpio** on 11 Nov 2011, 8:59 a.m.,*
in response to message #2 by Bart (UK)

Ah, That is a shame. Many thanks for clarifying

Re: 200LX Ram cards compatible with 48GX?

*Message #4 Posted by **Thomas Chrapkiewicz** on 11 Nov 2011, 1:10 p.m.,*
in response to message #2 by Bart (UK)

...and, fwiw, those '48GX' style cards were also used in some IBM laserjet printers. I believe the original mechanical/electrical design was done by Epson (which HP modified slightly), although I have not been able to find an official specification.

Re: 200LX Ram cards compatible with 48GX?

*Message #5 Posted by **Raymond Del Tondo** on 11 Nov 2011, 1:31 p.m.,*
in response to message #4 by Thomas Chrapkiewicz

Look for JEIDA, and maybe PCMCIA 1.0 ;-)

Actually there were 8bit and 16bit cards of this mechanical layout, the 16bit cards having more slide-on contacts...

HTH

48GX cards?

Re: 200LX Ram cards compatible with 48GX?

*Message #7 Posted by **Raymond Del Tondo** on 11 Nov 2011, 7:40 p.m.,*
in response to message #6 by Thomas Chrapkiewicz

The cards for the HP-48 (S/G) are 8bit, but there were 16bit cards for other devices.

Slightly OT: Back then at W&W we used a Sprint Plus full size ISA card and software to burn OTPs and EPROMs for the HP-48,
and I still have my Needham's Electronics PB10 EPROM burner with a special dual socket for these 8 and 16 bit JEIDA cards.

Flashing 34s via USB--Prolific ruled out entirely?

*Message #1 Posted by **Les Wright** on 10 Nov 2011, 8:36 p.m.*

Hi folks,

I have the 30b, the cable from Gene, and a USB-Serial adapter that I have had for years and claims to have the Prolific chipset. I have updated the drivers accordingly. I am trying to flash under XP with MySamBA.

On my XP setup, Device Manager tells me the USB-Serial adapter is mapped to COM3. I pick that out in MySamBA, find the calc.bin file, and press Send File. The thing hangs for a few minutes and gives a little dialog box with an Unable to Connect error.

I am assuming I have the dreaded Prolific issue and really need to get the other type of adapter (FTDA or something like that?)

I guess my question is whether anyone has got this to work with a Prolific adapter. If there is any way to make this cable work, I would love to know. If not, I would like some direction as to the kind of USB-Serial adapter that people who have flashed over USB under XP have used successfully.

Many thanks,

Les

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #2 Posted by **Eric Rechlin** on 10 Nov 2011, 10:53 p.m.,*
in response to message #1 by Les Wright

I have used this cable with success.

Eric

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #3 Posted by **Les Wright** on 10 Nov 2011, 11:31 p.m.,*
in response to message #2 by Eric Rechlin

Thank you, Eric.

It is a little more expensive than I was hoping to pay, but if it works I can scarcely complain. To be frank, that Prolific cable was cheap and I don't think ever got it to work with any serial device. Good money after bad...

The cable will also get use when there is a firmware to the HP15C LE and I need to reflash that calc.

Many thanks for that--I ordered it post haste.

Les

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #4 Posted by **Marcus von Cube, Germany** on 11 Nov 2011, 2:11 a.m.,*
in response to message #3 by Les Wright

I've opened the little case on the cable, stripped the board off all electronics and soldered an FTDI 3.3V TTL cable directly to it instead of the cable end with the D connector. This has the added benefit that the cable no longer draws any current from the calculator to feed the level shifter. There is no level shifting involved at all.

BTW, without a voltage regulator you can't use the USB supply lines to feed the calculator because they are 5V, not 3V. I've added a plug so I can connect an external power supply to feed my development calculator.

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #5 Posted by **Bart (UK)** on 11 Nov 2011, 5:32 a.m.,*
in response to message #3 by Les Wright

I can vouch for the FTDI converters. I have a standalone module and it works for other applications too. It is a bit more costly, but worth it. Searching through previous posts on the subject also will confirm many 20b/30b flashing probems were solved when an FTDI based converter was used.

regards
Bart

Can you still turn the calculator on? If so, then it was not ready to be flashed.

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #7 Posted by **Les Wright** on 11 Nov 2011, 3:28 p.m.,*
in response to message #6 by Egan Ford

Yup. With the calc connected, it turns on and off just fine. The reset button on the cable does exactly that. A cautious press of the Erase button does nothing.

What should I be seeing on the calc if I have achieve a proper connection?

Les

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #8 Posted by **Marcus von Cube, Germany** on 11 Nov 2011, 3:58 p.m.,*
in response to message #7 by Les Wright

Press and hold erase, then press ON to make the processor run and it will properly erase.

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #9 Posted by **Les Wright** on 12 Nov 2011, 6:15 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Thanks Marcus, erasing obviously worked because I now have a calc that won't turn on :)

Still getting the "unable to connect" error.

Will try again with the proper adapter I ordered from Eric. If that doesn't work I guess I have bigger problems!

Cheers,

Les

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #10 Posted by **Marcus von Cube, Germany** on 13 Nov 2011, 3:27 a.m.,*
in response to message #9 by Les Wright

Remove the batteries while you wait!

Re: Flashing 34s via USB--Prolific ruled out entirely?

*Message #11 Posted by **Les Wright** on 14 Nov 2011, 7:55 a.m.,*
in response to message #10 by Marcus von Cube, Germany

Thanks Marcus. I bought a whole bunch of CR2032 batteries in bulk a while ago. I swapped out the once fresh pair from the 30b into my 17bii+, and sure enough the low batt indicator flashed momentarily when I turned the latter on.

I understand the flashing procedure puts a high drain on the cells if it doesn't go well. I am glad I have quite a few spares around just in case. I am surmising from your warning that an erased 30b puts a higher draw on the cells.

Les

Question about Numerical Integration

*Message #1 Posted by **Namir** on 10 Nov 2011, 5:53 p.m.*

The Integrate function in several HP calculators calculates the integral between two values, say A and B. Are there any tricks to use the same method when integrating between A and infinity, minus infinity and A, and minus infinity and plus infinity?

I know there are special types of Gaussian quadrature methods that can handle the above cases. My question is directed at working with the algorithms for finite integrals.

Namir

Re: Question about Numerical Integration

*Message #2 Posted by **Valentin Albillo** on 10 Nov 2011, 6:10 p.m.,*
in response to message #1 by Namir

>
> Namir

The usual trick is to first perform a simple change of variable which will reduce any interval, including infinities at one or both extremes, to any finite interval you care for such as [0,1] or [-1,1].

Best regards from V.

Re: Question about Numerical Integration

*Message #3 Posted by **Lyuka** on 10 Nov 2011, 6:41 p.m.,*
in response to message #2 by Valentin Albillo

Many RF engineers would like the conversion below,

s = (z - 1) / (z + 1)

that is used to plot various impedance in a Smith chart.

Lyuka

Re: Question about Numerical Integration

*Message #4 Posted by **Namir** on 10 Nov 2011, 11:31 p.m.,*
in response to message #3 by Lyuka

looks like:

s = (x^2 - 1) / (x^2 + 1)

is a better transformation, since it is valid for all real values of x.

Namir

Re: Question about Numerical Integration

*Message #5 Posted by **peacecalc** on 10 Nov 2011, 11:58 p.m.,*
in response to message #1 by Namir

Hallo namir,

when you need only numerical results, you can also use instead of infinities great/small numbers like +/- 10^6.

That's sometimes tricky, shown in the advanced handbook for the 15c.

sincerely peacecalc

Edited: 10 Nov 2011, 11:59 p.m.

Re: Question about Numerical Integration

*Message #6 Posted by **Namir** on 11 Nov 2011, 3:15 a.m.,*
in response to message #5 by peacecalc

That's the kind of tricks I was looking for.

Putting it in pseudo-code form in the case of integrating from A to infinity:

```
Given f(x), A, SmallValue, RelTolerance, and DiffTolerance
InfVal=10^6
IntegralVal1 = Integral of f(x) from A to InfVal
Do
  InfVal = 10 * InfVal
  IntegralVal2 = Integral of f(x) from A to InfVal
  if |IntegralVa2| < SmallValue then
    RelativeErr = 0
    DiffErr = IntegralVa2 - IntegralVal1
  else
    RelativeErr = (IntegralVal2 - IntegralVal1) / IntegralVal1
    DiffErr = 0
  end
  IntegralVal1 = IntegralVal2
Until |RelativeErr| < RelTolerance OR |DiffErr| < DiffTolerance
Integral = IntegralVal1
```

Here is a perhaps more efficient version that uses integration by parts:

```
Given f(x), A, SmallValue, RelTolerance, and DiffTolerance
B = 10^6 // or any other different high value (10^3, 10^4, 10^5, 10^6, 10^7, etc
IntegralVal0 = Integral of f(x) from A to B // should calculate most of the final
answer
InfVal= 10 * B
IntegralVal1 = Integral of f(x) from B to InfVal
Do
  InfVal = 10 * InfVal
  IntegralVal2 = Integral of f(x) from A to InfVal
```

```
  if |IntegralVa2| < SmallValue then
    RelativeErr = 0
    DiffErr = IntegralVa2 - IntegralVal1
  else
    RelativeErr = (IntegralVal2 - IntegralVal1) / IntegralVal1
    DiffErr = 0
  end
  IntegralVal1 = IntegralVal2
Until |RelativeErr| < RelTolerance OR |DiffErr| < DiffTolerance
Integral = IntegralVal0 + IntegralVal1
```

Edited: 11 Nov 2011, 5:47 a.m.

Re: Question about Numerical Integration

*Message #7 Posted by **Mike (Stgt)** on 11 Nov 2011, 7:04 a.m.,*
in response to message #6 by Namir

IIRC, there is a discussion worth to read in the PPC-ROM manual.

Hope this hepls

Ciao.....Mike

Re: Question about Numerical Integration

*Message #8 Posted by **Gjermund Skailand** on 11 Nov 2011, 7:11 a.m.,*
in response to message #6 by Namir

Tanh-Sinh transformation or "Double exponential method" may also be efficient, especially when the function is oscillating. There is a fast implementation in C (hpgcc2) for HP50G in my package INT1D at www.hpcalc.org.

Re: Question about Numerical Integration

*Message #9 Posted by **Dieter** on 11 Nov 2011, 7:53 a.m.,*
in response to message #1 by Namir

As already pointed out, there are basically two approaches for handling improper integrals:

- Use a large (finite) value where the integrand becomes negligible compared to the final result.

  Example: for an 8-digit result of the left tail Normal CDF a lower limit of -6 usually is sufficient as the PDF here is merely 6E-9 and the whole integral from -infinity to -6 is less than 1E-9.

- Apply a variable transformation to make infinity "less infinite". ;-) This is the preferred method suggested in most of the other posts in this thread.

  Example: Take a look at the 15C Advanced Functions Handbook, p. 54 ff. There, this topic is discussed with several examples on how to use the 15C's Integrate function for improper integrals. On p. 60-64 you will find a very nice and illustrative application of these ideas, evaluating the Normal CDF as well as the error function, with both plus or minus infinity as the limits, giving exact results even far out in the tails. This is accomplished by using the transformation $u = \exp(t^2)$ as soon as the integration limit exceeds a certain value (here: 1,6).

HP 67, 97, 97+ emulator

*Message #1 Posted by **Olivier De Smet** on 10 Nov 2011, 9:31 a.m.*

new HP97 model : HP97+ fully loaded HP97

896 program steps

106 registers (A to I are regs 100 to 105)

HD magnetic cards : one side is enough for either:
- whole program memory
- whole register set

Be careful not to mix your cards sets. (a tool to convert cards set will be done soon)

5 new instructions: one more indirect register E

RCL (e) keyed as 'RCL' 'e^x', printed as 'RCLe'
STO (e) keyed as 'STO' 'e^x', printed as 'STOe'
GTO (e) keyed as 'GTO' 'e^x', printed as 'GT->e'
GSB (e) keyed as 'GSB' 'e^x', printed as 'GS->e'
use the E register as a new indirect one, same functionnalities as I register

BACK x keyed as 'LBL' 'e^x', printed as 'Bc^x'
go back 'stack X' steps (stack X doesn't need to be negative)
This one was needed as there are still only 20 labels :(

A full rom source is given for the curious reader (patched and non patched)

As usual it's here : http://sites.google.com/site/olivier2smet2/hp_projects/hp97

Olivier

Re: HP 67, 97, 97+ emulator

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 10 Nov 2011, 5:29 p.m.,*
in response to message #1 by Olivier De Smet

Very nice windows emulator of HP 67 and 97, works fine and excellent graphics, thanks for sharing.

One question: What is the difference between HP97P and HP97? HP97P seems to work fine, however HP97, number entry on my Windows 7 machine doesn't seem to work.

Edited: 10 Nov 2011, 5:34 p.m.

Re: HP 67, 97, 97+ emulator

*Message #3 Posted by **Olivier De Smet** on 10 Nov 2011, 5:40 p.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

HP97p use a patched rom to use the full range of ram addressing of the woodstock family.

The HP97 use 4*16 registers ram chips to have 224 steps and 26 memory.

HP97p use the full 16*16 registers address space to give 896 steps and 106 memory

For the shorcuts in the kml files they are made for a french keymap. You can change it yourself if you like. On a full size keybord, all emulator key are mapped somewhere on the pc-keyboard (to have an efficient us)

Btw, I just put a 1.7.1 release which correct some bugs and gives more speed.

Edited: 10 Nov 2011, 5:41 p.m.

Re: HP 67, 97, 97+ emulator

*Message #4 Posted by **Namir** on 10 Nov 2011, 6:06 p.m.,*
in response to message #1 by Olivier De Smet

Hi Olivier,

Thank you for the HP97+ emulator.

I have been trying to run either version of the HP-67 but it does not seem to load right. I get to see the windows for the calculator image and the mag cards, but the HP-67 calculator freezes.

Namir

Re: HP 67, 97, 97+ emulator

*Message #5 Posted by **Duane Hess** on 10 Nov 2011, 6:25 p.m.,*
in response to message #4 by Namir

Namir: I had a situation, which may be different.

When I 1st got it to run, it wouldn't freeze entirely, just each keypress would take 60 (or more) seconds.

re-installed & found when I first run it or after a FILE/NEW clicking the "choose KML" button and specifying OK (didn't change any parameters, they were already correct) the emulator then runs A-OK.

Maybe not the same as your situation. Also, I run VISTA home premium, for whatever that's worth.

Re: HP 67, 97, 97+ emulator

*Message #6 Posted by **Namir** on 10 Nov 2011, 10:32 p.m.,*
in response to message #5 by Duane Hess

Duane,

I am running Windows 7. I was able to lunch the HP-67 emulator. I had to click the Cancel button on the first three dialog boxes that appear. Then I start working with the remaining dialog boxes. The emulator then runs correctly (from the little testing that I did).

I hope Olivier corrects this problem which occurred in a previous version, so that the emulator will run in a straightforward manner and without the need of *mouse acrobatics*.

Namir

Edited: 10 Nov 2011, 11:29 p.m.

Re: HP 67, 97, 97+ emulator

*Message #7 Posted by **Israel Otero** on 10 Nov 2011, 8:36 p.m.,*
in response to message #1 by Olivier De Smet

Thank you, Olivier,
The display emulation works much better and this version runs even better, very kind of you to share this, as the continuation of my most beloved calculators after the HP-41.

Edited: 10 Nov 2011, 8:38 p.m.

Re: HP 67, 97, 97+ emulator

*Message #8 Posted by **Olivier De Smet** on 11 Nov 2011, 6:00 a.m.,*
in response to message #7 by Israel Otero

new 1.7.2 version

When installing a new release clean the registry : HKCU/Software/ remove HP67, HP97, HP97p

Then launch the program, use 'kml' to choose a config, and then save a document to re-create the registry. The next launch will be a direct reload.

Some bugs on hp97 rom load, PSE duration, ... CORRECTED :)

Edited: 11 Nov 2011, 10:07 a.m. after one or more responses were posted

30b Probability Bug? Or Feature?

*Message #1 Posted by **Les Wright** on 9 Nov 2011, 10:22 p.m.*

Hi folks, just got a 30b which I hope to flash as a 34s once I get the cable from Gene.

In the meantime, I have been fooling with the native calculator. I just happen to be interested in probability distributions, so I fiddle with that.

In RPN mode, I try this: I want to compute the upper-tail probability associated with 2 and 3 df at F = 5. The 30b gives lower-tail probabilities, so instead I have to compute the lower-tail probability associated with 3 and 2 df at F = 1/5.

If I just put the three arguments directly on the stack (3 INPUT 2 INPUT .2 Math -> Probability -> F-Dist) a correct answer is put in the display register. (It's approximately 0.17117.)

But if I COMPUTE the final argument, it doesn't work: 3 INPUT 2 INPUT 5 1/x Math -> Probability -> F-Dist, nothing happens to the contents of the display.

I think the same problem exists with other probability distributions, but I haven't experimented extensively.

Anyone have a clue? These functions aren't terribly useful if they only accept entered and not recalled or computed arguments.

TIA,

Les

Re: 30b Probability Bug? Or Feature?

*Message #2 Posted by **gene wright** on 9 Nov 2011, 10:39 p.m.,*
in response to message #1 by Les Wright

The functions in the math menu were intended to function as an extension of the keyboard. That's why if you key a value and walk through the trig functions the display changes - it is showing you the result IF you press INPUT / = to choose the displayed function.

I don't have a 30b handy (they are all 34S units now) :-) but does it give the correct answer for the distribution if you press INPUT or = ?

If not, there could be a problem with this 3 argument function which is admittedly a tough one for this paradigm.

(and your cable should arrive any day now...I mailed 3 more to people today too).

Re: 30b Probability Bug? Or Feature?

*Message #3 Posted by **Mark Storkamp** on 10 Nov 2011, 8:18 a.m.,*

in response to message #2 by gene wright

I'll answer for him since I've got my 30b handy. No it doesn't, it returns with the .2 still in x. It also doesn't seem to work when you press INPUT after typing in the .2 (the INPUT doesn't, on this model, push the .2 into Y). Otherwise mine works just as he described.

Re: 30b Probability Bug? Or Feature?

*Message #4 Posted by **Thomas Radtke** on 10 Nov 2011, 8:46 a.m.,*
in response to message #3 by Mark Storkamp

The 20b, using the firmware from the SDK, returns an error. OTOH, I have no clue what I'm doing here since F-Distribution is completely unmentioned in my manual, it's not even shown in the menu scheme.

Maybe a straight RPN implementation instead of the RPN/RPL approach given would have been less prone to errors like these. Just speculating ...

Re: 30b Probability Bug? Or Feature?

*Message #5 Posted by **gene wright** on 10 Nov 2011, 10:10 a.m.,*
in response to message #4 by Thomas Radtke

Not mentioned in the small printed guide? It should be mentioned in the PDF manual at least, and I know it is in the learning modules. ;-)

Will it work if you compute the 0.2 then enter the other arguments, rearrange the stack, etc. then go to the F-dist?

It should work as you have tried, but now it is a matter of trying to figure out under what circumstances it works vs. not.

Re: 30b Probability Bug? Or Feature?

*Message #6 Posted by **Thomas Radtke** on 10 Nov 2011, 11:03 a.m.,*
in response to message #5 by gene wright

> Quote:
>
> Will it work if you compute the 0.2 then enter the other arguments, rearrange the stack, etc. then go to the F-dist?

No. But it's not a bug: The manual you've pointed me to explicitly requires the user to *type in* the value for the probability. Either it has been deliberately designed that way or the manual was done to reflect that glitch. You can probably tell which way it was, Gene :-D.

Re: 30b Probability Bug? Or Feature?

*Message #7 Posted by **gene wright** on 10 Nov 2011, 12:26 p.m.,*
in response to message #6 by Thomas Radtke

Suspicions are not proof! lol

I am not aware of any changing of the manual because of a bug. I do agree computing the argument would be best, but ...

Somewhat OT: Casio calculator reccomendation

*Message #1 Posted by **M. Joury** on 9 Nov 2011, 10:24 a.m.*

Hi All,

In the past I have seen postings that praised the Casio 9860Gii and the Casio FX-CG10 on this forum. I have also been led to believe that they have a very nice software development kit but that it is only available after you have registered your calculator (so I can't get a look at it's capabilities before purchase). I have searched a little online but have been able to find very little information on the SDK but I also believe that there is not much difference between these two machines SDK wise other than support for the newer screen on the FX-CG10.

So here is my question: If you were going to buy one of these to play around with which would it be? Any information or links to additional info on these two machines and their SDK(s) would be much appreciated.

Thanks,

-Marwan

Re: Somewhat OT: Casio calculator reccomendation

*Message #2 Posted by **Don Shepherd** on 9 Nov 2011, 11:02 a.m.,*
in response to message #1 by M. Joury

I think Katie knows about the SDK for these, I'm sure she will reply. I've used the fx-9860g Slim for a few years now. It is a compact speedy machine with the best backlight I've ever seen on a calculator. I also evaluated the Casio color Prizm for a month, and its graphics were out of this world. It also had a very good way to write programs (in Casio BASIC) on the PC and easily download them to the calc.

If I was going to do some serious work, I would choose the Prizm, although the few programs I wrote ran significantly slower on the Prizm than on the slim. Katie said that is probably due to the Prizm OS being larger and more complex than that of the slim.

Re: Somewhat OT: Casio calculator reccomendation

*Message #3 Posted by **M. Joury** on 9 Nov 2011, 11:14 a.m.,*
in response to message #2 by Don Shepherd

Hi Don,

Thanks you for your feedback. Yes, I have seen comments by Katie on these units in the past. I am hoping that she will step in with some advice <g>.

Cheers,

Re: Somewhat OT: Casio calculator reccomendation

*Message #4 Posted by **Katie Wasserman** on 9 Nov 2011, 11:23 a.m.,*
in response to message #1 by M. Joury

You can download the SDK for the 9860g starting here. After you click Accept you'll get to a page that you can check off all the documentation and software that you want. The SDK is listed under the 9860g section and you can download it after you clock Next. However I don't see a separate SDK for the CG series.

If you follow this thread you discover a group of Prizm uses that have developed their own "mini-SDK" using a different tool chain.

I have a 9860G and have read the manual for the CG10/20 and found very little difference other than support for the color display. We've discussed the differences in a bit more here but the various Casio forums have more detail.

Re: Somewhat OT: Casio calculator reccomendation

*Message #5 Posted by **M. Joury** on 9 Nov 2011, 11:25 a.m.,*
in response to message #4 by Katie Wasserman

Thanks Katie,

I'll try the links you suggested.

Cheers,

-Marwan

Re: Somewhat OT: Casio calculator reccomendation

*Message #6 Posted by **M. Joury** on 9 Nov 2011, 12:12 p.m.,*
in response to message #4 by Katie Wasserman

I tried the Casio SDK link and while I can download the manuals the SDK needs registration info that I don't have. Some codes that come off the calculator. However, the manuals will provide a good start.

Thanks,

-Marwan

HP-15c LE Out of Stock

*Message #1 Posted by **Jeff Johnson** on 8 Nov 2011, 1:43 p.m.*

Still waiting to order one (or two)... Anyone heard anything through the grapevine? I'm assuming this is another Kinpo product, so hopefully they'll get the bugs worked out and have a solid, useful product and a steady supply stream. They managed to do it with the 50g and 35s. The yearning masses are waiting ...

Re: HP-15c LE Out of Stock

*Message #2 Posted by **Lincoln R.** on 8 Nov 2011, 3:22 p.m.,*
in response to message #1 by Jeff Johnson

It is an HP design, but probably manufactured by Kinpo. They've had some early manufacturing slip-ups and some firmware bugs, but this time the firmware was developed by HP themselves, so we will probably see a fix.

Re: HP-15c LE Out of Stock

*Message #3 Posted by **Mike Morrow** on 8 Nov 2011, 8:50 p.m.,*

The 35S?!?! Not in any universe I know about. HP has done nothing to correct the many many bugs in that sorry piece of work. But...they've only had six years. :-)

Re: HP-15c LE Out of Stock

*Message #4 Posted by **Jeff Johnson** on 10 Nov 2011, 8:44 a.m.,*
in response to message #3 by Mike Morrow

Point taken! Let me clarify. There was initially a keyboard problem with the 35s, that appears to have been corrected. Yes, there's also some software bugs, but they really don't affect my day-to-day use of the 35s (it's my "daily driver"). I'm quite attached to both of my 35s calcs (work and home), and I'm calling it a "good" product, even though I find the keyboard layout rather disorganized. In my spare time, I photo-shopped my ideal "35s Pro" that has (in my little mind) the optimized keyboard and screen layout. Nice to dream about ... :o)

Re: HP-15c LE Out of Stock

May I ask why? It's a 'giant leap' ahead of the layout of the otherwise amazing 32SII in terms of organization, imo.

Re: HP-15c LE Out of Stock

*Message #6 Posted by **Jeff Johnson** on 10 Nov 2011, 9:13 a.m.,*
in response to message #5 by Thomas Radtke

Sure thing. The 5 algebra keys are laid out as a sideways "T", the 7 trig functions are laid out as a sideways "L", and the 4 log functions are laid out as a sideways "H". The human brain tends to search in straight lines, and follow patterns, but here we have neither, making the function search inefficient. Same for the alphanumerics. If you erase all the legends on the keyboard except the A-Z, it becomes immediately obvious why it's hard to find the letters when you're looking for them. Lastly, the conversion functions and menu buttons appear to be randomly mixed together in the bottom half of the calculator.

Why do you think this? As far as I know there never has been any change or improvement to the 35S. A month or two ago a guy claimed his 35s, made in 2010, was just fine and never missed keystrokes. A few days later he posted that he finally noticed his missing keystrokes sometimes.

Hear, hear...

Re: HP-15c LE Out of Stock

*Message #13 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 9 Nov 2011, 1:27 p.m.,*
in response to message #11 by Katie Wasserman

Please correct me if I am incorrect, HP-15C was popular and loved by many, because of:

1- Form factor

2- Advanced scientific capabilities like no other at the time (not even now, in most cases)

3- Robustness and Reliability: Keyboard, Screen, Hardware, Firmware, Battery Life.

4- Simplicity and Elegance.

If HP-15C LE will live up to the legacy of this great product, and not just a classic look alike, then at least should meet these criteria and (plus more without compromises, faster speed, etc). Then we have a winner.

Edit: I really want to give credit to the HP product and development team who did a great job with bringing this calculator back. It is almost there. It is unfair that they are getting blamed for the poor quality of the chinese manufacturer. However they did the right thing and addressing the quality issues in a timely manner. Hard to know what else is going on behind the scenes. But I am confident that HP product team will resolve the quality issues and the HP-15C LE will live up to the legacy of the

original 15C and more. What is next?, a hybrid 15C/12C with in the same package with customer keyboard layout? HP-42S LE? WP-34s -> ???? It has been awhile since 35s, perhaps it is time for the next big thing coming up??. Make Meg proud and fans happy!

Question about MROOT function

*Message #1 Posted by **Namir** on 8 Nov 2011, 12:17 p.m.*

Hi All RPL experts!

I am trying to see how an HP-50G can find the roots at least two simultaneous nonlinear equations. Does the function MROOT do the job. If so, how does one use it?

Namir

Re: Question about MROOT function

*Message #2 Posted by **Crawl** on 8 Nov 2011, 1:42 p.m.,*
in response to message #1 by Namir

Use MSLV.

The manual is here:

http://www.ele.uri.edu/faculty/vetter/Other-stuff/HP-calculators/HP-50g/HP_50g_advanced_users_reference_manual.pdf

Does this answer your question, Namir?

Re: Question about MROOT function

*Message #5 Posted by **Hal Bitton in Boise** on 8 Nov 2011, 11:15 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Hi Namir,
After trying (unsuccessfully) to make this function work, I'd be very interested in finding out how it's done as well.

The (skimpy) AUR documentation makes no reference as to how the equations are to be stored in the EQ variable...(as a list, a vector, or what?). I tried both of the above to no avail. I got either "bad argument type", "bad argument value", or just my 2 equations regurgitated onto the stack, as results.

Can somebody post an example using this function?
Best regards, Hal

Re: Question about MROOT function

*Message #6 Posted by **Namir** on 9 Nov 2011, 12:01 a.m.,*
in response to message #5 by Hal Bitton in Boise

My attempts to use MSLV have failed!!!

I must say that TI does a MUCH BETTER job with the TI NSpire CX CAS. The machine makes it soooo easy to define how many equations, declare the variable names, and then enter the equations. You can optionally assign initial guesses AND specify the range for the solutions. My guess is that this is the work of an ex-HP employee.

Namir

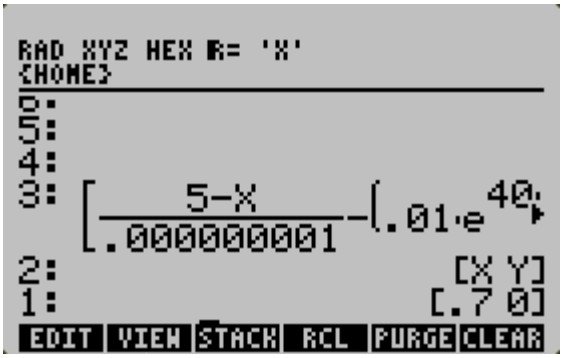
What's the problem?

Re: Question about MROOT function

*Message #8 Posted by **Crawl** on 9 Nov 2011, 7:52 a.m.,*
in response to message #7 by Crawl

Anyway, I made an animated GIF of me using MSLV once:



First enter the equations, then the variables, then the initial guess. Those are all entered as row vectors.

Re: Question about MROOT function

*Message #9 Posted by **Eddie W. Shore** on 9 Nov 2011, 9:21 a.m.,*
in response to message #8 by Crawl

> Quote:
>
> Anyway, I made an animated GIF of me using MSLV once:
>
> >
>
> First enter the equations, then the variables, then the initial guess. Those are all entered as row vectors.

So the syntax is: 3: [vector of equations] 2: [vector of variables] 1: [vector of guesses]

Re: Question about MROOT function

*Message #10 Posted by **Namir** on 9 Nov 2011, 10:29 a.m.,*
in response to message #8 by Crawl

Very nice!! I will try again!! I know the HP-50G is a very capable machine. It should be easy to solve the multiple roots for two or three nonlinear equations.

Namir

PS: It worked. I realized my mistaked. Here is the example:

```
x*y-4=0
x^2+y^3-31=0
```

I entered the following:

```
['X*Y-6','X^2+Y^3-31']
['X','Y']
[5 5]
```

Originally I was leaving out the single quotes and getting syntax error messages from the machine. When I made the correct input and then executed MSLV, I watched the machine update the guesses for the roots (at the top of the LCD) as they converged to the solutions x=2 and y=3.

Thanks!!

Re: Question about MROOT function

*Message #11 Posted by **Crawl** on 9 Nov 2011, 12:09 p.m.,*
in response to message #10 by Namir

I don't have my HP50g here to test this with, but I don't think I do it with the "entering quotes" method. I'll probably go to Matrix Writer to enter the vectors, and from there Equation Writer to enter the equations (or if you prefer RPN, build up the equations on the stack, then copy and past them into Matrix Writer). I think the Matrix Writer defaults to Vectors (if it's 1xn or nx1), so if you enter them on a row, the syntax should work itself out for you.

Also, (2,3) doesn't solve x*y-4=0...

Re: Question about MROOT function

*Message #12 Posted by **Namir** on 10 Nov 2011, 5:03 a.m.,*
in response to message #11 by Crawl

Ooops! That was a typo. I meant:

X*Y-6=0

I corrected that in my original message.

9100 Keyboard Rebuild (with pics!)

*Message #1 Posted by **David Ramsey** on 8 Nov 2011, 11:31 a.m.*

When you pull your 9100 keyboard and flip it over, you'll see that Cherry and Alps probably weren't making standard key switches in the 60s:

Each key switch is an apparently custom-made set of contacts with integrated springs. Since they're just hanging out in the air they can get dirty/dusty, which can make for marginal connections. Fortunately they're easy (if tedious) to clean individually. HP abandoned simple mechanical contacts in their subsequent machines (9810/9820) for fantastically complex contact-less switches that were extremely reliable but hell to fix when they malfunction due to the complex electronics involved.

BTW, see those two black cylindrical things at the bottom of the image? Those are high precision (fraction of a % tolerance) resistors. If they're bad your keyboard won't work, and you can't get 'em at Radio Shack. You can, however, get them at Mouser.

While you're waiting for the resistors to come in, you might as well pull each key, remove its crumbling black rubber O-ring, and replace it with a nice orange silicone O-ring that will last pretty much forever.

At this point both 9100s are fully functional: they can record, read, and execute the test program from the 9100 manual; and the digit spacing problem on the first unit (where the floating point display was not grouping digits by threes, the fault of a bum transistor in the horizontal deflection board) has been repaired. This had the beneficial side effect of brightening the display somewhat so that now it's only slightly dimmer than the display on the other machine.

(Actually only one keyboard works, since we're still waiting for the replacement resistor for the other; the working keyboard was plugged into the other 9100 to verify its operation.)

At this point it's mostly cleanup: once the parts arrive and the units are burned in for a few days, they'll be disassembled, thoroughly cleaned, and the upper and lower cases REPAINTED. Fortunately the plastic fascias of the keyboard and display/card reader area look great after a simple cleaning. The result should be two new-looking and new-operating calculators.

Re: 9100 Keyboard Rebuild (with pics!)

*Message #2 Posted by **Thomas Chrapkiewicz** on 8 Nov 2011, 12:08 p.m.,*
in response to message #1 by David Ramsey

A most interesting keyboard (electrical) design. I did not realize that it used this analog sensing of keypresses (hence the 0.1% tolerance resistors). This is the technology used in automobile steering wheel (infotainment system) switches and home (Sony) CD (mega)changers.

Is there a documented schematic of the 9100 keyboard available?

TomC

Re: 9100 Keyboard Rebuild (with pics!)

*Message #3 Posted by **David Ramsey** on 8 Nov 2011, 12:24 p.m.,*
in response to message #2 by Thomas Chrapkiewicz

I would hope that Tony Duell's hand-drawn 182-page schematic for the 9100B would contain the keyboard schematics...but I haven't looked.

Re: 9100 Keyboard Rebuild (with pics!)

*Message #4 Posted by **Randy** on 8 Nov 2011, 5:09 p.m.,*
in response to message #1 by David Ramsey

0.1% tolerance isn't exactly precision in the resistor world when it comes to analog circuits. The resistors are in the key strobe circuit and form a voltage divider so it is the ratio between the two values that is more important than the absolute value. Low TCR wire-wound or film resistors will work fine.

It is odd that a wire-wound device of that age would simply fail. Just out of curiosity, what is wrong with it/them?

BTW, yes, the schematics are in Tony's set.

Re: 9100 Keyboard Rebuild (with pics!)

*Message #5 Posted by **David Ramsey** on 8 Nov 2011, 5:48 p.m.,*
in response to message #4 by Randy

I don't know *why* it failed; but it's a 2K Ohm resistor and measures over 3K.

Any expert for polynomial roots here?

*Message #1 Posted by **fhub** on 8 Nov 2011, 7:40 a.m.*

For my WP34s Polynomial RootSolver I've used the Bairstow method, but I also checked many other algorithms that I've found. One of these is the Laguerre method - here's a short WikiPedia article about it:
http://en.wikipedia.org/wiki/Laguerre%27s_method

It's stated there that this Laguerre method should be VERY powerful in 2 ways: it converges almost always (independent of the initial guesses), and it converges very quickly (usually 3rd order convergence).

Now I made a 2nd version of my PolyRoots where I replaced the Bairstow method by this Laguerre method, and I'm absolutely disappointed: although it works correctly (i.e. finds the correct roots), it is damned slow - in average it needs about 3-5 times as many iterations as the Bairstow method (although it SHOULD be much better)! :-(

Has anyone here experiences with polynomial rootsolving methods?
Maybe someone could tell me what might be wrong with this Laguerre method?
(I'm talking about polynomials with real coefficients - maybe this is the reason why Laguerre works so badly?).

Franz

No, I didn't mean the download time but my old (and very weak) Win98 notebook that I'm using here: with about 70MB free RAM it even uses the Windows swapfile when I scroll through a 11MB PDF document! :-(

But I just saw that I have already exactly the same HP-Journal (found it when I made my HP-71 emulator package), but my file is only 1MB compared to the version above with 11MB (nevertheless it has the same content).

*Message #6 Posted by **Namir** on 8 Nov 2011, 7:57 a.m.,*
in response to message #1 by fhub

Hello Franz,

I use Bairstow's method when dealing with polynomials with real coefficients, because you should get all the roots--real or complex. HP seems to favor the Laguerre method. As far as speed is concerned, I never thought that Bairstow is slow. Maybe you need to double check you source of equations and your implementation.

Namir

Re: Any expert for polynomial roots here?

*Message #7 Posted by **fhub** on 8 Nov 2011, 8:18 a.m.,*
in response to message #6 by Namir

Ho Namir,

> Quote:

> I use Bairstow's method when dealing with polynomials with real coefficients, because you should get all the roots--real or complex. HP seems to favor the Laguerre method.

Well, if I don't misunderstand what I've read then also Laguerre should give all (real+complex) roots!?
The only problem could be that with real coefficients you always have pairs of complex conjugate solutions, and Laguerre doesn't seem to work very well if there are solutions with equal or similar absolute values (which is of course true for conjugates).

> Quote:
>
> As far as speed is concerned, I never thought that Bairstow is slow. Maybe you need to double check you source of equations and your implementation.

I guess you're talking about PC implementations!? Well, for a PC program the speed (of Bairstow) is of course no big deal - even a few 1000 iterations don't need much time - but on slow hardware like 20/30b the speed is indeed a very important factor. And this is the reason why I was searching for eventually better (=faster) methods than Bairstow (although less than 5 sec for a 10th-degree polynomial is acceptable IMO).

I don't think that something in my implementation is wrong (or inefficient), both algorithms are so simple that it's almost impossible to do anything more complicated than necessary.
Laguerre requires to do all calculations complex (which makes it a bit slower), but this should be compensated by what is stated in this WikiPedia article: "is only very rarely required to compute more than a few iterations to get high accuracy".
Well, with Laguerre I get about 200-300 iterations for completely solving a 10-degree polynomial, compared to 60-70 with Bairstow. (?)

Franz

Re: Any expert for polynomial roots here?

*Message #9 Posted by **hugh steers** on 9 Nov 2011, 8:48 p.m.,*
in response to message #1 by fhub

i can report that i use matrix methods for polynomial roots. essentially, i translate it into an eigenvalue problem. also i get complex results this way.

results are usually stable and quite fast. im using a 14Mhz calculator for this. with this method, you dont have to extract pairs of roots at a time and reduce. so you dont have a forward error problem.

however, Namir has done an in-depth study of polynomial root problems. you might want to try his examples. my method also has problems with multiple roots, where i get imprecise results. so my approach is not foolproof.

Re: Any expert for polynomial roots here?

*Message #10 Posted by **fhub** on 10 Nov 2011, 5:29 a.m.,*

in response to message #9 by hugh steers

> Quote:
>
> i can report that i use matrix methods for polynomial roots. essentially, i translate it into an eigenvalue problem. also i get complex results this way.

Yes, I know this method, but there are 2 problems (on the WP34s):
First this would limit the polynomial solver to degree 10 (max. 10x10 matrices possible) and then the WP34s has no eigenvalues function, so _this_ would have to be written instead of a direct polyroots. And when I look at the method(s) for calculating eigenvalues (e.g. QR decompossition), I'm not sure if this would even fit into one flash region.

> Quote:
>
> my method also has problems with multiple roots, where i get imprecise results. so my approach is not foolproof.

Well, multiple roots are of course no principle problem because they can always be removed by reducing the polynomial P to P/gcd(P,P'), but that would also need many additional program steps for getting the gcd(P,P').

After having read through all the infos about the Laguerre method, now I know what makes this polynomial solver on the HP-71 (which is based on the good old ZERPOL Fortran routine) so powerful: it's not the Laguerre method in the first, but the clever chosing and changing of initial values and/or iteration steps!
This method calculates 4 different boundary values where one of them even needs the calculation of the roots of a slightly modified polynomial of the same degree (again with an iterative method: Newton-Raphson)!
That means: just to get a good initial guess (or iteration step), you first have to solve almost the same polynomial with a different method, and then you can use one of these found roots (the minimum of 4 boundaries) for the Laguerre iteration!
Well, that may be no problem for a PC (or a calculator with enough RAM), but it's definitely not suited for a programmable calculator.

So in fact this Laguerre method isn't that good at all, it works only well if you have VERY good initial values in every iteration step. This is probably the explanation for my bad experiences with my Laguerre program on the WP34s compared to the Bairstow method.

Franz

> Well, multiple roots are of course no principle problem because they can always be removed by reducing the polynomial P to P/gcd(P,P'), but that would also need many additional program steps for getting the gcd(P,P').

Nope. Computing the gcd of two polynomials is pretty straightforward and fast, so it can be done if deemed useful.

> Quote:
>
> This method calculates 4 different boundary values where one of them even needs the calculation of the roots of a slightly modified polynomial of the same degree (again with an iterative method: Newton-Raphson)!

Nope. You misunderstood Fig. 4 in page 35 in the HP Journal issue I referred you to. It doesn't say "roots", plural, but "root", singular, i.e., you need just one root of the modified polynomial, which the Newton-Raphson method gets you in a flash using the very good initial estimate provided.

So it isn't that hard at all.

> Quote:
>
> Well, that may be no problem for a PC (or a calculator with enough RAM), but it's definitely not suited for a programmable calculator.

Nope. It is perfectly suitable, if correctly and efficiently implemented.

Nope on both counts. The Laguerre method is very good, that's why it was selected as the basis for the PROOT keyword in the HP-71 Math ROM, and I think the explanation for your bad experiences lies somewhere else.

Best regards from V.

Yes, straightforward and fast, but you need 3 routines for P', for gcd and polynomial division, and that's not done in a few bytes.

> Quote:
>
> Nope. It is perfectly suitable, if correctly and efficiently implemented.

Well, then why don't **you** make such a WP34s implementation? ;-)

> Quote:
>

And what should this reason be? It can't be any error in my code because else I won't get correct results. The reason is probably that I just use the origin (0/0) as initial guess and then random guesses in the interval [-1,1] after every 25 unsuccessful iterations, but if the Laguerre method would really be as good as stated everywhere, than it would also work with _these_ guesses (and not require complicated calculations for 'good' initial values).

Franz

Got much better things to do with my time, and besides *"been there, done that, bought the T-shirt"*. I already implemented a full-fledged, efficient polynomial solver for the HP-41C back then in the golden days some 30 years ago so no need to repeat myself, see the relevant PPC issue if interested.

> Quote:
>
> And what should this reason be? It can't be any error in my code because else I won't get correct results.

Nope, I haven't inspected your code but I'd hazard that the reason is your lack of relevant theoretical knowledge about the task you've set yourself up to.

> Quote:
>
> [...] but if the Laguerre method would really be as good as stated everywhere, than it would also work with _these_ guesses (and not require complicated calculations for 'good' initial values).

Nope, they aren't complicated at all, it's your lack of understanding that makes them seem complicated to your eyes, thus resulting in you unfairly critizicing something which you simply fail to understand.

> Quote:
>
> I've read again this part, but I'm still not sure who of us is right!?

I'll give you a hint: you're wrong.

> Quote:
>
> [...] so IMO to be sure to really get the minimum you would have to calculate all roots.

Nope, you don't need all roots at all, you only need a very specific one. It's just your lack of relevant theoretical understanding getting in the way, may I suggest you get and study any of the many good books on the subject, **"Higher Algebra"** by **Kurosh** is one of the best.

> Quote:
>
> So as I already stated: the 'power' of this PROOT routine is not the Laguerre method, but the big effort that is put into finding a good initial guess. But with such a good initial guess almost every other polynomial rootfinding algorithm would work just as well.

Nope, you're wrong in all counts but I won't push the matter further, I've already suggested that you learn the theory of what you're trying to accomplish lest you'll waste tons of effort to get a mediocre implementation at best.

Best regards from V.

in response to message #17 by Ángel Martin

and here are the roots found by the program for Valentin´s second example:

```
x^20+10 x^19+55 x^18+210 x^17+615 x^16+1452 x^15+2850 x^14+
4740 x^13+6765 x^12+8350 x^11+8953 x^10+8350 x^9+6765 x^8+
4740 x^7+2850 x^6+1452 x^5+615 x^4+210 x^3+55 x^2+10 x+1 = 0
```

1,473-J7,264
1,473+J7,264
0,476-J1,533
0,476+J1,533
-0,769-J0,180
-0,769+J0,180
-0,593-J0,367
-0,593+J0,367
0,138-J1,013
0,138+J1,013
-0,028-J0,805
-0,028+J0,805
-0,146-J0,684
-0,146+J0,684
-0,247-J0,599
-0,247+J0,599
-0,346-J0,528
-0,346+J0,528
-0,456-J0,458

-0,456+J0,458

execution time on V41: about 8 seconds (TURBO mode of course). It´s included in the 41Z module, so just load the image MOD file and turn it loose.

Write or wrong? Easy enough to check ...

*Message #19 Posted by **Gerson W. Barbosa** on 11 Nov 2011, 10:20 a.m.,*
in response to message #18 by Ángel Martin

According to Wolfram|Alpha there are the following coincident roots:

```
x = -1/2 - sqrt(3)/2*i

x = -1/2 + sqrt(3)/2*i
```

Cheers,

Gerson.

I've read again this part, but I'm still not sure who of us is right!?

This Cauchy lower bound RA is defined there as "**minimum** positive zero" of this modified polynomial, so IMO to be sure to really get the **minimum** you would have to calculate **all** roots. Ok, with the given (small) initial guess you'll rather get the minimum root first, but it's not absolutely sure. And furthermore I wonder why I would need this Cauchy bound as a 4th guess, when the 3 previous guesses are already so good!?

So as I already stated: the 'power' of this PROOT routine is not the Laguerre method, but the big effort that is put into finding a good initial guess. But with such a good initial guess almost every other polynomial rootfinding algorithm would work just as well.

Franz.

Is there any means to reduce the "shipping price" to, let's say, 25$. In consequence, the customs would treat the device at that rate.
Of course, the actual price may be still 235$ + X$. A sum which will be payed in advance anyway, and which, of cource would not be disclosed to the delivery service.

Would that be fraud? Would this have any consequence for the sender if discovered?

70% import duty explains why HP built calculators in Brazil.

As far as declaring a lower value, yes, that is fraud. It is also an easily uncovered fraud, since the Systemyde website lists the price. (Although based on my experience with customs, discovering that information is probably beyond what they are capable of.) But it would also be obvious if the package was fully insured.

The shipping/handling is expensive because I don't use the small flat-rate box because then the package can't be insured. A catch-22 that is expensive. The small flat-rate box is 13.25 to Brazil, while an 8 oz package is 24.23 plus another 5.40 for insurance. The box and packing material is another 3.00, and I tack on another 5.00 because it's a PITA to fill out customs forms and deal with the Post Office.

It's actually 60%, extortive nevertheless. Even when HP built (assembled) calculators here they were very expensive. My first HP-28S came from UTAH, not from Samson's but aboard a Cessna Caravan (thanks to a coworker, a flight mechanic). It cost me $211.00 then (here the price tag was well over $500). Not illegal as it fitted in the duty-free import quota.

You just reminded me of something. Back in the 90's i worked at a place that performed a service for a group from Venezuala. When they were ready to go home they would hit Wal Mart and buy as much electronics as they could possibly carry. Us Americans were puzzled by this. Since being on this forum i understand why. I still smile thinking about them making several attempts at lifting off till they had burned just enough fuel to get airborne.

Ouch. At that point I think it would be cheaper to get a plane ticket to the US to buy one, install it in your 41, and if asked at customs declare it as "1980s Electronic Calculator - Value $10"

Re: I'll be without my 41CL :-(

*Message #11 Posted by **Lincoln R.** on 8 Nov 2011, 12:55 p.m.,*
in response to message #10 by Lincoln R.

Note: I don't condone tax fraud (even if Brazil's import tax is ridiculous...), however the claim could be made that the 41CL board is "repair parts" or "upgrades" for a non-working 41C. If I put an $3000 new engine in a 20 year old car with a blue book value of $300, the car's still 'worth' $300 for tax purposes.

Re: I'll be without my 41CL :-(

*Message #12 Posted by **Frido Bohn** on 8 Nov 2011, 1:49 p.m.,*
in response to message #11 by Lincoln R.

The idea to declare the 41CL as a repair part of a system brings me to the idea of "divide et impera".
Pricing is all of the manufacturer (or intermediate) and the policy might be
adjusted for foreign customers in a way that the actually sent hardware makes
only a fraction of the system. The other part, the software, would then be the
major part. The software will be traded via a download page and is therefore
inherently customs-free.
For the 41CL the circuit board would constitute the hardware and the flash ROM/RAM
the software. Would there be a means of customs to check for a pre-installed RAM/ROM
on the board?

This are only free thoughts. I don't want to incite nobody.

Share my grief....

*Message #1 Posted by **cbuhmann** on 8 Nov 2011, 2:01 a.m.*

Hi guys, I ordered three 15C LE from SE to be sent to Germany in middle of September. They were shipped immediately after my order with USPS and handed over some days later to the customs here and further to DHL. So far so good, when the deliverer came to our office I was in a meeting so I could not take it personally. Unfortunately the deliverer had to take the additional taxes (~60,- EUR) cash. The receptionist did not know what to do, couldn't reach me and..... refused to take the parcel... !!! After one hour I tried to call DHL to redeliver it. After long discussions with the hotline I could convince them to try it. Tracking the parcel I saw the way it went. Back to the parcel center in Hamburg (I tried to call again). Nothing happened again. Then it was one week in the center, lying around. I called again daily. Nothing happened. It went back to the airport in Frankfurt. I called again.... And there the story is now. It is still in the export center (five weeks after the one and only delivery try), waiting to be sent to the States back.

Now tell me guys, what can I do...? I really want these three pieces of hardware back.

Rgds Chris

*Message #2 Posted by **Frido Bohn** on 8 Nov 2011, 3:28 a.m.,*
in response to message #1 by cbuhmann

Sounds like a piece of Kafka...

So, there is no way to let the parcel be sent to a central delivery station where you could pick it up? Parcels which cannot be delivered directly, usually are stored somewhere but not sent back to the sender. Maybe, that the way your receptionist managed this let the DHL deliverer assume that you refused the acceptance. Consequently, the parcel is going back to sender. Interesting is that there appears no way to intervene - a really weird situation.

This frankly is the problem when you get private mail to a company. In my company, the mail central generally refused to receive private mail a few years ago. Possibly, just because of such kind of problems. So, it would be better to have a notice in your mailbox at home and go to the central to pick up things personally.

I got my HP-15 LE few weeks ago and had to pick it up from the customs in Berlin. It took about 2 hours to get it. But in summary this is much less than the time and annoyance you are experiencing now.

File a "Schadensmeldung" or "Verlustmeldung" or "Nachforschungsauftrag" immediately at your nearest DHL office. Feed them all the known information where you assume your package is, maybe that will keep the items from being send back.

I'm also in Hamburg and I find it very interesting that DHL even tried to deliver the package to you and wanted to collect customs fees. I was never that lucky, I had always to go to the central customs office which is now based in Hafencity and 'bail out' my deliveries all by myself!

I've read about Samson Cables being very customer friendly and trying everything to get your items to you. If all fails, I have two and would be willing to part from one of them...

If declaration and bill are visibly accessible from the outside, then DHL may cash the custom fees. I was lucky enough to have it delivered to me on a Saturday, which was a big surprise since I already considered it lost.

I underline your idea with the 'Verlustmeldung'. It's worth a try.

If you can find the name of a high level manager in DHL's organization I would write and call them to request that they intervene to try to solve your problem.

Good luck,

John

Office delivery

*Message #7 Posted by **Frank Boehm (Germany)** on 8 Nov 2011, 9:55 a.m.,*
in response to message #1 by cbuhmann

Just a silly advice: If there is a risk of customs handling *never* use your office address as a delivery address. In most cases, you need to pick up the package at local customs and they will issue an invoice to your company (requiring ZOLL ATLAS number, Warentarifgruppe and so on) which could lead to all kind of taxing troubles. You might be able to talk them out of a company invoice when an invoice sheet with your home address is included - but that rarely seems to be the case.

Honestly, I don't think there is a way to reroute the package back into delivery, but you should simply call DHL to find out.
I have this number on file, not sure if it still works:
DHL Gold: 01803-221122
Otherwise, the DHL web site should have a more "public" number available.

Re: Office delivery

*Message #8 Posted by **cbuhmann** on 8 Nov 2011, 11:42 a.m.,*
in response to message #7 by Frank Boehm (Germany)

Hi all, I tried it now with a "Verlustmeldung" (=declaration the parcel is lost). Let's see if I have success.

I tried in the beginning nearly every day to call DHL, also at the hotline they could not understand.

Seems that many others from Germany ordered their machines.

Rgds Christian

Are you sure the parcel is still in Germany? Judging from your last tracking date I would guess it is back at Samson Cables. Have you contacted them about it?

Re: Office delivery

*Message #10 Posted by **Borja** on 8 Nov 2011, 1:05 p.m.,*
in response to message #9 by Alexander Oestert

Samson Cables people are very friendly, so I would contact them.

They made a mistake with my order. I had ordered two units and they sent just one.

I emailed them and within hours there was a second package on its way. Of course it's frustrating to open the package and find out thay despite having paid for two units you get only one, but they really did their best to amend the problem.

In the worst case, if the package has gotten back to them, I assume they will accept to ship it back, with you paying just the shipping cost again, which is fair solution, after all they didn't refuse the package ;)

most likely back to the US already

*Message #11 Posted by **Frank Boehm (Germany)** on 9 Nov 2011, 4:18 a.m.,*
in response to message #8 by cbuhmann

DHL tracking is nice and fun, but often misleading. Usually, foreign tracking numbers are not "compatible", so once the package is handed over, a new tracking number is attached (of course there is no way to find out that number) and the package status will not change (at least not until the end of the world).
I would assume the package has long been returned.
But then there is another possibility: when doing international shipping, you have to chose between two options in case the package cannot be delivered: "return to sender using the cheapest shipping option" or "give up". The second option would be %&$&$&$

Re: Share my grief....

*Message #12 Posted by **Thomas Radtke** on 9 Nov 2011, 5:29 a.m.,*
in response to message #1 by cbuhmann

One thing I don't understand: How could a different person initiate a RTS? If the addressee is not available,

usually a notice is left and the parcel goes back to the depot, waiting for you for a week or two.

The postman must have had a really bad day to not propose that option to the receptionist :-(.

Re: Share my grief....

*Message #13 Posted by **Maximilian Hohmann** on 9 Nov 2011, 9:41 a.m.,*
in response to message #12 by Thomas Radtke

Hello!

> Quote:
>
> One thing I don't understand: How could a different person initiate a RTS?

The postman can check one of several boxes on his mobile terminal: like "Nicht angetroffen" (adressee not present) or "Annahme verweigert" (acceptance refused). In the first case, a message will be left in the post box (or at the receptionists desk in this case) and the parcel will be stored at the nearest post office for a week. In the second case, it will go straight back to the sender. Oviously, the postman took the receptionists „I will not pay for this“ as a refusal.

As others already said: Private stuff -> private address!

But grief for a modern LCD calculator? Or even share this grief? Certainly not. Had it been a red-dot 35 in an unopened box, I might have shared some of your grief though...

Regards, max

[WP34s] Bugs in V3.0

*Message #1 Posted by **fhub** on 7 Nov 2011, 5:56 p.m.*

It's better to start a new thread, because the buglist in V3.0 seems to be endless ... :-(

Next bug: the register browser (with [f][EXIT]) doesn't work correctly anymore - first it shows RgX, but with arrow-up/down it immeadiately switches to R00 or R99 and you can't get back to the stack registers anymore.

Edit: and now I found another thing, but this is the same in ALL previous versions I have (back to SVN 1294): when I'm in the register browser and switch to the flag browser (with [->]), then I just see "not numeric" for every flag number I chose!?
Maybe I misunderstand something here, but what's the purpose of this flag browser when I don't see which flag is set or cleared?
(but as I already said, it seems this feature has never worked)

Edited: 7 Nov 2011, 7:25 p.m. after one or more responses were posted

*Message #2 Posted by **Dominic Richens** on 7 Nov 2011, 7:07 p.m.,*
in response to message #1 by fhub

Might be good to have this kind of detailed testing discussion on the sourceforge forum:

https://sourceforge.net/projects/wp34s/forums/forum/1342471

You can create a new "V3.0 bugs" topic under "Open Discussion".

P.S. I'm enjoying these discussions between Franz, Marcus, Walter and Pauli and will follow them wherever they happen I'm just concerned that: a) not everyone feels the same b) it'll be easier to search the discussion if it's stored in sourceforge's forum.

Edited: 7 Nov 2011, 7:13 p.m.

Yes, in principle you are right, but there's only one big problem: with my old internet notebook (Win98 + IE6) I can't create an account on sourceforge - I've already tried it many times. :-(

This one was fixed last night but not committed. Typing a '.' toggles between X and the local registers if there are any defined at the moment.

> (but as I already said, it seems this feature has never worked)

This is a misconception. The register browser does not show any **Fl**ags but accesses the **Fl**ash backup instead. On the hardware the backup area is always valid but on the emulator you need(ed) to have a valid wp43s-R.dat file for this. I've automated the process: If no backup exists, the backup area and the RAM contain the same data when the program starts.

I changed the display in the browser to "Bkup" to make this clearer. Revision 1847 contains the changes.

Ahhh, so my "Maybe I misunderstand something here" was the right guess. :-)

Re: [WP34s] Bugs in V3.0

*Message #7 Posted by **fhub** on 18 Nov 2011, 7:25 a.m.,*
in response to message #6 by fhub

Since yesterdays release SVN1879 there's a serious new bug.
Suddenly my polynomial solver stopped to work correctly, and I could track it down to the SLVQ command, which now seems to clear the return stack and immediately stops the program with the program counter at 000.

The only difference for SLVQ in xrom.wp34s that I can see is this new XLOCAL command (instead of the previous LocR 04), so I guess the problem is anywhere in these new "private XROM local registers" introduced in SVN1879.
And I find this XLOCAL also in a few other routines in xrom.wp34s, so I guess these commands will also make problems!?

Well, too much 'optimization' isn't always a good idea. ;-)

Re: [WP34s] Bugs in V3.0

*Message #15 Posted by **fhub** on 27 Nov 2011, 6:55 a.m.,*
in response to message #7 by fhub

And the next one:

The stack is: X:1 Y:2 Z:3 T:4

After executing CPX RCL X the stack is: X:1 Y:1 Z:1 T:2

After executing CPX RCL Z the stack is: X:1 Y:2 Z:1 T:2

Slowly I'm wondering what is still working at all, the current SVN version is in fact absolutely unreliable and thus unusable. :-(

Franz

Re: [WP34s] Bugs in V3.0

*Message #16 Posted by **Marcus von Cube, Germany** on 27 Nov 2011, 8:44 a.m.,*
in response to message #15 by fhub

I don't think these are any new bugs. I assume this has ever been the way you found out.

The problem with cRCL Z seems to be that the stack lift is performed before the command is carried out which leads to the result you see. In the case of cRCL X, there seems to be an additional issue with the direction of the memory copy. This seems all to be a little bogus to me and I'll check with Pauli what can be done about it. It's certainly not a new problem.

Re: [WP34s] Bugs in V3.0

*Message #17 Posted by **fhub** on 27 Nov 2011, 9:00 a.m.,*
in response to message #16 by Marcus von Cube, Germany

> Quote:
>
> I don't think these are any new bugs. I assume this has ever been the way you found out.

Well, it's at least new since 2.3 (or 3.0).
I've tried it with the last stable 2.2 version (SVN 1797), and both commands work correctly as they should, and not like in the new 3.0 SVNs. But even my last 3.0 SVN 1865 (which I thought would be a correct release) shows this new buggy behaviour, so it would be needed to go back even before 1865 to find where this bug (and it definitely is one!) has been introduced.

> Quote:
>
> The problem with cRCL Z seems to be that the stack lift is performed before the command is carried out which leads to the result you see. It's certainly not a new problem.

Well, I don't really care about stack lifting or not - a cRCL Z should put Z and T in X and Y, and a cRCL X should do the same (and so move X and Y to Z and T). I think there's no discussion about this.

Edited: 27 Nov 2011, 9:01 a.m.

Re: [WP34s] Bugs in V3.0 - Fixed!

*Message #18 Posted by **Marcus von Cube, Germany** on 27 Nov 2011, 9:29 a.m.,*
in response to message #17 by fhub

I agree that the behaviour is wrong. We have to investigate the reasons. It's most certainly not a change in the keyboard engine but some other code change. Thanks again for finding this out.

Edit: On my V2.2 (1782) 30b, cRCL Z returns the same (bogus) values you are reporting.

Edit 2: The code wasn't using intermediate variables which caused the stack lift and the recall

to interfere if the source register pair lived on the stack. Should be fixed now.

Edited: 27 Nov 2011, 10:19 a.m. after one or more responses were posted

Re: [WP34s] Bugs in V3.0

*Message #19 Posted by **Walter B** on 27 Nov 2011, 10:17 a.m.,*
in response to message #18 by Marcus von Cube, Germany

That's a real old one: even on my v2.0 build 1108 complex RCL Z returns these wrong values. It does a proper stack lift, however, so there are 1 2 1 2 3 4 in levels X through B (guess what stack size I use ;-)

Re: [WP34s] Bugs in V3.0 - Fixed!

in response to message #25 by Alexander Oestert

Alexander, I don't have a problem if you take care of this. Here is the code I changed:

xeq.c:

```
static void do_crcl(const decimal64 *t1, const decimal64
*t2, enum rarg op) {
        decNumber r1, r2;

        if (op == RARG_CRCL) {
                decimal64 x = *t1;
                decimal64 y = *t2;
                lift2_if_enabled();
                regX = x;
                regY = y;
        } else {
                ... // no changes in this part
        }
        set_was_complex();
}
```

Re: [WP34s] Bugs in V3.0 - Fixed!

in response to message #26 by Marcus von Cube, Germany

> Quote:
>
> Alexander, I don't have a problem if you take care of this. Here is the code I changed:

Well, I doubt that many here (including me) have the environment to change and compile the WP34s project themselves.
So it would indeed be a good idea to release an updated/bigfixed V2.2 version (maybe the last stable SVN 1797 would be a good candidate).

Re: [WP34s] Bugs in V3.0 - Fixed!

*Message #28 Posted by **Alexander Oestert** on 27 Nov 2011, 2:18 p.m.,*
in response to message #26 by Marcus von Cube, Germany

Thanks for the honor but I have absolutely NO idea how to do this. And frankly, even in my wildest dreams I don't picture myself learning to read and write code or install IDEs and compilers on my

netbook or iPhone... ;-)

Re: [WP34s] Bugs in V3.0 - Fixed!

*Message #29 Posted by **Alexander Oestert** on 28 Nov 2011, 1:41 a.m.,*
in response to message #28 by Alexander Oestert

I just wanted to add that I'm perfectly happy with my V2 version as it is. I will most probably never ever encounter this bug while using it - or any other, for that matter. So only if one fine day you definitely have no better things to do, only then you may consider working on V2. It is in no way urgent to me and I will live happily ever after praising the WP34s in the state it is in right now! :-)

Thanks to you and the whole team for making it and for putting so much time and effort in it!

sound like time to create a V2.2 branch (I know, I sound like a broken record :-)

What Revision should be used: 1797?

Re: [WP34s] Bugs in V3.0 - Fixed!

*Message #31 Posted by **Walter B** on 28 Nov 2011, 2:47 p.m.,*
in response to message #30 by Dominic Richens

Build 1797 is a good start. Then read SVN, especially the short release notes accompanying each build.

We will proceed with what's going to be v3.0, however, as Pauli posted here earlier already. Sorry, but we simply don't have the resources to follow two development lines at the same time - may lead to losing both tracks shortly.

1800 was labelled "safety checking" and appears to be the

beginning of the local register code so I would start with 1798.

> Quote:
>
> Sorry, but we simply don't have the resources to follow two development lines at the same time - may lead to losing both tracks shortly.

Agreed, there should be another (group of) volunteer(s) that takes care of back-props to V2.2. I'll see if I can get around to creating the V2.2 branch this week. Then I have to re-install the ARM cross compile environment.

1798 was no build, it was just a source change with a macro removed.
The last 2.2 build version was indeed 1797.

*Message #34 Posted by **Dominic Richens** on 28 Nov 2011, 8:53 p.m.,*
in response to message #33 by fhub

My rationale is that 1798 was a zero-risk change (removed code that was #ifdef'd out) that will make merging fixes easier.

Re: [WP34s] Bugs in V3.0 - Fixed!

*Message #35 Posted by **Dominic Richens** on 3 Dec 2011, 7:38 a.m.,*
in response to message #34 by Dominic Richens

I have created wp34s/branches/V2.2 and submitted the fixed xeq.c along with an updated wp34sgui.exe.

When I'm back at work Monday (where my serial cable is) and I can test the calc.bin I'll commit that too, along with another wp34sgui.exe with the correct VERS.

We have to figure out what will be in the V2.2.zip file now. The equivalent would be everything under wp34s *except* trunk. Perhaps we should do

something more paired down? Just the V2.2. manual, the library, DLLs and binaries?

Re: [WP34s] Bugs in V3.0 - Fixed!

*Message #36 Posted by **Marcus von Cube, Germany** on 3 Dec 2011, 2:05 p.m.,*
in response to message #35 by Dominic Richens

You may need to branch the library, too.

*Message #37 Posted by **Dominic Richens** on 4 Dec 2011, 1:32 a.m.,*
in response to message #36 by Marcus von Cube, Germany

Technically that means library needs to move under trunk. I could just make a copy under branches/V2.2 I guess it really depends on whether we think we'll have a V4.0 one day with new command mnemonics.

I've patched, built and tested the V2.2 version of calc.bin. You can download it and install it with MySamba.

The revision number is 1990, which is a sub-version-ism, but it still says V2.2

I have also uploaded a new version of the V2.2 zip file, called wp34s-V22-1990.zip.

Going forward I'm open to suggestions as to what fixes should be ported over. I'd be open to doing a monthly update to the V2.2 load.

Seems like there must be some. The only thing I have noticed recently (which may or may not be considered a bug), is that when single-stepping through a program, if an alpha prompt is encountered which would normally be displayable in large font, it will instead be displayed in small font.

*Message #50 Posted by **fhub** on 1 Dec 2011, 8:04 a.m.,*
in response to message #15 by fhub

And again something broken in the latest build SVN 1967: the quadratic solver SLVQ doesn't work anymore!

If I run it without any program loaded (i.e. after a fresh install with "Erased") it just does nothing.
And if I've loaded a program and I'm within this program (i.e. have previously switched to program mode and moved down a few steps), then SLVQ (back in manual mode) seems to execute **any** step of this program and thus ends up in any error message.
The same if SLVQ is used in a program: in this case SLVQ just seems to jump to any program step.

And a different problem: when I load a flash region with PRCL n, then a simple R/S doesn't start the

loaded program - it works only if I first switch to program mode, make at least a SST, go back to manual mode and R/S again.

Edit1: also scrolling with [h][CAT] doesn't work with [up] when at the beginning of the list ([down] at the end works)

Edit2: all mentioned problems did not happen with SVN 1950/51 from 29.Nov.

Thanks for the report. There is certainly more broken than you have found because we did a major rewrite of label search and such to support END. This affects all programs, not only those actually containing an END statement.

Until we have ironed out this all, you should better revert to an earlier release for actual work.

This is very much appreciated. I found a bug in the XROM calling code (the label in XROM wasn't found and no error thrown). I don't know if that has an effect on the other bugs found but SLVQ should work again. PRCL needed an update, too.

I won't have time to do much work on the project in the next few days but I'll try to fix the

bad bugs at least.

Well, your last 'bugfix' makes the emulator now completely unusable. :-(

Starting the emulator, clicking on R/S ---> Crash!
New start, trying to do PRCL n ---> Crash!
New start, trying to solve a quadr. equ. with SLVQ ---> Crash!

Good night ---> Crash! ;-)

Well Marcus, also this new compile 1970 crashes exactly the same way as 1969, so there was definitely something "kaputt" in it. ;-)

Fortunately in the current SVN 1974 these problems have disappeared again - they are working (almost) fine.

But there's one small bug in SVN 1974 I've just found, and it's about scrolling through the catalog ([h][CAT]):

If there is no program loaded in memory, then everything works fine - scrolling [down] and [up] is working correctly and is wrapping around at the bottom and top of the list.
But if you have (loaded) any program in RAM, then going [up] in the list

makes problems as soon as you reach the top of the list, i.e. your program in RAM. If you continue to press [up], then suddenly strange commands (instead of labels) appear in the list (and even 'exotic' characters), and finally the program crashes again.
These commands or strange characters look as if the catalog code would jump anywhere into the XROM code when pressing [up] beyond the top RAM program!?

So I guess I've finally found a way of 'Synthetic Programming' on the WP34s ... ;-)

Franz

Yes, it's working now!
But the bad thing is, that now there's no chance anymore for synthetic programming. :-(
(and I was already looking forward to a 'flying goose' on the display ... ;-))

BTW, is it normal (intended) that immediately after loading a program/flash with 'PRCL n', a simple [R/S] doesn't work, ie. doesn't start the program?
Only after switching to program mode and going one step down (to the program label) R/S starts the program.
I guess the program counter isn't set automatically INTO the first program when you load a flash dat-file!?

Franz

Definitely not! I've no time to work on this now (my table tennis team is waiting). It's a bug and must be related to the new handling of program bounds.

Re: [WP34s] Bugs in V3.0

*Message #62 Posted by **fhub** on 4 Dec 2011, 6:50 a.m.,*

in response to message #15 by fhub

No end in buglist ... ;-)

Today I wanted to enter a "cpx x~~0?" (in SVN1977) just to see that this command is not accepted.

After clicking [CPX][h][TEST] the command "Cx~~_?" appears, but when I now enter 0 or 1 then I get "undefined op-code" (or ??? in programming mode), and when I enter 2 (or any higher number) I get a "SKIP 2_" instead of the complex-compare.

Happy bugfixing, :-)
Franz

Well, that's also a method for bugfixing: simply removing the buggy code. ;-)

But I don't really understand the/your problem with complex approx compares? Shouldn't e.g. a "cpx x~~0?" be just equivalent to real compares "x~~0?" AND "y~~0?" ?
And the same for register Rn: "cpx x~~? nn" is equivalent to "x~~? nn" AND "y~~? nn+1".
Or does it mean that also real approx compares aren't working realiably or correctly?

Franz

[WP34s] Aprroximate compares.

*Message #65 Posted by **Marcus von Cube, Germany** on 4 Dec 2011, 12:26 p.m.,*
in response to message #64 by fhub

We had an internal discussion about it and an approximate compare of a complex number to zero only makes sense if you define a small circle around the origin of the complex plane and check if the number falls within the bounds of this circle. (The comparison between arbitrary numbers can be reduced to comparing the difference against zero). But what is the correct size of the circle? If you have a workable idea, we can rethink it.

From a math standpoint, the whole business of approximate compares is a bit flaky. The present implementation uses the display setting to round the number(s) and compare the rounded results. It would be better to define some system value epsilon and check if the difference of the compared values is smaller then epsilon. This doesn't scale very well. A

relative measure would be more appropriate.

Re: [WP34s] Aprroximate compares.

*Message #66 Posted by **fhub** on 4 Dec 2011, 12:52 p.m.,*
in response to message #65 by Marcus von Cube, Germany

I understand your considerations about these approximate compares in general, but I don't see any difference between real and complex numbers.
If you use the current display setting for real compares, then why not do the same for complex? And whether you test separately the real and imaginary part for being ~0, or you do it with the cABS value (which would mean your 'circle') is just a matter of taste.

Your idea with a system value 'eps' is indeed not that bad - and if one wants relative compares, well, then he has to do code it himself. ;-)

9100 printer paper

*Message #1 Posted by **David Ramsey** on 7 Nov 2011, 11:01 a.m.*

The 9120a printer that sits on top of a 9100 calculator seems to be the electrostatic type: that is, the printhead electrically vaporizes a thin coating on the paper's surface to expose a black layer underneath.

I recall these printers from the 70s, but it's been decades since I've seen one or the special paper they use.

Are there still any sources for this paper?

Edited: 7 Nov 2011, 11:01 a.m.

Re: 9100 printer paper

*Message #2 Posted by **Katie Wasserman** on 7 Nov 2011, 12:04 p.m.,*
in response to message #1 by David Ramsey

I've never had any luck finding a supply of this other than on ebay and only very rarely. While I no longer have a 9100 and printer, I do have a couple of other calculators (Olivetti Divisumma 18 and a Sharp El-8151) that use electrosensitive paper (that's the proper name for it) and they are equally hard to find paper for.

Re: 9100 printer paper

*Message #3 Posted by **David Ramsey** on 7 Nov 2011, 6:08 p.m.,*
in response to message #2 by Katie Wasserman

Electrosensitive paper still seems to be used in the medical industry (makes sense, give that the printouts will never fade), but it all seems to be 2 5/16" width rather than the 2.5" width HP specs. Wonder if that would be a problem?

Please, let this forum be free of religion and politics

*Message #1 Posted by **Alexander Oestert** on 7 Nov 2011, 9:52 a.m.*

We have seen some incidents of discussions about religion here recently. I confess I have participated in some. I've already started to feel odd about some of the things that were said and about the people that said them. This is not a good thing. I'd rather not know at all about other forum participants' believes (and politics, for that matter) but enjoy talks about math, calculators and science in general.

In real life I very much enjoy all things philosophical, but they should never be mixed with other topics and are best discussed face to face .

Please join me to keep our believes and politics to ourselves!

Emerson E12 (rebranded Corvus 500) pics

*Message #1 Posted by **Cristian Arezzini** on 7 Nov 2011, 8:40 a.m.*

A few days ago I posted about this calculator, now I managed to take some photos and upload them online (took me too long, I know...) but that thread is in the archives now so I have to start a new one. Anyway, for those interested, here are the pictures, showing the front and the insides of the calculator - you can clearly see the Corvus mark on the motherboard, and the HP display...

*Message #2 Posted by **Cristian Arezzini** on 7 Nov 2011, 8:52 a.m.,*
in response to message #1 by Cristian Arezzini

So, does anyone know: 1) where to find that high-density foam that is between the keys and the metal domes in many keyboards; 2) where to find the HP display shown in the pic (I have little hope...) 3) What material to use to rebuild the battery contacts when they're too corroded to be just cleaned?

Cristian

Re: Emerson E12 (rebranded Corvus 500) pics

*Message #3 Posted by **Michael de Estrada** on 7 Nov 2011, 8:59 a.m.,*
in response to message #1 by Cristian Arezzini

Thank you, Cristian. You are correct that it looks identical to a Corvus 500, except for the logo. Have you succeded in repairing the battery contacts ?

Edit: I see you still have the battery contact problem.

Edited: 7 Nov 2011, 9:00 a.m.

Re: Emerson E12 (rebranded Corvus 500) pics

*Message #4 Posted by **Dan W** on 7 Nov 2011, 7:19 p.m.,*
in response to message #1 by Cristian Arezzini

Which Emerson is this? There's an Emerson Electronics out of Canada, but they use a G Clef as a symbol. Is this the same one?

There's another Emerson in the US but they make mainly industrial controls and telecom equipment.

Re: Emerson E12 (rebranded Corvus 500) pics

*Message #5 Posted by **Cristian Arezzini** on 8 Nov 2011, 3:40 a.m.,*
in response to message #4 by Dan W

I don't know... It's "Emerson Electronics", made in Hong Kong. I bought it on eBay a few weeks ago from an Italian seller, so I suppose it was bought in Italy (the seller was not a collector)...

HP41 battery pack

*Message #1 Posted by **Cristian Arezzini** on 7 Nov 2011, 5:52 a.m.*

A few months ago I bought a 41CX. It came with the rechargeable battery pack (the one with short batteries and an electronic circuit inside). The battery pack looks "like new" externally, but the two inner batteries have some corrosion right where the metal tab connects them. The tabs that connect to the calculator are clean and shiny like new, as are the charger contacts. I don't know how the "bottom" of the cells looks like because I didn't open the pack (I don't know how to) but looking through the openings on the back, where you can "sort of" see the bottoms of the batteries, everything seems clean.

Now, my question... I don't have a charger and I usually prefer alkalines, so, would it be reasonable to ask an "exchange" with a battery pack that holds alkalines? Is there a big difference in value?

In case... is there someone in Europe interested in an exchange? :)

Cristian

Re: HP41 battery pack

*Message #2 Posted by **Ignazio Cara (Italy)** on 7 Nov 2011, 6:36 a.m.,*
in response to message #1 by Cristian Arezzini

Cristian, IMHO, it's seems reasonable to swap an exaust battery pack 82120A for a battery holder without/with alcaline battery. You have mail.

Regards

Ignazio

a tad pricy thermal paper source

*Message #1 Posted by **Duane Hess** on 6 Nov 2011, 9:30 p.m.*

Must admit this is a self-serving post (but not of a monetary nature). Wanted to e-mail someone, but it wouldn't let me until I posted. So decided to copy a document I put on the HP Calculator Fan Club on FB concerning a possible paper source for HP-91/92/97 & HP-9810 printers.

received a question concerning how long the print will last before fading. I don't know. The PMC paper I've had only about 12 months. Things printed a year ago are still plenty dark and have been kept in a home environment in a folder. Tried to find some genuine 82045 listings, sure I have some somewhere that should be about 3 years old, but can't find them. hmmm.. IDK.

Saw a post on hpmuseum.org about HP-97 printer paper. As many of you know PMC-05233 is an equivalent. I called their tech support and verified it actually is an OEM equivalent to HP-82045A (other than paper width, length & color). Spoke to PMC's tech support as most Google-located thermal paper supply companies I called simply wanted to know the roll width/length and then declared it "OEM compatible". I specifically quizzed those reps & they didn't know if it was equivalent to HP-82045A, but assured me if it was the same width/length, then it would be OK. Maybe now-a-days all thermal paper is suitable with most everything as opposed to earlier days when 82175A paper shouldn't be used in a calc designed for 82045A.

I buy PMC05233 directly from a local office supply store, who has it in stock. Don't recall the price, but it was under $3 for a 3-roll pack and (obviously) there are no shipping charges as with Internet orders. i.e. don't forget your local suppliers.

Other info, which I've never taken advantage of, is Graphics Controls, Buffalo NY, 800/669-1535. Talked with their technical support and they claimed to be an OEM paper manufacturer; i.e. they are/were a supplier of HP labelled papers for many years. Last August they had part number 9281-0401 available in their catalog which is the HP part number for the paper used in the HP-9810/9820 built-in printer. Its a tad expensive at $8.14/roll, minimum order is 12 rolls, lead-time is approx 6(?) weeks. Their part number was 00595090. HP-82045A (blue) paper for the HP-91/92/97 was $4.99/roll minimum 12, same 6-8 week lead time; GC P/N 10149780. HP82175A (GC P/N 10134081) $5.50/roll, 6 roll minimum, forget lead time.

I am no way associated with Graphics Controls or any paper manufacturer/distributor, simply passing along information I learned. Due to health reasons and subsequent monitary diminishment, never persued the issue. I noticed the HP-9810A printer paper is no longer listed on their website, which is what originally lead me to them. The GC tech rep didn't know if they were an OEM supplier directly to HP for the 9281-0401 paper, but insisted it is equivalent with all specifications HP originally gave for the paper and GC is itself a paper manufacturer. Don't recall the shipping charges on any of the minimum orders listed above, but they were reasonable. about $5-$7 per minimum order. Never checked groups of orders.

Granted the per roll price may seem high, but compared with "TAS" they're cheaper than some sales I've seen.

www.graphiccontrols.com takes you directly to their web page, in the upper right simply enter:

82045A

and you'll see the HP-82045A paper. You'll have to call them for a price quote/lead-time info.

I used PMC-05233 paper in my HP-9810 and holy crap, it printed but black fuzz came off all over the place (presume from higher heat of print head compared to HP-97) The paper was also a bit thin to feed well. The HP-82045A worked well in the 9810, but only tried it just to see. Tried to find a direct equivalent to the HP-9810 paper (9281-0401) as I didn't want paper issues hurting the printhead. That's what originally lead me to Graphics Controls.

The above information was as of August 2010.

Re: a tad pricy thermal paper source

*Message #2 Posted by **David Ramsey** on 7 Nov 2011, 10:57 a.m.,*
in response to message #1 by Duane Hess

2.25" thermal paper doesn't seem to be hard to find; I bought a 12-pack of it at my loco OfficeMax and it works fine in my 97s, 82240 IR printers, and whatnot. I can't speak to its longevity, though.

Now, finding paper for an SR-60 printer is a bit harder...

Re: a tad pricy thermal paper source

*Message #3 Posted by **Thomas Chrapkiewicz** on 7 Nov 2011, 12:07 p.m.,*
in response to message #2 by David Ramsey

Do any of the available thermal rolls produce black print (like the old HP material)? The local office supply stuff I've used is all blue print.

TomC

Re: a tad pricy thermal paper source

*Message #4 Posted by **Duane Hess** on 7 Nov 2011, 12:36 p.m.,*
in response to message #3 by Thomas Chrapkiewicz

TomC:

The PMC-05233 paper produces black, not quite as dark as the HP-82175A paper, but close. I have several HP-82143A (HP-41C type) printers; both produce the same black intensity difference between the two papers. I'd say about 20% less dark with the PMC; at least using the equipment I have. The printers I have produce nearly jet-black using the original 82175A paper. PMC is not faint, just lighter.

Originally obtained the PMC part number from earlier threads on here. Those threads indicated a number of people use it and feel comfortable using it. After talking with their tech support I feel comfortable about using it in my 97.

I'm intrigued you have a blue paper source. Those always seemed difficult for me to find. Just plain don't like black myself. Do you have a brand/part number for it? Or where you buy it? Always interested in furthering my "paper search".

Re: a tad pricy thermal paper source

*Message #5 Posted by **Thomas Chrapkiewicz** on 7 Nov 2011, 12:59 p.m.,*
in response to message #4 by Duane Hess

Duane:

Here are some paper(s) I have: (I have not yet tested them - perhaps at a later date. I have had these a while and not certain if they are all still available)

- Staples brand 226290 - 2.25"w, 165' roll - Sears MY58005 - 2.25"w, 165' roll - PM (Paper Manufacturers Company, Indianapolis, Ill, USA)5233 - 2.25"w, 85' roll (found this at a Rite-Aid Pharmacy)

Note that the Staples and Sears products are very large rolls and my not fit in HP applications.

Also, I've noticed on a HP82175A box, it says specifically to NOT use it in Hp97/91/92.

TomC

Re: a tad pricy thermal paper source

*Message #6 Posted by **Duane Hess** on 7 Nov 2011, 1:19 p.m.,*
in response to message #5 by Thomas Chrapkiewicz

Thanks for the blue info!

I've seen the 82175 warning for the 97. The PMC 05233 paper is allegedly an OEM equivalent for the 82045A paper (other than color & paper weight). The 82045A paper should work anywhere 82175 is used, but not the other way around. I sure hope PMC wasn't feeding me a line about 82045A equivalence. Granted I might die before wearing out the printhead, but why take a chance? I like to feel I'll outlive my 97. (however, find that concept annoying as I'd need to get another one)

Re: a tad pricy thermal paper source

*Message #7 Posted by **Thomas Chrapkiewicz** on 7 Nov 2011, 2:00 p.m.,*
in response to message #6 by Duane Hess

Hi Duane:

Some of these may be black; I'll try to test them all out soon (weeks/months), and I'll report back. My testing will likely be in a HP82240B.

TomC

Re: a tad pricy thermal paper source

*Message #8 Posted by **Duane Hess** on 7 Nov 2011, 12:17 p.m.,*
in response to message #2 by David Ramsey

Glad you responded, it was a reminder my usual verbosity buries the point.

My concern was the issue of whether incorrect paper actually does damage printheads. Or whether modern paper is compatible with everything. There have been several threads on that here, not sure there was ever an answer other than a generic "the paper I use hasn't hurt anything so far."

Which was the point of my post, if there are other users as neurotic about the issue as me, GC might be a paper source.

Thanks Tim for blue HP50g's keyboard colors

*Message #1 Posted by **Carey** on 6 Nov 2011, 10:03 a.m.*

When I read Tim's Sept 18 post that he had checked the blue HP50g against color blindness (Protanopia and Deuteranopia) I ordered one as I have the milder and more common (5% of males) form (Deuteranomaly). I am finding the blue HP50g's keyboard to be the clearest and easiest to read (for me) of any calculator and much easier to read than the standard HP50g keyboard. Some web photos don't do it justice. Many thanks Tim for your colorblind-friendly color choices on the blue HP50g's keyboard.

Carey

*Message #5 Posted by **Jan** on 7 Nov 2011, 2:33 p.m.,*
in response to message #1 by Carey

I am not sure for what market the new colour scheme was intended but my advise would be to keep the old black colourscheme available for the professional market. The new blue colours may be nice for schoolkids but in my view they are just horrible. They give the calculator an aura of cheepness unmatching its pricetag and its capabilities.

Wang 360 RPN calculator

*Message #1 Posted by **aj04062** on 5 Nov 2011, 10:45 p.m.*

Does anyone in this forum have experience with these units?

I have a system on its way to me that needs work to get operational.

Re: Wang 360 RPN calculator

*Message #2 Posted by **Juergen Keller** on 6 Nov 2011, 2:14 a.m.,*
in response to message #1 by aj04062

According to Wang Model 360SE Calculator System these are not RPN calculators as they do not have a stack. Not all calculators having and ENTER key are providing RPN.

Re: Wang 360 RPN calculator

*Message #3 Posted by **aj04062** on 6 Nov 2011, 6:51 a.m.,*
in response to message #2 by Juergen Keller

I thought it was RPN after watching this video

Re: Wang 360 RPN calculator

*Message #4 Posted by **Thomas Radtke** on 6 Nov 2011, 7:06 a.m.,*
in response to message #2 by Juergen Keller

It should have at least two registers if I correctly understood the examples given, and the entry method appears to be RPN.

Re: Wang 360 RPN calculator

*Message #5 Posted by **Katie Wasserman** on 6 Nov 2011, 10:12 a.m.,*
in response to message #4 by Thomas Radtke

I have a Wang 520 that works the same way only with a lot more functions and stuff. I would not call it RPN any more than I'd call a Commodore Minuteman 6 RPN. There's no stack, no swap, no roll.

Re: Wang 360 RPN calculator

*Message #6 Posted by **aj04062** on 6 Nov 2011, 10:37 a.m.,*
in response to message #5 by Katie Wasserman

Okay,

Not RPN, but has Nixie Tubes! It will be interesting to play with. will soon have:

1 - CPU - model 360 SE
7 - 360K / 362K keyboards
1 - 320K keyboard
3 - CP-1 Card reader
1 - IBM Porta-punch for punching cards

If any of these extra pieces are of interest, let me know. I know I will not want all of them as I envision they will take up too much space.

Re: Wang 360 RPN calculator

*Message #7 Posted by **Katie Wasserman** on 6 Nov 2011, 10:45 a.m.,*
in response to message #6 by aj04062

Some might call it RPN, but not me.

However it will definitely be fun to play with! I love the Nixie display and Wang signature huge square buttons with nice click feedback.

Question about Hungarian Sellers on TAS

*Message #1 Posted by **Namir** on 5 Nov 2011, 5:50 p.m.*

Hi All,

Can anyone tell me (especially our European friends on this site) why do Hungarian sellers on TAS attempt to sell calculators and pocket computers at very high prices?????

A Confused American!!!

Edited: 5 Nov 2011, 5:51 p.m.

Re: Question about Hungarian Sellers on TAS

*Message #2 Posted by **Michael de Estrada** on 5 Nov 2011, 5:52 p.m.,*
in response to message #1 by Namir

Because they are hungry.

Re: Question about Hungarian Sellers on TAS

*Message #3 Posted by **Walter B** on 5 Nov 2011, 6:23 p.m.,*
in response to message #1 by Namir

Why shouldn't they? Teacher, they've learned their lesson well, they are trying to maximize profit.

Re: Question about Hungarian Sellers on TAS

*Message #4 Posted by **Nick Taylor** on 5 Nov 2011, 7:23 p.m.,*
in response to message #1 by Namir

Can I ask what "TAS" stands for?

Re: Question about Hungarian Sellers on TAS

*Message #5 Posted by **Roger Blake** on 5 Nov 2011, 7:28 p.m.,*
in response to message #4 by Nick Taylor

Apparently it's this forum's nickname for Ebay - stands for "That Auction Site". Being in the UK, I initially thought it must be some other US auction site until I ventured to ask here. So you're not the only one to have been puzzled !

Re: Question about Hungarian Sellers on TAS

*Message #6 Posted by **Walter B** on 5 Nov 2011, 7:44 p.m.,*
in response to message #5 by Roger Blake

Search for TAS and TOS in the museum archives and you'll find out more ;-)

Re: Question about Hungarian Sellers on TAS

*Message #7 Posted by **Nick Taylor** on 5 Nov 2011, 10:21 p.m.,*
in response to message #6 by Walter B

Does "TOS" mean "The Other Site"?

Re: Question about Hungarian Sellers on TAS

*Message #8 Posted by **Martin Pinckney** on 5 Nov 2011, 10:29 p.m.,*
in response to message #7 by Nick Taylor

Yes, and you dast not mention it by name, or your posts will be moderated for a few days.

Re: Question about Hungarian Sellers on TAS

*Message #9 Posted by **Raymond Del Tondo** on 5 Nov 2011, 10:35 p.m.,*
in response to message #7 by Nick Taylor

"The Other Site" or "That Other Site" . Mainly related to HP41 topics. Maintained by Warren Furlow. Four-letter ORG domain;-)

Re: Question about Hungarian Sellers on TAS

*Message #10 Posted by **Gerson W. Barbosa** on 5 Nov 2011, 7:44 p.m.,*
in response to message #5 by Roger Blake

This recurring question about TAS meaning surely belongs in the FAQ. I won't bother our host about that, however, as he's apparently very busy lately.

Re: Question about Hungarian Sellers on TAS

*Message #11 Posted by **Don Shepherd** on 6 Nov 2011, 12:54 a.m.,*
in response to message #10 by Gerson W. Barbosa

Maybe we should just refer to Ebay as Ebay and not confuse people.

Re: Question about Hungarian Sellers on TAS

*Message #12 Posted by **Eric Rechlin** on 6 Nov 2011, 9:19 a.m.,*
in response to message #11 by Don Shepherd

I agree. I feel it is incredibly irresponsible to new people here when others refer to things in code. Given the history, I can understand the whole "TOS" debacle, but everyone, please stop using "TAS" to refer to eBay. There is no reason this should be a FAQ, because everyone should just stop this immaturity.

Eric

Re: Question about Hungarian Sellers on TAS

*Message #13 Posted by **Gerson W. Barbosa** on 6 Nov 2011, 11:22 a.m.,*
in response to message #12 by Eric Rechlin

This is not a taboo word to me, but it is to some. Well, perhaps a poll might be held to check if it is an ominous word to **some** or to **most** of us here.

Gerson.

Re: Question about Hungarian Sellers on TAS

*Message #14 Posted by **Donald Williams** on 6 Nov 2011, 2:29 p.m.,*
in response to message #13 by Gerson W. Barbosa

I suggest all forum members go back and carefully read the curators "Terms of Use" agreement. Dave clearly wants to discourage ebay discussions on this forum. If you have been around very long then you know how disruptive these discussions have become in the past.

Still some members insist on ignoring this simple request and attempt to conceal their disrespect by making reference to TAS rather than ebay.

Sad.

Re: Question about Hungarian Sellers on TAS

*Message #15 Posted by **Don Shepherd** on 6 Nov 2011, 3:00 p.m.,*
in response to message #14 by Donald Williams

Donald, I read the Terms of Use and don't see any prohibition about discussing Ebay and auction sites. Indeed, Dave says discussions about them may come up from time to time. What Dave does say is that if you refer to a specific Ebay auction, you need to list your Ebay ID in your post; it seems that that frequently doesn't happen, so that would be a violation. This thread is not about a specific auction, it is just a general question that Namir has and I believe it is appropriate and not in violation of the Terms of Use.

Re: Question about Hungarian Sellers on TAS

*Message #16 Posted by **Donald Williams** on 6 Nov 2011, 4:16 p.m.,*
in response to message #15 by Don Shepherd

I don't think I used the term prohibited. I used the term discouraged. Otherwise, I agree with all points of your response. I do not believe this particular thread violates those terms. No offense intended.

IIRC the term "TAS" came into existence following the the additional paragraph added to the terms of use concerning ebay discussions. I think forum members originally used this term in jest, and it has persisted since.

I do confess however, IMOHO if all ebay discussions were prohibited it would be no great loss.

Re: Question about Hungarian Sellers on TAS

*Message #17 Posted by **Maximilian Hohmann** on 6 Nov 2011, 4:49 p.m.,*
in response to message #16 by Donald Williams

Hello!

> Quote:
>
> I do confess however, IMOHO if all ebay discussions were prohibited it would be no great loss.

For me, eBay is about the only remaining source for finding collectible calculators. HP and others. The have disappeared from flea markets and second hand stores long ago, at least in my part of the world. And I doubt that it is much different elsewhere.

So where would be a better place for discussions about this main source of historic calculators if not in the discussion forum of a calculator museum?

And everybody who read "1984" knows that it doesn't help to avoid certain terms or even to rename them. Therefore I will call eBay eBay as long as it calls itself eBay. Anywhere.

Regards, max

Re: Question about Hungarian Sellers on TAS

*Message #18 Posted by **Donald Williams** on 6 Nov 2011, 5:26 p.m.,*
in response to message #17 by Maximilian Hohmann

"So where would be a better place for discussions about this main source of historic calculators if not in the discussion forum of a calculator museum?"

I think it is discouraged because this forum is so "ripe" for commercial abuse. In the past eBay sellers have focused on this "primo" site to show case their auctions, and then later, began a "flame war" campaign to discredit one another. It became so contentious and ridiculous that Dave was forced to step in and personally censor posts and eventually instigate some changes to the forum.

Hence the long running taboo over mentioning eBay and the use of the pseudonym "TAS".

I think the abuse still exists at a much lower level,and those individuals will be more than willing to ramp it back up given the opportunity.

Re: Question about Hungarian Sellers on TAS

*Message #19 Posted by **Duane Hess** on 6 Nov 2011, 9:00 p.m.,*
in response to message #17 by Maximilian Hohmann

I can sympathize with that. Still finding units at garage sales, flea markets, 2nd hand would be wonderful.

Re: Question about Hungarian Sellers on TAS

*Message #20 Posted by **Don Shepherd** on 6 Nov 2011, 6:53 p.m.,*

in response to message #16 by Donald Williams

No offense taken, Donald. I personally don't find the Ebay discussions in this forum very useful either. I buy things on Ebay now and then, and I've never had a bad experience, but I'm aware there are crooks out there so you have to be careful.

Dave is a very good moderator and he will not ban discussions here unless they are extremely offensive to a large number of people--and I don't think I've ever seen that happen. There are some discussions I don't find very interesting, but I'm learning just to pass them over in the list.

Hello,
IMHO because the 400 USD HP 15C American prices.

An angry Hungarian buyer. ;)

Re: Question about Hungarian Sellers on TAS

*Message #23 Posted by **Bart (UK)** on 7 Nov 2011, 5:28 a.m.,*
in response to message #1 by Namir

There is a Hungarian equivalent to Cobubba that is to Sharp as Cobubba is to HP. There is the occasional low starting price auction, but admittedly few. I generally ignore auctions if I see Country is Hungary, Italy or any from the far east. Personaly I think they see the rest of Europe & US as "people to make lots of money from". Harsh? maybe, but the result of my observation that most of them list calculators with high starting prices/BIN (I don't mind bidding on items with reasonable starting prices, but not several times what it normally sells for).

> I've made lots of tests with random polynomials (of degree 10 and 20, and with coefficients -100..100) and calculated the optimal parameters for the iteration process. With the current (internal) setting of these parameters there was not one single failure for a few thousand polynomials, so I would say the program is now working quite well.

Tests using random polynomials are no good to check polynomial root finders, on the contrary you should check very specific, difficult cases which actually test the limitations and weak points of your particular implementation.

For instance, try this one and see how it fares:

x^30+30 x^29+435 x^28+4060 x^27+27405 x^26+142506 x^25+593775 x^24+2035800 x^23+5852925 x^22+14307150 x^21+30045015 x^20+54627300 x^19+86493225 x^18+119759850 x^17+145422675 x^16+155117520 x^15+145422675 x^14+119759850 x^13+86493225 x^12+54627300 x^11+30045015 x^10+14307150 x^9+5852925 x^8+2035800 x^7+593775 x^6+142506 x^5+27405 x^4+4060 x^3+435 x^2+30 x+1 = 0

then, you might consider to try this one as well:

x^20+10 x^19+55 x^18+210 x^17+615 x^16+1452 x^15+2850 x^14+4740 x^13+6765 x^12+8350 x^11+8953 x^10+8350 x^9+6765 x^8+4740 x^7+2850 x^6+1452 x^5+615 x^4+210 x^3+55 x^2+10 x+1 = 0

Best regards from V.

Hi Valentin,

I must say: really very useful and 'realistic' examples! :-(

I've tried this 30-degree polynomial with 4 different 'professional' polynomial solvers on the web and all 4 programs give completely different results.
One of these programs has even several (7) different methods and each method gives also different results!
This last mentioned program can be found here:
http://www.hvks.com/Numerical/websolver.php

BTW, my program is even better than all others that I've tested: it just give NO solution (which is indeed better than wrong solutions). ;-)

So what do you really expect from a small polynomial solver made for a simple calculator???

And one other point: for EVERY program which solves any problem with approximate methods you can always find input values which make the program fail (I know from your AMx matrices that you're an expert in this) - however the question is: how useful (or realistic) are such 'strange' and 'artificial' conditions?

So what to do if EVERY approximate algorithm fails for SOME conditions? Should you avoid writing such a program at all, just because it doesn't work 100% perfectly?

Well, maybe it would be the best to remove my program again ... :-(

Franz

> Well, maybe it would be the best to remove my program again ..

Please don´t ¡ Valentin's counter-examples don't signify a lack of merit from your program's part but only that the topics addressed are deeper than it appears on first (or second, or third) inspection.

As you say they are a stretch for the typical daily use of the system at hand, yet they are a wonderful challenge to the algorithms - and that's what we're also delighted to have in this forum :-)

I don't have a 34S (imagine, the 41 system quenches my thrist, how's that for (su)real-life systems :-) but otherwise I'd've saved and tried your program, thanks for sharing it.

Best, 'AM

Ángel, why not try the Windows emulator?

Re: [WP34s] Polynomial RootSolver

*Message #6 Posted by **Dieter** on 6 Nov 2011, 9:11 a.m.,*
in response to message #1 by deleted

Let me add a few remarks.

- I had to re-assemble the code to make it run on the emulator v 2.2.1789. The documentation does not mention the version required by the .dat file.
- The documentation also says that only the numbered registers are used. This is not correct - the program uses J and K as well.
- I do not like the way complex roots are displayed. They real part is labelled x_n while for the imaginary part x_n+1 is used. That's why I modified the program the following way:

```
   current         improved
   ----------------------
   x1              x1
   -1,4918         -1,4918
[R/S]
   Re x2           Re x2,3
   -0,8058          -0,8058
[R/S]
   Im x3           Im x2,3
   1,2229          1,2229
[R/S]
   Re x4           Re x4,5
   0,5517          0,5517
[R/S]
   Im x5           Im x4,5
   1,2533          1,2533
```

- There are some hard-coded constants like 1E-12 and 1E-16. At Lbl 85 a value less than 1E-12 is rounded to zero. Why is this done? Step 241 tests if the current value is less than 1E-16. I wonder if this will work for any order of magnitude a solution may have. What if x is > 10^6 and 1 ULP equals 1E-9?

Dieter

Re: [WP34s] Polynomial RootSolver

*Message #7 Posted by **fhub** on 6 Nov 2011, 9:39 a.m.,*
in response to message #6 by Dieter

> Quote:

Fine - and let me add a few remarks to the remarks, too. ;-)

> Quote:
>
> I had to re-assemble the code to make it run on the emulator v 2.2.1789. The documentation does not mention the version required by the .dat file.

You're right - I didn't mention it because I always use the latest SVN build. And of course everyone could (or should) recompile it for their own WP34s version.

> Quote:
>
> The documentation also says that only the numbered registers are used. This is not correct - the program uses J and K as well.

No, I didn't write anywhere that ONLY the mentioned numbered registers are used, I just listed only the NUMBERED registers.
And BTW, not even your list is complete, because despite of J and K the program even uses X,Y,Z and T. ;-)

> Quote:
>
> I do not like the way complex roots are displayed. They real part is labelled x_n while for the imaginary part x_n+1 is used. That's why I modified the program the following way:

Well, I had a few different version of displaying complex solutions, and one of them was exactly the way you do it now (with n,n+1). But this needed a few more instructions, and since space is 'expensive' on the WP34s I did it the easier way.

> Quote:
>
> There are some hard-coded constants like 1E-12 and 1E-16. At Lbl 85 a value less than 1E-12 is rounded to zero. Why is this done?

Well, this 1e-12 is the precision of the calculated roots (and can be changed by the user while running the program), and thus I round solutions to zero if their absolute value is less then this calculated accuracy. This makes results look much nicer, especially if the imaginary part is 'almost' 0 (within the calculation accuracy).

> Quote:
>
> Step 241 tests if the current value is less than 1E-16. I wonder if this will work for any order of magnitude a solution may have. What if x is > 10^6 and 1 ULP equals 1E-9?

This 1e-16 is in fact not very important and I doubt that this value is reached at all during any calculations - it's just to avoid division by zero (or overflows by VERY small denominators). In different implementations of the Bairstow method I've even seen values for this from 1e-10 to 1e-99.

Franz

Re: [WP34s] Polynomial RootSolver

*Message #8 Posted by **Dieter** on 6 Nov 2011, 1:34 p.m.,*
in response to message #7 by fhub

> Quote:
>
> No, I didn't write anywhere that ONLY the mentioned numbered registers are used, I just

(deleted post)

> listed only the NUMBERED registers.

Let's see:

```
Used Flags/Registers/Labels:
----------------------------
Flags:     00
Registers: R0-Rn ... Polynomial coefficients a(n) - a(0)
           R(n+1)-R(2n+1) ... Polynomial backup copy
           R80-R94 ... internal usage
           R95 ... maxdeg (30)
           R96 ... eps (1e-12)
           R97 ... randfact (3)
           R98 ... newinit (25)
           R99 ... maxiter (500)
Labels:    11,12,13 & 80-89
```

This does not leave much room for interpretation. ;-) It's a simple documentation error. No big deal, but it should get fixed. Simply add J and K to the "internal usage" line. And while we're at it: the backup of the polynomial coefficents uses the registers up to R(2n+2).

> Quote:
>
> Well, I had a few different version of displaying complex solutions, and one of them was exactly the way you do it now (with n,n+1). But this needed a few more instructions, and since space is 'expensive' on the WP34s I did it the easier way.

I do not think that 10 or 15 steps will prevent the program from fitting into the available memory. If everything else fails lines 002-007 may be removed.

Finally, I am not sure if rounding everything less than 1E-12 to zero is a good idea. But I have to think harder before I can comment on this. B-)

It's a nice piece of software. Why not make it perfect?

Dieter

> It's a simple documentation error.

Well, not mentioning something (or everything) isn't what I would call a 'documentation error'.

> Quote:
>
> And while we're at it: the backup of the polynomial coefficents uses the registers up to R(2n+2).

For even degrees my R(2n+1) is correct - for odd degrees (where I add one additional degree) it would even be R(2n+3). But I guess it would even confuse most users if I would describe so many internal details. ;-)

> Quote:
>
> Finally, I am not sure if rounding everything less than 1E-12 to zero is a good idea. But I have to think harder before I can comment on this. B-)

What sense would a result of x0=1e-14 make when the calculation accuracy is only 1e-12???
And I hate 'pseudo-complex' results with imaginary parts of 1e-13,14,15 ...

> Quote:
>
> It's a nice piece of software. Why not make it perfect?

Well, if you tell me what 'perfect' is, I'll think about it ... :-)

Franz.

I know I'm asking too much. ;-) This type of error can be easily avoided by using either a label (will cost a step) or the preprocessor with its symbolic labels. Both approaches would make it easier to maintain the software, especially for others.

As you might have noticed, I'm working on local registers and on a REGS command that will reduce the number of available global registers in favour of more local registers (for deeper nesting). In such a scenario it's probably better to work with lower numbered or local registers instead of the fixed high numbered ones. Data interactively entered by a user is better stored in global registers but all temporary data that is only used while the program is busy may well be put in locals.

Just a few remarks for future developments.

Yes Marcus, you're of course right, but: ;-)

1) you know why I don't/can't use the preprocessor

2) I would really like to try all those new features like LOCL etc., but unfortunately I don't even see any of them mentioned in the new manual 3.0, so I have no clue WHAT can be done or HOW it has to be done. :-(

Well, it was no complaint but just a (true) statement.

And my PolyRoots IS already perfect. ;-)

[WP34s] Local variables

*Message #15 Posted by **Marcus von Cube, Germany** on 7 Nov 2011, 4:59 a.m.,*
in response to message #14 by fhub

When the new features become usable and stable enough I will discuss them here. If you want to play around with them, here is a short guide:

- In a subroutine, issue LOCL nn where nn denotes the highest numbered local register you want to use. Newly created registers are zeroed.

- In the same or any nested subroutine you can now address the newly created registers with a dot in the name: .00 to .nn. For direct addressing, .nn is limited to .15 (these are restrictions in the internal coding of commands.) but indirect addresses may go higher, starting at 112 for .00.

- Another call to LOCL in the same subroutine just changes the size of the local register space. LOCL in any nested subroutine will establish a new frame which hides the local registers one level up.

- Use MEM? to find out about the number of levels left. Each frame needs 2 levels + 4 for every local register. The space is taken from the return stack which extends downwards into program space. If you need many local variables, run your program off flash memory and clear the program in RAM.

- Be aware that any action that clears the return stack will remove all local variables: Manual RTN, editing your program and some more keyboard actions. This is the reason why data that is input manually by a user is better held in the normal register space.

- Each frame establishes 16 local flags .00 to .15 in addition to the registers. They can be used like any other flag.

- Use RTN from the same subroutine that has issued LOCL to get rid of the most recently allocated frame and return to the caller. Use LPOP to just delete the variables without returning.

For examples, just look at xrom.wp34s.

in response to message #15 by Marcus von Cube, Germany

Thanks for this explanation, Marcus!

At a first look all this seems to be a bit complicated, so I'll stay away from these new features for a while.

But now I have an other problem with the current SVN 1241: I guess it should be back-compatible to V2.2 if you don't use any of these 'local' features at all, but now with SVN 1241 almost nothing seems to work anymore. :-(

I've recompiled my yesterdays PRS (PolyRoots) program with SVN 1241, but all I get are all kinds of error messages:
1) for example a R-COPY with 0.1111 in X gives "out of range"
2) if I run my program with degree n=5, I get "domain error" after the input, and when I check the registers (00-06 should hold the coefficients) after this error stop, each of these 7 registers contain "nonnumeric".
No chance to get the program working at all.

There is something seriously broken in the latest build ...

Franz

in response to message #16 by fhub

I'm in the middle of something... Thanks for your reports on errors.

Can you 'reset' the emulator from the menu and try again?

EDIT: I just did some tests.

You need to change the argument to R-COPY from .1111 to .11011. The reason is that register index values now are 3 digits in length to allow for the local registers to be addressed. The R-COPY syntax is hence: sss.ccddd for source/count/destination. The count is still limited to 2 digits. Sorry for any inconvenience.

What statement throws the "domain error"?

Reset? Whenever I use a new SVN I delete the file wp34s.dat before, so it automatically does a 'Reset'.
Or do you mean I should try it with the newest SVN 1842? But from what I see in the 'changes' I can't imagine that this new build would solve the problems I've mentioned above.

You must know that I can't try it here one my old internet notebook (because of Win98), so I always have to go to my other computer and copy the new version from the USB stick ...

Ok, that's not nice - requires a lot of changes in almost every program! :-(

And about "Domain error": well, IIRC it was just any arithmetic operation which used one of those registers containing 'nonnumeric'.

I have no idea where the 'nonnumeric' data might come from.

I see that your trick in line 199 no longer works. It's the art of magic digit juggling that fails here. I know that you are swapping source and destination here, but in fact you assign the count to the destination and the former source to the count, then setting the destination to zero. This makes a lot of assumptions about the values and their grouping and works only if two of the values are equal and the other is zero. This makes it almost impossible to use other index values are adopt the new alignment. A more classical approach (get the values on the stack in the proper ordering and then build the descriptor for R-COPY) would be more flexible and better to read.

```
<compute src>
RCL X       because SRC=CNT
CLx         destination
FS?C 00
x[<->] Z    swap source and destination
SDR 03      move destination beyond decimal point
+           add count
SDR 02      move both count and destination to
the right
+           add source
R-COPY
```

I know this is a bit longer but it's much more readable (and should work in the new version.)

Sorry, but what 'trick' do I use there??? It's just shifting the decimal and using LastX register.
Ok, my 2-digit shifting may not be correct anymore with the new SVN (and it's no problem for me to change this), but I don't see any reason to completely change this subroutine to your way.
And the (currently) wrong shifting should only give an error for wrong R-COPY parameters, but this does still not explain why any registers contain 'nonnumeric'.

Edit: now I see why you have problems with my R-COPY parameter calculation! I didn't write this subroutine for 'general' usage but only for this program, and here the original polynomial always starts at R00 (and both have of course the same number of elements).

To copy 07~13 into 00~06 you need 7.07000 in X.
To copy 00~06 into 07~13 you need 0.07007 in X.

I see no way to transform the former into the latter with a single shift operation.

> Quote:
>
> but this does still not explain why any registers contain 'nonnumeric'.

I wanted to test the situation here and was unable to do so. I need to fix the R-COPY problem first.

Re: [WP34s] Local variables

*Message #24 Posted by **Marcus von Cube, Germany** on 7 Nov 2011, 12:26 p.m.,*
in response to message #23 by Marcus von Cube, Germany

There is a shorthand: You can leave out the count if it can be determined automatically which is the case here because source and destination are adjacent.

This should work:

```
RCL 94
INC X
FS?C 00
SDR 05
```

Re: [WP34s] Local variables

> Quote:
>
> There is a shorthand: You can leave out the count if it can be determined automatically which is the case here because source and destination are adjacent.

LOL, so far about **me** using tricks! ;-)

But your method seems quite suspicious to me!? For example if X=15 (without any decimals) how should R-COPY determine how many registers to copy? And the same after SDR 05, i.e. X=0.00015.
The only thing I can imagine is that the 34s then uses 15 also for the count, but that's nowhere described in the manual (and also

(deleted post)

not really obvious).

Re: [WP34s] Local variables

*Message #26 Posted by **Marcus von Cube, Germany** on 7 Nov 2011, 12:48 p.m.,*
in response to message #25 by fhub

I can't speak for the manual but from what I read in the sources, R-COPY tries to determine the count from the largest non overlapping area between source and destination. This will work nicely here. :-)

I've just committed a new bugfix and ran your program. I didn't check the solutions but it returned some. :-)

Re: [WP34s] Local variables

Well, but here's already the next problem:
Just tried the new SVN 1843 with the changed R-COPY code, and now I see that also R-CLR doesn't work anymore. Examples: 80.2 with R-CLR clears only R80-R89, and 80.03 clears only R80.

This change of ss.ddnn to ss.dddnn was no good idea, it has broken some other things, too.

Re: [WP34s] Local variables

>
> This change of ss.ddnn to ss.dddnn was no good idea, it has broken some other things, too.

I didn't change the parameters to R-CLR. If 80.2 does not clear 80 to 99 than that's my fault. I'll check it later. The ddd parameter is at the end of the fractional part. The length change was inevitable to support addresses 100 and above.

EDIT: It was a programming error and should be fixed now. One of the many optimizations to save precious code space.

HP 9100A/B Transistors

*Message #1 Posted by **Richard Wilder** on 5 Nov 2011, 11:12 a.m.*

Anyone know the significance of the colored paint dabs on many of the transistors in these calculators? Maybe they were hand selected for parameters to work in the particular circuit(?)

Re: HP 9100A/B Transistors

*Message #2 Posted by **Joel Setton (France)** on 11 Nov 2011, 9:08 a.m.,*
in response to message #1 by Richard Wilder

Richard,
The HP Journal article on the 9100 mentioned that the transistors were burned-in, to detect early failures and improve reliability. As far as I know, this is not related to select a particular parameter.
I hope this helps!
Joel

WP 34S: CAT on version 3.0

*Message #1 Posted by **Miguel Toro** on 5 Nov 2011, 10:22 a.m.*

Hi,

A little request, in case it is possible to do, of course: it would be nice if CAT worked as the other catalogs in the calculator, at least keeping the last called label and second, having a quick access to a label by using the first characters of the item.

Thanks and regards,

Miguel

Re: WP 34S: CAT on version 3.0

*Message #2 Posted by **Marcus von Cube, Germany** on 5 Nov 2011, 1:21 p.m.,*
in response to message #1 by Miguel Toro

Both requests aren't easy to implement. The list of labels isn't at all a list, each label is searched for in its respective region. Moreover, the labels aren't in any particular order so that typing a letter will not find the next label starting with the letter(s) typed so far in alphabetical sequence. Saving the position might be possible but any update to the program will make it invalid. Today, you can select the region by typing its digit but the search will always start at the beginning.

Re: OT: NO IC's :-) nor Oscillator !

*Message #5 Posted by **Katie Wasserman** on 5 Nov 2011, 11:25 a.m.,*
in response to message #4 by Thomas Chrapkiewicz

While it's been true for decades that 60Hz power in the US has a very high low-term accuracy that may no longer be the case in the future. I've see this story referenced several times in the past few months. It's very disturbing to me as I've designed and built a few clocks that depend on accurate 60Hz.

OTOH, you can buy TCXO (temperature compensated crystal oscillators) for a few dollars that have infinitely better short term accuracy (1 ppm over a huge temperature range) with low aging rates and initial accuracies to rival the long-term accuracy of the 60Hz power grid.

Still, there's nothing like an old-fashion 60Hz motor-based clock that you can refer to when trying to figure out how long the power has been out in your house.

*Message #6 Posted by **Lincoln R.** on 5 Nov 2011, 1:21 p.m.,*
in response to message #5 by Katie Wasserman

Historically, those synchronous-motor clocks were the reason for accurate 60Hz. The inventor, a guy named Henry Warren, had this great idea on how to make an accurate electric clock but then realized that the 60Hz from the power company wasn't always 60Hz. Rather than give up, Warren sold the power companies fancy clocks combining one of his electric motors and an accurate mechanical movement to help them regulate frequency: Telechron Master Clock

Re: OT: NO IC's :-) nor Oscillator !

*Message #7 Posted by **Marcus von Cube, Germany** on 5 Nov 2011, 1:30 p.m.,*
in response to message #6 by Lincoln R.

There is a good reason to have the 50 or 60 Hz accurate: Power systems are networked and need to in sync when this shall be without any programs: Imagine a power plant of a few megawatts working with just the wrong frequency or phase compared to the power line it is feeding!

Re: OT: NO IC's :-) nor Oscillator !

*Message #8 Posted by **Katie Wasserman** on 5 Nov 2011, 1:45 p.m.,*
in response to message #7 by Marcus von Cube, Germany

Sure, power plants need to sync to the 50Hz or 60Hz grid before feeding power into it, so they need short term accuracy of maybe 0.01%. However, other than time keeping there's no reason that they need to have good long-term accuracy.

Getting rid of long-term accuracy on the power grid will instantly obsolete millions of clocks and devices with embedded clocks that rely on the 50Hz/60Hz line.

Re: OT: NO IC's :-) nor Oscillator !

*Message #9 Posted by **Katie Wasserman** on 5 Nov 2011, 1:50 p.m.,*

Thanks for pointing that out and the link, it's interesting history.

Re: OT: NO IC's :-) nor Oscillator !

*Message #10 Posted by **Frank Boehm (Germany)** on 5 Nov 2011, 5:32 p.m.,*
in response to message #5 by Katie Wasserman

With the shutdown of several nuclear plants in Germany, the frequency of the electrical grid has become rather unstable - in fact the drift is that huge, most older wind and solar power stations will do an emergency shutdown once in a while. They all have to be upgraded to a modern (more forgiving, working on a wider frequency range) DC/AC converter. The 50Hz based clock is probably dead as of now.

Re: OT: NO IC's :-) nor Oscillator !

*Message #11 Posted by **Martin Pinckney** on 5 Nov 2011, 10:27 p.m.,*
in response to message #5 by Katie Wasserman

The 60 hz. frequency is maintained simply by the rotational speed of the generators. (3600 RPM => 60 hz.) The RPN varies slightly as load varies during the day. The power company has devices that simply count revolutions, and during the wee hours of the morning when load is low they either speed up or slow down the generators enough to correct the clocks once every 24 hours.

Nice that it is sold as a kit, I am a big fan of nixie clocks, my last nixie clock used a very early clock chip that I demultiplexed and converted the 7 seg code to BCD for the nixie drivers. I wanted to build a electromechanical one using stepping relays but, stepping relays seem very hard to come by now. I saw a web site for one built from vacuum tubes. The most unusal one I have seen using neon tube ring counters to keep track of time.

Remember Heathkit

*Message #15 Posted by **Joerg Woerner** on 6 Nov 2011, 5:11 p.m.,*
in response to message #14 by Paul Berger (Canada)

I just had to dig out my Heathkit GC-1005 - still works like a charm. It is centered around the famous Mostek MK5017 chip and was a wonderful, yet affordable kit sold between 1973 and probably 1975 or 1976.

I guess this is the HP 35 for clocks:

Have a great weekend,

Joerg

Re: Remember Heathkit

*Message #16 Posted by **Paul Berger (Canada)** on 6 Nov 2011, 7:10 p.m.,*

in response to message #15 by Joerg Woerner

I have a brand new MK5017 sitting here on my desk just waiting for my next clock project, maybe I will use some of my 7 segment nixies with it. I built my first digital clock in 1975 it used LED displays,and it still operates fine. It was built on a project board sold by Radio Shack, and the parts to build it cost be about the equivalent of a weeks salary.

in response to message #15 by Joerg Woerner

Aw, that is great! And in perfect shape!

I wanted to build a Heathkit transceiver soooo badly--and I wanted to build a Heathkit oscilloscope, too. But alas, they went out of business before I could get to that point.

I had a strong Ham radio interest as a kid in the late 70s. It seemed as if *every* elmer ham had built a digital clock--not unlike the Heathkit you have--and set it to "UTC".

Good memories. Maybe someday I'll buy an SB-101 just because...(god, I remembered the model name! Just checked google! Youthful memories are so strong...)

Edited: 6 Nov 2011, 9:02 p.m.

Re: Remember Heathkit

*Message #20 Posted by **Garth Wilson** on 6 Nov 2011, 9:58 p.m.,*
in response to message #19 by bill platt

They never totally went out of business (see http://heatkit.com) but they quit making kits in '92. (They are starting back into the kit business now.)

I have to disagree with their reasons for quitting. They said kitbuilding was no longer possible for the hobbyist because of SMT, while the truth, especially back then, was that most things could still

be done in thru-hole, and there are plenty of areas of electronics that can still be carried out that way today. As for compactness, many of the products were, as I used to like to say, packed tight with empty space. For those, whether TVs, stereos, non-mobile amateur-radio equipment, etc., making it really small was irrelevant.

Heathkit also said the kit builder could no longer save money by assembling it themselves; but saving money was not the issue with most of the kit builders in my observation. If the same thing could be gotten in a non-kit form from another company, they were frequently paying more to get the same thing in a kit version, and they knew it; but they wanted the experience that went with it. Although I had about 20 Heathkit products at one time, I never thought of Heathkit as being the way to save money. They did however have some rather unique products I didn't know any other way to get. They could have taken advantage of that niche-market situation.

The most complex Heathkit product I ever assembled was a compact portable 20MHz dual-trace triggered oscilloscope which could run on an internal battery. It really was too much. I got 80% or more of the way done and basically gave up and let it collect dust for a few years before I got it back out and decided to finish it.

There are some amateur radio kits today from other companies, and it looks like Heathkit has decided to get back into it. It will be interesting to see what happens, since a company is basically the people, and all the ones who were there in the 70's are undoubtedly gone.

They were a great company, I can't imagine that the reinvention of it will be nearly as good. I had a part-time job in college working in a neurophysics lab run by a professor who loved Heathkit. Some of the work I did there was to build these kits for the lab.

They also came up with the incredible OC-1401 5-level RPN navigation calculator that is one of the most creative machines I know of from several standpoints: functionally (full scientific calculator and navigation and clock/stopwatch), electronically (3 communicating microprocessors and an interesting mix of power options) and a colorful, cool looking design with clicky keys too!

Woops, my apologies. That comes from being too tired when I wrote.

Silly story about a Heathkit from my last place of work, in the late 1980's: The Heathkit AD-1309 noise generator looked like the perfect fit for a need we had, and it was cheap too-- maybe around $40 IIRC. I think it was even on sale. We were going through a temporary financially tight period, so we had to write up a justification for every piece of equipment we wanted. I wrote up something short for this, not wanting to take much time since it was so cheap anyway, and it was so simple that the labor to put it together would be minimal. The general manager came back to our office and said he needed me to write up a little more detail about <bla bla bla...> There was yet another iteration of this, such that the company cost for my time spent justifying it and the general manager's time spent trying to over-analyze because of the tight finances was considerably more than the cost of the noise generator itself.

I built a lot of Heathkits in the 1970s: scopes, meters, generators, the transistor tester, power supplies, clocks, stereos, the microwave oven, and even a Heathkit all-metal power strip, which I still have. The kit business has evolved and the heir to the Heathkit throne (in my mind) is Sparkfun (www.sparkfun.com) in Boulder, Colorado. They offer a bunch of great kits, parts, and are very youth-oriented. At this year's Maker Faire in Silicon Valley, they had a booth with about 30 soldering stations where kids sat intensely building their kits, with and without parents' help.

The Maker ethos is this century's version of the electronic kitbuilder. Check out Sparkfun's every-Friday new-product videos. These guys know how to market on the newfangled "Internets." They set the bar for the new Heathkit as far as kitbuilding is concerned.

I agree that Make, Sparkfun, Adafruit and the like do a good job at generating enthusiasm. I've been to a Maker Faire (in NY) and seen people soldering at the Sparkfun booth and subscribed to Make magazine for a while too.

What I find different from the Heathkit of old is the near total lack of theory behind the projects. Make magazine, for example, ncourages you build stuff without explaining really anything in the way of theory. Heathkit always had a good description of the theory and circuits in their kits they were very focused on education and became just an education company.

I suggest that Parallax and Revolution Education (PICAXE) are more the heirs to the Heathkit throne. They do a great job of teaching, especially Parallax.

I kept a few Heathkit catalogs over the years, the earliest being from when they actually published the schematics in the catalog. Later of course they got too complex. Imagine putting an oscilloscope schematic there in the catalog. Mine was 24"x36" with rather small print IIRC, printed on both sides.

Quote:

> They never totally went out of business (see http://heathkit.com) but they quit making kits in '92.

Yes, and they sold ham equipment to the end. One would need to be younger than about 35 to have missed the Heathkit ham era. I had an order for a low power ham kit in to them when they dropped out of the market, cancelling my order.

Quote:

> Heathkit also said the kit builder could no longer save money by assembling it themselves; but saving money was not the issue with most of the kit builders in my observation.

Saving money was certainly **the most important advantage** to a Heathkit purchase for me. There was never anything particularly clever or innovative about Heathkit gear, except the associated construction manuals. Plus, whatever resulted from the built-by-customer process was extremely variable in quality, which makes purchase of used Heathkit gear a big gamble.

I would have liked (even today) the Heath H-11 (their version of the PDP-11) computer system. Now that *was* expensive!

Quote:

> There are some amateur radio kits today from other companies, and it looks like Heathkit has decided to get back into it.

I wouldn't bet on anything substantive coming from a Heath re-start. The majority of Heath's real corporate direction was toward the amateur radio market. I always questioned the appeal their other *junk* had for their customer base. Today's heir-apparent for **amateur radio** gear in fact, *not just potential*, is Elecraft Company in California, which has been marketing several sophisticated amateur radio transceiver kits using through-hole construction (K1, K2, KX1), a world-class performance semi-kit (K3), along with various accessories. A new portable transceiver (KX3) is expected soon that is, IMHO, the most interesting electronic device I've seen in 45 years as an amateur radio operator. Construction and operation manuals are available for free download and are generally superior to the excellent and legendary output from Heath in its best days.

I'd been a ham for quite a few years by the time I used *six weeks* (!!!) of take-home pay as a Navy lieutenant(j.g.) to purchase my first HP in 1977...the newly-introduced HP-67 (which is today out for card reader repair). That was a great machine to start my 35-year collection!

It was one of my two "major" purchases made while in military service. The other was a new 1976 Heathkit HW-101 ham transceiver kit that took me four months to build due to my having almost non-existent free time. The money-saving aspect of Heathkit ham gear was its *most important advantage* to me, at a time when Navy junior officers got paid less than unskilled civilian laborers performing welding-spark fire-watches in a shipyard.

It's really odd today to recall the purchase of a handheld calculator qualifying as the major purchase made during a period of five years service. :-)

> Quote:

> And yes, I want a KX3 like nobody's business :)

I'll wait about six months after introduction just to let any hardware issues settle out. Until then, there's my 11-year-old K1.

Don't you mean the 70's... as the GC-1005 was introduced, IIRC, in 1972. I was a tech in HEC #42 during the 70's and remember when it came out - the first kit to have the crazy Molex staggered pin IC socket strips. Oh, brother, the hours I spent resoldering those monsters.

Re: Remember Heathkit

*Message #34 Posted by **Katie Wasserman** on 10 Nov 2011, 5:29 p.m.,*

I built one of their darkroom timers sometime in the late 60's/early 70's. It was the first time I ever soldered anything and it used point to point connections on terminal strips, it even had a vacuum tube in there for voltage regulation. It didn't work right after I finished of course and I sent it to Heathkit for repair. I'm not sure if it came back with a label telling me which tech did the work but I'll bet it was lucky #42! :)

I've built many Heathkits since then and never had to bother #42 again, but it was good to know that he was there if I needed him!

Randy, How long did you work there?

Re: Remember Heathkit

*Message #35 Posted by **Randy** on 11 Nov 2011, 8:07 a.m.,*
in response to message #34 by Katie Wasserman

#42 was the store number in suburban Philadelphia, not a tech at Benton Harbor. I worked there from 72 to the summer of 1977, when I got my first job in engineering. I was the RF (ham,CB,R/C) and general kit guy, another did just stereos, another just televisions.

It was was a great place and after '77, I did weekend work for a while fixing the "dogs" the new guys couldn't or did not want to get working. It really did build great trouble-shooting skills because just about anything could be wrong. Swapped resistor values was always my favorite... had one that I remember that had every 1k and 10k resistor swapped.

After Zenith acquired them, I remember seeing for the first time the H89 terminal - with the factory assembled processor board. When I asked why it was already built, I was told it was because Heath felt it could not be assembled reliably by customers due to the density. I thought to myself "the goose is dead". As in the goose that laid the golden egg of kits. What's the point of a kit that's not a kit?

Fast forward a few years later, I stopped by the store one day only to learn that everybody I knew was gone, as in fired. They shipped the inventory back to the factory and that was it for #42. Today, the building is a local family pizzeria.

My two latest HP calculators

*Message #1 Posted by **Michael de Estrada** on 4 Nov 2011, 8:53 p.m.*

Today I purchased 2 new calculators from HP Home & Home Office, an HP 33s and an HP 10bII+. The HP 33s replaces one I bought 6 years ago and I couldn't stand the invisible decimal point that has been corrected in newer displays. Although I don't like it's keyboard, it's much more comfortable as a hand-held than the 35s, due to its rounded sides and soft grips. Also, it has separate STO and RCL keys.

I needed to add another calculator to the order so I could use a discount coupon and qualify for free shipping, so in the end the 10bII+ ended up costing only about $15. What is noteworthy here is that the 10bII+ is the first non-RPN HP calculator I've ever owned, other than a $4.99 HP Quick calc 4-banger that is stuck by its magnet to my refrigerator door. Although the 10bII+ is touted as an entry-level financial calculator, it is an amazingly capable scientific / statistical calculator as well. It also has nice data entry features such as a backspace key. Finally, it has chain data entry mode to eliminate the need for those pesky parentheses. Hopefully the keyboard won't be too mushy, given its low price. I've already downloaded the User's Guide from the HP website so I can read up and hit the ground running when it arrives.

in response to message #2 by Tim Wessman

I've been using the HP 10bII+ extensively for the past several months and can say that I've been happy with it, mostly. There have been several instances where it missed number entries and caused me to calculate erroneous results. That's forced me to have to watch the display, now, to verify that it caught/captured what I intended to enter. This is contrary to how my favorite calculator, the HP 32sii, reacts to number entries.

RPN gets rid of those pesky parentheses for good :-)

Re: My two latest HP calculators

*Message #6 Posted by **Marcus von Cube, Germany** on 5 Nov 2011, 7:39 a.m.,*
in response to message #1 by Michael de Estrada

> Quote:
>
> Finally, it has chain data entry mode to eliminate the need for those pesky parentheses.

This statement is beyond me. Chain entry mode will require more parentheses than algebraic entry with operator priority. It's mainly invented for those who don't have a clue about math rules, the 'typical' business people? For me it's as useless as it can be. If you want to forcibly end a calculation, use '=' when needed, not chain mode!

Re: My two latest HP calculators

*Message #7 Posted by **Lode** on 5 Nov 2011, 9:09 a.m.,*
in response to message #6 by Marcus von Cube, Germany

In chain mode, 5 + 3 * 2 gives 16 while 2 * 3 + 5 gives 11.

In algebraic mode, 5 + 3 * 2 and 2 * 3 + 5 both give 11. You need to use parentheses to get the "16" result.

More parentheses are needed, because you can't affect the result by changing the order in which you enter numbers.

So the statement makes sense to me.

Re: My two latest HP calculators

*Message #8 Posted by **Marcus von Cube, Germany** on 5 Nov 2011, 9:29 a.m.,*
in response to message #7 by Lode

No parentheses, just press '=' after you have done the addition. I wouldn't even think of rearranging the formula.

Most simple (household) calculations consist of additions, sometimes together with a multiplication (number of units x unit price). This is almost always better handled by not using chain mode. Chain mode would either require parentheses, or if they are lacking (4 banger) a memory.

Yes ! I forgot to mention that as well. You have to go through all sorts of contortions with complex mode to do it on the 35s.

Also, the 33s sells for $20 less than the 35s, and is the cheapest RPN programmable calculator that HP sells.

Mine arrived today, and what a revelation.

The HP 33s is much improved over the early model that I used to own. The display has fixed the invisible decimal point problem and the keyboard button action is a lot smoother as well. My serial number of CNA 141000X suggests that it was manufactured a scant 2 months ago (41st week of 2011), so the batteries should be fresh. They are still supplying it with a full-sized printed User's

Guide and a very nice slip case. It's a joy to hold in my hand with its rounded edges and soft gripper material. And then there's separate STO and RCL buttons, P<->R conversions direct from the keyboard and a big primary DISPLAY button. Only the weird ENTER key location spoils the fun. And it offers virtually all the functionality of the 35s for $20 less, without all the bugs and missed keystrokes. I'm glad HP continues to make it.

The HP 10bII+ was a very pleasant surprise with a very nice keyboard and display, and a solid quality feel. The keyboard layout is very logical and uncluttered with the down-shifted operations on the bottoms of the keys ala 12C, 15C and 35s. It's a stealth scientific calculator listed under financial calculators.

I'm very happy to have bought these two calculators, and for any of you who may be interested, HP Home & Home Office is currently offering both of them with free domestic shipping.

I'm surprised the 33s still available, IIRC it was discontinued in UK when the 35s came out. Certainly it's not been listed on HP's UK website or any local reseller I know of for several years. I spent an afternoon trying to buy one (and a 30b) over the counter in New York last year, but without success. I found plenty of 12C's, a few 35s's and 50G's but that was all. At least the 30b has finally now appeared in the UK, long after the US launch.

Yes, I have not seen any available at UK shops or websites. Fortunately I managed to get a NIBP (new in blister pack) on eBay for about £20 about 3 years ago.
I must say I think it looks better in real life than pictures. I find the keyboard a bit cramped and have to search for functions sometimes, but the enter key is at least in almost the same position as the 50G. I use it at work and leave it in my desk drawer without too much worry.

> Quote:
>

*Message #19 Posted by **Derek Walker (UK)** on 9 Nov 2011, 7:17 a.m.,*
in response to message #18 by Bart (UK)

I bought a 20b as a (relatively) cheap and pocketable RPN calculator, but its mushy keyboard was so bad for missed keystrokes I gave up using it.
As mentioned on here recently, it's a pity that RPN never appeared on the cheapie scientifics (10s, 300s) but presumably they are supplied as a package with non-HP firmware. The 10s still has a problem with memory recall not updating the ANS register

that I remember fromn old Casio calc's around 10 years ago.

Michael, I was one of the loudmouths that mocked the 33s when it debuted, and only because of its unusually arranged keyboard. However, I surprised myself by quickly getting used to looking at it, never mind using it, and also found it a joy to use, and in fact, it's still my main "go-to" calculator when I just want to do quick calculations or short, easy programs and don't need something with a Core-i7 chip, like the 50g (just kidding about the chip).

I truly enjoy using the 33S, now the original with the infinitesimal decimal point that was really hard on my eyes (missed it, actually, once or twice) was pretty good, too, except for that tiny LCD element. But the one with the larger dot, well, that one's great. In addition to the facility of use and familiarity of keys and functions due to similarity to older models (that I love), it's got a fair amount of power, for a physically lightweight and small footprint handheld device. And I agree that it feels good in my hand because of the rounded "soft-feel" polymeric stuff on the edges. Nice calculator... no, a good calculator!

What is the keyboard like? Are they keys Can you compare it to the HP-15c, HP-48SX or HP-20b - the only HP calculators I've owned. I'm guessing they don't "click", but is there any kind of physical feedback?

Re: My two latest HP calculators

*Message #22 Posted by **Michael de Estrada** on 9 Nov 2011, 12:43 p.m.,*
in response to message #21 by Dominic Richens

The keys definitely do click and have a similar feel to those on the 35s. The feel is not quite as smooth and sophisticated as a 15c or 48SX, but it definitely offers good tactile and audible feedback, and the effort to depress a key is just about perfect. It is certainly on a par with the new 15c LE. No complaints.

Re: My two latest HP calculators

*Message #23 Posted by **M. Joury** on 9 Nov 2011, 1:14 p.m.,*
in response to message #21 by Dominic Richens

The 33S keyboard is quite nice in terms of feel. I don't particularly like the chevron shape or the size and position of the enter key but other than that I don't have any real complaints. It has the same trig bugs that the 35 has but it has primary placement for both the STO and RCL keys which is a big deal for me.

Other drawbacks include the limited number of labels without a workaround similar to that offered by the 35S which can make do with a single label per program since you can jump to line numbers, a more limited set of storage registers, a single looping / indirect register whereas the 35S has 2, and not quite as good complex number support. Among the advantages are the ones mentioned in earlier posts: R-P and P-R functions, much better base arithmetic handling, the primary placement of STO as mentioned above, faster speed, and (not really a big deal) single key cube and cube root functions.

Well, there you have my 10 second tour <g>.

Cheers,

-Marwan

> Quote:
>
> My serial number of CNA 141000X suggests that it was manufactured a scant 2 months ago (41st week of 2011), so the batteries should be fresh.

Today I was running a program on my new 33s that pauses for two seconds, and noticed that the low battery power icon was turning on. So then I ran a benchmark program that lasts about 11 seconds on this machine, and about halfway through the display went blank and did not return. So I removed the batteries and they showed only 2.57 vdc and 2.50 vdc on my voltmeter. I replaced the batteries with fresh new ones and ran the benchmark w/o the low battery icon appearing or the display blanking out. Hopefully, the original batteries were simply old and weak, and that this is not an indication of some power drain problem with this unit. I guess I'll find out soon enough.

FWIW, the 33s appears to run a bit faster than the 35s.

Re: Well, maybe not

*Message #26 Posted by **Ed Look** on 10 Nov 2011, 11:40 a.m.,*
in response to message #25 by Michael de Estrada

Oh yeah... ... I forgot that once a few years back I had a surprising loss of battery power after testing a longish program that ran for a while. I suspect that if a long or long-executing program is run, that'll tax the batteries more than just making calculations by using the keys.

Re: Well, maybe not

*Message #27 Posted by **M. Joury** on 10 Nov 2011, 1:57 p.m.,*
in response to message #25 by Michael de Estrada

Hi Michael,

> Quote:
>
> FWIW, the 33s appears to run a bit faster than the 35s.

Yup, that is one of the advantages. In some calculations it is quite a bit faster. I have a program that calculates sunrise / sunset times and it is over twice as fast on the 33S as compared to the 35S. 35S: ~8.5 seconds. 33S 3.1 seconds. As an additional reference point the same program on the 42S takes 6.7 seconds.

Cheers,

-Marwan

As far as I am aware, nobody has done this before

*Message #1 Posted by **Dusan Zivkovic** on 4 Nov 2011, 6:37 p.m.*

Here we have a music video featuring HP-41CV, HP-15C (LE, 1:0, 00927, obviously :), then TI-59, a bunch of Sharps, a bunch of Casios... Can you identify them all?

Go to Pandovisia/Songs and then look for "Girl From Facebook". The video is posted on a popular site - and here is a direct link for convenience Pandovisia - Girl From Facebook

Now, a challenge for the members of this forum: which calculator's display is at the bottom of the screen from about 3:05, and which function is it executing?

Also, a mini challenge for Sharp fans: which simple command causes Sharp pen plotter CE-150 to draw four squares on its own, one in each colour?

Enjoy

PS Best regards to Hrast Programmer! Maybe we can collaborate on a single one day :)

Probably a 65 or 67 running a user program. No way to tell what the program is, probably just an arbitrary loop for filming.

Re: As far as I am aware, nobody has done this before

*Message #3 Posted by **Katie Wasserman** on 4 Nov 2011, 8:38 p.m.,*
in response to message #1 by Dusan Zivkovic

My guess:

Right after the 15C flashing "running" is a Spice machine (probably a 34c) running some program, possibly an integration or solver equation.

Re: As far as I am aware, nobody has done this before

*Message #4 Posted by **Dusan Zivkovic** on 5 Nov 2011, 6:35 a.m.,*
in response to message #3 by Katie Wasserman

Well done! Spice. It indeed is a 32E, running the rarely seen and implemented inverse normal distribution Q^-1 function, producing a "mysterious" display dance, just right for that scene. Maybe I'll post a picture of the whole calculator crew behind this video one day - I first have to think how to put them all in a single frame...

Re: As far as I am aware, nobody has done this before

*Message #5 Posted by **Bart (UK)** on 5 Nov 2011, 5:52 a.m.,*
in response to message #1 by Dusan Zivkovic

I'll take the easy one:

TEST

Re: As far as I am aware, nobody has done this before

*Message #6 Posted by **Dusan Zivkovic** on 5 Nov 2011, 6:40 a.m.,*
in response to message #5 by Bart (UK)

Easy :) I didn't have enough time to write a program to draw a flower or a star or something, so I "cheated" with TEST. How many viewers of that video will know what a pen plotter is, that's another question.

Re: As far as I am aware, nobody has done this before

*Message #7 Posted by **Thomas Chrapkiewicz** on 5 Nov 2011, 10:06 a.m.,*
in response to message #1 by Dusan Zivkovic

Very Clever!

Atari made a small 4 pen plotter for use with the 8bit (400/800) series. I wonder if the Sharp plotter is the same mechanism.

Some people still use pen plotters quite regularily.

> ...Atari made a small 4 pen plotter for use with the 8bit (400/800) series. I wonder if the Sharp plotter is the same mechanism.

I think a number of companies used the basic plotter mechanics, which I believe were made by Alps, and

added their own controller/electronics. The Radio Shack CGP-115 and a Panasonic printer for their HHC's both used the Alps mechanism's.

The CGP-115's usually succumbed to "split drive gear syndrome" - the nylon drive gear on one of the motors (pen drive, I think) would split lengthwise and that was that. Great little gadget though, and extremely easy to control. Using a small program I found in BYTE as starting point, I wrote a translator that let it emulate a Tektronix graphics terminal, which was pretty handy in school.

Cheers, Bob

9100B progress

*Message #1 Posted by **David Ramsey** on 3 Nov 2011, 7:47 p.m.*

Larry received the second, non-functional eBay 9100B. Since the first unit worked (aside from the display anomaly), a few board swaps isolated the problem to the A1 ROM board. A little poking around isolated the problem to a single bad transistor:

HP uses weird part numbers and cross-references are rare, so Larry replaced it with a modern transistor that seemed electrically similar. It's working fine so far.

The "comet tail" display anomaly on the first 9100B was caused by the intensity being turned up too high, probably because the display is slightly dim. Here's the "fixed" display:

And here's the brighter display from the second unit:

Both units measure about 3200VDC on the display. Note that the second unit breaks numbers up into convenient groups of three...was this a feature that was rolled into production? It's a later serial number than the first unit.

9100s together!

Re: 9100B progress

*Message #2 Posted by **Israel Otero** on 4 Nov 2011, 12:35 a.m.,*
in response to message #1 by David Ramsey

My HP9100A also breaks numbers in groups of three. Is amazing that this problem was caused by a single bad transistor. Wonderful machines they are indeed. ;-)

Re: 9100B progress

*Message #3 Posted by **David Ramsey** on 4 Nov 2011, 1:03 a.m.,*
in response to message #2 by Israel Otero

Wait, your 9100 _A_ breaks digits in groups of three? Why would they do this originally, take it away in early 9100Bs, and then put it back?

Re: 9100B progress

*Message #4 Posted by **Israel Otero** on 4 Nov 2011, 1:52 a.m.,*

in response to message #3 by David Ramsey

I just don't know, David, but it seems your machine is different, as the first brochure I have about the operation of the HP9100 "A" show it with a display with group of digits of three.

The Hewlett-Packard Journal of September of 1968 dedicated to the 9100 also showed the original calculator with that feature.

Re: 9100B progress

*Message #5 Posted by **Eric Smith** on 4 Nov 2011, 2:44 a.m.,*
in response to message #3 by David Ramsey

I suspect that there is a specific circuit that causes the grouping. Perhaps a component in that circuit has gone bad?

Re: 9100B progress

*Message #6 Posted by **Katie Wasserman** on 4 Nov 2011, 10:38 a.m.,*
in response to message #5 by Eric Smith

3 digit spacing is normal behavior for floating point displays. The service manual for the 9100A/9100B discusses this and shows a waveform that drives the X deflection circuit to the CRT:

> Quote:
>
> Also, at times during A15C2's charging, (assuming a floating display presentation) ZDSL will pulse negative. When it does, both A15Q4 and Q3 will saturate, charging A15C2 rapidly. This creates a spacing of the alphanumerics seen on the CRT when FLOATING is selected. When the register has been displayed, ZDRL will discharge A15C2 and the cycle starts again.

Re: 9100B progress

*Message #7 Posted by **David Ramsey** on 4 Nov 2011, 11:32 a.m.,*
in response to message #6 by Katie Wasserman

In the images you can see that both calculator are set to floating point via the appropriate paddle switch. Perhaps it's just a failure in this switch, but I'll send the information to Larry.

The keyboard on the earlier unit (the one with the dim screen) failed yesterday due to a defective 2.2K resistor (probably) on the keyboard PCB. Replacements ordered from Mouser.

Design for a simple, entry-level RPN calculator

*Message #1 Posted by **Eddie W. Shore** on 3 Nov 2011, 3:53 p.m.*

A simple scientific, 4-register stack calculator with statistics but no programming. 10 memory registers with storage and recall arithmetic.

```
ES RPN 10

_x^2 _______ ø^-1_____ HYP____ R(up)_____FIX____ STD_
[SQRT_ ]__[__ ø_ ]__ [x<>y]__ [ROLL ]__ [_EEX]__ [_ Pi_ ]

Sigma-      XROOT       ASIN    ACOS      ATAN    e^x
[Sigma+]   [ y^x ]   [ SIN ]  [ COS ]  [ TAN ]  [ LN ]

                10^x       >H        >HMS    >P          >R
[Shift]        [ LOG ]   [  7  ]    [  8  ]   [  9  ]  [  ÷  ]

CLStat       x!       >DEG          >RAD       %     %CHG
[ CLx ]   [ STO ]   [  4  ]      [  5  ]    [  6  ]    [  x  ]

OFF          CLReg          DEG     RAD         PDEV         r/Sxy
[ ON ]        [ RCL ]   [  1   ]     [  2  ]     [  3  ]     [  -  ]

        Lst x             MEAN       SDEV       SUMS       L.R.
   [   ENTER    ]        [  0  ]      [  .  ]    [ +/- ]    [  +  ]

Notes:
ø = Lower tail Normal Distribution with mean = 0, variance = 1
ø^-1 = Inverse lower tail Normal Distribution with mean = 0, variance = 1
PDEV = Population Deviation of x and y
SDEV = Standard Deviation of x and y
SUMS = Sigma(x) and Sigma(y)
Sxy = Sigma(xy)
L.R. = returns a and b in y = ax + b
```

(Sorry that keys don't align perfectly - I don't know how to get things to "line up" and I used the "pre" tags)

Re: Design for a simple, entry-level RPN calculator

*Message #2 Posted by **Paul Dale** on 3 Nov 2011, 5:10 p.m.,*
in response to message #1 by Eddie W. Shore

Why not use the 30b keyboard layout for this? Your suggestion has 35 keys, the 30b has 37 so there isn't a huge difference there. The big advantage is the 30b hardware is available and more than capable of such a device and most of the firmware is written already :)

Why no GRAD mode?

- Pauli

Re: Design for a simple, entry-level RPN calculator

*Message #3 Posted by **Dave Shaffer (Arizona)** on 3 Nov 2011, 5:42 p.m.,*
in response to message #2 by Paul Dale

Does anybody besides artillery gunners use that?

Re: Design for a simple, entry-level RPN calculator

*Message #4 Posted by **Walter B** on 3 Nov 2011, 5:45 p.m.,*
in response to message #3 by Dave Shaffer (Arizona)

IIRC, we had this discussion about GRAD here many months ago already. Perhaps I'll succeed in excavating.

Re: Design for a simple, entry-level RPN calculator

*Message #5 Posted by **Frank Rottgardt** on 4 Nov 2011, 11:36 a.m.,*
in response to message #3 by Dave Shaffer (Arizona)

at least every german surveyor needs GRAD because they calculate with 400 GON instead of with 360 DEG. Funny enough GRAD is the german word for degree. Can be confusing.

Re: Design for a simple, entry-level RPN calculator

*Message #6 Posted by **Eddie W. Shore** on 4 Nov 2011, 9:27 a.m.,*
in response to message #2 by Paul Dale

I was going for a 15C layout at first.

We could switch out >DEG/>RAD for GRAD mode and RAN# (random numbers). It is a challenge to fit everything you want on a limited amount of keys.

Re: Design for a simple, entry-level RPN calculator

*Message #7 Posted by **Eddie W. Shore** on 5 Nov 2011, 2:26 p.m.,*
in response to message #2 by Paul Dale

```
This is an attempt to redo the design based on the 30b calculator (still no programming):

-------------------------------------

ES RPN 10II

XROOT  x^2    Phi^-1 >HMS   >Polar DATE+
y^x    Sqrt   Phi    >H     >Rect  DAYS

ASIN   ACOS   ATAN   10^x   e^x    1/x
SIN    COS    TAN    LOG    LN     Pi

Last X        R-Up   FIX    STD    Cl Regs
ENTER         R-Down x<>y   EEX    < --

Sigma+ DEG    RAD    GRAD   x!
STO    7      8      9      ÷

Sigma- %      %Chg   %T     RAN#
RCL    4      5      6      x

       COMB   PERM   Clr St r/Sxy
Shift  1      2      3      -

OFF    Mean   SDev   PDev   L.R.
ON/C   0      .      +/-    +
```

```
-------------------------------------

Phi = Normal Distribution Lower Tail
Phi^-1 = Inverse Normal Distribution Lower Tail
DATE+ = Add days to date code mm.ddyyyy (or dd.mmyyyy international editions)
DAYS = Days in between dates
(** These four functions are personal favorites of mine!)

Added: Gradian mode, Combination, Permutation, DATE+, DAYS
```

Re: Design for a simple, entry-level RPN calculator

*Message #8 Posted by **Walter B** on 3 Nov 2011, 6:19 p.m.,*
in response to message #1 by Eddie W. Shore

I guess that's the way it should have looked:

```
  x^2       Phi^-1       HYP       R(up)       FIX        STD
[ SQRT ]   [ Phi  ]   [ x<>y ]   [ ROLL ]   [ EEX  ]   [  Pi  ]

 Sigma-     XROOT       ASIN       ACOS       ATAN       e^x
[Sigma+]   [ y^x  ]   [ SIN  ]   [ COS  ]   [ TAN  ]   [  LN  ]

             10^x        >H        >HMS        >P         >R
[Shift ]   [ LOG  ]   [  7   ]   [  8   ]   [  9   ]   [  ÷   ]

 CLStat       x!        >DEG       >RAD        %         %CHG
[ CLx  ]   [ STO  ]   [  4   ]   [  5   ]   [  6   ]   [  x   ]

  OFF        CLReg      DEG        RAD       sigma      r/Sxy
[  ON  ]   [ RCL  ]   [  1   ]   [  2   ]   [  3   ]   [  -   ]

       Lst x            MEAN        s         SUMS       L.R.
[      ENTER      ]   [  0   ]   [  .   ]   [ +/-  ]   [  +   ]

Notes:
Phi    = Lower tail Normal Distribution with mean = 0, variance = 1
Phi^-1 = Inverse lower tail Normal Distribution with mean = 0, variance = 1
sigma  = Population Deviation of x and y
SUMS = Sigma(x) and Sigma(y)
Sxy  = Sigma(xy)
L.R. = returns a and b in y = ax + b
```

If true, the distribution of various functions looks a bit arbitrary to me. Of course, personal preferences vary. Anyway, however, I second Pauli's vote for using the HW of a 30b for your design.

FWIW,
Walter

P.S.: Remember also while designing calculators: Counting is the fundament of math ;-)

Re: Design for a simple, entry-level RPN calculator

*Message #9 Posted by **Michael de Estrada** on 3 Nov 2011, 7:03 p.m.,*
in response to message #8 by Walter B

To me "entry level" means a cheap MSRP, i.e. $19.99 or less. Anything more, and you might as well just buy a 33s and not use the programability. Also, I could care less if a calculator has a Grads mode or the Normal Distribution.

Re: Design for a simple, entry-level RPN calculator

*Message #10 Posted by **Bart (UK)** on 4 Nov 2011, 6:17 a.m.,*
in response to message #9 by Michael de Estrada

I agree. Since obtaining an HP-45 some time ago, I've thought a "cheap & cheerful" calculator with HP-45 functionality would be good, i.e. a "quick access scientific banger" - more complex stuff gets done on a computer anyway. And it could be in the hardware of the current HP-10s.

If HP had kept a basic RPN scientific in their line-up priced to compete with the entry level Sharps and Casios, then RPN might have been more popular today.

Re: Design for a simple, entry-level RPN calculator
*Message #11 Posted by **Eddie W. Shore** on 4 Nov 2011, 9:24 a.m.,*
in response to message #8 by Walter B

Wow - that looks very nice Walter! Thanks! ;)

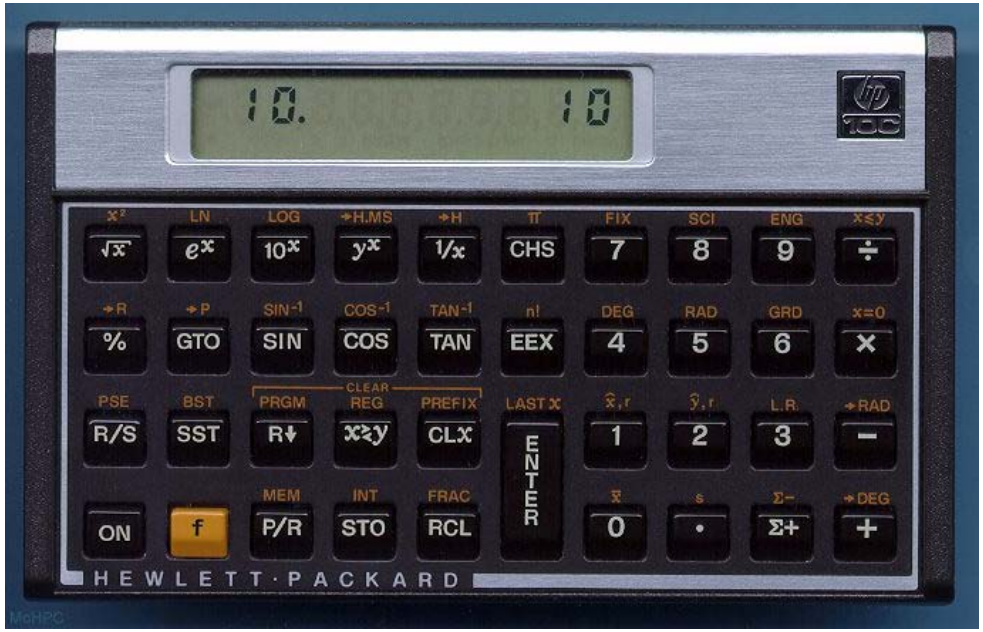
Yes, a 30b design can work. We could swap out the >DEG/>RAD for GRAD mode and RAN# .

Since it is not programmable, it should not be hard to make the simple RPN calculator a solar-powered one. So instead of HP SmartCalc 300, which I think is really a clone of the Casio fx-300S(?) - they could have gone with something like a solar-powered 10C.

And yes, Phi and Phi^-1 are personal choices because I would like to have the calculator to have normal distribution functions.

Re: Design for a simple, entry-level RPN calculator
*Message #12 Posted by **Egan Ford** on 3 Nov 2011, 6:55 p.m.,*
in response to message #1 by Eddie W. Shore

Here's a design:



Re: Design for a simple, entry-level RPN calculator
*Message #13 Posted by **Michael de Estrada** on 3 Nov 2011, 7:06 p.m.,*
in response to message #12 by Egan Ford

Sell it to me for $19.99 or less, or I'm not interested. It's just as easy to use my 15C / 15C LE.

Re: Design for a simple, entry-level RPN calculator
*Message #14 Posted by **Walter B** on 3 Nov 2011, 7:07 p.m.,*
in response to message #12 by Egan Ford

Get the shifted labels on the slanted key fronts and I'm with you ;-)

No matter how many times we reinvent the wheel it invariably comes out round.

I'd expect at the present a 10c vs. 15c manufacturing materials cost differential is likely US$1~2 at best. And most of that would probably be the additional process step of laying down the 15c's blue "g" key legends. IOW from the practical perspective of today's commodity technology, a 15c arguably *is* the entry-level RPN calculator.

I completely agree.

Re: Design for a simple, entry-level RPN calculator

*Message #17 Posted by **Michael de Estrada** on 3 Nov 2011, 8:07 p.m.,*
in response to message #15 by uhmgawa

To me the term "entry-level" means it must be the least expensive of the genre. IOW, unless the MSRP of the 15C is lowered below the 33s, it cannot be termed entry-level. That was the idea behind the 21, 31E and 10C. Each time HP found out that it wasn't worth the effort to dumb-down a model to artificially lower its price. I think most RPNers expect higher quality clicky keyboards that cost more, such that the best bet would be to mass produce the new 15C and package it similarly to the basic 12C, so the price could at least be halved to no more than $49.99.

Re: Design for a simple, entry-level RPN calculator

The problem with the 15c is somewhat of a market quirk in that it became a cult following. While arguably it has earned that status, it does tend to push it into the collectible space and distort its price. We'll see to what degree HP is actually leveraging that distortion by what becomes of the 15c le marketing strategy. Seems too early to tell at this point what the actual product motivation may have been.

My point was rather, not much is needed to implement a voyager given contemporary technology. And no significant overall cost savings will result by sizing a SoC for minimal support of a 10c vs 15c.

> Quote:
>
> That was the idea behind the 21, 31E and 10C. Each time HP found out that it wasn't worth the effort to dumb-down a model to artificially lower its price. I think most RPNers expect higher quality clicky keyboards that cost more, such that the best bet would be to mass produce the new 15C and package it similarly to the basic 12C, so the price could at least be halved to no more than $49.99.

I don't pretend to be a marketing pundit, but there does appear to be some fine tuned balance in such captive market, popular appeal cases. Eg, the availability is regulated to slightly under feed the market in order to maximize price, sales volume, and sustained consumer demand. Mass producing the 15c and selling at a less inflated end user price I suspect will jostle the above marketing optimization.

What is true is that most *current* RPNers expect ... . Sooner or later H-P has to understand that the current RPNers aren't the ones who will buy an entry level RPN machine so that they might as well be ignored when talking about one.

in response to message #21 by Michael de Estrada

Both my kids are, and they have an RPN dad...who is always switching it on them, with no success.

Of course I prefer my 27s over the 15c and all the others, hands-down, for most things. Having been exclusively RPN forever, the discovery of the 17bii and later 27s was an epiphany. And I remembered having seen that 27s in the shop a long time ago, in the 90s, and turning my nose up at it then. What a fool I was! Live and learn--never too late to come to the Dark Side :-)

*Message #23 Posted by **M. Joury** on 4 Nov 2011, 11:09 a.m.,*
in response to message #22 by bill platt

I own both the 27S as well as the 17bii as well as the 19bii. I simply have never been able to switch to algebraic mode and therefore I rarely, if ever, use the 27S. Now if that machine only had RPN <g>...

Maybe we on this forum are the odd ones out but I still feel that RPN is the better user interface. I *KNOW* what the machine is doing and I don't have to remember the differences between the different ways that algebraic can be implemented. Also I don't have to keep track of all those darn parens.

Cheers,

-Marwan

I agree with you about the directness of RPN, and the potential screw-ups of varying implementations of algebraic.

Once a few years ago I started working on an article about the various algebraics but lost motivation--I didn't have anyone paying me to do it...

Unlike many algebraics, the 27s shows intermediate results as they develop. And it is the traditional semi-algebraic, so only the 2 number functions and the arithmetic operators are infix. Other than that, it is still rpn, and has a stack, too (I wish it had a swap function though!).

The one potential screwup in rpn is the stack depth. With singe line, you will from time to time run out...which means that aspect is not transparent--you have to keep track of it in the same way as keeping track of parenthesis on an old Ti...

That's important to know. The majority of calculator users think algebraic is "normal".

> Quote:
>
> I *KNOW* what the machine is doing...

A misunderstanding that some RPN users seem to have. For someone brought up on algebraic, it is easier for me to "know" what it is doing compared to keeping up with what I have pushed onto the stack.

> Quote:
>
> ... and I don't have to remember the differences between the different ways that algebraic can be implemented.

Don't forget there are different ways the stack is implemented on different RPN machines!

> Quote:
>
> Also I don't have to keep track of all those darn parens.

Another misconception! While this can be an issue on older algebraic machines, the newer ones display the parentheses so you can see them.

It's not the tool that makes the mistakes, it's always the one who uses it. But a tool that fits well in your hands or your mind is less prone to being used for making mistakes.

Outside of RPL I don't see any real differences in the machines I use. All the RPN calculators I use today work identically other than the 20b and 30b which really aren't RPN and which I converted to WP34S firmware as soon as I could for that reason (among others). There is that CHS weirdness in the 12CP and some other early RPN machines but I don't tend to use those either. As for RPL, save the 20b and 30b implementations (which are a mix of RPN and RPL perhaps leaning to RPL a little), the differences hardly matter because like you point out for modern algebraics one can see exactly what is happening on the stack.

> Quote:

>
> Another misconception! While this can be an issue on older algebraic machines, the newer ones display the parentheses so you can see them.

I have never had a problem with keeping track of things on the stack. I started with algebraic calculators and yet from very early on (with RPN) I could just look at a problem and break it down into it's component pieces to attack it with RPN. Parens, on the other hand, would always screw me up. Back then there were no multi-line

displays that showed parens or intermediate answers. I would find myself doing every problem twice to verify it and then a third time if the answers came back differently to figure out which of the two was correct. And I'll be darned if I didn't sometimes end up with a third answer. It was either that or write down all the intermediate answers or save them in memory until I could assimilate all the results. I never had this problem with RPN. Now it's true that modern algebraic machines don't generally have this problem due to larger displays and ability to show parens and intermediate results but now I find them impossible to use simply because my fingers are used to a particular order of input--it's what one is used to.

So, not a misconception at all since it is true for me (and I would suspect others). Instead I would say that we see the problem differently and so while you are more comfortable with algebraic I am far more comfortable with RPN. Neither viewpoint invalidates the other.

Marcus is right when he points out that the tool that works best for an individual is one s/he should use.

Cheers,

-Marwan

You are right, both viewpoints are valid. I used the term "misconception" because some RPN boosters keep saying the same thing about not being able to keep track of parentheses or not seeing intermediate results as if this were still true today. Meanwhile, algebraic calculators have changed and most of the calculating world has moved on, too.

My point being, that the advantages RPN once had compared to algebraics has mostly disappeared as algebraics (now with "textbook" entry) have advanced.

So RPN is not "dead", but just not relevant to most calculator users.

I actually like the semi-infix of old algebraics much more than the formula entry systems--unless I am doing a solving operation. That is what I love about the 27s and even the 33s--because you get both systems, each with their strengths for particular aspects.

I also do not consider RPL to be RPN. very closely related, but not the same, but of course I have noticed that some people who have only used rpl d get confused when using rpn and so I suppose it is a perfectly valid observation--because most rpl people assume rpn willbe the same. But we old timer rpn guys never make that mistake;-)

I agree, but it's because it's what I am used to.

Interesting thing about the 17b/27s, you can enter several functions two different ways in the Solver. For example, pressing the squared function key gets you SQ(, but you can also use the alpha menu and put in ^2. Similarly, you can hit the SIN key, or spell it out using alpha, either works!

The part infix, part postfix works well for me, and I like getting intermediate results, for instance every time you close a parenthesis or otherwise complete a partial result due to math hierarchy.

I really did not like the "true algebraic" way of the 35s, which uses infix for *everything*. SQ( ) is somewhat tolerable, but MILE( )?

The real question is, do financial types use the 12c because it's RPN, or do they use RPN because that's what the 12c is?

i.e, the 12c has been for so long the de facto standard financial calculator, has its popularity simply become self-sustaining regardless of interface?

They are conditioned to use RPN now, they still don't understand it nor even make use of a 4-level stack. They are hooked, having used it for so many years, they can't switch to algebraic. Find me any 12CP user that sets it to algebraic mode, and I'll show you someone that has never used RPN.

Dave Hicks once told me that RPN was a good but slight upgrade from the adding machine logic that bean counters were accustomed to in the last generation of, well, adding machines. It also has the advantage of being consistently postfix and consistent in everything else. So: adding machine > hp80 (or 70) > hp22 > hp37,38.38c > hp12c for the old guys and first monkey suit, first calculator (12c) for today's crop of trump-a-bees.

I'm sympathetic with Bill. My first son turned his nose up at RPN. He's in the business world and uses TI business calcs. Second son is a college junior in Engineering, uses a TI-89 grapher, because that's the "standard" calculator for engineers at the school. Third son is also an engineering major, and is in love with the TI Inspire grapher. 4th son is in high school, has an HP-35s, but uses it only in algebraic mode. I can't win...

I had been pondering proposal of a repurposing of the 10bii+ as a simple RPN. It is light, relatively cheap, has a decent keyboard, and perhaps most importantly, a large, legible numeric display with **big, bold decimal points and commas** that can be easily seen. If we are talking simple, nothing would be more simple than one function per key, no shift key, no programming, no statistics. I tried to determine if I could fit enough functions on the 10bii+'s 40 keys, and came up with the following:

```
SIN     COS     TAN     LOG     LN
```

```
ASIN    ACOS    ATAN    10^x        e^x

sqrt(x) y^x       1/x     %       pi

Rv      x<>y    +/-     EEX     <-

LASTx   7       8       9       ÷

STO     4       5       6       x

RCL     1       2       3       -

ON/OFF  0       .       ENTER   +
```

The position of the ENTER key might be argued, or perhaps the need for Last x, but in general, the above is about as basic as can be had without deleting transcendental functions. (It actually compares pretty well with the original HP-35.) It would be nice to have a few more functions, like x^2 or delta-% or x^{th} root of y. Adding functions would require a shift key, which opens a lot of possibilities. But it also tends to lead to feature creep, and before you know it, you might as well go with wp34s. Trying to find the right place to stop, I present the layout below as a basic programmable RPN. It is loosely based on the 10C, but I dispensed with all statistics functions in favor of better programming. Programming could be artificially limited to a couple hundred steps. If you need more than that, time to graduate to wp34s (or maybe wp43s someday.)

```
ASIN    ACOS    ATAN    10^x        e^x
SIN     COS     TAN     LOG     LN

x^2       y^1/x       HYP     delta%
sqrt(x) y^x       1/x     %       SHIFT

n!      FIX     SCI     ENG     ->P
STO     RCL     LAST x  pi      ->R

R^     DEG     RAD     GRD     Clx
Rv      x<>y    +/-     EEX     <-

GTO     x=0?    x<0?    x>0?    DSE
XEQ     7       8       9       ÷

LABEL   x=y?    x<y?    x>y?    ISG
P/R     4       5       6       x

PSE     ->H     ->H.MS  INT     FRAC
R/S     1       2       3       -

OFF     ->DEG   ->RAD   LAST x  CLEAR
ON/EXIT 0       .       ENTER   +
```

*Message #44 Posted by **Walter B** on 5 Nov 2011, 5:12 p.m.,*
in response to message #42 by Jeff O.

Both your designs look very nice and consistent IMHO, though I clearly prefer a big ENTER for obvious reasons. Just in the second design I can't find RTN - where do you hide it? And CLEAR on shifted + looks a bit ... strange to me ;-)

Just my 20m€ as usual,

Walter

Re: Design for a simple, entry-level RPN calculator

*Message #45 Posted by **Jeff O.** on 6 Nov 2011, 12:22 p.m.,*
in response to message #44 by Walter B

Thanks for the positive comments. I would of course prefer a large ENTER key, but one is not available on the 10bii+.

I might have missed including RTN. Maybe no subroutines are allowed. Yeah, that's the ticket. It is a simple RPN, so no subroutines allowed. (Or perhaps we could do without Pause.)

The CLEAR above the + was intended as a master clear that would not be used often. In program mode, it would clear all programs. In run mode, it would clear the stack and all registers.

Re: Design for a simple, entry-level RPN calculator

*Message #46 Posted by **Dieter** on 6 Nov 2011, 1:12 p.m.,*
in response to message #42 by Jeff O.

Obviously you clearly see the importance of a dedicated LastX key - that's great. On the other hand even the most passionate RPN user probably will not insist on having two of them. ;-)

You say there will be no subroutines. So what is the use of the XEQ key? It could run individual routines starting at Label 0..9, just as earlier HPs did with their GSB key.

Finally, there are six tests, but none for X#0 and X#Y. These are essential since a combination of these and the others can easily replace the missing X>= and X<= tests. On the other hand, do you think such a basic device requires DSE and ISG?

Dieter

Re: Design for a simple, entry-level RPN calculator

Ah, I see you found my Easter egg. Good job! Or perhaps I made an error.

With no subroutines, XEQ would be used just as you say. But I think I would actually include a RTN function and allow subroutines. As for DSE and ISG, pehaps a basic device needs only DSE.

Based on the above, here is a revised layout:

```
ASIN    ACOS    ATAN    10^x        e^x
SIN     COS     TAN     LOG     LN

x^2       y^1/x       HYP     delta%
sqrt(x) y^x         1/x     %       SHIFT

n!      FIX     SCI     ENG     ->P
STO     RCL     LAST x  pi      ->R

R^     DEG     RAD     GRD     Clx
Rv      x<>y    +/-     EEX     <-

GTO     x=0?    x=/=0?  x<0?    x>0?
XEQ     7       8       9       ÷
```

```
LABEL    x=y?    x=/=y?  x<y?    x>y?
P/R      4       5       6       x

RTN      ->H     ->H.MS  DSE     INT
R/S      1       2       3       -

OFF      ->DEG   ->RAD   CLEAR   FRAC
ON/EXIT  0       .       ENTER   +
```

Maybe something like this:

```
This is an attempt to redo the design based on the 30b calculator (still no programming):

-------------------------------------

ES RPN 10-Solver

XROOT  x^2    Phi^-1 >HMS   >Polar FUNC
y^x    Sqrt   Phi    >H     >Rect  APPS

ASIN   ACOS   ATAN   10^x   e^x    1/x
SIN    COS    TAN    LOG    LN     Pi

Last X        R-Up   FIX    Spec   Cl Regs
ENTER         R-Down x<>y   EEX    < --

Sigma+ DEG    RAD    Mode   x!
STO    7      8      9      ÷

Sigma- %      %Chg   Base   RAN#
RCL    4      5      6      x

       COMB   PERM   Clr St r/Sxy
Shift  1      2      3      -

OFF    Mean   SDev   PDev   L.R.
ON/C   0      .      +/-    +

-------------------------------------

FUNC: Enters a function f(x), use the registers as variables - up to 10 equations (0-9), 100 steps each
```

```
APPS = cycle through the steps
FUNC = when you are complete

APPS:
1.  2 x 2 or 3 x 3  Simulatenous Equations - prompted
2.  Quadratic Equation - prompted
3.  Cubic Equation - prompted
4.  Evaluate Function X, variables are prompted
5.  Root of Fucntion X for Register #
6.  Integral of Function X in terms of Register #
7.  Derivative of Function X in terms of Register #
8.  Sum of Function (Sigma) of Function X in terms of Register #
9.  Turn TVM Solver On/Off
0.  Solver for TVM variable:

R0 = P/Y (not solvable)
R1 = N
R2 = I/YR%
R3 = PV
R4 = PMT
R5 = FV

Mode:
1.  GRAD  (DEG and RAD are on the keyboard)
2.  ALL (FIX is on the keyboard)
3.  ENG

in response to message #48 by Eddie W. Shore

Looks a lot better than your first draft :-) Some remarks in random order:

- I'd put FIX into Mode, too. Since the display mode previously set will be kept it looks like a waste of keyboard space else. Then, I'd put Mode on shifted x<>y instead.
- x! should be placed in a line with COMB and PERM.
- ClrSt is a bit isolated - I'd put it either on shifted / (next to the other clearing commands) or somewhere next to Sigma+ and Sigma-. Looks more logical IMHO.
- Same applies for RAN# ...
- You may deserve compliments for your design, but not for the two last items of Base. Oh, why can't the English learn to spell? ;-)
- Regarding hexadecimal numeric input: Please note you can't use the functions in row 2 in hex mode, so you can easily put A ... F there for free.
- What shall r/Sxy do?

Just my 20m€, as usual.

Walter

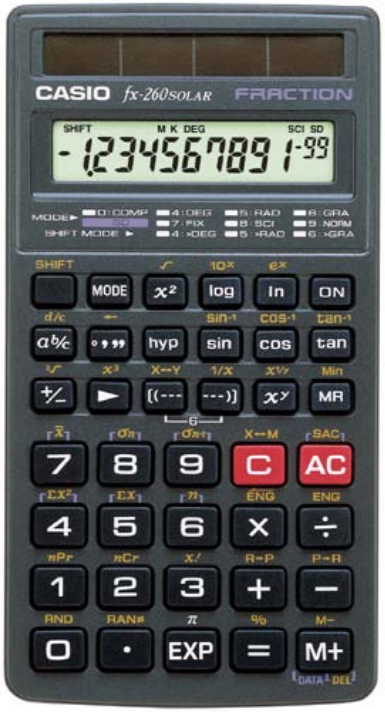
Here's a better one. $12 USD at Amazon.

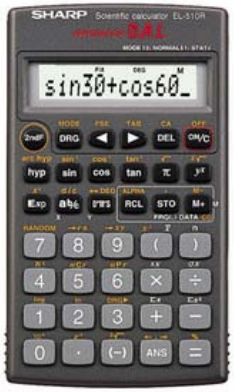
And another:

$16 at calculatorsinc.com

$16 at calculatorsinc.com

Or another that is available in every Staples for $10.





Or this, which seems tiny:

They tout they're Direct Algebraic Logic (D.A.L.): http://sharp-world.com/products/calculators/sc_calculator/el-510r/index.html

Simple, inexpensive, non-programmable, introductory (to RPN), scientific RPN calc that can be a stepping stone to higher end calcs like the 15c.

> Where is the RPN in these machines?

There isn't any RPN in those machines. That was the point. No non-programmable, entry level, value-priced RPN calc from HP. No stepping stone, (or gateway drug, judging by the denizens here) to higher end HP calcs.

It need not be a hp-10c. It need not be landscape mode. It need not have 15c style buttons. It just needs to be RPN and have a nice wide enter key on it. It needs to be priced (as others here suggested) at $20USD or under.

No high school or college student will ever consider a $99 15cLE (as another person here mistakenly suggested) an "entry level" scientific calculator.

That's true, and for a very good reason: there is no market for such a thing. TI owns the high school and college market. HP owns part of the financial market. HP would be foolish to make something they could not sell.

RPN is fun to play with for old fossils like us, but tomorrow's engineers and scientists will be ipad-equipped with all the calculating power they need. I'd say that is the principal reason HP is not making RPN scientific calculators anymore.

They don't know that. They screwed the pooch with the 10c. Look at the response of the 15cLE. How can they _not_ have an entry level RPN calc for high school students? One that

is non-programmable and allowed on state tests. How do they expect to keep replenishing the "fossils"?

And you don't get to be an old RPN fossil if the barrier to RPN is set very high. And all of tomorrow's engineers will still have to take exams in settings where iPad, iPhones, Androids and other gadgets will not be permitted. Thus, the need for an RPN version of the Casio fx-260 or similar. Or, their only introduction to a basic scientific is a Casio, TI, or Sharp...

Well, for one thing, high school math teachers don't teach RPN because (a) they don't know RPN, (b) kids don't want or need to know RPN, and (c) I seriously doubt that RPN is in the math standards of any state, standards that dictate what will be taught in the classroom and tested on standardized tests.

Just as the HP-35 effectively made slide rules obsolete and the PC made typewriters obsolete, I think devices like the Ipad will ultimately make handheld calculators obsolete.

IBM doesn't make Selectric typewriters anymore. I don't know that anyone makes typewriters anymore. I think there will come a day when HP won't make calculators anymore as well. And I think the testing organizations will ultimately allow students to use Ipads during tests.

RPN is for hobbyists, just like programmers who still code with zeroes and ones. It's a very tiny market.

I agree with you Nick.

If RPN is such a dead thing - then how come RPN calculator apps keep appearing on the market?

IHMO, HP missed the boat with the 10S, or the Smart Calc 300, both would have been the **perfect** opportunity to introduce an entry-level RPN calculator.

That's probably true.

Quote:

..will ever consider a $99 15cLE (as another person here mistakenly suggested) an "entry level" scientific calculator.

That comment may not have been clear. It was not directed at HP's 15c le productization but rather the functionality of a 15c relative to the cost of contemporary silicon required to implement it. IOW stripping resources down to minimally satisfy a less capable device is unlikely to produce a justifiable cost savings.

Perhaps a moot point as I suspect RPN devices vanish along with those who still recall its long since dwindled market justification.

The Casio fx-260 isn't a bad utility calc for the glove box and I've picked up several in recent years at MalWart for about US$7. Actually at the risk of near blasphemy in this forum I'd admit Casio calculators IME have held up surprisingly well for an econo caclulator. In the general use scientific market I'd imagine they are the leader in features*reliability/price.

OTOH most Sharp and every TI I've had the misfortune to own have consistently and reliably failed primarily due to lcd zebras or heat seal deterioration and of course TI's infamous keeeeeepppppaadd debouncing algorithms.

BTW I've never seen a TI-34 before but I wouldn't want to be seen in public with anything so hideous.

Quote:

The HP-6S solar holds up well in the glove box as well.

The HP 6S is a pretty good item to have in the glove box, because it has a hard plastic rim along the sides that makes it a serviceable windshield ice or mud scraper. Other than that, IMHO the 6S is without contest the poorest excuse for a scientific calculator ever made by (or for) anyone. Even though it uses solar and battery power there's no power OFF key, the keys are abominable in feel, and my 2001 batch CN10015 started loosing display segments six years ago just sitting in a drawer. But it *is* kind of pretty (after I wash the mud off). :-)

Quote:

It's nearly identical to the Casio fx-260 in function.

The fx-260 is a nice low-end $10 unit. I've still got every Casio I ever purchased new. One from 1978, the credit-card scientific fx-48, was carried in my pockets at work for years. *All* still work as well as when new, keys respond just as when new, and all LCD segments are still clear a third of a century after manufacture. Even HP's 1979 HP-41C series can't claim similar long-endurance display quality...the HP's 48S and 48G series couldn't claim that even when new!

The current Casio fx-115ES (a.k.a. 991ES) is one of the most amazingly capable devices in my 35-year collection. Yet it costs only $13 to $18 retail in the USA. There's a very slightly improved 991ES Plus, but I've never seen it for sale here. It's the only non-RPN calculator that is worth the adjustment effort to use. The 115ES is my take-everywhere calculator. I've got one at my desk, one in the truck, and even one in my day-hike backpack. Really. :-)

You are right about the displays and keys of the older Casios (heresy I know). I have an FX-350 which I was given when I started high school around 1981 and the keys and display are still fine. It's very light and thin and not overly endowed with functions but I did get about 10 years out of the first battery. In contrast all the recent Casios I've used have been utterly poor quality. I went through two FX-991ESs in three years at work due to key problems and odd errors and started to take a 33S of my own in with me as the key bounce on them was truly infuriating. I did eventually manage to get my my employer to replace the Casios with a 35S which is a definite improvement. I think the FX-991s only cost about £19 which kind of says it all as regard to the quality you can expect though. I suspect the old FX-350 cost substantially more.

I do think a basic feature set RPN calculator is needed as an introductory (or harsh environment) machine. I also think it should be decent quality though and reliable. Twenty Dollars sounds too cheap for that and I think quality can help sell even a basic device if it's marketed properly. What it needs to be is small and tough. It needs an easily read display (an illumination button would be a great selling point) and enough basic functionality to make it useful for simple engineering or scientific calculations. It also needs to be just cheap enough so you won't worry unduly about taking it where it might get dirty, damaged or stolen. For me that price point sits at about £25 (c.$40) though I'm sure others will think differently.

in response to message #68 by Eddie W. Shore

I just bought an HP 10bII+ for $29.99, and am extremely impressed with the overall quality of the product, keyboard and display. If HP could use it as a platform for a basic non-programmable RPN scientific calculator, and lower the price to $19.99, I'd call it a sure winner. I'm not sure how profitable it would be at that price point, though.

in response to message #1 by Eddie W. Shore

But really, what't the point? Even the old 65 was no more difficult to use for simple stuff, than the 21. Back then, there really was a price difference based on hardware differences.

Today, the hardware is so overpowered to begin with that it is foolish to underdesign the capabilities, since you can have all that extra power without detracting from the simple stuff.

Or in other words, it ain't any cheaper anyway.

It's more about perception these days (more functions = more value = more money) and manufacturers exploit this to try and maximise sales and profit. As I said in an earlier post, if HP had kept a cheaper basic RPN scientific in their line-up to compete with entry level Casios and Sharps, the RPN might have been more popular today.

The obvious difference in the hardware between models is the display. (Ironically, seven-segment displays have the best contrast and look the clearest.) Though I wonder how much the cost difference is between a 12 digit 7-segment, 12x 5x7 dot matrix and two line 16x144 dot matrix?

The 10bII+ is half the selling price of the 30B ... how much of that is the display or is it just functionality: it does more so it must cost more?

Another reason calculators with larger function sets cost more: you have to write a larger manual. It's not the cost of thicker printed manuals (they are all PDF now) it's the labour for writing the documentation.

I agree with you last comment: a non-programmable RPN calc aimed at college students who had to do just the basic math+stats courses (and not the engineering, maths, physics majors) would have spread the gospel.

Kevin

It isn't so much a matter of the calculators in the lineup as it is the calculator availability in the mass market. I was in both a Target and a Wal-Mart this past weekend. There were too many TI models to count, several Casios and some Sharps. Not a single HP. How can that lead to popularity of HP or of RPN?

I never see HP at Target. Staples only has the HP 12C. Office Depot carries the HP business line (10BII+, 12C, 30b).

You have to go to an electronics store like Frys to find them. They sell them for MSRP, same as the HP online store.

Re: Design for a simple, entry-level RPN calculator

*Message #81 Posted by **Håkan Thörngren** on 4 Nov 2011, 9:17 a.m.,*
in response to message #70 by bill platt

It all boils down to that different customers are prepared to pay a different amount of money for a given (same or similar) product. Those who wants a lot and are not cost sensitive will buy high end. Then there are those that want to pay less. You want to sell to them too (as long as you are making decent money), without affecting the price and sales of the high end product. Making a cheaper alternative with less capabilities is the answer to this.

Hardware cost is the same today, but I think the manufacturing cost for the original 10C compared to a 15C were similar back then. HP even invested the money in another code base variant (10C) in order to sell to other customers.

For some reason, the plot failed with the 10C. If it was because the 10C sold too little to make any point, or if it affected the sales of the 11C in a negative way, I do not know.

*Message #82 Posted by **Jeff Johnson** on 4 Nov 2011, 11:03 a.m.,*
in response to message #81 by Håkan Thörngren

It is interesting to note how manufacturers have competed by cramming more features into the calculators, as opposed to making them cheaper. I'd bet that only a small percentage of that advanced capability is used by the average buyer. Case in point - Even though I have multiple high-end calculators, on a daily basis I typically use no more than the functionality available on my HP-45. My daily driver is a 35s, and my "high-end" calculations are usually basic algebra, trig, and logs. Only a few handy programs (closer to macros, actually) are programmed in either my 35s or 50g. So I see the logic in making an "Entry Level" calculator.

Re: Design for a simple, entry-level RPN calculator

*Message #83 Posted by **bill platt** on 4 Nov 2011, 12:23 p.m.,*
in response to message #82 by Jeff Johnson

If I have to do any sums, for any purpose, I go as fast as I can to a spreadsheet or failing having a machine on, to a 48G, using a list. I have to be dragged kicking and screaming to do sums on *any* calculator (the 48G isn't a calculator, is it;-)

The 32s, the 33s, any non-I/O machine is great for the trigs,logs, and very short ad-hoc programs when you are on the run and don't need to document with a spreadsheet or mathcad. Or perhaps you are working by hand step by step and validating a spreadsheet. That might be my most important use of RPN. I even skip the 27s if I can in this and grab RPN, probably for the very same reasons Marwan mentioned.

I posit that if failed for exactly my hypothesis previously mentioned: that the savings, which were minimal, weren't enough to justify buying one. The market proved this. They are the hardest to find. As I remember it, they came out at $80 when the 11c was $100. And I bet they had almost no profit margin. If I remember correctly, my 11c cost $120 in 1982. Man, was that a fantastic machine at that time! I think I must have had the same sort of joy the iphone users have now :-D

I think HP created too much choice, or the price difference was too small. It would have been better to stick with the 11C, maybe at a slightly cheaper price they would have sold more than the 10C & 11C together. Of course retrospect is easy, but HP seemed to have learnt the lesson and with the Pioneers released 2 RPN versions, the 32S (followed by the 32SII) and the 42S. Both have quite a following.

15C in Wikipedia: Update, anyone?

*Message #1 Posted by **Peter Murphy (Livermore)** on 3 Nov 2011, 2:14 p.m.*

Would anyone like to update (and perhaps expand) this short Wikipedia item on the 15C?

"The HP-15C is a high-end scientific programmable with a root-solver and numerical integration. It is able to handle complex numbers and matrix operations. Although out of production, its popularity has led to high prices of US$200–400 on the used market[5] and a petition asking HP to restart production. The HP-15C was a replacement for the (LED Display based) HP-34C. On September 1, 2011, HP announced that a limited edition 15C based on the ARM hardware used in the modern 12C would be released.[6]"

http://en.wikipedia.org/wiki/HP-10C_series

*Message #4 Posted by **bill platt** on 4 Nov 2011, 2:26 p.m.,*
in response to message #3 by Jim Johnson

Right. So why enable it? Why enable it to become a "facebook" or a "google"? I say help keep good information decentralized. Also, I don't want to waste my time on volunteer stuff that just gets written over by a bunch of porno editors. Ever looked at what the big barnstar" editors actually do? They provide "content" for porn stars!

Re: 15C in Wikipedia: Update, anyone?

*Message #5 Posted by **Lincoln R.** on 4 Nov 2011, 4:08 p.m.,*
in response to message #4 by bill platt

It is a useful resource for a lot of things. Is there a lot of info on porn, sex, drugs, crime, and other things that a 'reputable paper encyclopedia' wouldn't provide? Sure. But there is useful info. Admittedly, it's not the best place to look for unbiased information about big-ticket issues like religion and politics, but I can't see there being too much controversy over the history of HP calculators.

in response to message #6 by bill platt

Wow, you really hate Wikipedia... I'm definitely not suggesting "Let's move all the info off the forum and close up shop." However, info there could be useful for drawing more people here. IIRC, several articles on vintage HP calculators have links to hpmuseum.org.

Really, I agree that this site is probably one of the best (if not the best) resources for HP calculators out there. If there isn't an article or museum page here that can answer your question, there's someone lurking around the forums who can. However, people have to *find* this site first. Google works well for that. Wikipedia can also work well for that.

Re: 15C in Wikipedia: Update, anyone?

*Message #8 Posted by **bill platt** on 5 Nov 2011, 11:24 a.m.,*
in response to message #7 by Lincoln R.

Obviously I can't enforce my opinions, but I don't see any value in Wikipedia drawing people here. People find hpmuseum easily enough using a search engine.

And the most obnoxious thing is that the google "wizards" have programmed their search order to maximize wikipedia exposure. It always comes up ahead of real information--for instance the Mayo Clinic and the CDC are below wikipedia if you look up a health or medical topic. 10,000 monkeys write it, and 10,000 chimpanzees read it.

To me, wikipedia, facebook, google, amazon are "centralizers" or "monoplizers." They are one size fits all but fit nothing solutions. To me, Wikipedia is an experiment gone wrong.

Bill, a little strong it seems to me. I have found Wikipedia a good source of general information for most topics I have searched for. Occasionally I have found errors, and corrected them. I guess that makes me both a monkey and a chimpanzee at the same time! :)

If I want to go beyond what Wikipedia does (and I usually do), it's easy to follow the other links returned by google.

You cannot choose to be ignorant. Ignorance is by definition lack of knowledge or awareness.

This is elitism - defining someone you disagree with as ignorant because they have a different point of view.

Re: 15C in Wikipedia: Update, anyone?

*Message #19 Posted by **Marcus von Cube, Germany** on 6 Nov 2011, 1:54 a.m.,*

In German, 'ignore' has the specific meaning of being unwilling to know or learn. This fits perfectly.

To know or to believe

*Message #20 Posted by **Walter B** on 6 Nov 2011, 7:15 a.m.,*
in response to message #18 by Martin Pinckney

You can agree or disagree about topics being disputable. Creationism today, however, is a mere (bad) joke - or call it religion. That was and is the reason for my statement above, where I tried to refer to the great historical achievement of separating science and religion some 300 (!) years ago.

Religion, per definition, is what you can rely (sic!) on but cannot dispute (believe it or not). Science, OTOH, is what you can **know** (Lat. "scientia" from "scire" = to know), meaning science explains (or elucidates) reproducible observations the easiest possible logically consistent way (which did and will change with the progress of knowledge, also as a result of many hard disputations, thus science can never be as comfortable as religion). Of course, you may introduce GODS (i.e. the Great Old Divine Spaghettimonster) for having buried all the fossiles all over the world in correct depths, but that's not the easiest explanation IMHO ;-)

"But what is truth? / Is truth unchanging law? / I have my truth - / is it the same as yours?" (IIRC the words of Pontius Pilatus in the musical Jesus Christ Superstar)

HTH but doubt it,

Walter

You can, and as a result, religions split sometimes. Creationists did so, too. You can even qeuestion the existence of god (that's what you probably meant), but that would make religion unfounded in your view and you'd have to ask yourself why to deal with it anymore ;-).

> Quote:
>
> Science [...]

I agree with this paragraph, of course. Unfortunately, science too has a problem in that by neccessity law of natures have to exist (I'm not talking about how they may look like) as the foundation of any scientific theory. If everything you observe happens just by chance in a way you expect (or is explainable off), scientists are out of luck. Again, if this is anyones religion, he may just wait for the universe to vanish, not discuss this with a physicist.

IMO the only problem with having a religion is to abridge the natural common sense (like cooperation between individuals helps the species to survive) and replace it with

arbitrarily interpretable tradition. But this is also true with secular law *g*.

If it's "just by chance" but complies with the present scientific model of the world, then both descriptions (the present scientific and the chance model (CM)) are equally valid - until an experiment or observation falsifies one of them, which will never be possible for the CM. Not being falsifiable rules it out from being scientific - additionally the CM has a damn low probability (think of multiple chance coincidences), so I wouldn't pick this as the "easiest possible ... way" explaining the world. YMMV ;-)

How would you falsify the current model of having natural laws? If one stops working, you can always devise another one replacing it. We did this all the time in physics history ;-).

> Quote:
>
> [...] additionally the CM has a damn low probability [...]

Arguing with probabilities is very weak, imo.

> replacing it. We did this all the time in physics history ;-).

Well, usually it didn't turn out we had to adopt the opposite ;-) So e.g. apples on this planet fall down anyway, just the law we think governing this fall has seen some states of refinement. Natural laws at all are a matter of millennia of experience - and the present scientific set of laws complies with what we see in a timeframe of some 1.4e10 years, which is quite astounding IMO. If GODS, being able to switch off the sun today, would have done all that, it would have been very busy 1.4e10 years. But I may be terribly wrong - I feel very well, however, based on our collective experience that natural laws seem to exist. Nevertheless I'm willing to accept that they don't, if reasonable proof is presented ;-)

> Quote:
>
> Arguing with probabilities is very weak, imo.

You're right, I shouldn't have done that - the CM is not scientific anyway.

Edited to correct a factor of 10 - shame on me, but at least nobody else found it earlier ;-)

Running against open doors, is that an idiom in english, too? Reread my initial text about it and you'll find the word 'religion'. But it doesn't matter really, we can always only argue in the realm of what we defend, otherwise we wouldn't defend it at all. Some people have faith in the existence of god, others in the existence of natural laws, and a whole lot of people have just both, likely due to being open minded.

BTW., if all apples 'fall up' (rise?), you still can make quantum mechanics responsible for it. How unlikely is that? Not enough to make it entirely impossible!

Good science and good religion go hand-in-hand. Bad science and bad religion are an anathema to each other.

If you have read much on Creationism , you know there is at least two schools - Young Earth and Old Earth. Both acknowledge that all of creation was, well, created. Old Earth creationism acknowledges the findings of science regarding the age of the universe.

> Quote:

Yet I am often surprised at how some make such rigid statements about how such-and-such is "settled science" or in some way indicate that a particular scientific "fact" cannot be disputed - forever.

> Quote:
>

In a part of Europe which was utterly devastated in a religious war some 380 years ago, killing a quarter of its population. I don't want to see that repeated. De gustibus

non est disputandum. That's the realm of religion. Of course you may dispute, but it's no use. Thus my statement above.

> Quote:
>
> Would it surprise you to learn that many, probably a majority, of Christians accept evolutionary theory as far as explaining natural selection? It does not, at least as presently constituted, explain the origin, nor the complexity of life.

That's another step in the great retreat of religion as a whole over the last 4000 years. Way back, people had made gods responsible for sunrise and sunset ...

*Message #34 Posted by **Katie Wasserman** on 7 Nov 2011, 1:56 a.m.,*
in response to message #18 by Martin Pinckney

I'm not being elitist, did you read the stuff on this site? They argue that the Earth is 6 to 10 thousand years old and similar craziness.

Here's their statement:

> Quote:
>
> The subject is still debated today, particularly between young-Earth scientists, who believe that the Earth is only approximately 10-6,000 years old, and Old Earth creationists and scientists who argue that Earth is approximately 4.5 billion years old.[1] **The scientific evidence points to a young age of the earth and the universe.**

Why not claim that the world is flat and that the Sun orbits us? Just becasue no one has witnessed 10,000+ years of history that doens't mean it didn't happen. How many people have witnessed the structure of the solar system? Yet no one doubts that it's heliocentric.

Edited: 7 Nov 2011, 2:37 a.m.

Re: 15C in Wikipedia: Update, anyone?

*Message #35 Posted by **Marcus von Cube, Germany** on 7 Nov 2011, 8:29 a.m.,*
in response to message #34 by Katie Wasserman

Religion has always been of some value in *explaining* and *controlling* the world. You see fog? Must have been the Goddess of Fog! The sun rises? Helios is busy moving it around the sky. Want people to follow you blindly? Tell them otherwise Helios might change jobs and the sun will stay below the horizon for some time. But if people obey the rules you've set up you'll talk Helios into not neglecting his duties...

People have always felt the need to explain what's around them and in absence of a better understanding, Gods and Fairies have proven to be the best explanations. Whenever some social group has managed to reclaim the whole truth about the world by proclaiming a tight bond to the 'responsible' beings, things have gone awry. Not only in the past, I fear. Just remember 9/11!

Re: 15C in Wikipedia: Update, anyone?

*Message #36 Posted by **Dominic Richens** on 4 Nov 2011, 1:24 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

The best person to update it is yourself. I won't because I have little interest in it.

I updated both the HP-20b and HP-30b because I have an interest in promoting these are platforms for the WP-34s.

Re: 15C in Wikipedia: Update, anyone?

*Message #37 Posted by **Peter Murphy (Livermore)** on 7 Nov 2011, 1:40 p.m.,*
in response to message #36 by Dominic Richens

Dominic, thanks for your response. I'd like to see an update to the Wikipedia entry on the 15C done by an experienced 15C user who has worked with the 15C-LE and can give a good account of the similarities and differences between the two. Perhaps, in addition, that person could tell something of the troubles with the LE, and how they're being addressed. That's not me, in either case.

Aristo M85 -- What charger?

*Message #1 Posted by **gene wright** on 3 Nov 2011, 11:17 a.m.*

What charger does this model take? Assume I need it spelled out for a 1st grader. ;-)

Isn't it beautiful? I think so!

Re: Aristo M85 -- What charger?

*Message #2 Posted by **Katie Wasserman** on 3 Nov 2011, 11:39 a.m.,*
in response to message #1 by gene wright

Very pretty!

All you need to know about charging these old calculators is the shape and polarity of the plug and the number/size of the nicad cells. Almost all of them use AA, so figure that back then they were around 700mAH per cell and charge at a 1/10 rate. Voltage isn't important, just enough to give you current needed, 70mA in this case. Of course almost no vendor used a regulated charger back then so the 70mA should be the average during the charging cycle -- it will be more at the start and less at the end.

Back when I used to charge my rechargeable calculators, I would experimentally pick a charger from a box of junk ones and measure the current when connected to the numbers of cells in the calculator. When I found the right one I'd solder on a plug and that was my custom-built charger. This worked great until I tired of charging them every few months. That's when a moved to primary AAA cells in plastic battery holders to replace AA nicads. Additionally, I use Energizer lithium AAA cells since they have near zero self discharge and never seem to leak.

in response to message #1 by gene wright

There is a special ARISTO charger on the market - well, I should say it was, but you find it on a German auction site every once and a while. And yes, ARISTO got awards for "good industrial design" quite regularily those days. You know why :-)

Re: Aristo M85 -- What charger?

*Message #4 Posted by **Joerg Woerner** on 3 Nov 2011, 2:53 p.m.,*
in response to message #1 by gene wright

Gene,

I received last week an M85S from Germany including a 230V charger.

Two choices: You wait three weeks and bid on my auctions OR you wait a few hours and I measure the voltage on its tip.

I have a few 220V outlets in my home (sewing machine, calculators, fondue set, raclette etc).

Cheers, Joerg

PS: Glad you like German design.

Re: Aristo M85 -- What charger?

*Message #8 Posted by **gene wright** on 3 Nov 2011, 3:45 p.m.,*
in response to message #7 by robertoataulfo

Actually, it has new rechargeables inside.

I just need to know what exact type of charger to use, which I think is the one Joerg specified!

Re: Aristo M85 -- What charger?

*Message #9 Posted by **Katie Wasserman** on 3 Nov 2011, 3:53 p.m.,*
in response to message #6 by gene wright

The old AC nicad chargers were usually not regulated, most new universal ones are. So a 7.5 volt setting will be 7.5 volts all the time, that's almost certainly going to pump way too much current into the 3 x AA nicads and they will get hot and be damaged.

The old AC chargers were essentially current limited devices due to their small transformer size, that's what kept the nicads from overheating and being damaged. The voltage rating on them was just a nominal value for "voltage at the rated load" if they had a rated load. If they had no rated load the voltage was pretty much meaningless, open circuit these would often be twice the stated value. There's no substitute for actually measuring the current draw when trying to fit a charger to a calculator.

The ideal solution is to get an external power supply that let's you limit the current and monitor it. Then you'll really know what's going on and have a single charger for all your calculators. For not much money you can find ones that are perfect for almost any battery powered calculator:

here's an example

here's one with a big more range

I wouldn't use these for anything other than battery charging, but they should be great for that.

Aristo M85 -- no charger.

*Message #10 Posted by **Mike (Austria)** on 3 Nov 2011, 4:56 p.m.,*
in response to message #9 by Katie Wasserman

The LED version of the Aristo M85 is designed to be operated with 3xAA Alkaline or NiCd cells or with a 7.5V= max.200mA voltage supply (Aristo #6790) to save batteries. I have just verified that minus is on center.

The M85 is NOT designed to recharge batteries inside the calculator, so please do NOT try to connect it to a current source. Aristo sold an external recharger (#6795) for NiCd cells. Actually, the M85 runs quite long on a single set of Alkalines, so you'd be best off just using these.

The "M85 S" model has a builtin NiCd battery. There was a later version of the M85 with a green fluorescent display operating on 2xAA cells.

This is one of the most beautiful and mechanically best calculators ever built. The keys have no click, but excellent response. They precisely register at approx. 1/3 of their 2mm travel without bouncing ever, even after 40 years of (initially intense, later occasional) use.

IIRC, its LEDs were manufactured by HP. Arithmetic is chain logic (i.e. no precedence, two levels of parentheses). Log, exponential and trigonometric functions are computed to six digits.

Kind regards and enjoy, Mike

Integration

*Message #1 Posted by **Paul Dale** on 3 Nov 2011, 7:52 a.m.*

As a result of providing local registers for subroutines and programs in the 34S, I'm looking at redoing the internal integration routine. The current Gauss-Kronrod quadrature was chosen primarily because it would fit into the available five registers. With locals this can be relaxed and something more sophisticated is possible.

I'm eyeing off the PPC IG routine as a possibility, but would like to know if anyone here has a pet keystroke integration routine of some kind of another.

The current integrator consumes flash equivalent to about 230 program steps (this includes both the program and the tables of constants required) so something of similar magnitude (or smaller) would be perfect.

Any suggestions anyone? Better still, any keystroke programs :-)

- Pauli

Re: Integration

*Message #2 Posted by **Marcus von Cube, Germany** on 3 Nov 2011, 9:09 a.m.,*
in response to message #1 by Paul Dale

Just to add some info about the current development:

Local registers, local flags, recursion, nested solve/integrate/sum/prod, ...

And a new keyboard layout is active now.

Re: Integration

*Message #3 Posted by **Kevin Colville (S. Africa)** on 3 Nov 2011, 11:50 a.m.,*
in response to message #1 by Paul Dale

My pet routine is a modified midpoint rule coupled with Richardson acceleration, ie, Romberg's method.

This code is similar to the method devised for the HP-34C by W.H. Kahan as described in HP Journal, Aug 1980. (This integration routine was later used in the 15c, 42s, ...)

I adapted Peter Henrici's version (from his book Computational Analysis with the HP-25 Pocket Calculator) to the 21s. It's about 70 steps, uses all ten registers of the 21s and was quite challenging because the 21s lacks an index register and only has x==0? and x<=y? tests. I'm sure there are better versions of Romberg for more advanced models without the limitations of the 21s (and the HP-25).

Kevin

Re: Integration

*Message #5 Posted by **Kiyoshi Akima** on 3 Nov 2011, 4:14 p.m.,*
in response to message #1 by Paul Dale

My personal preference would be for some kind of locally-adaptive routine. I've always considered the lack of local adaptivity one of the most serious flaws in the Romberg-based routine used from the HP 34C to the HP 50g (and the 15C LE, if I'm going to mention the most chronologically recent).

There are plenty of locally adaptive algorithms based on Newton-Cotes and Maclaurian methods, as well as Gaussian.

As an alternative to the Gauss-Kronrod I'd suggest considering Gauss-Bond instead:
http://www.crbond.com/integration.htm

G-B requires no more work than G-K and attains a higher-order for the same number of function evaluations.

Also, if you include the nonlinear argument transformation as done in the HP and PPC-ROM routines, please consider a flag to turn it off.

Re: Integration

*Message #6 Posted by **Paul Dale** on 3 Nov 2011, 5:40 p.m.,*
in response to message #5 by Kiyoshi Akima

I didn't know about G-B quadrature. I don't think I'll implement it however. I think some kind of adaptive method is better value for bytes.

Any specific suggestions (or code) for a locally-adaptive routine?

- Pauli

Re: Integration

*Message #7 Posted by **Kiyoshi Akima** on 3 Nov 2011, 6:31 p.m.,*
in response to message #6 by Paul Dale

If you've already got a G-K routine then it shouldn't take much effort to change it to a G-B. Mostly changing the constants.

I've got a bunch of locally-adaptive routines I'm playing with, but they're all in SysRPL for the 50g. They rely on recursion so I don't think they'll port well to the 34S. I've got G-B, Newton-Cotes, and Maclaurian. If you'd like, I can send you the documented SysRPL sources.

IIRC there's a FORTRAN routine in Conte & de Boor's "Elementary Numerical Analysis: An Algorithmic Approach". It's an oldie which I used as a textbook back in my student days and I remember programming my 41C to do it, but that program used synthetics to expand the return stack.

Re: Integration

*Message #8 Posted by **Paul Dale** on 3 Nov 2011, 6:50 p.m.,*
in response to message #7 by Kiyoshi Akima

I understand that G-B will be a switch the constants exercise, but it will still be static. I.e. small gain for effort.

The 34S will handle recursion reasonably in version 3. Not as well as in RPL but okay.

- Pauli

Re: Integration

*Message #9 Posted by **Kiyoshi Akima** on 7 Nov 2011, 2:31 p.m.,*
in response to message #6 by Paul Dale

Below is the UserRPL code for a crude non-recursive globally convergent adaptive quadrature routine on a 50g. It uses a second-order open Newton-Cotes formula (25.4.22 in Abramowitz & Stegun).

It's globally convergent in that it only requires that the total error satisfies the criteria, instead of requiring that each subinterval meet its "quota" of error. Thus, if 90% of the error occurs in 10% of the interval but the other 90% of the interval only contributes 10% of the error, then the routine is satisfied. A locally convergent routine would require the first 10% of the interval contribute no more than 10% of the error tolerance.

I slapped the code together in an evening, so I'm sure it's far from optimal. It also doesn't do any error- or limit-checking.

```
lower_limit upper-limit Function error_tolerance -> sum

<<
 -15. * ROT 4. PICK - { }
 <<
  NOVAL DUP DUP2
  -> a h y2 y4 y6 y1 y3 y5 y7
  <<
   IF 10 FS? THEN
    a     1. DISP
    a h + 2. DISP
   END
   a h .125 * + <-f EVAL DUP 'y1' STO
   a h .375 * + <-f EVAL DUP 'y3' STO
   a h .625 * + <-f EVAL DUP 'y5' STO
   a h .875 * + <-f EVAL DUP 'y7' STO
   + + +   DUP + y2 - y6 - h * 6. /
   y2 y6 + DUP + y4 -      h * 3. /
   OVER - ABS NEG SWAP a h y1 y2 y3 y5 y6 y7 10. ->LIST 1. ->LIST
  >>
 >>
 -> a <-f e h d r
 <<
  a h DUP2 .25 * + <-f EVAL
  a h      .5  * + <-f EVAL
  a h      .75 * + <-f EVAL
  r EVAL 'd' STO+
  WHILE
   0.
   1. d SIZE FOR i
    d i GET HEAD +
   NEXT
   e <
  REPEAT
   d SORT DUP TAIL SWAP HEAD
   LIST-> DROP 8. ROLL 8. ROLL
   .5 * 'h' STO 'a' STO
   h a OVER + SWAP 5. ROLLD 5. ROLLD r EVAL
   6. ROLLD a h    5. ROLLD 5. ROLLD r EVAL
```

```
   UNROT DROP2 + + 'd' STO
  END
  0.
  1. d SIZE FOR i
   d i GET 2. GET +
  NEXT
 >>
>>
```

Re: Integration

*Message #10 Posted by **Kevin Colville (S. Africa)** on 4 Nov 2011, 4:56 a.m.,*
in response to message #5 by Kiyoshi Akima

Romberg has the advantage that it doesn't need a table of weights and abscissae like the Gauss-* methods. At least the 34s has more space for that then earlier calculators. On the other hand Romberg can require a *lot* of function evaluations.

Adaptive methods require a trade-off between using a large enough table (can be held in ROM) for the base G-* method and enough return levels (in RAM) for the recursion. So it depends very much on the resources available in the 34s.

Quadrature is hard: everyone has their zoo of pathological examples that numerical methods trip over. Whether wildly fluctuating or steep singularities. Kahan's HP-34c article, the advice in several HP manuals and, of course, the 15C Advanced Functions manual all address these.

Good luck.

Re: Integration

*Message #11 Posted by **Paul Dale** on 4 Nov 2011, 5:20 a.m.,*
in response to message #10 by Kevin Colville (S. Africa)

Space use is easy. The current integration uses the equivalent of 230 steps of program. Any constant is equivalent to four steps.

The PPC IG routine is well under half of this for a Romberg implementation.

- Pauli

Re: Integration

*Message #12 Posted by **Wes Loewer** on 4 Nov 2011, 3:34 p.m.,*
in response to message #5 by Kiyoshi Akima

> Quote:

I agree. The Romberg method made perfect sense for the 34C with its limited memory. In the article, Kahan states: "For example, consider Gaussian quadrature. This method is widely regarded as 'best' in the sense that it very often requires fewer samples than most other methods to achieve an average A that approximates the desired A to within some preassigned tolerance." He goes on to explain why Gauss was not used as it would have taken all the calculator's memory to store the necessary nodes and weights.

Now that calculators have more memory, the widely used Gauss-Kronrod method seems well suited. I don't know how tight memory is on the 34S, but if you can fit something like Gauss-Kronrod onto it, it would be worth it. Romberg works fine for well-behaved functions, but it really bogs down on functions with cusps or corners. It reiterates deeper and deeper on the entire function intead of just where the problem is.

Functions with corners from absolute values are common when calculating the distance traveled given the velocity function: d = integral abs(v(x)) dx.

I came across such an integral on a standardized exam that would have taken over 30 minutes on the 50g in the default STD mode. (Students had 50 minutes to answer 17 calculator based questions on that section of the exam.) Setting the mode to FIX 5 reduces the time to about 30 seconds, but for comparison, the slower ti-84+, which uses the 15 node GK method, takes about 6 seconds.

The recursive 15 node Gauss-Kronrod method is commonly used, but if memory is tight, fewer nodes could be used. Because of symmetry, the 15 node GK requires storage of 8 node values and 12 weight values for a total of 20 values. A 7 node version would require 4 node values and 6 weights for a total of 10 values.

~wes

Re: Integration

*Message #13 Posted by **Paul Dale** on 4 Nov 2011, 6:18 p.m.,*
in response to message #12 by Wes Loewer

The 34S currently uses a 10/21 point Guass-Kronrod quadrature. The weights and nodes are just under half the space occupied by the routine. The big advantage of this integrator is the forty bytes of RAM it requires.

G-K is very good for well behaved functions but an adaptive method is preferable I feel. A recursive G-K method could be used but this will increase memory requirements & we're really tight on both RAM and flash. Romberg would consume less flash but more RAM.

All said, a wrapper has been written for the built in integrator to act more adaptively.

- Pauli

Re: Integration

*Message #14 Posted by **Kiyoshi Akima** on 7 Nov 2011, 2:16 p.m.,*
in response to message #13 by Paul Dale

A 10/21 G-K, eh? That's exact for order-32 polynomials. A 9/19 G-B would be exact for order-37 polynomials, with two fewer function evaluations. Admittedly, it would cost two additional constants and eight additional multiplications and sixteen additional additions, though the extra operations should just be a matter of changing loop limits and not additional code.

A 10/21 G-K starts with a 10-point Gauss-Legendre (G-L) quadrature, which is "optimal" for 10 function evaluations. An additional 11 points are then selected so that, in combination with the original 10, we have an optimal 21-point expansion (note that this is NOT an optimal 21-point quadrature, just optimal using the 10 original points). The two quadratures then provide an error estimate. If the estimate is "good enough" then the 21-point result is accepted. Otherwise the interval is subdivided and the process repeated on each subinterval.

G-B goes the other way. If we're going to evaluate the function 21 times anyway, let's do the best job of it we can, which is a 21-point G-L. We then pick an appropriate subset of those 21 points to evaluate another result so we can estimate the error. Alternatively, we can use fewer points, such as a 9/19 G-B and still get a "better" result.

HP-71B Forth Module

*Message #1 Posted by **Nick Taylor** on 3 Nov 2011, 7:17 a.m.*

I've been searching with Google to try to find out as much information about Forth on the HP-71B.

I keep stumbling across the following two Module part numbers:

82478a 82441a

Both of which seem to be linked with the Forth module.

Given how unlikely I am to find one, and then afford it (!), can anyone enlighten me as to which of these I should try to find in order to use Forth on the HP-71B?

Thanks

Nick

Re: HP-71B Forth Module

*Message #2 Posted by **Egan Ford** on 3 Nov 2011, 10:14 a.m.,*
in response to message #1 by Nick Taylor

You want to get HP-41 Translator Pac for the HP-71 (HP 82490A) or HP-71B Forth/Assembler ROM (HP 82441A). Both can be run under EMU71 emulation and the docs can be had on the MoHPC DVDs. I cannot tell you if the FORTH is exactly the same or not on both. I think it is.

I use the HP-41 Translator Pac for the HP-71 (HP 82490A) on my 71B as well as in EMU71.

Some of my 71B FORTH Pi Programs (if you are interested):

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=147662

You're wrong, Egan, the FORTHs are distinct and what's worse, incompatible.

All in all, I'd rather have the FORTH/Assembler ROM than the HP-41 Translator Pac because I see no real use nowadays for HP-41 programs translated to run in the HP-71B while using the Assembler to create and compile your own binary subprograms, FORTH primitives, and custom LEX keywords still holds some magic.

Best regards from V.

Re: HP-71B Forth Module

*Message #4 Posted by **Egan Ford** on 3 Nov 2011, 4:20 p.m.,*
in response to message #3 by Valentin Albillo

> Quote:
>
> the FORTHs are distinct and what's worse, incompatible.

Thanks for the clarification. As far as I could tell from the documentation the FORTHs are the same. All I could find:

Relation to the HP-71 FORTH/Assembler ROM

The FORTH system contained in the HP-41 Translator Pac is very similar to that in the HP 82441A FORTH/Assembler ROM. The HP-41 Translator Pac does not contain an assembler, but its built-in word set contains additional floating-point words and other HP-41 words not found in the FORTH/Assembler ROM.

The floating point words in the HP-41 Translator Pac differ from their FORTH/Assembler ROM counterparts in two respects:

- The HP-41 Translator Pac words will error if any of their arguments are alpha data.
- The HP-41 Translator Pac words perform a stack lift only after computation is finished, so that the stack is unaffected if a word terminates due to an error. In the FORTH/Assembler ROM, the stack lift is performed before the computation.

FORTH words defined from words common to both modules can be compiled into either system from a text file containing the definitions. However, because the addresses of built-in words and user variables are not the same in the two systems, you should not attempt to exchange files of type FORTH between the systems. That is, a file originally created as `FORTHRAM` by the FORTH/Assembler module should not be renamed as `FTH41RAM` for use with the HP-41 Translator Pac, and vice-versa. The most likely result of such an exchange is the `Memory Lost` error.

So the FORTHs are source compatible and the same in that sense.

Re: HP-71B Forth Module

*Message #5 Posted by **Frido Bohn** on 3 Nov 2011, 10:29 a.m.,*
in response to message #1 by Nick Taylor

HP 82478A - Debugger for the HP-71: Simulator of assembly language
Provided as LEX files to be copied into RAM from mass media.

HP 82441A - Forth/Assmbler ROM: Development environment in Forth/Assembler. Provided as (hardware) ROM.

The debugger may work as a kind of expansion of the Forth/Assembler ROM, but the ROM is what you are seeking for.

If you want to play with it you should use Emu71 and the emulator-based ROM. Visit Christoph Gießelink's and Jean-François Garnier's pages.

Re: HP-71B Forth Module

*Message #6 Posted by **Garth Wilson** on 3 Nov 2011, 11:24 a.m.,*
in response to message #1 by Nick Taylor

I can't tell you the differences between the two, but I have the 82441A Forth/Assembler module, and I will comment that it is

a really lousy implementation of Forth. I can't believe how slow many of the Forth words are. But, being Forth, it allows you to raplace words with your own definitions and speed them up. Re-writing many of them in Forth as secondaries, ie, without even using assembly and writing primitives, I was able to improve their speed by a factor of anywhere from two to fourteen! (CHR$ was the one I made 14x as fast.)

in response to message #6 by Garth Wilson

The FORTH/Assembler ROM is definitely great - especially the SATURN manual that was included.

I used it to disassemble the 48SX ROM initially.

Re: HP-71B Forth Module

*Message #8 Posted by **Christoph Giesselink** on 3 Nov 2011, 5:29 p.m.,*
in response to message #1 by Nick Taylor

Some month ago I also gone through the Internet searching for HP71B ROM module numbers. That's what I found about this:

HP 82441A was the number of the first Forth/Assembler ROM. This package did not contain the Debugger LEX files. Later the Forth/Assembler ROM was republished with the Debugger LEX files and new package got the number HP 82478A.

At this time I made a cross reference list with all HP ROM module numbers and labels I found:

```
Number cross reference list

HP 82441A                       HP-71 FORTH ASSEMBLER (without Debugger)
HP 82478A       5061-7234       HP-71 FORTH ASSEMBLER
HP 82479A       5061-7290       DATA ACQ
HP 82480A       5061-7226       HP-71 MATH
HP 82481A       5061-7237       AC CIRCUIT
HP 82482A       5061-7239       FINANCE
HP 82483A       5061-7238       SURVEYING
HP 82484A       5061-7241       CURVE FIT
HP 82485A       5061-7240       TEXT EDITOR
HP 82488A       5061-7271       DATA COMM
HP 82489A       5061-7270       AMPI STATISTICS
HP 82490A       5061-7269       HP-71 41 TRANSLATOR
```

If somebody may recognize a mistake in the list above, don't hesitate to correct me.

Christoph

*Message #7 Posted by **Namir** on 3 Nov 2011, 12:03 a.m.,*
in response to message #6 by Michael de Estrada

No ... the dude may simply have two accounts.

The new eBay handle might suggest that his first (or last) name is Gabriel. He seems to have an attachment to Colorado since "co" has shown up in his handles and he lived in CO when he had the "burlin" handle way back. Has anyone bought anything from Cobuba and might know his name?

Namir

Re: No more Cobubba?

*Message #8 Posted by **Paul Gaster** on 3 Nov 2011, 12:00 a.m.,*
in response to message #5 by Lincoln R.

It has to be the same guy. Look at the Completed listings for coburlin. There is a 10C with Serial No. 2237A00058 that never sold.

Now the new guy, garboco, is selling a 10C with the same serial, same picture, same description, everything. If coburlin never sold it, how could a new person sell it?

item numbers: 260860868285 and 220885617880

Re: No more Cobubba?

*Message #11 Posted by **Namir** on 3 Nov 2011, 12:39 a.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

Cobuba can have not two accounts but a hundred account. Unless he changes his approach to selling, he is going to get the same reaction from eBay buyers regardless of what he calls himself. If he wants to move items and have more sales, he needs to lower his prices. He can do that without reinventing new aliases.

Stupid is as stupid does!!

in response to message #11 by Namir

The thing is, he makes an occasional sale at his ridiculous prices (usually to someone overseas). A lot of eBay sellers aren't willing to ship calculators overseas, but for what he's charging he can afford to insure the thing to make sure he doesn't take a loss if the post office loses it or uses it as a hockey puck. I agree that what he's doing is shady (buying up calculators in decent condition cheaply and pairing them up with assorted manuals and cases, then selling them for ridiculous prices), but unfortunately it is neither illegal nor an eBay TOS violation.

in response to message #13 by robert rozee

310 million gas hogging americans are worth at least 5 billion bicycling chinese people, and at least 600 million Europeans, in terms of market. That's changing, but isn't there yet. Maybe if the new class of World Rich can get their act together, they can eviscerate the U.S. economy in the next 5 years so that the Chinese can become the top consumers. That is the goal. New and growing consumer markets are much more exciting to businesspeople than are established, saturated and shrinking ones.

Countries such as N.Z. and Au. are nice and tiny. You guys can be more nimble during these massive adjustments :-)

I admit to not like to ship outside the US, the reason is multi-part: (1) The buyer ends up paying a

lot for shipping, often more than what the item is worth. If you use a good carrier, like UPS, this is almost always the case. (2) I often get requests to not put the full value of the item on the shipping forms so that duty is low on the buyers end, this is fraud and I don't want to take part in that. (3) In general, the US Post Office people are not at all helpful in shipping items overseas and it can take a lot of time hanging out and the PO (30 minutes on a couple of occasions) to get the shipping forms correct.

Re: No more Cobubba?

*Message #18 Posted by **Paul Berger (Canada)** on 4 Nov 2011, 11:33 a.m.,*
in response to message #17 by Katie Wasserman

I do all my shipping using the Canada Post for 99% of it I can buy my postage online and even fill out the customs information, print a label and then drop it in a mail box or take it to one of the many convenient postal outlets. When I buy from an eBay seller in the US, which is quite often, I always ask for shipping via USPS as mail flows smoothly to Canada Post and most often I am not even billed for taxes or duty. I will not bid on anything if the seller will only ship via UPS because UPS always collects taxes and charges very high customs brokerage fees. My experience has also been that a lot of sellers that advertise that they will not ship to Canada when I ask if they will make an exception most often they are willing to do so.

Re: No more Cobubba?

*Message #19 Posted by **Michael de Estrada** on 4 Nov 2011, 12:18 p.m.,*
in response to message #18 by Paul Berger (Canada)

I ship all my items via USPS Priority Mail to international destinations. I have yet to have anything lost or damaged, although sometimes the delivery time can be very long and there is no way to actively track a shipment. I always insure it and buy a return receipt so I can verify delivery if the recipient does not notify me. Paperwork is a very simple 1 page customs form, and many entries are not required for non-commercial shippers and items valued at under $2500. I fill everything out in advance, so the wait at the post office is typically very short. Shipping to Canada costs about 1/2 the rate for the rest of the world and I believe that NAFTA reduces or eliminates tariffs that apply elsewhere. I never use UPS or FEDEX.

As far as TAS is concerned, they now include shipping costs in their fees, such that it is not profitable for sellers to ship overseas. So, you can thank TAS for discouraging US sellers from shipping internationally.

Re: No more Cobubba?

*Message #20 Posted by **Francis Pierot** on 4 Nov 2011, 11:59 a.m.,*
in response to message #17 by Katie Wasserman

I live in France and have buyed a lot of items from US sellers on *bay, never had any problem since one year.

Delays were about 10 or 15 days for boxed items and sometimes, customs asks for 19,6% VAT which I must admit, can make the item a little expensive in the end. But the euro/dollar exchange rate makes things smoothier, seen from the european side. Also, for manuals, lonely calculators with no boxes or accessories, items less than about $100, I frequently had no custom taxes at all, and even had short delays.

Still, I understand your point 3:

> Quote:
>
> In general, the US Post Office people are not at all helpful in shipping items overseas

You can probably pull the "US" mention out of this sentence.

I don't know why. I'm done in 5 min., 10 if there's a queue. I have some CN22 forms at home and fill it in beforehand (my local postmaster gives me about 5 at a time). The Royal Mail has good description of how to write addresses for different countries (no lost/returned items so far). So all is ready when I get to the post office and I tell him what services I want (air/surface, insurance, signed/tracked etc.) and he gives the best price option (I have double checked this sometimes, again on the Royal Mail website). All done in a few minutes on my way to work, which fades into insignificance with the traffic queues...

Maybe we should cool down a little. Reading his post again, he said "in terms of the world population america is quite small and insignificant". I think the American population is less than 1/20th of the world population... in my book 1/20th *is* small. Everyone likes to think that their country isn't insignificant, but "in terms of world population" most are... except maybe for China and India! :)

[rant on] Unfortunately, today, that is to some small extent true. Our economic might, once supreme, is waning and we are using our quickly draining treasury (like sand in an hour glass) to garrison the world. Isn't this what happened to the Soviet Union when they decided to go into Afghanistan? Why exactly do we think that we are immune to the same sort of financial stresses that broke the USSR? I would love to see us become, once again, that old force in technology, innovation, and industry. I don't say it is all

gone, that is surely not the case, but we are certainly weaker than we once were and economically far less important. [/rant off]

Sorry, just my $0.02.

Cheers,

-Marwan

*Message #28 Posted by **Don Shepherd** on 4 Nov 2011, 7:40 p.m.,*
in response to message #27 by M. Joury

Marwan, I wouldn't be too quick to write off the economic influence of the United States. We've been through some tough times during the last few years, like many countries, and our government is certainly dysfunctional at times, again, like many countries, but it seems that many people still want to come here, some legally some not.

And I certainly wouldn't write off the United States as a military power. Just ask Saddam Hussein, Osama bin Laden, or Moammar Ghadafi (a US-built drone ratted him out I think). Oh, I guess you can't ask them after all.

Gee, it was more fun discussing Coburlin.

Re: No more Cobubba?

*Message #29 Posted by **M. Joury** on 4 Nov 2011, 10:57 p.m.,*
in response to message #28 by Don Shepherd

Oh, I am certainly not willing to write us off quite yet. In fact I am rather more optimistic than many. It just sometimes seems that we keep shooting ourselves in the foot. And no fear, I am not writing off our military might. On the other hand our pockets are not infinitely deep and with our military expenditure being something like 40% of the total world military expenditure (2009 figures) and something like 6 times that of China I just don't see how we can realistically maintain that.

As for people coming to the US, we are still the land of hope for most of the world. And dysfunctional? Not even close to some other countries. None of that means we can't do better.

Ok. Back to coburlin <g>. Sorry I went off on this side trip.

Cheers,

-Marwan

You certainly raise a good point. The USSR was a centralized socialist regime, with no effective market to fuel growth economic growth. With "universal health care", "stimulus plans" and "jobs bills", ever increasing government spending and government control, we seem to be heading in that same direction.

> I would love to see us become, once again, that old force in technology, innovation, and industry.

I'm a little pessimistic, not just about the US, but about the world. 40 years ago we (meaning "we mankind") could go to the moon, now the only way to go even to low Earth orbit is the Russian Soyuz. 30 years ago we had great new calculators almost every year, and people who wanted/knew how to use them; now we have mostly cheap-ish gadgets, and if we want something more we have to rely on community efforts. A few decades ago we were willing to take risks, experiment, push the frontiers beyond: now everything has to be "politically correct", risk is evil and so on.

This is stagnation, or worse. I think the human creativity and enthusiasm are atrophising, slowly but constantly. :(

Cristian

Interesting find: HP 9875A dual cassette drive

*Message #1 Posted by **David Ramsey** on 2 Nov 2011, 5:56 p.m.*

I took a chance and bought this HP 9875 Cartridge Tape Unit from a recycled equipment company recently.

It's an HPIB device designed to be used with the 9820, 9825, 9830, etc. with the appropriate interface, so the back panel will look familiar to those of us who've used HPIB devices before.

The 9875A is an "intelligent" peripheral with its own processor and memory. This explains the giant circuit board inside. In fact according to HP it could be connected directly to HPIB measuring equipment and accumulate data on its own without a host computer. Flipping a "Self test" switch on the back will cause the unit to perform write and read tests on cassettes in both drives and blink a drive light if any errors occur.

Inside are two 9825A-era cassette drives that use DC100 tapes. Fortunately I have one good DC100 tape! Both tape wheels were goopy, but the good 'ol "heat shrink tubing" fix, inelegant though it may be, fixed that.

Being expensive, 70s-era HP equipment, it's built like a tank, with a thick aluminum frame supporting all components.

A clever feature: angled mirrors and clear ports above the tape drives allow you to see the label on the tape, if any, or the spinning tape reels if not.

Although the device predates the HP-85, it's a lot easier to play with on an 85 (with the optional HPIB interface) or HP-87 than on earlier machines, because these let you do BASIC things from the command line, like dimension string variables to hold status results, which can only be accomplished inside a program on earlier machines.

Although "intelligent", the 9875A doesn't have anything in the way of file system smarts, nor is it supported by "mass storage" ROMs. When you insert a tape, the first thing you need to do is send a "rewind" command, because otherwise the unit doesn't know where the tape is. You create files, specifying the number of records and bytes per record, and can write to and read from files or records programmatically. Various operations let you select optional read-after-write verification, select drive 0 or drive 1, and retrieve error codes, which are typically delivered as a single long string consisting of comma-separated numbers you must then parse yourself.

You can't (easily) save or load programs from the unit; and using data files is quite tedious: for example, you must

programmatically position the tape to the start of a file with the "find file" command before reading or writing to the file; and files have no names and there's no concept of a "directory", so you'd better make notes.

Still, it's an interesting little bit of HP history, and the only one I've ever seen. $150 well spent.

Edited: 2 Nov 2011, 5:58 p.m.

Re: Interesting find: HP 9875A dual cassette drive

*Message #2 Posted by **Eric Smith** on 2 Nov 2011, 8:32 p.m.,*
in response to message #1 by David Ramsey

Nice find!

What is the part number of the white ceramic chip? It is probably a HP proprietary microprocessor, and it is in the "SLAM" (Single Layer Alumina Metallized) package. This package was mostly used by HP, but Motorola used it for a short while for their DSP56000/DSP56001 DSP processors.

In the mid-1970s when this product was designed, there weren't any commonly available IC packages with more than 42 contacts. The SLAM package was developed to provide a larger number of contacts, as well as to package chips with higher power dissipation than could be accommodated by the more common plastic packages. By using a single metallization layer etched on the alumina substrate, it was a fairly inexpensive package to produce, compared to other high-contact-count ceramic packages of that time.

The industry generally went a different direction, with the JEDEC CLCC (Ceramic Leadless Chip Carrier) packages and ceramic pin grid arrays. Today ceramic packages are rarely seen in commercial products, with the notable exception of microprocessors for general purpose computing, where they are used due to power dissipation requirements of 50 to 145 watts.

The Motorola 56K DSP parts used a 100-contact SLAM package, but this one might have fewer contacts.

in response to message #3 by David Ramsey

I was wrong, that isn't a microprocessor. I've seen that one before in other HP gear. It is a "CHI" HP-IB (IEEE-488) interface chip. Possibly a 48-contact SLAM package. It is probably NMOS. Given that it doesn't even include the bus buffers, it seems unlikely that it would draw more than 150mA at 5V, so the reason for use of the SLAM package must be the contact count rather than power dissipation.

Re: Interesting find: HP 9875A dual cassette drive

*Message #5 Posted by **Steve Leibson** on 5 Nov 2011, 7:22 p.m.,*
in response to message #4 by Eric Smith

You're sure that's a CHI chip? Given the vintage, I would have thought it was a PHI (Processor-to-HPIB Interface) chip made with HP's proprietary silicon-on-sapphire process technology for high speed and low power.

That package was first used in the HP 9835A/B for the language-ROM drawer and to expand the capacity of the front option-ROM drawers. In those days, the option ROMs were high-margin products so finding a way of putting four different option ROMs in each ROM drawer was akin to printing money.

I used the same package, but with a pc-board substrate for the laser-trimmed precision-resistor networks in the never-produced HP 98037A Analog I/O card (http://www.hp9825.com/html/analog_i_o.html) for the HP 98x5A/B desktop computers. It was a good way to get a high-density, pluggable component in those days.

*Message #6 Posted by **Eric Smith** on 5 Nov 2011, 11:32 p.m.,*
in response to message #5 by Steve Leibson

The service manual for another HP product (I forget which one), referred to that part number as a CHI. It didn't give the expansion of the abbreviation. Maybe "Computer to HPIB Interface"?

Certainly functionally it is a processor to HPIB interface.

I thought HP started using SOS in the late 1970s. Were they really using it around 1975?

Regarding the ROM package, I imagine that you must be talking about the rectangular package with holes for the contacts? I've never seen ROMs packaged in the square SLAM package like the HPIB interface chip.

*Message #7 Posted by **Steve Leibson** on 6 Nov 2011, 9:00 p.m.,*
in response to message #6 by Eric Smith

The first HP Journal mentioning silicon on sapphire at HP is the July 1978 issue. (http://www.hpl.hp.com/hpjournal/pdfs/IssuePDFs/1978-07.pdf) That article references another HP article about silicon on sapphire dating back to April, 1977. There's also an HP ad you can Google up from November, 1977 that talks about the PHI chip and silicon on sapphire. That article says that the HP silicon-on-sapphire program dates back five years from the end of November 1977 or some time in 1972.

The HP 9875A tape drive doesn't date back to 1975. It came later, as evidenced by the use of the Tape Controller chip (TACO) that was designed for the HP 9845A. (http://www.hp9845.net/9845/hardware/processors/ and scroll down) I'm pretty darn sure that The HP 9825A (introduced in 1976) used discrete electronics and TTL chips for its tape controller. The NMOS TACO came later. According to the HP Computer Museum, the intro date for the HP 9875A was 1978, so that is the same time period as the HP Journal article. Also, the HP 98034A HPIB interface card for the HP 9825A was based on HP's NMOS Nanoprocessor (as was the 98035A Real Time Clock card and the 9885A floppy drive) because there was no HPIB chip available during development of that I/O card.

All of which doesn't prove that the chip in the HP 9875A is a PHI. It does prove that HP's silicon-on-sapphire chips existed in the proper time period to go into the HP 9875A. My

hazy memory recalls hearing a lot about the PHI chip and nothing about the CHI chip at the Desktop Computer Division. I didn't use any of the HPIB chips for my design work at HP. Didn't need to.

As for the ROM in the HP 9875A, indeed I was referring to the ceramic package with the holes. The other ceramic package in the clips which you call SLAM (never heard that term, but sounds good) is clearly the HPIB chip. That's how the PHI was packaged. I don't know about the CHI chip.

Is there any published information on the Nanoprocessor?

Nanoprocessor

*Message #9 Posted by **Steve Leibson** on 7 Nov 2011, 5:43 p.m.,*
in response to message #8 by Eric Smith

As far as I know Eric, details of the Nanoprocessor were never published. There was no external development system available for it, so there was little reason to publish that info.

Re: Interesting find: HP 9875A dual cassette drive

*Message #10 Posted by **Jim Horn** on 7 Nov 2011, 5:51 p.m.,*
in response to message #8 by Eric Smith

Eric, I don't know if he actually did but I was told while I worked at HP's Santa Rosa Instrument Division with Larry Bower and Dyke Shaffer that Larry was responsible for the Nanoprocessor. He's long since left HP and now has Larry Bower Engineering in Santa Rosa. Details are via Google. He may have more info on it. Dyke may be a good source as well, having done much of the work on the 9825 and its peripherals (as well as the serialized HP-IB known as RIB: Redwood Interface Bus, but that's another story). Dyke can be found on LinkedIn. Both are tremendous engineers!

A tiny version of the nanoprocessor was used in the Logic Pulser probe back then, too...

The HP9825.COM web site has some pages that talk about using the nanoprocessor in the interface cards for the HP98x5 desktops.

Nanoprocessor

*Message #12 Posted by **Steve Leibson** on 8 Nov 2011, 9:48 a.m.,*

in response to message #11 by Craig Ruff

Uh, the HP9825.com site is mine. There's a discussion of the use of the Nanoprocessor in HP 9825A I/O cards on the site but not the internals of the chip. It's more of a sequencer than an actual microprocessor (hence the name). The page I referenced on HP9845.net (http://www.hp9845.net/9845/hardware/processors/) has a pinout for the processor about four-fifths of the way down the page, derived I think from the complete product-level schematic in the back of the HP 98034A HPIB I/O card manual. Oh for the simple days when we could actually include schematics in the back of a manual and they'd be useful.

OT: 9825 Memories

*Message #13 Posted by **Craig Ruff** on 8 Nov 2011, 6:39 p.m.,*
in response to message #12 by Steve Leibson

Steve, thanks for your great site about the 9825, which I found after a nostalgic search a while back. I have very fond memories of using a 9825T at my college work study job in a chemistry lab to manage experiments, perform data collection and post analysis from various analytical instruments, as well as other non-work related tasks. We produced crude hidden line 3D plots of geometric shapes for fun, and even on topic for this forum, plotting 41C barcode on a 9872C. I also used it as a dial up terminal for CS class assignments with a 9871 printer. Those memories prompted me to acquire two each of the 9825T and 9872C to play with in the future. Now all I need is to find a 9895 ROM so I can have some real storage!

Re: Interesting find: HP 9875A dual cassette drive

*Message #14 Posted by **Eric Smith** on 3 Nov 2011, 2:26 a.m.,*
in response to message #3 by David Ramsey

I just found the service manual on hpmuseum.net. It lists the HP-IB interface chip as a 1AA7-6001, so apparently some revision was made to the chip during the production life of the product.

Could you also post a closeup of the 40-pin chip with the heat sink on and the funny rectangular chip near it? They are near the edge connector. The service manual lists the processor as an 1818-2500 "Binary Processor Chip" in a ceramic DIP, but doesn't show a heat sink on it. The BPC is one of the chips used in the processor hybrid of the 9825/35/45, and does draw a lot of current, so I'm not surprised that they decided to heat-sink it.

The funny rectangular part is the ROM, which the service manual lists as P/N 1818-2814. It's a 64K ROM, probably 4K*16 of the same type used in the 98x5.

There's another HP custom chip with a heat sink on the "tape control and power" board, the 5061-3012 "Tape Control Chip". I expect this is probably the same chip used for tape control in the 98x5.

Thanks! Eric

*Message #17 Posted by **Eric Smith** on 3 Nov 2011, 6:59 p.m.,*
in response to message #16 by Rik Bos

In the 98x5 computers, the ROMs were packaged that way both because the 28-pin DIP wasn't yet an established standard, and for compactness. Essentially the same reason as for the SLAM package for the CHI part.

In the 9875A, there would have been enough room for a 28-pin DIP if it had existed, but I'm sure it was easier to stick with packaging all of their ROMs in the same way.

If I remember correctly, though, the 9872 series plotters did not use ROMs in that same package, even though it used the same processor.

Happy Birthday HP9810A

*Message #1 Posted by **Achim (Germany)** on 2 Nov 2011, 4:38 p.m.*

The day is near to celebrate the 40th birthday of the HP9810A. The first machines where produced in late 1971. One of my 9810s (I have 3 working and one waiting fo repair) may be one of the oldest produced in Boeblingen, Germany. It has the serial 1147G00560 which qualifies it as one of the first series. The ICs inside have datecodes between 7045 and 7144. The seal on the memory cage has a hand written date 7.2.72 (7th of feb. 1972), obviously written by a HP service man (the famous KG., whoever that may have been) when the machine was delivered to the customer, my school. So the machine must have been assembled somewhen between November 1971 and January 1972. I'm curious if someone has an older 9810. I was able to buy that machine some years ago from my old school.

On that very machine I wrote my first program ever in 1973, which solves a highly complex mathematical problem: calculating the binomial products of two numbers entered by the user. The program was coded with a pencil on marked cards and could be entered into the calc by the 9860A card reader.

My contribution to the birthday is the latest release 1.50 of my HP9800 emulator, which may be found on www.sourceforge.net/projects/hp9800e. It will propably be the final release since after nearly five years I finished the family of series 9800 calculators with the HP9821A. After a long quest I came by the original 9821 system ROMs and read them out for use in the emulator.

HP once did some test equipment manufacturing in Germany. I suspect a lot of it had to do with not shipping heavy things like metal casework and transformers (Although Carnegie Mellon has a lot of 80s HP function generators that were "Made in the Federal Republic of Germany").

Re: Happy Birthday HP9810A
*Message #4 Posted by **Katie Wasserman** on 2 Nov 2011, 8:00 p.m.,*
in response to message #1 by Achim (Germany)

Very nice.

The 9810A that I have was also made in Germany, with a serial number of: 1410G02081. So HP was producing the 9810 in Germany for at least a couple of years. I bought it from someone in the Netherlands about 10 years ago and paid to ship it to the US. It needed work to rebuild the card reader and printer and a new power switch but it's still working.

*Message #5 Posted by **qgrdne** on 3 Nov 2011, 9:42 a.m.,*
in response to message #4 by Katie Wasserman

The emulators are very impressive. But it is very difficult to read the key-labels. The images are just too small. For example I've start the 'HP9820A.cmd' and I cannot read the keys's and labels on and above the keys on the part with 1, 2 and 3 (left side of the emulator). Is it possible to use bigger images for the calculators so that it's easier to sea what's on and above the labels? J.Groenendijk

Re: Happy Birthday HP9810A

*Message #6 Posted by **Achim (Germany)** on 3 Nov 2011, 3:24 p.m.,*
in response to message #5 by qgrdne

Yes, I know of this issue. The image resolution is a compromise to all possible display sizes down to 1024x768. If I would rise the resolution the window would'n fit on such a display. On the other hand the resolution is optimized to match with the size of the LED display and printer output. Printer dots are 1x1 pixel and the 9810 LED segments are 1 px wide. Here the next possible step would be to double the dot size (from 1x1 to 2x2). Consequently the keyboard would have to be 2000px wide, which fits on neary no display.

Re: Happy Birthday HP9810A

*Message #7 Posted by **Achim (Germany)** on 3 Nov 2011, 3:12 p.m.,*
in response to message #4 by Katie Wasserman

My 9810 with highest serial has 1410G02889. The IC date codes range from 7335 to 7648, so it was propably manufactured in late 1976.

The HP factory in Boeblingen exists since 1959 and they produced besides the desktop calculators HP workstions (series 9000) and unix servers.

WP 34s: UP and Down key in program mode

*Message #1 Posted by **Miguel Toro** on 2 Nov 2011, 10:21 a.m.*

Hi,

Using version 2.2 rev. 1782, I see that in program mode, when I keep the up key pressed, the calculator does a fast up-scroll through the steps of a program, but if do the same with the Down key, I just get a NULL and nothing else happens, so think is a little inconsistent. Is that the intended behaviour?

Thanks,

Miguel

Re: WP 34s: UP and Down key in program mode

*Message #2 Posted by **Dominic Richens** on 2 Nov 2011, 12:29 p.m.,*
in response to message #1 by Miguel Toro

the keys.c code to handle SST versus BST is different:

```
                case STATE_SST:
                        xeq_sst_bst(0);
                        OpCode = c;
                        OpCodeDisplayPending = 0;
                        break;
                case STATE_BST:
                        xeq_sst_bst(-1);
                        break;
```

stepping works properly if those OpCode* lines are removed, or at least if OpCode is set to 0 on STATE_SST - not sure why those lines are there, though.

Edited: 2 Nov 2011, 12:29 p.m.

Re: WP 34s: UP and Down key in program mode

*Message #3 Posted by **Marcus von Cube, Germany** on 2 Nov 2011, 4:12 p.m.,*
in response to message #2 by Dominic Richens

I changed this because I think it's a good idea to be able to NULL a command that is selected via SST. You see the command before it is executed and holding the key longer cancels it. This is, of course, incompatible with the autorepeat feature. The latter is therefore disabled for SST.

EDIT: In program mode, autorepeat should work. I've to check this.

Edited: 2 Nov 2011, 4:16 p.m.

Re: WP 34s: UP and Down key in program mode

*Message #5 Posted by **Walter B** on 2 Nov 2011, 4:06 p.m.,*
in response to message #1 by Miguel Toro

Both directions should work symmetrically. What you observed is *not* the intended behaviour.

Re: WP 34s: UP and Down key in program mode

*Message #6 Posted by **Marcus von Cube, Germany** on 2 Nov 2011, 4:41 p.m.,*
in response to message #5 by Walter B

Yes, but only in program mode. I found the error. It's not in the keyboard handler but in xeq_bst_sst(). It will be fixed in an upcoming release.

In run mode, SST and BST are not symmetrical by design: A SST executes the instruction while BST only displays it. So autorepeat is fine for BST but for SST, NULLing makes more sense.

Edit: Fixed and committed but the present release is unstable so please be patient!

Edited: 2 Nov 2011, 4:58 p.m.

Re: WP 34s: UP and Down key in program mode

*Message #7 Posted by **Cristian Arezzini** on 3 Nov 2011, 12:41 a.m.,*
in response to message #6 by Marcus von Cube, Germany

I used to be able to reflash the calc without losing data - a "Backup to flash" would leave me with a calc displaying "Restored" after flash. Now it's very common that after flashing I get "Erased" and I have to transfer my programs again. Should I stop updating for a while until things "settle down" a little?

Cristian

in response to message #9 by Jeff O.

I've put up a V2.2 earlier as a release package. This should work even with some minor problems left.

Re: WP 34s: UP and Down key in program mode

*Message #11 Posted by **fhub** on 3 Nov 2011, 9:58 a.m.,*
in response to message #9 by Jeff O.

> Quote:
>
> Which revision number is the final 2.2? Is it considered stable?

I have SVN1797 as lastest (stable) 2.2 version.
After that Marcus introduced these new feature like LOCL, adresses with ".nnn" etc...

Franz

Re: WP 34s: UP and Down key in program mode

*Message #12 Posted by **Jeff O.** on 3 Nov 2011, 12:31 p.m.,*
in response to message #11 by fhub

Thanks.
The version in the release package is "only" 1790. I'd hate to miss out on any improvements.

For what it is worth, through trial and error I determined that rev. 1805 is the last one identified as 2.2, with rev. 1806 and later being 2.3.

> For what it is worth, through trial and error I determined that rev. 1805 is the last one identified as 2.2, with rev. 1806 and later being 2.3.

Yes, but a few versions after 1797 (where some new features were implemented) didn't work correctly here - I couldn't even load flash files compiled with the assembler. So I don't think it's a good idea to use these SVNs.

Re: WP 34s: UP and Down key in program mode

*Message #14 Posted by **Marcus von Cube, Germany** on 3 Nov 2011, 2:34 p.m.,*
in response to message #12 by Jeff O.

1805 isn't very stable. Stick to an older release!

The current build is starting to get stable with all the new bells and whistles but with a slightly modified layout. The medium emulator skin is adapted (select option 4).

Emu42 for IoS / Android

*Message #1 Posted by **Vincent Weber** on 2 Nov 2011, 8:45 a.m.*

Hi all, (and especially Christoph, if you are reading ;))

Emu42 is a wonderful program, but as far as pocketability is concerned it only runs on an outdated platform (Windows Mobile). Today, most PDAs/Phones you can buy are either Android or Ios-based...

Would you consider porting Emu42 to one of or both these platforms ? Both support C++ programming (unlike Windows Phone 7 which is supposed to be a Windows Mobile successor but only supports F# or C# !). So My guess is that the porting effort, while non trivial, would ne require a complete rewrite.

Of course you could not include the ROMS. On Android it is pretty easy to transfer them (if you own them) from your PC to your mobile device; on IoS it is more complicated, you need to fetch them from within the application, but it is not impossible to do - Marcus has done it for m48+ ! :)

That would be sooo nice to enjoy this accurate emulator on a "modern" portable device... please.... :)

Thanks and regards,

Vincent

*Message #3 Posted by **Vincent Weber** on 2 Nov 2011, 9:15 a.m.,*
in response to message #2 by NateB

I have been a faithful user of Free42 since 2004, on PalmOs, Windows Mobile, Iphone and Android :) While I really love it, it is not a replacement for the 27S/17BII/28S that Emu42 emulates. Also, there are some situations where it is nice to have the real emulator, to compare tricky behaviour for instance.

Re: Emu42 for IoS / Android

*Message #4 Posted by **Egan Ford** on 2 Nov 2011, 10:52 a.m.,*
in response to message #1 by Vincent Weber

EMU48 was ported to iOS and the source per the GPL is available. So the hard bits (UI) are done and can be used for EMU42, (and 71 :-).

Another thought is to use Javascript. Javascript emulators are very impressive. I can boot x86 Linux on my iOS devices in Safari.

Javascript versions of EMU* could run on any platform. Tools like Enscripten can take LLVM C binaries and convert to JS. This may speed up development.

Re: Emu42 for IoS / Android

*Message #5 Posted by **Christoph Giesselink** on 2 Nov 2011, 4:42 p.m.,*
in response to message #1 by Vincent Weber

As you know my Emu development is a non commercial business, so I have no income from the published software. Everything I need for the development I have to pay for.

In past I developt programs and features I want to have and published these to the public. So I bought a Windows Mobile device in 2004 for personal use, and found Emu48CE unuseable. So it was my decision to make a new port base on the actual Emu48 Win32 sources. Because it was easier to do, in fact Emu42 PPC was my first Mobile port.

2nd I have carefully watch about my free time. The last two years were extremly stressing: ILPer port, Virtual HP-IL, Emu71/Win, HP82240B printer simulation and integration into the Emu's. Especially this point is responsible that I ignore most feature wishes on the emulators.

I recently got another request about a "Single Instance" option, I decided now it's time to do it. Forthcoming versions will have this feature, but yesterday I spent about 3 hours to make a new Settings dialog design on Emu48. The current one growed massive in height, so I had to make sure that the dialog still fit on a 800x600 (netbook) screen.

Especially the iOS port m48 which base on Emu48PPC brought me to some sleepless nights. Apple's strong restrictions in regards to redistribution breaking the GPL! So I was asked why I, as one of the copyright owners, don't deny further distribution?

There are other copyright holders which also can deny further distribution.

I'm also not glad about that you only get the sources of m48 from the author when you "buy" the App over iTunes.

In respect to the users who are looking for such a program on iOS I decided to hold the Status Quo.

In fact the emulators Emu28, Emu42, Emu48, Emu71 and also m48 (!!!) are published under the GPL. So you have the rights to use the sources to make an own application also published under the GPL.

Maybe there will a time that I buy a new Mobile device and that I'm interested to run some of my emulators on this device, maybe than I think about porting. But be sure, at the moment it will definitely not be an iOS or Win Mobile >= 7 device. It must be a system where the manufacturer accept that I'm the owner of the device and want to run every software I want.

Regards

Christoph

Re: Emu42 for IoS / Android

*Message #8 Posted by **Nick_S** on 4 Nov 2011, 3:33 a.m.,*
in response to message #7 by Christoph Giesselink

Well, running Emu42 with an HP28S ROM on Android, would be my ideal mobile platform (no more floppy hinges or fragile battery doors to worry about). The Android application model certainly seems more oriented to open software standards. I gather that the Android operating system is itself open-source.

Nick

wp34s - Maybe dumb question

*Message #1 Posted by **John Abbott (S. Africa)** on 2 Nov 2011, 6:13 a.m.*

I am writing a program for the 34s, and registers I, J and K store Matrix descriptors.
Within the program I call the vector routine V.V, which then overwrites I & J and the stack, as explained.
So, prior to calling the vector routine, I do a SAVE and later a RCF.RG to restore registers (I, J & K)and stack.
The problem is I need the result from V.V on the stack but the RCF.RG overwrites this, and I can't seem to find a solution to retrieve this value.
Is there a possible way which I am overlooking. Any comments will be appreciated.
Thanks John

Re: wp34s - Maybe dumb question

*Message #2 Posted by **Paul Dale** on 2 Nov 2011, 6:19 a.m.,*
in response to message #1 by John Abbott (S. Africa)

Don't don't don't don't don't call SAVE from a program that is frequently executed. You will destroy the flash in the device :-(Flash has a limited number of write cycles and one is used each time SAVE is executed.

That said, RCF can be used to recall the individual registers you want. Better would be to not use I & J in your code.

Even beter would be to take the V.V routine and remove the stores to I and J:

```
001 ***LBL'V.V'
002 [cmplx]R[v]
003 RCL[times] T
004 R[^]
005 RCL[times] T
006 +
007 R[^]
008 ENTER[^]
009 RCL[times] T
010 RCL+ Z
011 STO Z
012 DROP
013 STO L
014 DROP
015 RTN
```

Re: wp34s - Maybe dumb question

*Message #3 Posted by **John Abbott (S. Africa)** on 2 Nov 2011, 6:41 a.m.,*
in response to message #2 by Paul Dale

Arrrgh... Thanks Pauli, sometimes one can't see the wood for the trees.
I never even thought about removing the stores to I & J - Thanks. Also never gave the multiple writing to flash a thought(that's dumb..)

Something I haven't got figured out yet, - is RCF used to call registers in flash after a save or is there another use?
Thanks again Pauli

*Message #4 Posted by **Paul Dale** on 2 Nov 2011, 6:46 a.m.,*
in response to message #3 by John Abbott (S. Africa)

RCF and the arithmetic versions allow you to directly access the saved registers in the backup flash region. No other use.

Re: wp34s - Maybe dumb question

*Message #5 Posted by **Marcus von Cube, Germany** on 2 Nov 2011, 9:59 a.m.,*
in response to message #4 by Paul Dale

If we run out of space we may even get rid of those. I'm working on a scheme that allows to have more data in RAM and it should then be easy to just copy the backup registers over to temporary storage for easy access.

Auction Disaster

*Message #1 Posted by **Nick Taylor** on 2 Nov 2011, 5:11 a.m.*

I've been after a HP-71B for quite some time. One appeared on EBay here in the UK recently and I managed to win it.

I paid the money immediately via PayPal and began to get excited. Soon, I would have one!

After about 5 minutes, I received an email from PayPal stating that my money had been refunded. A feeling of dread began in the pit of my stomach.

A few minutes later, I received an email from the seller saying that he had managed to tread on the calculator in the dark, and had smashed it!

Is it safe to assume that this hasn't happened to anyone else?!

My search for a HP-71B continues. Hopefully from a less clumsy seller in future.

My girlfriend doesn't really understand why I'm so disappointed, but I know you all will.

Regards

Nick

in response to message #1 by Nick Taylor

I have had similar incidents with several calculators (at least 3 that I recall off the top of my head). One I think was genuine - he sent the manuals for no charge. Others I think are just an excuse as they wanted a higher price.

Re: Auction Disaster

*Message #6 Posted by **Paul Gaster** on 2 Nov 2011, 12:53 p.m.,*
in response to message #5 by Bart (UK)

> Quote:

You are probably correct.

Nick, if I were you I would watch the seller's items for sale for a while. Of course if this person puts it up for sale again I doubt even a complaint to ebay would make the guy sell it to you at the previous final auction price.

Re: Auction Disaster

*Message #7 Posted by **Maximilian Hohmann** on 2 Nov 2011, 2:44 p.m.,*
in response to message #6 by Paul Gaster

Hello!

> Quote:

> Of course if this person puts it up for sale again I doubt even a complaint to ebay would make the guy sell it to you at the previous final auction price.

He will certainly come up with some kind of excuse like "I was able to repair it, the damage was not as bad as I initially thought". Almost impossible to prove the contrary, eBay won't help either as you already got your money back.

But don't worry, 71s are not really rare. With a little patience you will soon find another one. I have three or four (I buy them mainly for the modules) and will sell you one if nothing else helps!

Good luck, max

Re: Auction Disaster

*Message #8 Posted by **Nick Taylor** on 3 Nov 2011, 12:26 p.m.,*
in response to message #7 by Maximilian Hohmann

Well, you were right - it has been relisted:

Relisted Item

However, it's marked as not working, so maybe he was telling the truth?

That said, he did tell me it was "smashed" rather than it won't turn on.

He had offered it to me for £5. Should I have accepted?

Something you hadn't mentioned in your first post ;-) (maybe because you hadn't received the offer yet).

He's used the same photo. Maybe he hadn't actually tested it before the first listing, and was too embarassed to admit it when he tried to test it before posting it off to you.

And yes, always good idea to get cheap spares when you can.

Re: Auction Disaster

*Message #11 Posted by **Nick Taylor** on 3 Nov 2011, 5:19 p.m.,*
in response to message #10 by Bart (UK)

To be honest, it was in his email, but his English was so garbled that I missed it!

I'll try and get it for £5 as the general consensus is that it would be a good idea.

Sorry for all the questions - I'm very new at this, and clearly have a lot to learn!

Thanks for all the patient advice. This is a fascinating forum, and it's good to know that I'm not the only one who thinks these old machines have an almost magical charm about them.

in response to message #1 by Nick Taylor

Hi Nick
I think I can dust up a spare HP-71B. It is not mint at all but will satisfy your need for the calculator for a while. I will like to trade for some other vintage electronics.

Cheers!
Johnny

Re: Auction Disaster

*Message #13 Posted by **Nick Taylor** on 3 Nov 2011, 8:57 a.m.,*
in response to message #12 by Johnny Bjoern Rasmussen

Many thanks Maximillian and Johnny, but Pauli has very kindly agreed to sell me one of his.

I'm still looking for that Forth/Assembler Module though if you have one going spare?

Johnny - I don't have much of a collection really. Certainly nothing in comparison to yours. The only spares I have are: HP-12C (USA), HP-12C (Singapore) and an HP-97 for parts, which I use to keep my favourite desk-calculator working.

Re: Auction Disaster

*Message #14 Posted by **Maximilian Hohmann** on 3 Nov 2011, 4:37 p.m.,*
in response to message #13 by Nick Taylor

Hi!

> Quote:
>
> I'm still looking for that Forth/Assembler Module though if you have one going spare?

Unfortunately, I have only one of those... But if you ever come across a 71 that "won't turn on" it is always worth buying (if cheap enough), as some of them require a couple of seconds of pressing the ON key to come alive!

Regards, max

Re: Auction Disaster

*Message #15 Posted by **Bart (UK)** on 4 Nov 2011, 6:57 a.m.,*
in response to message #14 by Maximilian Hohmann

> Quote:

Ah, that happens more often then? That did puzzle me when I first got mine a few months ago. I had been meaning to ask this forum, but hadn't gotten around to it yet. Thanks for mentioning it :-)

Re: Auction Disaster

*Message #16 Posted by **Paul Dale** on 4 Nov 2011, 7:40 a.m.,*
in response to message #15 by Bart (UK)

Is it having an HP IL module without cables?

- Pauli

Re: Auction Disaster

*Message #17 Posted by **Bart (UK)** on 4 Nov 2011, 8:14 a.m.,*
in response to message #16 by Paul Dale

Yes, is it looking for something to communicate with?

Re: Auction Disaster

*Message #18 Posted by **Nick Taylor** on 4 Nov 2011, 8:44 a.m.,*
in response to message #17 by Bart (UK)

Well I took your advice and have bought it for £5.

I don't think it has an IL module in it though, so maybe the reason that it's not turning on is that it is broken.

Still, at least I have some spare parts now if Pauli's one ever fails me!

Re: Auction Disaster

*Message #19 Posted by **Bart (UK)** on 4 Nov 2011, 8:50 a.m.,*
in response to message #18 by Nick Taylor

I noticed he had ended the auction. I think £5 is well worth it, even for parts.

41-CX with 'Creeping LCD Disease'

*Message #1 Posted by **Tim C** on 2 Nov 2011, 1:43 a.m.*

After 20+ years of flawless service, my 41CX is fading fast on me.

The top portion of the LCD is turning black, like as if someone spilled ink inside.

I see many 41C and 41CV's with Fullnut LCD's available with corroded battery terminals and such for parts but working LCDs and my question is, is there anyway to transplant my in-perfect-health 41CX guts into one of those Fullnut housings and use its LCD?

I've already contacted the HP repair houses and been told the Halfnuts are not repairable, but what about a transplant? Everything on my CX is in fine condition (battery terminals, module sockets, keyboard etc) and my Memory and Advantage modules work 100%, just the display is toast.

I'd hate to lose my trusted partner over this tragic 'Creeping LCD Disease'...

Re: 41-CX with 'Creeping LCD Disease'

*Message #2 Posted by **Paul Dale** on 2 Nov 2011, 3:12 a.m.,*
in response to message #1 by Tim C

The screen is dead :-(

RIP.

- Pauli

Re: 41-CX with 'Creeping LCD Disease'

*Message #3 Posted by **Raymond Del Tondo** on 2 Nov 2011, 4:12 a.m.,*
in response to message #1 by Tim C

The cheapest (and least effort) way is to get a replacement 41CX.
Due to the higher chip integration, halfnut displays are not replaceable as easy as the ones in the non-halfnuts.

HTH

Ray

Re: 41-CX with 'Creeping LCD Disease'

*Message #4 Posted by **Alexander Oestert** on 2 Nov 2011, 12:51 p.m.,*
in response to message #3 by Raymond Del Tondo

Unless the experts say otherwise, you may try to canibalize a C instead of a CX, because it should be cheaper and easier to obtain. I have exchanged keyboards between a C and a CV without problems.

Re: 41-CX with 'Creeping LCD Disease'

*Message #5 Posted by **Cristian Arezzini** on 2 Nov 2011, 7:08 a.m.,*
in response to message #1 by Tim C

Ouch. But what is that "disease" exactly? Are the two glass plates "separating" too much, or on the contrary, touching? A LCD screen is a relatively simple device, I've never understood why that thing happens. I've had a couple of nice watches and a calculator ruined by it...

Cristian

Re: 41-CX with 'Creeping LCD Disease'

*Message #6 Posted by **sylvandb** on 2 Nov 2011, 2:48 p.m.,*
in response to message #5 by Cristian Arezzini

> Quote:
>
> But what is that "disease" exactly?

Maybe an LCD expert can answer the question with some real details, but from my understanding the seal of the LCD has broken and either air is getting in or the 'liquid' is getting out.

In my experience it is most frequently caused by physical shock, but can also happen if the seal ages and either shrinks or becomes permeable. Sometimes it seems as if the seal might become less flexible and a shock that would have been no problem when new will 'break' an older LCD.

I have a CV with the same problem on the right end of the display after a drop onto that corner. The blackness is just touching the top of the 9th digit and are large part of both the bottom and top of the 10th and exponent digits. The unit also shuts off in about 10 seconds and has other problems as I've been swapping in 'worse' parts. But it still works and sits on my desk as my 'daily driver' scientific calculator. (contesting that position right now with the 15C LE).

Re: 41-CX with 'Creeping LCD Disease'

*Message #7 Posted by **Lyuka** on 2 Nov 2011, 2:54 p.m.,*
in response to message #5 by Cristian Arezzini

That problem may occur when the LCD had been kept under strong direct sunlight.

The heat from the sun can physically damage LCD unit.
The plastic polarize film absorb the heat ray effectively,
and the LCD unit can be deformed by heat.
The sealing of the liquid crystal can break down to cause leakage.

UV rays in direct sunlight can also cause the chemicals in the LCD to deteriorate.

Lyuka

Re: 41-CX with 'Creeping LCD Disease'

*Message #8 Posted by **Garth Wilson** on 2 Nov 2011, 5:37 p.m.,*
in response to message #5 by Cristian Arezzini

What I read 25 years ago is that UV will damage it like that (but I don't imagine that would be so localized), and that moisture and heat are enemies but especially the combination of the two. I had a cheap $2 stick-on LCD clock in a car from 1985 to 1992 though since the car's mechanical clock on the dashboard didn't work anymore, and although the car was always parked outdoors (including in the summer), the heat did not seem to affect it at all in those seven years. I seem to remember that on the hottest days it would turn dark, but then come back to normal after I got in and started to drive, cooling it off. There are wide-temperature LCDs that are made to operate at up to 70 degrees C and be stored at up to 85C. (Maybe they go further than that now-- I don't know.) I had a couple here in the office in the 1990's that I was testing for a product that got cancelled, and was testing it at the temperature extremes (including -55C which also did no damage).

Re: 41-CX with 'Creeping LCD Disease'

*Message #9 Posted by **Tim C** on 3 Nov 2011, 12:09 a.m.,*
in response to message #1 by Tim C

```
Well if I can't revive this one, is it possible to use the battery terminals from mine in
one of the units I see being sold with corroded ones?
I have a hard time buying a "working" 41-CX for well over $350.00
If fact I saw on E-Bay some person selling a CX plus a printer/card reader for Two Grand!!
Yikes, I hope no one buys it for that price...

This is sad, those people over-pricing us for old equipment we want/need and HP starving
us with unrealistically small releases of the 15-C
All the small release of the 15C did was create a market for people on EBay to jack up the
price on.

There's no love for us people that actually use these things to make a living...
```

Re: 41-CX with 'Creeping LCD Disease'

*Message #12 Posted by **Paul Berger (Canada)** on 3 Nov 2011, 7:32 a.m.,*
in response to message #9 by Tim C

Yes you could use the I/O and battery connector block in another 41 they are all the same. While damage to the battery connectors due to battery leaks seems to be a very common problem, my experience is that there is often other things wrong like broken posts.
To swap the display module in a halfnut you would need to remove the keyboard circuit board which is held in by about 40 heat stakes. The display module in the half nuts also contains ROMs, I looked inside my halfnut CV and compared the part number on the display with a picture of the inside of a halfnut CX on Diego Diaz's website http://www.clonix41.org/Maintenance/hp-41_PCBs.htm and the part number on the display module is different, this may indicate that the ROMs in the CV and CX versions are different. In the halfnut CX not all of the ROMs are in the display module, the CX has a sub board that contains the clock and possibly some of the extra ROMs. It may be possible to swap the glass part of the display if it is connected to the electronics by elastomer connectors like the connection between the electronics and the glass in a full nut, but this can be tricky and just getting to the display in a halfnut is already a big job.

Agreed. The simplest swap-out would be to find another halfnut CX with a damaged i/o block. With a halfnut, you'll avoid the more common post issues that can occur with fullnuts. IMO, circuitry of the halfnut is more robust due to lower parts count.

FWIW, the LCD failure mode is usually a failure of the glass to glass seal resulting in the loss of the liquid.

HP-01 Band and Crystal Questions

*Message #1 Posted by **Ron G.** on 1 Nov 2011, 9:49 p.m.*

I just got an 01 with a damaged band/bracelet. The uppermost link with a slot for removing lower links, is missing the spring and pin. Is there a way to remove this damaged, permanent link. The link above it doesn't have a slot for removal of this link.

Also, the crystal does not say Hewlett Packard on it, but all the pictures on the Museum (and TAS) do. This is a gold watch with dark keys, S/N 1707. Any ideas about this?

Many thanks.

Re: HP-01 Band and Crystal Questions

*Message #2 Posted by **Lincoln R.** on 2 Nov 2011, 1:39 a.m.,*
in response to message #1 by Ron G.

I think the Hewlett Packard lettering was printed on the crystal, I just saw one on TAS the other day that had the lettering wearing off. As for the band, I'd ask a reputable jeweler, they might be able to repair the link.

ILPilbox (HP-IL Interface - PIL-Box Bridge) v1.1

*Message #1 Posted by **Christoph Giesselink** on 1 Nov 2011, 7:30 p.m.*

I just published an update of the ILPilbox (HP-IL Interface - PIL-Box Bridge) software to version 1.1 on my homepage at http://hp.giesselink.com.

It now should solve the problems with Emu71/Win as controller communicating with real devices over JFG's PIL-Box.

Christoph

Re: ILPilbox (HP-IL Interface - PIL-Box Bridge) v1.1

*Message #2 Posted by **Frido Bohn** on 2 Nov 2011, 11:39 a.m.,*
in response to message #1 by Christoph Giesselink

Just tried it out in a setting with a HP71B/Emu - PilBox - 82162A Printer - HP71B/Flesh&Blood.
It works perfectly when the HP71B/Emu works as a controller while the HP71B/Flesh&Blood works as a device.
I was able to address the printer as well as the real HP71B as different devices in the loop.
Tried to do it the other way round with the HP71B/Emu as device and the real HP71B as controller, but unfortunately, it did not work. This was all in a Windows 7 /64 bit environment.

However, Christoph, thank you for your efforts and for sharing!
I will try to let the HP-IL loop work across different computers. Any suggestions with respect to the firewall? Should I drill some holes in the address space of interest?

Re: ILPilbox (HP-IL Interface - PIL-Box Bridge) v1.1

*Message #3 Posted by **Christoph Giesselink** on 2 Nov 2011, 3:29 p.m.,*
in response to message #2 by Frido Bohn

> Quote:
>
> Tried to do it the other way round with the HP71B/Emu as device and the real HP71B as controller, but unfortunately, it did not work. This was all in a Windows 7 /64 bit environment.

In the HP71 IL-Module is a separate HP-IL processor which is only simulated. The IL processor simulation was written by JFG for his Emu71/DOS. JFG gave me the permission to use his HP-IL processor simulation sources inside Emu71/Win. So the HP-IL command capabilities between Emu71/DOS and Emu71/Win are identical. But not all commands are implemented, such command are everything around CONTROL OFF. At Emu71/DOS you can access the virtual devices inside, at Emu71/Win it's implemented as bridge to avoid breaking the virtual IL loop. You may read the Emu71/DOS manual about the HP-IL limitations (4.3 Support for various modules, section "HP-IL module").

> Quote:
>
> I will try to let the HP-IL loop work across different computers. Any suggestions with respect to the firewall? Should I drill some holes in the address space of interest?

Normally you must drill holes into your firewall. The holes you already made for the "localhost" transfers by accepting the application with the OK button depends on the firewall, the OS version and the used user for the permission. A user with Admin privileges normally enabled the software for the Internet, so you have already the (too) big hole. If you made the same thing on WinXP with a non-privilege user, you have only the rights for the local machine. I personally use always the Windows internal firewall and then modify the permissions of the program by Change area on WinXP to "Only own network (Subnet)" and on Win7 to "Home/Work(Private)".

If you get no connection and you're not sure if it's a firewall problem then temporary disable the firewall to be sure that you have a firewall permission problem.

I recently had a problem on Win7/x86 with Emu71/Win. As Admin everything worked fine, as normal user I was able to send over port 60001 but received nothing over port 60000. First a thought about a user privilege problem, in fact as normal user port 60000 was already in use.

To check the port usage you may call:

netstat /a

Hope this helps

Christoph

Well, should have done that beforehand, sorry.

Regarding HP-IL across computers: Ever managed to put a world-spanning HP-IL into working condition?
For example, the controller in the US, a multimeter in Asia and the printer in Europe?

in response to message #5 by Mike (Stgt)

> Quote:
>
> I would join with the printer in old Europe, simulated of cause - the printer, not Europe :)

Would be too easy. It should be real hardware.
I believe there is enough HP-IL related equipment around the world. The problem will be the interface to an internet-connected computer. The best choice would be of course JFG's PilBox. At least it should be some kind of HP-IL/computer interface that offers serial connectivity, I assume.

Another Red Dot on TAS. Is it or is it not ?

*Message #1 Posted by **Michael de Estrada** on 1 Nov 2011, 2:06 p.m.*

There's another HP 35 Red Dot listing on TAS. From the front it looks legitimate, but from the rear it does not. It sure would be interesting to see the insides. I've asked the seller to test for "The Bug."

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #2 Posted by **Katie Wasserman** on 1 Nov 2011, 2:16 p.m.,*
in response to message #1 by Michael de Estrada

The serial number alone makes this bogus. While it could have been an original red dot, it's clearly been worked on and has at least had the labels replaced.

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #3 Posted by **Michael de Estrada** on 1 Nov 2011, 2:26 p.m.,*
in response to message #2 by Katie Wasserman

Either that, or it's the case back from a Version 3 with all its labels and serial number, grafted onto a Version 1 Red Dot. Even the bridge contact appears to be from a Red Dot. The real question is whether the guts are Version 1 or Version 3.

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #4 Posted by **robertoataulfo** on 1 Nov 2011, 2:29 p.m.,*
in response to message #3 by Michael de Estrada

It has already been opened. Lost Originality

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #5 Posted by **Michael de Estrada** on 1 Nov 2011, 2:43 p.m.,*
in response to message #4 by robertoataulfo

That didn't prevent the last one on TAS selling for well over $1000.

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #6 Posted by **Michael Eckstein** on 1 Nov 2011, 6:14 p.m.,*
in response to message #3 by Michael de Estrada

It looks that almost all is from a newer version, inside included. But the front case might be from some Red Dot.

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #7 Posted by **aj04062** on 1 Nov 2011, 7:20 p.m.,*
in response to message #6 by Michael Eckstein

In your estimation, is the lack of a split battery tray an indication that it is later?

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #8 Posted by **Michael de Estrada** on 1 Nov 2011, 7:41 p.m.,*
in response to message #7 by aj04062

I have a Version 4 with the wider upper keys with the legends on them that has a "split" battery tray, so I don't think this is definitive evidence of the version of an HP 35. I think if you look really closely at the middle section of the case that forms the battery tray and connects the battery contacts, it is actually always two pieces, however, sometimes there is no visible gap. This gives the false impression that it has been molded as a single piece. More telling is the serial number which is affixed to the middle section and appears to be original.

Re: Another Red Dot on TAS. Is it or is it not ?

*Message #9 Posted by **Michael Eckstein** on 2 Nov 2011, 3:44 a.m.,*
in response to message #8 by Michael de Estrada

There are more signs besides the gap, the serial number or the back label. This calculator is definitely a later version, where the front cover might be replaced by a Red Dot version in a HP service or elsewhere.

I doubt it, must have been some top secret extra terrestrial substance which would destroy the planet Earth if disclosed. Which explains the silence and the tasteless jokes.

Re: 32Sii mushy keys

*Message #5 Posted by **Martin Pinckney** on 1 Nov 2011, 8:33 a.m.,*
in response to message #4 by Reth

Rather, the silence is probably explained by corporate policy.

As for the jokes, someone described it as gallows humor.

Think of it this way. You work hard for years against all odds to bring to market a seemingly unlikely product: a remake of a 30-year old classic, only to have the rug pulled out from under you by sloppy Chinese quality control. Not to mention snide comments from the group that should most appreciate your efforts.

I did not buy anything from China but from HP. I payed them for goods that turned out to be defective. I can't care less who did not do their job right.

And all want to hear is what went wrong and how this gets fixed. Am I wrong to expect that?

Re: 32Sii mushy keys

You are not wrong. My only point was to argue for understanding of the behavior of one individual, not a company.

Re: 32Sii mushy keys

*Message #9 Posted by **Lincoln R.** on 1 Nov 2011, 12:37 p.m.,*
in response to message #1 by David Griffith

Sorry for the lack of serious replies (including my own)... Anyhow, have the keys always been mushy, or did

this happen over time? Is it most/all of the keys or only a few?

If they've always been mushy/it was like this when you got it, that may just be the way it is, I've seen a lot of variance in Pioneer keyboards, ranging from very firm and snappy to almost impossible to feel when the button has been pushed.

If it's just a few/this happened over time, it's probably the mylar sheets wearing out. I'm not sure if much can be done for this short of painstakingly disassembling the calculator and replacing the sheets with ones from another calculator (You might be able to get spare parts relatively cheaply by buying a 10B, those frequently sell for $15 or less on TAS).

Re: 32Sii mushy keys

*Message #10 Posted by **Thomas Radtke** on 1 Nov 2011, 1:15 p.m.,*
in response to message #9 by Lincoln R.

Indeed, there's quite some variance, and my 32SII is a good example - 'mushy' from day one. But ... it is actually reliable and I immediately loved the soft feedback after having had the 20S with very stiff keys. Don't repair what's not broken.

Re: 32Sii mushy keys

*Message #11 Posted by **David Griffith** on 1 Nov 2011, 3:01 p.m.,*
in response to message #9 by Lincoln R.

I bought this calculator off ebay a few days ago. All the keys are good except the '8' key. That's the mushy one.

Re: 32Sii mushy keys

*Message #12 Posted by **Lincoln R.** on 1 Nov 2011, 4:15 p.m.,*
in response to message #11 by David Griffith

Does it feel "sticky" or just soft? If it's sticky, someone may have gotten food, glue, coffee, etc. into it, in which case it could carefully be cleaned with high-purity (91% or better, no coloring/perfume added) rubbing alcohol.

Re: 32Sii mushy keys

*Message #13 Posted by **Bart (UK)** on 2 Nov 2011, 6:13 a.m.,*
in response to message #12 by Lincoln R.

I had a similar problem with an older 12C that I bought off ebay. One of the keys seemed permanently depressed, but still registered. I carefully brushed around the keys with a toothbrush, holding the calculator upside-down to reduce the risk of the loosened debris going into the keyboard. Fortunately this solved the problem for me as I was reluctant to clean with liquids.

HP-65 card motor screws

*Message #1 Posted by **Kees Bouw** on 31 Oct 2011, 4:17 p.m.*

Hi All,

Last week I could hear a small object rolling around in my HP-65... it turned out to be one of the two screws of the card motor. I think this may have been caused by vibrations from the running motor. However, if I fasten the screw too tight, reading and writing is no longer reliable. Can anyone confirm that the position of the screws can be critical, and has anyone found a way to fix the screw (some kind of lacquer perhaps) so it does not come loose? I am quite new to restoring HP calculators, so any help will be appreciated. Another question: does a HP-65 Service Manual exist and where can I find a PDF version?

Many thanks in advance,

Kees.

Re: HP-65 card motor screws

*Message #2 Posted by **aj04062** on 31 Oct 2011, 5:31 p.m.,*
in response to message #1 by Kees Bouw

Use a very small drop of BLUE (not RED) Loctite on the screws and they will NOT get loose.

Re: HP-65 card motor screws

*Message #3 Posted by **Kees Bouw** on 1 Nov 2011, 3:03 p.m.,*
in response to message #2 by aj04062

> Quote:
>
> Use a very small drop of BLUE (not RED) Loctite on the screws and they will NOT get loose.

Thank you for your response! Can you be a little bit more specific about which type of Loctite to use? On amazon.co.uk there are 649 Loctite products in the DIY department :-) The "*Loctite 243 Lock 'n' Seal Fast Acting Thread Lock and Sealant 3ml*" seems to be appropriate, but that's RED. The BLUE ones are mostly some form of superglue, is that what you mean?

Re: HP-65 card motor screws

*Message #4 Posted by **Ethan Conner** on 1 Nov 2011, 4:31 p.m.,*
in response to message #3 by Kees Bouw

Loctite "blue 242" threadlocker.

Re: HP-65 card motor screws

*Message #5 Posted by **Kees Bouw** on 1 Nov 2011, 5:04 p.m.,*
in response to message #4 by Ethan Conner

> Quote:
>
> Loctite "blue 242" threadlocker.

Loctite 242 and 243 appear to be the same stuff, judging by the specifications. The confusion about the colours is probably caused by the fact that (both 242 and 243) are in a RED bottle while the substance itself is BLUE.

Re: HP-65 card motor screws

*Message #6 Posted by **Ethan Conner** on 1 Nov 2011, 5:59 p.m.,*
in response to message #5 by Kees Bouw

I'll agree with you the packaging color is a mistake. I actually have a tube of 242 and the packaging is blue, of course i bought it five years ago. Trust me on this they may appear to be close in the spec but the red doesn't have near the holding power of the blue. I highly recommend the blue for your application unless you just like tinkering and want to go in often and reset hardware. :)

Re: HP-65 card motor screws

*Message #7 Posted by **Kees Bouw** on 2 Nov 2011, 5:14 a.m.,*
in response to message #6 by Ethan Conner

This is the one, right? I can't find it on amazon.co.uk but it is on amazon.com.

Re: HP-65 card motor screws

*Message #8 Posted by **Ethan Conner** on 2 Nov 2011, 12:36 p.m.,*
in response to message #7 by Kees Bouw

Yes that is what you want. I use it on places where there is something rotating or a pivot point and it works very good.

Re: HP-65 card motor screws

*Message #9 Posted by **Kees Bouw** on 2 Nov 2011, 8:19 a.m.,*
in response to message #6 by Ethan Conner

Additional info received from Henkel Ltd., UK:

"*The product is just called Loctite 242, the blue refers to the products colour. In America they often refer to the colours of the product as the numbers are a bit tricky. Loctite 243 is an improved version of 242 so you might find this easier to find.*"

Re: HP-65 card motor screws

*Message #10 Posted by **Raymond Del Tondo** on 31 Oct 2011, 6:35 p.m.,*
in response to message #1 by Kees Bouw

It's Not the Position of the screw as such, but the movement space at the ends of the motor axis. If the screws are too tight, the pressure against the ball bearing on the external side of the axis may be too high, and thus the motor movement is out of tolerance.

Ray

Re: HP-65 card motor screws

*Message #11 Posted by **Kees Bouw** on 1 Nov 2011, 3:09 p.m.,*
in response to message #10 by Raymond Del Tondo

> Quote:
>
> It's Not the Position of the screw as such, but the movement space at the ends of the motor axis. If the screws are too tight, the pressure against the ball bearing on the external side of the axis may be too high, and thus the motor movement is out of tolerance.

Thank you for your response. That really helps to understand the problem. I wonder how it was done in the factory, and in repair shops at the time. There must be people still around who worked there and know exactly how it is supposed to be done! What also puzzles me is that no-one has ever seen a HP-65 Service Manual. Did it not exist, is it very rare, was it impossible to scan into a pdf document, what is going on with this. For most other calculators there is a Service Manual, so why not for the HP-65?

Need a US proxy for a battery for an HP Portable Plus

*Message #1 Posted by **Geir Isene** on 31 Oct 2011, 4:15 p.m.*

I need to buy one of these:

HP Portable Plus Battery

... but they only ship in the US.

Anybody wants to act as a proxy?

Re: Need a US proxy for a battery for an HP Portable Plus

*Message #2 Posted by **M. Joury** on 31 Oct 2011, 4:22 p.m.,*
in response to message #1 by Geir Isene

Hi Geir,

If I am not mistaken these are D cell sized Lead Acid cells such as these. I built my own pack out of three of the above for considerably less. Are these or something like them available where you are?

Cheers,

-Marwan

Re: Need a US proxy for a battery for an HP Portable Plus

*Message #3 Posted by **Ángel Martin** on 31 Oct 2011, 5:43 p.m.,*
in response to message #1 by Geir Isene

It's the same one used in the 9114 disk drive, just with some connectors added to change the leads.

I ordered at "www.accu-ecke.de", model number: MP2, 8-6P Multipower Batterit 6V/2,8Ah (C20).

Re: Need a US proxy for a battery for an HP Portable Plus

*Message #4 Posted by **M. Joury** on 31 Oct 2011, 6:22 p.m.,*
in response to message #3 by Ángel Martin

I don't think so. The battery used in the 9114 looks completely different. Unless, of course, the image on the web page is not correct. Here is a link to the 9114 battery: battery.

Cheers,

-Marwan

Re: Need a US proxy for a battery for an HP Portable Plus

*Message #5 Posted by **robert rozee** on 31 Oct 2011, 7:00 p.m.,*
in response to message #1 by Geir Isene

the page you point to lists the capacity as 2.5 amp-hours. that is pathetically low compared to modern cells. you'd be better off using five AA sized Ni-Mh cells (close to 3 amp-hours), then charge them externally.

in the same space you could fit 10 AA cells wired parallel/series to get over twice the original capacity (and hence twice the run time).

Re: Need a US proxy for a battery for an HP Portable Plus

*Message #6 Posted by **John Pierce** on 31 Oct 2011, 7:56 p.m.,*
in response to message #1 by Geir Isene

```
I'll act as your proxy.  This can be taken care several ways; I can buy the assembled
battery locally or receive one that you order and have shipped to me and remail it to you.
Regards John Pierce

WP34s -- not turning on after flash

*Message #1 Posted by **David Persinger (US)** on 31 Oct 2011, 4:08 p.m.*

I have flashed the 30b several times, but now it will not turn on after a flash. I got all the correct messages, set boot from flash, execute, cable reset, on button : blank screen.

I also went through the entire erase procedure from scratch and same thing happens.

Any suggestions?

Re: WP34s -- not turning on after flash

*Message #2 Posted by **Dominic Richens** on 31 Oct 2011, 4:42 p.m.,*
in response to message #1 by David Persinger (US)

did you try popping the batteries out and back in again?

Last time I tried to flash, I got the same thing. I remembered something Neil had told me that sometimes the calculator will appear to be dead but actually still be on at full power. So the recommendation was to pop the batteries out if I was going leave the calculator for a while.

Anyhow, I did this, and when I put the batteries back in it turned on properly!

Re: WP34s -- not turning on after flash

*Message #3 Posted by **David Persinger (US)** on 31 Oct 2011, 4:43 p.m.,*
in response to message #2 by Dominic Richens

Yeah, tried that.. will try again...

Re: WP34s -- not turning on after flash

*Message #4 Posted by **Dominic Richens** on 31 Oct 2011, 6:54 p.m.,*
in response to message #3 by David Persinger (US)

the corollary to that is that if you didn't pop the batteries out immediately they may be dead.

Re: WP34s -- not turning on after flash

*Message #5 Posted by **Marcus von Cube, Germany** on 31 Oct 2011, 8:04 p.m.,*
in response to message #4 by Dominic Richens

Maybe I've uploaded a binary that does not work so try the V21 install if in doubt.

Re: WP34s -- not turning on after flash

*Message #6 Posted by **David Persinger (US)** on 31 Oct 2011, 9:02 p.m.,*

in response to message #5 by Marcus von Cube, Germany

Still no go. Everything appears normal in the flash process. It just won't turn on.

Re: WP34s -- not turning on after flash

*Message #7 Posted by **Marcus von Cube, Germany** on 1 Nov 2011, 3:03 a.m.,*
in response to message #6 by David Persinger (US)

David, try MySamba.exe, please! Can yo reflash your calculator with the original 20b firmware?

Re: WP34s -- not turning on after flash

*Message #8 Posted by **David Persinger (US)** on 1 Nov 2011, 1:06 p.m.,*
in response to message #7 by Marcus von Cube, Germany

Can you provide a link to the MySamba.exe program?

I don't have the original 30b firmware to try.

David

*Message #9 Posted by **Jeff O.** on 1 Nov 2011, 1:38 p.m.,*
in response to message #8 by David Persinger (US)

http://sourceforge.net/projects/wp34s/files/FlashTool/

Re: WP34s -- not turning on after flash

*Message #10 Posted by **David Persinger (US)** on 1 Nov 2011, 8:30 p.m.,*
in response to message #9 by Jeff O.

Problem resolved!

Thank you Marcus, Gene, Dominic, and Jeff!

The problem was that when I downloaded calc.bin I right clicked and "save link as" on the calc.bin file. The resulting file was only 8k in size. The correct file would be ~121k. This 8k file would give the appearance of flashing but obviously would not work.

The proper method of downloading from the SVN page is to double-click the calc.bin file then select the download link.

It is interesting that even flashing the correct file did not solve the problem. I had to flash the original 30b rom back into the unit and then reflash with the WP34s rom. The unit worked just fine after that.

Also the lead to use MySamba.exe was very helpful, it is much easier to use and very fast.

Wonderful support from all you guys. What a joy. Thank you!

David

Re: WP34s -- not turning on after flash

*Message #11 Posted by **Dominic Richens** on 1 Nov 2011, 8:53 p.m.,*
in response to message #10 by David Persinger (US)

oh yeah, I had forgotten that I had done that too once. The clue for me was that SAM-BA wasn't doing 14 or 15 segments, only 1.

phoenix 35sx happenings?

*Message #1 Posted by **David Griffith** on 31 Oct 2011, 12:27 p.m.*

Has there been any more development towards a "phoenix 35sx" replacement board for the hp35s?

Re: phoenix 35sx happenings?

*Message #2 Posted by **Walter B** on 31 Oct 2011, 1:59 p.m.,*
in response to message #1 by David Griffith

Any *more* ??

Re: phoenix 35sx happenings?

*Message #3 Posted by **Martin Pinckney** on 31 Oct 2011, 2:06 p.m.,*
in response to message #2 by Walter B

I completely missed this. And maybe this.

Re: phoenix 35sx happenings?

*Message #4 Posted by **Walter B** on 31 Oct 2011, 2:20 p.m.,*
in response to message #3 by Martin Pinckney

Long time no see. All quiet at the western front AFAIK.

Re: phoenix 35sx happenings?

*Message #5 Posted by **Matt Fegenbush** on 31 Oct 2011, 2:48 p.m.,*
in response to message #1 by David Griffith

This raises an interesting question. *If* such a kit were to be created to, say, add IR or a hard connection port (at minimum), would NCEES still allow the calculator on the FE and PE exams?

It seems that if you get a bunch of engineers together with a common goal of removing the entire set of test questions, it would be a practice that would surely get the calculator banned. It is my understanding that is the sole reason there does not exist such a port on this model.

Re: phoenix 35sx happenings?

exams?

Only if the proctors did not notice the calculator had been modified.

Re: phoenix 35sx happenings?

*Message #7 Posted by **Jeff O.** on 31 Oct 2011, 9:11 p.m.,*
in response to message #5 by Matt Fegenbush

Such a calculator would already be banned, i.e., the 35s is allowed, not some modified device. Attempting to use such a device would violate their rules and subject you to their penalties.

I don't really agree with the NCEES calculator policy. Someone could do just as you postulate, and get away with it, but I could not use a real 15c (or 15c LE) because it is not on their list.

Images of my 9100B
*Message #1 Posted by **David Ramsey** on 31 Oct 2011, 1:37 p.m.*

Picked up on TAS a few weeks ago...

Man, they knew how to make ROMs in those days. Check each individual bit with a Radio Shack multimeter!

The beauty of discrete components...

CRT deflection boards. Note how they're screwed directly into the cast aluminum case body.

Nothing seems to be leaking, but we're gonna replace those caps anyway. In England, Tony Duell cringes.

The keyboard fascia and labels are in excellent condition.

Board closeup...pretty!

The unit was advertised as "working", and aside from the doubtless gummy card reader wheel, the only problem we've noticed so far is this "comet" artifact in the display. It grows shorter, reducing to a tiny dot, as the digits in the first line extend farther to the left. Hopefully this will be an easy fix, but even if it remains, it doesn't affect the usability of the machine.

Re: Images of my 9100B
*Message #2 Posted by **Marcus von Cube, Germany** on 1 Nov 2011, 3:22 a.m.,*

Looking at your pictures I can imagine the puzzled faces of the engineers when Dave Packard told them to pack the functionality into a shirt pocket sized device. :-)

"It's impossible!"
"I know, just do your best!"
...
"We've done it!" (Very big grin!)

Re: Images of my 9100B
*Message #3 Posted by **David Ramsey** on 1 Nov 2011, 11:35 a.m.,*
in response to message #2 by Marcus von Cube, Germany

You'd think those integrated circuits would make all the difference! But I have the 9100's successor, the 9810, stuffed full of ICs and it's even larger! Of course it does a lot more, too...

Re: Images of my 9100B
*Message #4 Posted by **Tony Duell** on 2 Nov 2011, 5:46 a.m.,*
in response to message #3 by David Ramsey

Actually, the base model of the 9810 does less than the 9100. The trig and log functions are an optional module for the 9810, admittedly one that fits entirely within the machine.

That big board of diodes in the 9100 is not a ROM. It's often thought to be one, but it's the AND gates and OR gates that interconnect the flip-flops and the other parts of the machine. One odd feature is that none of the power lines are used on this board (they are routed through it between the plug-in boards, but none of the resistors or diodes are connected to any power line or ground).

The ROMs are the 'core on a rope' microcode on the leftmost plug-in board (visible in one of your photos) and the inductively-coupled PCB ROM that is under the gating board (the board of diodes). For the latter, the ROM itself is the PCB in the middle of the assembly, the 2 boards down the left and right sides are the sense amplifiers (32 bits each), the board across the back is the address decoder.

*Message #5 Posted by **Frido Bohn** on 2 Nov 2011, 12:40 p.m.,*
in response to message #3 by David Ramsey

Very nice sample you got there, Ramsey.
The close up pictures are amazing and no IC anywhere. Would like to have one but I have no place on my desktop.
I was very amused by the desciption of the development of the 9100 where Bill Hewlett demanded a machine which would fit on his writing desk. The engineers tried to place the final calculator there but the result was sobering as it was a little bit too big. Wisely, they did this secretely while Bill Hewlett has been off and engaged a carpenter who managed to enlarge the opening in the desk so that the specifications were met.

I wonder if something similar happened with the proverbial shirt pocket-size calculator years later. Maybe someone changed secretely Bill Hewlett's shirts with pockets beeing able to fit the HP35.

The 9100 actually does contain one IC.

Re: Images of my 9100B
*Message #7 Posted by **Tony Duell** on 3 Nov 2011, 5:03 a.m.,*
in response to message #6 by Eric Smith

Are you thinking of the main ROM PCB (which is, I suppose an integrated circuit of inductively coupled tracks), the resistor/capacitor modules used to couple transistors in the flip-flops, or the op-amp ICs (8 in total, all the same type) used on the card reader PCB?

Or something else that I've forgotten?

Re: Images of my 9100B
*Message #8 Posted by **Eric Smith** on 3 Nov 2011, 11:26 a.m.,*
in response to message #7 by Tony Duell

I was thinking about the op-amps, but had forgotten that there are eight of them.

*Message #9 Posted by **Israel Otero** on 1 Nov 2011, 8:45 a.m.,*
in response to message #1 by David Ramsey

(From Puerto Rico)

Your machine is very clean and in good shape cosmetically, mines is somewhat neglected condition as appears that it got hard use. Yesterday as per your posting, I powered it up and the display comes on in 3 minutes. It is a bit dim, the 2 right digits position (exponent) are with less contrast than the others, but it worked fine. For a machine that old, the HP9100s are really robust. I am very happy about your wonderful example, enjoy.

Israel.

in response to message #10 by David Ramsey

> Quote:
>
> Wonder how many we could sell?

Probably none. The major cool feature about the 9100a/b is the CRT. However it would be a fun project to read the X-Y analog values and map them to pixels on the LCD. I agree that this should be pretty straightforward using a micro with ACD inputs and a serial LCD with a decent enough (64 x 128?) number of pixels.

Re: Images of my 9100B
*Message #12 Posted by **David Ramsey** on 1 Nov 2011, 12:19 p.m.,*
in response to message #11 by Katie Wasserman

Of course, some of those CRTs don't work any more, and replacements are unavailable. And you wouldn't have to wait 30 seconds or more for the CRT to warm up every time, either.

Nothin' worse than a bored engineer or programmer!

Re: Images of my 9100B
*Message #13 Posted by **Juergen Keller** on 1 Nov 2011, 12:48 p.m.,*
in response to message #12 by David Ramsey

> Quote:

> And you wouldn't have to wait 30 seconds or more for the CRT to warm up every time, either.

But it resumes where it left off when power was turned off (even when this was done in the middle of a running program). My PC takes several minutes until it is ready for use. In that respect the 9100 was way ahead of time.

BTW, I'm still seeking for a 9102A Buffer Box for my 9100B, just for the case someone has a spare one :-)

Re: Images of my 9100B

I was amazed when I discovered for the first time, that one could turn the HP9100A off in the middle of a running program and be resumed when the unit is turned on.

Re: Images of my 9100B
*Message #15 Posted by **Tony Duell** on 2 Nov 2011, 5:51 a.m.,*
in response to message #12 by David Ramsey

If you want a fast modern machine, buy one :-). For me, the warm-up time is part of the charm of the 9100.

That said, yes, the CRT is a custom part and is unavailable. It's odd in that it's an electrostatically-deflected CRT with a fairly wide deflection angle (this would lead to non-linearity of the display which would matter in a 'scope but not in a numeric display).

I think if either of my CRTs ever failed, I'd find some other CRT that could be driven by the 9100's deflection boards and hack the PSUs and z modulation to get it to work. I've got plenty of calculators with LCD displays after all...

Re: Images of my 9100B
*Message #16 Posted by **Gerry Schultz** on 2 Nov 2011, 3:16 p.m.,*
in response to message #15 by Tony Duell

Hi Tony. Your comments triggered an old memory for me. I'm presently in the broadcasting industry and back in the mid-70s all the test gear we used had electrostatic deflection for their CRT displays. As I remember, electrostatic deflection was much more precise and could hold a calibration better. Also it was easier to draw discrete characters directly on the display since it's basically vector graphics. Displays with electromagnetic deflection (like home TVs) were less precise and used for raster-style displays.

We used Tektronix test equipment back then and they built oscilloscopes that would actually display the time-base and vertical sensitivity directly on the screen. You could also separately adjust the character display brightness from the waveform brightness. When I first saw that I was blown away, it was so neat for the time.

I am assuming, that since HP built o'scope based test gear as well, they had a lot of electrostatic CRTs around and could build vector-based characters directly on the CRT that were bright, easy to read and stable (they didn't wobble around on the display). It was probably the most cost effective way to have a bright, clear display that was easy to refresh with parts used in other equipment.

Also, when I looked at the pictures on inside the 9100, it reminded me of how equipment was built back then. A lot of this stuff had to meet military specifications (I was in the Air Force at the time) and they could be difficult to repair given all the circuits needed to maintain temperature stability for calibration. I had to troubleshoot and repair this equipment down to the component level but it was such a pain. I'm so glad it's now done to the board level; it's a lot less time consuming but you have to be more proficient in system troubleshooting with individual parts being so small.

Gerry

Re: Images of my 9100B
*Message #17 Posted by **Paul Berger (Canada)** on 2 Nov 2011, 4:27 p.m.,*
in response to message #16 by Gerry Schultz

Electrostatic deflection is more precise because there there is a liner relationship between the charge on the deflection plates and the amount of deflection, because of this the electronics to drive electrostatic deflection are also simpler. The down side is that the angle of deflection for electrostatic tubes is quite low so the length of the tube is quite high relative to the size of the screen. Electromagnetic deflection on the other hand has a non-linear relationship between field strength and deflection of the electron beam so the electronics driving it has to be designed to compensate for this to get a constant sweep rate, making the electronics driving it more complicated. Magnetic deflection likely won out because much sharper deflection angles could be obtained making large screens practical.

Re: Images of my 9100B
*Message #18 Posted by **Tony Duell** on 3 Nov 2011, 5:17 a.m.,*
in response to message #17 by Paul Berger (Canada)

One of the main advantatges of electrostatic deflection over electromagnetic deflection is that it's a lot easier to change the voltage on a small capacitor (the CRT deflection plates) quickly than to change the current through a sizeable inductor (a deflection coil) quickly.

To generate a steady ramp, as is needed for a raster display, is quite easy in an elecrtomagnetic display, you make use of the inductance. But to move the beam around 'at random' requires a current source with enough voltaeg compliance to overcome the back EMF of the deflection coil. It can be done, but it means a big PSU, particularly if you want much bandwidth from it.

Re: Images of my 9100B
*Message #19 Posted by **Tony Duell** on 3 Nov 2011, 5:14 a.m.,*
in response to message #16 by Gerry Schultz

Oh don't get me started on board-swapping. There is absolutely nothing sensible (IMHO) about replacing parts essentially at random until the device seems to work again. Note I said 'seems to work again' -- if you don't really know what the fault is, you can't know you've fixed it.

And yes I've seen plenty of examples where board-swapping has appeared to cure the problem only for it to come back a little later. Either because the problem was actually a bad connection and replacing a part -- any part -- disturbed it enough for it to work again, or because the part that was replaced wasn't the real problem in the first place, but the new one will just about work with another part that really is failing.

And of course board-swapping makes no sense at all if you don't have a known-perfect set of boards _of the right revisions_ to swap in.

It's odd, but every one of the books I have on electrical and electronic faultfinding stresses that the only way to find a fault is to make measurements, think about what those measurements mean, and then (and only then) replace the faulty component. I do that on all my computers, calculators, instruments, etc, which may be why they work :-)

Getting back to the HP9100 CRT display, certainly HP had a lot of experience with electrostatically-deflected CRTs in 'scopes, etc. I don't think they had as much experience of magneticallly-deflected CRTs, but I am darn sure the engineers could have made such a device if they had wanted to. But for a numeric display as on the 9100, the vector approach saves a lot of electronics (the beam essentially scans a '7 segment raster' and is unblanked as appropriate), and it's a lot easier to make an electrostatically-deflected vector display than an electromagnetic one.

Incidentally, one reason the HP9100 display is stable is that the 'display task' is synchronised to the mains. So a bit of ripple on the power lines may cause digits to be displaced slightly from where they should be, but they will be in the same position each time, so they don't wobble.

Re: Images of my 9100B
*Message #20 Posted by **Gerry Schultz** on 3 Nov 2011, 1:40 p.m.,*
in response to message #19 by Tony Duell

If someone is randomly swapping boards in a piece of equipment to try to fix it, they are asking for trouble and will probably get it. Having an understanding of how a piece of equipment works as well as technical documentation is critical to finding a problem quickly and safely. In my case, I have qualified engineers on staff to troubleshoot and repair our equipment and keep the facility functioning. The reason we are doing more board-swapping is based upon how OEMs have designed their equipment and the economics of repair.

First, at a systems level, broadcasters are consolidating their facilities to take advantage of the economics of scale by doing more with what they have. That means adding more revenue streams by having more cable channels that are little more than another automated playlist and a simple master control(M/C)switcher added to an existing facility and expanding the infrastructure.

Second, facilities like these have large items like a router that can be expanded (in our case) to 1024 x 1024 (that's the chassis limit) and we add I/O cards as necessary to handle more sources and destinations. Some manufactures have added extras into simple routers like M/C switchers on an output card, multiviewers (allows one large LCD display to show many router sources at once with a browser-based software application for configuration) and shufflers (which allow reconfiguring of embedded audio in A/V sources among other things)to add more 'flexibility' to their product. It works fine when it works but when it breaks it's usually not at a convenient time. So, spare boards and maintenance agreements are used to reduce downtime. In our case downtime can literally translate into millions of dollars. A Super Bowl spot can cost up to $2 million but that's an extreme, if often quoted example.

This brings me to my point (finally!). My staff will troubleshoot a problem and if necessary call the OEM to narrow down where the problem is and then they send us a replacement part. (For critical systems we do maintain a set of spare cards but that can be a quite expensive way to tie up capital money that's not doing anything until that one critical failure occurs that was anticipated.) 90% to 95% of the time that fixes the issue. But if not, then Engineering management will step in to expedite the issue and, if necessary, and OEM rep will arrive to figure out what's going on.

What I'm saying in a long-winded way is that boarding swapping is a compromise between keeping a facility running and keeping costs down. It's great fun to sit down and spend the time troubleshooting an piece of analog gear with a scope and multimeter, but in this day an age board-swapping is the only economic way to go. And that's why OEMs build their equipment that way, it's what broadcasters want to save on costs.

When commodity items like LCD displays or PCs act up for any reason, we just replace them and dispose of the broken stuff, it's just not economically feasible to repair them; though it does break our hearts. We all hate to see repairable equipment go to waste.

Anyway I've blabbed on long enough. I haven't even mentioned trying to replace surface-mounted parts that you need a magnifying glass to read or the desoldering station needed to replace ICs on a bad board. The horror stories I could tell about boards being butchered when someone thought they could just fix it. BTW, if we damage a board trying to fix it, the OEM won't accept it for repair and we have to buy a NEW board. It's no fun going to the VP of Engineering and explaining why we have to spend $20,000 for a new board. I happen to like my job so being conservative about repairs helps to keep me employed.

On a personal note, no matter the challenges when trying to repair an item, there is no greater sense of satisfaction when you fix something that was broken by replacing a some small part. My wife has the mindset of if it's broken it has to be replaced and she sees dollar signs. So when I say I fixed it by replacing a $1 part, she is always amazed and grateful for a husband that can fix stuff (usually). It helps to make up for other stuff I can't do, like dance.

Gerry

Re: Images of my 9100B
*Message #21 Posted by **Tony Duell** on 2 Nov 2011, 5:49 a.m.,*
in response to message #11 by Katie Wasserman

IIRC you can grab the digits in BCD (+ a few other codes) from the expansion connector. There are 2 other signals which indicate which register is being displayed, basically yopu wait for those to change to a different state, then start grabbing digits (Least significant first IIRC). Look at the HP9125A plotter

schematics (which does this to get the X and Y values to plot).

Of course the expansion bus levels are totally non-standard...

Re: Images of my 9100B
*Message #22 Posted by **Mike Morrow** on 1 Nov 2011, 1:16 p.m.,*
in response to message #1 by David Ramsey

Very nice unit, and very nice photos. Thanks!

It's prettier than my non-working HP 9820A. I never saw a 9100 anywhere at Georgia Tech from 1970 to 1974, but I did see and use a 9820A. There were some WANG 360SE units around, whose nixie-tube digital displays were almost as neat as the 9100's CRT display.

What's the first few characters of the serial number? It's amazing that 40 year old units like this still work, especially since a rather high voltage power supply was needed for the CRT. I can understand wanting to replace electrolytic capacitors in the CRT HV supply, but unless an exact replacement can be obtained, I personally would be reluctant to alter the original and now almost historic condition of such units.

Re: Images of my 9100B
*Message #23 Posted by **Tony Duell** on 3 Nov 2011, 5:23 a.m.,*
in response to message #22 by Mike Morrow

What's wrong with your 9820? I would assume a totally blank display at power-on, which means a fault just about anywhere in the unit :-(. However, if you want to have a go at fixing it, I can talk you through it. In many ways the 9800 machines are easier to work on than the 9100, in that it's mostly TTL logic using voltage levels you can handle, but being a bit-serial machine, a logic analyser is very useful....

As regards replacing old electrolytics (in 40 year old computer/calculator) : I must have 20 or 30 machines of that date (certainly not all HP desktop calculators!), and, yes, I've had to replace the odd electrolytic capacitor. But certainly not all of them. Quite a few of my old machines are still running on all their original capacitors. I feel that this 'witch hunt' on old electrolytics is totally unjustified.

There is, of course, the issue of what will happen if the capacitor fails. If the only effect is that, say, the machine stops working, or the display goes unstable, then I'd leave it. Replace the capacitor when it fails. If, as in one much more recent HP I repaired, the result of a bulging capacitor actually 'blowing its top' would be that it would hit the neck of the CRT and probably let the vacuum out, then I'd replace it (as, indeed, I did).

I didn't "give" it away, I sold it to someone that thought he could repair it. I bought it broken and I had made some progress is repairing it myself, at one point getting the X and Y registers working along with basic arithmetic. I never got past that point however. It was very frustrating since I didn't have a full schematic and nothing to test against -- just Tony's hand drawn 9100B schematic.

I did learn a lot about it in the process of doing some repairs (I needed the bulbs too).

Modular exponentiation with a noninteger base

*Message #1 Posted by **Oliver Unter Ecker** on 30 Oct 2011, 8:05 p.m.*

I'd like to compute "floor(3.8^98) mod 100" for the latest Project Euler problem (#356). Does someone know how to do this?

Fast modular exponentiation using the binary method doesn't seem to work for noninteger bases (I may well be overlooking the clever modification that will make it work), and I'm finding nothing that can do the job. I tried replacing the power function with exp(exponent * ln base) and a Taylor series for exp(), using modular aggregation. This converges a million times too slowly, and just can't be the way to do this.

WolframAlpha will gladly do the calculation (the result is "20"), but it fails for greater exponents.

For exponent 9876543 and modulus 100000000 it still produces output. For exponent 98765432, it appears to bring down a server (!); for exponent 987654321, it switches its input interpretation over to stocks...

Any ideas or keywords that would help to research this? Thanks!

EDIT: Here's the link to PE problem 356. Warning: enormous time sink. Largest root for n=2 is '1/3*(4+16/(37+3*i*sqrt(303))^(1/3)+(37+3*i*sqrt(303))^(1/3))'.

Edited: 30 Oct 2011, 10:20 p.m.

Re: Modular exponentiation with a noninteger base

*Message #2 Posted by **Eric Smith** on 30 Oct 2011, 10:36 p.m.,*
in response to message #1 by Oliver Unter Ecker

Use the "Russian Peasant" method of exponentiation. Iterate to compute b^2, b^4, b^8, b^16, etc. Then b^98 = b^64 * b^32 * b^2. Even for the problem 356 exponent like 987654321, this takes only 29 squarings (log2 of 987654321), so no more than 58 multiplications in total for each exponential.

in response to message #2 by Eric Smith

Thanks, Eric. "Russian Peasant" == "binary method". So, that's what I tried.

Re: Modular exponentiation with a noninteger base

*Message #4 Posted by **Crawl** on 31 Oct 2011, 8:40 a.m.,*
in response to message #2 by Eric Smith

This by itself doesn't solve the problem -- even with this approach, even with a CAS, you need to figure out how to truncate the results so you still get the correct result and so the computer doesn't have to handle billion-digit arithmetic.

Re: Modular exponentiation with a noninteger base

*Message #5 Posted by **Crawl** on 30 Oct 2011, 11:52 p.m.,*
in response to message #1 by Oliver Unter Ecker

I'm getting 60, not 20, for that problem, with both the HP50g and TI89.

Basic idea: You can calculate 3.8^98 exactly as (38/10)^98.

You can also get the approximate value of that.

And then convert that approximate value to an exact value (eg., 6.558e50 becomes 6 followed by 50 zeroes), and subtract.

Repeat until you get a value that's small enough (less than a billion, say) that you can read all the values down to the decimal point exactly.

And then you read the last two digits.

In fact, Wolfram Alpha seems to give the same thing (...160.982...)

So why is it giving 20?

Re: Modular exponentiation with a noninteger base

*Message #6 Posted by **Crawl** on 30 Oct 2011, 11:59 p.m.,*
in response to message #5 by Crawl

Utterly bizarre.

```
658858978275742440319523292513429252482438987872804536320
658858978275745389910397903226911721462945575230733045160
```

The top is what Wolfram Alpha gives for floor of 3.8^98.

The bottom is what Wolfram Alpha gives for 3.8^98 (truncated at the same number of digits)

This seems like a bug in Wolfram Alpha.

Re: Modular exponentiation with a noninteger base

*Message #8 Posted by **Paul Dale** on 31 Oct 2011, 2:21 a.m.,*
in response to message #6 by Crawl

Might it be the floating point number (3.8) confusing things?

Calculate it as floor((19/5)^98) mod 100 and it gets the correct answer.

- Pauli

Re: Modular exponentiation with a noninteger base

*Message #9 Posted by **Oliver Unter Ecker** on 31 Oct 2011, 7:50 a.m.,*
in response to message #5 by Crawl

Thanks, Crawl and Pauli!

I never thought for a minute that WolframAlpha could be wrong. The query "floor((38/10)^98) mod 100" computes the correct value.

EDIT: Interestingly, while I now have floor-result harmony between WolframAlpha, bc (thanks, Pauli, for the steps!), and a BigFloat result in my calculator, they each (!) go their own way when it comes to 987 as a power. Shared digits in the beginning and divergence further on.

The 50g, following the steps by Crawl (thanks!), actually accepts to EVAL '(19/5)^987', but didn't finish after a long time, so won't be providing a result to compare. (The resulting number has 500+ digits.)

Re: Modular exponentiation with a noninteger base

*Message #10 Posted by **Paul Dale** on 31 Oct 2011, 5:56 p.m.,*
in response to message #9 by Oliver Unter Ecker

For the larger exponent, you'll need to increase the scale parameter significantly in bc. 1000 or 1500 ought to be enough but err cautiously and go for e.g. 2500

- Pauli

Re: Modular exponentiation with a noninteger base

*Message #11 Posted by **Oliver Unter Ecker** on 31 Oct 2011, 9:58 a.m.,*
in response to message #1 by Oliver Unter Ecker

Ok. Notwithstanding the WolframAlpha bug, the problem remains how to calculate the modular result, without calculating the whole number.

When I hear "exponentiation" and "8 digits", I hear modpow with 10^8.

A 50g will easily tell you the result for 4^98 mod 100:

```
<< 100 MODSTO 4 98 POWMOD >>
```

If I try this with '19/5' instead of 4, "No solution in ring" is returned. (3.8 yields "Bad Argument Type".)

It returns a negative number (?) for "4^987654321 mod 100000000" (i.e. 100000000 MODSTO 4 987654321 POWMOD) but WolframAlpha and my other calc return the correct result, in no time.

If I do modpow(3.8, 98, 100), with a standard implementation for modpow

```
        // credit: book "Applied Cryptography" by Bruce Schneier
        result = 1;
        while (exponent > 0) {
                if ((exponent & 1))
                        result = (result * base) % modulus;
                exponent >>= 1;
                base = (base * base) % modulus;
        }
        return result;
```

an incorrect result is returned. (Note, for floats, "%" becomes an "fmod" and that may be the catch here.)

This works correctly for integer bases.

It also works for a small power (such as 9), suggesting that precision issues could be the problem. (123.456 mod 100 == 23.456000000000003 in IEEE 754.)

For solving this PE problem, this is likely a wrong attack angle altogether. Brute-force hardly suffices with these problems, and the roots will likely not do, expressed as reals. Purely symbolic solutions are rare in PE, but I'm not optimistic that the task is as straightforward as it may look at first glance.

At any rate, I'd still like to know how to compute the last few digits of a fraction, or real, raised to a large power.

To spell out the PE problem, the complete calculation becomes:

```
floor(1/3*(4+16/(37+3*i*sqrt(303))^(1/3)+(37+3*i*sqrt(303))^(1/3)) ^ 987654321) mod
100000000
```

That's for the second(-simplest) root. The last term in full:

```
floor(1/3 * (1073741824+115292150460684697 6/(123794003928538027 4899123819+
9*i*sqrt(123794003928538027 48991240215))^(1/3)+(123794003928538027 4899123819+
9*i*sqrt(123794003928538027 48991240215))^(1/3)) ^ 987654321) mod 100000000
```

WolframAlpha will not compute the results for these.

I'd like to do this on my calculator...

[EDIT: On reflection, as a noninteger float is multiplied the digits are spreading in both direction. So, a large exponent would cause an enormous amount of spread, and all digits needed to be retained to not cause wildly different results in the output. So... inaccurate representation reasons aside, I think it's safe to say this cannot be solved with floats. A fraction would require huge numbers, too, for the result to be accurate. The solution will be a different method, and I guess properties of those roots may well come into play.
Too bad PE doesn't let you "give up" and look at the solution thread to learn from it.]

{WP34S] Minor stats bug

*Message #1 Posted by **Nigel J Dowrick** on 30 Oct 2011, 11:22 a.m.*

I'm running Build 1784 (on the actual calculator, not the emulator.)

The function NORML returns the cumulative normal probability distribution from negative infinity up to its argument, for a distribution with mean stored in register J and spread in register K.

When J contains 1 and K contains 10^-40, NORML returns 0 for an argument less than 1, 0.5 for an argument of 1, and 1 for an argument greater than 1. This is correct behaviour.

However, when J contains 1 and K contains 0, NORML simply returns its argument, whatever that argument is.

This is unlikely to be a problem, but I think it's a bug!

Nigel (UK)

Re: {WP34S] Minor stats bug

*Message #2 Posted by **Dieter** on 30 Oct 2011, 11:40 a.m.,*
in response to message #1 by Nigel J Dowrick

Sounds like an error in the routine that checks for valid inputs: a zero standard deviation should throw an error here. BTW the same happens in the student case with an illegal parameter (d.o.f. =< 0) - in this case simply X is returned as well, while the routine is supposed to return an error message. Also, $Norml^{-1}$ behaves the same way for illegal parameters, e.g. sdev in K =< 0.

So there seems to be a general problem with the initial tests in the statistical distributions. Which should not be too difficult to fix. ;-)

Dieter

Re: {WP34S] Minor stats bug - fixed

*Message #3 Posted by **Marcus von Cube, Germany** on 30 Oct 2011, 12:46 p.m.,*
in response to message #2 by Dieter

Since I did some updates to the error handler it's probably my fault. Does 0 1/x still throw an error?

EDIT: It **was** my fault (sort of) and should be ok now.

Re: {WP34S] Minor stats bug

*Message #4 Posted by **Dieter** on 30 Oct 2011, 1:20 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Yes, at least in 2.2. 1782 this returns an error ("+infinity").

Dieter

Re: {WP34S] Minor stats bug

*Message #5 Posted by **Marcus von Cube, Germany** on 30 Oct 2011, 1:28 p.m.,*
in response to message #4 by Dieter

Should be fixed now.

Re: {WP34S] Minor stats bug

*Message #6 Posted by **Dieter** on 30 Oct 2011, 4:23 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Fine. I use the emulator and downloaded v. 1791 of wp34s.exe and wp34sgui.exe to replace the existing files in v. 1782. Now there is an error message, as expected.

However, I saw that the student distribution t(x) accepts non-integer degrees of freedom (which is a thing that may be discussed), and even values between 0 and 1. Is this the way the function is supposed to work?

BTW - the manual lists Norml (pdf) first, then Norml_p (cdf), while the corresponding explanation states the cdf first, then the pdf (i.e. the other way round). This should be corrected. And finally: please do not compare these functions with the ones used in Excel (cf. footnotes). The 34s does not return hilariously incorrect results like the ones Excel may come up with. ;-)

Dieter

Re: {WP34S] Minor stats bug

*Message #7 Posted by **Walter B** on 30 Oct 2011, 5:15 p.m.,*
in response to message #6 by Dieter

FYI, within the Index of Operations, the manual generally lists the command names in alphabetical order since they appear in the catalogues in that order as well (see page 33 for more). Distributions share a common remark, wherein the general order is pdf/pmf, cdf, inverse cdf.

And I know Excel is far from excellent. It's just a tool most people have access to on their PCs.

Walter

Re: {WP34S] Minor stats bug

*Message #8 Posted by **Dieter** on 30 Oct 2011, 6:14 p.m.,*
in response to message #7 by Walter B

I don't think it's a good idea if understanding a non-obvious explanation on page 49 (Norml, Norml_p and Norml^{-1}) requires an additional information somewhere else in the manual. Especially in this case where things can be improved so easily for the reader: in the remarks column, simply mention the cdf first, then the pdf, then the quantile

function. Simply use the same order as in the function column. Not only for the normal distribution, but for all others as well.

I also would suggest omitting the term "pmf" completely. But maybe there is a native speaker with mathematical/statistical background here to say a bite more on this. As far as footnote 4 on p. 15 is concerned: cdf is "(Wahrscheinlichkeits-)Verteilungsfunktion" and pdf is "(Wahrscheinlichkeits-)Dichtefunktion". It's really that simple. ;-)

Dieter

Re: {WP34S] Minor stats bug

*Message #9 Posted by **Paul Dale** on 30 Oct 2011, 6:22 p.m.,*
in response to message #8 by Dieter

I'm a native speaker and completed undergraduate and postgraduate degrees in statistics at university many years ago. That ought to count as sufficient background :-) My understanding is that *pdf* is the term for continuous probability functions and *pmf* is the term for discrete ones. They are not interchangeable (although I tend to do so more than I should).

Re: {WP34S] Minor stats bug

*Message #10 Posted by **Dieter** on 30 Oct 2011, 6:30 p.m.,*
in response to message #9 by Paul Dale

Ah, okay, in this case "pmf" of course has to stay where it is. However, to the best of my knowledge in German "Dichtefunktion" is used for both continuous as well as discrete probability functions. So the final sentence in footnote 4 should still get rewritten.

Dieter

Re: {WP34S] Minor stats bug

I disagree. I don't think it's a good idea to pick an arbitrary location in the index without taking the slightest care of what was said before. Especially in this case where it's so easy to look up the table of contents for "Statistical ...", jump there, and find all explanations in a **very** concise text. Even the difference between *pmf* and *pdf*. While I can't change the alphabet ;-) the *logical* sequence IMHO is to start with the pdf/pmf, then sum up or integrate to get the cdf, then invert to get its inverse. Please

try to find an easier alternative sequence ;-)

Walter

Re: {WP34S] Minor stats bug

*Message #12 Posted by **Alexander Oestert** on 31 Oct 2011, 4:19 a.m.,*
in response to message #11 by Walter B

I agree with Dieter. When I first wanted to use those functions to follow my son's homework, I found the one I needed by the explanation on the right side of the table and used the calc function that corresponded to it on the left side - which was the wrong one.

Re: {WP34S] Minor stats bug

*Message #17 Posted by **Dieter** on 1 Nov 2011, 9:25 a.m.,*
in response to message #11 by Walter B

> Quote:
>
> Please try to find an easier alternative sequence

Obviously you found a solution yourself - great. :-)

This leads to the question whether it's time for a general naming convention for the statistical distributions. Currently the binomial and normal cdfs are called Binom and Norml while the student and Fisher cdf are t(x) and F(x). The pdf has a subscript p suffix that on the calculator display is hard to identify as such. So what about a general and consistent naming convention. Assuming a maximum of six characters the pdf/pmf, cdf and quantile functions could be named like this:

```
normpd   binopd   studpd   poispd   fishpd   geompd  ...
normcd   binocd   studcd   poiscd   fishcd   geomcd  ...
normqt   binoqt   studqt   poisqt   fishqt   geomqt  ...
```

This would also improve the legibility of 34s programs and the usability in manual calculations: the user knows what he will get ...even without the manual.

Dieter

I didn't change the sequence at all :-)

With respect to names, your suggestion reads well as long as all such functions are seen in one block as you put them. But if an arbitrary such function crosses your way without its companions you won't know it has to be read as four letters for its name and two letters for its type. That's the reason why I prefer a notation using indices and exponents: it allows for easy differentiation of function name and suffix. YMMV

Walter

Re: {WP34S] Minor stats bug

I see. If the user comes across a function named "t(x)" it is completely obvious what it does while "studcd" will stay a miracle forever ?-) Come on...

I would like to ask you - and the whole community of course - to consider the following aspects:

- You say that the suggested names look fine as long as they are seen side by side. That's exactly what they are. They will appear in the PROB menu one after the other: studcd, studpd, studqt. Or for the Normal case normcd, normpd and normqt.
- If you really think the function type does not stand out, simply use mixed case names: NormPD, NormCD, NormQu or StudPD, StudCD and StudQu.
- The current designation especially of the Student and Fisher distibution (t(x) resp. F(x)) is unintuitive, maybe even wrong. Suppose you want to determine the Student CDF for a certain value. You enter the PROB menu and you see a function named StudCD. Hmm... what may this function do ?-)
- On the other hand, the current names t(x) and F(x) will leave the user clueless unless they have been looked up in the manual. I even feel they are wrong since t(x) does *not* determine a t-value from x. On the contrary, it *takes* a t-value *from* x and returns its value of the Student CDF.

That's why I think the proposed function names are a significant improvement over the current implementation.

Dieter

Re: {WP34S] Minor stats bug

*Message #20 Posted by **Alexander Oestert** on 1 Nov 2011, 1:10 p.m.,*
in response to message #19 by Dieter

I very much second Dieter's proposal.

Well, I can say that the intial guesses for the student and F-quantile were designed for integer d.o.f. values. I would say that at least values less than 1 should throw an error. Let's see what the community says on this. On the other hand, if you don't remember a good reason for the current implementation... ;-)

Dieter

Re: {WP34S] Minor stats bug

*Message #24 Posted by **Paul Dale** on 30 Oct 2011, 6:27 p.m.,*
in response to message #23 by Dieter

I've changed the T and F distributions so that they require an integer for their degrees of freedom parameters.

I vaguely remember seeing F distributions with fractional parameters but can't remember what for or why.

Changing back is trivial if it is warranted.

I'd suggest to use the IP of J and K for computing those statistical functions. That's what some popular statistical tests do as well.

Walter

Re: {WP34S] Minor stats bug

*Message #26 Posted by **Paul Dale** on 31 Oct 2011, 6:01 p.m.,*
in response to message #25 by Walter B

I'd suggest not. We don't truncate the *n* parameter for the binomial. Why should we truncate the DoF parameters here?

In all cases it is possible to extend the definition of the distribution to have real parameters but we've not done so. Thus accepting a real parameter and truncating it is wrong anyway.

HP80 doesn't work without the battery charger

*Message #1 Posted by **aurelio** on 30 Oct 2011, 5:21 a.m.*

Hello! I got a HP80 which is cosmetically very pretty, but doesn't work if the battery charger is unplugged. The batteries are new and tested. I've opened the calculator and found a little corrosion on the batteries' compartment terminals, expecially on the - connector. I've checked inside to see if the connection were damaged or not by this corrosion, but it seems that everything should be ok. I checked the continuity of the power supply circuit with a tester (I mean the cable connections and I can say that the calculator doesn't work even if I shorcut the two connectors on the plug (I read the article on the main board of the Hp museum) ..... the spring is clean and quite free of corrosion, so that I don't understand what is going on: the pcb is free from corrosion (I've removed with a vinegar washing the little green dirty I've found) So that I ask you please for any advice which can help me to find the reason of this fault. Thanks

Check that you measure battery voltage at the ac adapter receptacle contact pins on the calculator. Even with the calculator switch in the OFF position, you should measure battery voltage at either of the positive (+) outer pins with the negative voltmeter probe on the center negative (-) pin. If not, you have an open circuit somewhere inside the calculator. It could be a broken wire solder connection, a broken circuit board trace or broken wire. Also, you may have poor contact between the battery and the spring contacts.

> Check that you measure battery voltage at the ac adapter receptacle contact pins on the calculator. Even with the calculator switch in the OFF position, you should measure battery voltage at either of the positive (+) outer pins with the negative voltmeter probe on the center negative (-) pin. If not, you have an open circuit somewhere inside the calculator. It could be a broken wire solder connection, a broken circuit board trace or broken wire. Also, you may have poor contact between the battery and the spring contacts.

Thank-you Michael, I'm measuring 3,11 V only between the (-) and the lef pin I don't measure anything between the central pin and the third pin on the right!

Re: HP80 doesn't work without battery charger

*Message #6 Posted by **Michael de Estrada** on 30 Oct 2011, 10:34 a.m.,*
in response to message #5 by aurelio

Well, in that case I agree with aj that you are not getting a good connection between the spring contact and the pins. Try shorting the 2 outer pins. Also, if the battery voltage is only 3.11 vdc, it is discharged and will not power the calculator.

Re: HP80 doesn't work without battery charger

in response to message #6 by Michael de Estrada

Michael excuse me but I don't understand, I must measure voltage on both the outer pins, toward the inner pin or just on the (+) one? Notice that when I test the voltage of course I do it without the cover (it means without the spring)

well, only 3,11V but the battery is the same I use now with a 67 calculator and even the card reader works!!

Re: HP80 doesn't work without battery charger

*Message #8 Posted by **Michael de Estrada** on 30 Oct 2011, 11:39 a.m.,*
in response to message #7 by aurelio

The bridge contact must be installed and making contact with the 2 outer (+) pins with the ac adapter not connected. The two outer pins are positive (+) and the center pin is common negative (-). If the bridge contact is working properly, the two outer pins will be common positive (+). Place the voltmeter negative probe on the center pin and the positive probe on either outer pins. If your battery is measuring only 3.11 vdc, then I don't understand how it can power the calculator.

Re: HP80 doesn't work without battery charger

*Message #9 Posted by **aurelio** on 30 Oct 2011, 12:03 p.m.,*
in response to message #8 by Michael de Estrada

with the bridge contact installed and making contact with the 2 outer (+) pins with the ac adapter not connected, the voltmeter negative probe on the center pin and the positive probe on either outer pins I got a value near to 2.50 vdc, but when measuring the battery directly I have 3.49 vdc! I drop that battery inside my hp 67 calculator and it can power the calculator. I have not another teste to check if my meter is calibrated or not. Anyhow, if I measure these values it means that there's a drop of 1 vdc in the circuit, is that right?

*Message #10 Posted by **Michael de Estrada** on 30 Oct 2011, 12:23 p.m.,*
in response to message #9 by aurelio

If the calculator is OFF, then there should be no voltage drop. Something may be wrong with your voltmeter or its leads.

Edited: 30 Oct 2011, 12:26 p.m.

*Message #11 Posted by **aurelio** on 30 Oct 2011, 12:40 p.m.,*
in response to message #10 by Michael de Estrada

Michael, if there is a problem with the meter (we assume it as uncalibrated) we can trust, I suppose, in the relative measures. There'a fact: with the calculator turned off the voltage is 2.50 vdc, with the calculator turned on the voltage is 0.17 vdc. The voltage of the battery out of the calculator , retested now, is 3.97 vdc. What do you think about?

Edited: 30 Oct 2011, 12:46 p.m.

Re: HP80 doesn't work without battery charger

*Message #12 Posted by **Michael de Estrada** on 30 Oct 2011, 12:50 p.m.,*
in response to message #11 by aurelio

It almost sounds like you have an internal short somewhere inside the calculator. You should only see about a 0.2 vdc voltage drop between the calculator in the OFF and ON states. For example, I just checked an HP 55, and the voltages at the pins are OFF = 3.94 vdc and ON = 3.75 vdc.

Re: HP80 doesn't work without battery charger

Quote:

> I have not another teste to check if my meter is calibrated or not.

You can check your meter with a good battery or two (or three or ...).

Do you have a fresh, unused AA, C, or D alkaline battery available? They should give you almost 1.60 V. I measure around 1.56 - 1.59 V on brand new batteries. You can put 2 or more in series to check your meter at higher voltages.

A fresh-from-the-charger NiMH AA should give you between 1.30 and 1.35 V.

Are you VERY SURE that the bridge spring IS making contact? Did you check for continuity between the two outer pins?

I had a similar problem in the past with an HP-67 that after some days of search finally found that the culprit was a bridge spring that "seemed" to be making contact but in fact was not.

I tested the continuity at first between the two outer pins, when I read this advice on the forum here, I tested it elecctrically with a digital multimeter, then with a analogic one that I found out last sunday, so that I'm pretty sure that there's continuty What do you mean, please, with "that "seemed" to be making contact but in fact was not" ?

*Message #18 Posted by **Tony Duell** on 2 Nov 2011, 5:56 a.m.,*
in response to message #17 by aurelio

Have you checked the wires from the battery spring contacts to the plug pins with your ohmmeter? It's not unhead-of for battery electrolyte (from a leaking battery pack) to creep inside the insulation and corrode the wire itself.

Re: HP80 doesn't work without battery charger

*Message #19 Posted by **aurelio** on 2 Nov 2011, 10:11 a.m.,*
in response to message #18 by Tony Duell

Hello Tony, thank for your interest! I checked the continuity at first with the digital multimeter (buzzer) and even if I test it now, I get sound, but actually, when I test it with the analogic ohmeter, the result is quite different: the continuty is not "continuous" (excuse me the words) between the spring on the negative pin (the central one). I think that the problem should be not due to the wire but to the corrosion on the surface of the spring; infact if I test it between the pin and the lower part of the spring (the one which goes into the chassy) there are no problems, but if I move the probe along the upper surface of the spring, the resistance change and somewhere there is no contact!. At the end (the top) of the spring, the contact is good, but I don't know what happens when I pus the battery into my calculator and lies in the compartment..I mean if the contact between the pack and the spring is good or not. I can imagine that at least the upper part should get in contact, but in that case, the calculator should be powered, what do you think about? I've tried at the beginnig to apply a drop of soldering wire, on the corroded spring, but I was not able to pristine the surface (the corrosion doesn't allow the the soldering wire to attach-on). Maybe it need to be cleaned or prepared somehow. I

confess to have not geat experience in soldering.....

EDIT: just edit now, I placed a piece of metal on the spring, then I drop the battery pack, I got this way a better contact and the calculator works!! It means that the problem is on the spring, I must get a better contact, what can I do?

*Message #20 Posted by **Katie Wasserman** on 2 Nov 2011, 11:45 a.m.,*
in response to message #19 by aurelio

Remove the spring and re-tension it by bending it back, then replace it. There's also likely a thick oxide coating on the contacts. Use some DeoxIT on them, it works wonders.

Edited: 2 Nov 2011, 11:46 a.m.

Mini challenge. CEIL / FLOOR in RPN

*Message #1 Posted by **M. Joury** on 29 Oct 2011, 7:42 p.m.*

Hi All,

Recently I needed a FLOOR function on my HP41. Easy enough, but I decided to generalize the solution. I wanted FLOOR and CEILING functions that did not effect the stack (Y, Z, and T are preserved) and that did not use any registers. LASTX does not have to be correct.

My solution uses 44 bytes on an HP41 including 19 bytes for the LBL FLOOR, LBL CEIL and the END instructions. My solution does not update LASTX correctly but it could if I were willing to use more memory. I use no SP tricks but they are not disallowed. Off the top of my head I can't see how SP would help but I am going to look into it in more detail to see if I am missing something.

I worked on this for longer than I expected when I started the exercise and would love to see other solutions. I just can't shake the feeling that I am missing something obvious--some trick that will shave the code to half the size and twice the speed. At one point I thought that I had a very elegant truly tiny solution but it did not work for certain cases. I'll share later.

Cheers,

-Marwan

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #2 Posted by **Allen** on 29 Oct 2011, 7:45 p.m.,*
in response to message #1 by M. Joury

How do you define FLOOR and CEIL for negative numbers?

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #3 Posted by **M. Joury** on 29 Oct 2011, 8:05 p.m.,*
in response to message #2 by Allen

```
FLOOR(-2.3) = -3.0
CEIL(-2.3) = -2.0
```

Therein lies the trick because otherwise (for a positive number) FLOOR is just INT or IP. INTG on the 33S or 35S is a FLOOR function but as far as I can tell there is no CEILING on those machines.

Cheers,

-Marwan

Edited: 29 Oct 2011, 8:10 p.m.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #4 Posted by **Marcus von Cube, Germany** on 30 Oct 2011, 4:51 a.m.,*
in response to message #3 by M. Joury

FLOOR(x) = -CEIL(-x) and vice versa. This should help on the 33/35S.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #5 Posted by **PeterP** on 29 Oct 2011, 8:44 p.m.,*
in response to message #1 by M. Joury

can we use alpha?

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #6 Posted by **M. Joury** on 29 Oct 2011, 10:19 p.m.,*
in response to message #5 by PeterP

No.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #7 Posted by **Egan Ford** on 29 Oct 2011, 8:48 p.m.,*
in response to message #1 by M. Joury

41 RPN:

```
  1 LBL FLOOR
  2 INT
  3 x<0?
  4 x<>0?
  5 RTN
  6 X<>L
  7 FRC
  8 x<>0?
  9 ST- L
 10 X<>L
 11 INT
 12 RTN
```

Q&D. CEIL shouldn't be much different. Correct me if wrong, but LastX preserved.

Edited: 29 Oct 2011, 9:05 p.m. after one or more responses were posted

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #8 Posted by **Paul Dale** on 29 Oct 2011, 9:04 p.m.,*
in response to message #7 by Egan Ford

Extending Egan's code using CEIL(x) = -FLOOR(-x):

```
  1 LBL CEIL
  2 CHS
  3 XEQ 00
  4 CHS
  5 RTN
  6 LBL 00
  7 LBL FLOOR
  8 INT
  9 x<0?
 10 x<>0?
 11 RTN
 12 X<> L
 13 FRC
```

```
 14 x<>0?
 15 ST- L
 16 X<> L
 17 INT
 18 END
```

Is this 38 bytes all up?

- Pauli

Edit: merged in Egan's improvements

Edited: 29 Oct 2011, 9:12 p.m. after one or more responses were posted

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #9 Posted by **Egan Ford** on 29 Oct 2011, 9:06 p.m.,*
in response to message #8 by Paul Dale

Doh! Concurrent updates. I changed it, shorter now.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #10 Posted by **Paul Dale** on 29 Oct 2011, 9:12 p.m.,*
in response to message #9 by Egan Ford

Easily fixed :-)

- Pauli

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #11 Posted by **M. Joury** on 29 Oct 2011, 10:32 p.m.,*
in response to message #8 by Paul Dale

-2.3 return -2.0 not -3.0. INT would give you the same results. Solution not working correctly for negatives. Also, your solution to CEIL is exactly what I used in my solution. That is why LASTX does not work for CEIL in my solution.

Cheers,

-Marwan

Edited: 29 Oct 2011, 10:35 p.m. after one or more responses were posted

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #12 Posted by **Paul Dale** on 29 Oct 2011, 10:34 p.m.,*
in response to message #11 by M. Joury

Blame Egan for the floor -- I just copied his code :-)

I checked the one byte longer version and I'm pretty sure floor(-2.3) was correct then.

- Pauli

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #13 Posted by **M. Joury** on 29 Oct 2011, 10:41 p.m.,*
in response to message #12 by Paul Dale

I never got to see the 1 byte longer version. I count 39 bytes in the current version (?). If the original version was 1 byte longer and works it is 4 bytes shorter than mine (I think).

Cheers,

-Marwan

Edited: 29 Oct 2011, 10:41 p.m.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #14 Posted by **M. Joury** on 29 Oct 2011, 10:27 p.m.,*
in response to message #7 by Egan Ford

Don't think that this is right. For FLOOR(-2.3) it returns -2. FLOOR(-2.3) should be -3.00.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #15 Posted by **Dieter** on 30 Oct 2011, 10:08 a.m.,*
in response to message #7 by Egan Ford

This will not work. First, the inital test makes no sense. It uses a well-known technique from the good old days: use two consecutive tests, and you will get a "composite test" for (NOT condition1) OR condition2.

So x<0? followed by x<>0? logically equals "X>=0 OR X<>0?", or in other words: "is x greater than zero, or equal to zero, or not equal to zero". Which is the case for *any* number. So the program will always stop after this test, simply returning INT(x). #-)

There also is not much sense in the sequence "X<>0? ST-L" as the test for non-zero X is obsolete: if X actually *is* zero subtracting it from L will not change anything.

Here's my (also Q&D) first idea for the '41:

```
01 LBL"FLOOR"
02 INT
03 X<> L
04 X<0?
05 DSE L
06 LBL 00
07 X<> L
08 END
```

It even sets LastX correctly. But it will not work for negative integers, so I'll keep trying. ;-)

Dieter

Edited: 30 Oct 2011, 10:12 a.m.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #16 Posted by **Werner** on 30 Oct 2011, 5:26 a.m.,*
in response to message #1 by M. Joury

43 bytes, perfect function (YZT preserved, LASTX contains last X):

```
01*LBL"CEIL"
02 INT
```

```
03 X<>Y
04 X<> L
05 X>Y?
06 ISG Y
07 LBL 00      (NOP)
08 X<> L
09 X<>Y
10 RTN
11*LBL"FLOOR"
12 INT
13 X<>Y
14 X<> L
15 X<Y?
16 DSE Y
17 LBL 00      (NOP)
18 X<> L
19 X<>Y
20 END
```

it won't win the elegance prize, though ;-)
Cheers, Werner

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #17 Posted by **M. Joury** on 30 Oct 2011, 8:38 a.m.,*
in response to message #16 by Werner

Nice. Actually I think it is pretty elegant--a single test, a single exit point (RTN), shorter, and you don't use a flag. Better than mine. But see Pauli's and Marcus's solution and comments above. If you are willing to give up LASTX (as I was) you can use:

```
LBL CEIL
CHS
XEQ 00
CHS
RTN
LBL FLOOR
LBL 00
...
```

This is what I did in my original solution and why I said that LAST X is correct for FLOOR but not for CEIL. It shortens the code considerably.

Cheers,

-Marwan

Edited: 30 Oct 2011, 8:47 a.m.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #18 Posted by **Dieter** on 30 Oct 2011, 10:19 a.m.,*
in response to message #16 by Werner

clap *clap*
I see the idea with DSE/ISG is quite obvious. And it's sufficiently elegant as well. ;-)

Dieter

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #19 Posted by **Namir** on 30 Oct 2011, 10:53 a.m.,*
in response to message #16 by Werner

I regard the STO X command is the best NOP for the HP-41C and HP-42s.

Namir

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #20 Posted by **Dieter** on 30 Oct 2011, 10:57 a.m.,*
in response to message #19 by Namir

But STO X requires two bytes, while LBL 00 only takes one. ;-)

Dieter

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #21 Posted by **M. Joury** on 30 Oct 2011, 11:00 a.m.,*
in response to message #19 by Namir

The Zenrom module offers a NOP instruction that is basically a text byte (I think) but I am not sure of the length. Also X <> X works well but is also two bytes as is STO X.

Cheers,

-Marwan

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #22 Posted by **M. Joury** on 30 Oct 2011, 11:56 p.m.,*
in response to message #16 by Werner

Hi Werner,

Did you see Alan's solution below? It does not work for integer values but he uses a trick that can shorten your version by 3 bytes.

Instead of:

```
ISG Y
LBL 00
X<> L
X<>Y
RTN
```

You can use:

```
ISG Y
LBL 00
GTO 00
```

A savings of 3 bytes.

Cheers,

-Marwan

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #23 Posted by **Werner** on 31 Oct 2011, 3:40 a.m.,*
in response to message #22 by M. Joury

Only two bytes ;-)

Werner

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #24 Posted by **M. Joury** on 31 Oct 2011, 6:58 a.m.,*
in response to message #23 by Werner

Right, sorry, GTO 00 is 2 bytes not 1 byte.

Cheers,

-Marwan

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #25 Posted by **M. Joury** on 30 Oct 2011, 11:05 a.m.,*
in response to message #1 by M. Joury

Here is my original solution. But as noted elsewhere Werner's is better (which was partially what drove the challenge--find a better solution).

```
LBL CEIL
CHS
XEQ 00
CHS
RTN
LBL FLOOR
LBL 00
CF 20
FRC
X=0?
SF 20
CLX          These two instruction could also be X <> L
LAST X       which is the same number of bytes
INT
FS?C 20
RTN
X>0?
RTN
DSE X
RTN
END
```

44 bytes total preserves Y, Z, and T. Preserves LASTX for FLOOR but not for CEIL.

I don't see any way to do this without using a DSE instruction so I would love to see Egan's original solution it works. The later solution does not.

Cheers,

-Marwan

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #26 Posted by **Gerson W. Barbosa** on 30 Oct 2011, 12:06 p.m.,*
in response to message #25 by M. Joury

Quote:

```
LBL CEIL
CHS
XEQ 00
CHS
RTN
```

I found this relationship yesterday, at Wikipedia:

$$\lfloor x \rfloor + \lceil -x \rceil = 0,$$

FLOOR(x) can be defined in terms of INT(x) and FRC(x), but I don't see this being mentioned there:

```
FLOOR(x) = INT(x) + INT(FRC(x) + 1) - 1
```

On the HP-15C, the following avoids any test, but preserves Y only. Perhaps it can be optimized on the HP-41.

```
001- f LBL C      ; CEIL
002-   CHS
003-   GSB A
004-   CHS
005- g RTN
006- f LBL A      ; FLOOR
007- g INT
008- g LSTx
009- f FRAC
010-   1
011-   +
012- g INT
013-   1
014-   -
015-   +
016- g RTN
```

Regards,

Gerson.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #32 Posted by **Werner** on 30 Oct 2011, 2:28 p.m.,*
in response to message #26 by Gerson W. Barbosa

Equivalent formulas:

```
CEIL(x)  = x - FRC(FRC(x) - 1)
FLOOR(x) = x - FRC(FRC(x) + 1)
```

However, as Dieter pointed out in a previous post a few weeks ago, these do not work for very small x.

eg for x = -1e-50 your FLOOR function will return the wrong result

Cheers, Werner

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #33 Posted by **M. Joury** on 30 Oct 2011, 5:17 p.m.,*
in response to message #1 by M. Joury

Well, I continued to think about this while out cycling today and I think I have a 37 byte solution. There are a couple of caveats:

```
1.  LASTX is not preserved and
2.  The solution is NOT symmetrical.  That is you can't write a solution for FLOOR on it's
own it has to be done through a call to CEIL because
the HP41 does not have symmetrical tests (that is there is an X<=0? but no X>=0? on the
41.  It is symetrical on the 42S which has both tests.
```

Here is my latest effort:

```
LBL FLOOR
CHS
XEQ 00
CHS
RTN
LBL CEIL
LBL 00
FRC
X<=0?
GTO 00
CLX
1
ST+ L
LBL 00  This is *NOT* a NO-OP
X<>L
INT
END
```

Cheers,

-Marwan

EDIT: Fixes issue with longer fraction (ss.eeeii) as pointed out by Werner but adds 2 bytes. 39 bytes now.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #34 Posted by **Werner** on 31 Oct 2011, 3:55 a.m.,*
in response to message #33 by M. Joury

Perhaps we can use a 'test' suite to guarantee that a program returns the correct solution in all cases.

So, how about (just for CEIL):

```
CEIL(0)      :   0
CEIL(1e-50)  :   1
CEIL(-1e-50) :   0
CEIL(2e-5)   :   1
CEIL(-2e-5)  :   0
CEIL(1)      :   1
CEIL(-1)     :  -1
CEIL(PI)     :   4
CEIL(-PI)    :  -3
CEIL(10)     :  10
CEIL(-10)    : -10
CEIL(1e50)   : 1e50
```

That will do, I think ;-)

Cheers, Werner

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #35 Posted by **M. Joury** on 31 Oct 2011, 7:09 a.m.,*
in response to message #34 by Werner

Good idea. There are so many cases where true decrement / increment operators would have been useful.

Cheers,

-Marwan

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #36 Posted by **Paul Dale** on 31 Oct 2011, 7:15 a.m.,*
in response to message #35 by M. Joury

That's why the 34S has them :-)

I was also tempted to do the equivalent of ISG and DSE but without the skips.

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #37 Posted by **M. Joury** on 31 Oct 2011, 8:04 a.m.,*
in response to message #36 by Paul Dale

It always seemed to me that they should have been able to squeeze them into the 41.

28 bytes with alpha lables

*Message #38 Posted by **Allen** on 30 Oct 2011, 11:06 p.m.,*
in response to message #1 by M. Joury

Here's a 28 byte version, including 17 bytes for the alpha labels: Using D. Knuth's definitions (Concrete Mathemetics, Ch. 3, p.67

```
FLOOR(x)="the greatest integer less than or equal to x."
CEIL(x) ="the least integer greater than or equal to x."
```

For CIEL, we increment 1 for negative input, for FLOOR we decrement 1 for positive input, then return the IP of the result in all 4 cases (pos,neg input and CIEL,FLOOR selection).

```
00 { 28-Byte Prgm }
01>LBL "CIEL"
02 X>0?
03 ISG ST X
04 IP
05 GTO 00
06>LBL "FLOOR"
07 X<0?
08 DSE ST X
09>LBL 00
10 IP
11 .END.
```

Note: Does not account for integer inputs when ciel(x>0) or floor(x<0).

Re: 28 bytes with alpha lables

*Message #39 Posted by **M. Joury** on 30 Oct 2011, 11:26 p.m.,*
in response to message #38 by Allen

I came up with this solution very early on in my efforts but it doesn't work. CEIL(2.0) is 2.0 not 3.0 as returned by this algorithm. Similarly FLOOR(-2.0) should return -2.0 and not -3.0.

Cheers,

-Marwan

Edited: 30 Oct 2011, 11:33 p.m. after one or more responses were posted

Re: 28 bytes with alpha lables

*Message #40 Posted by **Allen** on 30 Oct 2011, 11:29 p.m.,*
in response to message #39 by M. Joury

yep, just noted that in the comments.

Re: 28 bytes with alpha lables

*Message #41 Posted by **M. Joury** on 30 Oct 2011, 11:34 p.m.,*
in response to message #40 by Allen

Yes. So does not work as a generalized solution.

Re: 28 bytes with alpha lables

*Message #42 Posted by **M. Joury** on 30 Oct 2011, 11:49 p.m.,*
in response to message #38 by Allen

I like the trick you use to save a byte by:

```
ISG X
IP
GTO 00
```

Saves a byte over:

```
ISG X
LBL 00      NOP
IP
RTN
```

Very clever. Can be used to save 3 bytes in Werner's solution (which is, IMHO, the best so far).

Cheers,

-Marwan

Edited: 30 Oct 2011, 11:52 p.m.

Re: 28 bytes with alpha lables

*Message #43 Posted by **Allen** on 31 Oct 2011, 1:43 a.m.,*
in response to message #42 by M. Joury

Ok, last try for the night. Does NOT use synthetic programming or flags.

It works by hard-coding a 3-variable K-map for POS/NEG, INT/Non-INT, inputs and CIEL/FLOOR function. (8 cases)

```
1) If NEG CEIL then return IP(X)          (2 cases)
2) Else If POS FLOOR then return IP(X)    (2 cases)
3) Else If FP(X)=0 then return IP(X)      (2 cases)
4) Else If X>0 return IP(X+1)             (1 case)
5) Else If X<0 return IP(X-1)             (1 case)

00 { 43-Byte Prgm }
01>LBL "CIEL"
02 X<0?
03 GTO 02
04 GTO 00
05>LBL "FLOOR"
06 X>0?
07 GTO 02
08>LBL 00
09 STO ST L
10 FP
11 X=0?
12 GTO 01
13 X>0?
14 ISG ST L
15 X<0?
16 DSE ST L
17>LBL 01
18 X<> ST L
19>LBL 02
20 IP
21 .END.
```

Re: 28 bytes with alpha lables

*Message #44 Posted by **Marcus von Cube, Germany** on 31 Oct 2011, 2:55 a.m.,*
in response to message #43 by Allen

Allen, all your solutions have something 'heavenly' ;-)

Re: 28 bytes with alpha lables

*Message #45 Posted by **M. Joury** on 31 Oct 2011, 7:56 a.m.,*
in response to message #43 by Allen

This looks like a 42S solution. I count 44 bytes for a 41. Also see Werner's comment below. That got me as well in my second solution (now fixed but 2 bytes longer).

Cheers,

-Marwan

Re: 28 bytes with alpha lables

*Message #46 Posted by **Werner** on 31 Oct 2011, 3:16 a.m.,*
in response to message #42 by M. Joury

But that doesn't work.. ISG and DSE work on numbers in sss.eeeii format, and will thus add/subtract ii, or 1 when ii=0.
Try your example with PI for instance ...

Cheers, Werner

Re: 28 bytes with alpha lables

*Message #47 Posted by **Allen** on 31 Oct 2011, 8:09 a.m.,*
in response to message #46 by Werner

Wow- you're right, I get so used to using ISG/DSE on integers and forget there is a seldom-used increment value on the right!

Re: Mini challenge. CEIL / FLOOR in RPN

*Message #48 Posted by **M. Joury** on 31 Oct 2011, 10:11 a.m.,*
in response to message #1 by M. Joury

Following is a test driver based on Werner's test scenarios. It is not small but it does test all the suggested cases automatically. Since I currently have a number of FLOOR solutions in memory I have set it up so that the user enters the name of the CEIL and FLOOR functions. Run it by "XEQ FLTST" or if from within the program area "XEQ A" or simply A in user mode and then follow the prompts. You will be asked first for the CEIL FN name and then the FLOOR FN name. The calculator is already in ALPHA mode so enter the name and press R/S. Total size: 270 bytes.

Cleaning keys on a Woodstock (HP-27)

*Message #1 Posted by **Geir Isene** on 29 Oct 2011, 6:27 p.m.*

I just acquired an HP-27. Looks very nice, but the "4"-key is semi-responsive (need to press hard). Is this something I can easily fix myself or should I send it to a pro?

If easily fixable (and I do not want to run the risk of ruining the calc... at all), then please point me to some babystep procedure.

Thanks.

Re: Cleaning keys on a Woodstock (HP-27)

*Message #2 Posted by **Michael de Estrada** on 30 Oct 2011, 10:43 a.m.,*
in response to message #1 by Geir Isene

Working on Woodstock keyboards is not easy, because the circuit board is heatstaked to the front of the calculator. It is easy to separate the keyboard assembly from the case and electrical circuits, but about the only thing you can do is blow air into the sides or soak it in white winegar, which sometimes helps. Perhaps you can find another cheap dead HP 27 with a good keyboard to replace it.

Re: Cleaning keys on a Woodstock (HP-27)

*Message #3 Posted by **Geir Isene** on 30 Oct 2011, 3:53 p.m.,*
in response to message #1 by Geir Isene

I took out the battery to check it for leakage. It looks pristine also inside. When putting it back in, the calc wouldn't turn on. Charging it. Still won't turn on. I am guessing bad contacts from battery to calc. Sooo.... sending it to someone who can give it lots of hugs, kisses and love. Tried contacting fixthatcalc, awaiting an answer. Alternative fixers out there feeling competent with the HP-27?

Changing battery in 42S

*Message #1 Posted by **Keith Beyer** on 29 Oct 2011, 4:23 p.m.*

Changed the batteries in my 42S last week. I did so as quickly as possible, but the memory was still reset. Is there a way to change the batteries in a 42S without loosing the memory? Just would like to know for the next time.

Thanks!

Re: Changing battery in 42S

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 29 Oct 2011, 6:47 p.m.,*
in response to message #1 by Keith Beyer

If the old batteries are not exhausted, internal capacitors / capacitance will keep some charge and thus the contents of the calculator will be preserved for about one minute, which should be enough. It is important not to short the terminals when inserting the batteries.

Re: Changing battery in 42S

> If the old batteries are not exhausted, internal capacitors / capacitance will keep some charge and thus the contents of the calculator will be preserved for about one minute

Recently I needed three LR44/357 cells for a small UV light, and had none in the house. I had two Pioneers, a 17b and a 22s. Since I thought I could more afford to lose the Solver routines in the 22s than the 17b, the former became the donor.

Much to my surprise, even after being out of the calculator several minutes, when put back in the 22s had retained all memory.

Re: Changing battery in 42S

*Message #5 Posted by **Mike Morrow** on 30 Oct 2011, 12:02 a.m.,*
in response to message #1 by Keith Beyer

The HP 42S has been my main work calculator for 14 years, and I've replaced the batteries at least three times. I've never has a "memory lost" condition during battery change occur on the 42S, or any other of my six Pioneers and four (old) Voyagers.

I have the three new cells lined up, ready to go. Then I slap the 42S down in hand to make the old cells slip out, then I carefully insert the new ones, avoiding shorting of the battery clips.

Re: Changing battery in 42S

*Message #6 Posted by **uhmgawa** on 30 Oct 2011, 1:25 a.m.,*
in response to message #5 by Mike Morrow

> Quote:
>
> I have the three new cells lined up, ready to go. Then I slap the 42S down in hand to make the old cells slip out, then I carefully insert the new ones, avoiding shorting of the battery clips.

I routinely use stacks of three cells bound with a single wrap of thin (eg: 2mil) tape, which incidentally works better in a 42s/17b than a voyager due to more generous access to the battery well.

In any case the unified stack prevents inter-cell shorting and the tape excess can be folded over the edge of the negative-most cell to prevent accidental shorting to its case when the stack is inserted.

[s/14s/42s]

Re: Changing battery in 42S

*Message #7 Posted by **Lyuka** on 30 Oct 2011, 8:24 p.m.,*
in response to message #1 by Keith Beyer

Hi Keith,

The standby current of the HP 42S when power off is around 9uA by my measurement.
It's quite large to hold the memory without batteries i.e. the internal solid tantalum capacitor of 100uF lose its charge within several seconds.
It's because the internal clock oscillator is active and keeping oscillation (for the un-implemented real time clock functions) in that state.

On the other hands, in the sleep mode, it'll goes down to less than 100nA at nominal temperature.
In this case it will hold the memory for a minute or more.

So it's recommended to put the 42S into the sleep mode by pressing

[EXIT], [+] and [XEQ]

simultaneously before battery replacement.

The other option is to connect an external power supply of +3.6~5V with series protection resistor of 1K Ohm

before battery removal.

Good luck
Lyuka

Re: Changing battery in 42S

*Message #8 Posted by **Julián Miranda (Spain)** on 31 Oct 2011, 6:01 a.m.,*
in response to message #7 by Lyuka

I did a light search and didn't find a thread about, sorry if it has been discussed before. Talking about current draw, has someone measured the Pioneer series?, from my experience, time between battery change, 20S batteries seems to last forever, 22S and 32SII I will say it's OK, 4-5 years even if my usual choice is the 32SII, but 27S and 42S (upgraded to 32K memory) are around 1-1.5 years. Any measurements that can back up my experience?

Re: Changing battery in 42S

*Message #9 Posted by **Lyuka** on 31 Oct 2011, 6:33 a.m.,*
in response to message #8 by Julián Miranda (Spain)

Hi Julian,

Please take a look at,

HP 27S : Irun ~= 6~11mA, Iidle ~= 340uA, Istandby ~= 8.2uA, Isleep ~= 170nA
HP 32sII : Irun ~= 1.0mA, Iidle ~= 120uA, Istandby <= 100nA
HP 42S : Irun ~= 3.3mA, Iidle ~= 380uA, Istandby ~= 8.9uA, Isleep <= 100 nA

Regards,
Lyuka

Edit to use 'u' instead of using Greek mu character.

How can I enter sleep mode on my HP 32sII?

/Sören

Re: Changing battery in 42S

*Message #11 Posted by **Lyuka** on 5 Nov 2011, 4:01 a.m.,*
in response to message #10 by Sören Nilsson

Since the 32sII has no real time clock nor crystal oscillator,
there is no need to keep partial circuit active when power-off.
In other words, it's already in sleep mode with quiescent current of as low as 100nA.

Lyuka

> HP 27S : Irun ~= 6~11mA, Iidle ~= 340uA, Istandby ~= 8.2uA, Isleep ~= 170nA

How do you put a 27S into sleep mode?

Re: Changing battery in 42S

*Message #13 Posted by **Lyuka** on 5 Nov 2011, 7:39 p.m.,*
in response to message #12 by Katie Wasserman

Just same as 42s. Press [ON] [+] [1/x] simultaneously.

Lyuka

Re: Changing battery in 42S

*Message #14 Posted by **Katie Wasserman** on 5 Nov 2011, 9:31 p.m.,*
in response to message #13 by Lyuka

Thanks!

BTW you wrote:

> Quote:
>
> [EXIT], [+] and [XEQ]

for the 42s, it should be [ON] not [EXIT], correct?

Re: Changing battery in 42S

*Message #15 Posted by **Lyuka** on 5 Nov 2011, 10:31 p.m.,*
in response to message #14 by Katie Wasserman

Hi Katie,

If you mean [ON] as the key that activate the calculator, either way will do. Pressing that key combination will bring the 42s to the sleep mode regardless of its ON/OFF state.

Regards,
Lyuka

Re: Changing battery in 42S

*Message #16 Posted by **Jim Yohe** on 5 Nov 2011, 10:16 p.m.,*
in response to message #13 by Lyuka

Where is this documented? I must not be looking in the right place.

Re: Changing battery in 42S

*Message #17 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 6 Nov 2011, 1:07 p.m.,*
in response to message #13 by Lyuka

Pressing that combination [ON/EXIT][+][1/x] or [ON/EXIT][+][XEQ] on my 42S does not do anything while it is in "ON" state, while it is in "OFF" state no visible change either it remains off. Edit:[EXIT][+][XEQ] works only when the unit is off. When turned on following this key squence for deep sleep, gives Machine Reset message.

Edited: 6 Nov 2011, 5:40 p.m.

Re: Changing battery in 42S

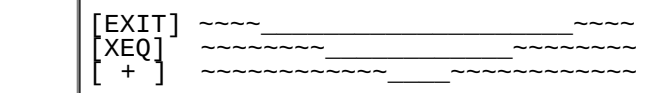
*Message #18 Posted by **Lyuka** on 6 Nov 2011, 5:48 p.m.,*
in response to message #17 by Kerem Kapkin (Silicon Valley, CA)

Hi,

Just try the key sequence below,

Press and hold [EXIT], press and hold [XEQ], press [+] and release, release [XEQ], release [EXIT].

Key sequence (timing chart) to put an HP 42S into sleep mode.



You'll see "Machine Reset" message at power on after sleep mode.

HP-25C Repairing

*Message #1 Posted by **aj04062** on 28 Oct 2011, 10:09 p.m.*

Hi, Just picked up a non-working 25C. When unit is switched on and off, different LED's light up with a 0. Occasionally 2 O's will appear.

Fearing fried memory & ACT, I opened and cleaned a fair bit of corrosion. I reassembled to test and no change.

While apart, I noticed the large resistor looks to have severely overheated in the past. Does all of this evidence point towards this thing getting fried from plugging in without a battery?

Edited: 28 Oct 2011, 10:09 p.m.

Re: HP-25C Repairing

*Message #2 Posted by **Eric Smith** on 28 Oct 2011, 10:38 p.m.,*
in response to message #1 by aj04062

No. The resistor limits the charging current to the NiCd pack, and does tend to heat up quite a bit, but use of the charger without the batteries won't damage the resistor, only the chips.

Re: HP-25C Repairing

*Message #3 Posted by **aj04062** on 28 Oct 2011, 11:01 p.m.,*
in response to message #2 by Eric Smith

Still sound like fried chips? The AM radio "test" indicates some acknowledgement to the pushing of some keys, but no key combination makes the display change.

Re: HP-25C Repairing

*Message #4 Posted by **Walter B** on 29 Oct 2011, 4:00 a.m.,*
in response to message #3 by aj04062

AFAIK this looks like the usual fried ACT. Sorry.

Woodstock troubleshooting

*Message #5 Posted by **Randy** on 29 Oct 2011, 9:08 a.m.,*
in response to message #1 by aj04062

Assuming the power supply is okay, remove the rom (1818-0154) and the ram (different numbers, depends on version). Power it up. If you get a 0.00 display, the ACT is okay, basic math should work. If not, check for oscillations at the tank circuit, pins 13/14. If it is dead there, the ACT is dead. If it good, have a look at the display driver components. Not very likely they are at fault but it happens, especially with the 27.

If the ACT is okay, re-install the rom and check transcendental functions. Add the ram and check program

storage.

While the ACT is a common failure, so is the rom in the 25. With ram or rom blown, it usually kills the clock and makes it look like a bad ACT.

Re: Woodstock troubleshooting

*Message #6 Posted by **aj04062** on 29 Oct 2011, 9:15 a.m.,*
in response to message #5 by Randy

Awesome,

Thanks for the nice step by step.

Could I follow similar steps on a malfunctioning 67 (minus RAM of course)?

Re: Woodstock troubleshooting

*Message #7 Posted by **Randy** on 29 Oct 2011, 10:37 a.m.,*
in response to message #6 by aj04062

The 67 isn't so cooperative. I isolate to the logic board, as the display/keyboard can cause non-intuitive problems.

Once I know it is the logic board, I strip all roms and test in a good board equipped with sockets. I've found it too painful to approach any other way as rom failures are more common on the 67/97 than ACT's since they don't get over-voltaged the way Woodstocks do.

Re: Woodstock troubleshooting

in response to message #5 by Randy

While we are on this topic of malfunctioning woodstocks: may I kindly ask for your jugdement regarding the 29C I acquired a few months ago? It worked fine for several days with a set of two NiMH batteries that were used in the original battery holder (and charged externally of course - I do not have the AC adapter). Then suddenly, while running a program, the device crashed and since then it will display nothing but twelve zeroes: 000000000000 is all it says.

Do you think it can be brought back to life? It's such a cutie... *sniff*...

Dieter

Re: Woodstock troubleshooting

*Message #9 Posted by **aj04062** on 30 Oct 2011, 11:44 a.m.,*
in response to message #8 by Dieter

Randy probably is the definitive word on this, but I saw that as a symptom of a bad ACT chip when researching my 25C issues.

Re: Woodstock troubleshooting

*Message #10 Posted by **Randy** on 30 Oct 2011, 12:08 p.m.,*
in response to message #8 by Dieter

I would first test with a 3 volt bench supply using clip connections to the battery terminals - as consumer AA cells (non-flat top design) do not play well with the Woodstock contact design. Also, relying on the spring to make the connection between cells can be problematic since the plating on the spring ends has usually been destroyed by cell out-gassing. FWIW, low supply voltage will cause strange behaviors, many times similar to an ACT failure.

If still no joy with the above, the troubleshooting is the same but you have 5 IC's to remove, not 2. That leaves two IC's on the board, the ACT and the power on reset IC (1820-1983).

Re: Woodstock troubleshooting

*Message #11 Posted by **Dieter** on 30 Oct 2011, 1:33 p.m.,*
in response to message #10 by Randy

Randy, thank you for your reply. Sorry if I'm asking, but I assume you are Randy from fixthatcalc, right? While I think I will manage to connect the 29C to a 3V power supply there are five left thumbs on each of my hands when it comes to replacing ICs and other delicate stuff. ;-) If nothing else helps, do you think there is a chance to get my little marvel back to life at fixthatcalc even if 30+ years old parts are required?

Dieter

Re: Woodstock troubleshooting

*Message #12 Posted by **Randy** on 31 Oct 2011, 1:11 p.m.,*
in response to message #11 by Dieter

Yes, that's me... and FWIW, I gave up trying to repair Woodstocks years ago.

Over the years, I have purchased quite a few 20 series units, some working and most not working. What I have found was the number of units that yielded usable parts was so low, I could not possibly charge what it really cost to do repairs.

IMO, the economics of repair don't work when it comes to Woodstocks and Spices.

HP 15C LE will there be more?

*Message #1 Posted by **Keith Beyer** on 28 Oct 2011, 12:28 p.m.*

I have not been paying attention to what HP is doing in calculators lately, and missed the HP 15C LE. Does anyone know (other than e-bay) where one can buy one at the list price, or if they will be available for purchase on the HP website again?

Thanks!

Re: HP 15C LE will there be more?

*Message #2 Posted by **Katie Wasserman** on 28 Oct 2011, 12:46 p.m.,*
in response to message #1 by Keith Beyer

Someone posted that they have been recalled from dealer stock to fix the key click problem (I think that they heard this from The Bach Company). But we have not heard directly from HP on this issue. TW, care to comment?

*Message #5 Posted by **Keith Beyer** on 29 Oct 2011, 3:49 p.m.,*
in response to message #4 by Brandon Poindexter

OK, I'd prefer to just order through HP if they are still going to be available at some point. The price on their website is $100. Not familiar with The Bach Company, but looks like they want $129. Has anyone had success at ordering them from HP at this point? Or do I need to wait until they are "in stock" again on the website?

Thanks!

Re: HP 15C LE will there be more?

*Message #6 Posted by **Jeff O.** on 30 Oct 2011, 12:41 p.m.,*
in response to message #5 by Keith Beyer

At this point, I don't think that anybody outside of hp knows if or when the 15c LE will be available again. Hopefully they are checking all the units that were produced in the first batch to weed out any with bad keyboards and will at some point put the rest up for sale. As far as ordering from hp, I don't think you have any other choice than to wait until they are "in stock" again.

Get 7 of these instead

*Message #7 Posted by **Michael de Estrada** on 28 Oct 2011, 1:16 p.m.,*
in response to message #1 by Keith Beyer

1) You can buy 7 of these for the price of one HP 15C LE @ MSRP

2) No keyboard problems

3) No battery current drain problem and uses cheaper AAA batteries

4) Pause function works properly

5) Much nicer case

6) Reset button on back (no need to remove batteries and short contacts to reset)

in response to message #7 by Michael de Estrada

But that's a financial calculator... The thread title says "15C".

I don't understand the point of this 12C anniversary edition. There were already two types of 12C available (regular and platinum). The AE is a third one. The 15C, that's what it's all about!

If they can sell more calculators that way, why not?

There will probably be a regular 15c w/o the fake snake-skin box, and with no printed manual, sold in a blister pack, once thy get the production problems ironed out.

"ON" in conjunction with all of "/", "x", "-", "+", and "." are decoded by the 15c firmware upon a power-on transition. Any difference relative to a legacy 15c is likely just an oversight in the emulation scheme.

Re: HP 15C LE will there be more?

*Message #19 Posted by **Eddie H.** on 30 Oct 2011, 9:55 p.m.,*
in response to message #1 by Keith Beyer

I had placed an order via the HP SMB (Small & Medium Business) site in mid-October (18th), which has been in backorder status, since. Last week, I called the SMB customer service number to inquire on the availability and/or possible re-stock of the 15C LE. I was transferred to someone else who stated that the entire inventory had been pulled from the warehouse and sent back to the manufacturer (Kinpo?) due to a "quality control issue" (this is how he stated it). I asked if there was an estimate for when they'd sort this "quality control issue" and begin to fulfill backorders, and I was told 4 to 6 weeks (end of November, beginning of December).

At the time I assumed this only applied to the HP SMB stock, but from what I'm reading here it seems they must've pulled the inventory from all resellers.

My 32SII was made in Indonesia in 1991. What is the fraction bug ?

Re: HP 15C LE will there be more?

*Message #23 Posted by **Miguel Toro** on 31 Oct 2011, 12:09 p.m.,*
in response to message #22 by Michael de Estrada

From HPDATAbase :

```
"1) The "Factors of Denominator" mode sometimes produces denominators
which are not factors.  In these cases, the 32SII seems to display
the "Most Precise Mode" fraction, so this is a minor bug. Example:

        SF 8
        CF 9
        8 /c
        3
        1/x

You see 0 1/3, but 3 isn't a factor of 8.

2) The "Fixed Denominator" mode (SF 8, SF 9) sometimes produces
denominators other than the specified one, along with incorrect
numerators.  The amount of the error can be about +/- 1.  HP is  now
sending a manual addendum recommending that Flag 9 not be used at
all. Example:

        SF8
        SF 9
        1
        ENTER
        ENTER
        ENTER
        8 /c
        32
        1/x     (which is 0.03125)

You see v 0 7/8 (which is 0.875) but should see ^ 0 0/8.  (Recall that
^ and v are the up- and down-arrows.)

Now press + repeatedly.  You'll see:

        v 1 7/8
        v 2 1/2
        v 4
        v 4 3/4
        v 5 3/5
        v 6 1/2
        v 7 3/7

etc...  all of which are WAY off, and very few of which have a "fixed"
denominator of 8.

3) The "Most Precise" mode (CF 8, CF 9) and the "Factors of
Denominator" mode (SF 8, CF 9) sometimes violate the commutativity of
addition, and produce incorrect results.  This only occurs when the x
value is close to 1/8 of the /c value, and the last two digits of the
LASTx register's exponent are nonzero.  The worst error this can
produce is approximately +/- 0.125, which makes this a substantial
bug. Example:

        CF 8
        CF 9
        8 /c
        32
        1/x

See v 1/8, but it should be ^ 0 0/8. Pressing:
```

```
        0
        +

gives ^ 0, but:

        32
        1/x
        0
        x<>y
        +

gives  v 0 1/8 . Addition should be commutative. The LASTx value is
causing the problems.

In late March, I called HP's Technical Support department about
problems with the fraction system (actually, at that time, I only knew
about bug 1).  The HP employee stated that the 32SII can give
incorrect answers when using fractions (although she would not go into
any details about what problems were known), and that HP would likely
be instituting some type of exchange program this summer.  She
suggested I call back after April 1 for details.  I did call back,
left a message, and haven't heard back from them yet.  "
```

*Message #25 Posted by **Lincoln R.** on 31 Oct 2011, 11:48 a.m.,*
in response to message #24 by CAD_Jockey

I doubt this would happen. It would be too trivial to simply flash a 15C LE with 12C firmware and claim it came that way. There might be someone crazy enough to pay for a buggy early model 15C LE, although faking those might not be that hard either (print a plausible serial number sticker and flash an old firmware revision).

Re: HP 15C LE will there be more?

it seems they must've pulled the inventory from all resellers.

I don't think either the official HP eStores or any of the resellers have their own stock. I bought mine from Buy.com, CostCentral (Erie Computer) and HP Home and Home Office. However, all of mine shipped directly from "Distribution Center" in either Memphis, TN or Olive Branch, MS. Those are the true warehouses with physical stock that have apparently been returned to the manufacturer in China. About the only place you will find any at the present time are from a few individuals selling them on TAS at inflated prices.

HP 10bII+ vs. 10bII first impressions

*Message #1 Posted by **Kevin Colville (S. Africa)** on 28 Oct 2011, 11:35 a.m.*

My new HP 10bII+ arrived yesterday and, of course, I had to pull out my three year old 10bII for comparison.

The 10bII+ keyboard: not as good as the 10bII. The new machine has noisier keys with a more hollow click sound. This suggests the keys are sitting loosely in the case and, sure enough, shaking the 10bII+ produces a definite rattle. In contrast the 10bII has a solid firm click and no rattle. Just made a short video to demonstrate the differences: video clip.

There is also noticeable bending of the 10bII+ top case when pressing down on the top three rows of keys.

Display is clear with a greenish tint, but I prefer the yellowish 10bII with its better contrast.

Speed: the 10bII+ is much faster. Tried the usual 253! factorial calculation which responded instantaneously. No "running" message for the 10bII+!

Current state is now fully preserved at power off: even in the midst of entering a number.

The new colours of the key legends are a mixed bag: the orange is slightly darker and slightly reddish while the blue (more cyan) is easier to read than the dark blue of the 10bII, but I prefer the orange of the older model.

Lots of new functions! I am really happy to see trigs and hyperbolics and especially the normal and t distributions. A real pity HP couldn't include F and chi-squared then I would have a replacement in case my 21s dies.

Overall, the keyboard of the older model is much superior (in fact it's the best keyboard HP have made in the last decade) but the 10bII+ gives us faster electronics and more functions. Sigh, HP: always two steps forward, one step back...

Kevin

PS. Long time lurker on these forums and mild HP collector (er, fanatic?). Thought it was about time I contributed something ;)

Re: HP 10bII+ vs. 10bII first impressions

*Message #2 Posted by **Katie Wasserman** on 28 Oct 2011, 12:42 p.m.,*
in response to message #1 by Kevin Colville (S. Africa)

Kevin,

Welcome! Thanks for the video.

My 10bii and 10bii+ feel and sound exactly the same as far as the key clicks go but only when hand held. On a smooth, hard surface desk I hear (but don't feel) the difference. I believe that this is caused by: (1) the 10bii is heavier than the 10bii+, (2) the battery door doens't fit as well on the 10bii+ and rattles a little when the keys are pressed. Both of these could be fixed with a little creative user engineering, I think. Perhaps HP could

tweak the production line on these aspects.

I do like the speed and potential to repurpose the 10bii+. It also has a nice bunch of functions including the Gamma function -- try 253.119!

-Katie

Re: HP 10bII+ vs. 10bII first impressions

*Message #3 Posted by **Bruce Bergman** on 29 Oct 2011, 12:58 a.m.,*
in response to message #2 by Katie Wasserman

Yeah, same here. No keyboard issues at all, so I'm kind of puzzled by that comment...

Re: HP 10bII+ vs. 10bII first impressions

*Message #4 Posted by **Kevin Colville (S. Africa)** on 31 Oct 2011, 4:18 a.m.,*
in response to message #2 by Katie Wasserman

Katie,

You are right: testing on the flat hard surface of my desk is probably worst case scenario for keyboard noise. When held the two models are quieter. The 10bii+ is still noticeably louder though: I think the extra noise and the keyboard flex is because the upper case is thinner than on the 10bII. Perhaps that is one tweak HP could look into...

Now that I've played around with the 10bII+ more I must say the feel of the keyboard is quite good. Perhaps better than the 10bII: the 10bII+ needs less force to press each key and I can type faster on the new model. I think I was too distracted by the noise to notice at first ;)

Kevin

Re: HP 10bII+ vs. 10bII first impressions

*Message #5 Posted by **Tim Wessman** on 28 Oct 2011, 12:56 p.m.,*
in response to message #1 by Kevin Colville (S. Africa)

The keyboard is identical between models, except for very very early 10bII units, so that is kind of surprising to me.

Glad you like it! I'm the one the wrote most of the software. :-)

TW

in response to message #5 by Tim Wessman

Yes! And by the way, one of the nicest collection of statistical functions around in such a calculator -- great job Tim!

Thanks, bruce

Re: HP 10bII+ vs. 10bII first impressions

*Message #7 Posted by **Kevin Colville (S. Africa)** on 31 Oct 2011, 4:38 a.m.,*
in response to message #5 by Tim Wessman

Tim,

After experimenting further with the 10bII+ I think my initial impressions were misleading: it's probably not the keyboard but the case that has changed. The extra noise and flex are more likely because the upper case is thinner, the keys are now held less tightly (hence the rattle) and the click echoes.

I am in awe at the work done on the software. I worked through some of the manual this weekend and especially love the new stats editor. It's very impressive how easy it is to use and how the 7-segment display is not limiting at all! Thank you.

Kevin.

[WP34s] Questions about extended precision

*Message #1 Posted by **fhub** on 28 Oct 2011, 8:13 a.m.*

In my Polynomial RootSolver there are a few expressions in an iteration loop of the form r = s - a*b -c*d.

I see 3 possibilities to calculate this expression:
1) without any tricks in the given form s - a*b -c*d
2) using complex multiplication (cpx*) in the following way: first a*b + c*d (complex) and then subtract from s
3) using cpx* twice: 1*(1*s-a*b) - c*d, i.e. first calculate 1*s-a*b and then 1*result-c*d

Currently I'm using method 2), i.e. (a*b+c*d) complex and then s - (result).
Now I would like to know if method 3) would give a higher precision than 2), or if even none of both complex tricks is better than the standard way 1) ?
Method 1) of course needs less (internal) calculations (no real+imaginary part!), so if there's no difference than I would switch back to 1).

And then one more (principle) question: is there any difference between the precision (i.e. used/stored digits of a number) of the stack and the registers?
I guess there's none (?), but then I don't really see the advantage of using cpx* : what is an internal precision of 34 digits worth, when I only have 16 digit numbers on the stack?

Franz

Edited: 28 Oct 2011, 8:15 a.m.

Re: [WP34s] Questions about extended precision

*Message #2 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 8:49 a.m.,*
in response to message #1 by fhub

Franz, we have two types of number inside the machine: registers and internal decimals. The former is of type decimal64 (or a variant thereof) which packs 16 significant digits into 8 bytes of storage. The internal format is decNumber which we normally use at 39 digits but sometimes to an even higher precision. Whenever an internal result is moved to a register, it is rounded according to the current rounding mode.

All registers are alike, 00 to 99 and all the lettered registers.

The accuracy of your proposed methods depends on whether cancellation can occur or not. This is always the case when a subtraction of numbers of similar magnitude is done. The most accurate way would be to do all calculations with the internal precision. Your proposal does this at least for one of the two subtractions but it may still be that this is less accurate then desired due to cancellation in the second step. At least one intermediate result is always stored with 'just' 16 digits. You can, of course, define two matrices of dimension 3x1 and 1x3 and multiply these. This will be performed to the internal precision. It's only worth the effort when you know that the result will always be close to zero so that cancellation is an issue.

Re: [WP34s] Questions about extended precision

*Message #3 Posted by **fhub** on 28 Oct 2011, 9:17 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks Marcus, that was quite detailled! :-)

The problem is that I don't know the values of all those variables in these formulas, so I have no idea if such critical cancellations may occur or not. And I'm not keen on testing also these values, after I've already made hundreds of tests with random polynomials.

So I guess I should indeed rather remove these cpx* and use the usual calculation method instead, because these iterations are done quite often and cpx* needs twice as many operations.

Franz.

Re: [WP34s] Questions about extended precision

*Message #4 Posted by **Paul Dale** on 28 Oct 2011, 6:29 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Nice wrap up. I saw this come in just as I was heading to bed last night and decided I was too tired to answer it properly :-) Anyway, Marcus said pretty much what I was going to.

One thing that wasn't bought up is that the matrix multiply option is worth further consideration (i.e. multiply $[\ s\ a\ c\ ]^T$ by [-1 b d]. This is probably the most accurate way to perform the calculation since everything is done in internal precision. It also doesn't incur as much overhead as the complex multiplies will. It does, however, require the values in numbered registers and the matrix descriptors loaded -- store the descriptors in registers and RCL them or better RCLS them.

The matrix multiply might even be faster than doing the computations on the stack -- you'll be trading a multiply by -1 for the stack operations and lots of conversions from register to internal format and back. The actual arithmetic is all carried out in internal precision either way (although the long results could be a fraction slower for this). At least, it is seems to be worth a test or three to be sure.

- Pauli

Re: [WP34s] Questions about extended precision

*Message #5 Posted by **fhub** on 29 Oct 2011, 6:21 a.m.,*
in response to message #4 by Paul Dale

> Quote:
>
> At least, it is seems to be worth a test or three to be sure.

From the viewpoint of accuracy you're right of course, but using this matrix multiplication would require storing these variables in a special register order, and then all the other calculations (and there are many!) won't work anymore (because they also need a special order for complex multiplications). And it would dramatically increase the program size (and I'm already at more than 300 steps).

The main problem of my polynomial solver is not accuracy, the problem is that the used method (Bairstow) doesn't converge fast enough (or even not at all) for (some) higher degree polynomials - at least not on slow hardware like the 20b/30b. (1000 iterations on the PC emulation are no problem, but on the 20b even 100 already need about 10 seconds).
The program is already working (almost) perfectly for polynomials with degree upto 10, but with increasing degree (20-30) it happens quite often that the iteration doesn't converge, no matter what

methods for initial guesses I use (and I've tried lots of them!).

So I'll continue to find better ideas for polynomial degrees higher than 10 or 15 ...

Franz

*Message #7 Posted by **fhub** on 28 Oct 2011, 4:41 p.m.,*
in response to message #1 by fhub

Marcus, one other question:

Do you have any idea how a WP34s program could find out whether it is running on a real HP-20b/30b or in the PC emulator?

The only thing that I could imagine would be using a short loop of any commands and measure the time with TICKS. But what commands to use and how often to repeat the loop, so that at least 1-2 TICKS are over on a real 20b (whereas on the emulator it would be of course 0 TICKS)?

With this method I could use different default values in the program for a 20b and the emulator.

Or is there any other trick I could use for this purpose?

Franz

Re: [WP34s] Questions about extended precision

*Message #8 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 5:20 p.m.,*
in response to message #7 by fhub

Just measure the ticks consumed by your program and terminate the loop depending on the elapsed number of ticks instead of a fixed counter. We don't have a command to identify the emulator and even if we had, you never know how fast the underlying system is.

Stopwatch function implemented on WP34s

*Message #1 Posted by **pascal_meheut** on 28 Oct 2011, 2:36 a.m.*

Hi,

Just for fun, I've implemented a Stopwatch function like the one on the HP-55 and the HP-41C TimeModule.

Of course, it would need a quartz to be precise but I'll see later if I can implement a calibration function.

It is a simple addon to the last firmware version and if someone is interested, I can give the calc.bin and/or the source code.

How it works:

- there is now a TIMER function in the P.FCNS menu, under TIME - Pressing F then H then EXIT quickly enters the TIMER mode too - once in TIMER mode, R/S starts & stops the stopwatch - EEX toggles the 10th secs display - ENTER stores the current value in memory. 0 to start and the increments - arrows increment/decrement the memory used - one can also enter the memory number directly - the memory used is displayed in the exponent zone and -> toggles it

I plan on implementing a delta mode later, like the TimeModule one but maybe simpler.

Here is what it looks like:

Cheers

And received your email. Cannot respond still.

Re: Stopwatch function implemented on WP34s

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Oct 2011, 10:27 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Very nice, the TIMER function is very convenient indeed! Just a question: Given the current (pun intended) worries about CR 2032 batteries being not the best ones to cope with extended activity on these calculators, how feasible is to have the timer running for significant periods of time? Are you deliberately choosing a super-slow CPU clock mode to run the timer?

TIA

Re: Stopwatch function implemented on WP34s

*Message #6 Posted by **pascal_meheut** on 28 Oct 2011, 10:54 a.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

This is a first implementation and I've not measured battery drain yet. I plan to do so. Right now, running the TIMER should be the same as running a program but I guess I can try to slow down the CPU clock.

Edited: 28 Oct 2011, 10:55 a.m.

Re: Stopwatch function implemented on WP34s

*Message #7 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 11:26 a.m.,*
in response to message #6 by pascal_meheut

Pascal, you can wire the timer to the heartbeat interrupt. This will run at 2MHz and idle again after return. Just look into keys.c and search for K_HEARTBEAT. You will need a global variable which selects timer mode and disables all other functionality.

Re: Stopwatch function implemented on WP34s

*Message #8 Posted by **pascal_meheut** on 28 Oct 2011, 12:10 p.m.,*
in response to message #7 by Marcus von Cube, Germany

This is exactly what I've done. In the main loop, there is a global variable containing a function pointer. If it is not null, it is called on every key pressed including HEARTBEAT instead of the normal processing.

The TIMER function simply sets this variable and exiting it resets its to NULL. This mechanism could be used for any other interactive function which needs full control of the keyboard if we had more space :-(

Re: Stopwatch function implemented on WP34s

*Message #9 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 12:27 p.m.,*
in response to message #8 by pascal_meheut

Well done! :-)

Re: Stopwatch function implemented on WP34s

*Message #10 Posted by **pascal_meheut** on 28 Oct 2011, 5:13 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

BTW, I ran it for 2 hours straight on brand new batteries and the voltage went from 3.0V to 2.9V. The WP34s slows down at 2.5V and shutdowns at 2.2V. So timer's power consumption is not that bad.

Re: Stopwatch function implemented on WP34s

*Message #11 Posted by **Dominic Richens** on 28 Oct 2011, 9:46 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I'd like to see your code as well (or diffs).

Too bad the hp20b/30b doesn't have a tone generator, I'd like to have a count down timer.

I wonder what the simplest circuit is to use one of the GPIO pins?

Re: Stopwatch function implemented on WP34s

in response to message #1 by pascal_meheut

```
We can not take some factors of conversion?
I believe it is very easy to save some factor in a memory (STO) of him to leave the system
fixed.
We could gain a few bytes for further improvements.
```

Re: Stopwatch function implemented on WP34s

*Message #14 Posted by **pascal_meheut** on 28 Oct 2011, 3:31 p.m.,*
in response to message #13 by robertoataulfo

Initialized constants are 272 bytes whilst executable code is 122 Kb according to the linker. So this not where room can be found I guess.

Re: Stopwatch function implemented on WP34s

*Message #15 Posted by **robertoataulfo** on 28 Oct 2011, 3:33 p.m.,*
in response to message #14 by pascal_meheut

```
But these 272 bytes could not be used for something more important?
I think that any user can use some memories (STO and RCL) to save your constants.
```

Edited: 28 Oct 2011, 3:36 p.m.

Re: Stopwatch function implemented on WP34s

*Message #16 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 5:24 p.m.,*
in response to message #15 by robertoataulfo

But then you need to know them. We have a few areas where we might save code such as the integer code which deserves a rewrite in ARM assembly.

Re: Stopwatch function implemented on WP34s

*Message #17 Posted by **Walter B** on 29 Oct 2011, 4:30 a.m.,*
in response to message #15 by robertoataulfo

Using general purpose registers for constants would cost more *and* have the disadvantage of not knowing the names. We won't do that.

Walter

Re: Stopwatch function implemented on WP34s

*Message #18 Posted by **Paul Dale** on 28 Oct 2011, 9:58 p.m.,*
in response to message #14 by pascal_meheut

I suspect the conversion constants aren't in the initialised data segment. They definitely take more than 272 bytes.

They are still incredibly compact as commands go. I'd guess eight to ten conversions or constants occupy the same space as the most trivial of commands (think the single bit setting mode commands) and this is including the catalogue overheads.

- Pauli

There is no such thing as an initialized data segment, just ROM data. All data in RAM is just zero. I got rid of the 'copy ROM to RAM' sequence all together.

in response to message #1 by JDonley

There's an iPad 11?

Re: Simple RPN

*Message #5 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 3:51 a.m.,*
in response to message #4 by Eric Smith

It depends on the font used. :-)

Re: Simple RPN

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Oct 2011, 5:20 p.m.,*
in response to message #4 by Eric Smith

Current iPad is 10, next year model will be 11 :-)

Re: Simple RPN

*Message #7 Posted by **Jean-Michel** on 28 Oct 2011, 1:17 p.m.,*
in response to message #1 by JDonley

Hello

Do the shifted functions appear on the keys only once one has pushed the blue "f" key? I guess this is the role of this key! By the way, which shifted functions does it offer? Many thanks advanced for your answer.

Kind regards.

Re: Simple RPN

*Message #8 Posted by **JDonley** on 28 Oct 2011, 4:30 p.m.,*
in response to message #7 by Jean-Michel

Yes, the functions do appear on the keys. This is a very simple calc with the blue shift key shifting between "RCL"/ "STO". "CLa" shifts to "CLx". A third key "X-Y" [exchange] shifts to a function key that enables a change in the background color/style. Something I won't use.

This isn't meant to compete with the various HP calc emulators [HP41 is available]. For .99 it is totally adequate for someone who prefers RPN and doesn't need something that will handle a space launch.

Re: Simple RPN

*Message #9 Posted by **Jean-Michel** on 28 Oct 2011, 4:39 p.m.,*
in response to message #8 by JDonley

Thanks for your fast and accurate explanations. You may also like two other apps: AccessRPN and Pcalc lite. More to say, they are free! Give them a try... Access RPN has a funny feature that enables you to see the stack operating.

Re: Simple RPN

*Message #10 Posted by **JDonley** on 28 Oct 2011, 5:53 p.m.,*
in response to message #9 by Jean-Michel

thanks, I just downloaded both. Am ready for that space launch now!

Re: Simple RPN

*Message #11 Posted by **Michael Kussmaul** on 28 Oct 2011, 4:41 p.m.,*
in response to message #1 by JDonley

I use PCalc on my iPhone and iPad. It has a normal RPN mode and a HP 48 style RPN (RPL) mode. Works great and has a very nice UI.

The only thing missing is some kind of solver or programmability, but it has all trigonometry and even base conversion and calculation functionality.

Re: Simple RPN

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Oct 2011, 6:42 p.m.,*
in response to message #1 by JDonley

You may like Free42 or a derivative from it, named 42S. They are great on the iPod Touch, I don't know if there are differences on the iPad due to screen size, etc.

Re: Simple RPN

*Message #13 Posted by **Eddie W. Shore** on 31 Oct 2011, 3:24 p.m.,*
in response to message #1 by JDonley

Anyone try ActiveRPN for the iPhone/iPad? The basic version is free. The scientific version with macros is $.99. Each macro can hold up to 80 steps.

Re: Simple RPN

*Message #14 Posted by **JDonley** on 31 Oct 2011, 10:27 p.m.,*
in response to message #13 by Eddie W. Shore

there are a couple of utube videos that illustrate active RPN....interesting program.

Local variables in RPN programmable?

*Message #1 Posted by **David Hayden** on 27 Oct 2011, 5:50 p.m.*

I've been thinking of a way to add local variables to an RPN programmable calculator. Does anyone know if this has been done before, or discussed and ruled out as a bad idea? If not then I'll write it up in a Datafile article, and maybe use it as an excuse to try playing with the 34S source code.

Thanks, Dave

Re: Local variables in RPN programmable?

*Message #2 Posted by **Paul Dale** on 27 Oct 2011, 6:06 p.m.,*
in response to message #1 by David Hayden

This is something I've been thinking about for the successor to the 34S. I'd be interested in see what you've come up with.

I'm not aware of it being done before but it is an essential step towards coding built in functions as keystroke programs.

- Pauli

Re: Local variables in RPN programmable?

*Message #3 Posted by **Egan Ford** on 27 Oct 2011, 6:57 p.m.,*
in response to message #2 by Paul Dale

It'd be nice to push the stack on a stack and pop the entire stack back. Could be automatic on RTN.

```
LBL FOO
...
...
...
GSB BAR
...
...
...
LBL BAR
CLONE STACK, COPY STACK, SAVE STACK, etc...
...
...
...
RTN x (or RTN xy, etc...)
```

If we had an infinite stack I'd just need a 4DUP, 2DUP, etc... Perhaps just a FORTH-like stack setup.

Re: Local variables in RPN programmable?

*Message #4 Posted by **Paul Dale** on 27 Oct 2011, 7:07 p.m.,*
in response to message #3 by Egan Ford

I'm definitely thinking about an unlimited depth stack. The big issue with cloning the stack is you want

to take arguments from it and return results to it -- these aren't suitable to using a clone.

I'm also thinking about tagging commands as to the number of input and output arguments and setting/disabling stack lift etc. This allows automatic last X, undo etc to occur which in turn means commands don't need to worry about any of this themselves. It just happens.

- Pauli

Re: Local variables in RPN programmable?

*Message #5 Posted by **Garth Wilson** on 27 Oct 2011, 10:06 p.m.,*
in response to message #4 by Paul Dale

How about a separate unlimited stack for environments. It could hold a lot of things besides local variables, and the position of something in the stack does not depend on what you're doing on the data stack.

Re: Local variables in RPN programmable?

*Message #6 Posted by **Eric Smith** on 28 Oct 2011, 1:28 a.m.,*
in response to message #5 by Garth Wilson

Gee, sounds like RPL is being reinvented.

Re: Local variables in RPN programmable?

*Message #7 Posted by **Garth Wilson** on 28 Oct 2011, 2:44 a.m.,*
in response to message #6 by Eric Smith

I'll take your word for it. I don't speak RPL, but I do speak Forth, and I know they have a lot in common.

Re: Local variables in RPN programmable?

*Message #8 Posted by **Howard Owen** on 28 Oct 2011, 11:32 a.m.,*
in response to message #6 by Eric Smith

> Quote:
>
> Gee, sounds like RPL is being reinvented.

Sounds that way to me too. IMO, one of the evils of RPL is the large amount of anonymous data that an unlimited stack can carry. RPN uses addressable registers. Local variables in an RPN calculator should use the same approach.

Re: Local variables in RPN programmable?

*Message #9 Posted by **Paul Dale** on 28 Oct 2011, 6:38 p.m.,*
in response to message #6 by Eric Smith

I'm not planning anything like RPL. Commands will still have arguments after them e.g. The looping and branching constructs of RPL will be absent.

- Pauli

Re: Local variables in RPN programmable?

*Message #10 Posted by **Howard Owen** on 28 Oct 2011, 8:12 p.m.,*
in response to message #9 by Paul Dale

"Reinventing RPL" is probably over the top. It's just that this discussion triggered one of my RPN/RPL pet peeves. Anonymous data that moves is a Bad Thing, I believe. Four or even eight levels deep in a stack is manageable, more or less. More levels, especially with a rich bestiary of object types, overflows the mental list I maintain mapping stack levels to values. Register addresses, though limited in their ability to convey their contents at any given time, at least can be statically mapped to meaningful names.

Regardless of my personal hobby horse, I do believe that relying on the stack for local variables is an approach associated with RPL, and not RPN. That doesn't tie anyone's hands in terms of implementing it in an RPN machine, but it might muddy the water a little.

Re: Local variables in RPN programmable?

*Message #11 Posted by **Marcus von Cube, Germany** on 29 Oct 2011, 6:27 a.m.,*
in response to message #10 by Howard Owen

We will be coming up with a sensitive solution, I'm sure. All fully RPN, just a 'few' more data registers to play with as long as the program space isn't full or the program runs out of flash memory.

Re: Local variables in RPN programmable?

*Message #12 Posted by **Howard Owen** on 28 Oct 2011, 11:22 a.m.,*
in response to message #3 by Egan Ford

New stack semantics would be one way to implement locals, but there's another approach that would be consistent with classic RPN semantics. Like all programmable HP calculators, the 34S has addressable registers. Why not dynamically allocate space for a local register in a subroutine whenever the user uses a particular naming style. So register -10, for example, would be local to the current scope and all child scopes, if not overridden, and would go away when out of scope.

edit: I imagine this might be impossible to implement on the WP-34S, with its already full memory, This suggestion would be applicable to a follow-on machine with more resources.

Edited: 28 Oct 2011, 11:36 a.m. after one or more responses were posted

Re: Local variables in RPN programmable?

*Message #13 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 11:35 a.m.,*
in response to message #12 by Howard Owen

In WP 34S all data is global. Increasing the size of the return stack was a piece of cake (not yet committed, still testing) but we don't have any local data. An idea could be to treat the memory between and of program space and current return stack pointer as addressable memory, probably indirect only with negative indexes. There you need a thorough checking of the available space and corresponding pointers.

Re: Local variables in RPN programmable?

*Message #14 Posted by **Howard Owen** on 28 Oct 2011, 11:38 a.m.,*

in response to message #13 by Marcus von Cube, Germany

I didn't see your post before editing the parent, Marcus. Would it be possible to add the required bounds checking given current memory constraints on the WP 34S?

Re: Local variables in RPN programmable?

*Message #15 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 11:44 a.m.,*
in response to message #14 by Howard Owen

I'm thinking about it. We might add a command LOCAL n which reserves n registers on the return stack. It needs to place a special marker on the return stack so that a RTN can pop the data. This will be a non trivial modification.

Re: Local variables in RPN programmable?

*Message #16 Posted by **David Hayden** on 27 Oct 2011, 10:32 p.m.,*

Re: Local variables in RPN programmable?

*Message #17 Posted by **Namir** on 27 Oct 2011, 6:08 p.m.,*
in response to message #1 by David Hayden

I few years ago, I presented an RPN2 emulator at HHC2009. This Excel-based emulator supported modular code that used RPN. The variables and labels of each module lived in their own namespace (defined by the name of the host module). Thus it was possible to write libraries of modules, each with a distinct name, that used the same "local" variables without conflict with similarly named variables that live in other modules.

Namir

Re: Local variables in RPN programmable?

*Message #18 Posted by **David Hayden** on 27 Oct 2011, 10:31 p.m.,*
in response to message #17 by Namir

Namir,

I wasn't at HHC2009 but I think I saw your presentation on the DVDs. It sounds familiar.

If the local variables are stored with the library then doesn't that mean they take up space even when the program isn't running? Also, how does it handle recursion? I suppose recursive calls in an RPN calculator are pretty rare since the return stack is so limited, but it would be nice to allow it.

Dave

Re: Local variables in RPN programmable?

*Message #19 Posted by **Namir** on 27 Oct 2011, 11:37 p.m.,*
in response to message #18 by David Hayden

The life of local variables depends on the implementation. In the Excel-based RPN2 emulator the variables come into scope when you store data in them. They remain for the rest of the program life (and beyond in the Excel-based implementation allowing you to inspect the last values in the variables).

As for recursion. I did not support it.

Namir

I've an idea how to implement this on WP 34S, maybe my next venture into the sources. The idea is to share the return stack with program memory. If you need a large return stack, put your program in flash and clear program memory: This will give you more then 500 levels. :-)

[WP34S] Crystal

*Message #1 Posted by **robertoataulfo** on 27 Oct 2011, 4:22 p.m.*

```
I need crystal to maintain the accuracy of the clock.
Anyone know where I can get?
```

Re: [WP34S] Crystal

*Message #2 Posted by **Marcus von Cube, Germany** on 27 Oct 2011, 4:29 p.m.,*
in response to message #1 by robertoataulfo

Any electronic parts shop should carry these. It's a 32768KHz watch crystal together with two **15pF** capacitors in 0603 SMD format.

Edit: Correction to the capacitor specification (was nF instead of pF).

Edited: 28 Oct 2011, 3:45 a.m. after one or more responses were posted

Re: [WP34S] Crystal

*Message #3 Posted by **Walter B** on 27 Oct 2011, 4:33 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Be warned the latter are damn small !

Re: [WP34S] Crystal

*Message #4 Posted by **Tim Wessman** on 27 Oct 2011, 4:57 p.m.,*
in response to message #3 by Walter B

Not really. It is a whole 590% larger than a 0201! Seems pretty big to me.

TW

Re: [WP34S] Crystal

*Message #5 Posted by **Jim Horn** on 27 Oct 2011, 5:18 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Note that the two capacitors are 15pF each, not 15nF.

Re: [WP34S] Crystal

*Message #6 Posted by **Eric Rechlin** on 27 Oct 2011, 5:41 p.m.,*
in response to message #5 by Jim Horn

And you do have a little flexibility, too. Basically as long as it's the right order of magnitude it should be fine.

My kit (which I will bring back for sale soon) uses 18 pF capacitors.

Re: [WP34S] Crystal

*Message #7 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 27 Oct 2011, 7:09 p.m.,*
in response to message #6 by Eric Rechlin

I noticed one can get several different type capacitors ie ceramic, thin film, etc in 0603 SMD with different tolerances 5%, 3% or 2%. Would anything work, or one better than the other for this application? Any suggestions.

Re: [WP34S] Crystal

*Message #8 Posted by **Katie Wasserman** on 27 Oct 2011, 7:52 p.m.,*
in response to message #7 by Kerem Kapkin (Silicon Valley, CA)

They should all work fine. The tolerance and temperature coefficient will be factors in determining the price but not the frequency of oscillation, the tolerance of the crystal will be much more of a factor (not to mention luck in picking a good one). A while back I suggested trying to fit a tiny trimmer cap in place of one of the fixed caps to allow you to adjust the frequency, but I haven't gotten around to experimenting with that.

Re: [WP34S] Crystal

*Message #9 Posted by **Paul Dale** on 27 Oct 2011, 8:55 p.m.,*
in response to message #8 by Katie Wasserman

When I had job of calibrating real time clocks half a dozen years back, I got the joy of determining crystal tolerances. It very much seemed that you got the tolerance you paid for. Buy a 30ppm crystal and it will be very close to that. Not once did we see a crystal performing a lot better than its specified tolerance.

Our conclusion was that crystals are likely measured at the time of manufacture and graded accordingly.

Re: [WP34S] Crystal

*Message #10 Posted by **Katie Wasserman** on 28 Oct 2011, 4:00 a.m.,*
in response to message #9 by Paul Dale

I make some small electronic timers and stuff to give as gifts and have done some similar crystal testing. I think that you're right about that in general, but I found that the 30ppm ones were typically off by 20ppm. But being off about the same amount and (within a batch) almost always the same direction is a good thing. You can compensate for that by choosing load capacitors to pull the crystal to its stated frequency.

Re: [WP34S] Crystal

*Message #11 Posted by **uhmgawa** on 27 Oct 2011, 8:50 p.m.,*
in response to message #7 by Kerem Kapkin (Silicon Valley, CA)

Quote:

From a temperature/environmental stability perspective: polystyrene dielectric if you can still find them. Outside of military/esoteric capacitors they were the choice for timing critical applications. Unfortunately they are only available in leaded packages, though quite minuscule and inexpensive at the values required here. Failing that an NPO/COG ceramic.

But yes, this will address drift only and you'll need to compensate the xtal to the intended frequency if that's needed. Another thought is to forego absolute accuracy of the xtal oscillator in favor of stability, and compensate for whatever off-target frequency exists numerically.

Re: [WP34S] Crystal

*Message #12 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 3:49 a.m.,*
in response to message #11 by uhmgawa

We had the latter idea earlier. It would imply keeping an adjustment factor and adding this whenever the RTC is read. If the correction warrants it, adjust the RTC and start over. I'm not very keen at implementing this.

HP41 Barcode generation

*Message #1 Posted by **Raymond Wiker** on 27 Oct 2011, 4:17 p.m.*

I have put an on-line barcode generator up at http://rwiker.github.com/hp41barcode. This is still a work in progress, it does not work with Internet Explorer, and may contain bugs.

It should be able to take a program with line numbers in front of each statement (e.g, the "Catch the Goufers" game. It is also possible to to type several statements on one line, optionally separated with ";", as in the small example program.

PCs do not generally have the not-equals and Sigma characters easily available, so these should be entered as "!=" and "~", respectively. That means that "Sigma+" becomes "~+", and "X not-equals 0?" becomes "X!=0?".

To use, simply copy & paste the program into the text box in the "Input" tab, select the modules needed by the program, click the big button labelled "Do it!". If the bar codes look ok, simply print the page with the "Barcodes" tab selected.

Re: HP41 Barcode generation

*Message #2 Posted by **Geir Isene** on 27 Oct 2011, 4:31 p.m.,*
in response to message #1 by Raymond Wiker

The FOCAL Factory Board of Directors loudly applaud this excellent effort to bring more User Code programs to 'da peple'!

With this and the HEPAX+41CL, we can make FOCAL ROM modules in our sleep.

Cudos!

*Message #4 Posted by **Raymond Wiker** on 28 Oct 2011, 12:32 a.m.,*
in response to message #3 by Geir Isene

> Quote:
>
> BTW; What's the significance behind the list of checkboxes/modules on the right?

The checkboxes correspond to a (small) number of common extension modules - by ticking a box, you can use names of functions provides by that module, instead of specifying the XROM codes directly.

As an example, if you uncheck the box next to "wand" and convert the sample program (the default text when the barcode generator is loaded), you'll get an error message that the "WNDDTA" function is unknown.

Note that some of the extension modules have conflicting function names, and so you shouldn't use them at the same time (like the "math" and "advantage" modules.)

> Can the text parsing be adjusted to handle other relatively common ways of entering things like X not equal Y etc., such as shown in my Goufer's game?
>
> Things like X NE 0? and X <> 0?

I think the program handles those cases, as well as a few others (I know that it did earlier, at least).

If you have other mappings, or examples of programs that it does not handle correctly, please let me know.

Also, if you have mappings between function names and XROM codes for particular modules, I'd be happy to add those, too.

Re: HP41 Barcode generation

*Message #14 Posted by **Geir Isene** on 28 Oct 2011, 3:15 p.m.,*
in response to message #13 by Raymond Wiker

Synthetics? Like RCL M?

Re: HP41 Barcode generation

*Message #15 Posted by **Raymond Wiker** on 28 Oct 2011, 3:28 p.m.,*
in response to message #14 by Geir Isene

Can be added, given a little information... May be time for me to order the museum DVD :-)

Re: HP41 Barcode generation

*Message #16 Posted by **Geir Isene** on 28 Oct 2011, 3:36 p.m.,*
in response to message #1 by Raymond Wiker

This is getting awesomer by the hour. You're fast, man!

Feature request: Ability to upload ROM images that shows up in the list on the right.

Re: HP41 Barcode generation

*Message #17 Posted by **Raymond Wiker** on 28 Oct 2011, 5:21 p.m.,*
in response to message #16 by Geir Isene

Note that the checkboxes only affect the mapping from function names used in extension rome to the actual XROM codes. That said, if you have any particular roms that you want added, please let me know - I'll need either a binary dump of the rom, or a text file of some sort that specifies the mapping.

Re: HP41 Barcode generation

*Message #18 Posted by **Geir Isene** on 28 Oct 2011, 5:34 p.m.,*
in response to message #17 by Raymond Wiker

That is understood - but would it be easily feasible to let the user be able to upload a rom in order to make use of its labels?

Re: HP41 Barcode generation

*Message #19 Posted by **Raymond Wiker** on 29 Oct 2011, 2:14 p.m.,*
in response to message #18 by Geir Isene

Not the way it is currently implemented - the barcode generator consists of only HTML and Javascript, and has *no* active server side component that could accept and process modules from the user.

On the other hand, anybody can download the generator and make whatever changes they want to it - including adding information about whatever modules that they want to use.

Future I/O capabilities in WP-34S v3.x

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Oct 2011, 3:59 p.m.*

IIRC, there are printed circuit pads connected to analog input pins of the Atmel processor in the 20B/30B. Granted, such pads are not easy to reach, but it may be interesting to consider a couple of extra functions for future development (perhaps as a separate evolutive branch, because not all users will be interested). I guess some of the code is already there, supporting the BATT function. Perhaps we just need a function to select the active analog input channel, and another function to read the A/D value.

Given that internal wiring of the serial port, or installing a crystal are seen as "acceptable surgery", enabling analog input may also be.

Of course, users of such inputs should be warned about electrostatic discharge risks and also about acceptable signal levels. Eventually, some resistors and zener diodes may be added for some protection.

Just my 0.02 mV DC

Re: Future I/O capabilities in WP-34S v3.x

*Message #2 Posted by **Walter B** on 27 Oct 2011, 4:17 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Please be aware the capacity and will of the design team to support "separate evolutive branches" is **very** limited.

Re: Future I/O capabilities in WP-34S v3.x

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Oct 2011, 4:32 p.m.,*
in response to message #2 by Walter B

Accepted, but...

:-)

Re: Future I/O capabilities in WP-34S v3.x

*Message #4 Posted by **Marcus von Cube, Germany** on 27 Oct 2011, 4:23 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

If we support more hardware we need to drop some other functionality so it will be a WP 34X instead of 34S. BTW, the voltage detection is done via the brownout detector: You program a threshold, wait some time, and check it the brownout detector has set a bit in a register. If not, try another threshold. No analog/digital converter involved here.

Re: Future I/O capabilities in WP-34S v3.x

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Oct 2011, 4:31 p.m.,*

in response to message #4 by Marcus von Cube, Germany

Thank you for the clarification... but "BATT" gives a voltage as answer, doesn't it? So you are doing A/D via brownout and timing?

Re: Future I/O capabilities in WP-34S v3.x

*Message #6 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 3:36 a.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Not timing, more trial and error. If the detector triggers at 2.4V but not at 2.3V I assume that the battery voltage must be between these two limits and take the lower for BATT.

Re: Future I/O capabilities in WP-34S v3.x

*Message #7 Posted by **Paul Dale** on 27 Oct 2011, 5:52 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Flash is full. Very very full. I can't see such a change coming from us.

If we were to add some additional hardware, it would have to be a serial RAM or flash device to increase the available memory -- ideally both.

- Pauli

A less ambitious idea for WP-34S v3.x

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Oct 2011, 11:40 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Something on the line of classic BASIC commads PEEK and POKE, allowing to access arbitrary memory locations. Then, the user code may (perhaps) access I/O ports or devices via these commands.

Again, this is just an idea without any supporting, specific research.

HP-15C LE -- endless loop in SOLVER

*Message #1 Posted by **Gerson W. Barbosa** on 27 Oct 2011, 12:45 p.m.*

The HP-15C LE will alternate forever between "running" and "Error 0" in this example:

```
001- f LBL A
002- g LN
003-   /
004- g pi
005-   -
006- g RTN

1 ENTER f SOLVE A    ->  running
                         Error  0
                         running
                         Error  0
                            .
                            .
                            .
```

Re: HP-15C LE -- endless loop in SOLVER

*Message #2 Posted by **Jeroen Van Nieuwenhove** on 27 Oct 2011, 1:29 p.m.,*
in response to message #1 by Gerson W. Barbosa

Interesting. The 15C emulator in Nonpareil gets stuck at the first error message, as would be expected. I suppose the original 15C behaves the same. This is strange, since the 15C LE is based on the same firmware. The error handling seems to be influenced in some way.

Re: HP-15C LE -- endless loop in SOLVER

I'd be quite surprised if this was due to a change in the firmware error handling behaviour peculiar to the 15c le.

Gerson, is the alternating between "running" and "Error 0" occurring at the same rate of the display blink frequency? [I don't have a 15c le handy ATM.] If so I'd make a wild guess this is somehow due to the display update minimization logic along with an interaction of exiting the emulator driven display blink mode. Although I can't really think of a reason a shadow of the prior display contents would be needed.

Running this on KEMU I find the expected behaviour. The display update sequence preceding this point looks quite vanilla as well so I don't have a better guess.

Re: HP-15C LE -- endless loop in SOLVER

*Message #4 Posted by **Gerson W. Barbosa** on 27 Oct 2011, 3:44 p.m.,*
in response to message #3 by uhmgawa

Yes, exactly the same rate of the display blinking frequency (according to my measurement).

Re: HP-15C LE -- endless loop in SOLVER

*Message #5 Posted by **Marcus von Cube, Germany** on 27 Oct 2011, 4:16 p.m.,*
in response to message #4 by Gerson W. Barbosa

You can stop it with any key. It looks like a display problem.

in response to message #3 by uhmgawa

> Quote:
>
> Although I can't really think of a reason a shadow of the prior display contents would be needed.

Ah, I suspected it may be rooted in the lcd controller as it does provide a hardware timed blink. See section 34.5.6 Buffer Swap Mode (pg 502) here for details. There is a two level data buffering scheme allowing update to a yet-to-be-displayed buffer which is subsequently transferred to the lcd display (multiplex scan) buffer. If the lcd controller is placed in "Buffer Swap Mode" the data driven to the display will alternate between both buffers at the hardware blink frequency. Seems like the controller is unintentionally winding up in this mode vs. (presumably) Normal Mode.

Re: HP-15C LE -- endless loop in SOLVER

*Message #8 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 3:32 a.m.,*
in response to message #7 by uhmgawa

You need to wait long enough after you have written to display memory before you can safely change the mode. The docs say it takes 2 refresh cycles but my experience is that waiting even longer is a good idea. WP 34S does not do a busy wait, the display refresh triggers an interrupt (at roughly 50 Hz) and the number of interrupts is counted. The logic is in the sources in main.c under LCD_interrupt():

```
        /*
         *  Wait for LCD controller to copy the user buffer to the display
buffer.
         *  Then turn off the automatic update.
         *  WaitForLcd is set to 1 by finish_display()
         */
```

```
        if ( WaitForLcd ) {
                if ( ++WaitForLcd == 3 ) {
                        SLCDC_SetDisplayMode( AT91C_SLCDC_DISPMODE_LOAD_ONLY );
                }
                else if ( WaitForLcd == 4 ) {
                        WaitForLcd = 0;
                }
        }
```

I'm not using the blink option but I need the display memory for storing intermediate data. If I remove the 'else' part and clear the variable directly after mode switching, display memory gets corrupted. The trick is to wait for another cycle after switching to 'load only' mode.

Re: HP-15C LE -- endless loop in SOLVER

*Message #9 Posted by **Thomas Radtke** on 27 Oct 2011, 1:51 p.m.,*
in response to message #1 by Gerson W. Barbosa

The emulator just blinks w/o showing 'running'.

Why does it blink in the first place?

12c won't turn on --- options?

*Message #1 Posted by **gene wright** on 27 Oct 2011, 12:21 p.m.*

It has good batteries. What are the resurrection steps to try?

This is a single 2032 battery non-12c+ made in China a few years ago.

Not worth major surgery :-) but thought it would be good to try a couple of things.

So, batteries are NOT the problem.

Next? :-)

Gene,

Can you check the current drain, idle (no power), button pressed, etc? It may give an indication of any anomaly and narrow down possible fixes.

All keys 'click'? If one makes permanent contact, it wouldn't turn on.

*Message #8 Posted by **Randy** on 27 Oct 2011, 11:08 p.m.,*
in response to message #1 by gene wright

Not sure the age of the unit you have but a very common problem with early one cell 2032 units was a really *bad* design in the battery contacts.

The + contact on the left side gets bent out of position, failing to make contact. Remove the cell and look for the contact to protrude into the circular area taken up by the cell. If you don't see the contact while looking straight down into the cell area, that's the problem.

FWIW, the design was later modified.

Re: 12c won't turn on --- options?

*Message #9 Posted by **gene wright** on 28 Oct 2011, 10:45 p.m.,*
in response to message #8 by Randy

For the record, the problem suggested by Randy was the reason it would not turn on.

The small contact that touches the side of the single 2032 battery cell was not bending out enough into the cell receptacle to make contact with the battery.

A slight amount of bending and it made contact.

Voila. A working 12c.

Thanks all.

SAM-BA protocols and operating principles

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Oct 2011, 10:57 a.m.*

I would like to know if there are available documents describing the protocol implemented by SAM-BA when flashing devices like 20B / 30B. Details about messages and its answers, message sizes, acknowledgement of messages, command sequences, retries, timeouts, checksums, etc. should appear on such documents; along with a description of typical interchanges between SAM-BA and the devices.

Best regards, and thanks in advance.

Edited: 27 Oct 2011, 10:57 a.m.

Re: SAM-BA protocols and operating principles

*Message #2 Posted by **Marcus von Cube, Germany** on 27 Oct 2011, 11:25 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

I don't know what goes on once SAM-BA has downloaded a small program to the chip to which it then talks for flashing. The basic set-up commands are described in the Atmel AT91SAM7L128 Manual. I found it on the Atmel site for free download. The basic protocol allows reading and writing memory on the chip.

MySamba implements X modem if I recall correctly. It downloads a small ARM assembly language program which I present here in disassembled form:

This program receives the data in 256 byte chunks and does the actual flashing. It assumes a 128KB size download before it toggles the boot bit and resets the calculator. This should be modified for shorter files. My MySamba modification is a work-around: It toggles the bit before the download. That is the reason why you need to do a reset after flashing.

I know I have no standing to make a request, so I'll make some observations...

MySamba is written in Delphi (a Pascal variant). The code was offered and (as far as I know) Marcus

was the only one to do anything with it.

C/C++ is far more popular and so is supported on more platforms. Python is another choice, one often possible to write true cross-platform code and where performance is surprisingly good. With popular languages like C and Python the pool of potential contributors is much larger.

I really like the *ix philosophy of a small commandline program that does one thing well, and provides a way for a GUI to wrap it later if desired.

That's my thoughts. :)

MySamba and Linux: (easy) success!

*Message #1 Posted by **Cristian Arezzini** on 27 Oct 2011, 6:58 a.m.*

I use Linux Ubuntu, and I've been using SamBa on a virtualized Windows XP for all my wp-34s flashing needs. But I decided I should try mySamba.exe too. And I can report that it worked very easily, directly with Wine under Linux.

As others reported, it didn't enumerate the Com ports; but I just had to write "com1:" in the com port field, and it worked on first try. Of course I had Wine setup to map the USB-Serial adapter to Com1:. No more virtualized Windows for me!

Well, almost: I couldn't find a way to transfer the flash regions with mySamba. But for the main flashing it works great.

Cristian

You can:

1. cat calc.bin *.dat >fullcalc.bin and flash fullcalc.bin, OR
2. wine wp34sgui.exe and use SENDL, and other SEND* functions to send from virtual to physical and vv.

Re: MySamba and Linux: (easy) success!

*Message #3 Posted by **Cristian Arezzini** on 27 Oct 2011, 8:44 a.m.,*
in response to message #2 by Egan Ford

Thanks. I remember trying the cat command in the past, but SamBa crashed for some reason. I suppose it works with mySamba, I'll try as soon as possible!

And I had totally forgotten that the emulator can talk to the real calc. That might be the most fun way! :)

non-HP RPN knockoffs - the good, bad and ugly

*Message #1 Posted by **Michael de Estrada** on 26 Oct 2011, 11:40 p.m.*

The Compucessory CCS28956 and Victor V12 have been discussed before on this forum. They are basically knockoffs of the HP 12C Platinum, the Victor V12 is a copy of the original version and the CCS28956 is a copy of the newest version, that also adds a cost/sell/margin feature as well. Both calculators can be easily found for less than $15 shipped, although the CCS28956 has to be bought in quantity greater than one to get a unit price under $15. Compare this to a MSRP of $80 for the HP 12CP, and it's clear that the good of these knockoffs is their bargain basement price. Even if they didn't offer RPN, they are still about the cheapest programmable calculators on the market.

The Victor has a decent keyboard with large semi-clicky keys that are laid out exactly the same as the HP 12CP and are spread farther apart for easy desktop use. The bad thing is the choice of red for the color of the shifted functions on the bottom of the black keys, which makes them almost illegible under anything but the brightest ambient lighting. The display is angled up for easy viewing, has large crisp digits with contrast adjustment, but a small decimal point. It's size and bulky case make it non-pocketable and requires two-handed handheld operation. Processing speed is much faster than the original HP 12C and probably comparable to a modern HP 12CP, although

I can't make a comparison, since the only HP 12C I own is an original Voyager one from the 1980s. Finally, the Victor has a hard reset button on the back, so there's no need to remove the batteries (2 x AAA) if a reset becomes necessary. It's unfortunate that the Victor lacks the features added to the newer HP 12CP, such as backspace and undo. I don't miss the parentheses, because I never use algebraic mode. Overall, the Victor is mostly good, some bad and no ugly, and offers a good cheap alternative RPN calculator for non-critical situations, where a true HP RPN calculator is not required.

The Compucessory CCS28956 has an absolutely awful tiny mushy keyboard that has the key locations radically changed from the HP 12C as well as the key legends, such as STO changed to x->M, and critical keys such as ENTER are tiny buttons spaced so closely to other buttons that it is near impossible to depress it without hitting other nearby buttons. Also, the different key locations means that the program key codes are meaningless. This is all very unfortunate, because this is otherwise a very good calculator with a clear large display and a small size that makes it easy to use as a handheld device or carry in a pocket. I has a nice built-in plastic cover that makes it no thicker than a Voyager in its slip case, while actually being smaller in width and height. Processing speed is comparable to the Victor. Build quality is not as good as the Victor and it lacks a reset button. Overall, the Compucessory CCS28956 is some good in its compact size and a lot of bad and ugly in the crappy keyboard layout and button size/action. I can really only see using it in situations where I want to carry it around in a pocket and use in my hand.

in response to message #1 by Michael de Estrada

I have a 12C+ which has two CR2032 batteries... They are 3V batteries, connected in parallel, so when you change the batteries if you only remove one at a time, the program memory isn't erased. If the Victor has 2xAAA batteries, which are 1.5V each, does this mean they're connected in series? If so, this should mean that when changing batteries, the memory is lost, right?

Cristian

Re: non-HP RPN knockoffs - the good, bad and ugly

*Message #4 Posted by **Don Shepherd** on 27 Oct 2011, 7:05 a.m.,*
in response to message #3 by Cristian Arezzini

> Quote:
>
> when changing batteries, the memory is lost, right

For the Victor, if you change the batteries quickly you may be able to preserve program memory, but I wouldn't count on it. The manual says memory is preserved "for a short amount of time" while changing batteries, but I think I removed the batteries for only a couple of seconds and memory was lost. But that was yesterday, when it arrived and I first put the batteries in. Today it seems to keep continuous memory a

bit better.

The manual, by the way, is excellent. It is 72 pages and the font size is very large, making it a very easy read. It is a pleasant surprize considering most printed documentation for cheap products, if there is any at all, is a single multi-fold sheet with a font size of about .001. It doesn't have all the detail of the original HP-12c manual (notably absent are formulas used), but I was surprized by the quality of the manual for a $14 calculator.

Oh, regarding speed, the Victor is much faster at program execution than the 12cp 25th Anniversary edition. But it is nowhere near as fast as the ARM-based 12c+

*Message #7 Posted by **Don Shepherd** on 27 Oct 2011, 11:47 a.m.,*
in response to message #5 by Michael de Estrada

The manual, while good overall, does have a few peculiarities. A table on page 7 refers to the word "block" registers, which I think they use in place of "stack." I'm not sure why they would do that unless they just hate the word "stack" for some reason. On the following page they say that "blocks" will be discussed later in the manual, but if it's there I don't see it. They do refer to "x register" and "y register", so I don't know why they just don't call it stack.

At the top of page 36 I expected to see a picture of Dolly Parton.

:)

Interesting. Exactly how big is this calculator? Bigger than an actual 12c, I presume?

Something about the design of the calculator itself, and the lack of scale in the marketing images, gives me the impression that it's small, say the size of an iPhone.

Re: non-HP RPN knockoffs - the good, bad and ugly

No, it's big and rather ugly!

Re: non-HP RPN knockoffs - the good, bad and ugly

*Message #11 Posted by **Michael de Estrada** on 27 Oct 2011, 12:44 p.m.,*
in response to message #9 by megarat

The calculator itself measures 138.4mm x 88.2mm x 22.8mm, with the thickness measurement taken at the top of the display area. Compare this to a Voyager at 128.6mm x 80.0mm x 15.1mm. Inside its carry case it is approximately 147mm x 94mm x 35mm.

Re: non-HP RPN knockoffs - the good, bad and ugly

*Message #12 Posted by **Don Shepherd** on 27 Oct 2011, 12:45 p.m.,*
in response to message #9 by megarat

Approximately 3.5" by 5.5". The display area is a lot thicker than a normal 12c, presumably to accomodate the AAA batteries. I don't find the angled display to be very legible, certainly not as legible as a real 12c.

Re: non-HP RPN knockoffs - the good, bad and ugly

in response to message #13 by Michael de Estrada

I think I fooled with it yesterday for a while and it didn't seem to help too much, but I'll try it again.

Here is a side-by-side pic of the Victor and the HP12c+.

Re: non-HP RPN knockoffs - the good, bad and ugly

*Message #15 Posted by **Michael de Estrada** on 27 Oct 2011, 1:11 p.m.,*
in response to message #14 by Don Shepherd

Actually, I find there to be more difference between the display on the original Voyagers (12C and 15C) and the new HP 15C LE, than I do between the Victor V12 and the 15C LE. About the only thing I find annoying about the Victor V12 display is the tiny decimal point.

Need An Intro to WP34S

*Message #1 Posted by **Les Wright** on 26 Oct 2011, 5:34 p.m.*

Hi all,

I have been relatively inactive for sometime but am back more now.

I am interested in learning about the WP34S but feel I am coming way to late to the party. I was wondering if someone can point me in the direction of how to get started--the hardware requirements, where to get the cable, how to flash the memory, keyboard overlays, etc.

I don't want to pester the group with a lot of newb questions that would have been already answered for me had I been more regular here for the past two or three years.

TIA,

Les

WP34S Start

Re: Need An Intro to WP34S

*Message #3 Posted by **Les Wright** on 26 Oct 2011, 6:02 p.m.,*
in response to message #2 by robertoataulfo

Thank you! That is easier than I thought.

Assuming I can get a programming cable (I will contact Gene on FB and ask him), is it a serial port connection only? I have one of those USB-serial converters, supposedly one of the better ones, but I could never get it to work. Failing that, I think I have an old laptop around with XP and an RS232 port. I do prefer the simplicity of USB, though.

I also see that The Calculator Store in Europe seems to sell pre flashed kits without the cable. Looks expensive (especially with shipping and duty to Canada), but they do reflash for free, even though the return shipping costs add up. Is it worth it?

Thanks,

Les

Serial Questions

Re: Need An Intro to WP34S

*Message #5 Posted by **Les Wright** on 26 Oct 2011, 6:33 p.m.,*
in response to message #4 by robertoataulfo

Thanks! But I must admit the nuances of the USB-Serial conversion just sail over my head. I know that as one actually interested in wp34s I should be more tech savvy, but I am not.

Looks like I was wise to keep that old laptop with the RS-232 port. Otherwise, if I am serious I will look at buying one pre-flashed. That said, I really would like a cable so that I can reflash my 15C LE once the PSE and other bugs are fixed in firmware...

Re: Need An Intro to WP34S

*Message #6 Posted by **Jeff O.** on 26 Oct 2011, 9:17 p.m.,*
in response to message #5 by Les Wright

See here too for info.

I recommend at least trying to flash it yourself. Should be doable with your XP machine with a real serial port. Wp34s will probably get pretty stable at some point, but there will likely still be occasional updates.

...

Re: Need An Intro to WP34S

*Message #7 Posted by **Les Wright** on 27 Oct 2011, 12:30 p.m.,*
in response to message #6 by Jeff O.

Alas, I just took a closer look at that old XP machine, and it doesn't have a female RS-232, only a male parallel port (old printer port, basically).

Anyone have success with a parallel-to-serial converter?

Les

Re: Need An Intro to WP34S

*Message #8 Posted by **Marcus von Cube, Germany** on 27 Oct 2011, 12:43 p.m.,*
in response to message #7 by Les Wright

Forget it! If you can find a PCMCIA card with a COM port you are fine. Why not just buy an FTDI equipped USB/serial converter?

Re: Need An Intro to WP34S

*Message #9 Posted by **Egan Ford** on 27 Oct 2011, 1:19 p.m.,*
in response to message #8 by Marcus von Cube, Germany

You're assuming that old XP machine has USB ports. :-)

Les, what is your current modern machine? If Mac, you do not need XP. You can flash from the Mac via a USB-to-Serial device from FTDI. And they can be had for ~$14 US.

Re: Need An Intro to WP34S

*Message #10 Posted by **Les Wright** on 27 Oct 2011, 1:29 p.m.,*
in response to message #9 by Egan Ford

Is this the sort of thing you are talking about?:

FTDI Cable On TAS

And, Egan, thank you for remembering, even though I haven't been regular here for awhile. I do indeed use Macs. I am glad to hear that the flashing is doable and the converter cables are cheap, available, and seem to work.

Now, to write Gene about the programming cable...

Les

Re: Need An Intro to WP34S

*Message #11 Posted by **Egan Ford** on 27 Oct 2011, 3:19 p.m.,*
in response to message #10 by Les Wright

That should work. If you really want to play it safe then get this one http://www.amazon.com/gp/product/B004ETE9GO. That is what I purchased and used with my MacBook Air with OS/X 10.6.8. I have been able to flash via OS/X (and Wine, you'll have to install Wine) and to also use the Emulator (also with Wine).

I should probably write a 34S for Mac users page on one of the Wiki's.

Re: Need An Intro to WP34S

*Message #12 Posted by **Michael Kussmaul** on 27 Oct 2011, 5:27 p.m.,*
in response to message #11 by Egan Ford

Yes please!

Re: Need An Intro to WP34S

*Message #13 Posted by **Les Wright** on 27 Oct 2011, 8:45 p.m.,*
in response to message #11 by Egan Ford

I just wanted to share that I do have a USB-Serial converter cable with the Prolific chip-set. On installing the most recent driver from Prolific the cable is recognized fine in XP in a VMWare Fusion VM on my Mac. Regrettably, I don't have any old serial port hardware, not even a mouse, with which to test.

Could this work, or has the general experience been that it has to be FTDI? Indeed, for all I know the technology can be similar or identical, albeit under a different brand.

Les

Re: Need An Intro to WP34S

*Message #14 Posted by **Les Wright** on 27 Oct 2011, 10:54 p.m.,*
in response to message #13 by Les Wright

Disregard this. I just read in another thread that it won't work. "Anything but Prolific" seems to be the advice.

If anyone has different experience, please let me know.

Les

Re: Need An Intro to WP34S

*Message #15 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 3:22 a.m.,*
in response to message #14 by Les Wright

Les, you can try the serial commands between the calculator on the emulator? It may well be that only the original SAM-BA software from Atmel has problems with the (probably counterfeit) Prolific chip sets. MySamba could be much more robust in this respect.

Re: Need An Intro to WP34S

*Message #16 Posted by **Les Wright** on 28 Oct 2011, 10:01 a.m.,*
in response to message #15 by Marcus von Cube, Germany

Thanks Marcus, I will look into how to do that. At the moment, there is no huge rush. The calculator won't be here for awhile and I haven't heard back from Gene yet about getting a cable. That gives me lots of time to experiment with the port commands in the emulator. I will look at the documentation and see how that is done, and will return with any questions.

Thanks,

Les

Re: Need An Intro to WP34S

*Message #17 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 12:07 p.m.,*
in response to message #16 by Les Wright

If you want to learn the I/O commands you can run the emulator from two different directories: Just create two icons and change the working directory. Then install com0com to emulate a pair of com ports which are

internally tied together. Now edit wp34s.ini in both directories to reflect the virtual com ports.

Re: Need An Intro to WP34S

*Message #18 Posted by **Neil Hamilton (Ottawa)** on 28 Oct 2011, 1:22 p.m.,*
in response to message #17 by Marcus von Cube, Germany

What a cool trick!

Re: Need An Intro to WP34S

*Message #19 Posted by **Egan Ford** on 26 Oct 2011, 9:49 p.m.,*
in response to message #1 by Les Wright

The info above is a good start, but I'll add:

1. MySamba.exe has been easier for me to use for flashing and it works from Linux and OS/X via Wine.
2. I have been able to flash using USB to Serial (FTDI-based) without issue from Windows/XP in a VM on OS/X. Based on others feedback any FTDI-based USB to Serial should work.
3. I'd hold off until after the fork. 3.0 is about to be released and it will have a different overlay. Unless you want the older overlay then 2.2 is feature complete.
4. Reflashing after initial flash is much easier. Esp. with MySamba.exe. It takes me about 30 seconds to update to a newer version.
5. 20b looks better, 30b feels better.
6. There is a Windows emulator for the 34S if you want to test drive first. It also runs with Wine.

Looking to borrow an HP 9100a/b for a technology gallery in NYC

*Message #1 Posted by **Keenen Thompson** on 26 Oct 2011, 4:45 p.m.*

My company is working on a biannual technology event happening in December this year, in New York City. We have an exhibit called Past Perfect and are looking to feature a HP 9100a/b in display perfect condition. A bit of Google searching led me here, and I hope to hear from some members who may be in the area with one of the calculators. If you're out of the area and interested, please still contact me and we can chat about shipping the device back and forth.

My email address is keenen [at] gawker [dot] com

Thanks.

MySamba/Samba does NOT work with Vista - Problems again

*Message #1 Posted by **Eddie W. Shore** on 25 Oct 2011, 10:29 p.m.*

Today I tried to install build 1797 (or whatever it is) that was released today and first of all Samba-BA v2.10 once again failed to recognize my calculator and MySamba recognizes the COM but I keep getting "Failed to Connect" screen - no matter what COM I choose. I used another computer and that computer didn't even recognize the calculator even AFTER I installed the driver.

I am using EasySync ES-U-1001-R10 (US232R-10) - because that cord worked the last time. However it doesn't now and I'm back to having a dead 20b.

I am using Windows Vista. It doesn't matter how many times I download the driver.

I am putting a request for a cord that goes straight to USB cord without any need for a serial adapter because I can't imagine that I'm the only one with these problems.

---------- I should have enough saved up to buy an updated 15CE if HP gets the PSE thing fixed.

Marcus, when you have version 2 stabilized and officially released, I aim to buy an updated WP 34S from you.

Update: I downloaded the MySamba that was just released. Sadly, no success. I keep getting the Unable to Connect error.

Edited: 25 Oct 2011, 11:05 p.m.

Re: MySamba/Samba does NOT work with Vista - Problems again

*Message #2 Posted by **Marcus von Cube, Germany** on 26 Oct 2011, 2:34 a.m.,*
in response to message #1 by Eddie W. Shore

Ed. The dead 20b is most probably no longer listening to the serial port due to flat batteries.

1. Only connect the cable while flashing!
2. Once in SAM-BA mode, remove the batteries if you do not succeed on the first try. SAM-BA will eat them quickly.

As for the USB cable you mentioned: Yesterday I built my own from an FTDI 3.3V-TTL cable and the original HP cable. I stripped the level shifter off the board inside the cable case and connected RX/TX/GND directly. In order to power the calculator from the cable, I added an external connector for a wall wart. Using the USB supply would need a 3V voltage regulator which I don't have. Maybe some kind soul redesigns the tiny board to contain a mini USB socket, an FTDI chip, and a voltage regulator, besides the two buttons, to make this a viable option for all of us.

Re: MySamba/Samba does NOT work with Vista - Problems again

*Message #3 Posted by **Jeff O.** on 26 Oct 2011, 7:50 a.m.,*

in response to message #1 by Eddie W. Shore

Eddie,
I can tell you that I have gotten MySamBa (Marcus' version of the program available at Sourceforge) to work with Vista and the same USB-to-serial converter that you have, as described here. Did you right click on the MySamBa.exe file and tell it to run in XP compatibility mode?

Re: MySamba/Samba does NOT work with Vista - Problems again

*Message #4 Posted by **Eddie W. Shore** on 26 Oct 2011, 8:11 a.m.,*
in response to message #3 by Jeff O.

I may have forgot to do that. I'll check. Thanks.

Re: MySamba/Samba does NOT work with Vista - Problems again

*Message #5 Posted by **Eddie W. Shore** on 26 Oct 2011, 10:40 p.m.,*
in response to message #4 by Eddie W. Shore

So I checked the Compatibility Mode, put new batteries, connected the calculator when the cord was flashing (which was all but a millisecond it seems) - STILL THE SAME RESULT: NO CONNECTION.

So I am back to the Samba CDC program - I click on COM 7 - and the program disappears! Then when I unplug the adapter I get this long error message:

```
error reading "file2d0e110": I/O error
  while executing
"read $fd 4"
  (procedure "TCL_Read_Int" line 6)
  invoked from within
"TCL_Read_Int $target(handle) $cidr_addr err_code"
  ("foreach" body line 10)
  invoked from within
"foreach cidr_addr $addresses {
  #Check the processor ID
  set err_code 0
  set version_mask 0x0FF0..."
 invoked from within
"if {$target(board) != "no_board"} {
 set srcDevld [file join $libPath(extLib) "devices" "devices.tcl"]
 if {[catch {source "$srcDevld"} errMsg]}..."
 (file "C:/Program Files/AMTEL Corporation/SAM-BA
v2.10/sam-ba_cdc.exe/lib/tkcon.tcl" line 4950)
  invoked from within
"source [file join $starkit::topdir lib/tkcon.tcl]"
  (file "C:/Program Files/ATMEL Corporation/SAM-BA
v2.10/sam-ba_cdc.exe/main.tcl" line 7)
```

This is the in the window "Error in startup script". Hopefully someone knows what is file is missing (if I am understanding this message correctly).

If I click on COM 3, Samba v2.10 will give me that "Old communication error".

I will seek help to get my 20b back to working (if it is possible) but as far as me using the cord to flash calculators is concerned - I'm done. It is too frustrating a process.

Re: MySamba/Samba does NOT work with Vista - Problems again

*Message #6 Posted by **Marcus von Cube, Germany** on 27 Oct 2011, 2:45 a.m.,*

> So I checked the Compatibility Mode, put new batteries, connected the calculator when the cord was flashing (which was all but a millisecond it seems) - STILL THE SAME RESULT: NO CONNECTION.

The sequence of events should be:

1. Start MySamba and fill in the fields.
2. Connect the cable.
3. Reset the calculator.
4. Turn on the calculator (you will not see anything). Hold down ON for a second or so.
5. Click "Send File" in MySmBa.

If MySamba errors out immediately (no noticeable delay) you have a problem between MySamba and the Windows driver of your serial port. If it takes a second or longer to error out, the problem is between the communication endpoints such as a calculator not answering the packets from the PC.

Download and install "Free Serial Port Monitor". It will show you what is going on on the serial port. I used it to debug the communication between the emulator and the device but it should equally well tell you what is going on (or not) while flashing.

I have SAMBA 2.10 with my Vista (32 bit) machine. It installed 2 versions. The one with a "_cdc" tag indeed does NOT work. The one *without* the "_cdc" works fine with my FTDI USB-to-serial converter.

Re: MySamba/Samba does NOT work with Vista - Problems again

*Message #11 Posted by **Marcus von Cube, Germany** on 28 Oct 2011, 8:28 a.m.,*
in response to message #10 by Bart (UK)

CDC assumes a working USB device implementation on the target. This is obviously not the case with an HP 20b or 30b.

SAM-BA is awfully slow compared to MySamba. Either Atmel has done a horrible job or Cyrille an extraordinary good one. I assume both is true. Think of 3 minutes versus 20 seconds to reflash the device. Why SAM-BA is so slow and why it is so picky with the execution mode or the serial port driver is beyond me.

HP-97S

*Message #1 Posted by **aj04062** on 25 Oct 2011, 8:58 p.m.*

Rebuild time!

Just obtained this 97S (minus the front plate, Help?) from an old doctor friend who also let me take an old 9810 too!

It's connected to a digital caliper with RED LEDs (Digit-Cal)

All seem to work, except the printer and card reader. I have the software with the unit too. Hopefully with a card reader rebuild, I can measure catheters like it was 1982!

Can anyone answer how accurate the "rarity scale is" on HPmuseum?

Edited: 25 Oct 2011, 9:24 p.m.

WP 34S: Release Planning

*Message #1 Posted by **Marcus von Cube, Germany** on 25 Oct 2011, 4:35 p.m.*

We are planning to spit out a 'final' V2.2 release of WP 34S as a ZIP file. I have made a few crucial modifications to the power saving scheme (finding more bugs in the process than I'd like to admit). Chances are high that I screwed something up so I kindly ask you to update your 20b or 30b and use it to tell me what needs to be fixed. Please no ideas what should be added because new functions are exclusively planned for the next release! I'm talking about bug fixing here.

At present, the overlay works fine with one exception: x<>y in the f and g shifted planes. In normal mode, they generate y<> and z<>. But don't cry out too loud too early! ;-) The functions a->x and x->a are still on the keyboard: Just switch to alpha mode and the functions are mapped to their positions marked on the overlay. I would like to leave this in as a compromise and not change the mapping back to what it was in V2.1.

Re: WP 34S: Release Planning

*Message #2 Posted by **Alexander Oestert** on 26 Oct 2011, 1:35 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I'm ready for testing! Is it up already?

I would like to leave this in as a compromise and not change the mapping back to what it was in V2.1.

In the beginning I didn't like this idea. Now, after having played with it a bit, I think this is how it always should have been! It's the most intuitive solution I can think of!

To make the keyboard appropriately reflect this function switch I am thinking of printing a tiny [y<> and z<>] label on a paper sticker and putting it above the key beneath the [GRAD]. Is the artwork already updated with this?

Emulator updates & HP82240B printer simulation

*Message #1 Posted by **Christoph Giesselink** on 25 Oct 2011, 2:11 p.m.*

In the last weeks I updated Emu48 Classic to v1.51, Emu28 to v1.23 and Emu42 to v1.14. All three emulators for Win32 now contain an interface for a Redeye printer simulation.

Normally the calculator send infrared pulses in the Redeye format to a HP82240 printer. These pulses are decoded inside the HP82240 to a data byte stream. Because I have no real chance to transfer the infrared pulses over an interface inside a PC, I decided to integrate the Redeye format decoder inside the emulator listening at the STL bit of the LED control register at Emu28 and Emu42 and at the half bit frame generator bit at Emu48.

This beginning of this project go back to the year 2002 or 2003. Cyrille send me a decoder sample for Emu48 at this time. I know the Redeye format since I wrote a decoder for it in the early 90'ties, so I find it a good idea. But I also knew that an implementation for Emu42 is much more difficult. So I decided to integrate the Redeye decoder inside Emu42 first. Because I already wrote such an decoder in 8052 assembler, an implementation in C was rapidly done. But in not "Authentic Speed" mode weather a HP28S nor the HP42S was able to print 10 or 20 characters successfully. In "Authentic Speed" mode printing with a HP42S was working, but not with the HP28S. The reason for the HP28S in "Authentic Speed" mode is a timing issue, which base on the timer integration concept inside the Emu42 emulator. So I decided to use a workaround which you normally don't recognize. But the problem in non "Authentic Speed" mode (full running) was still left. I knew that the reason for this misbehaviour was inside the CPU cycle clock measurement (see also my MoHPC article Inside Saturn Emulator Timing, but I had no idea how to solve it. So I cancelled further working on this project for over 7 years. In spring 2011 I restarted the printing project and solved the timing problem. All three emulators now got the Redeye decoder.

But still a printer simulation was missing. IMHO it makes no sense to add a printer simulation to each emulator, so I decided to write a separate HP82240B printer simulation. After my experiences with TCP/IP in Emu71 I decided to use UDP for the inter-process communication between the calculator emulator and the printer simulator. So all emulators send their decoded bytes over IPv4 to the address "localhost" port 5025 by default. The address and port can be changed in the "Settings" dialog.

My new HP82240B printer simulator, available on my homepage at http://hp.giesselink.com/, set the main focus on text input. So the main window is a text mode window only. To support most of the Roman8 and ECMA94 character set, I decided writing an Unicode application with translation tables from the printer fonts to Unicode. So be aware to use a Unicode font which support most of the used characters and when you are doing Copy&Paste to a non Unicode editor, you will get conversation losses. This is a limitation, but after more than 10 years after introducing Unicode to a Windows OS, when should we begin using Unicode? But there's also an optional windows in the printer simulation showing the printer output in the original HP82240B printer font.

As input interface the HP82240B simulator support the native IPv4 UDP interface of the Emu28, Emu42 and Emu48 emulators, a serial COM port interface for the HP48 series wire interface and finally USB over the original HP USB driver used by Conn4x for supporting the HP48GII, HP49G+ and HP50G calculators. The display dump capture over a key isn't supported for the HP49G and later. Since the HP49G calculator the display dump over a key use a HP82240B incompatible format. Use Conn4x for a display dump instead please.

I hope you enjoy using the new printing capability of the emulators. For those which want to add the UDP interface to their own HP82240 emulator or simulator, just integrate a normal UDP server listening for the data byte stream

on the given port.

Caution: On slow PC's especially NET books with Intel Atom CPU the printing may not work properly with loosing transferred data or with decoding errors inside the Emu28 and Emu42 emulator.

Christoph

You can remedy this by making the printer a multi threaded process with a buffer that reads the UDP packets and feeds them to the printer window at a suitable pace. I'm wondering why the IP stack doesn't take care of this, it should buffer the packets until they are fetched by the server.

The receivers are implemented in a separate thread. Since USB support there's also a 64K print buffer between the receiver and the printing thread. Loosing characters happend very early in development on an Atom Net-book. With this last version the Net-book got defect characters from time to time. We recognized a heavy CPU usage at printing caused by Emu42 and the printer simulation. I have the suspicion that the redeye decoder inside Emu42 don't work properly at high CPU usage on slow machines.

The redeye decoder addition sounds like a nice project. :)

> Quote:
>
> I have the suspicion that the redeye decoder inside Emu42 don't work properly at high CPU usage on slow machines.

I haven't looked at the code yet, but I assume that the redeye decode is native code (not calculator code emulated by the emulator).

As the redeye decoder is checking the output bit, is it operating independently of the emulated machine (polling the emulated register)? Or is it in lock-step with the emulator (being triggered by changes to the emulated register and delaying the emulator until the decoder has finished)?

It seems if it were operating in lock-step with the emulator, it would be impossible to miss bits but that might affect emulator timing.

If it is operating independently of the emulated machine, it has to poll the emulated register very frequently and might miss a bit transition if the CPU is under heavy load. If that is the case, it probably needs to be multi-threaded such that the polling thread is high-priority and stores transitions in a ring buffer, while the decoder thread pulls transitions out of the ring buffer and decodes them to send out via UDP.

Using a ring buffer would allow the polling thread to detect overflow if the decoder was not keeping up. That overflow condition could possibly be used to pause the emulator (again affecting emulator timing).

Yes, it's done by this way. I watch for the rising edge of the STL bit and count the CPU cycles between them. So the decoding is independent from the real CPU speed during emulation.

UDP is allowed to lose packets.

I know, but I assume that is more relevant on a physical line than inside the stack. It's IP in general that allows packets being dropped, split and/or delivered out of order. UDP doesn't add any error recovery logic and leaves it to the application while TCP is designed to just do all the error handling transparently for the application.

Almost all IP loss is in the stack on one end or the other. You can see this if you use a network sniffer. In the old days network hardware had very small buffers (memory was expensive and wire speeds were slow) and if the stack didn't get the packet out of the hardware in time it would be overwritten by the next packet coming in. Even then loss on the wire essentially never occurred unless the equipment or install was faulty.

Speaking as someone who has implemented such stacks, usually today the loss is because there is little or no buffer in the receiving stack. Being stateless, there is no way to know if the layer for whom the packet is intended is still expecting it, so if for some reason it cannot be delivered before the limited buffer is full and the next packet comes in, something will be lost. Sometimes the sender will also throw away a packet for a similar reason -- if the line send queue is full a packet will be dropped instead of added to the queue.

The physical line essentially never loses packets. The hardware on both ends tries very hard not to lose packets with sender retransmit when it detects a problem and large direct to memory ring buffers in modern receivers. Of course, there was and is nothing in the ethernet physical layer for the recipient to request a resend so loss can still occur, but it is rare unless you have faulty hardware. (With WiFi physical layer there is ACK/NAK, so loss is almost never in the physical layer.)

Thanks for the insight. When IP was invented, things were different, of course: Wide area connections were unreliable and slow and CSMA/CD as the underlying Ethernet technology (shared media) for local networks is prone to data loss, too.

Either way, losing packets is part of IP and must be handled somewhere. I was thinking that modern implementations would have large memory buffers and only drop a packet when its TTL (time to live) field indicates it, but with the high speed networks of our days, this might not be the case.

The case of the printer emulation is special: with localhost being the destination there isn't a physical line involved at all so packet loss must occur in the software. I see two possible causes: The sender (low level IP driver) blocks because of a buffer full situation and this makes the timing critical decoder of the IR bit stream loss synchronization, or, if the sender does not block, packets are simply dropped if they don't fit in the available buffers. To get out of this situation, a lock-step method between the encoder and the decoder together with a large enough buffer in the printer emulator would be the only safe option.

TNX for the discussion above. I liked it very much forcing me to rethink about some implementation details. But I still think my implementation is ok.

The net-book (Win7 starter) I'm speaking about made trouble several times before. On almost all emulators on fast key input it loose keys, furthermore playing a keyboard macro works only with a very large delay between keystrokes.

The UDP packet loss on this machine happened with the two thread solution: 1st thread Main Windows and message loop, 2nd data receiver, converting and printing. An earlier proof of concept program with UDP server and text output only, worked without packet/byte loss.

The actual printer simulator is a three thread solution: 1st thread Main Windows and message loop, 2nd receiver thread putting the data into a 64K ring buffer, 3rd thread fetching the data from the ring buffer converting and printing. With this version we recognized no packet loss with UDP, but characters with code 127, which I use when I detected a decoding error in the emulator.

The ring buffer was primarily added for the USB receiver, because I also had CPU usage dependent character losses. It not really fixed the entire problem at USB, I had to do some additional work in the USB receiver thread to get rid of the problem, but it improved the software design and made some things easier.

I'm still wondering how this can happen with a fully synchronized (lock-step) decoder. A slow computer should slow down everything but not introduce such artifacts. Is there any timing involved in the decoder? Does it in fact poll the output triggered by the firmware in an independent thread or do you trap the toggle of the output when it's done? How do you determine the number of emulated clock cycles between state

changes?

Re: Emulator updates & HP82240B printer simulation

> Quote:
>
> Is there any timing involved in the decoder?

Not in the decoder itself. I had to slow down emulation speed during CPU speed measurement of the firmware which I described in MoHPC articel 1113. With the result of the speed measurement, the firmware generates the IR timing for the STL bit.

> Quote:
>
> How do you determine the number of emulated clock cycles between state changes?

The clock cycles are part of the CPU opcode emulation and are the basic for the "Authentic Speed" mode. In the case of the Redeye decoder I know that the first three IR data frames of each data byte are sync frames with half bit length, so I can combine the measured CPU cycles to the half bit length.

You run Emu42 on a battery powered computer. The Win OS know three battery states: OK, Low Bat,

Critical. You see these states also in the Bat annunciator of the emulated calculator. This is a wanted emulated feature.

Strangely for a mechanical engineer, I have had exposure to LISP. We used to call it, "**L**ots of **I**rritating **S**illy **P**arenthesis".

It was used as the scripting language for AutoCAD software.

RIP John McCarthy

Re: R.I.P. John McCarthy

*Message #4 Posted by **Nick_S** on 28 Oct 2011, 5:36 a.m.,*
in response to message #3 by Norman Dziedzic

That is shame. His LISP language seems to have been an important influence on HP's RPL, where HP removed the need for parentheses by making theirs a post-fix functional language drawing on their own RPN and Forth. I still get a buzz out of passing named and anonymous functions around as parameters, e.g, when using the R language or one of my HP calculators, rather than just manipulating data.

*Message #4 Posted by **Paul Dale** on 25 Oct 2011, 4:56 p.m.,*
in response to message #1 by John Abbott (S. Africa)

This was an error that used to be raised and then got lost in one of the reworkings/bug fixes in the input handler. We didn't deem it a high priority to get back when we eventually noticed it (much later).

Curious that the picture of the 39gii on the web-page Gilles referenced seems to be the same photo posted here a couple months ago, which has Chinese characters on the soft menus. There is a link on the page to HP's USA web store, but no inkling at all that this calculator even exists. I wish someone who actually knows could explain this.

Re: HP 39gII spécification

*Message #9 Posted by **M. Joury** on 25 Oct 2011, 3:05 p.m.,*
in response to message #7 by Don Shepherd

The information still appears to be pretty sketchy. I would love to hear more. I quite like the 39gs and would love to see that calculator expanded with a more powerful language and even better aplet programming support.

One of my complaints is the need for a one-to-one correspondence between the entries in the VIEWS menu and programs to support those menu entries. A much nicer solution would be passing a parameter to a program and then using an IF statement or a CASE statement to decide what to do next. It would leave the program "folder" much less cluttered. As far as I can tell there is no way to do this with the 39gs.

Some other issues I have they appear to be addressing if we can believe what we are reading: Lack of proper variables names and function calls are two of the current shortcomings of the 39gs.

Cheers,

-Marwan

Canon Pocketronic - Power Supply

*Message #1 Posted by **Joerg Woerner** on 24 Oct 2011, 6:49 p.m.*

Hi Folks,

Just received a very nice Canon Pocketronic with the famous 13 batteries inside. The cells look nice, I charged with a Bench Supply the 7 small ones at the lower end of the calculator.They still seem to hold a charge.

Unfortunately is the power supply missing, should be 16V DC. The connector had 3 pins, somebody out in the World who knows the voltages of the pins?

Thanks and Regards,

Joerg

Re: Canon Pocketronic - Power Supply

*Message #2 Posted by **Katie Wasserman** on 24 Oct 2011, 7:08 p.m.,*
in response to message #1 by Joerg Woerner

Joerg,

It's a split supply with -10.5 volts and +9 volts. Only the row of 3 pins on the power connector are used, the center one is ground (I don't recall which of the two is + vs -).

While you could use a single supply of 19.5 volts I would not recommend it. The -10.5 volt supply charges the 7 x 2/3AA cells while the +9 volt supply charges the 6 x AA cells. Since they have different capacities you'll either under or over charge one set of cells. However, if these are old cells that need to be replaced anyway, go right ahead.

It's possible to replace all the cells with AAA cells in plastic holders. Somewhere on this forum I described how I did this.

-Katie

*Message #12 Posted by **gene wright** on 25 Oct 2011, 4:55 p.m.,*
in response to message #10 by Olivier De Smet

1) I started a program on the HP 67 but could not stop it running.

2) When I right click on a card, I get a context menu to insert side 2 but cannot seem to get a context menu for side 1.

Re: And now an HP 67 emulator with the HP 97 one

*Message #13 Posted by **Olivier De Smet** on 26 Oct 2011, 3:45 a.m.,*
in response to message #12 by gene wright

1) to insert side 1, right-click on the left part of the card (side 1 mark) to insert side 2, right-click on the right part of the card (side 2 mark)

2) the keyboard of the 67 isn't mapped as the 97, it seems that the F2 line of the card reader is wired somewhere on the keyboard matrix for the R/S key behaviour, but I didn't find where actually (I don't have a 67, only a 97) (opcode 00400 and opcode 00500)

The opcodes 00760, 00160, 00060 are still unknow for me :(

Some other opcode are ok, other are working, but I'm not sure of their behaviour

I don't have the wiring of the F0, F2, F3 and F4 lines of the card reader.

F1 is for prgm/run switch

F2 ?? for some keys ?

F3 not used

F4 used externally for the A to E behaviour

I need to use a F0 internal flag for merge pending

The 67 emulator isn't as mature as the 97 one, sorry.

I made a quick hack, and now it's working, get version 1.1 on my site

Olivier,

Yes the HP-67 emulator works much smoother. Many thanks!

Namir

HP67 97 emulator

*Message #20 Posted by **Olivier De Smet** on 2 Nov 2011, 3:10 p.m.,*
in response to message #19 by Namir

New version 1.6

At speed greater than x1, ALL PAUSE, -x- & all for HP67 are at the right speed (better than a HP15C LE)

CPU is used at 100% only at max speed and when computing.

For the curious I'm curently dis-assembling the ROM of the HP97. I have currently 50% of code commented :) And I can re-assemble a good rom (same as the original bit-per-bit) with an home made assembler. Now it's time to patch it

Edited: 2 Nov 2011, 3:10 p.m.

HP 67 and 97 Emulator

Re: HP67 97 emulator

*Message #23 Posted by **Israel Otero** on 4 Nov 2011, 1:44 a.m.,*
in response to message #20 by Olivier De Smet

Hi Olivier, I am curious about the bitmap images you include in the 1.6 version files, with a photo of the actual display of the HP-97, do you will make the emulator more realistic with digits of the same separation between them and proportional size of the actual 97? That could be wonderful. I love both this display and the classic series, when the ones and fours are as tall as the other digits.

I still boggle why following up directly to a thread merely a month old in this forum is verboten, but anyway..

I finally heard back from Atmel (through their 3rd party die reseller) who declined to quote our bid on the at91sam7l128 citing the device in die form was either in, or will soon be EOL. I speculate that was the primary motivation for the board layout change to accommodate the 128 lqfp in the new ARM voyagers.

Not too surprising as the sam7 is getting rather long in the tooth and there hasn't been any follow on AFAICT to either l64/l128 version. Also other more recent vendor designs exist with improved performance/power capability. Yet despite its age the sam7l appears to still have some competitive differential particularly given its price point.

M1.4 x 4mm (or perhaps x 5mm depending on washer thickness) is just about ideal. I'd initially tried M1.2 x 5mm screws however due to the thread major diameter routinely running undersize for such a fine pitch, an M1.2 screw doesn't have much (if any) penetration into the stake void walls. I also expect substantial variation exists relative to screws and enclosure molding run.

However the M1.4 thread needed to be formed with a tap in my case as the fit was too snug. Machine screws will wedge vs. cutting threads and unless tapped there is a risk of randomly splitting the heat stake.

Another possibility is to intentionally slice the stakes in half lengthwise allowing a controlled expansion/wedging within the pcb. But use of a plug tap is probably an overall simpler approach.

in response to message #4 by DigiGal

> Quote:
>
> Read the whole thread. . .

Yes, I had.

My point rather was I'd originally suggested use of M1.2 screws after casually gauging the stake voids and neglecting to compensate for the typical clearance-reduced major diameter. So M1.4 is a better standard size for the task.

Still the use of a machine screw in ABS is unorthodox. The no-holds-barred approach would be to (slightly) drill out each stake void and heat-press in a threaded section of 1.6mm (1/16") brass tubing tapped in advance for a M1.4x0.3mm thread.

While the above admittedly is extreme for an ARM voyager, true hardship cases exist begging for similar treatment such as the 42s "write once" enclosure.

Create empy list on 38g/39g/40g

*Message #1 Posted by **Kiyoshi Akima** on 24 Oct 2011, 2:30 p.m.*

This is such a simple question, but I can't find an answer in the manual.

How do I, under program control, create an empty list, or else initialize an existing list (of arbitrary size) to empty? I know how to do it from the keyboard by going into the VAR menu, selecting the list, and pressing [DEL]. (By "program" I mean HP-BASIC, not SysRPL.)

I'm trying to get a program to initialize itself to a known state, which requires an empty list to which it can add things as it goes.

Re: Create empy list on 38g/39g/40g

*Message #2 Posted by **Eddie W. Shore** on 24 Oct 2011, 3:20 p.m.,*
in response to message #1 by Kiyoshi Akima

{ } -> L# should do it. (where # is 0-9)

Re: Create empy list on 38g/39g/40g

*Message #3 Posted by **Kiyoshi Akima** on 24 Oct 2011, 3:25 p.m.,*
in response to message #2 by Eddie W. Shore

Nope. {} gives a syntax error, with or without a space between the braces.

Re: Create empy list on 38g/39g/40g

*Message #4 Posted by **Eddie W. Shore** on 25 Oct 2011, 9:02 a.m.,*
in response to message #3 by Kiyoshi Akima

> Quote:
>
> Nope. {} gives a syntax error, with or without a space between the braces.

I got the same thing. MAKELIST requires a sequence - I can't imagine a way to create an empty list.

I have a feeling that empty lists aren't possible on the 38g/39g/40g.

Possible workaround (?):

Initialize the list with {1} and delete the "first 1" at the end program execution

```
{1} -> L1
** commands to add elements to L1
Result:  L1 = {1, #, #, ...}
**
SUB L1; L1; 2; SIZE(L1)
```

```
Result: L1={#, #, #, ...}

SUB - CMDS-Matrix menu
SIZE - MATH-List menu
```

I hope this helps.

Eddie

MySamBA execution level

*Message #1 Posted by **Masaki Adachi** on 24 Oct 2011, 1:15 p.m.*

FWIW when ran on my windows 64 bit install, MySamBA will not show available com ports unless the program is run as Administrator. Not sure if this is some seeting on my machine, but USB IO port controller that I use with my bitWhacker gizmo does not require this.

Re: MySamBA execution level

*Message #2 Posted by **Marcus von Cube, Germany** on 24 Oct 2011, 2:22 p.m.,*
in response to message #1 by Masaki Adachi

I cannot comment on this for various reasons (I'm running XP 32bit in Admin mode and I don't know the innards of the library used for the com port handling in MySamba).

But I have recently changed MySamba to allow the manual input of the com port. This might solve a Linux problem, too if it works at all. Please test!

Re: MySamBA execution level

*Message #3 Posted by **Masaki Adachi** on 24 Oct 2011, 10:41 p.m.,*
in response to message #2 by Marcus von Cube, Germany

It works. As long as one can guess a correct port number, that is.

Also, the new form's file selection box is rather long and pushes Browse button to far right, causing the form width to cut off the button. please check.

Edited: 24 Oct 2011, 10:53 p.m.

Re: MySamBA execution level

*Message #4 Posted by **Marcus von Cube, Germany** on 25 Oct 2011, 2:02 a.m.,*
in response to message #3 by Masaki Adachi

You can resize the Window to the right. I added this feature to allow seeing the complete file name of the binary file. But this looks strange when you have worked with the old version before because the stored width is just too small.

Re: MySamBA execution level

*Message #5 Posted by **Masaki Adachi** on 25 Oct 2011, 7:12 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Is vertical scroll bar supposed to display on the form? Mine does.. My system locale is set to Japanese in order to allow non unicode Japanese application to display correctly. This sometimes confuse size calculation for application. see the screenshot here

Re: MySamBA execution level

*Message #6 Posted by **Marcus von Cube, Germany** on 25 Oct 2011, 9:06 a.m.,*
in response to message #5 by Masaki Adachi

> Quote:
>
> Is vertical scroll bar supposed to display on the form?

No. I can only test on my XP box where it doesn't appear. I've added some more headroom around the borders.

Re: MySamBA execution level

TI's "fake weight"

*Message #1 Posted by **Cristian Arezzini** on 24 Oct 2011, 7:11 a.m.*

I was at a flea market yesterday, and saw a calculator that looked interesting. It was a TI BAII Plus Professional, "advanced business analyst". I'm not a finance type, I know nothing about business, so I have no practical use for it; but it was in good condition, it felt solid and well-built, and at 5 euro it was cheap, so I bought it.

I took it home and immediately disassembled it, to see how it is built. It does seem well-built enough - and the keyboard has a decent feedback, really usable - but I was amused to see that they screwed two heavy metal plates to the back shell, just to give it a more substantial feel. I mean, the weight doesn't come from solid casing and high-quality materials: but from something added just with the purpose of making you think it's solid! :) Personally I think it's a bit like cheating... like gold-plating a watch, or like putting a wing on a otherwise standard car, so that it just looks faster... But I do agree that it feels good to hold it! :)

Cristian

Re: TI's "fake weight"

*Message #2 Posted by **Paul Gaster** on 24 Oct 2011, 7:48 a.m.,*
in response to message #1 by Cristian Arezzini

I don't think TI is the only one who does this. The pictures I have seen of the 15C LE show a black metal plate in the back housing. I can't think of any reason it would be there except to add weight. Of course for the LE the goal was to make it look, feel, and get the same results as the original, so I guess it is a special situation.

Re: TI's "fake weight"

*Message #3 Posted by **Eric Rechlin** on 24 Oct 2011, 3:47 p.m.,*
in response to message #2 by Paul Gaster

Usually thin metal is put inside for RFI protection. You don't need a thick metal plate, but a lot of HPs, including the 48, have a thin metal sheet/plate covering the board to meet FCC requirements.

Eric

Re: TI's "fake weight"

*Message #4 Posted by **Paul Gaster** on 24 Oct 2011, 7:07 p.m.,*
in response to message #3 by Eric Rechlin

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=196943

The 15C LE metal has a bunch of holes and does not cover even half of the pcb.

Re: TI's "fake weight"

*Message #5 Posted by **db (martinez, ca.)** on 24 Oct 2011, 8:14 p.m.,*

in response to message #3 by Eric Rechlin

Eric; I was once told that weight for weight or mass to mass, a mesh is better for rfi protection than a sheet. Is that true?

Re: TI's "fake weight"

*Message #6 Posted by **Eric Rechlin** on 25 Oct 2011, 1:56 a.m.,*
in response to message #5 by db (martinez, ca.)

The point is you don't want the holes so big that the RFI can get out at the wavelengths you are trying to block. You're basically building a Faraday cage. More holes = less material = cheaper. It's reached the point where the simplest materials (like plain metal) are a big factor in the cost of electronic devices, because the electronics have gotten so cheap and commodities have gotten so expensive.

I think calculators these days probably emit so little RFI that there isn't a need for shielding anymore.

Eric

Re: TI's "fake weight"

*Message #7 Posted by **Katie Wasserman** on 25 Oct 2011, 11:13 a.m.,*
in response to message #6 by Eric Rechlin

Early calculators that used inverter circuits to obtain the higher voltages needed for early MOS chips emitted a huge amount of RFI. I don't think that there were any RF emission standards for low power devices back then. For laughs take a broadcast band AM radio and put in next to an HP-35 then tune between stations. You can hear the 35 calculate!

Re: TI's "fake weight"

*Message #8 Posted by **Ethan Conner** on 25 Oct 2011, 12:07 p.m.,*
in response to message #7 by Katie Wasserman

When i was in high school i remember being able to hear my TI-30 on my am/fm cassette player.

Re: TI's "fake weight"

*Message #9 Posted by **Palmer O. Hanson, Jr.** on 26 Oct 2011, 12:58 a.m.,*
in response to message #7 by Katie Wasserman

> Quote:
>
> For laughs take a broadcast band AM radio and put in next to an HP-35 then tune between stations. You can hear the 35 calculate!

At one time someone proposed that the way to tell that a lengthy TI-59 calculation had finished without watching the display was to listen to a nearby radio. .

Re: TI's "fake weight"

*Message #10 Posted by **Geoffrey Wang** on 24 Oct 2011, 11:46 a.m.,*

in response to message #1 by Cristian Arezzini

I read somewhere that TI did this with their recent calculators like the TI36X. It's not cheating, but rather paying attention to customer feedback. I doubt most people would not want to buy a calculator with a bunch of keys and light weight (just like keyboards). I just wish Casio had done it with non-HP16C alternative, the CM-100.

Re: TI's "fake weight"

*Message #11 Posted by **Cristian Arezzini** on 24 Oct 2011, 1:52 p.m.,*
in response to message #10 by Geoffrey Wang

I didn't know this was common practice, but after all it makes sense. I can see why people like to have something that feels "heavy" in their hands. It's just that I would prefer if the weight came from a more substantial structure rather than an iron bar screwed to the shell! :)

Cristian

Re: TI's "fake weight"

*Message #12 Posted by **Thomas Radtke** on 24 Oct 2011, 2:40 p.m.,*
in response to message #11 by Cristian Arezzini

Lightweight calculators are shirt pocket friendly. It is, after all, a *pocket* calculator, not one to fill a lead belt.

Re: TI's "fake weight"

*Message #13 Posted by **Jeff Johnson** on 24 Oct 2011, 3:57 p.m.,*
in response to message #12 by Thomas Radtke

Geoffrey and Cristian are spot on. It's not just calculators. Back when Bell Telephone went to electronic sets, users felt that the phones were "cheap" feeling, so Bell added metal plates to give it the "quality" feel. We have a paradigm that associates weight with quality. Much like the humorous problem with the HP-12C revision, where accountants were uncomfortable with the increased computation speed, afraid that the calculator was rushing through the calculation. They liked to see it "doing something".

Re: TI's "fake weight"

*Message #14 Posted by **Bill Wiese** on 24 Oct 2011, 4:01 p.m.,*
in response to message #1 by Cristian Arezzini

This is not unusual.

QA testing may have found that without added weight it scooted over the desk when in use, perhaps.

Weight also sometimes gives the perception of 'substance' and durability.

When I was at Motorola, one person told me that Moto - who for decades has made durable police radios, walkie-talkies, etc. - in the late 80s was able to reduce the weight of their police walkie talkies simply due to integration and materials changes.

In no way was durability or lifespan affected. But reports of 'issues' and quality drops kept coming in - after investigation, there was no substantiation but somehow "lightweight" kept coming up. Moto put some weights inside the radios without anything else changing, and the complaints stopped.

Perception is a nasty beast.

Bill Wiese San Jose CA

Re: TI's "fake weight"

*Message #16 Posted by **Lincoln R.** on 25 Oct 2011, 12:25 a.m.,*
in response to message #15 by BobVA

There's another more practical reason for putting weights in things. The weights make it less likely that the object will move when said movement is undesirable (for instance one would not want their calculator to go sliding around the desk when they push a button, or have a rotary dial phone spin when they try to turn the dial).

For that matter, my dishwasher has a large concrete block (I kid you not) zip-tied to the bottom part of the metal frame. The block does nothing for cleaning dishes, nothing for appearance, and I doubt anyone ever says "these darn lightweight dishwashers are junk."

Re: TI's "fake weight"

*Message #17 Posted by **Jose Gonzalez Divasson** on 25 Oct 2011, 3:55 p.m.,*
in response to message #15 by BobVA

There is a school of audio enthusiasts that claim that adding weight to audio components improve sound, by lowering their resonance frequency to below audio band. Hence, you see weights in turntable platters, lead shot in hollow tubes in audio racks, 150lbs loudspeakers, and so on.

There is another school that aims to low mass - and trying to have the q of that mass as low as possible (light woods, composites), trying to get a low resonance peak, but avoiding energy storage and therefore delayed release.

Another world altogether!

Re: TI's "fake weight"

*Message #18 Posted by **Michael Meyer** on 26 Oct 2011, 5:17 p.m.,*
in response to message #17 by Jose Gonzalez Divasson

I suppose that's the reason I'm heavier than I used to be--- to give the impression of increased quality!

Re: TI's "fake weight"

*Message #19 Posted by **Ren** on 27 Oct 2011, 2:41 p.m.,*
in response to message #14 by Bill Wiese

IIRC, back on the old USENET ham radio group, someone told the story of repairing an old handheld Motorola that a cop frequently used as a "billy club". It would arrive in the repair shop with bits of hair or skin stuck to knobs.

15C-LE Blinking

*Message #1 Posted by **dbatiz** on 23 Oct 2011, 11:50 p.m.*

Is it normal for an overflow condition to make the display blink on a 15C? On my 15C-LE, if I type 70!, i get 9.999999 99 blinking. I can then keep doing other problems, but the display keeps blinking until I use the "back arrow" key. Is this normal?

Very Respectfully,

David

Re: 15C-LE Blinking

*Message #2 Posted by **Michael de Estrada** on 23 Oct 2011, 11:56 p.m.,*
in response to message #1 by dbatiz

Yes. It is normal.

Re: 15C-LE Blinking

*Message #3 Posted by **MK-52** on 24 Oct 2011, 1:23 a.m.,*
in response to message #1 by dbatiz

The flag 9 is set to true when overflow happen. (HP-15C Owner's Handbook page 45) Thank you.

Re: 15C-LE Blinking

*Message #4 Posted by **dbatiz** on 24 Oct 2011, 1:53 a.m.,*
in response to message #1 by dbatiz

My apologies. Thank you for the prompt responses. I didn’t have my manual handy when I posted the question. I don’t remember if the 11C had any blinking error conditions for overflow.

Very respectfully,

David

Re: 15C-LE Blinking

*Message #5 Posted by **MK-52** on 24 Oct 2011, 2:33 a.m.,*
in response to message #4 by dbatiz

I checked HP-11C Owner's Handbook (Japanese version). The manual doesn't state the blinking. However, I don't have 11C, and so I cannot check it on real machine.

Edited: 24 Oct 2011, 2:42 a.m.

Re: 15C-LE Blinking

*Message #6 Posted by **Katie Wasserman** on 24 Oct 2011, 10:29 a.m.,*
in response to message #5 by MK-52

The 11C doesn't blink on overflow or for any other reason.

Re: 15C-LE Blinking

*Message #7 Posted by **Nicholas Winterer** on 24 Oct 2011, 3:52 p.m.,*
in response to message #6 by Katie Wasserman

The blinking feature cost extra, of course.

Re: 15C-LE Blinking

*Message #8 Posted by **Tim Wessman** on 24 Oct 2011, 4:01 p.m.,*
in response to message #7 by Nicholas Winterer

How about we make a LE 15c that blinks constantly. That should definitely be worth the price I think you will agree.

Clairvoyant 15C-LE Blinking

*Message #9 Posted by **Howard Owen** on 24 Oct 2011, 4:18 p.m.,*
in response to message #8 by Tim Wessman

Make one that displays your answer before you enter it and you'll have an even bigger hit. :)

Technically there is a single BLINK opcode in the 11c rom image, executed just after "running" is loaded into the display registers. Other instances of a 0x030 word are in what appears to be constant data.

[Edit: the same appears true for the 12c/16c firmware versions I've checked.]

*Message #11 Posted by **Gerson W. Barbosa** on 24 Oct 2011, 4:22 p.m.,*
in response to message #4 by dbatiz

No need to apologize. The HP-15C is the only Voyager that blinks on overflows, as far as I know. Cyrille once called this a "**strange 15C behavior**", perhaps the first indication that the HP-15C LE was on its way to becoming true :-)

Regards,

Gerson.

Re: 15C-LE Blinking

*Message #12 Posted by **Dave Britten** on 24 Oct 2011, 8:12 p.m.,*
in response to message #1 by dbatiz

You can also manually trigger the blinking display with SF 9, if you have some need to do that in a program (signal an error, or what have you).

Re: 15C-LE Blinking

*Message #13 Posted by **Marcus von Cube, Germany** on 25 Oct 2011, 1:57 a.m.,*
in response to message #12 by Dave Britten

Yes you can. SF 9 starts blinking, CF 9 stops it. At least on the 15C. I think the 11C doesn't have flag 9. (Just checked it: It has only two flags.)

Edited: 25 Oct 2011, 1:59 a.m.

Re: 15C-LE Blinking

*Message #14 Posted by **Jeroen Van Nieuwenhove** on 25 Oct 2011, 3:44 p.m.,*
in response to message #12 by Dave Britten

And, curious enough, the blinking behavior can be disabled again not only by entering CF 9, but also by pressing the backspace key, as well as by powering off/on the calculator.

Re: 15C-LE Blinking

> And, curious enough, the blinking behavior can be disabled again not only by entering CF 9, but also by pressing the backspace key, as well as by powering off/on the calculator.

That behaviour is intentional given the firmware disposition. The r2d2 display controller will exit blink mode when it sniffs a DISOFF instruction or DISTOG instruction (if toggling to the "off" state). Voyager firmware routinely emits DISOFF/DISTOG instructions during execution to minimize visual chatter due to the flurry of partial display updates it performs. In fact the act of pressing any key will disable blink mode. However the firmware keeps reissuing a DISBLINK instruction in the process of routine display updates until flag 9 is cleared.

in response to message #15 by uhmgawa

> Quote:

> In fact the act of pressing any key will disable blink mode.

Well, not any key, as an example, numerical keys do not disable blinking. You have to use backspace or ON/OFF on the 15c.

I believe we're tripping over semantics here.

From the perspective of the r2d2 display hardware, each key press results in a DISOFF instruction being emitted by the firmware which disables blink mode. However this isn't apparent to the user as the firmware reenables blink mode (via a DISBLINK/0x030 instruction) during its routine update of the display when flag 9 is set.

[WP34s] Question about ERR

*Message #1 Posted by **fhub** on 23 Oct 2011, 6:08 p.m.*

Is it possible that the ERR command is changing or destroying the return stack? :-(

In my main program I call a subroutine (with XEQ 81) and this subroutine makes a loop with a maximum of 100 runs. If the this loop reaches the desired accuracy before the counter is at 100, it makes a usual RTN and everything is working fine.
But if the counter reaches 100 I have a ERR 20 statement and a GTO 81 just after it, so if I just press R/S when the error message appears it repeats this subroutine (GTO 81) and should try another 100 iterations.
Now if within these next 100 iterations the accuracy is ok, then it goes to the RTN command again and so should return to the main program - but it doesn't! :-(
It jumps to the very first program step as if this RTN in the subroutine would be the RTN in the main program.

So I'm wondering if this ERR command has any effect on the return stack? Maybe it resets this stack?

Franz

Re: [WP34s] Question about ERR

*Message #2 Posted by **Marcus von Cube, Germany** on 24 Oct 2011, 3:19 a.m.,*
in response to message #1 by fhub

If I read the code correctly, ERR should not kill the stack but it decrements the program counter which is probably not what you want. Clearing the return stack might be a side effect which is not intended. I have to verify this.

Edit: I just found the piece of code that resets the return stack pointer. I cannot easily change this because an error in XROM might leave you in an illegal state. I'll discuss this with Pauli.

Edited: 24 Oct 2011, 4:00 a.m.

Re: [WP34s] Question about ERR

*Message #3 Posted by **Paul Dale** on 24 Oct 2011, 4:00 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Clearing the return stack on a hard error is the intended behaviour. At least until the triumvirate is convinced otherwise :-)

- Pauli

Re: [WP34s] Question about ERR

*Message #4 Posted by **fhub** on 24 Oct 2011, 4:42 a.m.,*
in response to message #3 by Paul Dale

> Quote:
>
> Clearing the return stack on a hard error is the intended behaviour. At least until the triumvirate is convinced otherwise :-)

Well, I would say using the ERR command in a program is a bit different to a 'hard error' produced by the XROM (because of an illegal operation).
If the programmable ERR command does really reset the return stack, then this command is almost useless for own programs.

So please rethink again your position about this issue ...

Franz

Re: [WP34s] Question about ERR

*Message #5 Posted by **fhub** on 24 Oct 2011, 5:04 a.m.,*
in response to message #4 by fhub

One more thing about ERR:

Yesterday I've even checked if an ERR command in my program would clear the ENTRY? flag - I hoped it would do it and in fact it did! :-)

So it's very comfortable to check if the user has entered any new value before pressing R/S on an intentional ERR command in the program to decide what to do afterwards. But if ERR has this side-effect of clearing the return stack then all this won't work of course.

Re: [WP34s] Question about ERR

*Message #6 Posted by **Paul Dale** on 24 Oct 2011, 5:40 a.m.,*
in response to message #5 by fhub

A program stopping should clear the entry flag.

If it doesn't it is a bug that will be fixed.

- Pauli

Re: [WP34s] Question about ERR

*Message #7 Posted by **fhub** on 24 Oct 2011, 7:07 a.m.,*
in response to message #4 by fhub

> Quote:
>
> So please rethink again your position about this issue ...

Oh, I just see that my request was granted - very nice, thanks! :-)

Now my Polynomial RootSolver is indeed ready. The only problem left is to improve the convergence speed a bit, because as Marcus told me a real HP-20b/30b is quite slow on some bad-conditioned polynomials.
But I've already an idea to solve this speed problem. Unfortunately it will need still more program

steps (currently about 250), and I hoped I could put this PRS program together with my TVM-Solver into one flash region. :-(
(well, maybe I should make the input and output a bit less comfortable!? ;-))

Franz.

WP34S flashed on Linux, with SAM-BA 2.10

*Message #1 Posted by **Hubert Weikert** on 23 Oct 2011, 2:43 p.m.*

Up to now I failed to get SAM-BA for Linux working on my Debian box.

On Linux only the CDC version of SAB-BA is available, this one does not work, the same as the Windows CDC version is also failing.

To make it short, it works for me now this way:

- install SAM-BA 2.10 for Windows with CrossOver on the Linux Box.
- I use a serial to USB adapter with a FTDI chip (FT232RL)
- configure the serial port com2 to point to /dev/ttyUSB0 (see UsbToSerial for details how to do this)
- started SAM-BA from the menu, selected COM2:, and flashed a WP34S as usual.

MySamba does not scan the available serial ports at startup under Wine or CrossOver, even when it starts in these environments.

Essentially, now the road is free to set up the compiler to allow a cross compile of WP34S on Linux.

Hubert

*Message #2 Posted by **Geir Isene** on 23 Oct 2011, 3:31 p.m.,*
in response to message #1 by Hubert Weikert

Thanks for this.

Re: WP34S flashed on Linux, with SAM-BA 2.10

*Message #3 Posted by **Lode** on 23 Oct 2011, 3:59 p.m.,*
in response to message #1 by Hubert Weikert

Personally, I got it to work with SAM-BA 2.9 under wine.

Just the normal wine, no crossover or anything. This works for me, under Archlinux.

The only catch is, it seems like sometimes I need to restart SAM-BA 2.9 a few times before it really detects that the calculator is there.

EDIT: forgot to mention that my PC has, afaik, a regular hardware serial port. And to make it work I also had to create a link from ~/.wine/dosdevices/com1 to /dev/ttyS0. I wonder why Linux calls a COM port a "teletype". Probably something historical :)

Edited: 23 Oct 2011, 4:02 p.m.

Re: WP34S flashed on Linux, with SAM-BA 2.10

*Message #4 Posted by **Rob Willett** on 24 Oct 2011, 1:59 a.m.,*
in response to message #3 by Lode

<history on> Linux calls com ports a teletype or tty because thats what serial ports (which are COM ports) use to drive. A com port is actually a DOSism (is that a real word?). I recall MS-DOS having COM1 and COM2 in the early 80's.

If you look at /dev on Linux (or most UNIX systems), you will see /dev/tty1, /dev/tty2 for some considerable number of /dev/tty's. This was how we use to connect terminals to UNIX boxs, we may have had 100 or more serial ports on a mini driving old VT100 type terminals.

Terminals were an enhancement of the original teletypes from the 60's and 70's and the naming of them carried over. </history off>

Rob

Re: WP34S flashed on Linux, with SAM-BA 2.10

*Message #5 Posted by **Hubert Weikert** on 24 Oct 2011, 11:40 a.m.,*
in response to message #4 by Rob Willett

The "teletype" used with minicomputers at these times for input and output was a Teletype Corp. ASR-33. It supported ASCII, had hardcopy, and allowed to use punched tapes for storage and restore of programs and command sequences. Electricaly they were connected with a 20mA current loop, the 'tty' ports. RS-232 was not yet widely used then, only for Modem lines.

Teletypewriters were some kind of precursor of today's email, in Europe they were using 5 bit Baudot coding, in the US 7 bit ASCII.

You can see Dennis Ritchie and Ken Thomson using ASR-33's in front of a PDP-11 in the picture in a WIRED article (see ASR-33), running probably an early version of UNIX there.

Hubert

> I cannot select .bin files. You got the filter set to scripts. .dat appear, but .bin does not.

I didn't change anything there, at least not deliberately. Can't you override the filetype settings in the open file dialog? Or just enter the filename?

Re: MySamba updated.

*Message #12 Posted by **Marcus von Cube, Germany** on 24 Oct 2011, 4:42 p.m.,*
in response to message #10 by Egan Ford

Can you try again?

Re: MySamba updated.

*Message #13 Posted by **Egan Ford** on 24 Oct 2011, 4:55 p.m.,*
in response to message #12 by Marcus von Cube, Germany

Thanks. It worked. I can now flash from OS/X using Wine. No problems. Took 19 sec for a "full" load.

Thanks again.

Re: MySamba updated.

*Message #14 Posted by **Egan Ford** on 24 Oct 2011, 5:00 p.m.,*
in response to message #12 by Marcus von Cube, Germany

Question:

1. Do I need to erase with the special cable to use MySamba? I have been, but wondered if there was a faster way.

Re: MySamba updated.

*Message #15 Posted by **Marcus von Cube, Germany** on 24 Oct 2011, 5:05 p.m.,*
in response to message #14 by Egan Ford

Good to know it works. Once WP 34S is installed, you can do ON+D (once), ON+S (twice). This will switch off the calculator with the "Boot from flash" bit cleared. The next power on will start the SAM-BA boot loader. This preserves any libraries and backups in flash but might need a few seconds more to write the data.

Re: MySamba updated.

*Message #16 Posted by **Egan Ford** on 24 Oct 2011, 6:10 p.m.,*
in response to message #15 by Marcus von Cube, Germany

Excellent. Just tested. It works, thanks!

For the rest of you:

1. Connect cable.
2. Turn ON 34S.
3. Press and hold ON, then D S S (D 6 6), then release on. Calc will turn off.
4. Press and release on. Flash with MySamba.
5. Press and release reset button on cable.
6. Disconnect cable.
7. Turn on. Check VERS and BATT.

How to go full RPN on the cheap

*Message #1 Posted by **Michael de Estrada** on 23 Oct 2011, 2:38 p.m.*

I'm a totally RPN person, but have used cheap algebraic calcs in harsh environments such as my garage workshop to avoid damage to my expensive RPN calcs. I hate algebraics and constantly make errors using them due to my RPN mindset. But now I've found a solution in the Victor V12 HP 12CP clone, that can be purchased for only $13.99 here with free shipping and no sales tax. I bought two for $14.98 from this seller, and then two more at the reduced $13.99 price. I've had a week to play around with one of them, and it is a good solid calc with a decent keyboard and contrast adjustable display. The only annoyances are the tiny decimal point and hard to read red shifted legends on the black keys. It uses two AAA batteries and is very fast. It comes with a very nice magnetic clasp carry case, and a limited printed manual that omits many features, but covers all the basics. Other than the Compucessory CCS-28956, where else could you find a RPN programmable calc even close to this price ? Even programmable algebraics sell for much more.

Re: How to go full RPN on the cheap

*Message #2 Posted by **Thomas Chrapkiewicz** on 23 Oct 2011, 3:02 p.m.,*
in response to message #1 by Michael de Estrada

Has anyone studied the hardware inside one of these?

Re: How to go full RPN on the cheap

*Message #3 Posted by **Jim Yohe** on 23 Oct 2011, 3:33 p.m.,*
in response to message #1 by Michael de Estrada

Is it a knockoff so close to the 12C that you can use the 12C manual for all of its functions and programming? I read that it also has an algebraic mode which, of course, isn't built into the 12C.

Re: How to go full RPN on the cheap

*Message #4 Posted by **Michael de Estrada** on 23 Oct 2011, 3:50 p.m.,*
in response to message #3 by Jim Yohe

It's the same as the first generation HP 12C Platinum, which has an algebraic mode but no parentheses. Also, it has 400 program steps, rather than 99 as on the original HP 12C. The old HP 12 CP manual can be used and the only feature that seems to be missing is the self test. Also, the keyboard layout and programming key codes are the same, so the original HP 12C manual can be used as well.

Edited: 23 Oct 2011, 3:55 p.m.

Re: How to go full RPN on the cheap

*Message #5 Posted by **Eddie W. Shore** on 23 Oct 2011, 4:16 p.m.,*
in response to message #1 by Michael de Estrada

This is a clone of the original HP 12C Platinum. A good buy if you are on a budget. I have not found a scientific RPN clone that isn't a computer emulator or iPhone/iPad app.

Edited: 23 Oct 2011, 4:17 p.m.

Re: How to go full RPN on the cheap

*Message #6 Posted by **Michael de Estrada** on 23 Oct 2011, 5:07 p.m.,*
in response to message #5 by Eddie W. Shore

Really, all I was wanting was an RPN 4-banger type calc to replace the various algebraic 4-bangers I have deployed around the house, garage and in the car. All the extra financial stuff and programming capabilities are just extra icing on the cake. I have an original mint made in USA HP 12C that more than meets any serious financial calculations I need to make. The Victor just saves wear and tear on that calc and allows me to use RPN wherever I go. As to scientific calculations, were I still working, I'd use the HP 15C LE at the office or on trips and leave my original HP 15C at home.

WP 34S: Power saving revisited

*Message #1 Posted by **Marcus von Cube, Germany** on 23 Oct 2011, 1:47 p.m.*

The latest build of WP 34S has a new algorithm for speed switching. Testers (on the real hardware) are welcome.

Background: Running at full speed is hard on the coin cells which are not rated for the 10mA current draw (20mA total) at 37MHz. We want the speed but we probably do not want it all the time.

1. When a program is started, the processor is immediately switched to full speed.* Label search would be too slow otherwise.
2. When numbers or commands are input, the processor runs at about 2MHz. You may notice this, it's a little less snappy than it used to be. This change was introduced earlier with the NULL option.
3. When a command is executed, speed switching is delayed about 0.1s. In a first step, speed is increased to 20MHz. 0.1s later, the calculator switches to full speed.*

* With SLOW in effect or with the battery symbol lit, this is 20MHz, 37MHz otherwise.

The main consequence of (3) is that many commands never switch to 20MHz or higher because they finish before the 0.1s elapse. This should reduce the stress on the batteries in normal manual operation. But some commands (try the factorial or LN) take noticeably longer in manual mode because they really need the full speed and do get it only after some delay.

I'd like to hear your comments on this.

As a side note: The power drain in idle mode (e. g. during a PSE) should be lower then it used to be (0.2mA instead of 0.4mA). I found some pull-up resistors which were unnecessarily left active. I still need to verify this but I have to modify my calculator first for the measurements.

Edit: Just fixed a bug with the latest changes.

Edited: 23 Oct 2011, 2:26 p.m.

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 23 Oct 2011, 4:55 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Just downloaded what appears to be 1769, but the VERS command on the calculator returns 1768... Please clarify.

TIA

Re: WP 34S: Power saving revisited

*Message #6 Posted by **Dominic Richens** on 23 Oct 2011, 7:09 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

That's a pretty typical source control problem. When the calc.bin was built, it was built using 1768 + changes. Only once the calc.bin was checked in did it become 1769.

So VERS always returns a revision behind.

Re: WP 34S: Power saving revisited

*Message #7 Posted by **Marcus von Cube, Germany** on 24 Oct 2011, 3:11 a.m.,*
in response to message #6 by Dominic Richens

Dominic, almost. I add one to the last checked out revision number during the build and compile it into the binary. No more REV tags in the binary files.

Re: WP 34S: Power saving revisited

*Message #8 Posted by **Marcus von Cube, Germany** on 24 Oct 2011, 3:09 a.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

This has to do with the way the revision number is calculated in the build process. Walter had updated the manual between my two commits. So adding one to the last checked out copy of the sources didn't work out this time.

I have my problems with Steiners esoterism. In my world, it's suspicious if things are supposed to work like people think they do isolated from any scientific theory. But that's just me.

Otherwise, I share the opinion that a slide rule is superior to any calculator when it comes to education. A microscope, otoh, is hard to replace by anything else.

Re: NY Times article - a school without "technology"

*Message #3 Posted by **Thomas Chrapkiewicz** on 23 Oct 2011, 2:15 p.m.,*
in response to message #1 by Don Shepherd

Any coherent philosophy is not without exceptions. I do fundamentally agree with the philosophy here; we cannot let technology impede the thinking/creative process.

I've been a professor and engineer in mathematics, electrical engineering and science for almost 40 years and fundamentally agree with this philosophy. Appropriate technology is essential and in many cases vital; however technology can be a distraction(and in many cases in some of our crumbling school systems in America is).

*Message #4 Posted by **robert rozee** on 23 Oct 2011, 2:54 p.m.,*
in response to message #1 by Don Shepherd

i thoroughly applaud this 'minimalist' approach. with modern computers in the classroom kids barely have to think for themselves at all - what would have once been a research assignment spanning many diverse skills becomes a browse using google and some judicious cut-and-paste... and the kids all hand in the same piece of work as google teaches you that the 'best' answers are always on the first page!

similarly we have kids who can perform what would have been mathematical wonders (20 years back) on a graphical calculator, yet struggle to tell you what 7 x 9 equals.

i do think there is a compromise, however, a technological 'sweet spot'. a class set of kindles e-ink readers can provide every student with a rich research library, while a single-line non-programmable calculator (such as an fx-31) eliminates the use of error-prone lookup tables. i'd allow teachers whiteboards and DVD players, yet keep the well stocked printed library of fiction reading material.

it is important to use technology as appropriate to teach, as opposed to simply teaching technology.

Yes, and this one includes an erasing device in case mistakes are made :-)

I remember once our Descriptive Geometry professor criticized my drawing and suggested I got a better compass. "It's a STAEDTLER!" I said while handing it to him. "No, you've engraved the brand name yourself", he replied. It doesn't suffice to have the right tool if one lacks the skills...

LOL.

My compass set was liberated from a trash heap somewhere in Germany by my father, some time in the 1940s...I bought one Staedtler small spring compass but the plastic threaded inserts stripped out.

indeed... when i was at primary school we all had access to a printed 'times table' chart on the back of every math exercise book - 144 entries covering 1 x 1 up to 12 x 12. cutting out the obsolete/imperial 11's and 12's, the trivial 1's, and reflections across the diagonal, one is then only left with 36 multiplications to learn.

i showed such a simplified multiplication table to a 'modern' teacher recently. said teacher was absolutely amazed at this ingenious and mysterious construction i'd devised!! :-(

You cheated yourself if you didn't go up to 12 X 12 and higher. We had to go to 15 X 15 but I didn't get good above 12 x 12. We still buy by the gross here :-)

With no imperial units to worry about, we don't go beyond 9x9 here. BTW, I remember those pencils were forbidden in class. They still are not allowed during public service and college admittance examinations, though I cannot realize why applicants would need them.

in response to message #1 by Don Shepherd

I have rolled my eyes and groaned every time administrators brag about the "technology" they are bringing into the classroom. All I can think of is the waste of net present value, purchasing rapidly depreciating assets in lieu of leveraging that money to buy the most talented and motivated instructors. Of course in pubic school, the teacher's unions prevent that...unless you are the Baltimore city schools, which managed to get consensus for change....

The comment about the ease of picking up the technology is so true, and yet there is some sort of (adult-experience) fear of not spooning computer-operator crap. IT all reminds me of my 9th grade maths teacher who said, "don't waste time with typing class--you'll figure that out on your own" and he was Right!

Furthermore, the rush to "technology" is so stupid when you consider that it will and has continued to evolve so rapidly that learning how to be a button-pusher today means nothing 10 years from now...

*Message #14 Posted by **Lincoln R.** on 23 Oct 2011, 9:31 p.m.,*
in response to message #13 by bill platt

I don't know about that. We had computers in my elementary school (Apple IIe Platinum, 5.25" floppy drive, some even had color monitors), and that was how I got introduced to computers and technology. My parents wouldn't have bought one, my dad was a factory worker with no use for such things. I didn't even know what a computer was before school, in fact I can distinctly remember asking the teacher "Why are there TVs sitting on top of the typewriters, does nobody use them?" 10 years later, I finally managed to convince my parents to buy a computer, taught myself some basic programming, read books about digital logic, decided I wanted to be a computer engineer, and ended up going from a decrepit and perpetually bankrupt public high school to Carnegie Mellon.

"Picking up technology" is easy if you mean learning about Facebook and video games and basic Microsoft Word, but getting a good understanding of technology is anything but easy.

I wouldn't say that I agree with the "middle school research papers turning into wikipedia cut-and-paste" thing, but then again schools can look for this. You simply explain that this is called plagiarism, and that it is not OK.

However, I am inclined to agree that making students actually learn how to do math is a useful skill. Not having to deal with the unit circle and approximation when I want to know some trig value is useful, but actually understanding what the trig value means is much more important, because it teaches you how to think, as opposed to how to just follow some instructions.

Yes. I agree with you here. Problem is that much of the computer use in schools is nothing more than facebook / word "appliance user" stuff rather than what you did as a kid--learning fundamentals of programming and of hardware architecture.

I can do basic calculations and estimate in my head. I am old.

I have an associate who is even older. He can do basic calculations and estimate in his head... much faster than I can.

He is of the slide rule generation.

My high school class was the first in my school to be allowed to have and use calculators.

An overwhelming amount of college students cannot do even simple algebraic problems in a reasonable time, if at all. They are of the powerful graphing calculator/home computer/laptop/smartphone/electronic gaming system generation.

This might not be too rigorous or even remotely scientific, but three points do define a line.

Take away their computers and smartphones and brick-heavy superpowerful calculators that can plot! Give them lookup tables- the point IS to make errors and learn how not to do so. Give them graphing paper, PENCIL & ERASER; how else can a student develop a feel for how different mathematical expressions move? More advanced students? Give them the equivalent of the old HP-31E or 32E. And even then, if they need to plot, use the numerical output, not an electronic display. I wish I was taught with the slide rule; it seems to develop your math senses better than with a calculator.

I remember being back at my community college doing Calc I-III and the physics I & II for my engineering path back in 2002-2004. Of course I had a TI-89 and could do many of the problems for my calculus classes. About half way through Calc II I went and got a HP 49G and although I felt it was a step back in capability, I was able to do ALOT more thinking on my own. It's really hard to explain what that means but with the HP I felt more connected to the logic involved in problem-solving. I had to really understand what I was doing and understand the problem. With the TI, i felt I was just punching crap into a black box and it was spitting stuff back out at me. I gave my TI-89 to a girl in pre-calculus for a few bucks (she was smokin!!!!!!!) and have been HP ever since.

My last year at Uni the Electrical Engineering department decided to ban the powerful graphing calculators for their courses. I was a senior at that time and didn't care as much although I was ticked that many professors didn't enforce this rule. I remember a Controls Systems exam and I used my HP-33S. Some students had other scientific calculators on their desks but a few (cheaters...) pulled out their 89s and proceeded to do matrices that would take me 10 minutes to do by hand in the amount of time it took to punch in the data. The difference is that I still know how to do determinants and other calculations by hand whereas they probably will have to grab a calculator or a computer software (matlab).

I don't have a problem using technology provided that it is used as tool and not a crutch. I still own a TI-92+ (yes, the brick!!) and a HP-50g but the only calculator I carry with me daily is my HP-15C LE.

I went back recently to the same community college that I graduated from a few months ago and talked to the dean (I taught algebra there for 1 1/2 years before I started my career as a Protection & Controls Engineer) and to her dismay they were doing away with teacher-taught prep math classes and using a new software with very limited classtime with another human. She and I both agreed that this was a horrible idea. I may be a well-paid engineer (HA!) but I would be an absolute fool to think I made it this far without many excellent teachers that took the time and love to teach me and others mathematics.

No misplaced fondness for the "good old days"

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 24 Oct 2011, 10:42 p.m.,*
in response to message #1 by Don Shepherd

I am 82. I graduated high school in 1946. I received my B.S. in Engineering in 1950.

We were taught to use logarithms in high school. No need to fool around with estimates there if one only paid attention to the proper use of the characteristic.

I was introduced to the slide rule in college. I eventually discovered that a slide rule, even my K&E Log Log Duplex Decitrig or my friend's Pickett with double scales in place of the A and B scales and triple scales in place of the K scale, was a sorry replacement for the use of my book of log tables. First, it was only good to three decimal places. Second, it made it hard to keep up with the characteristic so I had to mess around with estimates. If I really concentrated I could do the equivalent characteristic calculations on the side by, among other things, keeping track of how many times I moved the slide from left to right or right to left.

Furthermore, the slide rule offered no capability for chain calculations which combined addition and subtraction with multiplicaion and division. I don't count the efforts to place an Addiator on the back as a futile response to the early four bangers.

To put it as plainly as I know how, doing engineering with a slide rule was a big pain in the ass!

And, then there was plotting on semilog and log-log paper for curve fitting. Doing that sort of thing one time is enough. After that, it's bad for the soul.

If you think log log is bad, try running an integrator around section curves, and doing a weight estimate by hand...and computing curves of form by hand...yes, the digital computer saved us from a lot of paying of penance...

You have an interesting point about the slide rule versus the tables. My 1936 Eschbach (yes, I still use it frequently--some things never change...) has logs to 6 decimal places. If you are doing a lot of chaining, that sure is better than a slide rule.

Nevertheless, using these tools does give one a better understanding of the underlying mathematical principles, IMO.

I actually still enjoy manual plotting, and using a classic analog planimeter, when these are necessary from time to time. (Yes, sometimes I find no digital alternative).

The biggest breakthroughs the computer afforded in my line of work came when pipe network and pond routing software became available. Now doing those manually was indeed a chore!

What I am saying is that once you have done that a time or two and understand the underlying principles then it is time to move on.

> Quote:
>
> I actually still enjoy manual plotting, and using a classic analog planimeter, when these are necessary from time to time. (Yes, sometimes I find no digital alternative).

We used the manual plotting as one method of solution when I took a class in curve fitting back in 1949. It certainly was easier than accumulating the sums needed for a least squares fit. But once I had access to curve fitting programs on the Honeywell Computer Network and converted them for use with my TI-59 my stack of plotting paper didn't get much use.

I see use of a planimeter as a classic case of not needing to understand the underlying principles in order to obtain all of the benefit. I have one of my own that I managed to get for about twenty-five dollars about ten years ago. Last week there was a mint condition K&E (made after WW II in West Germany) for sale for $150 at a thrift store in Florida. Too expensive for my collection.

I did a lot of work with LeRoy sets in the Navy in 1951-1952. We were still using them in the mid-1970's to make slides for overhead projectors. Who uses a LeRoy set now?

> Who uses a LeRoy set now?

No one, I'd venture. I used one in 1977 to revise a City map (I was a graduate engineer but draftsman was the only job I could find at the time).

The LeRoy was replaced by the lettering machines (sort of an electronic LeRoy). We still used those up until about 1990, when CAD took over everything (except two guys who continued to hand-draft until 1995, in this company). I still know professional architects who refuse to use CAD.

Somewhere in the 1980's our tech pubs operation was still using LeRoys for lettering on slides. One of our engineers decided to make his own slides using computer generated lettering which was in its infancy. The lettering on his slides was barely legible. Many of the viewers were saying how wonderful it all was until I commented that if a tech pubs person had delivered slides with lettering as poor as that we would be calling his supervisor and demanding an explanation.

In 1985 we all used them and thought they were pretty cool, but something must have clicked in me and most if not all of my classmates. I never did go buy one. By 1995 there was no reason really to need one as software was then good enough and cheap enough to digitize anything and get at it with simpson's rule etc.

*Message #25 Posted by **Alexander Oestert** on 25 Oct 2011, 8:45 a.m.,*
in response to message #1 by Don Shepherd

The Waldorf school is not applying no technology at all but just not the latest technology. They are using blackboards and chalk in the classrooms which once were also new technology to pupils whose ancestors wrote on parchment, carved in wood or took chisels to a stone. One can now discuss if the advent of blackboard-and-chalk-technology did any harm to the kids back then. Would they have been better off had they only stuck to chiseling?

We all have lost knowledge about many technologies that once were important to mankind but are no more, and we are taught new things that are important now. Most of us don't have to know how to grow crops, as our ancestors had to. We can very well ponder the question if we really need to know 6x9 by heart when we can find the answer easily on the smartphone we have at hand at all times. It might be far more important to be able to judge how reliable a wikipedia article is.

The things people have to learn change and so do the means by which they learn them.

Re: NY Times article - a school without "technology"

*Message #26 Posted by **bill platt** on 25 Oct 2011, 9:11 a.m.,*
in response to message #25 by Alexander Oestert

All true, but the point isn't to eschew technology merely for eschewing's sake; rather, it is to focus on the fundamentals and understanding how and why--the kind of scalable intelligence that does give one the ability to judge the veracity of a wikipedia article...

10 years ago I did look closely at the possibility of enrolling my then 4 year old in a Waldorf school. By the time he reached kindergarten age we had moved and so that was no longer an option. The larger issue with Waldorf for us was that their approach was so different, that if you started with Waldorf, your child would, admittedly by the Waldorf people, be behind in grade 4, because the way they teach various disciplines is not in sync with the more prevailing ductus. This is a problem for people who move a lot. I have never lived in one place more than 4 years as an adult and I've been an adult for considerably more time than I've been a kid.

My kids have attended private school. Even there, I have seen misapplication of "technology" on occasion. What this means is that there is some "fancy" new idea about web-this or interactive-that which ultimately becomes a distraction from what is actually being taught. That is the risk with "implementation and deployment" of "the latest 'technology'" (I *hate* this use of the word technology.)

Re: NY Times article - a school without "technology"

*Message #27 Posted by **Dominic Richens** on 26 Oct 2011, 1:33 p.m.,*
in response to message #26 by bill platt

My kids all started in a Waldorf school and moved over to conventional school at different ages when

we moved. I have friends whose kids went all the way up until high school and know there are kids that go through high school and onto university.

My impression was the pedagogy was excellent - kids moved up in grades when they were ready as it was assumed that every kids learned differently. They still followed the standard provincial curriculum, so moving to a conventional school was not an issue in that sense. The biggest problem my kids had was moving to a public school was the assumption that they were either like the majority of kids or had a learning disability!

Waldorf is definitely more right-brained. I wouldn't say it is "anti-technology", but technologically appropriate. There is a real focus on depth and base principles and manipulatives.

Anthroposophy, on the other hand, is just plain nuts.

WP-34S: HP20B vs HP30B keyboard

*Message #1 Posted by **Rob Willett** on 23 Oct 2011, 12:25 p.m.*

I've just started using the WP-34S in anger and am slowly getting my head around it. I have to say how impressed I am with the software as a whole. Very, very professional.

I'm not as impressed with the HP-20B as the hardware for the calculator, the shape of it is not nice on the hand, the shaped sides mean the top digs into fingers. The keys aren't anywhere near as nice as any of the other 'decent' calculators, the whole calculator needs raising by as couple of mm's on the top to make it easier to use on the desk.

However all said and done, the massive advantages of the WP-34S easily outweigh the cheap and cheerful (ish) hardware.

I have no idea how good the HP-30B is as a foundation for the software. Does anyone have any comparisons they can offer. Is the keyboard any better, is the case any better?

If the HP-30B is better, does anyone want to buy a HP-20B loaded up with the latest software :) ?

Thanks,

Rob

in response to message #2 by Walter B

Thanks for the prompt reply. I'll look round for an HP-30B and see how much they are.

Re: WP-34S: HP20B vs HP30B keyboard

*Message #4 Posted by **Paul Dale** on 24 Oct 2011, 3:56 a.m.,*
in response to message #1 by Rob Willett

Get a 30b and repurpose that. The only single advantage the 20b has is the overlay matches its colour better.

The 30b has a significantly better keyboard and is available cheaper.

Tools for exploring the 41cv?

*Message #1 Posted by **Peter Murphy (Livermore)** on 23 Oct 2011, 11:00 a.m.*

I've got a 41cv for exploration, and no literature to go with it. I see three HP publications on TAS right now:

http://www.ebay.com/itm/190588555418?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1438.l2648

http://www.ebay.com/itm/280759260940?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1438.l2648

http://www.ebay.com/itm/280759262115?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1438.l2648

How useful might each of them be? (I can guess, of course, given their descriptions.)

What other publications might be useful?

Thanks for these and any other suggestions on exploration.
