The Museum of HP Calculators

The Museum of HP Calculators displays and describes Hewlett-Packard calculators introduced from 1968 to 1986 plus a few interesting later models. There are also sections on calculating machines and slide rules as well as sections for buying and selling HP calculators, an HP timeline, collecting information and a software library.

The Main Exhibit Hall

Before HP Calculators (1614-1968)

- The HP Garage - The Birthplace of Silicon Valley
- Calculating Machines, Slide Rules, etc.

The First HP Calculators (1968)

- HP 9100A&B Programmable RPN Calculators with *no digital ICs*

High End Desktop Series (1971)

- HP 9810A Second Generation RPN Calculator
- HP 9820A Full Algebraic Desktop
- HP 9830A Desktop Calculator with BASIC
- HP 9805A Algebraic Statistics Desktop
- HP 9815A/S Third Generation RPN Desktop
- HP 9825A First HPL Calculator

The Classics (1972)

- HP-35 The First Slide Rule Pocket Calculator
- HP-80 The First Business Calculator
- HP-45 Slide Rule++
- HP-65 The First Programmable Handheld
- HP-70 Inexpensive Business Calculator
- HP-55 Scientific/Programmable with Quartz Timer

Classic Printing Desktop Calculators (1973)

Message Index Display Configuration

Use the form below to search for messages which include certain keywords or which were posted at a particular time or by a particular individual, and/or to select the manner in which you wish the messages in the index to be displayed.

Display messages [Grouped into threads, indented]

When a message is selected in the index, if "Individually" is selected, a page containing only that message, a thread overview, and navigation features is displayed. When "Grouped into threads" is selected, all messages in the thread are displayed on a single web page. "Grouped into threads, indented" uses indentation to show the thread structure. "Grouped into threads, flush left" omits the indention and is mainly intended for small devices such as PDAs.

List only those messages:

- (•) Posted within the last [Several Eons]

(Options above this line are "sticky" if your browser accepts cookies. Options below are for the next view of the index only.)

- ( ) Posted between [Jan] [2013] and [Dec] [2013]

List:

- (•) All messages within the specified date range
- ( ) Only messages containing [Any] of the following keywords:

[ ]

- ( ) Only messages posted by:

recent HP 35 "Red Dot" on Ebay

*Message #1 Posted by **D. Taylor** on 26 Feb 2012, 8:00 a.m.*

I purchased Ebay item 260941694606.

Cleaned it up and it works and has the bug:

2.02 bug - quicktime

Below are some pictures.

Seems to me it is 1143a-00026 but the top case was probably replaced at some point.

in response to message #1 by D. Taylor

Interesting picture of the back side.

"Following any trig function Z is duplicated into register T". Now that's a useless and unhandy feature! Maybe this was some kind of memory limitation?

Absolutely correct. HP added one more scratchpad register in the CPU on the next generation (the 20 series) to eliminate this limitation.

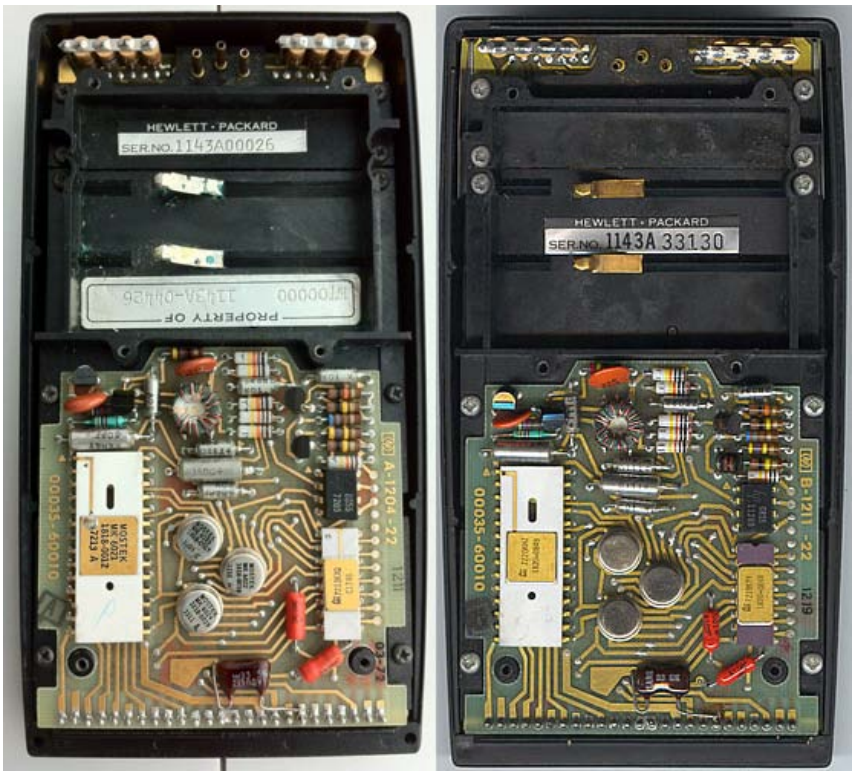
Re: recent HP 35 "Red Dot" on Ebay

*Message #4 Posted by **D. Taylor** on 26 Feb 2012, 1:52 p.m.,*
in response to message #1 by D. Taylor

Comparing the circuit board in this 1143A with Kees van der Sanden's 1143A33130 seems to support that this unit is indeed a Red Dot, and a very early one at that.

http://www.keesvandersanden.nl/calculators/hp35_inside.php

Note the revision number and date on the board in 1143A00026 vs. the revision number in 1143A33130.



Re: recent HP 35 "Red Dot" on Ebay

*Message #5 Posted by **aj04062** on 26 Feb 2012, 2:56 p.m.,*
in response to message #4 by D. Taylor

What is the date? 1211 and 1219?

I have an early, non red-dot SN 1143A 34416 with the same board layout and other PCA markings except instead of 1211 I have 05-72

This has the bug, but I also have what seems like a keyboard problem.

1/X acts like +, X<>Y seems to drop the last digit and makes the number negative (weird), R(down arrow) acts like CHS, STO acts like EEX, RCL acts like CLX.

Bad ROM or keyboard traces? I've been over it a couple of times and haven't seen anything..

Re: recent HP 35 "Red Dot" on Ebay

*Message #6 Posted by **D. Taylor** on 26 Feb 2012, 3:10 p.m.,*
in response to message #5 by aj04062

I think the 03-72 and 05-72 are either month and year or week and year, probably month.

Note, however, the numbers on the board below, which seem like week numbers, not month. I think that the chips are also dated with year week numbers.

*Message #7 Posted by **D. Taylor** on 26 Feb 2012, 3:16 p.m.,*
in response to message #5 by aj04062

As I recall some of the keyboard traces go under the separation in the battery compartment where corrosion may have occurred if it ever happened - though your battery compartment looks pretty clean. Weird also that mine and the other 1143A have that red capacitor or whatever it is and yours has the black diode or whatever that is...

WP 34S x-hat bug

*Message #1 Posted by **Nigel J Dowrick** on 26 Feb 2012, 6:03 a.m.*

I'm running build 2562.

I enter a set of (x,y) points satisfying y = 2x + 1 (for example).

I then enter 7, execute y-hat (yellow-shift 6) and obtain 15 (correct).

If I then enter 15, execute y-hat (from the STAT menu) I obtain 0.142857... i.e., the reciprocal of the correct answer.

This problem seems to occur with any set of data, not just the set above. I have not checked any regression other than linear.

I am astonished at the sheer volume of work that you guys have been putting into this project, especially recently. Thank you all - and take care of yourselves!

Nigel (UK)

Re: WP 34S x-hat bug

*Message #2 Posted by **Paul Dale** on 26 Feb 2012, 6:13 a.m.,*
in response to message #1 by Nigel J Dowrick

Yeah, a bug that crept in somewhere during the statistical rearrangements. Reciprocal is the fix.

Next build will have the fix included.

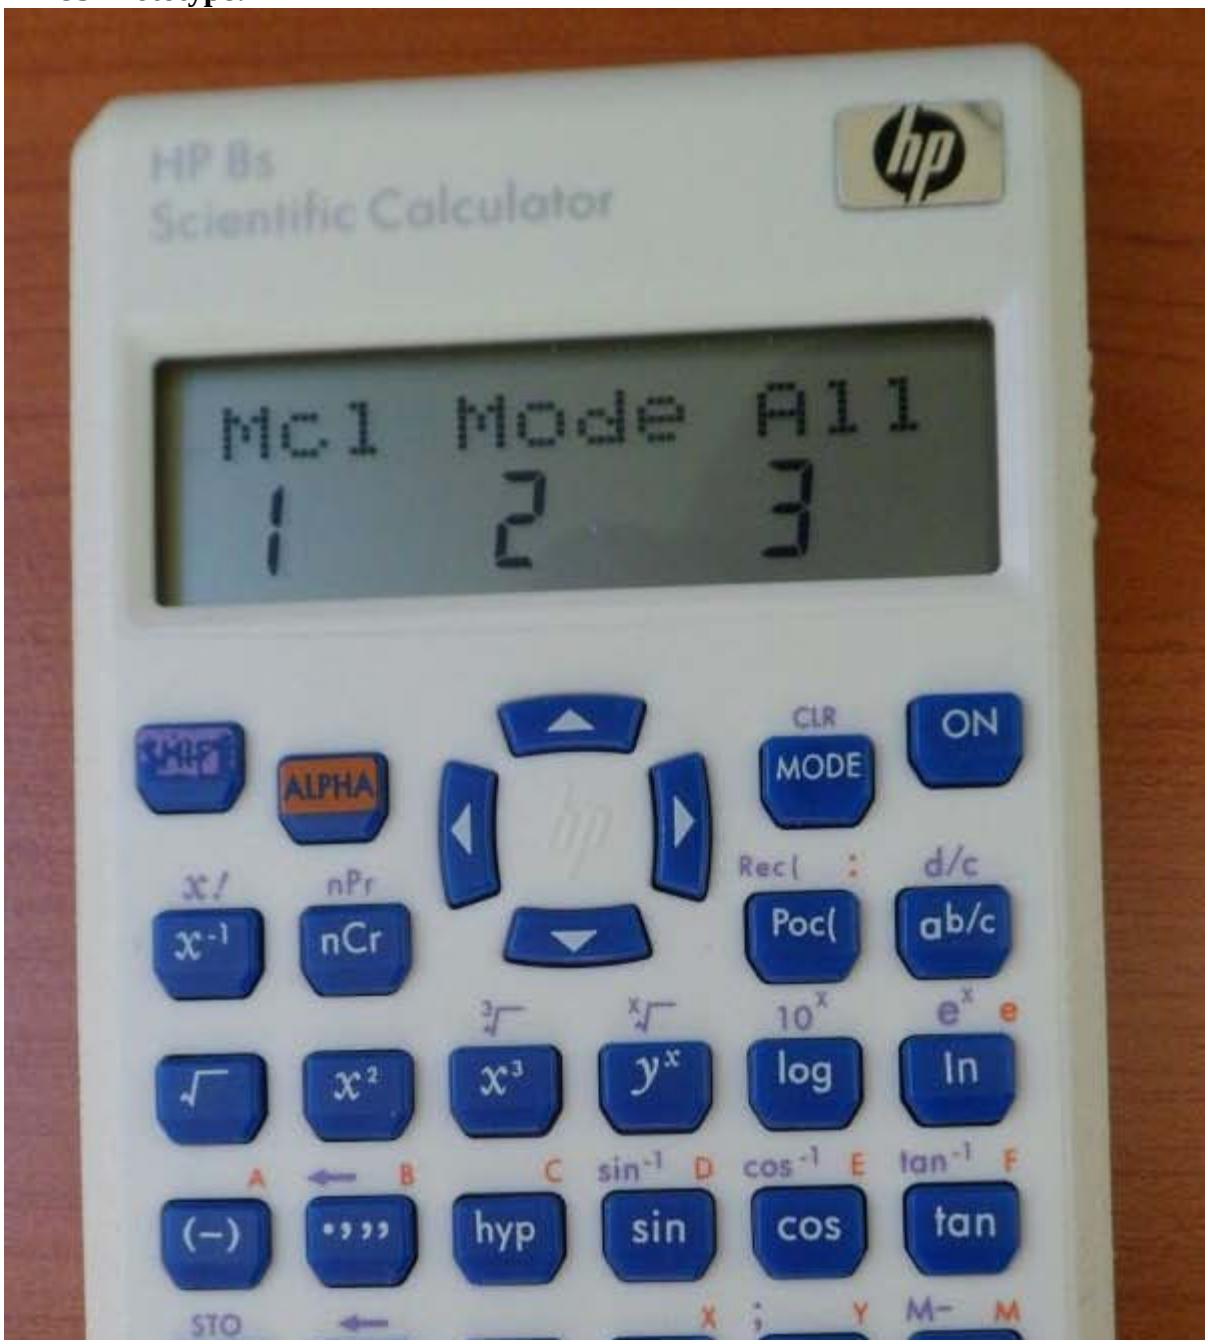
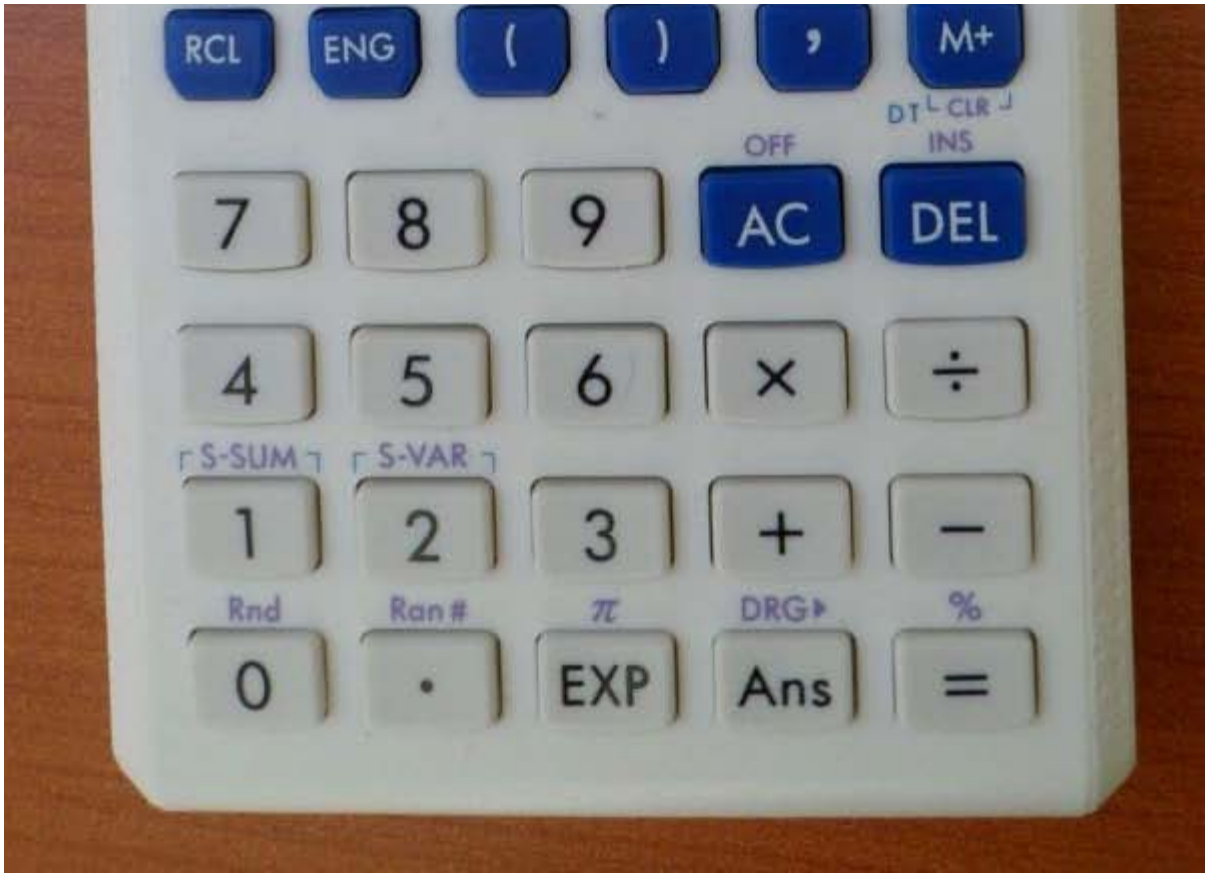
HP calculator prototype?

*Message #1 Posted by **Michael Eckstein** on 26 Feb 2012, 2:35 a.m.*

I obtained this HP 8S caculator which design differs from the production version. Has anybody seen this design before? I suppose this should be a prototype of the HP 8S Non RPN calculator. The production version HP 8S was released mainly in the Asia or Australia market.

HP 8S Prototype:





HP 8S production version

more HMS, aTIME, 34s display, 41c bugs?

*Message #1 Posted by **Christopher Johnson** on 25 Feb 2012, 9:34 p.m.*

```
Here is some more HMS,Alpha oddities. What do you think?

Hopefully I am presenting this in a clear way.

34s 3.0 2551

FIX 6
9.285964
ENTER^
aTIME
Bad time or dAtE
FIX 4
9.2860

9.285900
aTIME
9:28:59 AM

FIX 2
9.29
aTIME
9:28:59 AM

FIX 0
9.
aTIME
9:28:59 AM

41C - 2051A

FIX 6
9.285964
ENTER^
ATIME
9:28:59.64 AM

FIX 4
9.2860
ATIME
9:28:59 AM

FIX 2
9.29
ATIME
9:28 AM

FIX 0
ATIME
9 AM
```

I think the 34s is rounding to 4 places and throwing the error. Where as the 41c is taking just the absolute value. I prefer the 41c approach. Also the 34s does not follow the fix setting when appending to alpha like the 41c. Again I prefer the 41c approach. Just some observations I had.

Now this is more errors in HMS math functions. I know nsim uses 41c roms. I'm not sure if coconut uses roms but I'm fairly sure it does. free42 is a simulation.

Which calculator do you think is giving the right answer, out of the 3 here? I will go with the way free42 handles these numbers.

wp34s 3.0 2551

22.0500	22.4100
ENTER^	ENTER^
22.0000	22.0000
HMS-	HMS-
0.046000000	0.406000000

hp41c 2051A

0.045999999	0.405999999

nsim-0.61 - unknown rom version

0.045999999	0.405999999

free42 - 1.4.70 - linux

0.0500	0.4100

coconut on the palm 1.0

0.045999999	0.405999999

free42 - 1.4.70 - palm

0.0500	0.4100

These numbers cause the strange behavior. The numbers in between work just fine and get the same answer as free42.

22.02, 22.05, 22.08, 22.11, 22.14, 22.17, 22,20, 22.23 etc.

Could this be considered a 41c bug? What do you get on other hp's?

I searched for 41 bugs and found this:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv005.cgi?read=7416

Here is some more strange behavior

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61466

Now that is a conversion bug. I'm just doing straight HMS-. The other reason I

```
post this link is message #6 I see the same pattern as above. A thought just
came to me. Maybe the software is converting to HR performing the math and then
converting back to HMS?

I tried 3 online HMS calculators and they all gave me the same answer as free42.

I am interested in what others may think of this.

CJ
```

Yes, the 34S is rounding to four places before doing anything with the time. Yes, this is different to the 41c + time module. Likewise, alphaTIME on the 34S doesn't care about display mode. Now, the 34S could be made more like the 41c if this is desirable. Is it?

I'm unsure about using the display mode -- what happens in FIX 3 e.g. The way things are now, you append the time and can easily strip off whatever trailing characters you want -- we've a pretty good selection of alpha commands to assist here. Whereas, the 41c has a rather limited selection of alpha commands by default.

> 0.046000000             0.406000000
> ```

Fixed, built and in subversion now. Revision 2576. A problem rounding the result to register precision from internal precision -- effectively a double rounding where the first went down to 59.99999 which avoids the over sixty correction and the second pushed this up to 60.

> Quote:
>
> Could this be considered a 41c bug?

I would consider it one.

> Quote:
>
> Maybe the software is converting to HR performing the math and then converting back to HMS?

This is what the 34S does -- the code is smaller this way.

- Pauli

Hi.

> Quote:
>
> Maybe the software is converting to HR performing the math and then converting back to HMS?

It's more likely to be. The step-by-step true HMS+ (or HMS-) might be time- and memory-consuming, while addition and multiplication are already implemented. The HMS->HR might round the original numbers and HR->HMS would probably round the results as well. I do not have the emulators to test, though.

Cheers.

opening HP 30B

*Message #1 Posted by **Harald** on 25 Feb 2012, 6:01 p.m.*

Today I received my HP-30B and also the keyboard overlays. (Thanks Eric!) The cable seems to take a little longer to get here though. So I thought I'd have a look inside the calculater and maybe just connect the RS232 myself (yes, I am a bit impatient). I assume all I need is levelshifting to 3.3V on the RXD and TXD line. But so far I haven't even managed to open the calculator. I have unscrewed the 5 bolts but still can't figure out what to do next. Could someone enlighten me please?

Cheers, Harald

Re: opening HP 30B

*Message #2 Posted by **Marcus von Cube, Germany** on 25 Feb 2012, 7:23 p.m.,*
in response to message #1 by Harald

Pry it apart from the side by slightly bending the grey (softer) plastic.

Get yourself an FTDI RS232-TTL 3V3 cable. You can wire it directly to the pads. You will need a way to connect the erase pin to Vdd in order to activate the SAM-BA boot loader (by clearing the flash completely). Reset is available through a hole on the back.

Re: opening HP 30B

*Message #3 Posted by **Harald** on 26 Feb 2012, 5:50 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks Marcus, that worked. Got it open now. While I have it open, is it worth adding a crystal? Does that help with any functionality other than communication (I probably won't need that, so I am not too bothered)? I like your idea of adding a 3.5mm connector to the calculator, but unfortunately can't work out a solution that is a bit easier on the eye ;)

Cheers, Harald

Edited: 26 Feb 2012, 8:11 a.m. after one or more responses were posted

Re: opening HP 30B

*Message #4 Posted by **pascal_meheut** on 26 Feb 2012, 5:58 a.m.,*
in response to message #3 by Harald

Adding a crystal helps a lot with communication and with the STOPWATCH function. If you don't use them, don't bother. Soldering the capacitors is not obvious.

Re: opening HP 30B

*Message #5 Posted by **Harald** on 26 Feb 2012, 6:16 a.m.,*

in response to message #4 by pascal_meheut

A stopwatch sounds like a nice feature to have. So I think I will do the modification. Soldering the caps is no problem. After all they are the large 0603s and not 0402s ;) The crystal seems to be more of a problem - I haven't got one and need to order one -> more waiting :(

Cheers, Harald

What does the Erase Button on the HP cable do?

*Message #6 Posted by **Harald** on 26 Feb 2012, 8:01 a.m.,*
in response to message #2 by Marcus von Cube, Germany

I think I figured out how to connect everything appart from the "Erase" button. I belive the pinout on the flash connector to be:

J31: Vcc (3V)

J32: reset

J33: TxD

J34: RxD

J35: GND

J36: erase???

Is that correct so far? Does the "erase" button pull up J36 to Vcc like "reset" pulls up J32?

I bet the cable arrives by the time I worked all this out...

Cheers, Harald

Re: What does the Erase Button on the HP cable do?

*Message #7 Posted by **Marcus von Cube, Germany** on 26 Feb 2012, 9:07 a.m.,*
in response to message #6 by Harald

Erase needs to be pulled high to do an erase. The calculator needs to run for this to work. Just press the ON key to wake it up with ERASE pulled high. (I had accidentally written Vdd which is wrong.)

The SDK mentioned here contains schematics.

33s, 35s or 15cLE--which to buy?

*Message #1 Posted by **Matt Agajanian** on 25 Feb 2012, 11:17 a.m.*

Hello all. I'd like to add at least one of these to my collection for not only my library but also as a function set and programming enhancement to complement my already existing predecessors.

Here's what I've got in comparison:

An original lineage 15C an HP-42S and an HP-32S-II

So, with these as a base, which model or models should be my next investment?

Thanks in advance for your help

Re: 33s, 35s or 15cLE--which to buy?

*Message #2 Posted by **Michael de Estrada** on 25 Feb 2012, 11:29 a.m.,*
in response to message #1 by Matt Agajanian

I have all the models you mentioned.

The 33s is basically an enhancement of the 32SII with the main advantage of a two-line display. If you like the 32SII, then you will like the 33s, which is also the least expensive programmable RPN calculator currently made by HP.

The 35s is a step backwards, and not worth owning IMO. I don't use mine.

The 15c LE is an overpriced disappointment, with faster speed offset by short battery life and annoying bugs. Mine also suffer from random keyboard repeating errors.

My 2¢

Re: 33s, 35s or 15cLE--which to buy?

*Message #3 Posted by **Nick R** on 26 Feb 2012, 1:06 a.m.,*
in response to message #2 by Michael de Estrada

Due to the poor quality and performance of the last two models I'd say that the purchase of an HP scientific calculator is no longer an investment.

Re: 33s, 35s or 15cLE--which to buy?

*Message #4 Posted by **Chris McCormack** on 25 Feb 2012, 2:06 p.m.,*
in response to message #1 by Matt Agajanian

Between these three calculators, the HP33s provides a full-featured scientific RPN calculator with a very nice price point. A little ebay prowling can net one for around $20.

I have a 15C that I still use, but I'm not sure I would go with one of the 'new' 15Cs. On the other hand, if I could get the 'same' calculator (who needs speed, give me the batteries that last FOREVER) for under $50 I would consider it a winner.

We bought a 35s for my daughter to use on her FE exam. I've used it a few times, and it seems OK - but I think the discussions here have highlighted some serious flaws in the unit. Unfortunately, although it sounds like the shortcomings are fixable, it doesn't seem like HP will be updating that model.

What I find tempting now is the HP20b reprogramming project. It sounds like a fantastic unit with the sole drawback of stickers and labels on the keyboard.

Re: 33s, 35s or 15cLE--which to buy?

*Message #5 Posted by **Dominic Richens** on 25 Feb 2012, 2:53 p.m.,*
in response to message #4 by Chris McCormack

> Quote:
>
> What I find tempting now is the HP20b reprogramming project. It sounds like a fantastic unit with the sole drawback of stickers and labels on the keyboard.

So far Eric's overlays are durable and cheap enough to have a couple of spares on hand.

Re: 33s, 35s or 15cLE--which to buy?

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 25 Feb 2012, 2:36 p.m.,*
in response to message #1 by Matt Agajanian

Given what you already have, it' just a matter to choose the disappointment flavor you prefer. 33S, 35S, 15L... each has its own way to disappoint.

I think that the 33S is the less-buggy from this trio, but the display just evolved from "absolutely unreadable" to "barely readable", and the colors of the keyboard legends will heavily stress your eyes (leaving the angled legends alone).

The 35S has a lot of bugs, its display is also very uncomfortable to use. The keyboard legends are better than in the previous case.

The 15L comes from the internal HP development team, which makes a very positive difference from the other two; and recreates the classic vintage model. Ergonomics are good (not as good as the original, but close), and if eventually HP releases new firmware, the bugs may go away (the 15L may be updated, while the other two models cannot). Apart from the bugs, the numeric-only display may look as a limitation nowadays.

A 30B, converted to a WP-34S will be the best suggestion, IMHO.

Re: 33s, 35s or 15cLE--which to buy?

*Message #7 Posted by **Paul Dale** on 25 Feb 2012, 4:11 p.m.,*
in response to message #1 by Matt Agajanian

Definitely go for a WP 34S :-)

- Pauli

Re: 33s, 35s or 15cLE--which to buy?

*Message #8 Posted by **Benoit Maag** on 25 Feb 2012, 7:15 p.m.,*
in response to message #1 by Matt Agajanian

Matt,

I do not have a 33S, so I cannot commnt on it, though I do not like the looks of it much.

The WP-34S is a great integration, but I would not recommend it for sustained day to day use because you will need stickers on the keys and they will peel off quickly (especially if you use the very tight HP-30B case).

The 15C LE is a nice classic, but the PSE bug is annoying and the numeric only display is a limitation if you program because the program steps are shown in code (the line-column coordinates of the keys). It is also quite pricey.

Among the 3 models you are thinking about, I would recommend the 35S despite the bugs (which I did not notice really) and some oddities like the shifted STO key and the hard to read display annunciators. But the format is nice, a bit like the HP-65/67 classics, thinner and lighter (and LCD). Programming is easy (old style, not RPL) and the alphanumeric display makes it easy to read your programs. Memory is large (32k I think). Some common conversions are directly on the keyboard, which is handy if you use those a lot. At ~ 50$, it is a very good deal.

Decisions, decisions... or buy them all!

Re: 33s, 35s or 15cLE--which to buy?

*Message #9 Posted by **Matt Agajanian** on 25 Feb 2012, 7:27 p.m.,*
in response to message #8 by Benoit Maag

Pardon my misunderstanding but, what is a WP-34S?

Re: 33s, 35s or 15cLE--which to buy?

*Message #10 Posted by **Paul Dale** on 25 Feb 2012, 8:11 p.m.,*
in response to message #9 by Matt Agajanian

The WP 34S is a repurposing of HP's 20b and 30b business calculators for scientific purposes. It operates like the 32sii but with all the integer functions of the 16c (and even a few extra) and most of the functions of the 42s plus a whole swag of extra functions and capabilities.

Check out the development site. There is a comprehensive manual in the distribution which should give you an idea of the device's capabilities.

As for the actual repurposing, overlays and programming cables are available as are preprogrammed devices.

- Pauli

Re: 33s, 35s or 15cLE--which to buy?

*Message #11 Posted by **Matt Agajanian** on 25 Feb 2012, 9:59 p.m.,*
in response to message #9 by Matt Agajanian

Well, thanks for all your advice. Amazingly, on eBay (of course), I found a 33s. This seller offered returns (just in case I'd need it) and he had several BRAN' SPANKIN' NEW ones in stock so, I bought

two. YIPPEE!!

The topper was that earlier today, I was computing some integrals on my 32S II. They were taking unusually long calculation times on SCI 4 and FIX 4 settings. Yes, I know I could've stepped down to SCI 2 or FIX 2 but, it shouldn't be 15+ minutes on 4, should it? I figure this 33s should be much faster than my 32S II and that's why I picked the 33 over the 35. Is the 33 faster? If so, any benchmark figures?

As for the looks of it, considering it's an upgrade from my 32S II, the newfangled curved keys, although not my first pick for a facelift, are small adjustments to pay for getting a jump up from my old standby.

If an integral takes 15 minutes on the HP-32SII you can expect at least 6 minutes and 30 seconds on the HP 33s (and perhaps no more than 90 seconds on the HP-15 LE). It was a good idea to buy two. I am on my third one (one broken key on each of the previous two -- they still register, but look unpleasantly loose).

Re: 33s, 35s or 15cLE--which to buy?

in response to message #8 by Benoit Maag

> Quote:
>
> The WP-34S is a great integration, but I would not recommend it for sustained day to day use because you will need stickers on the keys and they will peel off quickly (especially if you use the very tight HP-30B case).

Hm... I don't know about your experience, but I've been using a WP34s as my daily calc now for many months. If by "peel off" you mean that the sticker will lift from the key, I can say that I *never* had any problem of that kind.

If you mean that the ink will peel from the vinyl substrate, that happened with the old, non-coated overlays; the more recent ones have a thin lacquer coating that improves overall durability, improves contrast, and prevents peeling - I had no peeling at all with the coated one.

This is my personal experience, YMMV! :)

Cristian

Re: 33s, 35s or 15cLE--which to buy?

*Message #14 Posted by **Paul Dale** on 26 Feb 2012, 4:13 a.m.,*
in response to message #13 by Cristian Arezzini

My experience with the overlays is the same. No problems and no sign of ware or peeling so far.

- Pauli

Re: 33s, 35s or 15cLE--which to buy?

*Message #15 Posted by **Nigel J Dowrick** on 26 Feb 2012, 6:08 a.m.,*
in response to message #13 by Cristian Arezzini

I totally agree. Although the process of applying the key stickers and overlay is not particularly fast, it isn't nearly as difficult as I expected (and I'm clumsy). I've done it twice, without problems. The WP 34S has become my main calculator and I've had no problems with anything peeling away.

I really do recommend this machine to any of you who are still thinking about whether to bother. There has quite simply been nothing else like it - ever. I can imagine exploring it for years!

Nigel (UK)

Re: 33s, 35s or 15cLE--which to buy?

*Message #16 Posted by **kc** on 26 Feb 2012, 12:12 a.m.,*
in response to message #1 by Matt Agajanian

I have both the 33S and 35S. My recommendation is the 33S, provided that you can stand the highly controversial chevron keyboard. Apart from the bugs in 35S, I think that the 33S has a better key press feel than the 35S. After using for several months, I've accustomed to the 33S' keyboard layout and for me, that strange chevron keyboard isn't so strange after all. The 35S is constantly reported to have unregistered key press problem, and I also have experienced that, though I'm not sure whether it is software or hardware based.

Mind you, the earlier version of 33S has the problem of small dot/decimal "." which is difficult to read, but seemed to have rectified in later productions.
The 15cLE is an out-dated technology IMO. I hate programming the 15cLE as it is nearly impossible to debug.

Re: 33s, 35s or 15cLE--which to buy?

*Message #17 Posted by **Jan** on 26 Feb 2012, 6:12 a.m.,*
in response to message #16 by kc

I hate programming the 15cLE as it is nearly impossible to debug.

Unless you know the key-coordinates by heart, which an experienced 15C user does.

Re: 33s, 35s or 15cLE--which to buy?

*Message #18 Posted by **Jan** on 26 Feb 2012, 6:10 a.m.,*
in response to message #1 by Matt Agajanian

The 33S looks terrible and the 35S has serious shortcommings wrt to speed and ergonomics. The 15C LE however is a good choice for someone who already owns a 15C. It's small, it's ergonomical, it's fast, the key-touch is not the same as the original but it is far better than the 35S. Yes, it has a few bugs but I can live with them in daily use. Frankly I don't understand people nagging about this machine, especially in view of the numerous requests in the past to reissue it. Keyboard-issues were a potential problem but that seems to have been fixed (and if not you have a warranty). I would go for the 15C LE. It also looks superb.

HP-35 Field Case?

*Message #1 Posted by **Michael Gasperi** on 25 Feb 2012, 10:30 a.m.*

I discovered my hard leather HP-35 Field Case the other day. I used it while I went to college because I thought it was too difficult to get the calculator out of the calf leather case it came with. Unfortunatly my loved HP-35 seems to have died, so I don't have much use for this case anymore. Looking around the web, I couldn't find much about the Field Case. I figured you guys would know more about how common this accessory was and what it is worth. Thanks for any help you can give me.

Re: HP-35 Field Case?

*Message #2 Posted by **aj04062** on 25 Feb 2012, 2:57 p.m.,*
in response to message #1 by Michael Gasperi

They come up for sale every once and a while on eBay.

I'd guess it is worth $30-50

[OT] Free42 on the BlackBerry PlayBook

*Message #1 Posted by **Les Wright** on 25 Feb 2012, 2:05 a.m.*

This is a a question that affects few if any people here, so I will keep it brief.

I am wondering if anyone here has managed to successfully repackage Thomas Okken's Free42 Android app APK file as the requisite BAR file for use under the recently released BlackBerry Tablet OS 2.

The compatibility tester on RIM's developer pages indicates that the original APK has some barriers to successful repackaging, but I don't know if they are so unsurmountable that someone hasn't managed to tweak Thomas's source code to make the repackaging successful. It certainly is a programming job outside of my knowledge base.

An obscure question, but if anyone has had any success here I would love to share in it.

Les

Re: [OT] Free42 on the BlackBerry PlayBook

*Message #2 Posted by **Thomas Okken** on 25 Feb 2012, 10:56 a.m.,*
in response to message #1 by Les Wright

I tried feeding the apk from my web site to RIM's compatibility tester, and got these results:

```
+--------+--------------------+----------------------------------------+
| Impact | Type               | Reason                                 |
+--------+--------------------+----------------------------------------+
| 2      | uses-small-icon    | Icon size must be 86x86                |
| 5      | uses-access-native | com.thomasokken.free42.Free42Activity |
+--------+--------------------+----------------------------------------+
```

The first issue is trivial; I can always add another icon.
The second is a killer. The Free42 core is written in C++ and must be compiled as native code. (Compiling C++ to Java byte codes is, for all practical intents and purposes, impossible, and rewriting 38,000+ lines of C++ in Java is something I'm unwilling to do.)

I did sign up to be notified when native code support becomes available, so if and when that happens, I'll take another look.

HP-67 not working

*Message #1 Posted by **Vassilis Prevelakis** on 24 Feb 2012, 7:51 p.m.*

Hi,

My hp67 is stuck, displaying a fixed pattern and not responding to key presses.

Power cycling sometimes changes the pattern, but otherwise its stuck.

Using a digital oscilloscope I confirmed that main voltages (Vbat, Vss, Vgg are all OK: proper voltages without ripple).

Both clocks are fine as well.

SYNC looks OK (but has some ripple) as well as RCD.

However, STR is stuck high.

Should I assume that ROM0 (which generates STR) is broken and needs to be replaced, or should I be looking elsewhere?

Thanks

**vp

Here is the SYNC signal:

Spares for vintage calculators HP-25, HP-27?

*Message #1 Posted by **Samo** on 24 Feb 2012, 7:14 a.m.*

Hello there

I would like to complete my two vintage calulators HP-25 and HP-27 and I would need some spare parts, if available: 1. AC adapter/charger preferably with EU plug 2. Battery pack (even just the case/housng without NiCd's) 3. Mounting screws 2pcs 4. Rubber pads (to cover the screws) 5. Spare "STO/N.D." key button for HP-27 6. Original printed manuals

Could anybody give me any help or hint about how/where to get this items?

Thank you very much. Samo

Re: Spares for vintage calculators HP-25, HP-27?

*Message #2 Posted by **Luiz C. Vieira (Brazil)** on 24 Feb 2012, 7:23 a.m.,*
in response to message #1 by Samo

HI, Samo.

Chances are you are going to succeed finding what you want and contacting the right people by posting your message here, at the classified ads. The 'for sale' and 'wanted' messages in this site are usually post there. Here, at this forum, people usually share their experiences and discuss repair and usage.

Success!

Luiz (Brazil)

Edited: 24 Feb 2012, 7:24 a.m.

Re: Spares for vintage calculators HP-25, HP-27?

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 24 Feb 2012, 2:10 p.m.,*
in response to message #1 by Samo

A respectful suggestion: NEVER use them with an AC adapter. Don't even connect them to an AC adapter. Run them from rechargeable AA batteries instead; and recharge the batteries outside the calculator.

Sometime ago, I used to run my HP-25 from alkaline AAs, as the greater voltage caused no harm on my units; but nowadays I'm more cautious and would play it on the safe side using NiMH AA rechargeables. Again, don't recharge the batteries in the calculator (BTW, the internal charger was designed for NiCds from the 1970's, current batteries are not the same).

Using the AC adapter puts your calculator at the verge of unrecoverable risk. If the battery contacts fail, even for a split second, the greater voltage from the AC adapter will kill the chips inside, and there are no spares available. Batteries act as sort of regulator, absorbing the voltage excess, but that is the only protection.

*Message #4 Posted by **Michel Beaulieu** on 25 Feb 2012, 8:17 a.m.,*
in response to message #1 by Samo

Just read this archive about charging a HP-25 safely with a simple mod :

Captain Zener

Re: Spares for vintage calculators HP-25, HP-27?

*Message #5 Posted by **JoeGeller** on 25 Feb 2012, 7:02 p.m.,*
in response to message #4 by Michel Beaulieu

The hp25 zener mod is excellent. I was wondering why no one had done something like that yet.

Since the original hp charging scheme was for NiCads, has anyone made a mod. to properly charge a pair of NiMH batteries in the unit, so the battery pack does not have to be disassembled for re-charging? (Does anyone make an aftermarket HP25 battery? Or, is it always a matter of putting new batteries in the original plastic shell?)

Is it practical to reuse the original charging cord with a modern charger e.g. something like a DuraCell minicharger? (I have not looked at the minicharger, no idea what the circuit is, or if it charges the two batteries individually or in series?) Or, is it practical to build a small modern (NiMH?) charger circuit into the original charger case?

RPN Programming exercise (HP-42S)

*Message #1 Posted by **Gerson W. Barbosa** on 23 Feb 2012, 7:45 p.m.*

Given two four-digit integer numbers on the stack, write an HP-42S program that returns their product in no more than 20 seconds on a real HP-42S.

Restriction: use no *, no BASE*, no /, no BASE/, no %, no MOD, no LN, no E^X, no LOG, no 10^X.

Currently I have two programs that meet the requirements:

```
00 { 77-Byte Prgm }
01>LBL "MLTA"
...
29 ROTXY
...
35 END
```

and, since ROTXY has been allowed,

```
00 { 50-Byte Prgm }
01>LBL "MLTB"
...
29 .END.
```

The latter has the advantage of being faster and shorter. Also, it accepts a wider range of non-fixed format operands.

Examples:

```
1234 ENTER 5678 XEQ MLTA   -->  7,006,652

9999 ENTER XEQ MLTA        --> 99,980,001

12 ENTER 3456789 XEQ MLTB  --> 41,481,468

1234 ENTER 5678 XEQ MLTB   -->  7,006,652
```

Gerson.

(7:57pm) Edited to add more restrictions:

No STO*, no STO/, no Y^X.

Edited again (the LAST time) for yet one more restriction

and no multiplication of any kind (except binary shifts).

Edited: 23 Feb 2012, 8:12 p.m. after one or more responses were posted

Re: RPN Programming exercise (HP-42S)

*Message #2 Posted by **Namir** on 23 Feb 2012, 7:50 p.m.,*
in response to message #1 by Gerson W. Barbosa

```
LBL MLTA
STO* Y
X<>Y
END
```

Edited: 23 Feb 2012, 7:51 p.m.

Re: RPN Programming exercise (HP-42S)

*Message #7 Posted by **Gerson W. Barbosa** on 23 Feb 2012, 8:05 p.m.,*
in response to message #6 by Paul Dale

Ah, and no multiplication of any kind (except binary ones), like DOT, for instance :-)

Re: RPN Programming exercise (HP-42S)

*Message #8 Posted by **Paul Dale** on 23 Feb 2012, 8:14 p.m.,*
in response to message #7 by Gerson W. Barbosa

Not explicitly. Does Sigma+ count :-)

- Pauli

Re: RPN Programming exercise (HP-42S)

*Message #9 Posted by **Gerson W. Barbosa** on 23 Feb 2012, 8:20 p.m.,*
in response to message #8 by Paul Dale

When I was asked to do this exercise, the programming language was COBOL and the only restrictions were "no MULTIPLY and no DIVIDE (no * and no /)". Times have changed :-)

Gerson.

Edited: 23 Feb 2012, 8:24 p.m.

Re: RPN Programming exercise (HP-42S)

*Message #10 Posted by **Paul Dale** on 23 Feb 2012, 8:32 p.m.,*
in response to message #9 by Gerson W. Barbosa

Something like this (which I've not even bothered trying):

```
01 0
02 +
03 LBL 00
04 ST+ L
05 DSE Y
06 GTO 00
```

Glacially slow but short and a certain fail on the exercise.

- Pauli

Re: RPN Programming exercise (HP-42S)

*Message #11 Posted by **Gerson W. Barbosa** on 23 Feb 2012, 8:41 p.m.,*
in response to message #10 by Paul Dale

> Quote:
>
> Glacially slow but short and a certain fail on the exercise.

This would have failed in the original COBOL exercise back in '84. Student's programs

would run for about half a second or so on the university DEC-10 System before being aborted. I remember we were given three sets of multiplicands, one of them (9999, 9999). Without a reasonably good algorithm, it would have been impossible.

Gerson.

Edited: 23 Feb 2012, 8:43 p.m.

Re: RPN Programming exercise (HP-42S)

*Message #12 Posted by **Chuck** on 23 Feb 2012, 8:26 p.m.,*
in response to message #1 by Gerson W. Barbosa

This may prompt Gerson for another restriction, but here goes:

```
01 LBL "MLTA"
02 sigma+
03 RCL 15
04 CLsigma
05 RTN
```

Should add another clear sigma as step 02 to be sure the stat registers are empty.

;)

Edited: 23 Feb 2012, 8:27 p.m.

Re: RPN Programming exercise (HP-42S)

*Message #13 Posted by **Paul Dale** on 23 Feb 2012, 8:29 p.m.,*
in response to message #12 by Chuck

This is my solution if you move the CLsigma to the front of the program.

i.e.

```
    01 LBL "MLT"
    02 CLsigma
    03 sigma+
    04 RCL 15
```

- Pauli

Re: RPN Programming exercise (HP-42S)

*Message #14 Posted by **Chuck** on 23 Feb 2012, 8:31 p.m.,*
in response to message #13 by Paul Dale

Ahhh, yes. That would be wiser!!!

Re: RPN Programming exercise (HP-42S)

*Message #15 Posted by **Gerson W. Barbosa** on 23 Feb 2012, 8:31 p.m.,*
in response to message #12 by Chuck

I think "no multiplication of any kind (except binary shifts)" might handle this, though Pauli may not agree.

Well, to the next round :-)

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #16 Posted by **Luiz C. Vieira (Brazil)** on 23 Feb 2012, 9:13 p.m.,*
in response to message #1 by Gerson W. Barbosa

Hi, Gerson;

maybe you should ask for logic operations and stack manipulation only. I remember the first time I red about CORDIC algorithm and the beauty of its solutions. I for one know that I need to go ahead and try some logic operations to solve math problems once in a while.

Just for the fun of it.

Cheers.

Luiz (Brazil)

(I red the proposition right now and I'm actually going to sleep. It has been a busy day and it is 00:11h right know. Wondering about how not to let the bugs byte... Show them this problem and ask them to solve, perhaps? Chances are they'll not have bugs in their solution. I'm too sleepy, not reasoning accordingly, sorry.)

Edited: 23 Feb 2012, 9:16 p.m.

Re: RPN Programming exercise (HP-42S)

*Message #17 Posted by **Gerson W. Barbosa** on 23 Feb 2012, 9:33 p.m.,*
in response to message #16 by Luiz C. Vieira (Brazil)

Olá Luiz,

This is very simple program, it doesn't compare to the beauty of the CORDIC algorithm. I don't know whether my original solution then was the expected one or not. Only thing I know the program was compiled and run, giving the right answers. Well, the restrictions didn't say anything about memory usage. So, I did use a lot of memory. That's what I had, not time.

Cheers,

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #18 Posted by **Gerson W. Barbosa** on 24 Feb 2012, 8:01 a.m.,*
in response to message #16 by Luiz C. Vieira (Brazil)

Hello again, Luiz!

Yesterday, (or early today), after I replied to you, before going to sleep I watched this movie. Close to the end one of the characters (Mr. Jones) said:

"I left the store open, I sold my car, all because of 42. Who's giving a damn about anything else when you're wearing a 42?"

The number had appeared already a few time in the movie. I found it a coincidence as we were talking about the HP-42S here.

Cheers,

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #19 Posted by **Luiz C. Vieira (Brazil)** on 24 Feb 2012, 8:21 a.m.,*
in response to message #18 by Gerson W. Barbosa

Hi, Gerson.

Well, not to worry about guns, Magnum's and stuff! After all, isn't '42' THE answer in search for a question, mostly related to the universe and everything? A good hitchhiker knows it better... ;)

Cheers! And thanks for the tip. I'll find a way to watch it.

Luiz (Brazil)

Edited: 24 Feb 2012, 11:12 a.m.

Re: RPN Programming exercise (HP-42S)

*Message #20 Posted by **Paul Dale** on 23 Feb 2012, 11:21 p.m.,*
in response to message #1 by Gerson W. Barbosa

Seems like we'd be allowed to use Prosthaphaeresis to solve this one using trig identities to change the multiply into an addition.

- Pauli

Re: RPN Programming exercise (HP-42S)

*Message #21 Posted by **Paul Dale** on 24 Feb 2012, 2:37 a.m.,*
in response to message #20 by Paul Dale

Since I'm steadfastly refusing to write the bit shift, test, add and double algorithm for multiplication, I sat down and wrote a 34S program that uses Prosthaphaeresis. Nice, short and should be fairly fast.

I think all these commands are available on the 42S -- the only one I've any doubt about is the final ROUNDI (round to integer) which can be done using FIX 00 and a round.

```
01: LBL A
02: 1/x
03: ACOS
04: x[<->] Y
05: 1/x
06: ACOS
07: ENTER[^]
08: RCL+ Z
09: R[v]
10: -
11: COS
12: R[^]
13: COS
14: +
15: 1/x
16: RCL+ X
17: ROUNDI
18: END
```

There are no multiplies or divides here. If exception is taken to the 1/x commands, they can be replaced by

any command that reduces an integer argument into a [-1, 1] range.

This code fails if either argument is zero but that would be easy to check for by putting a not equal to zero condition test before each of the 1/x commands.

- Pauli

Edited: 24 Feb 2012, 2:39 a.m.

Re: RPN Programming exercise (HP-42S)

*Message #22 Posted by **Paul Dale** on 24 Feb 2012, 2:47 a.m.,*
in response to message #21 by Paul Dale

Actually, thinking about this a little more...

This code works fine for smallish integers positive or negative but fails as they get larger. The reason is a loss of accuracy due to the cosine operations. Thus, it would seem better to use a variant based on SIN of the original numbers not COS.

Essentially, as N becomes large, COS(1/N) tends to 1 quadratically, whereas SIN(1/N) tends to 0 linearly. Also, we can represent a lot more small numbers around zero than around one. Thus SIN(1/N) is far better for large N.

- Pauli

Re: RPN Programming exercise (HP-42S)

*Message #23 Posted by **Gerson W. Barbosa** on 24 Feb 2012, 7:39 a.m.,*
in response to message #21 by Paul Dale

> Quote:
>
> Since I'm steadfastly refusing to write the bit shift, test, add and double algorithm for multiplication, I sat down and wrote a 34S program that uses Prosthaphaeresis.

It really doesn't pay to use this method just to multiply those two four-digit numbers together. I've cared about restricting logarithms, but I've forgotten about prosthaphaeresis. No problem, posing too many restrictions may prevent creative solutions to appear, so it's a good thing it has been left out. **0 BASE+** is an equivalent to **ROUNDI** that doesn't change the number format.

The traditional multiplication algorithm may require up to 1149 sums, if I am not wrong. That's better than up to 9999 but would take more than 100 seconds on the HP-42S.

```
          1  2  3  4
          5  6  7  8
          ----------
          9  8  7  2
       8  6  3  8
    7  4  0  4
6  1  7  0
--------------------
7  0  0  6  6  5  2
```

A variation can be imagined that will require up to 299 sums, which would take about 30 seconds on the HP-42S. I've used a method that will always perform 200 sums, no matter the operands, at the cost of using more memory. Unfortunately string manipulation is very limited on the HP-42, so the problem would requires less steps and no multiplication at all (no ROTXY) if the multiplicands had not a fix

format. For instance, if one of the multiplicands can be splitted in two parts, then a 21-step (and perhaps even shorter) program is possible:

```
00 { 47-Byte Prgm }
01>LBL "MLTC"
...
21 END
```

Example:

```
12 ENTER 34 ENTER 5678 XEQ MLTC  -->  7,006,652
```

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #24 Posted by **Marcus von Cube, Germany** on 24 Feb 2012, 10:35 a.m.,*
in response to message #23 by Gerson W. Barbosa

I would try to translate the number in X into a string and get the digits off the string. Then it's just a matter of multiplication by a value between 0 and 10. This can easily be implemented via an indirect subroutine call where each subroutine does some tricky adds (assume the stack is filled with the number):

```
LBL 09
+             * 2
ENTER
+             * 4
ENTER
+             * 8
+             * 9
RTN
```

To save steps, some routines (04, 08) may be factored out. The complete algorithm would involve a sequence of multiplication of the previous result by 10, multiplication of the multiplicand by the next digit of the multiplier, and an addition to the result. Repeat until the multiplier contains no more digits.

Re: RPN Programming exercise (HP-42S)

*Message #25 Posted by **C.Ret** on 24 Feb 2012, 11:31 a.m.,*
in response to message #24 by Marcus von Cube, Germany

Dear Marcus, I think you are on the right track!

I am currently looking for a solution close to your process. But since only binary operations are allowed, I would have suggested translating the two integers into binary.

The idea is to accumulate the larger of the two integers into an accumulator that will contain the product at the end of the algorithm. The smaller will be considered as (down)-counter.

At each step, I will only consider three cases:

```
Step1 - The (down-)counter is zero; end of multiplication.
Step2 – If the last bit of the (down-) counter is one, the larger integer is
add one time in the accumulator.
Step3 - The larger integer is shift one bit to the left whereas (down-)
counter is shift one bit to the right and process resumes at step 1.
```

I am not sure this will be easily implemented into a HP-42S? And whether a large operation will fit or not to the time limit. Note, that to speed up the process, the last byte of the (down)-counter may be considered instead of only a bit. In this case, depend of value of the ‘byte’ the

larger integer has to be added into the accumulator more than one time. To achieve this, left-shift of it may be useful to spare operation since it is equivalent to a multiplication by 2. Considering binary representation of integers may help here to find the needed trick!

For example, algorithm using a byte of 4-bits (a nibble) :

```
Step1 - The (down-)counter is zero; end of multiplication.
Step2 – Considering the last byte (a nibble) of the (down-) counter :
 - - Test 1 –if bit3 (2^3) is on then add three-times-left-shifted-larger
integer into the accumulator,
 - - Test 2 –if bit2 (2^2) is on then add two-times-left-shifted larger
integer into the accumulator,
 - - Test 3 –if bit1 (2^1) is on then add one-time-left-shifted larger integer
into the accumulator,
 - - Test 4 –if bit0 (2^0) is on then add larger integer into the accumulator,
Step3 - The larger integer is shift one byte to the left
 whereas the (down-) counter is shift one byte (a 4-bits/nibble) to the right
(with no carry)
and process resumes at step 1.
```

Still seeking how to implement all this efficiently…

Re: RPN Programming exercise (HP-42S)

*Message #26 Posted by **Katie Wasserman** on 24 Feb 2012, 1:27 p.m.,*
in response to message #25 by C.Ret

I had to actually program and use this in the real world for my work many years ago.

IBM VM/370 had a scripting language called EXEC (here's the manual). It allowed for addition and subtraction but no other arithmetic operations. However it had functions for substring, concatenate and length and basic looping and conditionals. All variables were essentially strings but the addition and subtraction operators would treat the strings as numbers. I needed an integer multiplication function that worked the same way and had to come up with how to do that in EXEC and it had to run on some pretty large integers.

Re: RPN Programming exercise (HP-42S)

*Message #27 Posted by **C.Ret** on 24 Feb 2012, 5:06 p.m.,*
in response to message #26 by Katie Wasserman

If EXEC is able of addition and handle numerics mostly as strings, an algorithm based on successive additions that sequentially consider unit, tens, tausend, etc. may have to be considerate.

As an illustration:

```
     5678 x 1234 :
=    5678 x    4 :  "5678" + "5678" + "5678" + "5678"
+   56780 x   3  :  + "56780" + "56780" + "56780"
+  567800 x  2   :  + "567800" + "567800"
+ 5678000 x 1    :  + "5678000"
_____________    :  _____________________
                    "7006652"
```

Dear Sirs,

May I try something in my HP15C ???? It is very fast and no + - * /, or log and ln or exp...

```
f LBL D
STO 0
X >< Y (X SWAP Y)
0
X >< Y
f INTEGRATE 0
g RTN
f LBL 0
RCL 0
g RTN
```

Well, we don't have bit manipulation on 15C ... Best regards! Artur

Olá Artur,

> Quote:
>
> Great problem!

But not properly written... Anyway, the good thing is this has allowed for imaginative solutions using commands and functions with implicit multiplications, like yours, Chuck's and Pauli's. (I am not criticizing Namir's instant solution - it perfectly complied to the rules at the time of posting :-)

So it appears the solution falls under three categories:

1) Mostly sums and occasional bits rotation, as is my first solution;

2) Mostly bits rotation, as my second solution and Werner's highly optmized program;

3) Mainly implicit multiplications (Sigma+, COS, Integrate--).

Perhaps we should include a fourth category, using free format operands, like (1 2 3 4 and 5678) or (12 34 and 5678) or even (12 34) for calculator which don't have string handling. This might make things easier for sums-only solutions.

I am glad you have like it,

Cheers,

Gerson.

*Message #32 Posted by **Paul Dale** on 24 Feb 2012, 5:58 p.m.,*
in response to message #31 by Gerson W. Barbosa

I am fairly sure that the COS function on the 42S is implemented using CORDIC. No multiplications hidden in there, everything is shift and add. I'll agree that sigma+ definitely uses multiply and integrate almost certainly does.

The modulo 2 PI reduction for COS doesn't apply to my program either, all arguments to COS are small enough to not need this. The only operation I've any doubt about is the reciprocal which might or might not be implemented using division and there is quite possibly an alternate way to range reduce the integers.

Re: RPN Programming exercise (HP-42S)

*Message #34 Posted by **Valentin Albillo** on 24 Feb 2012, 5:32 p.m.,*
in response to message #28 by Artur-Brazil

> Quote:
>
> Dear Sirs,
>
> May I try something in my HP15C ???? It is very fast and no + - * /, or log and ln or exp...

I came up with the same "solution" for the HP-71B where the simple statement:

```
INTEGRAL(0,X,0,Y)
```

will return the product of X and Y at once. For instance:

```
> INTEGRAL(0,41,0,271)

      11111
```

By the way, your 10-step HP-15C program can be made one step shorter this way:

```
01 LBL A
02 STO 0
03 CLX
04 X<>Y
05 INTEG 0
06 RTN
07 LBL 0
08 RCL 0
09 RTN
```

Best regards from V.

*Message #35 Posted by **Artur-Brazil** on 24 Feb 2012, 7:50 p.m.,*
in response to message #34 by Valentin Albillo

I have to admit: here is the place of gods ... the OlymHPus!!! I, a simple mortal, can't beat you!

Thanks for appreciating my "cheating" solution -I was just ashemed to put one involving logs:

a * b = c
log(a*b) = log(c)
logC = log B + log B
so:
c = 10^(logA + logB)

f LBL A
g LOG
X >< Y
g LOG
+
G 10^X
G RTN

For positive numbers, but there will be a small error for big numbers. Artur

54 XEQ 03
55 ENTER
56 GTO 02            Final * 2
.
57*LBL 07            * 7 = * 8 - * 1
58 XEQ 08
59 R^                ST Y is no longer correct after XEQ 08
60 -
61 RTN
.
62*LBL 09            * 9 = * 8 + * 1
63 XEQ 08
64 R^
65 GTO 02            Final add
.
66 .END.
```

There is room for improvement, e. g. the first multiplication by 10 can be avoided with a flag. But the routine is pretty fast anyway (2 to 3 seconds for a 4 digit multiplier).

From my knowledge of COBOL this could come pretty close to what a solution would have been because numbers are (or can be) stored as strings in COBOL.

Re: RPN Programming exercise (HP-42S)

*Message #39 Posted by **C.Ret** on 24 Feb 2012, 6:12 p.m.,*
in response to message #38 by Marcus von Cube, Germany

Your specific way to treat factor from 0 (obvious) to 9 give me a fool idea of using matrix and indirect addressing to compute the product.

Here a version into RPL, since RPN indexing of 2-D matrix makes code difficult to read.

```
                                                @ integers X and Y enter
as 4 digits string (ex. "1234" "5678")

«

Re: RPN Programming exercise (HP-42S)

*Message #40 Posted by **Marcus von Cube, Germany** on 24 Feb 2012, 6:21 p.m.,*
in response to message #39 by C.Ret

Your solution is limited to 4 digit numbers (and fails on the 12*3456789 example). What makes it less efficient is that you do a digit by digit multiplication while my implementation multiplies longer numbers by values from 0 to 10. It's even possible to multiply an integer with an arbitrary number because the multiplicand is treated as is, only the multiplier is split into digits.

Re: RPN Programming exercise (HP-42S)

*Message #41 Posted by **C.Ret** on 25 Feb 2012, 11:57 a.m.,*
in response to message #40 by Marcus von Cube, Germany

You are right.

The above version is limited to strictly 4 caracters integer string for the sake of clarity. Even low integer have to be enter as 4-car string : i.e. 12 x 345 have to be type as "0012"x"0345".

And your alose are right, the algorithm is far less efficient since it have to cross every digits of the two integer. This makes exactly 16 cycles.

```
« SWAP ->STR SWAP ->STR                                  @ integers X and Y
both convert ti string

next digit of Y
              END
            »
     NEXT                                              @ continue with
next digit of X
   »
»
```

This last version make possible integer of any length. But, as you point it out, is a lot of thinks except efficient and sparse.

Since yesterday, I found another way to make the multiplication without multiplication :

The two integers have to be input as singleton vector (with only one element).

For exemple 3456x8976 may have been type on HP28S as :

```
« [ 3456 ] [ 8976 ] DOT »
```

Re: RPN Programming exercise (HP-42S)

*Message #43 Posted by **C.Ret** on 25 Feb 2012, 12:31 p.m.,*
in response to message #42 by Gerson W. Barbosa

Yes ! A lot of fun.

Making multiplication codes without multiplication, is much more fun than riding a bicycle without it.

The end of my last message was lost during the cut&paste process.

"This code un-doubtfully fit in third Gerson's category of hidden multiplication process"

*Message #47 Posted by **Gerson W. Barbosa** on 25 Feb 2012, 9:12 p.m.,*
in response to message #45 by Marcus von Cube, Germany

Years ago I read about the Russian peasant multiplication algorithm (that's the one I have used in my second program). I found it quite suitable for the Z80 microprocessor, which lacks multiplication as you know. It was quite fun writing a program based on the method then. This exercise made me look for it in my backup files. Why would anyone want to multiply binary numbers this long anyway? :-)

```
; LMULT: Multiplies two n-byte
;        numbers together (n up to 128)
```

```
;    HL: 1st operand (LSB)
;    DE: 2nd operand (LSB)
;    IX: 2n-byte result (LSB)
;     B: n
;
;
        ORG D000H
LMULT:  XOR A           ;A <- 0
        LD C,B          ;save B onto C
        SLA B           ;B <- B*2
        PUSH IX         ;save IX on the stack
LMULT0: LD (IX+0),A     ;initialize result
        INC IX          ;
        DJNZ LMULT0     ;
        POP IX          ;retrieve IX from the stack
        ...
        ...
        ...
;Test data
        ORG C100H       ;1st op address (LSB)
        DW 0201H        ;04030201H
        DW 0403H
        ORG C110H       ;2nd op address (LSB)
        DW 0605H        ;08070605H
        DW 0807H
;
;Test routine
;
        ORG D100H
        LD HL,C100H     ;1st operand
        LD DE,C110H     ;2nd operand
        LD IX,C130H     ;result
        LD B,4          ;4-byte operands
        CALL LMULT      ;multiply
        RET
;
;Upon running the 8-byte result
;will be 0020343D3C221005H (LSB in C130H)
```

10*LBL 99
11 48                ASCII code for '0'
12 ATOX
13 X=0?
14   GTO 98          End of the string, done!
15 X<Y?
16   GTO 99          Take care of ',' delimiters
17 X<>Y
18 -
19 STO 02            Index of subroutine, digit value
20 FS?C 00
21   GTO 97          Avoid multiplication in first step
22 RCL 00            Sum
23 ENTER
24 ENTER
25 ENTER
26 XEQ 09
27 STO+ 00           10 * sum
28*LBL 97
29 RCL 01            X
30 ENTER
31 ENTER
32 ENTER
33 XEQ IND 02        Multiply by digit
34 STO+ 00           Add to sum
35 GTO 99            Next digit
```

```
.
36*LBL 98
37 RCL 00            Show result and quit
38 RTN
.
39*LBL 00            * 0
40 0                 fall through
.
41*LBL 01            * 1
42 RTN
.
43*LBL 03            * 3
44 +                 fall through
.
45*LBL 02            * 2
46 +
47 RTN
.
48*LBL 08            * 8 = * 2 * 4
49 +
50 ENTER
51 ENTER             fall through
.
52*LBL 04            * 4 = * 2 * 2
53 +
54 ENTER
55 GTO 02            Final * 2
.
56*LBL 05            * 5 = * 4 + * 1
57 XEQ 04
58 GTO 02            Final add
.
59*LBL 06            * 6 = * 3 * 2
60 XEQ 03
61 ENTER
62 GTO 02            Final * 2
.
63*LBL 07            * 7 = * 8 - * 1
64 XEQ 08
65 R^                ST Y is no longer correct after XEQ 08
66 -
67 RTN
.
68*LBL 09            * 9 = * 8 + * 1
69 XEQ 08
70 R^
71 GTO 02            Final add
.
72 .END.
```

If the smaller number (the multiplier) isn't integer, it's treated as if it did not contain a decimal point. So 1.1 ENTER 2 XEQ"MUL" will yield 22.

Execution time is always in the vicinity of 2 seconds.

Re: RPN Programming exercise (HP-42S)

*Message #49 Posted by **Werner** on 24 Feb 2012, 1:48 p.m.,*
in response to message #1 by Gerson W. Barbosa

32 bytes

```
*LBL "M"
 STO+ ST X
 15
 ENTER
 CLX
*LBL 02
 STO+ ST X
 RDN
 BIT?
 X=0?
 GTO 00
 RUP
 RCL+ ST T
```

```
 RDN
*LBL 00
 RUP
 DSE ST Y
 GTO 02
 END
```

Adjust the constant 15 for larger numbers.

Cheers, Werner

Re: RPN Programming exercise (HP-42S)

*Message #50 Posted by **Gerson W. Barbosa** on 24 Feb 2012, 3:05 p.m.,*
in response to message #49 by Werner

It seems highly optimized to me! Congratulations!

Mine uses about 50% more bytes to implement a similar algorithm.

Cheers,

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #51 Posted by **Olivier De Smet** on 24 Feb 2012, 5:25 p.m.,*
in response to message #49 by Werner

Less optimized, but ok for even a 41 (less than 20 sec)

```
01 lbl 'MLTA
02 x<=y?
03 x<>y
04 sto 00
05 clx
06 sto 01
07 x<>y
08*lbl 00
09 rcl 00
10 x<>y
11 1
12 x=y?
13 gto 09
14 st+ x
15*lbl 01
16 enter^
17 +
18 r^
19 st+ t
20 rdn
21 x<=y?
22 gto 01
23 clx
24 lastx
25*lbl 09
26 -
27 x<>y
28 st+ 01
29 x<>y
30 x#0?
31 gto 00
32 rcl 01
33 end
```

And works for any number (but not for 0 * x)

Olivier

It build two series : for a * b (with a < b, to be faster)

```
i     s
1     b              special case with gto 09 to finish properly
2     b
4     2*b
8     4*b
16
```

```
when i > a, sum s and substract i/2 (it's the last x) from a and
loop again at lbl 00 until zero
```

```
Simple classic algorithm in binary :)
```

Oliver, can you explain the algorithm a little, please?

Re: RPN Programming exercise (HP-42S)

*Message #53 Posted by **Olivier De Smet** on 25 Feb 2012, 2:43 a.m.,*
in response to message #52 by Marcus von Cube, Germany

Same algorithm for 42s :

```
01 lbl 'MLTA
02 x>y?
03 x<>y
04 sto 00
05 clx
06 sto 01
07 x<>y
08 1
09*lbl 00
10 rcl 00
11 x=0?
12 gto 02
13 rcl st y
14 and
15 x=0?
16 gto 01
17 sto- 00
18 clx
19 rcl st z
20 sto+ 01
21*lbl 01
22 rdn
23 sto+ st x
24 x<>y
25 sto+ st x
26 x<>y
27 gto 00
28*lbl 02
29 rcl 01
30 .end.
```

but avoid multi loops

*Message #63 Posted by **Thomas Klemm** on 26 Feb 2012, 3:01 a.m.,*
in response to message #1 by Gerson W. Barbosa

As you haven't excluded *SQRT* and *x^2* I used them in a poor man's aproach to implement logarithm (A) and exponentiation (B):

```
00 { 55-Byte Prgm }
01 LBL "MULT"
02 XEQ A
03 X<>Y
04 XEQ A
05 +
06 XEQ B
07 IP
08 1
09 +
10 RTN
11 LBL A
12 RCL 00
13 X<>Y
14 LBL 00
15 SQRT
16 DSE ST Y
17 GTO 00
18 X<>Y
19 RDN
20 1
21 -
22 RTN
23 LBL B
24 1
25 +
26 RCL 00
27 X<>Y
28 LBL 01
29 x^2
30 DSE ST Y
31 GTO 01
32 X<>Y
33 RDN
34 END
```

Initialize register 00 with 40 to meet the specifications of your 3 examples. However I guess it will only work with *Free42* due to the lack of precision of the original HP-42S.

> Quote:
>
> and no multiplication of any kind (except binary shifts).

The implementation of *x^2* probably uses multiplication so I might get disqualified. Still a nice challenge and lots of cool solutions.

Thanks

Thomas

Re: RPN Programming exercise (HP-42S)

*Message #64 Posted by **Gerson W. Barbosa** on 26 Feb 2012, 10:36 a.m.,*
in response to message #63 by Thomas Klemm

Hello Thomas,

> Quote:
>
> The implementation of x^2 probably uses multiplication so I might get disqualified

That's another one I forgot :-) I forgot LN1+X and E^X-1 also. These surely use CORDIC.

> Quote:
>
> Still a nice challenge and lots of cool solutions.

I am glad you have liked it. Yes, I like them all, even the ones that try to circumvent the rules :-) (I don't mean yours)

The idea of the original exercise is how one would implement multiplication in a machine that lacks it. Since I used a bit shift instruction in my first solution, this allows for the more efficient binary shift and add multiplication, as in my unoptimized second solution. Back to the original problem, it would be easier to implement it on the HP-42S is one of the four-digits operands could be entered in chunks of 1 or 2 digits, for instance 1, 2, 3 and 4, or 12 and 34. In my first solution, I've use many steps just to split one 4-digit number into two 2-digit numbers. That's not so easy to do given the restrictions. **Perhaps a better variation would be allowing all digits of one of the operands to be entered individually or in chunks of two digits, like 12 ENTER 34 ENTER 5678, for instance.** Then, a 21-step additions-only solution is possible:

```
00 { 47-Byte Prgm }
01>LBL "MLTC"
...
21 END
Example:
12 ENTER 34 ENTER 5678 XEQ MLTC  -->  7,006,652
```

Contrary to what I said earier in this thread, we can do it performing no more than 100 sums, depending of our approach. Both approaches below would take up many steps, I think. In my 21-step solution 200 additions are always made, no matter the operands. The program is short but 100 numbered registers are used, that's the drawback. I will post my solutions tomorrow night, in case someone still wants to try one of these or other methods.

```
                1  2  3  4
                5  6  7  8
                ----------
                9  8  7  2             (1234 * 9)       up to 8 sums  |                  (1234 * 8)
up to 8 sums
             8  6  3  8           (1234 * 7 * 10)      up to 18 sums  |             (1234 * 7 * 10)
up to 18 sums
          7  4  0  4             (1234 * 6 * 100)     up to 108 sums  |       (1234 * 6 * 10 * 10)
up to 28 sums
       6  1  7  0               (1234 * 5 * 1000)    up to 1008 sums  |  (1234 * 5 * 10 * 10 * 10)
up to 38 sums
       --------------------                           ---------------  |
-------------
       7  0  0  6  6  5  2                           up to 1145 sums  |
up to 95 sums

                                (1234 + 1234 + 1234 + 1234 + 1234 + 1234 + 1234 + 1234) =     9 872
 (1234 + 1234 + 1234 + 1234 + 1234 + 1234 + 1234) = 8638; (8638 + 8638 + ... + 8638) =    86 380
        (1234 + 1234 + 1234 + 1234 + 1234 + 1234) = 7404; (7404 + 7404 + ... + 7404) =   740 400
```

```
               (1234 + 1234 + 1234 + 1234 + 1234) = 6170; (6170 + 6170 + ... + 6170) = 6 170 000
                                                                                        ---------
                                                                                        7 006 652

(1234 + 1234 + 1234 + 1234 + 1234 + 1234 + 1234 + 1234) =     9 872
                                                                    (1234 + 1234 + 1234 + 1234 +
1234 + 1234 + 1234) = 8638; (8638 + 8638 + ... + 8638) =    86 380
                                                  (1234 + 1234 + 1234 + 1234 + 1234) = 7404; (7404 + 7404
+ ... + 7404) = 74040; (74040 + 74040 + ... + 74040) =   740 400
 (1234 + 1234 + 1234 + 1234 + 1234) = 6170; (6170 + 6170 + ... + 6170) = 61700; (61700 + 61700 + ...
+ 61700) = 617000; (617000 + 617000 + ... + 617000) = 6 170 000

---------

7 006 652
```

Cheers,

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #65 Posted by **Marcus von Cube, Germany** on 26 Feb 2012, 12:25 p.m.,*
in response to message #64 by Gerson W. Barbosa

My approach saves additions by grouping them:

To multiply by 4, instead of 4 additions, only 2 are necessary. Another addition and you get the multiplication by 8. You'll need no more then 4 additions for any multiplier between 0 and 9.

Re: RPN Programming exercise (HP-42S)

> Quote:
>
> To multiply by 4, instead of 4 additions, only 2 are necessary.

Only 3 additions are needed to calculate $4a = a + a + a + a$.

Cheers
Thomas

*Message #67 Posted by **Gerson W. Barbosa** on 26 Feb 2012, 1:20 p.m.,*
in response to message #66 by Thomas Klemm

Thomas,

He's calculating $4a = (a + a) + (a + a)$, reusing the result of the first addition.

Cheers,

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #68 Posted by **Thomas Klemm** on 26 Feb 2012, 1:33 p.m.,*
in response to message #67 by Gerson W. Barbosa

That's understood. I just wanted to point out that you need only 3 and not 4 additions to calculate *a* + *a* + *a* + *a*. Never mind: it's not that important.

Thomas

Re: RPN Programming exercise (HP-42S)

Sorry! I hadn't seen your point.

Gerson.

Re: RPN Programming exercise (HP-42S)

*Message #70 Posted by **Gerson W. Barbosa** on 26 Feb 2012, 1:06 p.m.,*
in response to message #65 by Marcus von Cube, Germany

I see. A multiply by ten, required for both approaches above, could be done this way:

```
01 LBL "TEN*"
02 STO+ ST X
03 ENTER
04 STO+ ST X
05 STO+ ST X
06 +
07 END
```

That is, 4 additions instead of 9. So the maximum number of additions required by the second approach would be 65, even if multiplications up to 9 were made by simple addition loops (for lesser code size, perhaps).

Re: RPN Programming exercise (HP-42S)

*Message #71 Posted by **Marcus von Cube, Germany** on 26 Feb 2012, 1:50 p.m.,*
in response to message #70 by Gerson W. Barbosa

I didn't think of using STO + ST X instead of ENTER +. It will save filling the stack with X but otherwise the program will not change much.

in response to message #63 by Thomas Klemm

> Quote:
>
> As you haven't excluded *SQRT* and *x^2* I used them in a poor man's aproach to implement logarithm (A) and exponentiation (B):
>
> *[...] (34-step, 55-byte program) [...]*

If you're going to use x^2 then there's no need for such a convolute approach, this much simpler code will

do:

```
01  LBL A
02  STO ST Z
03  X<>Y
04  STO- ST Z
05  +
06  X^2
07  X<>Y
08  X^2
09  -
10  4
11  /
12  RTN
```

which doesn't use square roots either and further the final division by 4 can be replaced by a mere shift if desired.

Example:

```
41,  ENTER,  271,  XEQ A  ->  11111.0000
```

Best regards from V.

HP 95LX to PC connection

*Message #1 Posted by **John West (UK)** on 23 Feb 2012, 2:16 a.m.*

Hello,

I'm seeking Windows 7 compatable software to transfer files to/from a HP 95LX handheld PC.

The hardware connection works ok, using the original serial cable via a FTDI USB to a virtual COM3 port.

The Kermit 95 file transfer software I've tried so far is currently limited to command line instructions, as used by the HP 48 calculator.

I cannot get the HP 95LX's Kermit to talk to Kermit 95, should I call for Miss Piggy? :)

Thanks in anticipation, John

Re: HP 95LX to PC connection

*Message #2 Posted by **BruceH** on 23 Feb 2012, 4:01 p.m.,*
in response to message #1 by John West (UK)

According to this link Kermit95 should work.

I would set the baud rate on the 95LX to 9600, put it into server mode and try connecting from Windows to get a directory listing.

If that fails, please post some more details. For example, how do you know that the hardware is okay?

Re: HP 95LX to PC connection

*Message #3 Posted by **John West (UK)** on 23 Feb 2012, 10:02 p.m.,*
in response to message #2 by BruceH

Hello, thank you for the reply.

Yes, according to Columbia Uni. the software has been downloaded and installed successfully many times, presumably by satisfied customers. Unfortunately, as of summer 2011, they have ceased to support Kermit 95; though they still have it available for download. I am currently in contact with a commercial mirror site at onthehub.com, trying to resolve their try-before-buy download which causes Norton 360 to warn of Trojan Horses! I've even tried re-installation in Safe Mode, but the results are very unstable.

My dilemma is even if Kermit95 works fine on Windows7, can it be made to work easily with HP 95LX Kermit?

The hardware setup was tested with 'Bray++ Terminal v1.9b' software which captures data sent to/from the HP 95LX. As you say, the connection works fine at 9600 baud and single text file transfer is possible, though fiddly.

Regarding 'server mode' and 'directory listing', I have no instructions on how to establish a software connection; and MS-DOS is a very distant memory!

Thanks again for your help.

Regards, John

in response to message #3 by John West (UK)

Hello, just a quick status update and say thank you again.

Having tried various combinations of re-boot and disable anti-virus between running Control Panel/Programs and Features/Run programs made for previous versions of Windows, finally have a working solution.

A 20 year upgrade for the HP 95LX!

Cheers!, John

Clamshell Battery Contact Repair

*Message #1 Posted by **aj04062** on 22 Feb 2012, 8:10 p.m.*

I have worked this part out in my sheetmetal shop:

I propose making it from .024 Stainless Steel. I think I can offer it @ about $20 as this would cover the setup and hand bending costs (the radius has to be done by hand)

This cost could come down if I knew my batch would sell out or I should setup and make more. I have 3 interested folks, Kerem, Nigel and David. Are there anymore?

Edited: 23 Feb 2012, 8:27 p.m. after one or more responses were posted

When is exact mode not so exact?

*Message #1 Posted by **hugh steers** on 22 Feb 2012, 3:44 p.m.*

so, sqrt(99) = 9.94987437106619954734479 8...

however, on the Hp50g in approx mode,

99 SQRT = 9.94987437107

so far, so good. But in "exact" mode...

99 SQRT ->NUM = 9.94987437108

how embarrassing :-)

[discovery credit to BruceH]

Edited: 22 Feb 2012, 3:46 p.m.

Re: When is exact mode not so exact?

*Message #2 Posted by **Marcus von Cube, Germany** on 22 Feb 2012, 3:53 p.m.,*
in response to message #1 by hugh steers

The result is 3 * sqrt(11), computed to 12 digits. Exact mode seems to simplify the expression before evaluating it.

Re: When is exact mode not so exact?

*Message #3 Posted by **Ronald Williams** on 22 Feb 2012, 6:21 p.m.,*
in response to message #2 by Marcus von Cube, Germany

FYI - If one is looking for a numeric result in exact mode then make sure flag -03 is set or using the mode key and menus check numeric and uncheck approx from the cas menu. Both results will agree.

Re: When is exact mode not so exact?

*Message #4 Posted by **Bart (UK)** on 23 Feb 2012, 6:14 a.m.,*
in response to message #3 by Ronald Williams

Is this always going to produce the more accurate result?

Re: When is exact mode not so exact?

*Message #5 Posted by **Ronald Williams** on 23 Feb 2012, 2:14 p.m.,*
in response to message #4 by Bart (UK)

The exact result is 3 * sqrt(11). However, numeric (floating point) results are usually approximations. For this case sqrt(99) = sqrt(9*11) = sqrt(9)*sqrt(11) = 3*sqrt(11). 11's sqrt does not have a an simple exact floating point representation. This brings up the topic of accuracy or in this case I would say consistency of results. If accuracy is desired then I suggest reading this article

http://h20331.www2.hp.com/hpsub/downloads/HP_Calculator_eNL_01_January_2012.pdf

pages 21-25 and pages 50-51. Here is another

http://groups.google.com/group/comp.sys.hp48/browse_thread/thread/16ea6ddfb49e34eb/a53d3ab60541838d?lnk=gst&q=accuracy#a53d3ab60541838d

Does the 12th digit really matter or is it more important to know the capability and limitations of the tool you are using to solve the problem at hand?

Hopefully, the links are not broken, I usually don't post.

Re: When is exact mode not so exact?

in response to message #5 by Ronald Williams

> Quote:
>
> Does the 12th digit really matter or is it more important to know the capability and limitations of the tool you are using to solve the problem at hand?

This is where I was heading

> Quote:
>
> 11's sqrt does not have a an simple exact floating point representation.

Neither does 99's sqrt. There is a natural loss of information in rounding. The difference here is that when converted to a numerical answer immediately, there is one rounding. However when simplified symbolically first, the loss of information from the rounding gets multiplied by 3.

Looking at another example (very simplistic, but it shows the point):
RPN: 1 ENTER pi SQUARED / SQRT (& -> NUM as required).
Hugh's first setting (symbolic approx.): 0.318309886183
Hugh's second setting (symbolic exact): 0.318309886184
Your setting (numeric exact): 0.318309886183
Something with more significant digits (Wolfram Alpha, windows calculator, Hugh's ExactCalc) etc.: 0.318309886183790671...
So in this case the symbolic simplification gives a better answer.

The example of the original post is very good in that it shows how the loss of accuracy accumulates. Anyone doing a series of calculations (e.g. a formula or program) and thinks they are getting an answer "correct to the last digit of the calculator's display capability" is fooling themselves. It is therefore always important to assess the influence of the elements of a formula on rounding & accuracy. Computers have made too easy to just put in numbers and take a result. Too often I see people using a result to many digits when they have not even considered the order of magnitude (and I can see the old slide-rulists jumping in here "we had to work that out, so you always had a sense of what order of magnitude to expect" :-)) .

Another interesting read is Prof. Kahan's A Logarithm Too Clever by Half, and many other articles he wrote (available on his webpage http://www.cs.berkeley.edu/~wkahan/).

So, my point in this is: Hugh's implication that the 50g is "not so accurate in accurate mode" is **A BIG RED HERRING**, which I am sure he knows as he is well versed in computer mathematics (Hugh, did you post this just to see where it would go? :-)).

Re: When is exact mode not so exact?

*Message #7 Posted by **Ronald Williams** on 24 Feb 2012, 10:42 a.m.,*
in response to message #6 by Bart (UK)

Not that I want to beat this issue to death but does the fact you used pi in your simple example stack the deck so to speak.

[/quote] "Looking at another example (very simplistic, but it shows the point): RPN: 1 ENTER pi SQUARED / SQRT (& -> NUM as required). Hugh's first setting (symbolic approx.): 0.318309886183 Hugh's second setting (symbolic exact): 0.318309886184 Your setting (numeric exact): 0.318309886183 Something with more significant digits (Wolfram Alpha, windows calculator, Hugh's ExactCalc) etc.: 0.318309886183790671.... So in this case the symbolic simplification gives a better answer." [/quote]

Would the same result be obtained if you selected a simple integer or 'e' or one of the internal constants from the Constants Library?

PS - Wasn't life much simpler when we only had 3 significant digits to worry about? My slide rule(s) all work today as they did when purchased. The only noticeable change is that it's harder for me to read them now :-)

Re: When is exact mode not so exact?

*Message #8 Posted by **Bart (UK)** on 24 Feb 2012, 5:37 a.m.,*
in response to message #5 by Ronald Williams

> Quote:

41CL and the Time Module

*Message #1 Posted by **Gerry Schultz** on 22 Feb 2012, 3:40 p.m.*

I just bought a 2nd 41C Time Module from eBay (I can write that now, right?) since my first one is tied up with my 41CL. I know the Time Module uses unique hardware which makes it difficult to emulate in the 41CL.

Here's a random thought. Could Monte, if he wanted to, rework the 41CL MB such that I could take apart a Time Module and plug the circuit board directly into the CL MB? I know that's a lot of work for Monte to re-engineer the circuit board, but is this practical?

Gerry

Edited: 22 Feb 2012, 3:40 p.m.

Re: 41CL and the Time Module

*Message #2 Posted by **Monte Dalrymple** on 22 Feb 2012, 5:30 p.m.,*
in response to message #1 by Gerry Schultz

You can already do this. The Time Module PCB doesn't "mount" on the 41CL board, but it will fit in the channel between the side of the case and the battery compartment. You can then solder wires from the Time Module board to the 41C bus, either on the main PCB or to the appropriate spots on the 41CL board. I seem to recall a forum message that had a photo of exactly this modification a little while ago.

I am currently working on a small PCB that can use this technique to add the timer functionality to a CL. There is room in this space for a PCB about 14mm x 40mm, which _should_ be enough room for the required circuitry. While it could _theoretically_ fit on a reworked CL board, I don't want to even attempt that. It would require changing the FPGA, CPLD and memories to BGA packages to make enough room. The design rules for the board would go from routine to state-of-the-art ($$$), with probably 6 layers ($) and blind and buried vias ($$).

I have probably invested close to a man-year on this project and don't expect to sell more than about 150 total 41CL boards. I'm only working an the Time Module clone because I have time available right now.

Monte

Re: 41CL and the Time Module

*Message #3 Posted by **Diego Diaz** on 22 Feb 2012, 6:57 p.m.,*
in response to message #2 by Monte Dalrymple

Hi,

It's not just about installing the TIMER inside the CL but applying a small mod by including one capacitor and one diode to extend a bit the time allowed to replace the batteries without loosing the contents of the TIMER registers.

It does however show how the TIMER module is placed into the CL case.

Here you'll find the referred post.

Hope this helps.

Diego.

PS. Just in case you don't have a use for the removed TIMER module shell and connector, I'll gladly accept them for a new life housing one of my project's modules... ;-) Contact me please.

Flashing a 30B from Linux or Mac?

*Message #1 Posted by **Tom Grydeland** on 22 Feb 2012, 8:45 a.m.*

Has anyone done this?

I tried Atmel's sam-ba for Linux, with a prolific PL2303 USB serial port. Having connected the calculator and prepared it for flashing, I started sam-ba. Sam-ba recognized the serial port, I selected the at91sam7l128-ek board from the drop-down list and pressed the "Connect" button. Sam-ba prints the following lines:

```
-I- Waiting ...
-I- TCL platform : Linux
-I- SAM-BA CDC 2.11  on  : linux
-I- Connection : /dev/ttyUSB0 (target(comType) = 0)
-I- Board : at91sam7l128-ek
-I- Traces Level : 4
-I- target(handle) : file7
```

(the last of these is printed after pressing "Connect".) Nothing else happens.

Has anyone else tried this? Made it work?

Re: Flashing a 30B from Linux or Mac?

*Message #2 Posted by **Glenn Becker** on 22 Feb 2012, 2:10 p.m.,*
in response to message #1 by Tom Grydeland

For what it is worth I would also be quite interested in hearing whether anyone has had success with this ...

Thanks,

Glenn

Re: Flashing a 30B from Linux or Mac?

*Message #3 Posted by **David Griffith** on 22 Feb 2012, 4:01 p.m.,*
in response to message #1 by Tom Grydeland

I understand that the CDC thing has something to do with the fact it won't work.

Re: Flashing a 30B from Linux or Mac?

*Message #4 Posted by **Tom Grydeland** on 23 Feb 2012, 2:55 a.m.,*
in response to message #3 by David Griffith

If that was a tip for me, I hope you can make it a bit more explicit.

Re: Flashing a 30B from Linux or Mac?

*Message #5 Posted by **Tom Grydeland** on 23 Feb 2012, 8:25 a.m.,*
in response to message #3 by David Griffith

I got hold of an Eee running W7. Using that, with MySamba and the same USB<->serial cable, the flashing worked on the first try.

Now how much work would it be to develop a tool like MySamba which works under Linux?

Re: Flashing a 30B from Linux or Mac?

*Message #6 Posted by **pascal_meheut** on 23 Feb 2012, 8:46 a.m.,*
in response to message #5 by Tom Grydeland

Once again, this is planned and should be available in a few months.

Re: Flashing a 30B from Linux or Mac?

*Message #7 Posted by **Jose Gonzalez Divasson** on 22 Feb 2012, 4:10 p.m.,*
in response to message #1 by Tom Grydeland

For what is worth, I am flashing all the wp34s with a Mac running Samba in XP in a Parallels session. At the same time, I connect to the store from Safari - seamlessly.

I have been using Windows since I left my father's HP85 in 1983 - and once made the jump to Mac, I am not looking back...

No experience with Linux, though.

Re: Flashing a 30B from Linux or Mac?

*Message #8 Posted by **Marcus von Cube, Germany** on 22 Feb 2012, 4:59 p.m.,*
in response to message #7 by Jose Gonzalez Divasson

José, why SAM-BA and not MySamba? The latter is much faster, it takes about 20 seconds for the complete flash.

Re: Flashing a 30B from Linux or Mac?

*Message #9 Posted by **Jose Gonzalez Divasson** on 23 Feb 2012, 5:11 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Marcus,

Sorry, I meant "mySamba". It is not only much, much faster but as well less prone to stop in mid-download (in case there is any other I/O going on, it is very likely that the download stops with the normal Sam-Ba)

Re: Flashing a 30B from Linux or Mac?

*Message #10 Posted by **Egan Ford** on 23 Feb 2012, 11:24 a.m.,*
in response to message #1 by Tom Grydeland

"wine MySamBa.exe" works from Mac and Linux just fine. I never got the Atmel code to work.

More info:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=202996

My reflash notes:

```
To flash existing 34S:

1.  Connect cable.
2.  Turn ON 34S.
3.  Press and hold ON, then D S S (D 6 6), then release ON. Calc will turn off.
4.  Press and release ON.
5.  Flash with "wine MySamba.exe".
6.  Press and release reset button on the cable.
7.  Disconnect cable.
8.  Press ON.  Check VERS and BATT.
```

DM-15CC always/frequently turns on in case

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 22 Feb 2012, 8:25 a.m.*

8 out of 10 times when I pull this little beast out of the case it is either saying "PR ERROR" or a scrolling name display.

I am very sure that the power button is not being depressed (and that would not answer the memory initialization message in any case).

Has anyone else experienced this? Could it be some kind of ESD upset?

It is annoying to have it always lose its program and state.

Other than that and a couple of *stubborn* keys, I like the machine.

Re: DM-15CC always/frequently turns on in case

*Message #2 Posted by **aj04062** on 22 Feb 2012, 8:55 a.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

I saw this a couple of times with mine. I'd like to know what the root cause is as well.

Re: DM-15CC always/frequently turns on in case

*Message #3 Posted by **Alexander Oestert** on 22 Feb 2012, 12:09 p.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

I saw the scrolling name display only during the (successfull) flashing process, never during normal use.

Re: DM-15CC always/frequently turns on in case

*Message #4 Posted by **Ethan Conner** on 22 Feb 2012, 2:46 p.m.,*
in response to message #3 by Alexander Oestert

Has anyone started a dm-15cc bug list?

Re: DM-15CC always/frequently turns on in case

*Message #5 Posted by **Massimo Gnerucci (Italy)** on 22 Feb 2012, 3:06 p.m.,*
in response to message #4 by Ethan Conner

Why? Are there any bugs?

Re: DM-15CC always/frequently turns on in case

*Message #6 Posted by **Massimo Gnerucci (Italy)** on 22 Feb 2012, 3:06 p.m.,*
in response to message #1 by Neil Hamilton (Ottawa)

Neither of my two *little beasts* shows such attitude.

Massimo

HP-41 Navigation PAC question

*Message #1 Posted by **Diego Diaz** on 22 Feb 2012, 5:22 a.m.*

Hi all,

To the sailors out there, I've been asked if there is any need to update the HP-41 Navigation PAC programs with new Nautical Almanac data of Declination and Sideral Hour Angle.

I've been told that these data slightly change along the years.

Since a have little-to-no idea about what these terms may mean, I'd really appreciate any knowledgeable advice.

Thanks for your attention and best wishes.

Diego.

Re: HP-41 Navigation PAC question

*Message #2 Posted by **Dave Shaffer (Arizona)** on 22 Feb 2012, 12:11 p.m.,*
in response to message #1 by Diego Diaz

Not really a sailor, but an astronomer!

Due to the precession of the Earth, the apparent position of stars in the sky with respect to the Earth-based lat/lon system changes slowly and systematically as the years go by. The annual change is around 1 arcminute per year - comparable to the accuracy that a really good sextant user might hope to achieve.

So, if you are worried about running aground at the nautical mile level, you do need current star positions.

I have no idea - does the Nav Pac apply precession? If it does, it should more-or-less stay up to date for quite a while.

There is also proper motion of stars (they move around in space), but this is at the arcsecond per year level (generally, much less) so you shouldn't have to worry about this for a century or more!

Re: HP-41 Navigation PAC question

*Message #3 Posted by **Alexander Oestert** on 22 Feb 2012, 1:21 p.m.,*
in response to message #1 by Diego Diaz

I'm not a sailor but I have used a nautical almanach and a sextant on a layman's basis. As far as I know the Nav Pac has an eternal almanach programmed in its ROM. For instance, the manual says on page 39 "What is the declination of Polaris on 1 Jan 1980? What will it be on 1 Jan 2080?"

See TOS for details on the Nav Pac manual.

in response to message #3 by Alexander Oestert

Hi, Dave, Alexander,

Thanks for your comments, I've sent them to my friend and hope they clarify his doubts.

Best wishes from Hispaniola island.

Diego.

Re: HP-41 Navigation PAC question

*Message #5 Posted by **Timo** on 24 Feb 2012, 5:40 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

I can only second what Dave and Alexander posted. However, I once compared the star positions computed by the eternal almanach of the NAV-Pack to those in a current release of the "Nautical Year-Book", the german version of the alamanach for celestial navigation. I noticed that they deferred by a couple of arc-minutes.

Regarding navigation accuracy that may not be too significant, at least not on open sea. Since star positions vary only slowly, a position fix computed using multiple star sightings should not be off by too much. It may be different once you get close to shore though.

However, I'm just an "armchair" celestial navigator doing some backdoor sun-sightings for fun. Never managed to do star sightings with my do-it-yourself sextant since the city backlight is just too brigth and it does not have a telescope. So maybe it is a good idea to verify this by someone who is more experienced with using celestial navigation out on the open sea...

Best regards, Timo

*Message #6 Posted by **Alexander Oestert** on 24 Feb 2012, 6:04 a.m.,*
in response to message #5 by Timo

Hi Timo,

you're using a DIY cardboard sextant like I did? I purchased that thing from AstroMedia some years ago and it was fun!

Re: HP-41 Navigation PAC question

*Message #7 Posted by **Timo** on 24 Feb 2012, 11:48 a.m.,*
in response to message #6 by Alexander Oestert

Hi Alexander,

yep, that's the one I've meant. ;)

Was really fun to build and it is good enough to produce a usable position using the Noon-Sighting method. Unfortunately, it is quite unlikely that I will ever come to test my skills out on the ocean...

But then again - maybe my stomach will be quite thankful for that!

Cheers, Timo

That seems rather big. Assuming the initial star positions (probably for either 1950 or 2000) are correct (can you compare those? Bright star positions are all known to MUCH, MUCH better than an arcsecond), almost any precession algorithm should be good to well under an arcminute with a few simple equations. (To do better than about 20 arcseconds for an instantaneous star position, you also have to account for the (non-circular) orbit of the Earth and how that affects the aberration of starlight.)

Does anybody have a description of the precession formulas?

Complete 12C collection

*Message #1 Posted by **Keith Midson** on 21 Feb 2012, 6:34 p.m.*

Today I received a long awaited, long searched for, 12C Prestige from Brazil (thanks Artur!). This pretty much completes my 12C collection (a subset of my overall HP collection).
You can see it here: 12C collection
I'm not sure how I ended up with so many 'financial' calculators with my engineering background ... it has been fun gathering these many variations/ versions though. Now ... I just need that clear cased 12C!
Cheers, Keith

Edited: 21 Feb 2012, 6:42 p.m.

Re: Complete 12C collection

*Message #2 Posted by **Artur-Brazil** on 21 Feb 2012, 7:50 p.m.,*
in response to message #1 by Keith Midson

Hello, Keith

I'm very pleased you received it in good conditions! Great collection and it deserved to be complete!

My congratulations and enjoy the new baby!!! Artur, from Brazil

Re: Complete 12C collection

*Message #3 Posted by **John Robinson** on 22 Feb 2012, 1:25 a.m.,*
in response to message #1 by Keith Midson

Nice collection, and well presented set if pictures too !!.

Cheers, John

Re: Complete 12C collection

*Message #4 Posted by **Keith Midson** on 22 Feb 2012, 11:31 p.m.,*
in response to message #3 by John Robinson

Thanks Artur and John,
I think my Sharp pocket computer collection is also complete: SHARP
Also my Lloyd's collection is just waiting for my Accumatic 100 (the first calculator to have an LCD display): LLOYD'S
The very popular HP collection: HP Collection
Rare HP stuff: RARE HP
And now the GREATEST HITS set.
I know i've posted these links a few times lately, but i'm taking a break for a while, so there won't be any updates for a long time. Enjoy! Keith

HP 50g User's Manual

*Message #1 Posted by **Luke Hoffmann** on 21 Feb 2012, 6:07 p.m.*

Could someone direct me to a post or link explaining where I could purchase a new user's manual for my HP 50G? My current one was water damaged, and the PDF option won't work for me.

I contacted HP and was told there was nothing they could do. They also said that this was their only recommendation (the Museum).

Thank you very much,

Luke

Re: HP 50g User's Manual

*Message #2 Posted by **Luiz C. Vieira (Brazil)** on 21 Feb 2012, 6:11 p.m.,*
in response to message #1 by Luke Hoffmann

Hi.

Have you tried e-bay? Chances are you'll find a hardcopy for a fair price.

Cheers.

Luiz (Brazil)

Re: HP 50g User's Manual

in response to message #2 by Luiz C. Vieira (Brazil)

I have not. I was hoping to purchase one new. I will go check it out.

Still hoping for a new copy We'll see lol.

Thank you :)

Re: HP 50g User's Manual

*Message #4 Posted by **NateB** on 21 Feb 2012, 7:04 p.m.,*
in response to message #3 by Luke Hoffmann

User's Manual on eBay. Samson Cables carries it for $19.99 + shipping.

You can get a printed copy of the User's Guide from hpcalc.org.

Re: HP 50g User's Manual

*Message #5 Posted by **Paul Berger (Canada)** on 21 Feb 2012, 6:14 p.m.,*
in response to message #1 by Luke Hoffmann

Try Eric Rechlin's site hpcalc.org he has reprints of the User's Guide and the Advanced Uses Reference available. I believe the User's Guide to be a more complete manual than the one the comes with the 50G If you want to get an idea what is in them they are likely the same as the PDFs by the same name.

Edited: 21 Feb 2012, 6:18 p.m.

in response to message #5 by Paul Berger (Canada)

Try Samson Cables.

Re: HP 50g User's Manual

*Message #7 Posted by **Mike Morrow** on 21 Feb 2012, 9:48 p.m.,*
in response to message #5 by Paul Berger (Canada)

Indeed! Getting the spiral-bound 887-page User Guide and the 691-page AUR from Eric Rechlin's site is the best possible choice. I have them both and I can't imagine how something so well made can be sold so inexpensively. Obviously the User Guide is *not* the skimpy useless filler that comes with the HP 50g.

Also sold there are other interesting things. The low-cost USB power adapters are wonders for saving HP 50g batteries, for example.

HP 50g batteries

*Message #8 Posted by **Luiz C. Vieira (Brazil)** on 21 Feb 2012, 10:27 p.m.,*
in response to message #7 by Mike Morrow

Hi.

I've been using rechargeables in my HP50G for such a long time I can't tell. In fact, I've been using rechargeables for all calculators I have that use AAA-size batteries, and also the ones which use the N-size batteries (HP41, mostly).

Indeed, I was taken by surprise when connecting the HP50G to a computer for data transfer purposes. I only realized the calculator was without batteries when I tried to turn it on after disconnecting. Was not aware of the fact the calculator could be powered through the USB port.

Cheers.

Luiz (Brazil)

HP-12C program

*Message #1 Posted by **Gerson W. Barbosa** on 21 Feb 2012, 5:43 p.m.*

```
001-    1               016-    +
002-    0               017-    1/x
003-    x<>y            018-    STO 1
004-    y^x             019-    RCL 0
005-    STO 0           020-    3
006-    ENTER           021-    CHS
007-    *               022-    y^x
008-  g LSTx            023-    STO+ 1
009-    2               024-    1
010-    *               025-    STO- 0
011-    1               026-    RCL 0
012-    +               027-  g x=0
013-    x<>y            028-  g GTO 30
014-    2               029-  g GTO 19
015-    *               030-    RCL 1
                        031-  g GTO 00
```

Given the proper argument this small HP-12C program will give a meaningful result in about 2 minutes on the classic HP-12C (under a couple of seconds on the HP-12C+).

Re: HP-12C program

*Message #2 Posted by **Paul Dale** on 21 Feb 2012, 6:07 p.m.,*
in response to message #1 by Gerson W. Barbosa

Very nice!

Not having a 12C to hand, I converted this for the 34S:

```
01:  LBL A
02:  10[^x]
03:  STO 00
04:  x[^2]
05:  RCL L
06:  RCL+ X
07:  INC X
08:  x[<->] Y
09:  RCL+ X
10:  +
11:  1/x
12:  STO 01
13:  LBL 00
14:  RCL 00
15:  3
16:  +/-
17:  y[^x]
18:  STO+ 01
19:  DSZ 00
20:  GTO 00
21:  RCL 01
22:  RTN
```

However, there is an alternative WP 34S program that produces the same limit using *four* steps *including* the LBL at the start and the RTN at the end -- so *two* steps of working code.

- Pauli

Re: HP-12C program

*Message #3 Posted by **Paul Dale** on 21 Feb 2012, 6:10 p.m.,*
in response to message #2 by Paul Dale

Drat, missed some optimisation in the above code. Change line 18 to + and delete lines 21 and 12.

- Pauli

Re: HP-12C program

*Message #4 Posted by **Gerson W. Barbosa** on 21 Feb 2012, 6:22 p.m.,*
in response to message #3 by Paul Dale

I thought of including "optimization of the code is left as an exercise to the reader", but then I realized figuring out what the program did was good exercise enough. That was my first attempt after I noticed it this afternoon. Without the trick, about 50k terms would have to be computed in order to get the same result.

Gerson.

Re: HP-12C program

*Message #5 Posted by **Gerson W. Barbosa** on 21 Feb 2012, 6:12 p.m.,*
in response to message #2 by Paul Dale

> Quote:
>
> However, there is an alternative WP 34S program that produces the same limit using four steps including the LBL at the start and the RTN at the end -- so two steps of working code.

Actually, I've tested my results upon the WP 34S function :-)

Gerson.

Re: HP-12C program

*Message #6 Posted by **Gerson W. Barbosa** on 22 Feb 2012, 4:12 a.m.,*
in response to message #1 by Gerson W. Barbosa

While we're at it, here's another one for another constant:

```
001-    1               019-    CHS
002-    0               020-    STO+ 0
003-    x<>y            021-    STO* 2
004-    y^x             022-    RCL 0
005-    STO 0           023-    2
006-    ENTER           024-    *
007-    *               025-    +
008-    8               026-    ENTER
009-    *               027-    *
010-    6               028-    1/x
011-    +               029-    RCL 2
012-    1/x             030-    *
013-    STO 1           031-    STO+ 1
014-    1               032-    RCL 0
015-    STO+ 0          033-    g x=0
016-    STO+ 1          034-    g GTO 36
017-    STO 2           035-    g GTO 18
018-    1               036-    RCL 1
                        037-    g GTO 00
```

Checking the archives, I found an old mini-challenge of Valentin's which is worth mentioning. Crawl's program in Message #52 appears to explore the same idea. I certainly read the thread at the time, but I'd completely forgotten about his particular program. It's worth reading Valentin's original solutions and other therein:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=95861

I've come up with a slightly faster series. I've started to implement it on the HP-15C LE, but the initialization alone takes up 37 steps. If I manage to optimize it a bit, I'll present it later.

HP42S freeze after "Fast mode"

*Message #1 Posted by **Tom Grydeland** on 21 Feb 2012, 8:24 a.m.*

I have an HP42S bought just after it was introduced, ROM version A1.

I attempted to enter the "Fast" mode which resulted in the HP42S freezing up (not responding to any keypress of any kind) and leaving the unit without batteries for a day or so was necessary to recover completely. I am curious to see if any wizards out there can help me figure out what happened.

When running through the memory in the debugger, I used the "up" and "down" buttons (to skip by 0x1000) in addition to the four buttons mentioned in the recipe.

When out of the debugger, I fumbled around a bit before finding the "IND" for "RCL IND X" (my HP is a bit rusty)

After step 9 ("STO IND Y"), the calculator blanked completely and did not respond to any keypresses

Leaving the batteries out for a couple of minutes did not change anything. Leaving them out for an hour or so returned the calculator to usability, but with some curious lingering effects.

The printer symbol was lit when turning on. It did not extinguish from regular use.

Attempting any function from the PRINT menu displays "Printing Is Disabled" and clears the printer symbol from the screen.

Whenever entering PRGM mode, the printer symbols lights up again, and again will only extinguish when attempting a print operation.

When running a program, the IR symbol (((.))) also lights up.

Leaving the unit without batteries for several hours appears to have restored the unit to normal and no obvious harm has been done to it. Still, I am curious what I did to make it react so, and what else I could have done to recover.

Thanks,

--T

Re: HP42S freeze after "Fast mode"

*Message #2 Posted by **Eric Smith** on 21 Feb 2012, 11:08 a.m.,*
in response to message #1 by Tom Grydeland

Bear in mind that there's a reason why HP didn't set the standard speed to the maximum, which is that they couldn't guarantee that they would work. "Fast mode" works by setting a register to an unsupported value.

Re: HP42S freeze after "Fast mode"

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Feb 2012, 6:50 a.m.,*
in response to message #1 by Tom Grydeland

IIRC, the ((.)) symbol is not an IR (infrared) indicator. The printer is the only official IR application, and it has its own annunciator. The ((.)) annunciator always flashes as a "running program" indicator.

Re: HP42S freeze after "Fast mode"

*Message #4 Posted by **Tom Grydeland** on 23 Feb 2012, 5:41 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

Right you are. It has been years since I played with this device, and I don't even know where the IR printer is anymore...

[DM-15cc] Flashing - worked!

*Message #1 Posted by **Alexander Oestert** on 20 Feb 2012, 4:29 p.m.*

Just to report my success and to encourage other proud new owners I wanted to inform you that flashing the cute little DM-15cc with MEM80 and MEM1b firmware worked just fine on an Asus eeePC running under XP/3.

Re: [DM-15cc] Flashing - worked!

*Message #2 Posted by **hpnut** on 20 Feb 2012, 4:37 p.m.,*
in response to message #1 by Alexander Oestert

Hi Alexander,

That's great! I am waiting for my DM-15CC to arrive. So please tell us what changes the flashing will do to the calculator?

cheers,

hpnut in Malaysia

Re: [DM-15cc] Flashing - worked!

*Message #3 Posted by **Alexander Oestert** on 20 Feb 2012, 4:43 p.m.,*
in response to message #2 by hpnut

Flashing with the alternative firmwares that Michael Steinmann provides on his site does increase memory - as described on his site!

DM-15cc fixed!

*Message #4 Posted by **gene wright** on 21 Feb 2012, 3:29 p.m.,*
in response to message #3 by Alexander Oestert

I had earlier posted that the lower left corner of my DM-15cc was not flush together and gave movement and an audible noise when the ON button was pressed.

Took it apart and the cause was that one of the 4 corner "posts" that the screws go into was not mounted on the main PC board corner. The other 3 were, but the fourth one was not.

Some soldering and a few minutes later, voila. No problem.

FYI. All is good.

Re: DM-15cc fixed!

*Message #5 Posted by **Reth** on 21 Feb 2012, 7:35 p.m.,*
in response to message #4 by gene wright

> Quote:

How about the keyboard? Mine is next to useless. I didn't expect it to be sooo bad...

Cheers,

Re: DM-15cc fixed!

*Message #6 Posted by **Alexander Oestert** on 22 Feb 2012, 2:48 a.m.,*
in response to message #5 by Reth

Overall, my keyboard is ok, I only have problems making the EEX/pi and + keys register. That sometimes takes a few more presses...

By no means the DM-15cc could replace any original HP machine, but due to its credit card size it is an easy to carry allways-in-my-pocket-calculator that has amazing powers. Still, I already thought about selling it again because I have quite large hands...but who on the auction site would know what it was?!? ;-)

Display_hp41c

*Message #1 Posted by **Armin Rösch** on 20 Feb 2012, 3:38 p.m.*

Hi all, my first generation hp41 does now suffer in the display. Some of the segments are missing! Is it possible to repair? (I am very familiar in microelectronics but do not have any mechanical drawing of the display section of hp41) Thanks for support.

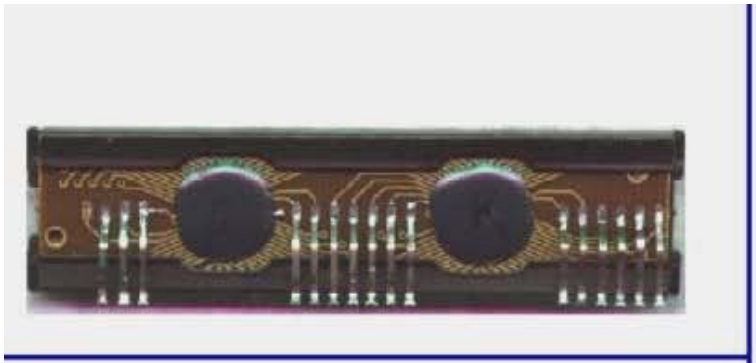
Armin Rösch HB9MFL

Re: Display_hp41c

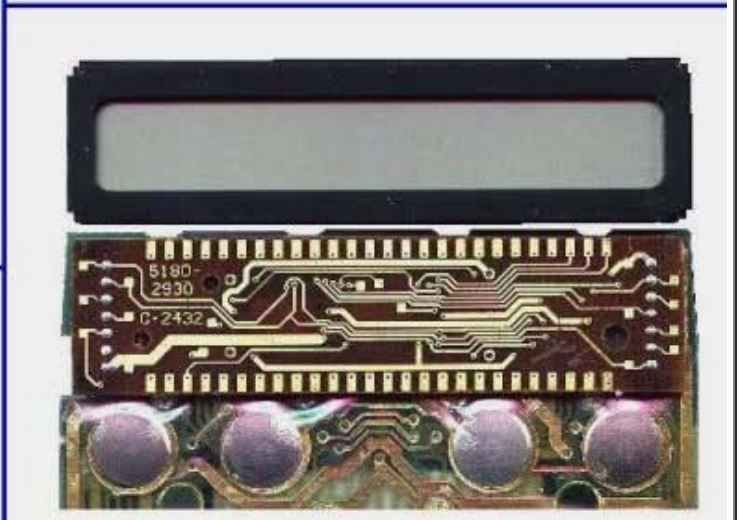
*Message #2 Posted by **Luiz C. Vieira (Brazil)** on 20 Feb 2012, 4:41 p.m.,*
in response to message #1 by Armin Rösch

Hi, Armin.

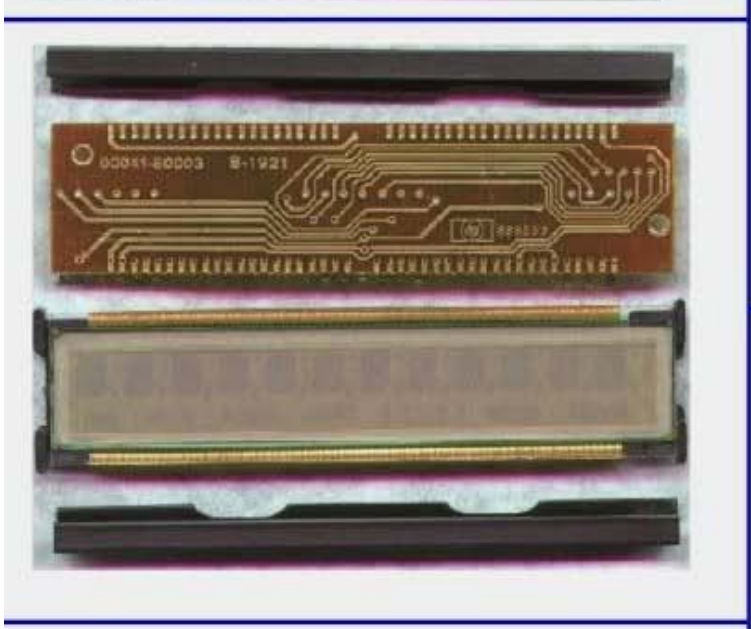
I guess some cleaning might help. Check if the picture below gives some guidance. It shows a vintage, first-series HP41 LCD's components.



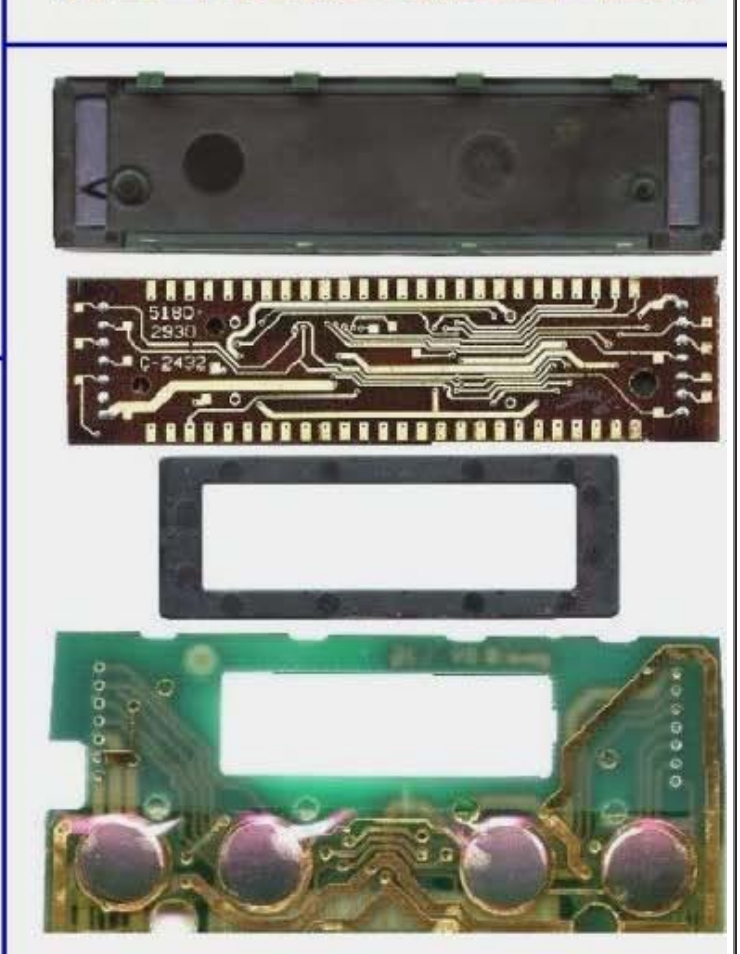
Metal Strips (unfold to remove LCD)
5061 7255



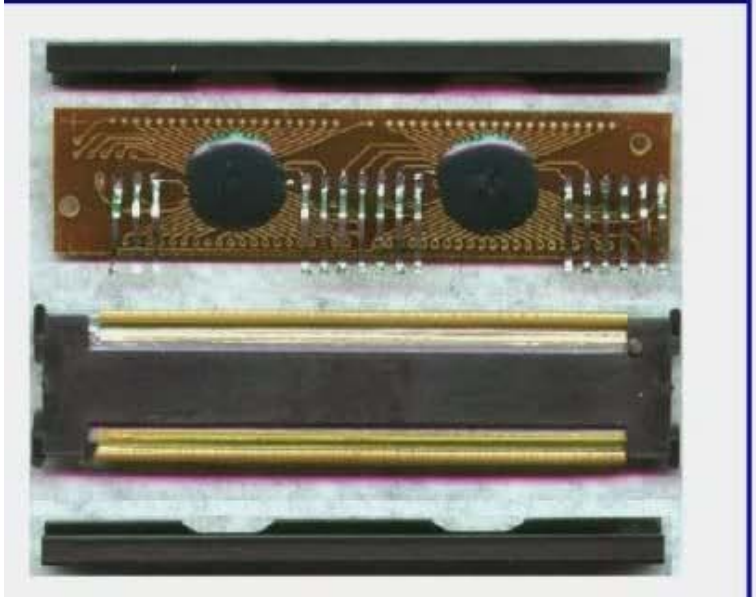
5180-
2930
C-2432



00041-60003 8-1921



5180-
2930
C-2432



There are some other pictures in this 'bucket' showing how to remove the earlier, vintage LCD module.

Success!

Luiz (Brazil)

in response to message #2 by Luiz C. Vieira (Brazil)

Greetings Luiz, glad to see you back! - Hope all is well.

Thanks for the display pics, I´m also in a similar case and they´ll come very handy if I ever decide to take the plunge and do the replacement (my soldering skills are all but acceptable).

Best, ÁM

in response to message #3 by Ángel Martin

Hola, Ángel; ¿que tal?

Thanks for your Welcome, I appreciate. I actually answered a call from a friend, Gerson, who told me I was mentioned in a recent post related to text fonts. I decided to have a look and, after creating a new account, I posted an answer. As you know, one thing leads to another and I could not help reading a few posts. after reading one post I could contribute I just found myself searching for the pictures at photobucket (user: hewpack_lcv) and posting a reply. My very friends are here, cannot help finding a way to make myself useful.

My activities as a teacher did not leave me any spare time. I'm now 50 Y.O. and I cannot loose track of current technology if I want to survive in the teaching field. If you do not follow it, you are left behind. If you follow it, you are just sustaining pace. If you want to go further then you should act as an R&D worker. I'm just doing my best keeping track of what is going on so my students feel they have a teacher that knows what they want to know and is ready to teach them. A 'Job done!' at the end of each day means the other one will just have different subjects... and challenges.

Sorry, guys, this is way off topic, but I should not simply get in as if nothing happened.

The MLDL2000 pictures are there, too. I guess they are worth checking, though.

Cheers.

Luiz (Brazil)

HI, Garth.

Actually I decided to build my units in such a way maintenance would be easier. Well, I tell you that they did not need maintenance so far... Meindert did a great, great job in the MLDL2000 design, and if one follow his instructions, building them is not hard at all.

I built two units almost the same way, and I tell you that it was fun doing it. I added many things not needed in the basic assembly. You can safely build one of these in a few hours given you have the necessary skills, follow the instructions and have all necessary material and tools. I took about two days to build each unit, not counting unscheduled interruptions.

And it was fun, indeed.

Cheers.

A firmware updated 15c+ as a regular, permanent, stock item? That would be nice. But maybe we should call it 15c*, because you know what they say: "when you wish upon a star..." (and I never heard the version "when you wish upon a plus...")

:-)

in response to message #2 by Paulo MO

All four machines shown use the same ROMs. Is it 15C or 15c? I once asked Sam Kim the general question regarding HP Calculator model numbers. The answer, he said, was that which is on the calculator, i.e. it is an HP-15C. The marketing types will want the "new" generation machine to be lower case C" but they are dealing with a legacy machine so they are "torn" between the old and the new. In the end I use whatever is printed on the calculator.

There is one exception, however. It is the model number used most often. Does anyone remember this model (hint: it is a "recent" small machine)?

X < > Y,

Richard

The marketing types will want the "new" generation machine to be lower case C" but they are dealing with a legacy machine so they are "torn" between the old and the new.

Marketing guys usually have no clue. If it had been up to them there would have been no HP-35 at all (and probably no HP-45, HP-55....). The capital C stands for 100 in roman numerals, which is about the relative increase in speed of the new 15C's compared to the old ones. For me it should therefore be a capital C (still) much like the V and X represented the the memory-increase (in roman numerals) of the 41CV and 41CX models compared to the 41C.

What's a 15c+ again? Some prototype?

Re: Richard Nelson's pictures of the 4 HP 15c versions

*Message #6 Posted by **Eric Smith** on 20 Feb 2012, 7:19 p.m.,*
in response to message #5 by Alexander Oestert

Yes. A very limited number were made, and some were given out at a conference. The hardware is basically the same as the new 12C.

in response to message #6 by Eric Smith

a question that has probably been asked before... does there exist a 15c+ with firmware such that:

- it does not exhibit the PSE bug
- the battery low indicator works
- it has no other major 'flaws'?

Re: Richard Nelson's pictures of the 4 HP 15c versions

*Message #8 Posted by **Katie Wasserman** on 21 Feb 2012, 11:46 p.m.,*
in response to message #7 by robert rozee

I don't have a 15C+ but this question has come up here before, and I've been paying close attention. While there are older versions of the ARM-based 15C firmware none of them have the battery indicator working correctly nor are they otherwise bug-free.

The 12C+ also does not have the battery indication working.

OTOH, Jeff did some extensive battery testing on the 15C LE and found that battery life was much better than one would expect given the 20ma load, when he used very high quality cells. Still the low battery indicator did not work at all (?) when the cells were finally exhausted.

Re: Richard Nelson's pictures of the 4 HP 15c versions

*Message #9 Posted by **Geoff Quickfall** on 22 Feb 2012, 2:20 a.m.,*
in response to message #7 by robert rozee

Unfortunately my 15c+ as with other beta testers was updated with each new version. As a result there may not be many with the original firmware.

I do remember there were only about 125 lines of program memory and many bugs in the original.

Also line number access was problematical to say the least.

Cheers, Geoff

in response to message #7 by robert rozee

Could the experts elaborate on the question if it would be possible to port the DM-15CC's firmware to the HP 15C LE hardware as it seems to be bug free? Or the code that go15c for Android is based on which also has no apparent bugs.

Re: Richard Nelson's pictures of the 4 HP 15c versions

*Message #11 Posted by **Paul Dale** on 22 Feb 2012, 3:43 a.m.,*
in response to message #10 by Alexander Oestert

I'd start with an older version of Nonpareil and port that to the 15C LE.

Several folks have asked for a KEMU port to the sam7 voyager. KEMU sidesteps all of the known problems with the current sam7 15c le firmware and additionally supports full NUT/voyager emulation including system/keypad self test, synthetic programming via y^x rotate-22, command line interface, multiple voyager family models, even the NUT ptr==13 CPU errata. It is fairly configurable and currently is optimized for size: bundled with a 15c firmware image it is well under 32K on an AVR core SoC and I'd expect substantially less for an ARM footprint. Even with all voyager images of (11c/12c/15c/16c), graphic support, and assorted bells & whistles as demonstrated in the Graphic Voyager Prototype, image size is under 64KB. Requiring support for only the sam7 voyager's segment display, image size reduces further and usage would be essentially the same the KINOMI/KEMU voyager. The point here being over half of the sam7's 128KB flash would be available for further optimization, functional customization, or user persistent storage.

The hold up thus far has been over logistics rather than technical issues, concerning how a prospective user deals with obtaining voyager firmware. The images I've been using have been captured from voyagers I own rather than elsewhere. Ideally I'll be able to reach some understanding with HP to allow bundling these images with a KEMU release but we're not there yet. The alternative of finding images elsewhere is certainly possible and that may be a fall-back if bundling isn't an option. But it is unwelcome end user clunkiness best avoided.

An alternative firmware would be really great, this could make the 15LE the ultimate version of the 15C.

Regarding clunkiness: It's already clunky enough to obtain the cable and flash the firmware with (my)samba, so the step of obtaining the 15C firmware and combining it with the emulator should be no real obstacle. If checksums and headers are all at the start of the file, couldn't it even be as simple as concatenating the two files?

in response to message #13 by Ingo Paschke

Quote:

> An alternative firmware would be really great, this could make the 15LE the ultimate version of the 15C.

The ultimate version of a 15c starts with a board swap of a 24xx <= S/N < 28xx 15c chassis with a suitable ARM core, reusing the enclosure along with the superior key caps and segment LCD found in the legacy voyager. The logical conclusion would be somewhere in the ballpark

of a matrix display and external i/o + power.

> Quote:
>
> Regarding clunkiness: ... If checksums and headers are all at the start of the file, couldn't it even be as simple as concatenating the two files?

It certainly could be made as simple for the case of a single 15c voyager model firmware. However for the general case of multiple images metadata is needed to describe each image to KEMU. Unless some sort of additional tool was created to obviate a rebuild, having a gcc toolchain available would be required. The anticipated "clunkiness" was of dealing with this vs. having prebuilt binary images available in a prospective KEMU release.

While the ability to switch the firmware is really neat and impressive, it wouldn't be of much use (at least to me), because I wouldn't know how to use a 12c or even a 16c with the 15c's keycaps.

In another recent thread the nonexistent copyright of this firmware was mentioned as it has been several times before. Given that, what is there to discuss with HP, just having some agreement that they won't bother you with frivolous lawsuits?

Re: Richard Nelson's pictures of the 4 HP 15c versions

Nothing in that thread nor associated research constitutes concrete legal advice -- at least not to my comfort level.

Quote:

Given that, what is there to discuss with HP, just having some agreement that they won't bother you with frivolous lawsuits?

Let it suffice to say my reading of the tea leaves suggests HP isn't at all pleased with an external attempt to commercialize their firmware and tread on their brand image. Doing nothing may also be construed as abandonment of any copyright/infringement claim, although I'll leave that for greater legal minds to debate. In any case I thought it reasonable to first see where such an upfront discussion may lead before considering alternatives.

On perhaps a personal note, what I'd developed wouldn't have existed if HP didn't release engineering specifications for their NUT silicon. I'd prefer not to be a potential source of regret for that decision.

wp34s capacitors

*Message #1 Posted by **David Griffith** on 20 Feb 2012, 5:19 a.m.*

How many people here would be interested in obtaining capacitors and crystals for their wp34s calculators? I can get 50 for $2, and 200 for $5. This works out to 5 or 8 cents for a pair. I have maybe fifteen of the sort of required crystals (through-hole) left over from the P112 project. This is cheap enough that I'll do it for free as long as the crystals last. Anyone interested?

Re: wp34s capacitors

*Message #2 Posted by **Paul Dale** on 20 Feb 2012, 5:22 a.m.,*
in response to message #1 by David Griffith

I've got a couple of re-purposed 30b's missing this addition, so I'd probably be interested. I'm also planning on eventually getting half a dozen more to give to family and friends eventually. Only after the firmware stabilises some more though.

- Pauli

42S Hope it' not dying

*Message #1 Posted by **Chuck** on 19 Feb 2012, 11:24 p.m.*

It's too late to track down batteries at the moment, but my trusty 42S for the last 15 years or so, had a horizontal line halfway across the screen and was unresponsive. Took the batteries out and put back in. Now it only lightly beeps when I press ON (descending frequency each time). Does this sound like failing batteries? Hopefully after 15 years it's just batteries and not a complete meltdown.

CHUCK

Re: 42S Hope it' not dying

*Message #2 Posted by **David Griffith** on 20 Feb 2012, 4:35 a.m.,*
in response to message #1 by Chuck

I've known other things to make a descending beep when the voltage was getting low. Try the obvious solution first.

Re: 42S Hope it' not dying

*Message #3 Posted by **Chuck** on 20 Feb 2012, 11:55 a.m.,*
in response to message #2 by David Griffith

It was the batteries and I'm back in business. I guess every 10-15 years one needs a fresh set of batteries. After that long you kind of forget and think the worst when something out of the ordinary happens.

C

Re: 42S Hope it' not dying

*Message #5 Posted by **Luiz C. Vieira (Brazil)** on 20 Feb 2012, 4:55 p.m.,*
in response to message #1 by Chuck

Hi.

A few days ago I heard what sounded like a faint digital clock alarm coming from a small pile of Pioneers (two HP42S, two HP17BII and one HP27S). I took one by one till I found an HP42S thinking it was a watch. I took the batteries off and found one of them with -0.24Vcc (reversed polarity, yep!). After replacing them for new, fresh ones, a [Memory Clear] announced it was back to its very own nature.

Good to know yours is OK, too.

Cheers.

35s - find roots of 3rd and higher order equations

*Message #1 Posted by **Chris C** on 19 Feb 2012, 8:42 p.m.*

Are there any programs (or built-in methods I'm overlooking) for the 35s to find the roots of equations higher than second order?

Thank you.

Re: 35s - find roots of 3rd and higher order equations

*Message #2 Posted by **Valentin Albillo** on 20 Feb 2012, 4:10 a.m.,*
in response to message #1 by Chris C

> Quote:
>
> Are there any programs (or built-in methods I'm overlooking) for the 35s to find the roots of equations higher than second order?
>
> Thank you.

Sure. Have a look at this article of mine, it features a short program for the HP35s (plus assorted examples) which will allow you to find any roots, real or complex, of most any equation, polynomial or not:

HP35s - Going back to the roots

Best regards from V.

Re: 35s - find roots of 3rd and higher order equations

*Message #3 Posted by **Bart (UK)** on 20 Feb 2012, 7:01 p.m.,*
in response to message #2 by Valentin Albillo

Nice one, thanks Valentin :-)

in response to message #5 by Paul Dale

It is in the library now :-)

Not sure if I ported it over completely properly or not but it handles the first example from the PDF article okay.

- Pauli

Re: 35s - find roots of 3rd and higher order equations

*Message #7 Posted by **Thomas Klemm** on 21 Feb 2012, 8:06 p.m.,*
in response to message #4 by Peter Murphy (Livermore)

In order to analyze Valentin's program I've translated it to Python while trying to keep it as close to the original as possible. You will find the whole program at the end. The examples are added as well.

Let me go through it step by step.

First we need the definition of some constants:

```
Z = 1 + 0j
S = 1E-4
T = S**2   # i.e. 1E-8
Y = 0.5
```

Now we use the function:

```
U = F(X) / Y
```

This leaves us with: *U = 2F(X)*

For the next step some approximations are used:

- *F''(X) ~ (F(X+S) - 2F(X) + F(X-S))/S^2*
- *F'(X) ~ (F(X+S) - F(X-S))/(2S)*

```
V, W = (W + V - U) / T, Y * (V - W) / S
```

So we end up with:

- *V ~ F''(X)*
- *W ~ F'(X)*

Next step is to divide *F''(X)* by *F'(X)*:

```
V /= W
```

Now we have: *V ~ F''(X)/F'(X)*

Since I don't have a stack I use a variable *D* which is not used in Valentin's program:

```
D = ( (Z - V * U / W) ** Y - Z ) / V
```

This gives the following expression:

$$\frac{\sqrt{1-\frac{2f(x)f''(x)}{f'(x)^2}}-1}{\frac{f''(x)}{f'(x)}}$$

Compare this with the 2nd formula in Halley-Verfahren but don't ask me why it's missing in the English version:

$$\frac{-\frac{2f(x)}{f'(x)}}{1+\sqrt{1-2\frac{f(x)f''(x)}{f'(x)^2}}}$$

To see that both formulas are equivalent use the following abbreviations:

$$u=\frac{f(x)}{f(x)'}$$

$$v=\frac{f(x)''}{f(x)'}$$

The trick is to use the binomial theorem $(a + b)(a - b) = a^2 - b^2$:

$$\frac{-2u}{1+\sqrt{1-2uv}}\cdot\frac{\sqrt{1-2uv}-1}{\sqrt{1-2uv}-1}=\frac{-2u(\sqrt{1-2uv}-1)}{(1-2uv)-1}=\frac{\sqrt{1-2uv}-1}{v}$$

Kind regards
Thomas

```

in response to message #7 by Thomas Klemm

Thomas,

It'll take me some time to work through your analysis of Valentin's program, but I must thank you now; I'm very grateful for the effort you've gone to, and I hope I can do it justice by understanding it well enough to write an RPL program (for 48G or 50g) that will do all that the 35S program does.

Many thanks!

Re: 35s - find roots of 3rd and higher order equations

*Message #10 Posted by **Thomas Klemm** on 21 Feb 2012, 10:14 p.m.,*
in response to message #9 by Peter Murphy (Livermore)

Meanwhile I found another reference: Halley's Irrational Formula (cf. formula #4)

Let me know if something is not clear in my analysis and please post your RPL program.

Cheers
Thomas

Re: 35s - find roots of 3rd and higher order equations

*Message #11 Posted by **C.Ret** on 22 Feb 2012, 6:31 p.m.,*
in response to message #10 by Thomas Klemm

The numerical analysis Halley's method is a root-finding algorithm used for functions of one variable with a continuous second derivative.

$$x_{n+1} = x_n - \frac{2f(x_n)f'(x_n)}{2[f'(x_n)]^2 - f(x_n)f''(x_n)}$$

Where f is the function were are investigating for roots.

Posing Hal(x)= 2.F(x)*F'(x) / (2 * [F'(x)]^2 – F(x).F("(x))) The series $x_{n+1} = x_n – Hal(x_n)$ converge to one of the f function roots depending of the initial vaue x_0.

In RPL, the code to follow such an iterative method will be as simple as the following: Imagine the initial value for the root-finding is in first stack level.

```
«  (1,0) *                          @  Converting x0 into complex z0
   0                                 @
   DO
      -                              @  x(n+1) <-- x(n) – Hal(x(n))
      DUP 1 DISP                     @  Display actual estimate
      DUP Hal                        @  Hal(x)
   UNTIL DUP ABS eps < END           @  if Ha(x) small enough, stop
   IF – DUP ARG SIN ABS eps <        @  if arg(x) small enough
```

```
        THEN RE END                    @  convert it to real
   CLMF
»
‘R.HALLEY’ STO
```

In RPL, invoking R.Halley may return the closest root from the inputted initial. It is quite like the LBL A program on HP-35C.

Nut this will be true only if the user function Hal is the appropriate one.

From the above formula, one may calculate the Hal function from any given secondly derivative continuous function and input it in the RPL calculator.

In RPL, a general formulae of the Hal user’function may be :

```
«  ->  x
   '2*F(x)*dF(x)/(2*SQ(dF(x))-F(x)*d2F(x))'
»
‘Hal’ STO
```

Where F(x), dF(x) and d2F(x) stand respectively for function, first derivate and second derivate of the function under investigation.

One major advantage of RPL is that they all are able to formally derivate any given function. So the user have not to calculate, write down the first and second derivates, nor the ‘Hal’ function, its RPL system can easily made it :

One way is to use one initialization program of the form :

```
«  DUP ->STRU                 @  copy ‘x’ as unquote string “x”
   -> x Sx
      «
        "'F("  Sx + STR->     @  put ‘F(x)’ on stack
        OVER = DEF            @  define user function ‘F(x)=...’

        x d/dx COLCT          @  derivate expression
        "'dF("  Sx + STR->    @  put ‘dF(x)’ on stack
        OVER = DEF            @ define user function  F’ =dF()

        x d/dx COLCT          @  derivate expression
        "'d2F(" Sx + STR->    @  put ‘d2F(x)’ on stack
        SWAP = DEF            @  define user function F” = d2F()

        { F dF d2F Hal R.Halley INIT } MENU
                              @ create dedicated custom menu
        35 CF                 @ on HP-28S numeric evaluation of constant
»
‘INIT’ STO
```

The user have to enter formal definition of the function/expression to investigate in level 2: and the name of the variable to scan in level 1:. Then pressing INIT will built up first and second derivate and create a soft menu with dedicated key. Next steps are to seek for root by trying different initial guess. As for the HP-35C, true real root are put in stak as real number and complex roots as complex number.

Examples:

To solve x^x=PI :

```
>> x x ^ PI – x INIT (takes a few secondes on an HP-28S)
3:                                    3:
2:                          'x^x-ð'   2:
1:                              'x'   1:
```

```
 [INIT ]                                          [  F  ][ dF  ][ d2F ][ Hal
][R.HALL][INIT ]

>> 2 [R.HALL]
(2,0)                                             3:
1:                                                2:
2                                                 1:
1.85410596792
[  F  ][ dF  ][ d2F ][ Hal ][R.HALL][INIT ]   [  F  ][ dF  ][ d2F ][ Hal
][R.HALL][INIT ]
```

The soft key can easily be use to check results or to show formulae :

```
>> x [ dF  ] returns 'x^x+LN(x)*x^x'
```

And

```
>> 'dF' RCL return « -> x  'x^x+LN(x)*x^x' »
>> 'd2F' RCL return « -> x  '(x^x+LN(x)*x^x)*LN(x)+x^x+LN(x)*x^x+x^(x-1)' »
```

To solve x^3-3.x^2+4.x-2 = 0 :

```
>> 'x*x*x-3*x*x+4*x-2' COLCT x [INIT] 0 [R.HALL] (2,3) [R.HALL] (2,3)[CHS]
[R.HALL] 5 FIX
3:                                                3:
1.00000
2:                '-2-3*x^2+x^3+4*x'              2:
(1.00000,1.00000)
1:                                'x'             1:
(1.00000,-1.00000)
[  F  ][ dF  ][ d2F ][ Hal ][R.HALL][INIT ]   [  F  ][ dF  ][ d2F ][ Hal
][R.HALL][INIT ]
```

To solve x To solve X^3 – (1+10i).X^2 - (33-6i).X + (5-40i) = 0 :

```
>> 'X^3-(1,10)*X*X-(33,-6)*X+(5,-40)' COLCT X [INIT] 1 [R.HALL] (1,1)
[R.HALL] (0,1)[CHS] [R.HALL]
3:                                                3:
(-1,2)
2:      '(5,-40)+(-1,-10)*X^2+X^3+(-33,6)*X'      2:
(2,3)
1:                                          'X'   1:
(0,5)
[  F  ][ dF  ][ d2F ][ Hal ][R.HALL][INIT ]   [  F  ][ dF  ][ d2F ][ Hal
][R.HALL][INIT ]
```

Re: 35s - find roots of 3rd and higher order equations

*Message #12 Posted by **Thomas Klemm** on 25 Feb 2012, 2:55 p.m.,*
in response to message #11 by C.Ret

As I'm not familiar with the HP-28 I made a few modifications to you programs which allows me to use them with an HP-48:

```
%%HP: T(3)A(D)F(.);
DIR
  eps .00000001
  Hal
    \<< \-> x '2*F(x)*dF(x)/(2*SQ(dF(x))-F(x)*d2F(x))'
    \>>
  R.Halley
    \<< (1,0) * 0
      DO
        -
        DUP 1 DISP
        DUP Hal
      UNTIL DUP ABS eps <
      END
      IF - DUP ARG SIN ABS eps <
```

```
      THEN RE
      END
    \>>
  INIT
    \<< \-> x
      \<<
        "'F(" x + STR\->
        OVER = DEFINE

        x \.d COLCT
        "'dF(" x + STR\->
        OVER = DEFINE

        x \.d COLCT
        "'d2F(" x + STR\->
        SWAP = DEFINE

        { F dF d2F Hal R.Halley INIT } MENU
        -2 SF
      \>>
    \>>
END
```

However I encountered a problem when I tried to solve Valentin's 4th problem:

> Quote:
>
> # 4. Solve Leonardo di Pisa's equation: *x^3 + 2 x^2 + 10 x - 20 = 0*
>
> ```
>  1, XEQ A -> X =  1.36880810782
> -6, XEQ A -> X = -1.68440405391 i -3.4313313502
> ```

When I use the same intital values I always get the same result for *1* as well as for *-6*:

```
>> 'x^3+2*x^2+10*x-20' x [INIT ]
3:
2:                      'x^3+2*x^2+10*x-20'
1:                                      'x'
[  F  ][ DF  ][ D2F ][ HAL ][R.HAL][INIT ]

>> 1 [R.HAL] -6 [R.HAL]
4:
3:
2:                              1.36880810782
1:                              1.36880810782
[  F  ][ DF  ][ D2F ][ HAL ][R.HAL][INIT ]
```

It is obvious that from real initial values you will never get complex roots. That's the benefit of using Halley's Irrational Formula because a square root is used. But thanks to your clever design all I had to do was to replace the program *Hal*.

In your version of *Hal* both functions *F(x)* and *dF(x)* are called twice with the same value. That's why I save the result of the function calls in local variables *u* and *v* (well not exactly that, but their quotients):

```
  Hal
    \<< \-> x
      \<<
        x dF
        x F
        OVER /
        x d2F
        ROT /
        \-> u v
        '2*u/(1+\v/(1-2*u*v))'
      \>>
    \>>
```

With this program I get the same results as with the HP-35S:

```
>> 1 [R.HAL] -6 [R.HAL]
3:
2:                              1.36880810782
1:                        (-1.68440405391,
                          -3.4313313502)
[  F  ][ DF  ][ D2F ][ HAL ][R.HAL][INIT ]
```

Thanks for posting your program: I've learned a lot from the ideas of your *INIT* routine. Very nice!

Kind regards
Thomas

Very cool. I haven't seen these before.

Re: 64 = 65 ??? (solution)

*Message #4 Posted by **Dieter** on 19 Feb 2012, 3:39 p.m.,*
in response to message #2 by C.Ret

All this - especially the well known property of moving colored shapes making algebra wrong ;-) - works because our eyes simply do not work sufficiently accurate to distinguish two very similar, yet different slopes in the red/green and blue/orange shapes (first example) resp. the red and green triangles in the second example.

If you look more closely you'll notice that the slopes of the mentioned shapes are slightly different, so they cannot be arranged the way the final layout suggests. One the one hand it's 3:8 boxes, on the other hand it's 2:5. In other words: 0,375 vs. 0,4. Which is so close that the difference it is not obvious for the human eye.

Dieter

in response to message #1 by Geir Isene

I wrote a really lame HP-35 simulator in the HP-94 Basic development package. It's a pretty lousy version of BASIC and not a lot of fun to program in since the development environment does not simulate the actual hardware at all. So you need to keep compiling downloading and testing, yuck.

If you're interest you should get a copy of the development system (I think it's on www.hpmuseum.net).

My stuff is here. Read the Commands.lst file it explains how to compile and download without having to read the reams of HP documentation. It also lists all the HP-94 commands, development system commands, etc.

I just rebuilt a couple of HP94. Had to burn EPROMs for them to get them to work.

Do you have any other HP94 stuff?

I was thinking of trying the development system but it looks like installing on a PC is a major pain?

Re: HP-94!

*Message #5 Posted by **Katie Wasserman** on 20 Feb 2012, 12:39 p.m.,*
in response to message #4 by Bruce Larrabee

No installation needed, it's old DOS stuff. The HP Computer Museum has this in a weird format I agree, PM me for a copy. Incredibility the 94 development environment still works on Windows 7 (at least the 32 bit version). But I used my HP200LX as the development platform, just because it's my only real DOS machine left and I know all the communications stuff (to the 94) runs without a hitch there.

I don't have anything else for the 94 series but I do have all three of them: D, E and F (my only HP collector bragging point).

calc cases

*Message #1 Posted by **JDonley** on 19 Feb 2012, 2:06 p.m.*

Here's a couple of calc cases I made. The calcs are protected by Astech clamshells, so this is really over-kill.

Re: calc cases

*Message #2 Posted by **Chris C** on 19 Feb 2012, 8:36 p.m.,*
in response to message #1 by JDonley

I recently bought a 35s that came with the sleeve case. I'd much rather have gotten the book cover type case so the calc and the case would be one unit. Since they're not, when I use the calculator (I'm a student) I have a loose case on my small desk/surface area to shuffle around, or I have to put it into my bag then get it back out when I'm done with the calculator. I'd just prefer to have a fold-behind case or a snap-on-back hard case. /endMoan

WP34 S: Fonts (a bit OT)

*Message #1 Posted by **Marcus von Cube, Germany** on 19 Feb 2012, 11:59 a.m.*

I've created TrueType fonts from the bitmap fonts used in the WP 34S. This is mainly for Walter's documentation efforts but may be of more general use.

Here is what I do:

1. Let a program generate Windows style bitmap font files directly from the original bitmap definitions.

2. Use FontForge to import the *.fnt file(s).

3. Use AutoTrace to convert the bitmaps to strokes. It's a feature in FontForge but needs the external tracer. (Some images don't get traced correctly but this can be fixed manually.)

4. Export the result as a TrueType file.

So far, so good. But here the trouble starts. Somehow FontForge doesn't get the encodings right. On my Mac the font simply does not show the characters in their intended positions but scattered over the whole Unicode range. Windows works better but I still need a way to properly address the special characters (in the range 01 to 1F).

My first attempt was to create Windows bitmap font (*.fon). The font installs but doesn't show up in Word.

Anybody out there with experience in this area? I'm even thinking of creating the TrueType font directly from my program in step 1. Is the format easy enough to go this route?

I've committed my work to SVN (trunk/windows/winfont) for testing.

*Message #3 Posted by **Luiz C. Vieira (Brazil)** on 19 Feb 2012, 8:35 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Hi, all;

sorry not being here with you these 'years' (I was actually 'called' by Gerson, who told me I was mentioned here...).

I was contacted some many months ago about these fonts, but free time seems to be water amongst my fingers. In fact, I do not even know if I remember how to use 'Font Creator', the application I got used to in order to

organize final true-type font files. Characters were created and exported to a TTF file with CorelDRAW!, then I used FontCreator to arrange characters in places inside the TTF file CorelDRAW! was not able to set them.

I still have the drawing I was sent with the characters needed when compared to the TTF I created for the HP48/49/50 series menu font, but I just did not find the time to work with them. Will not promise I'll do that, but if you believe I could be of any help, I surely promise to try hard finding time to go ahead with this WP34S font file. Still have my calcs, my books and (hopefully) all collected knowledge base, but I'd need some time to go ahead with the font. Will let you know as it goes.

Best regards.

Luiz (Brazil)

in response to message #3 by Luiz C. Vieira (Brazil)

Luis, thanks for offering help. I'm mostly worried about the Mac not being able to present a reasonable mapping of my font to the keyboard. If you need assistance with finding the fonts in SVN, ask here!

Re: WP34 S: Fonts (a bit OT)

*Message #8 Posted by **Luiz C. Vieira (Brazil)** on 20 Feb 2012, 9:59 a.m.,*
in response to message #7 by Marcus von Cube, Germany

Hi, Marcus.

I had a reply from Walter and he told me you were working on the fonts. The Windows-based program I used in order to actually fit symbols in some 'forbidden' places was FontCreator, but it's been a while, though. I'll have to read the manual again, but I remember it was not hard to overlap CorelDRAW! and Windows restrictions. It seems to me the places that could not be used were saved for control characters, but FontCreator allowed user definitions to take place.

I'll post later, need to go now.

Re: WP34 S: Fonts (a bit OT)

*Message #9 Posted by **Marcus von Cube, Germany** on 21 Feb 2012, 3:23 p.m.,*
in response to message #8 by Luiz C. Vieira (Brazil)

I went a totally different route with some success. I'm using FontForge on my Mac. My first attempts of importing a bitmap font weren't too successful, at least not with respect to my Mac. The little program which used to create the old fashioned FNT files does now generate the FontForge input file (of type *.fsd) directly. FontForge happily reads my files and creates OpenType fonts from it. The new fonts are here.

Re: WP34 S: Fonts (a bit OT)

*Message #10 Posted by **Luiz C. Vieira (Brazil)** on 21 Feb 2012, 6:18 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Hi, Marcus.

Thank you for your link, found the files.

I just did not find a way to visualize, neither use the .OTF files with my computer running Windows XP applications. Do they need to be converted? The fonts I created were all .TTF, an Adobe format (True-Type Font format). Is there a way to convert .OTF to .TTF?

Cheers.

Luiz (Brazil)

Re: WP34 S: Fonts (a bit OT)

*Message #11 Posted by **Marcus von Cube, Germany** on 22 Feb 2012, 4:11 a.m.,*
in response to message #10 by Luiz C. Vieira (Brazil)

OTF loads fine in my Windows XP and on my Mac. I had trouble with the TTF fonts on MacOS but the OTF files are fine.

Internally, the OTF is a CFF (Postscript) font. I'm not aware that I have installed any special drivers to make the OTF fonts work on my machine. Maybe the download didn't work? To check this, what are the file sizes?

(Edited for typo)

in response to message #11 by Marcus von Cube, Germany

HI, Marcus.

After [Properties] over both OTF files I have this:

WP34SRasterFontRegular.otf File size: 8,63 KB (8.838 bytes) Size in disk: 12,0 KB (12.288 bytes)

WP34SRasterFontSmall.otf File size: 8,60 KB (8.812 bytes) Size in disk: 12,0 KB (12.288 bytes)

Are these figures OK?

Cheers.

in response to message #9 by Marcus von Cube, Germany

I've now added a nice 7 segment font to the collection. It's generated in the same way the dot matrix fonts are, so changes in the sources are reflected in the font when it is regenerated. Dot and comma have zero width and are appended directly to the last typed digit. To emulate the exponent display just use the superscript function of your word processor.

As with the bitmap fonts which follow Unicode encoding instead of the internal mapping, I've rearranged some characters (codes 00 to 08, 18, 19 are on A0 to A8 and B8, B9, respectively), and added symbols for the separate segments. The latter can be reached (in Windows) with Alt+024x where x goes from 1 to 9. The funny thing here is that you can compose a character from the segments because these all have zero width.

Have fun!

Here you are: https://sourceforge.net/projects/wp34s/files/

in response to message #16 by Marcus von Cube, Germany

Hi Marcus,

I have a question about all this fonts stuff:
Has this any influence or consequences for the WP34s emulator?

I've just seen your new SVN labeled "Reworked Unicode encoding of fonts" with new EXEs for wp34s and wp34sgui, but so far I haven't found any differences in the emulator since you're working on these new fonts (and I haven't even installed any of them here on my Windows).

So what's all this stuff really good for (despite of maybe using these fonts for Walters manual)???

Franz

Re: WP34 S: Fonts (a bit OT)

*Message #18 Posted by **Marcus von Cube, Germany** on 24 Feb 2012, 10:12 a.m.,*
in response to message #17 by fhub

Try the Menu option "Copy Textline" and paste the clipboard in Word (or any other program capable of displaying Unicode characters). If you have one of the non ascii characters (like an arrow or umlaut) in the display or in alpha then the result will differ when you are using an older emulator (without the Unicode mapping): The characters will not show properly in Word . With the new emulator, all special characters are mapped to their Unicode equivalent and the clipboard is flagged as containing Unicode text. The new fonts follow the same encoding so that you can create an exact representation of the display contents on your PC.

*Message #19 Posted by **Luiz C. Vieira (Brazil)** on 24 Feb 2012, 11:07 a.m.,*

in response to message #18 by Marcus von Cube, Germany

HI.

Considering that the new fonts are freely available, anyone willing to write about the WP34S will be able to do it and keep the corresponding visual appealing of the WP34S original LCD fonts. I had that in mind when I created the first fonts back in 2004: documents written for HP calculator users (or other brand, actually) with the display and keyboard references close to the original. Matter for fact, I think this is one of the custom fonts goals. I used my fonts to create the LCD pictures when writing the HP12C learning modules, available at the HP website.

Cheers.

Maintenance and Durability: From NIB to abused calculators

*Message #1 Posted by **Fabricio** on 19 Feb 2012, 10:26 a.m.*

I´m following this thread from HERE

> Quote:
>
> ... Even an unused one cannot be guaranteed to survive for long because all electronic components have their respective lifetimes even without much use.

So the issue is, how to protect and keep a calculator for the next 20 to 30 years from 2012 on? My question is mainly headed to the vintage pioneer (27s, 32sii, 42s), clamshell (28s) and Charlemagne series (48s, 48GX).

I have my *stock* that is not in use packed without batteries, and am planning to unpacked them every 4-months or so to use them for a day or two just to keep their internals on action from time to time. Aside from the basics (not dropping the unit, putting the case for preventing it from unnecesary dust), what else would you recomend for both units in daily use and units in storage?

Thanks in advance!

Re: Maintenance and Durability: From NIB to abused calculators

*Message #2 Posted by **David Ramsey** on 19 Feb 2012, 11:08 a.m.,*
in response to message #1 by Fabricio

Other than storing them in a non-oxygen atmosphere, I think you're doing about all you can. Storing them without batteries is the biggie, of course. As far as I know the only electronic components that will fail under these circumstances are electrolytic capacitors, and I *think* that occasional power-on time helps retard this.

My Sharp PC-E500S was bought new around 1999. I removed the 4 AAA batteries but kept the button cell for memory backup in the battery compartment. A 32KB RAM card with a backup battery was installed in the machine. I remember that it was turned on one to two years ago. One day I put new batteries into the machine but I couldn't turn it on. I replaced all button cells in the machine and in the RAM card with new ones but it could't still be turned on. After several days, I could suddenly turn it on! I'm not sure whether

there were problems in certain electrolytic capacitors.

> As far as I know the only electronic components that will fail under these circumstances are electrolytic capacitors,

I have two counter-examples for this. I have two calculators: a Ti-68 and an Elorg-51. Both stored for years in a box without batteries, and with silica-gel to keep humidity low. The Ti-68 developed a fault at the flex cable connecting the display to the motherboard. Even though it doesn't move or actually flex in the Ti68, still it got degraded somehow, leading to display problems (in my case, no decimal point was displayed).

On the Elorg 51, I don't know how it happened, but the LCD became "slow" - i.e. the contrast is good, it doesn't look "dim", but it takes maybe 2-3 seconds to "change aspect". If I press a few numbers fast, you can actually see them slowly appearing, right to left. It's not a CPU-slow-speed thing because calculations happen fast enough.

Cristian

Re: Maintenance and Durability: From NIB to abused calculators

*Message #5 Posted by **Thomas Chrapkiewicz** on 19 Feb 2012, 11:28 a.m.,*
in response to message #1 by Fabricio

This is not necessarily a recommendation for prevention, but awareness.

The 48 series (and others?) relay on a spongy/conductive- 'zebra strip' for the display connections. This sponge loses its resilience with time, resulting in loss of connection(s).

Also, in the 48, the connections between the keyboard flexboard and the main pc board are simply 'connected' by pressure from behind with a piece of sponge. This type of 'connection' is fundamentally headed for failure from loss of resilience and the inevitable oxidation on the contacts. This has already been witnessed for years.

I've disassembled 48s, 48g and 38g families. If anyone could use pictures, or would like more details, drop me an email.

TomC

in response to message #5 by Thomas Chrapkiewicz

This sponge that presses the keyboard connector to the PCB seems to becoming a more prevelent failure. An easy fix really, but unfotunately the Pioneers and 48-series are the most difficult to take apart.

Re: Maintenance and Durability: From NIB to abused calculators

*Message #7 Posted by **aj04062** on 19 Feb 2012, 12:45 p.m.,*
in response to message #1 by Fabricio

I wonder if there is some MIL Spec grade storage bags that might help. I package items I sell in these types of bags. They inhibit corrosion and moisture. Problem is, I don't think either of these are the culprits to lost elasticity in pressure contacts.

Re: Maintenance and Durability: From NIB to abused calculators

*Message #8 Posted by **John B. Smitherman** on 19 Feb 2012, 1:01 p.m.,*
in response to message #1 by Fabricio

A dry and oxygen free environment is probably the best you can do. Maybe using nitrogen and desiccant would help. Or, think like an ancient Egyptians and use the power of the pyramid. ;-)

Good luck with your preservation!

John

Avoid temperature extremes. I lost the screen on a PC-1251 when it was left in an unheated room during a very cold night last winter (we were away visiting family for a few days).

Electrolytic caps (and some tantalums) are another weak point. This is because the dielectric layer is formed from the electrolyte in the cap and breaks down if the cap is left discharged for long periods of time (years). Powering on every 4 months should be fine. However, if you do come accross one that has been left unpowered for a very long time, do not just power it up as the current through the cap can permanently damage it. Connect a 1k ohm resistor in series with the normal supply voltage for 24 hours for the capacitor to re-form. In old calculators I replace the electrolytic caps as standard (particularly prevalent in those with VFD and Panaplex displays).

Be careful with the use of cleaning agents, because although they may be keyboard friendly, if it gets to rubber strips these can deteriorate quicker and fluids can also damage the connection of heat seal connectors (more commonly used to connect LCDs in modern calculators).

As for failures of other electronic components, these are pretty random - just depends on your luck (except for design flaws, e.g. the woodstock charging circuit).

Hmmm... I wonder if it could have been from something else. I had an LCD down to -55 deg C 10+ years ago in a test for a product in development, and it did not hurt it. It wouldn't work down there, but it was fine when brought back up to -20 or higher again. This was admittedly a wide-temperature-range one which was supposed to be able to go down to -40, but I expect the commercial grade should be able to go past freezing with no problem.

Re: Maintenance and Durability: From NIB to abused calculators

*Message #11 Posted by **Bart (UK)** on 20 Feb 2012, 5:21 a.m.,*
in response to message #10 by Garth Wilson

I agree that one would expect it to withstand temperatures to -10 deg C, many commercial parts are rated down to this (I estimate that the room may have briefly been as low as -5). I have a dozen other LCD calculators in the same room, they are all OK. I opened the 1251 up to see if the screen was under any stress, but it all seemed fine. It may have been a weak part, but I have seen quite a few 1251's with leaky screens, so perhaps the LCD quality for that particular model is not too good. As I don't know if any of my other calculators happen to have a 'boderline' part, I now try to keep them within +10 to +25 degrees C range.

Edit:
Just to describe what happened, I was writing a program on it before we went away, (leaving it the cold upsstairs room) and on return I fetched and I noticed the dark spot in the upper left corner. I let it warm up for a day in the lounge. The spot then mostly dissapeared, but a slight discouleration remained. I then opened it up to see if the screen was under any stress, but it all seemed fine. However, over the following months that corner went dark again and it spread - and took on the typical "LCD bleeding" look.

Re: Maintenance and Durability: From NIB to abused calculators

*Message #12 Posted by **Bruce Larrabee** on 19 Feb 2012, 11:27 p.m.,*
in response to message #1 by Fabricio

What was said about the 48s applies to all the clam shell models I think. That can be repaired. If you are good at welding plastic.

I would think that if you are going to store them a very long time pulling the caps out might be a good idea.

And then the nitrogen.

permanent storage is hardly possible

*Message #13 Posted by **Frank Boehm (Germany)** on 20 Feb 2012, 5:07 a.m.,*
in response to message #1 by Fabricio

- failure of electrolytic capacitors, these can be replaced
- disintegration of anything made out of plastics, including foam (used for key feedback, instead of springs) and casing parts (screw posts cracking away)
- corrosion of contacts, including key contacts, zebra strip contacts, display contacts
- corrosion of the LCD

For optimum storage, I'd recomment a dark, zero moisture, 10oC cold storage. One thing to remember: soft cases should not come into contact with the calculator, best is to keep them seperately (they often contain softeners, which will damage plastic parts).

Re: permanent storage is hardly possible

I've a Sharp PC-1250A put inside its soft case. One day I discovered that some 'oil' coming out from the inner sides of the soft case. The front and rear sides of the computer were in contact with the inner sides. The front side including the display is ok so far. However, the rear side is coated with some slightly sticky thing. I've no idea about this coating. Maybe something with softners.

The same problem causes a coating on the display of my Casio FX-603P. I've to rub the display by my thumb regularly to remove the coating.

in response to message #1 by aurelio

Good morning!

> Quote:
>
> Hi all, agree that the price is "fantastic"?

Yes, but it is a fantastic calculator!

Way too much of course, but for me it still makes more sense to buy an HP-97 for 1000$ than an HP-41, -42, -48 or -28 for more than 200$ as you can see on eBay every day.

Ciao, max

Re: $1000 for a vintage HP 97 printing calculator

*Message #3 Posted by **aurelio** on 19 Feb 2012, 9:00 a.m.,*
in response to message #2 by Maximilian Hohmann

Hi Max, agree for the fantastic calculator, but you understand that 1000$ is quite an exaggerated price for that calculator, no new no mint, also, "there was a number written in black marker on the back...but it is mostly worn off", maybe fully working.... (as from his words the seller is not an expert), I don't know, it looks too much.

good luck to the seller and good luck to the buyer!

Edited: 19 Feb 2012, 7:09 p.m. after one or more responses were posted

Re: $1000 for a vintage HP 97 printing calculator

*Message #4 Posted by **Jim Johnson** on 19 Feb 2012, 11:03 a.m.,*
in response to message #3 by aurelio

I suspect this seller is unaware of the "going auction price" for HP97's ($180 - $400) and this auction has no case or manual. This will go unsold if the price isn't lowered. My suspicion is that the card reader needs to be rebuilt as well. The marker on the case certainly lowers the value. No photo of

battery terminals so this is another unknown.

Re: $1000 for a vintage HP 97 printing calculator

*Message #5 Posted by **Michael de Estrada** on 19 Feb 2012, 11:48 a.m.,*
in response to message #4 by Jim Johnson

This sort of thing happens all the time with clueless sellers. It's not just HP vintage calculators either. This is pretty ridiculous as well, but you'd need to know something about it know the true market price.

HP28S screen noise generator

*Message #1 Posted by **Keith Midson** on 18 Feb 2012, 6:53 p.m.*

Hi all, following on from THIS thread, here is the HP28S program that produces a hypnotising screen display:
<< IMG 'TEST' STO 1 738 START
TEST 548 548 SUB TEST 1 547 SUB +
TEST XOR 'TEST' STO TEST ->LCD NEXT >>

You need to store a screen dump into the file 'IMG' first. Have fun! Will look like THIS , but the moving image is much more impressive than you can do justice with in a still picture. Cheers, Keith

Re: HP28S screen noise generator

Cristian

Re: HP28S screen noise generator

*Message #6 Posted by **C.Ret** on 19 Feb 2012, 4:09 a.m.,*
in response to message #1 by Keith Midson

Many Thanks for remember me *bitmap screen plays* on my old HP-28S.

If my memory don't abuse me, this code may not run on HP-28C due to the use of the XOR on strings. XOR function may not handel *binary* or *screen* strings on HP28C; only integers and regular binaries.

In your code, I still not understand why you loop 738 times ? Is there samething I miss interpret, is ther any effect I miss ?

```
«
  IMG 'TEST' STO
  1 738 START
          TEST 548 548 SUB
          TEST   1 547 SUB +
          TEST XOR
         'TEST' STO
          TEST ->LCD
  NEXT
»
```

(what a bunch as TEST ?)

Please consider my translation of your code without any use of any global variable. My version directly use actual screen apparence and loops until one key is pressed.

```
«
  DO
     LCD->
     DUP  548 548 SUB
     OVER   1 547 SUB + XOR
     ->LCD
  UNTIL
     KEY
  END
  CLMF
»
```

Great effet HP28S feature, isn't it ?

May same one bring down a version for HP48/49/50 ?

Edited: 19 Feb 2012, 4:10 a.m.

Re: HP28S screen noise generator

*Message #7 Posted by **Keith Midson** on 19 Feb 2012, 4:42 a.m.,*
in response to message #6 by C.Ret

That is a much better version of the program - thank you! I have long lost my original code from 1990, which was much neater - I wrote this in a hurry to see if I could replicate the effect all these years later. I think I used the word 'test' as it was me 'testing' to see if I could get it to work (after not using RPL for more than a decade). As for the importance of 738 ... I have no idea!!
I would love to see a comparable program on the 48 - when I upgraded to the 48 I was very disappointed that the screen graphics were handled so differently (and never actually took the time to learn).

Re: HP28S screen noise generator

*Message #8 Posted by **Gilles Carpentier** on 19 Feb 2012, 5:35 p.m.,*
in response to message #6 by C.Ret

"May same one bring down a version for HP48/49/50 ?"

Hello C.Ret... I don't understand the prog HP28 here... On the 48/50 bitmaps are special object and not strings...

Some ideas on 50G :

```
«
  DO
    LCD-> DUP {#0 #4} {#130 #79} SUB {#0 #0} SWAP GXOR ->LCD
  UNTIL
     KEY
  END
»

or

«
  DO
    LCD-> NEG ->LCD
  UNTIL
     KEY
  END
»
```

Joerg,

I've been meaning to ask you for the longest time.....

What's so special to you about 2*SQRT(2) that you show this on so many of the calculators in your pictures? Not that there's anything wrong with this irrational number, but it would not be at the top of my list of exciting numbers I have known :)

-Katie

Re: Yes, it's all about my gold card

*Message #14 Posted by **Joerg Woerner** on 19 Feb 2012, 6:30 p.m.,*
in response to message #13 by Katie Wasserman

Katie,

Good question...

I was inspired and mentored by Viktor T. Toth when I started the layout of the Datamath Calculator Museum and he used for all his calculator pictures pi = 3.14159265... in the display.

Long before (this was in 1999) I used already SQR (8) * 100000 - 282842 = ??? to reveal the number of digits used in internal algorithm of scientific calculators.

Now you know my little secret ;-))

Good that you didn't asked why my eBay handle was "jogibogi" till a few years ago. That's something I would whisper in your ear;-))

Cheers, Joerg

Re: Please translate to RPN!!!

*Message #15 Posted by **Joerg Woerner** on 19 Feb 2012, 6:31 p.m.,*
in response to message #14 by Joerg Woerner

Oops - can you translate the 282842 thing to RPN, please????

Regards, Joerg

Re: Please translate to RPN!!!

*Message #16 Posted by **Gerson W. Barbosa** on 19 Feb 2012, 8:35 p.m.,*
in response to message #15 by Joerg Woerner

Not related to your request, just an attempt to show SQRT(8) might be an interesting number :-)

```
8  SQRT  EEX  8  *  17  1/x  y^x              (RPN)

(  SQRT  8  *  EE  8  )  ^  17  x^-1  ENTER    (AOS)
```

Regards,

Gerson.

Re: Please translate to RPN!!!

*Message #17 Posted by **Katie Wasserman** on 19 Feb 2012, 9:29 p.m.,*
in response to message #16 by Gerson W. Barbosa

Only 6 significant digits, not a good enough reason for me to like this number :)

Re: Please translate to RPN!!!

*Message #18 Posted by **Gerson W. Barbosa** on 19 Feb 2012, 9:52 p.m.,*
in response to message #17 by Katie Wasserman

Ok, sqrt(2) is better, and given infinite time it would help compute pi to the last digit :-)

http://www.golfscript.com/golfscript/examples.html

I don't know GolfScript but I guess the 29-byte script for 1000 digits of pi uses the Vieta's formula, like your 12-step program for the HP-12C:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=101118 (Message #22)

OT: Re: Please translate to RPN!!!

*Message #19 Posted by **Katie Wasserman** on 20 Feb 2012, 12:29 p.m.,*
in response to message #18 by Gerson W. Barbosa

Gerson,

Golfscript has been mentioned here a few times, thanks for the reminder to looking into this some....

It looks to me like a mix of RPL and APL with a little LISP thrown in, only just for integers. I like all these characteristics in a programming language but not the "write only" usability of it. I wonder if there are more than 10 people in the world who've used this more than once.

Do people here have experience with GolfScript? I see that Oliver mentioned building this into his ND1, but I'm not sure if that ever happened.

-Katie

> Quote:
>
> Only 6 significant digits,

A more interesting result, perhaps:

pi^34 = 8.00010471505*10^16

The underlined digits match exactly the first five significant digits of pi/3. This leads to the polynomial

x^34 - (1/3)*10^12*x - 8*10^16 = 0

whose positive real root is

3.14159265364

Nice coincidence, isn't it?

Edited to correct a mistake in the second coefficient

On the HP 50g

```
[ 1 0 0 0 0 0 0 0 0
    0 0 0 0 0 0 0 0 0
    0 0 0 0 0 0 0 0 0
    0 0 0 0 0 0 0 0 0
    '-1/3*1E12' -8E16]

PROOT
```

returns a positive real root 3.14159265364. The wp 34s polynomial solver should return 3.141592653644187, but I haven't tested on it yet.

This fails for the 34S. The sixteenth digit is a zero.

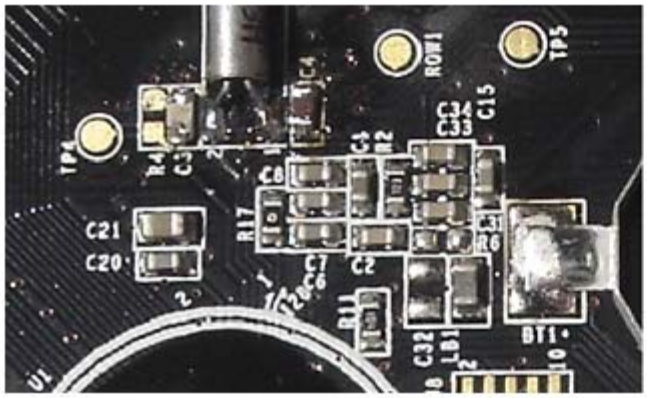
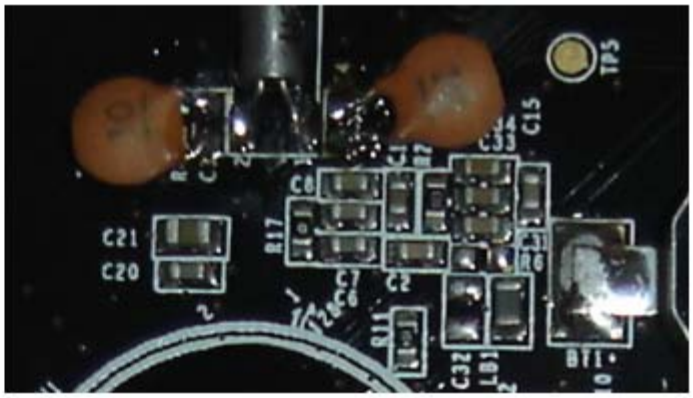
(Not so) successful crystal installation on my wp 34s

*Message #1 Posted by **Gerson W. Barbosa** on 18 Feb 2012, 5:58 p.m.*

As per the author of this video's advice I took the parts from a non-working PC motherboard. When I finished adding the crystal the ON/C/C procedure worked as expected. I thought everything was ok, but I noticed programs would not run anymore. Also, the pixels in last row of the first line of the display almost always were shifted. I hadn't measured the value of the SMD capacitors because the digital multimeter in the picture would not measure in the pf range. I measured them later using another multimeter and they turned out to be 34 pf each. I replaced them with 10 pf ceramic caps but the problem remained (I shouldn't have used those large caps but I did it as a test). Anyway, I've managed to set the time according to the Windows clock. After two hours both clocks remained perfectly in sync. It has occurred to me the batteries are far from fresh (I've been using them for seven months now). After resetting the calculator I ran a program for five seconds. The batteries voltage dropped from 2.9 to 2.6 volts. Perhaps it's time to finally replace the batteries (and update the firmaware). I suspect the batteries drain more current when a crystal is installed. I'll replace them next Monday.





Gerson.

P.S.: The sledgehammer was not necessary :-)

Edited: 18 Feb 2012, 6:00 p.m.

Re: A show review of the SmartCalc 300s...

*Message #3 Posted by **Maximilian Hohmann** on 19 Feb 2012, 6:28 a.m.,*
in response to message #1 by Jose Gonzalez Divasson

Hello!

Interesting review with 90% agreement to my own experiece. Our son at school jumped from "no calculator" to TiNspire without anything in between, so I had to buy this Smartcalc 300 for myself (1 Euro on eBay, NIB :-)) for the sake of having a complete collection. I played with it a little and found it quite pleasing to use, but as you said, totally different from any other scientific HP calculator.

Some day I needed to do a quick calculation and took it from the heap of uncatalogued calculators under my desk (you should hear my wife's opinion on that...) but only got the result displayed as a fraction. There was no intuitive way to change this (I never read manuals) so I threw it back on the heap and used the trusted old Star Trekulator instead.

As with all other "modern" HP calculators (I think I have all the SmartCalcs, OfficeCalcs, WhateverCalcs that they currently sell) it is really only a piece of plastic with an emotional factor of zero.

Regards, max

Re: A show review of the SmartCalc 300s...

*Message #4 Posted by **Chris Smith** on 22 Feb 2012, 5:10 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Thanks for this.

If you grab a Casio FX991ES PLUS, you will find it's pretty much exactly the same from a software point of view (I assume it's the same manufacturer) but it has load more features such as complex numbers, vectors, matrices, a half decent solver.

I have a SmartCalc 300s and it's a piece of junk compared to the Casio. They keys don't work properly, it's buggy and it feels like a toy.

The Casio is several orders of magnitude better even though it's pretty much the same.

Help building WP34s calc.bin

*Message #1 Posted by **Ed Wright** on 18 Feb 2012, 10:58 a.m.*

I'm trying to build calc.bin for WP34s for the first time. I have followed the instructions shown at http://sourceforge.net/apps/mediawiki/wp34s/index.php?title=How_to_build_the_firmware

I can successfully build the emulator, but not calc.bin. I enter win-build-arm.cmd, and I get the following warning: /pathname/ld.exe: warning: cannot find entry symbol entry; not setting start address followed by chcp 850 active code page: 850 The only file created in the realbuild directory is mapfile.txt. I'm a hardware guy, not a programmer and I can't figure out what I have wrong. Can anyone point me in the right direction? Thanks!

Re: Help building WP34s calc.bin

*Message #2 Posted by **Marcus von Cube, Germany** on 18 Feb 2012, 3:33 p.m.,*
in response to message #1 by Ed Wright

Ed, the cmd file you are using isn't the same I'm using. In the root directory you will find flash.cmd instead.

This might still not explain your trouble. Is Yagarto.de installed? If you run the flash.cmd script a log file will be generated which I may be able to analyze.

Re: Help building WP34s calc.bin

*Message #5 Posted by **pascal_meheut** on 19 Feb 2012, 2:13 a.m.,*
in response to message #4 by Ed Wright

You also ned a normal, windows compiler. Did you install mingw & perl? Or cygwin?

Do you have a "cc" compiler in your path?

Re: Help building WP34s calc.bin

*Message #6 Posted by **Ed Wright** on 19 Feb 2012, 7:19 a.m.,*
in response to message #5 by pascal_meheut

Yes to mingw and activePerl. I also have Visual Studio. Since the emulator builds and works I assumed these were working.

Re: Help building WP34s calc.bin

*Message #7 Posted by **pascal_meheut** on 19 Feb 2012, 8:38 a.m.,*
in response to message #6 by Ed Wright

minwg is not used to build the emulator, at least not the current one.

What happens if you simply type "cc" in your command line?

Re: Help building WP34s calc.bin

*Message #8 Posted by **Ed Wright** on 19 Feb 2012, 1:21 p.m.,*
in response to message #7 by pascal_meheut

not recognized.

Re: Help building WP34s calc.bin

*Message #9 Posted by **Ed Wright** on 19 Feb 2012, 2:13 p.m.,*
in response to message #7 by pascal_meheut

I'm downloading Gnu tools now. I was following the wiki. I'll let you know how it goes. Thanks for all the help!

Re: Help building WP34s calc.bin

*Message #10 Posted by **Dominic Richens** on 19 Feb 2012, 2:50 p.m.,*
in response to message #9 by Ed Wright

Hi Ed,

If you get a sourceforge account, you can correct the wiki instructions yourself.

If not, please let me know what's wrong and I'll update them.

cheers!

dominic

that doesn't work for me either, however this does:

```
cd wp34s
makewin.cmd
cd trunk
make REALBUILD=1
```

Re: Help building WP34s calc.bin

*Message #12 Posted by **Marcus von Cube, Germany** on 19 Feb 2012, 4:26 a.m.,*
in response to message #11 by Dominic Richens

The makewin script contains the call to make so going back to trunk and running make again is not needed.

As Pascal has pointed out, Ed is obviously missing the Windows GCC.

HP-42S displaying Runic alphabet

*Message #1 Posted by **Bill (Smithville, NJ)** on 17 Feb 2012, 6:43 p.m.*

I'm always on the lookout for different programs for the HP-42s and came across a program to display the Runic alphabet.

Runic Alphabet on 42S

This has to be one of the more unusual applications for the HP-42s. Does anyone know of any other unusal programs?

Bill

Re: HP-42S displaying Runic alphabet

*Message #2 Posted by **Gerson W. Barbosa** on 18 Feb 2012, 6:54 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Looks like the server is down. Google cache has it, except for the images.

http://webcache.googleusercontent.com/search?q=cache:Sw09gzxGNRcJ:www.jonsson.eu/programs/hp42s/+Runic+Alphabet+on+42S&cd=1&hl=en&ct=clnk

EXIT key reassigned on 42s

*Message #1 Posted by **Charles Mones** on 17 Feb 2012, 3:34 p.m.*

Here is an interesting problem: I recently was given a 42s that did not function. I installed 357 batteries (none were in the calculator) and with the help of this site was able to get it to turn on, but not in the normal way. I had to activate the self test or reset modes from the keyboard. I turned my 42s off by executing the "off" function. Shorting the battery terminals together for an entire day has not fixed the problem. The other day, by pure luck, I discovered that simultaneously pressing the EXIT and "summation+" keys turned the calculator on. Similarly shift then simultaneously EXIT and SUMMATION+ turns the 42s off. It seems to me that the EXIT key has been reassigned. I am aware that this can be done, but I would have thought that doing a memory clear would have undone the reassignment. Anyone have suggestions on how to fix this?

Many thanks, CMones

Re: EXIT key reassigned on 42s

*Message #2 Posted by **Eric Smith** on 17 Feb 2012, 3:43 p.m.,*
in response to message #1 by Charles Mones

That seems to me to more likely be a hardware fault.

Re: EXIT key reassigned on 42s

*Message #3 Posted by **Diego Diaz** on 17 Feb 2012, 7:25 p.m.,*
in response to message #2 by Eric Smith

Agreed.

Seems quite like a resistive "short-circuit" in the keyboard. Pioneers are prone to suffer from this desease after heavy (repetitive) use of a key.

Alas, lack of real steel dome keyboard... polycarbonate instead? :-(

Sorry for the bad news (wish I was wrong).

Cheers.

Diego.

Re: EXIT key reassigned on 42s

*Message #4 Posted by **Bart (UK)** on 17 Feb 2012, 3:47 p.m.,*
in response to message #1 by Charles Mones

Could be a bad connection of the keyboard connector onto the PCB. It is just under the LCD. If you press just under the screen, it will probably work too.

To see the internals of a 42s see: Lyuka's 42s page

Re: EXIT key reassigned on 42s

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 17 Feb 2012, 4:18 p.m.,*
in response to message #1 by Charles Mones

In the HP-42 (very different from the HP-41 in this aspect) keys are not reassignable. ASSIGN works only with the six top-row keys, and by means of the CUSTOM menu (three virtual rows of six keys each). So ASSIGN cannot cause this behavior. There are reset and diagnostics sequences involving the EXIT key and some keys from the top row.

The keys can be also polled in the context of a running program by means of GETKEY function, but your description does not suggest any connection with this function.

Re: EXIT key reassigned on 42s

*Message #6 Posted by **Thomas Okken** on 18 Feb 2012, 11:35 a.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

You're forgetting the "programmable menu", where you can reassign the top row of the keyboard, *and* the up, down, and EXIT keys.
Having said that, Charles' description does sound like a hardware problem. A key assignment wouldn't survive a cold start, and it sounds like the calculator had been without batteries for a prolonged period of time.

Re: EXIT key reassigned on 42s

*Message #7 Posted by **Charles Mones** on 17 Feb 2012, 10:41 p.m.,*
in response to message #1 by Charles Mones

It appears that I have a hardware problem. All of the keys on this 42s are tight and springy with no wobbles, and it appears to be in very good overall condition. Therefore I will send it in to FixThatCalc so they can try to repair it. Thank you all for your expert and prompt advice!

Charles

Re: EXIT key reassigned on 42s

*Message #8 Posted by **robert rozee** on 18 Feb 2012, 12:41 a.m.,*
in response to message #7 by Charles Mones

if the calculator is otherwise fully functional, and passes the keyboard test, then why have it fixed? all you need to do is remember the slightly 'odd' on/off keyboard sequences.

Re: EXIT key reassigned on 42s

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Feb 2012, 8:03 a.m.,*
in response to message #7 by Charles Mones

Does EXIT work after the calculator is turned on? I mean, for instance, if it works to exit from a menu.

If it works (and what follows is just a guess), then the issue may have to do with a hardware interrupt signal, specifically used for the power-on function. The problem may be related to the keyboard to mainboard connection.

If it doesn't work, then it looks more like a keyboard, keyswitch or keyboard connection to mainboard issue.

To turn the calculator off, you can use the OFF function (XEQ "OFF"). Keep in mind that the ON function merely disables the timer which turns the calculator off after some 10 minutes of inactivity.

Re: EXIT key reassigned on 42s

*Message #10 Posted by **Lyuka** on 18 Feb 2012, 9:48 a.m.,*
in response to message #1 by Charles Mones

Hi Charles

I've ever experienced that kind of problem on a heavily used 42s.
The 'PWRON' pin of the processor seems to have relatively heavy pull-down resistance
or requires relatively high current to activate the processor.

The nominal resistance of the 'ON' key is about 430 [Ohm] (at new) to 470 [Ohm] (after moderately used) by my measurement.
That resistance can go as high as 1K [Ohm] on heavily used - worn carbon contact - keypad
which is not low enough to rise the voltage to cross the threshold to turn-on the processor.
At the end of life of the contact, pressing several keys might barely work to assert the active high signal at 'PWRON'
by some internal voltage glitch caused by common impedance or so.

I did membrane switch transplantation to fix that problem. But it's a kind of difficult thing to do.

Regards,
Lyuka

Re: EXIT key reassigned on 42s

*Message #11 Posted by **Charles Mones** on 18 Feb 2012, 4:53 p.m.,*
in response to message #1 by Charles Mones

I've had a chance to play with my 42s as many have requested. Here is what I found: 1.With the calculator on, I can only use the exit key together with the SQRT and LOG keys to do a reset or self test but nothing else. These were also the methods I used to activate the calculator when it was off. (i.e. before I found the trick of pushing EXIT then SUM+. The EXIT key does not return from a menu, but EXIT-SUM+ does. I've not been able to change the brightness of the display, though. 2.No other two-key sequence turns the calculator on. 3.As Bart (UK) suggested, I was able to turn the calculator on and off by pushing just below the LCD screen in conjuction with using EXIT. This method worked as well and reliably as the EXIT-SUM+ method. 4.As Lyuka suggested, I was able to turn the calculator on (but not off) by hitting a group of keys together with EXIT. For example 7,8,9,DIV. This method seems to work better with the numbered keys than with the function keys. It also does not work very reliably. My decision to send the calculator in will depend on whether I feel my 42s will work reliably as is. If Lyuka's diagnosis is correct, the 42s may have a limited life span, plus the problem may be difficult to fix. If Bart is correct, then the fix might be simpler. I enjoy tinkering with electronics, but drilling on the back of a thin plastic case is beyond my comfort level.

Thanks again,

Charles

Re: EXIT key reassigned on 42s

*Message #12 Posted by **Charles Mones** on 18 Feb 2012, 8:27 p.m.,*
in response to message #11 by Charles Mones

Looking at pictures of the carbon button contacts attached by Lyuka reminds me of the contacts used in remotes (TV, CD, etc). I have been able to revive dead keys by using a product called Cramolin made by CAIG labs. This material goes by the names of Cramolin R-5, DeoxIT and ProGold G5. You want the stuff that is the cleaner not the protectant, though the ProGold is both. One can get it as a concentrated liquid or spray. Here is how I rejuvinate the controls: 1. First clean both services with 91%+ isoprolyl. 2. Then moisten a q-tip with Cramolin. 3. Sparingly apply the substance to both sides of the contact. Do not oversaturate to the point of making a mess. 4. Leave it sit for about an hour. Then with a clean q-tip slightly mointened with alcohol wipe off the contacts. The q-tip may get black. 5. Then apply a second light coat of Cramolyn to the contacts. Again be sure not to oversaturate. Wipe off the excess if you use too much with alcohol and start again. 6. Then reassemble. Some of the revived remots have lasted for a year or two. Some have lasted much longer before needing another treatment.

Hope this will be of use. Charles

Sounds like you've found your problem. The carbon ink traces on the key matrix flex interconnect mate to bottom pcb fingers under pressure via a foamed plastic/rubber/? strip. Either that strip has relaxed or the frame twist lock isn't creating pressure in the first place. If you pop the unit open (admittedly involved on the service-hostile 42s) you might have a look at the lower middle frame twist tab and take up on it a bit to see if doing so restores contact. Otherwise undoing all tabs, removing the pcb and either shimming the existing foam strip (or better yet replacing it) should solve the problem.

The sqrt key may possibly be only a mechanical factor as pressing in that area will cause the frame retaining the compression strip to move slightly toward the pcb and potentially restore electrical contact to pins. If this is indeed the case I'd expect pressing the 1/x key to accomplish the same. But intermittents IME can at times have puzzling behaviour.

HP-IL SCSI Interface

*Message #1 Posted by **Richard Wagoner** on 17 Feb 2012, 2:19 p.m.*

I recently came across two of these (Part number = 5061-3156) and can find no information about them. They did not come with their 'Wall Warts" so I'm reluctant to experiment with them.

The Museum and TOS are also void of any data.

Any information pointers would be appreciated.

Thanks,

Rick

Re: HP-IL SCSI Interface

*Message #2 Posted by **Eric Smith** on 17 Feb 2012, 2:29 p.m.,*
in response to message #1 by Richard Wagoner

Are they HP-IL, or HP-HIL?

Photos?

Re: HP-IL SCSI Interface

*Message #3 Posted by **Richard Wagoner** on 17 Feb 2012, 2:41 p.m.,*
in response to message #2 by Eric Smith

The labeling says HP-IL/SCSI Interface.

There are three connections: One for power. one set of HP-IL plugs and one 50 pin SCSI connector.

Photos soon.

Rick

Re: HP-IL SCSI Interface

in response to message #3 by Richard Wagoner

I'm wondering which kind of devices can be connected to a 71B or 41C. The SCSI devices (mass storage, scanners) need special drivers and are far from being supported by the built in software of these two calculators. Or does the interface provide the access logic to use an SCSI disk as an HP-IL mass storage device?

Re: HP-IL SCSI Interface

*Message #5 Posted by **Howard Owen** on 17 Feb 2012, 3:24 p.m.,*
in response to message #4 by Marcus von Cube, Germany

The latter is the only explanation that makes sense to me.

Now all you need is a SCSI-1 disk and cable :)

OK, we have TCP/IP, and now SCSI. Can an HP-IL NAS be far behind?

Re: HP-IL SCSI Interface

*Message #6 Posted by **Eric Smith** on 17 Feb 2012, 3:34 p.m.,*
in response to message #4 by Marcus von Cube, Germany

I'm only guessing, but I think most likely it would be for the 110, not the 41/71/75. It probably translates SS/80 commands to SCSI.

The 41/71/75 don't use the SS/80 command set, they only use the "Filbert" command set from the 82161A tape drive. (It is rumored that the 82479A Data Acquisition Pac for the 71B can talk to SS/80 disks, but probably only in a limited, application-specific manner.)

The 9114 supports both the Filbert and SS/80 command sets, so it can be used on the 41/71/75 and on the 110.

in response to message #7 by Richard Wagoner

Interesting they look like prototypes. The connector to the right of the HPIL connectors is likely the power connector and the type might suggest it is looking for DC voltage, but you would need to look inside to see how it is wired. You will probably find that connector goes to a 3 terminal 5 volt regulator inside.

The software described in this manual is pretty similar to software that I used for failure analysis on SCSI disks. The software I used could be used to dump internal logs from the drive, update firmware and also worked as an exerciser. It was one of my tools along with a bus analyzer for trouble shooting

shooting SCSI device issues.

Swiss 15C "Clone" has arrived

*Message #1 Posted by **Richard J. Nelson** on 17 Feb 2012, 12:41 p.m.*

The initial batch of the Swiss HP-15C “clone” is being received. This machine has been discussed on this forum several times. The photo shows the series of HP-15C’s to date with the Swiss clone being the fourth in a series. Oops. This site doesn't allow photos without a URL. sorry.

Here is my initial reaction.

1. Measured Specifications Size: Credit card: 2.249 x 3.381 x 0.302 inches.(HWD) - stack of ten credit cards. Weight: 50.6 gr. (1.79 oz.).

2. Construction Robust using a rigid frame. Back held by four Phillips screws. Simple three piece assembly – Front, Back, Internal frame. See video on Michael’s website: http://www.rpn-calc.ch/

3. Battery Single CR2032 coin cell. requires a #0 Philips screw driver to replace. Installing a new batter will produce PR ERROR in the display.

4. Keys Small, true metal dome similar to the original HP-15C. Keyboard colors identical to original HP-15C. The strong tactile feedback is not “in sync” with the key contact and it is possible to press a key and feel it “click” and not make contact. This appears to be in the design because it seems to apply to all keys. I have normal sized fingers with a lowered sense of “feel” so I simply press a bit harder. To address this issue I cut the erasure end off a pencil to use to press the keys. This “tool” fits nicely into the edge end of the soft case that comes with the calculator. The keyboard notations are clear and about as large as possible which is great for the visually impaired, i.e. over 40 years of age.

5. Display The display may be compare with the HP versions and Michael elected to use upper case for the error messages, etc. This makes it even easier to read. The test display shown in the photo was produced when turning the calculator on while holding the multiply key down. RUNNING will flash four times first.

6. I/O Connector An I/O connector is in the front edge. it is not a USB “B” connector but should not be difficult to find – according to Michael.

7. Speed Not as fast as the 15C LE but quite close.

Conclusion. This is a very nice always-with-you high end scientific calculator that will provide 95% of all scientific calculations you will need to make. Its small size allows it to fit nicely (with my Sony DSC-TX1 camera) in my shirt pocket.

X < > Y,

Richard

*Message #3 Posted by **Eric Rechlin** on 17 Feb 2012, 5:40 p.m.,*
in response to message #1 by Richard J. Nelson

Mine came today too. It's amazing how small it is compared to a real 15C.

Some of the keys are incredibly difficult to press (I have to get a firm grip on the calculator and squeeze very hard for it to register), so I will probably be taking it apart this weekend to see if I can adjust anything to make it work better.

Overall I am impressed by it. The screen is very nice. The re-creation of the rear label is a nice touch. The faceplate looks very professional, with the raised keys in the (Mylar?) overlay.

Eric

Re: Swiss 15C "Clone" has arrived

*Message #4 Posted by **Eric Rechlin** on 17 Feb 2012, 5:45 p.m.,*
in response to message #1 by Richard J. Nelson

Richard, the USB connector is a Mini B USB connector. It's deprecated so it probably should not have been used, but there are countless supplies of cables for it. It's the same type used on the 50g, so if you have a 50g you can just reuse the cable from it.

It was probably selected because it's easier to solder onto a board than the Micro USB ports favored today.

Eric

Mine arrived today as well. Neat little bugger. A lot less obvious you are nerdy as it can be concealed very easily.

My only initial concern is the whether or not the edges of the PCB board will wear over time and get damaged. I wonder if we could come up with a low profile black anodized frame. On to the CAD!

Mine is here, but ...

*Message #6 Posted by **gene wright** on 17 Feb 2012, 7:49 p.m.,*
in response to message #5 by aj04062

The lower left corner is not completely flushed/closed.

The top of the 3 layers comes up away from the lower two layers, causing it to "bounce" up and down

when I click a key in that area. It also caused a memory loss at least once.

The screw is all the way screwed in, so that does not appear to be what is wrong.

VERY fun little machine, but I will have to figure something out about it not being totally closed.

So who is going to have a try re-purposing this device?

The CPU is a bit light on memory but is plenty fast enough. I don't know for sure yet, but I have been lead to believe that there is an unpopulated eight pin SOIC pad in there that can accept an AT45DB041B serial flash device.

Small size, nice form factor, fast CPU, good display, ...

HP42s - deal?

*Message #1 Posted by **Cristian Arezzini** on 17 Feb 2012, 10:54 a.m.*

I have always wanted to have a 42s, because everybody says great things about it... but it's usually more expensive than I can afford. But then, I found one on eBay that was "mislabeled" as a 45s. Maybe for that reason, or because it was in Italy, or because it came with no box or manual... for whatever reason there was no bit war on it, and I got it for 160 euro. It's in (I'd say) mint conditions, no scratches anywhere, no bumps, no discoloration, great keys, the pouch is ok... the only sign of use is that the rubber feet have a "used" look, but they're still in great shape. So, a few questions...

- Is there some specific defect I should look for? It's a 1987 Singapore unit.

- The display contrast isn't that great. It's better than my 48SX but worse than my 48GX. Is this normal?

- Did I pay a good price for it? :)

Thank you, Cristian

In my opinion: No, Yes, Yes!

Re: HP42s - deal?

*Message #3 Posted by **Fabricio** on 17 Feb 2012, 11:30 a.m.,*
in response to message #1 by Cristian Arezzini

In my experience and with the currency in Mx, it was not the best price, specially as it came with no manual nor box.

Just last December, I guess because of most people were spending in christmas gifts, two HP 42s appeared on ebay, the first one in 129usd, the second one in 140usd. I bought both with no fighting at all. 129usd + shipping is in mx pesos aroung 1850mxp; and your 160 euros alone are 2770mxp.

Compared to the prices now on ebay for the HP 42s, it would seem that it is a good price, but right now prices on ebay are inflated. I think one of the reasons is the recent sell of a supposedly NIB unit that sold in nearly 700usd. BTW, sadly I contributed to that, because from the very begining I increased the bid on that unit to 425usd. I did´n want seriously that calculator (I mean, I want it, but not for those prices), but just wanted to see how the the ultimate crazyness in the market was. And well, the final price says all.

I bought a "mint, like new" HP-28s some few months ago in a fiercely bid. It was in something like 200usd in the last minute, so I entered 350 just to make sure I was the winner. Well, I won it with 325. Yes, 325 for an HP-28S. And to add insult to injury, it was no way near as "mint, like new" as described. Later I bought another one from another seller in 210. She didn´t want to sell overseas, so ask for a premium and that´s why I

paid that. In this case, the unit was even better than described; actually it looks like the box was somehow just opened to see it and never used. Recently, in january, 2 units new from an army surplus appeared on ebay, and sold for around 90usd each. Remember, we are talking about the HP-28S, which I love but a lot of HP users seem to hate, so its prices shouldn´t be that high. If you go to ebay now, there´s one unit offered in more thtn 250... is it worth or just inflated?

So, my experience on deseperately hunting down calculators in the last months says: be patient. When prices skyrocket, just slow down and wait for the right time. It always will come.

Well, I don't mind if it's not the best price, as long as it's a good price! And... buying in the US is problematic. Shipments to Italy are often very expensive, and really slow, and there is a hefty customs tax. And many packages just get lost. I go to the US about once a year, and when I can I have things shipped there so I can collect them there take them back with me, but I don't know when I'll be going there next, so... I just took this chance of buying locally!

In your experience, does it happen often that valuable calculators are mis-labeled on eBay? I found this by chance, and mine was the only offer... If only the base price was lower! :)

And I never "bid-fight". I decide a price, set an automatic bidder, then I don't even look at it until after the ending time. Prevents me from bidding more than I really want to. Many sellers don't like this, but as a user it's a great way to not have buyer's remorse!

Cristian

in response to message #4 by Cristian Arezzini

> Quote:
>
> Well, I don't mind if it's not the best price, as long as it's a good price!

I think it was a reasonable price, better than what the HP 42S typically brings on eBay.

I've got two HP 42S units made in 1993 with firmware version C, and one HP 42S made in 1989 with firmware version A. There were only versions A, B, and C, with version B being the rarest apparently.

No one has ever made a RPN calculator that comes even remotely close in capability.

```
Checking HP 42S or HP 17BII Firmware Version
```

```
 --PRESS--                        --RESULT--
  ON plus    Starts step-wise self test.
  (fourth
   top key
   from left)

   <--       Starts built-in hexadecimal memory scanner/editor.
(backspace)  LCD displays data similar to:
             "023F1:750D1F6E2051C11B"  (HP 42S   Firmware version A)
             "023F5:710D1F6E2051C11B"  (HP 42S   Firmware version C)
             "021E8:71FC70E81FC73055"  (HP 17BII Firmware version B)

     .       Executes ROM beginning at address shown on left side.
 (period)    Results are shown momentarily each time "." is pressed:
             "A                    7"  (HP 42S   Firmware version A)
             "C                    7"  (HP 42S   Firmware version C)
             "B                    1"  (HP 17BII Firmware version B)

  ON plus    Exits memory scanner/editor.
  (third     Gives "Machine Reset" message but causes no memory loss.
   top key
   from left)
```

See Craig Finseth's interesting HP 42S info, including some firmware version details and interesting FW memory locations that can be accessed with the memory scanner/editor, at his HP 42S page.

It is normal for all HP 42S units, which were sold by HP from 1988 to 1995, to have LCDs that are not the best for contrast. But all are completely serviceable. The later LCD type is recessed about three times deeper from the front than the first LCD type. However, the display contrast does not differ between these types to any discernible amount.

With respect to the side discussion on the HP 28S, I still have the one I bought new in 1988. I am surprised anyone would pay more than $25 for a new-condition one, and that only if it is without the typical cracked battery door opening. A used-condition HP 28S with cracked battery opening should be a give-away item. Clamshells are bad products, IMO.

OT: 28S prices

*Message #6 Posted by **Keith Midson** on 17 Feb 2012, 8:31 p.m.,*
in response to message #5 by Mike Morrow

I can't resist commenting on the 28S. I have a few of them, most in mint condition and they are my personal favorite HP. I have bought and sold many of them over the years - prices do vary considerably. I have sold 'like new in box' units for $105 to $350 in the last few years (it wasn't mine that was referred to earlier). I've also sold seriously damaged 28S's (not working, no battery door, water damaged) for about $5 (parts?).
I think it all comes down to personal preference. I love the 28S because of it's design, easy access to menus and alpha keys, and nice display. I still have my original from 1990, as well as a few 'extras' (well I am a collector after all!) and rare versions (clear cases, etc).
Yes the 28S has what could be considered a design flaw in the battery door, but considering that the few that I keep and use on a regular basis are in perfect condition after 20+ years, it comes down to how careful you are with battery changing. It is a shame that the rear battery door of the last version of the 19Bii didn't get transferred to the 28S.
My 2c. Keith

*Message #7 Posted by **Keith Midson** on 17 Feb 2012, 11:07 p.m.,*
in response to message #6 by Keith Midson

I should also add that I have bought 28S's for a wide price range as well. The best deal I got was $17 for a mint (appeared completely unused) Singapore version from an online marketplace (not ebay). The most i've paid is $305 for a complete boxed version (also mint). I recently bought 2 together for $40 (both in working condition). Cheers, Keith

Keith, I would have said it was a broken calculator... How did you program that?

Cristian

Re: OT: 28S prices

*Message #12 Posted by **Keith Midson** on 18 Feb 2012, 6:17 a.m.,*
in response to message #11 by Cristian Arezzini

Hi Cristian, I will provide a program listing later (the 28S with this program is at my office), but essentially you take a screen dump (LCD->) of anything (in this case it was just the screen with the STRING menu). Store the screen image in a file, then the program cuts the last character from the string file (the 28S stores a screen image as a 548 character string), then add the last character to the beginning of the balance of the string and XOR it with the original image. You then display this image and do it all over again - repeat 548 times and be amazed with the patterns that appear on the display!! I also tried this with a screen dump of a fractal back in my University days, but I can't get the fractal generator to work again (I converted an old Pascal file back then - lost my touch now!!).
I will provide a separate thread with the program tomorrow.
Keith

I totally agree with you. I bought HP-28S in 1988 because it has a beautiful design, a revolutionary structured programming language and abundant memory. As I didn't get enough money to buy the succeeding HP-48SX in 1990, I had to sell it with some solution handbooks to one of my college classmates. Twelve years later, I bought an NOS HP-28S from TAS.

I used HP-28S for two years but hadn't found any difficulty in replacing batteries. I'm surprised by cases of broken battery compartment.

*Message #14 Posted by **Keith Midson** on 18 Feb 2012, 2:23 p.m.,*
in response to message #13 by From Hong Kong

I think a lot of the damage to the battery door comes from dropping the calculator, not changing the batteries. I also sold my first 28S in to a friend to buy a 48G - it was in perfect condition when I sold it - he gave it back to me a few years ago (along with my original manuals and receipt for AUD$425!! - lot of money for a student back then!), but the battery door area was very damaged.
He told me that the damage was from a few unfortunate 'drops'. Because the battery compartment area (the case around the door, not just the door) is the weakest part of the calculator, then that is the place that suffers the most damage.

I regard drops as disasters to a calculator. Neither did I lend a calculator to my friends nor use it so carelessly. I treated my HP-15C so badly that it had dropped several times. Fortunately, it still works! :)

Re: HP42s - deal?

*Message #17 Posted by **Massimo Gnerucci (Italy)** on 17 Feb 2012, 4:26 p.m.,*
in response to message #4 by Cristian Arezzini

Hello Cristian,
That "mis-labeled" 42s didn't went unnoticed: I have it in my records since last october :).
First time it ended on 19/10/2011, its starting price was 210 EUR. Since then it appeared another eight times, lowering the asking price to 199.99, 179.99 and finally 159.99 when, on the second try, you bought it.

I was not interested since I considered it too pricey: I bought my four units for the equivalent of 25, 40, 70 and 85 EUR (the last one an unused replacement unit made in 2000). Several years have passed, that's true, but I still consider 160 EUR a bit too much for a used 42s... But, hey! That's just me. ;)

Enjoy your new toy! That's the only thing that counts.

Massimo

in response to message #17 by Massimo Gnerucci (Italy)

Hi Massimo, Wow, eight times, I never noticed it... because I don't regularly search for the 42S and

this time I only saw it by chance. I wonder what the base price would have been if I had let this auction pass too! :)

Anyway... now that I see what you paid... let's say I feel guilty again! Did you find those prices on eBay?

Cristian

Re: HP42s - deal?

*Message #19 Posted by **Massimo Gnerucci (Italy)** on 17 Feb 2012, 6:32 p.m.,*
in response to message #18 by Cristian Arezzini

No, please, don't feel guilty! Just enjoy it: if you felt you had to buy it, then the price was right.

After all I found those calcs around 10 - 12 years ago.

I bought the first and cheapest from a coworker (the only one without manual), one from iBazar (before it was bought by eBay), another on eBay and the last on a local board in Belgium.

Greetings,
Massimo

> - Did I pay a good price for it? :)

Was that a rhetorical question? :-)

Five years ago I shipped one in near mint condition to Italy. It cost the buyer US$ 140.00, only slightly above what I had paid for it here, but I was glad to get rid of it because I didn't like the early display style. The buyer got "molto contento", to use the words in his feedback to me:-)

Mine cost exactly 217 euro (the one in the left) and the equivalent to about 180 euro (the other one).

Ciao,

Gerson.

Thank you for the info! :)

> Quote:

> Was that a rhetorical question? :-)

Actually it was not. I know that many times the eBay prices are "bloated" and out of proportion. And I had no info about prices elsewhere. And I thought that, since it was mislabeled and I was the only bidder, it could be a good price! :) Anyway I like the calculator, it's really near mint, even the display glass looks like new... Now I would like to find the manual! :) I have the museum DVDs but I like to read manuals on paper - and printing would be too big a job...

Best regards, Cristian

*Message #23 Posted by **Vince (Italy)** on 18 Feb 2012, 2:47 a.m.,*
in response to message #1 by Cristian Arezzini

I was watching over the weeks that calc too, hoping for a further decrease in price. But I think it has been a bargain anyway, considering the current pricing of the 42s.

I recently bought one from a forum member (on eBay, anyway), for about 135 Euros, plus shipping, plus custom duty.

It came with manual, but it was refurbished by the seller, and (probably due to the disassembling and reassembling process) the keys are mushy and sticking or snapping, the good cosmetic condition notwithstanding.

So, congratulation for your recent acquisition! :)

Vince

Keyboards may fail and require to open it, which appears to be typical for all Pinoneer calculators. This is what has been reported many times.

OTOH, I now have a 20S, two 32SII, a 10B (I gifted it, but it's still within reach and in daily use), and a 27S. None of them failed so far.

in response to message #1 by Cristian Arezzini

You can adjust the contrast by pressing + or - while holding down the EXIT/ON key. You may be able to get it to be a bit more to your liking that way, but don't expect too much. The HP-42S display is widely considered to be a somewhat poor feature in an otherwise excellent calculator.

in response to message #1 by Cristian Arezzini

> Quote:
>
> - Is there some specific defect I should look for? It's a 1987 Singapore unit.

A problem that is by far the most serious yet obscure is the remaining lifetime of the calculator. I would like to share my experience with you. I had a HP-48SX bought new in 1990. Its serial number is 3051AXXXXX. I used it quite heavily from 1990 to 1992. After 1992, I used it occasionally. I found that part of the LCD display was dead only several years ago and that the calculator eventually RIP this year. Except some dirt, the calculator still looked mint for about 20 years without any wear or other cosmetic problems. If I had sold it to you several years ago, you would have lost your money!!!

Every one has to risk himself when deciding to buy a calculator used for more than 10 years. Unfortunately, a car has an odometer to log its mileage but a calculator has no corresponding meter to log its usage. Only the owner knows the truth. Even an unused one cannot be guaranteed to survive for long because all electronic components have their respective lifetimes even without much use.

Yes... I know. Unfortunately there's no way around that. If some components inside are only just "marginally alive", I can't know. But at least I know there are no already-worn parts. This is something I hate about new technology. Take an old transistor radio from 40 years ago... you can fix almost any defect. Take anything with custom components... you're out of luck. Even my old Commodore 64 was easily fixed, but only if you had access to spare custom chips.

The same goes with cars... I could keep my old 1983 Alfa Romeo alive for many years, right until it was destroyed in an accident last year. Modern cars have more complex, custom sensors/electronics parts which are not fixable and impossible to substitute with anything else when the stores run out of spares. Oh well, such is life...

Is the HP35s reliable?

*Message #1 Posted by **Chris Smith** on 17 Feb 2012, 9:52 a.m.*

I've been a TI user for about 20 years now, progressing through TI-81, TI-85, TI-92 etc. My TI-92 is now dying miserably and is just too large and heavy to cart around any more.

I sat down and wrote what I actually do and the HP35s appears to be a good fit feature-wise and I've always wanted to use RPN as it's more efficient.

Unfortunately there are less than favourable reviews from people complaining about battery use, dodgy keys and general reliability.

Are these rumors founded?

Re: Is the HP35s reliable?

*Message #2 Posted by **Glenn Becker** on 17 Feb 2012, 10:18 a.m.,*
in response to message #1 by Chris Smith

Hi Chris,

You can find a bug list here:

HP-35s bug list.

I'm not a power user by any means but there are some doozies on that list.

I've been told by a couple of the people here that the 33S, unconventional appearance aside (if you can manage to put that aside) is actually a more reliable machine if you are looking for straight RPN.

Re: Is the HP35s reliable?

*Message #3 Posted by **Chris Smith** on 17 Feb 2012, 10:39 a.m.,*
in response to message #2 by Glenn Becker

Nothing too horrible, especially compared to my TI92 which has some really annoying eye-poking bugs. Trig issues are slightly worrying but I'm not sure they will manifest themselves in my daily use.

Doing some research it suggests that all HP35s' are not equal. I wonder if there are a couple of versions floating around.

33s is missing a couple of things I'd like unfortunately :(

I could go for a 48SX/GX or possible a 15c but I can't get one for a reasonable price in the UK.

Have you considered the 50g instead? It's not expensive and has lots of power. Most probably more than you'll ever need.

Another option might be the WP 34S, a DIY project discussed here in some detail.

Re: Is the HP35s reliable?

*Message #5 Posted by **Chris Smith** on 17 Feb 2012, 11:19 a.m.,*
in response to message #4 by Marcus von Cube, Germany

I considered the 50g but it's a bit overkill for me and 2x the cost of the 35s.

My main application areas are pretty simple EE stuff (worst case complex numbers, some trig and solving sim. equations). I'm interested in developing a few simple programs to make the routine stuff slightly less laborious.

WP34S sounds good but I just want something that works these days (I'm getting old and lazy).

I doubt the HP-35s handles the following. The HP-50g does.

1) $V_1 - V_2 = 10*I_x$
2) $V_1/j20 + (V_1 - V_3)/20 + V_2/10 + (V_2 - V_3)/-j10 = 0$
3) $V_3/j10 + (V_3-V_2)/-j10 + 2\angle -45 + (V_3 - V_1)/20 = 0$
4) $I_x = -V_3/j10$

where j = sqrt(-1) and $2\angle -45$ is 2 angle -45 degrees.

in response to message #6 by Gerson W. Barbosa

This is true. However, my TI92 does/did this. I use it once a year perhaps. Most circuit analysis problems can be pretty much solved without very little math if you know how.

Re: Is the HP35s reliable?

*Message #8 Posted by **Brandon Poindexter** on 17 Feb 2012, 12:41 p.m.,*
in response to message #7 by Chris Smith

I've used the HP 35s for about 3 or 4 years now. It's never failed me. Although what i

use it for are quite less complex in terms of the mathematics involved, but in terms of physical build quality and keyboard I have had no problems what so ever. I had a TI-89 titanium before the HP 35s, and while powerful it was just too much for what I needed.

Battery use? I had mine on the batteries that came with it 4 years ago and just last month changed the batteries. Only because the battery symbol had been on for about a month.

Dodgy keys? Maybe. My plus key creaks for some reason when i press it lightly, but nevertheless all buttons feel the same after all these years.

General reliability has been great for me. While I do keep it in its (hard) case, I'm sure the HP 35s can take a good beating sliding around a backpack.

*Message #9 Posted by **Eric Smith** on 17 Feb 2012, 5:07 p.m.,*
in response to message #6 by Gerson W. Barbosa

If you use complex numbers, you'll be *much* happier with the 50g than with the 35s or 33s.

Re: Is the HP35s reliable?

*Message #10 Posted by **Bart (UK)** on 18 Feb 2012, 7:31 p.m.,*
in response to message #6 by Gerson W. Barbosa

Well, not as easy as the 50g, but it can be done.

The biggest necessity is matrix capability, but fortunately someone on the internet has done something already:
A Matrix Multi-Tool for the HP 35s

So we have to re-arrange the equations a bit and write down the co-efficients for input into the matrix:
Data for matrix A:
1**i**0; -1**i**0; 0**i**0; -10**i**0
0.05**i**-0.05; 0.1**i**0.1; -0.5**i**-0.1; 0**i**0
-0.05**i**0; 0.1**i**0.1; 0.05**i**0; 0**i**0
0**i**0; 0**i**0; 0**i**-0.1; 1**i**0

Data for column vector b:
0**i**0; 0**i**0; -2Ø-45; 0**i**0

Note:
Even 0 entries must be entered as 0**i**0 when working with complex numbers.
For -2/-45, the symbol Ø represents the theta symbol on the 35s. You can enter it like that as the 35s will automatically convert it to -1.41421356237**i**1.41421356237 (unles you have set it to polar mode, in case which all the other inputs are converted).

After about 15 seconds, the solution vector reads:
-1.88561808316**i**-24.5130350811
-1.88561808316**i**-5.65685424948
-18.8561808316**i**0
0**i**-1.88561808316i

Regards,
Bart

Hey, that's great! If they address at least some of the bugs (in order to show their good will) I'll buy one again!

Best regards,

Gerson.

Re: Is the HP35s reliable?

*Message #12 Posted by **Bart (UK)** on 18 Feb 2012, 8:16 p.m.,*
in response to message #11 by Gerson W. Barbosa

Yes, I am disapointed that after almost 5 years they still haven't fixed the bugs. For instance entering long programs like this matrix one or Pauli's 700+ line game is difficult when the checksum cannot be releid upon as I have had to spend time to check and re-check to ensure correctness.

Re: Is the HP35s reliable?

*Message #13 Posted by **Gerson W. Barbosa** on 18 Feb 2012, 8:46 p.m.,*
in response to message #12 by Bart (UK)

That's exactly what I felt when I read the remark in your complex functions program, linked below:

"Program length and checksum are not provided as they make no sense on this calculator"

> WP34S sounds good but I just want something that works these days (I'm getting old and lazy).

Version 2.2 of the 34S certainly does this now.

Version 3 is much improved but not quite stable now, although it is very close.

Download the emulator and give it a whirl. It is possible to buy a repurposed device where all you need to do is to apply the overly.

I'll try it in the emulator and see!

Re: Is the HP35s reliable?

*Message #16 Posted by **Michael de Estrada** on 17 Feb 2012, 3:55 p.m.,*
in response to message #5 by Chris Smith

Complex number handling is very cumbersome on the 35s, and it lacks some really useful features like direct polar to rectangular coordinate conversions, which I'm sure you know can be very useful in EE. I much prefer my 33s in these regards, and it's cheaper than the 35s.

Re: Is the HP35s reliable?

*Message #17 Posted by **Chris Smith** on 17 Feb 2012, 4:53 p.m.,*
in response to message #16 by Michael de Estrada

I noticed but from what i can see, it's possible to use a program to convert from polar -> rect and vice versa.

Re: Is the HP35s reliable?

*Message #18 Posted by **Michael de Estrada** on 17 Feb 2012, 5:13 p.m.,*
in response to message #17 by Chris Smith

But why go to the bother when you can do it directly from the keyboard ? And there's so many annoyances on the 35s, such as not having separate primary keys for STO and RCL or the negative sign on the number / mantissa not being centered, or the left / right shift arrows that should be up / down etc. Anyway, I hardly ever use it compared to my 33s and 32SII.

Re: Is the HP35s reliable?

*Message #19 Posted by **Bart (UK)** on 18 Feb 2012, 8:09 p.m.,*
in response to message #17 by Chris Smith

> Quote:
>
> ... it's possible to use a program to convert from polar -> rect and vice versa.

I have that program loaded, but I find it easy enough to just change the display. LeftShift, DISPLAY choose no. 10 for Polar or 9 for Rectangular. (shortcuts: "LeftShift DISPLAY .0" for Polar, "LeftShift DISPLAY 9" for Rectangular).

When in Rectangular mode, you can still easily enter polar values and they are automatically converted to Rectangular. And vice-versa when in Polar mode.

I find the actual entry of complex numbers the easiest on the 35s compared to all other

HP's I have worked with. You do just type 123 **i** 45 ENTER.

On the 42s it is: 123 ENTER 45 SHIFT COMPLEX.
On the 32S/SII and 33s a complex number takes up two stack levels and each operation has to be preceded by the COMPLEX key.
On the 50g entering in vector form is easy, but to get "123+**i**45 one has to do: 123 ENTER 45 LeftShift **i** * +

However, very few functions on the 35s support complex operations (unlike the 42s or 50g, where they form an integrated part of the functionality), but I have written some routines for that, listed in this other forum post: HP 35s complex operations

Interesting stuff!

I've bought a Casio FX991ESPLUS (sorry chaps!) and an HP35s. Will see how I get on with both!

Re: Is the HP35s reliable?

*Message #21 Posted by **Chris Smith** on 22 Feb 2012, 5:12 p.m.,*
in response to message #20 by Chris Smith

FX991ES PLUS arrived earlier today. Not a bad machine for 15GBP! Probably end up using this in the end.

Surprised to find that it's pretty much the same as my SmartCalc 300s but fixes all the horrible complaints I had about that.

Awaiting HP35S delivery still...

Re: Is the HP35s reliable?

*Message #22 Posted by **Lars Bergström** on 20 Feb 2012, 4:29 p.m.,*
in response to message #1 by Chris Smith

In my opinion, the 35s is decent calculator, much better than what some "purist HP-fans" tends to express. There are some quirks, but nothing that has bothered me, during the 4(?) years of daily use.

The trig error (close to 90 deg), is of little importance, unless you plan to send a rocket to the moon, where the error in digit position 8 might be of importance.

The keyboard has a good quality and the display is OK (but not perfect, as it is difficult to distinguish "8" from the angular symbol theta).

/ Lars B (29C, 41CV, 19BII, 35S, all in daily use)

Have you used the 33s as well?

Re: Is the HP35s reliable?

*Message #24 Posted by **Gerson W. Barbosa** on 22 Feb 2012, 8:25 p.m.,*
in response to message #23 by bill platt

Incidentally, the trig bug was first noticed on the hp-33s. I like this calc, but I got somewhat disappointed after that. I wasn't on my way to Mars, but I was checking the results of my own trig program for the HP-12C Platinum upon the hp-33s when the discrepancies arose. At first I thought my results were wrong, until I decided to doublecheck the results on my good old HP-32SII.

Re: Is the HP35s reliable?

*Message #25 Posted by **Lars Bergström** on 23 Feb 2012, 5:07 p.m.,*
in response to message #23 by bill platt

Yepp! I used it for 2 years, but was highly annoyed of the graphic design of the symbols on the keys and the frontplate. The locations of the keys seemed somewhat "cluttered" and the ENTER key was way to small. I put the 33 in a drawer and bought a 35s instead. I haven't used the 33 since then.

I previously had both a 32s and a 42s at my old workplace, so i'm familiar with those as well.

BTW, the 33s is -ugly-, and that might also bias my judgement....

Re: Is the HP35s reliable?

*Message #26 Posted by **Ed Look** on 23 Feb 2012, 11:30 p.m.,*
in response to message #25 by Lars Bergström

I originally felt as you did about the appearance of the 33s. But in using it on a continual basis, I found it to be much more pleasant to use than the 35s. The appearance no longer bothers me and the keypresses on the 33s feel better. I have even begun to like the HP's selection of unshifted keys for the 33s. It seems easier to calculate on and program than the 35s. In fact, it is the one I reach for most of the time, unless I need something only the 50g can do.

Re: Is the HP35s reliable?

*Message #27 Posted by **Jeff Johnson** on 24 Feb 2012, 11:38 a.m.,*
in response to message #25 by Lars Bergström

I'm with Lars. The 33s just looks too much like a prop from a Flash Gordon episode, although I know there's a good machine underneath those looks. As much as I like to think of myself as purely rational, I admit that I am in love with the retro look of the 35s, and I have yet to be affected by any of its "bugs". It's my "daily driver" calculator. I also like the action of the 35s keys better than my 28s and 50g. I think the feel of the 35s keys are as good as those on the 45, 25, and 41C,

although I know some folks have had problems with key presses registering on their 35s. I'll keep mine, thanks.

Interesting Book with lots of HP info

*Message #1 Posted by **Dave F** on 16 Feb 2012, 1:39 p.m.*

I just received a book I bought on Ebay that has some really good sections on HP calculators, including an essay on the evolution of HP calculators, a detailed chapter on the 9100 architecture by Tom Osborne, and a chapter on the 9845A hardware and software architecture. It's called **Computer Structures: Principles and Examples**. It's co-written/edited by Gordon Bell, who has the whole book available for download on his site:

http://research.microsoft.com/en-us/um/people/gbell/CGB%20Files/Computer%20Structures%20Principles%20and%20Examples%201982%20ng%20c.pdf

The download is huge, but definitely worth a look if you love HP calculators and early desktops.

Dave

Can't seem to flash 30b

*Message #1 Posted by **Matt Fegenbush** on 16 Feb 2012, 10:42 a.m.*

I tried to follow the instructions to erase and flash my 30b, but I fear I may have bricked it. I am running Win XP with a direct serial connection (COM1) and am getting "unable to connect" messages with the MySamba Flash Tool from the sourceforge page.

If someone can enlighten me as to the next step to correct this, I'd sure be appreciative.

Re: Can't seem to flash 30b

*Message #2 Posted by **Bart (UK)** on 16 Feb 2012, 10:47 a.m.,*
in response to message #1 by Matt Fegenbush

I'm sure it's not bricked, but the flash has been erased. You will not get anything on the LCD at this stage, as the bootloader does not output to it.

It could be that the batteries are drained (the 30b drains the batteries quickly in this "zombie" state) or that there is a bad connection. Try with new batteries and ensure the pogo connector is properly seated.

Regards,
Bart

*Message #7 Posted by **Eric Rechlin** on 16 Feb 2012, 11:28 a.m.,*
in response to message #6 by bill platt

I don't know, but I will say that the 30b cannot be bricked, so I can't help your argument.

Eric

Re: Can't seem to flash 30b

*Message #8 Posted by **pascal_meheut** on 16 Feb 2012, 11:41 a.m.,*
in response to message #7 by Eric Rechlin

Here is what I do when it happens:

I follow the whole procedure again, erase, reset, etc I launch the SAM-BA program, the Atmel one.

It usually connects. Then I quit and launch MySamba and use it to flash.

Re: Can't seem to flash 30b

*Message #9 Posted by **Bart (UK)** on 16 Feb 2012, 11:44 a.m.,*
in response to message #8 by pascal_meheut

Admittedly, I use the Atmel Samba to flash and have never used MySamba.

Re: Can't seem to flash 30b

*Message #10 Posted by **Marcus von Cube, Germany** on 16 Feb 2012, 11:55 a.m.,*
in response to message #9 by Bart (UK)

Both work but MySamba is much quicker and less picky with the serial adapter.

To Matt: Pressing ON after inserting batteries or pressing RESET is essential!

Re: Can't seem to flash 30b

*Message #11 Posted by **Alexander Oestert** on 16 Feb 2012, 12:35 p.m.,*
in response to message #1 by Matt Fegenbush

If I remember correctly I had this situation once. It only worked when I removed the batteries from the 30b, reinserted them and started the whole procedure from the beginning: connecting the cable, pressing buttons on the cable and the 30b, starting programs exactly as described, even as the display of the 30b didn't display anything. I only use Atmel's SAM-BA, not MySamba.

Edited: 16 Feb 2012, 12:36 p.m.

Re: Can't seem to flash 30b

*Message #12 Posted by **Matt Fegenbush** on 16 Feb 2012, 1:50 p.m.,*
in response to message #11 by Alexander Oestert

I have been able to sporadically achieve a new error (using SAM-BA v2.11):

TIME OUT The applet did not return Please check the connection and reconnect the target device.

Re: Can't seem to flash 30b

*Message #13 Posted by **JimP** on 16 Feb 2012, 2:52 p.m.,*
in response to message #12 by Matt Fegenbush

I had a similar problem when trying to use a serial port in a docked computer (where the serial port was on the dock rather than attached to the computer itself.) Changing to a computer with a native serial port solved this. Don't know if this is of any use but there you go.

Re: Can't seem to flash 30b

*Message #14 Posted by **Matt Fegenbush** on 16 Feb 2012, 3:45 p.m.,*
in response to message #13 by JimP

I am working with a docked laptop. I will try on a desktop with a serial port as soon as I can find one.

Re: Can't seem to flash 30b

*Message #15 Posted by **Matt Fegenbush** on 16 Feb 2012, 4:09 p.m.,*
in response to message #14 by Matt Fegenbush

Ok, that seemed to be the problem. All is well now. Thank you all for your help.

The story of HP's Logic Analyzers

*Message #1 Posted by **Steve Leibson** on 15 Feb 2012, 6:53 p.m.*

I've just posted a blog with some of the story of how HP got into the logic analyzer business. Not told is the story of how an HP 1615A prototype logic analyzer was essential in stamping out the last hardware bug in the HP 9845A desktop computer. There was a problem with the "high-speed" DMA I/O to the floppy disk drive (400K transfers/sec!) and the glitch-capture feature of the HP 1615A found the problem in minutes, once we got the box up from Colorado Springs Division.

After Silicon, SoC, and System Realization comes Dynasty Realization

Re: The story of HP's Logic Analyzers

*Message #2 Posted by **Artur-Brazil** on 16 Feb 2012, 4:56 a.m.,*
in response to message #1 by Steve Leibson

Hi,Steve! Great history and great equipments! I had one HP1630D and now the HP 1650B. The first, as oscilloscope, had, if I remember well, a difficulty with ranges or probes. Something is not variable, what makes more difficult to work with it, at least to me, that bought it more for its HP-IL connection. The other has an unbelieveable mistake: the operational systems is on flopy disks. My one sits, now, on bench, waiting for a new floppy drive, which is not the usual 3.5 floppy, as its power cable is not separeted from the data flat cable. As you seem to be acquainted with them, do you have any idea how to replace this floppy disk unit?

Re: The story of HP's Logic Analyzers

*Message #3 Posted by **Steve Leibson** on 16 Feb 2012, 8:42 p.m.,*
in response to message #2 by Artur-Brazil

Sorry Artur,

I do not know how to get a replacement drive for your analyzer. The guy you need to contact is Larry Atherton who has a store on that auction site called LA Tech Renewal. He might be able to help although his specialties are HP 85 computers and voltmeters.

--Steve

After Cuts, HP Labs Vows Return to Glory Days

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 15 Feb 2012, 5:17 p.m.*

....As for the next pocket calculator? It will come, but Whitman concedes that it will take time. “Listen, R&D in the technology business is a longer-term gain,” she said during the call. “I think the investments we make in 2012, you’ll start to see in 2014 and 2015. I wish I could tell you differently, but it’s not true…. We cut out a lot of muscle in R&D at this company, and we have to invest back in it.”...

Since taking over, Whitman has very “engaged” with the labs and has made Banerjee a direct report. Previously, he had reported to the company’s Chief Strategy Officer. “She felt that HP Labs, the central research arm, is so important in terms of innovation for a technology company that she felt no this needs to be a direct report to me,” Banerjee says. “So we feel honored and thrilled, but it’s not just on paper. I mean, she is now tracking us on a very regular basis.”

That means that she’s tracking Project Moonshot too. Moonshot means low-powered servers right now, but HP has a few other technologies: its memristor memory chips — essentially a low-power alternative to flash — and photonic optical interconnects that could link up servers or even processors themselves. Banerjee thinks that new nanostore chips, which marry low-power processors with memristors, could be the ticket.

“Moonshot is step one of this big dream that we have. Our end point is we are going to have these tens of millions of low-power processors connected right next to these nonvolatile memory, based on memristors. And how are we going to connect these things up? Through optical interconnects?”

“Once we do this, it’s going to be a complete killer,” he adds. “Better than the calculator.”

go41cx V1.4.0

*Message #1 Posted by **Olivier De Smet** on 15 Feb 2012, 4:16 p.m.*

Last release with the return of the text overlays :) But only with one label per key :((use them with 'black' graphic overlay or 'opt001' skin)

- sound added (even synthetic tones) - ADV working now - inline help

Olivier

Re: go41cx V1.4.0

*Message #2 Posted by **Vincent Weber** on 15 Feb 2012, 4:55 p.m.,*
in response to message #1 by Olivier De Smet

Thanks and congrats Olivier, this is awesome work !

Now go41CX is 99% on par with i41CX+ - your are not stuck with Apple if you want a pocketable emulation of the 41CX ! i41CX+ has a CAS in addition, but this CAS was never part of the real 41 and is really stretching it too far...

Now, the nice thing would be to bring your other calcs to the same level of polishing: high-res skins and moving keys, landscape orientation + better sized help screen for the voyagers,.... :)

Cheers,

Vincent

in response to message #1 by Olivier De Smet

Wonderful! Great! I'm loving it!:-)

You're shelling out new versions faster than I can find any flaws with the old ones... ;-)

I think I have only one wish on my list open: having a dedicated folder for all the associated files other than 'download' - everything gets so cluttered there as it mixes with all my other downloaded items.

Here is my version of an empty png overlay to use with user txt overlays as provided in the newest version 1.4 of go41cx. I have emptied just the first two rows, all the rest is the original.

EDIT: Edited the overlay png

DM-15CC Extended Memory

*Message #1 Posted by **Mark Hardman** on 15 Feb 2012, 2:58 p.m.*

The "Firmware" tab of the DM-15CC Website provides downloads for the following HP 15C versions:

DM-15CC firmware 'vanilla'
DM-15CC firmware 'mem80' with extended memory
DM-15CC firmware 'mem1b' with even more memory *

With the caveat on the last being:

" * with the mem1b version you must not make more than 999 pgm steps... the unpredictable may happen."

I would assume that the 'mem80' version has 128 (0x80) pool registers. But it is not clear about how much extended memory the 'mem1b' patch version provides.

In an old thread, Eric and HrastProgrammer made it clear that 128 was the upper limit of the number of pool registers available without the need for extensive patching to the ROM. But, given the caveat for the 'mem1b' version, we can assume that it supports at least 143 pool registers.

Has anyone successfully applied any of the alternate ROMs? I would be curious to know how far Michael was able to extend the DM-15CC's memory.

Mark Hardman

Edited: 15 Feb 2012, 3:02 p.m.

Re: DM-15CC Extended Memory

*Message #2 Posted by **Eric Smith** on 15 Feb 2012, 5:57 p.m.,*
in response to message #1 by Mark Hardman

I suspect that mem1b would have 229 pool registers (0x100 - 0x1b), but I haven't tried it.

Re: DM-15CC Extended Memory

*Message #3 Posted by **David Jedelsky** on 16 Feb 2012, 7:51 a.m.,*
in response to message #1 by Mark Hardman

The original HP15C has covered memory range c0-ff which means the area of 64 registers (note that the two or so registers in lower part of memory are counted to register pool, but just concentrate on this part of memory).

The mem80 extends this to 80-ff range i.e. 128 registers.

Similar situation with mem1c extends the range to 1c-ff i.e. 228 registers. I don't remember it exactly ... but I think the area is somewhat shrunk when the integration or solve is activated ... so the base for temporary

registers in such case starts at 20h not 1c. It means there will be 4 less registers then could be expected.

Re: DM-15CC Extended Memory

*Message #4 Posted by **Lyuka** on 17 Feb 2012, 12:13 a.m.,*
in response to message #1 by Mark Hardman

Does it mean that there is a possibility to upgrade the total amount of registers of HP 15C Limited Edition?

Lyuka

Re: DM-15CC Extended Memory

*Message #5 Posted by **Paul Dale** on 17 Feb 2012, 12:18 a.m.,*
in response to message #4 by Lyuka

A possibility, perhaps. It will depend on a few unknowns. How HP has allocated the 2kb of non-volatile RAM the 15C LE's CPU has. Is there "free" space the beside the current registers e.g.?

An alternative path to achieving something similar might be to port an older version of nonpareil to the hardware. At least, it would be worthwhile considering this option as well.

Followup to HP 12C keyboard problems

*Message #1 Posted by **Eric Rechlin** on 15 Feb 2012, 2:28 p.m.*

Just a follow-up to my post from last week about my 12C that had a defective [PV] key:

On Monday I called HP tech support to see if I could get a replacement.

The man with whom I spoke was very friendly and said they'd send me a replacement.

Well, today I just got a package from UPS from SPL Logistics Export Department of Miami, FL, containing a replacement calculator. But something looked different.

What was it? HP sent me a 12c Prestige to replace my 12C. It was just a bare calculator, wrapped in bubble wrap, with no case or anything. The serial number starts with CNA643.

I'm not complaining -- in fact, it was pretty cool to get a 12c Prestige. But what I find strange is how a model that was only sold in Brazil about 5 years ago ended up in the US HP warranty replacement inventory. The Prestige, for those who aren't familiar, is a rebadged second-generation 12c Platinum, but with a gold faceplate instead of a silver colored faceplate.

Eric

Re: Followup to HP 12C keyboard problems

*Message #2 Posted by **Bob Cortopassi** on 15 Feb 2012, 2:33 p.m.,*
in response to message #1 by Eric Rechlin

If the 12C with the problem was a 12C+ with the faster ARM processor, I'd consider this a downgrade rather than an upgrade.

Thanks for your comments on the Prestige, though, I'd never heard of it!

Re: Followup to HP 12C keyboard problems

*Message #3 Posted by **Eric Rechlin** on 15 Feb 2012, 2:42 p.m.,*
in response to message #2 by Bob Cortopassi

Yes, that's correct, it was a 12C+ so it was a downgrade, but considering I can easily buy as many 12C+ calculators as I want yet can't buy the 12c Prestige, this is arguably worth more.

They didn't make me send back the old 12C, though, so I still have that (if I ignore the fact that PV doesn't work so well).

Eric

Re: Followup to HP 12C keyboard problems

*Message #4 Posted by **Katie Wasserman** on 15 Feb 2012, 2:35 p.m.,*
in response to message #1 by Eric Rechlin

Pretty Cool!

On the other hand, pretty terrible HP service. This is especially terrible since you're one of their resellers, is that correct?

Re: Followup to HP 12C keyboard problems

*Message #5 Posted by **Eric Rechlin** on 15 Feb 2012, 2:46 p.m.,*
in response to message #4 by Katie Wasserman

I don't know how many at HP are aware of that.

These days I buy most of my calculators for resale on Amazon.com because it's frequently cheaper to buy calculators from Amazon than from the official HP distributors. When I do rely on my distributors (like for the 15C) I tend to get screwed over anyway.

Eric

HP-41 > USB printer simulation (82143A)

*Message #1 Posted by **Diego Diaz** on 15 Feb 2012, 1:35 p.m.*

Hi all,

I've been working on a new project for the HP-41 in order to provide HP-41 <> USB connection.

As a first step I found the unidirectional coms between the HP-41 and the printer to be a good starting point before going further to bidirectional coms.

So far I've developed the module code to handle the 82143A printer ROM and Peripheral interface chip (Helios) in its basic format and transfer the bytes to be printed through the USB (serial interface) to a PC where a slightly modified terminal program shows the printing in a text window.

The USB cable is attached to a standard module shell containing a modified Clonix-like device. Is uses the same Prolific chip for the USB <> serial conversion as it's used in the USB programmer for the Clonix and NoV's module family, so ther'll be no need for further driver installation.

The module is also re-configurable using the same Clonix USB progammer to allow upgrading and/or repurposing for future bidirectional comms use.

Now it comes the difficult part (at least for me): Which platform to use when developing the PC side of the interface?

My programming skills are very limited when it comes to object oriented languages.

So far I've just built the small GUI for the ClonixConfig utility in Visual Basic under .NET; and some testing for this USB > HP41 adapter using Python 2.7(and Boa Constructor).

Further more, serial interfacing is not one of the most popular application nowadays so I've found fery few examples out there to learn from.

I assume that there must be some very good programmers in here, and would like to get advice on the preferred platform and (if possible) some examples of serial interface data handling. :-)

Ejoy your toys!

All the best from Caribbean Sea.

Diego.

in response to message #1 by Diego Diaz

Here's a simple example for C# (.Net): Simple Serial

Microsoft Example for VB.Net

Sample Class for serial comms in VB.Net

Java example

Re: HP-41 > USB printer simulation (82143A)

*Message #4 Posted by **Marcus von Cube, Germany** on 15 Feb 2012, 2:51 p.m.,*
in response to message #3 by Bob Cortopassi

The problem with Java is that there are two libraries available: RXTX and JavaComm, and none is available on all platforms (RXTX an Mac and Windows, JavaComm on Linux and Solaris). They are very closely related but not identical. You might want to include an interface library to bridge the gap and provide versions for the common platforms. If you want to go the Java route I may be able to dig deeper into the subject.

After some digging on the Net, it looks like RXTX is the way to start.

Re: HP-41 > USB printer simulation (82143A)

*Message #5 Posted by **Eric Smith** on 15 Feb 2012, 4:47 p.m.,*
in response to message #4 by Marcus von Cube, Germany

RXTX works fine on Linux.

Re: HP-41 > USB printer simulation (82143A)

*Message #6 Posted by **Marcus von Cube, Germany** on 16 Feb 2012, 2:13 a.m.,*
in response to message #5 by Eric Smith

IIRC, JavaComm was first and the community was unhappy with the availability on the various platforms. This was the starting point for RXTX. As RXTX is a GNU project, the necessary native drivers for other platforms can be provided by the community. So RXTX is definitely the way to go for serial communications in Java.

Re: HP-41 > USB printer simulation (82143A)

*Message #7 Posted by **Christoph Giesselink** on 16 Feb 2012, 1:06 p.m.,*
in response to message #3 by Bob Cortopassi

I'm not convinced about the VB solution. JFG's original ILPer is written in VB. The Pilbox is connected over the integrated Serial-USB converter and the virtual COM port driver.

1) Connect ILPer (VB version) over the virtual COM port with the Pilbox

2) Unplug the Piolbox USB cable during connection open
3) Close Pilbox

-> ILPer crashed and ask if you want to send an error report to MS

This is a problem of MS VB serial implementation, and not a problem of the virtual COM port driver. I was not able to solve this problem, so this was one of more reasons to port JFG's VB program to C++.

Christoph

Re: HP-41 > USB printer simulation (82143A)

*Message #8 Posted by **Raymond Del Tondo** on 15 Feb 2012, 3:34 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

great thing again:-)

I may be a buyer if the PC-side code doesn't rely on any of the bulky and resource-wasting frameworks.
So please no .NET , and by no means Java!
Maybe Christoph Giesselink would be able to give some hints on using Visual Studio (w/o NET) ?

Regards

Ray

Re: HP-41 > USB printer simulation (82143A)

*Message #9 Posted by **Marcus von Cube, Germany** on 15 Feb 2012, 4:01 p.m.,*
in response to message #8 by Raymond Del Tondo

Raymond, without a framework you cannot build GUI software for multiple platforms. .NET is (almost) Windows only but it's readily available on Windows platforms so shouldn't be a problem if you are a Window user anyway.

Java is preinstalled on many platforms as well. Java programs are very easy to distribute because the programs themselves tend to be compact because the bulk of the code is already installed on the target platform. And you do not need to compile for different platforms, a huge advantage for developers. Java has another advantage: The error handling is superb compared to C. Have you ever compared a Java stack trace with a crash from an average Windows program?

Re: HP-41 > USB printer simulation (82143A)

*Message #10 Posted by **Antonio Petri (UK)** on 16 Feb 2012, 4:40 a.m.,*
in response to message #9 by Marcus von Cube, Germany

Java is not pre-installed on Windows, Microsoft doesn't include java in Windows since a long time. Hardware vendors might pre install it though. Anyway, My dell laptop didnt have it. On Mac it is currently pre-installed , but it will change in the future because Apple will not provide the Jdk anymore.

*Message #12 Posted by **Marcus von Cube, Germany** on 15 Feb 2012, 4:45 p.m.,*
in response to message #11 by Geir Isene

Qt isn't seamless, either, you'll need the libraries on the target platform.

Re: HP-41 > USB printer simulation (82143A)

*Message #13 Posted by **Håkan Thörngren** on 15 Feb 2012, 8:29 p.m.,*
in response to message #1 by Diego Diaz

Not the same, but what would it take to make an HPIL <> USB, but using the HP-IL protocol instead? That way the host computer could implement the HP-IL loop and by means of USB allowing the physical HP-41 to access it?

Re: HP-41 > USB printer simulation (82143A)

*Message #14 Posted by **Diego Diaz** on 15 Feb 2012, 10:22 p.m.,*
in response to message #13 by Håkan Thörngren

Hi Håkan, all

The HP-IL approach is already available thanks to J-F Garnier and his PIL-box; which exceeds by far the idea of the simple interface I'm building.

On the other hand, I'd like to keep both the memory and physical footprint as small as possible. Therefore plugging an 82160A HP-IL adapter + PIL-Box is above my target, and it would also fill page #7.

The final idea is to have a standard module with a USB cable, which can behave as a PRINTER, or transfer .ROM image page files to/from a PC and the RAM inside an HEPAX or NoV module... and, may be, allow text program files to be transferred to the HP-41 in a Wand-like fashion... (but this is for now just an idea).

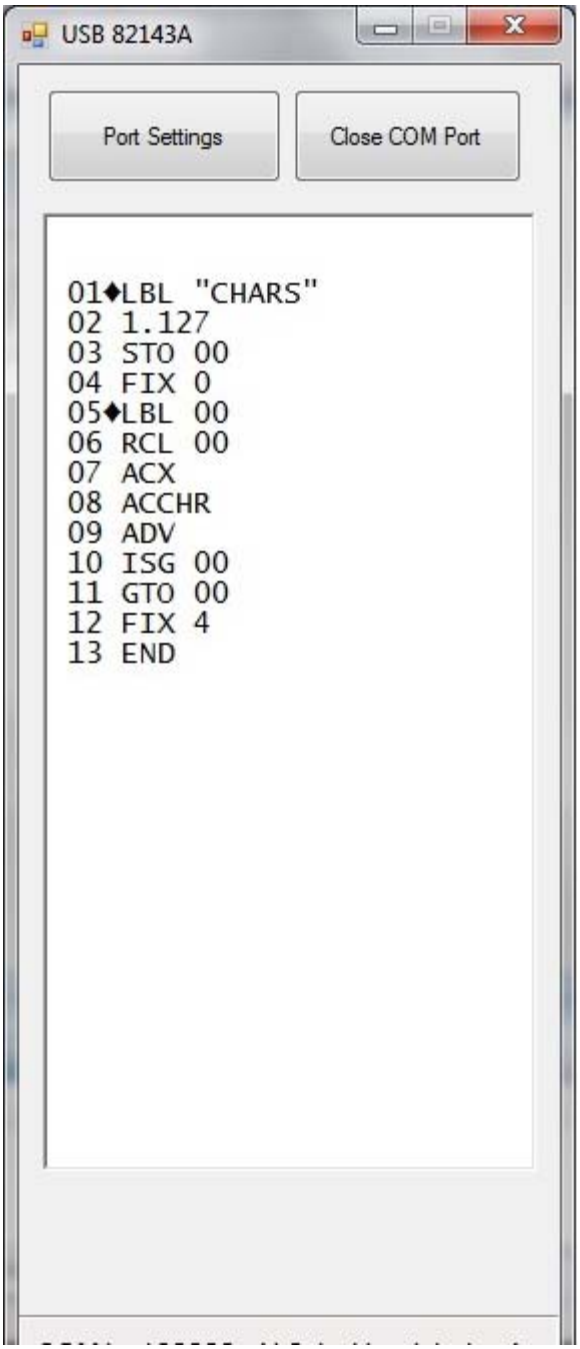
The only things that have been tested so FAR are:

- Program printing in MAN mode and

- Page transfer *to* PC .ROM file.

Here it's how it looks like:

And a program list sample from the 82143A manual (page 23):



I've modified a Visual Basic serial demo program to produce the listing above.

Still a lot of work ahead, but I'm having lotta fun! ;-)

Thanks a lot for the hints and advice, seems I have many things to read before making a decision.

Best wishes from Dominican Republic.

Diego.

Re: HP-41 > USB printer simulation (82143A)

*Message #17 Posted by **Diego Diaz** on 15 Feb 2012, 11:56 p.m.,*
in response to message #15 by John Robinson

Hi Jhon,

I thanks for your kind words.

As you can see for the posts above, the project is still in a very early stage. So there will still be a while before I can think in a small production run.

If things run smooth enough may be it can be ready in six to eight weeks.

Cheers.

Diego.

Re: HP-41 > USB printer simulation (82143A)

*Message #18 Posted by **Artur-Brazil** on 16 Feb 2012, 5:09 a.m.,*
in response to message #14 by Diego Diaz

Hi, Diego, the man of great ideas!

You seem to know well VB6. If you're going to learn Java or other language to make this interface programm, you may take much more effort and may lost your goal. Do it on VB6. Linux has a Windows emmulator, doesn't it? Windows runs well programs done in VB6... so, focus on your code ...

Just another idea - good or not!

Artur

Re: HP-41 > USB printer simulation (82143A)

*Message #19 Posted by **Antonio Petri (UK)** on 16 Feb 2012, 6:11 a.m.,*
in response to message #14 by Diego Diaz

I would first go with a command line interface written in C that can be easily compiled on all platform.

Re: HP-41 > USB printer simulation (82143A)

*Message #20 Posted by **Geir Isene** on 16 Feb 2012, 11:36 a.m.,*
in response to message #14 by Diego Diaz

Please go with Python here as that runds well on both Windows, Linux, *BSD and Mac.

Re: HP-41 > USB printer simulation (82143A)

*Message #21 Posted by **Marcus von Cube, Germany** on 16 Feb 2012, 11:50 a.m.,*
in response to message #20 by Geir Isene

It needs to be installed on most platforms, though. Whatever the language and associated framework is, you will not find a solution that works out of the box on all relevant systems.

Re: HP-41 > USB printer simulation (82143A)

*Message #22 Posted by **Geir Isene** on 16 Feb 2012, 12:45 p.m.,*
in response to message #21 by Marcus von Cube, Germany

No, and I would prefer a solution that in fact works on all systems rather than one that works only for one system out of the box.

Re: HP-41 > USB printer simulation (82143A)

*Message #23 Posted by **Geir Isene** on 17 Feb 2012, 1:42 a.m.,*
in response to message #22 by Geir Isene

And it would only be a matter of making it all into a package (program + libraries) and deliver it as a full executable on the various platforms. Then one would of course prefer the framework with the smallest footprint.

Re: HP-41 > USB printer simulation (82143A)

*Message #24 Posted by **Marcus von Cube, Germany** on 17 Feb 2012, 2:45 a.m.,*
in response to message #23 by Geir Isene

Pascal has done this with the new Qt based WP 34S emulators. Qt seems to be viable choice.

Re: HP-41 > USB printer simulation (82143A)

in response to message #14 by Diego Diaz

> Quote:
>
> I've modified a Visual Basic serial demo program to produce the listing above.

What about my HP82240B printer simulation at http://hp.giesselink.com/hp82240b.htm?

It has a serial mode with the baud rates 1200, 2400, 4800 and 9600 baud. In serial (COM port) mode you can select the printer type "HP-82240B" which starts with the Roman8 character set or "Serial Printer" type for the HP48 series which start with the ECMA94 character set at startup.

Has the 82143A printer a special character set?

Christoph

Re: HP-41 > USB printer simulation (82143A)

*Message #26 Posted by **Diego Diaz** on 17 Feb 2012, 6:38 p.m.,*
in response to message #25 by Christoph Giesselink

Wow!

Must admit that I feel a bit overwhelmed by the quality, diversity and *amount* of your responses: Thank you all! :-)

As I said before I know I have a lot of work ahead but it start to seem pretty clear that I cannot face the task of satisfying all the possible platforms and/or environments.

Moreover, it will take me months (may be years) to get the required expertise in some of the proposed developing tools, to build a "reasonably acceptable" and functional interface.

As it seems that some of you (most all of you) has already got said expertise in one or several of these development/programming languages. And since the 82143A intereface implemented in my HP-41>USB device is *sooo* simple. I think I'd better publish the very few lines required to handle the data reception (remember it's unidirectional) and its presentation. So anyone interested can write a suitable GUI on his/her favourite environment (and hopefully share it with the rest of us).

I'll still have to debug a few things but probably the final release will go "out of the box" with a (hated by most) VB GUI. Well, although not expert in this either, I have some previous experience from the ClonixConfig, and since most of the potential users already have Clonix/NoV's... :-/

BTW the USB interface cable is built with the same chip (Prologic) as the one in the USB programmer for the Clonix/NoV family, so previous users of any of these modules won't require new drivers installation.

Just to point it out, this small gadget is not pretended for replacing the 82143A, basically it's just a tool for saving some paper, *much time*: it tooks 43 seconds to list the complete "PRPLOT" program (340 lines) and the need for the physical (and somehow bulky) printer. Also useful with HEPAX DISASM dumps! In fact it was this point which makes me think in this approach... the text box has been sized to accept the complete disassembled listing of a whole 4K page. ;-)

Of course it does not handle the "graphical" features of the 82143A, and I'm still working in the possibility of implementing the TRACE mode (only MANUAL mode for now), mostly due to CAT listings, (any interest?)

The character set of the 82143A is sort of a nightmare, I've done my best in replacing the most weird characters with the better looking from the UTF-8 set. A look-up table is in charge of replacing the 7 bit code with its "equivalent" unicode.

Again my wholehearted thaks for the "massive" and positive response, and my apologies for not satifiying many of your expectations.

All the best from Dominican Republic.

Diego.

Reminders/notes to help recall variable meanings in equations

*Message #1 Posted by **Chris C** on 14 Feb 2012, 8:37 p.m.*

Several equations I want to store in my 35s contain, when written in books, variables using the same letter with different subscripts. (See the 3rd post here for an example of what I mean: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=211648#211648) Of course the 35s doesn't support subscripts so a letter can only be used once when storing an equation. This means other (non-meaningful) letters must be used in the stored version of the equation. I can see this being a problem after not using one for a while (I'll forget what values go where in the equation.)

I do know that setting flag 10 in a program allows prompting for variables using strings of descriptive characters. This works very well when using the equation as it is programmed, and would seem to avoid the problem described above. However, when a variable within an equation is needed to be solved for, SOLVE won't work for equations in programs unless the program uses the INPUT command to receive variables - and the INPUT command prompts for variable entry using single letters only.

So, despite the usefulness of flag 10, programs that don't use INPUT can't be used when I'll need to solve for different variables within equations. When this ability is necessary I'll have to use the equation list, and the original problem in the first paragraph comes back.

Is there a solution to this dilemma (other than writing a program for every way an equation can be solved) ?

Or if not, is there an intuitive way to save notes somewhere to help remind me which letters represent which variables for equations in the equation list?

Edit: I'm using this calculator because it's the best option on NCEES's approved calc list, so switching to another calculator isn't an option.

Edited: 14 Feb 2012, 9:44 p.m. after one or more responses were posted

in response to message #1 by Chris C

> Quote:
>
> ... is there an intuitive way to save notes somewhere to help remind me which letters represent which variables for equations in the equation list?

Perhaps I misunderstand your question? You are putting the (probably easy?) equations into your calculator so you don't have to remember them, and then making notes so you don't have to remember the variables in the equations you don't remember?

At some point you'll need to remember something, right?

May I make two recommendations: 1) Rather than spend time typing formulas into calculators, spend the same amount of time studying the physical units behind the variables and how to derive them from first principles, then you won't need to a mnemonic to decipher equations you can't remember. (e.g. learning -vs- memorizing -vs- using technology as a crutch)

2) You might consider an upgrade to a HP 48/49/50G and write a SOLVER routine. You can capture notes along with the benefits of making a nice GUI. It takes longer to write, but in the process you'll remember it better and have a cool navigation function. The TVM SOLVER is a good example. Or Page 4 of this HP guide

in response to message #1 by Chris C

> Quote:
>
> Or if not, is there an intuitive way to save notes somewhere to help remind me which letters represent which variables for equations in the equation list?

You may enter the original equation just above the equation to solve the problem:

```
NC=(H1-H2A)/(H1-H2S)
N=(A-B)/(A-C)
```

Kind regards
Thomas

*Message #5 Posted by **bill platt** on 14 Feb 2012, 10:31 p.m.,*
in response to message #4 by Thomas Klemm

That's exactly what I was going to say. It is a "dummy equation". Heck, I even put a phone number in mine once, when I didn't have a piece of paper and a pencil (how crazy!).

Re: Reminders/notes to help recall variable meanings in equations

*Message #6 Posted by **Chris C** on 15 Feb 2012, 5:13 p.m.,*
in response to message #4 by Thomas Klemm

This seems good. It's probably just about as good of a solution as there is. Thank you very much.

Re: Reminders/notes to help recall variable meanings in equations

*Message #7 Posted by **NateB** on 15 Feb 2012, 11:08 a.m.,*
in response to message #1 by Chris C

During the execution of a program, you can display a reminder prior to INPUT.

This listing displays the program name CROSS PRODUCT and then prompts for the input of VECTOR 1.

```
A001 LBL A
A002 SF 10
A003 CROSS PRODUCT
A004 PSE
A005 VECTOR 1
A006 PSE
A007 CF 10
A008 INPUT I
A009 INPUT J
A010 INPUT K
.
.
.
```

You can also use a dummy equation in the Equation List as a reminder.

Example:

If you are taking the FE, I'd reccomend sticking to the more common equations used for the discipline specific portion of the exam. (e.g. If you are taking the Civil specific, I'd go with Manning's eqn, Hazen-Williams, Darcy-Weisbach, nominal moment capacity for concrete beams, depth of compressive stress block for concrete, etc.)

Also, knowing how to use the STAT, nCr, and nPr functions will save you a lot of time during the morning session.

Re: Reminders/notes to help recall variable meanings in equations

*Message #8 Posted by **Chris C** on 15 Feb 2012, 5:22 p.m.,*
in response to message #7 by NateB

Using dummy equations as labels above equations is a good idea. I'll definitely do that. Thanks! And I am planning on taking the FE, so thanks for the heads-up on using the Stat, nCr, and nPr. I'll have to look into them.

I believe, though, that using reminder text before INPUT statements in programs doesn't help when using SOLVE on equations in programs (which is why I was looking for ideas on reminders for equation variables in the equation list). Won't the SOLVE function prompt for the INPUT statement variables without showing the reminder lines first? Or am I wrong?

Re: Reminders/notes to help recall variable meanings in equations

*Message #9 Posted by **Bart (UK)** on 16 Feb 2012, 9:21 a.m.,*
in response to message #8 by Chris C

Quote:

> Won't the SOLVE function prompt for the INPUT statement variables without showing the reminder lines first? Or am I wrong?

In a program, SOLVE does not prompt for inputs unless Flag 11 is set. However, Flag 11 is default clear, and also cleared after every SOLVE operation. See chapter 15 of the manual.

Thus while Flag 11 is clear, you have to write the prompts for inputs into your program (see the example for the Gas Law equation on p15-3).

Bart

Re: Reminders/notes to help recall variable meanings in equations

*Message #10 Posted by **Bart (UK)** on 16 Feb 2012, 9:12 a.m.,*
in response to message #1 by Chris C

Here you go!

This program uses SOLVE without requiring the use of an extra label, the only caveat is that you must start the program at line 004, i.e. with "XEQ A004".

Notes:

- This one skips input for the variable required to solve, but stores whatever is in the X-register at the time into the variable's register. It's OK in a simple equation as this, but for other situations you may wish to enter initial guesses (see manual p7-8).
- Indirect registers -1 to -26 refer to storage registers A to Z. Thus SOLVE(-1) = SOLVE A etc., the result being stored back into that register.
- The program does not end in a return, but a stop and a goto. This allows easy re-run of the program by pressing R/S.
- For "x<>y?", the "<>" is the "not equal" sign (equal with a strike through it) on the calculator.

Program listing:

```
LABEL  STEP                    COMMENT
A001   LBL A                   These first three lines
A002   A=(B-C)/(B-D)           define the function for SOLVE
A003   RTN
A004   SF 10                   the program actually starts here
A005   TEST EQUATION           information text briefly displayed with pause
A006   PSE
A007   NC=(H1-H2A)/(H1-H2S)
A008   PSE
A009   CHOOSE 1 TO 4
A010   PSE
A011   TO SOLVE FOR
A012   PSE
A013   1NC 2H1 3H2A 4H2S       waits for input (use right arrow to scroll for more text)
A014   +/-
A015   STO I
A016   -1
A017   x<>y?                   this tests if it is the variable to solve for
A018   ENTER NC                and will skip if it is
A019   STO A
A020   RCL I
A021   -2
A022   x<>y?
A023   ENTER H1
A024   STO B
A025   RCL I
A026   -3
```

```
A027   x<>y?
A028   ENTER H2A
A029   STO C
A030   RCL I
A031   -4
A032   x<>y?
A033   ENTER H2S
A034   STO D
A035   CF 10
A036   FN= A                  calls the function in label A (which returns after A003)
A037   SOLVE(I)               see second bullet point above
A038   CLSTK                  just to get rid of intermediate entries before recalling
result
A039   RCL(I)
A040   STOP                   program stops, but can continue with R/S
A041   GTO A004               restarts program
```

in response to message #10 by Bart (UK)

Extremely cool. Thanks again, very much, Bart! I won't be able to enter it for a few days, but it is at the top of my to-do list, and asap.

Re: Reminders/notes to help recall variable meanings in equations

*Message #12 Posted by **Bart (UK)** on 16 Feb 2012, 6:53 p.m.,*
in response to message #10 by Bart (UK)

Follow on:

After some experimenting, i managed to get more than 1 equation for "FN=" in a label space. It seems that this command will ignore anything that is not a valid equation. This allows for the use of conditional statements to select the required equation.

Example program:

```
A001   LBL A
A002   FS? 0
A003   GTO A005
A004   GTO A007
A005   A=B/(B+C)
A006   RTN
A007   A=B*(B+C)
A008   RTN
A009   CF 0
A010   SF 10
A011   USE EQN 1 OR 2
A012   1
A013   x=y?
A014   SF 0
A015   A=
A016   STO A
A017   C=
A018   STO C
A019   CF 10
A020   FN= A
A021   SOLVE B
A022   RCL B
A023   CF 0
```

```
A024    STOP
A025    GTO A009
```

This program would be started by "XEQ A009"

In this case I used one of the 5 user flags, but i guess other types of conditionals would work too.

Edit: Removed a stray "h" that crept in on line A009.

HP-41 Expandability Then and Now… TI?

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 14 Feb 2012, 12:43 p.m.*

HP-41 has always amazed me with its capabilities and expandability, even today it is the most used calculator I have and yet still so much to learn which MCODE being the next. Especially it was a great tool while I was doing my graduate work in a cryogenics lab at NIST in early 90's running various lab instruments on HP-IL and GP-IB, collecting data and analyzing. It was always ahead of its time and nothing since was developed with such expandability, I guess until now…

I was reading about "TI nspire" and "TI nspire Lab" which gives you five ports – three analog and two digital – the TI-Nspire Lab Cradle allows students to use up to five sensors at one time, including high-sample-rate sensors. In addition Verneir provides many different both digital and analog sensors and software to collect and analyze data. Amazing machine! So much more potential…

nspire lab

Vernier software and sensors for nspire

I think once HP's instruments and measurement division (which is Agilent now) had great influence and source of inspiration on their calculators' product line with quality, reliability, expandability, software, etc. There was a lot of synergy between the two, with the Calculator division to gain the most. The separation of these divisions to my opinion was a significant setback on quality, innovation and capability of their calculator line. Unfortunately started with a pessimistic point of view, I am hoping that HP Calculator Division will make the executive decision to choose to gain back the market once more with innovation, quality and customer service over slow death.

TI has a long tradition with student lab equipment (all build by Vernier), starting with the CBL. The main point here: It's education grade equipment, not professional. I had a lot of fun playing around with my CBLs, CBRs, and sensors, but I wouldn't run a hospital or nuclear power plant with the technology.

*Message #3 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 14 Feb 2012, 1:55 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Agreed that TI has a long tradition with student lab equipment, but having said that they are also very strong in industrial test and measurement equipment and growing in that segment. Just purchased National Semiconductor which gives them access to analog devices, and has their own fab to develop the IC's they need. nspire is the first device I noticed that is field portable combines DA and calculator to support such wide group of sensors although as you mentioned the sensors are education grade and not professional. TI also develops proffesional grade industrial sensors. If there is market out there (which I think there is) it is

only matter of time to come up with an industrial grade handheld device which combines both a powerful graphic calculator, DA and data analysis capability.

TI was huge (actually #1) in analog long before the NS purchase. I worked for TI for over 10 years and believe me, they knew how to do all kinds of analog in-house in their own fabs well before that purchase. They bought NS for the field sales channels and applications groups, not for their design nor mfr. expertise.

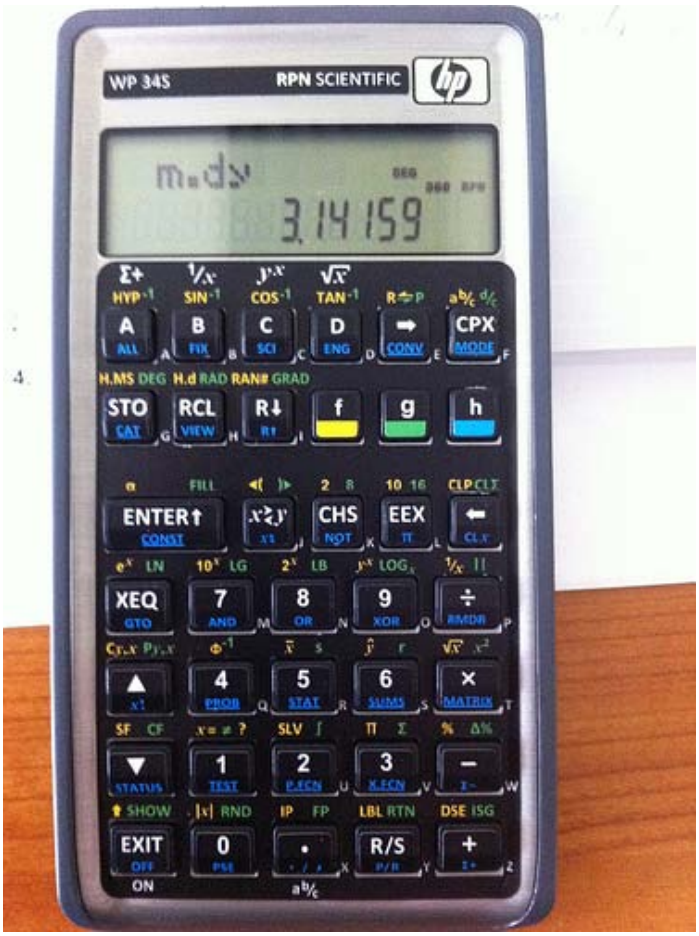
WP 34S - Pics of blue slant overlay on real calculator

*Message #1 Posted by **Bob Cortopassi** on 14 Feb 2012, 11:53 a.m.*

Please forgive my less-than-stellar application work. I've noticed that this overlay had a lit more varnish than my last. Smoother and more shiny. I prefer my last overlays with the slightly rougher and more matte finish.

Never the less, I'm very happy with the end result. Thanks to Eric for his hard work in producing these, and thanks to all who contributed to the design!

Best, Bob



Edited: 14 Feb 2012, 11:54 a.m.

Niiice - can't wait to get mine! I'm going to put one on an HP-20b, so I'll post a picture of that.

Re: WP 34S - Pics of blue slant overlay on real calculator

*Message #3 Posted by **Morten Nygaard Åsnes** on 16 Feb 2012, 7:00 a.m.,*
in response to message #1 by Bob Cortopassi

Very nice! I think this looks a lot less cluttered than the standard overlay. The only thing is the blue labels look very dark. Presumably it looks better in real life?

Re: WP 34S - Pics of blue slant overlay on real calculator

*Message #4 Posted by **Gerson W. Barbosa** on 16 Feb 2012, 8:30 a.m.,*
in response to message #3 by Morten Nygaard Åsnes

Less cluttered, that's what it looks to me as well. However, I'd rather swap green and blue and place the alfa labels at lower left, as in the original design.

Re: WP 34S - Pics of blue slant overlay on real calculator

*Message #5 Posted by **Dominic Richens** on 16 Feb 2012, 9:31 a.m.,*
in response to message #4 by Gerson W. Barbosa

Rob had one just like that I think - Eric can probably tweak it and has offered to do one-off. I don't think you are the only person who essentially wants just the labels above the keys and everything else the same.

Re: WP 34S - Pics of blue slant overlay on real calculator

*Message #6 Posted by **Dale Reed** on 16 Feb 2012, 12:02 p.m.,*
in response to message #4 by Gerson W. Barbosa

I don't want to stir the pot w.r.t. more or less cluttered, or more or less intuitive. Having grown up with the HP-25, and more recently used 32E (rescued from the trash!), 15C (and LE) and 35S (and having not used the HP-67), I will stick my neck out and say that the f / g labels above and the blue (h) key slant labels are more "familiar". I believe that was the whole point of this new run of overlays.

Net result: I like my new overly better and it makes the WP34S earier to use for ME.

Eric, you must have gotten your shipments to the post office early Friday, because I had mine in the Monday noon mail at work up here in Cleveland. Add my thanks for a VERY well done overlay.

Dale

Re: WP 34S - Pics of blue slant overlay on real calculator

*Message #7 Posted by **Gerson W. Barbosa** on 16 Feb 2012, 5:36 p.m.,*
in response to message #6 by Dale Reed

If there were only two shift keys, then I'd certainly prefer blue on the slanted edge like in the Voyagers, for instance. It just happens that I don't like gold & green on black. Gold & blue looks better to me. That's a matter of taste, of course.

Gerson.

Re: WP 34S - Pics of blue slant overlay on real calculator

*Message #10 Posted by **Bob Cortopassi** on 16 Feb 2012, 12:00 p.m.,*
in response to message #3 by Morten Nygaard Åsnes

Morten,

Overall I would say it looks better in real life, but the blue is definitely more subdued than the yellow/green. That was one of my main motivators behind having the blue front labels. Those (for me) are lesser-used functions than the yellow/green.

I think this is, overall, a much more intuitive layout. Normal calculating functions are the most obvious and at the top of the keys like every other calculator we use.

Alpha labels are muted and to the lower right, as on almost every other HP calculator.

The menus and mode settings are generally less used, and are a subdued blue on the key fronts.

My opinion is obviously biased. :-)

Regards, Bob

Behold - the WP34S "red dot"

*Message #11 Posted by **Dominic Richens** on 21 Feb 2012, 12:39 p.m.,*

HP-41 Focal Compiler/Decompiler

*Message #1 Posted by **MichaelG** on 14 Feb 2012, 11:30 a.m.*

The next version of the HP-41 Focal Compiler is ready. No new features, onlybug fixes. New in the package is the Focal Decompiler. It creates an ASCII file out of a given raw file. Just try it. The disclaimer as usual :-) the exceutables need a .Net 4 runtime environment like it is available in Win 7.

35s prompt for multi-character variables in program like "low footprint" root finder

*Message #1 Posted by **Chris C** on 14 Feb 2012, 10:49 a.m.*

I'm new to the 35s , and loving it, and wanting to learn to use more features. I was looking at programs and found the low footprint root finder (here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=146636). It looked great but I couldn't get it to work, so I ended up going with another root finder. The low foot footprint one stuck in my head because of how the writer prompted for variables using multiple characters, which would help make sure the correct value was entered in the correct place in an equation. (He prompted for X1 and X2 and Y1 and Y2.)

I tried to figure out the low footprint code, but I never could, so that's why I'm starting this thread. I'd like to be able have this functionality for a class where there are dozens of equations, and I need to make sure I enter the correct variable values in the correct places.

So, question (a): The author says he uses unnamed indirect variable addresses. Is doing this necessary to be able to use multiple characters to prompt for variables? (I don't store variable values in the A-Z spaces, so I don't need to preserve anything in those spaces.)

Question (b): How do I do this as simply as possible for programming and usage?

Thank you all, Chris C

No.

> Quote:
>
> It is my understanding that that is only necessary if I want to preserve the contents of the named A-Z variables

that is correct. If you are not concerned with preserving the contents of the named A-Z variables (or actually want to use them), you can use e.g. "STO A" instead of "STO (I)".

The other post is using the "message" function of the 35s to prompt for variables, load them on the stack and

then stores them. The INPUT does it all in one step, but with the limits of single letter variables.

See page 13-16 in the manual, section "Using Equations to Display Messages".
Also see this thread: HP-35s messages

Re: 35s prompt for multi-character variables in program like "low footprint" root finder

*Message #3 Posted by **Chris C** on 14 Feb 2012, 12:08 p.m.,*
in response to message #2 by Bart (UK)

Thanks Bart.

I've read and read in the manual and tried things but haven't been able to put it together into what I need. I do understand how to use flag 10 and show the multi-character prompts on screen. I just don't understand how the calculator treats the entries entered after the prompts. If you, or someone, wouldn't mind, could you post code for a small sample program so I could learn from it and apply it to my other needs?

NC=(H1-H2A)/(H1-H2S)

Thank you!

Edited: 14 Feb 2012, 12:13 p.m.

Re: 35s prompt for multi-character variables in program like "low footprint" root finder

*Message #4 Posted by **Bart (UK)** on 14 Feb 2012, 1:05 p.m.,*
in response to message #3 by Chris C

As I mentioned, the "low footprint" program first loads variable values onto the stack, then stores them.

So firstly to use the stack you must be in RPN mode.
Secondly, as the stack is only 4 levels, you can only do 4 variable values in one go.

```
LABEL STEP              COMMENT
A001  LBL A

in response to message #4 by Bart (UK)

Thanks very much. This looks like just what I was hoping for.

One question on something you said though. When you said:

"...the stack is only 4 levels, you can only do 4 variable values in one go."

are you meaning this is applies if using unnamed indirect variable addressing or does it apply to your example too? Can't your example below use up to 26 variables (A-Z)? Or am I misunderstanding? What if the variable values were entered one at a time? Like:

A003 ENTER H1
A004 STO C
A005 ENTER H2A
A006 STO B
A007 ENTER H2S
A008 STO A
A009 CF 10
A010 (A-B)/(A-C)

*Message #6 Posted by **Bart (UK)** on 14 Feb 2012, 7:44 p.m.,*
in response to message #5 by Chris C

I was referring to the number of variable values that could be handled in one line, as in my A003. You can still do 26^1, but just 4 at a time.

Doing it one variable at a time as in your example, you do not have to be concerned with stack depth limits.

1) more if you use indirect addressing.

Professional applications for the HP 50g

*Message #1 Posted by **Software49g** on 13 Feb 2012, 9:04 p.m.*

Hello,

some might remember my presentation I gave at HHC 2011 or have seen it on YouTube
HHC 2011: HP 49g+ / 50g O.S. Extension Pack

In this presentation I said: "Minimum development effort needed to create customized and professional solutions targeting at different industries through specialized equation libraries (e.g. Mechanical Engineering, Electrical Engineering, Civil Engineering, Chemistry Engineering, Petroleum Engineering, Physics, Statistics, etc.)."

A first attempt toward this is a professional data set for the TreeBrowser (first presented at HHC 2007) with over 500 Electrical Engineering Equations (including variable descriptions, units and pictures) covering the undergraduate curriculum for electrical engineers in most universities.

A preview of it is available at my website
http://www.software49g.gmxhome.de/EnglishSeite01.htm#ElectricalEngineering

As an aside remark:
Some "old" fellows might remember the plug-in cards by Sparcom for the HP 48GX or EE pro by Sparcom / da Vinci which were - amongst others - a reason for the success of the 48 family (and which are still sold today).

Ironically EE pro is available for years with any sold TI-89 / TI-92 Plus / Voyage 200 and guess which company took HP's position in the calculator market (which they gave up without any needs (as we all know), by the way) ?

And there is nothing in regards to software from HP for their graphical calculators as there is from TI at their website:
http://education.ti.com/calculators/downloads

Some might also remember that there was an attempt to bring EEpro to the 49g+ in 2006, but eventually it never happened.

Now, the Electrical Engineering data set for TreeBrowser will not be as functional / powerful as EE pro was for the 48GX. But missing things could be added ...
Also note that my code is totally unrelated to any existing HP 48 / HP 49 software - a data set is just a bunch of lists. Creating a data set is not sorcery, just labor-intensive.

Feedback and suggestions are welcome.

Regards,
Andreas
http://www.software49g.gmxhome.de

P.S. This is not meant as an advertisement. It is meant of what is *possible* now with the existing platform and that improvements could be done *fast* and *easy* which I have shown already with my 'MultiLanguagePacks', the 'O.S. Extension Pack', the 'HELP for *all* commands incorporated into the O.S.' and now with this Electrical

Engineering data set for my TreeBrowser (TB is included in the MLP / OSE).

Now, given the fact that the HP company has known this for years, but did not had any interest in updating / improving their top-of-the-line machine remains a mystery to me. What's not surprising is, that they keep loosing market-shares (according to NPD, HP's share in the graphing calculators market is less than 5%)

The new platform of the HP39gII is interesting, but the 39/40 series were always "closed" machines (much more closed than open) and this is still light years away from the functionality the HP 50g offers. And if it breaks compatibility then things won't become easier. Last but not least: What will it cost at which estimated ROI compared to updating the existing platform ?

And continuing in rushing out immature and buggy products (although common nowadays) looks rather like milking the cash-cow-customer instead of bringing quality products to loyal customers.

P.P.S. Since this forum is - at least - still read by HP people, there is no excuse for not doing anything ...

Not to be gloomy, but I think part of the problem is that calculators are no longer HP's bread and butter. I'm not sure what TI's bread and butter is nowadays, but making a name for themselves in calculators seems to be a priority.

Re: Professional applications for the HP 50g

*Message #5 Posted by **Software49g** on 14 Feb 2012, 4:56 a.m.,*
in response to message #4 by David Griffith

Hello,

This is, of course, right. It is neither the bread and butter of TI.
And, of course, it is known, that TI is a much smaller company.

TI: Rank 167 on Fortune Global 500, Revenue US$ 13.966 billion, 35.100 employess
HP: Rank 9 on Fortune Global 500, Revenue:US$ 127.24 billion, 349,600 Employees
(But keep in mind that this might not necessarily mean anything: Enron was Fortune Global 500, too.)

In consequence it than would mean to shut it down instead of keeping a zombie alive.
Is there a "Plan B" if the new entry graphical calculator is not fulfilling its expectations ?

Or is their future in rebranding calculators, which they still have in their portfolio and sell as a HP calculator ?
What a shame for a company, which says from itself that they invented it.
“HP rebrand” instead of “HP invent”.

FYI:
“TI's calculator business has generally accounted for about 5% of TI's annual revenue and profit. The unit had a profit of $208 million on revenue of $526 million in 2007 -- the last year in which the semiconductor giant broke out results for its education business. (Since 2008, the results have been folded into a larger segment.)”

So there is money in this market segment and what did HP do in the last five years to get their piece of cake ?
Wasn’t there time enough to do at least a little update to the 50g with some really minor effort ?
And if only some minor effort would have been given to it *after* HHC 2011, there would be an improved and modernized HP 50g by *now* available and hitting the shelves, signaling into the market that they are still there and having the most capable graphical calculator (with RPN as a USP instead of hiding the most natural way of entering numbers / calculations) ...

Regards,
Andreas

*Message #6 Posted by **Michael J.** on 14 Feb 2012, 10:39 a.m.,*
in response to message #5 by Software49g

To bring the HP50g back to the market and make a TI-comparable product the following things are necessary:
- higher display resolution
- dynamic geometry
- spreadsheet
- easy to read manual
- hpcalc-stuff (especially statistic-applets)
- 3D graphic improvements for visualizing vectors, straight lines, planes or spheres which need in the analytic geometry
- the implementation of analytic geometry calculations
- plot of functions with parameter
- scrolling of plots
- easy file management
- easy data transfer between PC and calculator
- last but not least a HP supported network or platform for graphic calculators like the Ti-sides.

Re: Professional applications for the HP 50g

*Message #7 Posted by **Software49g** on 14 Feb 2012, 11:29 a.m.,*
in response to message #6 by Michael J.

Hello,

> - higher display resolution

Can be done *fast* and *easy* with the existing platform. (Less than 6 month.)

> - dynamic geometry
> - spreadsheet
Was available in beta ROM 2.10-7 (11/2006 !), then got dumped.

> - 3D graphic improvements for visualizing vectors, straight lines, planes or spheres which need in the analytic geometry
> - the implementation of analytic geometry calculations
Not sure what you mean with this.

> - hpcalc-stuff (especially statistic-applets)
Not sure what you mean, but otherwise could be programmed easily.

> - plot of functions with parameter
Is available as far as I understand.
> - scrolling of plots
Is available.
> - easy file management
Is available, depends how you look at it. Is using a SD-card too complicated ?
> - easy data transfer between PC and calculator
Is available.

> - easy to read manual
This is really expensive and needs knowledge and expertise.
> - last but not least a HP supported network or platform for graphic calculators like the Ti-sides.
This is going to take years and will need continuous investment for a longer period with uncertain success if the investment will ever come back. Nothing for a management that changes in a yearly rhythm, like the management of the calculator division. Nothing for short term share holder orientated value. (BTW: The situation reminds a lot about how GM has been treating Opel for years and look where and how Opel ended up.)

Q.E.D.: The problem is not the used technology.

Besides a lot of other problems (challenge is the word to use nowadays ;-), the problem is getting back into a market that has been given up a long time ago and now wondering that others have taken that space. And that it will require long-term investment of time and money just to get a foot back...

Re: Professional applications for the HP 50g

*Message #8 Posted by **David Griffith** on 14 Feb 2012, 11:28 p.m.,*
in response to message #7 by Software49g

I'm not sure if the HP50g can do it already, but I'd like to have the ability to define and render a solid using a 2D function swept about an axis.

Re: Professional applications for the HP 50g

*Message #9 Posted by **Michael J.** on 15 Feb 2012, 2:55 p.m.,*
in response to message #7 by Software49g

Hi Andy,

1.
Dynamic geometry and spreadsheet in ROM 2.10-7 are only rudimentary programmes and not sophisticated. The competitors already have programmes whose features are comparable to Geogebra .
Besides: Where are the manuals of dynamic geometry and spreadsheet for ROM 2.10-7 ?

2.
As an example of 3D-Geometry there is a screenshot of Cabri3D, which is used by TI Nspire CX; that is the "state-of-the-art" 3D-Geometry on calculators.

3.
Examples for analytic geometry calculations:
- the length of a vector or a line segment
- the midpoint of a line segment
- solving vector equations
- intersecting angle or distances between vectors, straight lines or planes

4.
Dynamic plotting of a parameter function f(x) = a*x^2 for various parametres, e.g. for "a" between -5 and 5.

Generally:
In my view HP will stop the 48/49/50 series because they don't have enough staff to maintain or to update the (immature) HP 50g and at the same time to initiate the new HP 39gII platform. To my mind the entire manpower will solely be employed for the HP 39gII. It is impossible to operate two fundamentally different platforms (HP 50g and HP 39gII) with only two HP engineers.

I see two alternatives for you:

1.
Initiate a similar project for the HP 50g to the WP 34S project. Form separate teams for each "problem area" of the HP 50g an join the results of each team together to a new ROM.

2.
Turn to the new HP 39gII platform. The HP 39gII has got a higher-resolution display and can plot graphs very quickly. This platform is the future. And it is the only platform the small HP Calculator Group is able to maintain in the sector of graphic calculators. You can opt for the future and contribute lots of ideas for the HP 39gII:
- RPN

- CAS
- Spreadsheet
- various Aplets
- ...
- and last but not least: fight for the wider ENTER-key.

In your opinion the HP 50g is the greatest and best calculator because you know it inside out. But for a mainstream user, however, it is (sometimes) not worth discussing and too complicated and will remain that (see the many forum statements in the internet).
Yet no HP staff member will invest the time and effort to turn the HP50 g into a "cash cow". For that the competitors are meanwhile too far ahead. Only a higher display resolution and some equation libraries are not enough!

The HP 39gII series is the future. The HP Calculator Group will spend its entire energy on it and that is good so. The HP 48/49/50 series, however, is outdated, is death STOP, FULL STOP, FINISH!

Re: Professional applications for the HP 50g

*Message #10 Posted by **Software49g** on 15 Feb 2012, 4:29 p.m.,*
in response to message #9 by Michael J.

Hi Mike,

> is the future
The only thing that is certain about the future is that it is uncertain.
HP (and other companies, too) has dumped more than once products that were already on the market, for various reasons. Remember TouchPad/WebOS ?
But I understand your point.

> In your opinion the HP 50g
I do not think that my opinion matters.

> But for a mainstream user, however, it is (sometimes) not worth
> discussing and too complicated and will remain that (see the
> many forum statements in the internet).
Again, this has nothing to do with the underlying technology.
If you have a complex machine that you want to sell you need, for example, adequate documentation (and a lot more). This problems will not vanish if the technology used to create the product changes.
If this is not improved significantly a successor of the 50g will suffer from the same problems that the 50g is suffering from. Regardless of how much better/different the technology is !

That's why I wrote the 'Help integrated into the O.S.'

Let me try a metaphor:
It does not matter whether your car runs on gasoline or diesel (even Porsche is offering Diesel cars now ;-).
What matters is, if it takes you where you want to.

> Besides: Where are the manuals of dynamic geometry and spreadsheet > for ROM 2.10-7 ?
Please ask HP :-)

> The HP 39gII series is the future.
Maybe, maybe not. Only time will tell.
HP's behavior is unpredictable.
However, what do you sell in the meantime until (if ever) a successor of the 50g is ready ?
Like I said, updating the existing machine needs only minor resources and would generate extra cash *and* would slow down the loss of market shares. Regaining lost market shares is very, very expensive.

> You can opt for the future and contribute lots of ideas for the HP 39gII
I would love to and I know that the engineers are very friendly and helpful.
But those yearly changing management is not interested in anything ...
And a yearly changing management is more than just a poor management. It is a sign about a company problem and there is enough subject literature covering this topic and what it means ...
HP is simply *not* interested (read it again, if needed).

And besides that, there is no information available (officially) about used HW and SW, neither is there a SDK, documentation, etc. And these were the things that made the 48 family so successful: A wide variety of third-party-applications !

> Initiate a similar project for the HP 50g to the WP 34S project.
If there is someone with experience in the hardware needed to create a clone I am in for the software. But I am not a hardware guy. Everything that is needed is there, but just as in a puzzle it must be arranged properly.

Regards,
Andreas
http://www.software49g.gmxhome.de

P.S.
> The HP 48/49/50 series, however, is outdated, is death
> STOP, FULL STOP, FINISH!
This has been predicted for over twenty years ... ;-)
And I'd like to see quality products in terms of hardware and software instead of rushing out immature and buggy products (and then refusing to fix them) ...

Using SAM-BA on Linux and flashing WP34s

*Message #1 Posted by **David Griffith** on 13 Feb 2012, 8:56 p.m.*

I'm trying SAM-BA for Linux and Windows to get it to the point where I can specify a file to upload. I'm using an FTDI USB-to-rs232 port. All I get is two frozen dialog boxes. I can't even get the Windows version running in Wine. Help!

Update: I've gotten the Windows version... but it's sam-ba_cdc.exe, not sam-ba.exe (which still barfs with "abnormal program termination". This time I can select the com port and board type, but the dialog just goes away and the process freezes.

Edited: 13 Feb 2012, 9:26 p.m.

Re: Using SAM-BA on Linux and flashing WP34s

*Message #2 Posted by **David Griffith** on 13 Feb 2012, 11:35 p.m.,*
in response to message #1 by David Griffith

Another update: Managed to get MySamba working under Wine, but I'm not sure if anything is happening. I have /dev/ttyUSB0 linked to com1 but it just keeps saying it can't connect to the calculator. I managed to find a Windows XP machine to try this with. Ran MySamba there, and THAT can't communicate with the calculator. What do I do with a stone dead calculator that I can't tell if it's on or off? Do I need to do the dance of the buttons with the programming cable again?

Update: After insisting that Windows check to make sure the USB-to-RS232 dongle was enabled, I tried again. Oh, look, here's a new com device... com8. Why not? I tried everything else. THAT one did the trick. Now I have a freshly flashed wp34s and am waiting for some more overlays because I botched it the first time.

Quick question: Why can't I key in numerator-dot-dot-denominator to enter a fraction? Instead I have to key in 0-dot-numerator-dot-denominator.

*Message #3 Posted by **Sylvain Louboutin** on 14 Feb 2012, 12:36 a.m.,*
in response to message #2 by David Griffith

> After insisting that Windows check to make sure the USB-to-RS232 dongle was enabled, I tried again.

...out of curiosity, how do you manage to do that on windows?

(I reached the point of having a dead/bricked 30b, after a couple of hours developing murderous urges towards microsoft... well, an hour is kinda standard just to boot a windows machine, I know, I was prepared, but still...)

Also tried Wine by the way, same issue...

Re: Using SAM-BA on Linux and flashing WP34s

*Message #4 Posted by **David Griffith** on 14 Feb 2012, 12:43 a.m.,*
in response to message #3 by Sylvain Louboutin

I went through the control panel, add new hardware, and pointed it at the usb-to-rs232. It said the drivers were already installed. After that it was a matter of guessing which com device was the right one.

If I could get the source code to MySamba, I might be able to cook up something for use with Linux natively.

Edited: 14 Feb 2012, 12:43 a.m.

Re: Using SAM-BA on Linux and flashing WP34s

*Message #5 Posted by **Sylvain Louboutin** on 14 Feb 2012, 2:27 a.m.,*
in response to message #4 by David Griffith

Still no luck; will try with a different setup this week... I find it encouraging though that your formerly bricked 30b came back to life when you solved the communication issue.

*Message #6 Posted by **David Griffith** on 14 Feb 2012, 3:45 a.m.,*
in response to message #5 by Sylvain Louboutin

Try this sequence: plug in the calculator then press reset and hold for five seconds. Press and hold the on button for five seconds. Now start MySamba.

Re: Using SAM-BA on Linux and flashing WP34s

*Message #7 Posted by **Sylvain Louboutin** on 14 Feb 2012, 4:40 a.m.,*
in response to message #6 by David Griffith

I'll try that (and Marcus' suggestion as well); but if I start rebooting under windows now (bootcamp'ed Macintosh), I'll end up losing way too much sleep tonight :-)

(There are also a couple of USB->serial adapters that I can borrow with which I'd like to experiment as well).

Re: Using SAM-BA on Linux and flashing WP34s

*Message #8 Posted by **Marcus von Cube, Germany** on 14 Feb 2012, 4:02 a.m.,*
in response to message #5 by Sylvain Louboutin

Check the batteries! A common problem is that the boot loader drains the coin cells with no visible sign of activity. The cable itself draws a significant amount of current, too, even with the calculator turned off. If you are unsuccessful and want to do other things in the meantime then remove the batteries to save their juice! After putting good batteries in you need to press the ON button for a second or two.

If you have the crystal installed and can download the firmware but it does not come up, try the version without _xtal in its name. Then use ON+C to activate it. If the modification is working you will see OK on the display. You can then use the _xtal build which features the stop watch

function and does not need an extra activation of the modification.

Edit for typo.

HP30b design choices

*Message #1 Posted by **David Griffith** on 13 Feb 2012, 6:11 p.m.*

I just now got my HP30b for later transformation in a WP34s. Flipping through the manual I found something that made me wonder about what's going through HP's collective mind. That thing is a transparent overlay sticker. Why did HP choose to do that instead of printing the legends on the case of the calculator itself?

Re: HP30b design choices

*Message #2 Posted by **Tim Wessman** on 13 Feb 2012, 6:41 p.m.,*
in response to message #1 by David Griffith

1) The "printing on the case" is actually a foil film that is printed and embedded below the surface of the plastic during injection molding. The lead time on that was very, very long and needed to happen much earlier then the software was able to be finalized (due to #2).

2) The programming was still not yet finished as the beta testers kept pressing to add more features and turn it from a simple "macro recording" as originally envisioned, into a full fledged programming language. We, being advanced users, were more then happy to do that.

3) There was concern about making the device seem cluttered as the vast majority of users would never touch the programming capability. Hence #1 and #2 were not really a concern.

TW

Calculators on Standard Tests

*Message #1 Posted by **Norman Dziedzic** on 13 Feb 2012, 1:25 p.m.*

I was wondering if the hang up of getting certain calculators into specific tests is the ability to pre-program them or store text in them if it would be possible for a manufacturer to include a toggle switch on a calculator that wipes the memory with a corresponding message to the screen.

It might give the testing boards peace of mind (is that possible) that the memory is wiped and the manufacturers more freedom to design calculators as they see fit and not to a 3rd party requirement for use on a standardized test?

But I guess this isn't always the case as with the 35s on the NCEES exam?

Re: Calculators on Standard Tests

*Message #2 Posted by **Lincoln R.** on 13 Feb 2012, 1:44 p.m.,*
in response to message #1 by Norman Dziedzic

A lot of calculators do that, but honestly, if you wanted to circumvent it you could. For instance, on the TI-83 it's pretty easy for a test proctor to ask students to reset memory and show the "Mem Cleared" message. But you could just type it in (Although it'd be in all uppercase, lots of proctors would be too lazy to notice), write an assembly language program to display it in the correct case, or even go one step farther and write an assembly program that traps the key sequence and then displays the fake message.

Honestly, cheaters will always find a way to cheat, and stupid restrictions on what tools you may/may not use aren't the end-all answer.

Re: Calculators on Standard Tests

*Message #3 Posted by **bill platt** on 13 Feb 2012, 5:52 p.m.,*
in response to message #2 by Lincoln R.

"Honestly, cheaters will always find a way to cheat, and stupid restrictions on what tools you may/may not use aren't the end-all answer. "

Oh Really? You don't think you can't catch a cheat? And that it isn't worthwhile? What is so "stupid" about restricting cheat prone devices? The license isn't worth the paper it is printed on if cheats are getting through. There is a LOT riding on this.

Good test methods prevent cheating. Unfortunately good test methods also take more time and money. But it is absolutely possible to prevent cheating.

Re: Calculators on Standard Tests

*Message #4 Posted by **Kiyoshi Akima** on 13 Feb 2012, 6:06 p.m.,*
in response to message #3 by bill platt

Do you think you can catch ALL cheaters?

I'm sure somebody like the CIA could come up with a device that's externally indistinguishable from a Casio fx-115ES or an HP 12c Platinum, for example, but with a fast processor and a couple of gig of RAM and the entire contents of a college textbook in ROM.

Would it be worthwhile? For something like a standard test, no. But if someone did this, could you catch it? I don't think so.

I don't mean to say that it's not worthwhile implementing some protocols to deter the vast majority of potential cheaters. But the only way to prevent the use of the above-mentioned device would be to ban all calculators from the test. Then you'd have to ban all wristwatches... and hearing aids... and maybe even eyeglasses... and buttons on clothes...

Re: Calculators on Standard Tests

*Message #5 Posted by **bill platt** on 13 Feb 2012, 6:28 p.m.,*
in response to message #4 by Kiyoshi Akima

If it comes to that, so be it. No big deal. Heck, you could have to put on a smock to take the test. Like I said, it is time, effort and money. Bad tests are standardized and easily figured out. Good tests require longhand answers and work to be shown and are not repeated year to year. But that costs money.

I can assure you, my professors in graduate school knew exactly where every student stood, in actual understanding and capability, at the end of each course. The problem with these tests is, on a fundamental level, their anonymity. And now that many states' will only allow those with ABET accredited degrees to sit, it begs the question: what's the point? Why not make the degree process the proof of capability? And for the Principles and Practice exam, it was always open-book. The problems were difficult real-world problems. You can't cheat on them, if they are fresh each year...even if you have all the resources you could want...

So, yes, you can catch Every Single Cheater, if you care to.

Re: Calculators on Standard Tests

*Message #6 Posted by **Lincoln R.** on 14 Feb 2012, 11:44 a.m.,*
in response to message #2 by Lincoln R.

Actually, I agree with Bill on the "good tests" remark. I don't think standardized tests are an effective measure of anything other than how good you are at taking standardized tests (or cheating on them, as the case may be.)

While many people here probably finished primary school long enough ago to escape this atrocity, when I was in high school we had to take state-sanctioned standardized tests and pass them to graduate. Honestly, most of the tests were a joke, and just diluted the value of the education. Particular points of interest:

* Algebra II, where the last 1/3 of the class was spent studying standardized test taking strategies and taking multiple-choice practice tests, rather than learning real math. Why? The school district and the math teacher would get in trouble with the state if too many people failed the machine-graded multiple choice test.

* Chemistry. Every year, the vast majority of students failed this test (The class was mandatory, passing the test was optional because you had to take 4 sciences and only had to pass 2 or 3 of the tests depending on whether you were going for the standard or advanced diploma). When I took chemistry, I was one of

only three people in my school to pass it. However, the teacher told us of an interesting trend (and also gave us some old practice tests to prove his point): Did the large number of people failing this test convince the state that chemistry education needed to be improved? No. It convinced them that they needed to make the test easier, so every year the test got progressively easier.

Even those problems aside, the tests were poorly written, often contained typos, had ludicrous issues such as two multiple choice letters having the same answer, so on so forth. But that didn't matter. The point wasn't to prove that the state's public education was adequate - it was to produce a cookie-cutter test to let the state continue believing their education was adequate.

in response to message #7 by Tim Wessman

Very interesting video. Thanks for the link Tim.

My wife is a teacher and says right now the system seems set up to beat the kids over the head with their weaknesses.

Re: Calculators on Standard Tests

*Message #10 Posted by **Lincoln R.** on 15 Feb 2012, 1:11 a.m.,*
in response to message #7 by Tim Wessman

That was a really interesting video that seems to have a lot of things right. I agree, especially on the ADHD thing. There's not something wrong with children because they find a video game more entertaining than a math lecture, and loading them up on medicine isn't going to do anything except turn them into drones.

Re: Calculators on Standard Tests

*Message #11 Posted by **Marcus von Cube, Germany** on 13 Feb 2012, 3:06 p.m.,*
in response to message #1 by Norman Dziedzic

The nSpire has a "Press to test" feature that not only disables some functions (don't ask me which but likely those that access previously stored information) but lights an LED on the device which cannot easily be faked.

Re: Calculators on Standard Tests

*Message #12 Posted by **Don Shepherd** on 13 Feb 2012, 4:24 p.m.,*
in response to message #11 by Marcus von Cube, Germany

This explains the NSpire press-to-test thing. It blocks access to existing user files and, optionally, certain geometry things. But you don't want to do it accidentally (especially at home) because to get out of press-to-test mode requires a second NSpire.

Re: Calculators on Standard Tests

*Message #13 Posted by **bill platt** on 13 Feb 2012, 5:53 p.m.,*
in response to message #12 by Don Shepherd

I don't want a calculator with a stupid made-up misspelled name such as "nspire." That's more embarrassing than a pocket protector.

Edited: 13 Feb 2012, 5:54 p.m.

Re: Calculators on Standard Tests

*Message #17 Posted by **Cristian Arezzini** on 14 Feb 2012, 12:08 a.m.,*

in response to message #1 by Norman Dziedzic

They could keep a stock of calculators handy, and give each student, for the duration of the test, the same model he/she's used to... this way they would be sure it isn't a "cheat unit"! And it would increase sales :)

Cristian

Re: Calculators on Standard Tests

*Message #18 Posted by **NateB** on 14 Feb 2012, 12:17 a.m.,*
in response to message #1 by Norman Dziedzic

For the NCEES exams, the focus is on preventing a test taker from copying questions.

All phones, cameras, recording device, and other electronic devices are prohibited in the exam room. They check all calculators to make sure they are approved for use on the exam. Also, pencils, pens, paper, etc. are prohibited. They provide the (really crappy) pencil (with an even crappier eraser). All scratchwork is to be done in the test booklet only. They give you a final warning at the start of the exam. If you accidentally bring a prohibited item into the exam room, you can turn it over to a proctor. If you are caught with a prohibited item after the grace period, you will be ejected from the exam, your test will be ruled invalid, and depending on the circumstances, you may be sanctioned by the NCEES.

You also sign a non-disclosure agreement at the start of the exam.

You can use a fully programmed 33s or 35s. The concern isn't what you might bring in, it's what you may be able to get out.

Re: Calculators on Standard Tests

*Message #19 Posted by **bill platt** on 14 Feb 2012, 10:26 p.m.,*
in response to message #18 by NateB

"The concern isn't what you might bring in, it's what you may be able to get out. "

And that is the fundamental flaw with the system. A well-designed test can go home with the test-taker and it won't compromise the next test.

HHC 2012 location

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 13 Feb 2012, 7:15 a.m.*

I know it may be early for this question, but I would like to know if there are advances regarding the HHC 2012 location. Planning ahead a trip, and getting low fares (or using frequent flyer awards) is critical from people traveling from other countries. I'm not sure at all about being able to go this year, but such a definition may help to improve the chances. TIA.

Re: HHC 2012 location

*Message #11 Posted by **Ethan Conner** on 13 Feb 2012, 11:19 p.m.,*
in response to message #10 by gene wright

It didn't take long to put this years conference geographically out of reach. Lol

Re: HHC 2012 location

*Message #12 Posted by **gene wright** on 13 Feb 2012, 11:32 p.m.,*
in response to message #11 by Ethan Conner

Geographically out of reach...meaning what?

Are you outside the USA? This conference is almost always in the USA, but there is often a gathering in Europe in the fall as well.

Are you in the USA but not near Texas? Many, many people travel across the country and world to come to these HHC events.

What makes this out of reach? ...so far, not a single conference has been held within 2 hours driving time for me. :-)

Re: HHC 2012 location

*Message #13 Posted by **Ethan Conner** on 14 Feb 2012, 12:37 a.m.,*
in response to message #12 by gene wright

You posted last years site would do fine. That was California wasn't it? If Houston is still on that would be in my range. :) Houston is a four hour drive for me.

Re: HHC 2012 location

*Message #14 Posted by **Namir** on 13 Feb 2012, 7:01 p.m.,*
in response to message #6 by Michael de Estrada

Your mere presence is a valuable contribution. We all get together to enjoy the fellowship!

amir

Re: HHC 2012 location

*Message #15 Posted by **Dave Shaffer (Arizona)** on 13 Feb 2012, 7:18 p.m.,*
in response to message #14 by Namir

I heartily second Namir's comments.

I have been to only one HHC, and still remember the folks I met and the good time we all had. (And, I've even crossed paths with Namir a couple of times since then!)

That would make a very good reason to attend.

To be precise, another very good reason... :-)

Re: HHC 2012 location

*Message #18 Posted by **John B. Smitherman** on 14 Feb 2012, 11:21 a.m.,*
in response to message #17 by Marcus von Cube, Germany

Here are a few points of interest in the Houston area:

NASA Johnson Space Center link

Galleria link

San Jacinto Monument link

Kemah Boardwalk link

Galveston link

St. Arnold Brewery link

Haak Winery link

Re: HHC 2012 location

*Message #19 Posted by **Eric Rechlin** on 14 Feb 2012, 2:04 p.m.,*
in response to message #18 by John B. Smitherman

The San Jacinto monument is nothing special, but the battleship Texas parked right next to it is well worth visiting.

Saint Arnold is always fun to visit; I'm going there again this Saturday. Bring your own food and arrive early so you can get a picnic bench to comfortably spend your day with friends.

Houston has many, many museums, too. The Museum of Natural Science has an interesting permanent exhibit on oil extraction. The Museum of Fine Arts, though not as nice as what you might find in, say, New York City, is still quite extensive (and they are about to start a large expansion project, adding perhaps 50% to the exhibit space). We have a holocaust museum too, and some more unusual museums, such as the Art Car Museum, the Museum of Printing History, and the Beer Can House.

But in some ways, the biggest thing Houston has to offer is restaurants. Sure, Michelin doesn't bother visiting Houston to "star" them, but I personally think it's the best place to eat out in the world, due to the combination of affordable prices, a wide variety of different foods due to the mix of different cultures, and a huge selection (more restaurants per capita than anywhere but NYC).

Eric

*Message #21 Posted by **Patrice** on 14 Feb 2012, 3:59 p.m.,*
in response to message #20 by Ethan Conner

From France, there is something that make the NASA Johnson Space Center special.
The every day job of the guys working there is about writing the USA history of space, the only place where they can say the same is in Florida.
I only regret that they didn't have a failure such as a 41C could have saved the butt of a shuttle :)

Re: HHC 2012 location - NASA

*Message #22 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Feb 2012, 4:12 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Near (but not inside of) Johnson Space Center, NASA has (or at least used to have) a nice place for visitors, with an exhibit of some real, flown spacecraft, not-flown boosters such as a Saturn V, astronaut spacesuits from different time periods, an IMAX theatre projecting impressive space films, a piece of lunar rock (so visitors can touch it), a space shuttle mockup, including cockpit, some simulators, etc. I've been there four times, but all of them were some years ago, so it may have changed. Of course, there was also a nice gift shop, with items ranging from videos and books to posters and paintings to T-shirts and keychains.

Edited: 14 Feb 2012, 4:13 p.m.

Re: HHC 2012 location - NASA

*Message #23 Posted by **Eric Rechlin** on 14 Feb 2012, 5:19 p.m.,*
in response to message #22 by Andrés C. Rodríguez (Argentina)

Things have changed a lot.

There's Space Center Houston, which is a commercialized museum/gift shop. Then you can take a trolley from there to the Johnson Space Center, where they let you go into a few buildings.

However, this has been cut back a bit in the last decade, so if you want to do some of the more interesting stuff (like using the actual simulators the astronauts use, or visit the Neutral Buoyancy Laboratory) I think you might need to arrange for a special tour.

In front of JSC is the rocket park, with a bunch of unused rockets, including a Saturn V. Last time I was there it was completely open to the public, with everything rotting from exposure to the elements, but they have since built a large building to enclose them, and supposedly restored the Saturn V. I assume you could see this if you do the SCH tour; I don't know if this is still freely accessible to the public without a tour.

The JSC used to do an annual open house, where members of the public could freely see many of the facilities, covering far more than the normal SCH tour, but I don't think they've done that in years. That was a lot of fun.

Eric

Re: HHC 2012 location - NASA

*Message #24 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Feb 2012, 8:09 p.m.,*
in response to message #23 by Eric Rechlin

Space Center Houston was the visitor facility indeed, I couldn't recall the name. I liked it a lot. But I was not able to visit any "real" NASA buliding; as you said a previous appointment was needed, and it's a difficult thing to arrange for a foreign visitor with little available time. Yes, rockets were shown on the outside of SCH. You had to pay a ticket to enter SCH and also for the "rocket tour".

Re: HHC 2012 location - NASA

*Message #25 Posted by **David Ramsey** on 15 Feb 2012, 8:58 p.m.,*
in response to message #24 by Andrés C. Rodríguez (Argentina)

Given how tight a schedule HHC seems to be run on, how many people would take the opportunity to avail themselves of a NASA side trip, or indeed any side trip?

Just wondering. HHC 2011 left just enough time for a nice sit-down supper in a very nearby restaurant.

Re: HHC 2012 location - NASA

*Message #26 Posted by **Gerry Schultz** on 15 Feb 2012, 9:38 p.m.,*
in response to message #25 by David Ramsey

Hi David. If the location for HHC 2012 is Houston, I would probably drive and visit some relatives along the way. In the past I've added a couple of days before and after the end of the conference to visit the local attractions and go on tours like NIST.

The first conference day can go from 8 AM to 10 PM so it gets long. The second day lasts until around 6 PM and by then I'm pretty tired. So, I suggest any group tours should be scheduled for the Friday before or the Monday after. I know it's hard for some of my fellow attendees to commit to coming in early or staying an extra day due to scheduling constraints or finances. Let's have some fun while in Houston. I always intend to enjoy myself as much as possible.

Gerry

*Message #28 Posted by **Mark Hardman** on 15 Feb 2012, 9:54 p.m.,*
in response to message #25 by David Ramsey

Just to set expectations, from the HP/Compaq Campus in North Houston (off of Hwy 249) to JSC in South Houston (off of I-45 and NASA Road 1) it is a good 60 miles. Given the route and 25 years experience with Houson traffic, I'd expect the drive to take an hour and a half at a minimum.

But, for those interested, I'd be glad to look into renting a tour bus for an afternoon that does not interfere with the HHC conference.

Mark Hardman
Houston, TX

> But, for those interested, I'd be glad to look into renting a tour bus for an afternoon that does not interfere with the HHC conference.

Provided the HHCC2012 really will be at Houston:

I'll arrive on Thursday afternoon, and like others do I plan to support some preparatory work for the conference on Friday. I need to get more training in sacking the proceedings. :-)

The committee will be busy all Friday, and they deserve to have the oppurtunity for such an activity, if they like to.

Therefore I suggest that such an activity would be best suited on Monday afternoon, allowing for some cleanup activities in the morning. Concerning the transportation, I believe a lot of people will have a car. I'll have one, and more folks will join.

Nevertheless it would be great if you could do some planning beforehand enabling people to commit themselves.

Cheers, Günter

*Message #30 Posted by **Andrés C. Rodríguez (Argentina)** on 15 Feb 2012, 9:58 p.m.,*
in response to message #25 by David Ramsey

One of the times I was in Houston, I only had the "time window" for lunch at a conference (George Brown Convention Center, IIRC) as free time. With a fellow visitor, we hired a taxi, went from the convention center to NASA Houston Space Center, have the taxi waiting for us for an hour, and return to the conference just in time for the afternoon sessions. It was tight, but feasible (even on a regular weekday, not in a weekend). More time at HSC would have been better, but this arrangement was much better than nothing. The taxi costed U$S 100, and we shared the expense. Just recalling, it was my second visit to HSC...

Re: WP 34S: New release on SF

*Message #4 Posted by **Les Wright** on 20 Feb 2012, 2:13 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Thanks, gents.

I am a late rather than early adopter and was waiting for the Sourceforge release. Till now I have been pleased with 2.2.

I like what v. 3 is doing with organizing program, register, and flash memory. It actually is simpler than the multiple library setup of v. 2.

The manual still needs to be cleaned as it still mentions the now obsolete SENDL function when discussing Serial I/O syncing with the emulator. Apart from that, looks amazing.

I satisfied myself with throwaway paper overlays for 2.2, but now have splurged on Eric Rechlin's proper vinyl overlays for this version. I am assuming that the keyboard layout is settled and will not change throughout updates to v. 3.

Again, thank you for this amazing project.

Les

Re: WP 34S: New release on SF

*Message #5 Posted by **Paul Dale** on 20 Feb 2012, 2:26 a.m.,*
in response to message #4 by Les Wright

Please let us know about all and any problems with the firmware and the manual. They will be addressed.

Yes, version 3 is a significant improvement over version 2. The flash management is out of sight better, not to mention having more free flash for users. We've separate programs, more functions, better accuracy for some functions, double precision and more. I definitely think it is worth buying a new overlay and letting v2 die quietly :-)

The version 3 overlay is pretty much fixed. We're arguing over SHOW & up arrow (alpha case change) on the ON button, so a trivial change might happen. However, we're well aware of the need to not alter the overlay so don't expect to need a new one even if things do change. Currently the up arrow enters the register browser and SHOW displays the full mantissa. We're thinking of changing this so that SHOW enters the register browser and up arrow does something else. The reason being is that f-shift and g-shift x<>y <(and)> display the mantissa in single precision mode, the parts of the mantissa in double and shift around the integer display. Thus the current SHOW behaviour is redundant.

The outstanding question is what to put on the case shift up arrow (if anything). Any suggestions?

We also have a (very) small number of free character bitmaps available, any suggestions here?

- Pauli

> Quote:
>
> The outstanding question is what to put on the case shift up arrow (if anything). Any suggestions?

If we don't come up with anything better I would propose to enter lower case alpha mode directly with f EXIT. Let SHOW start the register browser and <( )> handle the display of numbers.

Scientific version of 30b by HP?

*Message #1 Posted by **kc** on 13 Feb 2012, 12:24 a.m.*

Well, I'm not talking about WP34S. WP34S is really great, but what if I'm too lazy to do all the cumbersome works of flashing and labelling?
People in this forum are highly demanding towards quality of HP calculators, and yet, the 30b seems to be generally regarded by the forum members as a quality product. I don't have a 30b, but AFAIK, it alreay contains common scientific functions, just buried somewhere inside menus. Therefore, I think it wouldn't be too difficult for HP to remap the keys to produce a scientific version of it. Or is HP already doing that?
Or better still, it would be really nice if HP would buy the invention of WP34S and produce a version of it :)

Re: Scientific version of 30b by HP?

*Message #2 Posted by **Paul Dale** on 13 Feb 2012, 12:34 a.m.,*
in response to message #1 by kc

You can buy a pre-flashed 34S plus overlay. Well not at the moment, buy I'm sure it will be available again soon.

HP wasn't interested in the 34S firmware when I offered it to them. We've come a long way since then, but I suspect this hasn't changed.

I've no idea what kind of scientific calculator, if any, they are working on.

in response to message #2 by Paul Dale

> Quote:

> HP wasn't interested in the 34S firmware when I offered it to them. We've come a long way since then, but I suspect this hasn't changed.

The reason behind is that HP doesn't want to pay even though HP is interested in your product. That's why HP's new breed of calculators have got a lot of H/W or S/W problems!

HP is a miser!!!

Re: Scientific version of 30b by HP?

*Message #5 Posted by **Paul Dale** on 13 Feb 2012, 5:07 a.m.,*
in response to message #4 by From Hong Kong

I very much doubt this was the reason. In fact, I'm certain it isn't. We didn't ask for money, the project is open source and hence freely available anyway. We can and would license it under alternative terms if asked -- this has been done for the power saving code e.g. (main.c from memory).

The reasons given at the time I asked were: no scientific calculator was on the immediate road map and that the software would need to be re-written to use HP's internal mathematics library. The former clearly changed with the 15C LE, the latter is likely still a concern.

You mean the library that says log(10^20)=14? (as on the 20b) That's a good plan.

in response to message #16 by Eric Rechlin

Eric, are you also considering with or without crystal upgrades, or by default all WP-34s' get the crystal upgrades. I think having the upgrade by default is a better choice.

Re: Scientific version of 30b by HP?

*Message #18 Posted by **Eric Rechlin** on 13 Feb 2012, 5:11 p.m.,*
in response to message #17 by Kerem Kapkin (Silicon Valley, CA)

I haven't decided, but I am strongly leaning towards having it be a full-service thing. Ideally it would be a 30b, with the overlay preinstalled, the crystal preinstalled, the latest 3.0 build flashed (or perhaps the last-known-stable build, but I don't know how to determine that), and maybe a printed manual (but as long as it still says "DRAFT" in the watermark I won't bother printing it, and I personally don't think the manual is suitable for printing anyway).

Eric

> (or perhaps the last-known-stable build, but I don't know how to determine that)

Version 2.2 would be this.

Version 3 will get there, probably fairly quickly though.

We've no current plans for major or significant changes after version 3. We've taken the hardware about as far as we can and a lot further than any of us thought possible at the outset.

Drat, I was hoping for at least a v3.5 with a "proper" complex mode per Marcus' proposal. (message no. 14)

Edited: 13 Feb 2012, 8:36 p.m.

Re: Scientific version of 30b by HP?

*Message #21 Posted by **Paul Dale** on 14 Feb 2012, 12:02 a.m.,*
in response to message #20 by Jeff O.

I'm pretty sure that proper complex support like the 42s is what we'll aim for rather than the 15c's relatively poor substitute. It won't, however, be in the 30b body. We'll be using something more capable: DIY RPN 5, OpenRPN, the 15CC or something entirely different. We simply don't know at the moment.

- Pauli

Re: Scientific version of 30b by HP?

*Message #22 Posted by **Jeff O.** on 14 Feb 2012, 10:19 a.m.,*
in response to message #21 by Paul Dale

Agreed that proper complex support is as on the 42S, with a display that can

show real and imaginary or magnitude and angle at the same time. However, I feel that a 15C-style implementation in a device that cannot display both parts (i.e., the 30b) would be preferable to the current wp34s paradigm. But I can see that you would not want to spend any time developing such a paradigm for wp34s if better hardware that will allow the preferred implementation is expected to arrive.

Re: Scientific version of 30b by HP?

*Message #23 Posted by **David Griffith** on 13 Feb 2012, 12:34 p.m.,*
in response to message #1 by kc

As others have stated, you can buy a pre-flashed WP34s. The unavoidable problem with the WP34s is that its hardware is fairly anemic and the display is not optimal. What really needs to happen is for HP to commission the WP34s team to decide what the hardware should be like and have them make the firmware. The last time HP tried to make an RPN calculator of that kind, they came out with the HP35s, which falls flat in several important areas.

Re: Scientific version of 30b by HP?

*Message #24 Posted by **Jake Schwartz** on 13 Feb 2012, 5:03 p.m.,*

Even if the 17BII+ screen was available, I feel that the 34S could be significantly more powerful than it is now. Imagine substituting soft-key menus in place of that keystroke-crazy catalog system....I guess it can't hurt to dream....

Jake

Re: Scientific version of 30b by HP?

*Message #25 Posted by **Paul Dale** on 13 Feb 2012, 5:22 p.m.,*
in response to message #24 by Jake Schwartz

I'm not sure I understand here. With the current screen a soft key setup just isn't viable. The dot matrix portion is simply too tight for this and seven segments don't work well. The CPU can't drive any more LCD segments so a screen upgrade isn't feasible either.

As for more powerful, yet alone significantly more powerful, I'd like to know how so we can implement it :-)

- Pauli

Re: Scientific version of 30b by HP?

*Message #26 Posted by **David Griffith** on 13 Feb 2012, 6:14 p.m.,*
in response to message #25 by Paul Dale

I'm talking about you working out what CPU and support chips to use in order to properly use a dot-matrix display and somehow getting HP to build that calculator. More memory would be good

too.

Re: Scientific version of 30b by HP?

*Message #27 Posted by **db (martinez, ca.)** on 13 Feb 2012, 7:24 p.m.,*
in response to message #26 by David Griffith

David; Yes on both. The 34s is 99% "all it can be" on the hardware it is on now.
The ability, and willingness, of the trinity to rewrite the firmware to fix each shortcoming has resulted in an OS that hp could only dream of.

The smallest ever LED RPN calculator

*Message #1 Posted by **Michael de Estrada** on 12 Feb 2012, 7:15 p.m.*

And it's not an HP

About the size of a pack of cigarettes, the Hanimex 276, made in Hong Kong for the Australian Hanimex Company was the smallest ever LED RPN calculator. It was based on the National Semiconductor MM5760 chipset with a calculator forensics number of 8.843762. It sports most of the same functions of the Novus Mathematician except for x^2 and M + x^2, due to the reduced number of keyboard buttons. This particular pristine unit currently resides in the collection of one out our beloved members, who is well know for his addiction to non-HP RPN calculators.

Edited: 12 Feb 2012, 7:25 p.m.

Re: The smallest ever LED RPN calculator

*Message #2 Posted by **Martin Pinckney** on 12 Feb 2012, 10:41 p.m.,*
in response to message #1 by Michael de Estrada

About the same feature set as the HP 35, and IMO very attractive styling, too.

When was it produced?

Re: The smallest ever LED RPN calculator

*Message #3 Posted by **Michael de Estrada** on 12 Feb 2012, 10:49 p.m.,*
in response to message #2 by Martin Pinckney

I can't say for certain, but mid to late 1970s when National Semiconductor was making the chips. There's a whole bunch of other brands that used them, including the Argentinian Microcifra 10 and Taiwanese Prinztronic. Two big differences from the HP-35 is that it only has a 3-level stack and no scientific notation.

Edited: 12 Feb 2012, 10:51 p.m.

Re: The smallest ever LED RPN calculator

*Message #4 Posted by **Paul Dale** on 12 Feb 2012, 10:49 p.m.,*

in response to message #5 by David Griffith

i wonder of Michael Steinmann can replicate an LED HP25C :-)

Re: Smallest?

*Message #7 Posted by **Maximilian Hohmann** on 13 Feb 2012, 2:28 a.m.,*
in response to message #1 by Michael de Estrada

Good morning!

I don't have that particular calculator (alas...) to take masurements, but if it's the same size than the similar looking Hanimex 202, then the Sinclair Scientific is smaller. In width, thickness, area and volume, but not in length. If that counts.

Funny contest. Usually it goes: Mine is bigger :-) !

Regards, max

Re: Smallest?

*Message #8 Posted by **Michael de Estrada** on 13 Feb 2012, 9:49 a.m.,*
in response to message #7 by Maximilian Hohmann

You are correct ! I had completely forgotten about the Sinclair Scientific.

The dimensions I measured using a ruler are as follows:

Hanimex 276 : 3-7/8" L X 2-1/2" W X 7/8" T

Sinclair Scientific : 4-3/8" L X 2" W X 3/4" T

That works out to the following areas and volumes:

Hanimex 276 : A = 9.7 in^2 V = 8.5 in^3

Sinclair Scientific : A = 8.8 in^2 V = 6.6 in^3

Also, the Sinclair is 9 grams lighter at 105gm with 4 AAA cells .vs. 114gm for the Hanimex with a 9V battery.

So, I probably should have made the title "the second smallest ever RPN LED calculator."

The Sinclair was far more limited with only a two level stack and no storage memory, although it could

handle much larger numbers due its perpetual scientific notation mode. Also, it performs trig operations in radians only and lacks the constant pi for easy conversion from or to degrees. Log operations are base 10 as well.

Edited: 13 Feb 2012, 10:59 a.m.

in response to message #1 by Michael de Estrada

My first ever calculator, well actually my fathers calculator was a Hanimex ESR 1010SN, see : Hanimex ESR1010SN I have fond memories of that little beastie !! But then my curiosity of electronics took over and I disassembled it, even took the metal lid of the main ceramic chip - needless to say, it didn't work after that :-(

Cheers, John

Re: The smallest ever LED RPN calculator

*Message #12 Posted by **Bill Wiese** on 16 Feb 2012, 10:24 p.m.,*
in response to message #1 by Michael de Estrada

This was a variation on my/my dad's 2nd calculator externals.

The package design & form factor look remarkably like that of the 1975-vintage Casio "Pocket Mini"... in particular - the on/off switch on the side - the black display area popping up from the metal faceplate

The std Pocket Mini used a blue-green 8 digit VFD display, as did most Casio calcs of those years.

The Pocket Mini came in a couple of revisions... including a LED version with rounder keys. The common VFD version had rounded-corner square keys pulled into a 'tighter matrix' (i.e, matrix has more substantial border from edge of calc) and had gasketing around the keys.

Casio VFD 4-bangers at the time used Hitachi calc chips.

HP-17B Language selection disappeared.

*Message #1 Posted by **Kees van der Sanden** on 12 Feb 2012, 8:03 a.m.*

A few day ago a receiver the next question:

After having used this calculator for 24 years now, suddenly the system-language has changed from German to English. How to switch it back to German? The INTL item has disappeared from the modes menu. The serial-nr is 2809A93321 HP1987 MADE IN USA. A hard reset by removing the batteries and short the battery terminals didn't solve this problem.

Any other suggestion?

Re: HP-17B Language selection disappeared.

*Message #2 Posted by **bill platt** on 12 Feb 2012, 9:35 a.m.,*
in response to message #1 by Kees van der Sanden

The 17b has an auto-detect feature. If it detects that its user's English is above college level, it disables all other languages.

Re: HP-17B Language selection disappeared.

*Message #3 Posted by **bill platt** on 12 Feb 2012, 1:07 p.m.,*
in response to message #1 by Kees van der Sanden

I wonder what would come out if you ran it painstakingly through the ROM extraction process? Would it spit out the original International ROM, or this strange switch?

Re: HP-17B Language selection disappeared.

*Message #4 Posted by **Don Shepherd** on 12 Feb 2012, 1:21 p.m.,*
in response to message #1 by Kees van der Sanden

Have you tried resetting via the sequence CLR + third menu key from the left? That might work.

Re: HP-17B Language selection disappeared.

*Message #5 Posted by **Don Shepherd** on 12 Feb 2012, 7:15 p.m.,*
in response to message #1 by Kees van der Sanden

You could perform the self-test. If you get OK-17B-I, I believe that means you have the international version, which has the language selections. If you get OK-17B-E, you have the English-only version.

I've never heard of an international version turning into an English-only version before. If true, that would seem to be a ROM defect.

Re: HP-17B Language selection disappeared.

*Message #6 Posted by **Kees van der Sanden** on 13 Feb 2012, 12:46 p.m.,*
in response to message #5 by Don Shepherd

I also think it is the ROM.

A few years ago a downloaded the ROM of a HP-17B for the EMU42 emulator.
The ROM size was 96K. That's 32K more than the ROM size of the LEWIS processor.
So, i think this calculator has an additional ROM for the languages.
As a test I emulated the original ROM image with EMU42. It emulates as an international version.
The language selection is available.
Then I stripped 32K at the end of the ROM image.
This ROM emulates as an HP-17B without the language selection!

Conclusion: The additional ROM is no longer detected by the calculator.

Edited: 13 Feb 2012, 1:07 p.m.

Re: HP-17B Language selection disappeared.

*Message #7 Posted by **Don Shepherd** on 13 Feb 2012, 1:31 p.m.,*
in response to message #6 by Kees van der Sanden

So when you do the self-test, do you get OK-17B-E or OK-17B-I?

Re: HP-17B Language selection disappeared.

*Message #8 Posted by **Kees van der Sanden** on 13 Feb 2012, 1:55 p.m.,*
in response to message #7 by Don Shepherd

Unfortunately i don't have the calculator here.
I received the question by email.
I will ask to owner to perform the self test and report the results.

Many thanks.

>
> I've never heard of an international version turning into an English-only version before. If true, that would seem to be a ROM defect.

I fully agree with Don.

The difference between the International and the English version of the 17B is the additional 32KB ROM chip mapped at address #20000. The English/Basic 64KB ROM (inside the Lewis CPU chip) look at

startup at address #20000 for the sequence 20000:F3C5A (output of the build in memory scanner). If the sequence is found the English ROM calls a specified address inside the additional 32KB ROM for the international initialization.

Here're HP82240B log's of the self test (done with Emu42 and HP82240B printer simulation)

```
17B International:

SPD 1004240
ROM  OK
ROM2 OK
DRAM OK
URAM OK
OK-17B-I
COPYRIGHT HP 1987

17B English:

SPD 1005392
ROM  OK
DRAM OK
URAM OK
OK-17B-E
COPYRIGHT HP 1987
```

One difference between the International and English version is the already mentioned OK message. The 2nd difference is the additional "ROM2 OK" message at the International version.

Any repeating byte sequence at address #20000 like 20000:A3A3A3 looks like an open data bus, in the case of the International version that means a defect around the additional ROM chip.

HP 48 Meta Kernel card for sale?

*Message #1 Posted by **bluesun08** on 12 Feb 2012, 7:51 a.m.*

Where can i get a HP 48 Meta Kernel card? Have someone a card for sale?

Edited: 12 Feb 2012, 8:18 a.m.

Re: HP 48 Meta Kernel card for sale?

*Message #2 Posted by **Gerson W. Barbosa** on 12 Feb 2012, 8:30 a.m.,*
in response to message #1 by bluesun08

An alternative is copying the Meta Kernal Full Version file (freely available at www.hpcalc.org) onto a 128K RAM card.

Re: HP 48 Meta Kernel card for sale?

*Message #3 Posted by **Timo** on 13 Feb 2012, 8:51 a.m.,*
in response to message #1 by bluesun08

Hi,

I'd also like to recommend SpeedUI 11.11 by Raymond Del Tondo. It is comparable to Meta Kernel in a certain way since it also greatly speeds up and simplifies the User Interface of the HP-48GX. You will also need a free 128k RAM card in Slot 1 to install it.

I've bee using it for over a year now and am absolutely satisfied with it. Compared to MetaKernel I see two significant advantages:

1. It is still being maintained by Rayomd who releases important updates every now and then.
2. It is a modular installation consistitng of several optional libraries. It allows you to only install the features you need most. Therefore you can save a bit of card memory for other things as well.

It's a bit tricky to filter out what you don't need at the beginning, but I can provide you with a list of the librares I use if you need one.

You can download the installation files here

Re: HP 48 Meta Kernel card for sale?

*Message #4 Posted by **Cristian Arezzini** on 13 Feb 2012, 9:36 a.m.,*
in response to message #3 by Timo

I second everything that Timo said. I've been using SpeedUI for a while now. It's a little complex to install, but after installing it, my 48GX feels like it's something ten years more modern...

Cristian

in response to message #3 by Timo

Timo:

I've been most curious to try it out for some time. Please share the details about the libraries you've used and instructions to install them (email is fine)..

TomC

Re: HP 48 Meta Kernel card for sale?

*Message #6 Posted by **Timo** on 16 Feb 2012, 8:17 a.m.,*
in response to message #5 by Thomas Chrapkiewicz

Hi Thomas,

you have mail. I'll also post the list of my SpeedUI libs below for all forum members to access.

Kind regards, Timo

```
Library-Name    Lib-ID  Port
_____________________________

SpeedUI 11.11:

CF              4       0
UFL             257     1
UI              805     1
UF              809     1
B0              176     1
B1              177     1
B2              178     1
B3              179     1
B6              182     1
E4              228     1
EA              234     1
SBC             224     1
```

Install CF.lib first, then all other librares. It must be installed into Port 0! Perform a warmstart [On]+[C] after storing each library in port memory.

The listing represents an almost full install of SpeedUI 11.11 but it leaves enough Port 1 memory to allow installation of additional libraries as well. The SpeedUI zip-file does contain readme material which will explain certain aspects of the installation quite good.

HP-41 NUT Assembler question

*Message #1 Posted by **MichaelG** on 12 Feb 2012, 7:06 a.m.*

While verifying the D41 NUT disassemlber I came across some strange code in the NUT ROM. It took me quite a while to figure out that the output of the disassemlber is wrong.

After digging deeper into the topic it turned out there is an ambiguity in the op codes.

It's about the op code 3E8. D41 turns it into "REGN=C 15" which doesn't make any sense in the context but the transformation seems to be right. Looking into the op code table there is a special case for 3E8 meaning "SLSABC" which is the right choice in the context.

I have the strong feeling there are more exceptions. My question is how are these exceptions defined? Do I need to check display writing op codes first? That would mean on the other hand there is a documentions error and "REG=C <n>" is valid for n=0..E instead of F.

Any ideas?

Michael

Re: HP-41 NUT Assembler question

*Message #2 Posted by **Meindert Kuipers** on 12 Feb 2012, 7:37 a.m.,*
in response to message #1 by MichaelG

Hi Michael,

This simply translates to WRIT 15(e) in JDA mnemonics, but could be a display write instruction, depending on the context. I think it will be very difficult to check for display instructions depending on which peripheral is selected.

You might want to take a look at my disassembler, built in the M2kM software. Take a look at the various options, it could be very interesting to take some of these in your software as well. I like your initiative, so please go on!

When you software is more stable, I will take it thorugh a test. I have a disassembly option to allow re-assembly with SDK41, and will test it with your assembler as well.

Regards,

Meindert

Re: HP-41 NUT Assembler question

*Message #3 Posted by **MichaelG** on 12 Feb 2012, 8:27 a.m.,*
in response to message #2 by Meindert Kuipers

Thx, got it. I wasn't aware about the fact that the display needs to be selected first (day by day I learn more about the inside of the 41). So, the disassembler creates the right code (or at least does it's best under the given circumstances).

Sure, I'll have a look at your suggestions.

Michael

Re: HP-41 NUT Assembler question

*Message #4 Posted by **MichaelG** on 12 Feb 2012, 9:08 a.m.,*
in response to message #3 by MichaelG

Success! I simply enhanced the definition of the input label file. There you now specify the address range(s) where the assumed peripheral is active:

```
display 07ef 07fc
```

That results in the following code (addr 07f1 is the one of interest):

```
 07EF 1B0    [MESSL]         C=STK
 07F0 330    (L07F0)         CXISA
 07F1 3E8                    SLSABC
 07F2 23A                    C=C+1   M
 07F3 2F6                    ?C#0    XS
 07F4 3E3                    GONC    (L07F0)         ;-4    07F0
 07F5 1E0                    GOTOC
 07F6 130010 [ENLCD]         LDI     010
 07F8 270                    DADD=C
 07F9 1300FD                 LDI     0FD
 07FB 3F0                    PFAD=C
 07FC 3E0                    RTN
```

Thx to Warren, the rest was already prepared.

I think you might try it. The 15C can be flashed with the 16C firmware, I guess

Re: DM-15CC

*Message #5 Posted by **Antonio Petri (UK)** on 12 Feb 2012, 7:22 a.m.,*
in response to message #1 by Benoit Maag

Placed my order too. I look forward to the 16C, as I have got only my original one and I am now too afraid to use it!

Re: DM-15CC

*Message #6 Posted by **Thomas Radtke** on 12 Feb 2012, 7:33 a.m.,*
in response to message #1 by Benoit Maag

Ordered one to leave the 15C LE at home :-).

Maybe the ON-key is stiff enough to even be able to carry it in my trowser (front!) pocket.

Re: DM-15CC

*Message #7 Posted by **Gerson W. Barbosa** on 12 Feb 2012, 8:15 a.m.,*
in response to message #1 by Benoit Maag

Mine has just been ordered. Thanks!

Re: DM-15CC

*Message #8 Posted by **Michael de Estrada** on 12 Feb 2012, 9:04 a.m.,*
in response to message #1 by Benoit Maag

Just placed my order for one as well. PayPal really screwed me on the exchange rate from USD to CHF. Am I the first Yank to order one of these ?

Re: DM-15CC

*Message #9 Posted by **Mark Hardman** on 12 Feb 2012, 10:19 a.m.,*
in response to message #8 by Michael de Estrada

I guess that I was the second "Yank" to order.

I agree that the PayPal exchange rate was on the extreme low side. The current exchange rate that I see published is 0.9163USD per CHF. PayPay charged 0.893929USD per CHF. But, in the end, its only a difference of $1.81. Thankfully the price was not in Euros.

Mark Hardman

Edited: 12 Feb 2012, 10:21 a.m.

Re: DM-15CC

*Message #10 Posted by **Michael de Estrada** on 12 Feb 2012, 11:07 a.m.,*
in response to message #9 by Mark Hardman

PayPal has all kinds of sneaky ways to increase their fees on international payments. I've been charged an effective fee of a little over 3% for domestic payments, but was charged nearly 5% on payments received in USD from Germany. They won't disclose how their fees are calculated, you just have to calculate it based on the fee amount that is deducted from the invoiced amount.

Re: DM-15CC

*Message #11 Posted by **Gerardo Rincon** on 12 Feb 2012, 11:44 a.m.,*
in response to message #9 by Mark Hardman

I Ordered mine today. Shipping to Michigan:

From amount $74.95 USD To amount 67.00 CHF Exchange rate: 1 U.S. Dollar = 0.893929 Swiss

Francs

I am very excited on receiving this calculator. It's a truly innovation.

How about trying an HP-32S also?

Re: DM-15CC

*Message #12 Posted by **RedGlyph** on 13 Feb 2012, 1:44 p.m.,*
in response to message #9 by Mark Hardman

You can choose, either Paypal does the conversion between the currencies, or it doesn't and Visa does it (which is usually most favourable).

They also got me the first time, then I changed the defaults.

Re: DM-15CC

*Message #13 Posted by **From Hong Kong** on 12 Feb 2012, 11:48 a.m.,*
in response to message #1 by Benoit Maag

I've already placed an order. Hopefully, the next incarnation of DM-15CC will have 2 CR2032 batteries loaded and be on par with HP-15C LE in speed.

Re: DM-15CC

*Message #14 Posted by **Lode** on 12 Feb 2012, 12:14 p.m.,*
in response to message #13 by From Hong Kong

It looks like HP managed to get the emulation running at way faster speed, but at the cost of emulation accuracy (almost all bugs are related to handling keypresses and the display), while the DC-15CC has a slower, but more accurate emulation. Just my wild guess from seeing the results posted here though :)

Re: DM-15CC

*Message #15 Posted by **Giancarlo** on 12 Feb 2012, 12:36 p.m.,*
in response to message #14 by Lode

Hello, Does anybody know the size of the calc? I saw the video on youtube but i cannot understand the size very well,

Thanks

in response to message #18 by Thomas Radtke

> Quote:
>
> If it is a true emulation, HP will likely hunt Mike down.

I'm concerned about this prospect too, but hope that HP realizes that this is not going to interfere with their selling the 15C LE nor cut into sales of anything else that have currently. They should view the DM-15CC as free advertising for the real deal and make the real deal more available and bug-free. Maybe the DM-16CC will get HP to offer a 16C LE (or 16C+).

Re: DM-15CC

*Message #20 Posted by **RedGlyph** on 13 Feb 2012, 1:51 p.m.,*
in response to message #18 by Thomas Radtke

Re: DM-15CC

*Message #22 Posted by **Ethan Conner** on 13 Feb 2012, 4:27 p.m.,*
in response to message #21 by Paul Dale

I agree having witnessed this "lawyering" over nothing more than a trade name. The large

company successfully beat the small company into submission and took the trade name. It was brutal. There was absolutely nothing right about it.

Re: DM-15CC

*Message #23 Posted by **db (martinez, ca.)** on 13 Feb 2012, 9:56 p.m.,*
in response to message #22 by Ethan Conner

Eathan & Paul;
Agreed, so lets hope that hp doesn't want to stir mierda, or doesn't want to try to bully around the country where their numbered bank accounts are.
Eathan; There's another sad story about laiers twisting around facts and stealing a well known name. In the late '40s the Pl**u**mb company, whose only claim to fame is boy scout hatchets, legally stole the right of Pl**o**mb Tools to use the name of it's founder Alphonse Plomb, which it had used for over 30 years. Note to self: always trademark the names for any major corporations that i found.

Re: DM-15CC

*Message #24 Posted by **Andy Lamming (UK)** on 12 Feb 2012, 2:23 p.m.,*
in response to message #14 by Lode

My DM-15CC completes Katie Wasserman's Pi programme for the 15C in 5 hours 48 minutes. So that's 7½ times faster than the 43 hours she reports for the original 15C, but quite a bit slower than the 16 minutes she reports for the LE.

Re: DM-15CC

*Message #25 Posted by **Giancarlo** on 12 Feb 2012, 4:54 p.m.,*
in response to message #24 by Andy Lamming (UK)

Just ordered mine...

bye

Giancarlo

Re: DM-15CC

Is the above 7.5x speed increase relative to a legacy 15C consistent for general operation? That seems disproportional given the LPC1114 and sam7 are both 32-bit ARM cores, moreover the LPC1114 design is capable of a 48MHz clock rate compared to the sam7 at 36MHz. While the LPC1114 could be running at a more conservative clock, even at 48MHz it is quite close to parity power-budget with one CR2032 cell vs. the sam7 @ 36MHz feeding from 2x CR2032.

As a reference point, KEMU configured for size optimization (rather than performance) on a C

runtime hostile 8-bit 8MHz SoC yields a rough 6x performance over a legacy voyager.

Starting at 35,000 with ten years experience and a 4 year degree.

Only make a good salary if airline grows and you are not living under a threat of chapter 11 for 25 years! Just watch the movie "wall street" to see what 'shareholder value has done to the airline industry in Canada.

Top salary in your last 5 years as a capt on 777 or larger. 8 paycuts in 26 years (each new contract to help the airline shift money to the shareholders) and not even cost of living in the mean time.

But it is fun!

Looking forward to stereo vision DM-15CC

HP 15C LE programming, does CPU run fast?

*Message #1 Posted by **designnut** on 11 Feb 2012, 10:26 p.m.*

Most of the time related to running a program is the actual keying of it, it takes time. Does the CPU run at warp speed during programming? Sam

Re: HP 15C LE programming, does CPU run fast?

*Message #2 Posted by **Jeff O.** on 12 Feb 2012, 5:13 p.m.,*
in response to message #1 by designnut

Sam,
As far as I know, during entry of data or programs from the keyboard, the processor runs at full speed only during the time that a key is actually held down. So if you are quick with your keypresses, you should not use up too much battery life entering programs.

HP-41C bad display - where to start from ?

*Message #1 Posted by **Alberto Fenini** on 11 Feb 2012, 6:28 p.m.*

ciao a tutti,
I have purchased for a fair price an HP41C, that I wanted to use as my everyday calc, thus I wasn't looking for anything mint, nos, nib ... just working...
There are a couple of small chips on the (plexi)glass, but I don't mind.
What I do mind about, is that when turned on, the display works like this : (sequence of 0, and sequence of 5) :

The second digit is missing a couple of segments, and this impair the view of few characters and numbers.
Since I had a spare "half Blanknut" I have tried to swap the keyboard/display unit, with the following result :

The board is the same, but the display is getting worst
I may have a bad "half blanknut", but I don't want to open the other 41Cs I have just for the fun of it.
What could I check to get the display working ?
Would it make sense to de-solder the blanknut display and put it on the original keyboard assembly ?
Curiosity : when opening the unit, rather than the usual gold zebra strip, I have found inside this one :

Thanks for any advice, take care, Alberto

Re: HP-41C bad display - where to start from ?

*Message #2 Posted by **db (martinez, ca.)** on 11 Feb 2012, 9:54 p.m.,*
in response to message #1 by Alberto Fenini

Alberto;
You might check the 13 or so fingers that connect the screen. If the unit was dropped one or two of the solder joints may be loose and need to be touched up. Just pry on them to see if they move.

Re: HP-41C bad display - where to start from ?

*Message #3 Posted by **Raymond Del Tondo** on 11 Feb 2012, 10:01 p.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto,

IMHO the "bacon strip" interconnector is the worst of the various interconnect variants used in the HP-41, because it shrinks over time, and thus is prone for bad contacts.
Theoretically the gold ring interconnector (zebra strip) shown above the bacon strip is the best solution, but your unit looks deformed, and thus may not provide proper contact between the CPU and the kbd pcb.

But let's get to the LCD. There's always a chance to get non-working segments,
especially when the damaged protective plexiglass indicates that the calc suffered rough treatment...

Did you actually put the 41C LCD into your blanknut, or did you really swap the keyboard pcb?
I ask because the latter is much work because of the many heat stakes, and isn't worth the effort in most cases.

Or does the blanknut LCD look like on the pic before any changes?

In my experience, bad interconnectors (CPU-KBD and KBD-battery) are the most common cause for display and keyboard problems.
In somewhat rarer cases, one or more solder bridges between the LCD and the kbd pcb have become bad.
The latter can be fixed using a suitable soldering iron.

HTH

Ray

Re: HP-41C bad display - where to start from ?

*Message #4 Posted by **Alberto Fenini** on 12 Feb 2012, 4:13 a.m.,*
in response to message #3 by Raymond Del Tondo

Thank you very much for your replies.
This is what I have :

The unit on the left is the complete HP41C I have purchased, it has the bacon zebra strip and few (two to my knowledge) segments not working on the second digit.
Then, on the right, I have the upper half shell of a blanknut, it includes the keyboard, the display, the gold zebra strip.
This unit was purchased as a spare for my Blanknut, just in case ... It's from "Better Control Medical Computers inc." as the front label reads, it was used in a medical environment as part of a proprietary system for insuline dosage.
Now, the back of the orginal HP41-c looks like this :

It looks nice, but, some cold soldering or detached links may always be possible. I don't know what's happend to the original unit, but I would exclude it has been dropped, since the rest of the case is in good conditions, no chips, no cracks.
The back of the Blanknut looks like this :

The only thing I did, was to move the CPU board from the original HP41 to the half Blanknut, at first using the gold zebra strip, than I also tried with the bacon zebra.
Question :is there any way, to lit up all the segments (no, I don't have the test module), may be just applying a low voltage to the display contacts, and check the functionality ?
This would isolate the problem eventually to bad contacts between the cpu board and the keyboard board because of the zebra connectors
Thanks everybody ! Have a nice weekend, Alberto

Re: HP-41C bad display - where to start from ?

*Message #5 Posted by **Randy** on 12 Feb 2012, 10:08 a.m.,*
in response to message #4 by Alberto Fenini

Display issues in fullnuts are a real pain as the only way to trouble-shoot is to swap parts. On the upside, it is good soldering practice ;-)

Missing segments have nothing to do with soldering as they are always a bad driver or a bad lcd and in some rare cases, both. If there was no corrosion in the unit, I would first try the driver. If there was any

corrosion, or gold interconnects, suspect the LCD first. Based on the greenish color of the polarizer in your problem unit, I suspect it has the more problematic connector. Pink or white LCD elastomers are far more reliable than the gold. This is the opposite of the situation with the keyboard to logic board connector.

Illuminating all segments: only possible with an HP service rom or PPC rom.

IMO, I would not mess with the damaged plastic lens. They are very, very difficult to replace/repair. Almost always turn out worse than they start.

Re: HP-41C bad display - where to start from ?

*Message #6 Posted by **Alberto Fenini** on 12 Feb 2012, 10:37 a.m.,*
in response to message #5 by Randy

ciao Randy,
thank you very much for your reply, do you mean that is probably a problem of the zebra strip ?
thanks for help, Alberto

Re: HP-41C bad display - where to start from ?

*Message #7 Posted by **Alberto Fenini** on 12 Feb 2012, 10:55 a.m.,*
in response to message #6 by Alberto Fenini

And, if I well understand, that the ony way to isolate the probelm, not having a PPC module, is to use a fully working unit and begin to swap elements.
This would tell me if is the board, the display, or the connectorm right ?
Thanks again Alberto

Re: HP-41C bad display - where to start from ?

*Message #8 Posted by **Randy** on 12 Feb 2012, 10:58 a.m.,*
in response to message #7 by Alberto Fenini

The pink elastromeric keyboard to logic board connectors are the source of many forms of 41 trouble. They can be the source of the missing display segments although the problem is more likely to be the driver or lcd.

Troubleshoot using only the gold version keyboard to logic board connector. Change only one part per test. You changed at least three by substituting the blanknut.

Re: HP-41C bad display - where to start from ?

*Message #9 Posted by **aurelio** on 12 Feb 2012, 2:01 p.m.,*
in response to message #7 by Alberto Fenini

Ciao Alberto, reading your words "use a fully working unit and begin to swap elements" I'm quite scared, maybe 'cause I'm not experienced like you in soldering, or maybe because always, first at school, then at work the advice for all was: "if the system works, don't touch it, let it work and it 'll work lifetime". Even if I had a dozen of 41 working HPs, never I should try the thrill... Excuse me, maybe I've not so skilled in this matter and for this reason I've not courage enough to to risk the healt of a fully working (ancient) calculator.

Classic cleaning tips?

*Message #1 Posted by **Kees Bouw** on 11 Feb 2012, 3:08 p.m.*

I am about to clean the HP-80 that I won a few years ago on eBay. Because it works fine, I am only going to clean the outside. The back label is intact and I do not want to open it. It is not very dirty and there are no particular problems with its appearance. There is just some dirt and dust here and there, like on the borders of the keyboard and at the sides of the keys. What would be the best way to clean it? Obviously, I don't want any liquid creeping in between the keys or the on/off switch. Does alcohol dissolve the key legends on the keyboard or on the keys? Anything else I should definitely NOT do? I don't have a lot of experience with this, so all tips are welcome. Thanks!

Re: Classic cleaning tips?

*Message #2 Posted by **Jan** on 11 Feb 2012, 4:16 p.m.,*
in response to message #1 by Kees Bouw

Does alcohol dissolve the key legends on the keyboard or on the keys?

Possibly or even likely. It actually DID on my 67 (tested it on a small spot => test failed so I stopped immediately). With the 80 more or less being of the same generation as the 67 I would not take any risks: avoid alcohol or any organic solvents in general.

Re: Classic cleaning tips?

*Message #3 Posted by **aurelio** on 11 Feb 2012, 6:27 p.m.,*
in response to message #2 by Jan

I tryed ttwo years ago to clean with alchool my 67 and actually I did it unsuccesfully, no good results but in confidence no damages too, only don't insist too much in the same point, problems could be in that case due to a too strong mechanichal action. I can say you: absolutely not try to clean even with water the woodstock calculators: the key legends on the keyboard dissolves just looking at them.....but in the classic models legends are pretty hard to dissolve

Anyway the best advice I can give you is to avoid any risk with these kind of jewels, let them be as they are, just remove the dust with a soft brush...calculators are like cats, don't like the shower and your 80 will apreciate if you will leave it "in peace"

Re: Classic cleaning tips?

*Message #4 Posted by **Jan** on 11 Feb 2012, 7:30 p.m.,*
in response to message #3 by aurelio

Much of the commercially available alcohol contains some water. Maybe that's the reason of the problem I had with the 67 (after all, the 67 is in fact a 2nd generation calculator, just like the woodstocks (same manufactoring techniques probably)). So avoid any cleaning with liquids and/or rubbing.

Re: Classic cleaning tips?

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 11 Feb 2012, 6:02 p.m.,*
in response to message #1 by Kees Bouw

I use a cotton swab and micro fiber cloth with lens cleaning solution holding the keyboard upside down. Works very well removing any black dirt on and around the keys, on the overlay.

Edited: 11 Feb 2012, 6:03 p.m.

Re: Classic cleaning tips?

*Message #6 Posted by **Nick R** on 11 Feb 2012, 7:48 p.m.,*
in response to message #1 by Kees Bouw

I use a Q Tip slightly moistened with Windex for removing dirt, followed by another Q Tip moistened with water to get rid of any Windex residue.

Making the wp-34s label glossy

*Message #1 Posted by **Jose Poyan** on 11 Feb 2012, 2:29 p.m.*

Hi, I sprayed a layer of varnish on my wp-34s label, which was too matt for my taste, to make it similar to hp keyboards. This is the result. Now it reflects too much light, but you can try it if you like it so I wanted to share the photos. The label doesn't really look like the calculator plastic. (I chose a hp-20b becouse it is black, like the label, althought I dont know the difference with the hp-30b; I still need to flash the calculator)

Re: Making the wp-34s label glossy
*Message #2 Posted by **Marcus von Cube, Germany** on 11 Feb 2012, 2:50 p.m.,*
in response to message #1 by Jose Poyan

The lightly rough surface of the print together with the varnish results in an irritating glare.

You will only know if it works for you or not after you have reflashed your calculator. Since it's a V2 overlay, get the most recent V22 release from SourceForge.

Next step: Get yourself a new (V3) overlay and put it on a 30b. With the soon to be released V3 firmware this is a whole new experience. :-) It might be fun to explore the differences between the two.

Re: Making the wp-34s label glossy
*Message #3 Posted by **Eric Rechlin** on 11 Feb 2012, 3:34 p.m.,*
in response to message #1 by Jose Poyan

You have one of the very oldest overlays, it seems.

The ones I have been making for the last 5 months or so have a thin coat of paint on them, giving them a semi-gloss appearance.

Eric

Re: Making the wp-34s label glossy
*Message #4 Posted by **Jose Poyan** on 12 Feb 2012, 10:05 a.m.,*
in response to message #3 by Eric Rechlin

Yes, I'll do it. I'll remove the overlay and I'll buy the new V3. But can I do it with my 20b? I dont understand why everyone is going for the 30b

Re: Making the wp-34s label glossy

*Message #5 Posted by **Marcus von Cube, Germany** on 12 Feb 2012, 11:10 a.m.,*
in response to message #4 by Jose Poyan

The keyboard mechanics of the 30b are far better than those of the 20b.

Re: Making the wp-34s label glossy

*Message #6 Posted by **Walter B** on 12 Feb 2012, 12:15 p.m.,*
in response to message #4 by Jose Poyan

The 20b has keys like - forgive me - a Casio, while the 30b has keys with tactile feedback like an HP of those days that were :-)

HP-41 Wand: scanning from monitor?

*Message #1 Posted by **MichaelG** on 11 Feb 2012, 2:20 p.m.*

Do you think the HP-41 wand scans a bar code from a monitor instead from paper? It's just an idea. If the idea promises some success I would try to modify the user code compiler to output the bar code in a window.

Michael

Re: HP-41 Wand: scanning from monitor?

*Message #2 Posted by **Raymond Wiker** on 11 Feb 2012, 3:06 p.m.,*
in response to message #1 by MichaelG

I'm almost certain that it won't work, but you can check it on http://rwiker.github.com/hp41barcode/ .

Re: HP-41 Wand: scanning from monitor?

*Message #3 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 13 Feb 2012, 12:38 p.m.,*
in response to message #1 by MichaelG

I am very certain that it will not work on a CRT monitor, however it may work on a LCD Monitor since many bar code scanners have been able to read successfully from LCD monitors or from mobile LCD devices.

Re: HP-41 Wand: scanning from monitor?

*Message #4 Posted by **MichaelG** on 13 Feb 2012, 2:33 p.m.,*
in response to message #3 by Kerem Kapkin (Silicon Valley, CA)

It's about an LCD only.

Right now I do not have a wand (that's why I'm asking). If the chance is high that it works I'd try to get one.

Michael

Re: HP-41 Wand: scanning from monitor?

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 13 Feb 2012, 3:13 p.m.,*
in response to message #4 by MichaelG

Michael, I would like to support your efforts. I can loan you my HP-41 barcode reader wand or can do some testing for you using specific bar codes on LCD PC monitors that I have. You can also send me an e-mail to discuss this further if you would like. Regards.

Re: HP-41 Wand: scanning from monitor?

*Message #6 Posted by **MichaelG** on 15 Feb 2012, 3:39 a.m.,*

in response to message #5 by Kerem Kapkin (Silicon Valley, CA)

I'll try again a response...

I really appriate your offer. I live in Germany and it is very expensive to ship a package from the US to Germany and back. For the first steps it would be very helpful if you could do some tests for me (when I have something testable).

Thx a lot! Michael

Re: HP-41 Wand: scanning from monitor?

*Message #7 Posted by **Ángel Martin** on 13 Feb 2012, 3:16 p.m.,*
in response to message #4 by MichaelG

Didn't work for me - LCD monitor, different scale sizes, to not avail. Just one data point, by all means you go ahead and try as well.

Re: HP-41 Wand: scanning from monitor?

*Message #8 Posted by **sylvandb** on 13 Feb 2012, 3:20 p.m.,*
in response to message #3 by Kerem Kapkin (Silicon Valley, CA)

Probably those barcode scanners which read successfully from LCD monitors/screens are using a camera and doing image processing.

IIRC the 41c wand is a simple phototransistor or photodiode set up to sense reflected light (white space) or its absence (the bars). I suspect that this design would not be happy with the flickering light emitted from a CRT or even the higher-frequency flickering light from the LCD backlight (either cold-cathode fluorescent or PWM LEDs).

But it might work... And perhaps could be modified to work.

It might be easier to start with a new approach. For example, two photodiodes could be aligned to two areas on the display and those areas could alternate light and dark. One could be a clock, the other data. Then the higher-frequency noise could be ignored because the clock would give the frequency of interest and the data could be checked in sync with the clock. (Think a one way optical I2C or SPI.)

Re: HP-41 Wand: scanning from monitor?

*Message #9 Posted by **Meindert Kuipers** on 13 Feb 2012, 3:26 p.m.,*
in response to message #8 by sylvandb

Or maybe connect a red LED to the PC and control it in the right sequence while holding the wand over it?

Re: HP-41 Wand: scanning from monitor?

*Message #10 Posted by **Diego Diaz** on 14 Feb 2012, 3:06 a.m.,*
in response to message #9 by Meindert Kuipers

Hi all,

The LED pointing to a Wand tip approach (or the other way around if you prefer) certainly works. I tested it a few years ago and managed to simulate some keyboard entries from the Wand.

Just the Wand switch must remain pressed along the whole transmission process.

Also have doubts that CRT or LCD screens can do the job... (too flickery IMHO) but it's just a hobby, so better give it a try and let us know! ;-)

Cheers from Caribbean Sea.

Diego.

Re: HP-41 Wand: scanning from monitor?

*Message #11 Posted by **Vassilis Prevelakis** on 16 Feb 2012, 9:42 a.m.,*
in response to message #10 by Diego Diaz

ho ho this brings back old memories.

it was back in 1983 or 1984 when I was trying to see how to get data into my HP-41C without actually typing it in when I investigated using the Wand as an input device (without going through the process of printing the barcode and scanning it manually).

So I used Blue Tac to anchor my wand over the "CAPS LOCK" LED on my BBC microcomputer and then wrote a program to flash the LED simulating various types of barcode. I remember being able to download entire programs, compiled using modified versions of the programs included in the HP Book "Creating your own Barcode" (available on the MoHPC DVD).

The Blue Tac also prevented stray light from confusing the sensor.

The only problem was that I had to press the key on the wand before sending each bar code.

I then came across the data sheet of the HEDS-3000 Wand (a version of the Wand designed for connection to other computers) and realized that the HP-41 Wand was a HEDS-3000 connected to the special connector with the ROM and interface. (more info on the HEDS-3000 are in the Jan.1981 HP Journal)

So I disassembled the connector and disconnected the cable. I then added connectors to both ends so that I could use the Wand as before.

Alternatively I could disconnect the interface connector and connect the Wand cable to the user port of the BBC (essentially a parallel port) and use the Wand as an input device of my BBC (I remember writing a program to read some barcode from BYTE magazine in HP-41 format). I also used the Wand to read BBC programs distributed in barcode format by the BBC-User magazine.

I also connected the interface connector of the Wand to the BBC so that I could use the BBC to send data and programs to the HP-41. I do not recall actually doing anything with that. It could be because I didn't have the time or I somehow was too scared to connect my precious HP-41C directly to another computer (I remember the HEDS data sheet suggested using a transient voltage suppression device - Transzorb - between the HEDS and the computer and I didn't have these parts at the time).

DM-15CC - got it !

*Message #1 Posted by **Andy Lamming (UK)** on 11 Feb 2012, 1:32 p.m.*

My order for the credit-card size DM-15CC has arrrived. It is a neatly finished-off product - and it works ! Someone remarked the display contrast ratio wasn't too good but mine is just fine. The blister keys do have to be pushed quite positively to register. The thingy the bank gave me to access my account online uses much the same plastic blister keyboard and that was stiff at first, but with use it has eased, so perhaps it will with the DM15.

I ran Katie Wasserman's pi programme, it took 5 hours 48 minutes. Katie says the original HP-15C takes 43 hours, so it is 7½ times faster than that, but obviously slower than the LE. (I set it off at 6 p.m. & I was just ready to give up & go to sleep when it got there!)

All in all I'd say not a replacement for the desk top, but so portable it is really handy for those programmes that you enter just once and use with different data when on the move. Like times & wind lay-off in a holding pattern (aircraft).

Re: DM-15CC - got it !

*Message #2 Posted by **Jeff Johnson** on 11 Feb 2012, 6:17 p.m.,*
in response to message #1 by Andy Lamming (UK)

Cool! Looking forward to hearing a lot of feedback on these little calculators. If reviews are favorable, I'll order one when they are available again. Seems like a useful size, like in a "Go" kit for field work.

Re: DM-15CC - got it !

*Message #3 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 13 Feb 2012, 1:58 p.m.,*
in response to message #1 by Andy Lamming (UK)

Just curious, does 15CC has the PSE bug?

Re: DM-15CC - got it !

*Message #4 Posted by **Marcus von Cube, Germany** on 13 Feb 2012, 2:57 p.m.,*
in response to message #3 by Kerem Kapkin (Silicon Valley, CA)

I was told it hasn't. I'll tell you when I've mine in the hands.

Re: DM-15CC - got it !

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 13 Feb 2012, 3:16 p.m.,*
in response to message #4 by Marcus von Cube, Germany

It will be interesting to see if DM-15CC has the HP-15LE bugs such as the PSE. Seems like not all new HP-15C emulations has the HP-15C LE bugs for an example, I recently downloaded HP-15C emulator for iPhone called ClassicRPN version 3.2.2 by AmeloConsulting. It does NOT have the PSE bug.

32-bit MCODE tool chain for the HP41 incl. D41 now

*Message #1 Posted by **MichaelG** on 11 Feb 2012, 3:15 a.m.*

This new release of the 32-bit MCODE tool chain for the HP41 now contains the disassembler.

Compared to the original version the disassembler mutated into a quite powerful tool. It is now a 2-pass disassembler that is able to create and insert symbolic labels instead of relative or absolute jump addresses.

Further you now can specify single addresses or adress ranges that the disassembler converts into constant tables instead of translating them into MCODE.

I am still investigation whether is makes sense to add 2 more options to convert the 2 message types (messl and mesa) into real message statements instead of simple constant tables. Unfortunately the A41 is lacking the MESA statement...

Pay attention new download link:

download.michael-goericke.de/hp41/SDK41R6.1-32.zip

Michael

Re: 32-bit MCODE tool chain for the HP41 incl. D41 now

*Message #2 Posted by **MichaelG** on 12 Feb 2012, 5:29 a.m.,*
in response to message #1 by MichaelG

The next version of the disassembler is available now. It implements decoding of MESSL and MESA strings. For details please refer to the manual.

download.michael-goericke.de/hp41/SDK41R6.1-32.zip

Michael

PS: I think I'm going to stop at that point. The 32-bit versions of the tools are running even with some more features compared to the original. If you think something should be implemented or a feature would ease your life let me know.

Edited: 12 Feb 2012, 5:31 a.m.

There isn't a DIY5 yet, though Rich has done some work on the schematic and on packaging concepts. The last updates on the DIY4X and DIY5 were posted here in December and January. The reason there aren't more frequent updates is that there isn't significant progress to report. Trust me, I definitely enjoy showing off cool stuff when we have it.

Since then I've been working on a rewrite of the keyboard scanning and debounce, which didn't work as well as I'd hoped. It was being done on a 100 Hz timer interrupt, along with timekeeping. Now I'm taking advantage of the GPIO edge interrupts and a separate timer.

Back in October I ordered 10 pieces of the new microcontroller with more memory, and tracking shows that the package was finally delivered yesterday, though I'm out of town so I won't get it until Monday. I need to find a rework technician that can replace a QFP100, to try it on one of the DIY4X boards.

I'm not much of a web developer, and don't want to spend any time or effort on developing a web page until we get closer to being able to offer a product.

Most Error Free HP Calculator Models

*Message #1 Posted by **Sid Cave** on 10 Feb 2012, 9:37 p.m.*

Which models of HP calculator are the most "error" free? I would categorize "bugs" (like the cosine bugs in the 33s and 35s) or "compromises" (like the Woodstock y^x implementation using logarithms "2^3=8.000000002") as "errors". Additionally, program execution errors, where the fault lies in the calculator, and other operational glitches ("1 1 . <- ENTER" bug in some 11c's) would count. I would not count the practical limits based on the number of digits of precision a calculator has and any unavoidable rounding that this would cause. Thus, a good 10-digit calculator and a good 12-digit calculator would score equally. I would also exclude any keyboard, switch or battery problems, as they are mechanical or electrical rather than algorithmic in nature, unless they were so pervasive as to make the model unsuitable for general use.

Models with errors that I have experienced or seen reported: 35, 21, 25(c), 11c(at least some of them), 15c, 32sii, 33s, 35s, 42s, 50g. What about the Spice series or the 32s? I have not heard of any errors in those.

in response to message #2 by John B. Smitherman

Thanks, that is where I saw some bugs reported. However, some models with errors do not have them indicated in their entries.

is it possible to "merge" an HP-42s into an HP-97 ?

*Message #1 Posted by **Giovanni Jimenez** on 10 Feb 2012, 4:37 p.m.*

I believe the HP-42s is one of the most versatile and powerful calculators by HP, and that the HP-97 has the best “layout” in terms of keys and size as a desk calculator, so I am wondering if it would be possible to combine these 2 jewels into one calculator.

My idea is to make this as simple as possible, which to me means physically installing an HP-42s inside and HP-97 and connect them (though a microprocessor maybe?), and map the keys on the HP-97 to get the Hp-42s results, on a modified double line LCD screen. For ex, when you press the [e^x] key (3rd row, 3rd column on the HP-97 keyboard), internally you are really “pressing” f^ [LN] (1st row, 5th column on the HP-42s).

I understand that there are many challenges like how to account for all those functions on the 42s not present on the HP-97 (for ex [Catalog]), but there are also some functions on the HP-97 not present on the HP-42s that could be remapped (like [Write data], or [Merge]). The idea would be to make the Printer and Magnetic Card Reader operationally as well.

I am sure that someone with the right training, experience and tools would be able to do it (and I suspect there are many skillful enthusiasts in this forum).

I am ready to offer my HP-42s and my HP-97 as “guinea pigs” for this project, and if it is successful, the brave person who makes this transformation can get either my (2nd) HP-97 or HP-42s, or some monetary reward to be determined.

Giovanni

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #2 Posted by **Donald Williams** on 10 Feb 2012, 4:51 p.m.,*
in response to message #1 by Giovanni Jimenez

Sorry. Beyond my abilities, but maybe I can find some help.

Hey guys!

He wants a "Desktop", "Modified", "WP-34S".

When can you start?

*Message #3 Posted by **Marcus von Cube, Germany** on 10 Feb 2012, 5:46 p.m.,*
in response to message #2 by Donald Williams

Give us the hardware!

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #4 Posted by **Giovanni Jimenez** on 10 Feb 2012, 8:12 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Marcus

If you are serious, I can send you the hardware (if by that you mean the HP-97 and the HP-42s). Just say the word.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #5 Posted by **Marcus von Cube, Germany** on 11 Feb 2012, 7:08 a.m.,*
in response to message #4 by Giovanni Jimenez

Not the way you are thinking. Just butchering two vintage calcs will not produce anything useful. I was thinking of a neat desktop platform with a modern processor and decent display so that we can start porting our firmware to it. A desktop version of Eric's design with a big rechargeable battery and USB for desktop connection and charging would be fine. Adding a printer wouldn't hurt either. :-)

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #6 Posted by **Barry Reeves** on 10 Feb 2012, 4:52 p.m.,*
in response to message #1 by Giovanni Jimenez

This sounds like a job for Dr. Frankenstein.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #7 Posted by **marais** on 10 Feb 2012, 5:17 p.m.,*
in response to message #6 by Barry Reeves

I often thought that the 97 should be a good platform for refitting with a modern CPU.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #8 Posted by **Paul Dale** on 10 Feb 2012, 6:37 p.m.,*
in response to message #1 by Giovanni Jimenez

Wouldn't it be better to get a small single PCB computer, put that in the 97 case along with a power supply and run a version of free 42?

- Pauli

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #9 Posted by **Giovanni Jimenez** on 10 Feb 2012, 8:11 p.m.,*
in response to message #8 by Paul Dale

Interesting. What "small single PCB computer" could do the work ?

And who would be able to do it ?

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #10 Posted by **Katie Wasserman** on 10 Feb 2012, 10:04 p.m.,*
in response to message #9 by Giovanni Jimenez

Take a look at this article I wrote. I added a somewhat modern but very limited microcomputer to a 97 and programmed it to take control of the keyboard when needed and do some simeple stuff.

It's not really what you're asking about because it's totally dependent on the existing processor in the 97, but it will at least explain the keyboard scanning. It would be easy to rip out the guts of a 97 and replace it with a fast processor that scans the keyboard and runs the display. (I've done exactly this on a broken HP-21 making it into a simple integer calculator.) Printing would probably not be that hard either. Porting all the 42s functionality over and having it work on an extremely limited display is another story.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #11 Posted by **marais** on 11 Feb 2012, 3:26 a.m.,*
in response to message #10 by Katie Wasserman

I would not want to keep the original display, but rather replace it with a DL1416B (or the HP equivalent) alphanumeric LED display. The size matches the original display. The tough parts really are the printer and the card reader. Are they sufficiently documented?

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #12 Posted by **Giovanni Jimenez** on 11 Feb 2012, 2:22 p.m.,*
in response to message #11 by marais

Marais, I agree that part of the improvement should be to install a new LCD multiline screen. The HP-42s has 2 lines, but 4 wouldn't hurt.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #13 Posted by **Steve Leibson** on 10 Feb 2012, 9:15 p.m.,*
in response to message #8 by Paul Dale

It looks as though Atmel has an eval/dev board for the ARM7 processor used in the retargetable calculators. The board's pricey at $100 but provides breakout access to the processor's I/O for a prototype. That board could take modified WP 34S code that's suitably altered to scan the HP 97 keyboard and drive the LED display. Once the code is written, creating a low-cost circuit board with just the needed parts is an easier proposition.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #14 Posted by **Paul Dale** on 10 Feb 2012, 9:53 p.m.,*
in response to message #13 by Steve Leibson

I wouldn't bother with something custom. Find a microATX or small device -- you get a full fledged PC in a small form factor. Install a basic operating system -- DOS, Linux or even Windows.

Hook up the keyboard -- I'd use an IPAC or equivalent to connect the switches to the keyboard port on the PC.

The only remaining thing is the screen, no ideas here but I'm sure something is available.

Finally modify the free42 software to handle the keyboard mapping and display and set it to start on

boot.

The end result wouldn't be battery operated but given the size of the 97's case, this doesn't seem like much of a problem.

- Pauli

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #15 Posted by **Marcus von Cube, Germany** on 11 Feb 2012, 7:21 a.m.,*
in response to message #13 by Steve Leibson

I wouldn't bother with the AT91SAM7L which is fine for a power constrained device such as the 30b or 12C but wouldn't be suitable for a desktop machine. We are constantly working on saving space here and there to be able to enrich WP 34S. On a platform with more power and memory this would be much less of a chore.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #16 Posted by **Donald Williams** on 11 Feb 2012, 2:39 a.m.,*
in response to message #8 by Paul Dale

Pehaps this

Raspberry PI

Model A approx $25.00.

The concept is to run Linux on-board so a Free 42 native application might be possible. I guess a GPIO hack for keyboard and display is also feasible. Not much documentation to date, but tantalizing block diagrams. I confess this is not in my area of expertise so better minds than mine could discredit this hypothesis.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #17 Posted by **Howard Owen** on 11 Feb 2012, 3:26 p.m.,*
in response to message #16 by Donald Williams

Want!

An initial run of 10,000 will probably vanish. They aren't taking pre-orders.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #18 Posted by **Eric Smith** on 11 Feb 2012, 5:59 p.m.,*
in response to message #16 by Donald Williams

It's an interesting product and the price is certainly good, but I don't think it will make a good calculator. From 6 AA cells, the battery life will be more like that of a cell phone than a calculator.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #19 Posted by **Donald Williams** on 11 Feb 2012, 9:14 p.m.,*
in response to message #18 by Eric Smith

I was thinking "Desktop". No need for portability.

Re: is it possible to "merge" an HP-42s into an HP-97 ?

*Message #20 Posted by **David Griffith** on 11 Feb 2012, 2:59 a.m.,*

the end of the world as we know it....

*Message #1 Posted by **troy** on 10 Feb 2012, 1:24 p.m.*

fellow forum members,

i just want to share an experience: i almost had a coronary the other day. i went to my lab class to help out the TA; i now always bring my 15c LE with me anywhere i go. left about an hour later and got back to the office and did some work. when it was time to go home, i was checking my pocket but could not find the 15c. it was too late to go back to the lab---already closed---and i was not sure if i actually left it there. double checked my office, backtracked my steps and checked every nook and cranny i could think of. but alas! no sign of the 15c.

i went home and complained to my wife that i just lost my beloved 15c. "don't worry, it'll show up at lost and found. nobody knows how to use it." i guess that's the silver lining.

as for me, i could not wait for the night to be over so i can go back to the lab and check if it's in the lost and found. and what do you know? holy of holies, it was there!

too much melodrama, no? :)

on a different note, somebody posted on the 15c facebook page about calling HP support and getting the info that there will likely be no more runs of the 15c LE. i guess the mayan predictions are coming true, huh?

have a good weekend everyone.

Re: the end of the world as we know it....

*Message #2 Posted by **Jan** on 10 Feb 2012, 6:25 p.m.,*
in response to message #1 by troy

"on a different note, somebody posted on the 15c facebook page about calling HP support and getting the info that there will likely be no more runs of the 15c LE"

I would have no problems with that, provided HP takes the 15C into production again as a regular model. It's simply a fantastic calculator.

My 15C LE has finally arrived...

*Message #1 Posted by **Antonio Petri (UK)** on 10 Feb 2012, 12:21 p.m.*

CNA151011Z; LE No 17906 for the record. All keys work ok and the PSE bug too :) I must say that, having bought all my HP calculators I have owned so far (total of 10) between 1979 and 1989, the keyboard of this unit is a bit odd. The keys feel so hollow and thin at the touch that they give the impression I could easily puncture them with a needle. But, apart from that, I am happy with this calculator and, given that I have bought it to use it daily and not to keep it in a drawer, I hope it will offer a good and reasonably long service.

that makes 2 of us

*Message #2 Posted by **Jan** on 10 Feb 2012, 3:24 p.m.,*
in response to message #1 by Antonio Petri (UK)

Same here. Mine arrived today as well. All systems go (yes, that includes the PSE-bug). Limited edition number: 17910 (odd how units with LE-numbers that close can end up in different places like the UK and The Netherlands). I like the keyboard actually. Indeed, the keys give a somewhat hollow impression (in fact they ARE hollow, if I am well informed) but the typical HP-click is much more pronounced than in the Voyagers of yesteryear. Only time will tell (my unit is for every-day use as well) but the 15C LE seems quite robust (shall I try Bill Hewlett's drop test or not?). The only issue is that there is a very small dent in the front-plate of my unit but I can live with that. And then there is my obsession: SPEED. Lovely to see an integral that takes minutes on a regular 15C being crunched in an instant. My advice to HP: consider the possibility of making this "new" 15C a part of your regular product portfolio (remove the bug(s) though). It's worth it and I think there is a market for it (IMHO). Anyway, it's a nice machine and my special thanks go to Tim Wessman and the rest of the guys involved for making it possible.

Re: that makes 2 of us

*Message #3 Posted by **Antonio Petri (UK)** on 10 Feb 2012, 4:13 p.m.,*
in response to message #2 by Jan

Yes, I would really like to see this 15C being part of the regular catalog. The speed is impressive indeed. IMHO, this is, at present, the best RPN scientific, non graphic, calculator and it should be regularly available. The HP 35S is good too, but the form factor and the Matrix operations (and perhaps the speed too? I haven't got a 35S so I cannot compare) makes the 15C much more attractive even if it lacks some of the functionality of the 35S. I had signed the 15C petition quite a long time ago, but I was almost certain it would have been ignored. Thank you HP for proving me wrong!

Re: that makes 2 of us

*Message #4 Posted by **Marcus von Cube, Germany** on 10 Feb 2012, 4:40 p.m.,*
in response to message #3 by Antonio Petri (UK)

You should have a look at WP 34S (try the emulator first)! It's the most powerful RPN programmable you can find at the moment.

Re: that makes 2 of us

*Message #5 Posted by **Antonio Petri (UK)** on 10 Feb 2012, 5:29 p.m.,*
in response to message #4 by Marcus von Cube, Germany

I know it would be by far the most powerful RPN calculator to buy if it was available as an off the shelf product. But there are too many steps to go through to have one up and running and at moment I am a bit lazy! :) Anyway, It is a great project and you guys have done and are doing really an outstanding job.

Re: that makes 2 of us

*Message #6 Posted by **Bart (UK)** on 11 Feb 2012, 5:34 a.m.,*
in response to message #5 by Antonio Petri (UK)

WP34s package at a European supplier

Re: that makes 2 of us

*Message #7 Posted by **Antonio Petri (UK)** on 11 Feb 2012, 9:22 a.m.,*
in response to message #6 by Bart (UK)

Ok, that's interesting. Still need to stick the overlays on the 30B, but I might give that chore to my 15 years old son as a first step into RPN...

Re: that makes 2 of us

*Message #8 Posted by **Bart (UK)** on 11 Feb 2012, 9:33 a.m.,*
in response to message #7 by Antonio Petri (UK)

At least you won't have to worry about software installions on a PC, a programming cable, serial port or USB->serial converter (although the excellent FTDI units are useful for connecting other serial-based products to a USB only PC too) etc.

And if shipping to Spain is too expensive when you need an update, I'd be willing to flash it for you so it will only cost local postage.

Edited: 11 Feb 2012, 9:36 a.m.

Re: that makes 2 of us

*Message #9 Posted by **Antonio Petri (UK)** on 11 Feb 2012, 10:11 a.m.,*
in response to message #8 by Bart (UK)

Thank you for the offer. I think that, if HP drops RPN, in the future the WP34S will be the only choice. I always wondered why HP has been unable to to promote properly RPN. I remember the AOS guys back in time trying to prove their point and then failing all the time to beat me in calculating correctly a complex numerical expression with a TI.

Re: that makes 2 of us

*Message #10 Posted by **Jan** on 10 Feb 2012, 6:21 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Well, with the HP20/30 serving as a "mothership", the formfactor of the WP 34S is less attractive in my view and (equally important) less handy. One of the main virtues of the voyager-design are its compact size and elegant dimensions (which could very well be one of the reasons the 12C gained such a popularity in the financial community (where looks are sometimes even more important than actual performance)). Being true shirt-pocket calculators, the voyagers are just convenient to carry around. Would it be a suggestion to repurpose the 12C into a scientific in the future? After all, for what I have heard the performance of the 34S is just great and in my opinion it deserves a better platform.

Re: that makes 2 of us

*Message #11 Posted by **Michael de Estrada** on 10 Feb 2012, 7:12 p.m.,*
in response to message #4 by Marcus von Cube, Germany

I just downloaded all the WP34S files and have the emulator up and running on my computer, so I'm going to play around with it for a while before I commit to hardware. Am I to assume that the emulator represents the latest version of the firmware ? The manual and emulator report version 2.2.

Re: that makes 2 of us

*Message #12 Posted by **Paul Dale** on 10 Feb 2012, 7:19 p.m.,*
in response to message #11 by Michael de Estrada

Grab the latest version from subversion directly. The download archive is the older v2.2 firmware.

We'll be putting together a v3.0 firmware download soon.

Re: that makes 2 of us

*Message #13 Posted by **Michael de Estrada** on 10 Feb 2012, 7:34 p.m.,*
in response to message #12 by Paul Dale

Sorry, but you lost me there. Can you provide a link ? Thanks.

Re: that makes 2 of us

*Message #14 Posted by **Paul Dale** on 10 Feb 2012, 9:58 p.m.,*
in response to message #13 by Michael de Estrada

It should be possible to download the files from: http://wp34s.svn.sourceforge.net/viewvc/wp34s/trunk/windows/bin/ You'll need to click on the *Rev* column to download the files.

To do this properly, you really want a subversion client. I don't remember what most people are using, although I'm sure someone will comment.

Or wait until the v3 release archive is produced -- soon hopefully.

- Pauli

Re: that makes 2 of us

*Message #15 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 10 Feb 2012, 5:19 p.m.,*
in response to message #3 by Antonio Petri (UK)

+1 Agreed with Marcus. If you need a very powerful, fast and everyday carry workhorse scientific calculator (non-graphic) try WP34s emulator, or repurpose a HP-20b/30b to WP-34s or two or three (can afford many).

Re: that makes 2 of us

*Message #16 Posted by **Jan** on 10 Feb 2012, 6:07 p.m.,*
in response to message #3 by Antonio Petri (UK)

Don't forget the complex-number capabilities of the 15C, which are far superior to those of the 35S.

Re: My 15C LE has finally arrived...

*Message #17 Posted by **Roger Blake** on 11 Feb 2012, 5:53 a.m.,*
in response to message #1 by Antonio Petri (UK)

My third HP-15C/LE has also arrived from wfsleath (first two were from Samson a few months ago.) Serial CNA1510118 and LEN 17915. No problems with keyboard, and as I've said before, unlike some other people, I think the keys on this model are absolutely fine and far better than the original, but each to his own taste I guess. What I do notice about the keyboard is the very slight flex when pressing keys hard, almost insignificant, but the original didn't suffer from this Same firmware date as others but manual is now Edition 2.4 Sep 2011 with correct self-test information. The case is poorer than the first two models :-(Slightly thinner and slightly glossier material, also mine is all creased up and doesn't look nice at all. The first two I was quite happy with. May treat myself to one of those leather cases advertised on Ebay ...

Re: My 15C LE has finally arrived...

*Message #26 Posted by **Rob Willett** on 15 Feb 2012, 6:43 a.m.,*
in response to message #25 by Roger Blake

Well my HP 15C LE (no 17301) turned up yesterday. A nice man from Sleuth rang me and asked for confirmation I still wanted it and needed a credit card number from me. I was rather touched and surprised about the personal element.

Turned up yesterday, very well packaged.

Unpacked, opened, turned it on and starting using it. Sitting in front of me on my desk at work. Not really used it any anger.

The keys feel firm to my touch with a slight looseness around the f and g key, but to be honest, I wouldn't have noticed if I hasn't checked specifically. Compared to my HP35S (which now looks SOOOOOOOO big) the keys seem fine. The calculator looks smart and exactly how I would expect it to.

The case feels a little flimsier than the original case (but thats from memory).

It feels odd looking at a brand spanking new HP 15C.

I might now sell my HP 35S. Any interest?

Rob.

Re: My 15C LE has finally arrived...

*Message #27 Posted by **Derek Walker (UK)** on 15 Feb 2012, 8:57 a.m.,*
in response to message #26 by Rob Willett

My two have now arrived from Sleath's as well, one Monday and one Tuesday, apparently due to an error when the first was sent, but rectified with no trouble.

To my relief, both passed the keyboard test, I'd say if anything the key click is slightly more positive than either my HP35s or 2007 vintage 12C. The case fit is tighter than the 12C, but not enough to be a problem.

LE numbers are 16110 and 17647, both with 2011 week 51 serial numbers. The LE numbers I've seen posted seemed to jump from up to 3000 for the first (US) batch, to 10000+ for all the subsequent ones, I wonder what happened to the ones in the gap, does anyone have one? I suppose the post-recall batch might have been re-numbered, but I would have expected that to be done with the serial numbers not the LE numbers.

Despite the PSE issue and others, I'm still very pleased to have a scientific Voyager on the desk in front of me, not something I ever really expected to see without a big investment via TAS.

Re: My 15C LE has finally arrived...

*Message #28 Posted by **Michael de Estrada** on 15 Feb 2012, 11:46 a.m.,*
in response to message #27 by Derek Walker (UK)

There are plenty of USA suffix ABA units with LE #s between 3000 and 10000. All of these were produced in the same time frame as the first 3000, but were released later after going through additional QC to weed out the bad ones. These are all distinguished by having a seal on the outer plastic package and an errata sheet for the self-tests. I bought 3 of these with LE #s 6487, 6915 and 7117, and they all had date codes 132. There are also reported to be a few replacements with LE #s in the 10000 to 13000 range, presumably for the ones that were discarded. So, it appears that 10000 were made for the USA market and less than 20000 all told

for the world market. At this time it appears that the entire USA market is secondary.

*Message #29 Posted by **Derek Walker (UK)** on 16 Feb 2012, 2:42 a.m.,*
in response to message #28 by Michael de Estrada

Thanks for the info', I'd missed that the later US batch had those numbers. The current European models also have the seal, but get a manual with corrected self tests.

In Britain, I'm only aware of one retailer offering the 15CLE so far (stock only arrived here last week), and they had around a dozen available in stock after fulfilling pre-orders.

Calculators Direct are now also offering the 15C LE.

I noted that Sleath's stock went down from 15 on Monday to 10 today - that's faster than what I've seen their stock go down on other HP calcs.

edit: What's interesting is that neither are selling the 12C 30th AE (I remember they did seem to have stock of the 12C Plat 25th AE well into 2010 - a slow seller?).

Which Italian seller did you buy it from? This is the first hp calculator I have bought outside Italy. I used to buy calculators from a shop and also have the possibility to try few of them before buying one, so there was no chance to get a defective one. I can't do this anymore, it seems you can only buy online now.

Re: My 15C LE has finally arrived...

*Message #33 Posted by **Antonio Maschio (Italy)** on 17 Feb 2012, 4:48 a.m.,*
in response to message #32 by Antonio Petri (UK)

I couldn't try my model before buying it, but it seems perfect, apart the rattling of the 'f' and 'g' keys.

I could write here the shop's mail, if I was sure I can. But if you are in a hurry, write me privately, and I'll transmit it to you. In the meantime, I can get some info, and if they let me, I'll share this shop with MoHPC, although I cannot believe an Italian small shop in a peripehrical small town can beat any UK shop... ;-)

Ciao!

(scrivi pure in italiano, se mi scrivi privatamente...)

[WP-34s] 30b for 18,99€ in Germany

*Message #1 Posted by **Alexander Oestert** on 10 Feb 2012, 4:16 a.m.*

Maybe intersting for future WP-34s conversions:

Do an ebay search for NW238AA, there is a brand new 30b to be had for 18,99€, free shipping in Germany.

I'm not the seller and am not affiliated to them in any way. The first one I bought was already delivered, so I purchased a second one before posting this here. ;-) I did not test the other item that comes up for 17,10€.

If you feel this posting to be inappropriate, I will delete it.

Edited: 10 Feb 2012, 4:19 a.m.

Thank you for the heads-up (sometimes it has its benefits to be sitting at home in standby-status...)! There is even a seller who has it 17,10 Euros including shipping, just finished clicking "Buy Now!".

Unfortunately, I will not be able to convert it to anything else as all the necessary software does not run on my Macintosh, if I understand correctly.

Regards, max

You can flash from a Windows XP virtual machine running on your Macintosh. This is what I do and it works fine.

We have plan to support flashing from any platform but I cannot tell you when it will be available.

As Pascal has already stated Parallels or other virtualization software running Windows XP works fine. If you do not want to install such an environment I can do the flashing for you. Mail me if you are interested.

Re: [WP-34s] 30b for 18,99€ in Germany

*Message #5 Posted by **Maximilian Hohmann** on 10 Feb 2012, 6:00 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Thanks Pascal and Marcus for your replies,

as old-fashioned as I am with my calculators, I am also with my computers... no parallels desktop here, my PowerBook still runs on a trusted G4 processor (but no red LED display, I'm afraid :-)) Recently I feared that it's time has finally come when the Video RAM failed, but I found a repair wizard over the internet who replaced (or resoldered?) it again for a fixed price of 100 Euros (cheeeeap compared to the alternative of having to buy the current 17" MacBook Pro for 2500 Euros...).

I think I could do the flashing at the office, but the PCs have all been upgraded to Windows 7 recently, will that work?

Re: [WP-34s] 30b for 18,99€ in Germany

*Message #6 Posted by **Marcus von Cube, Germany** on 10 Feb 2012, 8:08 a.m.,*
in response to message #5 by Maximilian Hohmann

The MySamba utility should work under Windows 7. I have yet install my Windows 7 copy in another virtual machine on my iMac and try.

Re: [WP-34s] 30b for 18,99€ in Germany

*Message #7 Posted by **pascal_meheut** on 10 Feb 2012, 10:50 a.m.,*
in response to message #6 by Marcus von Cube, Germany

Never worked for me under Windows 7 virtualized but it may be a driver problem with the USB->Serial adapter I'm using.

Also, the new emulator works under MacOSX but not on G4.

Re: [WP-34s] 30b for 18,99€ in Germany

*Message #8 Posted by **Bob Cortopassi** on 10 Feb 2012, 11:49 a.m.,*
in response to message #5 by Maximilian Hohmann

MySamba has worked perfectly for me in Windows 7 Professional using an FTDI USB->Serial converter I purchased from Eric Rechlin here.

Good luck!

Might be a better deal (If you need more than one)

12C has keyboard problems, too

*Message #1 Posted by **Eric Rechlin** on 10 Feb 2012, 1:17 a.m.*

It looks like it's not just the 15C LE that has problems with keys in the keyboard not working properly. I just grabbed a brand new 12C (just opened the packaging, serial number 4CY1300M4V), and its [PV] key doesn't register unless you press it really hard.

Anyone else seeing problems with recent 12C keyboards, too?

Eric

12C has keyboard problems, too

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 10 Feb 2012, 1:39 a.m.,*
in response to message #1 by Eric Rechlin

Eric, here is my experience with HP-12C keyboards: Purchased a 12C from a local electronics store in Santa Clara about 5 months ago which had a defective ENTER key, went back to replaced it with another one and checked the new one in front of the customer service which was also defective. We went through ALL 6 units in the store (Brand New) which had defective keyboards, 2X ENTER Key, PV, PMT, 5, +. So I drove to another store in San Jose which had 7 in stock. ALL HP-12C's except one had issues with Keyboard. 12 Bad ones and one good one, 8% Yield. Also my 30th Anniversary 12C (from HP EPP store) has a bad sigma and + key but too frustrated with HP to replace it. No more new HP calculators unless I can test the keyboard before I purchase it.

Edited: 10 Feb 2012, 1:40 a.m.

Re: 12C has keyboard problems, too

*Message #3 Posted by **Paulo MO** on 10 Feb 2012, 3:45 a.m.,*
in response to message #1 by Eric Rechlin

Some 5 months ago, I got a 12c+ from you (4CY11705LP). Bad ENTER key, bad "1" key, unsatisfying keyboard overall.

In another thread on this forum, some three months ago, we seem to have reached the empirical conclusion that calculators from 4CY have lower quality keyboards than calculators from the other factory (CNA). They can easily be recognized by a slightly different key font, and, notably, by the uncommonly large "%" key sign see here and here .

In my case, after many contacts and much frustration with an incredibly inefficient HP costumer service (Brasil), I decided to open the calculator. It turns out that the circuit board was not sufficiently pressed down by the heat stakes. I thus introduced a felt pad on the "bad key" region, so that the back panel would slightly push the board down. Both keys are now working fine. It still is an overall lower quality keyboard, though :-(

The 15 LEs seem to be produced only on the CNA factory. That is probably why the general feel of their keyboard is always good. But, as we all know, problems with particular keys exist there, also.

Paulo

Re: 12C has keyboard problems, too

*Message #4 Posted by **Bob Cortopassi** on 10 Feb 2012, 11:45 a.m.,*
in response to message #3 by Paulo MO

Of my recent production HPs, only one has keyboard issues, and that's actually a 30b.

- 12C - 4CY fine
- 35S - CNA fine
- 15C LE - CNA fine
- 30b - 4CY fine
- 30b - 4CY inconsistent) key

Maybe there really is a rhyme/reason to this, but it seems to me like common low-cost, average reliability Chinese manufacture.

In my experience, HP has been on par or better than their peers in this area.

Re: 12C has keyboard problems, too

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 10 Feb 2012, 11:52 a.m.,*
in response to message #3 by Paulo MO

I opened up one of the defective units with defective PMT and PV keys, no click, hard to press and difficult to respond. Removed the heat stakes holding the keyboard and found out that there is rubber pad between the keyboard and the keypad.

HOWEVER the rubber pad was almost 1/4"-1/2" bigger than its intended space so in order to fit the pad, it was wrinkled and somewhat folded into the space between the keyboard and the keypad. The keys over the folded/wrinkled areas of the pad failed to work properly thus required more force to press and didn't click. I was able to cut strips of that rubber pad in order to reduce the size to fit and put the keyboard back on using small screws. All keys worked fine. I am not sure all the problems on HP-12C keyboard were caused by this issue but at least one was.

Re: 12C has keyboard problems, too

*Message #6 Posted by **Steve Fennell** on 10 Feb 2012, 3:01 p.m.,*
in response to message #1 by Eric Rechlin

So far no issues with my 30th 12C. Serial number starts with CNA. Also have three 15C LEs with CNA serial numbers and no keyboard issues. Maybe the 4CY plant?

Re: 12C has keyboard problems, too

*Message #7 Posted by **Ernst Fueloep** on 10 Feb 2012, 4:08 p.m.,*
in response to message #1 by Eric Rechlin

Yes, I have bought a new HP-12C with serial 4CYxxxx and the 1 key and 9 key have to be pressed very hard to be recognized.

The calculator is basically unusable in this condition.

I have contacted HP support and wait for an answer. Hopefully they will replace it.

HP's Tired Basic Calculator Line

*Message #1 Posted by **Jeff** on 9 Feb 2012, 2:29 p.m.*

A few years ago HP introduced a new lineup of home and office calculators that looked kind of, well, ugly.

They've gotten rid of a bunch of them, but what's there now is less than inspiring.

I wonder if HP is giving up on them, or if they plan to spruce them up a little.

The scientific and financial ones are fine, but having a good shirt pocket unit is handy, as well.

http://www.shopping.hp.com/webapp/shopping/can.do?landing=calculator&category=Office&catLevel=1&storeName=storefronts&jumpid=in_R329_prodexp/hhoslp/psg_ipg/calculator/Home_&_office_calculators

HP-80 Function Question

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 9 Feb 2012, 1:52 a.m.*

I recently obtained a HP-80. While experimenting with various functions, I noticed that consecutive presses on (Yellow Shift)+(dot) changes the X value and the stack. Seems like doing some calculation, however couldn't find any information in the manual or elsewhere what type of function it is performing. Any idea? Thanks.

Re: HP-80 Function Question

*Message #2 Posted by **Ignazio Cara (Italy)** on 10 Feb 2012, 3:00 p.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

The result is the same as SIGMA+, and there are nothing in the user's manual, if I remember well.

You can make some test to verify the results in the stack:

Reg X SUM of data;

Reg Y Num of data;

Reg Z SUM of X^2;

Reg T the same of Y reg.

HTH

Ignazio

Edited: 10 Feb 2012, 3:02 p.m.

Re: HP-80 Function Question

*Message #3 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 10 Feb 2012, 4:27 p.m.,*
in response to message #2 by Ignazio Cara (Italy)

I was suspecting that however, after total clear: Pressing shift+dot generates: 0 1 2 3 5 11 26 66 227

Pressing sigma+ generates: 0 1 0 -1 -3 -5 -8 -20 -57 -158

Re: HP-80 Function Question

*Message #4 Posted by **Gerson W. Barbosa** on 10 Feb 2012, 7:51 p.m.,*
in response to message #3 by Kerem Kapkin (Silicon Valley, CA)

That's what shift-dot does on the HP-80, whatever it is, starting from a clear stack:

```
T: 0 0 0 1 5 14 39 160 836 5192
Z: 0 0 0 1 5 14 39 160 836 5192
Y: 0 1 1 1 2  6 15  40 161  837
X: 0 0 1 2 3  5 11  26  66  227
```

Here is a BASIC program that produces the contents of stack registers X and Y:

```
 5 CLS
10 A = 0: B = 0: X = 0: B = 1
20 PRINT X;
25 IF X > 100000 THEN END
30 C = A + B
40 D = B + X * X
50 X = A: A = C
60 Y = B: B = D
70 GOTO 20

0  0  1  2  3  5  11  26  66  227  1064  6257  62979  1251797
```

Re: HP-80 Function Question

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 11 Feb 2012, 2:27 p.m.,*
in response to message #4 by Gerson W. Barbosa

An interesting function. I wonder if HP was thinking about another financial or statistical function which later they decided not to include thus never made it to the keyboard. I am still trying to figure out what this calculation could be used for, expecially given the numbers displayed as an integer.

Re: HP-80 Function Question

*Message #6 Posted by **Gerson W. Barbosa** on 12 Feb 2012, 1:01 a.m.,*
in response to message #5 by Kerem Kapkin (Silicon Valley, CA)

Interestingly most of the first few terms are prime numbers:

```
1  2  3  5  11  26  66  227  1064  6257  62979  1251797
```

The next five terms are composites, however:

```
#include <iostream.h>
int main()
{
  unsigned __int64 a = 0, b = 1, c, d, x=0, y=0;
  a = 0; b = 1; x = 0; y = 0;
  for (char i = 1; i <=19; i++)
  {
    cout << x <<" ";
    c = a + b;
    d = b + x*x;
    x = a;
    a = c;
    y = b;
    b = d;
  }
  printf("\n\n");
  system("pause");
  return 0;
}

0 0 1 2 3 5 11 26 66 227 1064 6257 62979 1251797 41590664 4048283972 1575050706489 1732929385089902 16392067401671570099
```

RPL in exact mode on the HP 50g will handle those large numbers more easily than C++ though.

Update:

Yes, better on the HP 50g. No more primes, however. At least up to the 30th term:

```
\<< 0 1 0 { } 5 ROLL 1 SWAP
```

```
  START
    OVER + 4 ROLLD SQ OVER + UNROT OVER + UNROT 4 ROLL
  NEXT
  NIP NIP NIP
\>>
```

```

Re: HP-80 Function Question

*Message #7 Posted by **Thomas Klemm** on 13 Feb 2012, 6:32 p.m.,*
in response to message #6 by Gerson W. Barbosa

Yet another implementation using Python:

```
def diff(xs):
    y = xs.pop(0)
    ys = []
    for x in xs:
        ys.append(x - y)
        y = x
    return ys

x, y, z, t = 0, 0, 0, 0

xs = []
for i in range(10):
    x, y, z, t = x + y, z + 1, t + x**2, t + x**2
    xs.append(x)
```

```
print xs
dxs = diff(xs)
print dxs
d2xs = diff(dxs)
print d2xs
```

I calculated the difference between sequent elements:

```
[0, 1, 2, 3, 5, 11, 26, 66, 227, 1064]
[1, 1, 1, 2, 6, 15, 40, 161, 837]
[0, 0, 1, 4, 9, 25, 121, 676]
```

This shows that the 2nd difference is the same as the initial sequence squared and shifted.

Or as a recursive formula: $x_{n+3} = 2\,x_{n+2} - x_{n+1} + x_n^2$ together with the initial values: $x_0=0$, $x_1=1$, $x_2=2$.

This leads to the simple program:

```
x = [0, 1, 2]

for n in range(10):
    x.append(2*x[n+2] - x[n+1] + x[n]**2)

print x
```

... which produces the same result:

```
[0, 1, 2, 3, 5, 11, 26, 66, 227, 1064, 6257, 62979, 1251797]
```

I've tried in vain to use *WolframAlpha* to find a closed form. So I'm afraid there isn't.

Cheers
Thomas

It's not in OEIS either.

Regards,

Gerson.

Re: HP-80 Function Question

*Message #9 Posted by **Thomas Klemm** on 14 Feb 2012, 3:09 a.m.,*
in response to message #8 by Gerson W. Barbosa

> Quote:
>
> It's not in OEIS either.

You may ask them to add it. I wonder if they'll accept it.

Since after the first step of the recursion $t' = z'$ we can just forget about t:

```
  1. z' = z + x^2
  2. y' = z + 1
  3. x' = x + y

x''' = x'' + y''
y''  = z' + 1 = z + x^2 + 1
x''  = x' + y' => x'' - x' = y' = z + 1

x''' = x'' + x'' - x' + x^2
     = 2 x'' - x' + x^2
```

Just in case somebody might not believe that two sequences are equal when they agree on the first few elements.

Cheers
Thomas

Re: HP-80 Function Question

*Message #10 Posted by **Thomas Klemm** on 13 Feb 2012, 6:57 p.m.,*
in response to message #3 by Kerem Kapkin (Silicon Valley, CA)

This is my understanding what both operations *sigma+* and *shift dot* do:

```
T: T + X^2
Z: T + X^2
Y: Z + 1
X: Y + X
```

However *sigma+* seems to change its mind if you don't enter a number and starts to calculate the following instead:

```
T: T - X^2
Z: T - X^2
Y: Z - 1
X: Y + X
```

I filled the stack with *1*:

sigma+:

```
T: 1    2   -2  -18  -43
Z: 1    2   -2  -18  -43
Y: 1    2    1   -3  -19
X: 1    2    4    5    2
```

shift dot:

```
T: 1    2    6   22   71
Z: 1    2    6   22   71
Y: 1    2    3    7   23
X: 1    2    4    7   14
```

I can't help but I think you just found a bug. Try the following:

```
shift CLEAR
7
STO
sigma+
RCL
sigma+
mean
```

You'll get blinking *9.999999999 99* instead of *7*. But you get the correct result when using *shift dot* instead.

Kind regards
Thomas

Re: HP-80 Function Question

*Message #11 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 14 Feb 2012, 2:09 a.m.,*
in response to message #10 by Thomas Klemm

Dear Thomas and Gerson,thank you very much for your responses and detailed analysis. I will use your directions and further experiment with this function. I have been away from my HP-80 last couple days. I also noticed that the sequence you enter the numbers (PV first vs n first) for PMT calculation gives different results. This may be due to limited number of registers HP-80 has and trying to utilize the stack as much as possible in order to solve the equation. I have feeling that shift dot is executing some sort of a subroutine which is being used as part of this solver, although it does seems like a bug since under the right conditions works better than the sigma+ function. Your responses have been very helpful, I have much more to think about now. Sincerely.

OT - Vintage Computer Festival May 5,6, Wall NJ

*Message #1 Posted by **David Hayden** on 8 Feb 2012, 11:27 p.m.*

I just received an email saying that the Vintage Computer Festival will be May 5 and 6 this year at the InfoAge center in Wall, NJ. I attended the last one 2 years ago and it's a lot of fun. In addition to the Festival itself, the InfoAge center is on the site of the Marconi transatlantic telegraph receiving station. I believe this was the first transatlantic telecommunications available. They have a great radio museum and several other exhibits.

Choices, choices

*Message #1 Posted by **Geir Isene** on 8 Feb 2012, 5:54 p.m.*

The EVAL program I just created may or may not be of interest to you, but I would like to present a possibly neat way of using "dynamic" menus on the HP-41. The menu (top row of labels) changes depending on the context to make better use of the top labels and make the program more user friendly.

The program itself makes it easy to make a requirement specification and then pitch cases against that specification to get a total score of how well a case fits the bill.

Link to my blog post about the program.

Spice repair - dilemma & opinions, please

*Message #1 Posted by **McAllan** on 8 Feb 2012, 4:09 p.m.*

Hi

I do a bit of calculator collecting and mostly the machines I have in my collection I've repaired one way or the other so normally I've no bigger troubles here almost no matter what's wrong but the HP spice series seems to be the exception.

I got the following two half to/or fully defective ones. A 38E from '79 and a 32E from '82.

Lets start with the 38E. The zero-key does not respond - the keyboard is made of flexible plastic and so is the "PCB" the four chips are not soldered. I've tried cleaning the contact but no luck. I can short the traces near the contact point to the key which results in a zero so no defective ICs. Otherwise in great not very used condition and all other keys work. Do you think it's possible to repair the keyboard with conductive paint? Something tells me it's expensive and perhaps other keys are on their way to eternity too and because of construction they're as good as unreachable unless they're edge keys.

The 32E on the other hand is very well used, display glass not intact but based on past experience I might be able to fix it acceptable. However I cannot get it to work - it seems just dead. I wonder if the inverter could be the case. Is there a common fault in these I can look for? I've tried to measure for shorted transistors but no obvious defective one as far as I can tell from my multimeter on diode setting. Also the 32E is with a normal PCB and constantly messing with the inverter put stress on the soldered ribbon cable.

Another possibility. Which of the two do you consider the most interesting/valuable model? One has a nice PCB with decent "klixon" or what to call them style buttons, the other one an intact glass. The 38E worked flawlessly when I got it but some very occasional light use later the zero is not working. So my heart says the 38E even though I'm mostly a mathematical guy. Also I loved the date arithmetic. Btw. so far I can tell it's functionally and performance wise identical to the original/normal 12C. But It can very well be you say the 32E is more scarce so should repair that first.

My first though is to take the PCB from the 32E. It seems identical to the non solder "PCB" of the older 38E and it even got the room for the 3 small ICs while the 32E only populates two. So unsolder the ICs replace with those from the 38E. Reuse inverter from 38E (also because it's battery end isn't damaged by slight corrosion). Put the PCB in the 38E. As far as I can see closely comparing the outer shells of the 38E and 32E they seems 100% identical so it should be very doable - I have no trouble using a soldering iron. Yeah I "loose" a defective 32E which I btw. was given for free since I love old junk but gets a 38E with higher quality keyboard it should have had from the beginning. Oh and odds are the display is intact of the 32E so if buying one with defective segments it can be repaired - defective ones are cheaper ;) - exactly why most of my calculators have required some sort of repair or at least mostly a total clean w. total disassembly and shine up to look great again.

They must have had a lot of warranty issues since the newer is way better than the older. Without having tried the 32E functioning I believe it's almost on par with Ti SR-50(A) - functionally identical but of course the materials can differ. One can only wonder why many (all?) of their newer calculators use keys basically identical to the older 38E. IMHO that design should have been ditched at the design state. A much better choice would have been conductive rubber like many other things today and from the far east back then - with hard outer keys for quality

appearance - it's much more durable and when they make trouble a clean is usually all that's needed.

Edit: One last question. The big IC - I believe that's the CPU? Are they identical on the 38E and 32E? If so I can just use the one already on the 32E if it's not defective. Leaving one unsoldered for a spare part. That is of course if there's no risk the CPU may damage the ROMs from the 38E. Uf only I could get some life into the 32E...

Edited: 8 Feb 2012, 4:14 p.m.

*Message #2 Posted by **McAllan** on 9 Feb 2012, 3:41 p.m.,*
in response to message #1 by McAllan

Got the 32E to work. Was a bad connection.

But the dilemma still stands. Should I try to fix both or just combine the best parts to get a good one.

Does anyone know at which dates HP switched to making soldered versions of the spice series? Seems like defective ones of those will be good to keep an eye out for as spares for those with flexible non-solder boards gone bad.

Yeah not quite original. But IMHO better a working one than a paperweight ;)

HP 12C Production nmrs

*Message #1 Posted by **Dominique Deprez** on 8 Feb 2012, 2:43 p.m.*

Dear

I have 2 HP12C in my collection with the following numbers

USA 2749AQ7554 USA 2324AQ4570

Which one is the oldest and best produced ?

Thanks for informing me

Dominique

Re: HP 12C Production nmrs

*Message #2 Posted by **Jeff O.** on 8 Feb 2012, 3:15 p.m.,*
in response to message #1 by Dominique Deprez

Are you sure those are Q's and not 0's (zeros)?

Assuming they are zeroes, the 2324A unit is oldest, having been made in 1983. The other was made in 1987. As for "best produced", I believe that all units from the 1980's are regarded as high quality.

I agree, I prefer version 3 as well.

Re: devolution of the wp34s label---or fun with colors

*Message #4 Posted by **Jeff O.** on 8 Feb 2012, 10:07 p.m.,*
in response to message #1 by troy

I also like version 3.

Things I like: the pi symbol, the sigma symbol, the separate Cy,x an Py,x labels.

Nit-picky things I would change: the slanted 1 with serif in both instances of 1/x, the x with a bar, the x in |x|, and the y with carat are not the same as the other lower case x's and y's, and I would raise the x in 2^x and 10^x.

...

Re: devolution of the wp34s label---or fun with colors

*Message #5 Posted by **Walter B** on 9 Feb 2012, 1:31 a.m.,*
in response to message #4 by Jeff O.

> Quote:

in response to message #5 by Walter B

thanks!

those are excellent points! you look at the monitor too long, everything starts looking the same.

that's why a different set of eyes always help.

Re: devolution of the wp34s label---or fun with colors

*Message #7 Posted by **Philippe Lasnier** on 9 Feb 2012, 4:38 a.m.,*
in response to message #1 by troy

I like version 3 too, although I agree that this is nothing more than a personal aesthetic opinion.

But, and I know this looks too obvious to be a mistake, so there must be a reason I missed, why is there two entries for 1/x, Sigma+, Y^x, sqrt(x), a b/c ? E.g. 1/x is over the B key in white and above the / (divide) key accessible with "f".

Regards,

Philippe

Re: devolution of the wp34s label---or fun with colors

*Message #8 Posted by **Dirk Mehldau** on 9 Feb 2012, 5:34 a.m.,*
in response to message #7 by Philippe Lasnier

As long as there is no LBL A to LBL D in programm memory the keys A to D will act as Sigma +, 1/x, y^x, SQRT(x).

As soon as there is one of LBL A to LBL D defined the corresponing key will A to D will call the programm and the "white fuction" has to be called the alternative, shifted way.

Regards

Dirk

Re: devolution of the wp34s label---or fun with colors

*Message #9 Posted by **Dirk Mehldau** on 9 Feb 2012, 5:40 a.m.,*
in response to message #1 by troy

One could have the g-functions on the buttom of the keys and leave their colour blue, the gold f-functions and the green h-functions above the keys.

...or rename h to something completely different, use a symbol.

Just for those who are familiar with the Voyager series. ;-)

But at the end, the WP 34s neither is a "genuine" Hewlett Packard calculator nor is it a Voyager series calculator. Why not try something different?

*Message #12 Posted by **Jeff O.** on 9 Feb 2012, 9:26 a.m.,*
in response to message #10 by Dirk Mehldau

Yes, I would like to see that.

Color choices may be challenging. The keys themselves can stay the same, white for primary function and blue for the h-shifted functions on the lower slanted portion. I think that black will just about have to be used for one of the keyboard-plane label colors. If the yellow-gold that has been used for the f-shifted

functions on the black overlays shows up well on the silver background of the 30b, f-shift could stay that color and g-shift could be black. If yellow-gold does not show up well, I'd say use black for f-shift. That leaves the g-shifted and alpha labels. Not sure if green will show up very well on the silver background. For the default functions of the A, B, C and D keys, I might suggest something like below, i.e. white (edit - as Eric points out, this will not work on a clear overlay, so it will have to be siver) labels inside black boxes, to emphasize that these are primary key functions when active.

Edited: 9 Feb 2012, 10:19 a.m. after one or more responses were posted

Re: devolution of the wp34s label---or fun with colors

*Message #13 Posted by **Eric Rechlin** on 9 Feb 2012, 9:32 a.m.,*

Limited run of blue key slant WP34S overlays

*Message #1 Posted by **Bob Cortopassi** on 8 Feb 2012, 12:02 p.m.*

Forum Friends,

Eric has graciously offered to do a custom run of overlays for the WP 34S. I'm embedding an image of the overlay that myself and at least one other forum member are ordering.

In the interest of maximizing Eric's ROI, I thought I would let everyone know in case there is additional interest in ordering one or more of these overlays.

Regards, Bob

in response to message #1 by Bob Cortopassi

I have to admit, I like this layout better. It seems much cleaner. I'll be ordering some too.

*Message #3 Posted by **Walter B** on 8 Feb 2012, 1:03 p.m.,*
in response to message #1 by Bob Cortopassi

As the designer of the original UI I must ask you urgently: please (!) print the labels on the prefix keys white and get that 'g' from Helvetica. Will calm my stomach significantly :-) TIA!

Besides, there's a very long tradition of g-shifted functions being printed blue - nearly as long as f-shifted ones printed yellow (or golden, as HP expressed it). Where present, h-shifted functions were printed black so far, what we cannot allow here ;-) Anyway I still think the green color is the better alternative on the slanted front. Depending on the printer, both green and blue may be chosen a bit lighter.

Respectfully,
Walter

Re: Limited run of blue key slant WP34S overlays

*Message #4 Posted by **Walter B** on 8 Feb 2012, 1:11 p.m.,*
in response to message #3 by Walter B

Well, why not print the h-shifted labels black on a grey background? So the slanted part of the key will become grey. Just crossed my mind - sometimes the so called 'impossible' may be the best choice :-)

Done!

> Quote:
>
> Besides, there's a very long tradition of g-shifted functions being printed blue...

I agree with this, as it is clearly a fact. Never the less, set your 15C or 41 or any number of other calculators next to your 34S. The similarity of the blue "g" key is much less noticeable than the glaring difference of the green key slants shining out at you.

Ideally, I'd like to keep g blue as well as the key front, but that would require firmware changes, and I've no doubt how you and the rest of the team would shoot me down if I proposed swapping the function (and keycodes all over the place) of the g and h shift keys.

Thanks for your thoughts, Walter, and all the hard work that got us to this point. Customizing wouldn't be possible if you and the team hadn't first created it.

Regards, Bob

Re: Limited run of blue key slant WP34S overlays
*Message #6 Posted by **Jeff O.** on 8 Feb 2012, 1:16 p.m.,*
in response to message #1 by Bob Cortopassi

I had been working on an alternative overlay since the other day when Eric said he would be willing to make custom ones. It is very similar to yours except for a couple of things:
1. changed the font of all lower case x and y to Century Schoolbook, to more closely match the classic HP look for these characters
2. moved the alpha labels to the lower right corner of each key instead of lower left.

Edit - Bob was kind enough to incorporate my ideas, see his following post.

*Message #7 Posted by **Marcus von Cube, Germany** on 8 Feb 2012, 1:25 p.m.,*
in response to message #6 by Jeff O.

I can live with the placement of the f/g labels above the keys but I prefer the yellow/blue/green color scheme of the original design.

Re: Limited run of blue key slant WP34S overlays

in response to message #7 by Marcus von Cube, Germany

Happily, it appears that various preferences can be accommodated.

Re: Limited run of blue key slant WP34S overlays
*Message #9 Posted by **Bob Cortopassi** on 8 Feb 2012, 3:00 p.m.,*
in response to message #6 by Jeff O.

Here's an updated version with Helvetica "g", white shift labels, and the serif'd lowercase x/y. I've also shifted the alpha labels to the right of the respective key instead of the left. I think this will accommodate Jeff's request, and is a look I really like.

Edited: 8 Feb 2012, 3:10 p.m.

*Message #12 Posted by **Dominic Richens** on 9 Feb 2012, 11:52 a.m.,*
in response to message #6 by Jeff O.

Hi Jeff,

> Quote:
>
> 2. moved the alpha labels to the lower right corner of each key instead of lower left.

Just curious, why move the alpha labels?

Re: Limited run of blue key slant WP34S overlays

*Message #13 Posted by **Jeff O.** on 9 Feb 2012, 12:24 p.m.,*
in response to message #12 by Dominic Richens

Lower right corner matches previous HP calculators, for example the HP48.

Re: Limited run of blue key slant WP34S overlays

*Message #14 Posted by **Gerson W. Barbosa** on 9 Feb 2012, 12:52 p.m.,*
in response to message #13 by Jeff O.

But this causes the alpha labels to hide when keying (wasn't this the reason for placing the lettering above the keys rather than below?) Also this breaks the symmetry of the alpha labels placement in the lower half of the overlay. The only change I would suggest to Walter's design would be placing the labels above the keys, as in the original HP-34C and these later overlays.

Re: Limited run of blue key slant WP34S overlays
*Message #15 Posted by **Dominic Richens** on 9 Feb 2012, 4:07 p.m.,*
in response to message #13 by Jeff O.

> Quote:
>
> Lower right corner matches previous HP calculators, for example the HP48.

That's what I thought. Good reason for it.

Though I do concur with Gerson that as a right-handed person, I have a slight preference for labels on the left so that my big fat thumb doesn't obscure the alpha label when it is already on the right key.

Re: Limited run of blue key slant WP34S overlays
*Message #16 Posted by **Gerson W. Barbosa** on 9 Feb 2012, 6:30 p.m.,*
in response to message #15 by Dominic Richens

Actually there's no problem if the labels are hidden when the keys are pressed, this happens with the primary functions all the time. Anyway, it would be great to have three or four options to choose from when ordering the overlays. I think I'll stick to the current version. It looks just fine for me.

Re: Limited run of blue key slant WP34S overlays
*Message #17 Posted by **Marcus von Cube, Germany** on 9 Feb 2012, 6:43 p.m.,*
in response to message #16 by Gerson W. Barbosa

I hope you have upgraded the 20b to V3 and flashed the 30b to a 34S in the meantime. ;-)

*Message #18 Posted by **Gerson W. Barbosa** on 9 Feb 2012, 7:29 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Not yet. No FTDI USB-serial cable no joy. Might get one soon :-)

Re: Limited run of blue key slant WP34S overlays
*Message #19 Posted by **Walter B** on 10 Feb 2012, 5:26 a.m.,*
in response to message #16 by Gerson W. Barbosa

Obrigado, Gerson. Thanks. The current version comes closest to what the designer had in mind d:-) and of course you're right with the hidden labels.

Re: Limited run of blue key slant WP34S overlays
*Message #20 Posted by **troy** on 8 Feb 2012, 2:11 p.m.,*
in response to message #1 by Bob Cortopassi

oh, dang! and i thought i could capitalize on you guys so i can get back the price i paid for the cutter! :)

anyway, i should say that i've seen the light (or the printout of my friend's printer), and green/yellow/blue isn't as bad on my eye as i thought it'd be. i guess i'll have to get an hp printer now! (mine's an old canon).

here's the layout. any takers? :)

i still prefer the linux libertine greek fonts though.

Re: Limited run of blue key slant WP34S overlays

*Message #21 Posted by **Bob Cortopassi** on 9 Feb 2012, 6:49 p.m.,*
in response to message #1 by Bob Cortopassi

This is the version that we actually ended up ordering from Eric. Printing is set to occur on Friday.

There are numerous changes in addition to the color swap and label relocations:

1. Numerals changed to Arial font to match legacy HPs
2. Key top labels changed to a very light gray instead of stark white
3. Revised pi symbol
4. Larger -1 exponent on inverse functions to make them more visible
5. Changed all register references (x and y) to italic serif font to match legacy HPs
6. CPy,x expanded to discrete labels
7. Increased size of s and r
8. Change sign key relabeled CHS
9. Relabeled factorial key to x! for better visibility and to match legacy HP
10. Many small alignment changes to improve consistency and legibility

Re: Limited run of blue key slant WP34S overlays
*Message #22 Posted by **Dirk Mehldau** on 10 Feb 2012, 1:47 a.m.,*
in response to message #21 by Bob Cortopassi

Even though we all are used to see blue labels on the slanted edge, I must admit that the green g-shift-key embarresses me.

Couldn't the f- and h-labels be placed above the keys - even though this is in contrast to the classic HP three-shift-keys-layout?

Dirk

Re: Limited run of blue key slant WP34S overlays
*Message #23 Posted by **Alexander Oestert** on 12 Feb 2012, 6:57 a.m.,*
in response to message #22 by Dirk Mehldau

> Quote:
>
> the green g-shift-key embarresses me.

One could get rid of the letters f, g and h altogether and just put the respective colors on the labels. Or do the letters serve any specific purpose?

Re: Limited run of blue key slant WP34S overlays
*Message #24 Posted by **Marcus von Cube, Germany** on 12 Feb 2012, 9:28 a.m.,*
in response to message #23 by Alexander Oestert

The letters help to name key sequences in absence of color.

Re: Limited run of blue key slant WP34S overlays
*Message #25 Posted by **Walter B** on 10 Feb 2012, 5:35 a.m.,*
in response to message #21 by Bob Cortopassi

The x and y letters look quite nice in general. The f, g, h letters are looking like they were originally designed.

> Quote:
>
> Change sign key relabeled CHS.

FYI, +/- was prefered over CHS resulting from a poll in this forum many weeks ago.

Re: Limited run of blue key slant WP34S overlays
*Message #26 Posted by **Barry Reeves** on 10 Feb 2012, 10:07 a.m.,*

in response to message #25 by Walter B

Very nice tweeks. Looks good. As for little things like the CHS vs +/- Eric certainly has the ability to include both on the new overlays, then people can choose the one they prefer.

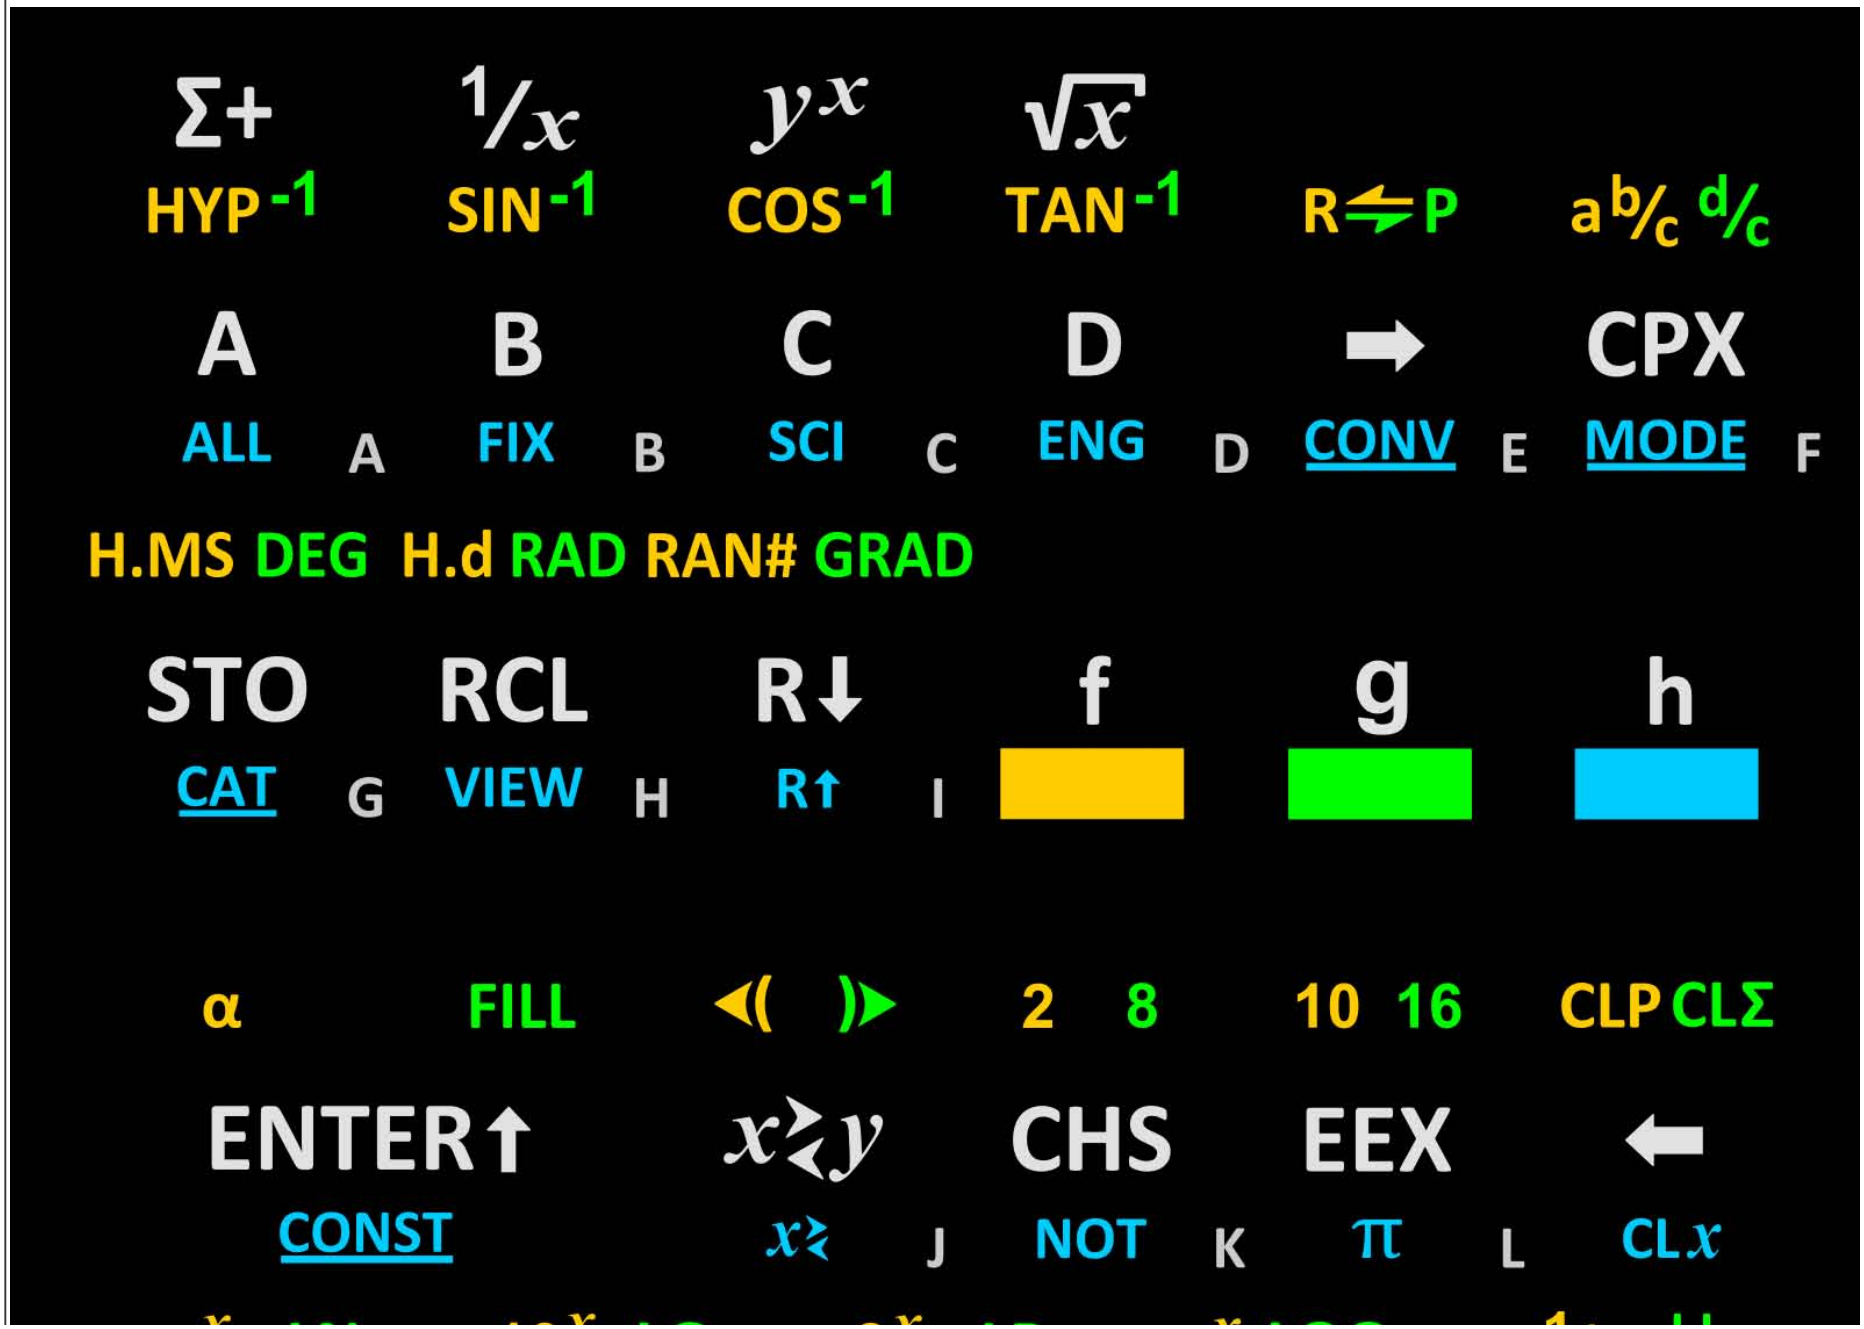
*Message #27 Posted by **Eric Rechlin** on 11 Feb 2012, 3:39 p.m.,*
in response to message #21 by Bob Cortopassi

This is what I ended up producing and mailing today for those who had ordered it:



e^x LN 10^x LG 2^x LB y^x LOG$_x$ $1/x$ Π
XEQ 7 8 9 ÷
GTO AND M OR N XOR O RMDR P
Cy,x Py,x Φ^{-1} $\bar{x}$ s $\hat{y}$ r $\sqrt{x}$ x^2
▲ 4 5 6 ×
$x!$ PROB Q STAT R SUMS S MATRIX T
SF CF $x=$ ≠ ? SLV ∫ Π Σ % Δ%
▼ 1 2 3 −
STATUS TEST P.FCN U X.FCN V Σ− W
⬆ SHOW |x| RND IP FP LBL RTN DSE ISG
EXIT 0 • R/S +
OFF PSE • / , X P/R Y Σ+ Z
ON $a^b/_c$

Eric

Re: Limited run of blue key slant WP34S overlays
*Message #28 Posted by **Marcus von Cube, Germany** on 11 Feb 2012, 3:48 p.m.,*
in response to message #27 by Eric Rechlin

Alpha left and swap back blue and green and I'm a taker. I don't like the yellow/green pairing for f/g. (Eric, don't take this as an order, it's just me expressing my personal opinion.)

Re: Limited run of blue key slant WP34S overlays
*Message #29 Posted by **Bob Cortopassi** on 13 Feb 2012, 12:37 p.m.,*
in response to message #28 by Marcus von Cube, Germany

Marcus,

I'm curious as to your preference for the alpha labels on the left. To my knowledge, the WP 34S is the only HP (or HP-like) that has ever had alpha labels to the left of the respective key. Here's a partial list of alpha to the right models:

- HP-22s
- HP-32s
- HP-32sii
- HP-48s/sx
- HP-48g/gx
- HP-49g/gii/g+
- HP-33s
- HP-50g
- HP-35s

Of the other HP models with alpha, the 42s uses menus, the 41C family has alpha as the only marking on the slanted key fronts, and the clam shells have dedicated alpha keyboards.

Thoughts?

Those were just guidelines to show approximately where to cut. They should never have been shown to the public, but some people didn't hide those layers before posting sample images here.

Eric

Re: Limited run of blue key slant WP34S overlays
*Message #32 Posted by **Alexander Oestert** on 13 Feb 2012, 1:15 p.m.,*
in response to message #31 by Eric Rechlin

Eric, is there a difference for you (in cost and work involved) wether you produce an overlay from your own image or from an image provided by the customer? Is the number of overlays produced from a specific layout an additional factor in this or could you produce just one custom overlay at the same cost as usual?

No matter what I like your original overlays I have in V2 and V3 and am also looking forward to having this limited run version, be it grey or black!

Re: Limited run of blue key slant WP34S overlays
*Message #33 Posted by **Eric Rechlin** on 13 Feb 2012, 2:37 p.m.,*
in response to message #32 by Alexander Oestert

The time to set up a custom run is relatively minimal, but it's likely that I would need to spend some time tweaking the layout to get all the alignments right. After I got the "final" image from Bob for this, I still had to go in and rearrange some things, and it still took me 3 tries (making useless overlays in the process) to get the cut lines right.

If it's a minor variation of one of the (now two) existing layouts, it should be pretty simple, but if it's significantly different it will take some work.

Eric

The Condition Number of a Matrix

*Message #1 Posted by **Namir** on 8 Feb 2012, 9:50 a.m.*

I have heard of the **Condition Number of a Matrix** in the past and have not paid much attention to this matrix property, until recently. I have been playing with a search algorithm that solves iteratively systems of linear equations. After the basic testing, I moved to more involved testing that uses random matrices. I began to notice that the number of iterations (for a fixed number of equations) varied widely!! I wrote my Matlab and Excel VBA code such that I can watch the progress of conversion to the solution. I noticed that in some cases the solution converged faster than other cases, where the iteration seem to struggle. I first looked at the value of the determinant of the matrix as a possible indicator for how easy or difficult to work with a articular matrix. I then came across internet articles that talked about the condition number of a matrix as being a good indicator for the ease or difficulty of solving linear equations with a matrix [bold]regardless of the algorithm used and the precision of the computation[/bold]. I find this to be somewhat of a revelation since most numerical analysis books rarely mention the condition number of a matrix as an indicator for the level of ease to solve linear equations.

Namir

Edited: 8 Feb 2012, 9:50 a.m.

Re: The Condition Number of a Matrix

*Message #2 Posted by **Jeff Kearns** on 8 Feb 2012, 2:48 p.m.,*
in response to message #1 by Namir

Condition Number is defined as the product of the norm of A and the norm of A-inverse.

If we use the usual Euclidean norm on vectors and the associated matrix norm, then the condition number is the ratio of the largest singular value of matrix A to the smallest. (Singular values are computed by process called SVD - Singular Value Decomposition and in Matlab the calculation is simply invoked by command svd).

Condition number depends on the underlying norm. However, regardless of the norm, it is always greater or equal to 1. If it is close to one, the matrix is well conditioned which means its inverse can be computed with good accuracy. If the condition number is large, then the matrix is said to be ill-conditioned. Practically, such a matrix is almost singular, and the computation of its inverse, or solution of a linear system of equations is prone to large numerical errors. A matrix that is not invertible has the condition number equal to infinity.

HP 15C LE: keyboard problems

*Message #1 Posted by **dietmar13** on 7 Feb 2012, 2:04 p.m.*

hello, i have bought a HP 15C LE from "The Calculator Store" and got it today.

S/N: CNA148022R (Lim. Ed. No.: 11041) - european version?

unfortunately is the "*" key not working as expected. you have to press hard or more than twice until it is recogniced.

how should i proceed: contact the store or HP directly?

i thought, the keyboard problem was solved?

the best

dietmar

hp 30b -> wp 34s

*Message #1 Posted by **Christopher Johnson** on 7 Feb 2012, 12:06 p.m.*

Alright, putting in the caps and crystal to say the least was quite a job. WOW those things are tiny. 2 caps are gone somewhere in the carpet. I'm glad I bought 8 of them. Quite a job for 51 year old hands and eyes. I was going to take pictures but I wouldn't want anyone to see my GREAT solder work. The calculator still works.

Is there anyway to check the clock without the 34s firmware?

I'm guessing that calc_xtal_full.bin is the firmware that I need to be able to use the clock. That is the standard firmware with the clock function. Correct?

Now waiting on the cable and overlay.

CJ

Re: hp 30b -> wp 34s

*Message #2 Posted by **Marcus von Cube, Germany** on 7 Feb 2012, 12:40 p.m.,*
in response to message #1 by Christopher Johnson

I'm not aware of a feature in the original 30b firmware to enable the crystal so you will have to wait for the cable.

calc(_full).bin supports the crystal but you need to activate it with ON+C.

calc_xtal(_full).bin supports only modified calculators. The crystal is activated on a cold boot (you'll notice a delay when powering on the calculator the first time after a reset.) I've added the stop watch function to this release.

The images with _full in the name contain some user code library routines which show up in CAT.

HP28S battery door trouble

*Message #1 Posted by **David Griffith** on 6 Feb 2012, 10:43 p.m.*

I recently acquired an HP28S in good condition except for one problem. It seems to be a design flaw making itself known. Anyhow, the battery springs push against the batteries and the battery cover causing it to bulge out. This leaves a palpable edge that makes it a difficult to close the cover without pushing on the battery door. Is there a workable fix for this?

Re: HP28S battery door trouble

*Message #2 Posted by **Michael de Estrada** on 6 Feb 2012, 11:03 p.m.,*
in response to message #1 by David Griffith

This is the achilles heel of this design, and is absolutely the worst battery door design ever devised by HP. Eventually either the door breaks or the case breaks, leaving you with no way to keep it in place. Perhaps some other forum members can help with preventive measures or fixes, but my only advice is to pray.

Re: HP28S battery door trouble

*Message #3 Posted by **David Griffith** on 6 Feb 2012, 11:53 p.m.,*
in response to message #2 by Michael de Estrada

Looking closer, it seems that the door is okay, but the case is starting to fail. If I could get the calculator open, then I think I could push on the springs to reduce their height a bit, then wedge a metal rod in there to keep the cells back. Then the door can be inserted and it won't stick out.

Re: HP28S battery door trouble

*Message #4 Posted by **Barry Reeves** on 7 Feb 2012, 10:13 a.m.,*
in response to message #3 by David Griffith

If nothing has chipped off yet, a bit of epoxy on the case should strengthen it enough.

*Message #8 Posted by **Mike Morrow** on 7 Feb 2012, 3:52 p.m.,*
in response to message #6 by Sylvain Louboutin

I sense gospel from the Book of Jobs in the Apple religion. It's obvious that the money to be made by Apple servicing departments, or by the purchase of a new phone, is the only reason Apple batteries aren't accessible. The same pathological need for control prevented SD card support. Saint Steve apparently even disliked SIM card access, but that privilege was graciously granted by Apple-god.

The Clamshell door design is a yet another example of poor engineering by HP. It's failure is not a rational argument for Apple-Nazi-like customer control, any more than the failure of the Woodstock charging system is an argument against rechargeable batteries in any device.

Re: HP28S battery door trouble

*Message #9 Posted by **Ethan Conner** on 7 Feb 2012, 4:24 p.m.,*

"Saint Steve apparently even disliked SIM card access"

He wouldn't have sold a single phone in many countries round the world if he had not given simm access--that's how it works in the rest of the world. The "unlocked phone" is actually normal--the US phone-facsists have us brainwashed thinking it is not.

> I've gone through *three* $150 point and shoot cameras for essentially the same reason. You'd think someone would learn something...but some of us are slow on the uptake :-/

Ha! That reminds me of my Olympus D-340R -- one of the nicer early digital cameras, took great pictures, and I took it with me wherever I went, until the LCD on the back stopped working after 10+ years... But nice as it was, the one thing that *always* ticked me off was the battery door. Having to apply 100 pounds of pressure on an area of 1 cm^2 while twisting a tiny recessed lever that also needs massive force but that you can only get purchase on with your fingernails... how does such a horrible design ever make it past QA? The irony being that Olympus is not a company that has a reputation for crappy products, and neither is (or, well, was) HP, and yet sometimes they produced these real stinkers. Oh, yes, the Woodstock battery situation... Or my 1991 VW Passat with its flaky electronics and a cooling system that could not keep the engine cool while also running the AC in stop-and-go traffic in 90 °F weather... It's the juxtaposition of *mostly* great products that then have these glaring flaws (that any halfway sane QA process would have caught) that is so weird, and so amusing. I guess it's also a bit endearing. My perfect Toyota is just a bit... well, *boring*, by comparison...

in response to message #1 by David Griffith

The 28S is my personal favorite of all the HP's (well it was my first HP - I do have many other favorites now as well ...). I've found the best way to fix the battery door is to buy a new 28S!
HP did overcome this design flaw in the last version of the 19Bii - a back access battery door. This design came about well after production of the 28S ceased unfortunately. Cheers, Keith

Someone has built one of them using a computer case slot insert. Hope it helps.

Re: HP28S battery door trouble

*Message #24 Posted by **Neil Hamilton (Ottawa)** on 8 Feb 2012, 8:24 a.m.,*
in response to message #23 by Vince (Italy)

That would be me and there is more info here in this article -- skip to the bottom.

I would not say I did a very good job but at least it was simple and has the calculator functional again, if not esthetically pleasing.

The offer from Adam's metal shop is likely your best bet if you want a result more in keeping with the original source from the link you gave.

You'll note that I mentioned in the article that I thought that the springs were way too stiff and should be cut down to reduce the stress on the case.

Good luck David!

it's here !!!

*Message #1 Posted by **Alberto Fenini** on 6 Feb 2012, 6:22 p.m.*

I know it's kind of childish, but I couldn't resist.
When I started collecting few years ago, I had never thought I would have one
I just wanted to share with everybody that my Red Dot is finally here...

The serial number (barely readable) is 1143A 02499
This unit is actually joining the rest of the family, a version 2 with raised dot, a more common version 3 and a very common version 4.
Should I consider opening this unit and replacing the key "." and restoring the silver trim or should I leave it the way it is ???
If of interest to anyone, I will post pics of the manual, which is also for the red dot, and of the power supply which to me looks very much older than the usual classic power supply
Take care everybody, Alberto

Re: it's here !!!

*Message #2 Posted by **Michael de Estrada** on 6 Feb 2012, 6:32 p.m.,*
in response to message #1 by Alberto Fenini

Fantastico ! Please don't restore it or open it. Antiques should be only carefully cleaned and left in their original condition. What is wrong with the "." key, anyway ?

Re: it's here !!!

*Message #3 Posted by **Alberto Fenini** on 6 Feb 2012, 6:57 p.m.,*
in response to message #2 by Michael de Estrada

I agree with you, even if I have restored all my calcs, I feel I should only clean this one and nothing more.
The "." key is kind of molded, like if it was exposed to some high temperature or if it came in contact with some fire
but is fully working.
thanks for the comment !

Re: it's here !!!

Wow - Now that is cool, even the keyboard doesn't look too bad.

Given that I know defiantly don't want to buy a buggy 15LE, this looks very interesting even if it isn't the 'real thing'...

Mike T.

PS - I Bet it doesn't have the PSE bug :-)

Re: DM-15CC launched

*Message #16 Posted by **RedGlyph** on 12 Feb 2012, 6:50 a.m.,*
in response to message #15 by Mike T.

The HP-15LE isn't buggy at all.

Only time will tell how long the keyboard lasts, of course, and how often the batteries must be replaced, but I'm very pleased with that version even if I prefer the quality look and feel of the original HP-15C.

The only feature that is not working is the original self-tests, which have been replaced by another test at the CPU level, for the display, the memory and the keyboard. It's true they didn't anticipate that though, the back of the calculator still mentions "Error 9" for the ON-x test, and the manual is a copy of the HP-15C one with both self-tests and no mention of the new test except on a separate errata sheet.

It even comes with a printed manual, which is an exceptional move from HP these days! The printed manual is the Owner's Handbook, but you get a copy of the Advanced Function Handbook on the CD-ROM, along with a buggy software emulator for Windows that I discarded immediately (to think they actually sell those!).

It all depends what you are looking for. If you actually want to use the calculator on a regular basis, the HP-15LE is perfect, and I wouldn't choose the HP-15CC for that purpose. If you are interested in HP calculators in general, the HP-15CC is an interesting piece... but then so is the HP-15LE. When available of course, I see that it is out of stock again on HP site, after a second batch last December.

Re: DM-15CC launched

*Message #17 Posted by **Alexander Oestert** on 12 Feb 2012, 7:06 a.m.,*
in response to message #16 by RedGlyph

Not buggy? Have you recently purchased a version with all the software bugs gone? That would be great news!

Bug list 15c LE

Edited: 12 Feb 2012, 7:09 a.m.

Re: DM-15CC launched

*Message #18 Posted by **RedGlyph** on 18 Feb 2012, 6:19 a.m.,*
in response to message #17 by Alexander Oestert

Thanks for the link, that's interesting to know :)

I haven't checked them all, but those I did are on my version as expected, since I own a "first batch" version. Did HP fix that later on, we'll know if someone post it here but I doubt it.

At least the first bug was already in the HP-15C, and neither of them is critical for the calculations, but some can be annoying (battery-related ones especially).

That being said, those bugs are apparently on the 15CC as well... so while they could be more easily fixed on that version, I'd still rather use a reliable keyboard and comfortable display for everyday's use than the frail and awkward DM-15CC design (not a criticism - it's not intended to be a professional design).

Re: DM-15CC launched

*Message #19 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Feb 2012, 9:19 a.m.,*
in response to message #18 by RedGlyph

Battery issues are quite important.

PAUSE issue is annoying indeed, severely impairing programs. With a one-line, numeric display, PAUSE is one of the very few tools available for a user interface. And is irritating to see kow this product went into production with such a bug; as almost any simple program used as a test would have pointed straight at it.

I hope HP will offer a software update somehow. For now, my HP-15L just rests on its beautiful box as a conversation piece.

[Please note that I call it "15L" because the battery issues prevent it to deserve the "continuous memory" badge. It certainly deserves the "limited" part of the "limited edition" string].

Re: DM-15CC launched

in response to message #26 by gene wright

It keeps my hair on the scalp, not too successful though!

Re: DM-15CC launched

*Message #28 Posted by **Egan Ford** on 7 Feb 2012, 2:56 p.m.,*
in response to message #1 by Andy Lamming (UK)

Awesome. I cannot wait to get both the 15 and 16. My only concern from the video is that it looked like it takes a bit of effort to press a key.

Re: DM-15CC launched

*Message #29 Posted by **Bruce Bergman** on 7 Feb 2012, 10:27 p.m.,*
in response to message #28 by Egan Ford

I noticed the same thing. It looks like he is really pressing hard to get some of those keys to register. Not sure if that's just big thumbs, or poor keyboard...

Re: DM-15CC launched

*Message #30 Posted by **Michael de Estrada** on 7 Feb 2012, 10:42 p.m.,*
in response to message #29 by Bruce Bergman

Not big thumbs, but really tiny keyboard. Trying to cram a 4 row x 10 column keyboard into that footprint makes it impractical.

Re: DM-15CC launched

*Message #31 Posted by **bill platt** on 8 Feb 2012, 1:19 p.m.,*
in response to message #30 by Michael de Estrada

You use a Dixon Ticonderoga or a Venus Velvet eraser to push the keys :-)

Re: DM-15CC launched

*Message #32 Posted by **Juergen Keller** on 8 Feb 2012, 1:31 p.m.,*
in response to message #28 by Egan Ford

I've got one from the sample batch a few weeks ago but unfortunately didn't had much time to use it. My first impressions were:

* you have to get used to the form factor; I hold it with both hands and use my thumbs to press the keys; works quite well

* it's really small and fits into every pocket; there is no excuse anymore to not have a calculator at your fingertips

* the keys need strong pressure; however, I've got a message from the manufacturer that this will change in the production run units

* the keys do not always register even if you hear the click

* the display contrast is low; you need good light to read it comfortably

* it is pleasingly fast; sorry, didn't had time to run comparisons yet

* works as the original 15C, including self-tests; no PSE bug :-)

* fair pricing (considering the small production run)

* it looks sweet (the baby factor)

* the sandwich construction provides no good protection against dust sneaking into the display

Re: DM-15CC launched

*Message #33 Posted by **RedGlyph** on 12 Feb 2012, 6:09 a.m.,*
in response to message #32 by Juergen Keller

I have received a production unit on Friday, so here are my first impressions.

Admittedly the size makes it more difficult to punch the keys than a full-sized calculator, but the idea was to build a small calculator from the start. For me the size of the keyboard doesn't make it difficult to use the calculator though, I think it has the right dimensions to be both small and not too small as to be impractical - key spacing makes it more comfortable than a BlackBerry for example.

However, I confirm the keys are hard to press and don't always register, which makes this calculator a bit awkward to use. Add to that a curved surface due to too few screws (four, one in each corner) that makes the calculator bend and sometimes produce a little crushing sound when you press some of the keys, and you get a general impression of something that will not last and is not so pleasant to manipulate.

It is faster than the original HP-15C, although not as fast as the HP-15LE. For example, integration of sin^2(x) from 0 to 45 degrees takes about 30 seconds on an HP-15C, about 5 seconds on the HP-15CC, and less than one second on the HP-15LE. I'd say it more than enough for a calculator.

EDIT: A simple loop with 2000 iterations (LBL A, 1 STO- 0, RCL 0, TEST 1, GTO A) takes

- 19'27" on HP-15C
- 6" on HP-15LE, about 194 times faster
- 2'12" on HP-15CC, about 8.8 times faster. Some complex operations may be faster though.

The ON-x self-test works, the ON-/ one doesn't, however. It displays the first symbols on the screen but pressing any key doesn't make it progress. The only way out is pressing the ON key which produces an "Error 9". Not a big deal I suppose, and it doesn't work on the HP-15LE either, but I think this calculator should have a keyboard test at some point, given this is a weak point of the design.

Unfortunately I could not test the mini-USB connection because I don't have a compatible cable, it looks like a mini-B type like those used on the Motorola smartphone. Not the most common type...

The display is fine, the large numbers are visible enough. While it doesn't offer the same contrast ratio as an original or an LE model, it shouldn't cause any problem in normal conditions. My display was slightly scratched when I received the calculator, it looks like it's prone to being scratched if not taken care of, for instance if stored in a bag without protection. I suppose the units were stacked together after production, that's when it must have happened.

The calculator comes with a protection sleeve that can be seen on the site photos. What is not rendered is its nasty synthetic smell though ;-) It tends to pervade quite a bit.

So in conclusion, this is an interesting gadget for HP-15 enthusiasts, but definitely not something you want to use on a daily basis, or if you must depend on it for an exam or in the field. It could use a better keyboard design, and a more robust case, I expect either to be the weakest feature and to break down first. But you have to look at this as a DIY-grade design, and as such this isn't bad at all!

Mini-USB is deprecated and I agree it should not have been used (modern devices should use Micro-USB instead), but it's still fairly common. All the recent HP graphing calculators prior to the 39gII still use it, and I have countless devices at home that use it (my old HTC phone, Sony Reader, portable hard drive, memory card reader, GPS, etc).

Eric

Finally got a compatible cable from an old Lacie HD drive. But unfortunately, I couldn't establish any connection, neither with FlashMagic, nor with Putty.

There isn't much information to start with, so it could be that (which interface to use, what subtype of LPC1114 CPU), it could also be the USB - RS232 known for being capricious, or a missing driver...

Just got my two DM-15CC.
Funny how they sit in the palm of your hand!
Yes, keys do not always register even if you feel the dome "snap" but, all in all, it's a good compromise.

Quite fast relative to the original but obviously not on a par with a 15C LE.
I tried a quick and dirty benchmark (please forgive any inconsistencies/errors due to me not being proficient with the voyagers).

```
LBL A
SIGMA+
SIN
COS
TAN
GTO A
RTN
```

I let them go for 60" and found the following:

```
HP 15C          22 iterations
HP 15C LE             2118 iterations
DM-15CC         140 iterations
```

Here's a family photo! :)

Massimo

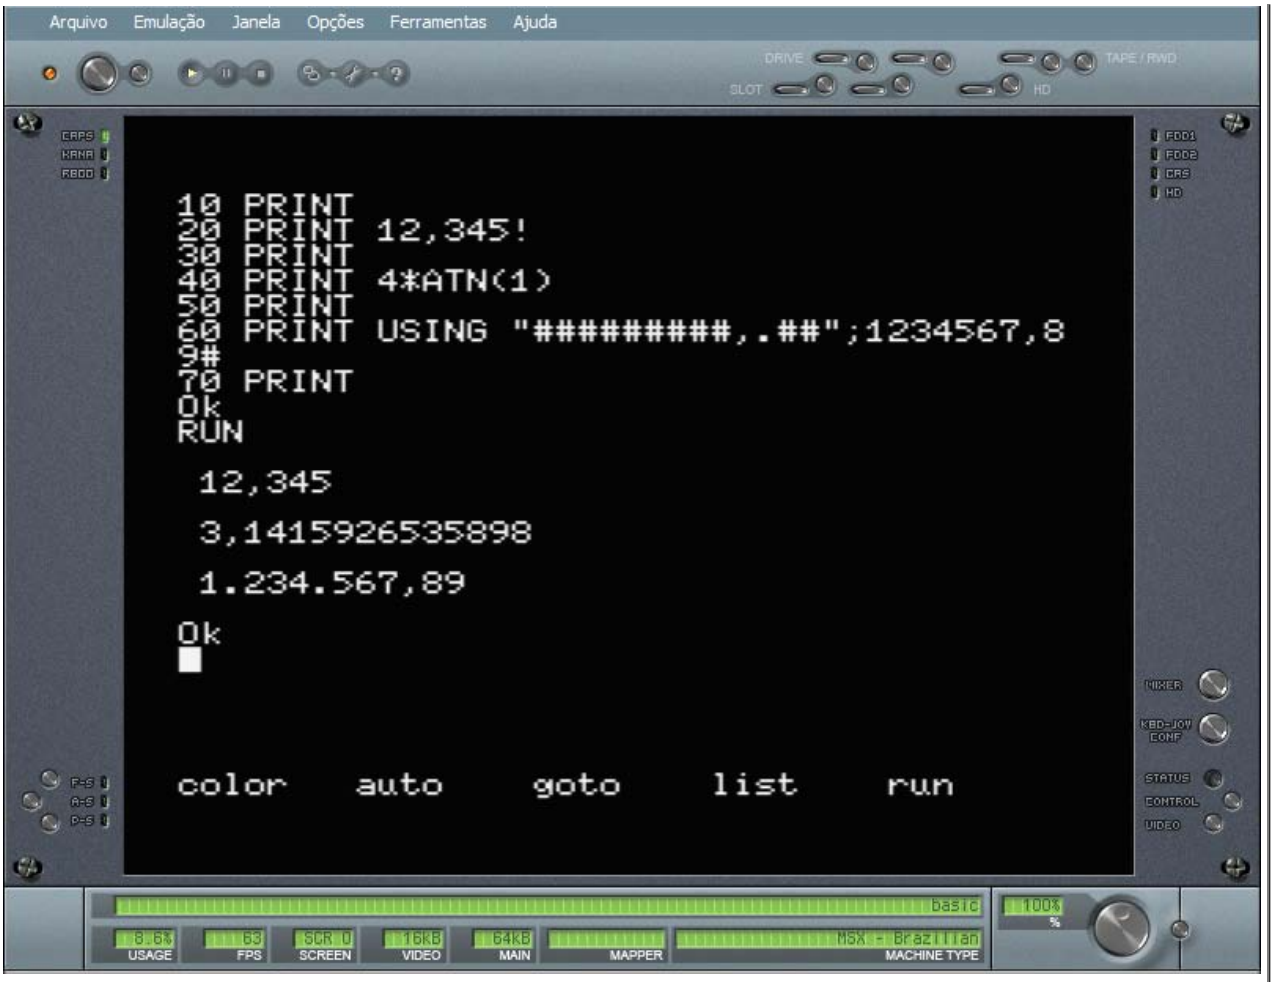
That's the only thing I liked in COBOL. In my MSX computer I transferred the ROM to RAM using a program that came in the manual and made some experiments. After some trial and error I found which bytes had to be changed so that everything looked normal also in BASIC :-)



Gerson.

WP34S nested error

*Message #1 Posted by **Alessandro Castellani (Italy)** on 6 Feb 2012, 3:42 a.m.*

hi to all,

I've tried on the WP34S emulator (22.1990) to find the minimum of a function using the built-in f'(x) command and solving it for zero:

LBL A my function f(x) that I want to study, result returned in X stack RTN

LBL B f'(x) LBL A RTN

but when I solve for B I receive the message : Nested use of solve (SLV and SLVQ), integrate, sum or product is not allowed.

Could I do this in this way or I must write a routine that calculate the derivate and then use solve on it?

thanks

Alessandro

Re: WP34S nested error

*Message #2 Posted by **Paul Dale** on 6 Feb 2012, 3:48 a.m.,*
in response to message #1 by Alessandro Castellani (Italy)

Version 2 firmware does not permit solve, integrate, f', f'', sum or product to nest or call any of them others.

This stems from a limitation on the number of reserved internal registers.

There are two obvious solutions here.

Code f' or solve yourself and use the built in version of the other (hint: look in the library directory on subversion for outline code for these or grab versions from the library here on the Museum).

The alternative would be to upgrade to version 3 which removes this restriction entirely. In version 3 firmware, you can freely nest and mix these functions subject to having enough available RAM.

- Pauli

HP-71B: fastest memory copy?

*Message #1 Posted by **Hans Brueggemann** on 5 Feb 2012, 10:29 a.m.*

gents,
any hints to a fast solution for copying a contiguous memory block (say, a 64kB block from address 0h to 30000h)? i'm currently investigating how to swap the 64kB ROM area with a 2 x 32kB ram area of my FRAM71 module.
http://www.flickr.com/photos/75954327@N05/
that would give the opportunity to "upgrade" an HP-71B with 1BBBB firmware to 2CDCC (or whatever else one would like to put in there). in order to test that "swap" feature, i simply copy the rom area to 30000h, then swap the addresses and set OD to high. however, the copy process via peek/poke is pretty time consuming, and considering the many "memory lost"s along the road, i would rather prefer a faster solution...
thanks in advance,
hans

*Message #3 Posted by **Raymond Del Tondo** on 5 Feb 2012, 11:01 a.m.,*
in response to message #1 by Hans Brueggemann

Hi,

you could use a small copy routine using Saturn machine language.
Actually there are suitable routines in the ROM,
like MOVEUP or MOVEDN, which expect the source in D0 and target in D1, and the amount of nibs to copy in C[A].

To call the routines from Basic, you may have to write a small BIN file,
or create a LEX file with a suitable keyword, like MEMCPY(src,tgt,nibs)
which then will call the internal memory copy routine.

However I'm sure someone already wrote s.t. like this back then,
so you may also check the LEX file library;-)

HTH

Re: HP-71B: fastest memory copy?

*Message #4 Posted by **Paul Berger (Canada)** on 5 Feb 2012, 11:17 a.m.,*
in response to message #1 by Hans Brueggemann

I am pretty sure you will need to resort to assembler for this. It is possible that if the peek and poke commands make good use of the processor peeking and poking multiple, up to 16 nibbles at a time may be faster than a single peek and poke. However it can never be as efficient as something written in assembler. Peek would read the target memory into a variable you assigned and then poke would read the data from that variable and write it out to your target address, so your data is handled twice. With a solution written in assembler you could go directly from your source location to you target location.

Memory moving is one where the simplified bus structure of the Saturn processor bites you. The design has all memory devices keeping a local copy of both the program counter and data pointer, and before reading or writing, the CPU sends out a command to tell memory devices load a one of these registers and then 5 more bus cycles to clock out the 5 nibbles of the 20 bit address then the read or write command at which point on the strobe you may read or write data, however the architecture allows for up to 16 data strobes following sending out an address and bus command with each strobe the memory device are supposed to increment their local copy of the address in use (program counter or data pointer). So it would seem to me that the most efficient way to do this would be read 16 nibbles into a register and then write them out to the target. I am sure that it is not coincidence that the working registers in the Saturn are 16 nibbles in size, briefly looking at the instructions available there seems to be instructions to load and save a register in one shot. There are also two data pointer registers that could hold the source and target addresses which should be pretty efficient.

Re: HP-71B: fastest memory copy?

*Message #5 Posted by **Craig Ruff** on 6 Feb 2012, 8:08 p.m.,*
in response to message #1 by Hans Brueggemann

If you get your FRAM module into production, I would be certainly be interested in acquiring one!

Re: HP-71B: fastest memory copy?

*Message #6 Posted by **Hans Brueggemann** on 7 Feb 2012, 3:32 a.m.,*
in response to message #5 by Craig Ruff

craig,
thanks for your interest! there are three FRAM71 currently in prototype state. putting documents and everything else together will take another 6 months. i'll be putting up a doc in the articles section here, so that everybody can decide whether he/she would like to order an FRAM71. if everything works fine, there will be a batch of 25 units (pc.b.s. without parts are already done). anyway, there will be the opportunity to buy the un-assembled p.c.b. for those who don't mind a little soldering challenge.

HP Calculators in 2025, As Predicted In 1978

*Message #1 Posted by **hpnut** on 5 Feb 2012, 7:25 a.m.*

Hi all,

I came across this blog entry http://blog.geekpress.com/2012/02/hp-calculators-in-2025-as-predicted-in.html

from the picture, nice to know that big ENTER key is available in HP calculators in 2025, also a yellow shift key :-)

the calculator has a laughable 1 gigabyte memory

*Message #8 Posted by **Eric Smith** on 6 Feb 2012, 1:32 a.m.,*
in response to message #7 by Keith Midson

If you want scarily prescient science fiction predictions from a hundred years ago, it's hard to top the short story *The Machine Stops* by E.M. Forster. A free eBook (with minor OCR errors) can be found at ManyBooks.net.

We haven't quite yet reached the society depicted in the story, though we must be getting close, given how accurate this news video from the Onion seems.

Re: HP Calculators in 2025, As Predicted In 1978

*Message #9 Posted by **Mark Scheuern** on 6 Feb 2012, 6:37 a.m.,*
in response to message #8 by Eric Smith

A fun read. Substitute "iPhone" for "HP Calculator" and it's not very far off.

I noticed the cover picture says 2050 but the story takes place in 2025.

My wp 34s V3

*Message #1 Posted by **troy** on 5 Feb 2012, 4:07 a.m.*

first thanks to walter, pauli, and wp34s for their work on the project! and thanks to gene for the cable.

i've finally flashed and put the overlays on my wp34s.

i made some changes to the default overlay:

1. Color scheme: f = orange; g = blue; h = yellow. i didn't like the green look on the original (no offense to walter/pauli); the green looked very dark on my printer no matter how light i get try it and i can't see it well. the yellow color isn't great, but i think it's better.

2. i put the f and g functions (orange and blue) above the key, instead of below. i'm more used to this layout.

3. used BIN, OCT, DEC, HEX instead of 2, 8, 10, 16, respectively.

4. CHS instead of +/-.

5. the divide key (÷) instead of slash (/)

6. alpha characters on the lower right of the key instead of the lower left.

7. Fonts: Linux Biolinum for the keys, Linux Libertine for the label

i'm also planning to write a user's manual for the calculator that can be printed and bound. it will be based largely on the 15c, 32sii and 42s manuals. hopefully, i'll finish the manual by end of march.

my plan is to flash some calculators, apply the overlays, and print and bind the manual and give it as a gift to some friends. I have engineers, college professors, and scientists friends that might appreciate the gift. none of them are RPN users, but hope to convert them to rpn through wp34s.

i'm trying to compile the firmware to individualize some greeting and include the name of the person to whom i'll give the calculator to.

anyways, here's some shot.

in response to message #1 by troy

Nice!

Are you also selling your overlays? Cost+shipping worldwide?

Re: My wp 34s V3

*Message #3 Posted by **troy** on 6 Feb 2012, 11:39 a.m.,*

in response to message #2 by Alexander Oestert

hi alexander,

thanks!

actually, i wouldn't mind selling some of the overlays.i don't want to compete with eric's but i figured if i could sell ~60 or so, i would have at least gotten back the investment on the cutting machine, and my wife would be happy! the time spent i consider a labor of love :)

anyways, something like the price that eric is selling would be ok with me.

contact me if you're interested.

thanks!

Re: My wp 34s V3

*Message #4 Posted by **robert rozee** on 5 Feb 2012, 5:48 a.m.,*
in response to message #1 by troy

looks pretty neat... might i suggest that the letters 'f' 'g' and 'h' be printed in black to make them stand out more?

btw, a customizable greeting message would be a nice option in general, perhaps moving the developer's names to an 'about' menu item.

cheers, rob :-)

Re: My wp 34s V3

*Message #5 Posted by **Dominic Richens** on 6 Feb 2012, 9:21 a.m.,*
in response to message #1 by troy

Very nice and great to see this kind of customization by users!!!

While I still prefer Walter's design of font, colour and base labelling (perhaps because I've been using it for 6 months) the one think that immediately strikes me is how much better having f and g labels **above** the keys looks.

For example I still have to think to not hit f - instead of f x for sqrt(). Either because it is more natural (finger does not obscure the label as I push the key) or because that's what every HP calculator I have used did (HP-15C and HP-48SX).

BTW - how do you make yours? Do you have your own cutting machine?

Re: My wp 34s V3

*Message #6 Posted by **troy** on 6 Feb 2012, 11:47 a.m.,*
in response to message #5 by Dominic Richens

thanks dominic,

i used inkscape for the layout and the silhouette cutting machine. i think both of these have been discussed here before. but inkscape mainly because it is free, and linux libertine fonts because it is also free.

[WP34S] alternate V3 overlays

*Message #7 Posted by **Dominic Richens** on 6 Feb 2012, 1:26 p.m.,*
in response to message #5 by Dominic Richens

I am going to try using this with the emulator for a while and see how I like the f and g labels on top.

Already I like that when converting between decimal and hex, I don't have to lift my finger to see which key I'm suppose to press.

IIRC we already had this debate - can't remember why "under" won out?

Edited: 6 Feb 2012, 2:05 p.m. after one or more responses were posted

Re: My wp 34s V3

*Message #8 Posted by **Walter B** on 6 Feb 2012, 1:47 p.m.,*
in response to message #7 by Dominic Richens

> Quote:
>
> IIRC we already had this debate - can't remember why "under" won out?

- The HP-67 featured it ;-)
- All shifted labels are found on one side of the key. Is more logical IMHO and needs less real estate, resulting in a cleaner design.
- The default primary functions in the top row fit nicely.

That's it, if I haven't forgotten anything important :-)

Walter

@troy: Nice job - but I wouldn't choose orange *and* yellow: too little difference IMHO. Did you try red instead of orange already? And I continue prefering the shifted labels on *one* side ;-) And please choose another font for 'g'.

Edited to emphasize point 2.

*Message #14 Posted by **Jeff O.** on 6 Feb 2012, 4:37 p.m.,*
in response to message #1 by troy

Troy,
Nice work!

I like the concept of putting the f-shift and g-shift functions above the keys. Regarding your color scheme, I guess I agree with Walter below that orange and yellow are too similar, and would suggest red if you do not like the green. What I would really like to see, though, is for the h-shift legends on the sloped portion of the keys to be blue, because they are blue on the voyagers (except the 10C which has no blue shift key) and the 41C series, and so it just seems like they should be blue. Based on these thoughts, I guess I suggest something like this:

I also like that your small x's and y's as in 10^x, y^x, Cy,x, etc. are in a font that closely matches the classic HP font for these characters. Was it an oversight that the "x" in the "1/x" above the "B" key does not match this font?

Best regards,

Jeff

in response to message #15 by Massimo Gnerucci (Italy)

> Quote:
>
> They were blue also on classics, woodstocks, stings and spices... :)

Are we talking about h-shifted functions or merely functions on the slanted part of the keys?

Classics: Yes, the HP65 has blue functions on the slanted portion of the keys, but those are g-shifted. The HP67 h-shifted functions are on the front portion of the keys and are black.

Woodstock (25, 29C) and Sting (19C): The scientifics have blue functions on the slants, but they are g-shifted.

Spice: The 32E and 33E/C have blue functions on the slants, however they are g-shifted. The 34C has h-shifted on the slants (like the 67), and they are black (like the 67).

Jake

Re: My wp 34s V3

*Message #18 Posted by **Jeff O.** on 7 Feb 2012, 11:29 a.m.,*
in response to message #17 by Jake Schwartz

I think we are talking about whatever appears on the slanted portion of the keys. If this change were to be made to an alternate wp34s overlay, the blue functions would be h-shifted instead of g-shifted.

To stirr the pot a bit ;-) traditionally g-shifted functions were inverting f-shifted ones, starting with the HP-55. The HP-65 had that famous f^-1 shift key, but that was the one and only.

Walter said: "The HP-65 had that famous f^-1 shift key, but that was the one and only."

Gene: Which I have always liked. If there are enough functions and inverses, I have always thought this is a great idea to put more things on the keyboard. Costs you nothing in terms of keypresses and you gain a LOT of additional functions on the keyboard. :-)

in response to message #19 by Walter B

This seems like it's turning into a poll. That said, almost every popular calculator, modern or vintage, has key functions printed above the keys. I prefer this, and it seems many others do too. I'd pay for an overlay with top labels.

I agree with the arguments for blue slant labels. Unlike the OP in this thread, I think the choice to use bright yellow for the f functions makes perfect sense - they are those I use most often, and it makes them stand out quickly.

My ideal overlay would simply swap the blue and green colors on the overlay, and have function labels at the top.

Re: My wp 34s V3

*Message #22 Posted by **Neil Hamilton (Ottawa)** on 7 Feb 2012, 1:24 p.m.,*
in response to message #21 by Bob Cortopassi

I find that it is difficult to distinguish the blue from the green in low light conditions so would prefer higher contrasting colours.

Love the idea of labels on the top!

in response to message #22 by Neil Hamilton (Ottawa)

When I have some time I will take a stab at editing Eric's inkscape and Silouette files.

While I have no objection to swapping green and blue, but I loathe to change the green, aside from maybe lightening it up. I prefer Walter's original aesthetic of analogous colours (e.g. from one side of the colour wheel). Replace the green with a red turns it looks like a kid's toy as the colours are no longer complementary nor analogous.

haha! To get the X.FCN catalogue I hit 'g' twice before I realized it wasn't green anymore *sigh*

Sigh!

Need glasses to see up close. Need different glasses to see far away. Can't see in the dark anymore...

Something has got to give! :-)

But... I did manage to solder several sets of crystals and caps a few months ago. Can't be all bad!

Re: My wp 34s V3

*Message #25 Posted by **Bob Cortopassi** on 7 Feb 2012, 3:36 p.m.,*
in response to message #23 by Dominic Richens

That looks fantastic!

Yellow stands out, and (for me) those are the most used functions. Blue on the slants is somewhat muted, and those (again, for me) are the least-used functions and menus.

If Eric builds them, I will buy at least 2 more.

*Message #28 Posted by **troy** on 7 Feb 2012, 6:08 p.m.,*
in response to message #1 by troy

thanks everyone for the response.

i agree that orange and yellow are hard to distinguish. i would love green but my printer just can't print it good enough to be seen properly. it always comes out dark no matter how light i set it---but if too light, it gets washed out.

so i settled for red. it does not look too good on the screen, but once i laid it on the keys, it actually looked nice, at

least to me. and i can see it---the most important part.

i also changed the f/g/h fonts to Helvetica---people in Switzerland are loving me now!

anyway, here's what i changed it to.

*Message #30 Posted by **Dominic Richens** on 8 Feb 2012, 7:04 a.m.,*
in response to message #29 by David Griffith

oh boy Troy, look what you've started :-)

The little bit of industrial design instruction I got really stressed the importance of choosing colours carefully.. If this was, for example, a piece of safety equipment we would use 3 colours as far apart as

possible from each other (red, blue, yellow) with saturation adjusted so that people with trichromacy can still distinguish between them. The same rule seems to be followed when designing children's toys.

However for a calculator, I think a more subtle approach is needed.

I think Troy needs to buy a better printer :-)

Information that may be of interest to HP-75 users posted

*Message #1 Posted by **Paul Berger (Canada)** on 4 Feb 2012, 7:52 p.m.*

When I first got a 75 and started playing with it, I started trying out some of the programs found on the archive diskettes available as lif images on the museum's web site and quickly got frustrated with all the "Error: ROM Missing" messages and to make matters worse there did not seem to be any way to identify what "ROM" was missing A little later I did some reading in the NOMAS for the 75 and figured out was the token was for and external ROM call and found that immediately following the token was the hex LEX number associated with the external call. I then wrote a perl script to go though the lif images and yank out basic 75 files and scan them for external calls. Also from the NOMAS I learned where to look in a LEX file for its LEX number and I built another list of the LEX numbers, names and achhive that contained them, and to that file I added the 'LEX' number for all of the plug in ROMs I have available to me, and then wrote another perl script to merge the two files and the result is a file I call Basic_xref. This file along with the LEX list and a list of keywords from all the LEX files and ROMs I have access to is available on my webspace at Paul's Web Space the file name is 75LEX.zip.

At the end of March last year there was a brief discussion about a EPROM board for 75s http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=181314 that I was interested in but the seller would not ship to Canada and I was unable to contact him before the auction ended. Through the kind efforts of a gentleman in Australia that was put in touch with the seller, who told me that he was sure he had another one and would look for it for me, well he found it, and I bought it from him. While doing some restoration on the board I rang out all the connections and from that drew a schematic of the board and then later wrote a short description of the circuit, this is also available on my webspace, see link above as 75EPROM.pdf. this exercise has proven very useful as I now have a very good understanding of how the 75 processor accesses memory and how the plug in ROMs work.

I post this in the hopes that some of this will be of some interest and use of others here.

Non-HEPAX configurations for NoVRAM/NoV-32

*Message #1 Posted by **Diego Diaz** on 4 Feb 2012, 4:10 p.m.*

Hi all,

By the time Clonix & NoV family was appearing, back in '03 & '04; with several MS-DOS based configuration tools for every different module, there was a NoVRAM-F.exe and NoVRAM-F.asm which were intended for the user to create a "Free" (hence the "F") configuration for the NoVRAM module. It was very limited though as it only allowed four ROM images to be placed into pages #C to #F, while keeping RAM fixed into #8 to #B area.

One of the advanced users asked me for the possibility of extending this to the available six ROM images and also to allow the four RAM pages to be placed either on #8 - #B or #C - #F, because he was interested on some RAM-Boxes emulation. This was the origin of the latest NoVRAM-R.asm and NoVRAM-R.exe configuration tool from '05.

As several users have currently showed up a growing interest in expanding the range of NoVRAM and NoV-32 configuration possibilities to different non-HEPAX applications I think that recovering this files may be of interest to some of you.

Further more I know of one user that will be very happy to see that page #4 is available in this tool... :-)

The download link for the relevant files is here.

This is just limited to MS-DOS environments (works on any DOS Window) and it calls IC-Prog upon completion but, of course, you can close it and use the NoVRAM-R.HEX file with your USB programer instead.

Also, when used on a NoV-32 module it is just limited to one 16K RAM block, therefore behaving just like a simple NoVRAM.

I will appreciate your feedback in order to evaluate this optional configuration to be included in the next release of the ClonixConfig utility.

All the best and have a nice weekend!

Diego.

32-bit version of User Code Utiltiy for HP-41

*Message #1 Posted by **MichaelG** on 4 Feb 2012, 2:41 p.m.*

To be honest I'm still not 100% sure how this forum works. It seems that one or two replys have been eaten up some how. That's why I restart a new topic.

The next 32-bit version of the user code compiler for the 41 is available. You may want to download here:

download.michael-goericke.de/FocalComp.zip.

It fixes a bug in the code creation of local numeric labels 0-14)and adds a small docu.

As mentioned previously this version needs the .Net 4 runtime (which is available on Win 7 by default).

Michael

> To be honest I'm still not 100% sure how this forum works. It seems that one or two replys have been eaten up some how. That's why I restart a new topic.

Michael,

It's not your fault. It's just the overwhelming quantity of postings on this forum that makes it difficult to pick the information one is interested in. All messages are treated with the same priority. Seemingly, posts with a broad audience being marked by a huge tail of replies tend to "eat up" postings with less reply. However, this does not mean that posts with little reply are not valuable. In the contrary, this may be excellent information for few people only. But somehow this is not appreciated by many responses.

With respect to your work, I appreciate your efforts to transfer old 16-bit DOS software to the 32-bit system very much, and at least for me your contributions are very valuable.

Thank you very much!
Frido

*Message #5 Posted by **MichaelG** on 8 Feb 2012, 7:12 a.m.,*
in response to message #1 by MichaelG

Thx to all for your replies. I see that as an encouragement to continue.

While the assembler and linker are ports from 16- to 32-bit, the focal compiler is a new implementation started from scratch. Of course I reused a lot of details and special handling from the 16-bit version.

The MCode disassembler is working and got a new feature: it creates a label for each jump (instead of giving an address) where no label is given. Will be released soon.

To keep this posting's topic, I have a very first prototype of the focal decompiler running. I guess you are interested as well...

Michael

Help with HP 41CX - 95% working

*Message #1 Posted by **Russell Dobson** on 4 Feb 2012, 5:44 a.m.*

Hi I just picked up a 1984 model 41CX and there are a few things that are not working. If anyone can help it would be great, everything is working properly except:

1. The USER key needs a firm press to work (using SF27 instead) 2. The ON key won't work at all (remove batteries and press any key gets it started) - I haven't tried using contact cleaner or this like just yet... (not sure but it may be stuck ON) 3. Running CATALOG 5 (lists all alarms that are set) freezes the display (with 'CAT 5' showing)but after I remove batteries and press any key to restart the calc works fine - well everyting except CAT 5. 4. Time and stopwatch functions seem to work fine, but alarms might be a problem as the display goes blank when I execute any xyzalm command. By removing batteries and pressing any key the calc restarts fine but loses the time so its hard to check xyzalm.

I have already repaired the slightly cracked posts and seem to have good contact between the keyboard-CPU and keyboard-display.

The reason I think the on/off key might be stuck ON is that my fully working 41C doesn't restart by pressing any key after putting the batteries in...

thanks, Russell

Re: Help with HP 41CX - 95% working

*Message #2 Posted by **Paul Berger (Canada)** on 4 Feb 2012, 8:08 a.m.,*
in response to message #1 by Russell Dobson

1. Does the user key seem to move normally compared to you C? Does it depress normally but just requires extra force to get it to register? The user button uses the same kind of switch as any other key you should be able to feel the "click" when the dome under the key distorts, if it seems to operate normally, but you have to lean on it to get it to register that would suggest there is contamination under the dome. 2. Again does the action of the on switch feel ok? If it feels ok when the calculator is turned on what happens if you press shift then on? It should display the time. 3&4 These do not sound good. It seems that these functions are causing the calculator to go off into the weeds perhaps there is a faulty component on the CPU card. Access to a diagnostic ROM would be useful here.

I don't think that the problem is the on key being stuck on, I tried holding the on button while inserting batteries and I do not see the behavior you describe on one CX that has been sitting without batteries for a long time I got the memory lost message on the others, two CVs and a CX if I hold the on key while I insert batteries it will not power on when I press a key. The on button does have one unique connection to the CPU card, it is the only button on row 9. So perhaps you still do have a connection problem between the keyboard and CPU card. If your calculator has the elastomer or "zebra" connectors these are know to be problematic in 41s the interface that is two plastic tube with wire ring around them are much more reliable.

If you are really brave you could swap CPU cards with your C, the keyboard and display is identical.

Re: Help with HP 41CX - 95% working

*Message #3 Posted by **Russell Dobson** on 4 Feb 2012, 7:22 p.m.,*
in response to message #2 by Paul Berger (Canada)

Paul, thanks very much for the quick reply. My comments to yours below: 1. The USER and the ON keys feel

very normal in operation and the click is distinct as with all keys. 2. When the calc is on and I press shift ON, I get the same response as just pressing ON - the display goes blank and the only way to restart is to remove batteries very briefly, reinsert and press any key. The calc then operates 'normally'again. 3 & 4. Diagnostic ROM - not sure what/where to get this kind of help?

Connectors shown in this photo:

Any furhter suggestions? Thanks, Russell

Re: Help with HP 41CX - 95% working

*Message #4 Posted by **Paul Berger (Canada)** on 4 Feb 2012, 8:18 p.m.,*
in response to message #3 by Russell Dobson

Well it does indeed look very nice inside, I can't really make out what the interconnect is from your picture, however the plastic frame around the interconnect looks like the one that was used with the elastomer interconnect, and as I said previous if it is the elastomer one they can be bad news in a 41. I know of a source for the better interface which is tiny wires wrapped around a hollow plastic rod, for a good picture of this interconnect go to http://www.keesvandersanden.nl/calculators/coconut_repair_fullnut.php If your CX does have the elastomer interconnect it is likely at least part of your problem.

For the diagnotic ROMs the images are available on a another site, however you need a ROM emulator of some sort to store them on, I built a ROM emulator just so I could use the diagnostic ROMs as well as HPIL related ROMs.

Re: Help with HP 41CX - 95% working

*Message #5 Posted by **Randy** on 4 Feb 2012, 8:59 p.m.,*
in response to message #4 by Paul Berger (Canada)

Unfortunately, as described, it has all the signs of a ROM failure. An HP service rom would be the fastest way to debug.

FWIW, only early CV's had the nasty pink internconnects. The CX pictured has the last version gold

devices.

Re: Help with HP 41CX - 95% working

*Message #6 Posted by **Randy** on 5 Feb 2012, 8:04 a.m.,*
in response to message #5 by Randy

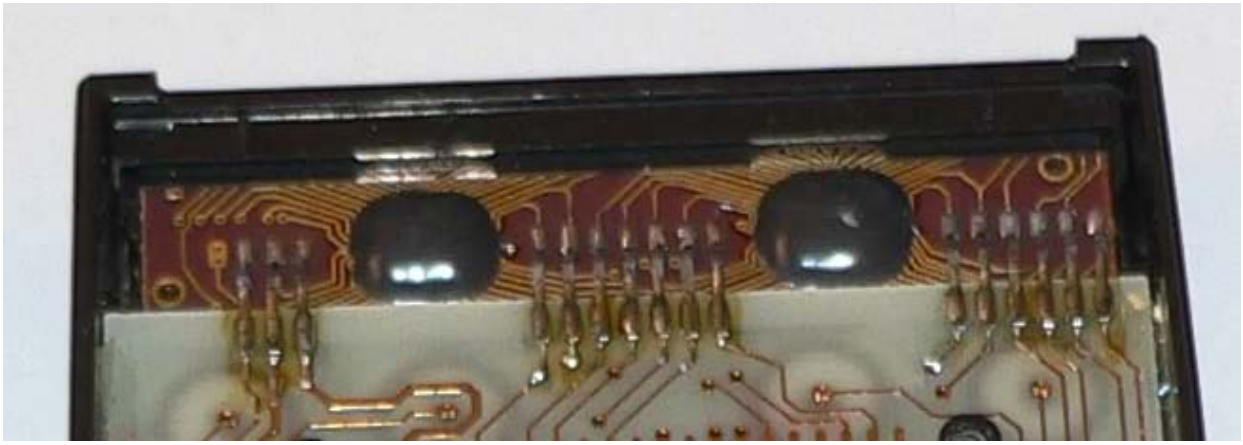
Upon much closer inspection, I would recommend you clean the flux from the display driver contacts. Use the solvent sparingly, otherwise it will get into the four switch domes at the top of the keyboard.

The reason: the bus is exposed there, any contamination can make rom and ram look defective.

Re: Help with HP 41CX - 95% working

*Message #7 Posted by **Russell Dobson** on 6 Feb 2012, 5:32 a.m.,*
in response to message #6 by Randy

Randy, I had a closer look and I see what you mean, there is a lot of flux around the solder on the keyboard circuit board where it connects to the display board:



I will try careful cleaning and let you know.

Thanks, Russell

Prices on 15C.

*Message #1 Posted by **Paulo MO** on 4 Feb 2012, 3:05 a.m.*

Item #290663440996 (new/pristine old 15c) on TAS just ended. Check out the price, and be amazed.

Who said the market for 15C is exhausted?

:-) Paulo

Re: Prices on 15C.

*Message #2 Posted by **Jim Johnson** on 4 Feb 2012, 8:18 a.m.,*
in response to message #1 by Paulo MO

Boxed items typically go for much higher prices due to collectors driving up the prices. The seller in this auction claimed that the calculator was never used and, indeed, the manual and calculator were pristine. But then there were two bidders that became irrational beyond the $400 price and bid it up just to out bid each other. At that point, it's just who has the most money and the least sense.

Re: Prices on 15C.

*Message #3 Posted by **Michael de Estrada** on 4 Feb 2012, 8:39 a.m.,*
in response to message #2 by Jim Johnson

Also, they were two inexperienced bidders, one with 6 positive feedback and the other a newbie with zero. However, I also agree that the price is not all that extraordinary, and I've seen much higher prices paid on less desirable items.

Re: Prices on 15C.

I would rather call them "alter egos" of the seller.

Re: Prices on 15C.

*Message #5 Posted by **Ethan Conner** on 4 Feb 2012, 1:19 p.m.,*
in response to message #4 by Maximilian Hohmann

Having a low amount of feedback is not necessarily a bad thing. I've been on TAS for years and do about one transaction per year. Being in a bidding war with someone who has zero feedback throws

a big red flag for me. A while back i was about to have the winning bid on an item till noticing all the sneaky tricks the seller had used to disguise the true nature of the item. I sent him a letter calling him on it and shortly after that a bidder with zero feedback outbid me and that was the end of it.

Re: Prices on 15C.

*Message #6 Posted by **Michael de Estrada** on 4 Feb 2012, 2:25 p.m.,*
in response to message #5 by Ethan Conner

I suppose it is possible that the zero feedback newbie was a shill, trying to push the bid price up. Since the other bidder eventually won the auction, there's no way to know. I buy very little on Eb@y now, and much of it is fixed price (BIN) or best offer anyway. On the rare occasions that I do bid in a regular auction, it's a single snipe bid in the last 10 seconds, where I either win or don't.

Re: Prices on 15C.

*Message #7 Posted by **Namir** on 4 Feb 2012, 2:52 p.m.,*
in response to message #2 by Jim Johnson

What percentage of newbies who jack up the price beyond reasonable values end up actually paying??? Any stories folks want to share here?

Namir

Re: Prices on 15C.

in response to message #7 by Namir

Namir,

This guy (110786150114) paid within a few minutes after the auction ended. He received his FIRST feedback from me.

And bought with his second auction the manual for the HP-16C ;-))

She (110788530799) never paid a $15 calculator - just disappeared.

He (110803246120) won three auctions - paid within a few hours.

This guy (110803246120) received his first and second feedback from me. Paid instantly.

She 110814236369) received her FIRST feedback from me. Paid within a day.

I'm very, very pleased with newbies and had never any problems with them on eBay.

Have a great weekend and don't miss my TI Programmables next week ;-))

Cheers,

Joerg

Re: Prices on 15C.

*Message #9 Posted by **Michael de Estrada** on 5 Feb 2012, 9:40 a.m.,*
in response to message #8 by Joerg Woerner

It depends what kind of product you are selling. I've sold dozens of vintage calculators, and never had any non-paying winning bidders, although a few have not paid immediately. I have had problems with other types of items, such as bicycle parts. I think the type of person who buys vintage calculators tends to be more serious and responsible than the average buying public.

Re: Prices on 15C.

*Message #10 Posted by **Rob Willett** on 5 Feb 2012, 9:54 a.m.,*
in response to message #9 by Michael de Estrada

I've only sold one calculator, an HP 48, the bloke had some feedback but not for some time. He came in about 10 mins to go, so wasn't a snipe he'd forgotten about and won. That's the last I heard from him. Never replied, never paid, raised a dispute with eBay and sold the calculator again a few weeks later, I actually got more for it the second time than the first which was kinda nice, but if I was in this to make money, I'd be bankrupt by now :)

I've brought and sold around 300 things on eBay, I tend to buy more than I sell as eBay has rigged the rules to be so much for the buyer, I think anybody who sells anything worth more than Â£100 is pushing their luck. There's so many ways a buyer can rip you off, from Goods not as described, goods never turning up, claiming the goods are fake etc etc. So long as you're selling lots of cheap stuff, you can lose the costs in the same way shops 'lose' shoplifting costs, simply add a few pence to the average cost, if you're only selling 10 items a year, a single dodgy buyer can wipe out all your profit.

just my 2p worth.

Re: Prices on 15C.

*Message #11 Posted by **Rob Willett** on 5 Feb 2012, 9:57 a.m.,*
in response to message #10 by Rob Willett

I know it's bad form to reply to your own messages, but just seen the eBay price for 290663440996.

I spat out my drink in surprise. Wow oh wow.

Anybody who wants to buy my pristine vintage 15C with case and manual for that price is more than welcome. I'll throw in a few old calculators as well.

There is one born every day...

Re: Prices on 15C.

*Message #13 Posted by **Michael de Estrada** on 5 Feb 2012, 12:26 p.m.,*
in response to message #10 by Rob Willett

Actually, the main reason I no longer sell much on eB@y is that they now charge a lot more in auction sales fees, and the fee now includes the shipping cost. This makes it particularly unprofitable to ship internationally, where shipping costs can easily exceed the sales price of the item itself. The other change is that although a buyer can leave negative feedback for a seller, a seller can only leave positive feedback for a buyer. So the buyer feedback rating is now pretty much meaningless. Most of my recent calculator sales have been via the MoHPC classifieds, where I can charge less by eliminating the eB@y middleman, and deal with reputable people who pay up front. All of my customers have been very satisfied with their purchases, which is very gratifying as well.

Re: Prices on 15C.

*Message #14 Posted by **Fabricio** on 5 Feb 2012, 1:55 p.m.,*
in response to message #9 by Michael de Estrada

> Quote:
>
> I think the type of person who buys vintage calculators tends to be more serious and responsible than the average buying public.

With exceptions, as always, most of HP-RPN classic calculators users/collectors are engineers and scientists from their middles upward. That most probably results in well educated guys, that has settled in life and have a good income; that would explain their shopping behaviour and also would explain the exorbitant prices that are paid for some of those calculators.

As I wrote in another thread, just ask yourself how much would be paid for a NIB HP42s (if such a thing would still exist) in 2025. Perhaps new HP calculators will exist, some few still with RPN, but definitely a very few of the now new 15cLE will be around by then, and the Voyager and Pioneer series will never ever be seen again, unless in the hands of us in the forum that holds with blood to them. Well, at least I think so.

Re: Prices on 15C.

*Message #15 Posted by **M. Joury** on 6 Feb 2012, 1:10 p.m.,*
in response to message #14 by Fabricio

Hi Fabricio,

It happens that I have three NIB HP-42S calcs. Not offering to sell or anything, just letting you know that the beast does still exist. I grabbed them at sale prices from the UVA (University of Virginia) bookstore several years after they had been discontinued. Four of them were just sitting there on the shelf gathering dust and they were asking around $60 per (if I remember correctly). I instantly bought them all and the three HP-32SII's that they had.

Cheers,

-Marwan

Re: Prices on 15C.

*Message #16 Posted by **Mike Morrow** on 6 Feb 2012, 2:21 p.m.,*
in response to message #15 by M. Joury

Somewhat similar story here. I bought two HP-42S (ROM rev. C) units NIB in 1997 from the bookstore at University of Alabama at Huntsville...unsold stock with dead batteries that had been in store since 1993. One is still NIB, minus the dead batteries. The other after 14 years of daily use still looks new. I bought another one (ROM rev. A) in 2010 NIB at a ham radio fest. All of these were about $100 each.

So there's likely many NIB HP-42S units out there. That's a good thing, since HP no longer has the expertise to make anything as capable.

But like all Pioneers and all other HP calculators since 1985, these have a real butt-ugly color scheme that's very hard to tolerate. I hope the "artistic" imbeciles who set such sub-standards at HP were fired, but with HP being a left-coast company they probably were promoted instead. Or perhaps they went to Apple.

Sorry to hear about your getting stuck with those HP 32Sii units. I bought one of those dogs in 1997...it's still NIB because I found that it was such a poor excuse for an electrical engineer's calculator. That's when I sought the capable 42S instead.

I'm pretty sure the expertise is there. The question is if they want to relaunch a scientific model with the feature set of the 42S or similar. The big markets seem to be elsewhere.

I pretty much doubt that.
Even if the two remaing software engineers would have all models in their head there is still a

- non existing calculator marketing (or no resources given)
- non existing calculator management (or no resources given)

If no resources are given then draw your own conlcusions.

lol...

A lot of people around these parts seem to love the HP-32S and HP-32Sii. I for one have to agree with you that the 42S is WAYYYY more capable. I take the 32Sii out once in a while just to play.

*Message #3 Posted by **Raymond Del Tondo** on 3 Feb 2012, 11:10 p.m.,*
in response to message #2 by Geoff Quickfall

A really NOS HP-41CX can certainly cost more than $450.
However the unit offered on eBay is not even complete. There is no box, no manuals.
Actually there's only the calc and the zipper case.
The eBayer writes: "What you see is what you get" ,
so you might get that awful Sony Vaio keyboard, too;-)

That's my thinking also. I have a super clean hp41cx with the manuals I am thinking of selling. I could call mine NOS and probably get away with it. I won't and I am not saying anything bad about this seller. All the best to them for anything they can get for it.

I am just amazed how much the prices have gone up on this stuff. I should have held onto the stuff I

sold years ago. Oh well hind sight is 20/20 as they say.

WP 34S bitwise logical operations bug?

*Message #1 Posted by **Nigel J Dowrick** on 3 Feb 2012, 2:55 p.m.*

I'm running build 2356 on my (ex-!)HP-30b. When I do yellow-shift-+/- (i.e., entering binary mode), "2c64" appears on the top line and "b" appears in the exponent. So far, so good.

Now, I enter 1010 and press ENTER, twice. I then do green-shift-7 - i.e., AND. I get a binary integer with 64 1s in it! I had expected to get 1010.

Digging out my HP-20b, still running a late version 2 build, I find that I do get 1010 as the result.

A little more experimentation reveals that in version 3, 0 AND 0 is 1 (other arguments giving correct answers). OR has the same problem, and XOR doesn't work either!

Is this a bug? Or have I inadvertently selected some special "give wrong answers" mode setting?

Nigel (UK)

Re: WP 34S bitwise logical operations bug?

*Message #2 Posted by **Marcus von Cube, Germany** on 3 Feb 2012, 6:06 p.m.,*
in response to message #1 by Nigel J Dowrick

Bad bug :-(

I have no idea where this crept in. I'm not aware of having changed anything in this area except the register access (which might well be the culprit.)

Edit: Fixed. It wasn't the register access. :-)

Edited: 3 Feb 2012, 6:36 p.m.

go41cx overlay Math module

*Message #1 Posted by **Alexander Oestert** on 3 Feb 2012, 12:33 p.m.*

My attempt at overlay files used with the Math module for the go41cx android app by Oliver de Smet

Math Overlay 01

Math Overlay 02

EDIT: I have purged the files on my drpbox due to changes in Oliver's program design.

Edited: 13 Feb 2012, 4:06 a.m. after one or more responses were posted

Re: go41cx overlay Math module

*Message #2 Posted by **Olivier De Smet** on 3 Feb 2012, 4:28 p.m.,*
in response to message #1 by Alexander Oestert

Nice, could I put them on my site ?

Olivier

P.S. printer emulation and hepax support are almost finished .... (next will be sound)

Re: go41cx overlay Math module

*Message #3 Posted by **Vincent Weber** on 3 Feb 2012, 5:45 p.m.,*
in response to message #2 by Olivier De Smet

Great Olivier ! Can you tell me if you intend to extend te character set to halfnut, i.e lower case ? The sandbox module does not display correctly its names.... Also do you intend to support skins/existing modules overlay (graphically complex, cannot be done in pure text). Thanks and cheers

Re: go41cx overlay Math module

*Message #4 Posted by **Olivier De Smet** on 7 Feb 2012, 3:44 a.m.,*
in response to message #3 by Vincent Weber

Hi,

Key entry now useable at speed greater than 1, even works very well at x32 or max speed (around x50 for my slow motorola defy), but PSE and CAT are accelerated too

Fullnut display is done (sandbox is ok), but with the same restriction as real hardware :)

Printer is done, just some limitation about the size of the paper ...

Hepax support (up to 32 KB : 4 8KB modules) with relocation of the rom is done

I added CV support to allow more modules if you don't need XF and Time. But you can still plug XF and Time modules in the CV if needed

I added a CCD-OSX with special addressabilities : look for free page from 3 to 7 then from 15 to 8 :) So you can have a CX with printer (page 6), Hepax (page 7), 3 8K modules (ports 1, 2 and 3), CCD page 15 and a 4K rom module in port 4 (page 14), only page 4 is free (as usual). it gives 48 KW rom, 24 KW hepax ram, 600 regs XF and a 4 KW application pac :)

For the graphical overlays, it's possible, but it is a major rework of the keypad part ...

I hope to post this v1.2 on market tomorrow.

Olivier

*Message #5 Posted by **Vincent Weber** on 7 Feb 2012, 4:47 a.m.,*
in response to message #4 by Olivier De Smet

Hi Olivier,

That's awesome work, thank you so much ! I think you'll be the primary reason why I will ditch my Iphone ! A bit more polishing in the graphics/skins/overlays, and you'll be on par with i41cx+ ! Well no, because Antonio also included a CAS in i41cx+, but I've always thought that was a bit too far off ;)

But thanks to all your emulators you 've made the Android plateform the primary one for HP calculators ! Just would need a 17Bi++ as on the iphone. If you get bored, you could port Emu42 from Christoph to Android ;))

I love your 15C too, the way you replaced the useless key codes with mnemonics is brillant, I would just would a bit more polishing (e.g. the size of the back help), and landscape mode to make it perfect.

And, of course, a 65... :)

Sorry to be that demanding, but that's your awesome work that triggered this in the first place :)

Cheers,

Vincent

in response to message #9 by Olivier De Smet

New release 1.3.0 with graphics for skins and overlay will be soon in the market, now you could customize your overlays. For skins, send them back to me, I will include them.

Olivier

Re: go41cx overlay Math module

*Message #11 Posted by **Alexander Oestert** on 13 Feb 2012, 4:05 a.m.,*
in response to message #10 by Olivier De Smet

Very nice! I'm thinking about throwing out my hardware 41c's...

The only problem I'm having (and had since earlier versions): ADV doesn't work on the printer.

I wish though you had kept the text only overlays as a second option. They would be handy for a quick and dirty user program overlay as they are so much easier to make.

Re: go41cx overlay Math module

*Message #12 Posted by **Vincent Weber** on 13 Feb 2012, 4:26 a.m.,*
in response to message #11 by Alexander Oestert

I fully agree about this overlay. I feel guilty, because I suggested Olivier (probably I was not the only one) to make graphical overlays because the text ones were too limited; but these text ones had the big advantage to be quickly and easily done. What about a code like:

if (file_extension_is_ovl) load_the_text_way(); else load_the_graphics_way();

or is it too naive ? ;)

Cheers,

Vincent

Re: go41cx overlay Math module

HP-15C Bug with MATRIX 5
*Message #1 Posted by **Thomas Klemm** on 3 Feb 2012, 11:39 a.m.*

So I was trying to use A^TB to calculate the scalar product of a vector with itself:

Definition of a *4x1* vector *E*

Set *USER* mode to enter the coordinates of the vector $E = [1\ 2\ 3\ 4]^T$:

```
4
ENTER
1
DIM E
MATRIX 1
1 STO E
2 STO E
3 STO E
4 STO E
```

Calculate E^TE

We'd expect that to be: $1^2 + 2^2 + 3^2 + 4^2 = 30$.

```
RCL MATRIX E
RESULT A
ENTER
MATRIX 5
MATRIX 1
RCL A
```

And we get indeed: *30.0000*

Running as a program

Use *CLEAR PRGM* to have all the programs removed. **WARNING:** you may not want to do that!

Now enter the few steps from above:

```
001-42,26,11   RESULT A
002-      36   ENTER
003-42,16, 5   MATRIX 5
004-42,16, 1   MATRIX 1
005-ᵘ  45 11   RCL A
```

And run the program:

```
RCL MATRIX E
RTN
R/S
```

I get an **ERROR 11: Improper Matrix Argument**. For *MATRIX 5* the *Appendix A: Error Conditions* states as possible reasons:

- the input is a scalar;
- the dimensions are incompatible; or
- the result is one of the arguments.

The funny thing is that the result is there. The stack consists of the following values:

```
T:
Z: A       1   1
Y: 30.0000
X: 30.0000
```

But the program stopped at this line:

```
003-42,16, 5   MATRIX 5
```

Workaround

A simple workaround is to add a *RTN* statement at the end of the program. Or you can single-step through the program as well.

Now is this a well known bug of the HP-15C? Could somebody verify this on a *real* calculator and possibly on the HP-15C LE? Unfortunately I can only test this with an emulator.

Kind regards
Thomas

PS: You think I should use *MATRIX 8* followed by x^2 instead?

Edited: 3 Feb 2012, 11:44 a.m.

Re: HP-15C Bug with MATRIX 5

*Message #2 Posted by **Paulo MO** on 3 Feb 2012, 12:34 p.m.,*
in response to message #1 by Thomas Klemm

1. Same thing on the LE.

2. But the problem is not with Matrix 5. It blows up on Matriz 5 simply because you're trying to use it with the number "30", and not with a matrix descriptor.

3. The problem is (and I don't understand what is going on) that the program tries to do a second loop (which is simultaneously why Matrix 5 is being fed the "30" - and thereby screaming for help with the Error 11 - , and why the RTN instruction solves the problem).

4. Why you would need an explicit return is what bothers me. Being the only program in memory, the RTN should be automatic; the program should return to address 000 and halt, not go for another ride at the merry-go-round.

:-(

Paulo

Edited: 3 Feb 2012, 12:36 p.m.

Re: HP-15C Bug with MATRIX 5

*Message #3 Posted by **Thomas Klemm** on 3 Feb 2012, 1:31 p.m.,*
in response to message #2 by Paulo MO

Thanks to your comment I understand better what's happening. But still I think it is somehow related the *MATRIX* operations. Because it never occurred to me in simple programs like:

```
001-       36   ENTER
002-       40   +
```

I'm just leaving the above statement, but I guess the real problem is the *RCL A* command in *USER* mode.

Since the dimension of *A* is *1x1* it jumps over the next step. But this is missing so it starts from scratch at line 000. This is what I consider the bug. Or is it a feature?

With the following program you get an endless-loop:

```
001-45,16,11   RCL MATRIX A
002-42,16, 1   MATRIX 1
003-u  45 11   RCL A
```

This appears to happen with *ISG* as well:

```
001-42, 6,25   ISG I
```

Start with *0* in register *I* and you're *running* for ever.

Thomas

Edited: 3 Feb 2012, 2:06 p.m.

Re: HP-15C Bug with MATRIX 5

*Message #4 Posted by **Paulo MO** on 3 Feb 2012, 2:12 p.m.,*
in response to message #3 by Thomas Klemm

Yeah. It seems that, by some reason it stops the implicit RTN function. When you plug in an explicit RTN instruction, everything works

ok, right? I have no clue as to the "why".

> Quote:
>
> Since the dimension of A is 1x1 it jumps over the next step

It makes no sense. You're being far too nice and/or forgiving. RCL A (after Matrix 1), is supposed to simply return the element 1,1 of A. Not jump, move, skip, or even think :-)

You may have found a bug on the original 15C firmware, and that would be something. It seems to be either that, or that I'm just deeper into Alzheimer than I thought :-)

Cheers Paulo

Re: HP-15C Bug with MATRIX 5

*Message #5 Posted by **Thomas Klemm** on 3 Feb 2012, 2:32 p.m.,*
in response to message #4 by Paulo MO

> Quote:
>
> RCL A (after Matrix 1), is supposed to simply return the element 1,1 of A. Not jump, move, skip, or even think :-)

There's a subtle difference between:

```
003ᵘ   45 11   RCL A
```

and

```
003-   45 11   RCL A
```

The first is entered in *USER* mode while the latter isn't. The first does some *very cool* magic:

- auto-increments registers R_0 and R_1
- skips the next instruction if the end of the matrix is reached

This makes looping through the elements of a matrix very easy. Say you want to square each element:

```
MATRIX 1
LBL 0
RCL A
x²
ᵘ STO A
GTO 0
```

Re: HP-15C Bug with MATRIX 5

*Message #6 Posted by **Paulo MO** on 3 Feb 2012, 4:39 p.m.,*
in response to message #5 by Thomas Klemm

In user mode, the increment of R0/R1, thus pointing to the next element is supposed to happen (when reaching the end of a matrix, R0/R1 return to 1,1, in readiness for the next matrix). But the mentioned skipping of the next instruction when the end of a matrix is reached and the instruction is being executed from within a program is, AFAIK, not a feature.

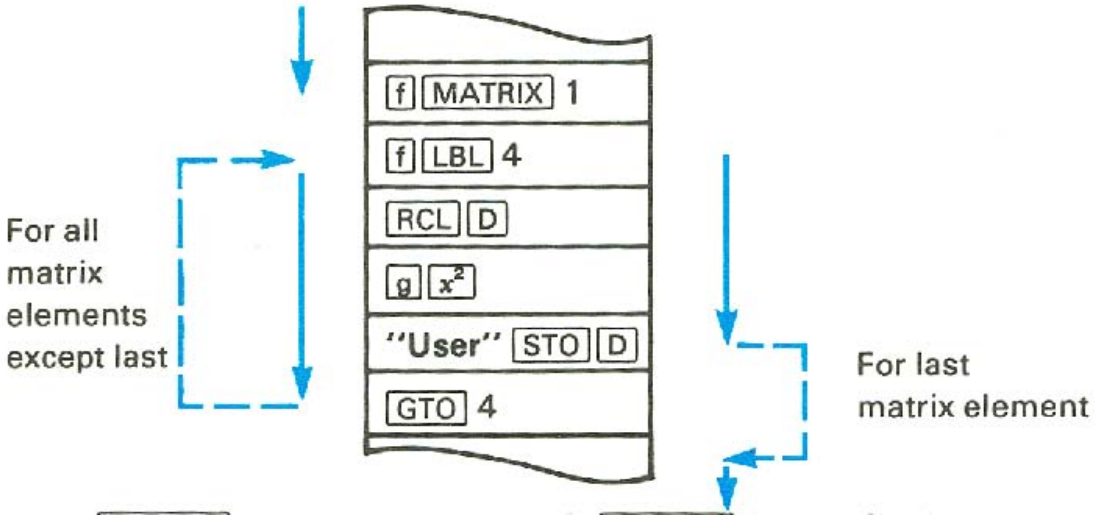
Best

Paulo

Re: HP-15C Bug with MATRIX 5

*Message #7 Posted by **Thomas Klemm** on 3 Feb 2012, 4:54 p.m.,*
in response to message #6 by Paulo MO

In addition, when the last element is accessed by the "User" [STO] or [RCL] instruction—when R_0 and R_1 are returned to 1—program execution skips the next line. This is useful for programming a loop that stores or recalls each matrix element, then continues executing the program. For example, the following sequence squares all elements of matrix **D**:



Best regards
Thomas

Re: HP-15C Bug with MATRIX 5
*Message #8 Posted by **Thomas Klemm** on 3 Feb 2012, 2:49 p.m.,*
in response to message #3 by Thomas Klemm

> Quote:
>
> This appears to happen with *ISG* as well.

This seems to be a general issue with conditional jumps on the last line of the program. You may try this with *MATRIX 7* (row norm) and *MATRIX 8* (Fobenius norm) as well. Just make sure you have a number in the *X*-Register. And unsurprisingly it's the same with *DSE*, *F?*, *x=0*, ...

So this might be the shortest loop-test:

```
001-       40   +
002-    43 20   x=0
```

Just fill the stack with *1s* and hit the *R/S* key.

Thomas

Re: HP-15C Bug with MATRIX 5
*Message #9 Posted by **Paulo MO** on 3 Feb 2012, 4:46 p.m.,*
in response to message #8 by Thomas Klemm

I don't follow you. Conditional jumps are done to either jump the next instruction or not. That is fine and expected. But the point is that RCL A is not a conditional jump instruction, just a RCL (with increment of the indices if in User mode), and that is what makes it awkward. Why should it jump over the implicit RTN, just because the end of the matrix was reached?

I'm giving up. Maybe someone will explain this. I'll be happy if it happens (and feel stupid, too, but I'm getting used to that ;-))

Paulo

Edited: 3 Feb 2012, 4:47 p.m.

Re: HP-15C Bug with MATRIX 5

*Message #13 Posted by **Marcus von Cube, Germany** on 3 Feb 2012, 6:50 p.m.,*
in response to message #8 by Thomas Klemm

We had a hard time to get the automatic return on the last step right. It was causing so much grief that I was happy to get rid of it completely by forcing an END statement as the last step in any program.

Re: HP-15C Bug with MATRIX 5

*Message #14 Posted by **Paul Dale** on 3 Feb 2012, 7:02 p.m.,*
in response to message #13 by Marcus von Cube, Germany

Agreed, this was one of the worst bits in the program execution support. Made worse by the introduction of END statements :-(

The current enforced END is a bit confusing to me at times I feel. Single or back step with an empty program from run and you stick at the END, switch to program mode and it swaps between steps 0 and 1. Don't step and you insert after then END making a new program. This has caught me out a few times now.

- Pauli

WP34S: Implicit END

*Message #15 Posted by **Marcus von Cube, Germany** on 3 Feb 2012, 7:14 p.m.,*
in response to message #14 by Paul Dale

> Quote:
>
> The current enforced END is a bit confusing to me at times I feel.

I know. :-(

But we need it nonetheless. If you switch to program mode now and the program memory is empty (just containing the single END statement) the PC is reset to zero. I may change it to not putting the END into empty program memory and just add it together with the first command entered. But this will cause problems in other areas.

This discussion may look a bit misplaced in this forum because it deals with very specific implementation details of WP 34S. But I believe this helps to understand how much care and thought is needed to get things right for the user.

Re: HP-15C Bug with MATRIX 5

*Message #16 Posted by **J-F Garnier** on 4 Feb 2012, 4:33 a.m.,*
in response to message #8 by Thomas Klemm

This happens also on the HP11C and HP16C, and even on a HP-34C. I believe this is also the same some many pre-HP41C machines - without END statement.

Re: HP-15C Bug with MATRIX 5

*Message #17 Posted by **Thomas Klemm** on 4 Feb 2012, 7:58 a.m.,*
in response to message #16 by J-F Garnier

You may add the HP-12C to the list. It appears if you manage to make the conditional statement the last one and avoid the *GTO 00* statements that are otherwise added at the end. Just include a few dummy statements until you have a multiple of 8.

It doesn't occur in earlier models I checked and not in subsequent models like the HP-32Sii , HP-20S or the HP-35S as well.

Cheers
Thomas

HP Solve issue #26 is posted...

*Message #1 Posted by **Richard J. Nelson** on 2 Feb 2012, 6:12 p.m.*

Hello,

Issue #26 of HP Solve has been posted at: [http://h20331.www2.hp.com/Hpsub/cache/580500-0-0-225-121.html] Issue # 26

Museum readers may be interested in the HHC 2011 report, the best speaker winner's paper, and other articles.

X < > Y,

Richard

Re: HP Solve issue #26 is posted...

*Message #2 Posted by **Don Shepherd** on 2 Feb 2012, 6:30 p.m.,*
in response to message #1 by Richard J. Nelson

Richard, the link for issue #26 looks like it downloads something for about 3 minutes (flashing modem lights), but I just end up with an empty .pdf file.

Re: HP Solve issue #26 is posted...

*Message #3 Posted by **Paul Dale** on 2 Feb 2012, 6:32 p.m.,*
in response to message #1 by Richard J. Nelson

Nice work as usual.

A factual error on page 50. The WP 34S uses *decimal* arithmetic not binary. It doesn't use BCD because there are more efficient decimal packings methods available and we've the CPU power to use them effectively.

- Pauli

Re: HP Solve issue #26 is posted...

*Message #4 Posted by **Richard J. Nelson** on 3 Feb 2012, 10:28 a.m.,*
in response to message #3 by Paul Dale

Thanks Pauli for the correction. It is a double mistake because i thought it used BCD. Now I need to review the differences.

X < > Y,

Richard

Re: HP Solve issue #26 is posted...

*Message #5 Posted by **Paul Dale** on 3 Feb 2012, 6:14 p.m.,*
in response to message #4 by Richard J. Nelson

Registers store floating point numbers in densely packed decimal format. We're not using the prefix encoding so we're not binary compatible with other such implementations -- not doing so avoids some large look up tables. Floating point numbers in registers are stored in decimal64 format, double precision numbers in decimal128. Statistical accumulations use *both* of these formats to avoid the large but similar numbers causing truncation problems (as mentioned in many HP calculator manuals).

Internally, computations are performed in base-1000 carrying 39 digits and a huge exponent range.

WP34s Parts List

*Message #1 Posted by **Barry Reeves** on 2 Feb 2012, 3:25 p.m.*

I've just repurposed my first HP30b into a WP34s.(Version 2.2 because those are the overlays I had). It's, by far, the coolest project I've seen in a long time Now I have two others I'm planning to repurpose as well (With version 3). I want to totally populate the PCB of at least one of them, and at least add the clock circuit to the other. I've searched these forums, and I can't seem to find a parts list any where here, but I'm sure I've seen it some where. Can somebody point me in the right direction? If someone knows of a parts kit that can be purchased that would be even better. :).

Re: WP34s Parts List

What additional board population options are there beyond the addition of the crystal (which was recently discussed in this thread)?

Edited: 7 Feb 2012, 7:45 a.m. after one or more responses were posted

Re: WP34s Parts List

*Message #3 Posted by **Barry Reeves** on 2 Feb 2012, 4:28 p.m.,*
in response to message #2 by Jeff O.

There is a place to add a JTAG connector and an on board serial interface.

Re: WP34s Parts List

*Message #4 Posted by **Marcus von Cube, Germany** on 2 Feb 2012, 6:43 p.m.,*
in response to message #3 by Barry Reeves

JTAG is useful if you want to join the team for hardware development. My original unit which has the JTAG connector broke (failure of the serial connection) and I have yet to add the connector to my present development unit. So far I could live without, thanks to the emulator as a debugging platform.

The serial port modification will most probably be not very useful as well. It's better to butcher one of the programming cables and add an FTDI 3V USB/serial converter to the RS232 end of things. I just removed all the guts from the small board, except the switches, and wired the FTDI cable ends directly to the other end of the board.

The crystal modification is very useful. You can then install a special image (calc_xtal.bin) which starts the quartz oscillator on startup and lacks the internal logic to support the RC oscillator. I've added the stopwatch instead (which makes the image larger than the default image, of course.)

Re: WP34s Parts List

*Message #5 Posted by **Barry Reeves** on 3 Feb 2012, 10:20 a.m.,*
in response to message #4 by Marcus von Cube, Germany

I was thinking that the serial port would be very useful to drive IR. This could be used for unit to unit data transfer or data transfer to other devices. It could also be used for remote control. With the extra power drain, it would probably be better to replace the batteries with AAAs, or perhaps a mobile phone lithium polymer battery.

Unless, there are plans to add data transfer to the WP34s, then a serial port is of little use to most people, however I just want to tinker around with hardware a bit. I'll keep one HP30b for tinkering, and the others will become WP34s with crystals.

Re: WP34s Parts List

*Message #6 Posted by **Marcus von Cube, Germany** on 3 Feb 2012, 5:56 p.m.,*
in response to message #5 by Barry Reeves

Bary, the wp34s does data transfer! The serial interface is supported by the software to transfer registers, state and programs. The communication is possible between the device and the emulator or between devices. But you don't need the level shifters for the latter, a simple cross over cable is sufficient.

Re: WP34s Parts List

*Message #7 Posted by **Barry Reeves** on 4 Feb 2012, 2:03 p.m.,*
in response to message #6 by Marcus von Cube, Germany

If you can already transfer data between calculators, having IR would make it easier (No cables). But the easiest mod to the calculators would be to run the RX and TX to a small headphone jack. The transfer cable would be very simple and cheap.

Re: WP34s Parts List

*Message #8 Posted by **Marcus von Cube, Germany** on 4 Feb 2012, 2:22 p.m.,*
in response to message #7 by Barry Reeves

Do you mean like this?

Re: WP34s Parts List

*Message #9 Posted by **Barry Reeves** on 6 Feb 2012, 10:40 a.m.,*
in response to message #8 by Marcus von Cube, Germany

That's pretty much exactly what I was thinking. Nice work! If I get mine modded, I'll be sure and follow the same convention of RXD tip, TXD ring, GND sleeve. With some care, you could install a photo diode and IR LED on the other side of that screw post. You would have to cut an opening in both the case and the slide cover, that might be kind of tricky.

Re: WP34s Parts List

*Message #10 Posted by **Barry Reeves** on 6 Feb 2012, 1:17 p.m.,*
in response to message #9 by Barry Reeves

I think I'll just try something like a TFDU6300. I might get by with no additional parts requirements, though a small buffering cap may be required on VCC2.

Re: WP34s Parts List

*Message #11 Posted by **Paul Dale** on 2 Feb 2012, 5:06 p.m.,*
in response to message #1 by Barry Reeves

The only additions we support are the clock -- two capacitors and a crystal. Marcus has bought out the serial port but the programming cable works for this just as well.

We don't have commands to directly access the I/O headers that are present and haven't any intention of adding any.

- Pauli

Re: WP34s Parts List

While I've been following all the 34s activities pretty closely I've been busy with other stuff and haven't actually re-purposed a 30b yet (would you believe!). However adding the ability to read/write bits from/to an i/o port under program control would be take this project to a whole different level, making the calculator into a hand-held controller for all sorts of electronic things. I would love to help out on such a project.

I'm still waiting on arrival of a 30b. However unless a manufacturing change has already displaced the obsoleted die sam7 in favour of the lqfp package, I'm unsure if usable gpio is accessible. Anyone know for certain if recent production has transitioned from die to lqfp package, or if still COB die whether unused gpio is bonded out to the PCB?

Re: WP34s Parts List

*Message #14 Posted by **Barry Reeves** on 3 Feb 2012, 2:41 p.m.,*
in response to message #13 by uhmgawa

Most I0 pins are used by the LCD and keyboard. However, eight of them are brought out to pads on the PCB as well as all four ADC inputs.

Re: WP34s Parts List

*Message #15 Posted by **uhmgawa** on 3 Feb 2012, 6:45 p.m.,*
in response to message #14 by Barry Reeves

> Quote:
>
> Most I0 pins are used by the LCD and keyboard. However, eight of them are brought out to pads on the PCB as well as all four ADC inputs.

I'd forgotten all about the 20b developers kit documentation I'd squirreled away back when, and more importantly the existence of a schematic. Are the board layouts effectively identical between the 20b/30b? Except for the clandestine jumper Marcus had suspected earlier, that is. This could be accomplished via one of the unused floating gpio lines in the 20b being tied to GND in the 30b.

Re: WP34s Parts List

*Message #16 Posted by **Andrés C. Rodríguez (Argentina)** on 6 Feb 2012, 3:17 p.m.,*
in response to message #12 by Katie Wasserman

Even simple low-level "read byte" (PEEK) or "output byte" (POKE) functions may open a full new I/O world for WP34S; and more if analog input is allowed. Let's hope, "NULL" was once dismissed and now it's part of the game!!

Re: WP34s Parts List

*Message #17 Posted by **Marcus von Cube, Germany** on 6 Feb 2012, 3:59 p.m.,*
in response to message #16 by Andrés C. Rodríguez (Argentina)

The software is open source, just go ahead!

Re: WP34s Parts List

*Message #18 Posted by **Andrés C. Rodríguez (Argentina)** on 7 Feb 2012, 3:22 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Would you assist a neophyte in his first steps to add code to the project? I may ask some colleague here at my university to help with the tool chain, etc; but if I eventually start with this I would be starting from absolute zero. I'm interested, but somehow fearfully impressed about starting such an endeavor.

Re: WP34s Parts List

*Message #19 Posted by **Marcus von Cube, Germany** on 7 Feb 2012, 3:30 p.m.,*
in response to message #18 by Andrés C. Rodríguez (Argentina)

Andrés, you are welcome.

The first step should always be to get the tool chain up and running and do a clean rebuild. Code changes should mainly be done on a PC platform. I'm doing all my testing which isn't device specific on the Windows GUI. The debugger coming with Visual C/C++ Express is quite capable.

Re: WP34s Parts List

*Message #20 Posted by **Eric Rechlin** on 3 Feb 2012, 5:02 p.m.,*
in response to message #1 by Barry Reeves

I used to sell a kit with all the parts. This is what I included:

- 18 pF 0603 capacitors (quantity 2)
- 100 ohm 0603 resistor (quantity 1)
- Zero ohm 0603 resistors (quantity 2)
- PNP SOT-23 transistor (quantity 1)
- 32.768 kHz clock crystal (quantity 1)
- MAX3232 TSSOP level shifter (quantity 1)
- 16-pin header for JTAG (quantity 1)

Eric

HP15C LE Price Lowered by HP

*Message #1 Posted by **Namir** on 2 Feb 2012, 8:25 a.m.*

I just checked the hp web site and the price of the HP-15C LE is back to $99.99 AND IS NOT OUT OF STOCK. So all of you crying foul and bitching about the price hike, take a chill pill!!!

:-)

Namir

Edited: 2 Feb 2012, 8:26 a.m.

Re: HP15C LE Price Lowered by HP - REALLY???

*Message #2 Posted by **Joerg Woerner** on 2 Feb 2012, 8:57 a.m.,*
in response to message #1 by Namir

Namir,

Please remember, the steep price tag of $179.99 was at hp's Home & Home Office section. The page and calculator disappeared there...

Regards,

Joerg

Re: HP15C LE Price Lowered by HP

*Message #3 Posted by **Michael de Estrada** on 2 Feb 2012, 9:16 a.m.,*
in response to message #1 by Namir

Namir - That is the hp Small & Medium Business Store, where it has always been $99.99. However, they take orders and charge your credit card w/o having immediate stock, and some people are still waiting to receive their calculators. As Joerg posted, the listing has mysteriously vanished from the hp Home & Home Office Store, where they actually don't sell unless they have stock.

Re: HP15C LE Price Lowered by HP

*Message #4 Posted by **Lincoln R.** on 2 Feb 2012, 9:35 a.m.,*
in response to message #1 by Namir

I still don't think HP was trying to rip people off, it was probably another mistake. Jacking up the price would be stupid - it doesn't take a rocket scientist to realize that very few people would pay $180 for this product, actually resulting in *reduced* profits. That's a kid with lemonade stand mistake ("If I sell 20 cups a day for a quarter each, couldn't I charge $2 for a cup and make 8x the amount of money?")

Re: HP15C LE Price Lowered by HP

*Message #5 Posted by **Namir** on 2 Feb 2012, 11:26 a.m.,*
in response to message #4 by Lincoln R.

People buy the machine for MORE THAN $180!!!!

Re: HP15C LE Price Lowered by HP

*Message #6 Posted by **bill platt** on 2 Feb 2012, 11:31 a.m.,*
in response to message #5 by Namir

How many people?

I bet fewer than 200 around the world will pay that for this new one (unless they think they are getting an original NIB on ebay--by not looking at the fine print so to say)

Re: HP15C LE Price Lowered by HP

*Message #7 Posted by **Derek Walker (UK)** on 2 Feb 2012, 12:32 p.m.,*
in response to message #6 by bill platt

Many of the people who bought calculators from the initial batch from outside the US have paid at least this price. Mine was $99.99 from SC but in excess of $185 (at today's exchange rate) by the time it was in my hand. Buyers in Brazil reported much higher prices due to local taxes.
My UK ordered ones (still not yet arrived here) will be equivalent to about $145 assuming the supplier honours the order price.

Re: HP15C LE Price Lowered by HP

*Message #8 Posted by **Michael de Estrada** on 2 Feb 2012, 11:38 a.m.,*
in response to message #5 by Namir

Exclamation mark abuse !!!!!!!!!!!!!!!!!!!!!!!!!!!!

HP-15C LE no more on HP Home&Home Office Store

*Message #9 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 2 Feb 2012, 12:39 p.m.,*
in response to message #1 by Namir

After Namir's message, I checked the HP Home&Home Office store where 15C was listed for $179 yesterday, but this morning HP-15C LE has been removed from the store website. link to HP Home&Home Office

Edited: 2 Feb 2012, 12:41 p.m.

Re: HP15C LE Price Lowered by HP

*Message #10 Posted by **Jan** on 2 Feb 2012, 12:47 p.m.,*
in response to message #1 by Namir

Maybe it was just a mistake. Maybe some HP guys have checked our reaction and decided it wasn't a good decision to increase the price. Anyway: thanks HP.

Re: HP15C LE Price Lowered by HP

*Message #11 Posted by **Andreas Grund** on 4 Feb 2012, 1:55 a.m.,*

in response to message #10 by Jan

For those who want to know, here in Tokyo/Japan the HP15c is sold in Akihabara for 10900Yen, which is 142$. Beside the English manual, a japanese one is included as hardcopy.

Andreas

Re: HP15C LE Price Lowered by HP

*Message #12 Posted by **Michael de Estrada** on 4 Feb 2012, 9:05 a.m.,*
in response to message #11 by Andreas Grund

So, assuming a 5% consumption tax, the total price would be about 11445 Yen, which is less than $150. How does that price compare with other HP calculators sold in Japan, such as an HP 50g ?

Re: HP15C LE Price Lowered by HP

*Message #13 Posted by **Andreas Grund** on 4 Feb 2012, 9:53 a.m.,*
in response to message #12 by Michael de Estrada

Michael,

the 5% consumption tax is already included in the 10900Yen. Don't ask me about HP's pricing in Japan...

BTW, the serial No. of the one I bought is 14817 and the manufacture date is mid of Dec. 2011 (CNA 1500298). And they keep several more in the shelves.

Andreas

Edited: 4 Feb 2012, 9:56 a.m.

Re: HP15C LE Price Lowered by HP

*Message #14 Posted by **Mark Puscas** on 5 Feb 2012, 3:44 a.m.,*
in response to message #13 by Andreas Grund

What's the key to translating CNA number to manufacture date? For that matter, what is a CNA number? My 15C LE has 4 digits followed by 3 letters.

On a different note, I tried the "$99" link to the 15C on the small business store, it still (Feb 5) says "$99" but when you place it in your cart, it mysteriously jumps to $129.

Thanks, Mark

Re: HP15C LE Price Lowered by HP

*Message #15 Posted by **Andreas Grund** on 5 Feb 2012, 4:31 a.m.,*
in response to message #14 by Mark Puscas

Mark,

CNA means "China" and the codes translates easily

First digit "1" is 2011 (consequently, a "2" will be 2012 eventually)

Second/third digits are "50", this is calender week 50 - mid December

The remaining digits "xxxx" probably are a lot/batch No., seems, as in your case letters are used as well.

Andreas

Re: HP15C LE Price Lowered by HP

*Message #16 Posted by **Marcus von Cube, Germany** on 5 Feb 2012, 10:50 a.m.,*
in response to message #15 by Andreas Grund

My 30bs are 4CY######## (8 digits following the CY). Do you have an explanation?

Re: HP15C LE Price Lowered by HP

*Message #17 Posted by **Michael de Estrada** on 5 Feb 2012, 11:01 a.m.,*
in response to message #16 by Marcus von Cube, Germany

Different manufacturers / factories ?

Re: HP15C LE Price Lowered by HP

*Message #18 Posted by **Jeff O.** on 6 Feb 2012, 7:48 a.m.,*
in response to message #16 by Marcus von Cube, Germany

Marcus,
My understanding is as follows:

The difference between 4CY and CNA as the leading three characters is explained here.

The eight digits break down as follows: digit 1 is the year, digits 2 and 3 are the week, and the last five are an individual unit number. With the 15c LE, there are only 7 characters after the factory ID, with only four characters for the unit number. Since they now use alpha as well as numeric characters, four characters allows a total of 1,679,616 individual ID strings as compared to 100,000 strings with 5 numbers, so four characters is probably enough.

Re: HP15C LE Price Lowered by HP

*Message #19 Posted by **Thomas Radtke** on 6 Feb 2012, 8:04 a.m.,*
in response to message #18 by Jeff O.

> Quote:

>
> Quote:
>
> Yes, 4CY is a different factory. I do not work for HP or either of these companies, so I am not 100% sure, but I believe that 4CY == Inventec Appliance, and CNA == Kinpo Electronics.

What's CNG as found on the sticker of my 20b? Maybe a different Kinpo plant?

Re: HP15C LE Price Lowered by HP

*Message #20 Posted by **Jeff O.** on 6 Feb 2012, 8:29 a.m.,*
in response to message #19 by Thomas Radtke

I have never see that one, but my guess would be another manufacturing plant, either Kinpo or other.

(If you google CNG, you will find lots of useful information about compressed natural gas.)

Re: HP15C LE Price Lowered by HP

*Message #21 Posted by **Derek Walker (UK)** on 6 Feb 2012, 8:51 a.m.,*
in response to message #19 by Thomas Radtke

I don't know the answer to that, but it's not a new designation, my 2007 HP12C has serial number CNG738#####.
Incidentally, that unit has all loose keys, not just the [f] & [g] keys as much commented on in the 15C-LE. I've never found it an issue when used flat on a desk.

Re: HP15C LE Price Lowered by HP

*Message #22 Posted by **Mark Puscas** on 5 Feb 2012, 12:37 p.m.,*
in response to message #15 by Andreas Grund

Andreas,

Thanks for the info!

Mark

Re: HP15C LE Price Lowered by HP

*Message #23 Posted by **Vince (Italy)** on 5 Feb 2012, 4:37 a.m.,*
in response to message #14 by Mark Puscas

Now it says "$129". I can't see any mistake here. Only bids for making money

Re: HP15C LE Price Lowered by HP

*Message #24 Posted by **Andreas Grund** on 5 Feb 2012, 5:34 p.m.,*
in response to message #23 by Vince (Italy)

Marcus,

my 30b's are 4CY030xxxxx and 4CY031xxxxx, indicating built 2010 in China, CW 30 and 31 respectively.

However, this scheme doesn't work with my 20b....

Gruss,

Andreas

accuracy of integration and solve routines HP 15C LE

*Message #1 Posted by **Jan** on 2 Feb 2012, 5:34 a.m.*

Hi,

Has anybody tested the integration- and/or solve-function of the 15C LE? And if so, do they seem work properly or not? Doing a lot of algebraic work I primarely use my calculators for checking results. With an increase in speed of 100 times the speed of the original 15C (of which I got 2) and therefore even exceeding the speed of my 32SII and 48G, the 15C LE seems a perfect tool for the job. That is, when I can rely on it. Thanks for your respons.

Re: accuracy of integration and solve routines HP 15C LE

*Message #2 Posted by **Marcus von Cube, Germany** on 2 Feb 2012, 8:40 a.m.,*
in response to message #1 by Jan

The accuracy of the 15C LE is exactly the same as that of the original 15C because it runs the same software. All problems are related to the operation environment of the emulation (display, battery, keyboard).

Re: accuracy of integration and solve routines HP 15C LE

*Message #3 Posted by **Jan** on 2 Feb 2012, 12:51 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks for the info. I had the idea though that the original firmware had to be reverse-engineered since the original documentation was lost at HP. Or is that just a rumour? If not, was the reverse-engineering done in an appropriate way?

Re: accuracy of integration and solve routines HP 15C LE

*Message #4 Posted by **Marcus von Cube, Germany** on 2 Feb 2012, 1:03 p.m.,*
in response to message #3 by Jan

I'm not the most qualified to answer your question but I doubt that any reverse engineering was really necessary. The original code is run in a virtual environment as if the nut processor were still there. It's not, the instructions are interpreted by some software running on the ARM chip. This piece of software not only has to implement the processor but all of the peripherals, too, and map them to the real hardware. Here the trouble has its origins.

HP joins the price gougers

*Message #1 Posted by **Michael de Estrada** on 31 Jan 2012, 9:36 p.m.*

Well, HP has decided to join all the profiteers and price gougers, and the HP 15C LE is now in stock for $179.99 at hp Home & Home Office. In fact, they don't even offer free shipping on it, even though shipping is free on much cheaper models such as the 35s. Shame on you, HP.

Edited: 31 Jan 2012, 9:39 p.m.

Re: HP joins the price gougers

*Message #2 Posted by **db (martinez, ca.)** on 31 Jan 2012, 10:01 p.m.,*
in response to message #1 by Michael de Estrada

They probably noticed the old low price and raised it when it was mentioned here.

I totally agree. I guess although the name is the same, the HP from today is quite different from the HP that once was proud to sell quality products. "It's HP Jim, but not as we know it..." as Mr. Spock would say.

Would that be the same HP that did such a great high quality job of engineering fool's tech NiCD charging systems on relatively expensive calculators like the Woodstocks...charging systems that easily destroys the calculator? Or produced flimsy press-fit PCB calculators like the early Spice models? Or produced card readers whose rollers turn to gum? Or produced an expensive calculator whose internal plastic screw columns split, causing circuit board separation, like the HP-41? Or produced battery compartment doors that crack the case like the Clamshells? Or produced an expensive RPL calculator with the worst quality fuzzy LCD that's ever been put on a calculator by anyone, like the HP 48S and G?

That must have been when Mr Hewlett and Mr. Packard were elsewhere. No, in fact Hewlett was President and CEO and Packard was Chairman of the Board for most of that time.

> Shame on you HP! I hope they will sell none for this price.

I agree that raising the price this much isn't cool but I suppose the argument could be made that if they

realize there actually is still a market for calculators reminiscent of the days of yore and they can make a profit at it, they'll do more of this.

Re: HP joins the price gougers

*Message #10 Posted by **Michael de Estrada** on 1 Feb 2012, 10:27 a.m.,*
in response to message #9 by Mark Scheuern

I doubt it. The only reason this particular product came to light is that there was a concerted effort over many years to do so, based on a petition with many signatures. Then, when it finally happened, there was a perfect storm of problems that sent those involved running for cover. I doubt anyone has the stomach at HP to go through all this again. Frankly, I interpret this latest action by HP of nearly doubling the already high price as their way of giving us the tifosi the big middle finger salute.

Re: HP joins the price gougers

*Message #11 Posted by **Howard Owen** on 1 Feb 2012, 11:49 a.m.,*
in response to message #10 by Michael de Estrada

Let's say you aren't a member of the calculator division at HP. Maybe you are up the management chain some. What do you see? You see a runaway popular product in the HP-15C. You see gougers buying the machine at wholesale, and reselling it for a big premium on the SRP. You see some people buying at retail, and also making a killing. Strictly from a business perspective, does it look to you like the calculator is priced appropriately by HP for the actual retail market?

Modern business exalts shareholder value over all else, including quality, suitability and customers. These are all means to an end: to boost the share price. Those of us who feel that customer focus and passion lead to brilliant design and thus to successful products, with increasing shareholder value as a side effect, will often be disappointed by companies like HP. It's not that the idea of building quality products has disappeared.The people who create products often have that customer focus, if for no other reason than it confers some self respect if you think you are helping to deliver something worthwhile. The problem is, that quality approach is subordinate to shareholder value. If the two ever conflict, the bottom line will win every time.

Re: HP joins the price gougers

*Message #12 Posted by **Michael de Estrada** on 1 Feb 2012, 1:18 p.m.,*
in response to message #11 by Howard Owen

This item has a microscopic impact on company profits, regardless of sales price. It is strictly an image item, and stock value or profitability is irrelevant. HP could have easily controlled the secondary market price gouging by increasing production levels and dispensing with the limited edition moniker.

Re: HP joins the price gougers

*Message #13 Posted by **Howard Owen** on 1 Feb 2012, 1:53 p.m.,*
in response to message #12 by Michael de Estrada

One possibility is that this price hike is a prelude to the introduction of just such a model. I'm always wildly optimistic. :)

My father worked for a rich guy in Nome Alaska in the 1950s.. He told me that he got this advice from his employer: "You get three pennies, you spend one, save one and invest one." Also, ignoring an opportunity to positively impact the bottom line is not the way for a

manager to get ahead in a company that values its share price above all else. The increment you add may be tiny, but it shows that you hew to the bottom line, just like the people who might promote you do.

Re: HP joins the price gougers

*Message #14 Posted by **Antonio Petri (UK)** on 1 Feb 2012, 4:19 p.m.,*
in response to message #13 by Howard Owen

I have signed the hp15C petition just for that reason, I expected to see a 15C or a modernised version of it back in the HP catalog on a regular basis like the 12C+. I didn't want a "limited version", which is quite difficult to get hold of and with an inflated price. Therefore, I haven't decided yet whether to buy one or not, given that I have my original 15C and 11C still perfectly working and in mint conditions. In general, I would like to have the chance to buy a numerical, non graphic, scientific RPN programmable calculator more powerful than the current 35S and possibly with the form factor of the 15C.

Re: HP joins the price gougers

*Message #15 Posted by **Namir** on 1 Feb 2012, 7:56 a.m.,*
in response to message #1 by Michael de Estrada

What was the list price of the original HP-15C? With this figure we can compare prices, be more objective, and set emotions aside.

Namir

Re: HP joins the price gougers

*Message #16 Posted by **Namir** on 1 Feb 2012, 7:59 a.m.,*
in response to message #15 by Namir

I found the price of $135 on this web site!! Cool. So the higher price is not off if you account for inflation and the fact that the 15C LE is 100 times faster than the vintage version.

Re: HP joins the price gougers

*Message #17 Posted by **Jeff Kearns** on 1 Feb 2012, 11:48 a.m.,*
in response to message #16 by Namir

Also from this site... HP 12C price at introduction: $150, now selling at $69.99 HP Site.

The logic escapes me.

Jeff Kearns

Re: HP joins the price gougers

*Message #18 Posted by **Jeff Johnson** on 1 Feb 2012, 11:58 a.m.,*

in response to message #16 by Namir

If they had initially come out with the LE for the same $135 price as the original, we probably wouldn't have batted an eye at it. In the 70's, people were spending weeks of salary for an HP calculator. As a high-schooler, I just drooled on my TI as I looked over the quite-unaffordable HP calculators. But I must agree that listing the LE for $99, then seemingly arbitrarily jacking the price up to $179 is a real slap in the face. If they were wanting to insult their faithful devotees, that was an excellent start! Not hard to see why the WP34S project came into being.

Re: HP joins the price gougers

*Message #19 Posted by **Walter B** on 1 Feb 2012, 1:14 p.m.,*
in response to message #18 by Jeff Johnson

FYI, Pauli and me started the WP 34S project since

1. HP did not offer any reliable scientific RPN calculator we liked for many years after the HP 42S, nor did they seem to listen to engineer's wishes (as expressed in this forum many times) anymore,
2. HP launched a repurposable platform at low cost with the HP 20b, featuring just enough to look promising to us,
3. (last not least) we enjoyed designing a scientific calculator and wanted to show them.

We did *not* do this for price reasons. If we'd have to ask you to pay for our time and development effort, a WP 34S would be a very expensive toy.

For the 15C LE, I've no idea about its startup costs. But as long as HP finds sufficient customers willing to lay down 179 US$ for it, they are free to set its price accordingly. As stated here before, we won't repurpose a 12C nor a 15C LE - too limited and outdated.

Re: HP joins the price gougers

*Message #20 Posted by **Namir** on 1 Feb 2012, 1:47 p.m.,*
in response to message #19 by Walter B

I hear you Walter. when the HP-35s came out, I wrote a comprehensive stat pac for that machine (now available for free on my web site). HP did not offer any support or effort to promote it, or even mention it.

Re: HP joins the price gougers

*Message #21 Posted by **uhmgawa** on 1 Feb 2012, 12:51 p.m.,*

I don't think comparing it to the 30 y/o original is really how most consumers operate. Rather calibrate it to what $180 will get you for a competitive pocket calculator today. One particularly ironic comparison is the 30b right in HP's backyard which is essentially the same system in an alternate footprint and a slightly *more* expensive lcd glass. Concerning firmware the 15c le leveraged the 12c+ voyager emulator and the original 15c's firmware, which I'd hazard was likely to be no greater than the

development burden of the 30b firmware. The resulting street price for the 30b is around $18 which presumably includes a sustainable profit.

IMHO the premise for the 15c le price increase is fundamentally flawed, leveraging the misconception of the 15c le's value being comparable to the legacy 15c. Eg, I'm reasonably certain 30 years from now no one will be signing petitions and banging on the table with a "bring back the 15c le" campaign. While I doubt the near double of list price will translate into increased bottom line revenue for HP, I suspect it will delight the ebay trolls who were formerly sitting on hoarded product and facing dwindling sales to more quickly liquidate their surplus.

Inconceivable, I also believe.

But I have little doubt there will still be a "bring back the 42s" campaign...a request that future-HP will, no doubt, have fulfilled just as competently as they have since 1995.

I love the HP 30b concept. I'd love to see an enhanced *non-emulated* 42S with USB I/O, more RAM, real-time clock/calendar, and beeper all in the HP 30b package produced as a commercial HP product.

You forgot to address the other fundamental limitation of the 30b: the screen.

With more RAM and a better screen we would have aimed for a 42S replacement not a 34C/15C/32sii.

- Pauli

Re: HP joins the price gougers

*Message #24 Posted by **David Griffith** on 1 Feb 2012, 4:44 p.m.,*
in response to message #23 by Paul Dale

Given how far you guys have come with creating a calculator firmware that people would really want to use, I'm miffed that HP hasn't contacted you to ask what the specs on a new calc should be... At least if they did, you haven't said anything about it. I would love to see what amounts to a turbocharged 42s (though I do have a soft spot for the 32sii). And, yes, I count the limitations of the screen as one of the big warts of the 30b.

Hardware Specifications

*Message #25 Posted by **Paul Dale** on 1 Feb 2012, 5:48 p.m.,*
in response to message #24 by David Griffith

I've not been contacted about anything like this, but if I had I imagine it would have been under a non-disclosure agreement.

I did once offer the 34S firmware to HP but received a negative response at the time. If HP does ever want the firmware, they know my email address :-)

- Pauli

in response to message #25 by Paul Dale

> Quote:
>
> I did once offer the 34S firmware to HP but received a negative response at the time. If HP does ever want the firmware, they know my email address :-)

I'd read that as HP not wanting to risk compromising their closed IP codebase with GPL code and/or any external code for that matter. The latter may well be boilerplate policy. Introducing the former into their codebase may be seen as even more risky given competitive differential in this market is largely retained in a device's firmware. Corresponding hardware design is off-the-shelf SoC centric with little margin existing here for differential. So the motivation to retain competitive IP within closed proprietary firmware is likely substantial.

A more pessimistic interpretation would be of RPN as the dwindling cash cow, where given the overall legacy investment in that segment there is no reason to abandonon it [yet] assuming a low maintenance revenue stream. Bringing in new technology however would seem a low priority with such a business approach.

Re: HP joins the price gougers

*Message #28 Posted by **Mike Morrow** on 1 Feb 2012, 1:32 p.m.,*
in response to message #16 by Namir

From the US Bureau of Labor Statistics, $135 in 1982 is equivalent to $315 in 2011.

One would be foolish to send HP $180 dollars for the 15C-LE when for $150 they'll send you the 50g.

The 15C-LE is not, after all, equivalent to the original 15C. It's only an awkward imitation of old firmware emulated on modern *cheap* hardware. It has no logical reason for existence when something like the 50g is available at lower cost. (Yes...I've got two 15C-LE units...but they cost me each $75.)

Edited: 1 Feb 2012, 1:46 p.m.

Re: HP joins the price gougers

Let me hazard a guess here. You pre-ordered two from CostCentral at $70.52 apiece plus $8 shipping ?

Re: HP joins the price gougers

*Message #30 Posted by **Mike Morrow** on 1 Feb 2012, 2:11 p.m.,*
in response to message #29 by Michael de Estrada

No, it was buy.com. Ordered on-line at 1400 on 8 September and received at 1200 on 9 September (22 hours elapsed time!), using standard Fedex ground shipping! It turned out that the distribution point was just south of Memphis, only 170 miles away.

Edited: 1 Feb 2012, 2:16 p.m.

Re: HP joins the price gougers

*Message #31 Posted by **Michael de Estrada** on 1 Feb 2012, 2:25 p.m.,*
in response to message #30 by Mike Morrow

Interesting. I bought one from Buy.com on the same day at about the same time as you did, however, the price was $78.99 with free shipping. I used a new customer $5 coupon to knock the price down to $73.99. Later that same day, the price jumped to $84.99. The one I pre-ordered from CostCentral.com cost me $80.52 plus $8 FEDEX shipping. I've since bought more for myself and on behalf of other people for more money, but still they all cost less than $99.99, including any sales tax I had to pay. They all were shipped for free.

Edited: 1 Feb 2012, 2:27 p.m.

Re: HP joins the price gougers

*Message #32 Posted by **Mike Morrow** on 1 Feb 2012, 2:45 p.m.,*
in response to message #31 by Michael de Estrada

Yep...with coupon the price each was actually about $76.50. I just rounded to $75.

The thing that really really amazed me was delivery in less than one day. I've never experienced that anywhere anytime...even high-cost Amazon.com one-day shipping. I was not in a hurry to get them, so I wasn't interested in paying for expedited shipping.

I've heard that others have had to wait a bit longer. :-)
(It's too bad it really isn't worth a long wait.)

Brilliant post, mate !

Re: HP joins the price gougers

*Message #36 Posted by **Bruce Bergman** on 2 Feb 2012, 12:11 a.m.,*
in response to message #34 by John Robinson

I have to agree with John.

YES, it sucks that the price went up. If indeed it went up purposefully, as opposed to just being another of the (zillions of) mistakes that they've made. Shame on them.

However, WE all wanted it back. We begged for it. We signed petitions. We used these hallowed forums to dream about seeing the 15c (and others) come back from the dead. And what did the caring, honest folks at HP do? They listened, and they provided the 15CLE for us. Bless them.

It wasn't perfect, and it still isn't. But it's what we asked for. Just be thankful they didn't originally price this unit at $180. You know you would have bought one regardless. So some of us got it for less -- our win.

Personally, I'm getting really tired of all the HP bashing.

That's just MY $0.02.

thanks, bruce

It may be helpful to keep the context in mind vs. the literal dialogue alone.

I don't believe the critical commentary here is intended to wound HP but rather honest, passionate marketing feedback from a zealous audience uniquely qualified to do so. IOW folks here *care* about what HP is producing because they want to *buy more* HP product. Were I in HP marketing shoes I'd welcome such valuable feedback, which is otherwise obtained at substantial effort and cost to the vendor. But admittedly separating the useful content from the associated delivery style may at times require a thick skin.

Hello Christoph!

With 'some minor bug fixes' you do not mean "minor fixes of some bugs" but "fixed some minor bugs", I assume. Just sophistry. :)

Ciao.....Mike

HP15C LE Pause Operation not as expected

*Message #1 Posted by **Russell Dobson** on 31 Jan 2012, 2:35 a.m.*

Hi, I just got my new 15C LE yesterday, its my 9th HP so I am farily familiar with programming these calcs. When using a very simple loop programme the PSE instruction only allows you to see the x register result on the first iteration, then you just see a blank screen until you stop execution with R/S Eg:

LBL 1 1 STO+1 RCL1 PSE GTO 1

It seems like the PSE instruction on each subsequent iteration is in sync with a blank display because after several seconds if I stop execution, the x register might be say 10 or so. All similar previous calcs 29C, 11C, 41C, 32S2 etc all pause and display the x register for about 1 second. (which is what the manual says for the 15C LE as well) Any explanations would help. Thanks

PS: without the PSE those iterations are nice and fast ~485 loops/sec!

Re: HP15C LE Pause Operation not as expected

*Message #2 Posted by **Katie Wasserman** on 31 Jan 2012, 2:59 a.m.,*
in response to message #1 by Russell Dobson

This is very old news. See the list of known bugs here.

There's been no word as to if/when HP will fix any of these bugs, but their silence on the issue is not encouraging.

Re: HP15C LE Pause Operation not as expected

*Message #3 Posted by **Howard Owen** on 1 Feb 2012, 12:11 p.m.,*
in response to message #2 by Katie Wasserman

What if the recent price rise is making the way clear for a new HP-15C? That is, a "non-LE" version, with a MSRP similar to the old 15CLE price? Perhaps the bugs would be fixed in a new model. We might even hope that new bugs wouldn't have been introduced.

The obvious success of the 15CLE makes this more plausible in my mind. That would leave the LE, bugs and all, as a mildy popular collectors item with a truly limited supply. HP would then sell a workaday 15C priced more reasonably.

*Message #4 Posted by **Kees Bouw** on 31 Jan 2012, 3:29 a.m.,*
in response to message #1 by Russell Dobson

What puzzles me is why this was not noticed by anyone at HP, prior to releasing the product. I mean, it is a pretty obvious problem. It is not like you have to do anything unlikely or complicated. Just use a PSE in any program and bingo, it does not work. It makes one wonder if this product was ever tested at all.

Re: HP15C LE Pause Operation not as expected

in response to message #4 by Kees Bouw

Thanks Katie and Kees, I am new to the HP forums and didn't try a search first. I think these calcs have only just arrived here is Australia. Amazing that some of these weren't picked up, the pse function was the first thing I tried!

*Message #6 Posted by **Thomas Chrapkiewicz** on 31 Jan 2012, 8:46 p.m.,*
in response to message #4 by Kees Bouw

This bug does not exist in the preproduction 15c+ machine (the prototypes from the HHC2010). (Has this been reported here?) ...and of course this bug does not exist on the original 15c.

Has anyone compared the advantages/disadvantages of the 15c+ code with the 15CLE code?

Perhaps it would be worth transplanting the 15c+ code to a 15CLE machine.(?)

in response to message #6 by Thomas Chrapkiewicz

Now, may be am I imagining things, I'll have to double check when I go home, but I am pretty sure that the PSE bug can also be observed on the emulator (the one on the CD that comes with the 15C LE); dunno if this makes a difference but I am running it using CrossOver (a commercial version of Wine) on Mac OS X.

Re: HP15C LE Pause Operation not as expected

*Message #8 Posted by **Michael de Estrada** on 31 Jan 2012, 10:09 p.m.,*
in response to message #7 by Sylvain Louboutin

It doesn't matter. The PC emulator works exactly the same way as the hardware. I ran the program on page 114 of the manual on emulator on my PC running Windows 7, and the calculator initially pauses for 1 second, displaying 9.000000000, and then goes blank for the remainder of the program, until displaying 0. when it terminates. So, it's a coding problem, not a processor speed or operating system problem.

>
> Perhaps it would be worth transplanting the 15c+ code to a 15CLE machine.(?)

The firmware that came on the 15C+ units presented to HHC 2010 attendees is dated 2009-08-03. While it may not exhibit the so-called PSE bug, there are issues with it, as follows:

At the conference, we were told (if I recall correctly) that integration was “slow” with 15C+. The sample program that was presented with the 15C+ included an integration. The documentation that I have from the meeting states that the program ran on the original 15C in 123 seconds and on the 15C+ in 7.5 seconds. I went ahead and entered the program onto machines running both the 2009-08-03 firmware and the 2011-04-15 firmware of the current production units. On the machine running the 2009-08-03 firmware, it indeed ran in 7 to 8 seconds. With the 2011-04-15 firmware, it ran in about 1.4 seconds, so I can confirm that integration was indeed slow with the 2009-08-03 firmware.

Also found at the conference was a bug in the display of program line numbers. For example, enter 62 steps in program memory, then go to step "000" and back-step. The program counter will show "05o", "05-", then "05r" before showing the correct "059" step number. If you enter 63 steps and back-step, it will start at "057", then "056", etc., all the way down to "000". Continuing to back-step shows step “999”, “998” “997”, “996”, “995” and “994” before cycling back to “057”.

Like the 2011-04-15 firmware of the production units, the 2009-08-03 firmware does not like combinations and permutations in programs. Enter the following program from the 15c LE bug reports article:

```
LBL A
STO 0
LBL 9
8
ENTER
3
Cy,x
DSE 0
GTO 9
RTN
```

Now enter a small number, 1, 2, 3, etc. and run the program. It will come back quickly with the expected answer of 56. Now enter a larger number, like 56, and run the program. The display will briefly show “running” once, then go blank. Despite the blank display, the program continues to run, executes the loops, and then stops. Now alter the program like this:

```
LBL A
STO 0
LBL 9
8
ENTER
3
Cy,x
DSE 0
PSE
GTO 9
RTN
```

Note that I put the PSE in the wrong place if I want to see each iteration then stop. Enter a small number like 5 and run the program. It dutifully stops at each pause and displays 56. Then the display goes blank, but the program is still running. Wait a while and press a key to stop it, then recall register 0. It will have a large negative number in it, indicating that the calculator continued to run after counting down to zero. This is proper execution of the program as entered, except there was no “running” display to tell you that the calculator was still running to indicate that you made an error in the program. If you replace the Cy,x with Py,x, you get the same behavior. If replaced by another function, say y^x, it works fine. So using Cy,x or Py,x in a program blanks the display while the program is running. If you somehow got into an endless loop, you might think the calculator was off while it continued to run with a blank display.

Another anomaly is if you set flag 9, either manually or in a program. With proper operation, the display starts flashing when you set flag 9, and stops if you clear it with g-CF-9, or press the back-arrow key. This is what happens with the 2011-04-15 firmware. With the 2009-08-03 firmware, setting flag 9 causes the display to go blank. If you press a key, there is a momentary display, then it goes blank again. It appears that keystrokes and functions work normally, the display just blanks out after each key-press. Normal display is returned by pressing the back-arrow key, or g-CF-9, i.e. the standard way to clear flag 9.

The above behavior also occurs for overflow conditions which would normally cause a flashing display.

Finally, the 2009-08-03 firmware also exhibits items 3, 4, 5, 6 and 10 from the 15c LE Bug Report Article.

Based on the above, I do not consider the 2009-08-03 firmware to necessarily be a good alternative to the 2011-04-15 firmware.

Continuing to back-step shows step “999”, “998” “997”, “996”, “995” and “994” before cycling back to “057”.

That's quite bizarre and I'd wager a sympton of an instruction emulation bug. Otherwise such behavior is outside the scope of functional impact by the emulator to firmware execution.

> Quote:
>
> The display will briefly show “running” once, then go blank. Despite the blank display, the program continues to run..

This and similar quirks including those surrounding display flash are likely related. Voyager firmware emits an excess of writes to the display registers which if strictly emulated can consume substantial cpu time to no benefit. I encountered this rendering to a graphic display which is expected. It isn't immediately obvious to me the sam7 lcd controller presents such overhead however it does appear to require updates to synchronize with its blink timebase. So that may be the root of the problem depending how the emulator was designed to interact with it. It appears all of the above could be addressed by allowing firmware display updates to hit the controller asynchronously. But admittedly speculation on my part as I haven't had to interact with the sam7 segment controller thus far.

Re: HP15C LE Pause Operation not as expected

*Message #14 Posted by **Marcus von Cube, Germany** on 3 Feb 2012, 5:43 p.m.,*
in response to message #13 by uhmgawa

The LCD controller memory in the SAM7 can be updated without caring about the display refresh. But if you want to have it blink you need to wait for at least to update cycles (you can have an interrupt generated on each refresh) before you program the controller to blink. It will then autonomously alternate between the previous and the current images. This requires some software infrastructure but isn't overly complicated.

Bold and stylish...

But, it could be confusing if you forget which key in the original layout is the blank orange key referred to in the instructions...

Re: HP 18C Frankencalc

*Message #3 Posted by **Keith Midson** on 31 Jan 2012, 3:26 p.m.,*
in response to message #2 by Ken Shaw

The blank orange keys at the top replaced blank grey keys (menu soft keys), and the orange key on the left on the next row down is the original shift key (which is exactly the same color!). The other keys replaced were: EXIT (same, but orange), ENDE (replace ON), NEXT (replace down arrow), and all the numbers and arithmetic keys. So still easy to navigate. There was a SAL button and I couldn't decide where to place that one.

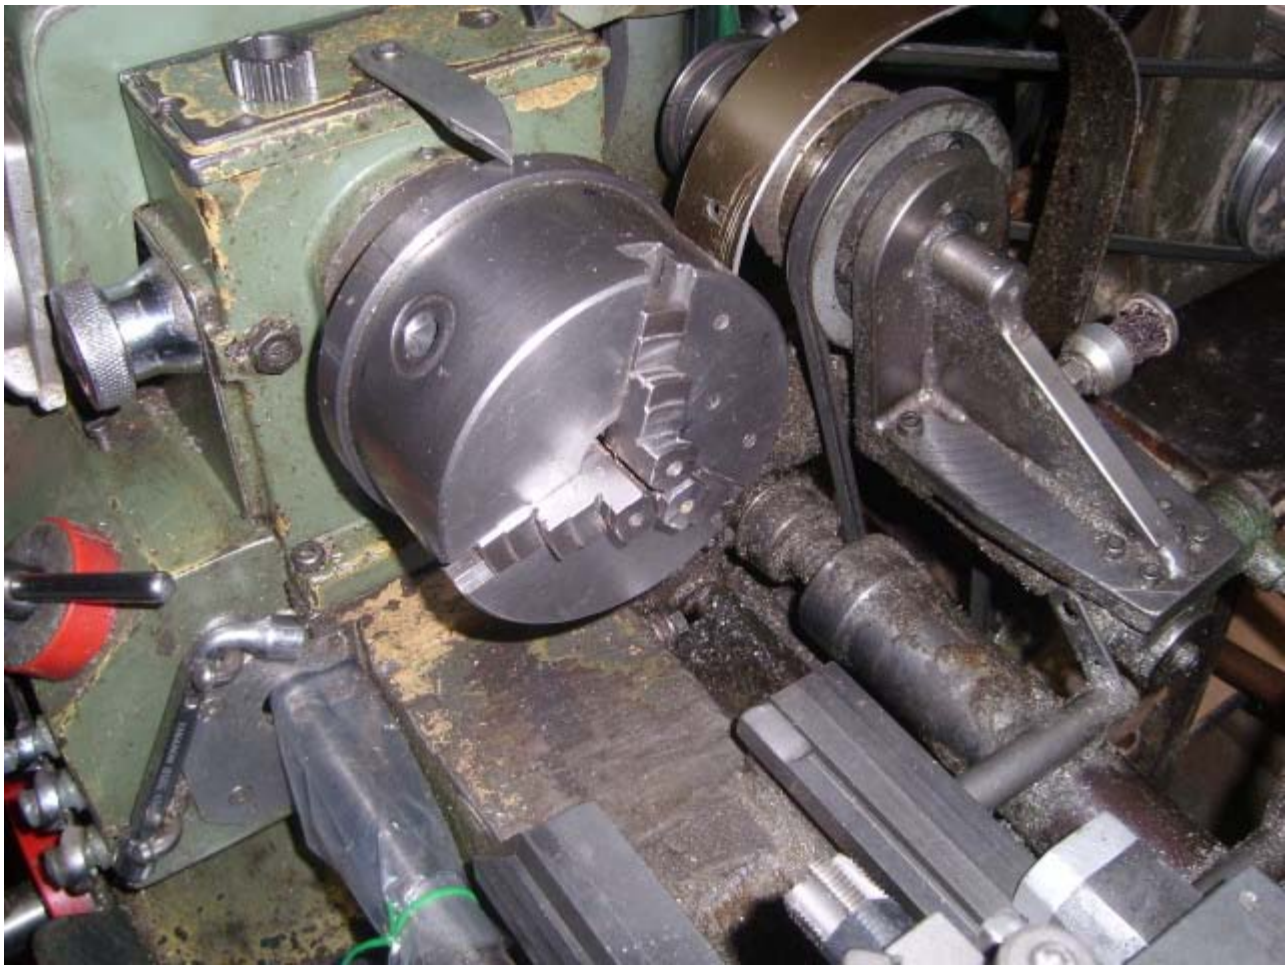
HP Printer paper... any worries?

*Message #1 Posted by **Greg Swartz** on 30 Jan 2012, 11:31 p.m.*

Picked up some 82175A Black Print Thermal Calculator Paper and noticed some pictures on the box. Looks like this paper is not recommended for HP-91, 92, and 97. I have a 82143a (or two, and on the lookout for a 82162a, if you have one handy) and will use this for the 143a for now.

Does anyone know why this paper should not be used on the older units? I have a 97 (or two) that I'd like to use it with as well. Any insight would be most appreciated! Especially after what I went through to get the 97 printing again! BTW, thank you wanavet (eBay name, and I saw his gear mentioned here first) for the gear for the 97! I think it was Katie Wasserman's post on making the best of the gear parts available (very nice and self-explanitory post!!), and even got the parts, other than the gear itself, then saw that wanavet had the actual gear made... anyway...



Edited: 1 Feb 2012, 9:44 a.m. after one or more responses were posted

Re: HP Printer paper... any worries?

*Message #2 Posted by **Michael de Estrada** on 30 Jan 2012, 11:53 p.m.,*
in response to message #1 by Greg Swartz

Interesting. I have HP 91, 92, 97 and 82143A, and use the same printer paper in all of them interchangeably without any problems. According to the manual for my HP 91, the part number for a box of six rolls of printer paper is 9270-0513, so maybe there is a difference. Then, the HP 97 and 92 manuals show the part number as 82045A, which definitely suggests a difference.

Edited: 31 Jan 2012, 12:03 a.m.

Re: HP Printer paper... any worries?

*Message #3 Posted by **Bill (Smithville, NJ)** on 31 Jan 2012, 8:06 a.m.,*
in response to message #1 by Greg Swartz

I may have this wrong, but I seem to recall someone saying that there's a difference between the blue versus black thermal papers and the effect on some of the HP calcuators print heads. But I can't find the message thread where this was discussed.

Okay found a couple of discussions:

Paper Too Rough

Different Chemestry

Take your pick - either paper is too rough or the different chemestry in the paper can harm the print head.

Bill

Re: HP Printer paper... any worries?

*Message #4 Posted by **Duane Hess** on 31 Jan 2012, 10:58 p.m.,*
in response to message #1 by Greg Swartz

Hi. This has come up before numerous times. Never sure, in my mind, there was a diffinitive answer.

The HP Journal that announced the printers for the HP-41C series indicated not to use 82175A paper in the 91, 92, and 97 as it would damage the print heads via premature wear. From the 41C Journal articles and others on the 97, etc., the resistors for the 41C era print devices and the 9x units operate at different temperature. If you touch and run your fingernail across the 82175A and 82045A they do feel different.

Various HP product brochures (via the DVDs on this site) have specifically stated 82045A can be used in the 9x calcs and 41C type printers, but the 82175A is for the 41C (and later) printers. However, I was not able to locate those again before this post. Which puzzles me, as I know I've seen them.

One of the posts subsequent to yours suggests there is a 82175B paper. There may very well be, but I've never located it (which doesn't necessarily mean a lot).

PM Corp has paper they claim is OEM equivalent (but the paper is thinner) to 82045A, PMC-05233. Seems in previous articles people have used NCR and various other common papers w/o problems, but I was unable to decipher whether they know the paper is OK or just haven't had problems yet.

What I have found on my own is in the link below: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=204244#204244

Re: HP Printer paper... any worries?

*Message #5 Posted by **Michael de Estrada** on 31 Jan 2012, 11:13 p.m.,*
in response to message #4 by Duane Hess

The paper I've been using came in a box marked 9270-0513, suggesting that it is the same as 82045A. Perhaps this is why I've had no problems using it in my HP 82143A printer that I use with my HP 41CV.

Re: HP Printer paper... any worries?

*Message #6 Posted by **Duane Hess** on 1 Feb 2012, 2:26 a.m.,*
in response to message #5 by Michael de Estrada

I agree. The HP-82162A owner's manual indicates it can use 82045A or 82175A paper. I can't locate references at the moment for some reason, but completely sure the same applies for the 82143A printer.

I'm quite sure 9270-0513 and 82045A is exactly the same paper. I've seen the reference numerous times before. I don't know if it was a part-number change or what.

For example, the HP-91 Owner's manual refers to 9270-0513. There are manuals/brochures which clearly indicate 82045 is the correct paper for the 91/92/97. So 9270-0513 & 82045A, if not the very same paper, is certainly compatible.

I have various HP units & manuals. Certainly for products from the 9810A calculator & onward the 9xxx-xxxx format has been used for paper. Often for the rolls of paper supplied with the unit (typically 2 although that P/N format has 6 roll boxes).

I've often wondred if the 9270-xxxx version is the part number for paper supplied with the unit and 82xxxA is for after-market paper sales. Maybe an HP'er knows.

Tried looking on the DVD's and can't find what I want. My older copies of CD's are in another town. Think with more recent DVD releases some older manuals/brochures may have been replaced with newer editions. i.e. references to older part numbers disappeared. For whatever reason, I'm having a serious frustrations locating what I want. Who knows, somedays the mind goes you know!!!

damn, I'm gabby. Paper discussions seems to torque me up. Not a good sign!

Re: HP Printer paper... any worries?

*Message #7 Posted by **Greg Swartz** on 1 Feb 2012, 9:42 a.m.,*
in response to message #6 by Duane Hess

Thank you all for the wealth of info! I did not mean to rehash an old issue, but at least it was 10-12 years ago, from some of the links provided! I will go look for some appropriate paper for my 97 to keep the old (but ever so pretty) gal in tip-top.

Again, many thanks!!

HP-30b unknown options

*Message #1 Posted by **Christopher Johnson** on 30 Jan 2012, 8:23 p.m.*

I'm exploring my 30b and I hold the PMT button and turn the unit on. I see Tst Screen, Tst Keyboard etc. onto TSys Off and Slow Clk.

Does anyone know what Tsys and Slow Clk are, or what they do?

Thank you for any information on this.

CJ

Re: HP-30b unknown options

*Message #2 Posted by **Eric Smith** on 31 Jan 2012, 3:45 a.m.,*
in response to message #1 by Christopher Johnson

Tsys will, if enabled, prevent the calculator from going into sleep mode, which means that it will drain the batteries much faster than usual.

Re: HP-30b unknown options

*Message #3 Posted by **Marcus von Cube, Germany** on 31 Jan 2012, 4:28 a.m.,*
in response to message #1 by Christopher Johnson

Slow Clk is a way to tell the firmware the actual processor speed which depends on temperature, humidity, and whether it's a holiday or not ;-). The test system has a serial connection, and to make this work a more accurate knowledge of the speed of the system is needed.

Re: HP-30b unknown options

*Message #4 Posted by **Christopher Johnson** on 1 Feb 2012, 8:37 p.m.,*

Update: HP 50g with HELP for *all* commands integrated into the O.S.

*Message #1 Posted by **Software49g** on 30 Jan 2012, 6:57 p.m.*

Hello,

as promised I made an update for the help.

Included now are

- Help for 201 built-in CAS commands.
- Help for 563 built-in non CAS commands.
- Total help for 764 built-in commands including stack diagrams.
- Context sensitive help from the stack
- "Hyperlinked" navigation to related commands.
- Detailed access for every commands
- Supports all built in fonts.
- New: Detailed description of the related flags used by the command / function
- New: Detailed description of all flags.
- New: Detailed description of all keyboard shortcuts.
- New: Detailed description of all reserved variables.
- New: Detailed description of the Computer Algebra System.

Registered users can download the update from my website here
http://www.software49g.gmxhome.de/Updates.htm

Further information is available here
http://www.software49g.gmxhome.de/FullCommandAndFunctionReference.htm

Let me know if there is anything missing that you would like to see in it.

Enjoy,
Andreas
http://http://www.software49g.gmxhome.de

P.S. I am using a SD card labeled '133x speed' and with it the help shows up instantly.

WP34s Stopwatch

*Message #1 Posted by **Hans-Peter Bieger** on 30 Jan 2012, 4:47 p.m.*

How can i get the stopwachmode with the 2351 firmware?

"Made stop watch work again. Hot key is now h (hold) + EXIT."

At my wp34s: h+Exit=power off

can anyone help me?

Hans-Peter

Re: WP34s Stopwatch

*Message #2 Posted by **Marcus von Cube, Germany** on 30 Jan 2012, 6:08 p.m.,*
in response to message #1 by Hans-Peter Bieger

It's normally not compiled in. You should equip your device with a crystal, then you can simply use the calc_xtal.bin variant of the flash file.

If you need it, I can prepare a version with the stop watch enabled even without a crystal but it is of limited accuracy.

Re: WP34s Stopwatch

*Message #3 Posted by **pascal_meheut** on 31 Jan 2012, 12:23 a.m.,*
in response to message #2 by Marcus von Cube, Germany

This is still a work in progress but as Marcus said, it should be available in an specific firmware version.

Without a crystal, the accuracy is indeed quite limited so the plan is also to integrate a calibration mechanism in the distribution. But it will take some time.

Re: WP34s Stopwatch

*Message #4 Posted by **Hans-Peter Bieger** on 1 Feb 2012, 3:00 p.m.,*
in response to message #3 by pascal_meheut

Today i had the "sandcorns" in my mailbox. Ich hope to get the crystals for the weekend. Then i will see:-)

Thanks for the fast answer

Hans-Peter

I Wish HP Higher End Calcs Were Solar-Powered!

*Message #1 Posted by **Jeff** on 30 Jan 2012, 2:54 p.m.*

I don't know why they aren't. While the solar panels might not have enough capacity for real time use, they could be used to charge rechargeable batteries.

Re: I Wish HP Higher End Calcs Were Solar-Powered!

*Message #2 Posted by **Jake Schwartz** on 30 Jan 2012, 4:11 p.m.,*
in response to message #1 by Jeff

Hi,

Back in the early 1980s, I managed to hook up a small solar panel to successfully run the HP41 (except for the card reader) in ambient light. That panel was around 20 square inches - around the same size, or possibly slightly larger than the HP41 itself. I hope that cells have gotten much better in the past three decades or so to do the job.

Jake

Re: I Wish HP Higher End Calcs Were Solar-Powered!

*Message #3 Posted by **Garth Wilson** on 30 Jan 2012, 7:37 p.m.,*
in response to message #2 by Jake Schwartz

The 41 manual says it takes about 20mA when a program is running, which is a lot to get from calculator-sized solar cells at 5 to 6V even in the sun. Common indoor lighting in a house will be well under 1% of the brightness of sunlight. The 50g, inspite of bigger batteries, has very short battery life compared to the 41.

Re: I Wish HP Higher End Calcs Were Solar-Powered!

*Message #4 Posted by **Eric Smith** on 31 Jan 2012, 3:51 a.m.,*
in response to message #1 by Jeff

Why they aren't is that photovoltaics not only don't supply enough current to run the calculator, but also don't supply enough to charge a rechargeable pack in any reasonable interval. They barely supply more than the self-discharge of NiCd and NiMH (except the low-self-discharge NiMH). The amount of power you can get from 10-15 cm^2 of photovoltaics even in bright sunlight is negligible.

Photovoltaics only are sensible on calculators with *extremely* limited processing power, which means not beyond low-end scientific or business calcs. You might notice that on solar-powered scientific calculators, the transcendental functions are often very slow. Such calculators use ultra-low-power masked-ROM microcontrollers which have very little memory and run at amazingly slow clock rates. For obvious reasons that is unsuitable for high-end calculators.

Installation of Sparcom NavPac on 48GX

*Message #1 Posted by **Timo** on 30 Jan 2012, 2:08 p.m.*

Hi Forum members,

it seem that I'm requiring the concentrated knowledge of the forum again. I've recently downloaded the Sparcom Navigation Pack from hpcalc.org. It contains a .bin file that (according to the readme) can be used to install it on a HP 48GX.

I have a 48GX with a 512k RAM card installed and ports 3,4 and 5 completely free. However, I do not know how to handle the bin file and how to install it.

Is there any way to get this pack running in any of my free ports? I've already searched the forum but I could not find anything useful on that problem.

Any advice is greatly apreciated! Kind regards, Timo

The .bin file cannot be installed in a normal way, because the .bin file is an image dump of the original card content.

You can make such an image with the CARDUPL program from the CARDUPL package. This package also contain the inverse program CARDDWL, but CARDUPL and CARDDWL were designed to make copies of a complete card of any size. So you have _no_ control to which port in the memory card the image is downloaded.

In your case CARDDWL will _overwrite_ the content of port2!

Sorry, I don't know any other program which can do this. I only remember some programs which can copy data from one memory card to another.

Christoph

Re: Installation of Sparcom NavPac on 48GX

*Message #3 Posted by **Timo** on 31 Jan 2012, 3:26 a.m.,*
in response to message #2 by Christoph Giesselink

Hi Christoph and thanks for that interesting response.

If I understand you right, all I'd have to do is to relocate the libs currently installed in Port 2 and then use the CARDDWL tool (just downloaded the package you mentioned) as per the instructions given in the readme and then the card dump sould end up in Port 2 memory. Is this correct?

The NavPac .bin file has a size of about 131kB which seems to be more than the 128k of port memory. Could that pose any problem during transfer?

I assume, that the Sparcom Nav Pack is an auto-attaching lib so restarting the calc after uploading the card should install the lib.

Thanks again and best regards, Timo

Re: Installation of Sparcom NavPac on 48GX

*Message #4 Posted by **Marcus von Cube, Germany** on 31 Jan 2012, 4:22 a.m.,*
in response to message #3 by Timo

Timo, 1K is no always 1K. It depends if you count in powers of 10 or powers of 2. 128KB is 128*1024 which are 131072 bytes.

Yes, it is.

But no tool is perfect, so a unknown bug may destroy your data during the download process with CARDDWL. I recommend to make a backup of your RAM card with the CARDUPL program first.

> Quote:
>

Marcus already gave the correct answer 128KB = 131072 bytes, so no problem.

> Quote:

> I assume, that the Sparcom Nav Pack is an auto-attaching lib so restarting the calc after uploading the card should install the lib.

The last step of CARDDWL on success is doing a calculator warmstart.

BTW: the CARDUPL package at hpcalc.org is a little bit older than the version at my page http://hp.giesselink.com/emu48.htm. The latest version of CARDDWL can simulate a 32KB ROM card with a 128KB RAM card after setting the RAM card write protection switch.

Christoph

Re: Installation of Sparcom NavPac on 48GX

*Message #6 Posted by **Timo** on 31 Jan 2012, 5:34 p.m.,*
in response to message #5 by Christoph Giesselink

Thanks a lot for the tips Christoph and Marcus!

Christoph that backup you mention would only be a backup of port 2, is that correct? And I guess that backup is not required in case I move the libs in port 2 to port 3, again correct?

I've just downloaded the new version of the package from your site.

Ah, and thanks for clarifying that 128k question. I never really gave these fine differences much thought. Guess that's the effect of having been exposed to near-unlimited memory on the home PC for the last couple of years...

Regards, Timo

Re: Installation of Sparcom NavPac on 48GX

in response to message #6 by Timo

> Quote:
>
> Christoph that backup you mention would only be a backup of port 2, is that correct?

No, it isn't. Both programs were developt to handle a complete memory card. In your case CARDUPL would transfer the complete 512KB content to the PC.

> Quote:
>
> And I guess that backup is not required in case I move the libs in port 2 to port 3, again correct?

A backup is always a security issue. For the case the file on the PC is larger than the 1st port size, the additional bytes will be loaded at the beginning of the next port (3) and destroy the port information. Or a possible bug of CARDDWL will write one byte more... or there's a bug in the XMODEM download program...

Many things can destroy data, so be sure that you have a copy of the memory card data

somewhere else.

Christoph

Re: Installation of Sparcom NavPac on 48GX

*Message #9 Posted by **Timo** on 1 Feb 2012, 4:25 p.m.,*
in response to message #1 by Timo

I've just finished installing the Sparcom Nav-Package and everything just went like a charm!

Just in case some else tries to install it I will give a short transcript of what I've done:

1. Copy the nav-2.5.1.bin file contained in the download to a directory of your choice.

2. Use the interface program of your choice to transfer the CARDDWL program contained in Christophs CARDUPL package (download link see above) to your HP-48GX.

3. Start the Hyperterminal Application of Windows and define a new connection with the following parameters:

   COM-Port: Same you used in your HP interface program
   Baud: 9600
   Data-Bits: 8
   Stop-Bits: 1
   Parity: None
   Flow Control: None

   After accepting the settings the new connection should automatically be established.

4. Select "Transfer->Send File" from the Hyperterminal menu bar. In the following pop-up window select the bin file you want to transfer and select "XModem" as protocoll in the dropdown menu. Once set up, click the "Send"-Button. Hyperterminal will now wait for an XReceiver on the other end of the line to become active.

5. On your HP-48GX put the number of the port where you want to install the Sparcom Nav-Pack (1 or 2) on the stack. Format must be in Hex so if you which to install to port 2 type R-Shift -> # -> 2 -> ENTER. Then start the CARDDWL program be selecting VAR -> CARDD. The download should start immediately. You can observe the status of the download in the Hyperterminal Window. The HP-48GX will display "Downloading Slot...". The complete download should take about 3 minutes.

6. After the download is finished the HP-48GX automatically performes a warmstart and the NAV48 library of the Sparcom Nav-Pac will be attached. Your done!

Please refer also to the readme in the CARDUPL package for further information on the programs.

I've installed the package in Port 2 of my 512k RAM Card. Previously I moved the libs that were stored there (Chem-Lab and Stat48 Pro) to port 3. Also, the Sparcom pack seems to blend in perfectly with SpeedUI 11.11 that I have installed in ports 0 and 1. No problems encountered so far.

Christoph, that is one really fine tool you have created there, I think I will use it as a standard now to back up my RAM-Cards from time to time. Once again, thanks for pointing me at it and for all your valuable tips!

Kind regards, Timo

WP34S: "Domain error" when running a program

*Message #1 Posted by **Cristian Arezzini** on 30 Jan 2012, 11:48 a.m.*

I just entered a short program on my 34s, freshly updated. The program ends with a RTN and then an END. After entering it, I went to the CAT, saw it there, and pressed XEQ to run it, and I got a "Domain error". I cleared the error, went to CAT again, pressed XEQ again and now it worked.

Now comes the weirder part. Executing it again, it returned the result "plus one". I tried single-stepping it, and in the single-stepping it got stuck in a loop: where it encountered the RTN, it skipped one step back, thus executing the previous command (which happened to be a INC X); after the INC it executed the RTN again, and so on, always adding 1 to the displayed number.

I have no idea why the single-stepping looped while normal execution only "skipped back" once, but I think neither is the intended behaviour... The manual says that RTN, if in a program and not a subroutine, should stop execution and set the pointer to 000.

The same happened in the emulator.

In case it matters, here's what is in the memory:

```
001   LBL'D'
002   DATE
003   YEAR
004   # 1
005   # 1
006   ->DATE
007   DATE
008   (Delta)DAYS
009   INC X
010   RTN
011   END
```

Cristian

Re: WP34S: "Domain error" when running a program

*Message #2 Posted by **Marcus von Cube, Germany** on 30 Jan 2012, 12:25 p.m.,*
in response to message #1 by Cristian Arezzini

I think I can explain the SST issue: A top level RTN sets the PC back to where it was when the program was started. In the case of SST this is the step before the RTN. I agree that this is a little strange and worth reconsideration.

I can't reproduce the strange CAT behaviour. What is your version? I'm running 3.0/2347.

BTW, END serves as a RTN. So RTN is not needed in your case.

Re: WP34S: "Domain error" when running a program

*Message #3 Posted by **Cristian Arezzini** on 30 Jan 2012, 1:39 p.m.,*
in response to message #2 by Marcus von Cube, Germany

The version I'm using is 2347. It's reproducible here, I'm writing down a list of operations to do to show the problem. I'll report it here when I have it.

I concur. I've uploaded a new build.

Re: WP34S: "Domain error" when running a program

*Message #6 Posted by **Cristian Arezzini** on 30 Jan 2012, 3:14 p.m.,*
in response to message #5 by Marcus von Cube, Germany

I updated the emulator, and the loop bug is gone, but the "domain error" and hang-up are still there, as described in my post below...

I also have a .dat file from before the crash... with that dat file, you just go to program mode, move to step 008, exit program mode, and run the program, and here comes the crash. Do you want it to test it?

Cristian

Re: WP34S: "Domain error" when running a program

*Message #7 Posted by **Marcus von Cube, Germany** on 30 Jan 2012, 5:22 p.m.,*
in response to message #6 by Cristian Arezzini

I was able to reproduce a loop in the error handler. Pauli has recently converted more stuff to XROM which made the error apparent. The "Domain Error" is thrown inside the [delta]DAYS routine by some bogus input.

I have not tested the weird CAT behaviour. There is most probably still something wrong.

Re: WP34S: "Domain error" when running a program

*Message #8 Posted by **Cristian Arezzini** on 30 Jan 2012, 2:02 p.m.,*
in response to message #3 by Cristian Arezzini

I have problems here. I'm able to consistently get weird results (sometimes the program gives the correct result but also displays the day's name; sometimes I get totally wrong results like 735628; and so on) but I have problems in finding the exact order of commands to induce them. But it seems (though I can't believe it) that unexpected results are triggered when exiting the program edit mode at different locations. If when I exit program mode I was at location 000 I get different results than if I was at 001 or, say 008... I have to experiment some more. I'll report back.

Re: WP34S: "Domain error" when running a program

*Message #9 Posted by **Cristian Arezzini** on 30 Jan 2012, 2:34 p.m.,*
in response to message #3 by Cristian Arezzini

OK, the exact errors aren't exactly reproducible, but a weird behaviour is. Here are the exact steps I take (it seems that every individual keystroke counts...)

```
0) Hard reset, using the cable's "reset" button
1) Contrast- three times, to make display more readable
2) DATE (to verify reset) - it shows 1.012007
3) Back arrow twice to clear display
4) P/R (to enter program mode), it enters at step 000
5) Enter above program, without inserting the ending END because it's already there
6) Right after entering RTN, press P/R (to exit program mode)
7) CAT (it shows Lbl'D' RAM)
8) XEQ (it shows Monday 2007)
```

At this last step, sometimes it shows "Monday 2007", sometimes just 2007, sometimes "Monday 0", sometimes just 2, sometimes "Monday 732679" and so on... and doing CAT and XEQ again and again always gives different results (though sometimes you get the same result 3 or 4 times in a row). I have reflashed the calc, just in case, but it still does the same thing.

On the emulator instead, these following steps:

```
1) Total reset by removing wp34s.dat
2) DATE (shows today's date, taken from system clock)
3) P/R to enter program mode
4) Enter program as above, without ending END
5) Right after entering RTN, press P/R to exit program mode
6) CAT
7) XEQ (it seems to work right, even after several tries)
8) P/R
9) move to step 000
10) P/R
11) CAT
12) XEQ (it displays the correct result but also the weekday)
13) P/R
14) move to step 008
15) P/R
16) CAT
17) XEQ (it says Domain Error)
```

The emulator seems more consistent in that the results are always the same. I was wondering if maybe I had faulty hardware but the emulator does similar (though not identical) things... After the Domain error, sometimes the emulator is left in a locked state. After forcing a quit, and reopening the emulator, it shows garbage on the screen. I have a .dat file from this state if needed...

Cristian

*Message #10 Posted by **Marcus von Cube, Germany** on 30 Jan 2012, 3:14 p.m.,*
in response to message #9 by Cristian Arezzini

I think I can explain why a message is shown: The date functions set an internal message to be shown on the next display event. This only occurs when the program has come to an end. I think it's better not to set the message when a program is running.

Can you try the latest build please? (It still sets the message.)

The day of week command probably should set the message either way. I agree the rest can not. Or we should be clearing the message a bit more often than we do perhaps.

Walter, the emulator is more consistent, did you try on the real hardware? Also, did you try on the emulator to enter program mode, go to step 008, exit program mode without changing anything, then run the program wia the CAT? Doesn't it give you the Domain error if you do that?

Cristian

Re: WP34S: "Domain error" when running a program

*Message #15 Posted by **Paul Dale** on 30 Jan 2012, 5:07 p.m.,*
in response to message #14 by Cristian Arezzini

I'm getting no stack change from the console build executing this via CAT when I start with the PC at step 008.

I suspect we might be executing stuff after we return or at least not quite executing properly from the CAT display.

Re: WP34S: "Domain error" when running a program

*Message #17 Posted by **Marcus von Cube, Germany** on 30 Jan 2012, 5:30 p.m.,*
in response to message #16 by Paul Dale

There was a bug which led to the repositioning of the PC to the INC X statement. There is a problem with resetting the PC to the begin of the current program when we hit a top level RTN: Technically, executing a command that is implemented as XROM is just an ordinary XEQ to a routine which ends in a RTN statement. This would affect the user's PC which is undesirable.

HP 30-B size Question

*Message #1 Posted by **Jeff** on 30 Jan 2012, 10:14 a.m.*

I have always wanted to find a financial calculator that is physically smaller.

Amazon gives the 30-b these dimensions: 9.4 x 7.1 x 1.3 inches HP says: 5.84 x 3.03 x .63 inches.

I wonder which are correct.

Also, it's about time for them to retool their ugly, tired lineup of home and office devices!

http://www.shopping.hp.com/webapp/shopping/can.do;HHOJSID=VfSRPmnQrDntnfpjJWL7QMrCqqPVLNWSpLtQg25G3PJLqcXPjhWY!677933928?landing=calculator&category=Office&catLevel=1&storeName=storefronts&jumpid=in_R329_prodexp/hhoslp/psg_ipg/calculator/Home_&_office_calculators

Re: HP 30b size Question

*Message #2 Posted by **Mike Morrow** on 30 Jan 2012, 7:46 p.m.,*
in response to message #1 by Jeff

Certainly the larger dimensions are not those of the HP 30b.

The HP 30b is one of the most satisfying products from HP Calcs in a long time, IMHO. It is the fastest HP calc ever, and although financial in flavor, it has a reasonable and useful set of scientific functions too. Its firmware does not run through a level of emulation like the HP 50g, HP 12C+, and HP 15C LE.

For speed testing, I use the common 2500-iteration Savage Benchmark. For comparison, benchmark completion times are:

```
HP 50g      65 seconds
HP-15C    5840 seconds
HP 15C LE   48 seconds
HP 30b       6 seconds
```

The result accuracy and precision for the 50g and the 30b are identical, and several orders of magnitude better than that of the 15C and 15C LE.

The 30b is about eight times faster than the 15C LE, even though both use the same AT91SAM7L128 SoC and clock speed. That illustrates the waste in time and battery energy that occurs because an emulation layer has been inserted between the original firmware and the SoC, rather than compiling new code for the SoC.

The HP 30b is a great machine, even if you don't transform it to a WP 34S.

New release of go41cx

*Message #1 Posted by **Olivier De Smet** on 30 Jan 2012, 8:19 a.m.*

Release 1.1.0

This one correct a timer bug (now, 'shift' ON works nicelly) and add a new config panel. You can manage :

- States of emulator: save as, load, export/import, ...
- Modules: plug, import/export, infos, ...
- Raws: load, import/export, infos, ...
- Programs: save from main memory to a raw file
- Overlays: load, import/export, ...
- XMem: load, save, import/export, ...
- Regs: display data regs, buffers, program, system, xmem, ...

Overlays are just text files, 70 lines max, 2 lines per key, first for top label, second for shifted label. "null" means no change.

Import/export permit to load/save from the internal files of the application and 'Download' directory of your sd-card, so you can download or mail files.

Olivier

Re: New release of go41cx

*Message #2 Posted by **Vincent Weber** on 30 Jan 2012, 10:54 a.m.,*
in response to message #1 by Olivier De Smet

Hi Olivier,

Nice piece of work !! thanks and congrats ! :) If you can do the following, I will ditch my Iphone and go for Android as a unique mobile phone, as i41cx+ (which is still better than your program so far, but you are catching up !) is the only reason why I keep the iphone:

-Printer emulation -qwerty keyboard for alpha mode -Sound -HEPAX support

How high as those on your to-do list ? ;)

Did you get a chance to look at the HP-65 emulator I indicated to you in a previous post to get inspiration from it to do an HP-65 emulator ? :)

Thanks again for all what you brought, and cheers,

Vincent

in response to message #2 by Vincent Weber

One more thing:

I noticed that the lowercase characters are not displayed correctly: take the Sandbox ROM for instance, which is supposed to display "Welcome" on startup, only a few letters are visible. I had the same problem with P41CX on Palmos, but not on i41CX+ on Iphone. It makes me think that the emulation is fullnut rather than halfnut display. Could this be corrected ?

Thanks and cheers,

Vincent

Re: New release of go41cx

*Message #4 Posted by **Alexander Oestert** on 30 Jan 2012, 12:40 p.m.,*
in response to message #1 by Olivier De Smet

I have a 70 line file named math.ovl in the SD download directory that I managed to import and load. How do I now make the overlay visible on the app's keyboard? I downloaded finance.ovl from your site and tried USER mode but can't see anything...

EDIT

Now it works...but I can't say why and what I did differently...

Very nice! :-)

EDIT 2 … and now I can't get rid of it no matter what I do: delete, reset, on-backspace…

EDIT 3 Finally found out how to use EMPTY ;-)

Edited: 30 Jan 2012, 1:49 p.m.

go41cx overlay

*Message #5 Posted by **Alexander Oestert** on 2 Feb 2012, 2:17 a.m.,*
in response to message #1 by Olivier De Smet

Is there a way to display unicode characters like integral or greek theta on the overlay? When I save them in the text file where I can display them, I only end up with garbage on the go41cx user mode.

Re: go41cx overlay

modern HP-41 "supermodule" choices on the market

*Message #1 Posted by **Garth Wilson** on 30 Jan 2012, 1:00 a.m.*

I posted questions about the MLDL2000, NoV32/64, Clonix, and 41CL comparison on TOS, as having it there will keep it much easier to find later than it would be here on the hpmuseum forum, and much easier to update months or even years later. From the forum front index page, look under "OPTIONS" and click on "Modules" about 3/4 of the way down the page, and then 'modern "supermodule" choices on the market' (which will probably be at the top of that section now).

Re: modern HP-41 "supermodule" choices on the market

*Message #2 Posted by **Diego Diaz** on 30 Jan 2012, 11:49 p.m.,*
in response to message #1 by Garth Wilson

Hi there,

In order to cover the Clonix and NoV's side of your post, I'm preparing a comparative chart of the modules I've developed along these years.

Hopefully it will be on-line in a couple of days.

Best wishes.

Diego

Re: modern HP-41 "supermodule" choices on the market

*Message #3 Posted by **Meindert Kuipers** on 31 Jan 2012, 1:36 p.m.,*
in response to message #1 by Garth Wilson

I have seen the questions on TOS. I would prefer this forum to collect data, then you could compile a single document to be stored forever in the MoHPC and on TOS.

Here is my feedback regarding the MLDL2000 to your questions:

Battery life: about 8 mA extra when the HP41 is running, less than 1 mA in standby

Module support: virtually no limits, but knowledge of HP41 architecture required. both ROM and ROM emulation (mcode development) supported. HEPAX limited support (like in 41CL, special configuration needed).

Communication: Module images to be up- and downloded using Windows PC with special program (M2kM) using a USB connection. No Linux support (tried, but could not get the USB support properly running). No serial port, but USB. Serial port possible with V2 prototype, but not implemented.

Settings: Controlled by PC software M2kM, no special ROM's needed to control MLDL2000

Storage: FLASH and SRAM storage for many ROM images. Switchable via PC connection or dip-switches on unit (8 configurations possible). Mass storage possible on MLDL2000 V2 prototype, but this will probably not happen. microSD support an USB comunication planned as extension to the HP41CL

Compatiblility: works with all HP41 variations, including CL. Can co-exist with Clonix if correctly configured.

Mcode development: YES, offline (with SDK41 and M2kM), and inline with DAVID assmebled for example

Learning curve: somewhat steep, knowledge of HP41 architecture required

Documnentation: all details available, inlcuding all sources and schematics

How to buy: sorry, all units sold out, no plans for further production runs or a new version V2 (unless I get an offer I cant refuse ...)

WP34S Overlay

*Message #1 Posted by **Patrice** on 29 Jan 2012, 8:26 p.m.*

Hi Eric,
Do you have a procedure about how yo apply the overlay?
What not to do?
Order of apply?

Patrice

Re: WP34S Overlay

*Message #2 Posted by **Eric Rechlin** on 30 Jan 2012, 2:44 p.m.,*
in response to message #1 by Patrice

Did you see me give the presentation showing how at HHC?

If not, you can see part of it on YouTube, starting around the 25 minute point, although the video got cut off so you can't see the whole thing.

Basically, I do it like this:

1. Place the overlay that goes around the keys. I start in the wide area between the second and third rows of keys, and then slowly go one row at a time, up and down, to make sure it is all even and without any bubbles. Try to center it as best as you can, because there isn't much tolerance in any direction.

2. Place each key label using tweezers/forceps. You don't want to touch the stickers with your fingers, or the oil from your fingers may degrade the adhesive. Bend the overlay backing sheet if it helps cause the stickers to release, making them easier to grab.

If you've already been using the calculator, I suggest cleaning the keys with isopropanol to remove any oil residue.

Eric

What is that white stuff in the battery compartment?

*Message #1 Posted by **Kees Bouw** on 29 Jan 2012, 2:14 p.m.*

A recently acquired HP-65 has white staining in the battery compartment, presumably from a leaked battery. I can't get it off. I tried to remove it with swabs with only water, but after it dried up it seemed worse. Then I used lemon juice, from a small bottle that is normally used for cooking. That did not do much at all. Before I move on to more aggressive solvents, I thought I would ask if anyone here knows what exactly the white stuff is, and how it can be removed. On the same topic: which chemicals leak from a NiCd battery in general and how toxic or aggressive are they? Is there cadmium or a cadmium compound coming out at some point?

Re: What is that white stuff in the battery compartment?

*Message #2 Posted by **Lincoln R.** on 29 Jan 2012, 5:25 p.m.,*
in response to message #1 by Kees Bouw

Ordinary white vinegar will dissolve that stuff, although you want to make sure you clean off all the vinegar with something (distilled water, isopropanol, etc.) afterwards.

On the same topic: which chemicals leak from a NiCd battery in general and how toxic or aggressive are they? Is there cadmium or a cadmium compound coming out at some point?

I used antiseptic alcohol to remove those stains in three occasions and the results were encouraging. It's because: 1) it isn't corrosive to metal; 2) it dissolves both organic and inorganic compounds; and 3) it evaporates rapidly

I hope my experience can help! :)

The white stuff may be the oxides or hydroxides of cadmium.

*Message #5 Posted by **Ed Look** on 1 Feb 2012, 12:06 p.m.,*
in response to message #1 by Kees Bouw

If there is a suspected leakage of material from a nickel-cadmium battery, then also suspect that it is toxic. Touching a small amount won't hurt you; but do wash your hands and do not ingest any. This sounds silly, but grown people do lick their fingers when they need a little more grip, for example. Do wear thin latex or nitrile gloves. Water will remove it better than alcohol, but in the case of the former, don't use much, just a damp paper towel.

I would recommend also that you do not dispose of the used paper towels, etc. in the trash, if there is a lot of it. With just a smear or little bit of the "white stuff", then it should not be problem.

Cadmium is an internal organ poison and nickel... well, it's not good for you, either, but it's less of an issue than cadmium.

Capacity of the CR2032 Batteries as used in the 15c LE

*Message #1 Posted by **Jeff O.** on 29 Jan 2012, 2:08 p.m.*

There has been a lot of discussion regarding just how much capacity the pair of CR2032 cells will provide as utilized by the 15c LE. I decided to go ahead and run a fresh set of batteries all the way down to see for myself. I did not want to just enter a simple continuous addition loop program and set it running, for a couple of reasons. First, continuous running of a program is not a very real-world test, i.e., I don't think anyone would run a program continuously for a real purpose. Second, and more importantly, I did not want to have to watch it continuously for an unknown amount of time to see when it quit. So I used the following process:

1. Entered Katie Wasserman's "306 digits of pi on a 15C" program. This program takes approximately 16.5 minutes to run on my 15c LE.
2. Ran the program a few times over the course of a morning or a day
3. checked battery voltage
4. repeated steps 2 and 3 until the unit finally quit during a run of the program, keeping track of the number of runs and battery voltage at the checkpoints.

I am happy to report that the unit ran 60 times without issue, each time in the expected execution time of approximately 16.5 minutes. On the 61st run, it finally quit during execution. I'm not sure how long it ran, the display was blank when I checked at about 16 minutes run time. (Each time I ran the program I set an alarm on my 17bII for 16 minutes later. Then when the alarm went off, I watched the "running" display" until it stopped, then verified that it performed correctly by checking the first 20 or so digits and the last 6.) I turned it on and got the "Pr Error" message. It seemed to just clear memory, no weird data corruption or other effects. I reentered the program (it is only 79 steps) and ran it again, this time watching to see when it would quit. It ran for 13 minutes, then the display went blank, and I got the "Pr Error" message when I turned it on. So then I entered a simple addition loop and watched, it ran for 6 minutes. Did that again, and it ran for 5 minutes. That was Thursday afternoon, I believe. Friday morning I entered another simple loop and set it running; it ran for 20 minutes, so the overnight rest allowed the batteries to bounce back a bit. But they are obviously essentially depleted, although I may continue to use the calculator for normal day-to-day calculations to see just how long they last.

At 60 reliable runs of a 16.5 minute program, that represents 16.5 hours of program run time. Based on Katie's reported draw of 10.5 mA per cell during program execution, I managed to extract over 170 mA-Hours from each cell. The cells are Panasonic brand, rated 225 mA-Hours when running at 0.2 mA. So I managed to get over 75% of rated capacity running at 50 times rated current.

As I said, I measured the voltage along the way:

After 4 runs: 2.8 Volts
After 8 runs: 2.7 Volts
After 12 runs: 2.7 Volts
After 16 runs: 2.7 Volts
After 20 runs: 2.8 Volts (yes it seemed to go up.)
After 28 runs: 2.7 Volts
After 36 runs: 2.7 Volts
After 44 runs: 2.6 Volts
After 52 runs: 2.7 Volts (yes, increased again)

After quitting on the 61st run: 2.6 Volts
After quitting 13 minutes into the next run: 2.4 Volts
After quitting 6 minutes into the next run: 2.4 Volts
After quitting 5 minutes into the next run: did not measure
After quitting 20 minutes into the next run the following day: 2.5 Volts

Unfortunately, I forgot to check the initial battery voltage. I used my 15c LE that I received in September and did not use at all beyond doing the keyboard test to insure I had a good unit, so I assume the batteries were in as-new condition. I measured the battery voltage by swapping the cells into a 30b running wp34s and using the BATT function to check voltage. It seems like fresh batteries show 3.1 Volts in wp34s, so I'll assume that's where mine started. If they were actually lower, that means battery life should be even better with new batteries.

16.5 hours of run time on a 15c LE is equivalent to around 2000 hours, or 86 days of run time on a 15C Classic. Would a 15C Classic be able to run that long? Based on these results, I for one feel that battery life with the 15c LE is acceptable. I don't think that HP needs to slow it down to extend battery life, although a user-settable speed setting would certainly be a welcome addition. The high current draw on key press should also be fixed to eliminate any adverse impact on battery life during normal use.

Although battery life may not be as bad as feared, I did confirm that no low-battery indication is given, and that when battery voltage drops too low during program execution to feed the processor, it shuts down and flushes memory. I also discovered another troubling behavior. As I said, I measured the battery voltage by swapping the batteries into a wp34s. I changed the batteries one at a time as directed, putting a new set in the 15c while measuring the test set, but about half the time I got a Pr Error and had to re-enter the program. (That's why I starting measuring every eight runs instead of every four.) If you cannot swap batteries while preserving memory, it does not really matter if there is no low-battery warning or it shuts down and flushes memory during program execution.

Edited: 29 Jan 2012, 2:17 p.m.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #2 Posted by **Kees Bouw** on 29 Jan 2012, 2:22 p.m.,*
in response to message #1 by Jeff O.

As I understand it, pressing a key on the 15C LE draws quite a lot of current. Testing battery life by just running programs therefore may not be accurate, because not many keys will be pressed.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #3 Posted by **Jeff O.** on 29 Jan 2012, 3:31 p.m.,*
in response to message #2 by Kees Bouw

My understanding is that holding a key down draws the same current as a running program. If each key press is roughly 0.5 seconds, it would take 118,800 keypresses to equal 16.5 hours of run time. I'm not saying that the two uses are equivalent, as perhaps it is harder on the batteries to draw 10.5 mA in 118,800 0.5 second pulses than in 60 16.5 minute pulses.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #4 Posted by **Lode** on 29 Jan 2012, 2:42 p.m.,*
in response to message #1 by Jeff O.

It would be interesting to measure how long it takes a fresh set of batteries to be depleted if all you do is continiously hold down a key :)

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #5 Posted by **Jeff O.** on 29 Jan 2012, 3:33 p.m.,*
in response to message #4 by Lode

My understanding is that holding a key down draws the same current as a running program. So it should presumably be the same as if you just ran a program continuously. I did not test that, so I cannot say.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #6 Posted by **Paulo MO** on 29 Jan 2012, 3:39 p.m.,*
in response to message #4 by Lode

AFAIK, the high current draw on key press is the result of setting the processor at full speed whenever a key is detected (to ensure a fast reaction to key press). Hence, as Jeff points out, pressing a key, or running a program at full processor speed should amount to the same.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #7 Posted by **Kees Bouw** on 30 Jan 2012, 7:57 a.m.,*
in response to message #6 by Paulo MO

In the 15C LE Bug Report, Katie writes: *"Current draw is over 20ma when holding down a key, leading to rapid battery depletion. While not a bug this is fixable in firmware and does not happen on the 12C+."* But if it is done purposely (to ensure a fast reaction to a key-press) should it be fixed ? And why does it not happen in the 12C+ ? Or is the problem only in the "holding down" (if so, it can't be a serious problem, because mostly keys are just pressed and not held down).

Edited: 30 Jan 2012, 8:02 a.m.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #8 Posted by **Jeff O.** on 30 Jan 2012, 12:43 p.m.,*
in response to message #7 by Kees Bouw

According to this post by Cyrille de Brébisson:

> Quote:
>
> the 12C emulator, in order to try to preserve power usually tells the calculator that the keys are released instantaneously. this avoid a dead loop waiting for the key to release in the 12C ROM and the power use associated with that...

It sounds like in the 12C+, pressing a key runs the processor at full speed for an instant, then the emulation layer tells the processor that the key has been released whether it has been released or not. So apparently you will get fast response to a key press without continuous high-current draw.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #9 Posted by **Gerson W. Barbosa** on 29 Jan 2012, 8:28 p.m.,*
in response to message #1 by Jeff O.

Great experiment! I tried to run a program that would take about six hours to run, but after 2 hours and 40 minutes I noticed the display was dim. I stopped the program and waited five minutes before continuing, so the batteries recovered. When I checked again half an hour later the display was blank and the program had gone (Pr Error).

I used the original Panasonic cells that came with the calculator, both at 3.039V each in the beginning and 2.803V and 2.808V when I measured their voltages again as soon as I noticed the calculator was off. Probably the HP-15C LE had worked for about 10 or 15 minutes before turning itself off. This means it cannot run a program continuously for more than three hours. I had barely used the calculator, but I may repeat the test with fresh cells tomorrow to be sure.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #10 Posted by **Jeff O.** on 29 Jan 2012, 9:56 p.m.,*
in response to message #9 by Gerson W. Barbosa

How many steps is your program? I might want to test another set.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #11 Posted by **Gerson W. Barbosa** on 30 Jan 2012, 6:46 a.m.,*
in response to message #10 by Jeff O.

74 four steps. That's the listing in the message #19 of this thread. Perhaps the less efficient way to solve Karl Schneider's arithmetical challenge :-)

Update: actual running time is shorter than I thought, about three and a half hours (would have to check it again).

Edited: 30 Jan 2012, 5:16 p.m.

So you couldn't run it for 3 hours continuously, but Jeff O. ran it for 16.5 hours running in intervals. Does running in intervals make that big of a difference to battery life, or is this because your program draws more current than his?

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #13 Posted by **Katie Wasserman** on 29 Jan 2012, 10:56 p.m.,*
in response to message #12 by Bruce Zastera

Running in intervals is much better for battery life (lithium coin cells in particular) than running continuously. Indeed Jeff's rough calculation of the number of keystrokes based on 16.5 hours of battery life might be on the low side.

What greatly surprises me about Jeff's measurements is that he got 75% of the rated capacity on these cells even though they are being run at 100 times the rated current draw. These are super cells!

What doesn't surprise me is the horrible way the 15C LE and 12C+ just die when the cells are exhausted wiping out memory. There's no good reason why they can't shut down gracefully when low voltage is detected.

Re: Capacity of the CR2032 Batteries as used in the 15c LE

*Message #14 Posted by **Lyuka** on 29 Jan 2012, 11:07 p.m.,*
in response to message #13 by Katie Wasserman

> Quote:
>
> There's no good reason why they can't shut down gracefully when low voltage is detected.

As the name implies - HP 15 Continuity Limited Edition.

BTW, by the data sheet of Panasonic's CR-2032, though its capacity is rated at standard discharge current of 200uA, the characteristics is specified from relatively heavy load of 1Kohm(3mA)

The data sheet of Maxell's CR-2032 shows very heavy load (300ohm, 5sec) pulse discharge characteristics. Its capacity under that condition is 160mAh(Ta=25) at terminal voltage of 2.5V.
It's 70% (160mAh/230mAh) of nominal capacity.

The data sheet of Energizer's CR-2032 shows very aggressive load (100ohm, 2sec) pulse discharge characteristics. Its capacity under 400ohm, 2sec * 12 times / day condition is 220mAh(Ta=25) at terminal voltage of 2.5V.
It's 97% (220mAh/230mAh) of nomninal capacity.

IMHO, Li-Mn batteries from these three brand have both reliability and surprising high performance.

Lyuka

> The data sheet of Energizer's CR-2032 shows very aggressive load (100ohm, 2sec) pulse discharge characteristics. Its capacity under 100ohm, 2sec * 12 times / day condition is 220mAh(Ta=25) at terminal voltage of 2.5V.

I see that here. but it's 400 ohms not 100. At higher currents things get much worse: 1 msec on and 14 msec off pulsed load of 23ma which yields 150mah with a terminal voltage of 2.4. Which is only 62% of nominal capacity. Jeff's test was at 10ma per cell with a pulse that's 16 minutes, nearly 1 million times longer than the short spec sheet pulse and 480 times longer than the long spec sheet pulse.

I think Jeff's batteries were far better than the spec sheets indicate. I suspect that there's something to having two cells in parallel that allows the combination to do better than the sum of the parts.

It was my mistake. 400 ohms is correct. I'll correct my post later.

> So you couldn't run it for 3 hours continuously, but Jeff O. ran it for 16.5 hours running in intervals. Does running in intervals make that big of a difference to battery life, or is this because your program draws more current than his?

Running in intervals does make a difference, as Katie said. However the original Panasonic cells were not as fresh as I imagined, so the actual capacity is longer. I've repeated the test succesfully with brand-new maxell cells (initial voltages 3.270V and 3.267V). I was expecting the program to run for 5 hours and 40 minutes, but it didn't take that much time. I checked the display after 3 hours and 5 minutes and didn't notice anything wrong. When I checked it later, the calculator was off. I turned it on and was prepared to see the "Pr Error" message. Instead it displayed the expected result: 534,912,768.0. The chronometer was stopped at 03h52m35s. I don't know long it actually took. Final voltages were 2.874 on both cells (actual voltages were lower, since they had had some time to recover).

My multimeter has a serial interface, but unfortunately the software doesn't run on Vista OS. A discharge curve would be nice, but I am not willing to do this manually.

15c / 15c LE Hard Case?

*Message #1 Posted by **bluesun08** on 29 Jan 2012, 12:55 p.m.*

Is there a hard case for the 15c / 15c LE?

Re: 15c / 15c LE Hard Case?

*Message #2 Posted by **Brandon Poindexter** on 29 Jan 2012, 7:11 p.m.,*
in response to message #1 by bluesun08

A couple days ago i posted a similar question. And i asked if anyone has these.

If you want a "hard" case i.e. one that is rigid, you might do well with this.

Original idea from this post : http://hagy-box.cocolog-nifty.com/blog/2012/01/15c-gametech-ev.html

Re: 15c / 15c LE Hard Case?

*Message #3 Posted by **Calum Tait** on 29 Jan 2012, 7:41 p.m.,*
in response to message #2 by Brandon Poindexter

To let you know, I bought one of the faux leather expanding kind in your first example and am pretty pleased with it. It fits my 11C very well with just a little, perhaps 2mm, of the calculator showing over the limits of the open end of the case. It is pretty much the same as the original HP soft case in that respect. It seems to be rigid enough to give decent protection too without adding a lot of bulk. Indeed, the case still fits in my shirt pocket! I would certainly recommend this case for early Voyagers but I have heard that there is a slight dimensional difference between the original Voyagers and the 15C LE. I don't have an example of the later machine so can't comment on this model.

*Message #5 Posted by **Paulo MO** on 31 Jan 2012, 3:47 p.m.,*
in response to message #4 by Sylvain Louboutin

Don't these cases have a seam on the top border (where the faux leather meets the inside fabric) that colides with the calculator's feet every time you pull it out? I have one of those (from the same seller, so I assume it is precisely the same article) which I don't use for fear of forcing (and losing) the rubber feet.

Re: 15c / 15c LE Hard Case?

*Message #6 Posted by **Neil Hamilton (Ottawa)** on 31 Jan 2012, 3:56 p.m.,*
in response to message #5 by Paulo MO

I have never lost original HP-installed feet (meaning original 12C and new 12C+) using these cases but am **ALWAYS** losing the feet I replaced on my 11C.

The funny thing is that the feet on the 12C+ are way more proud that the original 12C feet or the 11C feet.

My 11C problem is likely that the adhesive I used for my home-made replacement feet isn't up to snuff -- contact cement and bicycle inner-tube patches are what I used. Anybody got a better combo?

Re: 15c / 15c LE Hard Case?

*Message #7 Posted by **Paulo MO** on 31 Jan 2012, 4:31 p.m.,*
in response to message #6 by Neil Hamilton (Ottawa)

The slip cases which come with the machines (if you don't have one, see here, for example) don't seem to put any type of stress on the feet on insertion/withdrawal. Wouldn't that solve your problem?

Re: 15c / 15c LE Hard Case?

*Message #8 Posted by **Neil Hamilton (Ottawa)** on 31 Jan 2012, 4:41 p.m.,*
in response to message #7 by Paulo MO

Agreed. My original cases do not have this problem, and I use an orignal case with my 11C but I bought the hard cases for the purpose of using it with my more treasured 11C rather than my knockoff 12C+. :-)

Does anyone have any good advice on replacement feet and adhesive? How are the replacement feet I have variously seen on EBay?

Re: 15c / 15c LE Hard Case?

*Message #9 Posted by **Dale Reed** on 1 Feb 2012, 8:28 p.m.,*
in response to message #8 by Neil Hamilton (Ottawa)

I have used these feet with good success on a U.S. made 11C.

Note that it might be possible to identify the replacements (besides the fact that they are not worn) by the corners. The new feet have sharp right-angled corners, but the feet I took off the 11C (I presume they were original) had very small, but non-zero, radius rounding at the corners.

I bought a few sets from this seller. I also used them on my 15C LE when I fixed a marginally-functioning divide key. (I couldn't get the feet off without leaving some adhesive. Others have posted here with how to do it so you don't do that!) Note that the feet on the 15C LE (and I would have to guess on the 12C 30thAE and 12C+...) are a little thicker. The feet I bought were not tall enough to peek over the edges of the little plastic surround ("footwell") in which they sit. So when I set the calculator on a table, the plastic surround sat on the table, not the feet. Simple solution: stack two feet on each corner. (Not the most economical, but expedient at the time....) They have stayed on fine,

even though they catch on stuff because the doubled feet are now thicker than the original.

So I'm guessing that if the 11C feet are, say, 1.0 mm thick, then the 15C LE feet are more like 1.5 mm.

I mailed one of the feet I took off the 15C LE to the seller so he could measure, compare, and perhaps find some thicker stock.

Anyway, to answer the original question: The feet I've purchased from this seller have worked fine and stayed stuck. YMMV. Just be sure to tell the seller if you are putting the feet on a "new" Voyager -- and see if he can send thicker feet.

Dale

> I have never lost original HP-installed feet (meaning original 12C and new 12C+) using these cases but am **ALWAYS** losing the feet I replaced on my 11C.

I've seen voyagers lose feet due to breakdown of the adhesive rendering it "gummy" and subsequently failing. The other issue being the location of the screw wells are typically in corners of a foot such that there isn't much surface to anchor it in the areas most subject to peeling.

> Quote:
>
> Does anyone have any good advice on replacement feet and adhesive?

When I looked at this a while ago the best solution for securing replacement feet was an Adhesive Transfer Tape designed for low surface energy plastics. This is adhesive alone without a carrier film and tends to fair better on slightly irregular surfaces compared to film carrier tapes at the same installed thickness. 3M makes an absolutely dizzying number of products which seem suitable. Those with their 300LSE adhesive are specifically designed for low surface energy plastics, ABS in particular.

The only problem is finding someone to sell you a single roll of the product vs. a carton of 48. Failing that you can find evilbay sellers offering what appears to be similar product in small inexpensive quantities albeit from mysterious sources.

Concerning feet you could probably use any rubber sheet around 30~60 durometer. Bicycle inner tube patches sound like a great idea assuming they are about 1mm or so thick. EDPM pond liner "samples" can be had for free although those I've seen have an anti-slip a surface treatment which needs to be sanded off for better performance on the adhesive mating side. Shower stall liner is another possibility.

> Quote:

> How are the replacement feet I have variously seen on EBay?

No idea but I do marvel at the profit margin.

in response to message #10 by uhmgawa

I use carpet tape to attached my replacement feet and find it works very well to adhere rubber/vinyl to plastic. It's cheap and available at almost any hardware store in a variety of fabrics.

Re: 15c / 15c LE Hard Case?

*Message #12 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 3 Feb 2012, 5:38 p.m.,*
in response to message #11 by Katie Wasserman

I agree carpet tape works very well, easy to find and cheap. Also I would like to suggest "Servo Tape" for a few reasons. First it is strong but once its removed, won't leave any residue, second it is somewhat compressible therefore provides stability when the rubber pad thickness is uneven and absorbs vibrations very well.

Re: 15c / 15c LE Hard Case?

*Message #13 Posted by **Katie Wasserman** on 3 Feb 2012, 7:57 p.m.,*
in response to message #12 by Kerem Kapkin (Silicon Valley, CA)

Thanks. I've never heard of servo tape, I'll have to give it a try.

> > I agree carpet tape works very well, easy to find and cheap. Also I would like to suggest "Servo Tape"..

I've looked at servo tape but wanted an adhesive relatively thin (<10 mils) to avoid excessive height. The feet are less likely to creep out of position if they are sitting within their retaining well. 3M and others make an automotive grade adhesive that would otherwise fit the bill but this is a relatively thick tape with a foamed carrier.

I'd actually looked around for carpet tape initially. However most of what I'd found was reinforced with a loose fabric weave and had an adhesive of fairly gummy consistency. The carpet tape I recall available years ago seemed far more suitable.

Re: 15c / 15c LE Hard Case?

*Message #15 Posted by **Katie Wasserman** on 4 Feb 2012, 11:58 a.m.,*
in response to message #14 by uhmgawa

3M makes a "Scotch" brand 2" wide carpet tape that measures 6 mils, that's the one that works best for me. It's non-woven and feels like paper (but I think it some polymer). I'm pretty sure this is it.

Edit: I'm sure that this is the stuff. And the latest roll I bought is even thinner than the previous one I got, it measures only 4 mils.

Another bug in the HP15C LE manual

*Message #1 Posted by **Antonio Maschio (Italy)** on 29 Jan 2012, 6:01 a.m.*

In effect this is not a simple bug, since it originates from the original manual (page 53 of Feb. 83 edition).

At page 53 of the LE manual the Average tons of rice should read 6.20, instead of 6.40, being the result 6.202.

Since this mistake is also in the 1983 version, I suppose it was not corrected and simple OCRed into the new version, but I could complain about a missing verification...

My 2 cents for Felix Article.

Please, verify for yourself.

--Antonio

Getting HEXEDIT to work on the HEPAX itself

*Message #1 Posted by **Ángel Martin** on 29 Jan 2012, 5:40 a.m.*

There recently was a thread about getting DISASM to work on the CL, and a related topic was overcoming built-in features in the HEPAX to avoid its own disassembly.

here

Monte´s instructions solved the riddle for DISASM, but there was still another location checking on the same protection which stopped HEXEDIT to work.

To prevent this you need to patch bank'1 of the HEPAX ROM again, at location H´p474 (where p is the page number). Simply replace the current instruction with ¨10B¨ JNC +33d

If you´re using YPOKE on the CL you´d of course do:

"8xx474-010B" YPOKE

where 8xx is the RAM location holding the HEPAX- bank1.

Caveat emptor: as always, this is not thoroughly tested yet. Initial checks show it works without a glitch - pls. report if you find any issues.

Cheers, 'AM

Re: Getting HEXEDIT to work on the HEPAX itself

*Message #2 Posted by **Ángel Martin** on 29 Jan 2012, 6:42 a.m.,*
in response to message #1 by Ángel Martin

Just occured to me that I should make a couple of additional remarks:

1. HEXEDIT on the HEPAX will only work while you stay on Bank'1, for obvious reasons

2. DISASM on the hepax will show the second bank code, as this is where the currently excecuting code resides.

On the DISASM patch, there is a simpler alternative to Monte´s solution. The FOCAL program below does all three patches for you, assuming the HEPAX ROM is plugged on page A and also using the same CL sRAM addresses as in Monte´s document.

```
01 LBL "HPXPTCH"
02 "HEPX"
03 PLUG2L
04 "030>83F"
05 AVIEW
06 YMCPY
```

07 "83F08D-0000" - patches the DISASM glitch
08 YPOKE
09 "8040AC-883F" - maps the patched bank'4 to the MMU
10 YPOKE
11 "02D<83E"
12 AVIEW
13 YMCPY
14 "83E12F-0033" - patches the self-DISASM limitation
15 YPOKE
16 "83E474-010B" - patches the self-HEXEDIT limitation
17 YPOKE
18 "8040A0-883E" - maps the patched bank'1 to the MMU
19 YPOKE
20 "DONE"
21 AVIEW
22 END

Enjoy, 'AM

WP34s complex matrix functions

*Message #1 Posted by **Ed Wright** on 28 Jan 2012, 9:42 p.m.*

Does WP34s support determinant and inverse of matrices with complex elements? I know how to do it on the 42S, but not on the WP34s.

Re: WP34s complex matrix functions

*Message #2 Posted by **Paul Dale** on 28 Jan 2012, 9:46 p.m.,*
in response to message #1 by Ed Wright

There is a very good reason you don't know how to do this: the 34S doesn't support complex matrices. Currently, this simply isn't possible -- there is no distinction between real numbers and complex numbers (unlike on the 42s and the RPL devices).

The trick used on the 15c is applicable however, although no special support is present to do the necessary conversions.

- Pauli

new convert?

*Message #1 Posted by **db (martinez, ca.)** on 28 Jan 2012, 4:05 p.m.*

Having bought from Datamath, i'm on Joerg's mailing list. Here's two quotes from this weeks ebay advertisement:

referring to the Corvus 500: "perfect. RPN!"

and "Hewlett Packard HP-11C - Still the best!"

Has *Mr. T.I.* finally been won over?

Re: new convert?

*Message #2 Posted by **Mike Morrow** on 28 Jan 2012, 10:11 p.m.,*
in response to message #1 by db (martinez, ca.)

Not if he classifies the HP-11C as "the best"! I'm not aware of *any* quality of the HP-11C that comes close to being "the best", even if the competition is limited to HP products.

Re: new convert?

*Message #3 Posted by **db (martinez, ca.)** on 28 Jan 2012, 11:10 p.m.,*
in response to message #2 by Mike Morrow

Well, being my first hp doesn't make it the best. You're right in that being equal to the best battery life is not THE best battery life. Having the same high level of protection from dust, liquids, and esd as any other voyager doesn't make it the best either. That it is in the class of hp with the least battery/battery bleeding/battery door/memory lost related (stupid design) problems doesn't make it the only one in that desirable group.

Still; if i was going to be trapped on a desert island for 17 years then an 11c with new batteries would be my *second* choice for a calculator.

Re: new convert?

*Message #4 Posted by **Mike Morrow** on 28 Jan 2012, 11:41 p.m.,*
in response to message #3 by db (martinez, ca.)

If I had a way to charge AAA-cells, the HP 50g would be my choice even though I don't like its RPL or its size. If no electrical resupply was possible, then I'd take an HP-42S, followed rather distantly by a real HP-15C (not LE!!). The HP-11C is far from qualifying as "the best" (in the true since of the term) in any specific detail, and even more removed when an overall evaluation is made.

Re: new convert?

*Message #5 Posted by **uhmgawa** on 29 Jan 2012, 3:27 a.m.,*
in response to message #4 by Mike Morrow

> Quote:
>
> The HP-11C is far from qualifying as "the best" (in the true since of the term) in any specific detail..

AFAIK only one slight but measurable advantage exists for the 11c relative to the 15c as the 11/12/16c only contain one ram/rom/display device vs. two present in the 15c. When the NUT is active and generating bus clocks the additional R2D2 adds ~0.37mA to the dynamic current consumption of the system. This is only significant when the NUT is active due to a lengthy native operation or executing a user program. However in typical usage this is likely buried in the measurement noise.

Re: new convert?

*Message #6 Posted by **Joerg Woerner** on 28 Jan 2012, 11:36 p.m.,*
in response to message #1 by db (martinez, ca.)

Dennis,

The HP-11C has at least a much better keyboard than the HP-16C LE ;-))

The Corvus 500 has such a crisp and snappy (perfect) keyboard and great (HP) display.

BUT: Did you notice that I offer both of them CHEAPER than my TI-59???

Cheers, Joerg

BTW: The best of this week's calculators is for sure the Panasonic 850. Go for it. 40 years old and still new.

Re: new convert?

> I offer both of them CHEAPER than my TI-59

so; since almost every corvus and 11c ever made that hasn't been closed up in some surveyors tailgate is still operating, good ones aren't *that* rare. i'll guess that your expensive 59 is one of the few not crippled by battery leakage directly onto the pcb, bad keys, or card reader issues. some people liked the traverse program in the 58/59 rom more than the 65/67 or even the 41 because it stored points. the 3rd party roms and kirber's rewrite of the hp rom using extended for storage took care of that TI advantage.

if that 850 is as valuable as you say, i may auction off mine next. i never use it. dam thing is missing the enter key. ;-)

I own a very minty Corvus 500, and while the keyboard is certainly clicky, I would not put it in the same league as the better HP models of the day. The snappyness is excessive, obnoxious and noisy to the point that I would probably be removed from a library were I to use it there. Much better is the keyboard on the Omron 12SR, and that green VFD display is positively dreamy.

Sandbox ROM vs Childish Prank

*Message #1 Posted by **Howard Owen** on 28 Jan 2012, 3:35 p.m.*

On the HP41 Facebook group, a member posted the ol' SF 11 turn off trick. I recalled another prank along the same lines:

```
01 SF 11
02 OFF
03 'MEMORY LOST
04 AVIEW
```

I keyed this into my HP41CL and it failed, much to my surprise. It turns out the Sandbox ROM startup banner interferes with the AVIEW somehow. I tried it on i41CX and had the same result with the Sandbox ROM installed. Taking it out made it run like I expected.

I don't think Ángel should worry. Given what I'm trying to do here, it's hard to call this a bug. :)

Re: Sandbox ROM vs Childish Prank

*Message #2 Posted by **Ángel Martin** on 29 Jan 2012, 3:03 a.m.,*
in response to message #1 by Howard Owen

Howard, you must be the only SandBox user left in the world ! Sorry it ruined your prank demo :-)

Yes its greetings banner does not yield to the other modules plugged after it, as back then (2002 if memory serves) I knew little about other ways to implement that. The name "SandBox" says it all..

I can of course change this now but it's hardly worth the effort. All other modules after it (SandMATH, 41Z, TOOLBOX, etc, etc) use "approved" calls that hand the execution back on to the OS after the code in the polling points is done - creating buffers, assigning keys, etc.

Best example is the SECURE functions in the CL_Utils module, which allows for user prompts *during* that phase, and yet it returns happily to the OS - assuming the right password is entered.

Best, 'AM

Ángel, Howard is not alone! ;)

I have it burnt into Clonix, and a couple of instances of V41, if memory serves... fond memories, maybe.
Thanks for it, of course.
Massimo

*Message #6 Posted by **Ángel Martin** on 29 Jan 2012, 4:04 p.m.,*
in response to message #5 by Massimo Gnerucci (Italy)

Well well, it looks like the the needed changes weren´t that difficult - see below for the required patch, involving just patching 5 bytes at address pFE0 to pFE4:

```
BFE0    320     DSPTOG  display ON
BFE1    391     PORT DEP:
BFE2    08C     XQ
BFE3    3DB     ->BBDB  [WAIT&SEE]
BFE4    320     DSPTOG  display OFF
```

Since it uses HalfNut lower case characters it won´t be very descriptive on the CL, specially if you have it in TURBO50 startup.

Best, ÁM.

HP-41 printer interface question. (To the M-code gurus out there)

*Message #1 Posted by **Diego Diaz** on 28 Jan 2012, 3:15 p.m.*

Hi all,

I've read almost every line of info regarding HP-41 <> PRINTER interface.

Still a (great) doubt remaining; quoting William Doug Wilder:

"It makes me wonder how the carry bit gets set, what is the hardware sequence that sets carry?"

So far I've been unable to figure out how instructions h'003, h'043 & h'083 handle the carry flag *into* NUT CPU.

These are instructions decoded and executed by the Peripheral chip, issued right after the SELP 9 instruction.

Any comment will be much appreciated.

Thanks for your attention

Diego

Re: HP-41 printer interface question. (To the M-code gurus out there)

*Message #2 Posted by **Eric Smith** on 29 Jan 2012, 4:40 a.m.,*
in response to message #1 by Diego Diaz

For the flag tests of the "intelligent peripheral" chips, the peripheral puts the flag value onto the ISA line during bit time 0. The CPU copies that to the carry flag.

This is for any instruction of the form hexadecimal x03, x43, x83, or xc3 (x being 0, 1, 2, or 3), in a sequence following a peripheral select instruction (x24, x64,xa4, xe4). It does not apply to the "normal" x03, x43, x83, xc3 instructions, which are jump instructions.

NoVRAM-M and NoV-32-M

*Message #1 Posted by **cgh** on 28 Jan 2012, 12:50 p.m.*

Hi,

I delievered on TOS a modifed code for the NoVRAM and NoV-32 built by Diego Diaz. This is the **-M** extension.

The aim is to use the 6 pages ROM and 4 or 8 pages RAM at almost the same time, with a dynamic configuration. Like I do not like very much HEPAX, I was finding a solution to test WWRamBox and ES-MLDL images.

I also introduced based on the first work of Diego a feature to disable the RAM read at module plug-in, but keep the write. This is useful to correct or erase a bad RAM page without loosing the others and without flashing the whole module.

Like this code is not handled by the ClonixWinCfg or ClonixCfg tools, please, read the PDF included to learn how to install them. Do not hesitate to contact me if you got trouble.

This code is NOT currently confirmed and approved by Diego but I did not run any problem while using it for one month.

I only tested these two codes (NoVRAM-M and NoV-32-M) in a NoV-32 module, but I believe that NoVRAM-M will run on a NoVRAM.

NOTE: **I am not responsible for any damage on the modules, accessories or calculator which may result when using the code.**

Thanks to Diego Diaz who has developpend and built the Clonix and NoV* module.

Enjoy,

Christophe

in response to message #1 by cgh

Hi Christophe, all,

Although I've not had the time for a throughout test, I'm positive that your mods won't hurt any module or calculator... ;-)

I'm also glad to see NoV's users offering other alternatives to the community based on my projects.

Keep up the good job and... enjoy it!

Cheers.

in response to message #2 by Diego Diaz

Hi Diego, all,

I am happy to ear that. This is due to a question asked by someone I gave the demonstration.

"Is there any risks to damage my calculator by using this module (NoV-32-M) ?"

Feel free to send me all remarks you may have.

Cheers,

Christophe

Re: NoVRAM-M and NoV-32-M

*Message #4 Posted by **Ángel Martin** on 29 Jan 2012, 3:17 a.m.,*
in response to message #1 by cgh

I also think this is good news, adds versatility to the NoVRAM´s platform (Diego´s brainchild) and keeps the 41 alive & kicking.

For sure it´s great if you don´t like the HEPAX or use it, but in your readme file there´s a couple of opening statements that I don´t think are accurate.

1.- the usage of page 6 is only done when there´s no printer, so no conflict will ever occur.

2.- despite having 4 pages they´re bank-switched, so the actual ¨footprint¨ is just one - albeit of course the four blocks need to be burned on the NoVRAM.

3.' Yes XF/XFA are redundant to a CX user, but remember that back then there was a huge instaled base using C´s and CV´s. Besides HEPAX/HEPAXA were all new, and the multi-function technique they invented broke the "FAT barrier". That was innovation - like your new application here also is!

Thanks for sharing, I´ll look into it as it deserves when time permits - but I´m an unconditional HEPAX fan :=)

Best, ÁM

HP raises MSRP on 15C LE

*Message #1 Posted by **Michael de Estrada** on 28 Jan 2012, 12:13 p.m.*

Today I went to the HP Home & Home Office webstore, and observed that HP has raised the MSRP on the HP 15C LE from $99.99 to $179.99 ! I find it interesting that it's close to the same price currently listed by Samson Cables via eB@y. Given that they show it as being out of stock, I wonder if they are just signaling the secondary market that it is ok to charge more for it, since they will probably no longer be selling them directly. Well, so much to the idea of lowering the price. :<(

Edited: 28 Jan 2012, 12:24 p.m.

Re: HP raises MSRP on 15C LE

*Message #2 Posted by **Michel lahcem** on 28 Jan 2012, 12:56 p.m.,*
in response to message #1 by Michael de Estrada

I've just bought a pair in France this week. Price for one piece was less than 100€ with shipping. Strange that it costs more in the US than in Europe.

Re: HP raises MSRP on 15C LE

*Message #3 Posted by **Eric Rechlin** on 28 Jan 2012, 12:58 p.m.,*
in response to message #1 by Michael de Estrada

I should be getting them in stock soon -- I have six 40-pound boxes scheduled for delivery next week!

Unfortunately, the price has indeed gone up at wholesale, and shipping costs have gone up, too. My supplier is not honoring the pre-order price, either, so I have to pay the new price for all of the calculators I ordered last fall.

This means that for the pre-orders I took last year that I will only now be able to ship, I will be losing an average of $10 per calculator (multiplied by the 90 calculators that were pre-ordered by my customers). Oh well, such is life.

Eric

*Message #4 Posted by **Michael de Estrada** on 28 Jan 2012, 1:43 p.m.,*
in response to message #3 by Eric Rechlin

Sorry to hear this. You are one of the few honest dealers out there, and now you are being punished for your honesty. I think the whole way this thing has played out really sucks, and ultimately reflects badly on HP for the short-sighted manner in which they have marketed this item.

Re: HP raises MSRP on 15C LE

*Message #5 Posted by **Jim Johnson** on 28 Jan 2012, 4:37 p.m.,*
in response to message #1 by Michael de Estrada

Seems to be profiteering by HP since the HP12c is still selling for $69.99. Both of these devices are ARM processor based. There's nothing uniquely different between the two since the display, keyboard and internals are essentially the same. This signals that HP has turned a very bad corner in their corporate direction leaving a legacy of recent poor management and bad marketing decisions.

Re: HP raises MSRP on 15C LE

*Message #6 Posted by **Mark Scheuern** on 29 Jan 2012, 8:32 a.m.,*
in response to message #1 by Michael de Estrada

Strangely, it's still listed as $99.99 in the HP Small and Medium Business Store. I placed my order there on January 19 and it's apparently in limbo, though, so who knows?

Re: HP raises MSRP on 15C LE

*Message #7 Posted by **Michael de Estrada** on 29 Jan 2012, 10:24 a.m.,*
in response to message #6 by Mark Scheuern

The S&MB store accepts orders even when it is not in stock. It can take weeks, even months sometimes to receive your order.

Edited: 29 Jan 2012, 10:26 a.m.

Android HP67 - v1.1 posted

*Message #1 Posted by **MikeO** on 28 Jan 2012, 1:38 a.m.*

I've posted version 1.1.

You can find it by searching the market for 'hp67'. I've added code which dynamically scales the button areas based on the screen density and size.

Not sure how the tablets will handle it - I think much better now - but I may need to produce some higher resolution graphics for those. In the meantime, checkout the tip from Bill regarding the 'zoom' option when running the app on tablets.

Thanks for the feedback. Hope you like this application!

-Mike

Re: Android HP67 - v1.1 posted

*Message #2 Posted by **Alexander Oestert** on 28 Jan 2012, 2:11 a.m.,*
in response to message #1 by MikeO

The LED display is still way too small but at the right position. The touch sensitive area is slightly above each corresponding key: in the first row it is approximately 1/3 of the key height too high, that distance rises the lower one gets and is over one whole key height in the last row on my android tablet.

Re: Android HP67 - v1.1 posted

*Message #3 Posted by **MikeO** on 28 Jan 2012, 12:45 p.m.,*
in response to message #2 by Alexander Oestert

Yes. I think I'm going to need to load up Honeycomb and/or Ice cream sandwich and make a tablet version of this. It's too bad that the android team didn't think of including a (effective) mode in the tablets that would support applications designed for smaller format devices.

;)]

Edited: 28 Jan 2012, 12:56 p.m.

Re: Android HP67 - v1.1 posted

*Message #4 Posted by **Bill (Smithville, NJ)** on 28 Jan 2012, 7:41 a.m.,*
in response to message #1 by MikeO

Hi Mike,

Just tested the latest. Somewhat better but still has issues with pressing the keys.

On my Droid X Phone, I need to press the keys slightly above the key. It's close, but I have to really concentrate on where I am touching.

On my Acer A500 Tablet, the keypress is quite a bit above the key. I'm thinking that zooming it up, accentuates the amount above the key.

You will diffintely want to create a higher resolution image for the tablets. It's like an out of focus photo.

You're getting close. Can't wait to see the next iteration.

Thanks,

Bill

Re: Android HP67 - v1.1 posted

*Message #5 Posted by **MikeO** on 28 Jan 2012, 12:45 p.m.,*
in response to message #4 by Bill (Smithville, NJ)

Hi Bill, yes. see above post re: tablet version.

As for the Droid X, not sure why it's behaving differently than the other phones. On paper, it's 854x480 - my EVO 4G is 800x480. Shouldn't be that different.

I'll have to add some metrics reporting to the application. I'm thinking it would be cool to generate a "data card" in the programs directory so that users could send it to me (or even examine the numbers in the registers) - but I'll probably just add a dialog that dumps the relevant metrics to the screen.

Edited: 28 Jan 2012, 1:16 p.m.

*Message #9 Posted by **M. Joury** on 29 Jan 2012, 10:19 p.m.,*
in response to message #1 by MikeO

Still can't load it on my 2.3.5 device. Has anyone else managed to load this on an Android 2.3.5 or 2.3.4 device?

Cheers,

-Marwan

Re: Android HP67 - v1.1 posted

*Message #10 Posted by **Vincent Weber** on 30 Jan 2012, 3:47 a.m.,*
in response to message #9 by M. Joury

Hi Marwan,

I had no problem loading it on my Samsung Galaxy Wifi 4.0 (YP-GP1, not a phone but a PMP tablet) running Gingerbread 2.3.5 then upgraded to 2.3.6.

Actually I'm quite surprise you can't load it. Very few devices will have 2.3.7, I think it was a very specific Gingerbread version to run Google Wallet on the Nexus. So if the 2.3.7 requirement was strictly enforced, that would be as good as saying that no Gingerbread device can run it, and that you need Honeycomb (for tablets only) or Ice Cream Sandwich (very few phones upgraded to it at the moment), so, it would be almost as good as saying "for tablets only, no phones". You should be able to see it on any 2.3.x device..... Strange how Aandroid can be sometimes !

Cheers, Vincent

Re: Android HP67 - v1.1 posted

*Message #11 Posted by **M. Joury** on 30 Jan 2012, 10:08 a.m.,*
in response to message #10 by Vincent Weber

Hi Vincent,

That is truly interesting. I am using the exact same device running 2.3.5 and I can't find it through the marketplace directly. If I access it through a web search I can find it but I am told that it is not compatible with my machine. Very odd. Off topic: How did you upgrade to 2.3.6?

I'll try again this morning.

Thanks!

-Marwan

Re: Android HP67 - v1.1 posted

*Message #12 Posted by **Vincent Weber** on 30 Jan 2012, 10:49 a.m.,*
in response to message #11 by M. Joury

Hi Marwan,

Amazing ! I can only think that you are running a US version (are you ?) while i'm using a French

version, and that makes a difference for the Market despite running the same version.

As for upgrading, that was painful. I was running Froyo, I decided that HP-67 emulator was a good reason to upgrade to Gingerbread... so I tried with Kies, which is a real piece of crap, could never get anything out of it. I managed to find a 2.3.5 rom and upgrade via Odin, which was a breezed a worked perfectly first time.... only to realize that 2.3.5 on the GB-YP1 had a major bug: plugging in earphones would crash the device, and that was fixed in 2.3.6 !! I tried the whole day to find a 2.3.6 rom, with no succes; i was discouraged, then, playing the settings on my device I realize that OTA (Over The Air) was actually available on 2.3.5, unlike Froyo ! if you run 2.3.5, simply open the settings, "about device", the first entry is "software update" ! it worked perfectly to upgrade to 2.3.6, unlike stupid Kies.

Hope this helps, cheers,

Vincent

Re: Android HP67 - v1.1 posted

*Message #13 Posted by **M. Joury** on 30 Jan 2012, 1:27 p.m.,*
in response to message #12 by Vincent Weber

Hi Vincent,

Thanks for all the information. And yes, I am running a US version. I wonder if that is indeed the difference. Very strange of ot os but as far as I can tell that is the only difference between our machines.

Thanks again,

-Marwan

Edit: And there is another difference. Mine does not have the "Update" option under Setting->About device. Odder and odder...

Edited: 30 Jan 2012, 1:31 p.m.

Re: Android HP67 - v1.1 posted

*Message #14 Posted by **MikeO** on 30 Jan 2012, 7:37 p.m.,*
in response to message #13 by M. Joury

Yes. I see that the market lists 2.3.7, but I know that the target SDK version is 10. This is a setting in the application manifest which tells the market which version of SDK the application is targeting. I think the market simply lists out the latest 2.3 version.

The level 10 Android SDK should target any 2.3.x android version. That said, manufacturers are free to change the Android source - I'm wondering if this is part of the problem. An update may fix the problem.

Re: Android HP67 - v1.1 posted

*Message #15 Posted by **Thomas Okken** on 8 Feb 2012, 7:29 a.m.,*
in response to message #14 by MikeO

For what it's worth, I was able to install and run it under 2.3.3 (CyanogenMod 7.0.3 on HTC Aria).

Is a new model of the HP-50G available???

*Message #1 Posted by **Bill Zimmerly** on 27 Jan 2012, 11:09 p.m.*

I saw this on Facebook a few minutes ago. The guy who made the posting (in Spanish) said that it had a blue casing and a color display! Can we get a comment from any of the HP insiders? I'm quite excited about this if true as the 50G is my favourite calculator.

Re: Is a new model of the HP-50G available???

*Message #2 Posted by **gene wright** on 27 Jan 2012, 11:35 p.m.,*
in response to message #1 by Bill Zimmerly

blue casing as shown in the picture: Yes

Color display?: No

Re: Is a new model of the HP-50G available???

*Message #3 Posted by **Peter Murphy (Livermore)** on 27 Jan 2012, 11:38 p.m.,*
in response to message #2 by gene wright

Googling yields this:

HP 50g Blue Product no.: NW240AA#B17

Blue and White Colour Scheme

The Blue HP50g is back!

After some time without stocks, we have located several lots of this calculator model. Its lively colours are outstanding when compared with the professional but boring black. No more questions in class about whose is the calculator - the blue is yours!

Equal to the black model in everything but colour.

Only available in Spanish-Portuguese (starting guide - the computer as such is in english as the rest of HP50g)

http://www.thecalculatorstore.com/HP-50g-Blue

Resurrecting a shattered HP 19B
*Message #1 Posted by **Neil Hamilton (Ottawa)** on 27 Jan 2012, 9:09 p.m.*

The Casualty

I recently acquired a truly devastated HP 19B. When it arrived **every** heat stake in the lower section was shattered. The keyboard was lifting off the body to such an extent that the keys in the lower rows were in danger of falling out. This is in addition, the missing battery door. What a wretched life this poor machine must have had!

However, when I hooked it up to power, there was life! I had to pinch the body just below the display (and in several other places as well -- some photos show a big paper clip holding the bottom of the keyboard together -- though this was more to keep the keys from falling out) but it was most definitely capable of life!

I am sorry I did not think to take a photo of the *before* state...

The Method

Having read Geoff Quickfall's excellent thread back in June ("HP 28S: Shucking the Clamshell"), I covered the LCD with a block of blue Styrofoam and heated the upper and lower labels with a blow drier to remove them. As with Geoff's experience, I had *a few* heat stake heads come away with the label. As I discovered later, the ones that were left in their little wells were shattered also. In fact, the only ones which were intact were the ones above the battery area.

There are 2 sizes of heat stake used in this calculator. The majority are 2.4mm (3/32") while there are 6 which are 1.6mm (1/16"). These smaller ones are the 4 middle ones above the top row of keys and the 2 middle ones just below and to the right of the ENTER key (oops! I meant INPUT key). After taking out all the shattered remnants of the heat stake heads, I drilled through every one using a drill press to maintain alignment. I used 0.060" and 0.0935 (ie: 3/32") bits to ensure a good, tight fit for the replacement styrene rods.

The battery compartment heat stakes where shaved conventionally (if not a bit over enthusiastically) with a brad-point bit.

Any crud left over from the drilling operation had to be removed from the body cavity so the calculator had to be fully disassembled at this point. When taking the front shell off the chassis, most of the keys fell out or *drifted* out of their assigned holes. The thin rubber membrane did essentially nothing to hold them in place.

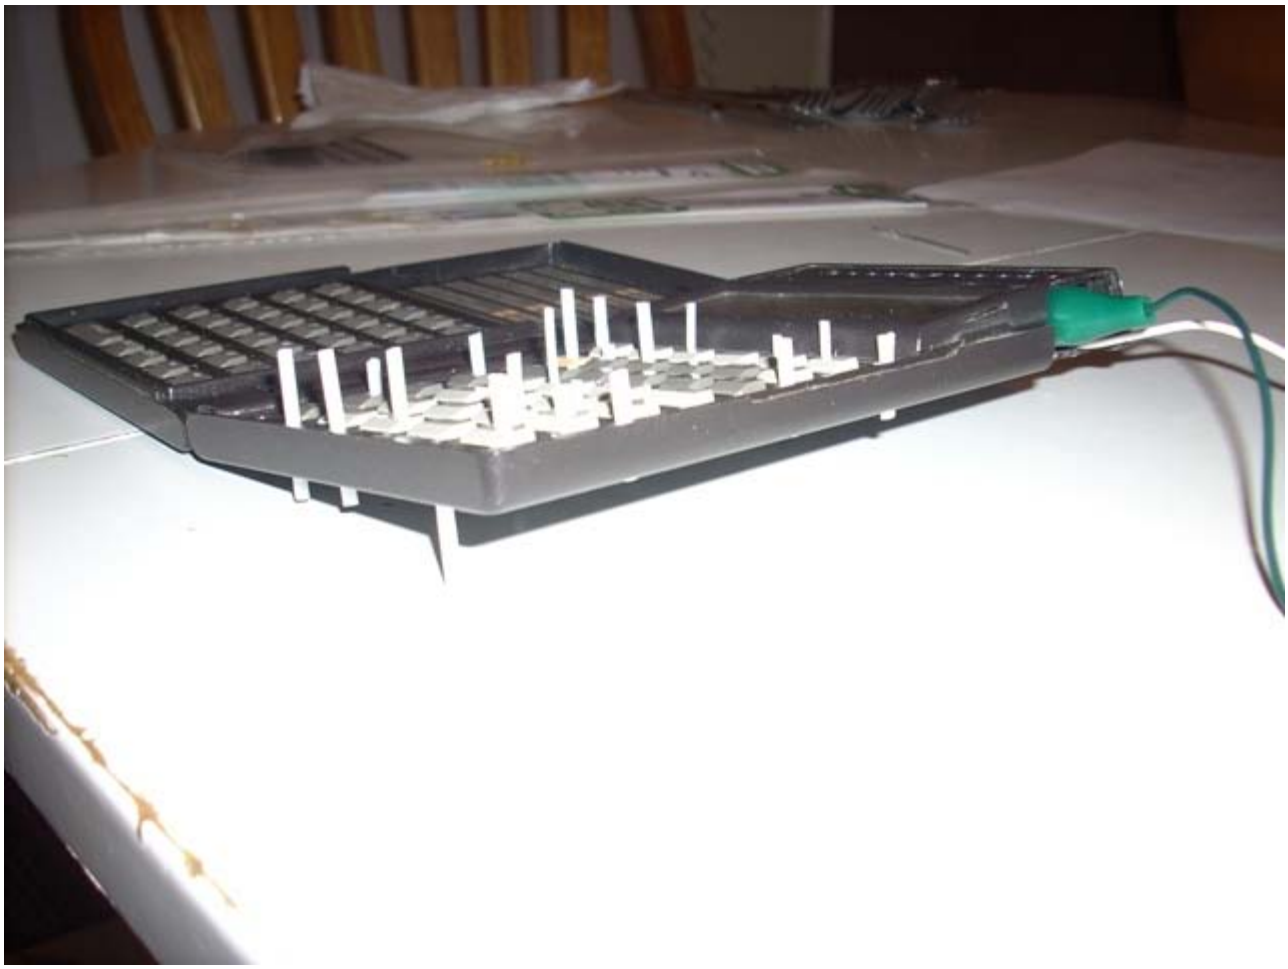
For obvious reasons, the keyboard wants to be key-side down when the reassembly takes place. However, it turns out to be a non-trivial exercise getting them back in and aligning all the keyboard sandwich layers together while trying to poke the styrene replacement rivets into place. As others have mentioned, my state of evolution has not yet advanced to having the required 3rd (or 4th) arm necessary for such a task. None the less, I persevered and repeated the task more than a few times before I finally got everything to stick in the right place when the 2 halves were joined.

It turned out that the *tight fit* for the styrene that I was hoping for was a little too tight. I had to ream each hole out by hand using the drill bits as tiny rasps. This did the trick and allowed the styrene rods to fit sufficiently well. (Note that, by mistake, I purchased 3/32" styrene tubing instead of rods. I don't think this made any structural difference but it would complicate matters if you wished to paint the back after you were done.)

With a minimal number of the styrene rods holding the keyboard (and keys!) in place, I was able to flip the calculator over and test the connectivity and integrity of the keyboard. All keys worked acceptably except that there was very little *snap*. I have some suspicion that I may have applied too much heat to the shell in order to remove the labels. This may have compromised the snap domes somewhat (only thing I can think of).

With the keyboard integrity proven, I inserted the remainder of the styrene rods.

With the still reasonably tight fit I had created for myself, I discovered that the easiest way to get the rods through was to feed the styrene in through the back and push the whole calculator down against the table to drive the rods up through the sandwich and out the keyboard side.



I had purchased a solvent cement that worked for both the styrene and the original ABS. This was a methylene chloride based solvent and due to its low viscosity was capable of wicking down between the tightly fitted styrene rods and the holes in the back of the calculator. I bonded both the back to the styrene rods and the battery compartment heat stakes as well -- since I drilled them a little too much in the first place!

Because of the solvent's low viscosity, I did a nasty job making sure it stayed on my tiny paint brush without dripping onto the back side of the calculator. (It drips pretty easily!!) Unfortunately (or fortunately?), none of my photos does my sloppy job justice.

I next trimmed the keyboard area rods down to just above the keyboard surface, compressed the keyboard, and melted the styrene with a soldering iron.

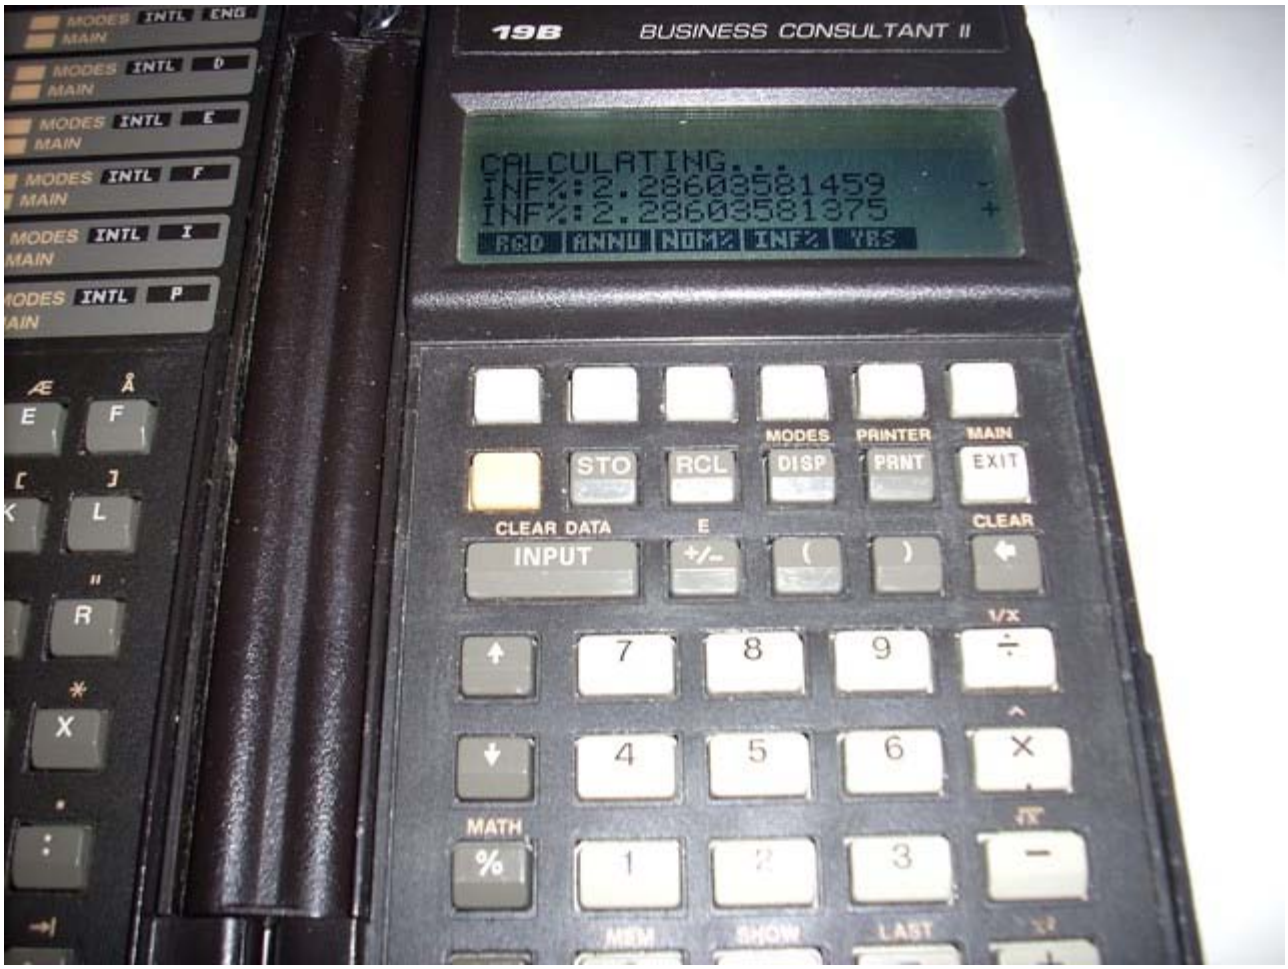
This left a final testing of the assembly, the replacement of the labels, and some work to get a suitable replacement for the battery door.

For the latter, I recalled seeing a link somewhere for a "replacement" Clamshell battery door. The following pictures show quite a reasonable, if not pretty solution to the issue.

Mine is made from an old PC expansion card bracket and is nowhere near as well made as the one depicted in the links but will do until I improve my metal bashing skills.

technical eraser
gommes tout usage

It will not win any prizes for beauty but it is now functional and ready for action once again!



What I Would Do Differently

- I would use a bit less heat to remove the labels as I think this might have softened the plastic snap domes a bit.

- I would look into cutting down the battery springs somewhat before I reassembled everything so they wouldn't impart so much force to the battery door area through the batteries.

- I would buy styrene rods instead of tubes in case I wanted to paint the back afterward.

- I might not have bought a 19B when it was a 19BII I was really looking for. Now I know the difference in the names! (D'oh! Where's the RPN?)

... "shoulders of giants" and all that!

HP 15C LE firmware and memory questions

*Message #1 Posted by **Lode** on 27 Jan 2012, 3:13 p.m.*

Hi,

I've got some questions about the HP 15C LE.

Would the HP 15C LE work exactly like a HP 12C LE (except for the labels on the buttons) if you put the firmware of the HP 12C LE on it? Or are there some internal differences?

Since it's an ARM CPU emulating a NUT CPU (afaik), which firmware can you change: only the NUT firmware, or can you change the whole firmware including the NUT emulator part, and e.g. create a firmware that just uses the ARM CPU directly to do stuff?

Does it really only have as little memory as the HP 15C had, or does it in fact have a lot more memory in it, for example to run the emulator, but it's just not accessible since the emulated HP 15C firmware isn't aware of its exixtance? Does a chip of 500 bytes of memory (or how much was it?) even exist today? How much physical memory is in there?

How large is the chance that there'll be released a bugfixed version of the HP 15C LE firmware, e.g. fixing the weird screen flashes that happen if you hold down "SST", the high battery drain when holding down a button, etc...?

Thanks a lot!

in response to message #1 by Lode

Last year one of the forum members purchased a HP-15C LE which was incorrectly loaded with HP-12C firmware at the factory although working fine (as a HP-12C). The person noticed the problem when he tried to take a square root of a number, instead he received the same number back (n button on the 12C). Here is the LINK.

in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

What a shame this person sent it back! If HP never releases the firmware, it's rare and special since nobody can create it by flashing. If HP does release the firmware for flashing some day, then it's not special anymore but then it could be flashed to the correct one and nothing of value was lost (and it could still be rare due to the firmware version).

Go to youtube and search uhmgawa. Hp voyager KINOMI and Kinomi Voyager Development may interest you.

Re: HP 15C LE firmware and memory questions

*Message #6 Posted by **Marcus von Cube, Germany** on 27 Jan 2012, 5:28 p.m.,*
in response to message #1 by Lode

HP hasn't split the firmware in separate files so you could decide which ROM image you want to run on the emulator kernel. Instead you just get an image to download to the Atmel processor that is fully integrated. In fact, HP has adapted the emulator to the ROM it emulates for various (technical) regions. One result of this approach is that an older (power consuming) bug in the keyboard handler which had already been fixed for the 12C has crept into the 15C LE firmware.

The Chip, an AT91SAM7L128, has 128KB of flash memory, 2KB of battery backed RAM and 4KB of working memory that gets lost in certain power saving situations, i. e. most of the time. This has a few implications:

- You can only emulate systems with at most 2KB or RAM. All the voyagers fall in this category.

- Flash ROM is sufficient for all needs. I've not seen an image file but I assume, they are much shorter than 128KB.

The ROM of the 15C has not been patched to support more than the original 64 registers (448 bytes). It would have been possible but the emulation isn't designed for it. Some RAM is required to save the emulated CPU state and registers but the 2KB aren't nearly exhausted.

> I really hope a bugfix version will be available some day!

Yes. This would likely mean 15C LE owners can turn a 12C+ into a 15C LE by exchanging keytops and firmware in case the LE dies. Too good to be true.

Re: HP 15C LE firmware and memory questions

Fundamentally there should be no differences as AFAIK the SoC is generic Atmel issue. But this does raise an interesting point as it is possible a board layout difference exists between the 12c+ and 15c le, where a gpio etc.. is bonded to vdd/gnd differently between the two board builds. The firmware could then verify the model specific configuraton before agreeing to operate. However while I didn't find evidence of that for the 15c le voyager, it is possible to exist on a COB sam7 only detectable from a practical perspective by crawling into the unit with diagnostic firmware to poke around a bit. However given the reported case of the 15c le mis-flashed with 12c+ firmware, I'd hazard such a contingency doesn't exist.

HP must have done something to this extent to distinguish between the 20b and 30b. If you load the 30b firmware (which is available through Tim) into a 20b it behaves exactly like a 20b without programmability.

Re: HP 15C LE firmware and memory questions

So perhaps we have a race between last buy for the obsoleted die form of the at91sam7l128 and the product life for the 30b/20b. While I fully expect HP had the wherewithal to engage Atmel contractually for a supply of the die through the product life, the lqfp package in the 15c le sort of sticks out like a sore thumb. I suppose such a supply contract could have been limited to programs in place at the time it was executed. Just wondering whether we'll see a pcb layout change to accommodate a lqfp sam7 in a 20b/30b at some point.

One question I've had which I hope someone can answer is whether the 12c+ 30th Anniversary Edition uses the lqfp package or rather the considerably less inviting COB die.

WP 34S overlays

*Message #1 Posted by **Gerson W. Barbosa** on 27 Jan 2012, 2:00 p.m.*

Here are the overlays I've received from Eric, installed on an HP-20b with an old version 2 firmware and on an HP-30B, still not reflashed. Prior to the installation, I sprayed some varnish onto the second overlay, only a thin layer to give it an extra protection. Both look nice, but perhaps the glossy finish overlay would have been a better match to the original HP-20b faceplace.

Re: WP 34S overlays

*Message #2 Posted by **Marcus von Cube, Germany** on 27 Jan 2012, 2:52 p.m.,*
in response to message #1 by Gerson W. Barbosa

Now you need to refresh both devices because neither has a matching keyboard layout. :-)

Enjoy!

My HP 15C LE has just arrived! Wow!

*Message #1 Posted by **Antonio Maschio (Italy)** on 27 Jan 2012, 6:08 a.m.*

My HP15C-LE is in my hands. All keys work perfectly, with a pleasent click (not equal to the vintage one I've got, but hey, that's it!) and it IS faster, wow!

I'm gonna use it as my everyday calculator, along with a vintage HP11C.

Long live the Voyager series!

Is it normal that the "f" and "g" keys rattle when you shake it? They all press fine.

Re: My HP 15C LE has just arrived! Wow!

*Message #7 Posted by **Paulo MO** on 27 Jan 2012, 7:47 p.m.,*
in response to message #6 by Lode

Yes. Those two keys are mounted differently from the others, and that creates the rattling (even though, depending on the moulding sequence, some calculators rattle more than others). You'll be fine. It's a great calculator.

Best

Paulo

Re: My HP 15C LE has just arrived! Wow!

*Message #8 Posted by **Brandon Poindexter** on 27 Jan 2012, 8:40 p.m.,*
in response to message #6 by Lode

Mine rattle as well.

It's a shame that they couldn't get this worked out at first, as when I use it on a solid surface, the F and G keys buzz a little as I type around. Would HP count this as a defect I were to ask for a replacement???

Re: My HP 15C LE has just arrived! Wow!

Just how fast does it eat batteries?

Frankly, I wish they would actually bring back the HP15C rather than a cheap knockoff of their own product. If I just wanted the same functionality with a lousy keypad and rapidly depleting battery, I could use my iPhone. :)

I must thank everybody who provided guides, tools and how-to's on flashing new firmware on 20B/30B.
Everything went really smooth in about 15 minutes (checking each step 3 times), without using the preferred environment: Windows 7 64bit, Prolific USB-RS232 cable, your modified MySamba program and 2344 firmware release.
I now have a new lightweight, extremely fast, easy to handle, inexpensive, replaceable scientific calculator.
I only miss the overlay that seems to be necessary to use it.

Thank you all: it's an impressive achievement!

Massimo

Vintage HP15C Key Clicks but Doesn't Register

*Message #1 Posted by **Bruce Zastera** on 27 Jan 2012, 1:07 a.m.*

Sometimes if I press the "1" key too lightly on my vintage HP15C, it clicks but doesn't register the number, but it will register it if I press a little harder. The other keys all register when they click. Anyone know of a fix other than trying to replace the keypad?

Re: Vintage HP15C Key Clicks but Doesn't Register

*Message #2 Posted by **David Griffith** on 27 Jan 2012, 1:15 a.m.,*
in response to message #1 by Bruce Zastera

Maybe there's crud underneath the key interfering with the contacts.

Re: Vintage HP15C Key Clicks but Doesn't Register

*Message #3 Posted by **Bruce Zastera** on 27 Jan 2012, 2:06 a.m.,*
in response to message #2 by David Griffith

> Quote:
>
> Maybe there's crud underneath the key interfering with the contacts.

If that's possible, that's likely the problem since I dug out massive amounts of crud with a dental pick from around the keys. From pictures I thought that the contacts were sealed. My pc board appears to be held on with a lot of heat stakes, so I guess I can't make progress without a lot of effort which could cause more problems than it would solve.

Re: Vintage HP15C Key Clicks but Doesn't Register

*Message #4 Posted by **bill platt** on 27 Jan 2012, 3:55 a.m.,*
in response to message #3 by Bruce Zastera

Search the articles forum and also this forum for stuff on cleaning keyboards. ook fr Randy Sloyer's posts. Also for Geoff Quickfall's. Sometimes you can actually soak the whole machine in water! (With batteries out).

Re: Vintage HP15C Key Clicks but Doesn't Register

*Message #5 Posted by **Bruce Zastera** on 27 Jan 2012, 3:54 a.m.,*
in response to message #1 by Bruce Zastera

I may have fixed it. I found this post by David Smith:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv010.cgi?read=26479

I put a drop of 91% isopropyl alcohol in the hole and scraped with a few strands of wire like he says. That didn't fix it, but then I used a dental pick. It took a couple of tries, but the "1" key seems to be working consistently now, at least for the time being. It still feels a bit softer with less of a click than the other keys. The "4" is a bit soft too, but not causing a problem. At one point while I was screwing around the ON key stopped working. Not sure what that was about, but it all seems OK now. Never in a million years would I have thought of this or thought that would ever work. Thanks David.

Speaking of keys, what is the status with the key problems on the LE? Will the next run have any fixes? I saw a youtube video where the f and g keys were very loose. It looked unacceptable to me, and I have one on back order.

Re: Vintage HP15C Key Clicks but Doesn't Register

*Message #6 Posted by **geoff quickfall** on 27 Jan 2012, 3:59 a.m.,*
in response to message #5 by Bruce Zastera

i was just typing the explanation when you posted. The spongy feel may vanish as the alcohol evaporates.

A better then alcohol result will occur if you purchase some DeOxit gold and introduce a tiny amount of it to the hole. Use a soft wire next time and not a dental pick as it can puncture the dome used to create the click and positive contact.

Cheers, Geoff

try with the gold first then step up the cleaning with the wires.

There are many types of DeOxit Gold, for example on www.deoxit.com. Can you be more specific about the exact product to use?

Re: Vintage HP15C Key Clicks but Doesn't Register

*Message #8 Posted by **Geoff quickfall** on 28 Jan 2012, 2:32 p.m.,*
in response to message #7 by Kees Bouw

Small tube, have to look for it. The small tube is excellent as you can trim the tip flat, place it over the hole and gently monitor the amount you introduce.

The key will feel soft depending on how much you insert but that will diassappear over time.

It is wonderful on hp 41 bouncy keys too.

Geoff

.

Here is a tube. They also have this can with a long applicator tube that I thought would be good. Which is better?

My "1" key has been working perfectly now for 2 days. I didn't even use the Deoxit yet. I stripped a solid copper wire that was the same diameter as the via hole, put 91% isopropyl in hole and on wire, inserted wire and turned it while holding key.

It makes sense to use a non-metalic brush though as that would have a better chance of sticking to and removing the debris. It might also be less likely to cause damage. Perhaps one can place lips over via and provide a suction.

I may have to repeat the process for my Enter key. It may be my imagination, but it feels harder to press now. It ocassionally doesn't register, whereas I never noticed that before. I don't know how I could have affected that key unless I used too much isopropyl and some debris floated over there.

Mine resembles pretty much the second video, but, as David already stated, it's just not annoying at all.

Re: Vintage HP15C Key Clicks but Doesn't Register

*Message #13 Posted by **Jeff O.** on 27 Jan 2012, 8:18 a.m.,*
in response to message #11 by Bruce Zastera

My two units are wobbly, but not as bad as either of the videos. I don't mind it and I am also pretty picky about such things. You originally asked "Speaking of keys, what is the status with the key problems on the LE? Will the next run have any fixes?" If you are hoping that the f- and g-key wobble will be fixed, I'm pretty sure you will be disappointed. The basic physical design of the calculator results in those two keys being more wobbly than the others. It is probably unlikely that HP will redo the basic design to eliminate this effect. As for the problems with keys not registering when pressed that were reported with the initial run of calculators received back in September, those problems seem to have been fixed in later shipments.

IME there are two common problem scenarios with the legacy voyager keypad. One being the ingress of contamination into the snap dome vent holes. Solvent soaking and/or probe scraping will probably move some of the contamination around, potentially away from the vent hole contact area and improve the situation. But I'm doubtful it actually flushes substantial contamination out of an individual snap dome land. Still if I had one or two problem keys I'd try to loosen up any contamination using a fine bristle brush twist-inserted into the via vent and then mushroomed out, add a mild solvent in the vent via, press down on the dome as the brush is worked/extracted to increase scrubbing pressure to loosen up the contamination. The vent holes are about 1.1mm in diameter.

The less welcome problem is keycap actuator wear-through of the elastomer membrane located over the snap dome array. Tactile domes are designed to be inverted by a probe in their center, sized relatively small compared to their diameter. This is required to minimize the inversion stress and maximize service life, minimize inflection force, and results in a sharper tactile snap. When the ~1.2mm probe in each keycap eventually wears through the membrane it creates a puckered bump which greatly increases the pressure area applied via the key. This is the reason addition force is required to inflect the dome and causes the "mushy" feel. Repair of this is only possible via replacement of the membrane. That's almost the good news as finding a replacement realistically means cannibalizing another voyager or attempting to create a replacement membrane. The original is ~0.45mm thick so 0.5mm sheet may work given the heat stakes are to be reset/glued under pressure. Accurate punching of holes in the elastomer blank could be accomplished via a 1/16" ID tube sharpened to a hollow cone using a drilled plate as an alignment guide.

Until it flashed off the isopropyl may have softened the contamination sufficiently allowing the dome to displace it when depressed, permitting electrical contact.

FWIW I've actually never encountered a voyager snap dome PCB land with worn gold plating. So it is difficult to predict whether it may be copper oxidation or surface contamination without further disassembly.

Whatever goes into that vent via which successfully dislodges contamination (or dissolves oxidation) needs to be removed as it is only going to hold it in suspension until it evaporates.

The starting address of RAM is 0x800000, but RAM below 0x804FFF is reserved for system use (the 41C register memory and the MMU entries). The memory from 0x805000 to 0x805FFF is the Y-functions buffer area, which can be used if you're not using the YBUILD command. The 58 pages starting at 0x806000 are available for any use.

Wrong answer when evaluating log(10^-12)

*Message #1 Posted by **Daniel Greenidge** on 26 Jan 2012, 10:53 a.m.*

Hello everyone,

I know from the power property that log(10^-12) should be -12. Wolfram-Alpha corroborates this.

However, when I evaluate this on both my HP 15C and 50g, the answer turns out to be -11. Here are the exact keystrokes I am using for my 15C:

10 EEX 12 CHS g LOG

Any ideas why this might be?

Thank you, Daniel

Re: Wrong answer when evaluating log(10^-12)

*Message #2 Posted by **Bart (UK)** on 26 Jan 2012, 11:09 a.m.,*
in response to message #1 by Daniel Greenidge

Hint:

You will get the right answer if you do:
10 ENTER 12 CHS Y^X g LOG

Regards

Edit: I should rather have said: "*expected* answer" above.

As Gerson says below, the answer you got is right too, to put it another way: EEX represents "10^" so 10 EEX x = 10 x 10^x = 10^(x+1)

Edited: 26 Jan 2012, 11:26 a.m.

Bart,

I hadn't read your post yet when I said the answer of the calculator was right. "Expected answer" appears to be a more didactic expression, I should have used it myself. By the way, my HP-15C gave a lot of "wrong answers" to me, especially in the beginning, when it was just replacing a TI-59. Oh, and more recently, just some threads below my HP-42S was refusing to give me the answers I expected :-)

Regards,

Gerson.

> 10 EEX 12 CHS g LOG

The answer is right. The input is wrong. You're actually entering $10*10^{-12}$, that is, $10^{1} * 10^{-12} = 10^{1-12} = 10^{-11}$

Enter the mantissa first, then press EEX and enter the exponent:

```
1
EEX
12
CHS
g LOG
```

When the mantissa is 1, it can be omitted.

Gerson.

Don't the version three function keys tell a different story?

Re: RedDot or no?

*Message #3 Posted by **Walter B** on 26 Jan 2012, 9:19 a.m.,*
in response to message #1 by Matthias Wehrli

To me, it looks like a version 4 with some blop next to the switch.

Re: RedDot or no?

*Message #4 Posted by **Lincoln R.** on 26 Jan 2012, 10:13 a.m.,*
in response to message #1 by Matthias Wehrli

Looks like a frankencalculator to me. Neither 1143A 00026 or 1143A 04426 (which might be a mistake since it's on the "property of" tag) seem like correct serial numbers for a version 4. I can't make out the serial number tag on the bottom of the machine in his picture.

If I had to take a guess I'd think this is a calculator that got repaired, possibly not by HP. Both of the legible serial numbers fall into the range that could be red dot models, although did the red dot calculators come from the factory with the sticker inside the battery compartment?

Maybe a lab freak calculator.

*Message #5 Posted by **Frank Boehm (Germany)** on 26 Jan 2012, 10:27 a.m.,*
in response to message #1 by Matthias Wehrli

The typed ser# stickers have been seen on repair units before, so I'd say the serial numbers look "official". However it rather seems someone built a calculator from scrap parts, who knows if there is any electronics in there. It's not impossible that this has been made in HPs own lab as a cheap office calc, the very technical

"name" on the property tag might hint at that too.

Re: RedDot or no?

*Message #6 Posted by **Michael de Estrada** on 26 Jan 2012, 10:45 a.m.,*
in response to message #1 by Matthias Wehrli

There's a 99.99999999% probability that this is not a Red Dot. However, I may walk outside today and get hit by a meteorite, so who knows.

Red Dot Disclaimer

*Message #7 Posted by **Howard Owen** on 26 Jan 2012, 11:30 a.m.,*

Some Vintage HP15Cs Faster than Others?

*Message #1 Posted by **Bruce Zastera** on 25 Jan 2012, 11:10 p.m.*

Someone mentioned that their HP15C circa 1985 took 30 seconds to compute 69 factorial. My vintage HP15C computes that almost instantaneously. I purchased mine in 1990, and going by the serial number, it was built in 1986 (first 2 digits are 26 which indicate the number of years since 1960). I'm considering purchasing one from 1983 or 1984, so if those are significantly slower, I'd really like to know that before I buy it.

I'd appreciate it if someone with an older model can tell me how fast their calculators perform the following 2 functions:

69 f x!

100 ENTER 50 g Cx,y

The second of those takes much longer than the first - about 10 seconds on mine.

Please post the first 4 digits of the serial number with any results. I'm only talking about the vintage models here. I understand that the new limited editions are much faster.

Thanks.

They may have just been mistaken. The clock frequency hasn't seen a manufacturing change and I've never come across more that one version of hp released firmware for the 15c.

~10s for x! and 0.5s for Cx,y on a 24xx and 25xx 15c.

Re: Some Vintage HP15Cs Faster than Others?

in response to message #2 by uhmgawa

> Quote:
>
> ..I've never come across more that one version of hp released firmware for the 15c.

But I have come across an apparent oddity which may relate to a firmware version change.

I had loan of a 10c for the purpose of testing KEMU with that model's firmware. When the 10c was running I would get jibberish on the display but the system test would succeed and render all available segments. It took me a while to realize the display mapping was different than every other voyager I've encountered.

This was a 22xx serial number 10c which has the early satellite PCB containing the NUT and display controller. However I have 23xx voyagers with the same satellite PCB configuration, and firmware captured from them treats the display mapping identical to the later single PCB voyagers. So I'm unsure whether the display mapping difference here is a function of the 10c, s/n <= 22xx voyagers, or possibly both.

The sequence of segments enabled during the keypad test for both cases differs although the data written to the display registers is identical. This makes for a simple check to determine what units have this configuration, just by the first set of segments enabled when the keypad ON + test is selected. The corresponding sequences are here although the first display rendered in the sequence is all which is needed. I've only ever encountered the "A" version up until the "B" version generated by this 10c.

Would someone with a 22xx serial number voyager other than a 10c mind telling me what sequence is followed? Also if someone has access to a 22xx < s/n 10c I'd be interested to know how that behaves as well.

Thanks!

Interesting find and nice display pattern map!

My collection verifies what you said:

```
10C 22xx --> b
10C 23xx --> b

11C 20xx --> a
11C 26xx --> a
12C 25xx --> a
12C 33xx --> a
15C 25xx --> a
16C 22xx --> a
16C 25xx --> a
```

Edited: 4 Feb 2012, 11:34 a.m.

> ```

Hmm.. given the above this may be a quirk unique to the 10c.

I have a 2301A 16c and several 23xxA 12c units which all possess the 'a' behaviour. I suppose the only missing data point would be a 24xx 10c, but I wouldn't expect a surprise there. AFAIK that was the last production year for the 10c.

It looks to be a layout change for unknown reasons on the display flex pcb. It is possible the R2D2 in the 10c has a modified pinout which admittedly makes little sense. The ROM image is only 4K words vs. 6K for other voyager models but I haven't tried to drive the bus to determine whether it appears the upper 2K is unused or simply not present. Nothing above 4K is accessed when the image is executing in KEMU and the self test checksum only addresses that range. The device code is 1LF7-0301 which I've never encountered before, however I'd expect an actual silicon change outside of the rom mask to be unlikely.

Unknown at this point. If I ever manage to add a 10c to my own collection I'll trace out the display pcb when I run out of things to do. ;)

Thanks!

*Message #6 Posted by **Peter Murphy (Livermore)** on 26 Jan 2012, 1:35 a.m.,*
in response to message #1 by Bruce Zastera

69! is quick.

100C50 takes 11.3 s on my 24xxA and 11.6 s on my 27xxA.

Re: Some Vintage HP15Cs Faster than Others?

*Message #7 Posted by **Gerson W. Barbosa** on 26 Jan 2012, 1:55 a.m.,*
in response to message #1 by Bruce Zastera

> Quote:

> Please post the first 4 digits of the serial number with any results.

This is irrelevant. Any differences you may notice are due to modifications done by some users, they are not related to the serial numbers. Please take a look at the following past threads:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=77430

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=157905 (professionally done mod)

Regards,

Gerson.

Since you've asked:

69 f x! -> about 0.8 seconds

100 ENTER 50 g Cx,y -> 11.4 seconds

69.5 CHS f x! -> 13.5 seconds.

I think we can safely assume that no 15C ever (and no other HP I can think of) would require half a minute to compute 69!. Even on my 34C (about the same speed, maybe a bit slower) this is done within a second. Half a minute might be okay for a user-written program. Maybe this is what the timing refers to.

> Quote:
>
> My vintage HP15C computes that almost instantaneously.

So should any other standard 15C.

> Quote:

These are two typical results.

Anyway, I wonder why the 15C took that long for the Cx,y function which is essentially a loop with 50 multiplications and divisions. The current 35s does this within a second, and even a hand-written program in user code does it in just 5 seconds. Yes, the 35s is much faster faster than the 15C (ten, maybe twenty times), but shouldn't a 15C-routine in machine code run at least as fast as a 35s-program in user code?!

Dieter

Dieter are you sure the 15C uses multiplications for Cxy? Another approach could be using lnGamma.

Re: Some Vintage HP15Cs Faster than Others?

*Message #10 Posted by **Dieter** on 26 Jan 2012, 3:36 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Of course I'm not sure of *anything* as far as the internal programming of the 15C is concerned. But I don't think that a lngamma approach is used here. First, because in this case that function probably would have been made available to the user. And second, simply think of the time three lngammas would require here... #-)

Dieter

The x! key appears to return gamma(x+1). For example, -0.5! returns gamma(0.5) = sqrt(pi).

Yes, this is documented in the manual, and it was already available on the good old 34C from 1979.

However, obviously two different algorithms are used for the factorial and the gamma function. Try 10! and the result appears immediately, as with other non-negative integers. Then try 10.001! and the calculator has to switch to "gamma mode" where the result requires a few seconds of computation time.

I'm guessing that it takes precautions against overflow such as adding logs. Something like that is required for larger combinatorics.

Re: Some Vintage HP15Cs Faster than Others?

*Message #14 Posted by **Dieter** on 26 Jan 2012, 3:34 p.m.,*
in response to message #13 by Bruce Zastera

I don't think that the 15C uses logs for the C(y,x) function. The usual straightforward implementation of this function will not cause an overflow either - at long as the result doesn't overflow as well.

Example for C(400, 108) = 9,432 E+99:

```
C(400, 108)  =  400 / 108 * 399 / 107 * 398 / 106 * ... * 294 / 2 * 293 / 1
```

Before the last multiplication the value is less than the final result, which is then obtained by the multiplication with 293. In other words: there is no "intermediate overflow". As long as the result is within the limits, the algorithm will not cause an overflow either. At least that's what it looks to me. ;-)

Dieter

You're right, I was thinking of evaluating the binomial distribution, where the C(y,x) terms can overflow even though the binomial terms do not since the large C(y,x) terms get multiplied by very small values. Excel had a problem with this a few years ago, and they implemented an algorithm to fix it. That can also be fixed by summing logs. Of course the HP15C doesn't have a key for the binomial distribution.

Re: Some Vintage HP15Cs Faster than Others?

*Message #16 Posted by **Dieter** on 26 Jan 2012, 5:36 p.m.,*
in response to message #15 by Bruce Zastera

Regarding statistical functions I don't think Excel *has* problems. For me it looks more like Excel *is* the problem. ;-)

Just as C(y,x), also the binomial pdf can be evaluated with minimal overflow risk. For instance this way (just the basic idea):

```
function binpdf(x, n, p)
  q = 1-p
  poverq = p/q
  pdf = q^n
  for k = 1 to x
      pdf = pdf * (n - k + 1) / k * poverq
  next k
  binpdf = pdf
end function
```

The major risk here is an underflow during the calculation of q^n. ;-)

Dieter

HP 17BII bug video on youtube

*Message #1 Posted by **hpnut** on 25 Jan 2012, 9:39 a.m.*

nice, with scary soundtrack at 00:38.

http://www.youtube.com/watch?v=hOBCpp4t6cg&feature=related

Re: HP 17BII bug video on youtube

*Message #2 Posted by **Juergen Keller** on 25 Jan 2012, 10:02 a.m.,*
in response to message #1 by hpnut

Thank you for the praise :-)

Re: HP 17BII bug video on youtube

*Message #3 Posted by **Gerson W. Barbosa** on 25 Jan 2012, 3:22 p.m.,*
in response to message #2 by Juergen Keller

I'm glad you haven't produced an HP-35S bugs video. The soundtrack would be frightening!

Re: HP 17BII bug video on youtube

*Message #4 Posted by **Juergen Keller** on 25 Jan 2012, 5:23 p.m.,*
in response to message #3 by Gerson W. Barbosa

Don't worry, I don't have that much spare time ;-) BTW, this 17BII bug was fixed by HP in later models, but I've never heard of fixes for the 35S ...

Re: HP 17BII bug video on youtube

*Message #5 Posted by **Nacho** on 25 Jan 2012, 10:58 a.m.,*
in response to message #1 by hpnut

I don't have that bug,

mine is a singapore from 1994 with rom : BA 0

yours?

regards

Re: HP 17BII bug video on youtube

*Message #6 Posted by **Juergen Keller** on 25 Jan 2012, 11:28 a.m.,*
in response to message #5 by Nacho

Only early 17BII calculators have this bug. I remember that I've read somewhere that the bug was fixed in early 1991.

If you use the "Link" function below the text entry box, you can very quickly and easily create a link to the URL that can be called up simply by clicking the text. For example: Link to Your URL .

HP67 Emulator for Android

*Message #1 Posted by **MikeO** on 25 Jan 2012, 2:27 a.m.*

Well, I finally got to publishing this application on the Android market. I decided to do it as a free application. It is a port of the Windows desktop versions which I developed a couple years ago on Limpidfox.com

I just published it, so it may not show up on searches of the market for a day or two. Olivier De Smet has published one. So, hopefully there will be two soon.

Let me know what you think.

The program files are compatible with the desktop versions - just copy them to/from the "HP Programs" directory on your phone's external storage (which is created when you install the application). For more information on the desktop versions, see the website I linked above.

I have tested these on the HTC Evo (hdpi 533x320) and HTC Rezound (xhdpi 720p 640x360). Requires a touchscreen.

Have fun!

P.S. If you should have other devices approximating the above screen specs, please let me know how it looks/works.

Edited: 25 Jan 2012, 9:56 a.m. after one or more responses were posted

Re: HP67 Emulator for Android

*Message #2 Posted by **Didier Lachieze** on 25 Jan 2012, 2:42 a.m.,*
in response to message #1 by MikeO

It's on the Market, but it says it's incompatible with my Moto Defy (Android 2.2 - 854x480):

Requires Android: 2.3.7 and up

:(

Edited: 25 Jan 2012, 2:43 a.m.

Re: HP67 Emulator for Android

*Message #3 Posted by **MikeO** on 25 Jan 2012, 9:50 a.m.,*
in response to message #2 by Didier Lachieze

Yes. Unfortunately, the ability to work with high density screens is in the 2.3 Android SDK. What I may do is post the 2.2 version on the website - which I need to update anyway.

Re: HP67 Emulator for Android

*Message #4 Posted by **Alexander Oestert** on 25 Jan 2012, 5:10 a.m.,*

in response to message #1 by MikeO

Does not work on my ipad-sized tablet (1280x800, Honeycomb), only a small area up left reacts to tapping, display is also small and in the upper left corner, whole rest of screen is filled with unsharp image of the calc, unresponsive.

Edited: 25 Jan 2012, 5:14 a.m.

Re: HP67 Emulator for Android

But then it would be a good opportunity to have both - the 67 when in portrait mode and the 97, with printing capability of course, when in landscape mode. :-)

in response to message #1 by MikeO

Looks nice, but the touch-fields don't line up correctly with the calculator-image (image is about a key height too high, so you have to touch the spaces between the rows). On Galaxy Nexus.

in response to message #8 by Ingo Paschke

Looks and works nice on my Galaxy Note @1280*800 but I have the same keys misalignement problem as reported by Ingo.
Anyway, thanks a lot!
Massimo

Re: HP67 Emulator for Android

*Message #10 Posted by **Jeroen Van Nieuwenhove** on 25 Jan 2012, 9:25 a.m.,*
in response to message #8 by Ingo Paschke

Same issue on my Acer Liquid Mini (320x480). On my petite screen and even taking into account the offset, it is very difficult to select the correct keys. I don't have these problems at all with e.g. Thomas Okken's Free42, although the 42 emulation has one row of keys less. Even Droid48, which has more keys, is relatively easy to use. Could it be that the touch sensitive area for each individual key is too narrow? Also, I would make the haptic feedback optional. Otherwise, good looking app, thanks for this port to Android.

Re: HP67 Emulator for Android

*Message #11 Posted by **MikeO** on 25 Jan 2012, 9:53 a.m.,*
in response to message #8 by Ingo Paschke

Got it. Thanks!

I can't seem to find it :(. What are you guys searching on?

Thanks,

-Marwan

Re: HP67 Emulator for Android

*Message #13 Posted by **Steve Simpkin** on 25 Jan 2012, 11:52 a.m.,*
in response to message #12 by M. Joury

If you are not running Android version 2.3 (Gingerbread) or newer, you may not see this App in the Market. I have an original Motorola Droid running Android 2.2 (Froyo) and I cannot find the App either. I

am hoping Mike will be able post a 2.2 compatible version on his website.

Re: HP67 Emulator for Android

*Message #14 Posted by **M. Joury** on 25 Jan 2012, 1:14 p.m.,*
in response to message #13 by Steve Simpkin

I am running 2.3.5 but I see that it requires .7. Thanks!

-Marwan

Re: HP67 Emulator for Android

*Message #15 Posted by **MikeO** on 25 Jan 2012, 1:20 p.m.,*
in response to message #14 by M. Joury

I think it will work with 2.3.x

Re: HP67 Emulator for Android

*Message #16 Posted by **M. Joury** on 25 Jan 2012, 3:41 p.m.,*
in response to message #15 by MikeO

Hmmmmm..... Still can't find it.....

Re: HP67 Emulator for Android

*Message #17 Posted by **M. Joury** on 25 Jan 2012, 9:19 p.m.,*
in response to message #15 by MikeO

Hi Mike,

Ok, it seems that the problem is indeed a compatibility issue. I found the app on my laptop and then used the browser on the Android device to find the app and tried to install it that way. Problem was that it immediately told me that my device was not compatible. As far as I can tell the inky issue might be the 2.3.5 vs. the specified 2.3.7. I can't find any way to force the device to allow installation to see if it works. If you believe that it will work on any 2.3.x device could you lower the requirement to 2.3.0 or whatever the lowest level of 2.3 is? I can then try to download and test it.

Thanks,

-Marwan

Re: HP67 Emulator for Android

*Message #18 Posted by **MikeO** on 26 Jan 2012, 1:34 p.m.,*
in response to message #17 by M. Joury

I'll definitely check it out. The market filter may need tweaking.

Looks pretty good on Samsung Galaxy I9000 (800x480 Android 2.3..) but the keys are hard to hit as Jeroen also has reported.

Looks awful on Acer Iconia 500 (1280x800 Android 3.2.1), but it works!! :-)

When this tablet loads an app with low resolution, it offers the choice to "stretch" or to "zoom". Selecting "stretch" has the effect which Alexander describes. Selecting "zoom" makes it workable. The keys are only slightly misaligned: top row 1/3 down, bottom row 2/3 down. Horizontal alignment is almost perfect.

HTH Günter

> Looks awful on Acer Iconia 500 (1280x800 Android 3.2.1), but it works!! :-)

I think it need a higher resolution image, then would be fine. And thanks for the tip on using Zoom instead of stretch. Still needs a little work on the key alignment, but is usable as is.

Image looks good on my Droid X phone. But the key allignment makes it unusable.

Bill

*Message #22 Posted by **MikeO** on 26 Jan 2012, 1:35 p.m.,*
in response to message #21 by Bill (Smithville, NJ)

With the great feedback on various devices, I'll be working out the key alignment shortly.

Re: HP67 Emulator for Android

*Message #23 Posted by **MikeO** on 28 Jan 2012, 1:34 a.m.,*
in response to message #22 by MikeO

I've posted version 1.1. You can find it by searching the market for 'hp67'. I've added code which dynamically scale the button areas based on the screen density and size.

Not sure how the tablets will handle it - I think much better now - but I may need to produce some higher resolution graphics for those. In the meantime, checkout the tip from Bill regarding the 'zoom' option when running the app on tablets.

Re: HP67 Emulator for Android

*Message #24 Posted by **Ingo Paschke** on 28 Jan 2012, 7:06 a.m.,*
in response to message #23 by MikeO

It's perfect now on my Galaxy Nexus. Even though it looks a bit pixelated in my screenshot above, it looks beautiful on the actual display. Thank you!

Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #1 Posted by **Diego Diaz** on 24 Jan 2012, 11:51 p.m.*

Hi all,

A new .ZIP archive including several updates is now available at Clonix home page.

Update record:

- NoVRAM & NoV-32 modules are now fully compatible with 41CL and both include the Crash Recovery Function (CRF) inherited from NoV-64. See NoV-64 manual for details on this function.

- Minor changes to NoV-64 manual.

- RAM erasing utilities for NoV's (CLR_RAMn) have been upgraded in order to prevent erratic behavior due to low battery. Now they run faster and more reliabily even with low battery voltages including USB power cable (5v.) as described in this post.

Thanks to Ángel for his patience and helpful test and comments while investigating for this upgrade.

- Patched HEPAX image (fourth bank) to prevent it from switching OFF the HP-41CL when executing DISASM command. This patch is automatically included in NoVRAM, NoV-32 and NoV-64 when configured with ClonixConfig.exe utility, and does not affect DISASM command execution on standard 41's (C/CV/CX)

Thanks to Monte for the patch.

All the best from Dominican Republic.

Diego.

Edited: 24 Jan 2012, 11:58 p.m.

Re: Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 25 Jan 2012, 12:37 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

Thank you very much for this update. Both Clonix-D and NoV-64 are great additions and indispensable tools to my beloved 41CL and HP-41 to unlock their potential and learn so much more. Very much appreciated.

Happy New Lunar Year!

Cheers, Kerem

Edited: 25 Jan 2012, 12:38 a.m.

*Message #3 Posted by **Diego Diaz** on 25 Jan 2012, 6:38 a.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

Thank you Kerem,

It's also great to have such positive feedbacks... ;-)

Enjoy your 41 system.

Cheers.

Diego

Re: Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #4 Posted by **Massimo Gnerucci (Italy)** on 25 Jan 2012, 7:24 a.m.,*
in response to message #1 by Diego Diaz

Thank you very much Diego for the, usual, excellent "service" you provide.

Greetings,
Massimo

Re: Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #5 Posted by **Frido Bohn** on 25 Jan 2012, 8:40 a.m.,*
in response to message #1 by Diego Diaz

Diego,
¡Muchas gracias por tus esfuerzos!

Frido

Re: Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #6 Posted by **Diego Diaz** on 26 Jan 2012, 12:38 a.m.,*
in response to message #5 by Frido Bohn

Thanks for your kind words (also in Spanish: Gracias por vuestros amables comentarios... ;-)

My pleasure.

Cheers

Re: Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #7 Posted by **Ángel Martin** on 25 Jan 2012, 4:22 p.m.,*
in response to message #1 by Diego Diaz

It´s even better than Diego makes it sound: the page4 library worls like a charm, so no need to have a CL or MLDL to get into the cutting-edge 41C MCODE, state of the art!

Best, ÁM

Re: Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #8 Posted by **Geir Isene** on 25 Jan 2012, 5:12 p.m.,*
in response to message #7 by Ángel Martin

So, no conflict between the #4 Lib and the NoV modules use of address h4100?

Re: Latest update for Clonix & NoV's modules (includes DISASM patch for 41CL)

*Message #9 Posted by **Diego Diaz** on 26 Jan 2012, 12:35 a.m.,*
in response to message #8 by Geir Isene

Certainly not Geir... :-)

Ángel was so kind to allow a "NoV-gap" in the H'41xx address range so no conflict will arise.

Best from the Caribbean Sea.

Diego.

go67c loss of data

*Message #1 Posted by **Vincent Weber** on 24 Jan 2012, 2:03 p.m.*

Hi Olivier,

It seems that sometimes go67c just looses its state - the current card with all its lables is gone... it cannot reproduce on demand, but it seems that the problem happens sometimes after lauching go34c and then switching to go67c. Do you have an idea ?

Thanks and cheers,

Vincent

Re: go67c loss of data

*Message #2 Posted by **Olivier De Smet** on 24 Jan 2012, 4:37 p.m.,*
in response to message #1 by Vincent Weber

Hi,

It's actually normal, only the card (and the pack) is gone, normally, the memory of the calc is restored and the pack was saved.

If you reopen the pack, the card is ok and was saved with the last data written to it.

It's due to the fact that android never tell you when you app will be killed for real. You know when you loose the focus (then i can save calc state and pack if needed) but that's basically all.

Android choosing to kill go67c after launching go34c is a coincidence :) it's just means that there were not enough free mem and the system choose to kill go67c.

So the next launch was a complete reload (and I choose not to save the inserted card and the currently opened pack). If it wasn't killed this will be just a re start with all the state still in mem so with the pack and card loaded

With a real 67 you loose all :(this one keep memory but close your packs, that's all :)

Perhaps I will change that ...

Olivier

Re: go67c loss of data

*Message #3 Posted by **Vincent Weber** on 24 Jan 2012, 4:46 p.m.,*
in response to message #2 by Olivier De Smet

thanks.! i tried "save as" for the first time... and the app crashed !! any clue ?

Re: go67c loss of data

*Message #4 Posted by **Olivier De Smet** on 25 Jan 2012, 5:36 a.m.,*
in response to message #3 by Vincent Weber

You were right, there was a bug in the save/load state behavior. Corrected in 1.0.3, should now save/reload full state (card pack and slot-card)

Olivier

Re: go67c loss of data

*Message #5 Posted by **Vincent Weber** on 25 Jan 2012, 6:22 a.m.,*
in response to message #4 by Olivier De Smet

Thanks Olivier ! seems to work fine now. Btw, a few issues with go41cx:

-Is the R/S key on long touch for some cases ? if you try CAT 2, then R/S to interrupt, it only interrupts if the press on the R/S key is long...

-if you use SHIFT + ON to start the clock, the seconds starts to move only after waiting for a while...

-when you launch the app it displays a lot of messages about the modules loaded, a bit ennoying.

-I put the Advantage, the CCD modified, the Sandmath-II and the 41Z modules in. A bit strange is that the menu structure has change, it is not port 1 2 3 4 in order, but the "Settings entry" is in the middle (between port 1 and 2). Is it normal ?

Thanks and cheers,

Vincent

Re: go67c loss of data

*Message #6 Posted by **Olivier De Smet** on 25 Jan 2012, 7:28 a.m.,*
in response to message #5 by Vincent Weber

- For the R/S key, yes you have to maintain it to register it, it's not a long touch, it's like that ... even to stop a program, sometime you have to maintain it (perhaps a bug in the key scanner)

- shit-on is difficult, it start a 0.01 sec alarm to initiate the display, then a 1 sec to make it change. timer code need more polishing I know.

- clock display blink, yes it's a bug : on a real HP, when you shut off the lcd it's not immediate, there is a fade out delay. Not in the emulation, off is off too fast.

- same for clock: after a master clear, to really start the clock, use 'TIME' function, you will see that it start at that moment.

- the messages can be suppressed, no problem with a settings later.

- the layout of the menu is done by android, if the names are a bit long, it rearrange automatically the display ...

HP-35 powers with negative numbers

*Message #1 Posted by **Dan Lewis** on 23 Jan 2012, 9:51 p.m.*

Hi everyone,

I was browsing the internet today, wondering why more of my fellow electrical engineering students won't learn RPN and stop using their TI-89s, when I came across a discussion comparing the TI-89 to the HP-50G. In the discussion, someone said that their little brother typed

-2^4 {which is actually -(2^4)}

into his TI-84 and got -16. This is right. If we type

(-2)^4,

the machine returns 16, also right.

The difference is obviously the parentheses.

WHAT DOES THIS ALL MEAN???

All I have to do with an RPN machine is 2 CHS ENTER 4 Y^X.

SO, I pulled out my trusty HP-35 and tried it!

I pressed:

4 ENTER 2 CHS X^Y (That should do -2^4 = -16 right?)

BUT, to my surprise, the display flashed a big fat ZERO at me!

Why is this? Why does the HP-35 refuse to take a negative number to a power?

I can understand if the power were fractional, such as (-2)^(1/2), resulting in the square root of negative 2.

But the calculator won't do ANY negative number to ANY positive or negative power!

(My 50G can do this just fine.)

Re: HP-35 powers with negative numbers

*Message #2 Posted by **Marcus von Cube, Germany** on 24 Jan 2012, 11:43 a.m.,*
in response to message #1 by Dan Lewis

I looks like it always uses logs and exponentials to compute powers and doesn't perform a check for integer exponents. My 30b and the 15C LE both handle the integer case correctly.

Re: HP-35 powers with negative numbers

*Message #3 Posted by **Katie Wasserman** on 24 Jan 2012, 11:47 a.m.,*
in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> My 30b and the 15C LE both handle the integer case correctly.

Re: HP-35 powers with negative numbers

*Message #4 Posted by **Marcus von Cube, Germany** on 24 Jan 2012, 12:35 p.m.,*
in response to message #3 by Katie Wasserman

Katie, that's a good one. ;-)

For those without access to a 30b: The result is a negative zero.

Re: HP-35 powers with negative numbers

*Message #5 Posted by **Katie Wasserman** on 24 Jan 2012, 7:00 p.m.,*
in response to message #4 by Marcus von Cube, Germany

That's not just a display of a negative zero, it's a whole new kind of number, one that does not equal zero.

Re: HP-35 powers with negative numbers

*Message #6 Posted by **Marcus von Cube, Germany** on 25 Jan 2012, 11:45 a.m.,*
in response to message #5 by Katie Wasserman

From what I have tested it's 0, at least if used in any simple arithmetic (*, +). If you have two of these in x and y then ?= returns 1. If you have -0 in y and 0 in x then ?< returns 1.

This looks like a negative zero to me.

Re: HP-35 powers with negative numbers

*Message #7 Posted by **Katie Wasserman** on 25 Jan 2012, 6:15 p.m.,*
in response to message #6 by Marcus von Cube, Germany

If you have -0 in x and 0 in y ?= will return 0. So it's not zero, it's less than zero yet it will work exactly like 0 if used in arithmetic. A pretty strange number if you ask me.

Re: HP-35 powers with negative numbers

*Message #8 Posted by **Marcus von Cube, Germany** on 25 Jan 2012, 9:24 p.m.,*
in response to message #7 by Katie Wasserman

Is -0==0 ? I doubt it.

Re: HP-35 powers with negative numbers

*Message #9 Posted by **Katie Wasserman** on 26 Jan 2012, 7:19 a.m.,*

in response to message #8 by Marcus von Cube, Germany

No -0 does not equal 0, maybe I just said that badly.

Re: HP-35 powers with negative numbers

*Message #10 Posted by **Paul Dale** on 26 Jan 2012, 7:30 a.m.,*
in response to message #8 by Marcus von Cube, Germany

-0==0 is true on the 34S. In both integer and real modes.

Same thing with the HP-71B:

```
> +0=-0

      1
```

However, some functions do treat them differently even though they test equal so -0 it's not just for show.

Best regards from V.

Re: HP-35 powers with negative numbers

*Message #12 Posted by **Dale Reed** on 26 Jan 2012, 2:24 p.m.,*
in response to message #8 by Marcus von Cube, Germany

All of this is specified in IEEE-754 (for binary float) and IEEE-854 (later, for binary and decimal float and others).

[As an aside, note that calculators generally use decimal floating point math, so that 0.1 is an exact number. PCs and other systems (using a C math library, etc.) often use binary floating point math, where the mantissa is binary and the exponent is a power of 2. In these systems, 0.1 decimal is a repeating binary fraction that cannot represent 0.1 exactly, so 0.1 * 10.0 results in a number slightly less than 1.0 (0.9999998 for example).]

I have a fair amount of experience with binary float --- less so with decimal. But I think what follows still applies...

In single precision binary float, +0 is the bit pattern: 0_00000000_00000000000000000000000 (sign, exponent, mantissa all zero bits) and -0 is the bit pattern: 1_00000000_00000000000000000000000 (negative sign, but exponent and mantissa still all zero).

IEEE says that -0 and +0 must compare equal, but many systems take the shortcut of comparing the underlying bit patterns and will result in 'not equal'. (These systems generally are coded to NEVER generate -0, sort of as a "workaround" -- so you'll never have to compare a -0 -- but a -0 received over a comm link will mess them up.)

IEEE 754 also has bit patterns for +/-Infinity, Indefinite, and both "signaling" and "quiet" NaNs (Not a Number). If a variable "x" has NaN (any) for a value, IEEE says x==x should compare FALSE (a NaN never compares equal to anything), but in a system which only compares the underlying bit patterns, x==x will compare TRUE, even if x is NaN.

So is -0==0? Not if the float library was written for speed at the expense of compliance with standards.

*Message #14 Posted by **Sid Cave** on 24 Jan 2012, 6:59 p.m.,*
in response to message #3 by Katie Wasserman

Being an incurable Smart Alec, I took Katie Wasserman's -55555 ^ -55555 as a challenge. I evaluated it to an exact proper fraction:

-1/12436709…248046875

Which turns out to be around four printed pages long. If anyone wants to see the entire number it is at:

http://home.earthlink.net/~zcave/longnum.txt

Of course I calculated it by hand. Well -- not really. I used Python which has unlimited precision integers. This works out because I could rearrange it like this: -55555 ^ -55555 becomes -1/(55555^55555).

If you want to try it yourself, run the following in your favorite terminal application, assuming you have Python installed. Any UNIX or UNIX like operating systems such as Mac OS X or Linux should already have it. If you are running Windows, first, my condolences. Second, you can install it for free. (http://www.python.org/)

python -c "print '-1/%d' % 55555**55555" > longnum.txt

This could also be calculated using "bc", since it too has unlimited precision integers.

in response to message #1 by Dan Lewis

The 35 was really simple and had limited ROM space so they coded x^y as exp(y * ln(x)). Thus if x is zero or negative the ln function will result in the flashing zero -- the error indicator. This is true for many of the early scientific calculators.

Re: HP-35 powers with negative numbers

*Message #21 Posted by **Valentin Albillo** on 24 Jan 2012, 12:45 p.m.,*
in response to message #20 by Katie Wasserman

> Quote:
>

The venerable ZX Spectrum of lore did even worse, as it computed Sqrt(x) as x^0.5, which in turn was computed as exp(0.5*ln(x)), thus needing two transcendental functions (and one multiplication), which made the square root function one of the slowest mathematical operations available while with a proper implementation it would be about as fast as a simple division.

If I remember correctly, the ROM code simply pushed x and 0.5 to the math stack and then either fell straight into the x^y routine or made an expression-evaluator call to it. I've got the commented ROM

listing somewhere so I'll eventually check it up.

Best regards from V.

Thank you Katie, that's just what I wanted to know.

I figured it had to be an algorithm/coding type issue, as that is the area of the calculator I know the least about!

Thanks to everyone who participated in this discussion, you have justified the three hours I spent talking to myself saying,

"WHY WON'T IT DO THAT?!"

-Dan Lewis

*Message #23 Posted by **Michael de Estrada** on 24 Jan 2012, 11:45 a.m.,*
in response to message #1 by Dan Lewis

Actually, this is a problem for all the HP Classics as well as some of the Woodstocks (HP 21 and HP 25). In fact, the HP 55 returns 4 as the result, instead of 16. By the time the Spices were introduced, the problem had been solved, and all later calculators work properly with negative numbers raised to a power.

Edited: 24 Jan 2012, 11:45 a.m.

*Message #24 Posted by **hugh steers** on 24 Jan 2012, 12:53 p.m.,*
in response to message #23 by Michael de Estrada

modern calculators should also handle certain rational power cases.

for example (-32)^(3/5) = -8

there are, of course, the complex answers which are also correct mathematically, but i always like to see the real result given if it exists - especially on calculators without complex numbers!

the above example should also work as (-32)^0.6 = -8

Re: HP-35 powers with negative numbers

*Message #25 Posted by **Nick_S** on 25 Jan 2012, 2:10 a.m.,*

in response to message #24 by hugh steers

>
> there are, of course, the complex answers which are also correct mathematically, but i always like to see the real result given if it exists - especially on calculators without complex numbers!

The HP15c LE returns an Error 0 for the 32 CHS [enter] 3 5 / y^x calculation in real mode so I tried it using Wolfram Alpha with the input: (-32)^(3/5) real

"Input interpretation: is (-32)^(3/5) a real number?

Result: (-32)^(3/5) is not a real number

Decimal approximation(split over 3 lines): -
2.472135954999579392818347337462552470881236719223051448 5...

+

7.608452130361228576931514667035057147245589073006001779 5... i "

which is the same to 8 dp as the HP15c gives in complex mode.

Nick

Re: HP-35 powers with negative numbers

*Message #26 Posted by **hugh steers** on 25 Jan 2012, 9:03 a.m.,*
in response to message #25 by Nick_S

unfortunately Alpha is not completely correct in saying "Result: (-32)^(3/5) is not a real number". There are, of course, 5 solutions to this calculation, four complex ones and one real one. calculators giving complex answers are just as correct mathematically, but it's nice to give a real output answer to a real input question, whenever it exists.

```
(-32)^(3/5) = ((-32)^3)^(1/5) = (-32768)^(1/5)
```

so, all 5 fifth roots are correct answers. ie the solutions to x^5 + 32768 = 0

However, since complex roots appear in conjugate pairs, there must be one real solution.

namely,

```
(-32)^(3/5) = ((-32)^(1/5))^3 = (-2)^3 = -8
```

Re: HP-35 powers with negative numbers

*Message #27 Posted by **Nick_S** on 26 Jan 2012, 2:41 a.m.,*
in response to message #26 by hugh steers

Thanks, if I feed Alpha the expression x^5 + 32768 directly as input then it does indeed produce

all five roots:

Real root:

x = -8

Complex roots:

x = 8 (-1)^(1/5) ~~ 6.47214 + 4.70228 i

x = -8 (-1)^(2/5) ~~ -2.47214 - 7.60845 i

x = 8 (-1)^(3/5) ~~ -2.47214 + 7.60845 i

x = -8 (-1)^(4/5) ~~ 6.47214 - 4.70228 i

together with a nice star plot of the roots in the complex plane.

in response to message #1 by Mike (Stgt)

Hello again,

here is the photo (a bit difficult to take, because the label is nothing but "raised white plastic on white plastic background")

Full size is here: http://www.bombie.de/tmp/IMG12553_5_6_tonemapped_fullsize.jpg

I have two of the three variants of the M27 and both have identical backs. Still missing the one without the

"CE" key...

Ciao,max

Re: OT: looking for pic of an ARISTO M27's backside

*Message #5 Posted by **Mike (Stgt)** on 25 Jan 2012, 11:36 a.m.,*
in response to message #4 by Maximilian Hohmann

Hallo Max!

Thank you very much for this excellent picture, it is realy perfect. Now my question: do you mind if I use it as "help" for a 4-banger I programmed with Delphi? My son has programming lessons at school and I assisted him a bit in the 'build a four function calculator' exercise. Looking for a fewest keys model I found the Aristo M27 ideal, in addition it has a good coloring and shaping. Like other calculator programs it has moving keys, error beep depending on the kind of error, keys with clicksound, changing cursor, and PC-keybord mapping. To simplify things it lacks calculating with constants and the display is made with fonts instead of pictures of the LED digits. But the backside picture as help screen would be nice because meanwhile I discovered that I accidentally used as faceplate the first calculator made in old Germany.

So I hope your answer will by yes.

Ciao.....Mike

Re: OT: looking for pic of an ARISTO M27's backside

*Message #6 Posted by **Maximilian Hohmann** on 25 Jan 2012, 3:56 p.m.,*
in response to message #5 by Mike (Stgt)

Hello Mike,

> Quote:
>
> So I hope your answer will by yes.

Of course it is, since I took the photo for you (and your son) :-) I hope he enjoys the programming excercise as much as I did mine back then!

BTW: The Aristo M27 is one of the three calculators that I will keep if one day someone or something forces me to give my collection away (together with an Hp-25 and my faithful companion when I really needed a caculator: the Ti59).

Ciao, Max

Re: OT: looking for pic of an ARISTO M27's backside

*Message #7 Posted by **Mike (Stgt)** on 26 Jan 2012, 8:26 a.m.,*
in response to message #6 by Maximilian Hohmann

Thank you very much for your permission! Of cause I will mention you as source of the original photo. I try to augment the contrast, may be I colorize it.

But - is the protokoll for substraction realy correct? To calculate 20-25 press C, 2, 0, +=, 2, 5, -. I assume there is a typo where += and - should be exchanged. As lucky owner of an ARISTO M27, could you please check this.

My son knows the emulators from Christoph Gießelink and as such he had the idea to use a nice faceplate/skin instead of a simple mask for this simple calculator exercise. Alas, because he lives not with me I could not show him my way unfamiliar with Delphi to get a result which was of much more importance - at least for me - than the result on its own.

I try to publish the result next month.

Ciao.....Mike

Re: OT: looking for pic of an ARISTO M27's backside

*Message #8 Posted by **Maximilian Hohmann** on 26 Jan 2012, 11:48 a.m.,*
in response to message #7 by Mike (Stgt)

Hello!

> Quote:
>
> Of cause I will mention you as source of the original photo.

That's really not necessary!

> Quote:
>
> But - is the protokoll for substraction realy correct? To calculate 20-25 press C, 2, 0, +=, 2, 5, -. I assume there is a typo where += and - should be exchanged. As lucky owner of an ARISTO M27, could you please check this.

It really works that way, I just checked to be 100% certain. But this kind of entry logic is not unique to that calculator. Quite a few other calculators of that era work the same way.

And regarding the "lucky ownwer": Yes for sure! What I really can't understand is that mass-produced memory modules for HP-41s from the late 80ies are sold for more than 100 Euros on eBay while you still can find absolute rarities like the Aristo M27 for less than 50 (I think I paid around 30 for each of mine).

Emulators on iPod touch

*Message #1 Posted by **Mike (Stgt)** on 24 Jan 2012, 7:32 a.m.*

I assume all calc emus written for the iPhone will work on the iPod touch too.

i) which app is recomended for the HP41, which one for the other HP calcs?

ii) are there emulators for this platform with CAS (HP or others)?

iii) are there serious reasons *not* to buy an iPod touch to 'play' with those emulators (or simulators if you prefere)?

Ciao.....Mike

Re: Emulators on iPod touch

*Message #2 Posted by **Maximilian Hohmann** on 24 Jan 2012, 8:01 a.m.,*
in response to message #1 by Mike (Stgt)

> Quote:
>
> iii) are there serious reasons *not* to buy an iPod touch to 'play' with those emulators (or simulators if you prefere)?

One serious reason comes to my mind instantly: The iPad! Depending of course what else you want/need to do with it. I have mine since four weeks or so and must say, that no other electronic device/gadget/toy has fascinated me that much ever. All calculators included...

I have tried a few HP emulators on the iPad (only free ones so far like an HP70 and several Hp48 models), but prefer the actual hardware calculators by far. The functions are there, but the look, feel and smell is missing. On the iPad, I rather use calculators specifically made for that device.

Regards max

Re: Emulators on iPod touch

*Message #3 Posted by **Mike (Stgt)** on 24 Jan 2012, 8:59 a.m.,*
in response to message #2 by Maximilian Hohmann

Thanks for your reply. The thing is, up to now I only had two devices that did fit my needs perfectly: as student the HP-41 and at work the HP200LX. Currently I use a netbook which is waaay too big compared with the Palmtop and - darn! - needs a new accu now. I was told that the iPad would be perfect, even w/o keybord. But I do not look for a replacement of the HP200LX, I don't work during traveling any more. While changing trains I'd like to download some podcasts, xchange mail (only if possible), and have some entertainment including emulators of pocket caöculators.

Ciao.....Mike

Re: Emulators on iPod touch

Thank you for the hint. I do like the HP17B2 with its solver.

Ciao.....Mike

Re: Emulators on iPod touch

*Message #20 Posted by **Andrés C. Rodríguez (Argentina)** on 25 Jan 2012, 7:58 p.m.,*
in response to message #1 by Mike (Stgt)

In my case, the mere availability of Free42 by Thomas Okken (and also Byron Foster's 42S derivative of Free42) were enough to justify buying my first iPod Touch in 2009; I later upgraded to a newer unit in 2010.

There are many HP emulators for free, so I currently have a 12C, 21, 35 (webpage, not resident) and two 48 emulators, even if I'm not a RPL type. But Free42 is what I use all the time.

I also have an Android phone, and Free42 also runs there, but (in my particular case) the screen quality and touch response are much better on the iPod.

Re: Emulators on iPod touch

*Message #21 Posted by **Mike (Stgt)** on 26 Jan 2012, 9:08 a.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

Thank you for your reply, now my decission is clear: I try to get a 32GB´model in black this WE.

Re: Emulators on iPod touch

*Message #22 Posted by **Andrés C. Rodríguez (Argentina)** on 26 Jan 2012, 6:24 p.m.,*
in response to message #21 by Mike (Stgt)

You will not regret your decision. If possible, obtain one which has been already updated to IOS 5 (otherwise, it's a free update, but you will need to take care of doing it, not a big problem anyway). When you open your iPod for the first time, you may find it frustrating to need an (free) iTunes account and download in order to start using it, but, after that, everything will be fine. Good luck!

Re: Emulators on iPod touch

*Message #23 Posted by **Mike (Stgt)** on 27 Jan 2012, 4:36 p.m.,*
in response to message #22 by Andrés C. Rodríguez (Argentina)

hehe, yes, frustrating. w/o internet access there is no chance to make it work. So I took my bike and drove to Basle, great fun, good music, a free wiFi and a bière grenadine. :) and too much devices authorized - hard cheese to get those emulators work. But I will get there.

Thanks again for all who helped.

Ciao.....Mike

HP 15c LE Case

*Message #1 Posted by **Brandon Poindexter** on 23 Jan 2012, 9:47 p.m.*

I've had my PH 15c LE for a good month now. But I had this nagging feeling that the case I was supplied with wasn't as "high end" as I had hoped. And after reading the following post:

HP 15c LE and 12c

and by viewing the following jpeg:

has me to believe that I was supplied with the HP 12c case (mine is not texture-marbled like the top one, but instead is flat). I'm not up in arms about it or anything, just a tad bummed is all. I must say though that the 15c LE case "looks" a tad better feeling compared to the one supplied for the 12c.

Which leads me to the question, has anyone bought these Voyager Cases on eBay? The rigid front/back is the reason I'd like it, but not sure 100% if these are any good. Does anyone have experience with them?

Edited: 23 Jan 2012, 10:27 p.m. after one or more responses were posted

I've bought 3 of them and like them a lot. They are well made with nice leather and fit very well. It's easy to insert and remove the calculator, and they appear quite sturdy. The cases supplied with HP 15C LE are useless crap, and are much worse than the original Voyager cases.

Re: HP 15c LE Case

*Message #3 Posted by **Brandon Poindexter** on 23 Jan 2012, 10:29 p.m.,*
in response to message #2 by Michael de Estrada

Cool! I guess ill try it out. I was a bit spoiled with the case that came with the HP 35s, as I always kept it in its case. Thanks for your feedback.

Re: HP 15c LE Case

*Message #4 Posted by **Michael de Estrada** on 23 Jan 2012, 10:49 p.m.,*
in response to message #3 by Brandon Poindexter

Even the case that came with the 33s is very nice. It's a similar slip case design with hard top and bottom pieces, although it is not leather. I certainly would have rather had a nice slip case with 15C LE, and dispensed with the silly presentation case.

Re: HP 15c LE Case

*Message #5 Posted by **bill platt** on 23 Jan 2012, 11:17 p.m.,*
in response to message #4 by Michael de Estrada

The standard voyager cases were never leather, either (the standard black ones)...

Re: HP 15c LE Case

*Message #6 Posted by **Michael de Estrada** on 23 Jan 2012, 11:41 p.m.,*
in response to message #5 by bill platt

I never said they were leather, but they were better made with thicker material and thinner seams, so you could easily insert and remove the calculator. Have you tried inserting or removing a 15C LE from it's case ? Not easy at all.

Re: HP 15c LE Case

*Message #7 Posted by **bill platt** on 24 Jan 2012, 12:13 a.m.,*
in response to message #6 by Michael de Estrada

I didn't buy an LE. I have two original Corvallis 15C...

Re: HP 15c LE Case (improving the fit)

This problem can be solved by turning the vinyl case inside-out and carefully trimming the excess fabric closer to the seam all the way round. Then, just reverse it and the calculator can slide in and out more easily.

Note that all three of my HP-15C LE calculators have the fine-grained vinyl case, rather than the marble textured one.

Nick

I haven't had to do this with the old ones. For that matter why should we be doing HP's work? It's easily done, but that's not the point. And yes, I know it's cheaper than 30 years ago, but then so are many things for which we don't expect to have have to do the finishing touches ourselves.

I just ordered 3 - one for my HP-16C, one for an HP-12C that I rescued at work, and one for my HP-15C LE.

HP-21 displays all zeroes

*Message #1 Posted by **Barry Smith** on 23 Jan 2012, 6:29 p.m.*

Hello, I have an HP-21 that was recently working just fine. I removed the battery pack and put it back in, and now the display shows all zeroes. It's possible that some small particles may have gotten inside the case.

Any suggestions as to what might be wrong?

Thanks!

Re: HP-21 displays all zeroes

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 23 Jan 2012, 7:43 p.m.,*
in response to message #1 by Barry Smith

Barry,

Katie has a very good article on this subject which may help. You can find her article in forum Articles area.

Seems like the solution may be to keep the unit on for up to 1/2 hour and turn off, turn it back on again. Quote from Katie's article "A seemingly common problem on some Woodstock machines is that they don't work until they are left on to "warm up" for some period of time. After leaving the on for several minutes (maybe up to 1/2 hour) then turning them off and back on again they start working normally."

Hope it helps,

Regards,Kerem

Edited: 23 Jan 2012, 7:47 p.m.

Re: HP-21 displays all zeroes

*Message #3 Posted by **Randy** on 23 Jan 2012, 9:18 p.m.,*
in response to message #1 by Barry Smith

The article does not apply to the HP21 as it has no external ram.

Based on what happened, the problem is either a bad battery or bad contact with said battery. If the battery has been rebuilt, make sure the cells are connected with a welded strap, do not rely on the spring to do the job - as even a small amount of corrosion will cause problems. When you have a bad battery or bad contact, connecting the calculator to the HP charger can and usually results in catastrophic failure of the ACT (arithmetic, control, timing) IC. In other models of the 20 series, other components can be damaged as well.

Re: HP-21 displays all zeroes

*Message #4 Posted by **Michael de Estrada** on 23 Jan 2012, 9:27 p.m.,*
in response to message #1 by Barry Smith

Some questions.

Is this a NiCd battery pack ?

If so, was it charged inside the calculator ?

Is there any evidence of corrosion on the battery contacts inside the calculator ?

Do you have a voltmeter, and if so what is the battery pack voltage outside the calculator ?

Re: HP-21 displays all zeroes

*Message #5 Posted by **Barry Smith** on 26 Jan 2012, 8:03 p.m.,*
in response to message #4 by Michael de Estrada

I replaced the original batteries with Everready NiMH 1.2V rechargables, then charged them up in the calculator using the original charger.

All was working well until I attempted some additional cleaning of the battery contacts using an eraser: https://picasaweb.google.com/rabbybuns/HP21#

I'll have to ask my brother for help with a voltmeter.

Thanks, everyone, for your advice!

Re: HP-21 displays all zeroes

*Message #6 Posted by **Steve Simpkin** on 27 Jan 2012, 1:22 p.m.,*
in response to message #5 by Barry Smith

Randy said, "When you have a bad battery or bad contact, connecting the calculator to the HP charger can and usually results in catastrophic failure of the ACT (arithmetic, control, timing) IC. In other models of the 20 series, other components can be damaged as well. "
I am afraid what may have occurred is that when you cleaned the battery with an eraser, eraser residue (or another battery connection problem) may have caused the battery to not make a good connection with the calculator. If this happens AND then you plug the charger into the calculator, circuitry damage often occurs. The lesson from this is: NEVER EVER charge the batteries in the calculator. Always use an external charger. Using the batteries as a voltage regulator and over-voltage protection was a very poor decision on HP's part.

ok, np

Anything I can do to inspire you to complete it?

Re: Port of ilper for PILBox under Linux & *BSD

*Message #7 Posted by **cgh** on 24 Jan 2012, 1:36 p.m.,*
in response to message #6 by Geir Isene

Yes ! Increase the number of hours in a day ;-)

The real problem is that the first port (in 2005) was done on an old FreeBSD (2.2.7). So, I suspect that some headers or structures have changed. I am now working on Debian/Linux and I have the same errors as you.

I will try to do something... during... this year...

Sorry, I do not have a lot of time to program as a hobby :-(

If I make a patch working, I will post here. So... Just wait.

Edited: 24 Jan 2012, 1:37 p.m.

Re: Port of ilper for PILBox under Linux & *BSD

*Message #10 Posted by **cgh** on 24 Jan 2012, 5:31 p.m.,*
in response to message #4 by Geir Isene

Hi,

Just comment the line **45** in file **m41/kbd.h**

You should have:
//extern struct kbd_data_type kbd_data[39];

With a lot of warnings, it compiles.

Interest in 32-bit version of User Code Utiltiy for HP-41

*Message #1 Posted by **MichaelG** on 23 Jan 2012, 3:32 p.m.*

The subject says it all. Is there any interest in a 32-bit Windows version of Leo Duran's User Code Utility for the HP-41?

The port does not seem that difficult but has one feature I'd like to change. The command seems to accept wildcards for input file names. I'd like to remove that feature and accept only real filenames.

Is is worth the work?

Michael

*Message #3 Posted by **Egan Ford** on 23 Jan 2012, 5:01 p.m.,*
in response to message #1 by MichaelG

I'd prefer a POSIX version that could then be compiled on any platform. For Windows you'd use DJCPP.

*Message #10 Posted by **MichaelG** on 27 Jan 2012, 12:41 p.m.,*
in response to message #1 by MichaelG

I haven't that good news. I've been a software engineer for almost 30 years. Not to blame the author of the tool but I personally judge the source code as highly unmaintainable. It is by far more effort necessary than I am willing to invest for the port. It took me a long while to find a not initialized variable in the original code which created big problems. All my experience tells me even if I get it to work there is a huge amount of testing needed.

The good news are it seems that the conversion from txt to raw works. Having the above information in mind what are the most important conversions for you. The converter support n x m conversions. Can we reduce that for the time being to a needed minimum?

Michael

I'm curious to see the source code. Can you say where you found it? I can't seem to locate the source with google.

Re: Interest in 32-bit version of User Code Utiltiy for HP-41

*Message #12 Posted by **MichaelG** on 28 Jan 2012, 2:25 a.m.,*
in response to message #11 by David Hayden

I found it here: http://hp41.claughan.com/file/hp41uc.zip

After digging a bit deaper into the code I finally gave up. The reason is the port might be possible. But I see the port only as a first step to move the tool to the 32-bit platform. If I port something I also want to be able to maintain the code up to a certain extend (like previously the A41, L41). I see no chance here. I think its better to rewrite the tool. Perhaps its possible to find the logic (its well hidden).

Michael

Re: Interest in 32-bit version of User Code Utiltiy for HP-41

*Message #13 Posted by **David Hayden** on 28 Jan 2012, 10:34 p.m.,*
in response to message #12 by MichaelG

Thanks for the pointer to the source code.

I see what you mean about the logic. The overall design seems to be "there are a few dozen distinct translations that can happen, let's code them all and factor out the common parts." If I were writing it, I think I would translate each supported format to/from one common format (maybe RAW). Then each translation would involve two steps: input format to raw, and raw to output format. It might take a little longer at run time, but it would drastically simplify the code.

Another problem is that the code assumes it's running on a little-endian machine. A 32-bit version should probably have source code that works on either little- or big-endian hardware.

Dave

*Message #15 Posted by **MichaelG** on 29 Jan 2012, 5:58 a.m.,*
in response to message #1 by MichaelG

As estimated it is by far easier to start from scratch. And I started it. The compiler now uses the classis technology and is fully table driven. First step is the lexical analysis (the tokenizer) then do what is needed

based on the table entry. There is an entry for each statement describing its opcode, parameters etc. The core compiler is only 260 lines.

The good news is the compiler already creates reasonable output (from txt to raw). The error handling is prepared, thats the next step.

I know some people won't love what's comming now: this version is written in C#/.Net 4.0. Besides the new structure it is one reason why the development can be that fast.

I'm not decided yet whether I go for a command line tool or some sort of GUI. Your input is welcome. For my tests the compiler has a window :-)

And I plan to introduce defines or however it gets called finally. The idea is you can define a constant and use that constant for the rest of the program. The compiler replaces the constant with the assigned value. E.g.

#def IAMACONST 12
RCL IAMACONST

results in

RCL 12

Michael

Re: Interest in 32-bit version of User Code Utiltiy for HP-41

*Message #16 Posted by **David Hayden** on 29 Jan 2012, 8:12 a.m.,*
in response to message #15 by MichaelG

The only time I've used hp41uc was to convert a bunch of programs to several different formats, so the command line abilities were my preference. I was able to create a script to convert all the files.

Note that what this really means is that it would be nice to be able to do some sort of batch conversion. A windowed utility could do that too.

One nice feature of a windowed interface might be the ability to expand/collapse LIF directories so you can convert individual files within them.

As for a pre-processor, I'd be happy with the C pre-processor.

Dave

Re: Interest in 32-bit version of User Code Utiltiy for HP-41

*Message #17 Posted by **MichaelG** on 30 Jan 2012, 2:01 p.m.,*
in response to message #1 by MichaelG

Here is the first 32-bit beta version v0.7 of the txt to raw compiler:

download.michael-goericke.de/FocalComp.zip

Right now without docu. The zip contains a small test file that shows how the defines work. The emulator V41 loads the raw files.

The command line is very simple:

FocalComp <filename>

No option right now. Filename needs to be fully qualified (with extension). The output filename is constructed by exchanging the extension with .raw.

As mentioned the runtime environment .Net 4.0 is required. Specifically the client profile version is sufficent. Its standard under Win 7 and there are installer available for XP and Vista in case it isn't already installed on your system.

Special characters in strings aren't handled yet like append

Michael

HP15C-LE European deliveries

*Message #1 Posted by **Derek Walker (UK)** on 23 Jan 2012, 5:16 a.m.*

Availability of the 15C-LE in Europe has recently been quoted as 'mid January' (i.e. about a week ago) or 'week 4 of 2012' (about now).

I have two on order from a UK supplier, who sent me this e-mail last Saturday:

```
We have now been advised by HP that the 15C will not be available until February. We have been
pressing them for a definitive date but are still awaiting confirmation.

Apologies for the inconvenience.

If you wish your order to be cancelled please advise otherwise we will keep it on backorder
for you.
```

Having waited this long (and having bought one US model), I will keep them on order, but I wonder what has caused this further delay? If they are coming from China by ship, one would expect the arrival date to have been fixed some time ago.

Edited: 23 Jan 2012, 5:18 a.m.

Re: HP15C-LE European deliveries

*Message #6 Posted by **Paulo MO** on 23 Jan 2012, 5:15 p.m.,*
in response to message #1 by Derek Walker (UK)

They're probably busy fixing the firmware. :-)

I would happily wait two more months, if they got it right (LSE and power consumption) for the next batch. Long live the concept of a bug free european batch!

Optimist makes the world go round! Yes, money too, Liza :P

Cheers Paulo

I once thought the batch that arrived in Hong Kong was bug free. I don't think they'll do anything

exclusively for the European batch. You will soon be disappointed!

in response to message #7 by From Hong Kong

I agree with your sentiment, I do not think the firmware will be fixed, but the keyboard issue should be fixed.

Re: HP15C-LE European deliveries

*Message #9 Posted by **Ernst Fueloep** on 26 Jan 2012, 9:03 a.m.,*
in response to message #8 by Bart (UK)

I have received now a HP-15C LE from an European supplier (www.thecalculatorstore.com).

Firmware is still dated 2011-04-15 and it still has the PAUSE bug.

But the keyboard is nice and fully working.

So, it looks like there is not really a change for Europe.

WP 34S - indirect addressing issue

*Message #1 Posted by **Gerson W. Barbosa** on 22 Jan 2012, 4:57 p.m.*

I've noticed indirect addressing doesn't work when the fractional part of the index is equal or greater than 0.5. Of course, by definition indices are integer numbers. However, as a convenience, HP calculators accept non-integer number as indices for indirect addressing and just ignore the fractional part. Is this a WP 34S bug or a feature? Thanks!

Gerson.

Re: WP 34S - indirect addressing issue

*Message #2 Posted by **Paul Dale** on 22 Jan 2012, 5:06 p.m.,*
in response to message #1 by Gerson W. Barbosa

It seems to be working:

```
1 STO 01
2 STO 02
1.75 RCL-> X
```

Returns 1 as it should.

In other words, I'm not understanding the problem here. Any chance of a step by step reproduction please?

- Pauli

Re: WP 34S - indirect addressing issue

*Message #3 Posted by **Gerson W. Barbosa** on 22 Jan 2012, 5:11 p.m.,*
in response to message #2 by Paul Dale

Returns 2 in version 2.2 build 1975 (Emulator).

Gerson.

Also,

```
99 STO 99
99.99 RCL-> X
```

returns 99.99

Edited: 22 Jan 2012, 5:20 p.m.

Re: WP 34S - indirect addressing issue

*Message #4 Posted by **Paul Dale** on 22 Jan 2012, 5:39 p.m.,*
in response to message #3 by Gerson W. Barbosa

You are correct. I tested in v3 which this is all working happily.

The proper solution is to upgrade ;-)

I've committed a fix. I don't know when the next v2.2 build will occur.

- Pauli

Re: WP 34S - indirect addressing issue

I could do one this week if someone can point me to the fix. I've yet to patch to serial port fix into 2.2 as well.

Re: WP 34S - indirect addressing issue

*Message #7 Posted by **Paul Dale** on 22 Jan 2012, 8:04 p.m.,*
in response to message #6 by Dominic Richens

I committed the fix in the 2.2 branch.

- Pauli

Re: WP 34S - indirect addressing issue

*Message #8 Posted by **Dieter** on 22 Jan 2012, 5:34 p.m.,*
in response to message #2 by Paul Dale

> Quote:

It seems to be working:

```
1 STO 01
2 STO 02
1.75 RCL-> X
```

Returns 1 as it should.

I can confirm an error for version 2.2 1789 (emulator) where this returns 2.
The same works fine in version 3.0 2289 (also emulated). Here it returns 1, as it should.

Dieter

Re: WP 34S - indirect addressing issue

*Message #9 Posted by **Gerson W. Barbosa** on 22 Jan 2012, 5:46 p.m.,*
in response to message #8 by Dieter

I was having trouble in a program that worked on the HP-42S but would not work on my outdated WP 34S.

Mine was flashed last July. Just received Eric's overlays (very nice on the former 20b!). A suitable USB-to-serial converter is still missing though.

Cheers,

Gerson.

> > Porting KEMU to the HP-12C+ or 15c le is relatively straightforward. But I'd be more interested to do so as part of a larger functional upgrade...
>
> *in response to message #15 by uhmgawa*
>
> That is a laudible goal which would be greatly appreciated, but I'm sure a lot of people would be very, very happy with a straightforward port, if you should ever be so inclined.

What I had in mind was something like this, described in the latter part of the video.

A KEMU port to a stock sam7 voyager isn't much of a technical hurdle. Rather the question of native firmware status is more of an issue, particularly for a multi-personality voyager.

Re: Voyager 1xC emulation in the same unit?

*Message #2 Posted by **Bart (UK)** on 23 Jan 2012, 5:27 a.m.,*
in response to message #1 by uhmgawa

Nice idea, however having multiple types on one unit presents problems with the keyboard. For functions not directly on the keys, an overlay would be fine of course, but how to change what's on the keys in an instant?

I think it might be a better idea to buy multiple 15C LE units and re-program dedicated units and have overlays like for the WP-34s.

There would of course be copyright issues, even if the code was not a copy of the HP ROM but entirely re-written, it would be a "copy-cat" issue - but HP would have the benefit of extra hardware sales.

Re: Voyager 1xC emulation in the same unit?

*Message #3 Posted by **uhmgawa** on 26 Jan 2012, 1:20 a.m.,*
in response to message #2 by Bart (UK)

> Quote:

> Nice idea, however having multiple types on one unit presents problems with the keyboard.

Indeed it does. The multi-firmware aspect was interesting (at least to me) from an experimental perspective. But the issue of key legends varying between models is a limitation, arguably offset by the partial solution of key legend support possible with a graphic display.

> Quote:
>
> For functions not directly on the keys, an overlay would be fine of course, but how to change what's on the keys in an instant?

>
> There would of course be copyright issues, even if the code was not a copy of the HP ROM but entirely re-written, it would be a "copy-cat" issue.

Before going through that effort, there is the more fundamental missing feature of interoperation (minimally data exchange) between models. Adding it is certainly possible. However the time is far more productively applied to creating maintainable and extensible firmware -- an approach which can straightforwardly address not some, but all of the above.

Re: Voyager 1xC emulation in the same unit?

*Message #4 Posted by **Jeff O.** on 23 Jan 2012, 8:03 a.m.,*
in response to message #1 by uhmgawa

I can see that what you would like to do would be an improvement over a simple port to a sam7 voyager if the hardware were available. I would of course encourage the simple port, because the hardware is available (in my hands, even.) But with the concern over the legality of using the original rom images or reproducing their functionality, I could not blame you if you did neither.

Re: Voyager 1xC emulation in the same unit?

*Message #5 Posted by **uhmgawa** on 24 Jan 2012, 1:09 a.m.,*
in response to message #4 by Jeff O.

> Quote:
>
> I can see that what you would like to do would be an improvement over a simple port to a sam7 voyager if the hardware were available.

I believe I'd started down this slippery slope with a well intentioned push from WalterB [appreciated] in the course of discussing my KINOMI/NUT replacement project. Yet even if one could scare up a display retrofit, there are interconnect issues to resolve. And quite honestly the easiest way to address this is with a new board layout which is a relatively simple task. Well if we've got a new board layout it is difficult to resist adding the sorely missing functionality in that otherwise vacant PCB real estate. But wait, if we're creating a replacement board there really isn't any compelling reason to put an aged AT91SAM7L128 back into the design -- we could do considerably better with a more recent SoC. And having arrived at the foot of the slope, what are we really repurposing besides an ABS enclosure in a unique form factor? If we toss out that design constraint we no longer have the severe display retrofit limitation.

> Quote:

> I would of course encourage the simple port, because the hardware is available (in my hands, even.)

Admittedly a valid argument exists there as the hardware is quite underutilized. Only about 25% of that 128KB flash is actually needed to contain the 15c legacy firmware and a NUT/Voyager emulator. Even the graphic voyager prototype depicted above with KEMU core, all of 11/12/15/16c rom images, multiple firmware support, serial console, graphic rendering, several fonts, demo cruft, etc.. doesn't even cross over 64KB on a C language challenged architecture. Add to this the idle resources present in the sam7 voyager and it is difficult to resist improving upon the design.

> Quote:
>
> But with the concern over the legality of using the original rom images or reproducing their functionality, I could not blame you if you did neither.

Well, there is certainly precedence for releasing an emulator decoupled from its essential firmware. Yet doing so makes for somewhat of a poorly scaling proposition where each user needs to locate and program firmware images before a unit is functional.

Meet @ Embedded World Nuremberg?

*Message #1 Posted by **Meindert Kuipers** on 21 Jan 2012, 9:00 a.m.*

I will be at my employers stand at the Embedded World exhibition in Nuremberg, see here, visiting is free for industry professionals when preregistering. This is one of the largest events worldwide for the embedded industry. When more of the regular MoHPC visitors are also attending we could setup an informal gettogether in Nuremberg in one of the evenings that week. Be aware that this is a busy week in Nuremberg, and that hotels are quickly filling up. As my employer is also based in Nuremberg, I have some resources to find and book a restaurant in advance.

Hope to see some of you there!

Meindert

Re: Meet @ Embedded World Nuremberg?

in response to message #1 by Meindert Kuipers

Meindert, I'm looking forward at meating you. I've just ordered a ticket. Can you somehow arrange for the Hotel? I'm totally free in the date so you can arrange it the way it is best for you.

Re: Meet @ Embedded World Nuremberg?

*Message #5 Posted by **Meindert Kuipers** on 22 Jan 2012, 5:05 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Marcus, I cannot make the hotel reservation for you, but I will be staying at Acom, right next to the Nord-Ost Bahnhof (on the U-bahn from airport to Hbf). I do not know the evening planning yet for me, but I figure that if there are customer meetings for me, they will be on the first 2 days, as people will want to leave on Thursday after the last exhibition day, so I would go for Thursday evening (March 1) for an HP related meeting. Do not forget to look for the mbed guys at either the ARM or NXP stand. Will probably know more about my own planning later next week. I will mostly be on our own stand (Hall 2, stand 220),

Meindert

CL_UTILS 2H now available - Library#4 is next.

*Message #1 Posted by **Ángel Martin** on 21 Jan 2012, 5:31 a.m.*

A new revision of CL-Utils is now available, as well as an updated manual with more examples and details on the operation.

Will be sumbmitted to TOS, and hopefully also the CL home page.

This is the last version on the "regular" platform (barring bug fixing, which so far it's clean). From now on the development has been transfered to the "LIBRARY #4" project - using a slient library located on page#4 - not as a take-over but as a "silent companion" instead.

Library#4 works great on V41, the CL, Clonix and the MLDL2k.

Obvious advantages are code consolidation, more robust and maintainable, easier to enhance, shared by many other plug-in ROMS, freeing space for additional functions. Can you ask for more?

Only drawback is: can´t have a disabled IL-Printer on the system. If you can live with that minor glitch (barely counts for me) then this is your next step as well.

Cheers, ÁM

Re: CL_UTILS 2H now available - Library#4 is next.

WP34s V3 - Build Number recommended?

*Message #1 Posted by **Thomas Chrapkiewicz** on 20 Jan 2012, 6:16 p.m.*

So, I'm ready to flash a WP34s up to V3.

What build number is recommended (and why?)

Thanks, TomC

Re: WP34s V3 - Build Number recommended?

*Message #2 Posted by **Paul Dale** on 20 Jan 2012, 6:27 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

The latest from SVN because v3 is still a work in progress and we're pretty much just bug fixing at this stage.

- Pauli

Re: WP34s V3 - Build Number recommended?

*Message #3 Posted by **Thomas Chrapkiewicz** on 20 Jan 2012, 6:34 p.m.,*
in response to message #2 by Paul Dale

Is there a current bug list?

Thanks, TomC

Re: WP34s V3 - Build Number recommended?

*Message #4 Posted by **Paul Dale** on 20 Jan 2012, 7:02 p.m.,*
in response to message #3 by Thomas Chrapkiewicz

It is empty at the moment :-)

We try very hard to keep on top of this.

- Pauli

Re: WP34s V3 - Build Number recommended?

*Message #5 Posted by **Thomas Chrapkiewicz** on 20 Jan 2012, 8:20 p.m.,*
in response to message #4 by Paul Dale

The link in the article (here in the museum) led me to sourceforge v22. Is this the correct one?

Re: WP34s V3 - Build Number recommended?

*Message #6 Posted by **Paul Dale** on 20 Jan 2012, 8:31 p.m.,*
in response to message #5 by Thomas Chrapkiewicz

Nope, that is version 2.2.

There isn't a proper release of version 3 yet. You'll have to grab it from subversion on sourceforge.

- Pauli

Re: WP34s V3 - Build Number recommended?

*Message #7 Posted by **Thomas Chrapkiewicz** on 24 Jan 2012, 9:21 p.m.,*
in response to message #6 by Paul Dale

So, when I go to subversion, I find revision 2320, 2318, 2311, 2309,...etc...

Can anyone out there comment on what versions they have used and what the bugs are (or are not) in that version?

I would like to be certain to use a reliable version.

Thank you, TomC

Re: WP34s V3 - Build Number recommended?

*Message #8 Posted by **Thomas Chrapkiewicz** on 24 Jan 2012, 10:58 p.m.,*
in response to message #7 by Thomas Chrapkiewicz

I just flashed 2306. It seems to work fine.

How do I find the manual for this version?

Thanks in advance, TomC

Re: WP34s V3 - Build Number recommended?

>
> How do I find the manual for this version?
>
> Thanks in advance, TomC

I'd just flash the latest one. Hopefully there'll be less bugs with each revision ;-)

The manual isn't updated with every revision anyway, so just grab the latest one here http://wp34s.svn.sourceforge.net/viewvc/wp34s/doc/Manual_wp_34s_3_0.pdf

I flashed 2310 a couple of days ago, and applied the new overlay. Works great so far.

Re: WP34s V3 - "ON" Button

*Message #14 Posted by **Jim Johnson** on 25 Jan 2012, 6:15 p.m.,*
in response to message #13 by Paul Dale

I've been playing with my WP34S (modified from an HP30b) and was curious about the amount of time that the "ON" button needs to be pressed to turn on the calculator. Mine seems to take more than a brief press to turn it on. Often I'll have to press the button twice to turn it on, or press it for what seems to be from a 0.25 to 0.50 sec. I've tried an unmodified HP30b and an HP20b and the "ON" button responds immediately. Is there a key scan timing issue? Or do I just have a bad HP30b?

Re: WP34s V3 - "ON" Button

*Message #15 Posted by **Jeroen Van Nieuwenhove** on 25 Jan 2012, 6:37 p.m.,*
in response to message #14 by Jim Johnson

I can confirm this behaviour (30B, v3), so it certainly is not something related to your unit. I noticed it as well initially, but I quickly adjusted to pressing the on-key just long enough. I'm curious as well to know whether this keypress latency was built in by design. Given the fact that the original 30b fires up immediately, it doesn't look like a hardware issue.

Re: WP34s V3 - "ON" Button

*Message #16 Posted by **Marcus von Cube, Germany** on 25 Jan 2012, 9:29 p.m.,*
in response to message #15 by Jeroen Van Nieuwenhove

The hardware supports a debounce value for the ON function which I have set to a somewhat higher value than the original firmware. It prevents accidental turn on.

Re: WP34s V3 - "ON" Button

*Message #17 Posted by **Eric Rechlin** on 25 Jan 2012, 9:38 p.m.,*
in response to message #16 by Marcus von Cube, Germany

I've noticed this too, and I'm wondering, have you changed this over the last few months? It seems longer than it once was. Any possibility of making it a little shorter?

Eric

Re: WP34s V3 - "ON" Button

*Message #18 Posted by **Marcus von Cube, Germany** on 25 Jan 2012, 9:55 p.m.,*
in response to message #17 by Eric Rechlin

I'm not aware of any changes to the value, at least not recently. V3 and V2 share the same low level routines.

Re: WP34s V3 - "ON" Button

*Message #19 Posted by **Jim Johnson** on 25 Jan 2012, 11:09 p.m.,*
in response to message #18 by Marcus von Cube, Germany

My recommendation would be to lower the debounce value. It's very frustrating to hit the "ON" key and have the calculator sit there with a blank screen. (I'm using ver. 2283)

Re: WP34s V3 - "ON" Button

*Message #20 Posted by **Walter B** on 26 Jan 2012, 5:42 a.m.,*
in response to message #18 by Marcus von Cube, Germany

It's a very old feature - observable in build 1108 already :-)

Re: WP34s V3 - "ON" Button

*Message #21 Posted by **Eric Rechlin** on 28 Jan 2012, 10:01 a.m.,*
in response to message #20 by Walter B

Actually, I think I know what it is. At first I only used a 20b as a 34S, and now I am using a 30b. The 30b keyboard is different so it makes this more noticeable.

Eric

Re: WP34s V3 - "ON" Button

*Message #22 Posted by **Marcus von Cube, Germany** on 28 Jan 2012, 11:24 a.m.,*
in response to message #21 by Eric Rechlin

It's not only the keyboard difference. The debounce delay was longer than the time the key connects when clicked and immediately released. I've reduced the delay now.

Re: WP34s V3 - Build Number recommended?

*Message #23 Posted by **Thomas Chrapkiewicz** on 25 Jan 2012, 10:31 p.m.,*
in response to message #9 by Morten Nygaard Åsnes

I agree (in theory), I flashed 2320 and it locked up the machine (twice), so that is why I 'backed up' to 2306.

Thank you for the link (below) to the V3 manual.

Regards, TomC

Re: WP34s V3 - Build Number recommended?

*Message #24 Posted by **Paul Dale** on 26 Jan 2012, 12:55 a.m.,*
in response to message #23 by Thomas Chrapkiewicz

Can you provide any details as to what you were doing when the crash occurred?

- Pauli

Re: WP34s V3 - Build Number recommended?

*Message #25 Posted by **Thomas Chrapkiewicz** on 28 Jan 2012, 11:19 a.m.,*
in response to message #24 by Paul Dale

After flashing, I toggled 'debug on' then 'debug off'.

The display then went to: 0.

...and the machine no longer responded to the keyboard.

Perhaps the flashing process corrupted the machine; if anyone thinks this build should be good, then perhaps I'll retry the flashing.

TomC

Re: WP34s V3 - Build Number recommended?

*Message #26 Posted by **Marcus von Cube, Germany** on 28 Jan 2012, 11:37 a.m.,*
in response to message #25 by Thomas Chrapkiewicz

Turning DEBUG ON will quickly deplete the batteries. This is mainly meant to disable some power saving to allow hardware debugging and should otherwise only be used to unlock the SAMBA mode (ON+S). A hang is nonetheless not intended. An initial flash or major version upgrade is better performed with the ERASE button on the cable. We are still changing op-codes regularly so any salvaged (binary) programs or data are most likely causing trouble.

If you have a program on your V2 device and want to upgrade it to V3 you should send it to a matching emulator with SENDP/RECV so that it can be saved to disk and disassembled by Neil's tools. The source can then be recompiled for the new version. Saved library regions can be sent with SENDL n. They can then be saved from the emulator to a region (file) to be later disassembled for recompilation.

Re: WP34s V3 - Build Number recommended?

*Message #27 Posted by **Thomas Chrapkiewicz** on 28 Jan 2012, 12:30 p.m.,*
in response to message #26 by Marcus von Cube, Germany

Thank you Marcus; good information.

I did not have any saved code; this was starting from a fresh 30b.

I likely messed up the flash process. I'll try again soon with the latest version.

The power thing brought up an interesting thought - I've seen the mods posted to include two AAA batteries; I wonder how workable it would be to install a (normally closed) pin jack on the WP34s to plug in an external dual AAA (or AA) battery pack - temporarily bypassing one of the CR2032s.

TomC

in response to message #27 by Thomas Chrapkiewicz

Since you can do backup/restore to/from flash, there is no need to keep a battery connected to avoid memory loss. Just do an ON+STO before disconnecting the CR3220s and connecting the external power pack. With the next power-on the memory is restored automatically.

Are you sure you plugged RAM into page 14 first (like "810-RAM" PLUG4L)?

Well, you can be doing many different things wrong ' hard to tell since you don't provide enough details to know:

- is "TEST" a valid rom image file in the HP-IL disk?
- are you using GETROM from the CCD_OS/X or READROM from the HEPAX?
- is there RAM loaded into the destination page?
- does the "TEST" rom have any viewable function header for CAT2

and a few others more... but hese will probably catch it.

SAVEROM/GETROM use a certain binary data format for the mass media files,
the HEPAX uses a different format, and the ProfiSET uses another format again, so they are all incompatible.

The W&W mass media functions are data format compatible to SAVEROM/GETROM,

(deleted post)

> but the W&W functions do some more copy protection checks and are able to use any drive in the loop,
> where SAVEROM/GETROM always refer to the first mass media device in the loop,

HP 34C and 67 for Android

*Message #1 Posted by **Vincent Weber** on 20 Jan 2012, 11:11 a.m.*

Hi Olivier,

Contrats for the very promising 41cx emulator for Android ! When do you think we could get the 34C and 67 on the market ? I've been waiting for this for years, can't wait...;)

Thanks and cheers,

Vincent

Re: HP 34C and 67 for Android

*Message #2 Posted by **Olivier De Smet** on 20 Jan 2012, 12:12 p.m.,*
in response to message #1 by Vincent Weber

33C will be a free app (perhaps tomorrow or monday) 34C will be a small fee app (same date)

I am finalizing only some test with save and load of state.

33C will have speed from x1 up to x8 34C from x1 up to x32

Both are patched to have correct PSE duration.

The textual instruction will be displayed under the keycode part to help programming.

The 67 will be later (need to finish the card and package concept on android) (you can see it on windows, it will be rather the same concept on android)

Olivier

*Message #8 Posted by **Vincent Weber** on 21 Jan 2012, 7:23 a.m.,*
in response to message #6 by Olivier De Smet

Thank you so much Olivier, I took both, and they are wonderful !

I had issues with Google market to purchase go34C, I have now 8 order confirmation emails, I'm affraid I will be charged 8 times... anyway.

One killer question - do you intend to port go33C and go34C to the Iphone someday ? would be wonderful ! :)

Also, do you intend to do a 65 after the 67 ? a 25c and a 29C ? do you intend to support overlays/printer/... for the 41CX ? :)

Thanks and cheers,

Vincent

Re: HP 34C and 67 for Android

*Message #9 Posted by **Guenter Schink** on 21 Jan 2012, 11:49 a.m.,*
in response to message #6 by Olivier De Smet

Hi Olivier,

the go34C looks good on the Galaxy S. On the Acer Iconia tablet the gold shifted labels are right justified, thus overlapping the blue shifted labels.

in response to message #1 by Vincent Weber

go67c is on the android market I also added go11c, go12c, go15c, go16c for voyager series, but YOU NEED TO HAVE A ROM DUMP. go12c is free.

Olivier

Re: HP 34C and 67 for Android

*Message #14 Posted by **Vincent Weber** on 23 Jan 2012, 7:33 p.m.,*
in response to message #13 by Olivier De Smet

They are all great, thank you SP much ! Just one thing, why is the back help on the 15C so small ? Do you intend to do a 65 ? A 25,29 ? Overlays and printer for the 41 ? And port them to the iPhone ? ;)

Thanks and cheers,

Vincent

Re: HP 34C and 67 for Android

*Message #15 Posted by **Olivier De Smet** on 24 Jan 2012, 3:41 a.m.,*
in response to message #14 by Vincent Weber

I will enlarge the help in the next revision for the 15C. For 65, it's another platform and actually I have very little documentation about it, and no rom dump ! (same for the 29). For 25, I have the rom so it could be done rather easily but the 33 is a better choice :)

For the 41, I want to improve it :)

For iphone port, I stopped coding on mac (even if i use a mac computer) when they decided that you have to pay 99$ per year to be a developer !

Olivier

Re: HP 34C and 67 for Android

*Message #16 Posted by **Vincent Weber** on 24 Jan 2012, 5:00 a.m.,*
in response to message #15 by Olivier De Smet

Thanks Olivier. For the 65, I think you could get inspiration from what Jcques Laporte did:

http://www.jacques-laporte.org/sim65.htm

He said that he adapted Eric's code for the 65 ROM, so maybe you could grab the ROM + some insight in his code ?

I understand that the 33 is a better choice than the 25 (same features + subroutines + linear regression), but emulation is not about power, but collection and completeness. Otherwise I would stick to Free42 and would have no interest in your emulators.... ;)

Cheers,

Viuncent

go12c and go15c

*Message #17 Posted by **Alexander Oestert** on 24 Jan 2012, 11:38 a.m.,*
in response to message #13 by Olivier De Smet

I have the go12c and the go15c. Both seem to work flawlessly as far as I can tell after only a few minutes of testing. I would love to see landscape mode in the future, though. :-)

The HP 15C LE has little appeal to youngsters

*Message #1 Posted by **Michael de Estrada** on 20 Jan 2012, 10:53 a.m.*

I was looking at the customer reviews at the HP Home & Home Office webstore and noticed that the vast majority of reviewers were in either the 55+ or 40-54 age group. I suspect that the 40-54 age reviewers are closer to 54 than 40. Many of them have been owners of the original Voyagers, and have a nostalgic connection to HP, RPN and vintage calculators. Given that this market is limited and not growing, perhaps HP was wise to issue it as a one-time limited edition. Although they seem to no longer be available though normal channels and at MSRP, there is a flood of unsold units on eB@y and the few that manage to sell are at only slightly higher prices. Most of the people like myself who were interested have already bought them, and the market seems to have evaporated. As for myself, this may be the last HP calculator product, either current or vintage, that I will ever buy. I now own all the vintage calcs that interest me as well as all the current models and don't forsee any future ground breaking models emerging.

Re: The HP 15C LE has little appeal to youngsters

*Message #2 Posted by **Paulo MO** on 20 Jan 2012, 11:43 a.m.,*
in response to message #1 by Michael de Estrada

The 15 LE has not yet arrived at all markets (e.g. Europe), and many are still hoping that new emissions may come with some of the early bugs already corrected. Maybe its too early in the game to say that the demand is over. The old ones are still selling, due to their perceived quality/reliability. If the new ones can achieve the same perceived quality levels, I believe we will se a new rise in demand.

In any case, maintaining the production line is probably not logistically expensive, due to the existence of the 12c.

Besides, humankind will tend to get wiser :-) (which means loving the 15c)

Being 50 still leaves us (probability distributions not withstanding) with enough time to see how this all thing will end up.

Best Paulo

Re: The HP 15C LE has little appeal to youngsters

*Message #3 Posted by **Michael de Estrada** on 20 Jan 2012, 1:11 p.m.,*
in response to message #2 by Paulo MO

My observations having both an original 15C and several new 15C LEs are as follows:

1) The new 15C LE are significantly lower quality than the original 15C and the battery life is vastly lower.

2) There is no indication that the bugs will ever be corrected. Some new models for non-USA markets have already arrived in Asia and they have the same version ROMs.

3) School and college age students will mostly buy the much cheaper 33s and 35s, which can also be used in algebraic mode and are far easier to program. The matrix capability of the 15C LE is hampered by the small amount of memory and the one line display. Anyone serious about matrix computation would probably use a 50g or equivalent.

4) Your optimism about increased human wisdom is admirable, but from what I've seen in young entry level engineers, alas I do not share this view. They tend to be intellectually lazy, and show little interest in understanding problems by working them through manually with calculators. Instead, they gravitate towards canned computer programs with GIGO (garbage in garbage out). Today, I spoke with a young engineer at my former company from which I am now retired, who was trying to use one of my programs without having a clue about the underlying theory. He just wanted me to tell him how to enter data so the program would spit out results w/o error codes. It turned out that the problem he wanted to

solve was totally inappropriate for the capabilities of my program. Sigh.

*Message #5 Posted by **Lincoln R.** on 20 Jan 2012, 7:44 p.m.,*
in response to message #3 by Michael de Estrada

I'm 22 with a degree in computer engineering. I bought 2 15C LEs and my 'everyday use' calculator is a 32s that's older than me by a few months. As for the computer program problem, first of all in my area (computer hardware/digital logic) it isn't such an issue: Either you know how to write good HDL code or do competent layouts, board designs, or whatever, or you'll get canned.

In other programs, a lot of it is the universities. They tend to only make students work through a few examples by hand, often picking the most painful and pointless ones possible (Analog circuits that serve no purpose but have tons of nasty arrangements of components resulting in foul systems of equations, mechanical design of something uninteresting like a screw driver or a wrench, etc.) and then tell the students "In the real world, we just let a piece of software do this for us" which convinces the students that doing this work and understanding the theory is a frustrating and pointless endeavor.

in response to message #1 by Michael de Estrada

Well, i'm 20 years old and have been using and enjoying the HP 15c LE in my EE class's. :)

Re: The HP 15C LE has little appeal to youngsters

*Message #7 Posted by **Jeff O.** on 20 Jan 2012, 12:28 p.m.,*
in response to message #6 by Brandon Poindexter

Have any of your fellow students taken note of or expressed interest in it? Do they still teach phasor analysis in the core part of EE programs, or do you only get that if you go into power engineering? The 15c will nicely handle the complex number calculations needed in such analysis.

Edited: 27 Jan 2012, 10:00 p.m. after one or more responses were posted

Re: The HP 15C LE has little appeal to youngsters

*Message #8 Posted by **Lincoln R.** on 20 Jan 2012, 7:45 p.m.,*
in response to message #7 by Jeff O.

At least at my university (Carnegie Mellon in Pittsburgh), Phasor analysis was taught in our sophomore-level analog electronics class. This was true as of 2009, and I believe the curriculum in that course has not changed since then.

Re: The HP 15C LE has little appeal to youngsters

*Message #9 Posted by **Brandon Poindexter** on 21 Jan 2012, 2:44 p.m.,*

in response to message #7 by Jeff O.

Well my major is Technology with a concentration in Network Engineering so my math class's are generally simpler algebra and calculus. And the two EE class's that I need probably wont turn me into a master in EE. So unfortunately i wont be able to utilize my HP 15c LE to its fullest extent. Although I still hope that it serves me well for the remaining years i still have at my university.

I showed it to a close friend and over the past couple years have tried to tell him what he's missing out on, but he isn't into calculator's as much. :)

I showed my HP 35s to a group of people i knew when we work on projects, and the first thing one of them said is "i really like how the buttons feel". I told him a 30-second lecture on how to use RPN, and he quickly got the hang of it. At least for simple one's like addition and subtraction.

The only problem i have with HP's calculators is that they are simply too expensive. One can purchase a TI-30XA anywhere for 10 bucks and use it well in many of there class's. Granted it's nowhere near the capabilities that the 15c has, but from the class's I have been through a TI-30XA will be just as well suited.

Now, I'm pretty sure this all changes once I step into a full fledged EE major type of discussion.

Re: The HP 15C LE has little appeal to youngsters

*Message #10 Posted by **Fabricio** on 20 Jan 2012, 5:17 p.m.,*
in response to message #1 by Michael de Estrada

In my "complain" about "looking for hp calculators", Bill Platt asked "How often and why do you need or find a calculator useful?", and I am going to answer him here for sake of this discussion:

The more basic use of a calculator currently for me is, in first place, simple arithmetic and trigonometry to get distances and angles when working on a FEM-model. But then it is mandatory in my company to do a double check of calculations; first one is thoroughly reviewing the model and the results from analysis to see everything is within reasonable expectations. Second one is to do a simplified independent verification of everything, from the global equilibrium of a structure to the steel area required by software for a concrete column. I do this with my hp, and that´s the reason why I love the 4-line format of the HP 28s, or at least the 2-line format of the 42s. In this stage of the process, a lot of the info used is constant (as the concrete strength for example), but nothing is recorded as this is just a quick independent verification of a structure previously modeled and analysed by state-of-the-art structural software. And this is the moment when I enjoy the most an HP calculator: the sound of the keys, the feeling of the keyboard, the sto-rcl function, rpn... Reality is I could do this with a sharp, casio, or whatever cheap calulator I find around the corner, just don´t want to.

> Quote:
>
> Many of them have been owners of the original Voyagers, and have a nostalgic connection to HP, RPN and vintage calculators...

That´s all: I am so nostalgically conected to the old famous HP and RPN. Plain truth.

Plus:

1. HP 15c (LE or not) is such a powerful calculator, but as you pointed out, with a simple one-line display you don´t love going further into matrix computations, for example. In my humble opinion, 2-lines´ HP42s is a minimum (frequently I fully use the 4-lines HP28s).

2. In Mexico, buying an HP 15c LE from Samson, who send it through UPS, and after clearing customs is around $300-310usd. I am asking myself if I have been the only one to do that crazyness... twice. And so far there is no expectation HP will sell that model in Mexico, as I am pretty sure it is the same in all Latinamerica: Brazil, Argentina, Peru... you name it. But even if it were for sale here, I think it wouldn´t sell that much because of the economical situation; still, in any case, there is no way to measure the appeal to youngsters in this area of the world.

*Message #13 Posted by **Paul Berger (Canada)** on 21 Jan 2012, 10:37 a.m.,*
in response to message #12 by Dave Shaffer (Arizona)

NAFTA only protects applies to duties, it does not prevent UPS from charging exorbitant fees for customs brokerage. NAFTA also does not prevent the receiving country from applying taxes to the imported goods. UPS fees are so bad that I will not bid on items out of country if they specify they will only ship via UPS. When I got my LE I chose shipping by USPS because packages cross the border smoothly to Canada Post, and they never charge any fees for customs clearance. I did however have to pay the 15% HST due in the province I reside in.

in response to message #1 by Michael de Estrada

I'm definitely beyond the 40-54 age group but my two sons, brought up on 34Cs then 15Cs, have produced three grandchildren for me between them, ages 16, 14, & 8 and they all love their 15Cs (original versions bought expensively on TAS) Granted for the 8 yr old it is only arithmetic calculations. I think they like them in part anyway *because* of the RPN, it makes them feel different (superior?). Also partly because their classmates are less likely to steal them - they don't understand RPN.

Re: The HP 15C LE has little appeal to youngsters

*Message #16 Posted by **Paulo MO** on 21 Jan 2012, 7:57 a.m.,*
in response to message #15 by Andy Lamming (UK)

Lucky skilled you. I have never been capable of forcing the 15c on my kids. Alas, they grew on TI 83's. Will try again when they turn at least 40 ;-)

Re: The HP 15C LE has little appeal to youngsters

*Message #17 Posted by **Tom Mathes** on 24 Jan 2012, 8:35 a.m.,*
in response to message #16 by Paulo MO

My 12 yr. old daughter uses my old HP-33S and she's asked me teach her how to use RPN. I guess the kid takes after my extreme dislike of anything TI (especially since I worked for them).

No shame in that :-). I spent many late nights adoring the smell and looks of my SR 51A. It even did linear regressions! :P

They blew it with the 58s and its unreliable key debouncing, though...

Paulo

Re: The HP 15C LE has little appeal to youngsters

*Message #20 Posted by **nick lidakis** on 27 Jan 2012, 5:25 p.m.,*
in response to message #1 by Michael de Estrada

The HP 15c LE has little appeal to youngsters because it costs too much as it's ugly.

More younger people than ever (females, too!) are active in tech hobbies. You don't have to browse the web forums for long t figure that out. Micro-controllers, ham radio, basic electronics, Arduino, Linux, the BSDs, etc., etc.

-Sparkfun electronics is doing brisk business, among others: Link: http://www.sparkfun.com/

-Arduio boards and shields are selling briskly.

-PFU/Fujitsu is doing brisk business selling their Happy Hacking Keyboard: http://en.wikipedia.org/wiki/Happy_Hacking_Keyboard A minimalist keyboard with the Control key where it belongs. The kids love 'em. Freaking love 'em.

Ti is selling its Launchpad micro-controller and dev board combo for $4.30. Four dollars and thirty cents! Link:http://processors.wiki.ti.com/index.php/MSP430_LaunchPad_%28MSP-EXP430G2%29

-Linux is humongously popular with the hip, tech kids. Debian, Slackware, Arch, etc., etc. They love their X terminals, love to trade super custom .Xdefault files, mutt .confs, etc. Love using minimalist window managers like awesome (http://awesome.naquadah.org/) and xmonad (http://xmonad.org/).

-Ham Radio has been doing quite well, too. After getting rid of the Morse code requirement, the ARRL is finding that many who get their license eventually get interested in Morse code *and* the new digital modes, like JT56B. Lot's of pics of young (again, females, too!)kids getting their licenses, talking to satellites, etc., in my monthly QST.

There's also a regular "tech" get together here in NYC. Hip guys and gals socialize while soldering. I forget the name of this regular event but it was featured in the New York Times.

So, RPN *could* have appeal to all these youngsters. But at an entry price of $99, I doubt it. Make an entry level RPN for $15, $20 or $25 bucks to whet the appetite. Marketing genius ain't required.

> The HP 15c LE has little appeal to youngsters because it costs too much as it's ugly.

The HP 15C is many things but I don't think ugly is one of them. And those of my students who care about calculators and the like agree. It's a different aesthetic from an iPhone, but that doesn't mean it's ugly.

I think youngsters don't care about the HP 15C because those who would have been interested in it in the 1980s are already running a symbolic mathematics program on their smartphone or tablet. When you've got a Maple equivalent in your pocket, the appeal of a keystroke-programmable calculator becomes very limited.

> Quote:
>
> -PFU/Fujitsu is doing brisk business selling their Happy Hacking Keyboard: http://en.wikipedia.org/wiki/Happy_Hacking_Keyboard A minimalist keyboard with the Control key where it belongs. The kids love 'em. Freaking love 'em.

If those youngsters can buy a $300+ Happy Hacking Pro keyboard, they could afford a $99 calculator if they wanted to. Unless you meant the Happy Hacking Lite, which is a mediocre membrane keyboard.

I would argue that it could look a bit dated. Personally, I like the format.

The $79 dollar mediocre keyboard is an upgrade path to the Happy Pro. The mediocre membranes give you the same format and ergonomics of the Pro in a cheaper package.

No such entry level calc available to get the RPN word out, sp to speak.

> Quote:
>

Which still can't be used on exams. HP needs an inexpensive, introductory, *NON-PROGRAMMABLE*, RPN calc to sustain a long term RPN customer base.

Don't say "a bit dated", say that it's "old school", and all the cool kids will want one. I suppose HP could glue a few brass gears to the backplate and call it steampunk. Or is that passé already?

> Quote:
>
> The [Happy Hacking Lite] is an upgrade path to the Happy Pro. The mediocre membranes give you the same format and ergonomics of the Pro in a cheaper package.

I still see no reason to buy a $79 rubber dome keyboard when you can get a small keyboard with real mechanical keyswitches, such as the Noppoo Choc Mini for about the same price.

The Control key position is a non-issue, because that's trivially fixed in software. I've always had Control to the left of A and Escape to the left of 1, even if the keys themselves have "Caps Lock" or "`~" on them.

> Quote:

Depends on which exams. Last year, I split my advanced calculus final exam in two parts. The first half was strictly without calculators of any kind, and the second half took place in a computer lab and students were expected to use Maple.

> Quote:
>
> HP needs an inexpensive, introductory, *NON-PROGRAMMABLE*, RPN calc to sustain a long term RPN customer base.

HP has never made an inexpensive RPN calculator in the past because they never were in the inexpensive calculator business anyway. Today there are cheap basic calculators with an HP logo, but today's HP is not the same company. I don't expect them to be interested in sustaining their RPN user base.

I like RPN and I think that explaining RPN to students is a wonderful way to teach them about the tree structure of an algebraic expression. I always show my freshman calculus students how traditional mathematical notation is just syntactic sugar for a parsing tree.

Despite my love for RPN, I would be extremely surprised to see a basic RPN calculator gain any traction in the marketplace (which is to say, education). The hobbyist market is something else altogether, fortunately.

HPTalx and HP48S

*Message #1 Posted by **Cristian Arezzini** on 20 Jan 2012, 10:01 a.m.*

After a nasty battery leak accident, I decided to remove the batteries from ALL my calculators, except the ones I use daily. This means I have to make backups where applicable, including my several 48 series. I used HPTalx (because I'm on Linux exclusively) and had no problems with my 48G/GX's. But when I try to connect my 48S, something happens - the calculator screen does show data going back and forth - but HPTalx complains that the calculator is unknown. The hardware settings are the same as on the G/GX. As fas as I knew, the protocol is the same... Has someone tried the combination HPTalx/HP48s? Can anyone try? Is there some protocol difference between the two families? I couldn't find anything online...

Cristian

Re: HPTalx and HP48S

*Message #2 Posted by **Raymond Del Tondo** on 20 Jan 2012, 10:36 a.m.,*
in response to message #1 by Cristian Arezzini

Hi,

does HPTalx support the S series at all?
While it implements KERMIT, there's a chance that
the one or other remote cmd returns different results.
As an example, the VERSION cmd is not available on the S series
Or maybe there's an assumption related to the BDL (Binary Download Header) ,
which may not be suitable for the target platform.

Maybe the doc or the sources could tell more?

Raymond

Re: HPTalx and HP48S

*Message #3 Posted by **Cristian Arezzini** on 20 Jan 2012, 10:47 a.m.,*
in response to message #2 by Raymond Del Tondo

Hi Raymond, I didn't think of looking into the sources, I will do that, thank you! At worst, I can always beam the data to a 48G with infrared (or cable) and backup the data from there...

Thank you, Cristian

HP15C-LE firmware

*Message #1 Posted by **Antonio Maschio (Italy)** on 20 Jan 2012, 4:55 a.m.*

Hi everybody,

I've just ordered a HP15C-LE, and I'm reading here and there about it, its features (and yes, its bugs too).

I've got a simple question: how can I retrieve the firmware version?

Is the firmware updatable? I guess a cable is needed, but: has anyone had such an experience? What is the procedure?

Thanks in advance.

-- Antonio

Re: HP15C-LE firmware

*Message #2 Posted by **Thomas Radtke** on 20 Jan 2012, 5:01 a.m.,*
in response to message #1 by Antonio Maschio (Italy)

There's no revised firmware and no public status report about it available. No one except HP knows *if* it will be available in the future.

Re: HP15C-LE firmware

*Message #3 Posted by **Jeff O.** on 20 Jan 2012, 8:13 a.m.,*
in response to message #1 by Antonio Maschio (Italy)

> Quote:
>
> how can I retrieve the firmware version?

When you get your new 15c LE, press and hold the g key, then press and hold the ENTER key, then press and hold the ON key, then simultaneously release all three keys. This should result in the following display:

```
1.L 2.C 3.H
```

Now press the “2” key. This should result in a display like this:

```
1ChE--FFFFh
```

The above is a checksum (or similar) for the current firmware version. Earlier versions had a different value, it is presumed that any future version will also have a different value.

Now press ENTER. This should result in a display like this:

```
2011-04-15
```

This the date of firmware version loaded on your machine, the above is the date of the current version. Earlier versions had a different date, it is presumed that any future version will also have a different value.

Press ENTER again. This should result in a display like this:

```
C 2008 hP
```

I assume this is HP's copyright notice for the firmware code, it has not changed since the first version.

Pressing enter again will take you back to the first menu. Press 1 or 3 to try those out if you want, they do tests of the keyboard and/or display. To exit, press ON at the main menu.

> Quote:
>
> Is the firmware updatable?

Yes.

> Quote:
>
> I guess a cable is needed…

Yes, a cable is needed. It is the same cable required to turn a 30b into wp34s. These have been supplied by Gene Wright, search for posts by him then contact through the Forum to see if they are still available and further details.

> Quote:
>
> has anyone had such an experience?

Yes.

> Quote:
>
> What is the procedure?

Well, it's a bit convoluted and fraught with pitfalls. As Thomas states, there is no revised firmware and HP has given no indication if there ever will be. So perhaps you could get your cable and if new firmware is ever released come back and ask for the procedure.

...

Re: HP15C-LE firmware

*Message #4 Posted by **Antonio Maschio (Italy)** on 20 Jan 2012, 10:23 a.m.,*
in response to message #3 by Jeff O.

Ok, thanks, very clear, very complete and very kind answer.

When the calculator is mine, I'll play (;-P) with it a bit, then I'll adopt it as my current calculator. Then, as you suggested, when (or should I say 'if'?) a firmware is available, I'll get the cable and ask for your kind help.

Ciao!

I've been longing a new HP15C production line for years!

At last here it is!

Looks great. Does it feel great as well?

I am just curious how fast this emulator is. Could someone run the following little program and post the result?

LBL "TEST" CLX SETSW 100 RUNSW LBL 01 DSE X GTO 01 STOPSW RCLSW STOP

It takes 9 sec for the real machine, 1.3 sec in the V41. Btw the 32sII runs that in about 3 sec.

Michael

*Message #5 Posted by **Olivier De Smet** on 20 Jan 2012, 7:11 a.m.,*
in response to message #4 by MichaelG

You can change the speed only in commercial release. The free one is about the same speed as real hardware

Actually the rom is not patched to allow a 'nice' experience at fast speed.

You can obtain x50 speed up but the keyboard debouncing is also speed-up so key entry became difficult.

up to x4 the keyboard is usable, but after ... but you can change speed after the program is started and reverse back to x1 when finished :)

for your program : x1 : 8.37 sec, x4: 2.48 sec x16: 0.76sec max: 0.13sec with a motorola defy (700MHz one core processor)

P.S. sound is not implemented actually, certainly later

Olivier

Thx for the data. They where very interesting. It took me a long while to figure out why your Android device is soooo fast or the V41 sooo slow.

My gut feeling told me a PC should be at least as fast as the Android. The result is not the PC is slow but the V41. I played around by modifying the V41 sources. Now I get down the time needed for that little program to 0.15 sec.

These 0.15 sec doesn't seem to be the end. Right now I cannot make V41 faster because the speed also influences the keyboard handling (like in the Android). Faster means the "NULL" as the response of a long (!) keystroke comes earlier -> too early, more or less instantly. Lets see whether that can be fixed...

Michael

HP 41CX unusual display

*Message #1 Posted by **Bill Kleinsorge (Austin, TX)** on 19 Jan 2012, 5:57 p.m.*

Earlier today, my trusty 41cx apparently went into scientific display mode, and the decimal turned to a comma. Now that it is back in fixed mode, the decimal continues to appear as a comma, and the bottom row of the display is showing a small 0 and a 3.

Is this a malfunction, or have I inadvertently entered some weird display mode?

I have repeated turned it off and taken the battery pack out and put it back in. I have not replaced the batteries since I have never had a low battery warning.

Re: HP 41CX unusual display

*Message #2 Posted by **Kiyoshi Akima** on 19 Jan 2012, 6:12 p.m.,*
in response to message #1 by Bill Kleinsorge (Austin, TX)

The small 0 and 3 indicate that flags 00 and 03 are set. These are user flags, with absolutely no predefined significance to the calculator. Another flag (off the top of my head I want to say 29, but I'm sure somebody will correct me soon) controls whether the radix mark is set to the US or European standards (decimal point is period/comma, thousands separator is comma/period). Whichever flag this is, you'll want to toggle it.

Re: HP 41CX unusual display

*Message #3 Posted by **Les Bell** on 19 Jan 2012, 6:20 p.m.,*
in response to message #2 by Kiyoshi Akima

Flag 29 controls display of thousands separator (set flag to display).

Flag 28 controls radix style (set flag for British/US style, clear for European).

So, for US and general usage, SF 28 and SF 29.

Best,

--- Les
[http://www.lesbell.com.au]

Re: HP 41CX unusual display

*Message #4 Posted by **Frido Bohn** on 20 Jan 2012, 3:36 a.m.,*
in response to message #1 by Bill Kleinsorge (Austin, TX)

Quote:

> Earlier today, my trusty 41cx apparently went into scientific display mode, and the decimal turned to a comma.

Basically, as already said, this all is a "phenomenon" which has its cause in the flag configuration and is completely harmless, although somewhat annoying.
More interstingly is that those flags were apparently switched inadvertedly. Usually, the flags for the numeric display (40 and 41) cannot be manipulated directly with the standard flag-manipulating commands (SF, CF). Can you reconstruct what you have done to get this behaviour?

Re: HP 41CX unusual display

*Message #5 Posted by **Hans Brueggemann** on 20 Jan 2012, 5:49 a.m.,*
in response to message #1 by Bill Kleinsorge (Austin, TX)

bill,
some event messed up the internal "REGISTER d" of your 41C. that register holds the status of the 41's system- and user flags.
i had this on rare occasions when plugging / unplugging modules, while leaving the calculator on (no good idea), or on very old machines with flaky internal contacts. just give your machine the standard ON/BACKSPACE treatment to reset all system/user flags to their default status.
hans

Re: HP 41CX unusual display

*Message #6 Posted by **Fouad M. Kaadou** on 20 Jan 2012, 10:37 a.m.,*
in response to message #5 by Hans Brueggemann

Hello Bill,

As Hans said the flag register also known as the "d Register" was altered. This has happened to my 41CX on a few occasions to. Here is what I did:

```
0
X<>F
FIX 4
SF 28
SF 29
```

and TADA back to normal without losing any data.

Cheers,

Fouad

Integration

*Message #1 Posted by **Marcus von Cube, Germany** on 19 Jan 2012, 12:49 p.m.*

I've stumbled across a problem with the Romberg integrator in WP 34S. Just as a test if I had made a mess of the firmware again - quite a common situation in the last few weeks - I started with the integral from 0 to 1 of 1/x. This is infinite but the poor calculator was busily trying to approximate the result until the algorithm failed with a programming error (register limit exceeded).

We tackled the problem by limiting the number of iterations and now the device gives up after a few minutes (a few seconds on the emulator).

I then tried the same with my 15C LE in FIX 4 mode: After 15 minutes or more the display still showed "running" and I stopped it to save on the batteries. My question is, how do other incarnations of the integrate function fare on this task?

Re: Integration

*Message #2 Posted by **Norman Dziedzic** on 19 Jan 2012, 1:22 p.m.,*
in response to message #1 by Marcus von Cube, Germany

50g seems to hang although I only waited about a minute on 'Integral(0,0,INV(X),X)'

From inside equation writer, entered the integral, highlighted the whole thing and got + Infinity very quickly.

Re: Integration

*Message #3 Posted by **Marcus von Cube, Germany** on 19 Jan 2012, 1:42 p.m.,*
in response to message #2 by Norman Dziedzic

> Quote:
>
> Integral(0,0,INV(X),X)

I assume you mean Integral(0,1,INV(X),X).

The immediate return with +infinity may be a result of the CAS knowing that the indefinite integral of 1/x is lnx which evaluates to infinity on the lower bound.

Re: Integration

*Message #4 Posted by **Howard Owen** on 19 Jan 2012, 8:38 p.m.,*
in response to message #3 by Marcus von Cube, Germany

If you are gong to special case the integral for the purpose of limiting the iterations, why not do what the 50G does and shortcut the processing up front? Am I misunderstanding what's happening in your code?

Re: Integration

*Message #5 Posted by **Paul Dale** on 19 Jan 2012, 8:39 p.m.,*
in response to message #4 by Howard Owen

We don't and won't do symbolic integration. It looks like the 50G knows that the integral of 1/x dx is Ln(x) and it is using that to short cut the evaluation.

- Pauli

Re: Integration

*Message #6 Posted by **Kiyoshi Akima** on 19 Jan 2012, 1:57 p.m.,*
in response to message #2 by Norman Dziedzic

My 50g hits the limit of 65535 function evaluations and returns a result of 22.8202972649 with IERR of -2.22365339103E-10 .

I don't have my 15C+ with me, but I believe it will hit its limit at 16383 function evaluations.

Re: Integration

*Message #7 Posted by **Marcus von Cube, Germany** on 19 Jan 2012, 2:17 p.m.,*
in response to message #6 by Kiyoshi Akima

From a recent mail from Pauli:

> Quote:
>
> The integrator does 8191 function evaluations maximum now.

Re: Integration

*Message #8 Posted by **Paul Dale** on 19 Jan 2012, 4:20 p.m.,*
in response to message #7 by Marcus von Cube, Germany

This is more a bug on my part -- it does 8191 evaluations but only the first 4096 are actually used. The "we've been going too long and need to stop test" is done too late.

We can set this iteration limit to any power of two we want and I will look into the earlier termination.

- Pauli

Re: Integration

*Message #9 Posted by **Marcus von Cube, Germany** on 20 Jan 2012, 11:40 a.m.,*
in response to message #8 by Paul Dale

I can't see the bug Pauli mentioned but I have increased the limit to 16383 again which is good for just below 5 minutes of execution time for 1/x (timed on my crystal-less 20b with TICKS). When the integrator is called from the keyboard it will show a progress message.

In a prior version I had added an exit similar to SLV ("Solution not Found") and a skip next

instruction return. It's back to how it was. Convergence can be easily tested with an x[approx]? Y test in a program or by manually comparing the values in x and y.

Edited for typos.

Re: Integration

*Message #10 Posted by **peacecalc** on 19 Jan 2012, 4:44 p.m.,*
in response to message #6 by Kiyoshi Akima

Hello folks,

my hp 50g shows an astonishing behavier:

If I start in exact mode with: for example

4: 192E-14

3: 1

2: '1/X'

1: X

Start with the integration symbol (RS Integral symbol), I get the question: approx. mode on? I answer: yes and I get immediatly the integration value: 2,6979E1

If I start within the approximation mode with the "same" (of course they are not interpretated as exact values) input numbers, I have to wait for the result some minutes.

This looks like a good work around against a long integration duration: just start in exact mode.

Sincerely peacecalc

Edited: 19 Jan 2012, 4:45 p.m.

Quote:

> where on the calc hp 50g you can see how many times the function is calculated for the integration? The "IERR" variable I've already found.

Rather than integrating the program

```
<< INV >>
```

I merely integrate the program

```
<< 'C' INCR DROP INV >>
```

with the global variable 'C' set to some known initial value.

The same thing can be done on RPN machines by including something along the lines of ISG 0 in the function, followed by a NOP if necessary. For this particular problem, another possible coding would be

```
LBL A
1
STO+ 0
x<>y
/
RTN
```

Re: Integration

*Message #13 Posted by **peacecalc** on 20 Jan 2012, 8:29 a.m.,*
in response to message #12 by Kiyoshi Akima

Hello Kiyoshi Akima,

thanx for your fast reply. The little proggie only works in approxmation mode.

I have a theory why the calculation works better in exact mode. The calc find the antiderivate, but cannot express it with the boundaries, so the calc forced the user to switch to approximation mode. That is shurly faster then the pure approximation.

Sincerely peacecalc

Has ND1 a CAS of some sort?

Re: Integration

*Message #17 Posted by **Oliver Unter Ecker** on 19 Jan 2012, 2:51 p.m.,*
in response to message #16 by Marcus von Cube, Germany

The currently released version has no CAS.

ND1 (and ND0, the free version) can do numeric integration, deal with algebraic expressions (by themselves or in vectors/matrices), has PEVAL, can use OBJ-> to "unpeel" expressions, and can do some things like prime factorization, BigInts, and other stuff listed by the 50g AUR in CAS section.

The last couple of months, I've been working on integrating with a commercial CAS, which will become available within 1-2 months. (Beta testers wanted.)

Details are being finalized, but I'll be very excited when I can make the announcement. It's not just any CAS...

Re: Integration

*Message #18 Posted by **Marcus von Cube, Germany** on 19 Jan 2012, 3:00 p.m.,*
in response to message #17 by Oliver Unter Ecker

How does ND1 then find out about the integral being infinite? Or is this just a failure because it attempts to evaluate the function at its endpoints?

Re: Integration

*Message #19 Posted by **Oliver Unter Ecker** on 19 Jan 2012, 4:51 p.m.,*
in response to message #18 by Marcus von Cube, Germany

Sorry, I didn't pick up on your question.

To avoid singularities, the endpoints are never evaluated.

In this specific case, an overflow in the interior of the interval is causing NaN values, which leads to the reported error (which should be changed to something more appropriate).

Re: Integration

*Message #20 Posted by **Gerson W. Barbosa** on 19 Jan 2012, 2:26 p.m.,*
in response to message #1 by Marcus von Cube, Germany

HP-42S: It was still 'Integrating' when I stopped it after thirty minutes. (ACC=0.0001)

Free42 Decimal v1.4.62: 26.97737115553 (ACC<=0.0001). (This corresponds to a lower limit of about 1.92e-12).

Re: Integration

*Message #21 Posted by **Valentin Albillo** on 19 Jan 2012, 3:02 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Hi, Marcus:

For the HP-71B, you get in a short while:

```
> INTEGRAL(0,1,0,1/IVAR)

     22.8202902142

> IBOUND

     -2.22365339102E-11
```

where the negative IBOUND means the specified precision (1E-12) wasn't achieved. Conversely:

```
> INTEGRAL(1,2,0,1/IVAR)

 .69314718056

> LN(2)

 .69314718056

>IBOUND

 6.93146313016E-13
```

in a few seconds (positive IBOUND, so 12 digits were indeed achieved).

Best regards from V.

*Message #22 Posted by **Paul Dale** on 19 Jan 2012, 4:23 p.m.,*
in response to message #21 by Valentin Albillo

I think we can work out the maximum number of iterations each integrator uses based on the result of this integral. At least the results being mentioned look rather close to some of those I got with larger iteration limits.

in response to message #22 by Paul Dale

> Quote:
>
> I think we can work out the maximum number of iterations each integrator uses based on the result of this integral.

It's well known that the modified iterative Romberg algorithm as implemented in the HP-71B does a

maximum of **65,535** function evaluations, which can be simply demonstrated like this:

```
>LIST

10 DEF FNF(X) @ N=N+1 @ FNF=1/X @ END DEF
20 N=0 @ DISP INTEGRAL(0,1,0,FNF(IVAR)),N

>RUN

 22.8202902142        65535
```

Best regards from V.

Couple of new HP-17bii solver programs in Articles

*Message #1 Posted by **Don Shepherd** on 19 Jan 2012, 11:04 a.m.*

Link to a couple of new 17bii solver programs.

Re: Couple of new HP-17bii solver programs in Articles

*Message #2 Posted by **y.miyata** on 20 Jan 2012, 9:30 p.m.,*
in response to message #1 by Don Shepherd

Thank you very much for the nice solver programs. Both works quite nicely as you have described. The "LOG(0)" technique should be a good trick to stop the solver when required. In addition, they clearly show how magically a sigle line solver program does a complex calculation.

In fact, now my main calculator is a HP-17BII. I have been using my favorite HP-42S for long for my daily work in biological scientific research field, where frequent calculations with many programs are necessary. However, because the 42S price became quite high, I'm afraid I might be unable to buy another 42S if I happen to break it. So, I tried to translate these 42S programs into 17BII solver forms. Surprisingly, almost all of programs I have written for 42S can be expressed as 17BII solver lines with similar user interfaces. Sometimes it resulted in a very tricky line, but in most cases my 42S program can be expressed as a short and smart equation. In addition, 17BII has a real time clock capability and financial functions which are also quite useful.

I bought a couple of 17BII at low prices for backups, and keep the 42S for other purposes such as programming fun and really complicated calculations.

I'm sure that 17BII is a very powerful and "programmable" calculator.

Re: Couple of new HP-17bii solver programs in Articles

*Message #3 Posted by **Don Shepherd** on 20 Jan 2012, 10:31 p.m.,*
in response to message #2 by y.miyata

You're welcome, I enjoyed writing them. I changed the Hi-Lo program because it really didn't need to end a loop early. LOG(0) (or any illegal instruction, like divide by 0) is handy for exiting a loop early after storing a value of interest in a menu variable, and then RCL'ing the variable, but there are situations in which it won't work, especially if you need to do a lot of further processing after exiting the loop. But it is an interesting approach.

I think most members of the forum aren't especially interested in the 17bii because (a) it's a financial calculator, and (b) it lacks trig functions. But I enjoy the challenge of seeing if the 17b and 17bii can be programmed to solve particular problems, and I'm constantly amazed at what a "non-programmable" calculator can do.

*Message #4 Posted by **Allen** on 21 Jan 2012, 12:17 a.m.,*
in response to message #3 by Don Shepherd

Neat Programs, Don! I love the 17bii, and use it as often as I use all my other 42s/32sii/50g/48gx machines combined. It's a very capable and stylish machine!

Re: Couple of new HP-17bii solver programs in Articles

*Message #5 Posted by **Don Shepherd** on 21 Jan 2012, 4:15 p.m.,*

in response to message #4 by Allen

Thanks Allen. I agree, the 17b and 17bii are simply very handsome calculators. I really like the single shift key and an uncluttered key layout. You can print your equations via the infrared printer. The date arithmetic is nice. The solver with its programming-enabling commands is second to none. I wish I could congratulate the HP engineer who invented this solver and thank him or her for IF and Σ.

One subject I don't think I've seen discussed in the forum before is the use of HP programmable calculators to create programs that offer simple challenges that require you to engage your mind, like the Hi-Lo game. I know I've read that stimulating your brain is effective in preventing Alzheimer's disease, and as we all get older that becomes something that I think is important. A collection of programs (that can be implemented on HP programmable calculators) that provide brain stimulation would be a good thing.

As for me, I don't plan to run out of 17b's!

Edited: 21 Jan 2012, 4:26 p.m.

Re: Couple of new HP-17bii solver programs in Articles

*Message #6 Posted by **y.miyata** on 22 Jan 2012, 9:13 p.m.,*
in response to message #3 by Don Shepherd

> I changed the Hi-Lo program because it really didn't need to end a loop early.

I have also enjoyed the upgraded program. When I modify solver lines, I often need to store several "versions" of solver lines in the memory and I wish if I could save the older line and copy it to a new line to modify it (I mean it is often painful to re-enter a whole long line again). Do you think it is possible on 17BII? In case I need a serious debugging, I prefer to do so on the solver in 200LX where I can copy and paste the line.

> (b) it lacks trig functions.

Yes, this might be a major drawback of 17BII, although I rarely need the trig functions. Previously, I had been using 19BII, and it has trig functions. In addition, the separate alpha-keys are convenient to enter equations. However, 19BII is too large and heavy for my lab-coat pocket, and it was painful (and dangerous) to change the batteries of 19BII.

I have 27S and this is also a very nice calculator with the same Pioneer form and the handsome solver with a lot of mathematical and financial functions. The problem is that it does't accept RPN input. Probably, "27SII" with an RPN option might be my ideal calculator.

Re: Couple of new HP-17bii solver programs in Articles

*Message #7 Posted by **Gerson W. Barbosa** on 22 Jan 2012, 10:03 p.m.,*
in response to message #6 by y.miyata

> Quote:
>
> > (b) it lacks trig functions.
> >
> > Yes, this might be a major drawback of 17BII, although I rarely need the trig functions.

Equations for them can be written, however. Here is a compact one for sine:

```
SIN=L(Y:SIGMA(N:0:5:1:(-1)^N*(X*PI/540)^(2*N+1)/FACT(2*N+1)))
*(3-4*SQ(G(Y)))
```

Another one, longer but faster:

```
SIN=L(Y:X*(5.81776417331E-3+L(X2:SQ(X))*(-3.2818376137E-8+G(
X2)*(5.55391606E-14+G(X2)*(2.0935E-26*G(X2)-4.47566E-20)))))*
(3-4*SQ(G(Y)))
```

Others available here.

Re: Couple of new HP-17bii solver programs in Articles

*Message #8 Posted by **y.miyata** on 23 Jan 2012, 8:28 p.m.,*
in response to message #7 by Gerson W. Barbosa

> Quote:
>
> Others available here.

Yes, in fact I remember that previously I have examined all of the equation listed in your link (quite impressive, I would like to take this opportunity to thank you for your very nice article), and I stored equation series No.2 in my HP17BII, which is useful to perform simple trig functions.

But in most of the cases where I need trig functions, I would like to use them in more complicated solver equations such as

COS(x)*(SIN(X))^2/(x*SIN(X+PI))=0.5.

In such cases, even with your trig equations, 17BII seems to be not that much convenient...

Re: Couple of new HP-17bii solver programs in Articles

*Message #9 Posted by **Gerson W. Barbosa** on 23 Jan 2012, 11:05 p.m.,*
in response to message #8 by y.miyata

Thanks! I started converting them from the HP-12C Platinum program during a dull day at the beach. The longer equations were edited and tested first on the HP-200LX, which made the task easier. I personally prefer the first set, but I guess most will prefer the second one for its compactness.

> Quote:
>
> But in most of the cases where I need trig functions, I would like to use them in more complicated solver equations such as
>
> COS(x)*(SIN(X))^2/(x*SIN(X+PI))=0.5.

Yes, you're right! After posting I realized you would need them for something like that. It's a pity the HP-17BII lacks trigs. It would be a great option in this form factor. Perhaps there would be space in ROM for these functions if an international option were not offered.

Gerson.

Re: Couple of new HP-17bii solver programs in Articles

*Message #10 Posted by **Thomas Klemm** on 23 Jan 2012, 11:12 p.m.,*
in response to message #8 by y.miyata

> Quote:
>
> COS(x)*(SIN(X))^2/(x*SIN(X+PI))=0.5

In this case even trigonometric functions wouldn't be of a help as the solutions turn out to be complex numbers:

x ~ +/-2.17519+/-0.743742 i

Kind regards
Thomas

Re: Couple of new HP-17bii solver programs in Articles

*Message #11 Posted by **y.miyata** on 24 Jan 2012, 8:00 p.m.,*
in response to message #10 by Thomas Klemm

> Quote:
>
> the solutions turn out to be complex numbers:

I'm sorry, I made a mistake in writing the equation. The right one is

COS(x)*(SIN(X))^2/(x*SIN(X+PI/**2**))=0.5

I would be glad if you kindly confirm that this equation has 2 real solutions.

Thanks!

Re: Couple of new HP-17bii solver programs in Articles

*Message #12 Posted by **Thomas Klemm** on 24 Jan 2012, 10:30 p.m.,*
in response to message #11 by y.miyata

I simply copied the equation *cos(x)×(sin^2(x))/(x sin(x+pi/2)) = 0.5* into WolframAlpha which gave me these two solutions. Just make sure to use only lowercase *x* and not both *x* and *X* in the equation.

```
x = 0.554572
x = 1.84908
```

From the result I used the alternate form to get: $1-\cos(2x) = x$. Now you could use the HP-17bii with the Taylor-series of this expression to solve the equation:

$$x = 2x^2 - 2x^4/3 + 4x^6/45 - 2x^8/315$$

I didn't do that but according to *WolframAlpha* you should get:

```
x = 0.554573
x = 1.80219
```

This might already be close enough to your needs. Otherwise add more terms of the Taylor expansion.

Cheers
Thomas

Re: Couple of new HP-17bii solver programs in Articles

*Message #13 Posted by **Gerson W. Barbosa** on 25 Jan 2012, 11:50 a.m.,*
in response to message #12 by Thomas Klemm

The equation has actually three real roots. It can be rewritten as $(\sin(x))^2 - 0.5*x = 0$, since $\sin(x+pi/2) = \cos(x)$. When submitting it to WolframAlpha we get

```
x = 0
x ~ 0.554572090829809021393830 36
x ~ 1.849076836438507890568685 1
```

The HP-42S solver gives

```
X=0
```

```
X=0.554572090831
X=1.84907683644

01 LBL "EQ"
02 MVAR "X"
03 0.5
04 RCL "X"
05 *
06 LASTX
07 SIN
08 X^2
09 -
10 .END.
```

The initial estimates, 0.1, 0.5 and 2, respectively, have to be changed *outside* the solver, otherwise the solver may get stuck to the first root it finds.

The HP-200LX solver will always return X=0, no matter the initial estimates, for

```
SQ(L(Y:SIGMA(N:0:5:1:(-1)^N*(X*PI/540)^(2*N+1)/FACT(2*N+1)))
*(3-4*SQ(G(Y))))-0.5*X=0
```

Cheers,

Gerson.

Re: Couple of new HP-17bii solver programs in Articles

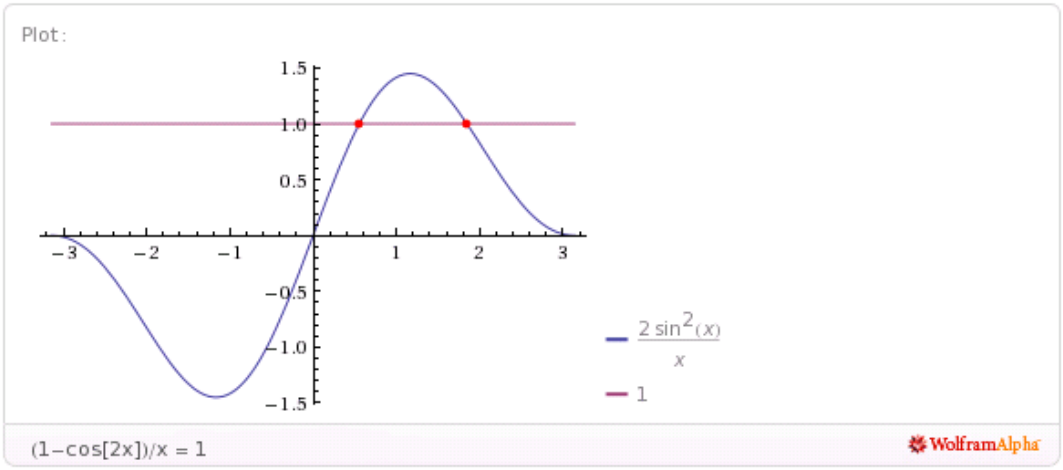
*Message #14 Posted by **Thomas Klemm** on 25 Jan 2012, 5:09 p.m.,*
in response to message #13 by Gerson W. Barbosa

But the value $x = 0$ is not a solution of the initial equation. Instead it's added because we multiplied both sides of the equation with x.

If that turns out to be a problem for the solver we can easily divide the Taylor series again by x and get the following instead:

$$1 = 2x - 2x^3/3 + 4x^5/45 - 2x^7/315$$

Just from looking at the graph I would not expect the solver to have problems to find these two solutions:



Best regards
Thomas

Re: Couple of new HP-17bii solver programs in Articles

Re: Couple of new HP-17bii solver programs in Articles

*Message #17 Posted by **Gerson W. Barbosa** on 25 Jan 2012, 7:01 p.m.,*
in response to message #16 by Thomas Klemm

Just follow these keystrokes considering, the program "EQ" above is in memory and the variable "X" contains 0:

```
             keystrokes                    display

[Shift] [SOLVER] [EQ] [5] [X] [X]         X=0
[2] [X] [X]                               X=0
[1] [X] [X]                               X=0             ; the
root is stuck at X=0, no matter the estimates
[EXIT]                                                    ; leaves
the SOLVER environment
[2] [STO] [X]                                             ;
stores 2 in the variable "X"
[Shift] [SOLVER] [EQ] [X]                 X=2             ; back
to the SOLVER enviroment again
[X]                                       X=1.84907683644
```

Strange, isn't it?

Cheers,

Gerson.

Edited: 25 Jan 2012, 7:03 p.m.

Re: Couple of new HP-17bii solver programs in Articles

*Message #18 Posted by **Thomas Klemm** on 26 Jan 2012, 3:00 a.m.,*
in response to message #17 by Gerson W. Barbosa

My understanding is that since you entered only one guess the previous solution is used as the other one. Thus it is stuck at *x = 0*.

Instead of leaving the SOLVER environment you can simply enter two guesses:

```
[Shift] [SOLVER] [EQ]
[1] [X]
[2] [X]
[X]
X=1.849077
```

It might be that the solver just uses one of the initial guesses if the result is exactly 0, because there's no possible way to improve that result.

Does this makes sense to you?

Regards
Thomas

Re: Couple of new HP-17bii solver programs in Articles

>
> Does this makes sense to you?

Yes, it does. Thanks! That's exactly the procedure described in the manual. I had already tried [1] ENTER [2] [X] but it would not work. The procedure for the HP-200LX is slightly different and also not so intuitive: *"to enter two guesses, key in the first guess and press the function key once, and then key in the second guess and press the function key twice."* I haven't succeeded on the HP-200LX, however.

Gerson.

Re: Couple of new HP-17bii solver programs in Articles

*Message #20 Posted by **y.miyata** on 26 Jan 2012, 8:47 p.m.,*
in response to message #19 by Gerson W. Barbosa

> Quote:
>
> I had already tried [1] ENTER [2] [X] but it would not work.

On HP-15C, I have got the answer with this way by [1] [ENTER] [2] [f] [SOLVE] [label].

> Quote:
>
> The procedure for the HP-200LX is slightly different and also not so intuitive:

I believe it is almost the same in HP-200LX as in HP-42S.

Store the equation: sin(x)*sin(x)/x-0.5

[calc] 1 [x] 2 [x] [x]

x= 1.849076836438508

0.1 [x] 1 [x] [x]

x=0.554572090829809

Often I prefer to get the answer after plotting the funcion.

[Plot] [Auto] (or [Draw]), move the cursor near the point where the graph crosses the Y=0, then [Solve]

You see the answer in the upper left corner of the screen.

Re: Couple of new HP-17bii solver programs in Articles

*Message #21 Posted by **Gerson W. Barbosa** on 27 Jan 2012, 2:34 p.m.,*
in response to message #20 by y.miyata

> Quote:
>
> Often I prefer to get the answer after plotting the funcion.

Duh! On plotting it I saw where I was going wrong. It turns out my equations assume X is in degrees, not radians! After editing, it works:

```
SQ(L(Y:SIGMA(N:0:6:1:(-
1)^N*(X/3)^(2*N+1)/FACT(2*N+1)))
*(3-4*SQ(G(Y))))=X/2

X=0.554572090829808

  and

X=1.849076836438507
```

Great advice! Thanks!

Gerson.

Re: Couple of new HP-17bii solver programs in Articles

*Message #22 Posted by **y.miyata** on 26 Jan 2012, 8:29 p.m.,*
in response to message #13 by Gerson W. Barbosa

> Quote:
>
> It can be rewritten as *(sin(x))^2 - 0.5*x = 0*, since *sin(x+pi/2) = cos(x)*.

Yes, you are right, the original equation I had was in fact (sin(x))^2/x=0.5, and I added cos(x) in the numerator (top) and sin(x+pi/2) in the denominator (bottom) [it added

nothing mathematically] to emphasize the trig difficulty in 17BII.

Next subjects you may be interested in will be:

1. Calculate the x value where (sin(x))^2/x reaches maximum. Looking at the graph Thomas kindly illustrated, you may agree that it should be somewhere between x=1 and x=2.

2. Calculate the integration [x=0 to x=pi] of (sin(x))^2/x.

I have done these with HP-42S and HP-15LE (fast!). It was a good exercise to remember how to use these calculators (and also to prevent from Alzheimer's disease...).

Cheers.

Out of laziness, I've done these on my HP 50g :-)

```
1. 'SQ(SIN(X))/X' DERVX --> '(2*COS(X)*X-SIN(X))*SIN(X)/X^2'
    '(2*COS(X)*X-SIN(X))*SIN(X)/X^2=0' --> X=1.16556118521 (Numeric
Solver)

2. 'Integrate(0,pi,SQ(SIN(X))/X,X)' EVAL  --> 1.21882669653
```

> Quote:
>
> It was a good exercise to remember how to use these calculators (and also to prevent from Alzheimer's disease...).

I've heard studying a foreign language is good for this purpose too. I hope this applies also to languages I started to learn when I was young (and never finished, like German and Russian-- never went beyond lesson 3). Perhaps a good reason to start over :-)

Cheers,

Gerson.

in response to message #6 by y.miyata

> Quote:
>
> When I modify solver lines, I often need to store several "versions" of solver lines in the memory and I wish if I could save the older line and copy it to a new line to modify it (I mean it is often painful to re-enter a whole long line again). Do you think it is possible on 17BII?

Unfortunately, no. It would be nice if there was cut and paste available when editing solver equations, but I don't think even the 19bii can do that either. I played with the 19bii solver a few months ago and discovered something I really did not like: if you have an error in your solver equation somewhere, you can't save it until you fix the error, unlike the 17bii solver which does save it, even with the error. That's a huge problem when you get into longer equations, and for that reason I would not want to work on the 19bii, even with its convenient alpha keyboard.

It is ironic that L() and G() were not documented in the 17b or 17bii manuals, but the actual solvers on those machines had them and they worked fine. By the time HP got around to documenting L() and G() in the 17bii+ manuals, Kinpo changed the solver so it didn't work (correctly) like it did previously in the 17b and 17bii.

[WP34s] Assembler problem

*Message #1 Posted by **fhub** on 19 Jan 2012, 4:53 a.m.*

Marcus, with your last change in wp34s_asm I suddenly get a bunch of error messages when I compile my libraries:
"Use of uninitialized value $chars[2] in length at C:\WP34S\TOOLS\WP34S_ASM.EXE line 637."

Franz

Re: [WP34s] Assembler problem

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 19 Jan 2012, 5:30 a.m.,*
in response to message #1 by fhub

We'll look at it. In the meantime, you can wind ASM back to 2225 for now.

This change was an attempt to fix a bug of mine where "0" in quoted labels was misbehaving. Oops!

Re: [WP34s] Assembler problem

*Message #3 Posted by **Neil Hamilton (Ottawa)** on 19 Jan 2012, 7:32 p.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

Franz,

Should be fixed now.

Marcus was kind enough to fix a long latent bug in the tool.

Cheers...

HP-41CL & NoV-64 (or its siblings)

*Message #1 Posted by **Geir Isene** on 19 Jan 2012, 2:59 a.m.*

I transcended to Nerdvana when I got my first NoV module from Diego, progressed to the Second Circle when I got the CL board and now moving into the Third Circle of Nerdvana with the CL/NoV combo.

I thought I'd share my views on this amazing combination.

First some specs; I have the HP-41CL loaded with the YFNS 2A in page #F, CLUTILS 2G in page #E and CCD OS/X in page #D. This leaves the full 4 blocks of wonderful HEPAX RAM from the NoV-64 module in pages #8-#B as well as the NOV CHAP burned into the ROM of the NoV-64 at page #C. The reason for the latter is that none of the NOV CHAP write-to-h4100 works if the module resides in the CL. These functions work only if the module is inside the NoV-64 module. Also, the NOV CHAP module is essential in the NoV-64 whenever I take the module out and plug it into another HP-41.

The advantage with using the NoV-64 to host the HEPAX are:

1. It saves one 4K page as the NoV module gets HEPAX into page #6, something that the CL cannot do.
2. The HEPAX RAM is permanent in the NoV - despite MEMORY LOST or flat batteries. To get the same permanency on the CL alone, you will have to write the HEPAX RAM to flash, something that takes a lot of time and is risky.

In addition, the NoV-64 provides a full 4 sets of 4*4K of HEPAX blocks. These blocks are easily swapped by writing the configuration into address h4100 - 10X, where "X" (from 0-3) indicates the block to use. This gives you a full 64K of HEPAX RAM for use - some 32 times the usual program memory on your HP-41. Programs can be saved permanently and run from HEPAX RAM. XM files can be saved, manipulated and used from HEPAX RAM. Calculator memory can be saved and retrieved easily (in a couple of seconds using the NOV CHAP command SAVEN and GETN). Unlike the WRALL from the CLUTILS module on the HP-41CL, the SAVEN doesn't save XM. For that, you have the NOV CHAP program BACKUP.

Switching the blocks of HEPAX RAM is done in less than a second with the functions NX (write the number in X to h4100 - such as 103 to switch to the forth HEPAX 4*4K block) or the direct switching functions N100, N101, N102 and N103. These makes it possible to assign the switching functions to keys for lightning fast block switching. Doing this on the CL alone is "possible" but extremely cumbersome and time consuming - taking minutes to do with permanent HEPAX saves - and it becomes increasingly risky.

You can of course save a copy of your favorite modules to the permanent HEPAX ram in the NoV as well. This makes it easy to have 4 different environments with both a couple of modules and plenty of HEPAX RAM to use for each - and even a memory save for each environment. What joy!

I use the 100 HEPAX block as my default and have the ISENE ROM in page #B while retaining pages #8, #9 and #A as HEPAX RAM with lots of programs, a memory save and a few XM files. My 101 environment contains pure math related programs in 4 HEPAX RAM pages. The 102 environment contains my Role-Playing programs with lots of XM files, while my 103 environment hosts my MCODE project(s). Switching between them is with the blink of the eye.

A simple RESTORE program loads the YFNS to page #F, the CLUTILS to #E and the CCD OS/X to page #D

whenever the CL needs new batteries or I manage to lock up the machine with some funny MCODE. Nothing is ever lost with this - I keep an additional backup of RAM and XM on a cassette tape (using the Extended IL ROM) for ultra safety.

With this I have leveled to Nerdvana 3rd Circle.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #2 Posted by **Frido Bohn** on 19 Jan 2012, 8:55 a.m.,*
in response to message #1 by Geir Isene

Having the HEPAX code in the NOV64 could you get DISASM to work properly in the 41CL environment?

Re: HP-41CL & NoV-64 (or its siblings)

*Message #3 Posted by **Geir Isene** on 19 Jan 2012, 1:36 p.m.,*
in response to message #2 by Frido Bohn

What exactly is the problem you encounter with MCODE on the CL?

Re: HP-41CL & NoV-64 (or its siblings)

*Message #4 Posted by **Ángel Martin** on 19 Jan 2012, 3:51 p.m.,*
in response to message #3 by Geir Isene

DISASM doesn´t seem work on the CL, not sure why.

This should not have any impact on the NoVRAM-32-64 or the real HEPAX plugged to the CL, which obviously don´t use the CL image, nor rely on the CL board to operate.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #5 Posted by **Geir Isene** on 19 Jan 2012, 4:58 p.m.,*
in response to message #4 by Ángel Martin

Are you talking about the DISASM 4D module here?

Re: HP-41CL & NoV-64 (or its siblings)

*Message #6 Posted by **Frido Bohn** on 19 Jan 2012, 5:55 p.m.,*
in response to message #5 by Geir Isene

DISASM is not a module, it's a command within the HEPAX module used for disassembly of MCODE. As Ángel said, this command does not work in the CL, more precise, if the HEPAX module from the CL flash is used.
I wonder whether this command will work from within the NOV64 when it's attached to the CL, i.e. if the HEPAX module stored in the CL is bypassed.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #7 Posted by **Geir Isene** on 19 Jan 2012, 6:25 p.m.,*
in response to message #6 by Frido Bohn

Ah, got it. I will check.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #8 Posted by **Geir Isene** on 20 Jan 2012, 12:31 p.m.,*
in response to message #6 by Frido Bohn

The DISASM in the HEPAX module does not work in the CL environment even though the HEPAX resides in the NoV-64 module (the screen simply goes blank, and I have to press ON to get it back). I also checked the DISASM 4D module - end there seems to be an issue there too (will check more).

However, the disassembler in the David Assembler module does work - at least when the module is copied onto the NoV-64 module. It may still work on the pure CL as well (will check that later).

Edited: 20 Jan 2012, 12:31 p.m.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #9 Posted by **Meindert Kuipers** on 20 Jan 2012, 12:33 p.m.,*
in response to message #8 by Geir Isene

I seem to remember that there was a mechanism preventing the HEPAX disassembler to disassemble itself, as a kind of source code protection, so this may be causing the problems.

Meindert

Re: HP-41CL & NoV-64 (or its siblings)

*Message #10 Posted by **Geir Isene** on 20 Jan 2012, 12:37 p.m.,*
in response to message #9 by Meindert Kuipers

The HEPAX module is in page #6 and I try to disassemble the HEPAX RAM in page #8. Would it prevent the user from also disassembling HEPAX RAM altogether?

Re: HP-41CL & NoV-64 (or its siblings)

*Message #11 Posted by **Meindert Kuipers** on 20 Jan 2012, 12:51 p.m.,*
in response to message #10 by Geir Isene

Good question ;) I do not know how this mechanism works, but the implementation of HEPAX support in the 41CL could prevent disassembly in other pages as well. Will it refuse to work on any page?

Re: HP-41CL & NoV-64 (or its siblings)

*Message #12 Posted by **Geir Isene** on 20 Jan 2012, 2:59 p.m.,*
in response to message #11 by Meindert Kuipers

The HEPAX itself resides in page #6 and is on board the NoV-64, not in the CL itself. It refuses to disassemble HEPAX RAM on the NoV-64. I will check later tonight whether it will disassemble another page - like the CCD OS/X on board the CL plugged into page #D.

Update: No, DISASM does not work on the CL regardless if HEPAX is on a

NoV module or not and regardless of the target for the disassembling is on the NoV or on board the CL. Upon running DISASM, the function asks for the start address and the end address. Upon entering the end address, the calculator actually turns off (nothing else happens)

Edited: 20 Jan 2012, 3:19 p.m.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #13 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 20 Jan 2012, 3:39 p.m.,*
in response to message #12 by Geir Isene

I assume if you remove the NoV-64 module from 41CL and plug it into another HP-41, NoV-64 DISASM "will" disassemble MCODE resides in HEPAX RAM correct?

I wonder it has some mismatch that prevents MMU to work with DISASM to fully function during Logical to Physical address conversion on the 41CL.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #14 Posted by **Marcus von Cube, Germany** on 20 Jan 2012, 4:26 p.m.,*
in response to message #13 by Kerem Kapkin (Silicon Valley, CA)

You might try with the MMU disabled.

*Message #15 Posted by **Diego Diaz** on 20 Jan 2012, 4:37 p.m.,*
in response to message #13 by Kerem Kapkin (Silicon Valley, CA)

Hi all,

Also tested with real HEPAX, but DISASM still doesn't work on CL.

And yes, DISASM works into NoVRAM-32-64, on any other HP-41C/CV/CX.

Will keep on investigating...

Cheers from the Caribbean Sea.

Diego.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #16 Posted by **Monte Dalrymple** on 20 Jan 2012, 4:47 p.m.,*
in response to message #15 by Diego Diaz

I have duplicated the behavior in the simulator. I think that it has something to do with the value returned from the keyboard scanner when no key is down. The keyboard is read at location

088 in Bank 4, and a branch to the OFF routine is taken at location 08E in the same bank. I will post more information as I discover it.

I think that I also found where the test for disassembling the HEPAX code is, and I'll post that information after I have verified it also.

Monte

Re: HP-41CL & NoV-64 (or its siblings)

*Message #18 Posted by **Diego Diaz** on 21 Jan 2012, 12:16 a.m.,*
in response to message #17 by Monte Dalrymple

Hi Monte, all,

Thanks a lot for the patch!

A modified version of HEPAX bank 4 is available for NoVRAM, NoV-32 and NoV-64 users here.

This version only patches the keyborad bug, but does not remove the limitation on self-dissasembling HEPAX.

Just un-zip in your working directory. You may want to keep the original copy of HEPX1D-3.ASM in a safe place, so rename it before you replace it with the new patched one.

You'll need to run ClonixConfig and configure your module as usual for the update to take place.

Enjoy your 41's

Diego

Re: HP-41CL & NoV-64 (or its siblings)

*Message #19 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 21 Jan 2012, 1:28 a.m.,*
in response to message #18 by Diego Diaz

Thank you Monte and Diego for such quick response and resolution!

Diego, do you recommend this HEPAX patch on NoVRAM for modules used with 41CL or can be use used for all HP-41c/cv/cx safely?

Great work, thanks again.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #20 Posted by **Diego Diaz** on 21 Jan 2012, 2:21 a.m.,*
in response to message #19 by Kerem Kapkin (Silicon Valley, CA)

Hi Kerem,

The modified image can be safely used both in CL and standard 41's.

I've tested it both in a CL and a CX, the only drawback I've found so far is that you can't stop the DISASeMbling command by presing ON.

However, in case you enter a long memory block to disasemble and want to stop it middleway, just press R/S; so not a big issue whatsoever.

Hope you find it useful.

Cheers.

Diego.

Re: HP-41CL & NoV-64 (or its siblings)

*Message #21 Posted by **Ángel Martin** on 21 Jan 2012, 5:19 a.m.,*
in response to message #17 by Monte Dalrymple

Fantastic news! Thanks Monte, once again the CL delivers on the promise to be the 21st-century premier calculator !

Hahhh, yes this is a very biased personal opinion, so pls. don't let the dogs loose on me :-).

Preservation of Vintage Boxes

*Message #1 Posted by **aj04062** on 18 Jan 2012, 8:24 p.m.*

I recently acquired a HP-91 box to match with the calculator and manual I have. The base of the box is not split, but the all 4 corners of the top are and some edges along the top are splitting.

Does anyone have experience preserving these? I know I could just tape the insides, but seems like a rough approach. These appear to be held together from the graphics paper, so to really "restore", I would need to pull this back to apply some type of tape.

Ideas?

Re: Preservation of Vintage Boxes

*Message #2 Posted by **bill platt** on 18 Jan 2012, 8:35 p.m.,*
in response to message #1 by aj04062

"restoration" is not desirable. More desirable is to simply prevent further damage. Put the box inside a cushioned box, or inside a plexiglas box for display (and a sun shield when not viewing it).

Keep the calculator separate.

All tape degrades with time and doesn't restore--rather it is an ugly defect and non-original.

Edited: 18 Jan 2012, 8:36 p.m.

Re: Preservation of Vintage Boxes

*Message #3 Posted by **aj04062** on 18 Jan 2012, 8:39 p.m.,*
in response to message #2 by bill platt

Why wouldn't you recommend keeping the calculator inside the box?

All ni-cads have been removed to prevent leakage.

Re: Preservation of Vintage Boxes

*Message #4 Posted by **bill platt** on 18 Jan 2012, 10:31 p.m.,*
in response to message #3 by aj04062

Because when you want to pull out the calculator to look at it, play with it, power it up to keep the caps "fresh" etc you would have to touch the box...

Re: Preservation of Vintage Boxes

*Message #5 Posted by **Mojo88** on 19 Jan 2012, 12:14 p.m.,*
in response to message #4 by bill platt

I've dealt a bit with this and had great success with white paper glue. Often I come across a split corner where somebody has taped it and the tape is yellow or peeling off and doing more damage to the artwork. If you can lift the tape off carefully without damaging the graphics, you can usually get a decent result. The glue holds very well, better than the tape if you can keep the corners mated tight while the glue dries. The glue doesn't show when dry unless you use too much and make a mess of it. I've had near perfect results on some occasions and the boxes hold up to regular wear & tear, much better than tape. I'm pretty sure you can get some favorable results. I studied this a bit on the net with some research on restoring antique box art. The next step if you are very serious is to touch up with paint that you match but I've not had to do that with any of mine so far. Good luck!

IBM 1620 computer

*Message #1 Posted by **Don Shepherd** on 18 Jan 2012, 8:13 p.m.*

I recently got a book on this scientific computer from the early 1960's. Supposedly, it couldn't add; it used lookup tables to perform addition. At one point it had the code name of "Cadet" which, humorously (I think) stood for: **c**an't **a**dd, **d**oesn't **e**ven **t**ry.

Did anyone here ever program or use this computer, and what was it like?

Re: IBM 1620 computer

*Message #2 Posted by **Gerson W. Barbosa** on 18 Jan 2012, 8:28 p.m.,*
in response to message #1 by Don Shepherd

Ah, but it was soon followed by a far more advanced model:

"The 1620 Model II introduced basic ALU hardware for addition and subtraction (making "Can't Add, Doesn't Even Try" no longer applicable) and index registers."

http://en.wikipedia.org/wiki/IBM_1620

Re: IBM 1620 computer

*Message #3 Posted by **Don Shepherd** on 18 Jan 2012, 8:43 p.m.,*
in response to message #2 by Gerson W. Barbosa

Thanks Gerson, but I can't see that page for 3 more hours! I really don't like this 24-hour blackout.

Yeah, I see that. That poor guy trying to thread his **paper** tape is interesting. Magnetic tape must have seemed like a huge breakthrough!

Re: IBM 1620 computer

*Message #8 Posted by **Dave Shaffer (Arizona)** on 18 Jan 2012, 9:51 p.m.,*
in response to message #1 by Don Shepherd

Our local college (Juniata College; Huntingdon, Pa.) got one of these in 1963. I was a Senior in high school then and took a calculus course at Juniata (everybody does that these days, or their high school has calculus, but in 1963 the highest high school math was algebra 2, and it helped that your Dad (who 10 years later introduced me to the HP35) was a part-time physics/engineering instructor got you in the door at the college). I was the "curve buster" in that calculus class - on the first exam I got a grade 30 per cent higher than any of the college students!

Part of the course was to program the 1620. As I recall, the FORTRAN compiler was a deck of cards - you read it in first, and then read in your FORTRAN deck. A bunch of us was sure that we had programmed things OK, but we kept getting error messages. Turned out, there was a bad card in the compiler. (bugs have been around forever!!)

It was S-s-l-l-o-o-w-w! One of the assignments was to calculate pi using various approximation integration over a quarter of a circle (i.e. a lot of square roots). Various members of the class had a different number of slices to use in the approximation (I had inside trapezoidal, some had box approximations, either inside or outside the circle). I had something like 2000 slices, and a run took about 15 minutes of CPU time (you were the only one using the CPU!). My recollection is that I was good to 3 or 4 significant digits. I think any one of our HP calculators would do this now in a second or less!

Re: IBM 1620 computer

*Message #9 Posted by **Steve Leibson** on 18 Jan 2012, 10:18 p.m.,*
in response to message #1 by Don Shepherd

One of these 1620s has been restored to operation at the Computer History Museum in Mountain View, CA. The magnetic core memory had deteriorated from solder flux and was neither operable nor replaceable. So the restoration team got the smallest semiconductor SRAM they could buy, interfaced it to the 1620, and used a small fraction of the capacity of the chip. Before the overall museum redo about a year ago, you could watch a

live demo of the 1620 in operation. I'm not sure they do that any more. And yes, the 1620 did indeed use lookup tables rather than an ALU.

Re: IBM 1620 computer

*Message #10 Posted by **Don Shepherd** on 19 Jan 2012, 5:22 a.m.,*
in response to message #9 by Steve Leibson

Thanks Dave and Steve, very interesting stuff. If I ever travel to California I'll have to see that museum.

So, there was a bad card in the Fortran compiler card deck you had to read in each time. It's amazing how far we have come in this industry. I graduated from high school in 1968, and no schools around here (Louisville KY) had any type of computers then; the closest they got was big old mechanical accounting machines. Upon graduation I enrolled in ECPI, Electronic Computer Programming Institute, and learned IBM 360 assembler, RPG, and COBOL. ECPI couldn't afford the monthly rent on an IBM 360, so our instructor took our card decks to his day job, programmer at Blue Cross Blue Shield, and compiled our work. I was so proud of my first printout from that machine, it said "no diagnostics". I asked the instructor what that meant, and he said "it means you had no errors, congratulations". Great memories.

Re: IBM 1620 computer

*Message #14 Posted by **Don Shepherd** on 19 Jan 2012, 10:03 p.m.,*
in response to message #13 by Mike Morrow

Mike, I don't remember learning a lot about JCL from that early course at ECPI. In looking back at my old notes (which amazingly I have after 44 years!), this is about the only thing I could find. As I recall, our instructor took our card decks to his Blue Cross Blue Shield office and ran an assembler run to produce our listings one time, but that was probably all. He undoubtedly had to get permission from his boss to do that. I'm sure those simple assemblies didn't eat up very much CPU time.

I never really worked on any 360 or 370 system in a job, but I did take a course at the community college in the Washington DC area on JCL specifically, years later. I much preferred Univac's Runstream to IBM's JCL, as I think anyone would.

>
> I much preferred Univac's Runstream to IBM's JCL, as I think anyone would.

I very much agree, Don. Forty years ago I spent many enjoyable hours with the Georgia Tech (GT) Univac 1108 system with Exec 8 Level 27 as the OS. All of my programming that mattered was on the 1108, using some ASR-33 demand access and a lot of batch runs using hollerith cards punched on IBM 026 or 029 punch machines. I did limited programming in Algol on the GT Burroughs B5500 with its TSMCP OS. It was a very intriguing *stack* machine mainframe that documentation described as "Polish Notation" at the machine code level (which users did not utilize). It had a push-*down* stack with elements arranged FIFO from the *top* of stack. That is pretty much really RPN from the early 1960s, long before any HP calculator used it.

GT had an IBM System/360 for administrative use, so there was no access to that. I had my first JCL experience on the University of Arkansas System/370 in 1980. JCL was entertaining to play with, with the proper references, but I never found any benefit to its complexity compared to the Univac 1108 Exec 8 environment. I loved Exec 8 (although Level 31 which replaced Level 27 at GT seemed a bit squirrelly to me).

The era of student mainframe use and the early days of electronic calculators...now those were the good old days. :-)

Re: IBM 1620 computer

*Message #16 Posted by **Marc Ferrer (France)** on 19 Jan 2012, 10:34 a.m.,*
in response to message #9 by Steve Leibson

Hello,

Having read that the 1620 uses lookup tables in its ALU makes me think about HP stuff : the 9810/9820/9830 CPU has 2 256x4 bipolar ROMs dedicated to BCD arithmetic (from US patent 3,839,630)... quite a similar system.

Regards, Marc

Re: IBM 1620 computer

*Message #17 Posted by **Eric Smith** on 20 Jan 2012, 2:40 a.m.,*
in response to message #16 by Marc Ferrer (France)

Yes, but on the 1620 the table was in core, so you could easily change it. For instance, if you wanted to do a bunch of octal arithmetic.

Of course, the next user would be really upset if you didn't restore it to the normal table.

[WP 34s] Changing the overlay

*Message #1 Posted by **Jeroen Van Nieuwenhove** on 18 Jan 2012, 4:51 p.m.*

Today I removed my v2 overlay for a v3 overlay. Just a few tips:
Use a knife with a very sharp blade (e.g. an x-acto knife) to free a small corner of every individual key overlay, but be careful not to cut in the key itself.
Next, use a pair of tweezers to remove the key overlay by pulling on the corner you just freed. When you do it right, you can remove the key overlay with only a tiny bit of glue remaining on the key.
Do the same for the big overlay between the keys (freeing one corner and then gently lifting the overlay). This overlay will rupture and in my case, a few bigger patches of glue remained.
Use alcohol and a cotton swab/kleenex/... to clean the keys and the space between the keys. The glue will come off quite easily. It is important to remove ALL glue residue, especially on the keys.
Finally, apply the new overlay. I recommend using a pair of tweezers to correctly position the individual key overlays on the keys before adhering them. It is equally important to press firmly along the edges of the key overlays. This way, the calc looks like it comes straight off HP's production line (well, almost).
Of course, with 30B prices under $20, US residents might prefer to simply buy another unit, but for those of us who have to pay a lot more, changing the overlay is quite feasible. I am considering buying another 30B nevertheless, because who knows how long HP will be offering it?

HP-41 MCode Assembler/Linker 32-bit version

*Message #1 Posted by **MichaelG** on 18 Jan 2012, 2:51 p.m.*

The current HP41 MCode development suite SDK41 from Warren Furlow was developed about a decade ago. The environment is developing and under the modern 64-bit Windows the 16-bit tools do not work anymore.

I started some research whether it is possible with low effort to move up the tools to the 32-bit level. And indeed the assembler A41 ist running well. The linker L41 produced its first .rom a few minutes ago.

Now everything needs to be tested.

My question for you all: Are you interested in the 32-bit versions at all? Or do you don't care? Meaning is that worth the effort? Do some people volonteer to help me testing the versions? E.g. comparing 16-bit results with the 32-bit results?

The suite contains more tools than A41 and L41. Which tools do you think should be ported to 32-bit as well (hopefully not all)? I guess the disassembler most probably.

Michael

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #2 Posted by **cgh** on 18 Jan 2012, 3:00 p.m.,*
in response to message #1 by MichaelG

Hello,

I have ported the SDK41 of Warren Furlow under Linux and *BSD. It works on 32-bits. It need GCC to be compiled, so it may be usable under DOS/Windows with the GCC. I used a41 to generate MCODE and d41 to disassemble. The linker l41 seems to work but I never went further. The t41 compiles, but I never use it. I have tried to make working the emulatotr m41, but I have preferred to start a rewrite of NSIM (nsimII) from Eric Smith.

Christophe

in response to message #2 by cgh

I am very interested in your Linux version - could you send it to me?

I don't care about a 32-bit Windows version as I haven't used Windows since 12 years (except for some once-in-a-blue-moon weird reason)

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #4 Posted by **Eric Smith** on 18 Jan 2012, 5:04 p.m.,*
in response to message #2 by cgh

I'm interested in the Linux version of SDK41 also. Maybe there's enough interest to warrant putting it on a web page? Warren would probably be willing to put it on The Site That Must Remain Nameless.

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #5 Posted by **cgh** on 18 Jan 2012, 5:32 p.m.,*
in response to message #4 by Eric Smith

OK. The work is sleeping from several years and will be delivered as is. I gave up. Currently, I have no time to continue this job. I will send it to Warren and see with him to put it on TOS.

Edited: 18 Jan 2012, 5:33 p.m.

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #6 Posted by **Geir Isene** on 18 Jan 2012, 5:38 p.m.,*
in response to message #5 by cgh

If it works OK, it would be an improvement over running the SDK in a Dosbox under Linux.

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #7 Posted by **MichaelG** on 19 Jan 2012, 2:15 a.m.,*
in response to message #2 by cgh

Thank for your offer. The Windows 32-bit port of A41 and L41 is already finished. Btw, I'm using Visual Studio 2010, so I don't need to deal with command line tools :-)

All the credit goes to Warren. The SDK is written in pure C and beside one or two little glitches they compile and run as 32-bit versions. Some years ago I ported a cross assembler and linker and that was really a pain.

To be honest I changed to behaviour of the assembler a bit. I simply couldn't live with the fact that the assembler modifies the original source code. I did a lot of assembler programming over the years with different tools but never came across that "feature".

The only difference now is the A41 only reads the source file and creates (on demand) a new listing file with the extension .lst.

Another new feature is the A41 now operates fully case-insensitive on the source file.

Lets see whether the demand of the 32-bit Windows version exists (at least for me since I have only 64-bit OSs running).

Michael

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #8 Posted by **Frido Bohn** on 19 Jan 2012, 9:12 a.m.,*
in response to message #7 by MichaelG

Well, at least for me a Windows 32-bit version would be very welcome (as I have given up struggeling with Linux for years).

The command-line structure of the assembler/disassmbler/linker complex is not just the state-of-the-art environment nowadays.
I don't know if you have integrated their functionality in one application. That would be nice.
Anyway, I would like to test it as long as you give the instructions what exactly you would like being tested.

Re: HP-41 MCode Assembler/Linker 32-bit version

in response to message #8 by Frido Bohn

> Quote:
>
> I don't know if you have integrated their functionality in one application. That would be nice.

This feature has already been availble. It is documented but I admit I came across that while studying the source code. If you list source files instead of object file in the linke file the linker calls the assembler automatically. Additionally when using this feature a small "make" feature makes it even more interesting. The linker checks the last modification date of both the source file and the object file and only runs the assembler if the source file has been modified after the last assembly run.

I discovered some major problems in this area. They seem to be solved now.

Next modification I made to both tools: you HAVE to specify the file extension of all input files. That also includes the object and source files in the linker project file. No implicit file extensions any more.

I think I can go public with the first beta version tomorrow.

Michael

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #10 Posted by **MichaelG** on 20 Jan 2012, 4:44 a.m.,*
in response to message #8 by Frido Bohn

I dare to go public. My tests show good results. E.g. I built Monte's huge source file for the CL and compared the ROMs. They are identical. That seems to be a good starting point for the 32-bit version.

If you are interested you can download the tools, a small manual (which lists the differences) and a small expample:

download.michael-goericke.de/SDK41R6.1-32v1.zip

I would be a great help if you have the chance to compare more ROM images created with both the 16-bit and the 32-bit version.

Michael

Hi Michael,

Every contribution to keep the HP-41 alive and kicking is very welcome to most of us... :-)

Thanks for sharing this new tool!

Cheers.

Diego.

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #15 Posted by **MichaelG** on 21 Jan 2012, 3:21 a.m.,*
in response to message #8 by Frido Bohn

Good news the disassembler is running fine. Again there are some slight changes all documented in the PDF:

1) As with the A41 and D41 you need to include the file extension for all input files.

2) Trailing NOPs are omitted

3) You can create both a pure source file or a list file that contains the object code as well as the mnemonics (same format as the list file created by the assemble).

To be consistent I change the format of the options of the tools once again. There are few options that need more data. Option and data are now separated by a colon. Its about these option: D41: /l:file.lbl, /p:9 A41: /a:<xx>

I am sure that makes the options a bit more readable - for humans :-)

The link to the tools is still the same:

download.michael-goericke.de/SDK41R6.1-32v1.zip

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #16 Posted by **MichaelG** on 22 Jan 2012, 6:06 a.m.,*
in response to message #15 by MichaelG

New version uploaded. The A41 now creates a list file with columns to beautify the output. New option /x added which turn on the expansion of the macros .FILLTO and .BSS.

Michael

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #17 Posted by **Monte Dalrymple** on 22 Jan 2012, 10:24 a.m.,*
in response to message #16 by MichaelG

One thing that I would find useful for A41 would be the ability to fill with 0x3FF instead of 0x000. This would leave unused locations unprogrammed when loaded into a Flash memory...

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #18 Posted by **MichaelG** on 22 Jan 2012, 11:50 a.m.,*
in response to message #17 by Monte Dalrymple

Shouldn't be a big deal. Do you need equivalents for both .BSS and .FILLTO? I could think of an optional parameter for both directives or 2 new directives. To be honest 2 new directives is a bit easier to implement. Any ideas for the names?

Michael

PS: I don't know whether you all get a notification mail when someone posts in a thread. At least I don't get one. In order to speed up some communication you can write me to hp41(at)michael-goericke.de

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #19 Posted by **Monte Dalrymple** on 22 Jan 2012, 12:22 p.m.,*
in response to message #18 by MichaelG

I haven't used .BSS yet. New directives might be preferable. A new directive could be .UNFILLTO ;-)

Re: HP-41 MCode Assembler/Linker 32-bit version

*Message #20 Posted by **MichaelG** on 22 Jan 2012, 12:44 p.m.,*
in response to message #17 by Monte Dalrymple

Ok, new version is ready for download (same link). I added a new directive .FILLTOVAL that takes 2 parameters <address> and <value>. E.g.

.FILLTOVAL 0045 35F

That enables you to fill with any value you like.

Michael

WP 34s Re-Flashing

*Message #1 Posted by **Jim Johnson** on 18 Jan 2012, 11:03 a.m.*

I was successful in finally re-flashing the memory of the HP 30b calculator, but with some difficulty. I'm using MySamba, running on a Windows 7 pc. I used a USB to serial adapter (Staples brand, but suspect it's really a Belkin adapter). This connects to the DB-9 serial connector on the flash cable that connects to the 6-pin connector that plugs into the back of the HP 30b. I was successful in getting the calculator to erase (no response of the ON button) after a lot of manipulation of the ERASE and RESET buttons on the programming cable. The HP 30b now "appeared" dead (no display response to a key press). After some frustration using various usb to serial converters, I re-read the instructions about pressing the "ON" key before you try to upload the code to re-flash the calculator. THIS IS ESSENTIAL! The board inside of the HP 30b won't automatically come on when you plug in the programming cable. So before you press "SEND" on the MySamba window, you MUST press the "ON" key (or EXIT key if you've re-labeled the HP30B) on the HP30b so the calculator will power up and communicate with the MySamba program. Once I figured this out, it uploaded the program and re-flashed the HP 30b. Sounds simple, doesn't it? Not if you are interrupted in the middle of the re-flashing process and you miss this step of pressing the "ON" key before re-flashing the AT91SAM7L128-EK processor! Good luck to all in this endeavor and thanks to the tireless WP 34s team.

WP 34s Overlay

*Message #1 Posted by **Jim Johnson** on 18 Jan 2012, 10:38 a.m.*

I just received my WP 34s overlay and was very excited to apply this overlay on my HP 30b. I carefully applied the labels and flashed the calculator. After some difficulty in re-flashing (more in another posting), I was finally successful. I noticed that the "OFF" label is located on the sloped portion of the EXIT key and is labeled in a green color. Using the green shift key didn't turn off the calculator. Looking at the WP 34s manual reveals that the blue shift key turns off the calculator, and indeed the overlay shown in the manual reflects that. It seems as if there is an error in the overlays that I received. Is there a corrected overlay? Has this already been noted? If so, my apologies for repeating this in the forum.

Re: WP 34s Overlay

*Message #2 Posted by **Marcus von Cube, Germany** on 18 Jan 2012, 10:52 a.m.,*
in response to message #1 by Jim Johnson

The overlay is for the most recent software version: V3. We have yet to create a zip file for release. For the time being, you need to go to the SVN repository and download the manual and the calc.bin file from there. This works fine from the web.

Edited: 18 Jan 2012, 10:53 a.m.

Re: WP 34s Overlay

*Message #3 Posted by **Jim Johnson** on 18 Jan 2012, 11:06 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thank you very much, Marcus. My apologies for the confusion. I'll retrieve the latest V3 version and reflash the micro.

Re: WP 34s Overlay

*Message #4 Posted by **Marcus von Cube, Germany** on 18 Jan 2012, 5:59 p.m.,*
in response to message #3 by Jim Johnson

I've updated SVN with the most recent build, including some files from the library which are now available combined with the flash files as calc_full.bin.

Beware: V3 is still a moving target!

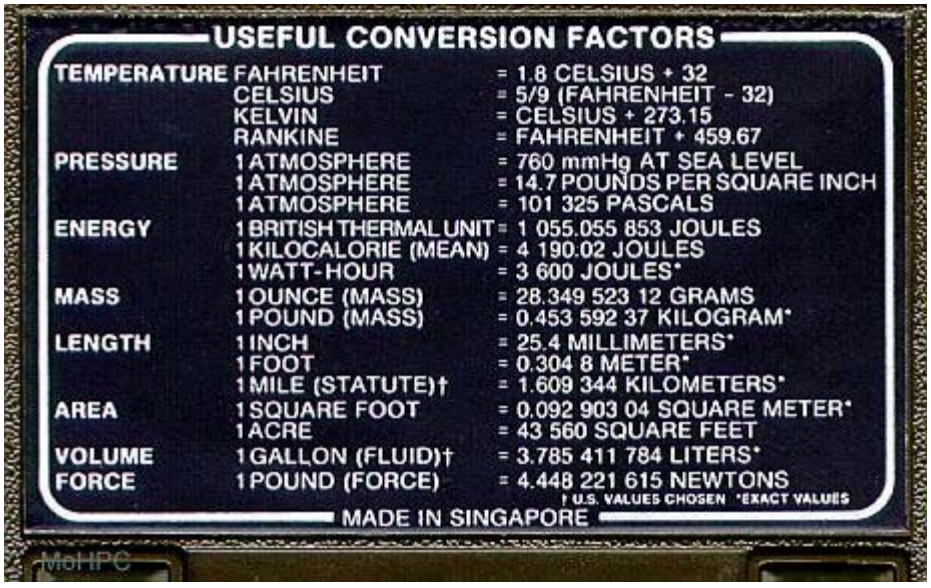
HP-65/67 back label

*Message #1 Posted by **Kees Bouw** on 18 Jan 2012, 4:55 a.m.*

Does anyone know if a HP-65 **ALWAYS** has this label on the back:

I have seen photo's of a HP-65 on eBay, where the label on the back is the one usually seen on a HP-67, titled "Useful Conversion Factors":



The label appears to be undamaged. Could it be an original HP-65 that has not been tampered with and that still has this Useful Conversion Factors label on the back? (The photo's above are from the museum just to show which label I am talking about, they are not from the HP-65 I have seen.)

Edited: 18 Jan 2012, 4:58 a.m.

Re: HP-65/67 back label

*Message #3 Posted by **Dale Reed** on 18 Jan 2012, 9:35 a.m.,*
in response to message #1 by Kees Bouw

Note the "Made in U.S.A." on the bottom line of the HP-65 label and the "Made in Singapore" on the conversion factors label.

If the serial number on the unit in question has an "A" after the first four digits, I would expect a label that says "Made in U.S.A. (the HP-65 label). If the serial number has an "S" after the first four digits, I would expect a label that says "Made in Singapore" (the conversion factors label).

Dale

>
> Dale

The serial number has an S and the label says "Made in Singapore" so that matches. Also, there is no serial number etched between the top two feet as is common for the HP-67 (instead, it is on a label between the bottom two feet, just where it should be), so I must conclude that the bottom is genuine HP-65. The "Useful Conversion Factors" label is very even, no folds or wrinkles of any kind. So if someone replaced the back label they have done an extremely good job. If it has been replaced by a new fake label, then it makes no sense that the wrong label was used. They might as well have put on the "usual" label. It's a mystery.

Re: HP-65/67 back label

*Message #5 Posted by **John Robinson** on 18 Jan 2012, 5:11 p.m.,*
in response to message #1 by Kees Bouw

The Useful Conversion Factors label is the HP67 back label. Every 67 I own or have seen has this label. Also, every 65 I own or have seen has the first label.

Cheers, John

Re: HP-65/67 back label

*Message #6 Posted by **John Robinson** on 18 Jan 2012, 5:14 p.m.,*
in response to message #5 by John Robinson

Of course the label could be one of Ben Ong's excellent reproductions, but I don't know why you would use a 67 label when Ben makes 65 labels as well.

The other option is that the whole case back has been swapped, but that would require access to the two screws under the label. I think the 65 and 67 case backs are the same.

Re: HP-65/67 back label

I seriously doubt it. Ben's labels omit the "Made in ..." at the bottom of the label to avoid fraud.

Re: HP-65/67 back label

in response to message #7 by Michael de Estrada

> Quote:
>
> Ben's labels omit the "Made in ..." at the bottom of the label to avoid fraud.

The label does have "MADE IN SINGAPORE" on it and as far as I can tell from this photo, is a genuine HP-67 label. Since there is no serial number etched between the feet, it must be a genuine HP-65 backside. At the moment, the only reasonable explanation I can think of is that the calculator was serviced some years after it was discontinued, and that the service center no longer had any HP-65 back labels. So they put a HP-67 label on it instead.

Re: HP-65/67 back label

*Message #9 Posted by **John Robinson** on 22 Jan 2012, 5:23 p.m.,*
in response to message #7 by Michael de Estrada

Hmmmm, the labels I have from Ben all have "Made In..." but I did buy them some years ago, so

maybe he has changed them now.

Cheers, John

Looking for HP calculators... I´m frustrated

*Message #1 Posted by **Fabricio** on 17 Jan 2012, 9:25 p.m.*

[NOTE: This is a long story out of frustration, not a technical one. Please read it only if you have time to spare!]

I am not a collector as some of you are, but only a hard-core user: my sin was that my father brought home an 11c when I was about to enter middle school (in the middle of the 80´s). For fun, wanting to show off, and a lot of spare time, I learnt rpn. Well, as most of you, I became adicted to it. Most of middle school I used it, as well as my first semester in college. Then HP-28s came around, but was way out of my reach; I even worked to make some money, but only managed to save like 1/3 its cost. I ended up buying a casio (yes, laugh or cry as much as u want). I was so frustrated with that that promised myself I would buy an HP 28s as soon as I could. That only happened when graduated from engineering, but by then HP 48GX was on the shelves and got mine in 1997. I used it very little in the following years, mainly cause my then boss gave me a 32sii. I loved that one, and used it every single day, from 6 to 10 hours daily, from somwhere in 1999 to somewhere in 2004, when it died. Then I started using again my old HP 48GX from somewhere in 2005 until mid 2011 (last august), when I realized that the keyboard was close to useless. I didn´t know about the hp situation nor about this forum; I was naive enough to think that I could get something like the 32sii. I called a friend and he told me he was using the 35s, so I ordered one. As soon as I opened the box, the yellow (turning quickly into red) alarm lights started flashing. You may defend or not the system/firmware of it, but just judging by the quality, it is awful (bear in mind that all I had in life was an 11c, jump to a 32sii, and then my 48GX, all "clasical" ones, at least in the middle level). As I started to look for more models, I realized that there were no "more models", and completely panicked; and then I found this forum, and found the "ugly truth". In desperation I started buying calculators in Ebay and other sites, trying to stock for the rest of my life. The result is that I have now:

HP 28s:

1 like new HP28s (I had to take my frustration out now that I can, in terms of money) from Ebay. 225+int´l shipping.

1 badly used HP28s from Ebay, that feel awful when pressing the keyboard (I don´t count this one for anything other than an expensive paperweight, 129usd+int´l shipping).

1 useless HP28s, bought in Ebay, whose keyboard does not recognize the last 4 keys in the bottom. 125+int´l shipping

1 decent HP28s. not the best but usable. 125+int´l shipping, from Ebay.

1 decent HP28s. offered as mint and the best I could find, but it is a bit worst than the previous one. 325+int´l shipping (it was a rocky mistake...).

HP 15c LE: 2, from samson. one bought in 100, the other one in 150. sent through Fedex, paying somwhere between 50 to 80 usd each, plus around 80usd in taxes, each.

HP 27s:

1 bought in Mexico, useful but it clearly looks was refurbished. aesthetically awful, to say the least. your fingers cry just when touch it.

1 HP 27s bought in Ebay. On it´s way still.

HP 42s:

2 bought in Mexico, one made in Brazil and the other one in Singapore. First one looks to be refurbished, but in great condition. The second one also refurbished, and in very bad condition aesthetically.

1 HP 42s offered as mint, like new, in Ebay, for 375usd + 75ups shipping + 110us taxes. Well, the best way to waste money: while aesthetically it looks really nice (it was originally boxed), it has been used as much as possible so that the keyboard is starting to feel a bit loose.

1 HP 42s offered as "in excellent condition" in Ebay that arrived today, but the faceplate is slightly lifted and with two very small deformations, so I am asumming it was also refurbished.

1 HP 42s bought in Ebay, on its way yet.

HP 48:

1 48GX offered in Mexico as new. Well, it was really new, but stored with bateries so there was some leaking in the batery compartment. I cleaned it, but there are traces of slight corrosion on the metal.

1 48S, bough it for 6usd in Mexico. It has a stain inside the display, that makes difficult to read the fourth line in the stack, but otherwise it is in good shape.

So, as you can see, in my desperation I have put a lot of money and effort to stock for the next 30 years (the span I expect to be left of my working life, clearly if I am not "called" before), and beside the 2 brand new 15cLE, I barely can say that 2-3 calculators are actually in a great, or excellent condition. So, that is my frustration: I can understand HP made the 15cLE for all of us, but it is made in China and don´t expect it to last that much (5 years of everyday use, as average, in my case for the classic ones). We may argue that most things these days are that cheap, but in terms of durability and availability expectation for it in the next 10 years that makes little help. And for the rest of my calculators, I have only to resign myself to live with a lot of them that vary from extremely used (or even abused) to highly used at least, with the suspicious that some of them are refurbished, with most of them with a scratch here and there, and then with the expectation that each will give me only 2-3 years of useful life.

I´m frustrated. Call me an old guy, but I miss the old hp...

PS. And am not talking about how close a cheat some ebay sellers are!

Fabricio,

My 17 years old has access to 3,200 TI calculators. He recently picked a TI Nspire CX and I don't expect it back till he graduates from high school!

He is an Apple guy with an iPhone 4GS, iPod Touch and Apple TV and disliked all the TI-84 iterations and early Nspire's but is hooked up with the new CX model.

Give it a try!

Cheers, Joerg

Our son got one of those at school too, recently. The kids love it, because they can download games from the internet and play secretly while pretending to study algebra :-)

But I'm not so convinced of this thing. It really should be called "educational toy" instead of calculator. The display size for simple numbers is microscopic, most functions are hidden in menus and worst of all, it is not programmable! I also have one of its predecessors, the Voyage 200, which I think is far superior in every respect and which I consider the best pocket calculator ever (apart from the Hp25 of course...). This also reflects in the eBay prices that are twice as high for a Voyage compared to the Nspire!

Ciao, max

The NSpires have always been programmable, in BASIC. And it is very fast. The current NSpires (CX) are also programmable in Lua, I believe, which is much more powerful but a bit more cumbersome than BASIC.

Bienvenidos al club de hombres viejos.

You can find good articles here on re-fixing your fixed calculators. There is also someone who posts here who is getting ready to publish a book on refurbishing hp calcs. Another person who posts here, Randy Sloyer of "fixthatcalc.com, does fine work on the models he works on but he is in the US and you'd probably have to pay import duties again.

There are worse addictions.

How can I confirm that 4 of my 5 HP42s I have now have been really fixed, as I suspect? The only evidence I have is that the face plate is lightly separated upwards, above the display. In some it is evident that it was badly pulled, but in others it is not that evident. As said, I have a dead 32sii, and although it lived for 5+ years the faceplate is still firmly attached to the body of the calculator. Any tip?

BTW, in case they were fixed, what is the usual fail *they*, whoever "they" are, fix in that model?

Fairly hard-core, indeed. :)

I buy old calcs to play with them. That makes me an enthusiast. I could describe myself as a collector in that I have several examples of all the models I'm interested in. But that's bush league compared to some of the folks you'll meet around here. :)

Welcome to the asylum!

in response to message #11 by Howard Owen

Asylum?

what asylum?

I'm 28 years old and like old calcs also :)

My big interest are 48 series.

I have 16 of them, one of the best I have "created" is a singapore unit in near perfect condition with molded keys and black LCD.

Why don't you swap parts of the calcs between them, so you can have prefect ones and not so nice ones?

Regards

I think that comment was meant for the original poster, but I personally have several "frankencalcs." Cobbling a working machine together from several broken ones is one of the great pleasures I derive from my hobby. I think that shows why I think of myself as an enthusiast and not a collector.

> > Yes, we know what an asylum is. In other languages it may have a different meaning.

Exactly. And even if the definition was clear, I used the word in a special sense that may not have been clear. The main meaning in English is "refuge," but the way I used it originally was short for "insane asylum," which is a somewhat ironic use of the word, given the history of such institutions. You may have had no trouble understanding that, but I thought the fellow I was responding to may have misunderstood me. My reply was intended both to provide more context to aid understanding, and to make a joke at my own expense. (Note the smiley. :)

Unfortunately I think I may have confused the issue by saying that the term "fit the definition *for me*." I wasn't trying to be patronizing. My apologies if it seemed that way.

in response to message #1 by Fabricio

My advice, sell all calculators you have to fund the purchase of an original 15C (or 11C) in mint condition, and never look back !!

Cheers, John

Re: Looking for HP calculators... I´m frustrated

*Message #17 Posted by **bill platt** on 18 Jan 2012, 7:53 p.m.,*
in response to message #16 by John Robinson

Better yet, sell them all and stop worrying about calculators...

I have two 15c but they are hardly the most effective or user-friendly machines. The ones with the algebraic solvers are much more useful, especially the ones allowing variable naming (48 series, 17/27 and 18/19 series)

You seem to like the same HPs that I do, so you may have some joy with the same "fix" as me. I've got a 16C, 28S, 42S and 48SX. I don't collect calculators exactly, just buy, use and accumulate them. I've also got a 35s, so I know what you mean from your description, although I seem to like it more than most here.

Anyway, for what it's worth, here's my suggestion: If you want to take a small gamble, please try the 50g. You can get one for a modest sum (compared to eBay prices for the more desirable older models). You know it will be brand new and not trashed, and will come with a warranty.

I bought one to try, and I was - against expectations - instantly delighted. I've grown more and more excited by it as each day passes. It's not as lovely as the older models, either aesthetically or in terms of build quality, but it's certainly not rubbish either. When you consider its 28/48 heritage, ALG48 and Erable extensions, screen estate and clarity, programming ability (user/sys RPL, Saturn and ARM assembler all on board), speed and memory capacity, you may find it to be a winner. I did, and I've since bought ten more of them! My daily use one is coming up for two years old, and it's been completely reliable. In fact it's probably my favourite computer of all time, perhaps *just* beaten (mainly due to nostalgia) by my first computer, a Commodore PET.

*Message #20 Posted by **Chuck** on 18 Jan 2012, 1:29 p.m.,*
in response to message #1 by Fabricio

I don't know if I'm a collector or also an avid user, and I too dislike most every calculator made in the last 10+ years from al manufacturers (exception Casio slim was nice).

Older HP's I have include the 10, 11, 12, 15, 16, 20, 21, 22, 32, 35, 41, 42, 48, 49, 50, (if I recall correctly) and maybe a few others.

The ONLY one that is ever with me all the time is the 42S from 1987. I hope it is never lost or dies because I don't think I can replace it for what I purchased it 10 years ago ($65).

*Message #21 Posted by **Jim Horn** on 18 Jan 2012, 2:13 p.m.,*
in response to message #20 by Chuck

I have to agree with the suggestion to try the HP-50 and WP-34S. I've been using HP calculators daily since July 1975 with my HP-25. Nowdays I use my WP-34S as my primary calculator with my HP-50 as backup (some things it does better; some things I know how to use better on it). Both are fantastic - even with my WP-34S being a repurposed HP-20, not -30.

For those who gripe about HP being untrustworthy, an earlier posting puts it well - we *know* about the bugs in these machines. Who knows how many are in other vendors' products? Better the devil you know...

Hello Fabricio,

Original from Frabricio: I am not a collector as some of you are, but only a hard-core user...

I've to smile about this: everybody who have more than one calc, becomes a collector, even he uses them as there are made for. No "normal" human creature will buy and use more than one calc, if he is satisfied with that calc. Why should anybody learn different keyboard layouts, commands and so on?

So don't worry, rarely you get really a "new" ancient calc...

Sincerely peacecalc

*Message #23 Posted by **Fabricio** on 18 Jan 2012, 4:18 p.m.,*
in response to message #22 by peacecalc

You are making a very good point that is in my head recently. Before my "crisis" began last august (2011), the only calculator I had was my old HP 48GX (remember, I had an 11c and the 32sii, but they are now just skeletons as they both died long time ago; the 11c probably in 1999, and the 32sii in 2004).

And the whole list in the first post was just purchased in the period september 2011 - January 2012. And not all of the calculators are in the same place; I have distributed several sets of them in three different places, so I can minimize the risk. Just think what would happend if there was a fire in my office, and all caculators are there.

But also reality is that now I have in my desk an HP 42s, which is my favorite one (BTW, I didn´t knew the 42s existed before I found this forum last year!), just 5cm away from my right hand. 50cm away, to the left of my laptop is an HP 28s which I simply love (I really apreciate the "infinite" stack and the 4-line display) and is just waiting for my hands when in need of multiple, larger operations. A 15cLE is beside it, just in case... ah! and a 27s, which is not rpn, but just like to play with it.

Yes, maybe am not "normal" anymore, but happy I found all you so we are not alone!

For all of you just curious, I´m a structural engineer. That is the reason I know nothing about fixing or re-fixing a calculator, and also the reason why I use extensively a calculator every single day.

Regards every one,

Do you do FEM?

How often and why do you need or find a calculator useful?

Just curious.

Re: Looking for HP calculators... I´m frustrated

*Message #25 Posted by **Fabricio** on 18 Jan 2012, 4:31 p.m.,*
in response to message #22 by peacecalc

> Quote:
>
> No "normal" human creature will buy and use more than one calc, if he is satisfied with that calc...

Forgot to say, I need all them not in the short term, but in a span of 30 years. I will be using a few at a time, and when they are dead I´ll pick up a spare.

Beside extensive use, apparently I use too much force when pressing the keys, that´s the reason why a brand new HP only lived around 5 years with me. I am assuming most of my used calculators I have bought now will live less than that, and my guess is 3 years. That also applies to the 15cLE, without any basis other than judging the build quality. Doing the math, I need then 10 calculators for a full stock.

Also think about this: if right now it is almost impossible to get a really "new" old calc, or even one in excellent condition, imagine how difficult will be in 2022 to find a usable (forget about aesthetically nice) 42s.

HP are you listening?

I can understand Fabricio. The only difference between him and me is, that I knew about everything going wrong and I was quick enough to get several 32sii and 48GX at reasonable prices before they got discontinued.

That's enough for my professional career. No longer need HP and their current lineup of crap.

*Message #2 Posted by **Namir** on 17 Jan 2012, 6:15 p.m.,*
in response to message #1 by Les Bell

My late father used to work for a local import company that sold Monroe calculators (those that did not need electrical power as well as those that did) in Iraq. He did such a good job that he outsold NCR calculators. he kept one of the top of the line electrical Monroe calculator in his office decades later. I used to play with that machine, before I got my hand of an electronic calculator.

And the world being small, here is an interesting connection. My father's boss at the import company was a Turkish businessman who set up shop in Iraq in the fifties. Around 1960, he moved to Paris, where his daughter married (the now late) French director Claude Berri. Claude's son, Thomas Langmann (named after Thomas, my dad's boss) is the producer of the hit new (and silent) movie "The Artist" that was honored in the Golden Globe Awards last Sunday. It's a small world!

Looking for more HP documents to scan

*Message #1 Posted by **Dave Hicks** on 17 Jan 2012, 12:37 p.m.*

Hi everyone,

I'm starting to plan for a Version 8 of the Museum DVD-ROMs for sometime later this year.

I have a page on manuals that have been submitted or promised since Version 7, here:
http://www.hpmuseum.org/software/swcdv8.htm

And a page on how to scan and transmit scans here:
http://www.hpmuseum.org/software/scanadv.htm

And the list of manuals already on Version 7 is here:
http://www.hpmuseum.org/software/swcdp.htm

If you have any manuals that are still missing, please contact me. Since I have mostly exhausted my own collection, I will have time available to scan manuals that are sent to me. So, if you have manuals, you can scan them, or I can do them.

Thanks!

Tiny Challenge: significant digits

*Message #1 Posted by **Werner** on 17 Jan 2012, 8:23 a.m.*

41/42/...

Challenge: Create a program that will return the number of significant digits.
When run on a 41, it must return 10. The *same* program run on a 42S must return 12, and on Free42 decimal, it must return 25.

Cheers, Werner

Same logic On a 50G :

```
« 1 3 INV 3 * - LOG NEG »

or

« 3 INV ->STR TAIL SIZE »
```

Edited: 17 Jan 2012, 12:05 p.m.

Re: Tiny Challenge: significant digits

*Message #6 Posted by **Oliver Unter Ecker** on 17 Jan 2012, 1:22 p.m.,*
in response to message #5 by Gilles Carpentier

Nice.

Insert ->NUM to make this work in exact mode, too:

```
« 1 3 INV 3 * - LOG NEG ->NUM »
« 3 INV ->NUM ->STR TAIL SIZE »
```

If you EVAL the first, instead of doing ->NUM, it returns +Infinity, as it should.

On ND1, it returns Infinity, too, even though there's no exact mode.
Intriguingly, 0.3333... * 3 is 1 with IEEE-754!

Are you doing binary arithmetic in ND1? With decimal arithmetic this shouldn't happen.

Re: Tiny Challenge: significant digits

*Message #8 Posted by **Oliver Unter Ecker** on 17 Jan 2012, 6:14 p.m.,*
in response to message #7 by Marcus von Cube, Germany

Marcus,

You mean BCD, right? ("Binary arithmetic" sounds like arithmetic with binary numbers...)
Sadly, ND1 doesn't have a BCD option yet.

Reals are IEEE-754 doubles in ND1. And the RPL programs above imply reals. (Unlike on the 50g in exact mode, where they imply BigInts. ND1 does have BigInt support, but I chose to not adopt the HP 50g convention (in exact mode only) to regard a decimal typed without a "dot" as a BigInt. Instead, if you want a BigInt, you have to use R->I (or toBig, in "modern" syntax).)

In the latest release BigFloats are supported, too.
So,

```
« 3 toBigF INV ->NUM ->STR TAIL SIZE »
```

will actually return whatever the BigFloat precision is set to (40 digits, by default).

To confirm that "1/3*3" is "1" in IEEE-754, just type this in gdb:

```
p 1.0/3.0*3.0
```

Works for any integer-valued double I tried.

Not bad for a format, for which 1.12 is 1.1200000000000001.
(Yes... I'm still yearning for including BCD at some point.)

EDIT: I educated myself and do understand now that with "binary arithmetic" you meant (and correctly termed) what to me is floating-point arithmetic. So, yes, ND1 is using binary arithmetic exclusively, for its Real data type.

Edited: 18 Jan 2012, 3:33 p.m.

Re: Tiny Challenge: significant digits

*Message #9 Posted by **Marcus von Cube, Germany** on 17 Jan 2012, 5:22 p.m.,*
in response to message #3 by J-F Garnier

On the WP 34S you need to add an ENTER^ after the first number or replace it by # 1 (from the CONST catalogue). It returns 16 in single precision and 34 in double precision which hits the nail on the head.

Re: Tiny Challenge: significant digits

*Message #10 Posted by **J-F Garnier** on 18 Jan 2012, 3:12 p.m.,*
in response to message #3 by J-F Garnier

Here is a version that works with binary arithmetic, such as Free42/Binary. The results is not exactly an integer since binary does not handle decimal digits as such.

Free42/Binary for Windows returns 15.95.

As it is less obvious than the BCD version, I added some comments.

```
01 LBL "T"
02 1.5
03 1/X  ; this creates a mantissa with 101010...
04 ENTER
05 ENTER
06 1
07 +    ; shifts the mantissa 1 bit right, loosing last bit
08 1
09 -    ; shifts back the mantissa left
10 -    ; difference is +/-1 LSB of mantissa
11 ABS
12 LOG
13 +/-
14 END
```

Re: Tiny Challenge: significant digits

*Message #11 Posted by **Oliver Unter Ecker** on 18 Jan 2012, 3:40 p.m.,*
in response to message #10 by J-F Garnier

Nice one! The string-based ones feel like cheats. I like that this uses purely arithmetic to figure the machine resolution.

Translated to RPL, this returns 15.95, too, on my machine.

Re: Tiny Challenge: significant digits

*Message #12 Posted by **Gerson W. Barbosa** on 17 Jan 2012, 10:05 a.m.,*
in response to message #1 by Werner

These have been tested on the HP-42S, Free42 Decimal and on the HP-15C:

```
00 { 17-Byte Prgm }
01>LBL "SD"
02 6
03 ENTER
04 1/X
05 1/X
06 -
07 1/X
08 LOG
09 1
10 +
11 .END.
```

```
001- f LBL A
002-   6
003-   ENTER
004-   1/x
005-   1/x
006-   -
007-   1/x
008- g LOG
009-   1
010-   -
011- g RTN
```

Cheers,

Gerson.

*Message #14 Posted by **Werner** on 18 Jan 2012, 1:46 a.m.,*
in response to message #12 by Gerson W. Barbosa

Almost what I had in mind..

```
01*LBL"SD"
02 .6
03 ENTER
04 1/X
05 1/X
06 -
07 LOG
08 CHS
09 END
```

Werner

Re: Tiny Challenge: significant digits

*Message #15 Posted by **Marcus von Cube, Germany** on 18 Jan 2012, 6:32 a.m.,*
in response to message #14 by Werner

To get this working on the 30b you need to input INPUT twice (or should I have said 'enter ENTER twice'? ;-)). The result is 12.

Re: Tiny Challenge: significant digits

*Message #16 Posted by **Oliver Unter Ecker** on 18 Jan 2012, 3:52 p.m.,*
in response to message #14 by Werner

Just for completeness: this method fails on a machine with binary arithmetic. Another instance of IEEE-754 cleverness. Double-reciprocation of 0.6 yields 0.6.

Re: Tiny Challenge: significant digits

*Message #17 Posted by **Werner** on 19 Jan 2012, 5:40 a.m.,*
in response to message #16 by Oliver Unter Ecker

? that has nothing to do with cleverness, but with the different base and smaller ulp.
okay, then this:

```
 .82
 ENTER
 1/X
 1/X
 -
 ABS
 LOG
 CHS
```

works on 41C, 42S, Free42 Decimal and Binary

Werner

in response to message #17 by Werner

> Quote:
>
> ? that has nothing to do with cleverness, but with the different base and smaller ulp.

Ok, thanks, I can understand that explanation and confirm that

```
<< .82 DUP INV INV - ABS LOG NEG >>
```

returns 15.95... on my machine too.

Sorry for using the word "cleverness". I'm inept at anything related to numerical analysis, and had guessed that maybe there was a design goal to build 1/x in IEEE-754 so that 1/(1/x) == x. Upon reflection, that requires infinite (and thereby theoretical) machine resolution.

In gdb:

```
p 1.0/(1.0/0.6) == 0.6  ==> true
p 1.0/(1.0/0.82) == 0.82 ==> false
```

Interestingly (to the goof I am), both 0.6 and 0.82 start out as non-exactly representable numbers in IEEE-754.

Can you tell if a given number (or its inverse) will pass this test, or not, without trying it out?

Re: Tiny Challenge: significant digits

*Message #19 Posted by **Werner** on 19 Jan 2012, 9:00 a.m.,*
in response to message #17 by Werner

In trying this out, I found an error in Free42 Binary (well, rather an 'inexactitude' ;-)
In Free42 Binary, do:

```
0.11 ENTER 11 ENTER 100 / -
```

it is not zero, and it should be. The 11 ENTER 100 / is correct (well to the full 52+1 bits), but the 0.11 constant is not, it misses the last bit (in the 52nd position, with the first bit implied). No doubt this happens because the decimal-to-binary conversion just stops at bit 52 - truncating the result instead of rounding it, as 11 ENTER 100 / does.

in HEX,

```
   0.11d = 0.1C28F5C28F5C28h
11d/100d = 0.1C28F5C28F5C29h
```

In Free42 Decimal, on the other hand, no round-to-even occurs (while it is of course implemented in the real 42S).

Still, I bow in wonder to the amazing achievement of Thomas Okken.

Werner

> No doubt this happens because the decimal-to-binary conversion just stops at bit 52 - truncating the result instead of rounding it, as 11 ENTER 100 / does.

I think you're right. I haven't touched that code in years and it's a bit light on comments, so I'll have to stare at it a bit more to make sure. The code is *supposed* to keep going through successively lower powers of 2 until they become too small to affect the mantissa, so it should give the correct result, but since it doesn't, I'll have to dust off the debugger and find out why...

- Thomas

Re: Tiny Challenge: significant digits

*Message #21 Posted by **Werner** on 22 Jan 2012, 3:32 a.m.,*
in response to message #20 by Thomas Okken

For this, I can use a workaround - just enter the constants in a different way (like 11 ENTER 100 /), but for the Decimal version not performing a round-to-even is much more fundamental to me, and there's no way round:

```
  3 1/X 2 /

 exact: 0.1666...6665, where the trailing 5 will be rounded.
 42S : 0.166666666666 (round-to-even)
 Free42 Dec: 0.16666 66666 66666 66666 66667 (round up)
```

Or, for addition:

```
 42S : 1 ENTER 5e-12 + -> 1.00000000000
 Free42 Dec: 1 ENTER 5e-25 + -> 1.00000 00000 00000 00000 0001
```

(all tested on iPhone Free42 version)
Werner

*Message #22 Posted by **Valentin Albillo** on 17 Jan 2012, 11:16 a.m.,*
in response to message #1 by Werner

Hi, Werner:

This doesn't meet the requirements of your challenge as it's not meant for the 41/42/... as asked but for the **HP-71B** instead, however I thought my approach might result novel.

For the HP-71B you don't actually need a program, just execute this from the command line:

```
-LGT(1-NEIGHBOR(1,0))

      12
```

This mathematical expression will work in any other calculator or computer provided you express it in its native paradigm (RPN, RPL, ...) and have available (or can inmplement) the two numeric functions required, namely **LGT** (base-10 logarithm) and **NEIGHBOR** (machine successor).

Best regards from V.

> Challenge: Create a program that will return the number of significant digits.

The significant digits *of the machine*, that is. When I first read this I assumed that the number of significant digits *of X* should be returned.
In other words: Enter 0.001234 or 1234 or 1234000 and get 4, while Pi would return 10 or 12, depending on the machine. Finally, 0 should return 0 ...or maybe 1?

Any solutions for this one ?-)

Dieter

in response to message #28 by Dieter

For the HP 50g:

```
<< MANT ->STR SIZE 1 - >>
```

Gerson.

Re: Tiny Challenge: significant digits

*Message #30 Posted by **Marcus von Cube, Germany** on 17 Jan 2012, 5:47 p.m.,*
in response to message #29 by Gerson W. Barbosa

In single precision this can be done on the 34S, too:

```
ALL 00
CL[alpha]
MANT
[alpha]RC# X
[alpha]LENG
DEC X
```

For double precision the alpha register is too short.

Edit: Thinking again this does not work :-([alpha]RC# X does format to the display size of 12 digits, not the full precision. Back to the drawing board!

Edit again: A loop should do:

```
MANT
0
x[<->] Y
LBL 00
x[!=]0?
SKIP 02
DROP
```

```
RTN
INC Y
FP
SDL 01
GTO 00
```

Re: Tiny Challenge: significant digits

*Message #34 Posted by **Gerson W. Barbosa** on 17 Jan 2012, 10:18 p.m.,*
in response to message #28 by Dieter

> Quote:
>
> Any solutions for this one ?-)

Here's my attempt at the HP-42S version. It will work for 0.001234 or 1234 or 1234000 but not for pi (because it's limited to 11 significant digits only)*. 0 will return 1 (because I think it should— but I may be wrong). On the HP-41 (not tested), all 1E10 constants should be replaced with 1E08.

```
00 { 33-Byte Prgm }
01>LBL "SD"
02 XEQ "MANT"
03 1
```

```
04 X<>Y
05>LBL 00
06 FP
07 X=0?
08 GTO 01
09 10
10 ×
11 1
12 STO+ ST Z
13 Rv
14 GTO 00
15>LBL 01
16 Rv
17 .END.

00 { 37-Byte Prgm }
01>LBL "MANT"
02 X=0?
03 RTN
04 ABS
05 LOG
06 FP
07 10^X
08 1E10
09 ×
10 0,5
11 +
12 IP
13 1E10
14 ÷
15 1
16 X>Y?
17 10^X
18 ×
19 END
```

Gerson.

---

* 12345678910 XEQ SD currently returns 11 instead of 10 because MANT returns 1.2345678909. Too bad the HP-42S doesn't have a MANT command like the WP 34S—

Edited: 17 Jan 2012, 10:46 p.m.

Re: Tiny Challenge: significant digits

*Message #35 Posted by **Werner** on 18 Jan 2012, 4:47 a.m.,*
in response to message #34 by Gerson W. Barbosa

use this MANT:

```
*LBL"MANT"
 X=0?
 RTN
 ENTER
 ABS
 LOG
 INT
 LASTX
 X<Y?
 DSE Y
 LBL 00
 RDN
 10^X
 /
 RTN
```

It only ever scales by a power of 10, and will thus never lose a digit.
Cheers, Werner

Gerson.

Re: Tiny Challenge: significant digits

*Message #37 Posted by **Dieter** on 18 Jan 2012, 1:18 p.m.,*
in response to message #35 by Werner

For the record: here's one for more recent models featuring a Floor function. Even though it may be called INTG. ;-)
It also handles x=0 differently so that the routine quits at one single common endpoint.

```
M001 LBL M
M002 ENTER
M003 ABS
M004 X<>0?
M005 LOG
M006 INTG
M007 10^x
M008 /
M009 RTN
```

And finally, here's a *completely* different approach for the HP41 with X-Functions resp. the 41CX. The goal was: Just display the mantissa, don't disturb the stack and leave everything as it is, including the display format.

The trick here is this: a ten-digit mantissa, one decimal marker and one leading space or minus-sign sum up to twelve alpha characters which will just fit in two registers, thus cutting off a trailing exponent such as "E-4".

```
01 LBL"MANT"
02 STO 01
03 " "
04 X<0?
05 CLA
06 CLX
07 RCLFLAG
08 SCI 9
09 ARCL 01
10 STOFLAG
11 CLX
12 RCL 01
13 ASTO 01
14 ASHF
15 ASTO 02
16 CLA
17 ARCL 01
18 ARCL 02
19 AVIEW
20 END
```

Yes, users with synthetic programming skills may provide a more elegant solution without any register use. ;-)

Dieter

This one uses another approach, here for the 41/42.

```
01 LBL"SDIG"
02 ,1          ; dummy ISG control number
03 X<>Y
04 LBL 00
05 ENTER
06 SCI IND Z
07 RND         ; round to (z+1) significant digits
08 ISG Z
09 X=Y?
10 GTO 01
11 RDN
12 GTO 00
13 LBL 01
14 RCL Z
15 INT
16 FIX 4       ; optional ;-)
.END.
```

Dieter

Re: Tiny Challenge: significant digits

*Message #44 Posted by **Oliver Unter Ecker** on 18 Jan 2012, 12:32 p.m.,*
in response to message #43 by Gerson W. Barbosa

I can't find either of these two in the AUR. Are these really stock functions?

ND1 extends SIZE to Reals.
So #1 can be written

```
<< pi SIZE 1 ->> // machine resolution for Reals
or
<< SIZE(pi)-1 >> // if you like algebraic...
```

and #2 can be written

```
<< MANT SIZE 1 - >> // # significant digits for input Real
```

Re: Tiny Challenge: significant digits

*Message #48 Posted by **Dieter** on 18 Jan 2012, 6:32 p.m.,*
in response to message #47 by Paul Dale

I'm not quite sure whether the 34s needs a neighbor function, but I think a function that returns 1 ULP of X might be useful. In this case, neighbor(x) simply equals x plus or minus ulp(x).

Assuming standard 16-digit precision, ULP(x) simply is 10^(EXPT(x)-15):

```
EXPT
1
5
-
10^x
```

Add an ENTER before the first line and a plus or minus at the end, and voilà, you got your neighbor function.

The "15" could be replaced by a special function that returns the current working precision (16 or 34). And if SDL and SDR would accept negative arguments they could be used instead of the final 10^x. Now, if I only knew the English term for "Wink mit dem Zaunpfahl"... ;-)

Dieter

*Message #50 Posted by **Paul Dale** on 18 Jan 2012, 8:43 p.m.,*
in response to message #48 by Dieter

> Quote:
>
> The "15" could be replaced by a special function that returns the current working precision (16 or 34).

We've got a conditional test to determine which mode the device is in. The ULP function should also work in integer mode returning '1'. Then that are infinities and NaN and subnormals to consider -- things are never as easy as they look :-(

> Quote:
>
> And if SDL and SDR would accept negative arguments they could be used instead of the final 10^x.

This works I think:

```
ABS
SDR or SDL
```

Maybe throw in a conditional and a branch to work either way.

Negative arguments are difficult given the way the opcodes are currently structured. Not impossible, just difficult.

> Quote:
>
> Now, if I only knew the English term for "Wink mit dem Zaunpfahl"... ;-)

Google translate gives "hint hint" which seems appropriate but I'm not sure if the intended meaning is quite the same.

- Pauli

Re: Tiny Challenge: significant digits

*Message #51 Posted by **Dieter** on 19 Jan 2012, 3:28 p.m.,*
in response to message #50 by Paul Dale

Here's my first attempt. Sorry, no assembler-compliant output. ;-)

```
01 LBL"ULP"
02  1
03 INTM?
04 SKIP 014
05 DROP
06 SPEC?
07 ERR 01
08 ENTER
09 EXPT
10  3
11  3
12 DBL?
13 SKIP 003
14 DROP
15  1
16  5
17  -
18 10^x
19 X<>Y
20 SIGN
```

```
21 STOx Y
22 DROP
23 END
```

The routine returns 1 ULP of x both in integer and real mode. The result is signed, i.e. the output has the same sign as the input. LastX (err... register L) is set correctly. All "special" arguments like NaN or infinity throw a domain error.

Regarding SDL/SDR and the mysterious "Wink mit dem Zaunpfahl": I realized that these shift functions are not very useful here since their arguments cannot exceed 99. So they will not work for very large or small arguments. A good old 10^x will do the trick.

There is no wrapper that saves and restores the stack, and local variables are not used either. I simply have not looked into this yet.

Dieter

Re: Tiny Challenge: significant digits

*Message #52 Posted by **Marcus von Cube, Germany** on 19 Jan 2012, 4:03 p.m.,*
in response to message #51 by Dieter

Don't worry about the stack mechanics, we can take care of this with some XROM only commands.

Re: Tiny Challenge: significant digits

*Message #53 Posted by **Paul Dale** on 19 Jan 2012, 4:18 p.m.,*
in response to message #51 by Dieter

There is no need to worry about stack dynamics or last X, we've special commands for dealing with these automatically. Writing proper internal functions in user code is easy now :-)

We can extend the range of SDL/SDR arguments to 254 but that still won't help since exponents go much further.

- Pauli

Re: Tiny Challenge: significant digits

*Message #54 Posted by **Marcus von Cube, Germany** on 19 Jan 2012, 4:48 p.m.,*
in response to message #53 by Paul Dale

Pauli, indirect arguments may well have much higher limits. It might need a modification but not a major one.

Re: Tiny Challenge: significant digits

*Message #55 Posted by **Paul Dale** on 19 Jan 2012, 5:23 p.m.,*
in response to message #54 by Marcus von Cube, Germany

For many commands having larger indirect arugments simply doesn't make sense. e.g. FIX, WSIZE, RL, SL, STO, ... The number of commands where a larger limit is sensible is really quite small and I can't think of any where no limit is good.

There are a bit or two left in the argument command table and we could allow an increased limit for indirect but restrict direct arguments to 254. Sounds potentially confusing to me.

- Pauli

The 34S will have the ULP function in the next firmware drop.

- Pauli

Re: Tiny Challenge: significant digits

*Message #57 Posted by **Dieter** on 20 Jan 2012, 9:16 a.m.,*
in response to message #56 by Paul Dale

Here is a slightly simplified version. It also does not take special care of LastX:

```
01 LBL"ULP"
02 1
03 INTM?
04 SKIP 013
05 DROP
06 SPEC?
07 ERR 01
08 ENTER
09 EXPT
10  1
11  8
12 DBL?
13 STO+ X
14  -
15  3
16  +
17 10^x
18 X<>Y
19 SIGN
20  *
21 END
```

I don't know if the 34s has a error-ignore flag (like the 41's Flag 25). If there is such a flag, the error command in line 07 also has to quit the function. This may be done implicitely (user code functions automatically terminate as soon as an error occurs), or two more lines SPEC? RTN are added.

BTW - I assume the original reason for the discussion on SDL/SDR instead of 10^x was execution speed. I wonder if 10^x really is so much slower that the additional code required for a SDL/SDR solution still makes the whole thing faster. On the other hand I did not look into the C-code for 10^x. There might be some more or less substantial improvement speed-wise if the 10^x code first checks whether x is integer or not. In the first case the result simply hat a mantissa of 1 and an exponent of x - no further mathematics required.

BTW2 - in other 34s code samples I noticed constants like #0 or #1. What's the use of these, and in which way do they differ from a simple 0 or 1? Would it make sense to use a "#1" in line 02 here?

Dieter

Re: Tiny Challenge: significant digits

*Message #58 Posted by **Marcus von Cube, Germany** on 20 Jan 2012, 9:36 a.m.,*
in response to message #57 by Dieter

0 differs from 0 in that no interpretation of the input has to take place. Think of # as a special RCL command that addresses a list of constants instead of memory registers.

Re: Tiny Challenge: significant digits

*Message #59 Posted by **Dieter** on 20 Jan 2012, 10:14 a.m.,*
in response to message #58 by Marcus von Cube, Germany

This doesn't seem to work in integer mode ("bad mode error"). Is this a bug or a feature?

Dieter

in response to message #59 by Dieter

> Quote:
>
> This doesn't seem to work in integer mode ("bad mode error"). Is this a bug or a feature?

A 'feature' I'm afraid. We have stored the constants in the internal BCD register format only, not as integers. There is no implied conversion (which would be costly in terms of processor cycles, more than interpreting a digit in the code).

Re: Tiny Challenge: significant digits

*Message #61 Posted by **Paul Dale** on 20 Jan 2012, 4:52 p.m.,*
in response to message #60 by Marcus von Cube, Germany

Plus only two of the constants are integers, so supporting such conversion doesn't seem like a big benefit.

- Pauli

Re: Tiny Challenge: significant digits

*Message #62 Posted by **Paul Dale** on 20 Jan 2012, 5:00 p.m.,*
in response to message #57 by Dieter

A few questions:

What is the result for ULP(0) ? 0, the smallest normalised number or the smallest denormalised number? I'll likely switch to the smallest positive denormalised

number instead of 0.

Why the sign preservation?

For integer mode I've used a separate routine:

```
STO L
CLx
INC X
RTN
```

The function table dispatches separately for integer and real modes so this is free space wise. For real mode, I've decided to code this directly in C -- I can play with the exponent field directly and thus avoid the 10^x. Also, handling denomalised numbers properly is something that I think will be difficult for keystroke programs to deal with.

- Pauli

Re: Tiny Challenge: significant digits

*Message #63 Posted by **Marcus von Cube, Germany** on 20 Jan 2012, 5:42 p.m.,*
in response to message #62 by Paul Dale

If we want to preserve sign and return 0 for 0 the function is identical to SIGN in integer mode. With Pauli's implementation of ULP (any mode), multiplication with SIGN will return the result of Dieter's routine.

in response to message #62 by Paul Dale

> Quote:
>
> A few questions:
>
> What is the result for ULP(0) ? 0, the smallest normalised number or the smallest denormalised number?

For the HP-71B, the **NEIGHBOR** function returns the smallest positive denormalized number if the second argument is positive, the smallest negative denormalized number if the second argument is negative, and 0 if the second argument is 0.

If you haven't set the flag to allow for denormalized results, you'll get an **Underflow** warning and a default 0 result instead.

Best regards from V.

Re: Tiny Challenge: significant digits

*Message #65 Posted by **Marcus von Cube, Germany** on 20 Jan 2012, 6:07 p.m.,*
in response to message #64 by Valentin Albillo

I think MINVAL & MAXVAL (mode dependent) may be useful information. Denormalized numbers are always allowed in WP 34S, only NaNs and infinities need a system flag to be set to not cause an error.

Re: Tiny Challenge: significant digits

The term you're probably looking for is "broad hint".
For the Germanistically challenged, the literal translation of "Wink mit dem Zaunpfahl" is "hint with a fence-post".

Re: Tiny Challenge: significant digits

*Message #67 Posted by **Paul Dale** on 20 Jan 2012, 7:06 p.m.,*
in response to message #48 by Dieter

> Quote:
>
> I'm not quite sure whether the 34s needs a neighbor function, but I think a function that returns 1 ULP of X might be useful. In this case, neighbor(x) simply equals x plus or minus ulp(x).

Actually it doesn't work this way :-(

ULP(10) = 1e-14. 10 - 1e14 = 9.99999999999999.

The correct neighbour below 10 is 1e-15 below = 9.999999999999999

i.e. 10 - ULP(10) loses a digit.

- Pauli

Re: Tiny Challenge: significant digits

*Message #68 Posted by **Dieter** on 20 Jan 2012, 8:00 p.m.,*
in response to message #67 by Paul Dale

First, it's easier to understand if these numbers with lots of zeros or nines are written with grouped digits. ;-)

Yes, exact powers of 10 are a special case. The next *higher* number here actually is 10 + 1E-14:

```
10 + 1E-14 = 10,00 0000 0000 0001
```

Which is what the proposed routine returns: ULP(10) = 1E-14.

On the other hand, the next *lower* value is not 1E-14 but just 1E-15 below 10:

```
10 - 1E-15 = 9,9999 9999 9999 9999
```

So there are actually two different ways to handle this.

This could be solved by two separate ULP functions, one for each case (up/down). Or we do it the same way as the 71B and implement a neighbor function with two arguments. Or... ;-)

Dieter

Re: Tiny Challenge: significant digits

*Message #69 Posted by **Paul Dale** on 20 Jan 2012, 8:15 p.m.,*
in response to message #68 by Dieter

I was copy/pasting the numbers from the console emulator that doesn't include digit separators or grouping :-)

ULP is good the way it is. It returns 1 ULP. Splitting this for ULP upwards and ULP downwards seems wrong to me. Having a neighbour function like the 71B is one option, having a pair of functions that return the next value larger or smaller than their argument is another (which I think I prefer but not by much).

Anyway, I've got ULP working properly for subnormals. For subnormals (and zero) it returns the smallest subnormal.

- Pauli

Re: Tiny Challenge: significant digits

*Message #70 Posted by **Dieter** on 21 Jan 2012, 8:54 a.m.,*
in response to message #69 by Paul Dale

With regard to the neighbo(u)r function:

> Quote:
>
> ...a pair of functions that return the next value larger or smaller than their argument is another (which I think I prefer but not by much).

Then throw in my preference for the latter solution. In addition to a (signed or unsigned) ULP function. Two separate neighbor functions are fine if they return two values that are not larger resp. smaller, but closer to zero resp. farther out. This difference is important for negative arguments. That's also the main reason why my original ULP routine returns a signed result: adding resp. subtracting this to the original X consistently returns the one or the other.

Dieter

Re: Tiny Challenge: significant digits

*Message #71 Posted by **Paul Dale** on 21 Jan 2012, 5:53 p.m.,*

in response to message #70 by Dieter

I think it would thus be better to have four functions which give the next representable value in the direction:

```
towards 0
away from 0
towards negative infinity
towards positive infinity
```

Maybe the 71b's neighbour or C nextafter function is what we want here after all. Then the user can specify exactly which direction to go.

Speed of the HP-41CL

*Message #1 Posted by **MichaelG** on 17 Jan 2012, 2:38 a.m.*

I recently watched a video on YouTube that shows a speed comparison of the 41CL and 41CX. My feeling was that the CL was about 4 time faster (or a bit more). The maximum turbo mode of the CL is 50.

Where does this big difference come from? I know the example makes intensive use of X-Memory. Does this slow down everything? Run "normal" focal programs faster?

Michael

Re: Speed of the HP-41CL

*Message #2 Posted by **Eric Smith** on 17 Jan 2012, 3:56 a.m.,*
in response to message #1 by MichaelG

In the 50x turbo mode, many, but not all, of the 41's microinstructions run at 50 times the normal speed. However, certain microinstructions, including all the ones that access the display and peripherals, have to run at normal speed, so those run at 1x, or perhaps even slower due to the delay to sync up to the 1x serial bus. This results in the average execution speed being much lower than 50x. The actual speed will vary a lot depending on exactly what your program is doing.

Edited: 17 Jan 2012, 3:56 a.m.

Re: Speed of the HP-41CL

*Message #3 Posted by **BobVA** on 17 Jan 2012, 7:10 a.m.,*
in response to message #1 by MichaelG

I don't think it's the X-MEMORY access, but rather what Eric mentioned above, the need to stay in sync with hardware not on the CPU board. In particular the 41CL manual notes that the keyboard must be scanned (a 1x operation) at every program line, which limits the speedup a program composed of relatively simple functions would see.

For example, a program that made multiple calls to transcendental functions would see a lot bigger speed boost than one that was just incrementing a counter. Cheers, Bob

I don't think they are in great demand. I bought one, with the appropriate books, for $20 at a local hamfest three years ago.

I'd always wanted a 990/189 since TI introduced it. It would have filled the empty spot of that KIM-1 that I wasn't able to afford in 1976. The 9900 series microprocessors had hardware multiply and divide instructions, which was rare back then.

wp34S timing crystal

*Message #1 Posted by **Peter Mansvelder** on 16 Jan 2012, 11:06 a.m.*

Hello, I have succesfuly flashed a HP30b into a WP34s, but I'd like to improve the timing by adding a crystal. I've seen in some earlier posts that it takes a 32768 kHz crystal and 2 capacitors, but since they're SMD devices, I would like to make sure I get the right specs; does anyone have part numbers or specs or even better, a small 'howto' to make the modification?

Peter Mansvelder

Re: wp34S timing crystal

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 16 Jan 2012, 2:10 p.m.,*
in response to message #1 by Peter Mansvelder

Hi Peter,

I purchased the caps and the xtal from Digikey which succesfully added more accurate time function, here are the part details:

300-8340-1-ND .68000 1.36 T CRYSTAL 32.768 KHZ 12.5PF SMD HTSUS: 8541.60.0010 ECCN: EAR99 LEAD: LEAD FREE ROHS: ROHS COMP COUNTRY/ORIGIN: JAPAN CAGE: 0CS65

445-1272-1-ND .10000 .50 T CAP CER 18PF 50V C0G 5% 0603 HTSUS: 8532.24.0020 ECCN: EAR99 LEAD: LEAD FREE ROHS: ROHS COMP COUNTRY/ORIGIN: USA CAGE: 1ZFM7

Cheers, Kerem

Edited: 16 Jan 2012, 2:11 p.m.

*Message #5 Posted by **Marcus von Cube, Germany** on 17 Jan 2012, 5:09 p.m.,*
in response to message #4 by Jeff O.

I'm afraid you will need to be able to solder grains of salt under a microscope. 0603 is definitely too tiny for the average soldering iron. I've done this trice and none of my attempts is worth a beauty contest price (even if all are working fine.)

Re: wp34S timing crystal

*Message #6 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 17 Jan 2012, 6:00 p.m.,*
in response to message #5 by Marcus von Cube, Germany

You are absolutely correct. Magnifying lenses and good lighting is a must. I have done these four times by now (2x30b,2x20b). What I found works the best and cleanest is to Tin the contact pads with enough solder (using a low power 8W-12W soldering iron with a fine tip) for attaching 0603 SMD components (holding them with a very fine tipped tweezers) without having to add more solder to the tip of the soldering iron. Also it is important to make sure the tip is cleaned with a tip cleaner and has no excess solder or kind of residues.

in response to message #6 by Kerem Kapkin (Silicon Valley, CA)

Do you have a brand/model/source suggestion for the soldering iron? (I did search at digikey and amazon, but there are lots of choices. This one looked most promising, but is 18 Watts and does not look like it has a "needle" tip.)

Edited: 18 Jan 2012, 10:29 a.m.

Re: wp34S timing crystal

*Message #10 Posted by **Marcus von Cube, Germany** on 18 Jan 2012, 10:42 a.m.,*
in response to message #9 by Jeff O.

I'm using a low voltage (12V) soldering 'needle' which has roughly the overall size of a

pen. I drive it off my lab power supply.

Re: wp34S timing crystal

*Message #11 Posted by **Jeff O.** on 18 Jan 2012, 11:18 a.m.,*
in response to message #10 by Marcus von Cube, Germany

So far I have come across no such animal in my search.

Re: wp34S timing crystal

*Message #12 Posted by **Marcus von Cube, Germany** on 18 Jan 2012, 11:22 a.m.,*
in response to message #11 by Jeff O.

Go to a Radio Shack or similar! I found mine in a local electronics store.

Maybe this link can help: http://hardforum.com/showthread.php?t=816830.

Edited: 18 Jan 2012, 11:26 a.m.

Re: wp34S timing crystal

*Message #13 Posted by **Jeff O.** on 18 Jan 2012, 1:02 p.m.,*
in response to message #12 by Marcus von Cube, Germany

OK, I just ordered a soldering station, 10 crystals and 20 capacitors*, so I should be able to ruin one of my 30b calculators attempting this in a week or so! (Actually, I think I'll practice on at least one 20b.)

* - ordered 10 crystals because it was something like $10 for 5 or $12 for 10. Ordered 20 capacitors because you need 2 capacitors per crystal and they were dirt cheap.

Edited: 18 Jan 2012, 1:10 p.m.

Re: wp34S timing crystal

*Message #14 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 18 Jan 2012, 1:18 p.m.,*
in response to message #9 by Jeff O.

Marcus' suggestion of a soldering "needle" would the best, but unfortunately I didn't have one. Instead I used an old low power radio shack soldering iron similar to this. Also I used a fine tip similar to this one.

If you go to RadioShack or a local electronic store you will find many choices for low power soldering irons (pens) with fine tips.

Make sure your hands are steady, no coffee or redbull before you begin soldering. Try to do it the right the first time, comes out cleaner, longer time you spend gets messier based on my experience. Also you can get blank, cheap boards with copper contacts from the same electronics store or RadioShack to practice first.

Edited: 18 Jan 2012, 1:19 p.m.

Re: wp34S timing crystal

*Message #15 Posted by **Dave Shaffer (Arizona)** on 18 Jan 2012, 3:08 p.m.,*
in response to message #14 by Kerem Kapkin (Silicon Valley, CA)

You can make a soldering needle: take your fine tip and use a file to thin it down some more. You will have to re-tin it. I have done that with one of those cheap Radio Shack irons.

You could probably also literally use a needle - use some wire to wrap it to the existing tip. You need to make sure there is adequate heat conduction to the needle - this might actually be good: you will effectively have a lower wattage tip (and, again, you will have to tin it somehow - you might want to file off whatever coating might be on the needle originally).

Re: wp34S timing crystal

*Message #16 Posted by **Eric Rechlin** on 18 Jan 2012, 3:05 p.m.,*
in response to message #9 by Jeff O.

You don't need a fancy soldering iron. You could do it with a $10 Radio Shack one if you wanted.

That said, I have a Metcal (OKi) PS-900 and I love it.

Eric

Edited: 18 Jan 2012, 3:07 p.m.

Re: wp34S timing crystal

*Message #17 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 18 Jan 2012, 3:24 p.m.,*
in response to message #16 by Eric Rechlin

Very Nice!! Those cheap RadioShack irons last very long time, they won't fail to justify getting a new iron like Metcal PS-900. That what I should have gotton in the first place. Let's see soldering a few more WP-34s, time module, pil-box,.. may be I need an upgrade.

Re: wp34S timing crystal

*Message #18 Posted by **Jeff O.** on 18 Jan 2012, 3:34 p.m.,*
in response to message #16 by Eric Rechlin

I did not order anything fancy. I needed a new one anyway, and prefer clicking on my computer to walking into a Radio Shack.

Re: wp34S timing crystal

*Message #19 Posted by **Christopher Johnson** on 18 Jan 2012, 1:06 p.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

Hi Kerem,

I have been researching how to do this(not much information out there) and I found this document.

How WP 34S Came into Existence

Page 18 of this pdf shows the crystal and cap(s) c3 and c4 and you say caps. Are 2 caps required for this modification? I haven't opened my 30b yet so I'm not sure what is there and what is not.

Thank you, Christopher

Re: wp34S timing crystal

*Message #20 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 18 Jan 2012, 1:50 p.m.,*
in response to message #19 by Christopher Johnson

Hi Christopher,

You are correct. These are the two (2) capacitors which are placed on C3 and C4 on the left and right side of the Crystal.

In order to open the 30b there are four screws. Two of the screws are under the long lower rubber pad. You don't have to remove the entire lower pad to get access to these screws, just lift the ends of the rubber pad enough to expose the screws. That way, once you are done the pad still retains its double sided glue and sticks very well back into its place.

-Cheers, Kerem

Re: wp34S timing crystal

*Message #21 Posted by **Peter Mansvelder** on 22 Jan 2012, 4:13 p.m.,*
in response to message #20 by Kerem Kapkin (Silicon Valley, CA)

Hello Kerem, I managed to get the parts and solder them onto the HP30B, it is rather simple, here are my findings:

- Backup up the calculator using ON + Store + Store
- Take off the battery cover and take out the batteries
- Take out the 5 screws: 2 on top, one in the middle, 2 under the 'antislip' strip at the bottom of the backside (outside the battery cover)
- flip the calculator over and pry off one of the sides by slightly bending the plastic outer housing, the center 'metallic' part has to come loose. First one side, then the top, then the other side. Actually this is so tight that I wonder where the screws are for...
- Now you have the complete calculator front with the back of the PCB visible.
- Top right you see a place for 3 components, marked C3, C4 and Y1. Each one has 2 copper-coloured pads.
- Take the smallest soldering iron you can find (I use a Weller 12W with a pointy tip) and put some solder on them.
- Take the 2 capacitors (I used 18pF ones in 0603 size, farnell article code 1612182), and solder them into place, using tweezers, a needle and a magnifying glass. It takes some practice, but it is not impossible: this is only my second time, and I haven't fouled up anything yet.
- I used a SMD crystal too (farnell part number 1712821), but there is enough room for a regular 'tubular' watch type crystal, which is much easier. Same method, be careful not to let any solder flow too wide.
- If there is any excess solder, clean it with a needle and some tissue (or better, use desoldering tape). I used regular solder, which is much too big for SMD use, so my work looked somewhat sloppy. But no matter, it worked!
- Put the calculator back in reverse order, and try to set the crystal: ON+C+C. If the crystal is mounted correctly, you get 'OK' and you now have a much improved WP34s! In my example,

there used to be almost 10 minutes to the hour discrepancy in time keeping, but now it runs like a clock!

Hope my findings help someone, it is really an easy job anybody with some electronics experience can succeed at.

in response to message #21 by Peter Mansvelder

Hello Peter,

Very good summary, thanks for sharing.

Actually Tubular crystals also come in SMD package (which I used and I believe most people have been using) with slightly open leads with a proper angle to allow surface mount on SMD pads, as well as straight leads for through-hole.

AFAIK You are the first/only person reported using non-cylindrical SMD packaging for 30b/20b, great information, thanks. I was wondering if it would work or fit on the space allocated for the crystal on the PCB.

Although you need to do ON+C+C once to get the crystal engaged, I sometimes forget to do the ON+C+C after each firmware update. Firmware updates disengages the crystal timing circuit.

Regards, Kerem

There is no way for the software to tell if a crystal is installed or not. The only way is to just set-up the hardware and see what happens. If no crystal is installed, the system simply hangs and can only be reset manually. :-(

Couldn't the calculator write something to flash memory to say the crystal is enabled, and read it back after an update?

That's of course possible but updates are often incompatible with previous backup images (even if the CRC is still valid). Now imagine the calculator tries to restore such an invalid image and inadvertently tries to activate the (non existent) crystal just because the respective bit is left over from an older software image. It will be a dead end.

Not a big deal, I just have to remind myself to ON+C+C after the firmware updates. For those who are just installing their capacitors and the crystal for the timing circuit, alhough it is documented in the user manual, ON+C+C after updates ;)

The only thing (which is a nice to have more than a need, especially given valuable limited memory space for the capabilities), is to have a time/date display like the one on HP-17BII+.

*Message #27 Posted by **Jeff O.** on 22 Jan 2012, 7:45 p.m.,*
in response to message #21 by Peter Mansvelder

Peter,
Thank you for the report. It gives me some confidence that I will be able to add the crystal. I received the parts two days ago, and the capacitors do look somewhat like grains of sand. Speaking of the capacitors, I purchased 15 pF, I assume that will not be a problem since the crystal calls for 12.5 pF and you used 18 pF. Now all I need is my new soldering iron, and working up some nerve to make the attempt.

18pf load capacitance is a bit high in my experience in using 32.768KHz crystals. Most crystal manufacturers recommend somewhere between 10pf and 12pf. The 18pf will work, you just don't want to load down the oscillator circuit too much.

Re: wp34S timing crystal

*Message #29 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 23 Jan 2012, 1:23 a.m.,*
in response to message #28 by Jim Johnson

Some research on getting the best accuracy from a 32.768 KHz ATMEL AT91SAM7L128 ARM Processor timing circuit suggested that I should use 18pF capacitors. The design specifications noted in this document from ATMEL, recommends 18pF capacitors C12 and C13 shown in the schematics. Therefore I selected 18pF.

*Message #31 Posted by **Bart (UK)** on 24 Jan 2012, 3:49 a.m.,*
in response to message #30 by Marcus von Cube, Germany

No one said they didn't. People are just quoting their various references for their choice of capacitor. For that matter probably anything from 10pf to 20pf will do. Some crystals even recommend as low as 6pf. Then we haven't even started talking about tolerance, temperature stability and drift (which all have a cumulative effect on the capacitance).

Personally, I'd go with the value recommended by the crystal being used. Chances are the Atmel designer just specified the value for the crytal they were using or had the datasheet for (but remember to calulate the required C_L as detailed below).

Edit:
The AT91SAM7L128/64 datasheet, paragraph 35.4.3, table 35-15 only states a maximum of 20pf.

This application note gives more info on the design for the xtal and the internal equivalent C_L.

Remeber too that
$C_{L_{total}}=(C_{L_1}*C_{L_2})/(C_{L_1}+C_{L_2}) + C_{L_i}$

where C_{L_1} and C_{L_2} are the two load capacitors (C3 & C4 on the 20b/30b board) and C_{L_i} is the equivalent internal load capacitance of the uP.

HP 39GII

*Message #1 Posted by **NateB** on 16 Jan 2012, 10:25 a.m.*

I ran across a post on HP's forum describing the new 39GII. Full thread.

> Quote:
>
> The 50g was essentially a response to the problems with the 49g+ keyboard (and color). The plastic on the keyboard tree cracked and keys broke because the suppliers (unknown to HP) were doing the standard practice of "recycling" the leftover sprue from the injection molds into subsequent runs. This meant the plastic no longer had the specified characteristics and was thus too brittle which led to cracking plastic. Once we put a stop to that, and the marketing person that designed the "hey wouldn't it be cool to have a gold calculator!" was no longer there, the reasonable neutral color scheme of the 50g and the name change let everyone know the problems were no longer there.
>
> Fast forward a few years and things have begun to change. Every calculator that has been released in the past 3-4 years that has MSRP of ~30$US or more has been designed in house. This includes the 20b, 30b, 10bII+, 12c (the new ARM version), the 15c (the new ARM version) and the just recently released 39gII.

> The 39gII is the start of a brand new, platform independent codebase for HP graphing calculators. It was developed, designed and written completely in house as a modern, flexible system. It was launched in late October 2011 in China for classroom purchase and is not yet avaiable in other regions.
>
> The 39gII does not emulate any old code. It is a complete implementation of a high end graphing

calculator system. The last time this happened for HP with any released models was back in the late 80s with the HP28c (which spawned the 28s, 48sx, 48gx, 49g, and finally the 50g).

It was deisgned from the ground up to support multiple languages natively through the entire system. It has extensive unicode support with over 23000 characters. Complete, contextual help is seamlessly integrated through the system. To support multiple languages, it has a much higher resolution greyscale screen of 127x256 pixels. The most powerful and capable graphing engine on any hardware graphing calculator sold can be found on this unit as well. Flash memory is handled using a standard 128MB flash chip.

Improvments over the 39gs include:

- full support for units (similar but more extensive to the 48 series with many units, conversions, post and prefixes and so on)
- complete and modern programming language that integrates with the rest of the system. The user can create and define functions and they work as if built in
- much more powerful graphing engine
- support for two font sizes and text formatting
- ability to use a RTF format with notes and embed images into notes
- USB on the go handles connectivity

You may say "well, the 48 had a lot of that stuff already". That would be correct. I like to explain to people that if you drew a line representing unit capability between the 39gs and the 50, the 39gII would be more than half way towards the 50g. It isn't just a "dumbed down high school unit" anymore.

However, this does have things not found on any HP calculator, or ANY othe brand's calculator, before either! :-)

Most common question - why doesn't it have a color screen/larger screen/more stuff? Simple - power consumption and cost.

This calculator runs on 4 AAA batteries in parallel. In fact, you can run it on a single battery in an emergency if needed. Power draw is ~4mA at idle, and ~20mA while running full out. I had one that ran for over 500 hours continuously a few months back. We were going for a lower end high school into college machine that would be a viable product in many developing regions of the globe.

While as a *nix user this probably will not be the type of machine that you would be attracted to, it definitely should show that HP is still serious about graphers and that there may be some great things to come in the future!

in response to message #1 by NateB

Hello,

in this case I'd like to point to my own post there, too.

--- Start of quote --- 24.12.2011 ---

@Tim

It would be fair to mention that (although it has not been done by HP)
- the 50g is available in 6 languages (of course this could be done for more languages)
- will get help for all commands (text and embedded graphics) in the very near future, I am almost ready to release ;-)
- could be updated to a *larger* screen easily, if you do the hardware I'll promise to do the software
- could be given more memory by expanding the virtual processor thus allowing to re-use the vast resources of software that already exist for this platform, and this could be done in a very short time compared to the development time needed for a true 50g successor with uncertain success of the product
- codepages could be flipped in real time to support non ASCII languages
- etc., etc.

Above can be done with the existing codebase and having a different (or called new) codebase does not necessarily extend the user-experience of a product...

SCNR,

Andreas

P.S. Merry Christmas

--- end of quote --- 24.12.2011 ---

Regards,
Andreas

P.S.: as correction to the above quote: the "new" help for the 50g for *all* commands has been released.

I think this is harder than it may appear. The emulated saturn processor uses a 20 bit address. Each address refers to a 4-bit nibble in memory. Most modern processors use a 32 bit address and each address refers to an 8-bit byte.

Suppose you try to expand the memory by going to a 32 bit address. This increases the size of every object in the calculator (because each object starts with a prolog that's an address). Suddenly any code that "knows" an object's size won't work. For example, code that moves a 21-nibble real number (or allocates 21 nibbles to store one) won't work because a real number is no longer 21 nibbles.

Problems like this can be solved, but it requires going through all the code by hand.

And this still assumes that the memory is nibble-addressable instead of byte-addressable. In my opinion, if HP is going through the hassle of converting to a 32 bit address, they might as well go to byte-addressable memory too.

All this assumes that the goal is to port the RPL code base for the 50g to a modern processor. If you're going to go through all that work, maybe it's easier to just abandon RPL as the code for the operating system and go with C instead? It's a whole lot easier to find C programmers than RPL programmers.

I suspect that HP has gone through a similar thought process as above. They've implemented a bunch of low-end machines in C code to build up a revenue stream. The 39GII is just an extension of that process and they must figure that the educational market will be profitable.

We can only hope that their next step will be a high-end scientific programmable.

Dave

P.S. Although I can see why HP might not want to re-implement the RPL code for a 32 bit byte-addressable machine, I think it might make a fun project for the community. For instance, maybe we can por the 48G code and get it running on the 50g hardware?

Hopefully this new platform is being developed to a stage where the 48G already was, and is not intended for educational purposes *only*.

If it is, it's great to have students sort out all bugs of the base system first ;-(.

Re: HP 39GII

*Message #5 Posted by **Software49g** on 16 Jan 2012, 5:06 p.m.,*
in response to message #4 by Thomas Radtke

Hello Thomas,

> to a stage where the 48G already was
Besides all that many, many if's and when's that are still before that (and even if done, that does not guarantee success of the product), could you explain to me where

- progress and
- innovation

are, compared to the already available model (HP 50g) if they finally reach the state of the 48G ?

Surely it might be nice to have a "re-programmed" machine as a programming-exercise for the calculator division (and as justification for their existence) *but* where is the benefit for the customer ?

Besides that I would rather see an environment that focuses on quality products in terms of hardware and software instead of rushing out "new shiny buggy" products. As HP calculators has lost the mass market a long time ago this would be a reason for buying one instead of getting a "me-too-toy" from HP.

Just in case you might have forgotten:
50g: still some minor bug, last ROM-Update three years ago. (Was there ever a ROM-Update for the

39/40 family?)
35s: buggy when it came out, will remain buggy until it fades away
20b/30b: depreciation bug since release and unfixed since then
12c: various bugs in the various reincarnations
15c: release bugs have been discussed in detail here recently, no fixes so far

Given all the above they have lost a lot of their credibility (if there is/was any left to loose) that HP calculators are better then their competitiors...
(But I guess, given the prices today for this machines includes beta-testing by the customer.)

Sometimes less is more.

Regards,
Andreas
http://www.software49g.gmxhome.de

P.S. when I got my 48SX in 1989/1990 I trusted the results given by the machine, today I do not trust a result given by a "recent" HP calculator!

>
> are, compared to the already available model (HP 50g) if they finally reach the state of the 48G ?

I understand the new platform contains no legacy code, and so is more maintainable by the calculator group. This is neither an innovation nor progress in the eye of the customer, but imo *could* lead to a new machine that eventually surpass the 48G.

> Quote:
>
> Besides that I would rather see an environment that focuses on quality products in terms of hardware and software instead of rushing out "new shiny buggy" products.

Agreed.

> Quote:

> Given all the above they have lost a lot of their credibility (if there is/was any left to loose) that HP calculators are better then their competitiors...
> (But I guess, given the prices today for this machines includes beta-testing by the

> customer.)

You're running against open doors, but don't forget that HP calculators are probably the best investigated calculators of all. Do you know what problems hide inside a machine like a Casio xyz?

More important, HP is the only manufacturer left selling calculators *I* would use in science and engineering due to the feature set and ease of use. PRN/RPL is important in this respect to *me*.

Re: HP 39GII

*Message #7 Posted by **Software49g** on 17 Jan 2012, 4:13 a.m.,*
in response to message #6 by Thomas Radtke

> contains no legacy code, and so is more
> maintainable by the calculator group.
Well, if they can not maintain their *old* code, now how will they be able to maintain the *new* code when it becomes legacy ?

> but imo *could* lead to a new machine that
> eventually surpass the 48G
So one *could* wait for a machine that *might* be available in a later uncertain future *but* what does one uses *now* ?

Again, all of that what would make up a 50gII is available *now*, with the benefit of *proven* code!
Somebody just needs to plug it all together (larger screen, more memory, O.S. fixes, language support, built-in help, improved EQNLIB, etc., etc.)
Could be done in 3-6 months with fewer effort...

Together with the people who are able to maintain it?

A new code base has the benefit of removing restrictions imposed by the obsolete hardware, and being better suited to the actual device. Power saving in an emulated device is more of an art than an exact science because you need to decide in the emulation layer what the original code is attempting. Strategies good on one platform, be it optimization for speed or for low power consumption, may fail on the emulating hardware. Emulation makes sense to conserve a given development until a replacement is available. Until...

You mean like the 12C that is running in an emulated environment for, say 10 years, now ?

> Together with the people who are able to maintain it?
Well, in my projects I always explain and explain and explain the importance of excellent documentation. And then I explain it once more.
Yes, it sometimes slows down progress to insist on documentation and it makes the project more expensive *but* it pays off in the long run.

I like new stuff but at the moment I see the 39gII nowhere close to a 50g replacement.

As I said in another post, HP had very, very little interest in the HP 50g the way they have been behaving with it in the past.
They rather leave this area for their competitors, like TI who keeps selling and selling the TI-83/84/89 and TI-Voyage 200, which, based on ancient hardware, is bought for around € 200,00 !!!

So where did HP fail while TI succeeded ? (And new machine does not guarantee success in the market.)

Thank god I am only watching the game...

They didn't make the transition from the 'professional' market to the educational market. Scientists and engineers moved from handheld programmable calculators to PC/software packages. Every year there is a new batch of children in need of a graphing calculator for their middle school or high school math class.

Re: HP 39GII

*Message #15 Posted by **Marcus von Cube, Germany** on 17 Jan 2012, 5:05 p.m.,*
in response to message #14 by NateB

If we look at what the machine does (or just at the type number) we can easily see what the intended market is: education. If you recall the earliest photos available, China comes into play here, a **huge** market. If that works, money will flow back to the calculator division which is good for all further development. Just believe the protagonists that HP is taking this business seriously, otherwise they would have withdrawn from the market a long time ago.

Now to a more technical detail, emulation. Andreas is citing the 12C and its newest incarnation. He's right that a new machine is emulating a very old design. The emulation layer is quite new, earlier attempts at reinventing the 12C, the platinum, were problematic because the latter is a reimplementation, alas, with mediocre success because neither the hardware nor the (outsourced) development team were in any sense 'leading edge'. The 12C legacy is kind of a mystery in that the customer base just wants to get the exact same thing again and again and again. Not very much room for improvement for the supplier. Here, emulation just isn't the worst thing that can be done.

On the other hand, a machine like the 50g devotes a complete overhaul, in the same way as the 39g was subject to a completely new design. The 50g is a very complex device. Emulating the outdated Saturn processor was the *only* economically viable way to bring something to the market that had a chance to do its job, especially taking into account the situation in the calculator division at the time in question. The effort was huge, simple things things like a larger screen turned out to be utterly complex to implement.

But today, things have changed. The work that had been put into the operating environment (CAS by Bernard Parisse, SYSRPL operating system) has long been put into more modern software by the same people (just try to find out about Bernard). So now, the calculator division which has been restaffed with brilliant heads like Cyrille and Tim is able to deliver something new and exiting without resorting to the old legacy code base. There isn't any 50gII yet, not even on the horizon, but the basis is there. Let's support the new device, at least give it a chance, and convince HP that they are doing the right things at the moment!

Re: HP 39GII

*Message #16 Posted by **Software49g** on 17 Jan 2012, 6:01 p.m.,*
in response to message #15 by Marcus von Cube, Germany

> The effort was huge, simple things like a larger screen
> turned out to be utterly complex to implement.
Sorry Marcus - without going any further into details - the screen has nothing to

do with the emulation.

It is simply a matter of organizing the sources and using defining code where appropriate.
If this hasn't been done, then the only people to blame are the ones working with the sources, period.
As a matter of fact, there are various applications in the ROM, like the 48GX Choose Box,
which is *laid out* for different screen resolutions.
And yes, there is code programmed in a rush which should have not gotten into the ROM at all.

Again, I am more than pretty sure that an update to the 50g can be done very quickly.
And if it is not done, than it means that HP sees no market for a machine like the 50g anymore
which, in conclusion, means that there is no market for a 50gII.

> the outdated Saturn processor
This outdated Saturn processor has 64bit registers, the ARM has only 32bit *today*.
The real pity is that the three pointer registers and the HW-RSTK are only 20bit.

> and convince HP that they are doing the right things at the moment!
I'd like to dream, too, but I have been watching HP calculators (and their decline) since school.

The fact is, that calculators are simply to unimportant for the Hewlett-Packard company nowadays.
The word "calculator" shows up three times in their 2010 annual report (180 pages) *but* no earnings are given.
HP has roughly 320.000 employees and 2 (in words: two) calculator engineers.

Greetings from cloud nine,
Andreas
http://www.software49g.gmxhome.de

P.S. SpeedUI from Raymond shows how much power can be unleashed in the Saturn.
How much of all this Megaherzs in the 39gII is (useless) eaten up from the O.S. and the HAL just to come up with re-inventing the wheel ?
Honestly, I am not too impressed...

> Again, I am more than pretty sure that an update to the 50g can be done very quickly. And if it is not done, than it means that HP

> sees no market for a machine like the 50g anymore which, in conclusion, means that there is no market for a 50gII.

I'm sure you're one of the few people on earth who could actually produce a 50g update, and that you're not wrong about it being possible to be done "very quickly" (for you, that is).

But, I think your reasoning here is flawed. The fact that HP is apparently not interested in an incremental update to the 50g, does not say anything about what they think about a future model.

It's been a decade without a truly new product, and releasing an incremental update *now* would be nothing short of a joke. You cannot impress and regain customers with a minor update, while the competition--with much larger resources--has improved by leaps and bounds. IMO, an incremental update would be completely unwise from almost every perspective: marketing, technoloy, use of resources, etc. (And, given that you don't work for HP... there's probably no one around to even do this.)

Why spend one dollar, one hour, on a 100% dead-end avenue?

I find Tim's note amazingly open and encouraging. It tells me the calculator group and ambitious product plans are alive. Building a generational upgrade is to be lauded, and I don't see any reason for negativity about this.

It sounds like they're using modern technology to recreate the feature set in a better way. That sounds like the only proper way to go to me. (SysRPL is *no* way to design a modern calculator!)

So, to me this is great (unexpectedly great) news.

You build for a market.

IF that is Chinese students, then so be it, and HP should go at it full force!

We old-timers will continue to enjoy our dinosaur technology--I know I will :-)

> Quote:
>
> You build for a market.

Yes, but in tech you often shape (or even create) the market too.

One of Steve Jobs' famous lines is "The customer doesn't know what they want." It worked out for Apple, didn't it?

If HP has a spine, they'll continue to have RPN in their future high-end machines. Because *they* know it's better for many use cases. The customer will come around to it, if the explaining is made so that it actually sounds as simple as it is. (Starting an explanation of what RPN is with that it stands for "Reverse Polish Notation", however, is guarantee for instant implosion of interest in newbies.)

Nothing wrong with Algebraic and RPN living in perfect harmony, btw.

Algebraic is often derided here as inferior, but I've not (in my one year here) seen a discussion about what's intimately tied to both: stack vs. notebook.

If you assume former, RPN is the way to go (and you can prove it with keystroke counts, and chaining behavior) and RPL is the *natural and simplest* programming language.

If you assume latter, ALG has the clear edge (because entry looks like math on paper) and any of most modern programming languages, with their free (and robust, highly-optimized) implementations, are the way to go.

A calculator--even in smartphone or tablet form--is different from a computer-based math environment, in how it's used. (Even if there were feature-parity.) Picked up for a few seconds, a few calculations done, little programs want to be written with least of amount of effort and keystrokes.

These observations benefit to keeping the stack and RPN/RPL around.

An example: << sqrt >>

You have two chars to key in to write this program.

There *is* no more efficient program than this here to take the square root of: a number, a complex number, all elements of a vector/list, an algebraic expression, etc.

A stack gives you zero declarative overhead for inputs and outputs. RPL gives you a richer host of math-relevant types than any stock computer language I know, and you can start using it as soon as you know that a program starts with << and is, in its simplest form, just a chain of the instructions you'd apply in interactive mode.

I'm *hoping* (and kinda trust) HP knows that what they created isn't dinosaur technology, and that this tech will be moved into new (possibly hybrid) machines.

Re: HP 39GII

*Message #20 Posted by **bill platt** on 19 Jan 2012, 12:09 p.m.,*
in response to message #19 by Oliver Unter Ecker

Personally, I think the coolest thing in concept is the 48 series with an RPN stack and algebraic objects on that stack. But the RPL language is different from RPN program spaces and so that has always been a source of vexation not only to legacy (rPN) users, but surely to HP marketing as well.

I really really like the 17b solver paradigm. It is actually easier to use than the 48 series solver, even though it would seem to be derived from it. I use the 48 solver as often as the 17b--but even now I trip up occasionally in its use for some reason. Perhaps I should RTFM yet again.

I agree that HP should not throw away the baby with the bathwater. RPL is a foundation worth building on.

in response to message #15 by Marcus von Cube, Germany

Very nice post, Marcus.

I second your thoughts about emulation and wish to add one (obvious) thing: for the 12C (now and the one in 10 years), there're no performance reasons not to emulate. Nor is there a growing feature set to consider. For a 50g successor, there would be both.

Really, let's not dismiss that the HP guys might just know what they're doing.

Re: HP 39GII

*Message #23 Posted by **bill platt** on 18 Jan 2012, 7:39 p.m.,*
in response to message #14 by NateB

Yes, this is true.

To me, the most exciting thing in handhelds is the smartphones--not because they do phone and email (BORING!) but because of the *instrumentation* and *toolmaking* possibilities. The combination of accelerometer, GPS, camera (CCD?), microphone, and what else? You could have a flux-gate compass, you could have a number of others---these sub-systems combined with a powerful processor and a

color graphics display have made all of the fascinating applications possible, from the adorable carpenter's level, all the way up to a FFT spectrum analyzer, etc. By building handhelds with really good specifications (say high bandwidth microphones) and adding some RF capability (can you say frequency counter) they can revolutionize the whole market for effective handheld instrumentation!

Who needs a calculator when you can have it all...

Re: HP 39GII

*Message #27 Posted by **Mike Morrow** on 16 Jan 2012, 4:27 p.m.,*
in response to message #1 by NateB

I think this is very welcome news. It seems to indicate that an HP 50g-class (or better) machine may be in the future. One that does not emulate the old terribly obsolete Saturn. One that has an attractive keyboard (as the 39gii seems to have).

Such a non-emulated machine must be blindingly fast, which the 49g+ and 50g never have been.

I'm not too wild about the four *parallel* AA-cells. Two paralleled primary cells have always seemed to be very bad engineering for self-discharge. Four would be much worse.

I also would prefer to see the cursor key set replaced by four separate keys (three in line, one below) just as found on the HP 48GX series.

Also, place the ENTER key *above* the /, X, -, + keys, not below it.

Ensure that the features of the Development Library are included (minus, of course, all the Saturn garbage).

Finally, put some decent feet on the bottom (like on the HP 30b). I've lost several of the tiny little micro feet on my HP 49g+ and HP 50g units, and I don't know where replacements can be obtained. The HP 30b feet are much more substantial and seem much more permanent.

In any event, there seems to be something good to anticipate.

And aside from how that looked, the big problem with that was that the gold paint delaminated. It was just a bad idea all around.

Re: HP 39GII

*Message #31 Posted by **Oliver Unter Ecker** on 18 Jan 2012, 2:13 p.m.,*
in response to message #29 by Crawl

I hear ya.

Of course, this is a way more complicated affair. (Though entirely solvable if they license something existing.)

One thing that speaks for eventually getting to a CAS is, that it seems to be the 2nd most important reason why people want a calculator these days.

Different to the feelings of most of us here, RPN, any level of programmability, double-wide Enter

keys (and other esoterics) play almost no role these days, in comparison to interactive graphing abilities and, as second priority (for a different set of people), CAS abilities.

I've learned the hard way with my own project that, by and large, people don't care about programmability. (Which, to me, even though I get the message by now, is still utterly amazing...)

To back up these notions, look at what calculator apps are the best sellers for mobile devices.

HP going after a new educational market (China) is a brilliant tactic to regain a foothold. (I'm guessing here that TI hasn't yet infiltrated the Chinese high-school text books...)

*Message #32 Posted by **Bart (UK)** on 19 Jan 2012, 6:39 a.m.,*
in response to message #1 by NateB

I think this is very welcome news.

I am really happy about this. A completely new design is long overdue. Companies that live in the past are doomed. I know there are a lot of "hangers on" for previous HP calculators, but they are not the future - their buying power is diminishing, selling to specialist groups (engineers, scietists, financiers etc.) is the past, wider appeal and market penetration is where it's at.

To Tim and the calculator team - you have my praise and full support for this move. I just can't wait for it (or similar) to be released in the West (particularly the UK where i live ;-).

Best regards,

Bart

15C LE keyboard fixed, plus: about the feet

*Message #1 Posted by **Dale Reed** on 14 Jan 2012, 3:54 p.m.*

All,

I was able to fix my 15C LE (#02198) with the bad divide key. Turns out it did not have any bits of white plastic under the dome. Instead, the dome was not aligned properly on the "sticky" sheet of plastic that holds it over the target PCB traces.

I cleaned the dome and the PCB traces anyway, then carefully centered the dome on the PCB traces and stuck the sheet down on it (it took a couple tries to get it just right) and now it works fine.

I had trouble getting the feet off without messing up the adhesive, so I bought some new feet on TAS. It turns out the feet on the original Voyagers are about 1 mm thick, but the feet on the 15C LE are thicker and sit in a well. The replacement feet didn't stick out of the well to contact the surface when I sat the calculator on a table. Simple solution: I bought more than enough feet, so I stuck two replacement feet in each well. Now the feet are a tad taller than the original feet (which are probably more like 1.5 mm) but perfectly acceptable for my use. The foot wells still hold them in place when I slide the calculator in and out of the case.

I sent a couple of the feet I took off to the seller so he/she can get exact measurements.

Thanks to the forum members for posting instructions on disassembly/reassembly and to the TAS seller for working with me.

Dale

Re: 15C LE keyboard fixed, plus: about the feet

*Message #2 Posted by **Don Shepherd** on 14 Jan 2012, 5:57 p.m.,*
in response to message #1 by Dale Reed

It is not necessary to say "TAS". Ebay works just fine and it doesn't confuse new members.

Re: 15C LE keyboard fixed, plus: about the feet

*Message #3 Posted by **Reth** on 15 Jan 2012, 4:24 a.m.,*
in response to message #1 by Dale Reed

I doubt it, plastic pieces are so small that it's very easy to loose them without even noticing. Also slight misalignment of a dome doesn't seem to be a problem at all.

To my observations, of course, but I played quite a bit with it.

82182A Time Module question

*Message #1 Posted by **Monte Dalrymple** on 14 Jan 2012, 12:53 p.m.*

The Time module includes hardware and functions to adjust the accuracy factor for the time module clock. How important are these features?

The hardware required is almost exactly 10% of the total, and with this hardware included it is probably impossible to fit the logic into a low-power programmable logic device. Hence my question.

Monte

Re: 82182A Time Module question

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 14 Jan 2012, 1:12 p.m.,*
in response to message #1 by Monte Dalrymple

What a pity... I've always found the accuracy factor management to be a real helper: I missed it in the newer calcs.

Greetings,
Massimo

Re: 82182A Time Module question

*Message #3 Posted by **Håkan Thörngren** on 14 Jan 2012, 2:19 p.m.,*
in response to message #1 by Monte Dalrymple

I think it is very useful, as it tends to make the clock quite accurate. I can never remember if it works with daylight savings hour (T+X). Hence, I tend to correct it once and live quite happily with it after that not trying to correct it again.

I would say it is important. The whole Time module is a piece of very well designed part of the HP-41 system. I am very especially impressed by the programming of it..

Re: 82182A Time Module question

*Message #4 Posted by **Eric Smith** on 14 Jan 2012, 2:25 p.m.,*
in response to message #3 by Håkan Thörngren

It does the right thing with T+X. In other words, it knows that T+X is not an adjustment for an error, so it changes both the current time, and the record of when the time was set, such that the effective elapsed time since setting remains the same.

Re: 82182A Time Module question

*Message #5 Posted by **Garth Wilson** on 14 Jan 2012, 2:25 p.m.,*
in response to message #1 by Monte Dalrymple

I suppose it depends on the cost versus accuracy of available crystals. Do you have room for a 3mm variable capacitor to trim the crystal frequency? I must have gotten lucky. My 41cx (time module is not separate) keeps very accurate time without ever applying a correction factor.

Re: 82182A Time Module question

*Message #6 Posted by **Eric Smith** on 14 Jan 2012, 2:28 p.m.,*
in response to message #1 by Monte Dalrymple

I've got the accuracy factor implemented in the firmware for the DIY4, though I couldn't do it the same way the timer chip hardware does. The way I've done it has the same long-term effect, but bunches the correction into a periodic "leap-centisecond" or missing centisecond. While having the correction occur closer to continuously would be better, this seemed like a reasonable compromise. Maybe something similar can be done in hardware with less logic required?

Re: 82182A Time Module question

*Message #7 Posted by **Monte Dalrymple** on 14 Jan 2012, 3:05 p.m.,*
in response to message #6 by Eric Smith

Hmm... back to the drawing board. If I restrict the use to the 41CL only perhaps I can pull enough of the functionality into the logic on the 41CL board to make everything fit.

Re: 82182A Time Module question

*Message #8 Posted by **Howard Owen** on 14 Jan 2012, 3:04 p.m.,*
in response to message #1 by Monte Dalrymple

Perhaps you could condition the clock in software? How about NTP/HP-IL? (0.5 :))

Re: 82182A Time Module question

*Message #9 Posted by **Monte Dalrymple** on 14 Jan 2012, 3:17 p.m.,*
in response to message #8 by Howard Owen

But that requires periodic communication with something outside the calculator. The advantage of the accuracy factor correction circuitry is that it is self-contained.

Re: 82182A Time Module question

*Message #10 Posted by **Geir Isene** on 14 Jan 2012, 5:09 p.m.,*

*Message #11 Posted by **Eric Smith** on 14 Jan 2012, 8:49 p.m.,*
in response to message #10 by Geir Isene

> Quote:
>
> Needed.

That depends on a lot of factors, and without considering those factors I don't think it's fair to simply say that it is needed.

It is possible to get higher-stability 32.768 kHz oscillators than the 82182A/41CX used, which would reduce the need for the AF.

Re: 82182A Time Module question

*Message #12 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 16 Jan 2012, 12:22 a.m.,*
in response to message #1 by Monte Dalrymple

Nice to have, but not necessary especially if it will make the time module form factor or system integration with 41CL much more difficult. Also I think with the current xtal and components the time keeping precision of the time module would be as good as a regular wrist watch.

In addition, personally I have no problem of the time precision of the WP-34S. If the same was achieved on 41CL with a time module, personally I don't see the need to use the AF adjustment.

Thank you again for making the 41CL a reality and investing your time and resources into the time module. Very much appreciated!

-Cheers, Kerem

Re: 82182A Time Module question

*Message #13 Posted by **BobVA** on 16 Jan 2012, 11:57 a.m.,*
in response to message #1 by Monte Dalrymple

I think a good solution would be to integrate as much of the timer functionality in the 41CL as you can and give the user the option of disabling it entirely in favor of an actual time module if they wish.

If the omitted functions are critical for a particular user they could then install an actual module and go with that.

The impact of no accuracy adjustment could be ameliorated by (as noted above) using a higher accuracy crystal, incorporating a physical trimmer or a even a TCXO.

I'd say it's well worth the effort of including. I know it's not a 100% solution, but for me it would be 95%. Given the price of used time modules, that's a significant accomplishment.

Bob

Re: 82182A Time Module question

*Message #14 Posted by **Ángel Martin** on 16 Jan 2012, 2:07 p.m.,*
in response to message #13 by BobVA

Well said, that´s the perfect compromise I concur.

I´ve never used the accuracy adjustments on the CX - but having said that I have noticed significant errors in the TIME keeping using the TIME module on a CL, so it may well be more needed there.

Re: 82182A Time Module question

*Message #15 Posted by **Monte Dalrymple** on 16 Jan 2012, 3:00 p.m.,*
in response to message #14 by Ángel Martin

As far as the Time Module is concerned there shouldn't be anything specific to the 41CL that would affect the time-keeping accuracy. The bus still runs normally even during Turbo operation, and all of the Time Module code runs at 1x speed. Signal edge rates are probably different, but that should not affect the time. I suppose that noise on the power lines might have some effect...

As far as a TXCO, they draw a lot more current, like 220uA, so that is not really an option.

Romberg Integration

*Message #1 Posted by **Paul Dale** on 14 Jan 2012, 6:15 a.m.*

The latest 34S firmware now has a modified version of the PPC IG Romberg integration routine in the firmware. The non-adaptive Gauss-Kronrod quadrature is gone -- for good I hope.

The main modification I made to the PPC IG routine is a little bit of extra code to ensure the final three estimates are equal like the 34c's integration code. The original PPC IG routine only required the final two to be equal. I made a few other small tweaks to Les Wright's port of the PPC IG routine but nothing too significant.

Yet another reason to upgrade to the upcoming v3 firmware. As if there weren't enough reasons already :-) Version 3 is far and away better than version 2!

- Pauli

Re: Romberg Integration

*Message #2 Posted by **Paul Dale** on 14 Jan 2012, 6:33 a.m.,*
in response to message #1 by Paul Dale

Version 3 features: A proper END statement and real separate programs. A proper delete the current program. No flash banks anymore -- all of flash is used now. Local registers for subroutines, deeply nested subroutines limited only by free RAM. Extra commands to check convergence of series and rearrange the stack in any manner. Extra complex constants.

Lots of program memory: 927 maximum program steps in RAM. 3838 program steps in flash. 927 steps in the backup flash region. A massive 5692 program steps maximum -- almost every command being fully merged.

Single and double precision real and complex numbers.

Plus all the old 34S features.

Expect a pre-release once were done with our internal testing and the documentation is updated.

As you can probably tell, I'm excited by this one.

- Pauli

Re: Romberg Integration

*Message #3 Posted by **Namir** on 14 Jan 2012, 4:41 p.m.,*
in response to message #1 by Paul Dale

Paul,

I am under the impression that the Gauss-Kronrod quadrature is better than Romberg's method. I am wrong (I always find it soooo hard to type in this sentence :-))?

I assume your implementation reduces errors in a manner that exceeds any work with Gauss-Kronrod quadrature?

Namir

Re: Romberg Integration

*Message #4 Posted by **Marcus von Cube, Germany** on 14 Jan 2012, 5:40 p.m.,*
in response to message #3 by Namir

The main advantage of the Romberg integrator as implemented is that it is adaptive. GK was always using the same number of points.

Re: Romberg Integration

*Message #5 Posted by **Paul Dale** on 14 Jan 2012, 5:44 p.m.,*
in response to message #3 by Namir

They are different.

Gauss-Kronrod isn't adaptive. It selects a number of fixed points (in our case 21 points) from within the integration interval and then produces an estimate for the integral. It is very good for some functions and utterly hopeless for others.

Romberg's method is adaptive. It refines the sampling until successive estimates agree. Generally, it works better with difficult functions.

Ideally I'd have provided an adaptive method that used G-K quadrature underneath & have had the best of both worlds. This would consume more resources but it is typical of mathematical packages these days.

- Pauli

Re: Romberg Integration

*Message #6 Posted by **Namir** on 14 Jan 2012, 6:48 p.m.,*
in response to message #5 by Paul Dale

How about an algorithm that uses the G-K quadrature in the following quasi-adaptive manner:

```
Set Area2 = G-K quadrature over the entire integral
Number_of_Integral_Divisions = 1
Do
  Area1 = Area2
  Increment Number_of_Integral_Divisions
  Set Area2 = G-K quad applied over Number_of_Integral_Divisions sub-intervals.
Until Abs(Area1 - Area2) < Tolerance
```

Would that work?

Namir

Re: Romberg Integration

*Message #7 Posted by **Paul Dale** on 14 Jan 2012, 7:00 p.m.,*
in response to message #6 by Namir

That ought to work. It is wasting a lot of function evaluations. Adaptive quadratures try to reuse existing evaluations the next time around. G-K isn't all that suited to this -- a method I have seen used is to increase the order of the G-K quadrature reusing the existing evaluated points. This isn't all that suitable for a small memory device. It is also better to be clever about when to subdivide the intervals and make it recursively applied. BTW: G-K gives you an error estimate -- well it gives you two estimates of the integral which is effectively the same which would simplify things a bit.

The problem was that I originally had exactly five registers when I coded the integrator. G-K quadrature just fitted into these. Now that we've local registers, this isn't so much a problem. Romberg does use more e.g.. Doing an adaptive G-K would also use more.

Ever since the 34S was first released, people have been wanting an adaptive integrator, so I've finally provided one. I don't have time to maintain two integrators and I've huge amounts of other coding for the 34S that needs doing so I won't be looking to improve the integration code for a long while yet, if ever. Nevertheless, feel free to code up an adaptive G-K quadrature and we'll look at including it :-)

- Pauli

48GX touchup paint

*Message #1 Posted by **David Griffith** on 12 Jan 2012, 9:18 p.m.*

Does anyone have any suggestions for dealing with a little scratch on the bezel of a HP48GX? It wouldn't bother me, but it's a bright slice of shiny in the middle of a field of flat grey

Re: 48GX touchup paint

*Message #2 Posted by **Vince (Italy)** on 12 Jan 2012, 11:54 p.m.,*
in response to message #1 by David Griffith

I treated several issue of this kind (including some faded badges on the Voyager series) with enamel paint for model making (Humbrol better than Revell, in my experience). You have to spread several thin layers of diluted paint, gently rubbing them on the surface. A satisfying result can be fixed with transparent spray varnish.

Obviously, you have to mask the surrounding area (and the whole calculator) with tape and paper.

Hope it helps

Vince

Re: 48GX touchup paint

*Message #3 Posted by **David Griffith** on 13 Jan 2012, 12:52 a.m.,*
in response to message #2 by Vince (Italy)

The scratch isn't bad. It looks like there was a burr left after the bezel was punched out. The shiny spot is on where a burr used to be. I'm probably just worrying about nothing.

Re: 48GX touchup paint

*Message #4 Posted by **Lincoln R.** on 13 Jan 2012, 12:55 a.m.,*
in response to message #2 by Vince (Italy)

I've been meaning to do some experimentation with Testor's model paint (much more available in the US than the brands you mentioned) on an old 32sII that looks like it went through a sand blaster. The last time I messed with it I was just trying to mix to get the colors right and painting some of it onto aluminum foil (similar color to the metal faceplate)

Re: 48GX touchup paint

*Message #5 Posted by **Vince (Italy)** on 13 Jan 2012, 1:19 a.m.,*
in response to message #4 by Lincoln R.

Probably the one is as good as the others. If you carefully try out progressive dilutions directly onto the calculator, it's likely you find the best matching mix; the paint can be easily removed by a specific

thinner, that shouldn't damage the original painting

HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #1 Posted by **Fouad M. Kaadou** on 12 Jan 2012, 4:53 p.m.*

Hello,

I need to connect my HP41cx to an Arduino through HPIL. I have seen many people on this site using one of these HPIL peripherals to control external devices. I just want to know the difference because they all seem to serve the same purpose (connecting to external devices).

Thanks in Advance,

Fouad

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #2 Posted by **Christoph Klug** on 12 Jan 2012, 5:29 p.m.,*
in response to message #1 by Fouad M. Kaadou

HP62164 = serial interface, AC powered HP82165 = parallel bus, AC powered some control lines missing HP82166 = parallel bus, DC powered including trigger control line my prefered solution please also review to PIL box

Best regards - Christoph

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #3 Posted by **Garth Wilson** on 12 Jan 2012, 6:47 p.m.,*
in response to message #1 by Fouad M. Kaadou

For RS-232 there is also the FSI-164A which is almost identical to the HP 82164A (including the HPIL commands and registers) except it came with two RS-232 channels standard (instead of just one) and optionally up to eight channels, and it also had a battery-powered option. I got the FSI-164A instead of the HP unit and was always happy with it.

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #4 Posted by **Fouad M. Kaadou** on 13 Jan 2012, 12:13 p.m.,*
in response to message #3 by Garth Wilson

Which would be best for Arduino communication?

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #5 Posted by **Garth Wilson** on 13 Jan 2012, 2:07 p.m.,*
in response to message #4 by Fouad M. Kaadou

RS-232 is generally slower than parallel, but in this case the speed of the HP-41 will be the limiting factor anyway so it doesn't matter. RS-232 requires fewer connections (a minimum of transmit data and receive data, two wires, not including ground), so I would go that way if the Arduino has RS-232 capability (including the line drivers and receivers). The 164 gives you the RS-232. The 165 and 166 are parallel.

On a note that is related and probably of interest on the Arduino but not directly applicable to the 41, synchronous serial (as opposed to **a**synchronous serial like RS-232) interfaces are very popular today for communicating across a PC board (not so much across a room) because they require fewer connections than parallel interfaces, and the fewer pins on the ICs also means you save board space. When you're breadboarding, it also means less labor.

Dallas' 1-Wire interface puts the clock and bidirectional data and sometimes even power on a single wire, but it is very slow, timing-critical, and really only suited for something like digital thermometers which can't change fast so there's no sense in requiring fast communication. Still, each device has a unique address it responds to, and you can have lots on a single wire. It seems extreme to me, taking it a little too far.

I²C uses a clock line and a bidirectional data line, and, although it's much faster than 1-Wire, is usually limited to around a megabit per second.

SPI uses a clock line, data in, data out, plus a select line for every device, meaning at least four lines but one additional one for every device after the first. It sometimes goes over 50 megabits per second, so it's definitely fast enough to store the data on an SD card when you're taking video on your digital camera. Since no line is bidirectional, logic-level translation between different operating voltages is easy too. Microwire is closely related to SPI and Microwire and SPI devices can be put on the same interface.

There are others, but I²C and SPI are the most common, and there are thousands of ICs on the market that you can take advantage of, for things like EEPROM and flash memory, reat-time clocks, relay drivers, keypad scanners, displays, digital potentiometers, A/D and D/A converters, UARTs, USB interfaces, general-purpose I/O expansion, programmable-gain amplifiers, signal generators, etc.-- you get the idea. It's easy to bit-bang these if you have to, but doggone it would be slow to do it on a 41!

Edited: 13 Jan 2012, 2:08 p.m.

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #6 Posted by **Fouad M. Kaadou** on 13 Jan 2012, 6:43 p.m.,*
in response to message #5 by Garth Wilson

What if this was done using a 41CL. Would that make things faster?

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #7 Posted by **Meindert Kuipers** on 14 Jan 2012, 8:57 a.m.,*
in response to message #6 by Fouad M. Kaadou

I think I have done your project already, see this link ;)

This is based on an ARM processor and uses SPI as the interface between the HP41 and the microcontroller. Sources are in the public domain, so feel free to borrow whatever you like ....

Meindert

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #8 Posted by **Howard Owen** on 14 Jan 2012, 3:19 p.m.,*
in response to message #7 by Meindert Kuipers

I missed that when it came out. That is stunning work, Meindert! Will you integrate it all into the MLDL2K13?

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #9 Posted by **Meindert Kuipers** on 15 Jan 2012, 8:43 a.m.,*
in response to message #8 by Howard Owen

At least you are optimistic with 2K13 ;) I seriously doubt if there will ever be a V2 of the MLDL2Kxx. I have played with my newly received HP41CL, and I am deeply impressed, as it can do much more than the MLDL2000. The only thing lacking is a good interface with the PC world (and M2kM Software of course), and I have some ideas to solve that as well.

Meindert

Re: HP 82165A HP-IL/GPIO Interface VS HP 82164A HP-IL/RS-232C Interface VS HP 82166A HP-IL Converter

*Message #10 Posted by **yves** on 15 Jan 2012, 3:45 a.m.,*
in response to message #1 by Fouad M. Kaadou

hello,

The library I previously uploaded for you here : "HP82165A arduino library" is for HP82165A parallel interface. This device provides a parallel port thru HP-IL loop. This implementation uses 8 bits bi-directional, plus software acknowledgment. It's not the fastest but it's reliable for Arduino communication.

The HP82166 is a similar device, which few extra capability (mainly automatic loop power up/down signal and external power source capability).

Yves.

eBay Impertinence (well, only close to)

*Message #1 Posted by **Juergen Keller** on 12 Jan 2012, 4:01 p.m.*

Just got a notice from a friend that one of my pictures is used for auctioning a 42S, eBay item no. 140678333792. At least, the seller should have stated in the auction text that the picture does not show the actual item, or even ask me.

It's not the first time that this happens to me (thanks to Google image search), I guess I shouldn't fuss and be proud instead ;-)

Juergen (alias jkxyz on eBay)

Re: eBay Impertinence (well, only close to)

*Message #2 Posted by **Jeroen Van Nieuwenhove** on 12 Jan 2012, 5:57 p.m.,*
in response to message #1 by Juergen Keller

Have you contacted the seller? Not only is he using your picture, perhaps infringing on your copyright, but more importantly to the calculator community is he misrepresenting a possibly cosmetically flawed item. You really should ask him to take down your pic and post an actual picture of the item in question. Also, the seller has lifted the description of the HP-42S on this museum without mentioning any source. Sigh.

Edited: 12 Jan 2012, 6:00 p.m.

Re: eBay Impertinence (well, only close to)

*Message #3 Posted by **Juergen Keller** on 13 Jan 2012, 2:28 a.m.,*
in response to message #2 by Jeroen Van Nieuwenhove

Yes, I asked the seller, and he can provide pictures of the actual item on request. He told me that in his opinion the eBay fees for additional pictures are too high.

I don't know what the regulations are for text. I guess it's not too different from pictures. Again, when copying text from the Internet, the minimum you can do is provide a reference to the source.

Re: eBay Impertinence (well, only close to)

*Message #4 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 12 Jan 2012, 6:46 p.m.,*
in response to message #1 by Juergen Keller

The seller says "Feel free to ask more pictures or questions !" so I did, let's see what response I will have, perhaps more of your pictures ;)

Cheers - Kerem

Re: eBay Impertinence (well, only close to)

*Message #5 Posted by **JoeGeller** on 12 Jan 2012, 7:11 p.m.,*
in response to message #1 by Juergen Keller

TAS is very good about taking down copyright material (infringing items). If you created the original photo, that is good enough, you are the copyright owner.

The information is all here: http://pages.ebay.com/help/tp/vero-rights-owner.html#report

Just fill out the form in -step 1- and send it to them. They say FAX, however there is also an email address below in the eBay's registered agent hot link: copyright@ebay.com

On notice (you sending the form to TAS), they act pretty quickly, within a day or two by ending the auction and notifying the seller of the infringing items (as listed in your "take-down" notice).

The seller might complain that you had no copyright claim to the photo at your website or on the picture. Such words are not needed. If you created the work (e.g. a photo), you own the rights to the photo, unless you have assigned the rights to others (e.g. sold or licensed rights to another).

Re: eBay Impertinence (well, only close to)

*Message #6 Posted by **Juergen Keller** on 13 Jan 2012, 2:33 a.m.,*
in response to message #5 by JoeGeller

There was a time when eBay didn't care about it at all. This seems to have changed. Thank you for the link, I will consider this procedure when the same will happen again in the future.

Honestly, I also have to mention that the opposite happened to me: there was a guy asking me to use parts of an auction text from one of my closed auctions. The awareness of copyright is quite different among people.

Edited: 13 Jan 2012, 2:33 a.m.

Re: eBay Impertinence (well, only close to)

*Message #7 Posted by **DavidShenk** on 13 Jan 2012, 12:14 p.m.,*
in response to message #5 by JoeGeller

My experience with TAS is that they are VERY fast at removing copyrighted content, unfortunately, that speed does not include your own personal photos, unless they have a team of lawyers behind them.

About 2 years ago, a seller had bought a custom made item from me, then turned around and relisted it. Not only did they use my photos, but photos I had of other listed items that were obviously not what they were even selling. They ignored my emails, so I complained to TAS. After a week, I complained again. It was at least two weeks before the auction came down. Then of all things, I get a nasty email from the seller that believed they were doing ME a favor by "promoting" my items by using my photos.

There are all kinds...

Dave

Re: eBay Impertinence (well, only close to)

*Message #8 Posted by **Juergen Keller** on 13 Jan 2012, 1:50 p.m.,*
in response to message #7 by DavidShenk

Sometimes it also can be very funny: once a seller directly linked pictures on my web server in his

auction text. I then replaced the pictures with Donad Duck images (or something similar, I don't remember exactly) :-)

Re: eBay Impertinence (well, only close to)

*Message #9 Posted by **davidshenk** on 13 Jan 2012, 1:56 p.m.,*
in response to message #8 by Juergen Keller

That's very thoughtful of them. Not only are they using your photos, they're expecting you to host them too.

I run a hiking website and there are several places where my photos have been directly linked like that. I haven't purposely changed them yet, but it does give you a bit of power.

Dave

Re: eBay Impertinence (well, only close to)

*Message #10 Posted by **JoeGeller** on 13 Jan 2012, 2:07 p.m.,*
in response to message #7 by DavidShenk

Any email or other communication to TAS about copyright infringement, -without- the Exact required bullet points, is considered "ineffective" notice and can be ignored. That's why nearly every service provider today uses nearly identical notice forms (Google, TAS, etc).

Bottom line: Most companies have converted the legalese to a somewhat standard, mostly readable form for non-lawyers. If you send them the exact form that they provided (with all of the items filled in), US companies are required to take some action.

This might be going to far off topic. Google(tm) 17 U.S.C. § 512 (c)(3)(A) to see the list of required items and/or DMCA for more info. If you follow the form exactly, you should have good results.

Slow LCD display - fixable?

*Message #1 Posted by **Cristian Arezzini** on 12 Jan 2012, 3:03 p.m.*

I recently acquired a calculator, it's the same model of my very first scientific calculator - alas it's not an HP, but I really wanted to have one back, as the original was thrown away many years ago. It's an ELORG 51, which is the same as the Elektronika MK-51. The sample I found is in good cosmetic conditions, and it works; but the LCD is "slow". I don't know how to explain exactly, but it sort of looks like each segment takes a long time to become black. It's a little like when batteries get very low, only that in this case, once the segments become black, it's a "bright" black, with good contrast, not faded. I disassembled the calculator, and the inside is in great shape: no corrosion anywhere and no visible damage. But the only components are the main processor, two things that look like dark red/brown resistors, and a small blue thing with two tiny leads on its side, which could be a capacitor. They are marked R1, R2 and C1 but it's a strange font and I don't know if they're actually Latin characters or cyrillic. Does anyone know these symptoms? What went wrong in the circuit? Is it fixable?

Thank you in advance, Cristian

Re: GETROM doubt

*Message #4 Posted by **Raymond Del Tondo** on 12 Jan 2012, 1:52 p.m.,*
in response to message #3 by robertoataulfo

It's the same as with SAVEROM: (Target) page number in X, mass storage filename in Alpha.
You only have to make sure that the page number contains RAM, but that should be described in the 41CL manual;-)

So if you previously stored a ROM file on tape with Alpha containing "ND1",
and now want to get that ROM back into the calc, put ND1 into Alpha, the wanted page number into X, and XEQ GETROM .

Re: GETROM doubt

Re: GETROM doubt

*Message #6 Posted by **Raymond Del Tondo** on 12 Jan 2012, 3:29 p.m.,*
in response to message #5 by robertoataulfo

Your Emu41 config doesn't include a "RAM" page at address 8 .
so the target page wasn't prepared to accept a ROM image download.
You'll have to include a line like
8 4 MLDLRAM.DAT ; RAM
into Emu41.ini , and after a restart of Emu41 there will be a RAM page at address 8.
Please take a look into Emu41.doc for more details.

Once the above config is active, your GETROM of 'TEST' to page 8 should work;-)

HP48GX : faulty Port 2 ? any way to repair it ?

*Message #1 Posted by **Antoine M. Couëtte** on 12 Jan 2012, 2:59 a.m.*

Hello to all,

In the past few weeks, I have observed the following symptoms on an HP48GX which I have extensively used to develop my HP41 ASTRONAV Software through HrastProgrammer HP41X/Y/Z Emulator.

Whenever I plug into port 2 any type of Card (ROM Card or RAM MEMORY Cards), I get the following message "Warning INVALID CARD DATA".

In addition to this, whenever I plug into Port 2 a RAM Memory card 256K or bigger, all Ports from :2: to ... :33: show as being physically residing within the system, although for a 2MB Ramcard for example, no such Ports above :17: physically exist in the Calculator.

Trying to "PINIT", or even trying "Hard reset" through inserting a needle into the appropriate "foot hole" does not solve this situation at all.

Any clue here ? any (simple) way to fix it ?

Thanks for any information and/or help here.

Antoine

Antoine M. "Kermit" Couëtte

Re: HP48GX : faulty Port 2 ? any way to repair it ?

*Message #2 Posted by **Raymond Del Tondo** on 12 Jan 2012, 3:56 a.m.,*
in response to message #1 by Antoine M. Couëtte

Hello,

the papaer clip reset does not automatically reset all memory,
it's just a hardware reset for the CPU.

Given the symptoms of your calc, you should unplug all cards,
remove the card batteries, and initiate a cold start (ON+A+F) .
After that, and _before_ loading any 3rd party software,
you can insert a ROM card, and check if the symptom is still existent.

HTH

Ray

Re: HP48GX : faulty Port 2 ? any way to repair it ?

*Message #3 Posted by **Antoine M. Couëtte** on 12 Jan 2012, 9:11 a.m.,*
in response to message #2 by Raymond Del Tondo

Thank you Raymond for your kind advice.

I followed it and proceeded as you indicated. I could not establish again a normal calculator behavior since it did not change anything from the previous state depicted here-above.

Is it a software or rather a hardware problem ?

Antoine

Re: HP48GX : faulty Port 2 ? any way to repair it ?

*Message #4 Posted by **Lyuka** on 12 Jan 2012, 7:16 p.m.,*
in response to message #1 by Antoine M. Couëtte

Hi Antoine,

> Quote:
>
> In addition to this, whenever I plug into Port 2 a RAM Memory card 256K or bigger, all Ports from :2: to ... :33: show as being physically residing within the system, although for a 2MB Ramcard for example, no such Ports above :17: physically exist in the Calculator.

The symptoms you stated above implies bridged contacts at the card slot or the malfunctioning address decoder i.e. dead 74HC174 chip on the mother board which is used to make signals to select memory chip in the card.

Try cleaning the contacts of the card slot using compressed air to remove contamination which might exists.

Good luck.

Regards,
Lyuka

Re: HP48GX : faulty Port 2 ? any way to repair it ?

*Message #5 Posted by **Antoine M. Couëtte** on 13 Jan 2012, 10:56 p.m.,*
in response to message #4 by Lyuka

Dear Lyuka,

Thank you for your information and advice.

I did blow compressed air on the card slots contacts to remove possible contamination. The symptoms remain unchanged, and I would conclude that there is something wrong with the address decoder, which is a gripe totally beyond my nonexistent repair capabilities.

In the (dubious ?) case when repairing might be an option, is it worth getting this HP48GX fixed ?

Thank you again, Lyuka San, and

Best Regards

Antoine

Are you referring to the 15C Limited Edition (that's what it says on the faceplate)? If so the bugs in the latest known version are listed here including the power consumption issues.

If you are referring to an earlier version of this (before HP decided to call it Limited Edition) it's quite possible that you do have firmware with even more bugs, limited memory and worse battery life. But that hasn't been discussed on this forum to my knowledge. What's the firmware date in yours. Pressing <ON> + <g> + <Enter> then <2> then <Enter> will show the date. The latest is 2011-04-15.

Re: HP-15c+ Firmware

*Message #4 Posted by **Matthias Wehrli** on 12 Jan 2012, 5:57 p.m.,*
in response to message #3 by Katie Wasserman

Yes, I talk about the new relesed HP-15, but not hte commercial version "c LE", but hte proto version of it which is labeled "c+"... Mine is 2011-04-15 but there must be older version(s)

LiPo rechargable for 41 pack rebuilding?

*Message #1 Posted by **Craig Ruff** on 11 Jan 2012, 11:26 p.m.*

Has anyone thought about using a small 2S LiPo battery pack for rebuilding an 82120A? A quick search found a small 120 mAh 7.4V pack (E-flite EFLB1202S20) that should fit with room to spare (30mm x 20mm x 9mm). It would need 3 diodes inline to drop the voltage to the calculator, and it looks like the standard LiPo charging connector might fit in the recharger connection opening.

Re: LiPo rechargable for 41 pack rebuilding?

*Message #2 Posted by **Juergen Keller** on 12 Jan 2012, 3:03 p.m.,*
in response to message #1 by Craig Ruff

There was a discussion about using LiPo batteries on this forum.

Google is your friend, e.g., search for:
82120a lipo site:hpmuseum.org

Re: LiPo rechargable for 41 pack rebuilding?

*Message #3 Posted by **Craig Ruff** on 12 Jan 2012, 6:01 p.m.,*
in response to message #2 by Juergen Keller

Doh! I only looked in the article section. I think using a 2 cell LiPo pack with voltage dropping diodes should work fine. I'll have a look at running a bench top test before going to the effort of retrofitting an old nicad pack case.

OT: TI Dataclip (TI1700) project

*Message #1 Posted by **Alberto Fenini** on 11 Jan 2012, 5:23 p.m.*

Dear All,
I have received today a TI1700 that from the pics had chances to be in working conditions.
These are quite rare to be found in working conditions, and I have one that is fully working, so that his was purchased mainly as donor for parts.
I also had another non working unit which I was trying to restore a couple of years ago, and has been useful for learning how to open it and make some tests.
Anyway, I have inserted the batteries in this newer unit and it came back to life. However, only few keys were responsive e no operation could be performed.
I decided to open it and try some basic de-oxidation. Battery compartment was clean, and overall I found no signs of corrosion.
However, once reassambled, I was only able to get a steady "0" and randomly, some numbers as shown in pictures by pressing the keys.
There are two set of pics, the first set belongs to the old unit, which I have pictired to show the components.
Basically there is a main unit, a zebra connector and the keyboard.
The keyboard flat goes under the zebra and is connected to the back of the module thanks to the zebra.
This zebra is very damaged and also the battery + lead does not make contact anymore with the back of the keyboard, which is why I have soldered the yellow cable.
I'm looking for suggestion, if anyone has ever done this before
I was thinking to replace the zebra with half of a zebra connector from a HP-41, would it work ?
Would it be possible to solder some thin cables from the kayboiard foil to the module without melting the keyboard ??
Secondly, would you suggest to drill the rivets and separate the sheets that make up the keyboard and do some seriuos cleaning ?
Thank you very much for any help, Alberto

Set 1 (older unit):

Set 2 (newer unit):

Re: OT: TI Dataclip (TI1700) project - 2nd step

*Message #2 Posted by **Alberto Fenini** on 16 Jan 2012, 8:18 a.m.,*
in response to message #1 by Alberto Fenini

ciao a tutti,
I have made a little step further.
Since this unit was non working, I have decided to open up the keyboard and see if a restoration was possible.
I have several pics, so if anyone is interested just write me and I'll be happy to send those to you.
I have ordered a silver pen which is conductive and is usually used for rework on flexible pcbs, to restore the contacts and eventually rebuild the zebra that connect both pieces.
Any suggestion, as always, is welcome !
Take care Alberto

CCD OS/X SAVEROM and GETROM doubt.

*Message #1 Posted by **robertoataulfo** on 11 Jan 2012, 11:37 a.m.*

What are the parameters of the commands SAVEROM and GETROM module CCD OS/X ?

Re: CCD OS/X SAVEROM and GETROM doubt.

*Message #2 Posted by **Raymond Del Tondo** on 11 Jan 2012, 12:07 p.m.,*
in response to message #1 by robertoataulfo

Parameters are as usual: Page number in X, name of the mass storage media file in Alpha.

Note that due to the compact size of the functions, only the first mass storage device in the loop will be accessed, regardless of the loop address.

HTH

Ray

HP48S, different hardware construction

*Message #1 Posted by **Cristian Arezzini** on 11 Jan 2012, 9:33 a.m.*

I recently disassembled two of my 48S, one was dead and I wanted to transplant its screen to another who had a bad display. The transplant worked, but I was surprised to see that the internal construction of the two calculators is WAY different. The motherboards just don't look like the same calculator at all. One is yellow/gold, the other is green (like the 48G); one - the green version - has a standard format processor, the other has the silicon of the processor in plain view, mounted on a sort of "holder" that is then soldered to the mainboard. I couldn't find any information about this difference, does anybody know when/why they changed? It must have been a great effort to totally re-design the board and processor...

Cristian

Re: HP48S, different hardware construction

*Message #2 Posted by **Eric Smith** on 11 Jan 2012, 8:00 p.m.,*
in response to message #1 by Cristian Arezzini

The "holder" assembly you describe is "TAB" (Tape Automated Bonding).

HP and other electronics companies redesign their products from time to time to deal with availability of components and for cost reduction.

Re: HP48S, different hardware construction

*Message #3 Posted by **Randy** on 11 Jan 2012, 10:30 p.m.,*
in response to message #2 by Eric Smith

TAB packaging in S and SX was a carry over from the Pioneer design.

When the 48 was updated to the G series, the processor was repackaged in what was then a standard molded flat-pack. HP then updated the S and SX logic boards to use the later package design. The same processor repackaging occurred in the 17Bii. The 42S was not updated even though the 17Bii was basically the same hardware. HP must have had a big pile of 42S TAB processors on the shelf which says alot about how rapidly the calculator market declined in the mid-nineties.

Re: HP48S, different hardware construction

*Message #4 Posted by **Cristian Arezzini** on 12 Jan 2012, 4:54 a.m.,*
in response to message #3 by Randy

Thank you for your replies... I suspected something like that, I just thought it wouldn't be worth the effort and the expense to re-engineer the motherboard for a product "almost" about to be discontinued. And the "updated" S/SX boards must be much rarer than the original ones... I opened maybe 6-7 series S and I only saw one of the newer boards!

Cristian

I think that the sales volume of the HP 42S was never great because HP went out of its way to hide it, or at least not advertise it, all through its short 1988 to 1995 life span. I remember a lot of HP advertising in IEEE Spectrum magazine and other publications for the HP 28S in 1988, and for the HP 48SX in 1990, but nothing *ever* for the poor unheralded HP 42S except what was in EduCalc catalogs. When I finally obtained an HP 42S to replace my old HP-15C, I was stunned by its capability. It made my trusty HP-15C look like a half-baked kludge. No doubt HP downplayed the 42S to direct buyer attention to the upper-end HP 48SX and follow-on models. It's little wonder that the HP 42S during its production life was never popular. I wonder why HP bothered to revise the firmware up to rev. C.

We didn't realize what we had until it was gone and only the mediocre HP 32Sii was available.

N batteries for HP 41's

*Message #1 Posted by **WaltMaken** on 10 Jan 2012, 11:05 p.m.*

Tuesday, January 10, 2012 Until today, I was buying N batteries for my HP 41CX at my local Radio Shack. They were costing $6.39 + tax for 2. Today I stopped at my local Staples store, and discovered they handle the N batteries, but the cost is only $3.29 + tax for 2. The Wal-Mart stores I've checked do not carry the N battery anymore. If anyone knows of any other sources for N batteries, please add to this thread for future reference. Thanks

in response to message #1 by WaltMaken

So ... to extend the life of all the other batteries one might purchase in order to get a better price, should they be stored at a temperature below freezing, just above freezing, or room temperature?

Re: N batteries for HP 41's

*Message #9 Posted by **Dave Shaffer (Arizona)** on 11 Jan 2012, 6:19 p.m.,*
in response to message #8 by Jim Yohe

Duracell says: "We recommend storing batteries at room temperature in a dry environment. Extreme heat or cold reduces battery performance. You'll want to avoid putting battery-powered devices in very warm places. In addition, refrigeration is not necessary or recommended."

Kodak says: "We recommend storing batteries at room temperature in a dry environment. Extreme heat or cold reduces battery performance. You'll want to avoid putting battery-powered devices in very warm places. In addition, refrigeration is not necessary or recommended."

Elsewhere I saw suggestions that it not be too dry (can suck the moisture from the battery chemicals).

So, it looks like you don't have to do much but keep them in the house where it's not too cold and not too hot. (Check with Goldilocks!)

Re: N batteries for HP 41's

*Message #10 Posted by **Ethan Conner** on 11 Jan 2012, 8:57 p.m.,*
in response to message #9 by Dave Shaffer (Arizona)

I used to have a job that took me to an extreme cold environment. We had to keep batteries close to our bodies when not in use. Otherwise they quickly become cold soaked and useless.

I only use recharge batteries. It's nice and cheaper... Regards...

Re: N batteries for HP 41's

*Message #13 Posted by **Garth Wilson** on 12 Jan 2012, 12:47 p.m.,*
in response to message #12 by dinamarco

That's not always an option. My 41cx halfnut would show low battery even on a fresh charge, because the voltage on rechargeables is not enough. Why use rechargeables and have to keep recharging though when a set of alkalines lasts a couple of **years** without having to think about it, unless you're using the card reader or the bar code reader a lot.

Edited: 13 Jan 2012, 2:49 a.m. after one or more responses were posted

Re: N batteries for HP 41's

*Message #14 Posted by **Massimo Gnerucci (Italy)** on 12 Jan 2012, 1:32 p.m.,*
in response to message #13 by Garth Wilson

You have to buy new rechargeables then... mine (I have several of them) do not show the low battery warning, when fully charged, on any of my 41s.
You will like them when you have peripherals, not limited to the card reader anymore, that eat quite a lot of juice. :)

Massimo

Re: N batteries for HP 41's

*Message #15 Posted by **Garth Wilson** on 12 Jan 2012, 2:00 p.m.,*
in response to message #14 by Massimo Gnerucci (Italy)

When the battery voltage is down to 1.20 to 1.25 volts, ie, the voltage of rechargeables, my BATT annunciator goes on. But even back when I was interfacing to lots of equipment on HPIL, the alkaline batteries lasted a very long time.

Re: N batteries for HP 41's

*Message #16 Posted by **Dieter** on 12 Jan 2012, 4:04 p.m.,*
in response to message #15 by Garth Wilson

On my 41C and 41CV the BAT announciator comes on as soon as the voltage of the battery pack has dropped to quite exactly 4 V, which means 1 Volt per cell - the usual final discharge voltage of a completely empty NiCd/NiMH battery.

So if your 41CX turns on the announciator at 1,25 V per cell there's something wrong - in this case it would almost permanently display BAT when HP's own NiCd-pack 82120A is used. Which of course is not the way the announciator is supposed to work. ;-)

That's why I think there's a problem with at least one of your rechargeable batteries. One of the cells seems to be dead, or at least its voltage drops more rapidly than in the others. You may determine the voltage of each battery separately with a load of, say, 50...100 mA. Metering the open circuit voltage of the complete pack does not make much sense here.

Dieter

Re: N batteries for HP 41's

*Message #17 Posted by **Garth Wilson** on 12 Jan 2012, 4:41 p.m.,*
in response to message #16 by Dieter

I've never used recheargeables with it, but I always measure the voltage on the alkalines when the BATT annunciator comes on, and the four of them together produce close to 5V. I realize the voltage will be lower under load, but the load when the calc is on but idling is only a couple of mA, and other extensive battery-life testing for our products tells me there's still a fair amount of energy left there. However, since the 41 is so valuable and I don't want to ever have any leakage, I replace them immediately when the annunciator comes on.

Re: N batteries for HP 41's

*Message #18 Posted by **Håkan Thörngren** on 13 Jan 2012, 1:08 a.m.,*
in response to message #16 by Dieter

I have never bought any alkalines for my HP-41s. Back in 1981 when I got my first HP-41, I replaced the supplied alkalines with a 82120A (which was pricy) once the original batteries drained after a couple of months. I usually charged it once per week for years and I used my HP-41 a lot back then.

When the 82120A finally died, I switched to to NiCd N cells and some 5+ years back NiMH N cells (which now need to be replaced).

Rechargeables have work fine for me for years, not a single problem.

I also use NiMH cells in my 48GX, but that one give very short notice before it lose memory after the low bat indication comes up...

Odd looking 41cx

*Message #1 Posted by **Chris Woodhouse** on 10 Jan 2012, 12:31 p.m.*

I had an interesting dream about a 41cx. I was out shopping trying to find a 15C LE when I came across what looked like a 41cx. However something looked odd, then I realized there was no display. So I started to enter some numbers, and as soon as I did, the calculator extended in length to reveal a single line of display. As I added more numbers to the stack it got longer showing more lines of display (up to 4) then as numbers were removed from the stack the calculator got smaller again only displaying the stack levels that had a number in them.

Obviously a ridiculous design for a real calculator (hey it was a dream) but it might translate to a cool feature for an emulator of the 41cx or any RPN calculator.

Chris W

[WP-34s] V3 overlay and flashing process - Questions

*Message #1 Posted by **Alexander Oestert** on 10 Jan 2012, 12:41 p.m.*

Seeing the V3 overlay reday to ship on Eric's site I actually have two questions before I'll buy them:

1) Is the V3 overlay final now?

2) Is the flashing process for V3 similar to the V2 process or does one have to do anything different?

Thanks in advance!

And a Happy New Year to all of you!

Re: [WP-34s] V3 overlay and flashing process - Questions

*Message #2 Posted by **Marcus von Cube, Germany** on 10 Jan 2012, 1:00 p.m.,*
in response to message #1 by Alexander Oestert

There is a difference if you want to fill the library section with the initial flashing process. In fact it's much easier now. Just compile your programs with the new LIB tool into wp34s-lib.dat and then join calc.bin with this single file (copy/b calc.bin+wp34s-lib.dat calcfull.bin). The resulting file can then be sent to the calculator, preferably with MySamba.exe. There are .cmd files that help in the creation of the necessary files.

I don't think we will change the keyboard before V4 which will contain tagged registers so that the calculator knows what is stored there: single or double precision decimals, complex numbers, integers, matrix descriptors, or strings. With such a change, complex mode will have to change and we may introduce assignable keys in the same run. Maybe sometime before the next HHC...

Re: [WP-34s] V3 overlay and flashing process - Questions

*Message #3 Posted by **Alexander Oestert** on 10 Jan 2012, 1:40 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks, Marcus. Please allow a follow-up:

a) If I don't want to join any own programs, I could simply flash the calc.bin in the known process, right?

b) V4? That makes me wanting to bail on V3 entirely and just use V2 until then...

Re: [WP-34s] V3 overlay and flashing process - Questions

*Message #4 Posted by **Dominic Richens** on 10 Jan 2012, 3:12 p.m.,*

Yes.

> Quote:
>
> b) V4? That makes me wanting to bail on V3 entirely and just use V2 until then...

I wouldn't. We don't even know how we'll approach v4 yet, it is still a bit of a dream.

v3 is much nicer than v2 for programming and library management. For day to day use as an RPN scientific, there isn't much difference.

In fact v3 implements everything I wanted for the 42 replacement except typed values (and perhaps a few functions).

- Pauli

Eric Rechlin - Overlay

*Message #1 Posted by **robertoataulfo** on 10 Jan 2012, 10:39 a.m.*

```
I hope it is of interest to other collectors.
I have several calculator with the metal damaged.
Eric you could not do overlay to replace the metal?
```

Re: Eric Rechlin - Overlay

*Message #2 Posted by **Eric Rechlin** on 11 Jan 2012, 2:36 p.m.,*
in response to message #1 by robertoataulfo

Because the damage is on the edges, which would be hard to cover with the overlay, I think it would better to try using something like model paint.

Geoff might be able to give some suggestions, too, as he has surely encountered similar damage when restoring calculators.

Eric

> Additional bypassing capacitor of 100uF will reduce the high current spike which may cause "Pr Error".

Have you actually measured the VDDCORE voltage rail depression which coincides with that transient? Reason being is the level of bypass Atmel calls for is fairly heavy and I believe HP followed their guidelines relatively closely -- well best I can puzzle out through opaque black solder mask.

What you may be seeing in the overall main inrush at power on also includes the LCD charge pump and its output bypass which is discharged at power on. Atmel had added series resistance to the LCD rail bypass possibly to reduce this turn-on transient. Note the VDDCORE rail is downstream from VDDIO1, is fed by the internal regulator, and has its own bypass so it should be relatively well decoupled from the main VDDIO1 transient. But admittedly I haven't confirmed the effective isolation via measurement.

Re: HP-15C LE : Workaround for the high current spike

*Message #3 Posted by **Lyuka** on 11 Jan 2012, 7:50 p.m.,*
in response to message #2 by uhmgawa

Hi uhmgawa,

The decoupling around the MCU seems good, but it's not the point. Though it's good for stable power supply, the total amount of the bypassing capacitance is not enough to eliminate the supply voltage drop by the internal resistance of the batteries for 40mA-40us spike.
To make the things worse, it's not the in-rush current, in other words, this spike occurs at every any key presses.

As previously mentioned by Seth Morabito at this thread, the battery voltage depression occurs by high current draw (20mA or so) and the internal resistance rises enough to drop the voltage below 2.0V at the current spike. The high current draw condition occurs at every key press or at calculator is "running", and the voltage recovery time of the CR2032 battery is quite long after such heavy load.

By my quick test, the "Pr-Err" happens after battery voltage drop less than 1.8V or so, at that voltage calculator will shutdown.

Regards,
Lyuka

I see. That's quite interesting as I'd misunderstood this to be a power-on transient.

In that case it seems whatever power conservation profile is in use may actually be disabling power domains in the sam7. Otherwise I'm not sure what would likely be causing such a wakeup transient upon any key press. Atmel doesn't specify instantaneous current draw for the sam7 but the rather heavy bypass usage would be consistent with attempting to tame transients upon wakeup from a power domain disabled to active state.

This is a combination of two effects: The CPU core is powered down between key presses to conserve power, just the LCD is powered and some pull-up resistors for the keyboard. On a key press, the device is woken-up. Here, something has been screwed up in that the processor goes to full power (and stays there as long as the key is down.) The latter should be responsible for the stress on the coin cells.

I'd like to see the same measurements for the 12C+ (same hardware, different firmware), an original 20b or 30b, and, of course, for WP 34S on either hardware.

The latter should be responsible for the stress on the coin cells.

The high sustained current draw at wakeup is a potentially missed power conservation optimization in the emulator design. The ~40us transients seen at beginning and end of this interval, which the additional bypass is attempting to suppress, appear to be a chip/hardware characteristic as this exceeds the sustained current draw specified for the device.

Profiling the current draw for the WP 34S would probably be the most useful as it would be possible to correlate the current draw to known activity in the sam7.

Alternately the added bulk bypass for the 3V0 rail (VDDIO1 / VDDLCD) can be distributed among C16, C17, C20, and C21. VDDCORE is decoupled by C11 and C12.

Bypassing local to the sam7 would also factor out the impedance of the 3V0 supply trace stretching across the board -- the board is only a two layer design without benefit of a power and ground plane. Actually getting this on two layers is a respectable effort given all vias had to live outside of the tactile dome lands on the opposite side. A concession to simplified (inexpensive) board routing is also quite likely how the 15c le ended up with legged domes vs. the smoother round domes found in the original voyager layout.

HP-15C LE: why emulate?

*Message #1 Posted by **Eric Zoob** on 9 Jan 2012, 9:29 p.m.*

I have a naive question: I thought contracting the manufacture of custom chips for embedded applications was standard practice. What would it take (or rather what would it have taken) for HP to send the original chip design out to be shrunk and manufactured using a modern process?

Second question: Has anyone successfully run a program or calculated an integral that takes, say 10-20 minutes or longer, on the new HP-15C LE?

Re: HP-15C LE: why emulate?

*Message #2 Posted by **Katie Wasserman** on 9 Jan 2012, 10:02 p.m.,*
in response to message #1 by Eric Zoob

I ran my pi calculation on a 15C LE for 16+ minutes. Why do you ask, battery life questions?

Re: HP-15C LE: why emulate?

*Message #3 Posted by **Eric Zoob** on 10 Jan 2012, 10:02 a.m.,*
in response to message #2 by Katie Wasserman

> Quote:
>
> I ran my pi calculation on a 15C LE for 16+ minutes. Why do you ask, battery life questions?

Mostly battery life, and the brown out issue mentioned earlier which I came across on my LE unit. I would rather have only a mild speedup (say 5x) and much longer battery life.

Re: HP-15C LE: why emulate?

*Message #4 Posted by **Katie Wasserman** on 10 Jan 2012, 1:58 p.m.,*
in response to message #3 by Eric Zoob

I like the mild speedup and long battery life idea, but better still would be some way to control the speed via the self-test menu. You can do this to a very limited extent on the 20b/30b by setting Test System On/Off. It would be easy to add a more comprehensive option for this to the 12C+/15C LE firmware once the proper way of doing real-time pauses is worked out.

Re: HP-15C LE: why emulate?

*Message #5 Posted by **Jeff O.** on 10 Jan 2012, 12:37 p.m.,*
in response to message #2 by Katie Wasserman

Katie,
I presume that the full 21 mA current draw during program execution (which you reported here) was being

extracted from the CR2032 batteries during the entire 16+ minute pi calculation program, correct? With all the talk about the weakness of the 2032 batteries, I find that quite surprising. Are you at all surprised that the batteries survived for the whole program and did not brown out, thereby wiping the program and all calculated pi digits? Would you be able to monitor battery voltage while running that program to see how it drops during such an extended period of high demand?
best regards,
Jeff

Re: HP-15C LE: why emulate?

*Message #6 Posted by **Marcus von Cube, Germany** on 10 Jan 2012, 12:49 p.m.,*
in response to message #5 by Jeff O.

The 34S can monitor its voltage (BATT). On the 15C (LE) there is no such function if I'm not mistaken.

Re: HP-15C LE: why emulate?

*Message #7 Posted by **Jeff O.** on 10 Jan 2012, 1:11 p.m.,*
in response to message #6 by Marcus von Cube, Germany

Marcus,
I meant monitor using some sort of test set up. Katie seems to have lots of cool test equipment.

Re: HP-15C LE: why emulate?

*Message #8 Posted by **Katie Wasserman** on 10 Jan 2012, 1:52 p.m.,*
in response to message #7 by Jeff O.

I'm away from my test equipment for a few weeks, but sure I could log the voltage and generate a graph. However, I'm not at all surprised that the CR2032 cells can supply 21ma for 16+ minutes. They are being damaged certainly but not exhausted. Also there are two of them so if they have the same internal resistance they're each suppling only 10.5ma.

Re: HP-15C LE: why emulate?

*Message #9 Posted by **Jeff O.** on 10 Jan 2012, 4:27 p.m.,*
in response to message #8 by Katie Wasserman

> Quote:
>
> However, I'm not at all surprised that the CR2032 cells can supply 21ma for 16+ minutes

Well, that is "only" about 2.8 mAh extracted from each battery, and their nominal capacity is something like 250 mAh, so I guess it should not have been that surprising. I did not do any calculations, I just recalled the discussion about the inadequacy of the CR2032 cells. According to this paper, the capacity goes down the harder you work the battery. The authors of that paper seemed most concerned with pulse loads, testing up to 80 mA. The highest continuous load for which they give the resultant capacity (to 2.0 FEP voltage) shows about 155 mAh. Capacity seems to drop rapidly with higher continuous load, so probably less than 100 mAh at 10.5 mA continuous. Even if it is only 50 mAh that would allow you to run a program continuously for nearly 5 hours. Does that sound remotely possible, or did I miss a factor of 10 (or 1000, more likely) somewhere in this analysis?

Re: HP-15C LE: why emulate?

*Message #10 Posted by **Katie Wasserman** on 10 Jan 2012, 8:42 p.m.,*
in response to message #9 by Jeff O.

I think that you're in the right ball park on this. There's a lot of variation among battery manufacturers on these CR2032 cells, 50mAh is likely be a realistic estimate for some of them at a current draw of 10.5 continuously. I should do some actual testing....

Re: HP-15C LE: why emulate?

*Message #11 Posted by **Eric Smith** on 10 Jan 2012, 4:19 a.m.,*
in response to message #1 by Eric Zoob

About $1M. Assuming that they actually still have the full engineering documentation on the original design, which they probably don't. And then a few years later the fab line would be shut down, and they'd have to do it again.

It is *far* more sensible to migrate to a standard architecture. When the Atmel part they use today eventually goes away, it won't be too difficult or expensive for them to switch to another ARM-based microcontroller. (Or even MIPS or something else.)

in response to message #11 by Eric Smith

> Quote:
>
> Assuming that they actually still have the full engineering documentation on the original design, which they probably don't."

That was my first thought upon reading this question. But HP has been evolving the hardware design throughout its lifetime for benefit of the 12C. So it probably wouldn't be as extreme a prospect as capturing a 1980 semiconductor design into contemporary tooling.

> Quote:
>
> "And then a few years later the fab line would be shut down, and they'd have to do it again."

I'd hazard the HP calculator division has no desire (nor budget) to be in the custom semiconductor business given the sales volumes and maturity of these products.

I'm still a little mystified of the rationale specifically for the encore voyager sam7 design in at the time. As a platform for the 12c it was/is complete overkill from a performance and component cost perspective. And HP has history of subcontracting out designs based upon economy architectures elsewhere. Perhaps it was more of a ongoing development/maintenance concern which tipped the scales to the sam7. Or the encore 15c was somewhere on the roadmap and the excess capability was believed a required contingency for that future product.

Re: HP-15C LE: why emulate?

*Message #13 Posted by **Eric Smith** on 10 Jan 2012, 1:35 p.m.,*
in response to message #12 by uhmgawa

They wanted to choose a microcontroller that would be suitable for a wide range of calculator products, not just a 12C or 15C.

Re: HP-15C LE: why emulate?

*Message #14 Posted by **Steve Leibson** on 11 Jan 2012, 12:48 a.m.,*
in response to message #1 by Eric Zoob

This is not a naive question at all. It's one of engineering economics. When the original HP 12C and 15C chips were designed, chips were developed using polygons--drawn rectangles. The design spec may have started with "I need four 56-bit registers for the stack" but would have quickly been converted into drawn rectangles on multiple mask layers, by hand. Today, the design would be specified in a Hardware Description Language (HDL), likely Verilog, and then automatically converted into a netlist of connections and logic elements by an automated synthesis tool. HDL descriptions are comparatively easier to migrate from one process technology to another. Polygon designs require a lot of work, hand work, to retarget.

On the other hand, HP elected to use a standard, inexpensive, and most important, an already designed microprocessor to implement the new 12C and 15C LE. The software emulation layer essentially existed already. So the project to revive the calculators was a relatively low-risk one with a potential payoff. Designing a custom IC would have greatly increased the risk and the cost, reducing the potential payoff and possibly creating a losing proposition for HP.

I'm at least a little foggy on that detail. But I believe I recall CAD for mask creation to have been in use by that point in time.

> Quote:
>
> Today, the design would be specified in a Hardware Description Language (HDL), likely Verilog..

It has already been accomplished as a comprehensive effort for the NUT CPU. The result of which

includes this design specification, a substantial and significant engineering achievement in its own right.

Re: HP-15C LE: why emulate?

*Message #17 Posted by **Steve Leibson** on 11 Jan 2012, 10:24 a.m.,*
in response to message #16 by uhmgawa

Yes, CAD was in use at that time. What that meant was that people didn't need to hand draw the polygons. They could drag a rectangle into place. More advanced: you could drag the symbol of a transistor onto a schematic and that would cause the rectangles to be generated. HDLs and synthesis tools did not come into wide use until very late in the 1980s and did not exist at all when the 12C/15C processor were developed.

The HP 12C was introduced in 1981. That means the processor chip was designed in 1980 or 1979. That's before the IBM PC was introduced. So bringing that design into the 21st century is akin to trying to bring one of my WordStar for CP/M files from one of my NorthStar Horizon's 10-hole, hard sector floppy disks into one of today's systems. First, there's the format conversion from WordStar's file format. Then there's the problem of reading a 10-hole, hard-sector, 5.25-inch floppy disk. Seen a new computer with any sort of floppy disk lately, let alone a 5.25-inch floppy?

That's assuming the oxide hasn't fallen off the disk already.

Now the design files for the original 12C/15C processor aren't likely to be on floppy disks. They're more likely to be on 9-track magnetic tape in GDS format. Those would be the files for mask making. The other design docs may or may not be even findable. In fact, the GDS files might not be findable after 30 years either.

FInally, the documentation of the reverse-engineered NEWT processor is truly impressive and I do not mean to say anything against it. But (A) it's not a chip design and (B) it doesn't belong to HP. Thus there is effort and risk needed to transform it into a chip. The HP 41CL project proves this can be done, with effort (and a lot of love).

There were several redesigns of voyager silicon, the last of which appears to have occurred somewhere around the start of the current millennium. My point (see #13 above) was speculation of the design being captured in more recent tooling than 30 y/o DG/Calma.

> Quote:
>
> But (A) it's not a chip design and (B) it doesn't belong to HP.

I wasn't suggesting HP should have designed yet another native NUT platform. Rather pointing out a successful design effort of the same in spite of being challenged to recreate a coherent reference specification in advance of its unique functional enhancements.

> There were several redesigns of voyager silicon, the last of which appears to have occurred somewhere around the start of the current millennium.

HP's IC operations went to Agilent in the split in 1999. Presumably Agilent was under contract to continue producing ICs for HP for some period of time. Agilent sold that operation off as part of Avago in 2005. Avago sold that (describing it as a "printer ASIC" business) to Marvell in 2006.

Although the IP probably belongs to HP, in the various reshufflings of HP's calculator business, from Singapore to Australia then back to the US, all of the engineering records were discarded. If HP had wanted to design new silicon for the 12C, they would have had to start from scratch.

While the cost of designing the IC might not have been too unreasonable, the cost of putting it into production would have been a deal-killer. Mask charges for ASICs in current CMOS processes tend to be $1M and up. The older processes had much lower mask charges, but those processes are all either already obsoleted, or on their way out.

I wasn't aware this IP was caught up in the above shuffle. The loss though does seem ironic if not somewhat depressing.

Although I suppose in one interpretation it gives added legitimacy to those motivated to recreate this legacy technology, effectively being an effort of preservation vs. simply a copy of closed IP.

How a little HP-50g program mutated into an iPhone app

*Message #1 Posted by **Peter Murphy (Livermore)** on 9 Jan 2012, 7:47 p.m.*

The program was developed by a pilot to do refueling calculations; the pilot was an engineer, and an experienced 48/49/50 user.

He generalized the program for other aircraft, taught himself programming for iOS, and ended up with a nice-looking application called Aviofuel.

Perhaps pilots and others familiar with such matters (and even with this particular app) will have comments. I think it's a nice and relevant story.

The mutation story is here:

http://www.aviobot.com/2011/aviofuel-story

The app is described here:

in response to message #1 by Peter Murphy (Livermore)

Very nice app, well done. This gives me something to look forward to do on lunch breaks this week: find out what these terms mean.

Very Neat. Thanks for sharing.

I am on a similar quest but only at the beginning of my App. We already had a mac book so that was not the hurdle is would be for many. Objective C is a bit strange for someone like me out of programming in C for a long time but the basic stuff is ok.

What I really need to find a way to do is mimic the multiple equation solver of the 50g which is no small task. All my equations will have closed form solutions so I don't have to do any iteration but just thinking of parsing and re-arranging equations programaticaly is a little daunting. But, I'm starting a chunk at a time with it and it really is pretty fun when I get the time to work on it.

in response to message #1 by Peter Murphy (Livermore)

Hello, I'm the AvioFuel developer.

I'm glad you liked the 'mutation' story. Thanks a lot for your comments.

I've been using the HP48/49/50 all these years for many pilot-related tasks, such as aircraft performance calculations, flight-time logging, flight planning, weight&balance calculations, and so on.

Nowadays I use the iPhone and the iPad. I still love my 50g, though. In fact, I use it a lot for app development.

If anyone here wants to play with AvioFuel, I can provide Promo Codes to download the app free of charge from the App Store. Feel free to contact me.

Regards.

> I spent my free time during the following months learning as much as could about Cocoa and Obj-C, reading blogs, tutorials, watching videos and reading books. I didn't even plan to release anything on the App Store. All I wanted was to take advantage of this little magical device for my own needs, to solve my own problems.

This is exactly where I am right now. My son keeps asking me if I'm still working on the that "app thing". I'm sure I have months and months ahead of me. The developer information online from Apple is pretty amazing but did you find any other resources particularly useful. I have a "theach yourself iPhone App developement in 24 Hours book" but I think it is a version old so I'm looking for other places to turn to for more recent information.

Thanks again for sharing!

You can find two great iOS development courses on iTunes, both of them for free:

- Stanford University iPhone/iPad Development Course, by Paul Hegarty. <- This is a must-see. Download the slides from the course site and follow the lectures on iTunes. I learned a lot from this course. Link: http://itunes.apple.com/WebObjects/MZStore.woa/wa/viewPodcast?id=473757255

- Madison Technical College Advanced iPhone Development, by Dr. Brad Larson <- Also very good. It dives into more advanced topics. Larson is the author of Molecules and Pi Cubed, two great apps. Link: http://itunes.apple.com/itunes-u/advanced-iphone-development/id407243032

Books (You can find most of them on Amazon):

Basics:

Learning Objective-C on the Mac, by Mark Dalrymple and Scott Knaster -> My first Obj-C book. Great for beginners.

Cocoa Programming for Mac OSX for Dummies, by Erick Tejkowski -> I learned the basics of Cocoa with this one. Very good read, easy to follow.

Beginning iPhone Development, by Dave Mark and Jeff LaMarche -> My first iPhone development book. Very good. Easy read. It gives you a very good foundation.

iPhone App Development: The Missing Manual, by Craig Hockenberry -> It covers the whole app development process, from the beginning to the end. You'll need basic Cocoa Touch and Obj-C knowledge in order to get the most out of it.

Intermediate/Advanced:

Core Animation, by Marcus Zarra and Matt Long -> Teaches you everything about Core Animation on iOS. I strongly recommend it if you wanna give your app a distinctive touch.

Pro Core Data for iOS, by Michael Privat and Robert Warner -> Once you get enough experience with basic iOS development, you'll realize sooner or later that you need to use Core Data for everything but the most basics apps. I found Core Data a bit complicated and obscure at first. This book helped me a lot.

iPhone 3D: Developing Graphical Applications with OpenGL, by Philip Rideout -> If you plan to develop 3D graphics apps (or games), this is a must. It covers OpenGL ES with lots of examples. You'll need a good C++ foundation, though.

Web:

There are plenty of great sites about iOS development. I think stackoverflow.com and iphonedevsdk.com are both extremely useful for beginners.

Regards, and happy coding! :-)

in response to message #6 by Luis Gonzalez

Luis Thank you very much! I found out that there are several different Stanford classes in the iTunes store (different semesters). The first one I got was too old. Looks like the latest will require me to update the OS on our mac book pro.

But I hadn't found the Madison Technical College one.

That looks like a great collection of references. I'm already finding I want/need to do things I can't with the standard controls.

> Funny you mentioned a good C++ background. I have a mediocre C++ at best :-) I'm old enough to have to take FORTRAN at school and tought myself C and a little C++ over the years.
>
> But strangely enough, I have been developing industrial machinery controls for a long time and the Interface Builder is very much like the programs we use to develop for machinery.

Homebrewed HP48 cards

*Message #1 Posted by **David Griffith** on 8 Jan 2012, 8:13 p.m.*

Some time ago I found pages on making homebrewed HP48 cards (typically battery-backed RAM), but I can't find them anymore. Does anyone here know anything helpful on that subject?

Re: Homebrewed HP48 cards

*Message #2 Posted by **Ben Moss** on 8 Jan 2012, 9:17 p.m.,*
in response to message #1 by David Griffith

There are a couple of designs available at hpcalc.org under HP48 -> Documentation -> Miscellaneous.

http://www.hpcalc.org/hp48/docs/misc/

CL-UTILS revision 2G released

*Message #1 Posted by **Ángel Martin** on 8 Jan 2012, 9:45 a.m.*

After much fiddling with Howard Owen's HEPINI function I managed to reduce its code lenght, reclaiming about 35 bytes. I also squeezed 50 more bytes from other sections, and got rid of Y1SEC - redundant with YSEC in the YFNS ROM - all in all freeing up space for four new functions, plus usability enhancements to the existing functionality.

Also as usual in this maintenance releases some minor bugs were fixed, none of them had been reported anyway.

Should be posted at TOS shortly, drop me a line if you need it before that.

Re: CL-UTILS revision 2G released

*Message #2 Posted by **Geir Isene** on 8 Jan 2012, 12:53 p.m.,*

in response to message #4 by Howard Owen

Here it is in all its g(l)ory ;-)

It wasn´t easy, but the COCONUT CPU has such an extense instruction set that it´s doable. I have to say I ´ve spent the unthinkable time trying to get this one shorter - but I did!

```
098     "X"
019     "Y"             Y: number of pages
010     "P"             X: first page#
005     "E"
```

```
008     "H"             Howard Owen
0B8     READ  2(Y)      Get the number of pages N
38D     ?NC XQ          Convert it to hex
008     ->02E3          [BCDBIN]
0E6     B<>C  S&X       store N in B
0F8     READ  3(X)      Get the first page number S
38D     ?NC XQ          Convert it to hex
008     ->02E3          [BCDBIN]
106     A=C  S&X        But store the result in A  (A=S)
130     LDI S&X         comparison with the start page# in A
010     CON:            Results in (hex) 010 in C [1:0]
306     ?A<C  S&X       Valid start page # is: 7< S <16
0B5     ?NC GO          Start >= 16, DATA ERROR
0A2     ->282D          [ERRDE]
130     LDI S&X         Now test the lower bound
007     CON:            Load hex 07 in C [1:0]
0A6     A<>C  S&X       C=Start page
306     ?A<C  S&X       is 7 less than Start?
3D3     JNC -06         Nope, DATA ERROR
0E6     B<>C  S&X       B=Start page, S
106     A=C  S&X        A=# of pages, N
130     LDI S&X         Valid #Pgs is 0 < N < 9
009     CON:            Load 09 into C [1:0]
306     ?A<C  S&X       Is N < 9?

Emulators for old HP

*Message #1 Posted by **Olivier De Smet** on 8 Jan 2012, 7:55 a.m.*

Hello,

I enjoy writing emulators of old computers and calculators (see http://sites.google.com/site/olivier2smet2/)

After finishing an hp67/97 emulator for windows (with the roms from nonpareil), I started an HP15C emulator for windows (with the roms of an old nonpareil release .. I use to archive files from internet for my own use ;)).

Soon I started a new hp 67 emulator for android, followed by an HP33/34 one (same woodstock processor).

As it was nice to write this one for android I started a new HP11/12/15/16 one for android.

Actually it's near the end of the beta phase. (perhaps I will start an HP41 emulator before finishing this one ...)

But I have now a strange observation :

when running emulators (windows or android) from the HP1x roms from nonpareil, it display "running" with the "r" in the lower part of the second digit, but my own original hp15c display "running" with the "r" in the upper part of the digit. (sr 2242a12656)

Did someone already notice this display artifact ?

Could it be due to roms version ?

Olivier

P.S. all those 1X emulator are private (as it seems there are some trouble with the copyright of HP1x roms)

I hope he changed some other stuff, this one is very easy to patch (even with checksum).

I have a dis assembler for those roms, I commented 50% of the 15 rom to patch it with 224 registers (vs 64

for original), btw it seems that the HP15 roms can't do certain matrix op for matrice larger than 9x9).

Its also usefull to find when to be in FAST or SLOW mode (for display pause ...)

it seems that the HP15 roms can't do certain matrix op for matrice larger than 9x9

Interesting observation. I too have my personal HP15C emulator (based on my Emu41 and using the same source for the ROMs...) and I also patched it for higher register size (up to 192 only, configured as 94 user registers and 99 register pool, so I didn't have to patch the MEM display code).

Can you give more details?

J-F

That level of coverage is quite encouraging actually. I myself had only commented scattered points of interest in the 15c image. I'd been interested to kindle an open effort documenting the entire rom image. However having some explicit release of copyright status from HP would lend creditability to the effort. I can't see that happening though until the 15c le runs it course as a product. assuming it would ever happen.

Also the persistent elephant in the room is that of time being better spent on truly reusable firmware such as the wp-34s work.

With patched roms (ie 224 registers) a 9x9 matrix can be used, determinant and inverse can be computed, but with a 10x10 matrix, determinant is always false (and take too little time to be computed).

The rom can deal with such a matrix ie you can have 64x1 matrix with regular roms, so non-square matrix can have one dimension greater than 9 (but less than 100).

The basic routines can deal with 10x10 and larger matrix but not with 100x1 matrix (2 digits for one dimension).

More elaborate operation such as inverse and determinant fail at 10x10 and success with 9x9 (even if standard rom are supposed to be limited with 8x8)

My guess here would be that the LU decomposition is storing the partial pivots in the matrix descriptor and that the descriptor is overflowing somehow. The Doolittle algorithm is easy to code without limiting the size of matrix it can handle -- putting a limit in would be more effort. However, it does need to store the pivots so that systems of equations and inverses can be evaluated and to restore the original matrix later.

Probably Eric Smith could do this but I'm afraid he won't. There were some nice pictures of his rom-sucker here: http://gallery.brouhaha.com/romsucker-voyager.

The link is broken, but we can still use The Wayback Machine.

IIRC the reason why he didn't extract the ROM of the HP-10C was that he didn't have one.

Chances are small that HP will ever release the HP-10C again even as an emulator. But just for the sake of completeness I'd appreciate it nevertheless.

So maybe if we ask him politely?

Kind regards
Thomas

I had been looking for a loaner 10c to complete the set of KEMU images. Yet from a practical perspective even the 11c image is hard to justify in light of a 15c. That said I wouldn't refuse access to a loaner 10c for a few minutes.

> Quote:
>
> So maybe if we ask him politely?

The polite asking needs to be of HP in terms of a clarification on *their* interpretation of voyager firmware copyright status, which matters far more than the apparent legal status. Although I'd be surprised to see this happen before the 15c le product life cycle draws to a close.

Re: Emulators for old HP

I'm not a lawyer but I read somewhere (maybe even on Eric's site) that in order to claim the copyright of the firmware ROM it must be "written" in it. Since this statement is missing in older ROMs it won't be possible for HP to sue you if you copy it. However this was my understanding why the ROM of the HP-42S is not available whereas the ROMs of the HP-41C and older models are: at the end of the HP-42S self-test it says: COPYRIGHT HP 1988. On the other hand the ROMs for the 48/49/50 series are available.

Recently I stumbled upon Dave's ROM Dump Copying Comments. Besides the legal there's a moral issue here as well. But then we know HP dumped all this information of the voyager series. Therefore I don't think we steal but preserve their work by sharing these ROMs.

With the advent of emulators as smart phone apps the situation changed: suddenly some money could be made with these outmoded ROMs. It's a pity because it made access of the voyager emulators harder.

So I hope you will gain "access to a loaner 10c for a few minutes" in the near future.

Best regards
Thomas

Probably technically true but I am neither a lawyer nor do I welcome needing one in order to prove that theory.

> Quote:
>
> So I hope you will gain "access to a loaner 10c for a few minutes" in the near future.

I'd like to cross off the 10c from a testing perspective. I don't expect problems but early on I did chase down KEMU bugs which I'd only seen surface on some Voyager models. Even then doing so may cross the line as thus far I've only used images captured from devices I actually own.

I just installed the app on my Acer Liquid phone.
There seems to be a problem with the LCD display handling: the regular LCD display elements work allright, but the display contains gibberish. Whenever I push keys, the display changes, so clearly the emulator reacts to keys being pressed, but I cannot make out anything from the screen.
Nevertheless, this app looks very promising, thank you for this effort!

I've downloaded the 41c and also bought the 41cx, probably I'm one of the first ones :-)

The 41cx (and the 41c) work good for the first few minutes on my Galaxy S GT-i9000. Not so on my tablet Acer Iconia 500. The "<--" from the menu and "on" simply don't result in "Memory lost"

As described, the calc being off, I press "<--" from the menu and the "<--" becomes and stays green framed. then I press and hold the "on" key until its green framed, release the "<--" button -- only garbage in the display. The same sequence works perfectly well on the phone.

But I believe it's a promising approach.

GÃ¼nter

Now busy playing around ...

[WP34s] About SKIP and BACK

*Message #1 Posted by **fhub** on 8 Jan 2012, 6:41 a.m.*

I found it already a bit strange when SKIP and BACK were extended to a range of 255 instead of 99 - we've always been told that long SKIPs/BACKs should be replaced by GTO labels, and that's in fact true: changing anything within this range would need to count all jumps again.

But now (with todays ASM tool) it's indeed necessary to change all SKIP xx by SKIP 0xx (same for BACK) - it just doesn't accept 2-digit jumps anymore! :-(

That's really a bit annoying - it requires to change all existing sources and you can't simply make sourcefiles compatible anymore for V2 and V3 versions of WP34s!

So I would suggest to either undo these changes for SKIP and BACK again (i.e. going back to 2-digit addresses) or make the ASM tool a bit more tolerant so that it would accept xx and xxx as jump addresses.

Franz

Re: [WP34s] About SKIP and BACK

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 8 Jan 2012, 8:06 a.m.,*
in response to message #1 by fhub

It does still accept 2-digit offsets for V2 code (or more correctly, older wp34s.op files).

The problem is (fully documented in the ASM manual) that the instruction format comes directly from the wp34s.op file. If that file generates an instruction with a 3-digit number, the assembler will be looking for a 3-digit number***. That is the price we are paying to have an assembler that will accept new instructions that were not ever dreamed up when the tool was written. Putting in exceptions to the rule tends to break new, upcoming features.

Technically, a 2-digit BACK/SKIP instruction does not exist in the current machine anymore.

Rather than using SKIP/BACK, use JMP and a symbolic label instead and feed this through the PP. That tool will correctly create 2-digit numbers for V2 code (or older wp34s.op file) and 3-digit numbers for V3 code. If your offset exceeds the maximum allowed, the tool will automatically switch the instruction to a GTO and insert a LBL at the appropriate target location.

PP has the other benefit that if you come back to your code and inject a few more steps between your branch and your target at a later date, PP will regenerate the correct branch offsets for you (or "promote" it to a GTO/LBL) automatically. It also alleviates the need for you to count steps -- which is even more important when the offset limit is north of 200 steps (I guess that should be "south" for those Australians among us)!

Additionally, many of us feel that the PP-ready JMP is much more readable and self documenting than using BACK/SKIP instructions.

In the meantime, you can use this little ditty to convert your older code to the newer style if you want. Simply

run it as a filter:

```
$ skip2.pl < old.wp34s > new.wp34s
```

(Hopefully there are no bugs :-)

```
#!/usr/bin/perl -w
# Convert 2-digit BACK/SKIP to 3-digit versions.
while (<>) {
  # Look for any 2-digit BACK/SKIP instructions.
  if (/(SKIP|BACK)\s+(\d{2})($|\s+)/) {
    my $offset2 = $2;
    my $offset3 = sprintf "%03d", $offset2;

    # Replace the 2-digit SKIP/BACK with a 3-digit variant.
    # Be careful to put the white space back exactly as it was found!
    s/(SKIP|BACK)(\s+)${offset2}/${1}${2}${offset3}/;
  }
  print;
}
```

*** This is a consequence of the instruction lookup method used. A table is built from wp34s.op with all legal instructions (eg: SKIP 000, SKIP 001, etc.). The source instruction is parsed out of the source line and an explicit match is attempted against the legal instructions.

Ok, I just thought that with all the powerful possibilities of Perl it won't be difficult to accept such 2-digit offsets for SKIP/BACK (maybe even for other commands) in all cases by simply replacing "SKIP xx" with "SKIP 0xx".

Re: [WP34s] About SKIP and BACK

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 8 Jan 2012, 8:35 p.m.,*
in response to message #3 by fhub

OK, since I was working it that area anyway, I decided I might as well just slurp that little fragment into the main script and do this for you on-the-fly.

You can add the "-sb2to3" switch to either LIB or ASM and it will do the conversion of BACK and/or SKIP from 2-digit to 3-digit on any instances it encounters.

However, the best approach is still to port your code to PP where all that messy stuff is done for you magically...

Re: [WP34s] About SKIP and BACK

Great service, many thanks! :-)

Franz

Re: [WP34s] About SKIP and BACK

*Message #6 Posted by **fhub** on 9 Jan 2012, 6:20 a.m.,*
in response to message #5 by fhub

Neil, just 2 little 'cosmetic' problems:

1) PP script: in the helptext for the -v3 option the letters in "enhancement" are a bit mixed-up ;-)

2) ASM & LIB script: my perl2exe doesn't like one line in your helptext for the new -sb2to3 option: it thinks that "use with old-style V2 ..." should include a module 'with.pm' - what a stupid compiler! ;-)
Maybe you could change the line-wrapping in these 2 scripts a bit when you make your next changes ... ("use with" shouldn't be the first text in a line).

Franz

*Message #8 Posted by **fhub** on 9 Jan 2012, 5:57 p.m.,*
in response to message #7 by Neil Hamilton (Ottawa)

Hey, I just saw this in the SVN:
"Pull in Marcus' really bright idea about zero extending instructions and re-search the instruction hash. Allows coding source with things such as "RCL 4"."

Great, that's much better than -sb2to3. :-)

I guess this also works for SKIP 05 (and even SKIP 5) --> SKIP 005.
Then you could remove this -sb2to3 option again. ;-)

RPN programming exercise - Fibonacci numbers

*Message #1 Posted by **Gerson W. Barbosa** on 7 Jan 2012, 8:27 p.m.*

Write a short program on your favorite RPN calculator to display the Fibonacci sequence:

```
0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, ...
```

No manual initialization allowed. On the HP-15C LE you might want to use R/S instead of PSE. Currently I have a couple of 7-step HP-12C programs and one 6-step WP 34S program, but this can always be improved (except by creating a new firmware just for this task - FIB can of course be used if needed :-).

Happy programming!

Re: RPN programming exercise - Fibonacci numbers

*Message #2 Posted by **Paul Dale** on 7 Jan 2012, 8:53 p.m.,*
in response to message #1 by Gerson W. Barbosa

Two completely untest 34S solutions both six steps.

```
01    iC 0          Clx
02    iC 1          FIB
03    x[<->] Y      PSE 10
04    RCL+ Y        RCL L
05    PSE 10        INC X
06    BACK 003      BACK 004
```

The left version is more suitable to other RPN calculators of course. Both are untested and likely broken but the ideas are probably okay.

- Pauli

Re: RPN programming exercise - Fibonacci numbers

*Message #3 Posted by **Gerson W. Barbosa** on 7 Jan 2012, 9:19 p.m.,*
in response to message #2 by Paul Dale

It works. It's similar to the one I came up with when using FIB. I forgot to mention the step count should include LBL when applicable, sorry!

```
001 LBL 99
002 0
003 FIB
004 PSE 10
005 INC L
006 RCL L
007 BACK 04
```

Gerson.

*Message #4 Posted by **Paul Dale** on 9 Jan 2012, 9:15 p.m.,*
in response to message #3 by Gerson W. Barbosa

How about another:

```
01 iC 0
02 iC 1
03 [cmplx]ENTER
04 +
05 PSE 10
06 BACK 003
```

Six steps, seven with an initial label.

- Pauli

Re: RPN programming exercise - Fibonacci numbers

*Message #5 Posted by **Gerson W. Barbosa** on 9 Jan 2012, 10:17 p.m.,*
in response to message #4 by Paul Dale

Nice use of ^{C}ENTER as DUP2 in RPL!

```
%%HP: T(3)A(R)F(,);
\<< \-> n
  \<< 0 1 1 n 2 -
    START DUP2 +
    NEXT n \->LIST
  \>>
\>>
```

Gerson.

Re: RPN programming exercise - Fibonacci numbers

*Message #6 Posted by **Paul Dale** on 9 Jan 2012, 10:32 p.m.,*
in response to message #4 by Paul Dale

And another:

```
01 iC 0
02 iC 1
03 +
04 PSE 10
05 y[<->] L
06 BACK 003
```

Same length though.

- Pauli

Re: RPN programming exercise - Fibonacci numbers

*Message #7 Posted by **Gerson W. Barbosa** on 9 Jan 2012, 10:46 p.m.,*
in response to message #6 by Paul Dale

There's more than a way to skin a cat. On the HP-15C:

```
001- f LBL A
002- g CLx
003- f MATRIX 1
```

```
004- f LBL 0
005- f PSE
006-   RCL + 0
007- f x<> 0
008-   GTO 0
```

Gerson.

in response to message #8 by Paul Dale

That would be useful, not just for this task, so go ahead if there's room enough. By the way, is it possible to enter **i** (1 0) in one step only? Thanks!

Gerson.

Re: RPN programming exercise - Fibonacci numbers

*Message #10 Posted by **Paul Dale** on 11 Jan 2012, 2:53 p.m.,*
in response to message #9 by Gerson W. Barbosa

I can't think of a way to get i on the stack in one step. Can do it in two though.

We do have a complex version of the constants catalogue which puts zero in Y already. This doesn't include any small integers though. "CPX h-shift CONST"

I've been thinking about possible functions to help with the commands in xrom stuff. If any more get added, some will be exposed to the user but don't expect them to necessarily be pleasant to use.

- Pauli

Re: RPN programming exercise - Fibonacci numbers

> We do have a complex version of the constants catalogue which puts zero in Y already. This doesn't include any small integers though. "CPX h-shift CONST"

Yes, I had checked that but then I realized it wouldn't make sense to include

small integers there. Changing the behavior of the CPX key before numeric keys and [.] might be a option, for instance CPX 123 would put 0 in Y and 123 in X. [CPX] [R/S] might be a non-intuitive shortcut for entering **i**. I don't know the impact of these changes in the executable size though. Also, this may not be useful enough to be worth the trouble.

Gerson.

Re: RPN programming exercise - Fibonacci numbers

*Message #12 Posted by **Paul Dale** on 11 Jan 2012, 4:19 p.m.,*
in response to message #11 by Gerson W. Barbosa

A function that does pretty much nothing requires of the order of 100 bytes. This is function table overheads, catalogue overheads and the actual function prelude/epilogue that seems almost unavoidable.

Making small changes to the keyboard handler isn't so bad -- much of this is table based now so adding a command to an unused location is usually cheap.

Adding a complex prefix to digit entry is quite a different change. No idea how large this would be.

The current work is moving as much functionality into internal keystroke programs as we can. Very slow but saving lots of space.

Re: RPN programming exercise - Fibonacci numbers

*Message #13 Posted by **Marcus von Cube, Germany** on 11 Jan 2012, 4:32 p.m.,*
in response to message #12 by Paul Dale

```
XLBL"i"
iC 1
iC 0
RTN
```

This should do the trick with minimum overhead. We have to add a catalogue entry and a command table entry but that's not too expensive.

Not quite -- the stack dynamics would be incorrect :-(

```
XLBL"i"
xIN NILADIC_1_COMPLEX
iC 1
iC 0
xOUT xOUT_NORMAL
```

will work however. The code is 8 bytes, the command table is 10 - 12 bytes (I forget which) and the catalogue entry is 10 bits but can't live in the complex constants catalogue which is compiled automatically -- the complex functions catalogue seems like an okay place to put it.

Pauli

Re: RPN programming exercise - Fibonacci numbers

*Message #15 Posted by **Paul Dale** on 12 Jan 2012, 5:25 a.m.,*
in response to message #11 by Gerson W. Barbosa

We've got a shorter solution on the 34s now:

```
01 [cmplx]i
02 RCL+ Y
03 PSE 10
04 x[<->] Y
05 BACK 003
```

Re: RPN programming exercise - Fibonacci numbers

*Message #16 Posted by **Gerson W. Barbosa** on 12 Jan 2012, 8:03 a.m.,*
in response to message #15 by Paul Dale

That's what [cmplx]i was for! If the steps 02 and 03 are swapped the sequence will begin with F(0). I'd searched for an **i** constant in the HP-42S catalog but there was none. I think this first appeared in the HP-28C. If now WP 34S has it, then it was worth posting this simple RPN exercise :-)

BTW, how [cmplx]i is entered?

Gerson.

It's in the complex catalogue (CPX 3) but I just mapped it to CPX dot as well. I'm sure Walter will find a better place on the keyboard.

Re: RPN programming exercise - Fibonacci numbers

*Message #18 Posted by **Paul Dale** on 12 Jan 2012, 5:34 p.m.,*
in response to message #17 by Marcus von Cube, Germany

We couldn't put it in the complex constants catalogue since that is automatically produced alongside the real version. Still, the complex catalogue is a decent place and Walter will likely find somewhere decent on the keyboard to locate it. "CPX 1" might be okay which would allow "CPX 0" as well :-)

Re: RPN programming exercise - Fibonacci numbers

*Message #19 Posted by **Marcus von Cube, Germany** on 12 Jan 2012, 8:33 a.m.,*
in response to message #15 by Paul Dale

Remember that WP 34S instructions are generally 16 bits long. This allows to cramp so much functionality into a single instruction but costs more bytes than other designs. We are down to 10 bytes here, still pretty decent...

Re: RPN programming exercise - Fibonacci numbers

*Message #20 Posted by **Paul Dale** on 12 Jan 2012, 5:38 p.m.,*
in response to message #19 by Marcus von Cube, Germany

We have way more than 256 different instructions kind of required this and by doing so the argument can be squeezed into the instruction as well.

We currently have 571 instructions and that is not counting integer, real & complex as different functions (there are 660 if you do that). We've almost got as many different functions as the 15C has total op-codes.

in response to message #1 by Gerson W. Barbosa

This is supposed to be just an exercise, not a challenge. Feel free to submit your solutions. Different approaches are always interesting, regardless of code size or register usage.

Here are my solutions:

```
WP-34S

001 LBL 88
002 1
003 LN
004 STOP
005 RCL+ L
006 BACK 02

HP-12C

01-  0
02-  n!
03-  LASTx
04-  PSE
05-  x<>y
06-  +
07-  GTO 03

01-  1
02-  LN
03-  PSE
04-  LASTx
05-  x<>y
06-  +
07-  GTO 03
```

Re: RPN programming exercise - Fibonacci numbers

*Message #24 Posted by **Fouad M. Kaadou** on 8 Jan 2012, 1:14 p.m.,*
in response to message #23 by Gerson W. Barbosa

Here are a few for the HP41C:

```
01 LBL 00
02 CLST
03 E
04 ENTER
05 LBL 01
06 X<>Z
07 ST+ Z
08 VIEW Z
09 PSE
```

```
10 GTO 01
11 END
```

16 Bytes

```
01 LBl 00
02 .
03 E
04 LBL 01
05 X<>Y
06 ST+ Y
07 VIEW Y
08 PSE
09 GTO 01
10 END
```

16 Bytes

```
01 LBL 00
02 E
03 .
04 LBL 01
05 +
06 PSE
07 LASTX
08 X<>Y
09 GTO 01
10 END
```

14 Bytes

I used local labels and synthetic instructions to make the programs shorter.

. = 0

E = 1

Cheers,

Fouad

*Message #25 Posted by **Gerson W. Barbosa** on 8 Jan 2012, 3:18 p.m.,*
in response to message #24 by Fouad M. Kaadou

Thanks for your participation!

I'd completely forgotten about this old thread. Not exactly the same problem, but some interesting ideas there, like Kioshi Ashima's as implemented on the WP 34S:

```
001 LBL 11
002 FIX 00
003 # Phi
004 FILL
005 2
006 +
007 /
008 PSE 10
009 *
010 BACK 02

This is based on the formula F(n) = round(phi^n/sqrt(5)) (See
https://oeis.org/A000045). The first two Fibonacci numbers are not
properly rounded by FIX 0 though.
```

Regards,

Gerson.

RPL programming exercise - One Fibonacci number

*Message #26 Posted by **Oliver Unter Ecker** on 8 Jan 2012, 3:27 p.m.,*
in response to message #1 by Gerson W. Barbosa

On an RPL machine, these two instructions

```
DUP2 +
```

will compute the *next* Fibonacci number, given the two previous ones on the stack.

So, a full program becomes

```
\<< 0 1
    2 100 START
       DUP2 +
    NEXT
\>>
```

(Though, on an RPL machine you'd want to collect the resulting numbers in a list, of course, and not just dump them on the stack.)

With this being too easy for an RPL machine, here's the advanced RPL programming exercise:
if F(10) is 55, what are the last 4 digits of F(10^14)?

(You're welcome to try this on your RPN machine, too, and I will be multo impressed if you can solve this...)

Re: RPL programming exercise - One Fibonacci number

Just a guess: 6875.

Re: RPL programming exercise - One Fibonacci number

*Message #28 Posted by **Oliver Unter Ecker** on 8 Jan 2012, 6:14 p.m.,*
in response to message #27 by Gerson W. Barbosa

lol. For a guess, that's pretty good! Did a calculator help you with your guess?

Re: RPL programming exercise - One Fibonacci number

*Message #29 Posted by **Gerson W. Barbosa** on 8 Jan 2012, 6:46 p.m.,*
in response to message #28 by Oliver Unter Ecker

Yes. I used your program to check it up to F(10^5) on my HP 50g:

```
%%HP: T(3)A(R)F(,);
```

```
\<< 0 1 2 4 ROLL
  START DUP2 + ROT DROP
  NEXT
\>>

  F(10^2)    354224848179261915075
  F(10^3)    final digits:  228875
  F(10^4)    final digits:  366875
  F(10^5)    final digits:  746875
```

These appear to follow a pattern.

P.S.: The latter has 20,899 digits (~10^5*$\log_{10}$(phi)). It took about one hour or so on the real 50g (I haven't timed it).

Re: RPL programming exercise - One Fibonacci number

*Message #30 Posted by **Oliver Unter Ecker** on 8 Jan 2012, 7:10 p.m.,*
in response to message #29 by Gerson W. Barbosa

Brilliant, Gerson!

Ok.

So, for the tenacious ones: how about the last 14 decimal digits of F(10^14)?

EDIT: you could have used the MOD instruction to keep the number of digits down. That would compute F(10^5) *a lot* faster. But, still, 10^14 is out of reach with this approach.

Edited: 8 Jan 2012, 7:21 p.m.

Re: RPL programming exercise - One Fibonacci number

*Message #31 Posted by **Gerson W. Barbosa** on 8 Jan 2012, 8:37 p.m.,*
in response to message #30 by Oliver Unter Ecker

The last four digits of F(10^4) coincide with the last four digits of F(10000) because 10^14 mod 15000 equals 10000.So it suffices to compute F(10000), easily done on the real 50g. See Pisano periods here. There is a calculator for the cycle lengths (scroll down halfway through the page). For modulus 10000 the result is

```
Fibs mod 10000: cycle length is 15000
```

It will not compute the cycle length for modulus 10^14, but it can be extrapolated from lower power of 10. The length appears to be 1.5*10^14, which means this approach won't be of help in this case.

Cheers,

Gerson.

P.S.: The fourth and higher powers of 10 modulus 15000 equals 10000 - so my guess was indeed right :-)

Yes, your guess was right. I volunteer your result is even right to 5 digits.
(Which still doesn't help much toward 14 digits...)

Re: RPL programming exercise - One Fibonacci number

*Message #33 Posted by **Oliver Unter Ecker** on 9 Jan 2012, 6:56 p.m.,*
in response to message #30 by Oliver Unter Ecker

If you look up the Fibonacci page on wikipedia, you'll see various methods for direct computation of F(n).

One is matrix exponentiation: F(n) = [[0 1][1 1]] ^ n

This program for the 50g will tell you what F(100) mod 10^14 is, for example:

```
\<< 1.E14 R\->I MODSTO
    [[0 1][1 1]] 1.E2 R\->I POWMOD
    {1 2} GET
\>>
```

It takes about 1s on Emu48, so I figure about 10s on a 50g.

Now, if you change 1.E2 to 1.E3 it will produce a negative result. No idea why.

If you try 1.E14 it will tell you: "POWMOD Error: Integer too large"

I conclude that on the 50g POWMOD first does the POW, then the MOD, which, uhm, renders this instruction pretty much useless for matrices. (You want to MOD while you're POW'ing, or else you don't avoid the giant intermediate numbers.)

Well, it works on ND1, and the result is: 88299560546875

Modular matrix exponentiation can be made very fast with the binary method, where you're, essentially, moving in powers of 2 with every iteration. There're only ~50 (~log2(10^14)) matrix multiplications necessary to arrive at 10^14.

This could also be made to work on the 50g with ~10 lines of code to write a proper version of POWMOD. I'm pretty sure this could be made to run in under a minute, for F(10^14).

There's a Project Euler problem (#304) where finding this number (almost this number, there's a different modulus) is the first part of the simple but brutal task of summing up the Fibonacci numbers for each of 100,000 primes following 10^14.

On the 50g, 10 of those primes

```
\<< 1.E14 R\->I 1 10 START NEXTPRIME NEXT \>>
```

take about a minute to find (5s in Emulator; not sure how long exactly on the 50g), so 100,000 is a bit... daunting.

(I'm not sure what's done on the 50g, but this speed suggests to me that they're not using Miller-Rabin for the probabilistic primality check that kicks in for large numbers, used by NEXTPRIME.)

Once you have the F(NEXTPRIME(10^14)) and F(PREVPRIME(10^14)), you can use normal Fibonacci iteration (with MOD) to compute the spans between primes and eliminate the need to use matrix exponentiation to find each F(n). With an average of 33 numbers from prime to prime in this range, you're looking at having to compute 3.3 million Fibonacci numbers, though.

If you're interested, here's RPL+ code to do all that:

```
\<< 1234567891011 =m
   1e14 =bias
   1e5 =count

   \<< [[0 1][1 1]] \->big  SWAP
      m modpow
      DUP {1 1} GET
      SWAP {2 1} GET \>> =F2

   0 =sum
   bias =:prev =a
   a F2 EVAL
   1 count START
      1
      a NEXTPRIME =:a prev -
      START
         DUP ROT +
         m MOD
      NEXT
      a =prev
      DUP sum + m MOD =sum
   NEXT
   DROP DROP
   sum
\>>
```

Note that the matrix exponentiation method actually computes F(n-1), F(n), F(n+1) at once. So, to continue with Fib iteration you can pick two of them from the result matrix, and you're ready to go.

Re: RPL programming exercise - One Fibonacci number

*Message #34 Posted by **Thomas Klemm** on 9 Jan 2012, 9:03 p.m.,*
in response to message #30 by Oliver Unter Ecker

> Quote:
>
> So, for the tenacious ones: how about the last 14 decimal digits of F(10^14)?

We can combine the Fibonacci- and the Lucas-Sequence to find a fast algorithm to calculate both sequences using the following identities:

$$F_{n+1} = \frac{1}{2}(F_n + L_n),$$

$$F_{2n} = F_n L_n,$$

$$L_{n+1} = \frac{1}{2}(5F_n + L_n),$$

$$L_{2n} = \frac{1}{2}(5F_n^2 + L_n^2),$$

The idea is similar to binary exponentiation (a.k.a square-and-multiply algorithm). Here's a Python-program:

```
#!/usr/bin/python

K = 10**14
B = 2**47
N = 0
M = 10**14

F = 0
L = 2

while B > 1:
    (F, L) = (F*L % M, (5*F*F+L*L)/2 % M)
    B /= 2
    N *=2
    print "%20d %20d %20d %20d %20d" % (N, B, K, F, L)
    if K >= B:
        (F, L) = ((F+L)/2 % M,(5*F+L)/2 % M)
        K -= B
        N += 1
        print "%20d %20d %20d %20d %20d" % (N, B, K, F, L)
```

And that's the output:

```
                   N                    B                    K
F                    L

                   0        70368744177664      100000000000000

```

My guess is that this algorithm should be fast on a HP-50g as well. Due to the lack of arbitrary precision the HP-42S doesn't qualify for this.

Kind regards
Thomas

That's what I used to think too, until, almost exactly one year ago, an intrepid bunch (some active posters here) showed the way: Making Fib bits visible (on Silicium.org)

(I think this is my all-time favorite calculator-related discussion. It starts slow but quickly shows real ingenuity. I still can't get over those HP-28C print-outs.)

Now, I'd be willing to bet that F(10^14) mod 10^14 can even be solved on a 15C (LE).

Thanks for link: it's an interesting post! I didn't mean to say it's impossible to do it using the HP-42S. Or we could use Peter's MCODE Multi-Precision Library for HP-41. I might give it a try but this is definitely not my first choice.

Thanks for the challenge as well!
Thomas

The 42S not, no, but Free42 decimal (as on the iPhone) can determine the last 12 digits this way.

Cheers, Werner

Re: RPL programming exercise - One Fibonacci number

*Message #39 Posted by **Thomas Klemm** on 9 Jan 2012, 3:02 a.m.,*
in response to message #26 by Oliver Unter Ecker

My approach was slightly different: It's clear that the last digit of F_n has to repeat since there are only *10x10 = 100* possibilities for the two previous values. I used the following program with initial values *ST X: 1* and *ST Y: 0*:

```
X<>Y
RCL+ ST Y
10
MOD
```

It turns out the length of the period is *60*. So I added a loop to find the period for the last two digits:

```
00 { 27-Byte Prgm }
01 LBL "Fib"
02 X<>Y
03 60
04 X<> ST Z
05 LBL 00
06 X<>Y
07 RCL+ ST Y
08 100
09 MOD
10 DSE ST Z
11 GTO 00
12 END
```

This gave me the following sequence:

```
y:  20   40   60   80   0
x:  61   21   81   41   1
```

Thus the period is: *60 x 5 = 300*

Next step was to change line 03 to *300* and line 08 to *1E3* to find another sequence of *5*:

```
y:  600   200   800   400   0
x:  801   601   401   201   1
```

After changing line 03 to *1500* and line 08 to *1E4* I got a sequence of *10*:

```
y:  8000   6000   4000   2000   0      8000   6000   4000   2000   0
x:  9001   8001   7001   6001   5001   4001   3001   2001   1001   1
```

Thus I ended up with a period of *60 x 5 x 5 x 10 = 15,000*. From here I did the same as Gerson: 10^{14} *MOD 15,000 = 10,000*. Changed line 03 to *10000* and line 08 to *1E5* to find:

```
y: 30626
x: 66875
```

Cheers
Thomas

Great! The first 6-step program for an unmodified HP calculator!

Since it does show F(0) and F(1) before looping (thanks to the 2-line display) that's okay. Also, this allows us to match Allen's 10-byte step solution for the HP-42S above:

```
00 {10-Byte Prgm }
01 LBL 00
02 CLST
03 N!
04 LBL 01
05 PSE
06 RCL+ ST L
07 GTO 01
08 .END.
```

Gerson.

I rather doubt the 35s solution is less than 10 bytes.

- Pauli

Re: RPN programming exercise - Fibonacci numbers

*Message #44 Posted by **Gerson W. Barbosa** on 13 Jan 2012, 4:28 p.m.,*
in response to message #43 by Paul Dale

Sorry! I think I didn't make myself clear. I meant showing F(0) and F(1) at the same time like Morten did would allow *me* to achieve the 10-byte count in the HP-42S. My post was really ambiguous, I realize now.

Gerson.

HP41 emaluation

*Message #1 Posted by **Eric Foers** on 7 Jan 2012, 2:55 p.m.*

I have just had a thought on the practical use of HP41 emaluators. What I find 'difficult' (for want of a better word) about the PC versions, is that you either have to use the mouse, or you have limited keyboard facilities.

This could be overcome by someone building a USB keypad with the 41's keys which interacts with the emulation software. I am not able to do so myself, but would glady pay for one (& suspect that may of us who would like to see the 41 revived would also), and imagine that there are one or two specialists who subscribe to this site who could.

There could be additional facilities on such a keypad, like a activation switch & memory on which to store programs, which would then be portable between PC's.

I very much agree with your thought, and had similar ideas for some time... unfortunately without the technical skills to realise them. I'd love to have a small Bluetooth connected HP41 keyboard that could be used to interact with PC, Mac or iPod/iPad based emulators!

In such a configuration one would combine all the power, storage- and extended display capabilities of the emulator device with the (in my opinion) never surpassed tactile quality of the physical HP41 keyboard. It would be hard to beat this combination!

The same keyboard could also be usable for data entry into other applications (such as spreadsheets). As an iMac user I find the Apple cordless keyboard a serious compromise when entering large amounts of numeric data and I often wondered how useful it would to be abke to simply connect a nice HP41-type keyboard.

[OT] Pens for SHARP CE-150 printer/cassette interface

*Message #1 Posted by **Miguel Toro** on 7 Jan 2012, 2:50 p.m.*

Hi,

I recently bought a Sharp PC-1500 + CE-150 interface for 40$ on eBay. The PC-1500 is as new and the CE-150 needed a battery replacement that I made, but the printer came without pens. Since I know that there are a lot of fans of Sharp pocket computers in this forum, I would like to ask if someone knows where I could find spare pens for the printer.

The PC-1500 is a beauty and I do not understand why it has a so low value at the auctions. Anyway, it was good for me. I think I had an excellent deal. Thanks and regards,

Miguel

Google for "Christiane Laß" in Germany. Her company sells accessories for medical equipment, the pens amongst them. Url: http://www.lass-hno.de

In 1980s', PC-1500 was one of the most popular pocket computers in Hong Kong because it was cheap and could be programmed in machine language. However, it has a large form factor and can only display one line only, making it less attractive especially when compared with later models such as PC-1350, PC-1360, PC-1600 and PC-E500S.

Re: [OT] Pens for SHARP CE-150 printer/cassette interface

*Message #5 Posted by **Klaus** on 9 Jan 2012, 9:45 a.m.,*
in response to message #1 by Miguel Toro

Do you know the pen that contain 3 tips: a pencil, a rolling-ink pen and a pen to write on a tablet computer? The pencil without the tip fits inside a dried-out pen. It can be refilled in seconds with a new pencil core in seconds. Plus, it is also the spirit of SHARP (was their first product) to use a pencil for that.

A dried-out pen is easy to obtain.

Custom Made Leather Cases for Voyager Calculators

*Message #1 Posted by **Juergen Keller** on 7 Jan 2012, 2:48 p.m.*

A while ago someone was asking for a defective Voyager calculator in the ads section. The reason was that he wanted to commission Gfeller Casemakers to produce a custom made leather case for his Voyager calculator, and obviously, he didn't wanted to give away his own. As I had a defective 12C I sent it to him, and he offered to return the favor by sending me such a leather case. Well, that made me quite happy! :-)

Last week, I found a letter from the US in my mailbox. I was amazed when I found two leather cases inside! The cases are professionally hand-crafted, look very nice and will last forever I guess. One of the cases uses a thicker leather, the other a thinner one. In my opinion the thinner case looks more elegant whereas the thicker case provides better protection. Therefore I would choose the thinner case for calculators residing at one location (at home, in the office), and choose the thicker case when I take a calculator around with me in my backpack.

If anybody is interested in such leather cases you may contact: Steve Derricott (sd@gfeller.us) at Gfeller Casemakers. I'm not affiliated with this company in any way. I can imagine that such cases are not cheap, but as the company says on their website, leather goods are a solid choice and a wise investment, and in my opinion, they suit HP calculators very well.

*Message #2 Posted by **jonathan G harris** on 7 Jan 2012, 2:56 p.m.,*
in response to message #1 by Juergen Keller

Looks pretty nice. As I keep my new (1rst stringer) 15C LE in my shirt pocket everyday at work I may have to get one of these.

Years back, before I was even out of school (2006 EE grad...) I thought I saw a link on the HP website that sold fancy calculator cases for the Voyager series. They had some crazy cases that were probably more for show than for actual protection. Some of the cases they had on their website were made of leather, snakeskin, ostrich skin. They were expensive(25-60ish?) but I thought one day I would buy one. I haven't been able to find that link since I last saw it back probably in 2005.

*Message #3 Posted by **hpnut** on 7 Jan 2012, 9:53 p.m.,*
in response to message #1 by Juergen Keller

fashion-wise, the tan colour is god awful. perhaps black leather is better match.

Re: Custom Made Leather Cases for Voyager Calculators

*Message #4 Posted by **Geoff Quickfall** on 8 Jan 2012, 3:17 p.m.,*
in response to message #3 by hpnut

Yes tan is bland, but it would shoe polish a nice rustic brown, which I prefer over black. Black leather might as well be Naugahyde (vinyl for you post 70's people).

Of course that is a personal choice!

I checked the site and a personal email is required as this is not in the catalogue.

Geoff

p.s. all spelling mistakes are the province of my IPAD "spell check an erroneous substitution" program.

*Message #9 Posted by **Paul Dale** on 9 Jan 2012, 2:47 a.m.,*
in response to message #1 by Juergen Keller

I managed to convince a boot maker friend to make some custom cases for the 42S and 32Sii as a special favour to me:

&

Made out of nice thick buffalo hide & yes the photographs don't even remotely do these justice. They are far more protective than the alligator leather ones I bought off eBay and as good or better than the real cases.

I know adverts are naughty here, but if anyone wants something like this as a special one off, message me. I *might* be able to convince him to make some more (or perhaps my eldest daughter -- who is also interested in leather work could make some). Absolutely no promises here however -- I've asked neither of them if they are willing or not.

in response to message #2 by Jim Yohe

Has anyone tried removing an overlay? How did you go? How did you do it?

- Pauli

Re: WP 34S Overlay Available For V3

*Message #4 Posted by **Jeff O.** on 11 Jan 2012, 8:45 a.m.,*
in response to message #3 by Paul Dale

I removed one of Eric's original matte finish overlays from a 30b. I wanted to replace it with one of the new satin finish ones which I thought looked much nicer. My intention was to attempt to remove it more or less intact so I could hopefully re-install it on a 20b that I had kicking around. Removal of the key-plane sticker was not difficult, I just lifted a corner and started pulling. Any hope of re-use was quickly dashed, as the very thin sections between the keys stretched and broke. Once I got the whole overlay off, there were a few places where the adhesive was left behind. This was easily removed just by rubbing with a soft cloth. To remove the key labels, I lifted a corner with a knife blade and pulled them off. Quite a bit of adhesive was left on many keys. Since the keys are not nearly as smooth as the keyboard plane, I did not think I would be able to simply rub the adhesive off. Rather than risk creating a gooey mess trying to somehow clean the keys, I decided to just leave it. I hoped that leaving the adhesive residue on the keys would be OK, since I was going to apply new labels anyway, so there would just be more adhesive in some spots. I then installed the new satin finish overlay and key labels. Over the next few days, various corners of various key labels kept popping up. I would rub them down, then later another would do the same. I eventually rubbed all of the key labels fairly aggressively with some smooth, round-ended tool, which seemed to adhere them. If I had it to do over again (which it appears that I will), I would find a way to clean any adhesive residue off of the keys.

...

in response to message #4 by Jeff O.

Thanks for your warning concerning removing the adhesive sticking to the keys. I will certainly take this to heart when "updating" the overlay. FWIW, I installed the matte overlay to begin with, but on a few keys on top, the lower corner keeps popping up ever so slightly. I would recommend not only thoroughly removing any adhesive residue from the old overlay, but also cleaning (perhaps with alcohol) every key before installing the new overlay to remove any fingerprint residue. You also *really* need a pair of tweezers to apply the individual key overlays neatly. Rub firmly around the edges after applying. That being said, I have nothing but praise for Eric's overlays quality wise.

*Message #12 Posted by **Mark Hardman** on 7 Jan 2012, 2:30 a.m.,*
in response to message #2 by Jim Yohe

I'm a collector at heart. The V3 upgrade represents substantially more than just moving around a few keyboard labels. I would no more replace the firmware and overlay on my WP 34S V2 than I would replace the ROM on my "all bugs" HP 41C. Ten years from now, I will be proud to display and make occasional use of the complete series of all of the WP 34S variants that were ever produced.

(I predict at least five distinct versions before each member of the PWM trinity is institutionalized by the authorities of their home countries.)

The v3 version will be significantly better than v2 in so many ways. At the rate I'm reclaiming flash space by converting functions to keystroke programs, it will have substantially *more* flash for user code than even v2 *without* matrix

support.

Seriously, forget v2 it is little more than a testing of the waters now :-)

> Quote:
>
> Ten years from now, I will be proud to display and make occasional use of the complete series of all of the WP 34S variants that were ever produced.

2202 and counting -- you'll never get them all :-) If you do I'll be very impressed. Even so, all firmware revisions and changes will survive on sourceforge forever so they aren't exactly collectable.

> Quote:
>
> (I predict at least five distinct versions before each member of the PWM trinity is institutionalized by the authorities of their home countries.)

Sadly, I don't :-(

Well I hope your last sentence will **not** be true if we replace "flash" by "bugs"! ;-)

You certainly know the saying "never change a running system", and you've developed all those builtin-functions over a long time and they have been tested thoroughly. Now you're rewriting lots of them as XROM code and so chances are not so small that many new bugs will be introduced (just remember your previous MIN/MAX attempt ;-)).

Franz

Re: WP 34S Overlay Available For V3

*Message #15 Posted by **Paul Dale** on 7 Jan 2012, 7:21 a.m.,*
in response to message #14 by fhub

We'll fix the bugs as they are found. I've also found a new bug which I've fixed -- to be honest, I don't think that a lot of the built in functions have been stressed all that much by anyone yet.

At least this time I'm making an attempt to verify the functions before I commit them -- I didn't do that with min & max with bad consequences :-(

- Pauli

We should all still run the ENIAC then? BTW, you can stick to an older version of the firmware or use another

calculator.

The WP34s is not a life-critical system as far as I know ;-)

Re: WP 34S Overlay Available For V3

*Message #17 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Jan 2012, 2:01 p.m.,*
in response to message #16 by pascal_meheut

Well, ENIAC would just run for some hours before needing changes of some of its electronic tubes, because they aged and failed frequently. So it would not keep its "running system" status for long.

That's what I said - only a few. BTW I use RPL a lot and I noticed it doesn't attract any interest here. A brief look at the archive would proof my point.

Re: ADVERTISEMENT! Yes but with a caveat...

*Message #5 Posted by **Geoff Quickfall** on 8 Jan 2012, 2:50 p.m.,*
in response to message #2 by Reth

Hello Reth and Andreas!

Must disagree with you on both counts, Reth:

RPL is alive and well, just attend any HHC and you will see how popular it is! All programming contests include if not feature or are tailored to RPL. It is not my favorite system because I grew up on RPN and am lazy by nature. having said that I have written my share of, albeit, clumsy RPL programs.

Your second point about advertisement, while technically correct, is a little harsh. of course I say this with a bias in mind. Would you have me post the eventual completion of my book some where else, or Eric hide his 34s overlays at another site. Perhaps Diego should not tout the latest clonix/novram or the pil box latest version should not be discussed. There are many more examples I am sure!

As in Andreas's case et.al. a little leeway may be allowed. This was part of his independent project which he has improved upon since I have had the pleasure of knowing him. It is created by one of ours at the museum and his contributions to RPL and the 48/49 are well known. Also, this was his presentation at HCC2011 and he mentioned that he would let us know when the project was completed as well as updated.

What better place then the forum. Consider this, he also created this with NO help or aid from a commercial enterprise.

In conclusion, I am more then happy to have member projects discussed and noted here on the forum. I would be totally adverse to commercial enterprises posting adds here such as HP, TI, SHARP and etc..

Again, this is my opinion and may not be shared by the others.

Happy new year and all the best,

Geoff

Re: ADVERTISEMENT! Full Stop ;)

*Message #9 Posted by **Reth** on 8 Jan 2012, 11:24 p.m.,*
in response to message #5 by Geoff Quickfall

Your caveat turns my point upside down, so I disagree with you completely. It's an advertising full stop. As a rule RPL stuff gets overlooked here. And I use only RPL for programing since the appearance of the HP-28S which replaced my stolen HP-41CV back then. So I know what I'm talking about.

Happy New Year to you and to all the rest, Andreas including.

Cheers, Reth

in response to message #10 by Geoff Quickfall

Geoff, if you're ever in Brisbane please let me know.

Sydney is about 1,000km away (it is the closest capital city from here) which is a *little* too far to drive for a day trip. I did once do an overnight driving trip to Sydney but never again.

- Pauli

in response to message #5 by Geoff Quickfall

Hi Geoff,

thanks for the flowers, it has been a pleasure meeting you again in San Diego. Too bad that there was only too little time...

A lot of people did ask for a fully integrated version of a help for the 50g as I showed at HHC 2011, so my only intention was to let people know that it is available *now* and at a very reasonable price, which is actually even cheaper than printing out the AUR at Staples or with HP ink.

I did not intend to offend anybody.

Regards, Andreas

in response to message #2 by Reth

Reth,

C'mon, the RPN/RPL world has gotten so small, let's be gentle with the endangered species of "active contributor".

Commercial or free, the few active heads are doing this mainly as a labor of love. I'm sure you don't mean to discourage, but negative feedback easily does just that.

I don't mind reading small relevant product announcements here. In fact, I'm glad to read about projects in this field and learn how some care to keep this world alive.

Best,

Oliver

Re: ADVERTISEMENT!

*Message #20 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Jan 2012, 7:26 p.m.,*
in response to message #2 by Reth

Perhaps a brief "announcement", which just lets us know that some product or program (or new version) is available, and just gives a email address (or web page address) for interested people to contact; and doesn't include any commercial hype or details, nor pricing; and coming from a member of the community (and not from a commercial entreprise or venture) should not be considered "advertising" or otherwise banned, IMHO.

It's good to learn when WP34S overlays, HP41 add-ons (such as Clonix, PILbox, MDL, etc), HP41 backplane replacements, 41CL Boards, DIY"x" (when available) and such offerings become available. Same for emulators, free or not.

OTOH, repeated (or long) messages about such availability may enter "advertising" waters, and should not appear in the forum.

Please disregard any idiomatic mistake.

It would be nice if HP would licence an on-line help system like this to distribute with the calculator. It would certainly be much more convenient that wading through the manuals to find what arguments a given command requires.

Nick

*Message #28 Posted by **Software49g** on 11 Jan 2012, 1:58 p.m.,*
in response to message #27 by Nick_S

Hello,

> much more convenient that wading through the manuals
> to find what arguments a given command requires
The help I coded contains the stack diagrams for *all* commands.

> It would be nice if HP would licence an on-line help system
> like this to distribute with the calculator.
They have my telephone number.

But HP has done *nothing* for the 50g in the past three years.

So, unfortunately, this allows only one conclusion: HP has very, very little interest in the HP 50g.

As I have said before, updating the HP 50g with a higher resolution screen and adding some more flash memory inside of it wouldn't be to hard to do including compatibility to the vast amount of software that exists already. (Remember: Customers do not buy hardware, they do not buy software either. Customers buy solutions.)

But apparently HP does not want to be successful with the HP 50g as they did everything they could to be *not* successful with it in the past, which is really a pity as everything one would need is already there respectively has already been written.

HP *could* update the 50g easily, I would estimate that updating the machine could be done in three to six months, but again, HP has shown very, very little interest in this marvelous machine, which is really a pity IMHO.

Anyhow, most likely I will now add the flags description to the HELP for *all* commands integrated into the O.S. and then anybody who wants it can have a *full* substitution for the manual *inside* the calculator which means that using it will get a lot easier.

And, as I said, it is possible to add anything you want, even long explanation texts including graphics. So if someone provides me with some good ideas of what else should be in an integrated help I could add it. As the help entries are fetched from the SD card the possibilities are endless...

Regards, Andreas

> *But* HP has done *nothing* for the 50g in the past three years.

Which leaves the field clear for talented people like yourself to exploit the nice, relatively open platform HP has provided.

This is the great strength of this community: so many brilliant people are motivated to work on these wonderful machines that even a 32 year old machine like the 41C is evergreen. If HP isn't pushing the state of the art forward as well as we might like, what does it really matter?

Calculator natural language user interface

*Message #1 Posted by **Donald Williams** on 6 Jan 2012, 5:22 p.m.*

Any predictions on when we will see this?

I am not sure if I would appreciate it or not. My wife has a new iPhone 4S and the SIRI interface is intriguing. I began to wonder about a calculator interface using the same technology.

I know it will happen sooner or later. Unfortunately I doubt that RPN will be in the mix.

Re: Calculator natural language user interface

Spoken language is not a good fit for math, but a CAS that can decipher handwritten math would be fun to use.

Japanese language grammar is basically RPN in the sense the predicate/operator follows its objects/arguments. I've heard Korean as well is of similar structure.

The other nice attribute being grammar rules largely apply, compared to say English where the exceptions to a rule seemingly outnumber the actual instances of it. It's fairly easy with a quite modest command of Japanese grammar to construct rambling sentences which while structurally correct, are so unnaturally complex that a listener is challenged to parse them in realtime. At least that's my excuse for being chronically unintelligible.

Re: Calculator natural language user interface

*Message #7 Posted by **Donald Williams** on 7 Jan 2012, 12:29 a.m.,*
in response to message #4 by Garth Wilson

I apologize for the poor communication on my part when I started the thread. I did not really mean "Natural Language" per se. What I was contemplating was a device which understood words rather than sentences. Something similar to what my Garmin GPS accomplishes now.

Imagine this

You speak the word "Start" or "Begin"

The device display turns on with -- 00.0000 --

You speak the word "Two"

The display changes to -- 02.0000 --

You speak the word "Enter"

The calculator copies the register to the stack

You speak the words "Log" "Ten"

The display changes to -- 00.3010 --

You speak the words "Ten" "Multiply"

The display changes to -- 03.0100 --

In other words you eliminate the keyboard. I have thought about it a great deal today and I think the approach has a lot of merit.

I realize this kind of technology is currently too expensive for consumer grade calculators at the present time, but think about it.

Dumping the keyboard has some pretty obvious economic advantages. I also think it has some advantages for the user. No more hunting for that seldom used function that resides on a shifted key or is buried in some menu. No more user assigned keys to compensate. In fact -No more keyboard - no more keyboard complaints.

I think we will see this on a smart phone soon.

Re: Calculator natural language user interface

*Message #8 Posted by **Ethan Conner** on 7 Jan 2012, 12:43 a.m.,*
in response to message #7 by Donald Williams

It will be just like present day voice command systems(siri,bluetooth voice dial) you have to raise your voice for the device to respond. There will be a room full of engineers or students shouting at their calculators. The guy in the cubicle or seat next to you will be picked up by your calculator and it'll screw up your equation or program.

Re: Calculator natural language user interface

*Message #9 Posted by **Donald Williams** on 7 Jan 2012, 11:17 a.m.,*
in response to message #8 by Ethan Conner

True.

That was my first criticism also. You won't use this technology in the class room or the exam room. So an on screen keyboard will have to remain available, and I really fumble with the iPhone screen keyboard.

Re: Calculator natural language user interface

*Message #10 Posted by **Garth Wilson** on 7 Jan 2012, 2:43 a.m.,*
in response to message #7 by Donald Williams

I think that for anything beyond the simplest operations, you'll run into problems like you get in "My father shot an elephant in his pajamas," or "The butler stood at the door and called the guests' names" versus "The butler stood at the door and called the guests names." (One was doing his job, whereas the other one ought to be fired.)

Although I don't dispute that there are valid applications for voice recognition, I hope the keyboard never goes away. I can write much better than I can talk. OTOH, I called the post office from my cell phone outdoors last year, and the voice-recognition system was totally unable to correctly interpret anything through the little bit of wind noise on the microphone.

There is the Frogpad though, which makes it possible to type 80wpm on a small, one-hand keyboard with about 20 keys. See http://www.youtube.com/watch?v=RNsrfaHl9kI and http://www.youtube.com/watch?v=TmzYovAMHE4 .

Re: Calculator natural language user interface

*Message #11 Posted by **peacecalc** on 7 Jan 2012, 6:10 a.m.,*
in response to message #7 by Donald Williams

Hello Donald,

your example illustrates fine, that this is not "natural language" anyway. It's a kind of adaptation the human speaking towards a machine.

And there are existing three problems:

The technical one: the spoken word has to be transformed into a signal which can be handled by the machine.

The semantical one: is the signal for the machine that, what it should be: a certain command in a distinct situation.

The anthropogenical one: In which ways I'm transforming myself in using such a machine? My speaking, my behavior and last not least my cognition of problems.

The first two are lying one the hand, the last is often forgotten, but in my eyes the most important.

It don't say: Don't do it, but I hope we beware of that.

Sincerely Peacecalc

Re: Calculator natural language user interface

*Message #12 Posted by **Donald Williams** on 7 Jan 2012, 12:29 p.m.,*
in response to message #11 by peacecalc

"The technical one: the spoken word has to be transformed into a signal which can be handled by the machine."

Nothing trivial about this problem, but I would argue that we are well along the path to a solution.

Example: I never use the on screen keyboard on my Garmin Nuvi GPS. It is much easier and simpler to use voice commands, than to attempt keyboard entry.

"The semantical one: is the signal for the machine that, what it should be: a certain command in a distinct situation."

Agreed. That is the difficult problem. The lexicon of a 4 banger calculator would be completely manageable. The lexicon of a 50G would be daunting.

Example: I think the Garmin GPS minimizes that problem by using voice prompts. Knowing the context created by the voice prompts it can then select the appropriate lexicon for the next command. I don't think you could implement a calculator that way and I don't know how to attempt to solve the dilemma.

"The anthropogenical one: In which ways I'm transforming myself in using such a machine? My speaking, my behavior and last not least my cognition of problems."

The device will transform the individual.

Example: I bought that Garmin GPS many years ago when it was "new" technology. I was not interested in voice recognition. I thought it was simply a marketing gimmick. It turned out that the worst feature of the device was the on screen keyboard. There is so much latency with key press response that it was frustrating to use, so I gave it to my wife expecting her to be disappointed also. In fact she commented often how pleased she was with the device. Her secret was that she never used the keyboard and now I realize that I never will either. The voice response is an order of magnitude faster than the keyboard even if it had a perfect keyboard.

OT: Since I introduced the topic with a comment about SIRI let me make another observation. The thing that impresses me the most about SIRI is not what SIRI understands, but what SIRI does when it does not understand. It is my first experience with a man machine interface that does not respond with "invalid input" and then just quit.

The SIRI interface must surely be intriguing on a phone; but the matter is probably quite a different thing on a calculator.

As far as I am concerned, one of the most fascinating aspects of a calculator dwells in its keyboard: colours, shape of the keys,feel... most of us pay considerable attention to "mushy" or "sticky" keys.

Maybe it's a silly attitude, but I like by far to feel the click of the enter key under my finger better than to hear the voice of myself commanding the calculator.

Warm regards

Vince

TI-88 and the TI CCC

*Message #6 Posted by **Joerg Woerner** on 7 Jan 2012, 1:33 p.m.,*
in response to message #5 by Joerg Woerner

CCC = Calculator Collector Community

I received yesterday multiple emails from HP Forum members about the TI-88 ebay auction and like to explain the background of it here in the Forum.

The seller of the TI-88 (he owned actually two of them) preferred to ship the calculator only within the US, a well known topic - just remember the HP-15C LE craziness...

Two TI collectors from Europe and regular customers on my own eBay auctions asked be on already on the very first day of the auction, if they could use my US based home address for their bids. I had already a bid (more than the minimum bid but less than the reserve price) on the TI-88 and BOTH gentlemen planned to bid higher than I wanted to bid. I contacted the seller, talked with him about half an hour and we decided to retract my bid and he ended the auction. Both TI-88 were shipped to me and I forward them (without any commission...) to the proud new owners.

For me a win-win situation:

(1) I can inspect them, one is a very early prototype and the other was used to debug the design flaw, that actually killed the TI-88! (Gene, now we / I know it...).

(2) I'll meet one of the collectors the first time in person!

Hope this explains what really happened.

Best regards, Joerg

Re: TI-88 and the TI CCC

17BII+ vs 19BII Business Consulatant II

*Message #1 Posted by **Jeff Kearns** on 5 Jan 2012, 11:27 p.m.*

I have read excellent comments regarding the 17BII+ (except for the keyboard) and have only just remarked, via the demo feature on the HP website here, the similarity between its menu system and that of the 19BII.

Is there anything the 17BII+ can do that the 19BII cannot? Sure, it has the clock, calendar and alarms features, but I suspect the 19BII is a much more capable all-purpose calculator, especially where maths functions such as trig and hyperbolic trig are concerned. What are the benefits of this calculator, aside from form factor - which is a matter of personal taste anyway?

Cheers,

Jeff Kearns

Re: 17BII+ vs 19BII Business Consulatant II

*Message #2 Posted by **bill platt** on 5 Jan 2012, 11:34 p.m.,*
in response to message #1 by Jeff Kearns

One of the most important distinctions is the solver. The 19bii has the original solver. The 17bii+ has the somewhat mucked-up solver, which I think doesn't handle Let and Get correctly and has some significant differences with how it handles initial guesses etc. Look in archives I think you'll find a discussion of this.

And yes, 19bii has trig functions in the menus.

Re: 17BII+ vs 19BII Business Consulatant II

*Message #3 Posted by **Jeff Kearns** on 5 Jan 2012, 11:57 p.m.,*
in response to message #2 by bill platt

Bill,

My initial search was incomplete. You are correct; this has already been discussed ad nauseam. I now have little interest in the 17BII+ after reviewing the archives. Thanks.

Jeff

Re: 17BII+ vs 19BII Business Consulatant II

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 6 Jan 2012, 8:51 a.m.,*
in response to message #2 by bill platt

I think you have to differentiate between the 2 "new" 17Bii+ machines; the latest (silver) **does** have L() and G() [they are documented in the manual as well]. I have no idea about the clunky bronze one. All reports I have seen say "no".

Running in my silver 17Bii+, several solver routines actually executed **faster** than my original 17Bii's. I have no doubt that it does have a different solver and if I put more complex problems in, some of the issues mentioned here in the last half year may very well crop up. However, I think that majority of these complaints have come from the early bronze 17Bii+, not the silver one.

About the biggest difference I note between the 17Bii and the (silver) 17Bii+ is the calculation of amortization schedules. The 17Bii+ seems to repeat the calculation from scratch when you are doing the later runs (say 49-60, for example). The 17Bii just continues where it left off so it is much faster there.

I picked up my 17Bii+ for $0.01 on TAS (plus $17 shipping, of course) and I am most happy with it (it definitely slipped in under the radar!)! The buttons are **WAY** better than the new-in-blister-pack very late model 17Bii (black face) I picked up at HHC2011. Those ones have the hollow feel of the current crop of HP's (ugh!) -- which includes the 12C+ I have BTW (and I suspect the 15C LE). My older 17Bii's all have gorgeous keyboards.

However the largest differentiating factor has got to be the screen of the 17Bii+ vs. the older ones. Just no comparison -- the 17Bii+ wins hands down! Contrast and viewing angle are far superior.

Battery consumptions? That remains to be seen but I doubt the new ones are in the same league as the 3x 357.

I can't answer the question about 19Bii vs. 17Bii+ because my 19Bii is still in transit (purchased yesterday). The 17Bii(+)'s do not have the rich set of math functions in the 19Bii so it is clearly not as useful as an all-around calculator.

Re: 17BII+ vs 19BII Business Consulatant II

*Message #5 Posted by **Don Shepherd** on 6 Jan 2012, 10:39 a.m.,*
in response to message #4 by Neil Hamilton (Ottawa)

> Quote:
>
> I have no idea about the clunky bronze one. All reports I have seen say "no".

The brown/bronze 17bii+ has L() and G() as well, and they are documented in the manual. But both the brown/bronze and the silver 17bii+'s have the exact same solver, and the problems documented elsewhere in the forum affect both machines. You won't run into the problems if you never use L() and G(), nor will you run into the problems if you do use L() and G() only for non-menu (that is, what you might call local) variables.

> Quote:
>
> I think that majority of these complaints have come from the early bronze 17Bii+, not the silver one.

That's because the problems were identified before the silver 17bii+'s came out. But, because they have the same solver, the silver ones are affected too.

Good to know. I certainly have not pushed mine to anywhere near the extent that you have yours. A

wizard like yourself, I am not! Some of your spectacular solver studies have just boggled my mind! :-)

...I seem to recall that someone had a run-in with HP trying to get a resolution to the L()/G() **not** being in their bronze unit. HP came back saying something to the effect that "These are not in the manual so they are not part of the specification" (I am paraphrasing wickedly here). Am I mistaken in that recollection?

I don't have a manual from the *bronze age*, nor do I have one of those units, so I cannot check...

Cheers...

> Some of your spectacular solver studies have just boggled my mind

I've been intrigued by the 17b solver since around 2007. I find the whole idea of "can an equation be a program" to be very interesting, and I have been amazed at what others have done with this solver. HP never advertised the 17b as a "programmable" calculator, but it certainly is, principally due to L() and G() and IF() and Σ().

> Quote:
>
> someone had a run-in with HP trying to get a resolution to the L()/G() not being in their bronze unit. HP came back saying something to the effect that "These are not in the manual so they are not part of the specification"

It may have been that someone with an HP17bii complained that their unit didn't have L() and G() because those functions were not in their manual, so they assumed the functions were not in the hardware. But they were. I've got about 10 17b/17bii's and they all have L() and G(), but only the manuals for the plusses contain the *documentation* for L() and G(). If someone has any 17b that they think does not have the L() and G() functions, I'd like to know about it. AFAIK, all 17b varieties have those functions.

It would not surprize me that HP customer service people wouldn't know about L() and G(), and therefore would give that response. They can't know everything.

I guess this was the thread I was recalling, maybe it is not correct:

L() and G() unsupported on NEW HP17BII+ (Long)

Re: 17BII+ vs 19BII Business Consulatant II

*Message #9 Posted by **Don Shepherd** on 6 Jan 2012, 3:09 p.m.,*

in response to message #8 by Neil Hamilton (Ottawa)

That thread was from 2005. I didn't own a 17bii+ in those days, I first got one in 2007 and it had the L() and G() functions and its documentation of solver functions included L() and G() as well. I believe that the author of that thread said that L() and G() were unsupported because they didn't work, but he was able to enter the L() and G() functions in a formula and get a result, just the wrong result!

This is the formula he entered:

```
L(A:X) + 2*G(A) – B = 0
```

He said he entered 5 for X then solved for B and got 5 when it should have been 10. Actually, it should have been 15 because L(A:X) will give you 5 and 2*5 will give you 10, hence 15 would be correct (which Hugh Steers pointed out). Entering that equation on my 2007 17bii+, I get the correct answer, 15. Entering it on a 17b also yields 15. So if that poster really got 5, maybe there was a problem with the early versions of the 17bii+ that was corrected by 2007, who knows. But the problem wasn't that L() and G() weren't present in his unit; they were, else when he CALC'd his formula he would have received the message INVALID EQUATION.

In those old threads, there was much gnashing of teeth regarding the 17bii+ solver not working like the original 17b and 17bii solver, and that is true and unfortunate. If HP ever updates the 17bii+ solver to perform like the original 17b solver, I'll be the first in line to buy one (or 2 or 3 or ...).

in response to message #9 by Don Shepherd

I know what you mean. I am an engineer and really have little professional use for a financial calculator but I just the **love** the 17Bii.

I put the $0.01 bid in on the 17Bii+ mostly as a joke but have been very pleased with it thus far. It would be really nice to attack its guts and replace it with an emulation of the the 42S some day... Its a great chassis.

Cheers...

*Message #11 Posted by **bill platt** on 6 Jan 2012, 5:52 p.m.,*
in response to message #10 by Neil Hamilton (Ottawa)

Have you seen the solver program listed in the Articles forum which runs on a 17b or bii (not sure it will work on the + as it uses L and G) which gives you trig functions?

W.B. McGuire wrote the first one I was aware of, but I see that Gerson has also written a bunch, including Hyperbolics!

*Message #14 Posted by **bill platt** on 6 Jan 2012, 5:50 p.m.,*
in response to message #7 by Don Shepherd

The L and G were included in an HP applications publication, back in the 17b/19b days.

Actually come to think of it, I believe it was in the 19b manaul, too (I don't have one). Somewhere, I have a paper copy of the pertinent pages of the applications book, which was written for the 19b, 17b and 27s (all three have the same solver).

Re: 17BII+ vs 19BII Business Consulatant II

*Message #15 Posted by **Don Shepherd** on 6 Jan 2012, 6:34 p.m.,*
in response to message #14 by bill platt

L() and G() are described in detail in the *Technical Applications Manual for the HP-27S and HP-19B*; that is **the source** for advanced solver techniques. L() and G() are listed as solver functions in the HP-17bii+ manuals, but they are not listed in any of the 17b, 17bii, 27s, or 19bii manuals that I am aware of.

*Message #17 Posted by **Don Shepherd** on 6 Jan 2012, 10:20 p.m.,*
in response to message #16 by bill platt

> Quote:
>
> I wonder why they didn't put ...L() and G()... in the manual?

I've often wondered about that too. One possibility is that L() and G() were meant for debugging the first solver, and they forgot to remove that code prior to production. That would explain why it wasn't in the manuals. Then someone--undoubtedly a member of this forum!!--found out about those functions, and the rest is history.

Alas, we'll probably never know because the authors and developers are long gone.

Re: 17BII+ vs 19BII Business Consulatant II

*Message #18 Posted by **Don Shepherd** on 6 Jan 2012, 3:59 a.m.,*
in response to message #1 by Jeff Kearns

Jeff, Bill is right, the solver in the 17bii+ will be a disappointment if you want to do formula customization using L() and G(). It also uses the iterative solver in some situations where the original 17b and 17bii solver would use the faster direct solver.

If you don't need trigs, I heartily recommend the 17b or, if you must have RPN, the 17bii.

The alpha keyboard of the 19bii is nice, as is RAN#, but the battery door is a well-known problem.

in response to message #18 by Don Shepherd

> Quote:
>
> but the battery door is a well-known problem.

The latest incarnation of the 19 BII with black housing and darker keys has the battery door like ist should have been from the beginning: A clip cover on the back side, which can easily be applied and removed. The whole battery contact force has been transferred to the housing. WAY better than the original battery door.

15c vs. 15cLE keyboard

*Message #1 Posted by **Ethan Conner** on 5 Jan 2012, 9:20 p.m.*

It took a few months but the right 15c for what i wanted showed up on TAS at the right price. It's beat up but functional. The keyboard does feel different but i don't know that it is "better" different, just not the same as an LE. Yes the "f" and "g" keys don't wobble but that's about the only thing that feels better than the LE. Semantics warriors unite! lol

Re: 15c vs. 15cLE keyboard

*Message #2 Posted by **Michael de Estrada** on 5 Jan 2012, 9:26 p.m.,*
in response to message #1 by Ethan Conner

I guess it's just a matter of personal preference. I prefer the softer but very positive feel of the original Voyager keyboards. They are also quieter and don't repeat the way the new ones do.

For those in UK: 15C LE available for pre-order at Sleath's

*Message #1 Posted by **Bart (UK)** on 5 Jan 2012, 5:42 p.m.*

The 15C LE is available in the UK for pre-order at WF Sleath's @ £89.95 inc. VAT with expected availability mid-January.

Sleath's HP15C Scientific Calculator (Limited Edition)

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #2 Posted by **Michael de Estrada** on 5 Jan 2012, 5:58 p.m.,*
in response to message #1 by Bart (UK)

That's about $140 USD, which is about what it would cost to have a friend in the USA get one for MSRP and ship it to the UK. How does VAT compare with import duty tax ?

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #3 Posted by **Bart (UK)** on 5 Jan 2012, 8:19 p.m.,*
in response to message #2 by Michael de Estrada

Any item (even a gift) coming into the UK is subject to both duty and VAT, see
HM Revenue & Customs: Tax on goods ordered from overseas.
Don't forget to include the £8 or so that Parcelforce/RM will charge for admin fee to collect the tax on behalf of HMRC.
See: the fees i paid on my original 15C LE & 12C 30th ed.

Edited: 5 Jan 2012, 8:29 p.m.

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #4 Posted by **Michael de Estrada** on 5 Jan 2012, 8:33 p.m.,*
in response to message #3 by Bart (UK)

So basically, it is cheaper for you to buy it directly in the UK.

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #5 Posted by **Derek Walker (UK)** on 6 Jan 2012, 2:56 a.m.,*
in response to message #4 by Michael de Estrada

I bought from SC in September when their price was $99.99. Tracked shipping added $40, and UK VAT and handling added £29.47, so my total cost was around £120 at the then exchange rate.
There's also the warranty issue, one hopes the key problems will not recur but had my unit suffered from faulty keys, I'd have had a dilemma whether to spend more money on trans-Atlantic postage or not.

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #6 Posted by **Bart (UK)** on 6 Jan 2012, 5:27 a.m.,*
in response to message #4 by Michael de Estrada

I purchased both the 15C LE and 12C 30th ed. as I figured this was the most cost-effective (and I wanted both anyway). The combined purchase price in £ was just below the Duty threshold of £135, so just VAT was payable on the price & postage. Total with all costs was just under £180, i.e. £90 each. So Sleath's 15C LE with cheapest postage is £92.30, is in that ball-park.

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #7 Posted by **Borja** on 9 Jan 2012, 3:32 a.m.,*
in response to message #2 by Michael de Estrada

I'm not affiliated in any way, but the Spanish "The Calculator Store" lists the HP-15C LE for € 109.90, VAT included. There's no additional VAT or import duties into the UK, just the shipping cost.

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #8 Posted by **Derek Walker (UK)** on 6 Jan 2012, 3:10 a.m.,*
in response to message #1 by Bart (UK)

Thanks for the tip - I was wondering whether any UK retailer would offer the 15C LE.
Although Sleath's are a mail order company, they have in the past (by prior arrangement) let me collect a calculator from their east London office (and pay for it on the spot), to avoid having to get it delivered to a work address.

Re: For those in UK: 15C LE available for pre-order at Sleath's

*Message #9 Posted by **Rob Willett** on 6 Jan 2012, 9:47 a.m.,*
in response to message #8 by Derek Walker (UK)

I've ordered one as a spare. We'll see how many actually get through and how many are put on TAS.

Rob.

OT: HP goes green

*Message #1 Posted by **Juergen Keller** on 5 Jan 2012, 3:40 a.m.*

From time to time there are discussions in this forum that HP is not the good company we knew from our younger days. So I thought I will spread some positive news about HP:

HP is the top scoring company in the Guide to Greener Electronics ranking. There is still much room for improvement but HP is definitely on the right path. Congratulation!

Re: OT: HP goes green

*Message #2 Posted by **Borja** on 9 Jan 2012, 3:29 a.m.,*
in response to message #1 by Juergen Keller

I'm afraid Greenpeace isn't exactly dependable as a source of information.

I just remember the inordinate quantities of carton boxes HP uses to ship anything. At least in my experience, any slightly complex system will be delivered as countless indivudual boxes. Each power cable in a box, each hard drive in a box...

Even _LICENSE CERTIFICATES IN A PADDED BOX, ONE SHEET OF PAPER FOR EACH BOX_.

I've really witnessed it, and I think there are published photos somewhere. The Register, maybe.

Perhaps they have changed, I haven't bought such stuff from HP in two years or so. But, consider them a green company...

Re: OT: HP goes green

*Message #3 Posted by **Juergen Keller** on 9 Jan 2012, 7:04 a.m.,*
in response to message #2 by Borja

I didn't say HP is already green but on the right path:

> Quote:
>

Re: OT: HP goes green

*Message #7 Posted by **Ethan Conner** on 9 Jan 2012, 1:25 p.m.,*
in response to message #2 by Borja

I'm afraid Greenpeace isn't exactly dependable as a source of information.

I have to agree with your statement. Having once witnessed their very selective application of going green to western nations with lots of money and freewheeling court systems. Let me say that there was some cleaning up to be done and it was taken care of. Meanwhile our communist neighbors were and still are free to continue massively polluting to the extent that their environmental disaster in the same area is visible with the naked eye from space. They don't operate in or go after countries where their safety is not 100 percent guaranteed or where they are not guaranteed a decent ROI through the court system. Having seen their hypocrisy first hand i'm not impressed nor do i trust much of what they say. It may have started with noble intentions but to me they are just as much a racket as any corporation you'd care to name.

Re: OT: HP goes green

*Message #8 Posted by **Hugh Evans** on 9 Jan 2012, 8:12 a.m.,*
in response to message #1 by Juergen Keller

From my experience in the chemical industry, going green is generally motivated simply by complying with the most restrictive state and federal regulations... Almost entirely for the purpose of maintaining competitive presence in all markets. Much of the time it does improve material costs and gives a nice bottom line. From a PR perspective, offering a "green" product line is a great marketing scheme. As far as I'm concerned, regardless of your anyone's personal views about the environment I think most of us can agree that reducing waste and improving efficiency are good things.

My long term concern is the movement by a few ultra environmentally conscious to begin requiring full disclosure of product composition. In other words "you can trust us to keep your trade secrets safe." In my line of work, it's hard enough already to trust partners in certain southeast Asian countries with anything remotely resembling formulation data. One would think we were guarding the Colonel's list of secret herbs and spices with the lengths we go to.

Overall, the end result is a good thing. But at the end of the day, 99% of green manufacturing is the result of adaptation to the current political climate in order to survive and compete.

Re: OT: HP goes green

*Message #9 Posted by **Howard Owen** on 9 Jan 2012, 10:00 a.m.,*
in response to message #8 by Hugh Evans

> Quote:
>
> Overall, the end result is a good thing. But at the end of the day, 99% of green manufacturing is the result of adaptation to the current political climate in order to survive and compete.

It's not just regulation that's driving green manufacturing.

Walmart famously squeezes its suppliers to use less packaging. More stuff crammed into a given shelf space means more products can squeeze in. Less packaging also reduces the suppler's costs, allowing them to meet WM's price demands. Shipping costs go down too. A felicitous side effect is less waste going into landfills.

Is there any advantage of the new Qt emulator over the old Windows emulator?

I'm sure some here would like to try this new emulator, but certainly not many of us (including me) have (or want to download and install) a complete C environment just to compile this sources.

Is it really so difficult to provide a ready-to-use Windows EXE for this new Qt emulator?

Franz

Re: WP34s build compiler

*Message #4 Posted by **pascal_meheut** on 6 Jan 2012, 12:00 a.m.,*
in response to message #3 by fhub

I'm currently working on the packaging so the next releases will include an .EXE (and the equivalent for Mac & Linux). I'll finish the serial communication after.

The main advantage over the old one will be its availability on other platforms and the fact that it will be easier for the team to add functions. We are considering flashing from the emulator for instance...

Re: WP34s build compiler

*Message #5 Posted by **Dominic Richens** on 5 Jan 2012, 10:24 a.m.,*
in response to message #1 by David Griffith

You'll find pages describing the free Windows build environment (for emulator and calc.bin) at wiki4hp.

I would say the Qt emulator is less mature (e.g. serial comms still a work in progress) plus the focus has been on getting the Mac and Linux emulators to work.

On the other hand - the Qt windows emulator certainly needs testers. The basic calculator, including simulator flash handing, works fine and Pascal could use some help testing.

I'll poke around tomorrow when I can get at my Linux environment. My initial guess is there is something wrong with your Qt build, since it's complaining that one QtCore bit is failing to link to another.

What version of Qt are you using and what verion of gcc?

Re: WP34s build compiler

*Message #14 Posted by **pascal_meheut** on 8 Jan 2012, 4:39 p.m.,*
in response to message #13 by Dominic Richens

I'm compiling using gcc-4.6.1 and Qt4.7.4. Other versions of gcc should work.

The problem may come from the qextserial library binaries. I plan to add a way to not include the serial code and also another to recompile the library too.

Re: WP34s build compiler

*Message #15 Posted by **David Griffith** on 8 Jan 2012, 7:04 p.m.,*
in response to message #13 by Dominic Richens

I'm using GCC 4.4.5 and Qt 4.6.3 as installed though APT on Debian Squeeze. I suspected my Qt problems might be because I don't have the right development packages installed, but based on what I see here today, that might not be right.

Re: WP34s build compiler

*Message #16 Posted by **pascal_meheut** on 9 Jan 2012, 6:01 a.m.,*
in response to message #15 by David Griffith

Qt 4.7.4 or Qt 4.8 are supported. I never tested with an older version.

Re: WP34s build compiler

*Message #17 Posted by **pascal_meheut** on 9 Jan 2012, 3:25 p.m.,*
in response to message #16 by pascal_meheut

You can also try "make qt_gui_no_serial". It compiles without the serial libraries. Just commited it.

Re: WP34s build compiler

*Message #18 Posted by **Nobby K.** on 16 Jan 2012, 9:45 a.m.,*
in response to message #13 by Dominic Richens

You should download the source code of 'qextserialport' using Mercurial and rebuild qextserialport.a reading trunk/QtGui/SerialPort.txt. The qextserialport.a which is downloaded from Sourceforge.net(SVN) is used only limited enviorment. If your version of toolchain is different to Pascal, you should re-build qextserialport.a.

I'm using GCC 4.1.2 and Qt 4.6.1 on linux self build for QtGui, and arm-none-eabi-gcc 4.6.2 ,which is builded from source code by my self, on cross build for calc.bin.

Re: WP34s build compiler

*Message #19 Posted by **pascal_meheut** on 16 Jan 2012, 10:13 p.m.,*
in response to message #18 by Nobby K.

There is even a SerialPort.txt file in the WP34-s/QtGui distribution describing how to recompile this library.

Re: WP34s build compiler

*Message #20 Posted by **Marcus von Cube, Germany** on 6 Jan 2012, 8:49 a.m.,*
in response to message #7 by David Griffith

I think the Yagarto.de offering is a port of the standard GNU ARM cross compiler, neatly packaged for MacOS and Windows. As stated earlier, CodeSourcery G++ does not produce working binaries of the firmware. I have no idea why.

I had a dream - HP's next calculator

*Message #1 Posted by **Michael de Estrada** on 5 Jan 2012, 12:30 a.m.*

Yes folks, I had a dream about the next calculator product from HP. It is a non-programmable business/scientific/statistics calculator with a nice segmented display and all functions on the keyboard. The nice clicky buttons are sloped like the 12c, 15c LE and 35s, so one shifted function is above the key and the other on the key slope to remove the clutter of both shifted functions above the key. It can work in both RPN and algebraic mode. It has an affordable MSRP of $30 USD. The model number of this fictional new calculator is HP 10sb.

Actually, except for the RPN part, that fictional calculator already exists in the HP 10bII+, which I've been playing with for a while, and am truly impressed with it's capabilities. It already has some of the trappings of an RPN machine, such as the INPUT key that functions as ENTER for two variable operations and a SWAP key that is effectively x<>y. All it needs is a full 4-level stack, roll down / roll up key, and a mode switch between RPN and Algebraic/Chain.

I had a dream.

Most usable keystroke calculator?

*Message #1 Posted by **Sid Cave** on 4 Jan 2012, 7:37 p.m.*

What do people think is the most usable calculator or calculator application (including apps for phones and tablets)? The criterion I propose is a calculator that is usable in a manual keystroke fashion. It may be programmable, but that is a neutral attribute. I am looking for one that I can bang away on the keys without getting frustrated by extraneous keystrokes. For example, the 50g and 35s get hurt by their HEX-OCT-BIN mode behavior. They are essentially unusable due to the enormous keystroke overhead for entering HEX values in particular. Sometimes there are more modifier keys for entering the numbers than there are digits. Two to five for the 50g (there is an extra ENTER required prior to an operation), and three for the 35s. That's simply unusable. Of the calculators that I own, two rise to the top, the HP32s and the iOS app PCalc. They are not without faults, but they are the best I have found. Why doesn't PCalc use BCD? Of course you can have my 16c when you pry it from my cold dead hands, though it fails for scientific functions. Oh, and RPN/L only, of course.

Re: Most usable keystroke calculator?

*Message #2 Posted by **Paul Dale** on 4 Jan 2012, 7:38 p.m.,*
in response to message #1 by Sid Cave

The WP-34S of course.

- Pauli

*Message #3 Posted by **Sid Cave** on 5 Jan 2012, 8:50 a.m.,*
in response to message #2 by Paul Dale

That is one to consider. The quick look I took found that it ships from a seller in Spain. I wonder how much it costs to ship to the US, or is there a US based seller?

Re: Most usable keystroke calculator?

*Message #4 Posted by **Jeff O.** on 5 Jan 2012, 9:01 a.m.,*
in response to message #3 by Sid Cave

You don't need to buy it from Spain. Buy a 30b from whoever you want (currently available from Amazon.com for $19.79), then read this article to learn how to turn it into a wp34s.

Re: Most usable keystroke calculator?

*Message #5 Posted by **Jeff Kearns** on 5 Jan 2012, 11:32 a.m.,*

Yeah no kidding. Perhaps someone can buy us a couple and ship them to Ottawa for us - even covering their time and postage we'd still be ahead.

Seeking benevolent middle-man for US to Can shipping

*Message #7 Posted by **Jeff Kearns** on 5 Jan 2012, 10:39 p.m.,*
in response to message #6 by Dominic Richens

Dominic,

I believe you are acquainted with Neil... I live in Aylmer and work downtown. Hopefully the subject line will result in a friendly offer to buy and ship on our behalf. I would get two at that price and just keep one as a 30b and use the other to create my own WP34s - that way I can return Neil's 20b modified-unit to him sooner.

Cheers,

Jeff Kearns

Re: Seeking benevolent middle-man for US to Can shipping

*Message #8 Posted by **Neil Hamilton (Ottawa)** on 6 Jan 2012, 9:11 a.m.,*
in response to message #7 by Jeff Kearns

While not as cheap as the Amazon.com site, Samson Cables is still selling the 30b for $30 with $12 shipping to our neck of the woods. I suspect that the pro-rated shipping would go down if several were purchased. Still much cheaper than the Amazon.ca site.

Re: Seeking benevolent middle-man for US to Can shipping

*Message #9 Posted by **Dominic Richens** on 6 Jan 2012, 9:38 p.m.,*
in response to message #8 by Neil Hamilton (Ottawa)

Thanks Neil I didn't notice they sold them. That works out to 8.75$ shipping each if Jeff and I order 2 each together.

Re: Most usable keystroke calculator?

*Message #10 Posted by **Ed Wright** on 4 Jan 2012, 8:53 p.m.,*
in response to message #1 by Sid Cave

I'm sure 10 people will have 11 different opinions. My favorite is Free42 by Thomas Okken. I use it on my PC and Android phone - it's available for many platforms (Windows, Linux, iPhone, WM, Palm, Android, etc.) which is a big plus. The HP-42S has many functions buried in menus, but it allows you to create a custom menu of six functions and have them available on the bottom line of the display, so they're available just as if they were unshifted keyboard functions. If you need more than six functions in addition to what's native on the keyboard, you're back to multiple keystrokes navigating menus, but for me it's the best calculator and simulator out there. Oh, and the simulator is, as the name suggests, free.

Re: Most usable keystroke calculator?

*Message #11 Posted by **Thomas Klemm** on 5 Jan 2012, 12:55 a.m.,*
in response to message #10 by Ed Wright

> Quote:
>
> it allows you to create a custom menu of six functions

The CUSTOM menu has 18 fields. The other two lines of six fields can be displayed using the arrow-keys.

Kind regards
Thomas

in response to message #11 by Thomas Klemm

Thank you for pointing that out. After all this time, I didn't know that. I can make good use of 12 more easily accessible functions.

Re: Most usable keystroke calculator?

*Message #13 Posted by **Sid Cave** on 5 Jan 2012, 9:35 a.m.,*
in response to message #10 by Ed Wright

Free42 is a nice one. I was a little put off by having to fiddle with the top row keys to go from "A…F" to "DEC". I was using "SHIFT BASE DEC" until I just found that "EXIT DEC" works as well. Not too shabby. One keystroke to go from DEC to HEX or A…F, and two to go from A…F to DEC.

There is also a excellent derivative of Free42 for iOS devices. It is "42s RPN Calculator" by Byron Foster. Thomas Okken even links to it on his Free42 page. It costs $9.99, but it has some very nice user interface enhancements, more preference settings and a nicely polished skin. It has the ability to turn off the key-clicks, which you cannot do in the original Free42 for iOS. It is one of the front runners now.

Re: Most usable keystroke calculator?

*Message #15 Posted by **Mike Morrow** on 4 Jan 2012, 10:15 p.m.,*
in response to message #1 by Sid Cave

Consider the Casio fx-115ES, a.k.a. fx-991ES, or the slightly improved but not generally available in USA fx-991ES Plus.

IMHO, it's the first non-RPN calculator that does so much (but not programming) that it's worth learning its very non-RPN user interface. Here in the US it's typically about $18. If you wind up hating it, you'd still not be out much.

Would you believe it performs Gauss-Kronrod numerical integration, and has stunning numerical accuracy in general? The keyboard "feel" is not like any HP, but that's not necessarily bad.

I have Casio calculators that are as much as 34 years old. They *all still work*. I can't say that about all of my TI and HP machines.

Re: Most usable keystroke calculator?

*Message #16 Posted by **David Hayden** on 4 Jan 2012, 11:00 p.m.,*
in response to message #1 by Sid Cave

I really liked my first HP calculator - the 29C because it could be operated completely with one hand. You cradle it in your 4 fingers and use your thumb to operate it. Calculator in one hand, pencil in the other - it was high school homework bliss, if there can be such a thing.

For modern calcs I'm with Pauli - the 34S.

Dave

Re: Most usable keystroke calculator?

*Message #17 Posted by **Michael de Estrada** on 4 Jan 2012, 11:32 p.m.,*
in response to message #16 by David Hayden

All the Woodstocks are like that. For me it was the 21, even with my small hands. I held it in my left hand. Also, it was far and away the most pocketable of the LED generation calcs.

Re: Most usable keystroke calculator?

*Message #18 Posted by **Sid Cave** on 5 Jan 2012, 10:00 a.m.,*
in response to message #17 by Michael de Estrada

The HP-21 is a sentimental favorite for me as well. It took me through 4 years of college. I still have mine, and it still works. It is sorely limited though. There are some nice free emulators available for it, such as Nonpareil and its offspring, like "rpn-21" by Maciej Bartosiak for iOS. There is also a payed one for iOS that is better in many regards, except for being implemented with binary math. Sorry, but 100 - 99.99 - 0.01 does not equal 5.1156995e-15.

Re: Most usable keystroke calculator?

*Message #19 Posted by **Vince (Italy)** on 5 Jan 2012, 12:12 a.m.,*
in response to message #1 by Sid Cave

It seems you already know the answer. My advice is: stick to the 32s; otherwise, you should give up RPN.

Warm regards

Vince

*Message #21 Posted by **Vince (Italy)** on 5 Jan 2012, 1:16 a.m.,*
in response to message #20 by Jim Yohe

From an aesthetical perspective, I like very much the turquoise/orange keyboard of the 32sII, but I find the layout of the 32s keyboard more straightforward, the greater number of menus notwithstanding. If you don't need the additional features, maybe the 32s remains the best choice. It seems that Sid doesn't care about advanced features (programming capability included); so, maybe a less cluttered keyboard could be more suitable. A strictly subjective opinion, of course.

Warm regards

Vince

Should replace the useless EEX key

Re: Most usable keystroke calculator?

*Message #28 Posted by **peacecalc** on 5 Jan 2012, 11:10 a.m.,*
in response to message #27 by Reth

Hello usabilities searchers,

CLX can be replaced by a multiplying with zero. Ouh the EEX key is very important, such a small calculator mutates to a real number-crusher!

Sincerely peacecalc

Re: Most usable keystroke calculator?

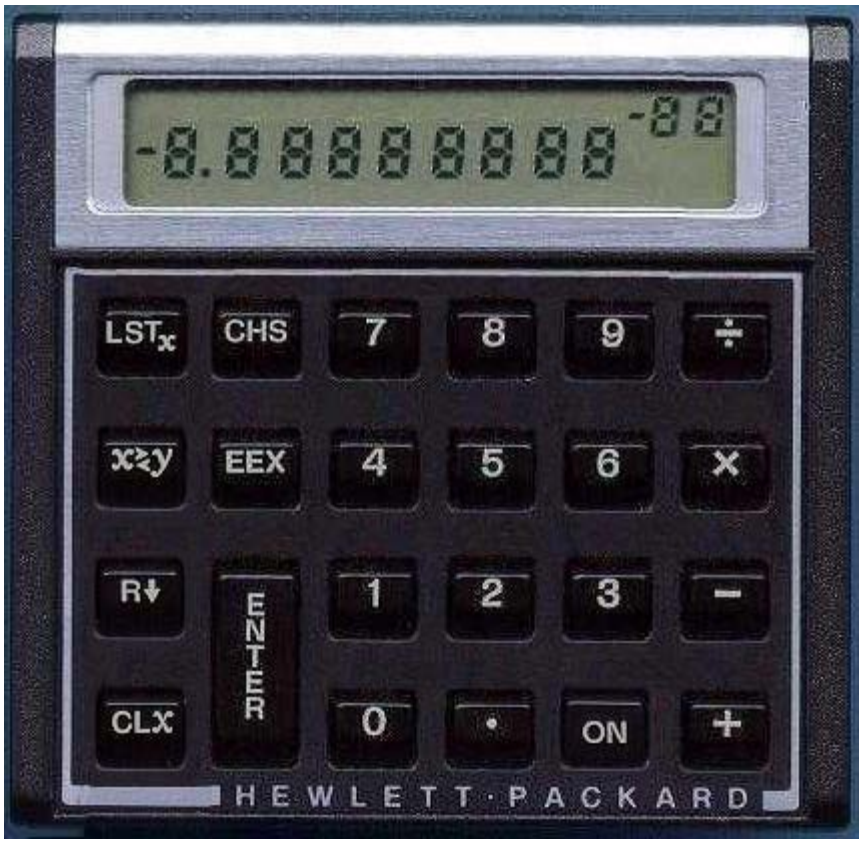
*Message #29 Posted by **C.Ret** on 5 Jan 2012, 2:47 p.m.,*
in response to message #28 by peacecalc

In fact, I realise that Pauly is right.

I so much use to type on keyboard, and I am so prone to errors, that I often have to correct entries with the 'back-delete' key.

That means that a keystroke calculator must have a 'back erase' key. Or as an alternative way to correct mistyping an 'Clx' Key.

Perhaps, we have to INVENT same thing more like this one:



which is a good full RPN four operation banger !

Re: Most usable keystroke calculator?

*Message #30 Posted by **Oliver Unter Ecker** on 5 Jan 2012, 12:00 p.m.,*
in response to message #1 by Sid Cave

Tried ND0 yet? (Free, for iOS.)

0xabcd will enter a hex number, and you can mix hex and dec at will.

Eval

```
\<< 1e6 primes total toHex \>>
```

to get the sum of the first million primes... as a hex number.

You didn't say what else you need. Personally, I'd die without a visible multi-level stack and an unshifted undo key.

I completely agree with that statement in regards to the HP35S. However, IMHO, the 48 series and their derivatives are pretty easy to use with non-decimal base input. All you need to do is prepend the '#' symbol to turn the number entered into the currently selected base. If you don't like having the '#' key shifted just assign it somewhere easily accessible.

Just my $0.02.

Cheers,

-Marwan

> Look where we are now!

Yes, look.

Surveying field work that used to take a three man crew a day to preform correctly is now done by one person in the field and two in the office (in the same time) but very often incorrectly because the automation has given anyone with a degree in computer-gamesmanship those office jobs and any unemployable relative can turn on the field computer. Simple but important things like turning multiple angles used to obtain an order of accuracy of one in 5000 for third order work was done with older equipment as a matter of course. It is still done to that level but totally automated with modern instruments operated roboticly by garbage like the carlson field computer. Results more than twenty times as fine are gotten using the old manual methods with the great new instruments. Mistakes are much more common now too. Since it is not absolutely necessary to have someone with experience and knowledge to do lay-out all the time; vacuum cleaners get sent to places they don't belong to do work they can't do.

The average office employee spends 25% of it's time goofing around on the internet. On the bright side: there are more arrogant twits than ever before in history who can pretend their data entry job at a terminal makes them a professional.
It used to be that employers had to have people who could think in lots of key positions. Now intelligence is concentrated in fewer positions and the merely connected or agreeable can be given a computer to do their "work", right or wrong.

If you are as old as me, you can remember how often a bill was wrong in the '70s: almost never. Now my AT&T bill for instance is wrong 10 months out of 12. This is because third rate hack bean counters with a secret handshake run things and let computers do the work because people are too expensive. How many times have you bought a computer or part that's screwed up from the factory? Or a program that's no good at all. How many people got saddled with Vista and then tried to replace it with Linux 11? How many of those would have gladly gone back to an abacus?

People used to think and take pride in their work. Now they hide in their cubicle checking their ebay bids over the the idiot filled porn pipe that is the internet.

The 41cx; now that is a computer.....

*Message #8 Posted by **Nick R** on 5 Jan 2012, 11:52 a.m.,*
in response to message #7 by db (martinez, ca.)

Your comments on surveying field work took me back to when I was working as a chainman in the 1970s. The minimum closing accuracy required legally on traverses was one in 5000, but our employers expected one in 10,000. Anything less than this meant we'd be sent back out to find the error. Distances were measured with a 200 foot steel tape pulled taught against the string of a suspended plumb bob. By today's standards, we chainman would be considered unskilled laborers, as most of the day's work consisted of cutting line with axes, but we very rarely failed to achieve the company's goal of accuracy. I'd like to think this was due to us taking pride in our work, but the reality was none of us wanted to go back and re-run an unsatisfactory traverse.
Everything is now electronic, and the reflectng prism has replaced the plumb bob held by a scruffy individual standing in a swamp surrounded by mosquitoes as his boots fill with water. Measuring a distance across a river is done in a fraction of a second with a laser beam. We did the same thing a lot slower by tying the end of the steel tape to a dog and persuading him to swim across for a biscuit.
Steel tapes did have one advantage, however. While working near an electric fence I was able to throw my end of it onto the wire and shock the instrument man who was holding the other end.

Red dot

Pictures show manual, AC adapter, case, etc. Looks in good shape and has the 2.02 bug.

FWIW.

in response to message #2 by Michael de Estrada

Just curious, what tells you that the hard case is from a newer model? The only difference I've ever noticed is the address, i've seen some later ones with a Corvallis, OR address on the label.

Sorry, but the price is double of that what I "usually" pay for RedDots.

Re: OT: FYI...Red dot HP 35 with rom bug on TAS

*Message #6 Posted by **Michael de Estrada** on 6 Jan 2012, 5:45 p.m.,*
in response to message #5 by Matthias Wehrli

Maybe the seller heard you, since the price has been reduced. Still, it's more than twice what I paid, and mine is 100% original. It also includes the cardboard box it was shipped in directly from HP to the original owner, who then sold it to me. I even have the printed invoice from HP to the original owner with name, address and serial number, such that it is completely authenticatable. Amazingly, the original owner lived in the same city for the nearly forty years between the time he bought it and sold it to me. And no, I'm not interested in selling it at any price.

HP 9826A key switches

*Message #1 Posted by **David Ramsey** on 3 Jan 2012, 10:22 p.m.*

I've come into possession of a 9826A controller, the red-headed stepchild of HP collectors.

It was free, and has 2.7MB of memory.

I installed a TAS-obtained BASIC 2.0 card. It took me a while to figure out how to use it, 'cause the manual says with a ROM BASIC card it will simply come up automatically and say READY, but in reality it displays "ROM: B B" at the upper right hand corner of the screen and you have to press "B". But I digress...

Several of the keys on the keyboard don't register. Checking with a multimeter, I can see that pressing a working key shorts the corresponding switch's two contacts on the bottom of the keyboard PCB, whereas pressing a non-working key does not. OK, so the problem is the key switch.

The dead keys are *really dead* and will not register no matter how hard I bang on them.

Physically, the 9826A key switches look very like modern key switches. They snap into a metal support plate and have two solder points on the keyboard PCB.

So: any suggestions as to my options? Is removing a key switch and trying to disassemble and clean it reasonable? Should I look for a parts machine?

Re: HP 9826A key switches

*Message #2 Posted by **David Ramsey** on 3 Jan 2012, 11:21 p.m.,*
in response to message #1 by David Ramsey

Ah, never mind. The solution is:

1. Unsolder and remove key switch. Professional desoldering station is a help, but a standard iron and pump type solder sucker can get it done.

2. Disassemble key switch. Surprisingly easy to do.

3. Remove metal switch contact plates. Wipe on T-shirt.

4. Snap switch back together and check for proper operation.

5. Repeat until done.

Re: HP 9826A key switches

*Message #3 Posted by **Tony Duell** on 4 Jan 2012, 4:34 a.m.,*
in response to message #2 by David Ramsey

I am pretty sure I totally dismantled one of these keyboards (perhaps on a 9836, it's the same part). As you

said, it's not hard, and I found a normal soldering iron and solder sucker was easily good enough.

One thing I did was to sort the keyswitches into working and not working when I took them out. I cleaned up the not-working ones and they seemed OK, but when I put it back together, I put the non-working ones in little-used places (I almost never use the numeric keypad, so the cleaned ones ended up there).

Re: HP 9826A key switches

*Message #4 Posted by **David Ramsey** on 4 Jan 2012, 7:29 p.m.,*
in response to message #3 by Tony Duell

I'm sufficiently unskilled with a soldering iron and sucker to worry about lifting traces or otherwise damaging the keyboard. I did remove, disassemble, and clean the four switches on the main keyboard that weren't working (A,H,J, and X) and they're all back in now. There are five more nonfunctional switches on the numeric pad and I just noticed the "6" key on the main keyboard doesn't work, but I'm going to wait until I get my desoldering station (reasonably cheap these days) to do any more work.

The machine has 2.7MB of memory but no language cards when I received it. I found the BASIC 2.0 card in California and the HPL card in Israel, both are now installed and working perfectly, although the manual's description of how the language cards work is nothing like my system. The manual says with just the BASIC card installed, the system will come up with BASIC READY, and that with both cards installed it'll say WHICH SYSTEM? B H

Mine says ROM: B H at the upper right of the screen with both cards, and ROM: B with only the BASIC card. But pressing B or H still works.

Disks format and I can save and load files with no problem.

Oddly, the machine identifies itself as a 9836A when it boots. Perhaps this is the result of a service or parts swap?

DIY4X, DIY5 update

*Message #1 Posted by **Eric Smith** on 3 Jan 2012, 4:59 p.m.*

Last month Angel Martin asked for pictures of the DIY5 (which doesn't exist yet), and I explained that the DIY4X that I showed at the HHC 2011 broke as soon as I got it back to the hotel.

Today Richard Ottosen finished assembling the first of the new DIY4X display adapter boards, and I made the necessary minor changes to the firmware, and we were both amazed that it worked the first time.

There are some photos here. The third photo in particular shows off the display, although not under ideal lighting conditions.

Richard will build two more display adapter boards so that we can upgrade upgrade the other two DIY4 calculators to DIY4X.

The new display adapter board also is designed to provide USB support, once we upgrade the processor to the newer chip with USB support (and more RAM and Flash).

We might make a few more DIY4X calculators for firmware development, but after this the main development thrust will be the DIY5, which will be functionally similar to the DIY4X, but designed for manufacture.

Re: DIY4X, DIY5 update

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 3 Jan 2012, 5:59 p.m.,*
in response to message #1 by Eric Smith

Thank you for the update Eric, really nice *beast* indeed!

Greetings,
Massimo

Re: DIY4X, DIY5 update

*Message #3 Posted by **David Griffith** on 4 Jan 2012, 1:42 a.m.,*
in response to message #1 by Eric Smith

Do you have any pics of hardware with the alternate keyboard?

Re: DIY4X, DIY5 update

*Message #4 Posted by **Eric Smith** on 4 Jan 2012, 4:16 a.m.,*
in response to message #3 by David Griffith

We haven't built the alternate keyboard (42S/10b/20b layout) yet. If we build more DIY4X units, we'll build the alternate keyboard and kludge it onto some units. However, the DIY4X with the alternate keyboard will be the same overall length as with the regular (41C) keyboard, because it will still have the full length of the DIY4 main board plus display adapter.

The objective with the DIY5 is to have a separate keyboard, so that the with the alternate keyboard layout, the calculator will be the same width and length as the 42S. The height will not match as the calculator will be more wedge-shaped to accommodate the two AAA cells at the display end.

Re: DIY4X, DIY5 update

*Message #5 Posted by **Ángel Martin** on 4 Jan 2012, 7:06 a.m.,*
in response to message #4 by Eric Smith

It´s looking good, nothing short of the expectations created from the HHC reports. Looking forward to the final product!

DIY4X USB power tested, and more photos

*Message #6 Posted by **Eric Smith** on 5 Jan 2012, 1:39 a.m.,*
in response to message #1 by Eric Smith

Designing the DIY4X such that it can be powered from either 3V (lithium coin cell, or two alkaline AAA cells), or from 5V from USB, while not drawing more current from the battery than we previously had without the USB circuitry, was slightly tricky. We weren't 100% certain that our method would work properly, but we tested it this evening and it seems to work OK.

When powered from USB, we still have about 15uA of drain from the battery, regardless of what mode the calculator is in, off, idle, or running. Part of that is the quiescent power consumption of the boost regulator used to power the calculator from the battery, but that doesn't explain the full 15uA. However, we feel that 15uA is low enough that it is not an issue. That's about the same current that the DIY4X draws from the battery when "off" and with no USB power. (We expect to do several things to reduce the "off" current in the future, but aren't sure how it will affect the battery drain when USB power is applied.)

The USB port will not recharge any kind of batteries, and supports calculator operation as a USB device only, not host or OTG.

We don't yet have the new processor with USB support (and bigger memory), so at the moment the actual USB data lines are not wired.

The MicroSD socket will eventually be jumpered over to the SD socket footprint on the DIY4 main board.

Here are three more sets of photos:

- original DIY4 with 16x2 character LCD module, as built in July 2011
- DIY4X display adapater (not attached to main board)
- DIY4X powered from USB port

I'm sorry that the pictures aren't better; I don't have a real digital camera or tripod here, and have been forced to rely on my cell phone.

Never make a dime of profit...

*Message #1 Posted by **Kees Bouw** on 3 Jan 2012, 3:31 p.m.*

It is quite shocking that recent HP calculators have so many bugs. Are all current HP calculators this buggy? If I wanted to use a new HP calculator for serious work, which model should I get to have a minimum amount of bugs and problems? Did the older ones, like the HP-25, HP-65, HP-67 also have this many bugs? Do TI calculators like the TI-84 and TI-89 also have (many) bugs? It is really not something you would expect from a company like Hewlett-Packard. Remember Dave Packards wise words about the bugs in the HP-35: "We're going to tell everyone and offer them a replacement. It would be better to never make a dime of profit than to have a product out there with a problem"

Re: Never make a dime of profit...

*Message #2 Posted by **Eric Smith** on 3 Jan 2012, 5:04 p.m.,*
in response to message #1 by Kees Bouw

The HP-25, HP-65, and HP-67 you mention have very few known bugs, although there were some bugs in the HP-67 early on, and not all units in the field were upgraded to fix them. The same is true of the HP-41C; the HP-41CV and HP-41CX have all of the most serious bugs fixed.

The newer calculators definitely have a lot more bugs than the older ones, but they also have a lot more features, and thus contain a lot more code. I think it is to be expected that software with more features and more code will have more bugs.

Re: Never make a dime of profit...

*Message #3 Posted by **Koralatov** on 4 Jan 2012, 7:26 a.m.,*
in response to message #2 by Eric Smith

In my admittedly limited programming experience, the number of bugs in any piece of software rises at least in proportion to the increased complexity of any code written.

It may be that this is often the case, but it should not be like that. More code just means that it has to be tested and debugged better. From a company like HP, which supposedly delivers high quality equipment, that would be expected. Furthermore, some bugs are not related to the complexity. They even managed to create new bugs in old software, like the PSE bug in the 15c LE that is running the

original 15c software, where this bug is not present. Remaining question: which currently available HP calculator has the least amount of bugs? The 50g perhaps?

Edited: 4 Jan 2012, 8:58 a.m.

Re: Never make a dime of profit...

*Message #5 Posted by **Marcus von Cube, Germany** on 4 Jan 2012, 9:41 a.m.,*
in response to message #4 by Kees Bouw

Don't underestimate the complexity of emulation. Especially the LCD controller in the original 15C seems to be hard to emulate correctly. The PSE bug is a consequence of an unsuccessful optimization attempt in this area.

Re: Never make a dime of profit...

I would rephrase that and say the PSE bug is a consequence of not properly testing an optimization attempt. Those who had tested the calculator the previous year did not have that version of software. I have not seen any group come forward and claim they tested the released version of software. Unless you count those who purchased it.

Re: Never make a dime of profit...

*Message #7 Posted by **Jeff O.** on 5 Jan 2012, 11:28 a.m.,*
in response to message #6 by Mark Storkamp

Firmware version 2011-04-15, which is the version loaded on the production machines, was made available on 2011-4-21 to some of those who tested the calculator the previous year. Unfortunately, apparently no one ran any tests using the PSE instruction, and no other issues with flashing displays or other odd behavior were reported. The memory corruption with self test problem had been found and reported with the previous firmware version. Unfortunately, the 2011-04-15 firmware was not re-checked for this problem. To my knowledge, power consumption was not measured by any user and power management was never considered or discussed.

Re: Never make a dime of profit...

*Message #8 Posted by **Eric Smith** on 4 Jan 2012, 5:58 p.m.,*
in response to message #5 by Marcus von Cube, Germany

It is not hard to emulate the Voyager LCD controller correctly. It isn't a complicated device. I got it working correctly in only a few hours. I've even told the appropriate people how to do it, multiple times.

It's fine to optimize things, but it shouldn't be that difficult to verify that the optimization actually works correctly.

Re: Never make a dime of profit...

*Message #9 Posted by **uhmgawa** on 6 Jan 2012, 1:06 a.m.,*

> Don't underestimate the complexity of emulation. Especially the LCD controller in the original 15C seems to be hard to emulate correctly. The PSE bug is a consequence of an unsuccessful optimization attempt in this area.

The only area I've found where the voyager lcd controller model itself can impact emulation is the lack of an inherent "update logically complete" operation to aid synchronization. The firmware simply writes to the display registers and the controller captures these accesses, updating the lcd scan data on the fly as a hardware function. Moreover as the voyager firmware emits redundant display register updates, considerable emulation time can be consumed to no benefit if the attempt is made to render the emulated display on every register modification. IOW if the cost of a display update is substantial relative to the intended speed of instruction emulation, this likely needs to be addressed.

The sam7's segment controller timing window constraints when entering/exiting hardware blink mode probably aren't helping here requiring the emulator update of the display effectively to synchronize with the controller's internal timebase. Add to this the practical need of the NUT instruction-to-glass update to occur within a latency appearing acceptably responsive to the user and overall there are some details which need to be worked out specific to the sam7.

IIRC when first implementing graphic support for KEMU, I'd reinitialized the phase of the blink timebase with each 030 blink operation on the assumption doing so would avoid runt blink periods. However exactly the opposite was true as the firmware effectively disables and reenables display blink mode for short intervals of time undetectable to the user when blink phase is maintained. Of course in hindsight that's exactly the behavior resulting from the r2d2 controller's internal asynchronous, free-running timebase.

Re: Never make a dime of profit...

*Message #10 Posted by **Mike Morrow** on 4 Jan 2012, 3:14 p.m.,*
in response to message #4 by Kees Bouw

> Quote:
>
> It may be that this is often the case, but it should not be like that...From a company like HP, which supposedly delivers high quality equipment, that would be expected.

Well, let's get a little perspective.

Here's some of the more important HP calculators produced since 1972, with their equivalent cost in 2011 US dollars (from US BLS)).

Model	Date	List Price	2011 Equivalent
HP-35	1972	$395	$2138
HP-45	1974	$395	$2012
HP-21	1975	$125	$ 526
HP-25	1975	$195	$ 820
HP-67	1976	$450	$1680
HP-41C	1979	$295	$ 919

```
HP-34C  1979    $150          $ 467
HP-15C  1982    $135          $ 316
HP-42S  1988    $120          $ 229
```

All these represent some top-quality popular HP calculators from "the good old days". The only one that would be a bargain at its inflation-adjusted price is the HP-42S.

If today it was possible to sell a *perfect* HP-15C for $316, I have no doubt that HP could match the original. But there would be few purchasers at that price. Frankly, everything available today is dirt cheap...an HP 50G is $150 list from HP, but typically $105 elsewhere. When the toys we buy are so cheap, there can be no logic attached to extensive error-checking and quality control prior to marketing. *There ain't no such thing as a free lunch*!

In addition, HP is usually awarded too much credit for perfection from 35 years ago. The Woodstock series have the most negligently- and incompetently-designed battery charging system in the history of portable calculators...it could and did easily destroy the calculator. A major product defect! The new HP-67 that I bought in 1977 (for a whole month's take-home pay) had some trigonometric result issues that HP addressed only by inserting a notice card with the manual. We've seen recently that the HP-15C has a basic bug with GSB and indirection that it handled, with NO notice made, by quietly eliminating the manual's reference to the intended function. The magnetic card readers on all HP calculators turn gummy. The battery door designs on most HP calculators really are weak, *except for the ill-fated Woodstock line*. The whole battery compartment design of the Clamshells is a horror which results in permanent cracking of the calculator case near the cell opening. I'm sure there are many more examples from *the good old days* of HP calculator history. On the cases I cite above, one could pay a lot of money for an item that was orders of magnitude less capable than today's models, and still wind up with a defective unit.

While you're at it, why not mention the awful flimsy junk that were known as Spices ? Of all the calculators that HP ever produced, these had to be the worst in this respect, and even the cheapest HP calculator made today is much better.

Re: Never make a dime of profit...

*Message #12 Posted by **Mike Morrow** on 4 Jan 2012, 4:45 p.m.,*
in response to message #11 by Michael de Estrada

> Quote:
>
> While you're at it, why not mention the awful flimsy junk that were known as Spices?

Agreed! My list from the good old days is far far from complete. :-)

I like a lot of things about how the HP-34C functions, and the later soldered-chip version is passable. But even that feels flimsy, and the Spice battery door design was done by fools, apparently.

The successor, the HP-15C, has a few oddities of construction especially in the early models. The several iterations of later single PCB design were a great improvement, yet it's hard to understand why HP would make such drastic physical modifications without also

correcting the GSB indirection bug that they didn't tell anyone about (but obviously knew about).

RE: GSB, was that the one that someone reported here just discovering recently?

Re: Never make a dime of profit...

*Message #14 Posted by **Mike Morrow** on 4 Jan 2012, 8:14 p.m.,*
in response to message #13 by bill platt

Yes. Unknown to the customer community apparently, but well known to HP, 30 years ago. HP then "solved" the problem by eliminating from the manual the description of the GSB function that did not work (negative numbers in the I register), even though the feature works on the HP-11C. Cheesy and somewhat dishonest. Dishonorable!

Re: Never make a dime of profit...

*Message #15 Posted by **Kees Bouw** on 4 Jan 2012, 3:53 p.m.,*

I doubt that. I think they easily could have sold the first batch at $ 295 or more. There was and still is very high demand, and even higher prices were paid on eBay.

> Quote:
>
> When the toys we buy are so cheap, there can be no logic attached to extensive error-checking and quality control prior to marketing. *There ain't no such thing as a free lunch*!

From Hewlett Packard I do not expect cheap toys. If I want cheap toys there are lots of other manufacturers to choose from. From Hewlett Packard I expect high quality, well tested products. Of course at a higher price. Now it seems that we have no choice anymore: you can only buy cheap toys, even from Hewlett Packard.

Re: Never make a dime of profit...

*Message #16 Posted by **Michael de Estrada** on 4 Jan 2012, 4:09 p.m.,*
in response to message #15 by Kees Bouw

Only a handful of buyers, mostly outside the USA paid very high prices for the 15C LE. Go to ebaby now and you'll see dozens of listings for it at much lower prices that are not selling. I certainly would not pay that much for it, when I can buy a very clean original for the same price.

Re: Never make a dime of profit...

*Message #17 Posted by **Juergen Keller** on 4 Jan 2012, 4:21 p.m.,*
in response to message #15 by Kees Bouw

Times are changing, and I suppose that the market for high-quality calculators is quite small. Calculators don't play the same role anymore, and the quality level of HP products is in the range of its competitors. The days of outstanding quality of HP products is gone.

Re: Never make a dime of profit...

> If I want cheap toys there are lots of other manufacturers to choose from.

The real problem is "who do you go to if you want quality that is *better* than what the idolized HP now provides?" I don't see any corporations eager to fill this "gap".

Contrary to what has been gratuitously asserted, there is NO verified (or likely) market of sufficient size that would pay $300 for an HP-15C. There's only a few oddballs with, arguably, a lot more money than sense. A company would be insane to go to the effort and expense to produce a Voyager or other old device that was identical or better in quality and performance to the 30 year old originals. Plus, as we know well, there were many surprising and significant lapses of quality of design and construction in many of the esteemed HP products of yesteryear.

One must resist the urge to live in a dream world that doesn't exist now, and in fact has never existed. I doubt that the entire HP calculator operation contributes significantly to HP's annual return to stockholders. Were I their CEO (apparently not much talent is required), I'd drop it altogether or sell it off if some imprudent buyer could be found.

Re: Never make a dime of profit...

*Message #20 Posted by **bill platt** on 4 Jan 2012, 5:29 p.m.,*
in response to message #10 by Mike Morrow

I agree with you in principle, however the following statement may require some further considerations:

"When the toys we buy are so cheap, there can be no logic attached to extensive error-checking and quality control prior to marketing. There ain't no such thing as a free lunch!"

I think market size, scale have to be considered here and would run counter to your hypothesis. In other words, take the preproduction market size estimate for the HP45, or the 657 etc, and compare it to the 15c or 42s market estimate. I think the market size grew much much larger with each generation and HP knew this and figured this into the price. The R&D was amortized over more units."

If we knew the estimated market size for the current production, we might find that in fact your hypothesis stand up: perhaps the latest production was based on a considerably smaller market, while still offering a lower price. "Something's gotta give" would apply here, in support of your hypothesis.

ILPer v1.41 published

*Message #1 Posted by **Christoph Giesselink** on 3 Jan 2012, 2:38 p.m.*

I just published the promised ILPer version 1.41 at http://hp.giesselink.com/hpil.htm.

To clear the complete text area call the context menu of text window and choose "Select All" then another call of the context menu and choose "Delete". This works in the "Printer" and in the "HP-IL Scope" window.

No further changes to the prior version 1.4.

Regards

Christoph

New Devil for 2012

*Message #1 Posted by **Ángel Martin** on 3 Jan 2012, 12:49 p.m.*

You would no doubt indulge my calling it Devil - as a friendly nickname for the HP-IL Development Module, a good old friend.

This module has a few wonders inside, like the SCOPE mode - a monumental tribute to the MCODE demi-gods. But if you've ever looked under the hood you'd be surprised to see how EMPTY that module is, really - with almost 3k blank it barely qualifies as an 8k module.

So I set forth to adding a few complementary functions to it, mainly launchers to group all related functions into a few ones - similar idea to the concept used in the CL-UTILS, if you're familiar with those.

Since there still was a lot of available room I included Ed Keefe's 16C Emulator in the upper ROM, changing all those Advantage Functions to the HP-IL Devl equivalents. This proved to be a nice exercise, as the upper page is totally self-contained, thus it leds itself to the 4k "DIGIT_PAC" ROM.

In summary, both the "DIGITPAC" and "HPIL-DEVL+" modules are now available as New Year's present to all who care. Soon in a TOS near you.

Best, 'AM.

BTW maybe somebody can explain to me why the HP-IL Devl module image locks-up V41? There's nothing wrong with the code for the polling points, so it must be V41's fault?

HP12c Anniversary Seft Test

*Message #1 Posted by **Nick Mihiylov** on 3 Jan 2012, 12:42 p.m.*

Could someone explain why the self test for the HP12c 25th Anniversary Edition and the 12c Platinum takes as long as it does? It seems that these self tests run for minutes as compared to the almost instantaeneous result I get on the HP15C LE model.

Is this something to be concerned with?

Thanks,

Nick

Re: HP12c Anniversary Seft Test

*Message #2 Posted by **Eric Smith** on 3 Jan 2012, 5:05 p.m.,*
in response to message #1 by Nick Mihiylov

The 12C Platinum and the 25th Anniversary Edition use a *much* slower processor than the 15C LE.

Re: HP12c Anniversary Seft Test

*Message #3 Posted by **Koralatov** on 4 Jan 2012, 7:23 a.m.,*
in response to message #1 by Nick Mihiylov

Seeing as there are some serious battery-life concerns with the HP-15C LE, I'd consider the slower processor a boon.

A propos battery life

*Message #1 Posted by **John Mosand** on 3 Jan 2012, 10:32 a.m.*

My 10c from 1982 still operates nicely on the original batteries! It was used quite a bit until I got my 48SX in 1990, then occasionally. The 48SX has been used almost daily since then and I've changed batteries only twice. Any better?

SOLVED !!! (was : Running EMU41 16-Bit MS-DOS Programs on new 64-Bit Windows 7 Laptop)

*Message #1 Posted by **Antoine M. Couëtte** on 3 Jan 2012, 9:50 a.m.*

Dear All,

In a recent Thread (which seems to have vanished somewhere, and by the way, WHERE ... ???) I recently reported my inability to run EMU41 on my new Windows 7 64-Bit laptop.

Thanks to information obtained here and there - including from this Forum (thanks again to you my Friends) I simply purchased the (expensive) Windows 7 PRO upgrade to my former "Family" Windows 7 Software. I then downloaded from the Internet the (free) "Windows Virtual PC" software which enables to run under "Windows XP Mode".

Under this "Windows (virtual) XP" mode, I was then able to run EXACTLY AS BEFORE ON MY FORMER WINDOWS AND VISTA laptops, both EMU41 and HrastProgrammer data exchange software between HP48GX/49G and laptop without any problem through my USB converter.

For my applications, i.e. running EMU41 as well as both way data exchange between Calculators and Laptop, I do not even need anything else. Therefore, although I downloaded a trial copy of the "Tao ExDOS 2009 Trial Version", I am not planning to register and use it all because it seems no longer necessary to me .... unless one of you recommends it for some reason (no longer immediately obvious to me).

Thanks again for the nice Info I could find once again on our HP Museum Forum.

Meanwhile, Best Regards to you all from Sunny Mauritius Island.

Kermit

Antoine M. "Kermit" Couëtte

Glad to see you got it solved, but...

It's a shame that you purchased Win 7 Pro. I'm pretty sure you could have use Sun's Virtual Box to do the same

with the standard windows 7. Sun's Virtual Box is also free. You'd just need the Win XP disk to install. I'm currenty running several versions of Linux, Win XP, Xenix 386, CPM/86, and several versions of DOS thru Virtual Box on my 64 Bit Win 7. All work great.

Bill

The same applies to VMWare Player. Note that the advertised VMWare Workstation is not that for free. Besides the serious ones, you would even be able to run that OS with the bitten-into apple ;-)

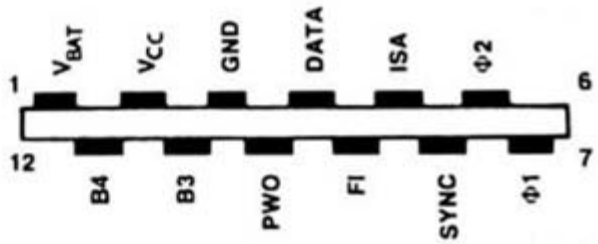
HP41C "Power Module"

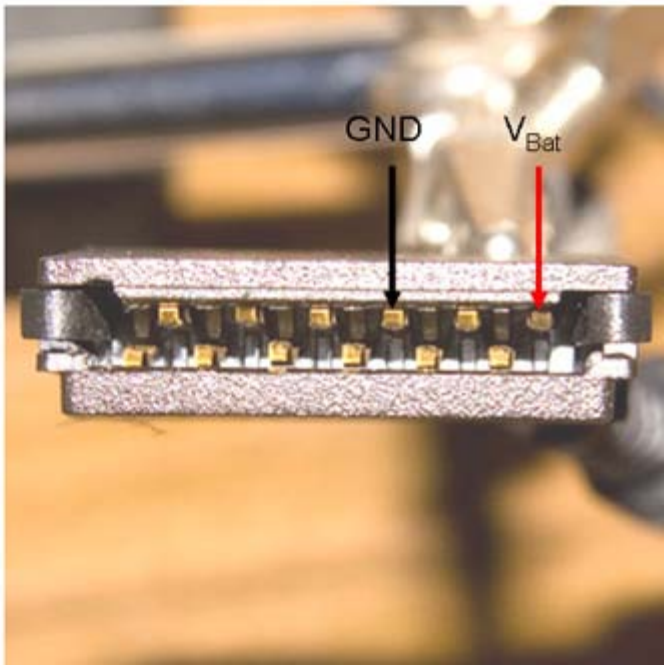
*Message #1 Posted by **Frido Bohn** on 2 Jan 2012, 12:05 p.m.*

Ever since the 41C has been built discussions came up because of the power supply. Although the standard machine is very "green" and has a minimum power consumption users get nervous when devices are connected that do not fit in that line. The first to mention is the magnetic card reader which eats lots of energy and renders a BAT signal pretty fast after not too abundant usage.
With the rise of the 41CL the energy question has become even more pressing, first and foremost if you want to perform writing operations on flash.

To make long things short, I pursued the idea to feed the 41C "backwards". The IO ports have connectors over which an external power source may supply the calculator, thus being independent of battery power (Figure 1).

Contacts at 41C Port
Source: Figure 4-6 HP-41C/CV/CX Alphanumeric Programmable Scientific Calculator Service Manual (Aug 1983)





View on 41C Module

Figure 1

I (ab)used a simple memory module and withdrew the memory chip for the purpose to solder wires on the respective port outlets and connect them to a 6V DC

supply (with VBat being positive and GND negative polarity).
Any other module would work just as fine but I think that a memory module is the most easily obtainable and cheapest. The power supply of a cell phone was a good solution for me. The voltage is stable and the output current of 800 mA is enough to drive a magnetic card reader and is sufficient to warrant accurate flash writings in the 41CL (Figure 2).

Figure 2

The battery compartment can be left operational while the external power source is used. I measured a "loading current" of about 2.5 µA when the power supply was used in parallel. A such a low current does not produce any heat even if the calculator is active over night and does not harm the batteries as far as I made the experience. Of course, the battery compartment may be pulled out while the external source is used. Caution has to be exercised if the external power supply is taken from the socket. I made the experience that in that case the batteries feed the voltage converter, in my situation with a current of about 8 mA.

Interestingly, this solution works well on all 41 fullnuts (HP41C/CV/CX) but not so well on the halfnuts (41CX with rounded display corners). The main problem in the halfnut models is that the external power supply appears not to render enough power to the circuitry to shut off the low bat annunciator (BAT). Even a rise of up to 8V (I didn't dare more) was not able to toggle off the BAT signal, i.e. Flag 49 was still active. However, the halfnut performed well with exception of the CLOCK (resp. SHIFT ON) operation - which of course is a default behavior when the battery is low.

I do not know if this kind of solution has been suggested before and if I have "carried coals to Newcastle" (the German proverb I am familiar with would be "to carry owls to Athens"). I have used this form of external power supply for a couple of months now and I am very satisfied with it. I think that this may be generally a good solution for people who do not have a battery pack with rechargeables as it is a "minimal invasive" way to supply the HP41 with external power. The basic prerequisites are a free physical port, some basic tinkering and the exertion of blasphemy on an original HP41 module.

Re: HP41C "Power Module"

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 2 Jan 2012, 1:00 p.m.,*
in response to message #1 by Frido Bohn

Well done.
Not so different from Diego's solution: he uses an USB cable connected to an empty module, so you can attach it to any free port or to a wall adapter. I have to try if it gives the problems you mention when attached to an halfnut.

Greetings,
Massimo

Or to a small USB LI-Ion battery pack. There are several makes of battery packs that are charged using a standard usb cable. I have the Energizer one which came with a zipper case that holds all sorts of adapters. The battery is 2 A capacity. I also have a smaller 1.25 A battery by Duracell.

Re: HP41C "Power Module"

*Message #5 Posted by **gene wright** on 2 Jan 2012, 2:46 p.m.,*
in response to message #4 by Bill (Smithville, NJ)

Ok, so someone needs to get set up making some of these. People donate some cash and a memory module :-) and get a power hookup back.

Re: HP41C "Power Module"

*Message #6 Posted by **aj04062** on 2 Jan 2012, 10:37 p.m.,*
in response to message #5 by gene wright

Gene, you got me thinking.

I think we could make up a small PCB that would have contacts that connect to the 41 and include either a micro or standard USB connector on the other side. We could then make up a shell using rapid protyping plastic. That way you could utilize any off the shelf cables or wall warts.

...2 Ah, 1.25 Ah??

Re: HP41C "Power Module"

*Message #8 Posted by **Paul Berger (Canada)** on 2 Jan 2012, 10:24 p.m.,*
in response to message #1 by Frido Bohn

I did some poking around inside my half nut and it would seem that the battery voltage is being monitored differently. My best guess would be that in the half nuts the battery voltage is monitored at the battery terminal. With +5VDC connected to Vbat on the I/O port the "BAT" indicator does come on however all the other voltages inside are normal and the calculator seems to operate just fine. There are a number of steering diodes inside to protect the calculator from reverse voltage and also to isolate the battery terminals from Vbat on the I/O ports, because of these diodes when you apply 5VDC to the Vbat connection the voltage on the battery terminal is about 1V, however if you apply 5VDC directly to the battery terminals the calculator of course powers on and the "BAT" indicator does not come on.

Re: HP41C "Power Module"

*Message #9 Posted by **Ángel Martin** on 3 Jan 2012, 8:53 a.m.,*
in response to message #8 by Paul Berger (Canada)

I confirm your findings for halfnuts. I´m using one of Diego´s USB power modules and definitely the BAT annunciator comes on - even if the calculator seems to work well without batteries.

So yet one more reason to favor FullNuts over their half-board breed, can you spell CL??

Best, ÁM

Battery life of HP 15c LE?

*Message #1 Posted by **Brandon Poindexter** on 1 Jan 2012, 10:22 p.m.*

Does anyone know if the battery life of the new HP 15c LE is comparable to the battery life of the HP 12c+? I think they use basically the same package, just a slightly different exterior ? If so what has been the battery life of the HP 12c+? (Beside what is advertised in the manuals)

Reason being is that my 3 year old HP 35s is, for the 1st time giving me a low battery warning. I'd like to think that I have used the HP 35s quite heavily. And if the HP 15c LE (or HP 12c+ if they are the same internally) can give me around 3 years of use on one set of batteries, I personally would think that is a pretty darn good in this day and age.

Re: Battery life of HP 15c LE?

*Message #2 Posted by **Michael de Estrada** on 1 Jan 2012, 10:50 p.m.,*
in response to message #1 by Brandon Poindexter

Katie Wasserman and others have documented very high power consumption in the 15C LE, so it's very doubtful that you'll get near the battery life of a 35s. I've been using a 15c LE regularly for 4 months, and the batteries are not yet spent, but I don't run a lot of time consuming programs. One thing you don't want to do is hold buttons down for extended periods.

Edited: 1 Jan 2012, 10:51 p.m.

Re: Battery life of HP 15c LE?

*Message #3 Posted by **Katie Wasserman** on 1 Jan 2012, 10:52 p.m.,*
in response to message #2 by Michael de Estrada

You beat me to the pumch by 1 minute!

Re: Battery life of HP 15c LE?

*Message #4 Posted by **Katie Wasserman** on 1 Jan 2012, 10:51 p.m.,*
in response to message #1 by Brandon Poindexter

You're out of luck. The power consumption is way too high on the 15C LE with the current fir mare and the low battery warning doesn't work.

Here's a summary of the known problems. You'll find more details, if you want them, by searching this forum.

Re: Battery life of HP 15c LE?

*Message #5 Posted by **Brandon Poindexter** on 2 Jan 2012, 8:24 a.m.,*
in response to message #4 by Katie Wasserman

Hmmm, is there any reason why the HP 15c LE does this but not the HP 12c+?

Also i tried installing the old batteries from the HP 35s into my HP 15c LE. I got a "Pr error". Which is fine considering how low it might be (i didn't have any Programs on the 15c LE). But is the original HP 15c (or LE) designed with some sort of fail safe when the batteries are TOO low? Because I could not do anything. Pressing any key turns it off completely, and turning it on would just display "Pr error" again.

Edited: 2 Jan 2012, 8:28 a.m.

Re: Battery life of HP 15c LE?

*Message #6 Posted by **Katie Wasserman** on 2 Jan 2012, 11:29 a.m.,*
in response to message #5 by Brandon Poindexter

> Quote:
>
> Hmmm, is there any reason why the HP 15c LE does this but not the HP 12c+?

The keyboard scanning code in the 15C LE appears to not be the same as the code used in the 12C+, if it were the 20ma key-down current draw would not happen. Both the 12C+ and the 15C LE have poorly functioning low battery warning code as well as non-functioning brownout detection. Translation: it's incredibly easy to lose memory with low batteries, as you apparently have already discovered.

Re: Battery life of HP 15c LE?

*Message #7 Posted by **Lyuka** on 3 Jan 2012, 7:17 a.m.,*
in response to message #6 by Katie Wasserman

Hi Katie,

I confirmed the high current draw issue of the 15C LE on the recently arrived my 15C LE.
The measurement have been done using a current sense resistor and a digital oscilloscope, and found an interesting behavior at a key press.

Confirmation of the High power comsumption issue of the HP-15C LE.

Regards,
Lyuka

Edited: 3 Jan 2012, 7:20 a.m.

Re: Battery life of HP 15c LE?

*Message #8 Posted by **Marcus von Cube, Germany** on 3 Jan 2012, 7:55 a.m.,*
in response to message #7 by Lyuka

I'm a bit envious. ;-)

This is exactly the kind of measurements I'd like to see for WP 34S. Test cases would be off, on (idle), deep sleep, wake-up (after half a second of idling the calculator goes to deep sleep; a key stroke will wake it up), a simple operation (ENTER), demanding operation (LOG, program), and flash write (ON+STO). This would help to identify any bugs in my power saving scheme.

Another test would involve a gradual lowering of the supply voltage to test the brown out detection algorithm. With the battery symbol lit, the above tests should give different results because high speed is disabled (you can force this with the SLOW command).

Re: Battery life of HP 15c LE?

*Message #9 Posted by **Katie Wasserman** on 3 Jan 2012, 10:10 a.m.,*
in response to message #7 by Lyuka

Lyuka,

Nicely done!

I'm not sure which part of the waveform you are revering to as "interesting", the little dip right after the key is pressed? Also, is the 42ma current spike an artifact of the way you did made the measurements, perhaps switching power on?

-Katie

Edited: 3 Jan 2012, 10:10 a.m.

Re: Battery life of HP 15c LE?

*Message #10 Posted by **Lyuka** on 3 Jan 2012, 10:38 a.m.,*
in response to message #9 by Katie Wasserman

Katie,

> Quote:
>
> the little dip right after the key is pressed

It might be the debouncing process period of which typically 10 to 20ms are used.
By this measurement, 'current-saving' seems working well within that period,
and the high power consumption after that period must be avoided and it can easily be fixed.

The high current spike might cause memory error when the battery's internal resistance got high.

*Message #16 Posted by **Jeff O.** on 3 Jan 2012, 8:32 a.m.,*
in response to message #13 by Jim Yohe

All of the bugs or issues described in the 15c LE bug list article pertain only to the new 15c Limited Edition running firmware revision date 2011-04-15. However, after the 15c LE was released, an issue with the original was discovered, as described in this thread.

Re: Battery life of HP 15c LE?

*Message #17 Posted by **Peter Murphy (Livermore)** on 2 Jan 2012, 1:29 a.m.,*
in response to message #1 by Brandon Poindexter

This may be old news, and it does not directly address Poindexter's question, but it's an interesting data point. The Introduction to the original 15C Owner's Handbook has four bulleted items touting the calculator's features:

****

* 448 bytes of program memory (one or two bytes per instruction) and sophisticated programming capability,

including conditional and unconditional branching, subroutines, flags, and editing.

* Four advanced mathematics capabilities: complex number calculations, matrix calculations, solving for roots, and numerical integration.

* Direct and indirect storage in up to 67 registers.

* Long-life batteries.

****

The Introduction to the 15C LE Owner's Handbook repeats the first three items word for word (the new Handbook was intended to duplicate the original exactly, as far as I know), but it omits the last item. A reasonable conclusion is obvious.

in response to message #1 by Brandon Poindexter

I have been using my 15C LE since October and it is still on its original batteries. Usage is anywhere from 2 to 10 hours a week.

Re: Battery life of HP 15c LE?

*Message #19 Posted by **Marcus von Cube, Germany** on 2 Jan 2012, 5:47 p.m.,*
in response to message #18 by Eddie W. Shore

Power saving on this type of device (with the added complication of the supply by two coin cells) is more of an art than exact science. The WP 34S is essentially the same device with a slightly more demanding display. I've put considerable effort into the power saving.

There are several modes of operation with varying demands on the power source. From full speed (1) to half speed (2) to medium speed (3) to idle mode (4) to deep sleep (5) to backup (6).

I know that (1) is too demanding on the coin cells and thus disabled when the battery voltage falls below a certain threshold. (2) is tolerable but the time for some computations increases noticeably. (3) is fine for routine tasks like keyboard scan but not for any serious computations. (4) allows interrupts to be active because the kernel is running but the processor clock is stopped unless an interrupt occurs; all RAM is active in this mode; I keep the calculator in this state for some tenths of a second to allow house keeping(*) and very fast reaction to user input before switching to the next state. (5) shuts down much of the device but the display is still showing; this is the mode you will see most of the time when the calculator waits for user input; the keyboard is active in a special wake-up mode, restarting the processor; this costs a little in terms of processor cycles because all state in the 4KB working RAM is lost and has to be rebuilt. (6) is the state when the calculator is apparently off; only the 2KB backup RAM are kept alive.

Choosing the best of these mode for the varying requirements isn't easy...

(*) House keeping includes monitoring the battery voltage and scanning the keyboard.

Re: AAA batteries on WP34S - a fantasy

*Message #20 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Jan 2012, 7:30 p.m.,*
in response to message #19 by Marcus von Cube, Germany

Hi Marcus,

I wonder (with little hope) if there is a hardware pin (or pad, trace or whatever) that may be used to signal the power state of WP34S. Such signal may control an external power supply, leaving the CR-2032s just for RAM backup purposes when everything else is turned off. When the calculator is not sleeping, the external power supply should turn itself on, and supply the needed current without exhausting the CR2032s. Such power supply may be just a simple circuit powered by two AAA batteries, and located on a yet-to-be-created holder fixed to the back of the WP34S.

(A less-polished implementation may use just a couple of AAA batteries and steering diodes).

Re: AAA batteries on WP34S - a fantasy

*Message #21 Posted by **Marcus von Cube, Germany** on 3 Jan 2012, 7:42 a.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

Setting a pin to high when not idling is certainly possible. There are pads on the board which might be interfaced. What you would need to implement in hardware is something that disconnects the coin cells while the power supply is active.

You can run the calculator without any coin cells by feeding power through the serial connector or the jtag connector. Before you disconnect the power, just do an ON+STO backup to flash. The restore will be automatic with the next power on after a memory fail.

30b/34s AAAA batteries a reality

*Message #23 Posted by **Bart (UK)** on 3 Jan 2012, 1:03 p.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

I converted my HP-30b (repurposed to a WP-34s) to 2x AAAA-style cells taken from a 9V battery. Mounted behind the screen.

Hole cut in the casing to accomodate the 2 cells:

Just right to fit the cover back on and hold it all in place:

NOTE: These cells that I extracted from the 9V battery had THE OPPOSITE polarity to that expected.

Re: 30b/34s AAAA batteries a reality

in response to message #23 by Bart (UK)

I applaud your ingenuity!

It looks like you need to solder in replacement cells, I would think that this would be more inconvenient than keeping around a large bunch of spare 2032 cells.

Re: 30b/34s AAAA batteries a reality

*Message #25 Posted by **Bart (UK)** on 3 Jan 2012, 7:08 p.m.,*
in response to message #24 by Katie Wasserman

Well, for me that is not a problem, I am quite happy to solder. These cells are from a 9V battery (thanks to your mention of it :-) and come nicely tabbed together and can be separated into 3 pairs, so it's just a quick desolder and resolder. I can pop in a CR2032 to save the memory whilst doing so. Also I paid £7.00 for 10 Procell 9v, that's £0.12 (or ~USD 0.20) per cell. I don't think I can find CR2032 cells at that price (for a decent brand).

Anyway, it is also somewhat of a proof of concept. I think this shows that with some internal re-design and no increase in dimentions, these batteries can used.

I have just completed a write-up on this: Installing AAAA batteries on the HP-30b

Re: AAA batteries on WP34S - a fantasy

*Message #26 Posted by **uhmgawa** on 6 Jan 2012, 6:39 p.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

> Quote:
>
> (A less-polished implementation may use just a couple of AAA batteries and steering diodes).

There is benefit in simple, SoC independent switching as this is arguably the definitive point to assess actual current draw. Other considerations exist once the SoC is in the decision loop such as detecting the external power supply is actually present and supplying an in-tolerance voltage under the prospective load. You'd likely still want to draw from the internal coin cells if that was the only viable power source.

I'd start with an analog approach using an unadorned mosfet high-side switch in series with the coin cells, the gate of which can be driven off by the external supply when it is within usable tolerance.

Conserving current draw is of course part of a well thought out design. But I think a more complete approach is to plan for the eventuality of a brownout and assure all user context is captured in nonvolatile storage. The worst case inconvenience for a cell/battery giving up the ghost should be finding a replacement, but not recovering data.

Re: AAA batteries on WP34S - a fantasy

*Message #27 Posted by **Andrés C. Rodríguez (Argentina)** on 7 Jan 2012, 9:29 a.m.,*
in response to message #26 by uhmgawa

I assume SoC means "system on a chip", please confirm.

I think that the CR2032s should always be kept installed, so to maintain the non-volatile RAM contents. The steering-diodes (or, better, your switch, or the "ideal diodes" suggested in a previous post) should help avoiding the drainage of the coin cells while running programs.

If a small, switching power supply is to be used, it may be important to knnow the power status of the system, in order to turn off such power supply when appropriate (CR2032s will then supply the standby power). If plain AAA (or AAAA) cells are series connected without a switching power supply, there is a chance that, if their voltage drops below a certain level, the steering circuit will put them off-line, and the CR2032s will unexpectedly be at the front line again.

In any case, the "low battery" condition acquires many new meanings, and more analysis is due to avoid undetected situations which may end in data losses. And backing everything to flash all the time is limited by the maximum number of reliable write cycles available.

Please disregard any idiomatic mistake.

> And backing everything to flash all the time is limited by the maximum number of reliable write cycles available.

Twenty thousand writes to flash according to the manual. I don't think you can achieve this with manual writes to flash every time you are about to change batteries.

Re: AAA batteries on WP34S - a fantasy

*Message #29 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Jan 2012, 12:12 p.m.,*
in response to message #28 by Marcus von Cube, Germany

I intended to mean "saving data to flash frequently", because it may be not clear if the CR32s are about to die...

Yes.

> Quote:
>
> If a small, switching power supply is to be used, it may be important to knnow the power status of the system, in order to turn off such power supply when appropriate (CR2032s will then supply the standby power).

I wasn't envisioning a boot regulator in that picture. If headroom is needed above the coin cell 3V, another cell can be added in the external pack which also simplifies isolation of the two power sources. Alternatively if a boot regulator is used to create the headroom it could be enabled via sensing the load current.

> Quote:
>

As long as the external source is isolated, it is possible to sense its voltage and make the decision of whether it is suitable to power the load independent of the coin cell voltage. Some hysteresis or memory would be needed in the voltage sensing to prevent either oscillation or partial biasing of the switch. Eg: a partially exhausted external supply may be sensed at suitable voltage until connected to the load, after which it droops out of tolerance, after which it is disconnected and recovers back within tolerance, etc.. In that scenario the coin cells are left enabled until the external supply is serviced.

HP41 Card Reader repairs

*Message #1 Posted by **Steve Hunt** on 1 Jan 2012, 3:41 p.m.*

I just finished replacing the "gummy" wheels on my two card readers with pairs of 'O' rings. The 'worm gear' on one of them seemed loose on its motor shaft, so I used a tiny amount of 'super glue' to fix it as recommended in one article. After much tearing out of what little hair I have left, I was able to re-assemble them both OK.

Both now work reasonably well. The one which I didn't need to glue works silently; it gives occasional checksum errors, but I can live with it. The other one is quite noisy, often shows MALFUNCTION, sometimes shows CHECKSUM error, and about one time in 5 passes it works OK.

Since doing the repairs, and a bit late in the day, I've learned through old postings on this forum:

1) There is a clutch mechanism between the motor shaft and the gear; so perhaps gluing the two together was not a good idea

2) The wheel shaft is eccentric and can be adjusted using the screwdriver slot for optimum pressure on the card.

3) 'O' rings might not be the best replacement solution because they apply uneven pressure.

So now I don't know what to do:

Should I pull them apart again and swap the 'O' rings for something else? If so, what?

Do I need to separate the glued shaft and worm gear, and try to implement a replacement clutch assembly? If so with what?

How important is it to have the drive wheel position adjusted correctly? Is there a recommended way to do it.

Grateful for any advice from the group. I'm not keen to pull them apart again, but neither do I want premature wear or damage to cards.

Regards, Steve

Re: HP41 Card Reader repairs

*Message #2 Posted by **Randy** on 2 Jan 2012, 10:17 a.m.,*
in response to message #1 by Steve Hunt

> Quote:
>
> 1) There is a clutch mechanism between the motor shaft and the gear; so perhaps gluing the two together was not a good idea

Urban legend. HP called it a coupler, not a clutch. Attaching with glue is perfectly acceptable.

> Quote:

> 2) The wheel shaft is eccentric and can be adjusted using the screwdriver slot for optimum pressure on the card.

HP service procedure is to power the motor from a 3 volt dc source (motor leads disconnected from electronics) and adjust the eccentric for 180 +/- 20 ma current while holding a card in place under the drive roller. What you'll find with most o-rings is the current will be on the high side (200-250ma) and the easiest procedure is to simply position the small molded indicator dot on the eccentric to be opposite the motor, the screwdriver slot perpendicular to the card path.

> Quote:
>
> 3) 'O' rings might not be the best replacement solution because they apply uneven pressure.

Not true at all, they just might not last as long as a solid face roller. In practice, they are far better and easier for the one-off home repair as they provide a consistent OD, something that is most times difficult to obtain with silicone tubing. The typical usage failure with o-rings is the wrong size. Should be US size 005. When placed on the shaft the OD should be very close to 0.250 inches. Better to be a little undersized than over. I know one eBay seller had be providing rings that were too large, don't know if that is still the case. FWIW, seller Waterhosko's are correct.

Re: HP41 Card Reader repairs

*Message #3 Posted by **Steve Hunt** on 2 Jan 2012, 1:41 p.m.,*
in response to message #2 by Randy

Randy,

Thanks for that. I think, then, that I'll simply strip the slightly noisy one and try adjusting the eccentric.

Thanks again. Steve

Re: HP41 Card Reader repairs

*Message #4 Posted by **Randy** on 2 Jan 2012, 2:52 p.m.,*
in response to message #3 by Steve Hunt

If you tear it back down, remove the gear/o-ring assembly and check the motor current with the drive screw only. It should be less than 40-50ma. Any more than that means the lead screw is not attached on center or is not fully seated. Either of these would likely cause noisy operation.

OTH, if the eccentric is set with the dot to the motor side, the motor current is sky-high and this would be the cause.

Squealing is also caused by bearing noise. The very end of the worm screw shaft where it enters the plastic frame has a thrust bearing inside the plastic. A micro-drop of plastic safe oil on the end bearing of the shaft cures most noisy readers.

Science Project with HP41CX and Arduino?

*Message #1 Posted by **Fouad M. Kaadou** on 1 Jan 2012, 3:17 p.m.*

Hello,

I have a science fair coming up at school and was thinking of making an Arduino robot controlled by my HP41CX using the IR module on the 41CX.

Is it possible?

Thanks in advance,

Fouad

Re: Science Project with HP41CX and Arduino?

*Message #2 Posted by **BobVA** on 1 Jan 2012, 6:26 p.m.,*
in response to message #1 by Fouad M. Kaadou

Depends on what you want to do. The IR link is one-way only, so you can't get data back from the robot. But, it sounds like that you want to use the 41C as a handheld controller? That sounds workable, but you'll have to decide if it's worth the effort. There are several articles you should be able to google up on the format of the IR printer data stream. Here's a start.

You might need a dedicated Arduino on the robot for this - recovering the data from the IR stream can be a processor intensive task. The HP-41c side would be simple - just "print" the appropriate commands.

Regards, Bob

Re: Science Project with HP41CX and Arduino?

*Message #3 Posted by **Fouad M. Kaadou** on 2 Jan 2012, 4:46 a.m.,*
in response to message #2 by BobVA

Thanks Bob. Yes I want the calculator to be the controller.

I'll do the research and see if its worth it. What about HP-IL? could that be used for a 2 way communication?

Regards,

-Fouad

Re: Science Project with HP41CX and Arduino?

*Message #4 Posted by **John Robinson** on 2 Jan 2012, 4:53 a.m.,*
in response to message #3 by Fouad M. Kaadou

HP-IL will permit 2 way communication, perhaps you could use a PIL IO board, see : http://www.jeffcalc.hp41.eu/hpil/index.html

Cheers, John

Re: Science Project with HP41CX and Arduino?

*Message #5 Posted by **Garth Wilson** on 2 Jan 2012, 5:17 a.m.,*
in response to message #3 by Fouad M. Kaadou

HPIL is a highly intelligent interface method that allows dozens of devices to be connected at once. There are interface adapters from HPIL to IEEE-488, parallel, RS-232, and video (I have all of these) but they're not cheap or easy to find these days. The HP-41 can handle all of these at once, and more, but be forewarned that it is not a fast machine. The HP-71 ran HPIL about 30 times as fast as the 41 did (around 5,000 bytes per second versus 150), and can process the incoming and outgoing info much faster too.

The HP-50g is in production today and is much faster than either of these, and, although it does not have HPIL, does have a serial port which I believe can be controlled to do a lot with it, if you write your software and make your devices to add the intelligence you need to split out signals to various processes and so on. I've used the 41 and 71 to control a lot of instrumentation and take data. Although I have a 50g, I can't say I'm familiar with it, and I think going the 50g route would require a lot more custom programming (it's not for casual users); but if you haven't already made a big investment in time and equipment with the 41 or 71, I tend to think the 50g might be the better way for you to go, based on computing power as well as support. Perhaps others can comment on that note.

Re: Science Project with HP41CX and Arduino?

*Message #6 Posted by **yves** on 2 Jan 2012, 2:58 p.m.,*
in response to message #3 by Fouad M. Kaadou

Hello,

I can provide to the community a software library for interfacing HP-IL loop to Arduino.

(I originally wrote it when my girlfriend asked if that old funny calculator could do the coffee ? then I created what we may call a "*vintage coffee/lamp/radio wake up device, with room heat temperature control*"... ;)

This library handles signals provided by an HP82165A HP-IL GPIO Interface, allowing Ascii commands and responses between HP-IL controller and Arduino, Trigger signal handling for sensors measures, and Services requests for emergency...

I can also give you a basic program (sorry it's for HP71) to test Arduino protocol.

Due to number of pins needed by the GPIO interface (8 data lines, 6 hand shake lines, 2 hp-il signals plus ground), you'll need an Arduino Mega (and patience to connect the correct wires).

Yves.

Re: Science Project with HP41CX and Arduino?

*Message #7 Posted by **Fouad M. Kaadou** on 2 Jan 2012, 6:48 p.m.,*
in response to message #6 by yves

Hello Yves,

I would be very thankful if you could provide me with some of your programs. I think HP-IL is the way to go. If that fails I will rely on IR interfacing.

Thanks to all,

Fouad

Re: Science Project with HP41CX and Arduino?

in response to message #7 by Fouad M. Kaadou

Muche more technical details about interfaching HP-41 by HP-IL to external interface hardware for advanced control and measurement applications you find in my two books "HP-41 Input Output Board" and "IL2000 Interface System". Look under ebay Germany HP-41 - there you find this reference book...

Best regards - Christoph Klug

Re: Science Project with HP41CX and Arduino?

*Message #9 Posted by **Fouad M. Kaadou** on 3 Jan 2012, 4:37 p.m.,*
in response to message #8 by Christoph Klug

Hello Christoph,

Nice book I am inclined to purchase a copy. Does it directly discuss anything about arduino interfacing?

Re: Science Project with HP41CX and Arduino?

*Message #10 Posted by **yves** on 4 Jan 2012, 4:04 a.m.,*
in response to message #7 by Fouad M. Kaadou

Hello,

You'll find the Arduino library for HP82165A GPIO Interface here : Arduino library for HP82165A GPIO Interface

Enclose file HP71_Basic.txt is a sample basic program (for HP 71B) to dialog with Arduino.

Instructions : - Turn on HP82165A GPIO Interface and connect HP-IL Loop - Turn on Arduino and coonect SUB25 cable to HP82165A - For this sample, Arduino is connected to 3 leds, 1 relay and a dht11 humidity/temperature sensor - Run HP 71B basic program

Press key 1 to enter and send an Arduino Ascii command.

Commands recognized in HP71b.ino sample are : - "red" : turns a red led on - "yellow" : turns a yellow led on - "green" : turns a green led on - "blink" : blink all leds - "on" : turns all leds on - "off" : turns all leds off - "up1" : turns a 220 V relay on (Switch on a lamp) - "down1" : turns a 220 V relay off (Switch off a lamp) - "srq" : tell Arduino to perform a service request interrupt (you can also press MSRQ button on HP82165A)

Arduino replies "OK" when command is recognized and handled.You may notice that Arduino

also understand french commands, so that my children can also play...

- Press key 2 to send a trigger signal In this example, Arduino send back humidity and temperature from a DHT11 sensor

Press key 0 to exit

Merry new year

Hp 50g finance program

*Message #1 Posted by **peacecalc** on 1 Jan 2012, 10:22 a.m.*

Hello Hp 50g,

the hp 50g has a built-in modul for payments with constant periodical payments. This works fine.

My proggies here are calculating the cashflow and the internal rate of interest for a certain cashflow. The proggies are not tested with a lot of examples, but with some examples out of the 12c or 17bii manuals.

I like to explain the two proggies in a short way for input and output. Enjoy!

First: the CFLOW-Program:

%%HP: T(3)A(R)F(,);

\<< 100 / { } \-> Co L Z LE

\<< PUSH -3 SF -105 SF Co 1 L SIZE

FOR I L I GET OBJ\-> DROP Z 1 + SWAP NEG ^ 1 SWAP - Z / SWAP Z

1 + SWAP NEG 1 + ^ * * LE SWAP + 'LE' STO

NEXT LE + \GSLIST POP

\>>

\>>

INPUT:

STACK 3: payment "Co", mostly negativ.

STACK 2: a list with lists of three objects

STACK 1: interest rate for that cashflow

a example for the list: {{500 1 2}{400 3 5}{100 9 2}} I have to explain the objects for example: {400 3 5} First Value: Payment Second Value: Payed at the end of third period Third Value: The payment of 400 bucks for five periods (group of payment with constant value)

interest rate value as percent without percent: 10% -> 10 as Input

OUTPUT: netto present value (NPV).

Second program: IRR Program:

Very important! This program only works when the program CFLOW is in the same directory, too.

%%HP: T(3)A(R)F(,);

\<< 5, 10, \-> Co L XI XI1

\<< PUSH -3, SF -105, SF Co L XI CFLOW Co L XI1 CFLOW DUPDUP ABS

WHILE ,005 \>=

REPEAT 3, PICK - ROT SWAP / XI XI1 2, PICK - ROT * - XI1 'XI'

STO 'XI1' STO Co L XI1 CFLOW DUPDUP ABS

END 3, DROPN XI1 POP

\>>

\>>

INPUT:

STACK 2: payment "Co", mostly negativ.

STACK 1: a list with lists of three objects (explained above).

OUTPUT: the internal interest rate in percent without percent f. e.: 12,5 means 12,5 %

The IRR program works with the regula falsi method. There is a difference which can be zero in a division. The program is simple and has no error handling for this situation. May be the IRR value converges against the wrong value, that could be caused by wrong start values for the rate (here 5 and 10, the first two values in the beginning of the program). IRR terminates, when NPV is zero, that means less then 0,005 Cent.

Sincerely peacecalc

Alexander, even if this is genuine code in his clone, do you seriously consider it being bugfree? Or more reliable than the emulated 15C by HP?

Remember, there's currently no way to get the original 15C LE firmnware back into the machine!

Hier könnte sehr gut der Teufel mit dem Beelzebub ausgetrieben werden.

Re: HP 15C Clone

*Message #7 Posted by **Alexander Oestert** on 2 Jan 2012, 1:11 p.m.,*
in response to message #6 by Thomas Radtke

Once it were ported, I am sure there would be a good chance of a community effort to make it bug free or even enhance it a little! Both machines could profit from that.

*Message #8 Posted by **Thomas Radtke** on 2 Jan 2012, 1:40 p.m.,*
in response to message #7 by Alexander Oestert

Hopefully, the RoHS hardware of the machine survives until this community effort is ready to rock *rolling eyes*.

Re: HP 15C Clone

*Message #9 Posted by **Thomas Radtke** on 2 Jan 2012, 11:31 a.m.,*
in response to message #4 by robert rozee

From the 'features' tab on his site:

> Quote:
>
> based on the original microcode of the HP-15C

I guess he (will) license(d) the code from HP, so we're out of luck here.

Re: HP 15C Clone

*Message #10 Posted by **Vince (Italy)** on 2 Jan 2012, 12:21 p.m.,*
in response to message #9 by Thomas Radtke

The complete quotation is:

"based on the original microcode of the HP-15C doing the exact same thing and a little more ..."

So, it appears that the code is different. Besides, since it's downloadable from the site:

"initial 'vanilla' firmware: firmware_vanilla.hex"

it's unlikely to be licensed from HP

Thank you, Vince. I omitted the last part of the sentence not for the bad. "doing the exact same thing", in my eyes, means a plain copy. Obviously I'm wrong here since, as you've pointed out, there's the firmware available.

[WP34s] XROM routines

*Message #1 Posted by **fhub** on 1 Jan 2012, 7:54 a.m.*

I just saw this in the new SVN:

```
XLBL"MAX"
        STO L
        x< Y
                x[<->] Y
        DROP
        RTN
```

I guess this gives the MIN and not the MAX of X and Y.
(same for XLBL"MIN", it's also wrong)

Just wanted to mention it before we really get a new build which then again doesn't work correctly anymore. ;-)

Franz

Franz, great catch. I threw that code together late last night and hadn't tested it :-(Luckily, it wasn't being included.

The current development effort is to move a lot of the C functions into the XROM (keystroke) portion of ROM. This should reclaim a lot of space which we can then either provide to the user as additional library space or use to add new functions and capabilities.

We've done a lot of working making XROM quickly callable and expanding and modifying the relative addressing the assembler can generate. We're also currently working on providing double precision support so the converted routines can work without introducing any additional error in the results and in providing some utility routine entry/exit routines to greatly simplify stack and last X management.

Exciting times for the project but also a huge amount of effort will be required. So if anyone wants to volunteer to help code some of the mathematical routines, drop any of us a line. The only skill you need is being able to write mathematical FOCAL programs.

in response to message #5 by Paul Dale

Is it intended that since a few versions manually entering a RTN (or END) is now displaying "true"? (and RTN+1 shows "false")

Franz

Re: [WP34s] XROM routines

*Message #7 Posted by **Marcus von Cube, Germany** on 6 Jan 2012, 8:40 a.m.,*
in response to message #6 by fhub

A manual RTN should simply set the PC to the beginning of the program area in RAM and clear the return stack. There was a bug which prevented RTN to behave correctly in certain circumstances. I suppose that my fix did break the manual RTN function.

Edit: It was just a missing "else". Fixed now.

Re: [WP34s] XROM routines

*Message #8 Posted by **Paul Dale** on 6 Jan 2012, 7:18 p.m.,*
in response to message #6 by fhub

No, RTN and RTN+1 shouldn't display true or false. If they are it is a bug.

Conversely, the built in quadratic solver will now display true for real roots and false for complex -- a function of the rewrite using double precision mode and the new XROM prelude / epilogue -- these handle all the stack and last X management and allocate local registers, switch to an eight level stack

and change to double precision mode. Porting code to XROM is now a matter of putting xIN at the start and using xOUT instead of RTN.

Re: [WP34s] XROM routines

*Message #9 Posted by **Marcus von Cube, Germany** on 7 Jan 2012, 3:39 a.m.,*
in response to message #8 by Paul Dale

The manual RTN case is fixed. The quadratic solver should not display true/false when called manually. If it does I need to look at the reason why. A neat "C" in the display should suffice for the complex case.

(Edit: C is shown as intended, not true or false)

We have many unused special flags, namely X, Y, Z, T, L, I, J and K which might play a role here. A to D already have a meaning, C is the binary carry bit, but may be redefined here. This would make the 'skip next step on complex result' mechanism obsolete. Any suggestions?

BTW, there's still another thing that would interest me: execution time!

Have you made any tests on a real calc of the execution times of these new (now XROM) functions? I could imagine that there might be a quite big difference between running these functions as either builtin or XROM code (maybe comparable to interpreted or compiled BASIC programs in the beginning of the computer aera)!?
Certainly not if you just use such a function once (i.e. manually), but what if these XROM functions are called within a program loop?

Franz

Re: [WP34s] XROM routines

*Message #11 Posted by **Paul Dale** on 7 Jan 2012, 7:28 a.m.,*
in response to message #10 by fhub

No we've not looked at execution time. The 34S guide has always been correctness then functionality then speed. That won't change unless the speed becomes unmanageably slow.

The keystroke program interpreter is fairly efficient and floating point operations are very slow on this device -- some very much so (logarithms). Most of what I've converted so far is pretty esoteric or fairly trivial -- i.e. speed isn't a big issue.

I'm not planning on ever converting the core functions (trig, exponential, log, arithmetic, square root). I doubt I'll convert gamma and a few other more advanced functions. I'm thinking about doing the statistical distributions where a slight slow down will hardly be noticed and more of the easy functions.

There is only one of me and there is a lot to do :-(

> I just saw this in the new SVN:

Well, since a few SVN versions I even see lots of (still undocumented) new commands in the XROM routines and also in wp34s.op, for example:
xIN, xOUT, xMSET, xMCLR, CNVG?, SHFL, iRCL, sRCL, dRCL, BSRF, BSRB ...

Now I'm curious: are these commands only for creating XROM routines (i.e. to compile for the developer team), or do they also have any use for the end-user in writing programs for the WP34s?

In the second case it would be very helpful if we could get at least a minimum description of what these commands do and how to use them.

*Message #15 Posted by **Neil Hamilton (Ottawa)** on 9 Jan 2012, 7:16 a.m.,*
in response to message #14 by fhub

Those commands that are only eligible for XROM will show up with an "xrom" attribute in the wp34s.op file. These will behave as unrecognized instructions if attempted to be used via the assembler in the user area of the calculator (RAM or flash).

Since they are not available to the user, they will not appear in any catalogues in the calculator itself.

*Message #17 Posted by **Marcus von Cube, Germany** on 9 Jan 2012, 10:21 a.m.,*
in response to message #16 by fhub

Franz,

here you are:

CNVG? - A convergence test. Ask Pauli for details.

SHFL - A generic 4 level stack shuffler. The argument is bit encoded, so not really useful for casual programming.

BSRF/BSRB - Branch SubRoutine Forward/Backward: SKIP and BACK for subroutine calls.

iRCL/sRCL/dRCL - These are mine :-). They are "alien" RCL instructions which allow the access to data stored in the "wrong" format.

iRCL - takes an integer value stored in one of the integer modes and recalls it to X, properly converted.

sRCL - takes a single precision value in a register and recalls it to X, properly converted.

dRCL - takes a double precision value (register numbers match those for DBLON mode) and converts it to single precision or integer if required.

DBLON mode creates a double precision environment. The named registers are converted automatically. The necessary room is taken away from the high numbered registers. Register access is double precision, too. For example, STO 01 will access the space otherwise occupied by single precision registers 02 and 03.

xIN/xOUT are only available to XROM code. They create a private double precision stack and return stack (for RTN addresses and local registers and flags), not interfering with the user's data.

Well Marcus, as you described these functions they are indeed 'alien' and would probably better fit into 'Area 51' than into the WP34s. ;-)

As for BSRF/BSRB: I've no clue how they could differ from the usual BACK/SKIP? If they should return after going to a subroutine, then what's the difference to a simple XEQ ?

And I guess SHFL can arrange the stack in any order!? Well, with the 4 available stack exchange commands (x/y/z/t<->..) I don't really see any use for this exotic command.

In short words: now I know just as much as before. ;-)

Nevertheless thanks!

Re: [WP34s] XROM routines

*Message #19 Posted by **Marcus von Cube, Germany** on 9 Jan 2012, 11:21 a.m.,*
in response to message #18 by fhub

In XROM, the relative branches are very fast because there is no search, the offset is directly added to the current program address. XEQ and GTO need to search for the label which is less efficient. For user code, the advantage is smaller because the relative branches make a search in order to detect the long instructions (such as LBL'ABC') and count them only as a single step. For XROM, all the 'dirty work' is done by the assembler during compile.

The "alien" RCL instructions are interesting for those who regularly switch between modes and need access to data stored in another mode than the one they are currently working in. Maybe I'll add the corresponding STO instructions one day.

SHFL simplifies some operations for XROM commands (look at xrom/quadratic.wp34s).

For XROM, all the 'dirty work' is done by the assembler during compile.

So the command BSRF/BSRB nnn is equivalent to SKIP/BACK nnn, but returns to the following step at the next RTN!? Or in other words it works like a subroutine call XEQ (current linenumber +/- nnn), but with the advantage that you don't need a LBL for it and so the WP34s doesn't have to search for a LBL first!?

I hope I got it know ... ;-)

SHFL doesn't just allow rearrangements of the stack. It can also duplicate stack levels. So e.g. you can rearrange [X Y Z T] into [Z Y Y X] using a single instruction (not that I can think of a use for that particular operation).

I added it back again because I noticed that the quadratic solver had a series of three consecutive stack manipulations and wanted to streamline that. I've also wanted a DROPY instruction on quite a few occasions and SHFL gives you this too [X Y Z T] -> [X Z T T].

I've not gone back an reworked all the existing code to use this instruction yet but will eventually.

Better to look at the comment above the cmdconverged() function in xeq.c

The command allows you to check for the convergence of a series approximation. It permits a check for relative error, absolute error or complex distance against one of three threshold tolerances (or optionally, one of these three chosen base on the current mode settings).

It is proving to be quite a step saver in xrom, although the argument is a bit cryptic.

Thanks, this CNVG? is indeed quite well documented there (but of course hard to remember for practical use).

The SHFL parameter is still not clear to me, but it seems to use a 8-bit structure (2 bits for each register)!? What I've not found out yet is the order (XXYYZZTT ?) and which value means to put which register content into which destination.
I'll have to read xrom.wp34s and xeq.c a bit more carefully ...

Franz

Re: [WP34s] XROM routines

*Message #25 Posted by **Paul Dale** on 9 Jan 2012, 4:10 p.m.,*
in response to message #24 by fhub

Registers are numbered 0 for X through to 3 for T.

The argument is of the form (in binary):

```
ttzzyyxx
```

where tt is the register to be placed into T, zz for Z etc.

Thus my earlier example of [X Y Z T] into [Z Y Y X] would require this binary pattern as the argument:

```
00 01 01 10
```

I.e. SHFL 022

And DROP Y is SHFL 248.

In the xrom.wp34s file, a number of macros are defined to make accessing these commands easier from xrom. Not useful for user programs though, but they do indicate what goes where.

- Pauli

Re: [WP34s] XROM routines

*Message #26 Posted by **fhub** on 9 Jan 2012, 4:28 p.m.,*

Ahhh thanks, now everything is clear - again a very powerful command!

It's a pity that 2 bits can only hold 4 numbers, otherwise you could have included the value 0 for putting into any register (something like CLy or CLz).

BTW, this CNVG? would have been very useful in my polynomial rootsolver.

> Don't you mean "will be" :-)

Well, I've already thought about rewriting my PRS program (and even made a few subroutines for the new version), but it would be much work and I'm not sure if it would still fit into about 500 steps.

The problem is that I've written it in the old V2 style and used the top registers R80-99 for the main variables (like the old statistic functions). Moving down these registers to R00-19 isn't a problem, but moving up the polynomial coefficients 20 registers makes many commands (or better their parameters) much more complicated and would need some additional steps for these commands (like R-COPY/SWAP, loops etc.).

It would be great if there would be a mechanism in WP34s to define somewhere a special register, and this value should be automatically used as an offset to all other (or only to specified) register calls. Or something like defining a second register set Sxx starting with a special register number Rnn, but being addressed as S00.

Maybe I could solve my problem also with local registers (but 16 are not enough, would require using also A-D), but so far I'm not familiar with this 'local' stuff.

Franz

Edited: 9 Jan 2012, 5:07 p.m.

Re: [WP34s] XROM routines

*Message #29 Posted by **Paul Dale** on 9 Jan 2012, 5:14 p.m.,*
in response to message #28 by fhub

It does sound like local registers are what you require here. Put a "LocR 16" at the start of the solver and then freely use registers .00 - .15 plus A - D throughout.

Leave the polynomial coefficients and order in exactly the same place they are now (i.e. registers 00 - 79) and there will be no conflict. You'd even gain another 20 registers for coefficients if the program was run from flash :-)

- Pauli

Re: [WP34s] XROM routines

*Message #30 Posted by **Marcus von Cube, Germany** on 9 Jan 2012, 5:24 p.m.,*
in response to message #29 by Paul Dale

Local registers are best suited to non interactive routines. As soon as you do an XEQ (or use a hot key) from the keyboard, the return stack is initialized and the local registers are gone. R/S is fine, though. So you should keep all data entered by the user in global registers and use locals for all the intermediate stuff which is used during the computation.

Re: [WP34s] XROM routines

Yep, that's exactly another problem I already found when I thought about a new version - just forgot about it at the moment. :-(

There's in fact a problem because the PRS program uses XEQ 11/12/13 to edit/recalculate or display the solution again, and then

the local regs are removed - damned, it's all not so easy ...

Re: [WP34s] XROM routines

Yes, that's what I was thinking about. And "LocR 16" does not reduce the user RAM (i.e. the registers R00-99) like loading a bigger program does?

I could even use this LocR twice, first in the main program and then again in the Laguerre subroutine, because they only share some of my 20 registers, so I could avoid using A-D.

Ok, let's see if I still have enough energy to rewrite my program, because I've already worked almost one month on it (reading certainly more than 30 articles and studying programs about efficient polynomial root solving methods, especially for multiple roots).

User RAM is divided in roughly 3 areas: Program/local data, global registers, and state.

You can shift the boundary between program/local data and the registers by executing a REGS command. If you have a long program in RAM and all global regs allocated then there will not be much headroom for local registers. For testing your program you should do a REGS 49 or something alike. When everything works, copy the program to the backup area or to the library and clear the RAM program to make room for more local registers. REGS can then be reset to 99.

They should have put a bit more logic in their clock, then it would be good for 100+ years.

I used to work at the National Radio Astronomy Observatory in W.Va., where there was a one second tick sent to all the telescopes from a master clock in the lab building. At each 'scope, there was the "NRAO Universal Clock" which

counted up the ticks and displayed the time (and made it available to the data computers to time tag data). The logic therein had leap years accounted for, but not the 100/400 year option.

The handbook for the clock, designed in the 60s or 70s, therefore stated (slightly tongue-in-cheek) that "the NRAO Universal Clock will display the correct date until March 1, 2100, at which point the operator will have to go over to the clock and manually advance the date by one."

One of the most optimistic things I've ever seen in print!

HP35S solve problem

*Message #1 Posted by **Alessandro Castellani (Italy)** on 31 Dec 2011, 9:35 a.m.*

```
I'm new in this forum and I have a problem on my 35S:
when I try to solve for the expression x^2-4 I always find only the
 positive root (2) even if I give it two initial estimates like -3
 and -1 very close to the negative root (-2).
This happens only trying to solve the expression directly from the
EQN list, if I define the expression  in a program and I solve it
 giving the same initial estimates, solve result is fine.

This is my operation sequence in RPN mode:
I insert the expression in the EQN list:
[EQN] X^2-4 [ENTER] [C]
I store in the X variable the first estimate (-3)
3[+/-][STO][X][ENTER]
I store in the X register the second estimate (-1)
1[+/-][ENTER]
from EQN list I recall the expression and I solve it for the variable X:
 result is always 2

Could anyone explain me where I wrong ?

Thanks in advance and my best wishes for an happy 2012 to everybody.
```

*Message #2 Posted by **Dieter** on 31 Dec 2011, 10:51 a.m.,*
in response to message #1 by Alessandro Castellani (Italy)

Alessandro, there's nothing wrong with your 35s. You just discovered a feature that is often overlooked: the 35s can solve equations symbolically. It does so if the variable appears only once in the equation.

This also happens in your case. Here, the equation

```
X^2 - 4
```

or

```
X^2 - 4 = 0
```

is automatically transformed to

```
X = SQRT(4)
```

This exact solution is then evaluated by the 35s, using its regular functions. So the square root always returns a positive result.

This also means that - in such a case - the two initial guesses do not matter at all, they are completely ignored.

If you want the usual numerical solution by successive iteration, simply change the equation a bit so that the variable appears twice:

```
X*X - 4
```

or

```
X^2 - 4 = 0*X
```

All this has been discussed before. For more information and further details, please take a look at this thread.

Dieter

in response to message #4 by Paul Dale

Without using the multiple variable trick in the equation it went for about 40 seconds and I canceled it.

Using the equation X!=6+0*X

It returned 3.000 (my setting Fix 3) after about 10 seconds.

Re: HP35S solve problem

*Message #6 Posted by **Dieter** on 2 Jan 2012, 3:06 p.m.,*
in response to message #4 by Paul Dale

Well, there are some restrictions so that not *all* cases with a single appearance of the variable are solved symbolically. For instance, consider periodic functions like sin or cos. An equation like

```
SIN(X) = 0,5
```

will not be solved directly since there is an infinite number of solutions (30, 150, 390, 510, ... degrees). So the 35s will not simply set x = arcsin(0,5) and return 30 degrees.

The case you mentioned

```
X! = 6
```

cannot be solved directly since there is no inverse factorial or inverse Gamma function on the 35s. So the usual iterative approach is applied here. I tried various initial guesses between 0 and 20 - the 35s always came up with the correct result x = 3, usually within 4 - 10 seconds. No tweaking (...+0*X) was required.

Dieter

Repurposing the HP20b in an engineering class

*Message #1 Posted by **Peter Murphy (Livermore)** on 31 Dec 2011, 1:45 a.m.*

Some specifics from the professor's web site:

****

Columbia University

ENGI E1112

Gateway Lab for Computer Science and Computer Engineering

Fall 2011

Overview

In this project, you will write new firmware for an HP 20b calculator. This is an example of embedded programming: coding software for something that does not, and should not, appear to be a computer in the traditional sense, yet is one at its core. The plummeting cost of integrated circuits has made such embedded systems ubiquitous, and this trend promises to continue. The challenges of designing such systems run the gamut from traditional electrical issues such as sensor noise and power consumption all the way to high-level computer science problems such as efficient algorithm design to human factors engineering. You will experience all of these, and learn some standard solutions, while performing this project.

1: Getting Started: Hello World

2: Listening to the Keyboard

3: Entering and displaying numbers

4: An RPN Calculator

****

Seven teams of students completed written reports and presentations. Links to those 14 items, to the professor's instructions for parts 1, 2, and 3, and to other pertinent stuff are all at the URL below.

All this might hold interest for the WP34 crowd here.

The URL:

OT but interesting; a new calendar proposal

*Message #1 Posted by **Don Shepherd** on 30 Dec 2011, 5:22 p.m.*

This article describes a proposal for a new calendar in which a given date would fall on the same day, forever!

Get ready to change all the days-between-dates algorithms.

Re: OT but interesting; a new calendar proposal

*Message #2 Posted by **Paul Dale** on 30 Dec 2011, 5:26 p.m.,*
in response to message #1 by Don Shepherd

Didn't the French try something like this around 1800?

I'm guessing the probability of this calendar being generally accepted is pretty much zero.

Still, it is a neat idea.

- Pauli

Here is an interesting page that includes a FORTRAN subroutine to determine which years get the extra week

to keep in synch with the sun. FORTRAN forever!!

Re: OT but interesting; a new calendar proposal

*Message #6 Posted by **Jeff O.** on 1 Jan 2012, 1:01 p.m.,*
in response to message #1 by Don Shepherd

I'm not sure that I see a real need here, although the concept is interesting. If Pope Gregory's monks had come up with it, it might have stood a chance. But I think their goal was to fix the Julian calanedar with as little impact as possible, other than skipping 10 days in October 1582. I always thought that a more sensible arrangement of the number of days in the months would have been as follows:

```
January - 30 days
February - 31 days
March - 30 days
April - 31 days
May - 30 days
June - 31 days
July - 30 days
August - 31 days
September - 30 days
October - 31 days
November - 30 days
December - 30 days in common years
December - 31 days in leap years
```

So in leap years, just add an extra day at the end of the year. Rules for leap years would be the same as the 97/400 Gregorian calendar. Of course the above has no real practical advantage over the curent system (of which I can think) but at least does not seem so random with regard to the numbers of days in the months.

Re: OT but interesting; a new calendar proposal

*Message #7 Posted by **Don Shepherd** on 1 Jan 2012, 1:35 p.m.,*
in response to message #6 by Jeff O.

Thanks Jeff. I agree, it is an interesting concept, but it seems to be a solution in search of a problem. I don't know of any business or indvidual that has a problem with the current system; a given date falls on a different day each year. So what. It's been that way for as long as I can remember. Even folks born on February 29 are able to celebrate their birthday each year. Heck, I wish I had been born on Feb. 29; then maybe I'd be 30 instead of 61!

I do see huge problems with adding another week at the end of the year every 5 or 6 years. Parents of school-age kids currently struggle to take care of their kids during the typical 2-week school vacation; how could they accomodate 3 weeks? And I would think that extra week would cause businesses lots of troubles.

The author also proposes everyone on earth use the same time (Greenwich time, UTC, or whatever it's called these days). I've often thought that that might have advantages, we'd just have to get used to "9 to 5" being a variable. Even if we didn't have time zones, localities would still want people working and going to school during the daylight hours, so the actual hours of work would vary based on geography.

in response to message #7 by Don Shepherd

> Quote:
>
> The author also proposes everyone on earth use the same time (Greenwich time, UTC, or

whatever it's called these days).

I've had a similar (even less likley to be adopted by anybody!) idea, but (as an astronomer) suggest that we all use Greenwich Sidereal Time (GST in astronomy parlance), which is the time kept by the stars.

Everybody could still have a "9 to 5" job (or whatever other hours you choose), but those hours would rotate throughout the year with respect to day and night. At times, you would go to work in the daytime, 6 months later you would go to work in the dark - so nobody would have a permanent "night shift"! Also, your day would be 3m 57s shorter, and you would gain an extra day each year, which should be a holiday!

For an even more radical alternative view, check out the Jan 1, 2012 Foxtrot cartoon.

Re: OT but interesting; a new calendar proposal

*Message #9 Posted by **Jeff O.** on 2 Jan 2012, 4:45 p.m.,*
in response to message #7 by Don Shepherd

Quote:

...it seems to be a solution in search of a problem. I don't know of any business or indvidual that has a problem with the current system; a given date falls on a different day each year. So what.

I agree completely.

But another thought did occur to me. Following their own logic, I think Hanke and Henry did not go far enough. With their system, the days of the months will still wander about the days of the week. Why not propose thirteen 28 day months? That way each date of each month will fall on the same day of the week as in every other month. They would still need to add their extra week every 6 or 7 years. In that case just make the 13 month 35 days long. Or call it the fourteenth month. Seems like this would further simplify figuring out the days between dates. Perhaps they considered it and worried that the triskaidekaphobes would protest too much.

In any case, I think I have probably devoted enough thought to these concepts. But thanks for bringing it up.

in response to message #12 by BruceH

> Quote:
>
> slow the Earth's orbit

Not exactly slowing the Earth's orbit around the Sun, but didn't Superman, in one of those movies, race around the Earth in a westward direction in order to get the Earth to reverse the direction of its rotation, so that he could "turn back time" and rescue someone who had died?

An idea that has always intrigued me (thanks to Carl Sagan I think) is that, if we could travel faster than the speed of light, we could race away from the Earth and, with a powerful enough telescope, see ourselves being born. But the physicists have always told us that nothing can travel faster than the speed of light. I believe that recently someone found something that could....

Dave Ramsey et al with early HP 41C conversions to CL

*Message #1 Posted by **geoff quickfall** on 30 Dec 2011, 3:16 p.m.*

I thought I would start a separate thread for this as a few people have converted the old hex nut version 41C's to the CL.

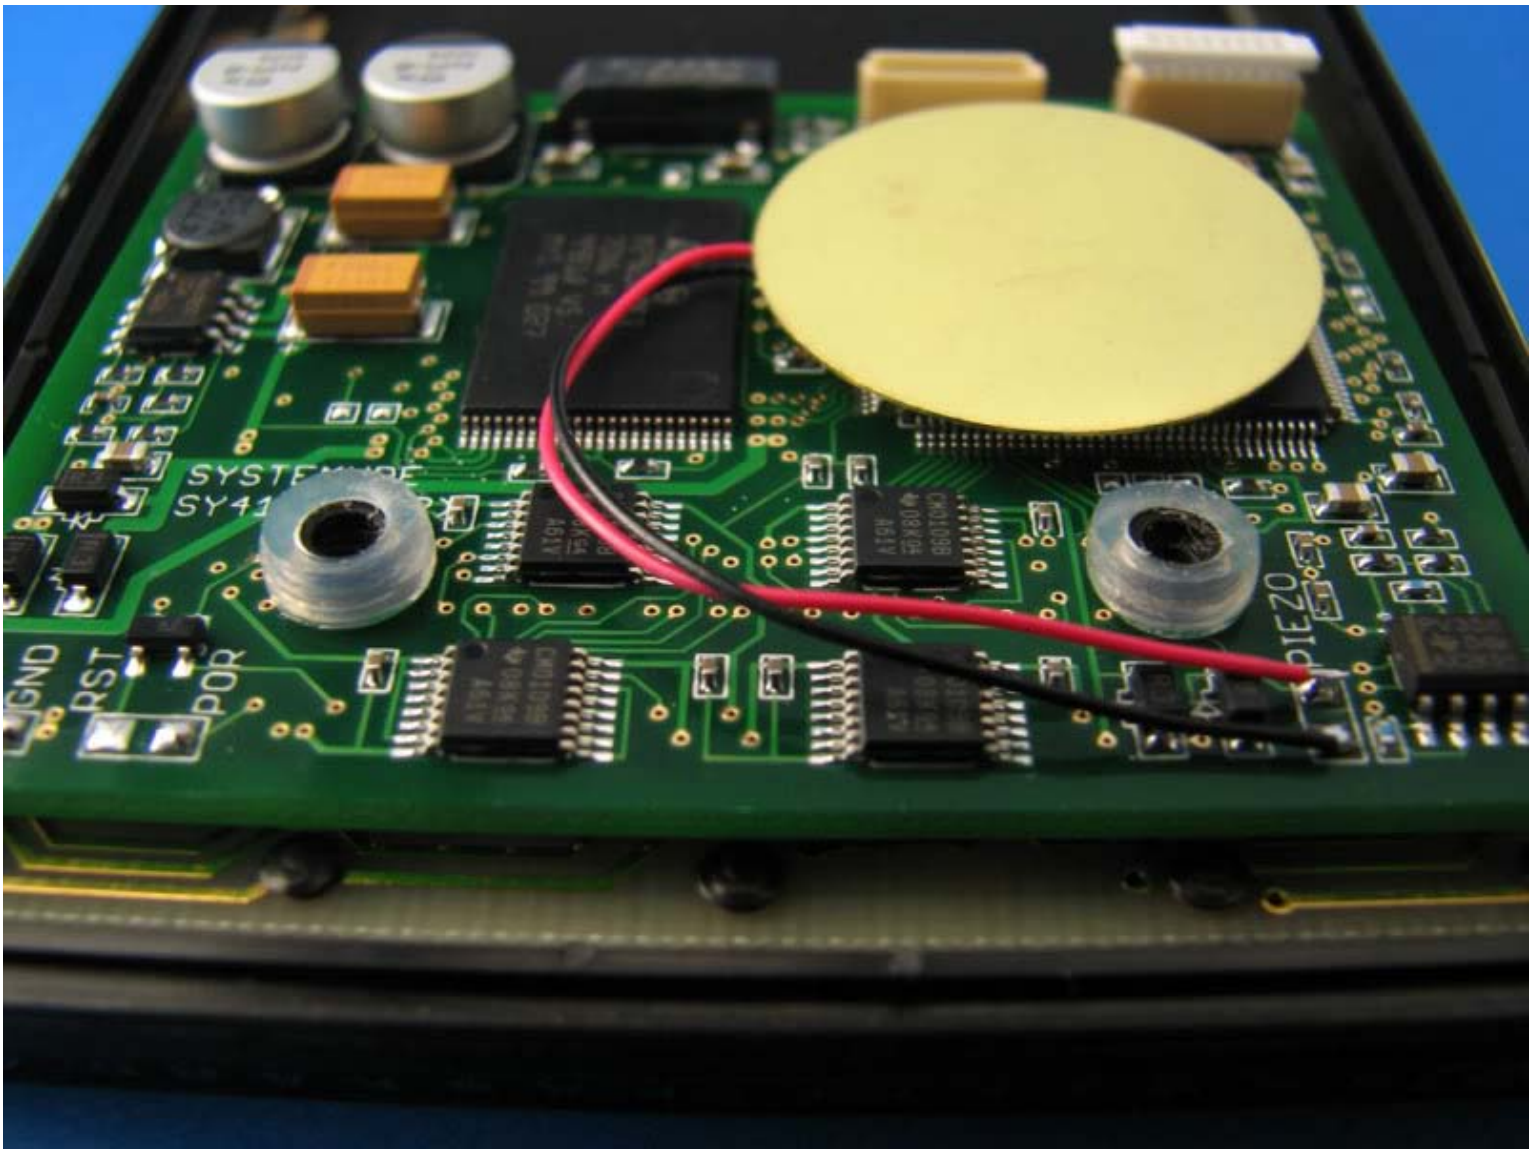
The hex nuts were not meant to be removed and replaced more then a few times at best. Maybe it just my clumsy fingers but read on!

The hex nuts indicate an early 41C. Trouble sometimes is the posts are not threaded initially and reinstalling them can result in a cross threading leading to a stripped and thinner post.

You are correct (from Daves posting below) as the back shell is different from later versions due to the hex nut installation. HP actually, on repairs, removed the hex nuts and replaced them with plastic spacers. These were slightly thicker then the height of the posts protruding from the logic pca. This resulted in the rear shell pressing the board onto the strips as opposed to the hex nuts doing the pressing.

A simple replacement for the hex nuts would involve similar spacers or silicon tubing cut to a slightly higher height then the protruding portion of the screw posts. This would have the same affect of the rear shell compressing the pca into the zebra strips.

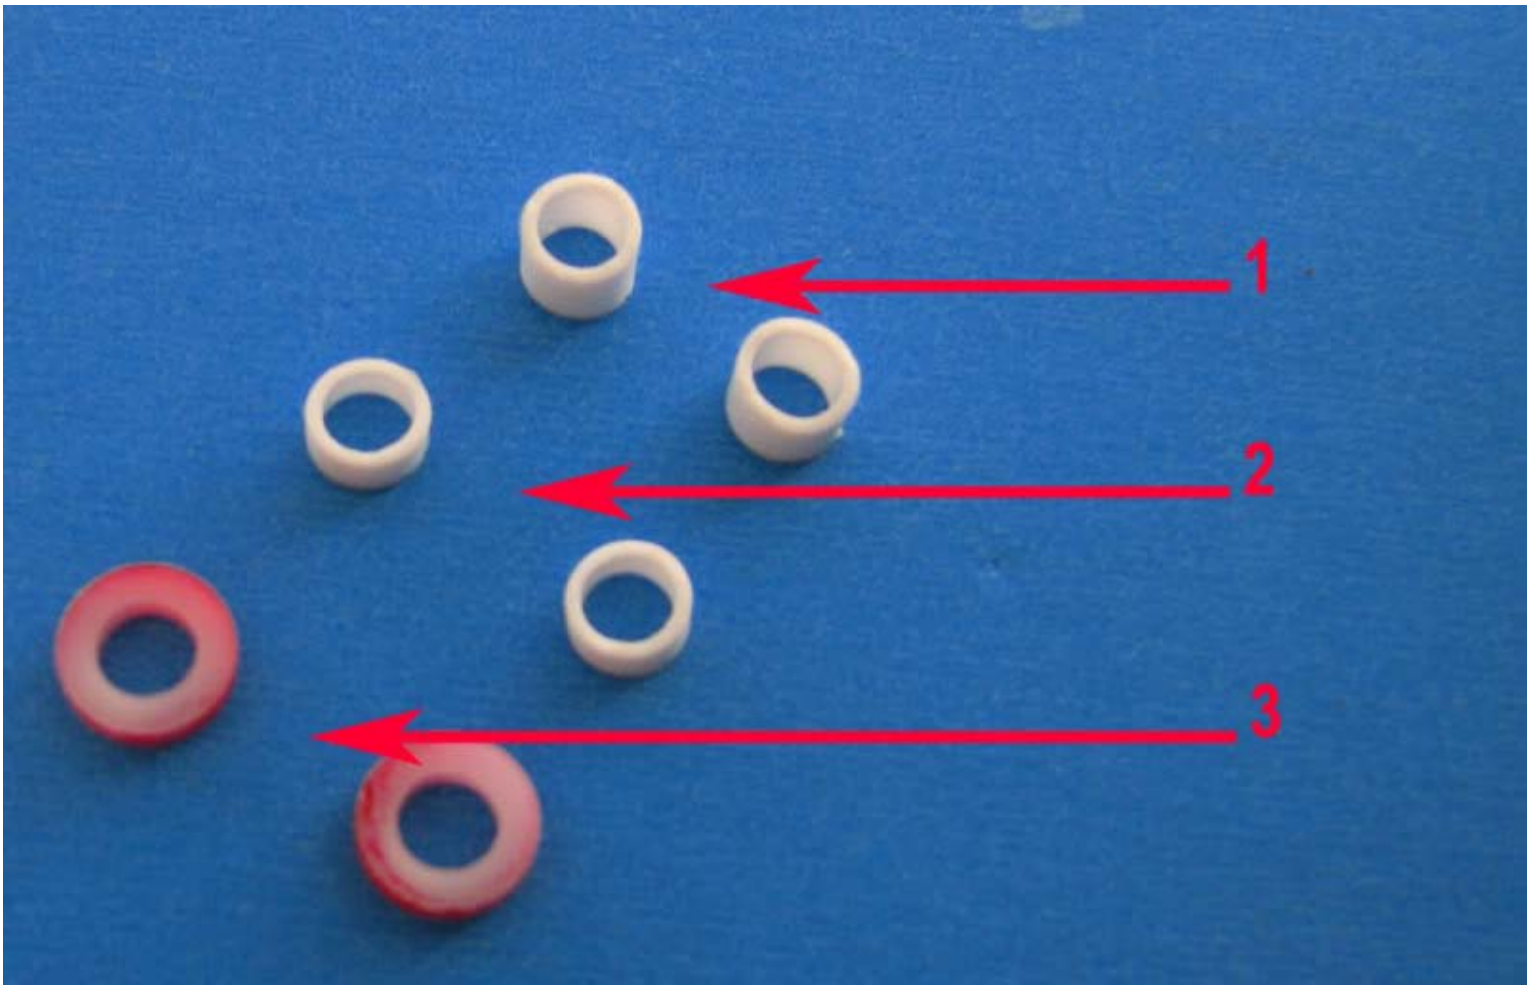
Silicon tubing replacements for stripped hex nuts:



Spacers precut; #1, #2

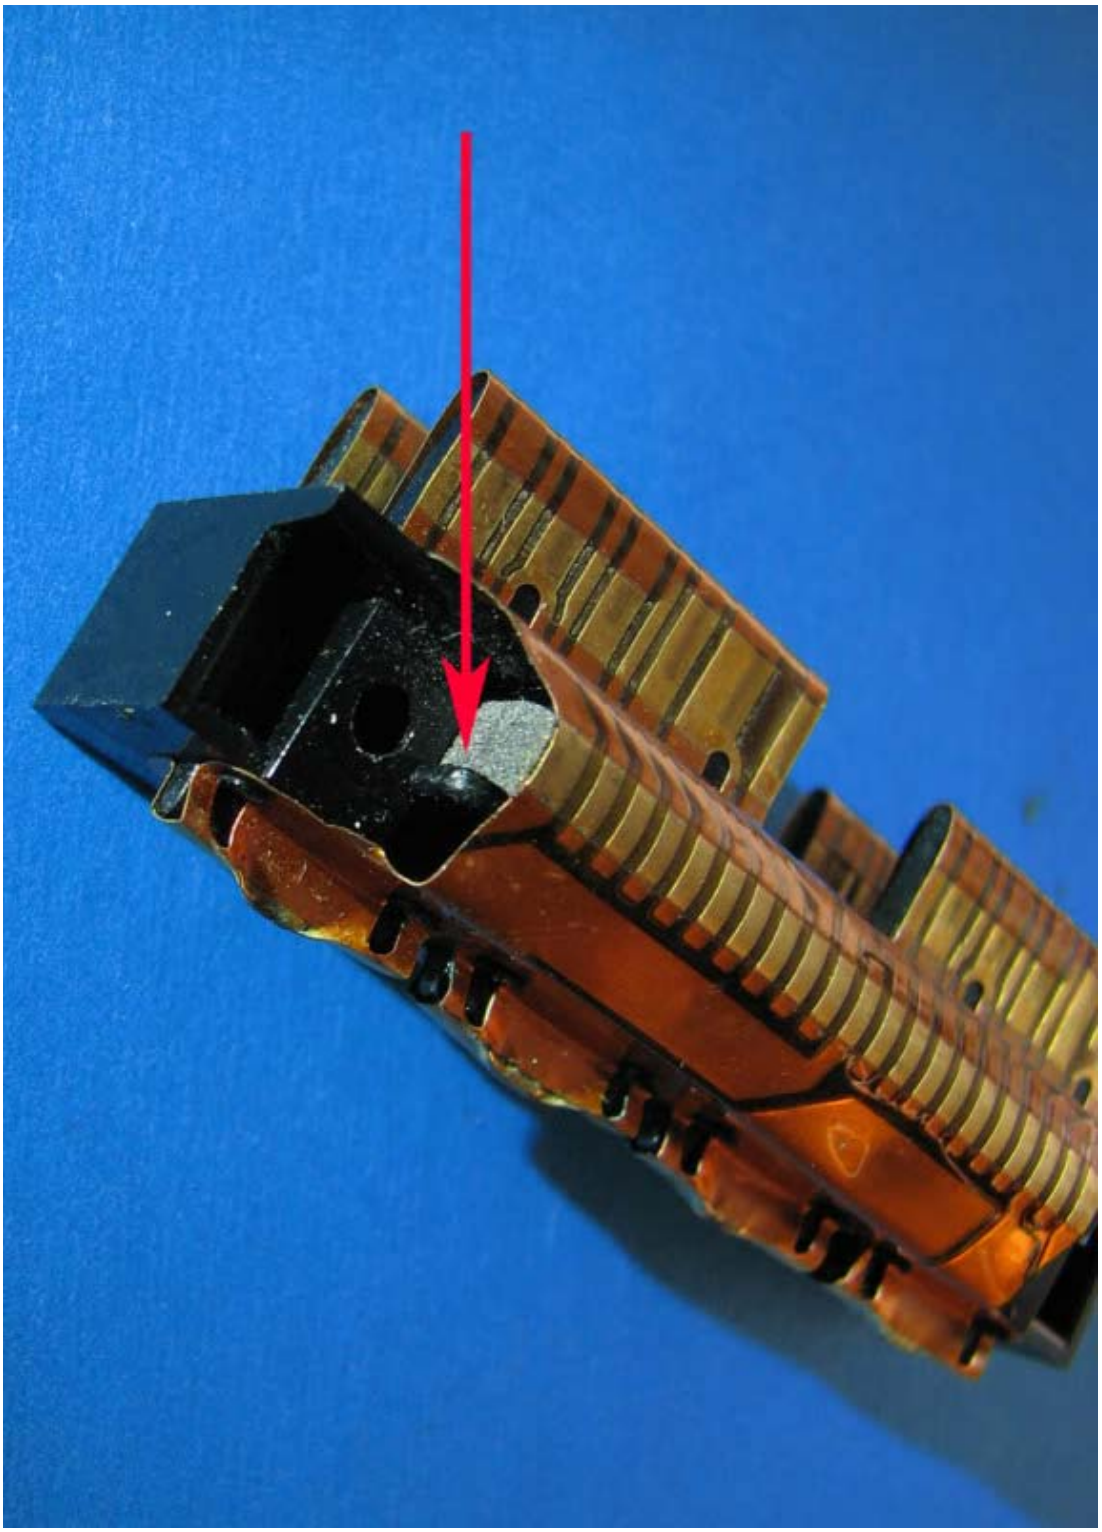
```
#1 top post reinforcements cut to length (flush with top of screw posts.

#2 bottom spacers/reinforcements cut to a silly millimeter more then flush.
#3 original HP spacers, which do not compress the screw posts, hence no reinforcement ability.
```



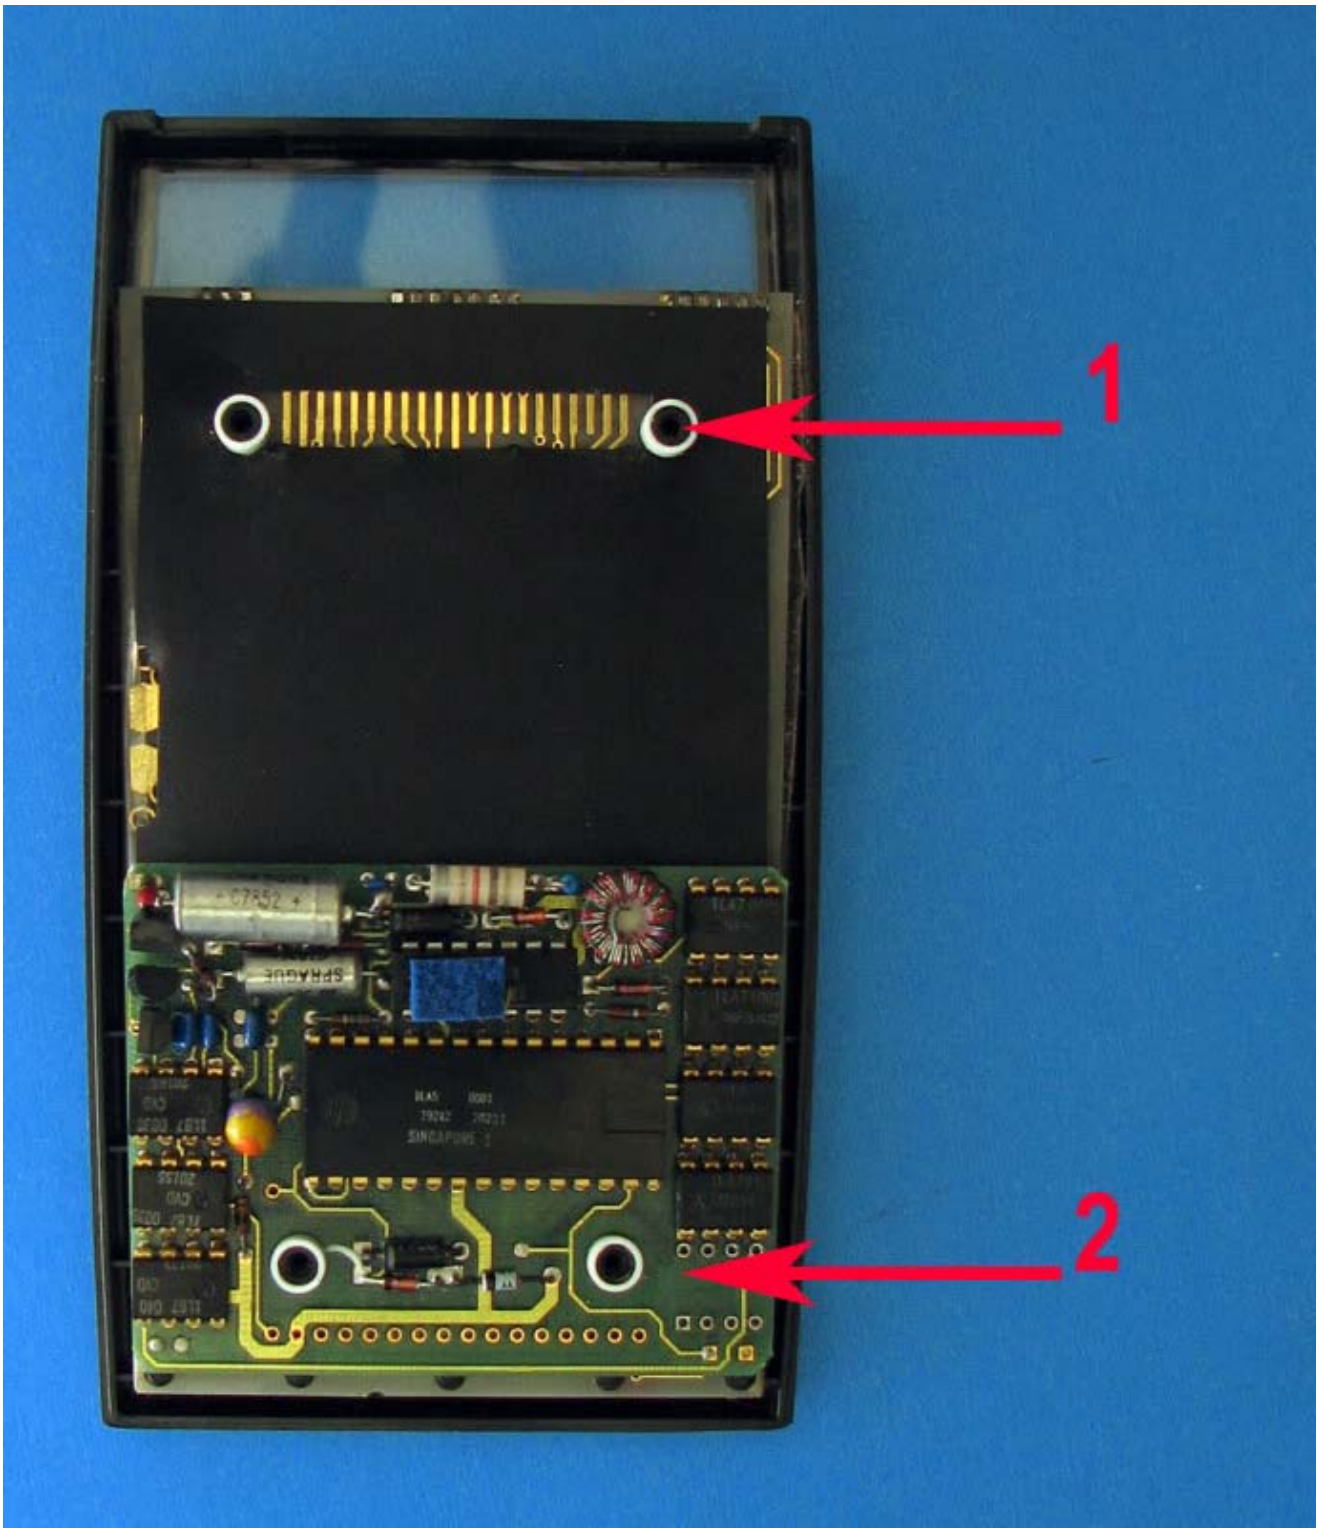
One can also purchase styrene tubing for the top posts but this requires shaving the very tips of the battery/module block. You probably remember this from the HCC2011 presentation and the youtube copy.

Shaving a tiny portion of the indicated vertical plastic from both sides of the battery/module block:



Module in place showing the new reinforcements and indicating the area of the battery/module block that needs shaving (immediately adjacent to the reinforcements on the screw posts (white):

The logic PCA plus spacers and upper post reinforcements in place:



The tubing is 7/32” or 5.5mm and also comes in brass (overkill?).

As Monte states, the posts and contacts must be good, or, as I found out during a flash write, BOOOM, no more CL. Fortunately Monte re-flashed the machine successfully. But as a simple google of "flash drives power interupts during write" this can be fatal to the drive.

So insure good connections. Non stripped posts, internally as well as the external hex nuts. Good elastomer (as Angel states below, how does one tell?) or wire wrapped zebras, clean pca and battery/module block contacts.

Cheers, Geoff

Edited: 30 Dec 2011, 3:40 p.m. after one or more responses were posted

>
> Good elastomer or wire wrapped zebras, clean pca and battery/module block contact

In your last sentence you imply that there are ¨good¨ elastomer stripes - how can we tell them from the ¨bad¨ ones??

Best, ÁM

Re: Dave Ramsey et al with early HP 41C conversions to CL

*Message #3 Posted by **Geoff Quickfall** on 30 Dec 2011, 3:40 p.m.,*
in response to message #2 by Ángel Martin

Well, that is a good question? Other then obvious defects I can only state that a working elastomer on a CL in normal operations would be and indication of a good elastomer.

Of course that does not involve the increased load on the elastomer during a flash write operation. But then, how does one now if the wire wrapped connector is any better in each individual case.

For me, the elastomer connector would, when placed in its brackets, be proud, that is extend above the retaining bracket to ensure a positive contact.

I guess a caveat on the elastomer statement is required.

Cheers, Angel!

Re: Dave Ramsey et al with early HP 41C conversions to CL

*Message #4 Posted by **David Ramsey** on 30 Dec 2011, 5:13 p.m.,*
in response to message #1 by geoff quickfall

I also saw one machine (my original dead 41) with the plastic spacers. The nuts are a way better solution: the only way to improve them would, of course, be to have the posts they screw onto made of metal, or at least pre-threaded.

I was very careful putting the nuts back on. HP appears to have used some sort of mild thread lock compound originally. None of my nut drivers would fit so I started the nuts with my fingers (one of them took quite a while to get lined up right) and tightened them with-- take a deep breath-- needle nose pliers!

But it all works. Just wish I had a suitable calc with a better keyboard. My Blanknuts were the only other candidates I had and I didn't want to potentially screw them up...

WP34S V3: Question about wp34s_asm.exe

*Message #1 Posted by **Miguel Toro** on 30 Dec 2011, 7:13 a.m.*

Hi,

Excuse if this is a stupid question but I see that the Perl version of the assembler is at revision 2093 and the exe version is at just 1698, instead (updated two months ago). Could I still use wp34s_asm.exe to assemble for version 3.0?

Thanks,

Miguel

Re: WP34S V3: Question about wp34s_asm.exe

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 30 Dec 2011, 7:38 a.m.,*
in response to message #1 by Miguel Toro

Hi Miguel,

Sorry, but the EXE is VERY out of date at the moment. And it is not a silly question at all.

There are some significant changes happening to the calculator binary images that would mean that 1698 will not build correct translations for the RAM/state file. I am trying to get those format changes resolved this week.

1698 *might* have a chance of building a flash image for V3, though the size limits will be quite constrained (V3 has a single consolidated flash image now instead of many smaller 'pages').

There are many new checks that 1698 will not undertake. For example, it will not force the image to have an END statement if you have forgotten to include one -- something the latest calculator needs.

I will try and get an EXE built soon.

(Here is my flimsy excuse:) I have to do the EXE compilation on a special, stripped down Windows machine (I develop the Perl on Ubuntu) which I have to get out and setup every time (including plugging in a special hard disk!). I have to admit to a certain laziness at doing this (and I have to find room on the dining room table).

However, the Perl is always up to date. Is there a chance of you installing one of the many Perl packages available -- at least for the short term? The documentation mentions and gives coordinates for several distributions.

(I had not been aware of anybody actually using the EXE versions... I never hear feedback about them. :-)

Best regards...

Re: WP34S V3: Question about wp34s_asm.exe

*Message #3 Posted by **Miguel Toro** on 30 Dec 2011, 7:55 a.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

Hi Neil,

I always used the exe versions that always did a good job, so I am one of its fans! if not the only one perhaps :-) So please, do not forget us, poor and lazy people not wanting to deal with Perl.

Thank you for your excellent work and regards,

Miguel

Re: WP34S V3: Question about wp34s_asm.exe

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 1 Jan 2012, 6:01 p.m.,*
in response to message #3 by Miguel Toro

Hi Miguel,

Happy New Year!

I have put the latest versions of both tools (ASM and PP) up on the SVN server.

Since I have been discussing this with Franz I might as well give some wider comment: There is also a newer tool called LIB (wp34s_lib.exe) designed for the V3 calculator (only!). This one is still pretty rough but its intention is to allow the user to add new programs to a library, remove existing programs, or replace programs of the same name. It works with both the flash (wp34s-lib.dat) and the brand new state-file (wp34s.dat) formats.

I am afraid there is no documentation as yet other than the standard '-h' switch. The program will likely attempt to pull a few surprises before we polish it up. Be patient with it.

Depending on what you have asked LIB to do, it may execute each of the other 2 programs several (many!?) times in sequence. Therefore, for the EXE version, the first time it runs it could take a while (because the previously documented decompression latency). Thereafter it should speed up.

Re: WP34S V3: Question about wp34s_asm.exe

*Message #5 Posted by **Miguel Toro** on 1 Jan 2012, 6:53 p.m.,*
in response to message #4 by Neil Hamilton (Ottawa)

Hi Neil,

Happy new year for you too!

Thanks for this update and I will also test the new tool. I will report to you on those "surprises" if any.

Thanks again and regards,

Miguel

Hi Neil,

I've made a few short tests with the new wp34s_lib.exe but no matter which function (i.e. options) I use, I always get an error message from the assembler about a missing "dat file '2'".

Here's one example where I just wanted to diplay a catalog:

```
C:\x>wp34s_lib -ilib wp34s-lib.dat -cat
ERROR: Cannot open dat file '2' for reading: No such file or directory
Initial library catalogue (format: flash file)
ERROR: WP34S_LIB.EXE::print_prog_name: First line of propram was not a correctly
formatted LBL: ''
```

It's now too late here to make more tests, but you can count on me again tomorrow.

BTW, I could manage to 'crack' the Indigo perl2exe, so now it doesn't display this 'evaluation' message anymore, and I could successfully compile all your 3 scripts to EXEs - and they work exactly the same way as your versions, but are only about 900 kB and also start much faster.
(of course the lib.exe does also not work - same error as above with your version).

Franz

Re: WP34S V3: Question about wp34s_asm.exe

in response to message #6 by fhub

Franz,

Turn on more debugging by adding "-d 2" to the command line of LIB. Capture the output and send both the output and the input "wp34s-lib.dat" file to me via email. I will have a look.

(I thought I had posted this same message last night but I must have screwed something up.)

Re: WP34S V3: Question about wp34s_asm.exe

*Message #8 Posted by **fhub** on 2 Jan 2012, 8:55 a.m.,*
in response to message #7 by Neil Hamilton (Ottawa)

Ok Neil,

I've now done the 2 steps again from the scratch (assembling 3 source files to a dat file and then trying to list them again with the libmanager with -cat, here's the console output:

```
C:\TEMP>wp34s_asm PF.wp34s TVM.wp34s TRIGON.wp34s -o wp34s-lib.dat
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// WP 34s version: 30
// CRC16: 6839
// Running in V3 State-mode. Max words: 922
```

```
// Total words: 596
// Total steps: 575

C:\TEMP>wp34s_lib -ilib wp34s-lib.dat -cat -d 2
// DEBUG: WP34S_LIB.EXE::disassemble_binary: Processing library binary for
'wp34s-lib.dat'
// DEBUG: WP34S_LIB.EXE::run_prog: Spawning command line: 'wp34s_asm.exe -
dis wp34s-lib.dat -s 2 -ns'
ERROR: Cannot open dat file '2' for reading: No such file or directory
// DEBUG: WP34S_LIB.EXE::run_prog: Output of spawned program:

Initial library catalogue (format: flash file)
Use of uninitialized value $prog_line in pattern match (m//) at
C:\TEMP\WP34S_LIB.EXE line 1036.
Use of uninitialized value $prog_line in pattern match (m//) at
C:\TEMP\WP34S_LIB.EXE line 1036.
Use of uninitialized value $prog_line in concatenation (.) or string at
C:\TEMP\WP34S_LIB.EXE line 1046.
ERROR: WP34S_LIB.EXE::print_prog_name: First line of propram was not a
correctly formatted LBL: ''
```

Running the lib.exe produced a file with the name "&1" in the folder which contains just the disassamber listing of the 3 source files - nothing strange in this &1 file except the 3rd commented line in the header:

```
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// WP34S_ASM.EXE: Source file(s): wp34s-lib.dat, 2
```

You can see, also here appears the same strange file "2" as in the error output above.

I guess there's some problem in the communication between the lib and the asm tool, probably this file "&1" shouldn't have been created at all but there should be some temporary output of the disassembler which is then the input for the libmanager!?

The problem is MS-DOS COMMAND.EXE. This command shell does not handle the redirection of both STDOUT and STDERR as I was expecting. The mysteriousness is all coming from LIB line 784. The '2>&1' thingy is designed to capture both STDOUT and STDERR to STDOUT. However, COMMAND.EXE is not recognizing this and is instead interpreting this as "2 > &1" which would translate to a file called "2" and redirection of the STDOUT to a file called "&1".

All subsequent errors and nonsense stem from this single line not behaving as expected.

I will have to see if there is a cure for this. If not, all sub-par shells, such as COMMAND.EXE from MS-DOS might be "out of the running" -- at least until I get a unified program together.

(I do have one other trick up my sleeve but will have no way to test it since I don't have any MS-DOS based computers at hand. It is a long shot.)

Yes, that's indeed not possible under Win98/MSDOS.

> Quote:
>
> I will have to see if there is a cure for this.

Why do you use these redirections (with ">") at all?
Why not simply (and consistently) use "-i infile" and "-o outfile" whenever you need a temporary file for the communication between your modules?

I was already long ago wondering why your asm expects a "-o outfile" but your pp requires an indirection "> file" to get a file instead of a console output.
With "-i" and "-o" you could certainly avoid all those problems with redirecting files ...

Re: WP34S V3: Question about wp34s_asm.exe

*Message #11 Posted by **fhub** on 2 Jan 2012, 11:21 a.m.,*
in response to message #10 by fhub

I've now tried it again after removing this 2>&1 in the line 784 (i.e. now it's just `$cmd`), and now the libmanager seems to work - no more error messages.

This is what I get when I run it:

```
C:\Temp>wp34s_lib -ilib wp34s-lib.dat -cat
Initial library catalogue (format: flash file)
  Source: wp34s-lib.dat, Program name: PF, Line number: 1
  Source: wp34s-lib.dat, Program name: TVM, Line number: 31
  Source: wp34s-lib.dat, Program name: TRI, Line number: 293
Library details:
// WP 34S assembly preprocessor enabled: '-pp'
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// Running WP 34S preprocessor from: wp34s_pp.exe
// WP 34s version: 30
// CRC16: EA42
// Running in V3 Lib-mode. Max words: 4094
// Total words: 596
// Total steps: 575
```

Edit: I've now also tried the other 2 main functions of the libmanager (adding and removing a file to/from the library) and both functions seem to work fine. :-)

There's only one thing that confuses me a bit: if I create a library from a few files which are together larger than about 520 steps, then the displayed CRC of the asm is different from the CRC which lib -cat shows!?

(and there's difference in the asm CRC between creating the lib.dat file with or without the option -lib)

Here's an example:

```
C:\TEMP>wp34s_asm TVM.wp34s TRIGON.wp34s -o Test.dat -lib
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// WP 34s version: 30
// CRC16: C1BB
// Running in V3 Lib-mode. Max words: 4094
// Total words: 565
// Total steps: 545

C:\TEMP>wp34s_lib -ilib Test.dat -no_pp -cat
Initial library catalogue (format: flash file)
  Source: Test.dat, Program name: TVM, Line number: 1
  Source: Test.dat, Program name: TRI, Line number: 263
Library details:
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// WP 34s version: 30
// CRC16: 43C0
// Running in V3 Lib-mode. Max words: 4094
// Total words: 565
// Total steps: 545
```

This does not happen for a single file or if the files don't go beyond this 520 step limit. I'm not sure if this is normal or if it's another problem?

Sigh! It must be nice to be so smart.

You do realize that much of the development in the last few days has been to solely support **you** and your antiquated system. No one else is having the issues you are having and it is all related to your choice of obsolete platform. Some amount of gratitude might be in order.

The changes you have made are fine as long as no errors occur anywhere in the tool chain. The reason that specific style of redirection was used was to ensure that messages sent to STDERR were also captured. Sure I could have used intermediate files for errors but **every** other command shell deals with

these things correctly. I use the facilities that are available to me.

Hi Neil,

I tested both wp34s_asm and wp34s_lib (great tool!) and so far so good. The programs work flawlessly so far. I first created a wp34s-lib.dat and then added some other routines, using -cat to see the results and not a single problem found. It is nice not to have to install Perl in my machine :-)

Thank you very much for a great job and regards,

Miguel

Thanks, Miguel. Its nice to know something is working. :-)

I have revamped the error handling mechanism in order to better support obsolete platforms. I can only test it on the COMMAND.EXE that comes with Windows XP. Works fine with that shell. We'll see what happens... So new Perl and EXE are available.

Many thanks, Neil!

Your new scripts are now also working perfectly in Win98 - at least as EXE versions (I've made again my own EXEs with perl2exe, because they are much smaller and faster).

Regards from an obsolete user on an obsolete OS, ;-)
Franz

*Message #16 Posted by **Neil Hamilton (Ottawa)** on 3 Jan 2012, 9:09 a.m.,*
in response to message #15 by fhub

Glad to hear that. Now I can get back to doing what I should have been doing to support the latest design wave. :-) The Australian and German wolves are howling at my door...

Only the 1st invocation of the current EXEs are vveeerrry sssllllooowww. Since LIB runs both ASM and PP, it will be even sssssssllllllloooooowwwwwwer the 1st time around. Subsequent runs come from cached copies of the decompressed image(s) so they are much faster.

It is still possible that these images can be made smaller with the tool I am using but I don't intend to look more deeply into it. :-) "It works for me!"

I suspect you will have to "refresh" yours every few weeks because the Indigo demo version of the tool probably has a time limit built into it the output EXE. Technically, you will be in violation of the terms of the Indigo Perl2Exe license if you use it beyond 30 days unless you register your copy (and pay the license fee).

From the size of your EXEs and even more from the temporarily created files (15-16MB!) I guess your tool includes the complete Perl library in the produced EXEs, even those modules that aren't used at all!?
The perl2exe I'm using only puts 3 or 4 small DLLs into the produced EXEs, so their size is only about 900kB and also the temporary files are no more than 600kB.

> Quote:
>
> I suspect you will have to "refresh" yours every few weeks because the Indigo demo version of the tool probably has a time limit built into it the output EXE.

No, I've just tried all 3 EXEs with setting the date forward (and back) even a few years, and they still work without any restrictions.

> Quote:
>
> Technically, you will be in violation of the terms of the Indigo Perl2Exe license if you use it beyond 30 days unless you register your copy (and pay the license fee).

Well, I know I'm a bad boy! ;-)
And I'm even a worse boy, because I even had to patch one of the files used by perl2exe, because without this patch it always displayed a message about being a "evaluation version...", and this message was then appended to every output file and confused your scripts of course - in short words: without my patch these EXEs won't

have worked at all!

But for working on my private computer in my own home I don't care about such things like copyrights or licenses at all - what I'm doing behind closed doors is solely my business. ;-)

Franz

That is fine, but that is also why I cannot build and distribute anything built using that tool -- unless I purchase a license -- something I don't see a need to spend my money on right now.

I'd rather spend money acquiring a 19BII than Indigo Perl2Exe. :-)

Yep, that's definitely the better choice!

BTW, since your tool for creating Perl EXEs is free, can it be downloaded anywhere?

Maybe I could have a look at it, but of course only if it's running under Windows ...

Re: WP34S V3: Question about wp34s_asm.exe

*Message #20 Posted by **Neil Hamilton (Ottawa)** on 3 Jan 2012, 10:37 a.m.,*
in response to message #19 by fhub

Yes it is free and the output is freely distributable. Where I got it, I cannot recall but it was probably CPAN (Comprehensive Perl Archive Network). I will look at my notes and see if I was careful enough to have recorded it.

I run it under Windows XP since I am creating a Windows EXE. I believe it can cross compile from Linux but I have never tried -- one step too many for me...

> I will try and get an EXE built soon.

Neil, before you do this you should know the following:

I've now found IndigoPerl 9.02 (Perl 5.10+) and installed this here because it's a lot smaller than ActivePerl or Strawberry.
And after many tests I've found that there's definitely a problem with your scripts when it comes to calling another script - at least under Windows!

Your pp is working perfectly, your asm is working perfectly as long as I don't use the -pp switch, but both the lib script (which always calls asm) and the asm script with -pp don't work at all: they just don't find the called script (there's an OS error message like "Command or file not found" and then a few more errors from the scripts, because they don't get any output file from the called script).

Since there's also a perl2exe on the IndigoPerl website (which BTW create EXEs of your scripts with only about 900kB!), I've tried it with both methods: running your scripts directly with Indigo's perl.exe and also as compiled EXEs (with perl2exe), but there's no difference: as long as the script doesn't call another script everything is ok, but calling another script fails (and I've set the path to perl.exe correctly and even made a file association from .pl to this perl.exe!).

So there must be some problems in your code for calling another script - maybe your method of calling another perl script doesn't work under Windows!?

Franz

*Message #23 Posted by **Neil Hamilton (Ottawa)** on 1 Jan 2012, 10:37 a.m.,*
in response to message #21 by fhub

OK, Franz. I have had a look at my tool-set creating the EXE.

The brand new LIB tool definitely has issues (but it is not officially released yet).

The EXEs I build using the compiler I have here (and I can't recall where I got it but it is documented in this forum) generates both ASM and PP that work fine. I can run ASM with the '-pp' switch and it does everything it is supposed to.

I suspect that there is a difference in the extraction of the script name, directory, and suffix in line 341 of ASM WRT to your compiler and mine. This is likely resulting in an invalid build up of the command I want to run.

Try this experiment and let me know the results:

1) Set the following environment variable to 1 in order to print some debug details.

```
$ set WP34s_ASM_PRESERVE_PP_DBG=1
```

2) Give me the command line you ran and any and all error logs generated using.

I downloaded Indigo but have not installed it. It sounds promising that its footprint is much smaller.

When I have some time to install it, I will give you more info.

Unfortunately, the Indigo Perl2EXE has exactly the same issue as the other attractive one I identified (thread). The license does not allow output from unregistered copies of the tool to distributed.

I am not really interested in spending money for a tool that is of little use to me.

Re: WP34S V3: Question about wp34s_asm.exe

*Message #24 Posted by **fhub** on 1 Jan 2012, 11:19 a.m.,*

> I suspect that there is a difference in the extraction of the script name, directory, and suffix in line 341 of ASM WRT to your compiler and mine. This is likely resulting in an invalid build up of the command I want to run.

Yes, but it's not only in the compiled EXE - both running the EXE and the .pl script don't work.

Here's the complete output after setting this debug option.

First for running the script:

```
C:\WP34S\tools>perl wp34s_asm.pl primesieve_pp.wp34s -pp -o Test.dat
// WP 34S assembly preprocessor enabled: '-pp'
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// Running WP 34S preprocessor from: wp34s_pp.pl
// Running: 'wp34s_pp.pl  -m 90 -cat  .__0.037200927734375.tmp -v3 -sd 4'
Befehl oder Dateiname nicht gefunden.
Use of uninitialized value $lines[-1] in pattern match (m//) at wp34s_asm.pl line
1421.
// WARNING: wp34s_asm.pl: V3 mode: Missing terminal "END" in file 'wp34s_pp.lst'.
Appending after last statement in source...
// WP 34s version: 30
// CRC16: FE44
// Running in V3 State-mode. Max words: 922
// Total words: 1
// Total steps: 1
```

And this is when I run the compiled EXE:

```
C:\WP34S\tools>wp34s_asm primesieve_pp.wp34s -pp -o Test.dat
// WP 34S assembly preprocessor enabled: '-pp'
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// Running WP 34S preprocessor from: wp34s_pp.pl
// Running: 'wp34s_pp.pl  -m 90 -cat  .__0.554046630859375.tmp -v3 -sd 4'
Befehl oder Dateiname nicht gefunden.
Use of uninitialized value $lines[-1] in pattern match (m//) at
C:\WP34S\TOOLS\WP34S_ASM.EXE line 1421.
// WARNING: WP34S_ASM.EXE: V3 mode: Missing terminal "END" in file 'wp34s_pp.lst'.
Appending after last statement in source...
// WP 34s version: 30
// CRC16: FE44
// Running in V3 State-mode. Max words: 922
// Total words: 1
// Total steps: 1
```

What's a bit strange is that also the EXE says "// Running WP 34S preprocessor from: wp34s_pp.pl"!?
I thought you have included a check whether it's running from a .pl script or from an EXE, and so it should call the wp34s_pp.exe in this case, shouldn't it?
And it's indeed running the wp34s_pp.pl because if I temporarily remove this file from the folder I get an error message that it doesn't find this script.

Re: WP34S V3: Question about wp34s_asm.exe

*Message #25 Posted by **fhub** on 1 Jan 2012, 11:43 a.m.,*
in response to message #24 by fhub

I just had another idea:
Looking into your asm script I don't see anywhere that you explicitely call/run/start perl.exe !?

I don't know which OS you're using (Linux/Unix?), and maybe on your OS it works if you just use "wp34s_pp.pl" on the commandline, but this doesn't work under Windows, not even if you have associated perl.exe with the fileextension .pl

In Windows you have to enter "perl wp34s_pp.pl" (or at least "start wp34s_pp.pl") for running this script, the scriptname alone is not enough! Maybe this is the reason for the failure (and the error message "Command or filename not found")?

It depends on how perl looks for a script. If it takes the present working directory into account, ok; if not, no luck. The original Unix behavior is not to have "." in the search path.

Re: WP34S V3: Question about wp34s_asm.exe

*Message #29 Posted by **Neil Hamilton (Ottawa)** on 1 Jan 2012, 2:11 p.m.,*
in response to message #28 by Marcus von Cube, Germany

Marcus,

MS-DOS is different from a Unix/Linux system. Close, but different. MS-DOS searches the current directory first, and only if this fails to find the program being sought does it resort to the PATH statement. Its exactly the same as if the path was setup with "./:${PATH}". Hence, that is probably not the problem.

It is more likely the file associations: ftype, assoc, and PATHEXT still need to be setup for Franz's Perl installation. This, along with the small change to the Perl script should solve the problem.

Franz,

Another thing you should try -- before you modify the Perl script -- is to run the program using the fully named executable:

```
$ wp34s_asm.exe -pp ...
```

This is likely the difference between your invocation and mine.

Re: WP34S V3: Question about wp34s_asm.exe

*Message #30 Posted by **Neil Hamilton (Ottawa)** on 1 Jan 2012, 2:04 p.m.,*
in response to message #24 by fhub

I *think* what is happening is that, for some reason, your executable is coming back with capital ".EXE" and not lower case ".exe". Why this would be different from my setup, I don't know -- unless its because I don't use the bare program name but tend to type "wp34s_asm.exe" instead of "wp34s_asm".

Unfortunately, my script is case specific and it is looking for lower case ".exe". The capitals are befuddling it. This is easily fixed by changing line 348 of the ASM from:

```
  if( $script_name =~ /\.exe$/ ) {
```

to:

```
  if( $script_name =~ /\.exe$/i ) {
```

and line 351 from:

```
    $preproc =~ s/\.pl$/\.exe/;
```

to:

```
$preproc =~ s/\.pl$/\.exe/i;
```

This makes the search and replacement case insensitive. If you can try this at your end and let me know the result, I will make the official change in my source.

(This is deduced because the second invocation is still trying to run the Perl version of PP and not an EXE version. Therefore the search. and thus the replace as well, failed.)

The other thing this log is telling me is that you don't have the MS-DOS file associations setup correctly. (See the Assembler documentation, section 7.2.2, footnote 28.) This is why you are still required to use "perl" in front of your Perl commands. Fixing the file associations will solve this. As noted in the documentation, some packages set these up for you (all should!!) and some don't.

Question: If you have Indigo up and running, why not just use it with the native Perl scripts rather than go to the trouble of the EXE? If you get the file associations setup correctly, it should "just work".

Re: WP34S V3: Question about wp34s_asm.exe

*Message #31 Posted by **fhub** on 1 Jan 2012, 3:22 p.m.,*
in response to message #30 by Neil Hamilton (Ottawa)

Ok Neil, I've now tried your suggestion with adding this "i" to make it case-insensitive, compiled new EXEs of your scripts and 'in principle' it works now. 'In principle' because calling the pp.exe from the asm.exe works, but now I have another problem: this crappy 'free' Indigo perl2exe displays a text like "This exe file was created with ..." after each run of such a compiled EXE, and this text is now appended to the preprocessor file wp34s_pp.lst, and so of course the assembler gives an error message because this text is just 'nonsense' at the end of this file!

So I'm again in the same situation - your scripts compiled with this Indigo perl2exe don't work.
BTW, since your libmanager contains the same code (checking for .exe) I've made the same changes with this "i" here, but for the lib.exe it didn't work - it still doesn't call the asm.exe (I've no clue why, it should work the same as for asm with -pp).
And this libmanager was indeed my main goal, because I always can run the preprocessor separately before using the assembler, but the libmanager works only with calling the asm.

And why don't I run the scripts directly? Well, because it doesn't work!
I've already said that I have set the file association (.pl to perl.exe), because if I enter "start xxx.pl" or if I choose xxx.pl in TotalCommander then perl.exe is called automatically - so the file association is ok. But of course just entering "xxx" or "xxx.pl" on the commandline does NOT work, because Windows/MSDOS doesn't recognize this as any executable command (like xxx.bat for example) - and I don't know HOW I should tell Windows to accept "xxx.pl" as such a 'command' (using perl.exe to execute it).

Well, I've now really enough of all those troubles and I'll probably stop trying to get these Perl scripts working correctly - I've already wasted MANY hours trying all possible tricks to get them running. I've already told you long time ago that it would certainly be much more comfortable to have all your scripts in one single tool (e.g. wp34s_tool.pl) and adding -asm, -lib or -pp to choose what you need to do - this would avoid all those damned problems under Windows with calling one script by another one (there would just be 3 subroutines WITHIN one script). But you decided NOT to make it that simple, and so we have now

these problems under Windows - and I'm finally giving up now. :-(

Franz

Re: WP34S V3: Question about wp34s_asm.exe

*Message #32 Posted by **Neil Hamilton (Ottawa)** on 1 Jan 2012, 3:45 p.m.,*
in response to message #31 by fhub

Sounds like you don't have your PATHEXT variable set correctly if DOS is not recognizing the Perl scripts as executables. Did you look up and follow all three steps in the footnote?

Puttting everything in a single tool is actually a goal but it is not quite so simple as you think. Partly because, as with many designs, it has been extended WAY beyond what its original intentions were. It has begun but don't hold your breath -- it will be a while.

As I said, LIB has not been officially released for public use yet. It still has many issues -- none of which are things you have identified. I haven't completed the code for it to work with DOS so Ii am not surprised it has issues there.

Well, I've just looked at those instructions but that's nothing I can do here. Although I have of course also newer computers (with Windows XP, Vista and 7), but most of the time I'm working on my very old notebook here (which is the only one connected to the internet), and on this notebook the only OS is Windows 98! And I'm sure you can imagine that these things just don't work in Win98. ;-)

Isn't there a simple way that I could just add "perl" or "perl.exe" in your scripts where those other scripts are called?

Well, you beat me! There seems to be nothing I can do to get antiquated Windows 98 running with this Perl stuff. I guess you are firmly in the EXE-land. Hopefully, we can make the EXEs work on that O/S. (Incidentally, it is because of Windows 98 -- or more particularly, CMD.EXE from MS-DOS -- that the name of the executable came back as ".EXE" instead of the ".exe" that I was expecting.)

> Quote:
>
> Isn't there a simple way that I could just add "perl" or "perl.exe" in your scripts where those other scripts are called?

I thought I supplied a method to do this but it does not work in this case. I supplied a mechanism to change the name of the script which was called. However, it doesn't allow you to put a "perl.exe " in front of it because the name is also used as a search parameter so I know where to get the script to launch. No good deed goes unpunished!

I am in the process of trying to get LIB working with the EXE. I could have it tonight -- or it may take longer....

The other 2 EXE's have been update but not committed. I will commit all 3 as a set.

Note that there are still issues with LIB and it is still **not officially released for public use yet**. There is no documentation and has been little testing. Expect you fingers to hurt from the sharp edges!

Re: WP34S V3: Question about wp34s_asm.exe

*Message #35 Posted by **fhub** on 4 Jan 2012, 8:13 a.m.,*
in response to message #1 by Miguel Toro

Hi Neil,

I've already posted this 2 days ago but maybe you've overlooked it in this long thread:

There's a difference in the displayed CRCs of wp34s_asm and wp34s_lib if all files together are bigger than the RAM limit (about 520 steps).

Here's a sample output:

```
C:\TEMP>wp34s_asm PF.wp34s TVM.wp34s TRIGON.wp34s -o Test.dat
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// WP 34s version: 30
// CRC16: E0E8
// Running in V3 State-mode. Max words: 922
// Total words: 596
// Total steps: 575

C:\TEMP>wp34s_lib -ilib Test.dat -cat
Initial library catalogue (format: flash file)
  Source: Test.dat, Program name: PF, Line number: 1
  Source: Test.dat, Program name: TVM, Line number: 31
  Source: Test.dat, Program name: TRI, Line number: 293
```

```
Library details:
// WP 34S assembly preprocessor enabled: '-pp'
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// Running WP 34S preprocessor from: wp34s_pp.exe
// WP 34s version: 30
// CRC16: 78C8
// Running in V3 Lib-mode. Max words: 4094
// Total words: 596
// Total steps: 575
```

You can see that the assembler produces CRC16: E0E8 for these 3 files (the same with or without the -lib option), but the libmanager displays CRC16: 78C8 for the 3 files!?

If I create the dat file directly with wp34s_lib, then this shows also CRC16: 78C8 at the end (i.e. different to the asm output).

Is this ok or is there a bug anywhere? (Maybe these 2 CRCs (of asm and lib) have different meaning?)

For a single file or if the files together are smaller than the RAM limit, this does not happen - here both tools show the same CRC.

Franz

Re: WP34S V3: Question about wp34s_asm.exe

*Message #36 Posted by **Neil Hamilton (Ottawa)** on 4 Jan 2012, 9:45 a.m.,*
in response to message #35 by fhub

The ASM run is reporting that the output is in "state mode" while the LIB is reporting "flash mode". The CRC and format are definitely different for these 2 modes***.

The ASM should not be able to write a state-mode file by itself. At the very least, it would need an initial (valid) wp34s.dat from the emulator to modify. (And I was not aware that the ASM even had this ability -- that is part of LIB. A surprise to me!)

Looks like a bug in the ASM.

For now, when building for the V3 calculator, I would use the LIB tool when creating flash images. The ASM tool will likely become obsolete as a standalone tool for pure assembly in V3 calculator very shortly. It will still have standalone uses as a disassembler though. Disassembly does not care if it is a state file or a flash file. Its primary use in the V3 flow is as a utility for LIB.

ASM will (hopefully) still work as the main front end for the V2 flow, as before. LIB is not designed for the V2 flow.

(Aside: LIB asserts several undocumented command line parameters when launching ASM -- designed only for the V3 flow. The user should not normally be setting these switches.)

I will look at this tonight.

*** The state file is the file emitted by the emulator covering the RAM, registers, and (well) the *state* (wp34s.dat). The flash format is the format used for the flash region (wp34s-lib.dat). They have different structures and uses. For example, the location and coverage of the CRC is different in the two formats. I am not sure if this is documented yet.

Re: WP34S V3: Question about wp34s_asm.exe

Well, but as I already mentioned above I get the same CRC if I run the ASM in libmode (with -lib) - look here:

```
C:\TEMP>wp34s_asm PF.wp34s TVM.wp34s TRIGON.wp34s -o Test.dat -lib
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: -- unknown --
// WP 34s version: 30
// CRC16: E0E8
// Running in V3 Lib-mode. Max words: 4094
// Total words: 596
// Total steps: 575
```

tapping heat stakes

*Message #1 Posted by **David Griffith** on 30 Dec 2011, 2:54 a.m.*

Back in October[1] Djj posted an account of threading the heat stakes inside a 15c-LE to reassemble it after repairing some keys. Would someone who knows what the inside of a 32sii looks like comment on whether or not a trick like that could be used to reassemble a 32sii? That approach would be much more preferable than using stubs of metal clipped from an old chip and then epoxying the PCB down.

[1] http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=200353#200353

Re: tapping heat stakes

*Message #2 Posted by **Artur-Brazil** on 30 Dec 2011, 11:12 a.m.,*
in response to message #1 by David Griffith

You really don't need to attach metal and epoxy to the posts. Just use 10 min expoxy in gel and a heavy weight to pressure the parts together. Cut the melting head of posts off the PCB, do what you need to the PCB, put it back; prepare some epoxy and, quickly put a drop over each hole. The epoxy will hold the pcb after cured. You will need to make the most well distributed pressure on pcb as you can during at least two hours, so, use something heavy and small plastic or wood pins to support it over pcb. No need to drill anything with the risks this proccess carry on. Best new year!!! artur mario jr at gmail dot com

Re: tapping heat stakes

*Message #3 Posted by **David Griffith** on 30 Dec 2011, 5:36 p.m.,*
in response to message #2 by Artur-Brazil

My reason for wanting to tap the heat stake stubs is because it makes subsequent disassembly easy. With the use of epoxy, that wouldn't be the case.

Re: tapping heat stakes

in response to message #3 by David Griffith

> Quote:
>
> With the use of epoxy, that wouldn't be the case.

Sure it is - I did it and it all works just fine. The PCB fits/snaps pretty well on the heat stakes and would stay in place even without sealing it with epoxy. Little drops are easy to remove if need be to open it again. Worked on mine - no problem for over a month now.

Cheers,

Reth

Re: tapping heat stakes

*Message #5 Posted by **uhmgawa** on 31 Dec 2011, 12:22 a.m.,*

Yea I really wouldn't recommend using epoxy as suggested here as it will bond far too well to the pcb and be a nightmare to remove should you have cause to subsequently free the pcb. Actually it probably isn't the best adhesive choice either for a number of reasons.

The best method I've found to reseat ABS heat stakes is with acetone. Acetone is an aggressive ABS solvent and spectacularly volatile. As such it creates an excellent weld bond and flashes off quite rapidly. The net effect is you can "glue" a new head onto a stake post in about 30 seconds, during which the head can be held under pressure to restore joint compression. I've built a small ad-hoc jig to apply pressure to the joint until the solvent dissipates but a drill press quill with a weight on the quill lever works as well.

A little acetone goes a long way and some experimentation on scrap ABS might be a good ideal to get the feel for its characteristics. One issue with pure acetone is its low viscosity which can cause it to run away from the intended target in this application. I thought to experiment by dissolving some scrap ABS in acetone to create a more viscous adhesive which should stay put far better, but have been doing ok with straight acetone applied sparingly.

On that last note I'd recommend using a syringe with about a 30 gauge needle to apply the stuff to the stake posts as you wouldn't want unintended ABS exposed to the solvent as I've alarmed earlier.

Re: tapping heat stakes

*Message #6 Posted by **David Griffith** on 31 Dec 2011, 3:04 a.m.,*
in response to message #5 by uhmgawa

I've done similar things with ABS and acetone with a slight modification. I dripped acetone on ABS shavings and stirred until I got a paste and then used that to make the bond. That fixes the low viscosity problem. It's particularly useful for filling gaps.

Circuit for HP3421A Data aquisition

*Message #1 Posted by **Barrie Carruthers** on 29 Dec 2011, 11:37 p.m.*

It may sound incredible but we are still using HP 85's and HP 3421A's in our workplace. Slowly, the HP3421A's are dying, and to get them up and running again I dearly need a technical service manual or the circuit diagram of the motherboard. Can anybody help?

in response to message #3 by RamLab

Thanks for your responses guys. Now the drama starts while I try to nut out what all these error codes are really trying to tell me. Cheers

Re: Circuit for HP3421A Data aquisition

*Message #5 Posted by **RamLab** on 6 Jan 2012, 7:14 a.m.,*
in response to message #4 by Barrie Carruthers

Hi Barrie,

The error codes you can find in the Operating manual on page 18. On one of the HP3421A's I get an Error 0. Most likely due to moving the 44462A Units. On the other one a 19... it took me a while to

realize that that one is under HPIB control, so that's the HPIB address.

Regards,

RamLab

WP34S V3 : STATUS questions

*Message #1 Posted by **Miguel Toro** on 29 Dec 2011, 5:46 p.m.*

Hello WP34s Team,

Today I finally made the jump to version 3.0. Reading about the new memory management I tried the STATUS command to see the new information available. So now I have some questions and a comment:

1 - What is exactly the first information shown? It says Steps: 531, FL. 2046

2 - Why is there a difference between the steps shown by STATUS and the steps available when I switch to program mode?

STATUS: 531, Program mode: 525.

3 - I think there is something wrong using [arrow down] and [arrow up] while in STATUS: when viewing the information with [arrow down] and after seeing the registers available, the calculator cycles through flags and stack registers only, but when using [arrow up], it cycles through the entire information.

Well that is all for now,

As always, thank you for this magnificent device and regards,

Miguel

Note: I am using revision 2092.

Edited: 29 Dec 2011, 5:48 p.m.

Re: WP34S V3 : STATUS questions

> 1 - What is exactly the first information shown? It says Steps: 531, FL. 2046

Steps of RAM and steps of flash available. The current work to put more commands in xrom has taken up some space which we hope to reclaim once the commands are moved.

> Quote:
>
> 2 - Why is there a difference between the steps shown by STATUS and the steps available when I switch to program mode?
>
> STATUS: 531, Program mode: 525.

Marcus will confirm this I'm sure but I think this is due to us reserving a few stack levels that can't be converted to program steps. Without any stack levels, programs cannot execute.

> Quote:
>
> 3 - I think there is something wrong using [arrow down] and [arrow up] while in STATUS: when viewing the information with [arrow down] and after seeing the registers available, the calculator cycles through flags and stack registers only, but when using [arrow up], it cycles through the entire information.

Seems like you found a bug.

- Pauli

Re: WP34S V3 : STATUS questions

*Message #3 Posted by **Marcus von Cube, Germany** on 30 Dec 2011, 5:58 a.m.,*
in response to message #2 by Paul Dale

The bug should be fixed.

Pauli is right, there are some return stack levels reserved which cannot be used as program memory. Try the REGS command if you need more steps. :-)

The new XROM stuff is work in progress (and disabled for the flash build in the most recent compile which recovers another page of user flash memory.)

Re: WP34S V3 : STATUS questions

but the functions of CLUTILS 2E (Angel Martin) has no more resources?

Re: [41CL] CLUTILS.MOD

*Message #4 Posted by **Ángel Martin** on 30 Dec 2011, 2:22 a.m.,*
in response to message #3 by robertoataulfo

CLUTILS-2E is a self-contained module, doesn't need other resourcers (but complements the YFNZ function set). It works perfectly well with the official revision YFNS-2B.

I included a copy of YFNS-2B' in the CLUTLS MOD file only to do testing on V41 of those functions that call Y-functions, like the launchers. Most of CLUTILS will obviously do nothing on V41 for obvious reasons.

Revision 2E corrects a few issues present in the 2C version included in the CL Library, plus it adds more functions for the HEPAX configuration, as well as the Page-plug functions PLUGG and PLUGGX.

I think it's a good idea to use it from RAM first, which BTW is also the only way the SECURE and PASSWORD functionality works - since it writes to RAM.

HP-15C LE received in Hong Kong

*Message #1 Posted by **From Hong Kong** on 29 Dec 2011, 4:37 a.m.*

The HP-15 LE has finally arrived in Hong Kong. I bought two units. Surprisingly, the LE# of one of my units is 168XX. I start to think the rumoured limited production run of 10,000 units is a hype!

The firmware is still dated 2011-04-15. I haven't tested against all the known bugs but tried out only a few tests. As expected, the PSE bug is still here.

Re: HP-15C LE received in Hong Kong

*Message #2 Posted by **Thomas Radtke** on 29 Dec 2011, 6:14 a.m.,*
in response to message #1 by From Hong Kong

We've already had 13xxx numbered replacement units for US models.

*Message #5 Posted by **Jorge Rodriguez** on 29 Dec 2011, 4:42 p.m.,*
in response to message #4 by Michael de Estrada

The back of the calculator has CNA1320HLD is that the product number? I will look at the box when I get home.

Re: HP-15C LE received in Hong Kong

*Message #6 Posted by **Michael de Estrada** on 29 Dec 2011, 6:14 p.m.,*
in response to message #5 by Jorge Rodriguez

No, that's the serial / date code number. The product number appears only on the transparent plastic

packaging for the presentation box. I expect yours to have the suffix #ABA, because you bought yours in the USA, but the Hong Kong unit to be different. You will also find a sticker with the serial number on it. BTW, that serial number indicates manufacture in mid-August, 2011 (32nd week), same as all the other units that have been sold in the USA. The only exception so far appears to be the replacement units for the ones with defective keyboards.

Edited: 29 Dec 2011, 6:17 p.m.

HP 200LX Solver program in HP Calc

*Message #1 Posted by **Ken Chevy** on 28 Dec 2011, 6:01 a.m.*

Hello... a little about me. I bought several HP calcs back in the 80's and then the 18c came out for $175. Bought that, then as soon as the 19B came out I bought that and a few months later bought the 19BII to get RPN. Fell in love with HP Solve. Then the HP95LX in 1991 and the HP 100LX in 1993 and then the HP 200LX came out in November of 1994 and I bought one of the first ones to hit Corvallis, Oregon... $660. Yikes! I still have a few... they are great. Now, last month Nov 2011, I bought a Kindle Fire. It has Android on it. I am looking for a 200LX EMULATOR or at least a 200 LX Calc/Solver emulator that will run on the Kindle Fire. I MISS MY SOLVER! Yes, there is a 200 LX sitting right here by my hand, but I want to have the functions on the Kindle Fire. Has anyone made an emulator yet that a dummy like me could figure out how to put it on the Kindle Fire?

I wish I would have caught that other thread a couple weeks ago. I MUST have the original disks and stuff for the 200 LX lying around here... since I have a few of them. Even got a 95LX and one of those 700LX, no phone to go with it though. It is like new. I need to get rid of some of this stuff.

Can anyone point me at an emulator? Please???

Regards,

Ken Chevy, Salem, Oregon

Re: HP 200LX Solver program in HP Calc

*Message #6 Posted by **Bill (Smithville, NJ)** on 28 Dec 2011, 8:45 a.m.,*
in response to message #1 by Ken Chevy

Ken,

I have an Android Acer A500 Tablet and use AnDOSBox to run the HP-200LX Cpack Program. This version of DosBox had better support for the touchscreen keyboard. I also use a replacement for the standard android keyboad. The program I use is "Tablet Keyboard" which has better support for the special PC keys that are really needed to run old PC programs.

Note: My Acer is running Android version 3.2 - I'm pretty sure the Fire is running an older version, so not sure how AnDOSBox and the replacement keyboard would run on the older Android version.

It is kinda fun running old dos programs on the Tablet. I've even run a CP/M emulator that worked great.

Bill

Re: HP 200LX Solver program in HP Calc

*Message #7 Posted by **Ken Chevy** on 29 Dec 2011, 6:33 p.m.,*
in response to message #6 by Bill (Smithville, NJ)

Hi Bill, The Kindle Fire is running a customized Android 2.3 Gingerbread OS.

I will see if I can figure it out, may have to call for help, for a list of steps to do. I have chronic pain issues and the narcotics I take for it, four pills every six hours, only usually give me two hours or so where I can think halfway decently and then the pain is back and I lay in bed with my eyes watering. After a couple of years, life has turned into a real drag, but I do the best I can with what I have.

So I really like computers and stuff like that. I really like the Fire. I just regret my health has this bad part in it until I can get it figured out with the doctor.

Do I REALLY need the HP Calc/Solver on the Fire? Probably not, since I have six or eight 200LX's lying around so one is always handy no matter where I am in the house, but it would be NICE to have it on the Fire!

So, if I can't figure out how to get the DosBox on the Fire in a couple of days, I will be back whining for help on how to do it by the steps.

Also, the Fire does NOT have an SDcard slot, all it has is a USB connection.

Depending on how well I am doing with the pain, you may not see me reply to a post for a day or so... it all depends if I can think or not. Sometimes it is lying in bed for even a week or more at a time, everything on hold as far as getting anything done.

I DO understand the saying "Life can SUCK at times"... now.

Thanks for the help so far!

Regards,

Ken

41CL installation on machine with zebra strip

*Message #1 Posted by **David Ramsey** on 27 Dec 2011, 11:42 p.m.*

My preferred donor calculator, a 41C with a dead CPU, meets the specifications for the 41CL except that its CPU board connects with the white zebra strip connectors instead of the desired wired-wrapped-around-a-tube connector.

That said, the existing connectors seem to be in fine shape and there seems no obvious physical reason they wouldn't work. Has anyone installed a 41CL circuit board in such a machine? Would long-term reliability be better with the other connector?

Re: 41CL installation on machine with zebra strip

*Message #2 Posted by **Ángel Martin** on 28 Dec 2011, 2:56 a.m.,*
in response to message #1 by David Ramsey

I have one CL board installed in a 41C with such elastomeric strip. It works fine, so far no issues. I also heard of others who installed it in similar setups, no bad reports. So it may be that although less preferable it´s also a valid configuration, I don´t know the reasons Monte had to recommend not to use those.

Re: 41CL installation on machine with zebra strip

in response to message #2 by Ángel Martin

```
I have two 41cl using elastomeric strip to about 2 weeks and not showing any error
I also like to know the reason for not using
```

Re: 41CL installation on machine with zebra strip

*Message #4 Posted by **BobVA** on 28 Dec 2011, 10:14 a.m.,*
in response to message #1 by David Ramsey

My uninformed guess is that Monte is concerned about the resistance of the zebra strip posing a problem during high-current operations, particularly during flash writing which could corrupt the firmware.

I saw this problem with a card reader and a dodgy zebra connector. Everything worked fine until it tried to read a card then the 41 would malfunction. Replacing the connector with a PW connector fixed it.

Regards, Bob

Re: 41CL installation on machine with zebra strip

*Message #5 Posted by **Monte Dalrymple** on 28 Dec 2011, 1:23 p.m.,*
in response to message #4 by BobVA

Yes, this is the reason that I don't recommend using this type of connector. Everything will be working fine until the (relatively) high current is needed for the Flash write operation. This is exactly where a contact

failure will be a problem, as it can lead to corruption of the Flash memory. Unfortunately such memory corruption is not necessarily restricted to the sector being written, so the OS might be affected, which is very bad news.

Re: 41CL installation on machine with zebra strip

*Message #6 Posted by **David Ramsey** on 29 Dec 2011, 12:16 a.m.,*
in response to message #5 by Monte Dalrymple

OK, good to know. Moving on to the 41CV with the correct display and serial number...and the correct contact thingy.

Too bad one of the lower posts came off with the original CPU. Sigh. And there are no hobby shops in Reno and Home Depot does not carry styrene cement. Perhaps I can order some online.

Re: 41CL installation on machine with zebra strip

*Message #7 Posted by **BobVA** on 29 Dec 2011, 12:58 p.m.,*
in response to message #6 by David Ramsey

Can you put the zebra connector in the CV, then use the printed wiring connector to install the NEWT board in the C?

Regards, Bob

Re: 41CL installation on machine with zebra strip

*Message #8 Posted by **David Ramsey** on 29 Dec 2011, 3:52 p.m.,*
in response to message #7 by BobVA

Tried that, but all I get is random scrambled flashes on the display...which is also what I get when I put in the known good CV board, so I conclude that my dead 41 has problems in the keyboard or display circuitry...

Re: 41CL installation on machine with zebra strip

*Message #9 Posted by **BobVA** on 29 Dec 2011, 4:43 p.m.,*
in response to message #8 by David Ramsey

Bummer - well at least you know you're not losing out on a good host due to lack of a PWC.

You might want to put up a separate post with the symptoms and see if someone (Randy!) has an idea for troubleshooting/repair.

Regards, Bob

Re: 41CL installation on machine with zebra strip

*Message #10 Posted by **David Ramsey** on 29 Dec 2011, 7:34 p.m.,*
in response to message #9 by BobVA

The "dead 41" is a machine I acquired years ago, for parts. I don't really care if it never works again; the only question now is if there any are usable parts in it at all. If a good CPU doesn't work in it, and its CPU doesn't work in other machines, I might as well toss

it...

In the meantime I found some styrene cement at a local crafts store and am waiting the requisite 24 hours for the repaired post to set.

Edited: 29 Dec 2011, 7:36 p.m.

Re: 41CL installation on machine with zebra strip

*Message #11 Posted by **Randy** on 30 Dec 2011, 11:24 a.m.,*
in response to message #10 by David Ramsey

Hopefully it was the liquid solvent welder, not thick cement... also, just as important are the screws. Early C's and CV's had 0.25 inch long screws in the lower posts. The short screws are the cause of most post failures. HP changed these out to 0.375 inch length screws in all later and serviced units.

Shoot me an email to my museum address if you need a set of screws and new rubber feet. I was going to contact Monty to see if he wanted to add these to the CL kit but he doesn't have an email :(

Re: 41CL installation on machine with zebra strip

*Message #12 Posted by **David Ramsey** on 30 Dec 2011, 1:05 p.m.,*
in response to message #11 by Randy

I would love a set (or two) of those screws, thanks! I just ordered extra rubber feet on eBay so I can pass on those.

The cement I used was a thick gel similar to what we used to call "airplane glue." However I used very little of it. I guess the stuff I should use is a rather thin liquid, right? Guess I'll have to find that online.

I see Geoff's paper wherein he not only glues the post but puts plastic shavings down the hole and a drop of solvent on top of that. I can try that as soon as I get the correct glue and some screws.

In other news, I installed the 41CL board in a 41C I had. It wasn't my first choice due to a slightly mushy "1" key (but it still works perfectly). The CPU board was actually held in by two silver nuts threaded over the plastic posts. I initially thought this was something someone had done to the machine, but the inside of the back case was different, too: on the other machines I've looked at, the plastic posts on the keyboard half fit into recesses on the back, and the back is designed to apply pressure to the CPU board when it's on. This back wouldn't work that way; it's obvious the nuts provide all the pressure.

Not only is this more reliable, it means cracked posts should be less of a problem.

In any case it all went together easily and now I have a working 41CL, finally! Now all I have to do is repair the 41CV I screwed up.

Re: 41CL installation on machine with zebra strip

*Message #13 Posted by **BobVA** on 30 Dec 2011, 4:48 p.m.,*

> In other news, I installed the 41CL board in a 41C I had. It wasn't my first choice due to a slightly mushy "1" key (but it still works perfectly).

This is a common problem in "tall key" 41C's. Most have less travel in the 1 and many times the 2 key giving the impression of "softness".

I've never pulled a board off one to figure it out why it only happens in those early units but I suspect they changed the frame and stake configuration to resolve the problem. The nuts used to attach the logic board amplify the problem so keep them as loose as possible to minimize the effect.

Installing longer screws will make the whole issue of the wrong glue a moot point. I would not remove them again just to re-glue. The plastic shavings trick, again, totally unnecessary with the correct screws.

BTW, "correct" is my way of saying tri-lobular plastic threading #2 sized screws, not plain old sheet metal spiral threaded types.

[41CL + ILPer] Help

*Message #1 Posted by **robertoataulfo** on 27 Dec 2011, 7:26 p.m.*

```
How do I load a module using the ILPer + 41CL?
Or is there another easier way?
```

Re: [41CL + ILPer] Help

*Message #2 Posted by **Ángel Martin** on 28 Dec 2011, 2:58 a.m.,*
in response to message #1 by robertoataulfo

Easisest way is to plug the HEPAX and use READROM-WRTROM. Other modules have equivalent functions, choose your favorite.

All this isn´t required if the module is already in the internal CL Libary of course.

Edited: 28 Dec 2011, 2:59 a.m.

```
Good but how can I use ILPer as the only file that it accepts .dat?
How do I convert a .mod for .dat or as I add one .mod for .dat?
```

Edited: 28 Dec 2011, 3:11 a.m.

Re: [41CL + ILPer] Help

*Message #4 Posted by **J-F Garnier** on 28 Dec 2011, 4:31 a.m.,*
in response to message #3 by robertoataulfo

Here is a possible way:

Use Emu41 to load the module into the Emu41 environment, then save it to the LIF image file. Then you can access it from your 41CL using ILPer/PILBox.

Note that Emu41 doesn't recognize .mod format, you have to use the .rom alternative. Most ROM from TOS are available in.rom format.

Re: [41CL + ILPer] Help

*Message #5 Posted by **robertoataulfo** on 28 Dec 2011, 5:34 a.m.,*
in response to message #4 by J-F Garnier

```
How do I convert .Mod to .Rom?
Thanks but is there another solution?
```

Edited: 28 Dec 2011, 5:35 a.m.

Re: [41CL + ILPer] Help

*Message #6 Posted by **Diego Diaz** on 28 Dec 2011, 8:55 a.m.,*
in response to message #5 by robertoataulfo

Hi,

To convert .mod files into .rom you can use "MODfile.exe", a small (DOS based) utility that you will find along with the V41 emulator on TOS.

Google for "V41 emulator" and you'll get the url... :-)

Cheers!

Diego

Re: [41CL + ILPer] Help

*Message #7 Posted by **Howard Owen** on 28 Dec 2011, 9:38 a.m.,*
in response to message #5 by robertoataulfo

I have been working on and off for years on a Perl solution that will take a .mod file, extract the roms, convert to .bin and place them into a LIF image. I have most of the pieces written except for the mod -> rom piece. Integrating them all will take a bit of effort too. I can't guarantee when I'll have that done, (I'm a lot slower than I once was at this sort of thing,) but I'm not that far off from a solution.

In the meantime, the .mod -> MODFILE.EXE -> .rom -> EMU41 -> LIF via WRTROM -> 41CL via READROM is the best path I've found.

Re: [41CL + ILPer] Help

I use the ML2k software alone (thank you Meindert Kuipers) to extract ROMs from MODs. To put the SW on work you have to install the USB serial converter driver from FTDI

which are freely obtainable. It is a superb tool to manipulate MOD files (on WINDOWS use the "right-arrow" context for further commands) and can be used also for FAT listing and disassembling code.

Some 41CL Questions

*Message #1 Posted by **Gerry Schultz** on 27 Dec 2011, 6:00 p.m.*

Hi, now that Christmas is over, I thought I would put together some of my questions about the 41CL. I've been reading the 41CL Calculator manual and was wondering about a few things.

First, some observations. In the supplemental sheet sent along with the 41CL circuit board, it shows 0x0DF000 as holding IMDB.ROM which, I assume, is the 41CL Image Database. On page 51 of the manual, the memory map shows this range of Flash to be open. The same thing for the 0x0C9000 through 0x0CF000 and 0x0D1000 through 0xD7000. I want to mention this because if someone starts tinkering without reading the supplemental sheet and copies data into these address ranges thinking they are available, they could get a nasty surprise.

I'm confused about how memory is addressed in a 41C. I've read a lot of books about the 41C so I do understand some of its unique capabilities, but RAM vs. ROM addressing I've never quite followed. I know that 41C storage registers are addressed in 7-byte registers and program instructions are byte (or multi-byte) in size. The absolute addressing for RAM is 000 to 1FF as explained in W.A.C. Mier-Jedrezejowicz's book "Extend your HP-41", in chapter 8. Extended memory goes on up to 3EF(and filling in some memory gaps as well), as explained on page 547. For ROM memory, there are 16 4K memory pages with the first 8 covering the internal O/S, Extended Functions (CX only), HP Diagnostic module, Timer module (page switched with additional CX functions), Printer and HP-IL. The upper 8 pages cover the 4 I/O ports (page 190). Finally, the ROM M-code instruction bytes are 10-bits long with some instructions being 20-bits long.

One area of confusion is the 10-bit ROM vs. 8-bit RAM addressing. For HP-41 FOCAL programs in ROM, the two extra bits are not used, but M-code instructions use all 10 bits are used. Is this why M-code programs can only be run in ROM space and not RAM space? Also, how does the 41 assign a memory module to the RAM address space when plugged into an I/O port verses assigning ROM modules plugged into an I/O port to the ROM addressing space? It appears these upper 8 4K I/O pages can assigned to either memory space, so is there an MMU in a 41C doing these memory re-assignments behind the scenes?

An interesting statement on page 193 says: "Programs in ROM always run from lower addresses to higher addresses. This is the same direction as data addressing in RAM, but the opposite direction to programming addressing in RAM. ...The HP-41 has to know if a User code program is in RAM or ROM since the instructions are read in the opposite directions in the two cases. COPY has to reverse the instructions when copying a program from ROM to RAM." How does the 41 do this? How does the 41 memory addressing ROM/RAM space map into the 41CL memory addressing space especially when one is 10-bits deep and the other is 8-bits deep?

Another area I'm confused about is Logical Addressing and Bank Switching. For instance, the function YMCLR in the 41CL manual, under logical address; L3, L2, L1, L0, - B arguments, what does that mean? At the bottom of page 39 of the 41CL manual, it says: "The 41C system uses a 16-bit (64K) program address, which is divided into sixteen pages of 4K each. For many of these pages, there can be up to four "banks", which are selected under software control during program operation." Which software control, the O/S or the program in ROM and what is being switched in and from where in relation to the 41C memory space? On the next page, "To accomplish this mapping, the MMU takes the upper four bits of the program address (which selects the page), plus the two bits which select the bank, and forms a special memory address." Which 4-bits and 2-bits? The 4K ROM addressing are absolute addressing bits 0 through 11. So are bits 12 through 15 page addressing and bits 16 and 17 are page addressing or since absolute addressing bit 23 identifies Flash verses RAM, are these page and bank addressing bits

17 through 22?

I want to understand these issues clearly before I do too much to not hose my 41CL.

Thank you for your responses. Gerry

Re: Some 41CL Questions

*Message #2 Posted by **Diego Diaz** on 27 Dec 2011, 11:30 p.m.,*
in response to message #1 by Gerry Schultz

Hi Gerry,

Your post looks quite more like an exam than a "... mmm... I was just wondering about a few things..." :-)

Ok, not that I'm the most authoritative voice in here (that's even more true when talking about 41CL) but since none of the "gurus" seems to be around... I'll give it a go and will try my best in order to explain HP-41 addressing scheme.

"RAM vs. ROM addressing"

In short this is the very key of the subject, if you get a clear picture on the details that make RAM and ROM addressing *soooo* different you will more likely have got a pretty good understandig of the remaining questions.

First of all, referring to user RAM, Data/Storage registers, User program area... and all the many different ways to call HP-41 "read/write" registers, is IMHO the cause of most misundertandings.

These storage registers *ARE NOT* RAM, in the sense we can see RAM into most any other type of microprocessor controlled device. These registers are built and are accessed (and this is more important from the point of view of the questions you've brougth here) like a solid state storage *peripheral*.

The only "memory" which NUT processor can access to and read from is the 64K (16 pages 4K each) with a word length of 10 bits.

So called "user programs" (FOCAL) are just a sequence of bytes (8bits) organized into registers (7bytes each) quite like a "record" in a disk drive. When you hit the "R/S" key, you're just instructing the CPU to start reading this bytes sequence from the "record" thru a "Parser" (interpreter) which decides the parts of the CPU program in ROM (this is the "real program" the NUT processor can execute: M-code) that is needed to perform the requirements in the "user instruction".

The NUT processor can only execute instructions stored into its ROM area (these 64K). Further more it cannot even write in this area, this is why when some users got access to the realms of M-code, they coined anew instruction to allow writing in the "ROM" addressing space. The instruction itself is a NOP for the NUT processor... so, every device willing to handle such writing instruction (H'040, aka WROM) has to find its own way to achieve the task. This is how most RAM boxes work (W&W, ERAMCO, HEPAX...)

When the parsing from a given command (say XEQ "ABC") finds that such "ABC" corresponds to a FOCAL program located into ROM area (this is encoded in the FAT of the page where the program is located) then it simply treats it like if there were a sequence of bytes just as if it was located in the storage registers (aka user RAM).

Therefore, RAM modules and ROM modules are intrinsecally different, when you plug a RAM module you're just plugging another "peripheral drive" while ROM modules are placed into the 64K memory addressing space.

I'm not familiar (yet) with CL's "logical addressing" so I think that some others here will give you a better advice on the subject.

Regarding Bank-Switching, this is a technique that allows a "program" (read M-code program into ROM addressing area) to turn OFF a given bank and turn another one ON in the same address.

The porgram continues on the new memory bank as if it still was in the same address (in fact it is) so effectivelly doubling (or even quadrupling) the amount of mamory without requiring a wider address bus.

Again, as in the H'040 WROM instruction, the instructions used to perform the bankswiching ON and OFF wereNOP's for the NUT processor, so every module that requred Bank-Switching, had to built its own scheme and inplementation. Most of them are similar like the ones in the Advantage PAC, the IR printer, the CX EXT funcs, or the HEPAX (this last goes a bit further by using four banks in a single page), but some curiousities can be found like the W&W 64K RAM box (or its implementation in the 41CY) which handles BS in a slightly different way.

Hope this may be useful. Sure you'll find more details on the CL from other contributors soon.

All the best from the Canary Islands.

Diego.

in response to message #1 by Gerry Schultz

Now that was a crystal-clear explanation on the RAM-ROM subject from Diego, I finally understand some things :=)

I´m no expert on the CL inner design, but it has helped me to think of ¨logical¨ addresses as those the native 41C OS would recognize, using its nomenclature and conventions - whilst ¨physical¨ addresses are the real ones used by the NEWT processor on the CL board.

Similar concepts are the DATA addresses and the PROGRAM addrsses, which I associate to ¨41-style RAM¨ registers and ¨41-style ROM¨ respectively.

HTH, I found the CL manual to be very well written, so after a few of my own CPU cycles I´ve normally grasped most of it. There is a lot of innovation in there ¡ mostly transparent to the typical user, to Monte´s credit, so no doubt some effort will be required.

Best, ÁM

Re: Some 41CL Questions

*Message #5 Posted by **Monte Dalrymple** on 28 Dec 2011, 2:09 p.m.,*
in response to message #4 by Ángel Martin

Diego covered the RAM-ROM quite well, so I'll just comment on the logical versus physical issue.

The logical address space consists of the ROM and RAM addresses available in a normal 41C context. That is, the 64k x 10 bit program memory and 1k x 56 bit (7 byte) register memory. To the 41CL user these appear to operate identically to how they work in the 41C. But in the 41CL these address spaces happen to be mapped into a much larger physical memory space. This phycical memory space is 16M x 16 bits and is divided in half, with the lower half assigned to Flash and the upper half assigned to RAM. On the current 41CL boards the Flash is 1M x 16 and the RAM is 256K x 16.

The regular 41C register address space is mapped to a specific location in the physical RAM, starting at address 0x800000. The details of this mapping is covered in the 41CL manual.

The 41C program address space is normally broken into 4k pages, and most of these pages can also use bank-switching to contain four banks (but only one at a time). These pages (and each bank) are also mapped into a physical address, in either Flash or RAM. A number of the pages (those used for the OS) are mapped to specific Flash addresses. Those pages that are not specifically mapped by the hardware (the pages used for the OS) can be optionally mapped to any address in physical memory using the MMU. This mapping information used by the MMU is also stored in specific locations in the physical RAM memory, and is automatically accessed by the hardware to calculate where in physical memory to find the required data.

Operation of the MMU is conpletely transparent to the user. When you use a PLUG command to insert an image into a Port, what the software is really doing is programming the MMU to point that correspond page of logical memory at the location in physical memory where the image is located. From that point on when the 41C software reads from that page of logical memory, the data will actually be fetched from the correct location in physical memory.

The details about where things are located in physical memory is also contained in the 41CL manual. Most users should not need to be concerned with these details, though. That's what the PLUG commands are for.

As far as messing up the 41CL, I've tried to make it hard to do. But there are a couple of things that you do need to be careful of. First, don't plug a module into an address that is concurrently mapped by the MMU. This will lead to a bus fight, because in this case the 41CL hardware actually drives the bus with the data just like a physical module would do. Second, be very careful when erasing or programming the Flash. I originally did not plan to make Flash erase and write operations available to the user, but changed m mind before the Beta units went out because I wanted to provide a way to patch the software in the field if necessary. (And it's a good thing that I did, given the bugs that I managed to miss the first time around). But aside from these two cases, the 41CL should be fairly robust. Certainly a memory clear or battery removal will fix just about everything except a corrupted Flash memory.

I hope this helps, Monte

Re: Some 41CL Questions

*Message #6 Posted by **Frido Bohn** on 29 Dec 2011, 9:39 a.m.,*
in response to message #5 by Monte Dalrymple

Dear Diego and Monte,

Thank you for the clarification of how RAM and ROM are defined in the 41C and the 41CL, respectively.
However, there are some assumptions (or better concealed questions) which came up after reading the

thread.

1.
The flash memory of the 41CL can be erased except for the portion where the OS resides. This is the area from 0x000000 to 0x007000.
Consequently, the command "000000 (in ALPHA) YFERASE" would render the error message "OS AREA" as the first 32k are protected. Trying to "patch" the OS area by YFWR would lead to the same error message. However, are there any commands documented in the 41CL manual that could harm this area?

2.
The content of the RAM of the 41CL (0x800000 and above) is restored to its initial status after power is turned off completely,
i.e. batteries are taken out for a while and a MEMORY LOST shows up after power on.

3.
Contents of flash which are overwritten, e.g. by a new version, may survive the writing procedure and generate artifacts or a strange behaviour if plugged on a page because "writes to flash can only change a "1" to a "0" and never vice-versa" as stated in the 41CL manual. Therefore, it is recommended to erase that portion first and filling it with "1s" before re-writing it. (How to handle this, is extensively documented in the 41CL manual.)
Thus, the revision of a 4k module in flash means that 28k have to moved around more or less unnecessarily, only due to the 32k span of the erase command.
To overcome this situation, would it be possible to generate a "zero-ROM" or "NOP-ROM" (full of "1s") which is written first on the 4k sector of interest as a means of deletion before the actual piece of code (e.g. a revision of a module) is written onto it?

Thanks for your patience

Re: Some 41CL Questions

*Message #7 Posted by **Monte Dalrymple** on 29 Dec 2011, 11:14 a.m.,*
in response to message #6 by Frido Bohn

1. The OS area (0x000000 to 0x007FFF) is protected by an address check in the YFERASE and YFWR functions. Since these are the only two commands that could conceivably affect the OS area, it is in all cases protected from corruption. The Flash memory itself can be programmed to protect certain sectors. I don't use this feature because my Flash programmer does not support this. Unfortunately I bought a relatively inexpensive Flash programmer.

2. RAM contents are not retained without power. There is a capacitor on the 41CL board that will supply the RAM for about 20-30 seconds without batteries, but after that time the contents are unpredictable. However, the OS does initialize the 41C "register" area when the "Memory Lost" condition is detected. Extended memory is not initialized, and neither are the MMU contents.

3. The erase operation is the only way to clear a Flash sector. The 32K word erase is a feature of the Flash chips themselves. It would be much more convenient if the erase size were 4K, but it is what it is. Writing all ones to a page doesn't do anything, because it is essentially a "No Operation" for the Flash memory device. Any existing zeros in the page stay at zero. The same will be true of the ones already existing in the page. This is why I initially located the "XXXn" user mnemonics in separate sectors. But then there wasn't room for the solution book images in the Flash for the production boards. If I revise the board I will probably route more address lines to the Flash so that I can place a larger device on the board.

Hope this helps,
Monte

Re: Some 41CL Questions

*Message #8 Posted by **Monte Dalrymple** on 29 Dec 2011, 11:22 a.m.,*
in response to message #7 by Monte Dalrymple

I should note that if power is interrupted during a Flash erase or write, unpredicatable things can happen. Geoff had his OS area corrupted when this happened. That's why you should always use fresh batteries when working with Flash.

I personally use RAM to hold stuff, and only update the Flash when I really, really want to make something permanent.

My original plan was to use and FRAM, which is non-volatile, for the RAM. But that would have added $25 to the cost, because the technology is very expensive. It would also have added another 30uA to the standby power. That's is why I went with regular RAM.

Re: Some 41CL Questions

*Message #9 Posted by **Geir Isene** on 29 Dec 2011, 6:09 p.m.,*
in response to message #8 by Monte Dalrymple

This is precisely why the HP-41CL and the NoV-64 (or 32K or the 16K version) are great companions. I now use only my HP-41CL, and with my NoV-64 plugged in, I have constant memory HEPAX to save RAM, programs, XM files etc. to easily (without having to erase any flash or do any risky operations). Heaven I say.

Re: Some 41CL Questions

*Message #10 Posted by **Gerry Schultz** on 29 Dec 2011, 6:58 p.m.,*
in response to message #8 by Monte Dalrymple

Hi Diego, sorry for my delay in responding. I've been busy at work and haven't had time to get back to this thread. I apologize if my "just a few questions..." seems more like an exam. I'm more of a hardware guy and I'm accustomed to the simple, flat addressing space of a PC. The RAM/ROM memory space was always a little weird in the 41 to me as RAM seems more assessable to the user than the ROM (storage registers, program space, key assignments, the curtain, etc) but all the heavy lifting is done by the uP on the ROM side. So, I've always thought of 41C RAM as primary as that's the space I work in.

So, thank you for the explanation on the differences of RAM space verses ROM space in the 41C. I had never thought of RAM as a peripheral with the basic addressing space of the 41C being ROM. On Bank switching, it sounds to me like you're saying the OS has nothing to do with it, but it's implemented in individual application modules and are unique to the application, though similar. The alternate banks are located within the module itself and are self-contained.

Angel, thank you for your posting. I agree that Monte's manual is well written. It's just that there's a lot of information packed into it and I really have to study what he's written. That's why my original questions were so detailed. I feel like I'm missing some basic information that would help fill the gaps between my knowledge and Monte's writing. I am very excited about the 41CL and it's literally a quantum leap from how I thought about how the 41C works to what Monte has put in the 41CL.

Monte, thank you for your posting. I won't claim to understand what everyone has written yet, but I like the 41C system and have a lot of fun with it. Now that I have just about every application module ever developed for the 41 here in one machine, it's almost like starting over again.

In reading and re-reading what you say about logical and physical addressing, I'm still confused. As an example, the YMCLR function that is used to initialize 4K blocks of memory to either a user-selected value or copies from another location in memory. Why 6 hex digits for physical addressing? If this function writes to 4096 memory locations and aligns the write to a 4K boundary, then all you would need to specify are hex digits P4 and P5 as P0 through P3 would be zero for the 4K boundary alignment. Unless the user has to put in zeros for hex digits P0 through P3 for this function to work properly (then why have 5 digits in the first place?). As for the logical addressing option in this function, L0 through L3 specifies a 4K block of memory within the 41C RAM/ROM memory space (assuming L0 is the least significant digit). How do you specify which page of the 41C 64K memory space are you referring to and how does the Bank hex digit fit into identifying the starting location (as an offset?)?

I apologize in advance if it seems like I'm nit-picking. I'm trying to understand how to properly set up the alpha register prior to using a function such as this. As another example of my confusion, under your section on Using FORTH41, you poke locations 0x804040 (MMU register for Page 4) with 809A and 0x80470 (MMU register for Page 7) with 809B after disabling the MMU. Yet the Flash addresses for forth4 and forth5 are 0x09A000 and 0x09B000 respectively. I don't understand. I would think you are specifying where in memory you want the 41C to look for the Forth41 module.

Thank you all again for taking the time to answer my questions. It will make sense to me and I hope you all have enough patience to put up with my struggle to understand this.

Gerry

Re: Some 41CL Questions

*Message #11 Posted by **Monte Dalrymple** on 29 Dec 2011, 10:49 p.m.,*
in response to message #10 by Gerry Schultz

YMCLR uses the same format as YPEEK and YPOKE for the Alpha register contents so that a common subroutine can be used to check the syntax. Characters 8, 7 and 6 are forced to 0s internally before the operation on the 4k page starts.

For the logical address format, L3-L0 are the 16-bit logical address. In this case characters 10, 9 and 8 are forced to 0s internally before the operation on the 4k page starts. In this format character 6 specifies the Bank information. Character 11 (L3) is the 41C "page".

Writing 809A to memory location 0x804040 tells the MMU to enable translation for page 4 (this is the "1" in bit 15), and to substitute the 12-bit value 09A for the "4" in a logical address in page 4. Writing 809B to memory location 0x804070 tells the MMU to enable translation for page 7, and to substitute the 12-bit value 09B for the "7" in a logical address in page 7. So, when fetching the first word of the Forth41 module at logical address 4000 the data at physical address 0x09A000 will actually be fetched instead.

Hope that helps,

Monte

[WP34s] Not working anymore

*Message #1 Posted by **fhub** on 27 Dec 2011, 4:49 p.m.*

Today I finally tried to switch to the newest SVN 2083/2085 and now nothing is working anymore. :-(

First problem is the new assembler: I compiled my 4 programs PF, TVM, TRIGON and PRS together with the new option '-lib' and got a wp34s-lib.dat, but when I tried to list it in the WP34s each of the 4 Libs just displayed END, none of the program was visible.
Then I compiled it without '-lib' (and had to use '-dl' because of the size) and then it seemed to work in the emulator - at least I could see, load and run the programs.

But now my PRS program suddenly stopped with an error message "Out of range" and the command was R-SWAP.
A few manual tests showed that this R-SWAP is now only working if the number nn is less than half of the sss number.

The R-SWAP parameter is sss.nnddd, and here are a few examples how R-SWAP behaves in the current version:

```
10 -> error
10.09 -> error
...
10.06 -> error
10.05 -> works
```

Maybe this has something to do with the new double precision (because of the half registers), but I definitely haven't set this mode (I've checked it).

Good that I still have some older versions ...

Franz

*Message #2 Posted by **fhub** on 27 Dec 2011, 5:12 p.m.,*
in response to message #1 by fhub

Oh my god, it's even worse! :-(

I just realized that for my test polynomial this R-SWAP code shouldn't even have been reached in my PRS program, so I single-stepped through the program and found that now even simple test functions don't work anymore!

For example: with 0 in the X-register the test x=1? returns true!!!

Ya know... you could supply feedback without all of the emotive angst. It would be just as helpful and not nearly so irritating.

If you are willing to go with the bleeding edge of the development, you will get paper cuts now and then. Calling on the almighty for deliverance will not hasten your respite.

There is (was?) a problem with the assembler up until a few minutes ago that it generated images of the wrong style for the latest calculator design. It should be fixed now. We are still trying to mix and match the images into the machine-as-a-whole. Your patience and understanding is encouraged.

From where did you get the idea to use the '-lib' switch with the assembler? The SVN log maybe? I didn't exposed it in the help menu (-h) for the very good reason that it shouldn't be enabled by the end user. It is used as part of the internal tool chain. Nothing good will likely come from trying to turn it on. It works in conjunction with the new LIB tool to modify how images are created.

Could you please stop trying to tell me what I should write and how I should write it?
Can't you imagine that everyone has it's own style?

> Quote:
>
> From where did you get the idea to use the '-lib' switch with the assembler? The SVN log maybe?

Yes, exactly from there!

Now I've recompiled it (or better: tried to do it) with your new SVN 2086 build and without this '-lib' switch and now guess what I get: an error message "ERROR: Too many program steps encountered (> 922 words)."
With the '-lib' switch it compiles without error - strange, isn't it? ;-)

Dial back your emotions and it will help all around. It is not "style" if my teenager says "Shut Up, Dawg!" to my mother. Such indiscriminate pleas to deities can offend a reasonable fraction of people.

> Quote:
>
> Now I've recompiled it (or better: tried to do it) with your new SVN 2086 build and without this '-lib' switch and now guess what I get: an error message "ERROR: Too many program steps encountered (> 922 words)." With the '-lib' switch it compiles without error - strange, isn't it? ;-)

This is telling me that you probably have more than 922 words in your program. Is that correct? If so, then the assembler is doing exactly what it should and trapping the error. If you have fewer than 922 words in your program and this is occurring, then there is a bug in the assembler and we will attempt to track it down.

The reason it may have "worked" before was that the limit check had been modified (note the use of past tense) to use the wrong value -- a MUCH larger value than was legal. I recently discovered that this has been the case for a few weeks (since SVN 2062). If you used these previous versions and your jobs went through, chances are the output image was not strictly legal if you were exceeding the 922 limit.

Can you provide the log spit out by the assembler after you ran with '-lib' switch on? That that would be very helpful. For example, the lines similar to these:

```
// Opcode map source:
/home/nhamilton/Downloads/wp34s/wp34s_svn/trunk/tools/wp34s.op
// Opcode SVN version: 2083
// WP 34s version: 30
// CRC16: E02F
// Running in V3 RAM-mode. RAM-mode max words: 922
// Total words: 37
// Total steps: 36
```

If your image is truly too large, you might have to assemble it with the LIB tool since that tool was designed to generate images for use with the flash. The flash has more space available than the RAM. As of now, the RAM is capable of holding 922 words and the flash 4094 words. You can look for these values at the top of the ./trunk/tools/wp34s.op file.

[It might be possible to assemble a monster program with the ASM tool using the '-lib' switch but this has not been tested in this exact manner as yet.]

Note that the emulator may behave differently from the actual calculator WRT to these numbers. So even if the emulator worked with these previous images, the actual calculator may not. Marcus will likely update you more completely on that matter.

Regards...

Well, "Oh my god" is in fact a very usual saying in German if you're shocked about something - and I was indeed shocked about such terrible bugs.

> Quote:
>
> Can you provide the log spit out by the assembler after you ran with '-lib' switch on? That that would be very helpful.

Ok, the call in my batchfile looks like this (everything needed is in the current folder):
tinyperl wp34s_asm.pl -op wp34s.op PF.wp34s TVM.wp34s TRIGON.wp34s PRS.wp34s -o wp34s-lib.dat -lib

And the assembler output is this:

```
// Opcode map source: wp34s.op (specified)
// Opcode SVN version: -- unknown --
// WP 34s version: 30
// CRC16: AC41
// Running in V3 Lib-mode. Lib-mode max words: 4094
// Total words: 1100
// Total steps: 1071
```

> Quote:
>

>
> [It might be possible to assemble a monster program with the ASM tool using the '-lib' switch but this has not been tested in this exact manner as yet.]

Yes, my image is indeed too large (for RAM), but what I want is a library file (wp34s-lib.dat) containing all my programs, since now it's not possible anymore to use/load those single wp34s-n.dat files.
And I've said already more than once that I can't get the LIB tool to work, so I have to do it directly with the ASM tool.

Yes, x=1? e.g. gives 'true' also with 0 in X.
And R-SWAP (with sss.nn in X) gives an error if nn>sss/2.
Both errors since SVN2071.

in response to message #9 by fhub

BTW Marcus, I saw that there's now a new function 'RND nn', that's really a great enhancement! :-)

I believe this new function will be used much more often than the ROUND function, and so I would prefer having this new RND on the keyboard on [g]0 where currently ROUND is located (and also the current keyboard label RND would better fit to this new function), and put ROUND into the catalog where also ROUNDI is.

So maybe you could change this during your bugfixing, but of course only if you agree with me ... ;-)

Re: [WP34s] Not working anymore

*Message #11 Posted by **Marcus von Cube, Germany** on 28 Dec 2011, 8:21 a.m.,*
in response to message #10 by fhub

I will not walk into Walter's territory without further consultation. Having ROUND on the keyboard is quite reasonable for the average user who wants to make the displayed result the

present value of X. Being able to round to a given number of significant digits is more a matter of programming, I suppose.

Yes, as for predators it's very dangerous to intrude into the marked territory of others. :-)

> Quote:
>
> Being able to round to a given number of significant digits is more a matter of programming, I suppose.

Well maybe, but for programming it would even be more useful if the parameter nn (the number of digits to round) could be taken from any register - but that was already discussed for SDL/SDR too, and probably it's just too complicated to implement.

in response to message #12 by fhub

All argument taking commands support the -> indirection operator.

The bugs should be fixed. Can you try again?

Re: [WP34s] working again

Yep, both things are working correctly again - thanks! :-)

BTW, I just found that [g]RTN doesn't display the BEG announciator anymore (if I have a program in RAM and I'm within this program).
Is this intended?

Another one I have to look into... [g]RTN no longer goes to location zero if not in program mode but to location 001 instead which isn't indicated by the annunciator.

Thinking a bit more about this [g]RTN it seems not so clear where this command should actually go!?

If you have more than one program in RAM and you're currently within (running) e.g. program 2, then should [g]RTN really put you on line 000, which would mean you're kicked out of your program 2 and have to choose it again via the CATalog if you want to restart it!

Maybe it would be better if [g]RTN would put you at the beginning of the current/active program (so a simple R/S would run it again) instead of line 000 - but I guess this won't be easy to implement (and maybe it would even require that each program has its own line numbers, i.e. start with 001 or 000).

Re: [WP34s] working again

*Message #17 Posted by **Marcus von Cube, Germany** on 28 Dec 2011, 11:28 a.m.,*
in response to message #16 by fhub

Use GTO [dot] [up] for this! (You can leave out the h prefix: XEQ [dot] is the same as [h] GTO [dot]).

Put LBL A in front of each program and a simple A will restart it.

A manual return is mainly useful to get you out of library space.

Yes, I was wrong, [g]RTN gets you out of the library.

Another question, Marcus:
In the CATalog I see Lib1, Lib2 and Lib3.
Lib1 is the file wp34s-lib.dat, Lib2 is wp34s.dat (backup?), but what's Lib3?

Couldn't this be named a bit better, e.g. Lib, Bak and ??? (don't know what Lib3 is for)?

And what's wp34s.dat (Lib2) really good for? Isn't this file always updated with the current RAM content when I close the emulator? And if it's automatically reloaded when I start the emulator again, then RAM and Lib2 should contain the same programs, right?

Re: [WP34s] working again

*Message #20 Posted by **fhub** on 28 Dec 2011, 1:34 p.m.,*
in response to message #19 by fhub

And another thing, a little request:

It now has already happened more than once to me that loading a program into the RAM automatically reduced the registers, and then running the program gave an error message.

Won't it be nice if this register reducing would give a short warning before or even ask if it should indeed be done (i.e. if the program should be loaded)? Something like "Reduce regs? " or "Set regs to nn?", as it is done when you try to clear a program.

Re: [WP34s] working again

*Message #21 Posted by **Marcus von Cube, Germany** on 28 Dec 2011, 4:25 p.m.,*
in response to message #20 by fhub

The respective chapter in the manual is still to be written. It should state: "Use local registers or start using global registers with low addresses first because high addresses may become deallocated when the program area grows."

Lib 3 is the ROM contents. It was just a little bit shorter to just number the areas instead of naming them.

Lib 2 is the backup. Do a SAVE to copy RAM to lib 2. This will prevent any automatic generation of backup data that you have observed. (It happens on startup of the emulator when no valid backup is detected.)

Re: [WP34s] working again

*Message #22 Posted by **fhub** on 28 Dec 2011, 5:36 p.m.,*
in response to message #21 by Marcus von Cube, Germany

Ok, so the relations are the following:

```
RAM  <-> wp34s.dat
Lib1 <-> wp34s-lib.dat
Lib2 <-> wp34s-backup.dat
Lib3 <-> ROM
```

BTW, an automatic backup-file is NOT created on startup (as you wrote), you definitely have to do a SAVE to create it (I've just tested it).

And for Lib3 I would really prefer the name ROM instead. OTOH what is this Lib3/ROM still good for, after WHO and deltaX have now also removed from there? Is this any area the user himself could access? Or is it just reserved for any future use?

One more question:
Is there any useful purpose for listing all those ENDs

in the CATalog? I find it a bit annoying to get an END after each name/label when scrolling through this list.

Edited: 28 Dec 2011, 6:05 p.m.

> Quote:
>
> BTW, an automatic backup-file is NOT created on startup (as you wrote), you definitely have to do a SAVE to create it (I've just tested it).

The backup is created internally but not written to a file. So you just get the same information in the backup that was in the state file on startup. This is only done if no backup file is found.

> Quote:
>
> And for Lib3 I would really prefer the name ROM instead. OTOH what is this Lib3/ROM still good for, after WHO and deltaX have now also removed from there? Is this any area the user himself could access? Or is it just reserved for any future use?

This looks more like a bug than a feature. I'll check it. WHO and '[delta]X' should still be present.

> Quote:
>
> One more question: Is there any useful purpose for listing all those ENDs in the CATalog? I find it a bit annoying to get an END after each name/label when scrolling through this list.

It helps you to distinguish between separate programs. Look into the vector or matrix code which has many global labels in a single program.

Re: [WP34s] working again

Almost all argument taking commands support ->. The exceptions are few: conversions, constants, alpha characters which you won't ever see directly and LBL which you will.

I'm likely to change SKIP and BACK to not accept -> and instead increase the branch range (via the assembler if not via the keyboard too). In light of this, can anyone suggest a good use for indirect SKIP or BACK? I can come up with a couple of things where it could be used but nothing that shouts out and demands its use.

- Pauli

RND nn

*Message #27 Posted by **gene wright** on 28 Dec 2011, 10:51 a.m.,*
in response to message #11 by Marcus von Cube, Germany

Hey Marcus!

Probably a dumb idea/question, as I haven't had enough coffee yet today.

Can the round function round values in a register other than X? Usually, we round the "displayed" value to the display setting.

how about rounding the value in a register in the same way?

Again, probably a way to do this already, but thought I'd ask.

Re: RND nn

*Message #28 Posted by **fhub** on 28 Dec 2011, 10:56 a.m.,*
in response to message #27 by gene wright

> Quote:
>
> Can the round function round values in a register other than X?

No Gene, that's not possible.
This would require 2 parameters (which register to round and how many digits), and I can't imagine that such double-parameters would ever be implemented.

Re: RND nn

*Message #29 Posted by **Marcus von Cube, Germany** on 28 Dec 2011, 11:30 a.m.,*
in response to message #28 by fhub

Franz has hit the nail on the head. You will need an exchange operation before and after applying the rounding operation (ROUND or RND nn) to get this effect.

Re: RND nn

*Message #30 Posted by **gene wright** on 28 Dec 2011, 12:58 p.m.,*
in response to message #29 by Marcus von Cube, Germany

Actually, I intended to say to the display setting.

So a round command like this would round register XY to the number of decimal places of the display setting.

More coffee so perhaps a clearer explanation of what I meant. ;-)

Re: [WP34s] Not working anymore

*Message #32 Posted by **fhub** on 28 Dec 2011, 8:26 a.m.,*
in response to message #31 by Marcus von Cube, Germany

> Quote:
>
> I found the R-SWAP error but I need a good idea on how to fix it. Hold on!

Well, without going through your C-sources I can't really help you of course, but I guess that both bug may be related. Maybe the true bug is in the test function, and the R-SWAP fails because testing source, destination and number of registers returns a wrong result if nn>sss/2 !?
(just a guess, but it would indeed be a coincidence if both bugs would have appeared independently in the same SVN)

And I have no clue how introducing double precision could have any influence on R-SWAP or testing x=_?

Re: [WP34s] Not working anymore

*Message #33 Posted by **Marcus von Cube, Germany** on 28 Dec 2011, 8:52 a.m.,*
in response to message #32 by fhub

The x=1 test was affected by a bad copy and paste. I had to provide for a double precision compare against zero and one in both single and double precision (complex and real variants). I changed the code for zero and pasted it for one without updating it correctly in all places.

R-SWAP did some pointer arithmetic for range checking which needed an update.

Reply from HP on 15C LE Availability

*Message #1 Posted by **frank Knight** on 27 Dec 2011, 3:41 a.m.*

Dear Frank,

Thank you for contacting the HP Home & Home Office Sales Center.

I understand that you are inquiring as to when the HP 15c Scientific Calculator will be back in stock. Before anything else, I would like to thank you for choosing HP as your brand of choice and buying your desired products here in our online store. HP offers the best and innovative products to assure customer satisfaction.

I am sorry for the inconvenience that this has caused you. This is a popular product, Frank, due to its demand we are current out of supply.

Regrettably, we do not have information as to when this particular product will be available. I am sorry that I cannot provide you with an exact date, however I do recommend that you visit our website regularly to check for availability since shipments of our products are received daily.

As an alternative, I would like to recommend that you take a look at the HP 48gII Graphing Calculator. With its 128K total memory, more than 80K of user memory, built-in constant library, and structured programming for creating applications, the HP 48gII gives you reliable, high-level assistance for demanding engineering and surveying applications. You can refer to the URL below:
http://www.shopping.hp.com/product/calculator/HP/1/storefronts/F2226A%2523ABA

I hope this information has been of assistance to you, Frank. Please reply to this message if there is anything else we can do. For online chat assistance, please visit: http://www.shopping.hp.com/webapp/shopping/help.do. For your convenience, you may also call the HP Home & Home Office Sales Center directly at 1-888-222-0029 between 7:00 AM - 2:00 AM EST, seven days a week.

Don't forget to be the first in the know regarding our new products, price drops, coupons and other promotions. Subscribe to our bi-monthly e-newsletter since the subscription is free:

www.shopping.hp.com/webapp/shopping/newsletter.do?destPage=news_sub

Thank you for shopping at the HP Home and Home Office Store. We value your business and support. Our goal is to continue bringing you quality products and solutions.

Regards, Chris E-Mail/Chat Representative HP Home and Home Office StoreTell us about your shopping and email experience so that we can make improvements!

Please complete our customer satisfaction survey.

He recommends the 48gII and not the 35S?

Re: Reply from HP on 15C LE Availability

*Message #5 Posted by **peacecalc** on 27 Dec 2011, 7:52 a.m.,*
in response to message #1 by frank Knight

Hello Frank,

it sounds like an automatically produced answer. You never know how many persons have to respond how many questions.

That the system recommends a hp 48 doesn't match to the hp 15c, but from the system point of view a good approximation.

Sincerely peacecalc

Re: Reply from HP on 15C LE Availability

*Message #6 Posted by **Paul Gaster** on 27 Dec 2011, 8:25 a.m.,*
in response to message #1 by frank Knight

I see a bigger problem with that canned response from HP.

1. The 48GII specs listed in the email reply are wrong. There are two versions of the 48GII. I think it was either 2006 or 2007 HP introduced an updated version that added a USB port and the Equation Library from the 48G. It also now takes 4 AAA batteries. Memory was updated also to 256k vs the old that has 128k. The old one had 80k free. The new one has much more.

2. HP's websites for the 48GII either have broken links or have wrong information on the 48GII as well.

store link with wrong info

broken Data sheet link and broken learning modules link

I know these have been pointed out before.

On a related note, HP still has an incorrect data sheet for the 15C LE floating around. You can find it with google easily:

15C LE with 12 character display

15C LE finally arrived

*Message #1 Posted by **Hal Bitton in Boise** on 27 Dec 2011, 12:03 a.m.*

My 15C LE finally arrived on Christmas eve. My wife stuck a bow on the mailing envelope and told me I couldn't open it until the next morning. Anyway, for the record, I'm very happy with it. Key detents feel great, and all the keys register perfectly. And it is fast...my '85 15C finds a root for x^2 -3x-10 in about 15 seconds, compared to about 1/2 second for the 15C LE.

Can anyone think of another instance of a company bringing back a product 22 years after it was discontinued due to popular demand? This is rather unprecedented, isn't it? Seems to me HP could capitalize on this with some sort of advertising campaign. Happy new year to all ! Hal

Re: 15C LE finally arrived

*Message #2 Posted by **David Griffith** on 27 Dec 2011, 12:29 a.m.,*

I agree. I would use my 35s much more if it weren't so confusing to use compared to my other HP calcs. One of the big appeals of the 15C LE is I already know where everything is on the keyboard and how to use the calculator.

The 35s with a 2 line display was a great idea, just not well executed.

Re: 15C LE finally arrived

*Message #6 Posted by **Michael de Estrada** on 28 Dec 2011, 9:37 a.m.,*
in response to message #5 by Keith Beyer

The 33s also has a 2-line display, and is almost identical in layout and functionality to a 32Sii. It has the same R<>P conversion, same separate STO and RCL primary keys, same minus sign nicely centered on the mantissa. And for all it's superior features, it costs $20 less. So, IMO the 35s is in many ways a step backwards. About the only superior feature is the less cluttered layout of the shifted functions with the sloping keys, which incidentally they copied from the 15C.

Re: 15C LE finally arrived

*Message #7 Posted by **Jeff Kearns** on 29 Dec 2011, 12:06 a.m.,*
in response to message #6 by Michael de Estrada

I agree. Given the choice, I would pick the 33s over the 35s, even though the latter 'looks nicer' and has the BIG Enter key in the right place with more efficient use of the available memory for programming and use of labels and line number addressing.

The 33s, despite its reputation for having a funky chevron keyboard, and a moderate list of bugs - see link below (some of which seem to have been addressed in later releases post 2005... but not the trigonometric bug) has a reliable keyboard with positive feedback and a great display. It is also faster than the 35s.

It really is the successor to the 32sii. The 35s with its unreliable keyboard and especially without R>P conversion on the keyboard as well as other nuisances, falls short of the mark. It could have been a real winner.

HP 33s Bug Discussion

HP 35S Bug List

it will be as much Dart as the new Charger is charger, and the new Camaro is camaro, in other words, in name only.

If you want it to be dart, first, it has to be ugly. Second, it has to have a carburator. Third, it has to refuse to go around a turn. 4th, it has to have 500 lb chrome bumpers. 6, it has to look like there is no bottom to the car, because it rusted out after the 1st 6 months.

The same thing as for the 15c LA. Just the name, not the calculator. The 15c LE is a hardware emulator of the original calculator. It's faster, but it isn't a real 15c

Re: Bringing back old products

*Message #21 Posted by **Eric Smith** on 29 Dec 2011, 2:30 p.m.,*
in response to message #20 by Vince (Italy)

There's simulation going on, but it is running the firmware of the original 15C, with only a few minor tweaks.

There were also hardware changes between a 1983 15C and a 1988 15C, yet I don't recall anyone complaining that the 1988 model wasn't a real 15C.

Re: Bringing back old products

*Message #22 Posted by **Vince (Italy)** on 29 Dec 2011, 3:08 p.m.,*
in response to message #21 by Eric Smith

I understand your point. But, anyway, the underlying hardware utterly differs from the original one. The firmware is running on a totally different platform. Several software emulators running on PC platform use the original firmware; they remain emulators anyway

There surely are some differences between a 1983 15C and a 1988 15C, but they are alterations made by HP in order to somehow improve the original project. The 15C LE is an entirely new machine manufactured by Kinpo.

I'm not a "serious" collector, because actually the serious collector should extend his/her collection following precise criteria; the only criterion I adopt is the subjective aesthetic sense: if I like a calculator, I buy it (without spending my last euro, of course).

However, from a (serious or not) collector perspective the 15C LE should have little or no value (besides the commercial value, I mean). But perhaps I'm going wrong...

Re: Bringing back old products

*Message #23 Posted by **Ethan Conner** on 29 Dec 2011, 4:28 p.m.,*
in response to message #22 by Vince (Italy)

All i know is people keep buying the LE and haven't heard of anyone giving them back so it must be "real" enough.

Re: Bringing back old products

*Message #24 Posted by **Vince (Italy)** on 30 Dec 2011, 5:04 a.m.,*
in response to message #23 by Ethan Conner

I wouldn't like to be misunderstood as a result of my bad command of the English language; hurting anyone's feelings has never been my intention, and I apologize, if I unintentionally did it. I'll try to explain my point in a more exhaustive way, hoping to succeed in making myself clearer.

In my opinion, the use of a calculator on a regular and methodical basis in (not just) professional contexts is a little anachronistic. And it must not be only my opinion, considering the difference between the wide assortment of models (not only from HP) available a couple of decades ago, and the current limited one. There are several ways to accomplish the same tasks in a "better, faster, cheaper" manner.

Nevertheless, many people still use calculators; and I obviously find it very understandable, considering that I am with them, reading (and rarely writing) some posts on this forum.

And many people use "old" calculators, not the new ones, although the newer calculators are a lot faster and more efficient. Somehow, it would be indicative of a passion for calculators that surpasses their practical use; hence, calculators must have an appeal that doesn't directly correlate with their function. This concept, in general, usually constitutes the basis of the collecting.

On the other hand,we observe here several occurences that are anomalous in collectors' enviroments. Every collector attaches fundamental importance to the genuineness of each item. The item has to be authentic, not tampered with. This principle someway clashes with the success met by the 15C LE, sold at up to 500$ on eBay. And still on eBay, I saw two seller refurbished 42s, one simply repaired, the other one improved as well (memory increased up 32k, overclocked), the latter obviously not being a valid instance of the original model. Well, the second calculator has been sold at a higher price than the first one.

Such situations seem to indicate that, in the current calculators' market, three distinct groups act: the advanced users (or hardened users of such a beautiful tool), the investors (or, if you like, the scalpers), and the collectors.

Introducing the 15C LE on the market obviously satisfies the first group, and evidently the second too. But not the group of the collectors, of which I consider myself an (unworthy) exponent.

So, if some members of the first group have bought the 15C LE, it's obvious that they don't regret it. But as it don't represent (currently, at least) a collectible item,as the real 15C is, paying it five times its commercial value makes little or no sense. That's all.

I only intended to express this idea, without offending anyone.

Warm regards

Vince

I for one use them because they are in fact *better, faster*, if not cheaper, for the purposes I use them - having considerable computing power at hand (literally) without moving to a different location (where a PC is) and loading up a specific program.

> Quote:
>
> And many people use "old" calculators, not the new ones, although the newer calculators are a lot faster and more efficient.

I for one use older calculators because they are in fact *better*, if not faster, than the newer ones.

The best explanation for the idea of

> Quote:
>
> a passion for calculators that surpasses their practical use; hence, calculators must have an appeal that doesn't directly correlate with their function.

is to simply recognize that cult-like characteristics are involved.

*Message #11 Posted by **Les Wright** on 29 Dec 2011, 11:59 p.m.,*
in response to message #1 by JimP

I love the project so much I got two 30b's (Samson Cables recently had them marked down) and have them flashed with the most recent v. 2.2. I spent a few dollars to get a bunch of temporary overlays colour laser printed, and this will serve me well until v. 3 gives us a release candidate and an established overlay for Eric to work with.

Indeed, I have become so enamoured with the calculator that my much-coveted 15C LE has gotten little attention since I got it. Anything I would want to do with a 15C the 34S does better and faster. It really is a labour of love by and for those who want a great RPN programmable in the best HP tradition.

Les

Most notably Neil who is quite busy at the moment implementing new requirements from Pauli and me. It might not be widely known, but Neil's tools are a vital part of the building process. We are working on moving more native code to user code in order to pack more functionality in the available flash space, a task which would be impossible without Neil's assembler and preprocessor.

WP 34S - INC X and RCL L (LASTx)

*Message #1 Posted by **Gerson W. Barbosa** on 26 Dec 2011, 1:10 p.m.*

Is there a reason INC X doesn't affect the register L (LASTx)? Thanks!

Re: WP 34S - INC X and RCL L (LASTx)

*Message #2 Posted by **Marcus von Cube, Germany** on 26 Dec 2011, 2:47 p.m.,*
in response to message #1 by Gerson W. Barbosa

Simplicity. X is just another register. We would need to check for X as a special case (not only for INC).

Re: WP 34S - INC X and RCL L (LASTx)

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 26 Dec 2011, 2:57 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I think it may be better not to save LastX when just incrementing (or decrementing) a register, to avoid the loss of generality. And, eventually, LastX may well end containing a "1" as the "last" operand added or substracted...

Re: WP 34S - INC X and RCL L (LASTx)

*Message #4 Posted by **Gerson W. Barbosa** on 26 Dec 2011, 3:17 p.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

I can't think of a situation in which updating LastX after INC or DEC would be inconvenient. On the other hand here it would save two steps:

```
001 LBL A               001 LBL A
002 1                   002 INC X
003 x<>y                003 RCL L
004 +                       ...
005 RCL L
    ...
```

Re: WP 34S - INC X and RCL L (LASTx)

*Message #5 Posted by **Paul Dale** on 26 Dec 2011, 4:33 p.m.,*
in response to message #4 by Gerson W. Barbosa

How about:

```
001 LBL A
002 ENTER
003 INC Y
    ...
```

No steps saved :-)

On the other hand, INC not setting LastX has been a boon several times.

- Pauli

But it's definitely inconsistent! IMO one should really be able to trust that LastX (L) is set to X whenever X is changed. Otherwise we would need a (complete!) table which operations set L and which not.

Re: WP 34S - INC X and RCL L (LASTx)

*Message #8 Posted by **gene wright** on 26 Dec 2011, 4:14 p.m.,*
in response to message #7 by fhub

I do agree that consistency is to be preferred.

What reasons are there for not incrementing X specifically?

Re: WP 34S - INC X and RCL L (LASTx)

*Message #9 Posted by **Paul Dale** on 26 Dec 2011, 4:46 p.m.,*
in response to message #8 by gene wright

Get out your trusty 41c and execute ISG X. Is the old X saved in LastX? No. The same is true on the 34S for all six increment and decrement operations. INC and DEC are there because I've seen way too many cases of "ISG nn NOP" in programs. i.e. they are very useful short cuts. In this way INC and DEC are *completely consistent* with their kindred commands.

Not setting LastX for these operations has actually been a bonus more times than not. There have been a number of rather clever pieces of code written that rely on this behaviour. As an aside: I've contemplated introducing fast arithmetic operations that allow you to add, subtract, multiply or divide X and a constant argument. These would most likely not save LastX either.

Finally, as Marcus mentioned, I'm very unlikely to introduce LastX saving here, checking for X specially would require extra code which we kind of don't have space for. What about ISG, DSE, X<> or even CLx ? They change X but nobody has ever called for them to set LastX that I'm aware

of? Must they too be modified to save LastX even though it breaks backward compatibility with everything?

Sorry, but I think it is consistent the way it is and that it is more useful not setting LastX. I'm going to be difficult to convince otherwise I suspect.

- Pauli

> What about ISG, DSE, X<> or even CLx ? They change X but nobody has ever called for them to set LastX that I'm aware of?

Perhaps because ISG and DSE are used primarily for loop control, unlike INC and DEC. My opinion is the same as Franz's above, but considering that lots of (built-in?) code have been written with this behavior in mind, better keep it this way.

Gerson.

Re: WP 34S - INC X and RCL L (LASTx)

*Message #11 Posted by **Paul Dale** on 26 Dec 2011, 5:33 p.m.,*
in response to message #10 by Gerson W. Barbosa

> Quote:
>
> Perhaps because ISG and DSE are used primarily for loop control, unlike INC and DEC.

Go through the 41c software archive -- ISG and DSE are very commonly used for their +1 or -1 effect and are often followed by a NOP instruction: DEG, empty alpha and the like. Not always of course but surprisingly often -- this is the heritage of INC and DEC.

HP 12C Prestige

*Message #1 Posted by **Keith Midson** on 26 Dec 2011, 3:32 a.m.*

Hi all, Hope everyone had a great Christmas!
I have a growing collection of 12C's (a subset of my larger HP collection - here: 12C collection). I am really keen to get hold of a 12C Prestige - there has been some discussion on this forum previously HERE
It looks like it was only released in some countries - does anyone know how to get hold of one? Can anyone help me get one (i'm in Australia). Many thanks, Keith

Re: HP 12C Prestige

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 26 Dec 2011, 3:16 p.m.,*
in response to message #1 by Keith Midson

Recently I noticed afew of them on TAS. However title says HP-12C#ABA AFAIK it is the part number for the current standard HP-12C with 2x2032 batteries. AFAIK the model number for the HP-12C Prestige is F2233A. However the photo is the photo of HP-12C Prestige with white face. Seller has not returned my questions about the clarification. If you search the TAS with HP-12C#ABA you will find a few sellers posting HP-12C Prestige (at least by photo).

Link

I hope this helps. Regards, Kerem

Re: HP 12C Prestige

*Message #3 Posted by **Don Shepherd** on 26 Dec 2011, 3:19 p.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

It would be extremely helpful to new users not to use the term TAS. Just call it what it is: Ebay.

Re: HP 12C Prestige

*Message #4 Posted by **Ron Ross** on 26 Dec 2011, 11:19 p.m.,*
in response to message #3 by Don Shepherd

I believe the moderator doesn't mind you using ebay in your post as long as you identify your ebay handle. This was to discourage others from bad mouthing others without actually identifying your ebay name. I feel this is only fair and this simple rule is often abused and or overlooked.

ebay name: fysics

WP 34S: Double precision registers - What are your feelings?

*Message #1 Posted by **Marcus von Cube, Germany** on 25 Dec 2011, 5:58 p.m.*

I know here are some numerical analysts which may help to decide about a feature in WP 34S which may, or may not, be exposed to the user: double precision registers.

The decimal64 format used for the registers and stack provide 16 decimal digits. The decimal128 variant has room for 34 decimal digits. All internal computations are done to at least 39 digits and then rounded to the register format.

The latest firmware has added commands to switch to decimal128 as the register format, thus exposing much higher precision to the user. The commands in question are DBLON, DBLOFF (in MODE) and DBL? (in TEST). The reason to implement the feature is that we want to implement more algorithms in user code which is hopefully much more compact than the present native implementations are. We do not want to sacrifice accuracy and will therefore use double precision registers internally for this.

The question is: Is it worthwhile - or even dangerous - to expose this to the user. There will certainly be some functions which will not return results accurate to 34 decimal places. On the other hand, there are many that do, most notably the basic arithmetic but also exponentials and logarithms.

As an example, I tried PI LN EXP PI - and got 1e-33 as the result which looks very promising. 10 Phi Phi^-1 returns infinity in normal mode and (10 - 5e-13) in double precision mode as the result. The usable range of the function is obviously considerably expanded.

What are your feelings about the feature? Leave it user accessible or not? Do you have applications for it?

Re: WP 34S: Double precision registers - What are your feelings?

*Message #2 Posted by **fhub** on 25 Dec 2011, 6:25 p.m.,*
in response to message #1 by Marcus von Cube, Germany

> Quote:
>
> What are your feelings about the feature? Leave it user accessible or not? Do you have applications for it?

Well, I can't say if I'll ever really need or use it, but who knows? So I would say: if it's already implemented and working then make it also accessible to the user.

BTW, does this double presision also increase the exponent range, i.e. work with higher exponents than E+/-380?

Re: WP 34S: Double precision registers - What are your feelings?

It does. See here! The exponent range is larger than the display can show. In this case, "HIG" is displayed in the exponent field. We need to modify SHOW to allow a better display of double precision numbers which exceed the range. You can use LOG for a quick estimate. The format is more suited to intermediate results than to final values.

WOW, more than 6000!?

This WP34s is more and more turning into a monster machine ... :-)

Several functions will break down for arguments with large exponents. For example, the trig functions won't modulo reduce properly but there will be others.

Well, on the 34s we have this EXP function that should return the exact exponent here. ;-)

I know, but LOG is on the keyboard. :-)

Basic arithmetic, square root should be correctly rounded. Exponentials could be wrong in the last digit -- I can live with that.

Logarithms won't be so good -- I terminate the series at a relative error of 1e-32 between successive terms. Which means the last two digits could easily be incorrect as could the third last. This is pushing past the bounds of what I deem acceptable in a calculator, at least what is exposed to the user.

Several other functions are, by design, not even close to 34 digits accurate. The statistical functions being some of them -- phi is better than many of the others. Try F or t they won't be as good -- stopping at a relative error of 1e-24 or less between successive methods.

SIN/COS/TAN should be good, their inverses less so. Gamma won't be accurate to all digits e.g.

Don't judge a function from a single or even many evaluations.

- Pauli

No Question! As a compromise, we could deliberately round functions with questionable accuracy to less digits or increase the number of iterations depending on the double precision flag. I'm on the side of rounding to less significant digits for those functions we do not trust.

BTW, I don't think anybody will ever try to calculate sin(10^6000). We can reduce the allowed argument range the same way we reduce the resulting number of figures.

I'm certain someone will try. I remember comparisons of calculators evaluating SIN(1E90 radians) and comparing the results, that value is pretty large.

There is quite a lot of discussion about argument reduction in the numeric mathematics literature I've got and quite some effort has been put into being able to do the modulo 2 PI reduction trig functions require. Muler's Elementary Functions has an entire chapter dedicated to this topic. A quick google turned up this one. Also this one talking about .NET's failings on this front.

Well, maybe you should implement a new constant with the value "Oops!" and return this value for function calls with such unusual arguments. ;-)

Nice suggestion :-)

The 34S should be good for trig arguments up to the largest decimal64 value (circa 10^384).

- Pauli

I would say that's more than enough in a universe with only about 10^80 atoms. ;-)

Usually the error in the final result is significantly less than difference between the last two approximations - since the algorithms converge the error decreases with every iteration. For instance, the method used for the normal quantile has better than quadratic, almost cubic convergence. So if the last two approximations are only 1E-20 apart, the final result usually can be expected to have about 50 valid digits. ;-)

So a closer look at the used methods and their convergence properties may show that the precision is "good enough" even for double precision mode.

However, there is an even better idea: an internal function may accept the desired precision as an additional argument, so that it is evaluated as precisely as required - neither better (slower) nor worse (inexact). So a direct call by the user or within a program may terminate as soon as the result has 16 correct digits, while the internal call of the same function, used within a more complicated algorithm, may return 30+ digits. On the other hand the initial estimates for the quantile functions only require logarithms that are correct in, say, five significant digits. That's why I think such a "flexible precision" approach may be a good idea.

Double precision? Yikes! Many struggle with the simpler dangers of floating point and decimal <-> binary conversions.

Yes, it can be dangerous to allow users access to double precision packages and operators.

Yes, it's very useful to those who understand it, and its limitations.

I'd allow it, and hope the manual eventually gets a complete listing of error bounds for the included functions.

Double complex even more so!

Are you volunteering to do the error analysis involved? I'm not up to it, I don't feel.

User accessible double precision? Great! No question - yes! yes! yes! Pleeeease keep this feature! That's what

I am looking for as long as I use programmable calculators!

There's a simple reason for this: if a user-programmed function is expected to return a full precision result (i.e. correct in all returned (standard-precision) digits) the calculation usually has to be done with some additional guard digits. You can't expect a 10-digit result if the whole calculation is done with not more than the same 10 digits.

So the idea is quite exactly the same as yours: Yes, let's provide the user with the tools that enable him to write his own routines *with the same precision as the built-in functions*. That's what I always missed on my other calculators.

i41CX+ Load Modules to Odd Pages

*Message #1 Posted by **Howard Owen** on 25 Dec 2011, 2:40 p.m.*

The title says it all. There's no reference in the FAQ to being able to load a module to an odd numbered (9, B, D, F) page. I also can't come up with a search that captures any discussion on this topic in the archives. Is this possible?

Thanks,
Howard

[WP34s] The ultimate polynomial rootsolver is here ;-)

*Message #1 Posted by **fhub** on 25 Dec 2011, 9:03 a.m.*

Although there seems to be not much interest in polynomial rootsolving, here's finally my program for the WP34s - maybe at least a few members here will like and use it. ;-)

I've put it in the Article section:
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=1133

Now I've also put the file in my download folder:
http://www.hpmuseum.org/guest/fhub/prs.zip

If you have any remarks, suggestions or questions about my program feel free to post them here. Of course also if you find any polynomial(s) where my program fails or gives wrong or inaccurate results - although this is very unlikely. ;-)

Just in case you need a polynomial rootsolver for the PC, or if you want to test my WP34s program - here's a very interesting website about polynomial rootsolving, which has programs for the PC and also an online rootsolver:
http://www.hvks.com/Numerical/winsolve.html

There's also still the previous version of this 'RootFinder' program available (WinSolve), which has the advantage that it doesn't need .NET4, so this is my prefered version:
http://www.hvks.com/Numerical/Downloads/winsolve.zip

Merry Christmas to all,
Franz

How does your root solver handle polynomials with a high number of duplicate roots? Such as:

(x-1.234)^20 = 0

Namir
