Can I ask an idiot question - what is TAS ? - not being in USA I just assumed it was another auction site, but my web searches haven't come up with anything ...

Re: More 15C LEs appearing on TAS

*Message #20 Posted by **Michael de Estrada** on 25 Sept 2011, 4:13 p.m.,*
in response to message #19 by Roger Blake

TAS = That Auction Site = eB**. It is considered the same as 666.

Re: More 15C LEs appearing on TAS

*Message #21 Posted by **PAtrick Rendulic** on 25 Sept 2011, 1:07 p.m.,*
in response to message #1 by Lincoln R.

What's going out there simply is dirty and plain business where maximizing profit rules.

Just check at Samsonc. $199.99 is the current price for a pre-order. I paid $94.99 for mine with the scratched #4 key.

Seems that dealing with HP calculators (even with the new ones) must make some people very rich.

Same thing happened with iPads when they came out. Give it some time, let the supply catch up to the demand, and the price will level out back at $99.

I got my two yesterday (purchased from the HP Home store). I ordered a 12C LE last week too, but it hasn't arrived yet.

Re: More 15C LEs appearing on TAS

*Message #23 Posted by **Michael de Estrada** on 25 Sept 2011, 1:50 p.m.,*
in response to message #22 by Todd Garabedian

The difference is that iPads were not limited production, whereas the HP 15C LE has been arbitrarily limited to presumably 10000 units, and the ultimate demand appears to be higher. Right now people are buying these up to prey on others who are freaking out without using a little common sense. Ultimately, the market will stabilize, but it's hard to predict exactly where it will settle. Had I not obtained mine at the normal price, I would never have bought them.

Re: More 15C LEs appearing on TAS

*Message #24 Posted by **bill platt** on 25 Sept 2011, 2:11 p.m.,*
in response to message #23 by Michael de Estrada

The price will certainly come down.

The originals were only going for abourt $100 to $150 except for unusual auctions. Nothing has seen the highs of 5 years ago except the rise in price with some of the others such as NIB 41CX and old 1970s in great shape. The pioneers and voyagers were significantly levelled off by the appearance of the 35 and 33s or some other causes. The Champagnes went from $300+ to low 100 with the release of the 50G...

So I expect we'll see this all level off.

The big difference between the old old stuff and the voyagers is the sheer number ofgood voyagers out there. THere's nowehre near as many 67 machines as 15C in circulation

Re: More 15C LEs appearing on TAS

*Message #25 Posted by **Michael de Estrada** on 25 Sept 2011, 2:23 p.m.,*
in response to message #24 by bill platt

Actually the 10C has always sold for considerably more than the original 15C. Just like the 70 is

the most pricey Classic, with the exception of a Red Dot 35. The current situation with the $300+ 15C LEs on TAS is totally ridiculous. I think in October when the next boatload of 15c LEs arrive, there will be some normalizing like you said although prices won't come down as much as the current 12Cs.

Re: More 15C LEs appearing on TAS

*Message #26 Posted by **megarat** on 26 Sept 2011, 12:22 p.m.,*
in response to message #24 by bill platt

I completely agree with Bill. We are witnessing a micro-bubble. While it's possible that some of the high-bidding eBayers are just ordinary schmoes who never learned that HP came out with the 15c LE, don't know that it's apparently still in production, and think they've missed the boat, I expect that the frenzy will wear down shortly, and the value of these calculators will drop to MSRP, whatever that turns out to be.

*Message #5 Posted by **Gene wright** on 24 Sept 2011, 5:35 p.m.,*
in response to message #4 by Egan Ford

Thanks for posting this

This morning was much more hectic than I had predicted

So far no corrections have been seen to the information in the document ... So the contest is now open

Remember ... Please do not post solutions and probably don't post many questions publicly either! :-)

Sorry for the delay and thanks again Egan!

Re: HHC2011 programming challenge?? Here you go!

*Message #6 Posted by **Thomas Radtke** on 25 Sept 2011, 4:32 a.m.,*
in response to message #5 by Gene wright

Hi Gene,

where to post the programs? I used your email address, hope that's ok.

Thomas

Re: HHC2011 programming challenge?? Here you go!

*Message #7 Posted by **Gerson W. Barbosa** on 25 Sept 2011, 3:17 p.m.,*
in response to message #6 by Thomas Radtke

Hello Thomas,

Here are my results, no spoiler:

```
    1 R/S ->           4       (   -  ,    2.2 s)
    5 R/S ->          88       (   -  ,    5.6 s)
  540 R/S ->      9#8#6#       ( 6.8 s,  407.0 s)
 5000 R/S ->    #8#5#6#0       (60.3 s,    -    )
```

(timings on the 12C+ and 12C, respectively)

If they are correct, the following is a nice approximation:

```
n = r*(pi*r + 4)
```

Regards,

Gerson.

Edited: 25 Sept 2011, 3:31 p.m.

Re: HHC2011 programming challenge?? Here you go!

*Message #8 Posted by **Werner** on 25 Sept 2011, 3:38 p.m.,*
in response to message #7 by Gerson W. Barbosa

Would posting the result for 540 constitute a spoiler? The number of pixels is what it is. Whether you reach that answer in 10 seconds or in 1000 seconds is more of a spoiler ;-)

Werner

Re: HHC2011 programming challenge?? Here you go!

*Message #9 Posted by **Thomas Radtke** on 25 Sept 2011, 3:40 p.m.,*
in response to message #7 by Gerson W. Barbosa

Hi Gerson,

the 32SII does R=5 in a fraction of a second. It's quite a fast baby :-). Just tried R=540 w/o precise timing, might be about 40s, same digits as you got.

Ah, why couldn't HP just produce the Pionieers and Voyagers forever... ;-(

Thomas

Re: HHC2011 programming challenge?? Here you go!

*Message #10 Posted by **Dieter** on 25 Sept 2011, 4:28 p.m.,*
in response to message #7 by Gerson W. Barbosa

But Gerson, what about the center coordinates? The text of the challenge says that the radius as well as x_center and y_center must be entered. :-)))

Anyway, I do not know if your results are correct but at least I get the same on the 35s. ;-)
Running times are quite exactly 10x those of the fast 12C+, resp. the 35s is 6x as fast as the original 12C.

Dieter

Re: HHC2011 programming challenge?? Here you go!

*Message #11 Posted by **Gerson W. Barbosa** on 25 Sept 2011, 4:41 p.m.,*
in response to message #10 by Dieter

> Quote:
>
> But Gerson, what about the center coordinates?

That's something I haven't understood. Because of the statement "assume that all circles fit on the display panel even if in reality they would not" it appears to me the coordinates are irrelevant. If only the pixels that fit on the screen should be computed, then the coordinates would be important. I may be wrong however.

Cheers,

Gerson.

Re: HHC2011 programming challenge?? Here you go!

*Message #12 Posted by **Dave Shaffer (Arizona)** on 25 Sept 2011, 4:48 p.m.,*
in response to message #11 by Gerson W. Barbosa

I agree with Gerson - the center coords don't matter for counting (theoretical) pixels.

Re: HHC2011 programming challenge?? Here you go!

*Message #13 Posted by **Dieter** on 25 Sept 2011, 4:51 p.m.,*
in response to message #11 by Gerson W. Barbosa

Well, I understood it that way either. So any solution should start with 2x RDN or DROP. ;-)
Either we miss something here ...or we are simply too clever. :-)

Dieter

Re: HHC2011 programming challenge?? Here you go!

*Message #14 Posted by **Gerson W. Barbosa** on 25 Sept 2011, 5:02 p.m.,*
in response to message #13 by Dieter

> Quote:
>
> So any solution should start with 2x RDN or DROP. ;-)

You're right. This makes my 12C program two steps longer (48 instead of 46). I thought of including Rv Rv in the beginning, but as it worked with the sample cases I just ignored it. Now checking the rules I see the radius should be entered first... That's how I got B- instead of B at school, by not reading the questions carefully :-)

Edited: 25 Sept 2011, 5:04 p.m.

Re: HHC2011 programming challenge?? Here you go!

*Message #15 Posted by **Paul Dale** on 25 Sept 2011, 5:06 p.m.,*

Definitely agreed here. In the case of the 34S, a complex roll down or complex drop at the start.

- Pauli

Re: HHC2011 programming challenge?? Here you go!

*Message #16 Posted by **Jeff O.** on 27 Sept 2011, 7:25 p.m.,*
in response to message #15 by Paul Dale

Or a RCL Z?

Re: HHC2011 programming challenge?? Here you go!

*Message #17 Posted by **Paul Dale** on 27 Sept 2011, 7:39 p.m.,*
in response to message #16 by Jeff O.

Yes. Or complex x<>y; complex R^ (default state being specified which is 4 level stack) or even x<> Z. I've probably still missed some options.

They'll all run sufficiently fast to make no noticeable difference to the execution time.

- Pauli

Re: HHC2011 programming challenge?? Here you go!

*Message #18 Posted by **Paul Dale** on 25 Sept 2011, 8:52 p.m.,*
in response to message #7 by Gerson W. Barbosa

34S after an integer mode bug fix to the firmware and I'm getting 7.6 seconds for r = 5,000. Without the fix and sticking to the same algorithm in floating point mode, 32.7 seconds for r = 5,000.

My best attempt (which is slightly broken but not due to a firmware issue and likely in a fixable

way) 4.7 seconds for r = 5,000.

- Pauli

Re: HHC2011 programming challenge. Here you go!

*Message #19 Posted by **Paul Dale** on 24 Sept 2011, 7:37 p.m.,*
in response to message #4 by Egan Ford

Time to add a special integral area of a circle function to the 34S ;-)

- Pauli

Re: HHC2011 programming challenge. Here you go!

*Message #20 Posted by **Gene wright** on 24 Sept 2011, 8:16 p.m.,*
in response to message #19 by Paul Dale

Nope, the contest rules specifically prohibit new code or binaries including new functions not present yesterday

:-)

Re: HHC2011 programming challenge. Here you go!

*Message #21 Posted by **Paul Dale** on 24 Sept 2011, 8:57 p.m.,*
in response to message #20 by Gene wright

I noticed that but had to say it anyway :)

I might have found another bug in the firmware too :-(Still investigating. Sigh. This task never ends.

- Pauli

Re: HHC2011 programming challenge. Here you go!

*Message #22 Posted by **Marcus von Cube, Germany** on 25 Sept 2011, 3:24 a.m.,*
in response to message #21 by Paul Dale

> Quote:

in response to message #23 by Paul Dale

Off to bed...

Re: HHC2011 programming challenge. Here you go!

*Message #25 Posted by **Walter B** on 25 Sept 2011, 11:55 a.m.,*
in response to message #4 by Egan Ford

Just a remark: IMHO, 8 pixels less would give a better circle in the case shown in the picture. But it would complicate the challenge, so take it just FWIW.

Re: HHC2011 programming challenge. Here you go!

*Message #26 Posted by **Thomas Radtke** on 25 Sept 2011, 12:17 p.m.,*
in response to message #25 by Walter B

For a certain feature, it could even be a square package of pixels to be as much a circle as the fit given ;-).

Re: HHC2011 programming challenge. Here you go!

*Message #27 Posted by **Walter B** on 25 Sept 2011, 12:23 p.m.,*
in response to message #26 by Thomas Radtke

Yeah, I think any pixel should be lit only if the circle covers more than 50% of it, but - as mentioned above - this condition would raise the level of complexity significantly.

Re: HHC2011 programming challenge. Here you go!

*Message #28 Posted by **Thomas Radtke** on 25 Sept 2011, 12:29 p.m.,*
in response to message #27 by Walter B

I know what you meant, I was just fooling around to compensate the frustration for not being at the HHC :-/.

Re: HHC2011 programming challenge. Here you go!

*Message #29 Posted by **Paul Dale** on 25 Sept 2011, 5:02 p.m.,*
in response to message #27 by Walter B

I don't believe it complicates the problem all that much.

My fastest solution does just this and since I've put too much time into this little puzzle already, I'm not planning on fixing it.

Anyone 'tweeting' from HHC2011?

*Message #1 Posted by **Pal G.** on 24 Sept 2011, 1:09 p.m.*

Please let us know, so we can listen in.

Thanks.

Re: Anyone 'tweeting' from HHC2011?

*Message #2 Posted by **Bruce Bergman** on 24 Sept 2011, 6:42 p.m.,*
in response to message #1 by Pal G.

There's ZERO wifi available, so it would have to be via phone, and cell coverage out in this area is crummy.

It's almost like they're TRYING to block us from getting to the net. ;-)

Re: Anyone 'tweeting' from HHC2011?

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 25 Sept 2011, 2:20 a.m.,*
in response to message #2 by Bruce Bergman

And we have an NDA to obey too...

Re: Anyone 'tweeting' from HHC2011?

*Message #4 Posted by **Marcus von Cube, Germany** on 25 Sept 2011, 3:10 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

At least it was a full day...

I'm just back but after having emptied a bottle of wine with my wife I'm not very good at reporting. We saw interesting stuff from the community (new non HP hardware is on the horizon), very serious programming efforts for existing platforms, and some enlightening reports about the new 15C (benchmarks and such) or the 41CL. I'm pretty sure the non HP efforts will soon be published by the respective persons. I'm posting my and Neil's presentations on SF.

Re: Anyone 'tweeting' from HHC2011?

*Message #5 Posted by **hpnut** on 25 Sept 2011, 5:03 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Hi Marcus, pls share with us.

Re: Anyone 'tweeting' from HHC2011?

*Message #6 Posted by **Marcus von Cube, Germany** on 26 Sept 2011, 2:28 p.m.,*
in response to message #5 by hpnut

The second day was far less exciting (and exhausting) as day one but it had its highlights, too. I very much enjoyed Richard Nelson talking about how the PPC ROM was put together by the community before the Internet and what huge effort was necessary to mail out the boxes to the PPC members. Richard should do a wright-up on this.

BTW, the folks at the conference are a nice crowd. I felt very comfortable with them.

Re: Anyone 'tweeting' from HHC2011?

*Message #7 Posted by **Eric Smith** on 25 Sept 2011, 8:49 p.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

You mean we can't tell them about the HP 51g?

Re: Anyone 'tweeting' from HHC2011?

*Message #8 Posted by **Marcus von Cube, Germany** on 26 Sept 2011, 2:23 p.m.,*
in response to message #7 by Eric Smith

I forgot the model number, was 51 or 15? ;-)

NDA is NDA is NDA is...

Re: Anyone 'tweeting' from HHC2011?

*Message #9 Posted by **Martin Pinckney** on 26 Sept 2011, 3:15 p.m.,*
in response to message #7 by Eric Smith

I would not want to be one of you guys who knew something terrific about a new release, but had to keep it secret for ... a year, in the case of the 15c LE.

Re: Anyone 'tweeting' from HHC2011?

*Message #10 Posted by **Steve Simpkin** on 27 Sept 2011, 2:00 p.m.,*
in response to message #7 by Eric Smith

Of course in Eric's case, if HP doesn't make the calculator he wants, he will "simply" make it himself, from scratch. I thoroughly enjoyed all of the presentations at HHC2011, but Eric's was astounding....

Re: Anyone 'tweeting' from HHC2011?

*Message #11 Posted by **David Hayden** on 25 Sept 2011, 8:05 p.m.,*
in response to message #1 by Pal G.

We just finished up and it was another great conference. The attendance was quite high (I think Gene said 67) and the talks were wonderful.

We heard from Dennis Harms, Product Manager (I think that was his title) of the HP 12C. He had some great stories. In the introductions, he said "if you press a math key on an HP calculator, that's probably some of my code you're running."

I think the highlight for me was the WP 34S. Marcus von Cube gave a great talk about it, Jake Schwartz talked about the 16C functionality in it, and Eric Rechlin explained his keyboard overlays, complete with a demonstration on installing them. I sat across from Eric and he spent most of the conference flashing 20b's and

30b's into 34S's. This is certainly an exciting machine.

Of course we heard lots of great stuff from HP also, including a Q&A session with the developers, marketing, product management etc. Information from HP is covered under the NDA that we must all sign, but trust me, it's very interesting and for me, the confidential information is reason enough to attend the conferences.

There were many other talks but I don't have time right now to go into them. Joe Horn won the Best Speaker prize.

Dave

Re: Anyone 'tweeting' from HHC2011?

*Message #12 Posted by **Walter B** on 26 Sept 2011, 1:24 a.m.,*
in response to message #11 by David Hayden

Now we who could not attend are all waiting for the proceedings to be published. Also individual files are appreciated :-)

Edited: 26 Sept 2011, 1:28 a.m.

Re: Anyone 'tweeting' from HHC2011?

*Message #13 Posted by **Olivier (Wa)** on 26 Sept 2011, 1:55 a.m.,*
in response to message #11 by David Hayden

I believe it was higher, in the mid-70, as we had at least a #74 ticket called during the door prizes drawing. Richard did mention something like 88 people signed-up and maybe 76 ended-up showing-up.

Re: Anyone 'tweeting' from HHC2011?

*Message #14 Posted by **Eric Rechlin** on 27 Sept 2011, 10:53 a.m.,*
in response to message #13 by Olivier (Wa)

I think 74 was the highest ticket, and there were another 4 or so HP people who came by but did not have to register, for a total of about 78.

Eric

Re: Anyone 'tweeting' from HHC2011?

*Message #15 Posted by **gene wright** on 27 Sept 2011, 11:35 a.m.,*
in response to message #14 by Eric Rechlin

74 was the highest ticket - Jeremy Smith, but he came after the HP people. I think we had 68 total non-HP attendees this year.

I believe that the total including HP folks was 69 or 70 back in 2007 when we were last in San Diego with the intro of the 34S, so this one beats that and easily is the largest attendance in a couple of decades. FYI, the 8/22/1981 conference in Corvallis when the 41 series was "fresh", attracted 180 people. This not only included a barbecue on the HP grounds, but a plant tour, where we got to see the manufacturing area as well as the R&D area. A few of us got early glimpses of the HP11C and 12C machines, to be officially announced only 3 weeks later. Ultimately, that manufacturing area built Voyager machines on an assembly line with robots controlled over HP-IL by HP71Bs. Is that cool, or what?

Hp48 mechanical engineering card

*Message #1 Posted by **Giancarlo** on 24 Sept 2011, 1:00 p.m.*

Hello, I would like to buy a mechanical engineering card for my beloved hp48gx. I remember the sparcom card and i don't remember if other ME cards were available.

Do you know where i can find the manual so that i can understand the topics covered in detail?

I also remember that the sparcom card had two flavors: the ME and the ME reference card...

Then i hope to find one here or eventually on TAS...

Thanks

Giancarlo

Cleaning HP-97 Print Head

*Message #1 Posted by **Fouad M. Kaadou** on 24 Sept 2011, 10:25 a.m.*

Hello,

I need to clean my HP-97 print head, but I have no idea how to get to it and with what to clean it with. Any ideas?

Thanks in advance,

Fouad

Re: Cleaning HP-97 Print Head

*Message #2 Posted by **Michael de Estrada** on 24 Sept 2011, 10:31 a.m.,*
in response to message #1 by Fouad M. Kaadou

You can run a red cleaning card through to do a reasonably good job unless it is badly gummed up. The card is abrasive and will wear a small amount of material off the head, so you want to use it sparingly. Direct access to the head itself requires complete disassembly of the card reader.

Re: Cleaning HP-97 Print Head

*Message #3 Posted by **Fouad M. Kaadou** on 24 Sept 2011, 11:40 a.m.,*
in response to message #2 by Michael de Estrada

Michael,

I am talking about the printer head not the card reader. Thanks anyway for looking.

Regards,

Fouad

*Message #4 Posted by **Olivier De Smet** on 24 Sept 2011, 12:26 p.m.,*
in response to message #3 by Fouad M. Kaadou

I had the same problem of bad printing with my HP97, it was solved by buying actual thermal paper (black). The old paper wasn't working good for printing and for advancing too.

HP97 use normal 57mm wide thermal paper.

Olivier

Re: Cleaning HP-97 Print Head

*Message #5 Posted by **Fouad M. Kaadou** on 24 Sept 2011, 1:24 p.m.,*
in response to message #4 by Olivier De Smet

I tried the same paper on my hp 82143a printer and works great. I also read on the museum that using black thermal paper on an HP97 wears out the print head.

Original HP15C article from HP Journal, May 1983

*Message #1 Posted by **JamesT** on 23 Sept 2011, 8:44 p.m.*

With all of the "renewed" interest in the 15C with the release of the limited edition, thought you might get a kick out of this issue of HP Journal from May, 1985. It has a very interesting feature (page 25) on the 15C and 16C calculators, which had just been released.

http://www.hpl.hp.com/hpjournal/pdfs/IssuePDFs/1983-05.pdf

It is refreshing to see how enduring a truly great design can be, even after nearly 30 years, and the article reinforces what a great engineering company HP was in those days.

Re: Original HP15C article from HP Journal, May 1983

*Message #2 Posted by **John B. Smitherman** on 23 Sept 2011, 10:02 p.m.,*
in response to message #1 by JamesT

Thanks James. That's some great stuff.

I doubt that Meg or any of the other board members could understand any of the articles.

John

in response to message #1 by JamesT

Great engineers in those days.

Now we can't even match up the right batteries with the new circuit. Isn't there anyone left in the calculator division that knows the difference between 20mA and .18mA?

Dwight

in response to message #4 by Dwight Sturrock

For sure there is. I know myself how hard it is to get everything right if administration doesn't really care for things you're working on. You simply get too little funding. That's all.

All sorts of crazy things happen in just about any company these days.

For an example I am now working as a temp engineer at a company, and my job is to get a new bench/workstation product launched. I will try to avoid the company name, etc. The company has been in business for decades and does great work. However they were bought out by a larger company about 2 years ago, and this parent company wanted them to have a new more modern looking bench/workstation with more features. The parent company paid a design firm over a quarter million dollars for development. There are more design problems and issues than you could imagine. The design firm never worked with the small company on details.

The workstation surface was supposed to be be available in two heights. There are some parts missing in the CAD files for one height, plus there is an interference problem if you drop the working surface and associated parts to the lower height. Oh, and some electrical wiring has no openings to run through for the lower height option.

On top of that the entire workstation was designed to use metric steel and fasteners and the company I am working with makes everything in house now and they don't have a metric wrench or tool in the place. There are other design issues and potential problems too. The workstation has a board and wire harness, but of course it doesn't look like the company's standard UL approved harness will be able to be re-used in this design, so we need to deal with that too. It really is a mess.

Anyway, back to reality here and HP calculators. I am encouraged about some recent things in HP like the new 15C LE, the 30B and overall the use of ARM processors. Also it's great to see support, input and help from HP people here.

Tell me about it! I used to work for Bell Northern Research, then Nortel. I'm one of the lucky ones that got a job with the engineering minded company that bought out our line of business. In BNR days us engineers could spent 10% of our time doing whatever we wanted. Sometimes those little skunkwork projects turned into a product/feature. Nortel did away with that. The new company has brought that back - it's awesome!

Hopefully HP's calculator team will be as lucky.

Re: Original HP15C article from HP Journal, May 1983

*Message #8 Posted by **Kiyoshi Akima** on 24 Sept 2011, 8:32 p.m.,*
in response to message #6 by Paul Gaster

If you think companies are bad, try governments.

I was once involved (somewhat peripherally) with the design of a radio tuner for the Air Force. This was a box to fit into an existing rack-mount unit, but with a new frequency range. The prototype worked fine, survived the vibration, heat, cold, and other tests. Then they initially rejected the unit because it weighed two pounds (that's about one kilogram, for those outside the US) LESS than the old unit it was replacing. Since our new digital design was so much more compact than the older analog circuit, we solved the problem by bolting two pounds of lead inside the case and raising the price accordingly.

This was for a radio intended for use aboard a Boeing 707. The two pounds were supposedly necessary to maintain aircraft balance during a twelve-hour flight.

HHC--- be patient tomorrow please

*Message #1 Posted by **Gene wright** on 23 Sept 2011, 6:11 p.m.*

Hi all. We are setting up the conference location and are running into a few interesting challenges. We will be packed tighter than usual with perhaps the largest crowd in years.

There will be no Internet access in the conference room.

The chairs may not be as comfy as previous years.

We are doing our best as we set up now but wanted to let people know early

The presentations are going to be great but please be patient this weekend!

Re: HHC--- be patient tomorrow please

*Message #2 Posted by **Seth Morabito** on 23 Sept 2011, 6:55 p.m.,*

Doom and Gloom

*Message #1 Posted by **Howard Owen** on 23 Sept 2011, 12:58 p.m.*

OMG!

HP is going to sell the huge division that includes the group that makes the calculators we obsess over. It's all coming to an end! Our hopes for new calculators that sort of work like the old calculators will be cast into the wilderness of crass corporatism to wander voicelessly for all time!

But wait!

There's a new CEO! Maybe ... but no. Meg hates computers too. OMG OMG.

Calculators are profitable. Although sales volume is tiny compared to to PCs, margins are almost certainly better. Wherever the calculator group ends up, they are likely to survive the transition based on the bottom line. We can worry that the our priorities won't be taken into account as much as in recent years, but this is the age of social networking. User communities like this one are considered in marketing plans now. We may excoriate the new calculator models, or HP's business practices, but more than half of us will give 4 star ratings to machines we like. We'll gush about the old quality, and we'll recommend that our friends and family buy a new machine. If the 15C LE is selling as well as it seems to be, there's a concrete measure of the influence we have. There's no guarantee that possible new owners will treat us as well as our current friends have, (*The 15C LE is an **astounding** gesture towards people like us*,) but it's unlikely we will be discounted completely. It's even possible we might get more love directed our way under new owners.

The current turmoil at HP presents us with uncertainty, not armageddon. The worst case scenario is going back to status quo before Sam Kim, with a company that pays no attention to the HP heritage of excellent quality calculators,* only now we have flashable platforms in both landscape and portrait formats. We can produce the machines we dream about now. Talk about empowerment!

But, hold the presses, I've just heard a rumor that Leo Apotheker has been handed the calculator group as part of his golden parachute. OMG OMG!

*** edit: This is not meant to disrespect our friends in the calculator division who have always cared about quality. My comment refers to managerial attention to those old values.**

HP-15c LE Bad Keys

*Message #1 Posted by **Gerry Schultz** on 23 Sept 2011, 12:54 p.m.*

I received two more 15C LEs last night (ordered from HP's website) and one of them has a 'CHS' key that is hard to push but does register according to the keyboard test. That prompted me to recheck my two original 15C LEs that I got from Samson Cables last week and the 'GTO' button on one of them doesn't have that 'positive tactile feedback' but registers fine on the keyboard test. That means that two of the four calculators that I've bought have a keyboard issue.

I'm bummed about this and will bring them to the HHC meeting to see what you guys think. I'm hoping that HP can tell me what I need to do to either get these calcs repaired or replaced. Other than they work fine as far as I can tell.

Gerry

HP200LX's Calc under Win7

*Message #1 Posted by **Mike (Stgt)** on 23 Sept 2011, 6:53 a.m.*

Hi connoisseurs of HP calculators!

There goes the saying that the calculator within the HP200LX was a migration of a HP19Bii to DOS. Anyway, it's graphing capability was quite good. There had been some migrations to M$ Windos arround.

2 Questions: i) is there one that still works on Win7 (or is the Connectivity Pack und DOSbox the prefered way to go)? ii) Where may I get it?

TIA

Ciao.....Mike

Re: HP200LX's Calc under Win7

*Message #2 Posted by **Dave Britten** on 23 Sept 2011, 8:15 a.m.,*
in response to message #1 by Mike (Stgt)

The HP200LX mostly uses a non-standard display mode, so getting the original to work on Windows would be difficult or impossible. I don't recall if the connectivity pack included the calculator, or if it did, whether there were any graphical capabilities (the whole thing may have been entirely text-mode).

I believe some older OmniBooks came with Windows 3.1 and some form of HP Calculator application. You might try tracking that down.

Or just keep a 200LX on your desk. :)

Re: HP200LX's Calc under Win7

*Message #3 Posted by **Bill (Smithville, NJ)** on 23 Sept 2011, 10:10 a.m.,*
in response to message #1 by Mike (Stgt)

Mike,

The connection pack called CPACK will work in most windows in a DOS Window. CPACK diplays exactly like the HP-200 screen and you can do eveything on it that you will do on a real 200lx, including all the features of the calculator. While it is NOT a windows application and displays as a realativey low quality resolution when compared to today's windows programs, it is very usable.

I have used CPACK to develop more complicated solver programs. Must easier to do than using a HP-19BII or HP-17BII. Once debugged, then I can transfer to the calculator.

As to Windows migrations, HP furnished a couple of Windows programs on their Omnibook computers:

HPCALC - This calcuator had many of the features of the calculator in the 200LX BUT it is missing the L()

ad G() commands which are really required for more complex solver programs.

HPPIM - Phone Book and Calendar program that used the same data files as the HP_200LX so you could take the Phone Book from the Calculator and use it with HPPIM on a Windows machine and vice versa.

Just noticed that you mentioned Windows 7. HPPPIM and HPCALC should run in 32 bit Windows 7, but will not run in 64 bit windows 7. There may be a way around this.

You probally will need to run DOSBOX to get the CPACK to to run on a 64 bit windows.

<edit> I just tried CPACK200 on a Windows 7 64 bit and it ran fine in DOSBOX.

Bill

Very interested. Thanks!

Gerson.

Re: HP200LX's Calc under Win7

*Message #9 Posted by **fhub** on 29 Sept 2011, 1:53 p.m.,*
in response to message #8 by Gerson W. Barbosa

Ok, here you go:
http://www.spaadyshare.net/569fgojaq6cf/HP200LX.zip

I've removed the Laplink files which are only needed for filetransfers between the real 200LX and PCs.

For starting the full 200LX emulator just run the first file HP200LX.BAT in the package, if you only want the integrated calculator then use the file HPCALC.BAT.

Have fun, :-)
Franz

>
> Any hints?

In what OS do you try to run it?
Since all apps are DOS programs, they don't run in Win7, so maybe trying them under DosBox would be an idea.

And try to delete the following 3 files:

```
APPMGRCP.DAT
SETUP.ENV
CALC.ENV
```

These are configuration files and have been created under my Win98, so maybe they aren't compatible with your OS.

And another idea:
try to run the emulation with APP200.BAT, this batchfile makes some tests before calling the emulator, so maybe you get an error message from this batchfile which tells a bit more!?

Re: HP200LX's Calc under Win7

*Message #14 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 10:42 a.m.,*
in response to message #11 by Pal G.

Adding a few lines to the batch files did it for me:

```
SET ALLUSERSPROFILE=
SET APPDATA=
SET CLASSPATH=
SET CommonProgramFiles=
SET include=
SET lib=
SET MSDevDir=
SET Path=.;C:\WINDOWS;C:\WINDOWS\SYSTEM32
SET PROCESSOR_ARCHITECTURE=
SET PROCESSOR_IDENTIFIER=
SET PROCESSOR_LEVEL=
SET PROCESSOR_REVISION=
```

Just get rid of most of the unnecessary environment variables. Just do a SET >clrenv.bat and see all the variables in your environment. Then add SET in front of each line and remove the text after the = sign for the variables which take up space. Some may be necessary for CMD.EXE to find the executables so just try which may be deleted. Start with the long entries first.

Error in wikipedia article on HP-35s (Solver)

*Message #1 Posted by **x34** on 23 Sept 2011, 1:13 a.m.*

wikipedia article http://en.wikipedia.org/wiki/HP_35s says "Equation solver (a feature first seen on the HP-34C)". While it is true that HP-34C was the first with RPN Solve, what was the first calculator with algebraic ALG EQN Solver?

Karl Schneider's article http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=556 does not give the exact answer, what model was the first with EQN Solver? HP-17B?

HP-41 Card Reader Error

*Message #1 Posted by **aj04062** on 22 Sept 2011, 11:36 p.m.*

I recently rebuilt my Card Reader. The card runs smoothly, but I consistently get Card Err or Malfunction or Checksum Error.

Some threads point to the 2 contacts. I swapped and checked to make sure they are flat. I applied contact cleaner as well.

I tried a different calculator, but that didn't work.

Suggestions?

Re: HP-41 Card Reader Error

*Message #2 Posted by **John Robinson** on 23 Sept 2011, 5:33 p.m.,*
in response to message #1 by aj04062

Hi Adam,

If you get inconsistent results, then I'd say there is hope. And I presume you had never seen such errors before the rebuild /

My guess is that you need to spend more time adjusting the roller pressure.

Is the motor struggling ?

Cheers, John

Re: HP-41 Card Reader Error

*Message #3 Posted by **aj04062** on 24 Sept 2011, 9:41 p.m.,*
in response to message #2 by John Robinson

I swapped the rebuilt drive assy with another card reader I had.

This assembly works great. So, I presume from browsing older posts, the cause of these errors/malfunctions could be the capacitor adjacent to the sense amplifier chip. I will try this next after I rebuild another drive unit.

Opening the HP49g+

*Message #1 Posted by **AdrianT** on 22 Sept 2011, 10:53 a.m.*

Good Day,

Does any know how to open this calculator? My decimal point button has broken off from the skeleton it's attached to and I want to replace the keyboard. The keyboard is on order after a long mission with HP... I've read one needs to drill (4mm bit) through the six heat stakes in the battery compartment but I only see 2 diagonally across from each other, and the two white looking things (rivets?) at the top. Any ideas?

Is the keyboard skeleton just like on cheapy calcs? A simple plastic part?

Thanks in advance :)

Thanks, Adrian

Re: Opening the HP49g+

*Message #2 Posted by **hpnewbie** on 22 Sept 2011, 7:15 p.m.,*
in response to message #1 by AdrianT

I imagine the hardware of the hp 49g+ is quite similar to that of the 50g. The enter key on my 50g went mushy, which is really annoying on an rpn/rpl calc where you're constantly mashing the thing. I asked for advice on this forum to fix the issue and successfully repaired my enter key with some glue and the advice in this thread - http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=171784 . Basically the post under the enter key and some of the other keys had punched clean through the foam backing that goes underneath the keyboard so they weren't getting the rebound that they were designed to. but on to how to open the calc...

To open the 50g up use a suction cup (you might need to moisten it to get maximum grip) to slowly pull the screen cover off, then find a small screwdriver to unscrew the screws behind the screen cover, then pull the two halves of the calculator apart with your hands (this is pretty hard, and will probably take a while.) Be careful not to pull it apart too hard or else you will break the wire that goes to your speaker, which is glued to the back cover of the calc. What I did was pull the speaker off the back cover so I could open the calc fully and lay it open. Then you need to unscrew a bunch of screws that go into the motherboard inside the calc, and use a drill bit to wear away the caps on the heat sticks (is that what they're called, the little plastic things that run through the motherboard to hold everything in position?). Once you've done this properly, you'll be able to separate the motherboard from the front side of the calc case, and access the keyboard.

On the 50g, I think all the keys were attached to a plastic framework thing except for the right and left shift things which are by themselves. The keyboard itself looks quite cheap honestly when you take it apart - the posts behind the keys are TINY.

Hope at least some of this is applicable to the 49g+, or someone else down the road looking to fix their 50g.

Re: Opening the HP49g+

*Message #3 Posted by **Bart (UK)** on 23 Sept 2011, 5:53 a.m.,*
in response to message #1 by AdrianT

Hi,

The drilling you describe is for the 48S/G series. As HPnewbie described, it is easier for the 49G+/50G. For a photo to see how to remove the screen, see here. There are two screws on the top of the screen. Once these are removed, you can carefully pry the calculator apart. I used plastic levers from what is commonly known as "mobile phone tools" (see this example)

Not really. Maybe for shareholders who get a temporary boost to their share value from the irrational exuberance that follows this announcement. However, I think HP is playing the last card out of their deck and it is going to land straight in the toilet.

Regards,

Mark

The epitaphy Hewlett-Packard Chief

*Message #8 Posted by **Artur - Brazil** on 22 Sept 2011, 8:27 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

Well, I can't understand how a group of idiots can lead such a historical company to the bankrupt!

First, the complete ignorant on tech - Ms. Karly. A celebrity of business!!! Ha,ha,ha ...

She starts the fall down of HP, putting the tech production - the real fundaments of HP - to a new enterprise, Agilent.

Each new CEO brings with him/her a home work from last firm the incumbence of making HP buying some putrid part of old job.

It's unbelievable how HP is far from its origin. How could such genious factory be quartered by ganancy and easy profit.

I really believe their own employees should buy each part that is still standing up and make new Agilents ... but in USA, all production line. Looking for low costs and producing everything in China (or wathever) is what I call: a shoot on own feet.

Re: The epitaphy Hewlett-Packard Chief

*Message #9 Posted by **Eric Smith** on 23 Sept 2011, 10:47 a.m.,*
in response to message #8 by Artur - Brazil

HP made plenty of stuff overseas in their heyday, and it wasn't a big problem. I don't think moving production lines to the USA would solve any of HP's current problems, but it would hurt their bottom line, either by a significant decrease to their profit margin, or increased list prices, either of which hurt the bottom line.

How overseas production is managed is another story. It can be done well, or it can be done poorly.

Re: The epitaphy Hewlett-Packard Chief

*Message #10 Posted by **Artur-Brazil** on 23 Sept 2011, 1:21 p.m.,*
in response to message #9 by Eric Smith

Hi, Eric

My feeling about producing something abroad is the basis on this is done: HP (and other inventors) is giving its technology to be copied. Also, when they privileges other to make all the service, I believe that they are loosing the capability of doing it at home...

HP calculators were always more expensive than others, I believe even TI ones, but this was compensated by their quality. You can operate your 11C, 15C or 41C until today, try do this with a TI-59 - it probably will have serious keyboard problems.

HP have produced its calculators here in Brazil too, but, at that time, there was no transfer of details or it would almost be impossible to replicate its hardware as it is today.

Well, any way, this is just my modest opinion. I really don't have all information to judge a big CEO or predict something. I just don't want to see people loosing their job due to bad administrators.

Re: Whitman Is Named Hewlett-Packard Chief

*Message #11 Posted by **Mark Harman** on 22 Sept 2011, 8:29 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

Worst. Decision. Ever.

Fiorina was horrible and destroyed the HP Way. Apotheker was a huge mistake and would have given away HP's cash cow if kept on board. However, Whitman? I think they would have been better off picking up someone who actually has vision and also gives a darn about engineering good products. Good luck, HP. It was nice knowing you.

Mark

Wall Street Journal: H-P Defends Hasty Whitman Hire

> I don't see this as bad. Whitman has a proven record with ebay.

I think ebay was in the right place at the right time - anybody with some experience could have grown it. The easy growth is done - just think of all the bitching and moaning that has occurred here with regard to their recent trends to try for more revenue by nickel and diming the sellers.

HP was different: they once had unquestioned superiority in test and measurement equipment (except, perhaps, oscilloscopes and niche equipment such as picoammeters). Every engineer in the US (if not the world) dreamt of the latest HP instrument for his lab. They spun that off (Agilent) and, IMHO, have been going downhill ever since.

You can sell only so many PCs and printers - so HP may be closer to ebay than one might think, in terms of stagnant product and marketplace. If she didn't turn ebay around, what is she going to do differently at HP.

Re: Whitman Is Named Hewlett-Packard Chief

*Message #17 Posted by **Dan W** on 22 Sept 2011, 11:14 p.m.,*
in response to message #16 by Dave Shaffer (Arizona)

eBay can nickel and dime people, and generally be as annoying as they want because they have no real competition. That's why we loath it so much, but we use it. Running a business without competition is going to be very different than HP. Having real concerns about customers, quality, and efficiency might be new concepts for Whitman.

(sigh) I don't understand (TAS revisited)

*Message #1 Posted by **Jim Johnson** on 22 Sept 2011, 3:45 p.m.*

How can someone bid an HP-15C Limited Edition up to $300.00??! . I just don't understand the logic behind the auction of a product that you can purchase brand new for between $99.99 and $149.99. There's some psychology in action here that doesn't make sense to me. LINK Thank goodness I had the sense to purchase 2 units when Buy.com had them for under $100.

Re: (sigh) I don't understand (TAS revisited)

*Message #2 Posted by **Michael de Estrada** on 22 Sept 2011, 3:58 p.m.,*
in response to message #1 by Jim Johnson

Many buyers are not aware of product sources beyond TAS and Amazon. Many have never heard of this forum. I didn't even know that Buy.com existed until I read a post about it on this forum. I also found out about CostCentral on this forum back in June, and was able to preorder, before they stopped taking orders. Also, many buyers live outside the USA and are limited in sources that will ship to them. For example, the auction that you linked will ship worldwide, but many others won't.

Re: (sigh) I don't understand (TAS revisited)

*Message #3 Posted by **Todd Garabedian** on 22 Sept 2011, 8:18 p.m.,*

You would think that potential buyers would check out the HP website store.

Re: (sigh) I don't understand (TAS revisited)

*Message #4 Posted by **Michael de Estrada** on 22 Sept 2011, 8:37 p.m.,*
in response to message #3 by Todd Garabedian

If they check the home store, it is out of stock, and most are not aware of the alternate business store. Some don't know anything other than TAS.

Re: (sigh) I don't understand (TAS revisited)

*Message #5 Posted by **Steve Simpkin** on 22 Sept 2011, 4:26 p.m.,*

in response to message #1 by Jim Johnson

But they are a "Limited Edition"! They are going fast! If you don't buy now you may be missing out! Pay any price! Just buy it!

Re: (sigh) I don't understand (TAS revisited)

*Message #6 Posted by **Michael de Estrada** on 22 Sept 2011, 4:30 p.m.,*
in response to message #5 by Steve Simpkin

Yes, and if you look at TAS today, there are many more listings now, and many at a lower price. For example, one listing is for 3 units at a $175 BIN price each with free shipping. Funny how a competitive market works.

Edited: 22 Sept 2011, 4:31 p.m.

Re: (sigh) I don't understand (TAS revisited)

*Message #7 Posted by **Geoffrey Wang** on 22 Sept 2011, 5:01 p.m.,*
in response to message #6 by Michael de Estrada

Since I'm a newbie, why is the acronym TAS used? It's not mentioned in the terms and conditions or in a FAQ.

BTW, there's only 2 left of the $175 BIN and the rest of the lower priced ones are gone.

Would you sell one of your stashed 15CLEs for $175 with the possibility that HP won't make more than 10K?

Re: (sigh) I don't understand (TAS revisited)

*Message #8 Posted by **Martin Pinckney** on 22 Sept 2011, 5:08 p.m.,*
in response to message #7 by Geoffrey Wang

Forum rules: if you mention an eB** auction, you have to list your own eB** handle in the post.

Re: (sigh) I don't understand (TAS revisited)

*Message #9 Posted by **Michael de Estrada** on 22 Sept 2011, 5:10 p.m.,*
in response to message #7 by Geoffrey Wang

TAS stands for "That Auction Site" and refers to eB*y. It is a matter of political correctness on this site not to refer to it directly. As to selling prices, the one referenced in the OP started out at $9, but has been rapidly bid up to $300. As to the risk that HP won't make more than 10K, I didn't buy mine to speculate, but to keep for all eternity, so what I could get for them is irrelevant.

Re: (sigh) I don't understand (TAS revisited)

*Message #10 Posted by **Michael Kussmaul** on 23 Sept 2011, 2:55 a.m.,*
in response to message #9 by Michael de Estrada

Funny :-) Now as former TAS CEO is taking over HP... Perhaps we should teach the media to replace eB** with TAS on every news outlet :-)

Re: (sigh) I don't understand (TAS revisited)

Equivalent generic part # for HP cold-cathode displays...

*Message #1 Posted by **Nick de Smith** on 22 Sept 2011, 3:29 p.m.*

Hi,

HP used an internal scheme for number display devices used in old test equipment and calculators.

I'm looking for an equivalents (i.e. to generic part numbers) list for cold-cathode display tubes (nixie & panaplex displays etc.).

HP used a numbering scheme of the form "1970-xxxx" for these parts. I've found partial lists out there (e.g. at Sphere), but not a complete one.

Any help appreciated,

Nick

Meg Whitman announces stunning strategy shift at HP

*Message #1 Posted by **Howard Owen** on 22 Sept 2011, 1:00 p.m.*

> Quote:
>
> Egan Ford:
>
> Meg probably rolled into the boardroom and amazed the board with the profits of HP calc's on eBay.

In related news, HP's soon to be not yet CEO Meg Whitman announced a plan to spin off every line of business in HP's portfolio but calculators. "We see a tremendous opportunity in handheld calculating devices," Whitman stated, in a not actually quite yet a CEO interview with selected members of an online calculator forum. "The value of physical buttons cannot be over-emphasized. Take that, iPhone!"

In separate interview, almost pre-announced HP CEO Meg Whitman announced a patent suite against Google, Oracle, Microsoft, Facebook and IBM. Two patents are at issue. The first describes a "method and apparatus for summing two numbers." The second concerns "A cookbook recipe for making calculator keys feel nice and clicky without necessarily indicating a successful registering of the keystroke."

The announcement was coupled with a new video depicting Google CEO Eric Schmidt as a bizarrely garbed wolf among a flock of hapless calculator toting sheep.

ROFL! Thanks, Howard! (nt)

Maybe HP's problem is they have a "strategery"
(sorry, I couldn't let that go ;-)

Re: Meg Whitman announces stunning strategy shift at HP

*Message #6 Posted by **Glenn Dowdy** on 22 Sept 2011, 5:12 p.m.,*
in response to message #5 by Walter B

How can we be a strategerific company without a strategery? ;)

Re: Meg Whitman announces stunning strategy shift at HP

*Message #7 Posted by **Calum Tait** on 22 Sept 2011, 9:01 p.m.,*
in response to message #6 by Glenn Dowdy

Surely a stratergy of paying lawyers millions and spending years of time and all the company's effort in court fighting patent suits is completely stratergificacious?

Re: Meg Whitman announces stunning strategy shift at HP

*Message #8 Posted by **Howard Owen** on 22 Sept 2011, 10:47 p.m.,*
in response to message #7 by Calum Tait

That's not a strategy HP is defining on its own. That's the result of a broken system that allows patents to be used as anticompetitive weapons. The system is such that you have to pay those lawyers and engage in litigation whether you think it's a good idea or not. HP certainly isn't the worst offender in that column either.

I just thought patents on addition and clicky keys would add to the joke. :)

Re: Meg Whitman announces stunning strategy shift at HP

*Message #9 Posted by **Walter B** on 23 Sept 2011, 4:00 p.m.,*
in response to message #8 by Howard Owen

May well be the system is broken at more than one end. By the mere rumor of L.A. been fired, HP's stock raised by 10% IIRC, by the knowledge of M.W. been chosen it dropped by 6%. Gives a nice math problem: Assume the rating is now as it was before the rumor, find how high it is ;-)

Seriously: When do we stop those casino players controlling our business? And ruining world economy? The longer I observe this and think about it the more I become a friend of Tobin tax.

in response to message #13 by Steve Simpkin

> Quote:
>
> I am thinking Meg Whitman is the joke :)

Actually, it's the whole HP Board that is the joke. They've got through, what, 7 CEOs in 10 years? Apoetheker lasted less than a year. Not a good track record. IMHO, the entire Board should be replaced. As a shareholder, I'm peeved!

Re: Its Official: Meg Whitman is announced as the new CEO of HP

*Message #16 Posted by **Walter B** on 23 Sept 2011, 1:53 a.m.,*
in response to message #15 by Todd Garabedian

Took the opportunity and checked the board. Some "statistics":

Of 13 people listed, 1 is member of the board since 2002, 1 since 2005, 2 since 2006, 2 since 2009, and 7 since 2011.

The vast majority seems to qualify by a background in "private equity/venture capital" and/or "counselling/consulting". Found very little traces of tech bases only. And I love Meg's record ;-)

Looks pretty desperate :-(Time to abandon the ship heading to floral business, and create/found/establish something new in the spirit of Bill and Dave? Maybe even in a country where case law doesn't rule? Really hard to tell :-/

And in light of those folks, all the nutty decisions in recent years make sense. First they decide to make a tablet, then they abruptly stop. Then they decide to get out of the personal computing business, then they abruptly reverse course. There appears to be no direction and no adult in the room to point the way. I hope Meg can do that.

Hp 97 faint printer

*Message #1 Posted by **Fouad M. Kaadou** on 22 Sept 2011, 10:35 a.m.*

Hello HP Museum, I have an HP-97 with faint printing, what can I do to fix this? possibly a capacitor or resistor change. The printing is variable. Take a look.

Thanks in advance,

Fouad

Re: Hp 97 faint printer

*Message #2 Posted by **Fouad M. Kaadou** on 22 Sept 2011, 10:38 a.m.,*

Re: Hp 97 faint printer

*Message #3 Posted by **Katie Wasserman** on 22 Sept 2011, 11:08 a.m.,*
in response to message #2 by Fouad M. Kaadou

The two recommended fixes for this are:

1) Try new paper. You can buy it a most office supply stores or on-line.

2) There is a resistor (R8) on the 97 printer controller board that can be changed to control the print intensity. See page 2-4 of the service manual. From my experiments this doesn't have a huge effect, but some.

Edited: 22 Sept 2011, 11:08 a.m.

Re: Hp 97 faint printer

*Message #4 Posted by **Fouad M. Kaadou** on 22 Sept 2011, 11:42 a.m.,*
in response to message #3 by Katie Wasserman

Hello Katie,

I have tried different paper and have tried the same paper on my HP-41c printer and printing was excellent so I am pretty sure the paper is not the problem.

I do not own the HP-97 service manual. Can you email me the necessary pages to do this resistor upgrade?

Regards,

Fouad

Re: Hp 97 faint printer

*Message #5 Posted by **Dan W** on 22 Sept 2011, 2:25 p.m.,*
in response to message #3 by Katie Wasserman

That really does look like the result of old paper to me. I would first try new paper.

It could be a build up of some gunk on the print head I suppose. I have repaired a lot of HP-97 printers and they have all responded well to a good cleaning. I have never had to change the resistor. Take it apart, clean everything and rebuild it. The really good news is the paper appears to be advancing evenly, a common problem that is a bit more difficult to fix.

Rebuilding the printer is intimidating at first but really isn't difficult. Get the technical manual from the museum DVD - it is an excellent investment and not expensive.

Side question: Is there any source of modern blue printing thermal paper?

Re: Hp 97 faint printer

*Message #6 Posted by **Fouad M. Kaadou** on 22 Sept 2011, 3:23 p.m.,*
in response to message #5 by Dan W

Hello Dan,

I have tested the same paper on a HP-82143a thermal printer for the HP-41c and it works fine. Could it be that the 82143a printer has just better printing power than the HP-97 and works better on old paper? I will definitely take your suggestion and try to clean the print head.

Thanks,

Fouad

HCC2011 and some 15LE observations

*Message #1 Posted by **geoff quickfall** on 22 Sept 2011, 9:56 a.m.*

Sitting at the airport waiting for my early morning flight. For all those travelling to HCC; by car or air, have a safe journey and see you there.

Wlodek and I are meeting in LAX, then a slow drive to San Diego and at the hotel by Thursday night. See you in the lobby.

My two HP 15LE arrived yesterday, serial numbers at the 500 level. No crooked or loose keys.

Interestingly enough: if you are QUICK, you can get the classic keyboard test to work:

Invoke the test with "/ and the ON key" and then quickly press the square root key and then each succesive key as with the 15C.

You just have to get to the square root key quickly or you get error 9. Once completed the classic 15 will show in the centre of the display.

Of course the new tests are similar to the HP 12:

"g" + "ENTER" pressed together then the "ON"key.

And in case it has not been explained well enough, the flashing porcedure for the 15LE is the same as flashing the 34S. Cable, Samba and away you go.

Cheers, Geoff

Cheers, Geoff

in response to message #1 by fhub

Hi,

i'm just going to add another twist here.

a bit late to the party, but i just tried the same acos(cos((200+200i)) on my reckon calculator. unfortunately it fails too. i am using an equally lame formula.

i changed my acos(z) routine to use this:

```
acos(z) = -2i*log(sqrt((1+z)/2) + i*sqrt((1-z)/2))
```

it's from Kahan 1987, but i dont have the paper with the theory behind it. anyhow it works fine for this problem. i've changed reckon to use this way of calculating acos and asin.

```
> acos(cos(200+200i))
1.06192982974676726160917 8-199.99999999999999999999i
```

my 2c.

-- hugh.

looks like my test case is getting a lot of attention :-)

thanks for the formulas, it's an interesting approach.

Best, 'AM.

Re: Free42 - A Complex glitch?

*Message #4 Posted by **Thomas Okken** on 22 Sept 2011, 9:36 p.m.,*
in response to message #1 by fhub

I'll fix the complex ASIN and ASINH in the Binary version this weekend, and check if any of the other code that uses atan2() in the Binary version is affected by the "negative zero" issue.

The "negative zero" thing only affects the Binary versions, so that doesn't affect my iPhone and Android builds, which are Decimal only. (Is anyone aware of problems with Free42's complex ACOS/ACOSH?)

Another 15C LE speed test

*Message #1 Posted by **Katie Wasserman** on 22 Sept 2011, 12:45 a.m.*

I know that you've all been waiting for my pi calculation test so here it is (scroll to the bottom). :) 306 decimal digits of pi in a bit over 16 minutes. This works out to about 160 times as fast as the original 15C, nice!

Edited: 22 Sept 2011, 12:47 a.m.

Re: Another 15C LE speed test

*Message #2 Posted by **hpnut** on 22 Sept 2011, 4:18 a.m.,*
in response to message #1 by Katie Wasserman

thanks Katie. I'll put my 15C LE to the torture test tonight and share the results here.

Re: Another 15C LE speed test

*Message #3 Posted by **Marcus von Cube, Germany** on 22 Sept 2011, 10:39 a.m.,*
in response to message #2 by hpnut

You all should measure the battery voltage before and after the test. It would be interesting to know how much we can get out of the batteries with heavy use. @20mA and a rating of 220mAh per cell it will not be more then 22 hours.

Re: Another 15C LE speed test

*Message #4 Posted by **Katie Wasserman** on 22 Sept 2011, 11:21 a.m.,*
in response to message #3 by Marcus von Cube, Germany

> Quote:
>
> @20mA and a rating of 220mAh per cell it will not be more then 22 hours.

Actually it's much, much less than this.

The 240mAh (Energizer's) rating is based on a continuous current draw of 0.19mA. At higher current the capacity drops off very rapidly. They give a pulse rating of 200mAh based on 12 2-second long pulses per day of 6.9mAh. The pi program is a 960 second long "pulse" at 3 times this current (but drawn from 2 cells, so really 1.5x this current). This simply destroys the cells. I'd estimate only a couple of hours running long programs on the calculator at best.

~ btw, where can the flash cables be purchased and are they USB or serial interface?

Re: Another 15C LE speed test

*Message #6 Posted by **M. Joury** on 22 Sept 2011, 11:55 a.m.,*
in response to message #5 by DigiGal

Gene has a few left apparently. He has asked for a moratorium on requests until after HHC. He sends them out for the cost of shipping and I don't know what is going to happen when they are all gone.

They are serial cables and they are finicky about the USB-Serial converter you use (if you have to use one). Someone else will be better able to tell you which converter or adapter to use.

Hope this helps a little.

Cheers,

-Marwan

Thanks for this info, hopefully there may be some news of an update that will come out of the conference. I'm on a mac, it only has USB/Firewire but could access a pc with a serial port if necessary for the update.

Seems if the cables are finicky and scarce perhaps HP will establish update centers or maybe a forum member may offer the service. Since HP has lots of uncertainty at the moment this is most certainly a low priority for them now. Appears we're just lucky they released the 15C LE, thanks to some dedicated folks within.

Fortunately, I've got my original 15C for daily use so my 15C LE is a secondary unit which will help maintain it's battery life until a solution unfolds.

Re: Another 15C LE speed test

*Message #8 Posted by **Marcus von Cube, Germany** on 22 Sept 2011, 10:23 p.m.,*
in response to message #5 by DigiGal

The current draw is a direct function of speed. So the 20mA while a program is running cannot be addressed by a firmware update without severely lowering the speed.

Re: Another 15C LE speed test

*Message #9 Posted by **Katie Wasserman** on 23 Sept 2011, 2:12 a.m.,*
in response to message #8 by Marcus von Cube, Germany

> Quote:
>
> The current draw is a direct function of speed. So the 20mA while a program is running cannot be addressed by a firmware update without severely lowering the speed.

The 20ma during a key press is certainly fixable in firmware, the 12C+ uses only 0.5ma when a key is held down.

The current draw when running a program is nearly perfectly linear with clock speed. Indeed the "L" in the chip's part number (AT91SAM7L128) is there to indicate that the current draw is 0.5mA/MHz. The maximum advertised clock rate is 36MHz and there's not much else in the calculator that consumes appreciable power. So the 15C LE must be running at maximum speed.

They could keep the clock at full speed for say, the first second or two of running a program or function and throttle is back to 5 Mhz or less and still advertise the 100x speed up, I think.

Better still would be a self test-mode function (number 4, for example) that would allow the use to toggle between full clock speed and 1/10 speed (or so). Running at 4MHz translates to 1ma/cell and would give you around 300 hours of run time on a set of batteries.

Marcus, you've got a SLOW/FAST toggle in the 34s, what are the corresponding clock rates? I think all ARM-based HP calculators should have this toggle.

Re: Another 15C LE speed test

> Indeed the "L" in the chip's part number (AT91SAM7L128) is there to indicate that the current draw is 0.5mA/MHz.

It's more in the range of 1mA/MHz according to my measurements.

Re: Another 15C LE speed test

*Message #11 Posted by **Katie Wasserman** on 23 Sept 2011, 11:37 a.m.,*
in response to message #10 by Marcus von Cube, Germany

> Quote:
>
> It's more in the range of 1mA/MHz according to my measurements.

That's pretty far out of spec from what I can tell. Even if all the peripherals are on it shouldn't be that high. Maybe HP got a deal on out-of-spec raw chips.

In looking at the original schematic in the hp-20b SDK I see that they apparently planned to run this on a single 2016 cells with a second one optional, ha! They must have been thinking at running this at a much lower clock rate originally.

Re: Another 15C LE speed test

*Message #12 Posted by **Marcus von Cube, Germany** on 23 Sept 2011, 12:27 p.m.,*
in response to message #11 by Katie Wasserman

I obviously haven't recalled my own measurements correctly. At full speed, WP 34S consumes 20mA. See here. It's not running at 40 MHz though so 0.5mA/MHz is a bit on the optimistic side.

Re: Another 15C LE speed test

*Message #13 Posted by **Mike Morrow** on 23 Sept 2011, 12:44 p.m.,*
in response to message #9 by Katie Wasserman

> Quote:
>
> Indeed the "L" in the chip's part number (AT91SAM7L128) is there to indicate that the current draw is 0.5mA/MHz.

I thought (wrongly) that the "L" just indicates that it has on-chip LCD display driver circuitry. The AT91SAM7S128 is almost identical except that it lacks such circuitry. NOTE: Edited to correct wrong information.

> Quote:
>
> They could keep the clock at full speed for say, the first second or two of running a program or function and throttle is back to 5 Mhz or less and still advertise the 100x speed up, I think.

That would then constitute a dishonest claim, IMHO.

A program that takes five seconds on the 15C-LE would take ten minutes on the original 15C. Such programs, if they are to run at all, should not be slowed after an arbitrary time elapse. And if such programs will never be run, then there is no real battery life issue.

I want the SAM7L in my 15C-LE running at maximum capacity. That is, after all, the *only* characteristic that is an improvement over the original HP-15C.

Quote:

> Better still would be a self test-mode function (number 4, for example) that would allow the use to toggle between full clock speed and 1/10 speed (or so).

Excellent idea!

Re: Another 15C LE speed test

*Message #14 Posted by **Marcus von Cube, Germany** on 23 Sept 2011, 12:56 p.m.,*
in response to message #13 by Mike Morrow

The L stands for the low power modes. The chip can power down each and every single component and can even reduce the kernel voltage below 1.8V if set to a lower speed. It has wake up pins which enable the "being dead but looking alive" mode used in the latest HP calculators. The chip is powered down except the LCD and some wake-up logic tied to the keyboard while the calculator is waiting for user input.

Credit card and 15C

*Message #1 Posted by **Mark Storkamp** on 21 Sept 2011, 10:46 p.m.*

Just a heads up to those who purchased the 15C LE. I purchased two, one each at two different merchants mentioned here. That's the only time I've used my credit card in the last two or more months. The day after one of the charges went through, I started getting fraudulent charges. Could be a coincidence, might not be. You might want to carefully review your next statements.

Re: Credit card and 15C

*Message #2 Posted by **bill platt** on 21 Sept 2011, 10:54 p.m.,*
in response to message #1 by Mark Storkamp

It is most likely not a coincidence. I *never* had a fraudulent charge on a card, ever* until the internet. $19000 (yes 3 zeros) a year ago (that happened while using a Mexican computer in a hotel) and also a few thousand in New Jersey, after buying an ANSI standard.

I am convinced that many of these so called "secure" sites are totally hacked. I also fail to understand how there can be useful "encryption" when the key obviously has to travel with the rest of the data--it isn't like there is a password coming by US mail first!

(* years ago, 1992, I had an item, one item, charged in Michigan, on a card which I had just received in the mail and never yet used at all. I think it was an account number screw-up!)

Most likely they are. Likewise for your PC.

I've heard several times that the time until hacked for a Windows machine on the Internet is in the 30 - 45 *seconds* range. This matches the the times we saw reported back when I was doing computer security incidence response work.

The crooks have the latest antivirus software. They code around it. If you machine is hacked these days, you won't and quite possible can't detect it.

> Quote:
>

With some rather clever mathematics there are ways to set up an encrypted session without transferring the key information. This only protects the data in transit between your computer and the vendor's. At either end, the information is unencrypted and that is where it will be stolen.

Bingo. Most credit card numbers get stolen by malware on a user's PC. This can be as simple as an email directing the user to what looks like a merchant site or a bank. Once you follow the link, it looks very, very similar to what you are used to seeing. You enter your credit card info and *poof* you are toast. (Checking the address bar to verify the site is what it should be is a good defense against this sort of thing. Another is to be very wary when following links from email.)

Another type of credit stealing malware is a "key logger." This logs the keystrokes you type, thus stealing passwords or CC numbers directly. This lovely beast is sometimes the payload of a virus. Regular scans with up-to-date virus definitions can help minimize this, as can software designed to find malware. The antivirus companies can't know about every threat. They do their best, but there's usually a lag between a new threat showing up and deploying an updated scan definition. Never, ever transact business on a shared PC. Those things can be accessed by anyone sitting in front. It's child's play to install malware when you have physical access to the machine.

If you have anything really valuable, none of those precautions will help. Billion dollar inside information and national secrets get subjected to attacks that beggar belief. (You only rarely hear about the existence of such things, let alone the technical details of how they are implemented, but some details of how information warfare is conducted have leaked out in the last couple of years.) So it's good to be ordinary in this regard. The strength of the herd is reasonably good protection. Unless you are targeted, normal precautions and expensive resource stealing software (read: AV) keep you mostly safe.

Don't for get used HDs. A while back I caught a documentary on e-waste. Long-story-short, your HDs end up in Africa where they extract any remaining data for fraud purposes.

All of my old floppies, HDs, CDs, flash memory, and tape are in a large box in the basement waiting for me to take them to the shredders. I've got stuff back to the '80s.

The best antivirus programs kill the user. :-) I've never had a problem with this using OS/X, Linux, or Windows (for 15 years). Commonsense and mistrust is your best defense.

If you do use a screwdriver (a small Torx - 8 or 9 - is necessary, in my experience), you can get the platters out quite easily - and smash them with your hammer if so inclined. You SHOULD save the very nice platter ball bearing for some home project. If you don't want it, please send it to me! You also get a couple of very strong magnets to play with.

Cryptography and security

*Message #10 Posted by **Eric Smith** on 22 Sept 2011, 1:12 a.m.,*
in response to message #3 by Paul Dale

Diffie-Hellman Key Exchange doesn't by itself give you much security, because there could be a man-in-the-middle that is separately negotiating DH with both parties. This is why the SSL and TLS secure session protocols need certificates, which are digitally signed proof of identity of the server.

Of course, there can still be problems. For instance, a certificate authority might be compromised, as recently happened with DigiNotar . That was serious enough that the company was taken over by the Dutch government, and the owners declared the company bankrupt.

Or the SSL/TLS protocol might have flaws, such as some that were just discovered in SSL version 3.0 and TLS version 1.0: Hackers break SSL encryption used by millions of sites (Versions 1.1 and 1.2 of TLS are not affected, but no common browsers or web servers support them.)

Cryptography is hard to get right. Anyone who tells you otherwise is a fool. The actual cipher (e.g., AES) may not seem to complicated, and it might not be too hard to implement it, but the cipher is only the beginning of what is necessary for secure cryptography. Getting the protocols right is incredibly difficult even for the experts, which is why SSL 3.0 and TLS 1.0 have this flaw.

You can't get security just by buying a product that is advertised as being secure. Any salesman that tells you otherwise is a liar and a thief. As Bruce Schneier says, security is a process, not a product.

I definitely agree here. It is possible to circumvent such key exchanges. However, the easiest line of attack is to simply compromise an end point. I don't remember ever seeing a man in the middle attack or even hearing of one taking place. Theoretically possible for sure but not worth the effort.

Even with a perfect cryptographic system in place, a couple of thugs and a wooden stick and you'll divulge your passwords in time. Very well expressed in this web comic: http://xkcd.com/538/.

Attackers will always choose the weakest link. That isn't the key exchange or a man in the middle or the cryptographic algorithms for the kind of transactions we're likely to be doing.

- Pauli

Re: Cryptography and security

*Message #12 Posted by **Howard Owen** on 22 Sept 2011, 2:26 a.m.,*
in response to message #11 by Paul Dale

Why do cryptography at all? Obviously, without end-to-end encryption, commerce on the Internet would not exist as we know it. It's a matter of trust. Yes, it's hard to do cryptographic protocols, period. Doing it with untrusted endpoints makes it tougher. Given that, how hard should we try to get transport security right? Hard enough to offer sufficient protection at a bearable cost. What is sufficient protection? Enough protection to ensure that transactions are not subverted to the point that people stop trusting the transport. What is a bearable cost? A low enough cost that those who pay it can afford the transport security, and the trust it brings. What is that trust worth? A **lot,** so merchants who depend on that trust pay a lot to maintain it. That's the economics of TLS at scale. It's all about trust.

Keeping something absolutely safe is very, very tough. End points are vulnerable. People do things they shouldn't with passwords and the like. If somebody wants a piece of information stored on my laptop badly enough, they can get it for a some amount of effort and expense. If they don't mind me knowing about it, they can burglarize my apartment. If they want to keep their interest secret, they can get malware on my machine. (I hope that will cost them a little more than doing the burglary, but I'm probably fooling myself. :)

Do I shop on the Internet? Of course! Why? Because *I've never been ripped off, and I'm like almost everybody out there!* I maintain some minimum level of client security. I have different passwords for different sites. I'm careful about what I click on. I use a Mac, which helps a little. Given all that, the trust paid for by Internet merchants is enough to convince me it's "good enough." I do this in spite of the knowledge that practically any bad guy anywhere can pwn my Mac if only they care to spend enough time and/or money. *I don't have anything worth that much time and effort!* So practicality cuts both ways. It is impractically expensive to achieve "perfect" security. But it's also impractical to put out too much effort to get through a prudent set of precautions. There's just too much lower hanging fruit out there. :)

> I don't remember ever seeing a man in the middle attack or even hearing of one taking place. Theoretically possible for sure but not worth the effort.

Come to one of my classes - I demonstrate them quite often. ;)

The reason they work is that the software concerned usually pops up a warning dialog or message along the lines of "Danger, Will Robinson! This site/server is possibly fake! It doesn't seem to know the correct private key! Danger! Danger! Do you want to proceed [Yes] [No]"

And guess which button the [*&^%$$%^&] user presses?

But I agree - rubber hose cryptography is usually faster, cheaper and less risky for the attacker.

Sometimes it is, sometimes it isn't. It depends on the specific circumstances.

> Quote:
>
> I don't remember ever seeing a man in the middle attack or even hearing of one taking place. Theoretically possible for sure but not worth the effort.

Man-in-the-middle attacks happen all the time. They're not just theoretical. There was a serious problem with MITM attacks against SSL in 2007, and software vendors offered

patches/upgrades to protect against it. Part of the problem is that many people do not install such patches/upgrades.

Most likely the motivation for compromising DigiNotar to obtain fraudulent certificates (e.g., for google.com) was to enable criminals to more easily do man-in-the-middle attacks, since fraudulent certificates make that even easier than the recently discovered SSL/TLS vulnerability.

> Quote:
>
> Even with a perfect cryptographic system in place, a couple of thugs and a wooden stick and you'll divulge your passwords in time.

The existence of that threat model exists does not excuse being lax about making systems and networks secure.

That one always cracks me up. And people say brute-force attacks take too long. :-)

Re: Credit card and 15C

*Message #18 Posted by **Les Bell** on 21 Sept 2011, 11:50 p.m.,*
in response to message #2 by bill platt

> Quote:
>
> I am convinced that many of these so called "secure" sites are totally hacked. I also fail to understand how there can be useful "encryption" when the key obviously has to travel with the rest of the data--it isn't like there is a password coming by US mail first!

Most merchants who accept credit card payment online have to comply with the PCI DSS (Payment Card Industry Data Security Standard) requirements. These are fairly prescriptive, rather than talking in general terms - e.g.

> Quote:
>
> "3.4 Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: * One-way hashes based on strong cryptography (hash must be of the entire PAN) * Truncation (hashing cannot be used to replace the truncated segment of PAN) * Index tokens and pads (pads must be securely stored) * Strong cryptography with associated key-management processes and procedures

(PAN = Primary Account Number = credit card number)

Most small merchants can self-audit, but would find the compliance requirements too burdensome, while larger merchants have to undergo and audit by a qualified assessor. For these reasons, many merchants prefer not to handle credit card numbers at all, but instead hand off the payment processing to an external provider (their bank, PayPal or some other service provider) whose pages may (or may not) be branded with the merchant's logo & color scheme, etc.

I ordered a 15CLE from Samson Cables, but didn't notice whether they did this; however, I did just check and see that they provide a "secure contact form" via an external provider and expect that they handle CC processing the same way.

As a result, even if a small site is "totally hacked", there are generally no credit card details there to be compromised.

As to what is known as "the key exchange problem" (how does Alice get a key to Bob without Eve [the eavesdropper) getting it?), public key cryptography solves that. When your browser enters SSL/TLS mode, it fetches a certificate from the web site which contains the site's public key, checks out the certificate and extracts the public key. It can then do one of two things:

a) either generate a short-term session key and encrypt it with the web site's public key and send it to the site (where the private key is used to decrypt it, or

b) use the Diffie-Hellman Key Agreement Protocol to arrange for both ends to come up with the same session key, while an observer can't deduce it.

Which technique is used really depends upon what the web server software is and how it is configured. Either way, all subsequent data is transferred using symmetric cryptography (for speed) in both directions. (I've simplified the actual TLS protocol, but this is basically how it works).

(I teach this stuff at the university where I'm doing my PhD).

So, I wouldn't panic, and I wouldn't worry too much about shopping online. It certainly wouldn't stop me ordering another 15CLE if I needed one urgently!

Best,

--- Les

Re: Credit card and 15C

*Message #19 Posted by **Ed Look** on 22 Sept 2011, 1:01 a.m.,*
in response to message #18 by Les Bell

Les, your post is impressively knowledgeable and therefore, comforting. It also reinforces my belief that the encryption on these sites are generally acceptable, rendering any transactions, in themselves, safe.

But I agree with other posters who have said that it is the relative insecurity at the other end of the transaction that permits the theft of credit card numbers or passwords, and the like. I have had some circumstantial hints that personnel at commerce sites and banks do not always observe or adhere to secure protocols. Years past, when checks were processed by banks, I suppose, with more people involved, some employee of my bank mailed back to me, in a handwritten envelope with a handwritten note, some checks that had been written by me and found by the unidentified person unattended at an improper location somewhere in their offices. (Complaints to the bank elicited little response.) I have seen in news reports that store and bank employees have been caught and arrested for stealing credit

card numbers along with other information.

It is possible that some of the fraudulent charges on the accounts of some here could have arisen in this way, i.e., either by sloppy handling or outright theft at that end, and not during the electronic transaction.

Re: Credit card and 15C

*Message #20 Posted by **Les Bell** on 22 Sept 2011, 2:37 a.m.,*
in response to message #19 by Ed Look

Ed, I agree that most people aren't particularly security-conscious; that's why the processes for dealing with credit-card payments are increasingly designed to keep the CC# away from people. ;) For example, in the scenarios I described, the clerical people at the merchant never see the CC# - they just get an "approved" indication (by email, a web interface, etc.) from their bank or payment gateway. Their systems never see the number, either.

Which leaves the other parties who do actually handle the CC# - the payment processors and the customer themselves. PCI DSS compliance of payment processors is no guarantee - remember Heartland Payment Systems (think I've got the name right - I'm going on memory here) who were breached while having passed audit. However, the publicity - not to mention direct and indirect costs - associated with such breaches means that senior management is getting the message and the situation has been improving. Gradually.

At the customer end, a malware infection on the computer or a hardware keystroke logger can capture all data entered via keyboard. The only defences here are use of good, frequently-updated antivirus or anti-spyware programs, and being alert. However, even that won't always protect you. One example I've been discussing with my students is the "osCommerce willysy mass infection incident" (I can't reveal too much here, as my students are doing an exercise on it, due in 10 days' time (!) but Googling will turn up info). In this case, vulnerabilities in an open-source merchant server product were used by attackers to inject two different malware exploits onto the Windows PC's of any shoppers who visited infected stores. It took a few days before the antivirus vendors caught up with that one, and at its peak a few weeks ago, Google was reporting approximately 8 million web pages infected with the malware. :(

The other mechanism that leads to breaches is credit card skimming, either by devices attached to the front of ATM's, or hand-held devices used by people who physically handle your card - and I think that's what you're alluding to. However, that mechanism probably doesn't apply in the case of these particular purchases.

In summary, for a reasonably switched-on user with a half-way decent antivirus program (and there are some good free ones) the risk of credit card fraud (particularly in this market) remains very low.

Best,

--- Les

Who has the highest 15c LE number?

*Message #1 Posted by **MBlount** on 21 Sept 2011, 4:05 p.m.*

Might be a good indication of how many have been sold and how many are left to be delivered. I've got 2306 purchased from buy.com on the first day of availablity. That's one of the highest numbers I've seen. It would appear there are still in excess of 7,000 units that have not made it to retail yet which should help on the $200+ prices they are currently commanding.

Seems like they are trickling in on the slow boats from China.

in response to message #4 by Glenn Dowdy

No one expects HP to reveal the amount, but at least you had the guts to ask, Katie.

I started thinking. Googling revealed that standard shipping containers are either 1172 CF or 2390

CF. The 15c LE presentation box is approximately 2.7"x6.3"x8.7", or 0.0856 CF each (calc'd on 15c, verified with attached units on 48sx). I'm going to add 15% to account for corrugated shipping box and dead space in the container. (0.0984 CF/15c).

That indicates full containers might hold either about 11,900 or 24,300 calculators. What does this tell us? Nothing, basically. But I had fun doing it.

*Message #17 Posted by **Paul Dale** on 21 Sept 2011, 6:59 p.m.,*
in response to message #1 by MBlount

There is actually a decent way to estimate this under the assumption that serial numbers are allocated sequentially (which means we'd discount the #888,888 unit).

If the highest serial number seen is s in a sample of n serial numbers, then the estimate for the total number produced is s + s/n - 1. From memory, this is the minimum variance unbiased estimator -- i.e. it has some good optimality properties.

For those interested, this is known as the "German tank problem" and it came about because the (Western) allied forces in the second World War needed to know how many tanks the Germans had. German tanks being better meant that a significant numeric superiority was required. However, the method is applicable to just about any problem were you have a sequential numbering to sample from.

Re: Who has the highest 15c LE number?

*Message #18 Posted by **Katie Wasserman** on 21 Sept 2011, 9:07 p.m.,*
in response to message #17 by Paul Dale

Interesting stuff and good to know if we're ever at war with the HP calculator division!

The problem with this method of analysis is that it only tells you how many calculators (or tanks, whatever) have been distributed up to this point or projecting into the future at a constant rate. But we know that the future is "limited" and I don't see how this will help until all the calculators that will be distributed are distributed.

Re: Who has the highest 15c LE number?

*Message #19 Posted by **Paul Dale** on 21 Sept 2011, 9:13 p.m.,*
in response to message #18 by Katie Wasserman

It only estimates the number distributed if they are distributed starting from number one onwards. I very much doubt this is the case, they'll most likely be distributed a little more randomly than that but

not completely at random -- cases will be opened and units shipped from that case but a new case won't be opened until the old one is finished.

If the units are being shipped out at random then it will provide an estimate of the total number shipped. However, it breaks down once all of them have been shipped and sold and the sample size gets large in proportion to the total.

Still it might be a start...

- Pauli

Unfortunately, the estimators used in the German tank problem assume a uniformly random sampling of serial numbers. This does not seem to be the case here.

Android: 15C Scientific Calculator

*Message #1 Posted by **Howard Owen** on 21 Sept 2011, 3:49 p.m.*

The first and only 15C emulator on Android is from Vicinno Soft. They also have a 12C emulator on Android. With all the talk of the GSB -I bug, I figured it would be a good test to try to try on the Android app. I wrote the following test program:

```
001    42,21,11      LBL A
002    0             0
003    43,30, 0      TEST 0
004    43  32        RTN
005    3             3
006    16            CHS
007    44 25         STO[I]
008    32 25         GSB[I]
009    31            R/S
```

edit: align columns properly.

On my classic 15C in FIX 4, I run the program like this:

```
[f][A]    - see "-3.0000"
[g][P/R]  - see "000 -"
```

We load zero in line 2, then test for != 0. This is false, so we skip the return instruction. Lines 005 through 007 load -3 into [I]. After line 008, a branch is taken to line 3, which tests for !=0. This time the test is true, and the calculator executes a RTN. In line with the observed bug, this transfers execution to the line immediately after line 003, the GSB-I target. In other words, the RTN is executed again. When we switch to program mode, we see the PC is at line 000, just as if we had executed RTN without a pending GSB call.

I get identical results on the Android app. So this program is an emulator, rather than a simulator.

Edited: 21 Sept 2011, 5:26 p.m. after one or more responses were posted

RTN two levels!

*Message #2 Posted by **Howard Owen** on 21 Sept 2011, 5:20 p.m.,*
in response to message #1 by Howard Owen

ahem This is a return stack pop, right? Might be useful after all.

Re: RTN two levels!

*Message #3 Posted by **Howard Owen** on 21 Sept 2011, 7:00 p.m.,*
in response to message #2 by Howard Owen

I'm nested in two levels of self-reply calls. :)

```
001    42,21,11      LBL A
002    32 1          GSB 1
003    31
004    42,21, 2      LBL 2
```

```
005    0              0
006    43,30, 0       TEST 0
007    43  32         RTN
008    6              6
009    16             CHS
010    44 25          STO[I]
011    32 25          GSB[I]
012    42,21, 1       LBL 1
013    22  2          GTO 2
```

[f][A] then [g][P/R] and see "004 42,21, 2 ".

Single step reveals that this works:

```
001    42,21,11       LBL A
002    32 1           GSB 1
012    42,21, 1       LBL 1
013    22  2          GTO 2
004    42,21, 2       LBL 2
005    0              0
006    43,30, 0       TEST 0
008    6              6
009    16             CHS
010    44 25          STO[I]
011    32 25          GSB[I]
007    43,30, 0       TEST 0       Incorrect line number - really line 6.)
008    43  32         RTN          Really line 7 and it returns to one past the GSB
target
                                   instead of one past where GSB was called
007    43  32         RTN          Right line#
003    31             R/S          Second RTN behaves correctly.
```

edit: change conclusion. It doesn't pop, it sizzles. :)

Conclusion: You only ever need one RTN instruction in a program! GSB [I] to the line before the RTN. The RTN will execute twice, and you will end up at the proper place for the GSB pending when you called GSB[I].

Bleh - trading RTNs for GSBs. Bet it's a net loss in memory.

I'll be impressed when I see a decent HP emulator for the iPad. So far, the best one I've found is i41CX,and it's very cool since it also implements the keyboard overlays and plugin modules. The premium version also adds an emulator of the HP 82240B IR printer, complete with sound.

I'd love to find a good Voyager emulator that takes advantage of the iPad screen. The iPhone apps like this one let you enlarge the screen to fit the iPad, but the display is all pixelated. I don't like pixelated. :)

What might that be? No rant intended, I'm asking seriously. The highest failure rate I had with consumer electronics was with HP. Marketing certainly doesn't belong to HPs strengths as well as cost cutting while preserving some level of quality isn't working for them. Also, I haven't seen any interesting inventions lately. What apparently remains is an attractive brand with not much behind it.

Please point out what's left.

:-(

>
> What might that be? No rant intended, I'm asking seriously.

As you're asking seriously, I shall not respond with "calculators, of course."

I meant making and selling hardware.

HP is the #1 PC manufacturer in the world. By and large customers must approve of their

products, or else HP wouldn't occupy that spot. It should be fair to call them "good at" something, based on this alone.

HP may not be the innovation engine it once was, but, as any technology company of their size, has deep pockets of innovation here and there. (One of them, arguably, the calculators group.)

I don't know much about HP's product lines, but I'm sure they're pushing the state of the art in a number of fields.

Also, HP has surely something left of the "HP Way".

Wikipedia tells us
"In September 2009, Newsweek ranked HP No.1 on its 2009 Green Rankings of America's 500 largest corporations"
and other things that indicate that HP is a "green" company.

If they're good at being green, they're good at their business, in my book, even if the business would be in boring commodity goods devoid of any innovation.

If you're doubtful that HP lives up to its potential with CEOs that knows zilch of technology and think about money before anything else, I'm with you. But this, of course, is the state of affairs with most big companies.

Re: More drama at HP

*Message #8 Posted by **Thomas Radtke** on 23 Sept 2011, 7:29 a.m.,*
in response to message #7 by Oliver Unter Ecker

> Quote:

Yes, I admitted already they have an excellent brand name. You know both german idioms: "auf seinen Lorbeeren ausruhen" and "Straßen benennt man nach Toten". That fits it best.

Re: More drama at HP

*Message #9 Posted by **Namir** on 21 Sept 2011, 3:36 p.m.,*
in response to message #4 by Tim Wessman

HP can still get into the software business a-la IBM, but they can do it slowly and gradually without axing existing business units. As the new software BU do well, they can transfer managers from the hardware BUs. At one point they can have a choice of keeping all of the BUs or selling the hardware-related ones (way down the road). Rushing into things is seldom the smart thing for huge corporations.

*Message #12 Posted by **Walter B** on 21 Sept 2011, 3:43 p.m.,*
in response to message #1 by Michael de Estrada

Quite popular method: raise the frequency of CEO changes to stabilize a tumbling company :-/ I doubt Mark Hurd would have had to resign in any other big economy of the western world for the reasons heard - but ok, it's the decision of the board. Nor is it up to me to judge Leo's performance - simply too short to see any major footprints at HP. But the apparent new choice needs a lot of explanations: a failed candidate for gouvernor, having no idea of neither SW nor HW - she's the best the board could find?!? Good luck, HP, you'll need it!

Re: More drama at HP

First honest true auction on TAS for an HP 15C LE

*Message #1 Posted by **Michael de Estrada** on 21 Sept 2011, 2:23 p.m.*

So far all we've seen on TAS has been price gouging for the the HP 15C LE in BIN (Buy it Now) "auctions", but this one is a true auction with a low $9 start price and no reserve. It has already been bid up to well over $100 with 4 days to go, but at least it will get a fair market price. Brought to you courtesy of that German guy who normally sells TI calcs. It will be interesting to see the nationality of the winning bidder.

Edited: 21 Sept 2011, 2:24 p.m.

Re: First honest true auction on TAS for an HP 15C LE

*Message #2 Posted by **Juergen Keller** on 21 Sept 2011, 2:34 p.m.,*
in response to message #1 by Michael de Estrada

I live in Switzerland and have bought 5 HP-15C LE at Samson Cables. Final price including shipping and custom taxes was around $160 per calc. Now enter some numbers in your new gadget and you'll see that buying it directly in the US is cheaper than buying it on eBay.

Re: First honest true auction on TAS for an HP 15C LE

*Message #3 Posted by **Thomas Radtke** on 21 Sept 2011, 2:48 p.m.,*
in response to message #2 by Juergen Keller

Grüezi Jürgen,

I conclude you already got your calculators. How long did it take? I'm still waiting for mine, also ordered from SC.

Thomas

Not any more. Here

Edited: 21 Sept 2011, 2:51 p.m.

Re: First honest true auction on TAS for an HP 15C LE

*Message #6 Posted by **Gerson W. Barbosa** on 21 Sept 2011, 3:15 p.m.,*
in response to message #5 by Michael de Estrada

Mine have been charged $94.99 each, which looks now a low price to me :-)

Back to the auction, I sincerely hope the seller hasn't actually computed the square root of 8 on the 15 LE.

Re: First honest true auction on TAS for an HP 15C LE

*Message #7 Posted by **Joerg Woerner** on 21 Sept 2011, 8:04 p.m.,*
in response to message #6 by Gerson W. Barbosa

Just look at the Datamath Calculator Museum - I always enter 2.8284271... on my calcs. Helps me to recognize my pictures on auctions ;-))

I calculated it multiple times on real calculators, aka AOS machines and memorized bout 14 digits of it.

Cheers, Joerg

Re: First honest true auction on TAS for an HP 15C LE

*Message #8 Posted by **Gerson W. Barbosa** on 21 Sept 2011, 10:00 p.m.,*
in response to message #7 by Joerg Woerner

It's just there's a discrepancy in the last two digits: ...56 instead of ...25. One might think the HP-15 LE answer is wrong... Fortunately it appears this minor detail will not affect the final price :-)

Cheers,

Gerson.

Re: First honest true auction on TAS for an HP 15C LE

*Message #9 Posted by **Michael de Estrada** on 21 Sept 2011, 10:21 p.m.,*
in response to message #8 by Gerson W. Barbosa

But, did you know that on the HP 15C LE that 8.000000000 Sqrt x^2 yields 8.000000001 ?

Re: First honest true auction on TAS for an HP 15C LE

*Message #10 Posted by **Gerson W. Barbosa** on 21 Sept 2011, 10:45 p.m.,*
in response to message #9 by Michael de Estrada

Yes, like on the original HP-15C. That's an expected result, considering the way the HP-15C rounds the results:

```
sqrt(8) = 2.828427124746
          2.828427125
```

```
2.828427125^2 = 8.000000001436
                8.000000001
```

> Quote:
>
> Just kidding...

Of course! I had checked it upon the 14-digit result. Furthermore, if there were any keyboard issue this would have been mentioned in the ad, knowing the seller as we do :-)

Something similar happened when the first official HP-15C LE image "leaked". It showed 3.141592653 instead of the rounded value of pi, which led to speculations about the HP-15C LC not replicating the answers of the original one.

Gerson.

*Message #13 Posted by **Namir** on 21 Sept 2011, 2:56 p.m.,*
in response to message #2 by Juergen Keller

The seller is forum member/friend Joerg Werner (Mr DataMath) and YES HE IS VERY HONEST!!! I am sorry that he is not attending HHC2011. I remember sitting right next to him at HHC2007 at HP's offices in San Diego. I recall teasing him about his TI calculators that he brought. I picked up my H-35S and challenged one of his TI prototypes in the style of the old west sheriff that tells an unwelcome intruder "This town ain't big enough for the both of us! You must leave town by sunset!"

This all reminds me of the lyrics of an old Seals & Croft song "We will never pass this way again!"

Since you were the challenger, he might choose the weapons and easily win the duel. Too many weak points in your gun for your opponent to take advantage of :-)

Re: Yes, it is me - the guy form the DARK SIDE aka TI

*Message #15 Posted by **Joerg Woerner** on 21 Sept 2011, 4:58 p.m.,*
in response to message #13 by Namir

Namir and All,

I'm really sorry to miss this great event - unfortunately I have to attend on Sunday/Monday the Pack-Expo in Las Vegas. I tried hard to combine at least Saturday in San Diego (my favorite city so far in North America) with Sunday in Las Vegas, but it didn't work out.

Hope to see you guys next year!!

I bought five of the HP 15c (missed the lowest price by a few days) to help my collector friends in Brazil, Switzerland, Germany and Portugal and couldn't resist.

I had no idea that they sell on eBay for $300 but I'm always short with calculator money. Had to split my living expenses from the Texas Instruments calculator expenses some years ago (I'm married and have four kids, two of them are already on colleges here in the US) and you know how expensive the last 10 calculators in every collection are. Looking for a CC 40 prototype, a TI-88 in the transparent housing...

Cheers and have fun on the HHC 2011!

Joerg

15C LE Synthetics

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 21 Sept 2011, 1:48 p.m.*

Has anyone tried Synthetics on the new 15C LE? Does it work?

Here is some reference on Synthetics on the original 15C.

15C Synthetics

-Kerem

Re: 15C LE Synthetics

*Message #2 Posted by **Gerson W. Barbosa** on 21 Sept 2011, 1:57 p.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

It should work on the HP-15C LE. It has on Michael Steinmann's DM-15C:

https://picasaweb.google.com/lh/photo/daRgFTSpGs0xkqIRPrw_OM-1Zt5lehVuSAVUkPdAHzU?feat=directlink

Re: 15C LE Synthetics

*Message #3 Posted by **Eric Smith** on 21 Sept 2011, 2:51 p.m.,*
in response to message #2 by Gerson W. Barbosa

It does NOT work on the 15C LE. I had strong reason to suspect that it wouldn't, and just verified it on an actual calculator.

The way synthetics on the 15C worked depended on an obscure hardware feature of the chip that is totally unrelated to the Nut instruction set, so most microcode-level simulators will NOT support it. If it works on Michael's DM-15C, it is because he went out of his way to support it.

The ON-y^x key combination of the original 15C (and the same combination of physical keys on the other original Voyagers) forces a hardware reset. The firmware has no control over this. It is mentioned in the original manual as something to try if the calculator is unresponsive, with the note that the X register will be altered and should be cleared afterward. The specific change to the X register is that it is rotated 22 bit positions. This can result in an NNN ("non-normalized number"), which on the 15C can be an invalid matrix descriptor.

I have reason to believe that other portions of the calculator internal state are also modified, but have not verified this. Probably the A,B,C,M, and N registers are all rotated by 22 bits, and the F, G, and S registers are probably also rotated by some amount. The P register might or might not be changed.

For example, press the key sequence 1 0 1 7, then the ON-y^x combo. On an original 15C this gives an invalid matrix descriptor, while on the 15C LE it just turns the calculator off, and turning it on again shows an unmodified value 1017 in the X register.

Re: 15C LE Synthetics

*Message #4 Posted by **Gerson W. Barbosa** on 21 Sept 2011, 3:25 p.m.,*
in response to message #3 by Eric Smith

Thanks for the clarification. Still, it's amazing that Michael has minded simulating an obscure hardware feature just to run the "hello PPC" program. Unless he needed this for something else, of course.

*Message #5 Posted by **Howard Owen** on 21 Sept 2011, 5:15 p.m.,*
in response to message #3 by Eric Smith

Eric, did you know that [ON] [SQRT] also appears to perform a 22 bit rotate right? I just discover this via dyslexia. I tried it with 1.000000044 and got the same descriptor display as for [ON]Y^X

(deleted post)

Re: 15C LE Synthetics

*Message #7 Posted by **Howard Owen** on 21 Sept 2011, 6:42 p.m.,*
in response to message #6 by deleted

Certainly. Working through the examples on Eric's site, I entered 1.000000044, turned the calculator off, then pressed SQRT, then ON, then released, I saw the same synthetic matrix descriptor as for when Y^X is pressed. Looking at the text, it seems to me that only a 22-bit rotate right would produce exactly that display, so I think that's what is happening with the SQRT case.

I wonder if [ON][SQRT] will reset the calc like [ON]Y^X does?

Re: 15C LE Synthetics

*Message #8 Posted by **Eric Smith** on 22 Sept 2011, 1:26 a.m.,*
in response to message #7 by Howard Owen

If it causes the 22-bit rotate, then it is doing a hard reset.

Re: 15C LE Synthetics

*Message #9 Posted by **Mike Morrow** on 21 Sept 2011, 3:37 p.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

You might be able to get something useful from the program memory corruption that occurs when the old *ON*

plus * or *ON plus* + self tests are attempted.

I reported the memory corruption problem and gave an example before and after the self tests in this thread.

Some bizarre results can be seen after the self tests. Do the self tests again and more program memory changes will take place.

Re: 15C LE Synthetics

*Message #10 Posted by **Eric Smith** on 21 Sept 2011, 3:44 p.m.,*
in response to message #9 by Mike Morrow

On the original 15C, interrupting the self-tests, or self-test failure, can result in the same sort of memory corruption.

[When composing this message, I started to write "On the real 15C", but obviously the 15C LE is a "real 15C".]

WP34S : RMDR remark in the manual

*Message #1 Posted by **Miguel Toro** on 21 Sept 2011, 1:25 p.m.*

Hi,

I think that, what is implemented in the WP 34s is RMDR(y/x) = y-x*IP(y/x).

The HP 42s implements MOD(y/x) = y-x*INT(y/x), where INT(A) is the greater integer less than or equal to A.

For example:

42S: 7, +/-, ENTER 3 MOD -> 2

34S: 7, +/-, ENTER 3 RMDR -> -1

The HP 71b implements both functions. So maybe the remark could say : "Equals RMD on HP 71B and HP 16C".

Saludos,

Miguel

Current Consumption and Program Performance HP15CLE

*Message #1 Posted by **Thomas Chrapkiewicz** on 21 Sept 2011, 1:03 p.m.*

Test Units:

15CHHC2010 CNA02130778, Code:2009-08-03

15CLE CNA1310KH3/02290, Code:2011-04-15

External 3V power supply, CR2032 Cells. Fluke 8060 Multimeter

---

I have verified that both the HP15CLE and the HP15C2010HHC draw about 20mA when any key is pressed. I tested this with both an external power supply and an externally applied CR2032 cell. They both draw about 20mA when a program (the LBL A + GTO A loop) is running.

Also, when the ON key is pressed to turn the calc off and held, it continues to draw 20mA until released.

Program execution time Performance:

The 15CLE is about 20% faster than the 15C2010HHC unit (also running the LBL A + GTO A loop). I wonder if this is due to code differences or manufacturing/component tolerances.

TomC

Re: Current Consumption and Program Performance HP15CLE

*Message #2 Posted by **Mike Morrow** on 21 Sept 2011, 3:52 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

It would be interesting to see the results of the Savage Benchmark for your examples. See message 68 in this thread for a listing for the 15C-LE and instructions.

My 15C-LE does the standard 2500 iteration test in about 48 seconds. The original 15C takes 5840 seconds.

Re: Current Consumption and Program Performance HP15CLE

*Message #3 Posted by **Thomas Chrapkiewicz** on 21 Sept 2011, 4:56 p.m.,*
in response to message #2 by Mike Morrow

I'll look into that.

Further tests have shown a great variance in timing tests. I have not yet determined which machine (or machine) is varying, but the difference now is closer to 1%.

TomC

Re: Current Consumption and Program Performance HP15CLE

*Message #4 Posted by **Thomas Chrapkiewicz** on 21 Sept 2011, 5:20 p.m.,*
in response to message #2 by Mike Morrow

Both my 15CLE and 15CHHC2010 complete the Savage Benchmark in 50 seconds with 2499.969898.

TomC

Re: Current Consumption and Program Performance HP15CLE

*Message #5 Posted by **DaveJ** on 21 Sept 2011, 9:41 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

If I designed a battery powered product that worked like that, I would have got the arse!

And I'll say it again, the HP design team were well aware of the issue 2 years ago, so no excuse.

Thankfully it could be fixed with a firmware upgrade.

Dave.

New -to me- Calculators, including WP-34s

*Message #1 Posted by **Dan M (Vermont, USA)** on 21 Sept 2011, 12:49 p.m.*

New calculators.

OK, the 15C LE is nice enough. THANK YOU HP!!!

But, as I may have said elsewhere, I personally do not like and have not gotten used to the "horizontal" layout style of this calculator. I don't think there is anything wrong with it, I just don't like it -- I'm an old dog and I learned calculators from the HP-45 on up, never using one of the "horizontal" models. This is likely a problem with me, not with the calculator.

So... I just now got onto the WP-34s bandwagon. THANK YOU PAULI and WALTER and ANYBODY ELSE WHO HELPED OUT (IS HELPING OUT) ON THIS!!!

This is a way cool device, I am looking forward to using it a lot!

Thanks, Gene, for sending out a cable. I got it at the same time as I got a couple of HP 30b calculators, and I must say that the calculators as they came out-of-the-box were a HUGE motivation to get the cable and the flashing program going in a hurry, because (sorry, HP), really, what a dog. Yes, I am very far removed from the target consumer for the HP 30b, but wth, I couldn't find anything within it to motivate me to delay the reflashing in the slightest. Wow. The hardware seems to be OK within reason, except for the IMO stupid trapezoidal shape to the base, and the case that doesn't look like it was designed to fit, and the colors that I don't like (and don't care about, and will be covered up by WP 34s soon anyway, so it doesn't really matter) and the battery cover that the mfr had to put some sticky goo inside because I think they fear it will fall off on its own, and the country of origin, and the consistently crooked sn sticker, and the on button that seems to click-but-not-register about 1 in 20 times. Yeah, that's about it. For now. I guess I have to maintain the reputation of people in this forum being hard-to-please.

But anyway -- I am liking the look and feel of the WP-34s so far!

And, it cannot be said enough, thank you HP for the 15C LE (and for the flashing connection available in the hardwares that have it). It is nice enough, and it has motivated me to start re-using calculators that I have and like (42s, 32sii, 97, 41, WP-34s, etc).

Oh and HP -- even though I called it a dog, please keep the HP 30b around and inexpensive/plentiful on the shelves, I think there is some volume potential for it as a hardware-source for the WP-34s. Would hate to see it disappear.

Everybody have fun in San Diego this weekend!

happy calculating,

Dan M.

Hey Tim, if I knew that was all it took to get HP's ear, I would have waxed poetic about the HP-42s (re-issue would be fun, and likely to create a lot to complain about!) :-)

But you should know about my 100% no-fail guarantee: any/all of my opinions are **GUARANTEED** to be worth **TWICE** what you paid for them.

Have a great weekend. If I wanted to hear about trees I would be there too.

Best regards, Dan M.

in response to message #1 by Dan M (Vermont, USA)

Well I just got the 30B today, with intent to flash to the 34S.

This is the first new calc I have bought from HP since my 42S in 1989, and I must say it is quite nice. The keyboard is crisp and solid, exactly what I would expect from HP. Very pleased with the hardware, though not a fan of the champagne color.

I might even buy a second one to retain as a financial calc, retiring my HP-80. ;)

HP 15C ; keys not registering

*Message #1 Posted by **Miguel Toro** on 21 Sept 2011, 12:19 p.m.*

I received my 15C LE and found that 10^x and GSB keys should be pressed really hard to register. If you put normal pressure like on the other keys, nothing is registered, even if you hear a nice click. So I wonder what the cause of this problem is. How does this mechanism works and why is there this kind of issue?

Any keyboards for dummies, please? The dummy being me :)

Thanks,

Miguel

Re: HP 15C ; keys not registering

Don't forget to add it to this thread.

Re: HP 15C ; keys not registering

*Message #5 Posted by **Thomas Radtke** on 21 Sept 2011, 1:57 p.m.,*
in response to message #3 by Miguel Toro

Miguel,

this is or will be under investigation, if I understood correctly what Tim said. I guess someone will take a keyboard contact apart and put it under the microscope or someting like that. Maybe it's just oil & dust residue if we're lucky. Could be corrosion or some kind of misalignment also, which would be fatal.

I really hope Tim is allowed to present the results they get.

Thomas

Miguel

Re: HP 15C ; keys not registering

*Message #7 Posted by **Lincoln R.** on 21 Sept 2011, 2:39 p.m.,*
in response to message #5 by Thomas Radtke

DISCLAIMER: You probably shouldn't take apart your 15C. We need to let HP handle this so they can work with the factory to correct the issue.

I believe the problem (in some cases) may be heat stakes not being staked down far enough. My 15C had a bad divide key, there's a heat stake right next to that and it was a bit loose on mine. Pressing the back of the PCB closer to the front of the case made the key work right while pressure was being held. I'm not 100% sure, I don't know the mechanical design of this keyboard, but if that's the cause of most of these, it would be trivial to rework.

Re: HP 15C ; keys not registering

*Message #8 Posted by **Dale Reed** on 21 Sept 2011, 4:49 p.m.,*
in response to message #7 by Lincoln R.

First post.... Hello, everybody!

I bought 3 at CostCentral, two are good, and I have one with the Divide key requiring significantly more pressure. (I already reported this, and have received an e-mail back instructing me to start a case with HP tech support, which I will do shortly.) It makes starting the keyboard test a bit more interesting.... ;-)

And when I do get the keyboard test to start, I also have a key in the third row (the Two or Three key, somewhere near there...) that doesn't always "catch".

The heat stakes thing is an interesting theory, and one I think should be pursued further. I have a 32Sii you have to press down on right below the center of the the display in order to turn it on and have all the keys work, and I have seen at least one other Pioneer on TAS that was described as needing the same "lean" on it to make it work.

I'll try the "lean-on" trick with my 15C LE when I get home and see if it acts similarly.

For those keeping track (and looking for possible correlations between LE #s and Serial #s), I have: 15C LE #1: LE#02173, S/N CNA1310KC1 15C LE #2: LE#02196, S/N CNA1310KBH 15C LE #3: LE#02198, S/N CNA1310KBQ 12C 30th: #05965, S/N CNA13007NQ

I can't remember whether it's #02196 or #02198 that has the bad divide key. Gotta go home and dig them out of the boxes again to check...

Re: HP 15C ; keys not registering

*Message #9 Posted by **Lincoln R.** on 21 Sept 2011, 5:32 p.m.,*
in response to message #8 by Dale Reed

The Pioneer problem of which you speak isn't a heat stake issue, it's a problem with the interconnect between the keyboard flex PCB and the CPU rigid PCB. These two circuits are held together by a piece of foam material that degrades over time, then you start having keyboard issues.

If you're feeling adventurous, this can be fixed by opening up the calculator (there's an article about that in the Articles section), removing the rigid PCB, scraping out the foam and replacing it with something else.

The 15C LE shouldn't be able to suffer from that problem, all the electronics are on one PCB except for the display, which is connected with a ribbon cable.

Re: HP 15C ; keys not registering

*Message #10 Posted by **Thomas Radtke** on 22 Sept 2011, 12:32 p.m.,*
in response to message #7 by Lincoln R.

Do we already know the 15c LE has heat stakes? I thought I read about them having been replaced by screws ..?

Crossing my fingers

*Message #1 Posted by **David Ramsey** on 21 Sept 2011, 10:57 a.m.*

Ran through my SR-60 presentation with the wife last night; tweaked a few things. Fired up the SR-60 and loaded the "Threez" program, which calculates all three digit numbers equal to the sums of the cubes of their digits. (This takes a 15C LE about 10 seconds, total, and takes the SR-60 about 15-20 minutes. But at least it can print out each one!)

The program should print "THREEZ", then 153, 370, 371, 407, and then "DONE".

Came back about half an hour later and found it had printed up through "407" and was sitting there with no display. Turned it off and left it for an hour, but it still wouldn't turn back on.

Opened it up, reseated every socketed chip, sprayed display connector and cable with contact cleaner, turned it on again...PROMPTING DESIRED?

Verified operation of printer and card reader, etc.

Let's just hope it holds together over the next few days.

There's visible corrosion on the legs of some of the socketed ICs. This has happened once before; I suspect some chip or two is getting slightly warm and losing contact with its socket...but it's just a guess.

In any case I'll be bringing the tools I need to open it up, contact cleaner, and a wrist strap. 'cause you never know.

Re: Crossing my fingers

*Message #2 Posted by **Namir** on 21 Sept 2011, 11:17 a.m.,*
in response to message #1 by David Ramsey

I hate to be the village idiot, but what is an SR60 exactly? Sounds to me like an old Texas Instrument calculator model.

Re: Crossing my fingers

*Message #3 Posted by **Katie Wasserman** on 21 Sept 2011, 12:00 p.m.,*
in response to message #2 by Namir

That it is. It's a big desktop machine and quite nice.

Re: Crossing my fingers

in response to message #2 by Namir

Here is some information about the SR60. It was very advanced for 1976!
http://oldcalculatormuseum.com/tisr-60.html

Re: Crossing my fingers

*Message #6 Posted by **hpnut** on 21 Sept 2011, 12:23 p.m.,*
in response to message #5 by Steve Simpkin

it's horrible! there's a big = key and it's in sickly yellow too!

it's an HP 97 wannabe!

Re: Crossing my fingers

*Message #7 Posted by **David Ramsey** on 21 Sept 2011, 12:42 p.m.,*
in response to message #6 by hpnut

> Quote:
>
> it's an HP 97 wannabe!

...with a full alphanumeric display. The 97 couldn't even *print* alpha.

But I confess I like my 97s better. I don't, for example, have to worry about them dying if I look at them cross-eyed.

Edited: 21 Sept 2011, 12:43 p.m.

*Message #9 Posted by **Martin Pinckney** on 21 Sept 2011, 1:34 p.m.,*
in response to message #5 by Steve Simpkin

From the article we know it displays alpha characters, and at least question marks. Does anyone know if it displays the parentheses?

Re: Crossing my fingers

*Message #10 Posted by **David Ramsey** on 21 Sept 2011, 2:07 p.m.,*
in response to message #9 by Martin Pinckney

Sure, it displays parentheses...

Re: Crossing my fingers

*Message #11 Posted by **David Ramsey** on 21 Sept 2011, 12:21 p.m.,*
in response to message #2 by Namir

Namir, it's a big desktop programmable calculator from T.I. AFAIK it's the only desktop programmable they ever made. Unlike the rugged HP desktops of the era, the SR-60 is delicate, like a butterfly's wing.

Why am I bringing it to HHC? It was Gene's idea. He swears you'll all be *fascinated.*

Edited: 21 Sept 2011, 12:43 p.m. after one or more responses were posted

Re: Crossing my fingers

*Message #12 Posted by **hpnut** on 21 Sept 2011, 12:25 p.m.,*
in response to message #11 by David Ramsey

Yes! pls bring it to HHC at San Diego and donate it to the speaker who exceeds his/her time limit!

Gene would be happy :-)

Re: Crossing my fingers

*Message #13 Posted by **gene wright** on 21 Sept 2011, 1:32 p.m.,*
in response to message #12 by hpnut

If so, when I get up to speak, I may never quit! :-)

Re: Crossing my fingers

Re: Crossing my fingers

*Message #15 Posted by **Howard Owen** on 21 Sept 2011, 1:28 p.m.,*
in response to message #11 by David Ramsey

I'm looking forward to seeing this thing. From the writeup you linked to, it sounds like a highly capable programmable calculator.

> Quote:
>
> A fully-optioned SR-60A could hold programs up to 5760 steps in length, and offered 430 memory registers.

Alphanumerics are a big differentiator too. So is reliability, apparently. I love the HP-97. It's my third favorite old calculator behind the 41C and 42S, but it's not in the same class as this machine. The SR-60 is a full size desktop calculator. I think a comparison with HP's desktop calculators of the time would be more fair.

WP34S complex RCL

*Message #1 Posted by **John Abbott (S. Africa)** on 21 Sept 2011, 9:54 a.m.*

Hi, I don't have a real WP34S yet, so I was using the emulator and doing some complex RCL's (RCL- , RCL+ etc) while running a test program, and noticed the following: Lets say I have stored a complex number say 2+i1 in register 16. If on the stack I have in [stack]Y, 1 and in [stack]X, 2.002. Now I perform the following: [cpx]RCL-16. I should get 0.002 in X and 0 in Y (ie [2.002+i1]-[2+i1]). Instead I get -.002 in X and 0 in Y (ie [2+i1]-[2.002+i1]). This seems to contradict the manual as well. If I have misinterpreted something, I apologise. Revision of emulator with VERS is: 34S 2.1 1610. Regards John

Re: WP34S complex RCL

Yes you're right, I've just tried it and unfortunately I can confirm this bug! :-(

I've also tried CPX RCL/ nn and got the same result, so the complex register arithmetic with RCL is incorrectly implemented, it does reg-/stk instead of stk-/reg (of course CPX RCL+/RCL* doesn't matter).

The other direction CPX STO- or STO/ seems to be correct at least ...

Franz

>
> Oh well, the fix is in. We've lost a flash segment though :-(12 bytes over.

Although I don't fully know your complex implementation, but I don't understand your changes for this cpxRCL- and cpxRCL/ bug:

Why was it necessary to introduce this new 'rev' argument and the additional code for those 2 cpxRCL ? If the argument order for these 2 functions was wrong, then why not just swap those arguments? And this could also be done for cpxRCL+ and cpxRCL*, because + and * are of course commutative.

So I don't get it why this extra code is really needed (?) - and you won't have lost a flash region ...

Franz

Re: WP34S complex RCL

*Message #6 Posted by **Paul Dale** on 22 Sept 2011, 7:03 a.m.,*
in response to message #5 by fhub

I'm not passing the full arguments to the complex sto/rcl operation function. I pass the two register pointers in only. The other arguments are the results returned from the function which will either go into the register pair of the stack depending on the caller. The complex sto/rcl function itself handles the two values from the stack.

For STO, it is registers op stack. For RCL it is stack op registers. Thus the order of the arguments to the operation have to be reversed. Hence the rev argument. BTW, this is the same as the rev argument for non-complex STO and RCL with arithmetic operator.

So yes, the extra code is necessary. Either I reverse things inside the operation routine (easy) or pass the extra arguments in and reverse them on the outside (larger but also easy).

I could spend some effort squeezing back the bytes elsewhere but that hardly seems worthwhile if we're about to add a couple of kb of matrix support.

- Pauli

Re: WP34S complex RCL

*Message #7 Posted by **fhub** on 22 Sept 2011, 7:26 a.m.,*

in response to message #6 by Paul Dale

Ahhh, now I got it:
When I saw this "if(rev)" I first thought this reversing would be for - and / only, but now after a closer look I see that the difference is between STO and RCL - that makes sense of course! :-)

BTW, what's your guess about how long until we'll have those matrix feature included? ;-)

Franz

Re: WP34S complex RCL

HP-19c battery pack replacement (again...)

*Message #1 Posted by **Xavier A. (Brazil)** on 21 Sept 2011, 8:28 a.m.*

Hello there,

I acquired a few weeks ago an old full-working HP-19c, delivered with 4 'new' - in box - *Clartech Ni-Cad 800 mAh cells* ; it seems to be a French brand, since user's instructions are in french only.

The first instruction recommends to "charge before use", which is obvious, but I am wondering if it is possible to charge them within the calculator, with the official HP adapter. I already charged the cells out of the calc and everything works perfectly.

Of course I read a lot of threads on the subject in this forum, Katie's recommendations included; it seems that some cheap Ni-Cad cells are not recommended, but **is it a risk to dammage the calc charging it (with my cells) directly from HP adapter?**

Any feedback will be appreciated, thank you.

(edited to correct my english!)

Edited: 22 Sept 2011, 9:46 a.m. after one or more responses were posted

Re: HP-19c battery pack replacement (again...)

*Message #2 Posted by **Katie Wasserman** on 21 Sept 2011, 12:06 p.m.,*
in response to message #1 by Xavier A. (Brazil)

It's fine to charge the cells inside the calculator while the calculator is off. The risk comes into play when running the calculator with the AC adulator and the batteries not making contact with the prongs from on the PCB inside the batter compartment.

So, charge indies the calculator when it's off and unplug from the AC to run it and you'll always be fine.

HP never made a charging cradle for this battery pock so the only easy option is to charge the battery pack inside the calculator.

Re: HP-19c battery pack replacement (again...)

*Message #3 Posted by **Xavier A. (Brazil)** on 21 Sept 2011, 12:19 p.m.,*
in response to message #2 by Katie Wasserman

Thank you so much, Katie.

Re: HP-19c battery pack replacement (again...)

*Message #4 Posted by **Tony Duell** on 22 Sept 2011, 4:22 a.m.,*
in response to message #2 by Katie Wasserman

Are you sure that's correct?

The 19C has continuous memory, which means the RAM chip is powered even when the machine is turned off. The battery pack acts as a shunt regulator and limits the voltage applied to the RAM when the charger is connected.

If the battery is missing or open-circut, the voltage applied across the RAM chip can be high enough to do damage.

However, when the machine is turned on, the current drawn by the rest of the logic is normally enough to pull the voltage from the charger down (the official HP transformer has a deliberately high internal resistance) and normally no damage is done.

So I believe that -C models are more at risk from charger damage when turned off than when turned on. Non-C models are totally safe when turned off because none of the electronics is powered in that state.

AFAIK you're right, there never was a 'reserve power pack' for the Sting models. There is for all the others, including the Spice series (that one is probably the hardest to find).

Re: HP-19c battery pack replacement (again...)

*Message #5 Posted by **Xavier A. (Brazil)** on 22 Sept 2011, 9:45 a.m.,*
in response to message #4 by Tony Duell

Thank you Tony for this new advice.

Well, the best is perhaps to charge the cells outside the calc, which unfortunately can not be applied for long computing - my goal actually.

Re: HP-19c battery pack replacement (again...)

*Message #6 Posted by **Katie Wasserman** on 22 Sept 2011, 10:50 a.m.,*
in response to message #5 by Xavier A. (Brazil)

I agree with Tony, partially. You're still at risk powering the any "C" Woodstock off an AC supply even when it's off. But I'm not sure that the risk is greater than when it's on. Even though the voltage is higher when off it's power is only going to one chip not all of them.

At any rate, charging outside the calculator -- however difficult -- is the safest way to go. I power almost all my calculators with primary cells of one type or another so never deal with charging. The Woodstock battery packs (2x series, 19C, 10A) lend themselves to this pretty well because of the built in springs. I use Energizer lithium cells for this because they have near zero self discharge and as far as I can tell never leak.

Re: HP-19c battery pack replacement (again...)

*Message #7 Posted by **Xavier A. (Brazil)** on 22 Sept 2011, 12:36 p.m.,*
in response to message #6 by Katie Wasserman

I do agree with you, Katie: charging outside is safer. Any idea about average computing time (before batteries fail) with my 800 mAh cells? How can this time be calculated?

Re: HP-19c battery pack replacement (again...)

*Message #8 Posted by **Katie Wasserman** on 22 Sept 2011, 1:55 p.m.,*

in response to message #7 by Xavier A. (Brazil)

It all depends on how much you use the printer. That requires a huge amount of current. I haven't measured the current draw, but without using the printer I'd guess around 6 hours of use on a charge.

Re: HP-19c battery pack replacement (again...)

*Message #9 Posted by **Xavier A. (Brazil)** on 22 Sept 2011, 4:41 p.m.,*
in response to message #8 by Katie Wasserman

Thank you Katie.

HP 50g - Good tutorials

*Message #1 Posted by **François Vanzeveren** on 21 Sept 2011, 4:48 a.m.*

Hello all,

Looking for tutorials to use my new HP 50g, I found these nice ressources: http://www.thiel.edu/mathproject/

Hope this might interest some of you.

François

Re: HP 50g - Good tutorials

*Message #2 Posted by **Namir** on 21 Sept 2011, 8:23 a.m.,*
in response to message #1 by François Vanzeveren

Thanks François! The Thiel COllege web pages have an interesting HP calculator tutorial and instructions for using it in solving different family of problems!

Namir

Re: HP 50g - Good tutorials

*Message #3 Posted by **Crawl** on 21 Sept 2011, 9:53 a.m.,*
in response to message #1 by François Vanzeveren

Vaguely related, I sometimes save formulas to my HP50g's SD card. But sometimes it's not so easy to do. Example, let's say I want to save a matrix formula, like

```
[a b] [x] = [m]
[c d] [y]   [n]
```

or even worse,

```
[x] = ([a b])^-1 [m]
[y]    [c d]     [n]
```

How do you do that? If you enter this stuff on the stack, it's just evaluated immediately.

Then I though, Aha! In algebraic mode, after you enter an expression, the original expression is displayed, then the evaluated version! I can copy that original expression, go back to RPN mode, paste it, and save it!

By the way, it turns out that if you enter matrix equations like that, you'll probably get an error (it probably tries to evaluate the equation to a Boolean value, but it's indeterminate since it's symbolic). But it doesn't matter if the second line is an error; the first, which is what I want, is correct.

So there's a use for algebraic mode after all!

It turns out that when you save expressions that way, they're considered to be "tags". There's probably a way to

enter them as tags directly in RPN mode, but for now this might be easier for me.

This is why I wish this calculator had a product (capital Pi) function. Yes, in terms of computation, you can do it with the Sum function and logs. But if you want to save a formula so it would look nice, you'd want Product.

HP 15C LE Engraving

*Message #1 Posted by **Russ Dill** on 21 Sept 2011, 4:35 a.m.*

Is any official or unofficial engraving offered?

Re: HP 15C LE Engraving

*Message #2 Posted by **Paul Dale** on 21 Sept 2011, 4:39 a.m.,*
in response to message #1 by Russ Dill

Get a Dremel or equivalent and start engraving :-)

- Pauli

Re: HP 15C LE Engraving

*Message #3 Posted by **Ed Look** on 21 Sept 2011, 12:26 p.m.,*
in response to message #2 by Paul Dale

LOL! & Ha ha ha ha!

Decades ago, I engraved a friend's original 15C... manually with either a diamond tipped stylus or some kind of small tool bit... I forget!

He thought I did a better job on my own 34C than his 15C. Oh, well!

Re: HP 15C LE Engraving

*Message #4 Posted by **MBlount** on 21 Sept 2011, 9:25 a.m.,*
in response to message #1 by Russ Dill

Not directly by HP. You can take it to one of the jewlery shops or gift shops in your local mall and have it engraved. A store called "Things Remembered" does it around where I live.

Re: HP 15C LE Engraving

*Message #5 Posted by **Michael de Estrada** on 21 Sept 2011, 10:14 a.m.,*
in response to message #4 by MBlount

Where exactly are you supposed to engrave it ? I don't see any blank area on the rear label plate to do so. Perhaps you were confusing this with the HP 12C 30th AE that presumably has a blank area for engraving ?

Re: HP 15C LE Engraving

*Message #6 Posted by **MBlount** on 21 Sept 2011, 11:54 a.m.,*
in response to message #5 by Michael de Estrada

Yep, I was looking at the back of my 12c AE. There is a place on the back for you to engrave your name.

Re: HP 15C LE Engraving

*Message #7 Posted by **Glenn Dowdy** on 21 Sept 2011, 11:20 a.m.,*
in response to message #1 by Russ Dill

Not from HP.

Re: HP 15C LE Engraving

*Message #8 Posted by **Lincoln R.** on 21 Sept 2011, 12:08 p.m.,*
in response to message #7 by Glenn Dowdy

Yeah, there honestly isn't space. However, this would seem to be because HP included all the information on the original back label at a readable font size, a lot of industry certifications (likely required for importing to various countries), French and English country-of-origin labeling (Is this for importing to Canada, or just Cyrille having a laugh?), the LE number, and an HP logo. The HP logo and LE number are probably the only non-mandatory things on here, but the LE number was wanted, and the HP logo is in a small enough space to not be useful for much else.

Re: HP 15C LE Engraving

*Message #9 Posted by **Mike Morrow** on 21 Sept 2011, 12:26 p.m.,*
in response to message #8 by Lincoln R.

> Quote:
>
> The HP logo and LE number are probably the only non-mandatory things on here...

Plus the table entry for Error 9, if it was intended that the old self tests were never to be performed.

Why would there be ANY desire to engrave a calculator? I used Dymo Label tape in the designated recess on the back of my 1997 HP 48GX that remains today, and that can easily be removed if someone else saves it from a landfill. The last $10 HP-15C I bought had the owner's initials engraved on the metal to the right of the LCD. Blah...permanent defacement! (But, still worth $10 I think.)

Edited: 21 Sept 2011, 12:29 p.m.

Non-removable identification in case it is stolen.

Re: HP 15C LE Engraving

*Message #11 Posted by **Martin Pinckney** on 21 Sept 2011, 1:41 p.m.,*

in response to message #10 by Michael de Estrada

> Quote:
>
> Non-removable identification in case it is stolen.

Yep. Unfortunately (for collectors, at least) there was a time period in the U.S. where police crime-prevention bureaus recommended engraving any item of value. A lot of fine vintage cameras were ruined because of this.

Re: HP 15C LE Engraving

*Message #12 Posted by **Mike Morrow** on 21 Sept 2011, 3:57 p.m.,*
in response to message #10 by Michael de Estrada

> Quote:
>
> Non-removable identification in case it is stolen.

That's not worth much. Not too many calculators are being stolen now-a-days. And none are worth the effort to recover (not even my HP-35 red dot, which I'm thankful the original owner did not engrave).

Re: HP 15C LE Engraving

*Message #13 Posted by **Norman Dziedzic** on 21 Sept 2011, 1:08 p.m.,*
in response to message #8 by Lincoln R.

There is a space on the back of the 15CLE between the battery cover and the rubber foot,just above the X Y column headings where you could fit a small engraving.

Or, if the engraver is good, they could do something on the side...

Old habits

*Message #1 Posted by **Ed Look** on 20 Sept 2011, 11:51 p.m.*

My first HP calc was the 34C, you know, with the three (3- count 'em) shift keys, gold f, blue g, and black h. I used it exclusively, and at times heavily, for over twenty years. (And then it got sick, and then slowly died.)

Many of the shifted functions that were on the h group in the 34C are, in the 15C(LE), a two shift key calculator, are redistributed between the f and g keys.

So, when I start using the 15C LE, I find myself either silently mouthing or thinking specifically things like "h PSE" (f, for 15C), "h SST" (unshifted), "h 1/x" (unshifted) "h LBL A" (f)... and continues even with other functions like SIN, COS, and TAN, which were f-shifted in the 34C. I actually did and still do this with other HP calculators, too that may have similar commands or functions, like ISG or DSE, but when I came to the RPL machines, since the keyboards and program paradigms were so different, that didn't happen! But when the 33s and 35s came out, even though their shift keys were not named by letters, it began to bubble back out from the depths of my memory... those calculators are similar enough to the old Spice machines, I guess...)

I hope this does not cause a confusion that will in turn cause dementia or insanity!

I guess riding a HP calculator is like riding a bicycle- you don't forget! But they might change the position of the shift levers, or reduce the three shift levers of your old bike to two! (Yes, yes, I know, no real bicycle has had three shift levers!)

Indeed. I've been using my HP 15c for such a long time, I have operations intimately wired into my muscle memory. I can literally use much of it blindfolded.

Does anyone have 15C LE dissection pics?

*Message #1 Posted by **Hugh Evans** on 20 Sept 2011, 9:26 p.m.*

I'm curious if anyone has done this yet. HP seems to have taken a liking to screws over heat stakes in recent years. If that is indeed the case with the 15C LE, I will take a stab at improving a couple of minor issues involving the keys. The first step will be that of taking the wiggle out of f and g. Then I will move on to filling them, probably with some polyurethane reactive hot melt to minimize downtime.

Re: Does anyone have 15C LE dissection pics?

*Message #2 Posted by **Lincoln R.** on 20 Sept 2011, 10:05 p.m.,*
in response to message #1 by Hugh Evans

I've opened the back of one. It's heat-staked, there's foam tape behind the LCD to keep it from bouncing around in the case, and the Atmel CPU is in an LQFP package instead of being a raw die underneath epoxy like my 12C+ is. I have a picture but the quality's not that great, I'll see if I can clean it up a bit.

Re: Does anyone have 15C LE dissection pics?

*Message #3 Posted by **Katie Wasserman** on 20 Sept 2011, 10:49 p.m.,*
in response to message #2 by Lincoln R.

It's the same as the 12C+. I've posted these pictures before:

Re: Does anyone have 15C LE dissection pics?
*Message #4 Posted by **Eric Smith** on 21 Sept 2011, 1:14 a.m.,*
in response to message #3 by Katie Wasserman

Nice pictures of the 12C, but if Lincoln R. is correct, the 15C LE does NOT look the same. That seems rather surprising since there isn't any need for the hardware to differ.. I haven't opened mine, though, so I can't confirm.

Re: Does anyone have 15C LE dissection pics?
*Message #5 Posted by **Tim Wessman** on 21 Sept 2011, 1:28 a.m.,*
in response to message #4 by Eric Smith

I believe the 15c uses a packaged IC. That is the only difference IIRC.

Does the AE 12C have bad keys, too?

Re: Does anyone have 15C LE dissection pics?
*Message #7 Posted by **Katie Wasserman** on 21 Sept 2011, 3:32 a.m.,*
in response to message #5 by Tim Wessman

Indeed, the PCB on the 15C LE doesn't have the potted chip on board, it's got the real packaged Atmel chip in all it's glory showing.

15C PCB

and the back of the case

If I'm reading this correctly the date code on this chip is from September 2009, ancient!

Why the switch away from the potted chip on board? Is this the same in the 12C 30th AE and newer 12C+ calculators too?

in response to message #9 by Masaki Adachi

There are 6 screws to remove, one under each foot and two inside the battery compartment (one of these is smaller than the other 5). Once you do this it prys apart quite easily.

Re: Does anyone have 15C LE dissection pics?

*Message #11 Posted by **Thomas Chrapkiewicz** on 21 Sept 2011, 12:41 p.m.,*
in response to message #10 by Katie Wasserman

The only mechanical constraints appear to be along the top and bottom edges of the case.

ALSO BE CAREFUL: Try to have the calc face down as you pry it apart as there are three springs in plastic collars in the keyboard half of the calc which can fall out. (These are used to electrically connect the keyboard to the metal plate on the battery compartment half of the calc - for ESD protection.)

Spec details on Atmel AT91SAM7L128

A member of the Atmel SAM7L series of microcontrollers based on the 32-bit ARM7TDMI processor. It operates at a maximum speed of 36MHz and features 128KB of flash and 6KB of SRAM. The peripheral set includes a 40-segment LCD controller, two USARTs, UART, SPI, TWI (I2C), three 16-bit timers, RTC and four 10-bit ADC. The SAM7L128 operates in single-supply mode down to 1.8V and consumes 0.5mA/MHz typical in active mode when executing code out of its flash memory, and a mere 100nA in power-down mode. The SAM7L128 is supplied in a 128-pin LQFP and 144-pin LFBGA packages.

It is the SAME Chip on HP20b Calculator: HP20b Calculator using ATMEL 91SAM7L128 Chip

Another good article about the 15c and ATMEL Processor EDA360 15C and ATMEL AT91SAM7L128 (BTW, I think that's where the "inmate" discussion started in the forums.)

in response to message #17 by Kerem Kapkin (Silicon Valley, CA)

There's a AT91SAM7S256 with lots of RAM, but without the LCD driver and requires higher voltage and more power.

Re: Does anyone have 15C LE dissection pics?
*Message #19 Posted by **Paul Dale** on 22 Sept 2011, 3:57 a.m.,*
in response to message #18 by Katie Wasserman

Flash isn't the big problem. RAM is.

The 34S could use more RAM. Lots more.

I know how to squeeze more into flash. It will require recoding many of the mathematics routines but it is possible.

Oh and the display needs to be a lot better. 400 segments isn't enough to do the hardware justice.

Re: Does anyone have 15C LE dissection pics?
*Message #20 Posted by **Katie Wasserman** on 22 Sept 2011, 11:02 a.m.,*
in response to message #19 by Paul Dale

There are a few spare i/o pins that are made available on the 20b and 30b PCBs. Have you experimented with adding a small serial non-volatile RAM chip? Such RAM wouldn't be in the calculator's memory space but you could write routines to page it in as needed or it might be fast enough to use for all memory access.

The change to (and developemnt cost of) a new board layout with an lqfp package is puzzling. Maybe a design/layout modification was pending for whatever reason and the projected volumes didn't justify the setup cost for COB a this stage.

Frankly I'm still not sure how a bare sam7l die ended up in the 12c+ version. There isn't a motivation due to high die pin count. Perhaps it was an early attempt to discourage reverse engineering over a concern of using an off the shelf commercial SoC. Hard to see an economic motivation but Atmel doesn't appear to openly sell the part in bare die form so that's inconclusive.

Re: Does anyone have 15C LE dissection pics?

*Message #23 Posted by **Eric Smith** on 22 Sept 2011, 11:52 a.m.,*
in response to message #22 by uhmgawa

Cost. In the quantities that HP makes the 12C, they are able to buy the bare die, attach and bond it, and encapsulate it, for less than what it costs to buy the packaged part.

The reason Atmel doesn't "openly sell" the part in bare die form is that they don't want to sell it that way to anyone that isn't buying a large volume and prepared to deal with the complexity of chip-on-board assembly. If you design a high-volume product, you can negotiate a bare die contract with Atmel too.

Re: Does anyone have 15C LE dissection pics?

*Message #24 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 22 Sept 2011, 12:13 p.m.,*
in response to message #23 by Eric Smith

Packaged chips go through extensive relaibility and retention tests including at high temperatures. Sometime the defects are not detectible until a high temperature test is performed. However bare die only goes through a simple probbing test. Testing becomes much more complex and difficult once the bare SoC chip is sureface mounted on a board, and some tests such as high temperature testing are not possible.

Therefore I would argue that 15C could be more reliable than 12C at least as far as the reliability of the SoC is concerned.

Possibly, but I believe the answer is only known to HP. There is also the need for precision die handling, die adhesion to pcb, wire welding, and encapsulation which add to the manufacturing process cost traded off against the uneventful alternative of reflowing a 128 pin lqfp on a board to be printed and reflow processed anyway.

> Quote:
>
> The reason Atmel doesn't "openly sell" the part in bare die form..

Apparently they do but through specialized die distributors and wafer processing third parties rather than directly.

Re: Does anyone have 15C LE dissection pics?

I stated that, less precisely. However, they don't add very much to the manufacturing cost, because the ODM in China is already equipped to do all of that, and does it routinely for many products.

This is why if you open up just almost any sub-$50 electronic item, you'll find that it uses CoB assembly. SMT assembly in low-cost items is the exception.

This is what makes it particularly bizarre that the 15C LE has moved to SMT assembly.

An interesting (to me) example of that is the Casio fx-115/991ES. It has a 204-connection chip die under the black epoxy blob, most of which go to the 31x96 dot-matrix LCD with 18 annunciators (2994 elements). It sells for less than $13 at some US major retailers.

Re: Does anyone have 15C LE dissection pics?

Most contemporary graphic lcd controllers of such density are as well only available in die form due to the sheer number of pins present on the device. But obviously a valid argument as the process must be economical at that price point.

> Quote:
>
> This is what makes it particularly bizarre that the 15C LE has moved to SMT assembly.

After a chat with an Atmel die reseller today it isn't quite as intuitive as I'd expected. The pricing is all over the map and in some cases singulated die will have an OEM cost greater than its packaged counterpart due to "market forces". Even if you're interested in buying full wafers from a semi vendor you may be stuck going through a reseller due to a vendor's traceability and liability concerns of the die ending up in unapproved hands, or being packaged for resale via unapproved parties. Other lesser logistical issues exist such as vendors only shipping full wafers so if your production pipe isn't continuous you may need to warehouse unbonded die in a nitrogen bath to avoid atmospheric contamination of the die's metalization.

No idea if any of the above applies to the 15c le's manufacturing disposition. However this tends to confirm the suspicion a few other variables exist in the equation concerning the economics of bare vs. package die use.

speculation follows...

The lqfp might be the new design/layout.

Has anyone opened a recent 12c (30th AE or similar vintage) to see if it is still using the COB?

Perhaps the bare chip contract ended, and rather than extend it the board was redesigned for the lqfp.

Maybe the lqfp price was near enough the COB not to matter?

Maybe the 12c volume has declined so that the COB was no longer justified/cost-effective?

in response to message #31 by Marcus von Cube, Germany

Yes it does if you're good at doing some very precise soldering, it's a 0.5mm lead pitch.

Re: Does anyone have 15C LE dissection pics?

*Message #33 Posted by **uhmgawa** on 24 Sept 2011, 9:05 a.m.,*
in response to message #32 by Katie Wasserman

> Quote:
>
> Yes it does if you're good at doing some very precise soldering, it's a 0.5mm lead pitch.

0.5mm pitch gull wing packages aren't too formidable. You can have at it relatively comfortably using a 5x jeweler's loupe and fine point soldering tip. Assuming the rework will be done in place with the pcb mounted, one caution would be to keep the typical flux drenching in check to avoid contamination via creepage through vias into the key matrix. Then again IIRC the vias may be small enough to have been closed by the solder mask. If so this may prevent the flux from migrating.

Alternatively (judging from the autopsy above) the 15c le as well uses hollow studs securing the pcb to the frame. I'd assume as for the 12c+ the ID of the stud bore is just under 1.2mm. So after cutting the heat staked heads the pcb could be reattached with 1.2~1.4mm self threading, flange head screws -- a *major* simplification relative to the trauma of pcb replacement for legacy voyagers.

[WP34S] [Manual] Units conversion question

*Message #1 Posted by **E.Lub_EU** on 20 Sept 2011, 8:03 p.m.*

Hello all,

In the manual dated 2011-09-15, p. 75, the "amplitude ratio to dB" formula is writen as 10 * lg (R) Page 76 shows the reciprocal conversion (is that the correct wording?) as using a multiplying factor of 20.

The dB <-> power conversions seem consistant (pp. 76 & 77), and use the 10 factor I am familiar with in EE.

Would anybody know of a field of engineering or science, in which something called an amplitude, would actually have a "dimension" akin to a power (using a dB factor of 10), therefore causing a confusion?

Re: [WP34S] [Manual] Units conversion question

*Message #2 Posted by **David Persinger (US)** on 20 Sept 2011, 9:29 p.m.,*
in response to message #1 by E.Lub_EU

I am a EE, but haven't used these units much.

I do know that electrical power can be in peak values, or RMS average values. I don't know if this comes into play here.

But here is a units website that deals with dB values and there seem to be some agreement with these conversion, but you have to know if you are basing the conversion on peak (full scale), or average.

http://www.unc.edu/~rowlett/units/dictD.html

decibels don't have units, per se, but there are different scales.

Re: [WP34S] [Manual] Units conversion question

*Message #3 Posted by **E.Lub_EU** on 21 Sept 2011, 5:01 a.m.,*
in response to message #2 by David Persinger (US)

Hi David,

Thanks for the link. I knew there were units I had never heard about :-)

About electrical power "varieties", they do not come into play (they do "behave" in the same way), but one has to be consistant (peak / peak or RMS / RMS) between the two values being evaluated, in order to keep the scaling factor being meaningful.

Thanks Etienne

Re: [WP34S] [Manual] Units conversion question

*Message #4 Posted by **Masaki Adachi** on 21 Sept 2011, 12:14 a.m.,*
in response to message #1 by E.Lub_EU

This comes into play when talking about gain of, say amplifier, since power ratio is a square of input/output voltage ratio

p1/p2=(v1/v2)^2

G=20log(y/x)[dB]=2x10log(y/x)=10log(y/x)^2[dB]

Something like that (its been decades..)

Re: [WP34S] [Manual] Units conversion question

*Message #5 Posted by **E.Lub_EU** on 21 Sept 2011, 4:20 a.m.,*
in response to message #4 by Masaki Adachi

Hello,

First let me apologize for not not knowing how to address you, I am not familiar with your mother tongue & culture, so even if I recognized your frst from your last name, I would not be sure which one to use.

Thanks for your input, you are indeed correct.

Re: [WP34S] [Manual] Units conversion question

*Message #6 Posted by **Walter B** on 21 Sept 2011, 1:59 a.m.,*
in response to message #1 by E.Lub_EU

Bonjour Etienne,

deziBel denote ratios of two measurements of equal kinds. Such ratios are dimensionless (or unit-free). So no problem with a logarithmic scale. Confusing - maybe. But useful e.g. assessing noise, amplifiers, damping, etc.

Edit: The factor on page 75 must be 20, of course. Thanks for pointing to that! Will be corrected in next edition. Merci!

Edited: 21 Sept 2011, 2:44 a.m.

Re: [WP34S] [Manual] Units conversion question

*Message #7 Posted by **E.Lub_EU** on 21 Sept 2011, 5:36 a.m.,*
in response to message #6 by Walter B

Hello Walter,

It seems I was not entirely clear.

As you noted, my point was that I thought there was an inconsistency in the manual. Not being able to read the code, I could not decide which scale factor was correctly documenting the function you had actually implemented. That is now solved.

Bieteschön...

Etienne

HP 15C LE Keyboard Survey Redux

*Message #1 Posted by **M. Joury** on 20 Sept 2011, 4:58 p.m.*

Back again...

As of Tuesday afternoon I have responses for 72 calculators of which 9 have keyboard issues giving a "failure" rate of 12.5%.

I have to say that I am surprised that there are only 72 from 42 people (including myself). I was hoping for many more to make this a meaningful exercise.

So in the hope that I can get some more responses I am pushing this back to the top of the forum.

For those of you that did not see the earlier post: I am trying to get a feeling for the seriousness of the keyboard problems being reported on the 15C LE. The more responses I can get the more meaningful the exercise. If you have not responded yet and you have received a 15C please let us know how the keyboard is. I only care about non-working (requires extra pressure, does not register, etc.) keys. I don't care about the state of the f and g keys as to alignment and looseness/rattle as long as they are responding properly to user input. If you would like to participate just provide the number of units you have purchased and tested and how many of those failed the test. 2:1 would mean that you tested 2 units and 1 failed.

Thanks,

-Marwan

>
> I have to say that I am surprised that there are only 72 from 42 people (including myself). I was hoping for many more to make this a meaningful exercise.

42 respondents doesn't seem like it's very few. I don't think it's like a thousand people regularly visit (or at least post) at this board.

I'd estimate the error as 1/sqrt(72), so the failure rate is about 0.72%-24.28%.

You'd need many *times* the number of respondents, not just *additional* respondents, to tighten up that estimate.

Re: HP 15C LE Keyboard Survey Redux (edited)

*Message #7 Posted by **M. Joury** on 20 Sept 2011, 6:48 p.m.,*
in response to message #6 by Crawl

Agreed. But more is better (if only a little). I actually made the same point elsewhere. I was hoping that with this new calculator available and all the people on this forum that wanted one that I would get at least 100 respondents with 200+ calculators. Maybe unreasonable but that was my hope.

Cheers,

-Marwan

Re: HP 15C LE Keyboard Survey Redux

*Message #8 Posted by **M. Joury** on 20 Sept 2011, 9:41 p.m.,*
in response to message #6 by Crawl

Maybe I am missing something but wouldn't it be:

1/sqrt(72) = 11.79% range giving me a failure rate of between 6.61% and 18.39%? Or am I missing something? Is it really 11.79% either side of my observed rate or is it 11.79%/2 either side of my observed rate?

Admittedly still a wide range but lets say we get 200 samples we get down to 7.07% range or (if the observed failure rate at that point was the same) 8.96% - 16% which definitely indicates a problem even if we assume the very lowest possibility. In other words the experiment becomes meaningful. Or am I missing something again?

BTW, as the sample size goes up the observed failure rate appears to be going down--the squeaky wheel gets reported theory that I have espoused previously. People with bad units are going to step up and report their problems before we get a good handle on all the good units out there--at least that is my expectation.

Thanks,

-Marwan

How many responses do you really think are necessary?

If you look at an AQL level chart like here, I think we have more than what we need. link

If we pick the most stringent Inspection Level of 3, and we assume this was a 10,000 piece production run, then that falls under the "M" on the chart, which calls for 315 samples.

Yes, it calls for 315 samples, but the number of rejects to reject the whole lot, if we just use AQL of 1.0, is just 8. We are beyond that already, not counting the new rejects in this thread.

If you pick a Level 2 which calls for 200 samples, and the same AQL of 1.0 then you can only have 6 rejects, so playing around with this chart doesn't help you much unless of course you really open up the AQL level. I don't think most HP calculator owners are the type who accept much in the way of defects so that does not seem very acceptable to me.

*Message #19 Posted by **Hugh Evans** on 20 Sept 2011, 9:07 p.m.,*
in response to message #1 by M. Joury

Two good, zero bad. Since it is known that 10,000 units are being produced it would be more fair to calculate failure rate from that population size. You're much more likely to get responses from people experiencing keyboard problems.

From a standpoint of production quality control: Presuming the 15C and 12C come off the same production line, where are the complaints about the latter?

I bought two. One is almost flawless except sloppy shift keys. However, another has some scratches and dents. I think a factory worker dropped it and unconcernedly shipped. :-(

Re: HP 15C LE Keyboard Survey Redux

*Message #46 Posted by **Roger Blake** on 25 Sept 2011, 7:40 a.m.,*
in response to message #44 by PAtrick Rendulic

2/2 Good (but one f/g keys loose and rattle)

Bought two from Samson Cables and shipped to UK - I got fast two day shipping which was very expensive but no problems and I did get the $99 (now $149 !))price which probably balanced out the shipping cost. Hoping they will eventually appear over here in which case I'll buy another, hopefully much cheaper.

The first with serial 1881 has firm-ish function keys which normally I wouldn't have noticed were any different to the others. The second, opened a couple of days later, surprisingly had a serial in the 500s and had noticeably looser function keys with a slight rattle.

Neither calculator has any other problems - keyboard test passed just fine. And I do actually like the keyboard on the limited edition better than the original. I found that the original's feel was not tbat positive with its much more limited key travel, and in particular the [Enter] key was attrocious], although it worked fine in practice. On the limited edition the only concern I have is that it seems the display easily acquires very fine scratches - as does the 35S. The original voyagers don't have this problem. Pity they couldn't run to a harder protective plastic like on the 50G.

*Message #47 Posted by **Michael Kussmaul** on 25 Sept 2011, 8:58 a.m.,*
in response to message #44 by PAtrick Rendulic

Bought: 1, Good:0

Bought one and it had a defective EEX key. When firmly pressed it works, but out of 10 clicks, 5 or so are missed, even when I hear the "click" sound of the key. Also the g-key rattles quite a lot. Bought mine at Samson and had it shipped to Switzerland, so I'm not that keen to send it back because of the high shipping cost... Serial CNA1320910, Limited Edition Nummer: 121 (wow, quite a low one :-)

Btw, the ON key is full height? On the picture on the manual (and as written in the manual itself) it seems the ON key should be a smaller/half-height key?

> Btw, the ON key is full height? On the picture on the manual (and as written in the manual itself) it seems the ON key should be a smaller/half-height key?

The ON key on the original 15C is significantly lower than the other keys, however, on the 15C LE it is the same. The manual is an exact copy of the original manual, such that it does not reflect differences in the new 15C LE. They even copied the original self-test incorrectly, although ironically it was the one for the original 12C. No doubt over time we will discover other minor differences as well. What concerns me a lot more are the bugs in the calc itself, such as the disfunctional PSE command. Personally, if I had a defective keyboard I'd demand a replacement, and that HP pay return postage. Absolutely no excuse or justification for all these problems.

in response to message #48 by Michael de Estrada

Sorry, was a little confused with 0/1 which is which :-) so I edited it to make it more clear.

For the ON-key: it's just funny, because on the manual they have clearly written "Limited Edition" on the image on the front cover, but as you said, the actual image is probably an original 15c, just photoshopped with this badge. That confused me a bit.

Re: HP 15C LE Keyboard Survey Redux

*Message #50 Posted by **Michael de Estrada** on 25 Sept 2011, 10:32 a.m.,*
in response to message #49 by Michael Kussmaul

I don't think the cover image is photoshopped, since all the keys have the dull finish of the new models, whereas the original keys are glossy. What may have happened is that the prototype had a lower ON key design that didn't make it into production. The cover on the original manual has a totally different image, which does not even include a calculator. The text in the new manual is the same, however, which was what I meant. There is a note at the bottom of page 18 on both the original manuals that states "*Note that the ON key is lower than the other keys to help prevent its being pressed inadvertently." They even repeated the spelling error of "its" instead of "it".

> They even repeated the spelling error of "its" instead of "it".

Nope - that is correct. "being pressed" here is a gerund, thus acting as a noun, and requiring the possessive "its" (usually mispelled, even in this erudite forum, as "it's" - which is ONLY the contraction for "it is").

Re: HP 15C LE Keyboard Survey Redux

*Message #52 Posted by **Dave Shaffer (Arizona)** on 25 Sept 2011, 4:57 p.m.,*

Is it equivalent to "to prevent its pressing down"? Would that work?

The sentence in question sounds quite weird.

Re: HP 15C LE Keyboard Survey Redux

*Message #54 Posted by **Dave Shaffer (Arizona)** on 26 Sept 2011, 3:30 p.m.,*
in response to message #53 by Thomas Radtke

> Quote:
>
> Is it equivalent to "to prevent its pressing down"? Would that work?

Not quite: a native English speaker would interpret that to mean that you are talking about the key DOING the pressing (perhaps due to its own weight), not being pressed BY something (someone) else.

While perhaps a bit convoluted, I think the meaning is clear - the key is lower so there is less likelihood that it would be pressed by mistake.

Bought 2 Good 2

Anyone compare HP15CLE key presses against a NIB or very lightly used HP1XC? Just wondering if age or usage makes the keys get less snappy with higher activation pressure...

Re: HP 15C LE Keyboard Survey Redux

*Message #56 Posted by **Roger Blake** on 25 Sept 2011, 1:00 p.m.,*
in response to message #55 by Geoffrey Wang

The originals have always had lousy keyboards - although obviously others disagree greatly with my view. As I've said in previous posts I've found the original's [Enter] key especially bad, and I don't think they've changed much over time. I still have a 16C which has been lightly used over the years, and my much used 15C (which got dropped a couple of years back :-( ) felt similar. Having said that - in use they never gave any problem - and hopefully the limited edition with its IMO much superior keyboard, apart from any f/G wobble, will last just as long. I find the new keyboard much like the older HP LED Scientifics in feel. In fact I distictly remember when first buying the voyager series, of being slightly disappointed that the keys didn't have the same feel of earlier HP calculators. And now they finally have !

*Message #2 Posted by **Eric Smith** on 20 Sept 2011, 7:07 p.m.,*
in response to message #1 by Frank Rottgardt

I don't think they are using the double-shot molded keys any more.

The electronics is definitely NOT "almost same", as it is entirely different. There is not a single electronic component in common with the original.

> I don't think they are using the double-shot molded keys any more.

She says "color injected plastic":

"The keys are all color injected plastic and that hasn't changed, they never wear down..."

This appears to be a simplified and cheaper process. Indeed, I haven't noticed any wearing down so far, but I may just not have used my 12C+ enough. *"That hasn't changed"* is wrong, however.

Rationale for 15C L.R. result order?

*Message #1 Posted by **Mike Fikes** on 20 Sept 2011, 3:31 p.m.*

I suspect that, in most scenarios, the *slope* of a given line is more "meaningful" than the value of its *y*-intercept, yet the L.R. operation on the 15C returns the slope in the Y register.

(A criticism of this choice is made in "HP-15C: FIRST IMPRESSIONS OF AN HP-41 USER" attached by Gene Wright to Some 15c files from HHC 2010 recently.)

Is there a logical argument that can be used to defend the choice that HP made for the 15C? Perhaps it facilitates certain use cases?

Edited: 20 Sept 2011, 4:09 p.m. after one or more responses were posted

Re: Rationale for 15C L.R. result order?

*Message #2 Posted by **Walter B** on 20 Sept 2011, 4:00 p.m.,*
in response to message #1 by Mike Fikes

Can't tell you a logical argument but only an historical. L.R. returns the regression parameters in this order since the HP-32E at least. So we did keep it this way for the WP 34S, too.

Addendum:

> Quote:
>
> A criticism of this choice is made in "HP-15C: FIRST IMPRESSIONS OF AN HP-41 USER"

Hmmh, the author of that article only claims the reverse order would be "more natural" without giving any rationale for this claim :-/ Looks like there are simply just two ways and HP chose one :-)

Edited: 20 Sept 2011, 4:09 p.m.

Re: Rationale for 15C L.R. result order?

*Message #3 Posted by **Mike Fikes** on 20 Sept 2011, 4:14 p.m.,*
in response to message #2 by Walter B

Right. With respect to being more "natural" I would argue that (to me at least) it would have been more natural, in the following sense:

In algebra class, you learn the formula for a line is $y = mx + b$. Because of this, I expect m to be "first" (in the X register), followed by b in the Y register.

Re: Rationale for 15C L.R. result order?

*Message #4 Posted by **Walter B** on 20 Sept 2011, 5:05 p.m.,*

in response to message #3 by Mike Fikes

Well, what's pushed on the stack first ends higher up :-) So what you see may be the consequence of m ENTER b . BTW, what's the rationale behind the abbreviations "m" and "b"?

Re: Rationale for 15C L.R. result order?

*Message #9 Posted by **Dieter** on 21 Sept 2011, 1:21 p.m.,*
in response to message #6 by Martin Pinckney

Well, of course real statisticians (tm) know that simple linear regression is just a warm-up for the real thing (multiple linear and nonlinear regression). They usually think further and use models with a larger number of variables. And so we finally get

$$y = a_0 + a_1x_1 + a_2x_2 + a_3x_3 + \ldots$$

So it's fine that a_0 is returned in X and a_1 in Y. :-)

Dieter

Re: Rationale for 15C L.R. result order?

*Message #10 Posted by **Crawl** on 20 Sept 2011, 5:59 p.m.,*
in response to message #1 by Mike Fikes

My guess: For estimating x.

There already is an estimating y function, but not for x.

To estimate x, you'd do

1. LR

2. CHS

3. y

4. +

5. Swap

6. divide

If the m, b order was different, it seems you'd want to do the same steps, but add an extra swap to get it to what it currently is. So why not have the swap built in?

HP 15C LE available as of 9/20 at ...

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 20 Sept 2011, 3:01 p.m.*

Following HP shopping site states that it is available and for $129
http://h10010.www1.hp.com/wwpc/us/en/sm/WF05a/215348-215348-64232-20037-215351-33532.html

Comes with Calculator emulator on CD as well. However the spec says it has 12 digit display, called sales and technical support they both claim, spec is true it is 12 digit display. Well, picture shows only 10 and the original 15C is 10 digits. Technical support even claimed that earlier product sheets for 15C LE stated 10 digits and they updated it with 12 digit. Doesn't make sense. Any comments?

-Kerem

Instructions for building WP-34s loads.

*Message #1 Posted by **Dominic Richens** on 20 Sept 2011, 11:34 a.m.*

Is this documented somewhere?

I figured it out by reading the source and perusing forum postings since January, and then a lot of trial and error.

Should I document what I did and what free tools I used? Where would be the best place to put it? Is wiki4hp.com the best place?

I haven't tried to cross-compile an actual firmware load yet, but I will get to that eventually when my 20b shows up and I get a cable.

cheers!

wp32sII anyone?

Re: Instructions for building WP-34s loads.

*Message #3 Posted by **Dominic Richens** on 20 Sept 2011, 3:02 p.m.,*
in response to message #2 by Bart (UK)

Thanks Bart, but I don't have permission to add the windows build instructions to your article. If you want, this is what I wanted to add:

Building the wp43s windows emulator from source
First you need to get and install some tools:

1. **SVN client**: I used Silk's subversion client http://www.sliksvn.com/en/download - I did a custom install of only the svn command line tool.
2. **Perl**: I used ActivePerl's package for windows http://www.activestate.com/activeperl/downloads

3. **MS Visual C++ Express**: thanks to Pauli's inclusion of libraries, MS's basic free C++ development environment will work - this is the latest 2010 version: http://www.microsoft.com/visualstudio/en-us/products/2010-editions/visual-cpp-express

Building a windows binary
Bring up a windows console (Run->cmd) and change to a directory path that doesn't have any spaces in the name.

1. Run the subversion command to get the latest software:

> Quote:
>
> svn co https://wp34s.svn.sourceforge.net/svnroot/wp34s wp34s

2. Change to "wp34s" directory and run makewin.cmd
3. In windows explorer, find and double cilck on wp34s\trunk\windows\wp34s_express.sln to startup Visual C++ Express.
4. In the "Solution Explorer" sub-window, click on wp34s_express and hit "F7" to build.

If all goes well, you should have a wp34sgui_d.exe in the bin directory.

Edited: 20 Sept 2011, 4:04 p.m.

Re: Instructions for building WP-34s loads.

*Message #4 Posted by **Marcus von Cube, Germany** on 20 Sept 2011, 7:25 p.m.,*
in response to message #3 by Dominic Richens

Steps 3. and 4. repeat what step 2 does: They build the executable. I've put some effort into splitting the emulator GUI from the rest because the GUI is MFC based and cannot be built using the free VC Express. The subversion windows/bin directory contains all files necessary to build and even debug the rest of the code.

Makewin.cmd just calls the command line build engine that comes with the VC installation. It's essentially the same process that is triggered by pressing F7 in the VC IDE.

I've setup a build system for Pauli which is a Windows XP box with just the tools you mention: SVN, Perl, VC++. In order to build the flash file you will need some tools from MinGW and the Yagarto.de ARM toolchain. Good luck!

BTW, I don't like the shifted arrow keys on your picture. ;-)

Re: Instructions for building WP-34s loads.

*Message #5 Posted by **Dominic Richens** on 20 Sept 2011, 9:09 p.m.,*
in response to message #4 by Marcus von Cube, Germany

> Quote:
>
> Steps 3. and 4. repeat what step 2 does

That's what I tried at first, but SvnRevision was undefined. I'll wipe it out and see what happens if I try again.

> Quote:

> BTW, I don't like the shifted arrow keys on your picture. ;-)

Yeah - I'm not going for a true replica, I'll be "improving" a few things :-)

Re: Instructions for building WP-34s loads.

*Message #6 Posted by **Marcus von Cube, Germany** on 21 Sept 2011, 12:15 a.m.,*
in response to message #5 by Dominic Richens

> Quote:
>
> That's what I tried at first, but SvnRevision was undefined. I'll wipe it out and see what happens if I try again.

That's a problem with your SVN client. SVNVERSION is used during the build to determine the revision number for the VERS screen. If it is not found a blank revision number should be created.

Edited: 21 Sept 2011, 12:37 a.m.

Re: Instructions for building WP-34s loads.

*Message #7 Posted by **Bart (UK)** on 21 Sept 2011, 5:22 a.m.,*
in response to message #3 by Dominic Richens

Sorry, I mis-read the post, I thought it was about programming a physical 34s :(

I will add your instructions :-)

Edit: could you just confirm steps 2, 3 & 4 as discussed with Marcus? Thanks.

Edited: 21 Sept 2011, 5:28 a.m.

Re: Instructions for building WP-34s loads.

*Message #8 Posted by **Dominic Richens** on 21 Sept 2011, 2:25 p.m.,*
in response to message #7 by Bart (UK)

I figured out the missed step.

Change step 2 to say:

2. Make sure the solution configuration is set to "Release" and not "Debug" in the toolbar drop down menu.

Debug seems to be the default when I open the solution and it doesn't run create_version.exe properly...it creates an empty revision.h file.

Also, just running the old step 2 builds everything - I thought it wasn't because I was looking in the wrong place for the binaries.

Re: Instructions for building WP-34s loads.

*Message #9 Posted by **Bart (UK)** on 22 Sept 2011, 10:15 a.m.,*
in response to message #8 by Dominic Richens

OK, I have updated the article. Can you check I have got it right?

Thanks
Bart

Re: Instructions for building WP-34s loads.

*Message #10 Posted by **Dominic Richens** on 22 Sept 2011, 10:46 a.m.,*
in response to message #9 by Bart (UK)

Bart,

you did exactly what I told you to - but it's wrong :-/

Building a windows binary
Bring up a windows console (Run->cmd) and change to a directory path that doesn't have any spaces in the name.

1. Run the subversion command to get the latest software:

   Quote:

   svn co https://wp34s.svn.sourceforge.net/svnroot/wp34s wp34s

2. To build from the command line, change to "wp34s" directory and run makewin.cmd.
3. To build from the GUI, do the next 3 steps:
   1. In windows explorer, find and double cilck on wp34s\trunk\windows\wp34s_express.sln to startup Visual C++ Express.
   2. Make sure the solution configuration is set to "Release" and not "Debug" in the toolbar drop down menu.
   3. In the "Solution Explorer" sub-window, click on wp34s_express and hit "F7" to build.

If all goes well, you should have a new wp34sgui.exe in the trunk\windows\bin directory.

Re: Instructions for building WP-34s loads.

*Message #11 Posted by **Bart (UK)** on 22 Sept 2011, 11:33 a.m.,*
in response to message #10 by Dominic Richens

That's OK, got it updated now ;-)

Re: Instructions for building WP-34s loads.

*Message #12 Posted by **Marcus von Cube, Germany** on 23 Sept 2011, 10:42 a.m.,*
in response to message #8 by Dominic Richens

I changed the default for the VC Express solution file to Release.

*Message #13 Posted by **Paul Dale** on 21 Sept 2011, 6:48 p.m.,*

in response to message #1 by Dominic Richens

Doesn't the 34S do everything the 32sii does already?

This was one of the model we wanted a feature super set of. Hence the fraction modes.

- Pauli

Re: Instructions for building WP-34s loads.

*Message #14 Posted by **Dominic Richens** on 21 Sept 2011, 10:44 p.m.,*
in response to message #13 by Paul Dale

Absolutely, and I don't intend to add any features. My impression of the very good keyboard layout of the wp-34s is that it is aimed at power users that do a lot of programming and use the calculator mostly to run those programs. Also, it puts most functions visible on the face-plate through multiple shift keys.

I tend to use my HP-48SX and HP-15C (before I lost it) mostly as a plain scientific calculator: trig, logs, stats. I usually have about 5 programs that I use occasionally (optical power/OSNR stuff). As a result I want most of the scientific and stack functions on un-shifted keys and I don't mind shifting or scrolling through catalogs for everything else.

When I get my cable and (hopefully) overlay I'll convert my 20b to a wp34s and use it for a while. Meanwhile I'll work on an alternate "scientific" layout on the emulator if it doesn't grow on me :-)

Re: Instructions for building WP-34s loads.

*Message #15 Posted by **Paul Dale** on 21 Sept 2011, 11:06 p.m.,*
in response to message #14 by Dominic Richens

I find the opposite, there are many programming functions missing from the keyboard. The number of programming functions on the keyboard isn't great: XEQ, GTO, LBL, RTN, ISG, DSE, R/S, x=, x!=, PSE and all but two are shifted. There are a few more keys with support stuff P/R, CLP, P.FCN, TEST, all of these are shifted. Solve, integrate, product and sum are programming related I guess but I tend to think of them more as maths functions. Likewise, up and down arrow have a programming meaning but aren't really programming keys. In all about an eighth of the stuff on the keyboard is programming related and nearly all of it is shifted. No doubt I've missed a few but the number is in the right ball park at least.

I agree it would be nice for some scientific keys to be unshifted but we couldn't figure out where to put them -- what loses the unshifted position to make way? I don't see anything less important. As an aside, integer mode fared far worse, most of its special functions are in a catalogue and much of the keyboard stops working.

I'd also hazard a guess that there are more functions in the various catalogues than are on the keyboard. We've packed a lot of functionality into the 34S :-)

- Pauli

Re: Instructions for building WP-34s loads.

*Message #17 Posted by **Dominic Richens** on 22 Sept 2011, 7:30 a.m.,*
in response to message #16 by Walter B

Don't hold your breath :-)

I was enjoying myself for about 45 minutes, editing keys.h and keys.c to remap all the primary keys (include f and g) to match the 32sII. Then it came time to decide which shifted keys to ditch and I wasn't enjoying myself anymore :-)

I did figure out that for scrolling through the menus, I could put the up/down keys as un-shifted modal keys on "X" and "/", since that column of keys doesn't do anything when in a menu. Of course these would have to be shifted keys to SST and BST :-(

Re: Instructions for building WP-34s loads.

*Message #18 Posted by **Walter B** on 22 Sept 2011, 12:57 p.m.,*
in response to message #17 by Dominic Richens

Tja, it looks so easy when it's done ;-)

Re: Instructions for building WP-34s loads.

*Message #19 Posted by **Paul Dale** on 23 Sept 2011, 5:01 a.m.,*
in response to message #17 by Dominic Richens

Far better to figure the layout out on paper or in a cad package and then start coding.

- Pauli

...powerpoint - I can move the little keys and labels around without them falling on the floor :-)

functions dropped from keys:
- DEG/RAD/GRAD -> MODE menu
- FILL
- A, B, C, D
- ALL, FIX, SCI, ENG -> MODE menu
- AND, OR, XOR, NOR > P.FCM
- CLP, CLx, CLα, CLΣ -> CLEAR menu
- Cy,x and Py,x -> PROB menu

Menus
- MODE
- CAT
- CONV
- CONST
- PROB
- STAT
- TEST
- P.FCN
- X.FCN
- CLEAR

Re: WP-34s overlays

*Message #21 Posted by **megarat** on 26 Sept 2011, 1:14 p.m.,*
in response to message #13 by Paul Dale

I've been reading so much about the 34s that I decided to join the fun and ordered a 30b today.

(On Amazon, the 30b is less expensive than the 20b. How strange, this world of retail.)

I already have a cable from Gene, so the only obstacles are my own time and effort. Well ... that, and an overlay. As an only occasional visitor to the forum, is there anyway I can be notified (mailing list, &c.) when the next batch of overlays are available?

Thanks!

Edited: 26 Sept 2011, 1:14 p.m.

All I could suggest is to send an email to Eric. See this page for contact info.

I did that last month but have not heard back yet.

Re: WP-34s overlays

*Message #23 Posted by **Dan M (Vermont, USA)** on 26 Sept 2011, 3:35 p.m.,*
in response to message #21 by megarat

I did the same as you (inexpensive calculator from Amazon, cable from Gene), and am quite pleased with the operation of the WP-34s.

Don't get me started on the intermittent operation of the keys that came with the hardware platform or the as-designed built-in applications and operation of the hardware platform.

That would just tend to generate random useless opinions from me :-)

For overlay, I printed out the actual-size PNG in color on ordinary paper, aligned it over the keys, then wrapped it around the hardware body and secured it in place with tape on the back of the calculator. Not the most elegant, but it works for me and it works for now. I should be able to repeat this process indefinitely when the paper wrapper gets worn out. I think I saw somewhere that somebody did this with printing on plastic or laminating a printed paper, but I am content with my plain paper version. I can feel the keys under it well enough.

Someday soon, I believe that there will be "commercially available" nicely-produced stick-on overlays again.

Good luck, and happy calculating!

Dan M.

HP Forum HHC Programming contest idea / possible rules

*Message #1 Posted by **gene wright** on 20 Sept 2011, 9:52 a.m.*

Hi all.

I think I have the final RPN programming problem figured out in my head at least and thought about trying to have a contest here at the forum this weekend for those who cannot attend the HHC in San Diego.

Here's what I was thinking:

1) Post the problem here early Saturday morning San Diego time.

2) Post the rules here as well, one of which will be for anyone in the forum who is working on the problem NOT to post their solutions, etc. here in the forum until after the end time of the contest. That would not be cool. :-)

3) Solutions should be emailed to my email address by the end time of the contest (which would be Sunday afternoon San Diego time).

4) I determine the winner of the forum submissions.

5) After the deadline... post away here at the forum with your solutions. :-)

This would require discipline not to search the internet for help, not to post solutions here early, etc.

The winner of the forum contest would receive world-wide fame and fortune and some sort of prize from me. :-)

What do all of you think?

Re: HP Forum HHC Programming contest idea / possible rules

*Message #2 Posted by **Thomas Radtke** on 20 Sept 2011, 11:37 a.m.,*
in response to message #1 by gene wright

I's a good idea to compete in the dark, so to say. I'll be there on Saturday with my 32SII between my teeth.

Re: HP Forum HHC Programming contest idea / possible rules

*Message #3 Posted by **gene wright** on 20 Sept 2011, 11:42 a.m.,*
in response to message #2 by Thomas Radtke

Well, the HHC attendees will be competing against each other, but those who cannot attend often want to compete too.

As long as people respect the goal of the contest which is to figure out your best effort on your own and not to publicize anything until after the contest is over!

Re: HP Forum HHC Programming contest idea / possible rules

*Message #4 Posted by **Pal G.** on 20 Sept 2011, 12:02 p.m.,*
in response to message #1 by gene wright

I think this would be fun for those of us who cannot attend. Thanks for thinking of us non-attendees.

Re: HP Forum HHC Programming contest idea / possible rules

*Message #5 Posted by **David Ramsey** on 20 Sept 2011, 5:51 p.m.,*
in response to message #1 by gene wright

When would we have time to work on the problem? The Saturday conference goes until 10PM!

Re: HP Forum HHC Programming contest idea / possible rules

*Message #6 Posted by **gene wright** on 20 Sept 2011, 6:19 p.m.,*
in response to message #5 by David Ramsey

But we don't start again until Sunday at 9am or so.

?

Alternatively (since I don't know what time Paris is on), when on Daylight Savings Time compared to GMT, San Diego is 7 hours different (I can't decide whether this should be called "later" or "earlier"!). i.e. at GMT midnight (beginning of the new day), it is 5 PM (the previous

day) in San Diego. During regular time, the offset is 8 hours.

Like most of the EU, also Paris claims to see the sun 1h earlier than Greenwich. Portugal's the only country on the continent joining British time.

*Message #14 Posted by **Dave Shaffer (Arizona)** on 22 Sept 2011, 9:24 p.m.,*
in response to message #13 by Walter B

I am under the impression that not even Britain is on GMT (?) but an hour (or two in the summer) different.

in response to message #12 by Dave Shaffer (Arizona)

Thank you, all this is of great help.

I am now sure not to miss start and end of the contest :-)

I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #16 Posted by **gene wright** on 22 Sept 2011, 7:42 a.m.,*
in response to message #1 by gene wright

I have (inefficiently) programmed the problem on a 15c LE and on the 34S so I know it can be done. lol.

Speed is of course important, but I hope people will try the problem on other, not-quite-as-fast machines.

I also hope you will enjoy thinking through the problem.

But remember --- please respect the rules by NOT searching the internet for hints on how to solve it AND by not posting solutions here to the forum until AFTER 5p.m. Sunday San Diego time.

Everyone agree? :-)

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #17 Posted by **Werner** on 25 Sept 2011, 2:12 p.m.,*
in response to message #16 by gene wright

Agree. No solution, no hint.

41C 58 bytes, r=100, (x,y)=(1,1) in 21.38 secs

Let's see how I fared.. Werner

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #18 Posted by **Thomas Radtke** on 25 Sept 2011, 2:31 p.m.,*
in response to message #17 by Werner

32SII, r=100: 45 byte, 10s. Not really optimized, I fear.

This was very much fun, and brought back a lot of the old fascination in this particular calculator. Thanks for it, Gene! :-)

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #19 Posted by **Werner** on 25 Sept 2011, 4:29 p.m.,*
in response to message #18 by Thomas Radtke

41C, 39 bytes, r=100 in 14.75s

I can only hope the 32SII is much faster than the 41C ;-)

Werner

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #20 Posted by **Paul Dale** on 25 Sept 2011, 5:03 p.m.,*
in response to message #19 by Werner

34S 21 steps, r=100 sub 1 second :-)

My fastest version is twice the size and about seven times faster but sadly incorrect.

- Pauli

A bit like the joke at NASA about spacecraft missions a while ago:

"Better, Faster, Cheaper - pick two out of three!"

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #22 Posted by **Paul Dale** on 25 Sept 2011, 5:50 p.m.,*
in response to message #21 by Dave Shaffer (Arizona)

:-)

In this case I'm sure the program can be fixed to give the expected results without any time penalty. I spent way too long fiddling around with the problem already and have real life things to get done. So yes, that quote applies.

- Pauli

*Message #23 Posted by **Dieter** on 25 Sept 2011, 5:25 p.m.,*
in response to message #20 by Paul Dale

35s: just 19 steps including LBL and RTN.
But r=100 takes ...a tiny bit longer: 13 seconds ;-)

Dieter

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #24 Posted by **Gerson W. Barbosa** on 25 Sept 2011, 5:39 p.m.,*
in response to message #19 by Werner

HP-12C: 48 steps, r=100 -> 97 seconds (equivalent to about 43 seconds on the 41C).

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #25 Posted by **Werner** on 26 Sept 2011, 2:19 a.m.,*
in response to message #24 by Gerson W. Barbosa

By my reckoning it's 11PM San Diego time, so I can post a solution:

```
41C 37-byte prgm (excluding label and end)
timing 100:    13.00s    31'796
       540: 1m 09.12s   918'168
      1000: 2m 07.44s 3'145'520

pixels in a circle
------------------

 observations:
 - input parameters x and y are superfluous. We will assume a circle with
centre (0,0)
 - solution is symmetric in every quadrant. We'll count the pixels in
quadrant 1 and multiply by four
 - a pixel(x,y) is lit when (x-1)^2 + (y-1)^2 < r^2

 Let's start by assuming all pixels of the quadrant are lit, and then
determine which ones are dark,
```

```
as follows (take r=10 as an example):

1. determine the first dark pixel in the top row:

   (m-1)^2 + (10-1)^2 >= 10^2
 or
    m = CEIL(sqrt(10^2 - 9^2) + 1) = 6

 so p(x,10) are lit, x=1..5
    p(x,10) are dark, x=6..10

 then, because of symmetry, we know these 9 pixels are dark:

  x x x x x . . . . .
  x x x x x x x x x .
  x x x x x x x x x .
  x x x x x x x x x .
  x x x x x x x x x .
  x x x x x x x x x x
  x x x x x x x x x x
  x x x x x x x x x x
  x x x x x x x x x x
  x x x x x x x x x x

2. determine the first dark pixel in the second row:

   (m-1)^2 + (9-1)^2 >= 10^2
 or
    m = CEIL(sqrt(10^2 - 8^2) + 1) = 7

 so p(x,9) are lit, x=1..6
    p(x,9) are dark, x=7..10 - but 10 we knew already

 and we can darken the following 7 pixels, too:

  x x x x x . . . . .
  x x x x x x . . . .
  x x x x x x x x . .
  x x x x x x x x . .
  x x x x x x x x x .
  x x x x x x x x x x
  x x x x x x x x x x
  x x x x x x x x x x
  x x x x x x x x x x
  x x x x x x x x x x

3. determine first dark pixel on row three

   (m-1)^2 + (8-1)^2 >= 10^2
 or
    m = CEIL(sqrt(10^2 - 7^2) + 1) = 9

this means (x,8) is dark for x=9..10, and we are done

in pseudocode this reads:

p := r^2;
y := r;
do
  y := y - 1;
  m := CEIL(sqrt(r^2 - y^2) + 1);
  t := (m-y)*2 - 3;
  if t<0 then p := p + t;
until t>=0;
```

```
41C 37-byte prgm (excluding label and end)
timing 100:    13.00s    31'796

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #27 Posted by **Paul Dale** on 26 Sept 2011, 6:43 a.m.,*
in response to message #26 by Paul Dale

Thinking about this some more, it won't terminate much sooner for large radii. e.g. At a radius of 250, it stops 10% sooner. Still a neat way to approach the problem.

Working with octants instead of quadrants should save more.

- Pauli

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

*Message #28 Posted by **Werner** on 26 Sept 2011, 7:25 a.m.,*
in response to message #27 by Paul Dale

But I work with octants already..
I determine the size of a 'corner' every time, and move in diagonally.
For r=100, I only go through the loop 29 times to determine all 31796 pixels..

Cheers, Werner

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

Re: I will post the RPN HHC Programming problem here Saturday A.M. San Diego time...

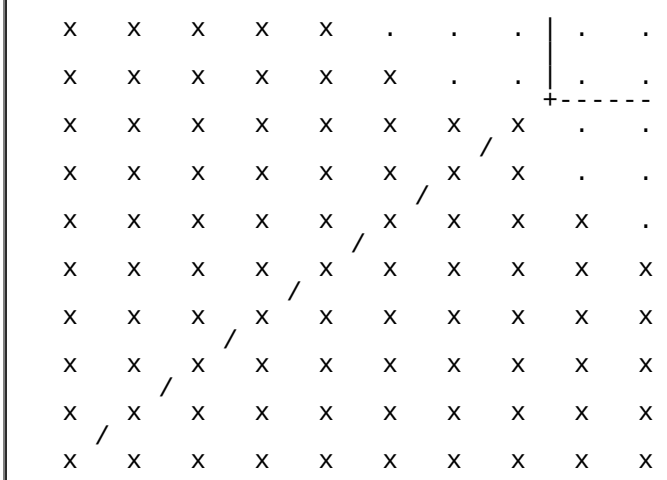
*Message #31 Posted by **Gerson W. Barbosa** on 26 Sept 2011, 8:07 a.m.,*
in response to message #25 by Werner

Very well explained!

Here's my approach, with much less detailed explanations:



Starting from the first column up to the 8th column (int[10*sqrt(2) + 1]), we check the number of dark pixels in each one. Using simmetry, the number of dark pixels in the quadrant is

```
d = 2*5 + 2^2 = 14
```

The total number of lit pixels is

```
n = 4*(r^2 - d^2) = 4*(100 - 14) = 344
```

That's the same number returned by your program.

The HP-12C program is almost a direct translation of the following BASIC program, hence its inefficiency:

```
 5 CLS
10 INPUT R
15 R2 = R * R
20 L = INT(R / SQR(2)): D = R - L - 1
30 I = 0: S = 0
35 IF I >= L THEN 70
40   I = I + 1
50   S = S + INT(R - SQR(R2 - I * I))
60 GOTO 35
70 PRINT 4 * (R * R - 2 * S - D * D)
80 GOTO 10
```

HP-12C program

```

Experience (Learning) Curve Program for HP-41C/CV/CX

*Message #1 Posted by **Chris Catotti** on 20 Sept 2011, 8:59 a.m.*

Help! I desperately need a copy of the Experience (Learning) Curve for Manufacturing Cost Program for HP-41C/CV/CX. I know I have it at home (somewhere), and I thought it was on the MUSEUM DVD version 5.00, but I could not locate it. I believe it is in the Business Statistics / Marketing / Sales 00041-90094 Library Solutions Book.

Can anyone email or fax Toll-free 1-855-248-4533 a copy to me?

I would greatly appreciate it!

kd4ace@earthlink.net

Best Wishes,

Chris Catotti Toll-free Fax 1-855-248-4533

HP 11C suddenly won't turn on

*Message #1 Posted by **Antonio Petri (UK)** on 20 Sept 2011, 6:36 a.m.*

I have an HP 11C that I use very rarely. I was doing a simple calculation and the display suddenly started flashing; The calculator became unresponsive and I had to take the batteries out to turn it off. When I put back the batteries the only thing that the calculator did was to display the message "Pr Error", and it was still unresponsive at any key press, including the "on" key. I then removed the batteries again and waited a few minutes before to put them back, and the result is now that the calculator doesn't even display the "Pr Error" message and it doesn't turn on at all. The batteries are ok as I have tested them on my 15C. I wonder whether what this problem is and most importantly, whether I can get my 11C working again.

Antonio

The batteries are ok as I have tested them on my 15C. I wonder whether what this problem is and most importantly, whether I can get my 11C working again.

Does the "Pr Error" still persist on the display when the 11c appears otherwise unresponsive? It may be the LC oscillator failing to start up coming out of power off. If you have access to an oscilloscope you can check for activity of the LC tank when the ON key is depressed.

I've seen the r2d2 lock up on occasion and give the external appearance the unit as a whole is defunct. The dropout voltage for the cmos process used in voyager silicon is phenomenally low (a good thing). Removing the batteries for even a few minutes I've often found insufficient to cold reset the device. Shorting the battery terminals however will discharge the bypass capacitor and do the job.

Other than this there isn't too much which can commonly go wrong with a voyager to make it appear defunct. Grab a 5-10x jeweler's loupe and have a look at the SMD solder joints on the lqfp packages. It is possible an intermittent connection has developed. In that event pressing down on any suspect lqfp leads with a wooden toothpick while trying to bring the 11c back to life would be my suggestion.

Re: HP 11C suddenly won't turn on

*Message #3 Posted by **Antonio Petri (UK)** on 20 Sept 2011, 3:30 p.m.,*

in response to message #2 by uhmgawa

Thank you for your detailed diagnosis. It happens that after about 8 hours since I removed the batteries the calculator is working ok again, I haven't done anything but putting the batteries back in. Yes, the "Pr Error" message stayed even when the calculator wouldn't respond to any key press; it disappeared when I removed the batteries for the first time. After putting back the batteries after about 15 minutes the calculator didn't turn on at all. So, I understand that, if it happens again, I will have to short the batteries' contacts, as you suggest, or... wait 8 hours again! Thank you again, Antonio

[BUG] HP 50g SOLVE/SOLVR menu does not display unknown var

*Message #1 Posted by **François Vanzeveren** on 20 Sept 2011, 5:01 a.m.*

Hello

I think I found a bug in the SOLVER application. This bug is reproducible also in the HP 50g emulator.

My VERSION:

Version HP50-C

Revision #2.15

Copyright HP 2009

Description of the bug

1. Put an equation into the variable EQ (eg. COS(X)).

2. If the variable 'X' exists, purge it.

3. Enter the SOLVE/SOLVR menu.

At that point everything seems ok, the menu displaying two items: 'X' and 'EXPR='

4. Enter a real number into 'X' (ex: 2) and press 'EXPR='. You get -.4161...

5. Press the VAR key to return to your home directory. You see the 'X' variable created.

6. Return to the SOLVE/SOLVR menu. No problem, both items ('X' and 'EXPR=' are still visible)

7. Now enter the symbolic value '2*pi' (using the greek letter for pi) into 'X' and press 'EXPR='. You get 1.

8. Press the VAR key to return in you home directory.

9. Return back to the SOLVE/SOLVR menu.

SURPRISE!!! The 'X' variable is no more displayed and accessible...

If you want to have it displayed and accessible, you have to enter non symbolic value!

I guess it has been already noted by some... Anyone knows if this has been notified to HP?

Regards

François

Edited: 20 Sept 2011, 6:13 a.m.

Re: [BUG] SOLVE/SOLVR menu does not display unknown var

*Message #2 Posted by **C.Ret** on 20 Sept 2011, 6:20 a.m.,*
in response to message #1 by François Vanzeveren

Bonjour François,

It's not a 'bug', it is a feature of the RPL solver.

The [X] disappear from the solver menu as soon as there no more adjustable variable in the expression.

If you store '2*PI*n' in variable 'X' instead of just '2*PI', you will see that [X] menu is replace by [n]. The solver menu only list variable, no constant of the stored EQ-expression.

Oppositely, if you store in the variable 'X' [... edited ...] a program (i.e. « 2 PI * ») you will observe again that the [x] disappear from the solver menu. If you PURGE the variable ‘X’, the [X] will immediately reappearing in the Solver menu.

In Hp-28C/S, the change fro [x] to [n] (or disappearance) is immediate, perhaps the 'bug' on HP-50g is due to display latency (or a missing refresh cycle is this case). Is that why you notice it only by swapping from and back to the solver menu?

Edited: 20 Sept 2011, 7:00 a.m. after one or more responses were posted

Re: [BUG] SOLVE/SOLVR menu does not display unknown var

*Message #3 Posted by **François Vanzeveren** on 20 Sept 2011, 6:28 a.m.,*
in response to message #2 by C.Ret

Thanks C.Ret

Looks as a functionality, indeed :)

Nevertheless, if I store in the variable 'X' a non symbolic constant, the [X] appears well in the solvr menu...

It is only when I store symbolic constant that it does not appear.

Cheers

François

Re: [BUG] SOLVE/SOLVR menu does not display unknown var

*Message #4 Posted by **C.Ret** on 20 Sept 2011, 6:56 a.m.,*
in response to message #3 by François Vanzeveren

Your right, I miss this point, using a constant, the [x] remain in the menu.

This is a trick I often used, to make physical or chemistry constant out of the solver menu, you simply have to enter the constant quote by « and ».

For example, suppose you have to investigate pressure and volume changes of a gas-phase reactor. Admitting your gas is considered as ideal, you may use the equation of state :

$$PV = nRT$$

As soon as you enter this equation, [P][V][n][R][T] show up in the solver menu. As the gas constant R will not change and you will only consider change in pressure, volum and temperature. The trick is to store «8.314 » in 'R' so that you may input P, V, n and T in respectively Pa, m^3, mol and °K. [R] disappear from the solver menu.

Storing '273.15+t' in 'T' makes [t] to replace [T] in solver menu and allow you to use temperature in Celsius.

OpenRPN: How about a desktop HP-42S?

*Message #1 Posted by **Dan W** on 20 Sept 2011, 12:34 a.m.*

A problem with the OpenRPN calculator is more of a hardware problem than a software problem.

But I'm looking at my HP-97 and thinking, with a desktop calculator, size isn't a problem, neither is power really. Find a case, 37 switches (or more!) and a large dot-matrix LCD screen. I'm sure there is probably some DIY thermal printer we could interface with too (if not, it isn't a big deal if we can interface with a PC). Add a USB or perhaps an SD slot, use code derived from Free42S, an Atmel or PIC based motherboard, and we're in business.

Just thinking out loud here. A desktop size model might reduce a lot of complexity, making it easier to get our feet wet.

Re: OpenRPN: How about a desktop HP-42S?

*Message #2 Posted by **DaveJ** on 20 Sept 2011, 1:00 a.m.,*
in response to message #1 by Dan W

Complexity of a desktop is not that much less than a handheld.
The main difference being that the keypad would be easier with off the shelf keyboard PCB mount switches. But key legend problems still remain.

If you want a desktop, then great, go for it. But if it's just to "get your feet wet" then I don't see any advantage in it. Most of the construction/production techniques are fairly different between the two.

Dave.

Re: OpenRPN: How about a desktop HP-42S?

*Message #3 Posted by **Walter B** on 20 Sept 2011, 1:38 a.m.,*
in response to message #1 by Dan W

IMHO, the market for this desktop is even smaller than for the pocket edition. YMMV

15C LE - weird self-test behavior

*Message #1 Posted by **Katie Wasserman** on 19 Sept 2011, 11:52 p.m.*

The ON+g+ENTER self test menu has 3 options the first of which turns on all the display segments. If you next press the roll-down key it will turn off half of them. Press it again to turn on the other half. The next press will turn them all back on again. This is all documented.

What's undocumented is what happens if you press and hold the roll-down key. On the 12C+ the display will rapidly cycle through the 3 displays a couple of times then terminate the self test showing the X register. On the 15C LE it will do the same then show the current program line. When you release the roll-down key it will run the program starting at that point.

This is pretty weird and a little scary, what's the self test doing running a program? I haven't seen anything like the other self tests that corrupt program memory but I haven't done much testing of this yet.

Re: A program for Normal Distribution on the 42s

*Message #2 Posted by **Ángel Martin** on 21 Sept 2011, 1:32 a.m.,*
in response to message #1 by snaggs

Very interesting. You could add this as an article in the museum so it doesn't get lost in the heaps of forum archives.

No I remember why the 42 is great and also how painful typing all these lines can be!

Re: A program for Normal Distribution on the 42s

*Message #3 Posted by **Dieter** on 21 Sept 2011, 1:48 p.m.,*
in response to message #1 by snaggs

Honestly, I would suggest a different approach, i.e. rational approximations. Expecially for the quantiles. A

mid-precision (3;4) type is able to return a result with absolute error less than 5 E-6 within one second (!) on the 35s. The 42s should be able to do the same.

Would you try the following examples with your program and see how long it takes?
Mean = 0 and standard deviation = 1.

```
p = 0,1     =>   z =  1,28155
p = 0,01    =>   z =  2,32635
p = 0,0001  =>   z =  3,71902
p = 1E-10   =>   z =  6,36134
p = 1E-400  =>   z = 42,81023
```

Dieter

Re: A program for Normal Distribution on the 42s

*Message #4 Posted by **snaggs** on 21 Sept 2011, 6:46 p.m.,*
in response to message #3 by Dieter

Will do, but it is quite slow, 10's of seonds. Can you link me to some theory or an algorithm on rational approximations? Faster would be. Better!

Also, the programmable menus is a big bonus of the 42s in comparison to the 35s.

Daniel.

Re: A program for Normal Distribution on the 42s

*Message #5 Posted by **Paul Dale** on 21 Sept 2011, 7:25 p.m.,*
in response to message #4 by snaggs

Dieter and I had a long long discussion about ways to implement the quantile (& other statistical) functions. I archived many of the tidbits as part of the documentation for the 34S.

- Pauli

Re: A program for Normal Distribution on the 42s

*Message #6 Posted by **Dieter** on 22 Sept 2011, 2:19 p.m.,*
in response to message #4 by snaggs

As Pauli already pointed out, some of the information that went into the 34s for the statistical distributions is documented, both here in the forum and in the text files that come with the software package.

However, for everyday use on the 35s I designed a simple (3;4) rational approximation with a a maximum absolute error of approx. 5 E-6 so that it will return five valid decimals (+/- 1 ULP). It was designed for p down to 1E-500, i.e. the full working range of the 35s, 42s and others. With a different set of coefficients even higher precision over a smaller range may be achieved. I currently use the following program (slightly modified, that is) to evaluate the quantile: input p, output z.

```
LBL Z
STO P
ENTER
SGN
RCL-P
x>y?
x<>y      ; r := min(p, 1-p)
LN
ENTER
```

```
+
+/-
SQRT
STO T      ; t := sqrt(-2 ln r)
0,010285   ; user Horner's method
RCL*T      ; for polynomial in t
0,694738
+
RCL*T
4,629359
+
RCL*T
2,94666537818
+          ; nominator of rat. approx.
0,0014392
RCL*T
0,158567
+
RCL*T
1,87944
+
RCL*T
3,47987
+
RCL*T
1
+          ; denominator of rat. approx.
/
-
0,5        ; set negative sign for p > 0,5)
RCL-P      ; (or the other way round, if you prefer)
SGN
*
FIX 5
RND        ; make sure that only valid digits are returned ;-)
RTN
```

The normal cdf itself can easily be calculated with the well-known series expansion for smaller z and a continued fraction approach for larger z. On a 12-digit calculator the result in most cases is correct to 11 digits, often even 12. On my 35s the algorithm usually takes between 1 and 4 seconds. IF you don't need that level of precision, there are polynomial and rational approximations for this case as well.

The result of the cdf routine can be used to improve the quantile so that with one single iteration usually 10-12 correct digits are returned. Instead of good old Newton's method I'm using one step of a Hastings iteration for this, so that finally the near-full-precision quantile is returned in 5 seconds or less. The details of this approach have been discussed here as well.

So there are three normal distribution routines on my 35s: One that returns the (almost) exact cdf, a second that returns a more-than-adaequate five-digit approximation for the quantile, and finally a third one that turns this mid-precision result into one with (almost) full precision. The latter two can be combined to return the (almost) exact quantile in 5 seconds or less.

Dieter

Unusual HP 15C on TAS

*Message #1 Posted by **Michael de Estrada** on 19 Sept 2011, 8:35 p.m.*

This is an unusual HP 15C on TAS.

Re: Unusual HP 15C on TAS

*Message #2 Posted by **Michael Meyer** on 19 Sept 2011, 8:40 p.m.,*
in response to message #1 by Michael de Estrada

Looks like an ordinary 11C to me.

Re: Unusual HP 15C on TAS

*Message #3 Posted by **Michael de Estrada** on 19 Sept 2011, 8:45 p.m.,*
in response to message #2 by Michael Meyer

Exactly. I wonder if the high bidder, who has two bids placed, realizes this. The entire description states that it's an HP 15C, and the logo is either missing or blurred to the point that one can't see the model number.

Re: Unusual HP 15C on TAS

*Message #4 Posted by **Peter Murphy (Livermore)** on 19 Sept 2011, 8:58 p.m.,*
in response to message #1 by Michael de Estrada

It looks as though the hp logo is missing.

I've asked the seller to consider running the ON/divide test and report the result, which should of course be "15."

There may be too little time for seller's response (if any) to affect the sale, which ends about 2 hours from the time of my message.

Re: Unusual HP 15C on TAS

*Message #5 Posted by **Michael de Estrada** on 19 Sept 2011, 9:09 p.m.,*
in response to message #4 by Peter Murphy (Livermore)

Look at the front and back photos. It's clearly an 11C.

Re: Unusual HP 15C on TAS

*Message #6 Posted by **Lincoln R.** on 19 Sept 2011, 9:19 p.m.,*
in response to message #4 by Peter Murphy (Livermore)

It's obviously an 11C. 15Cs have "MATRIX" as the orange-shifted function of CHS, not pi.

Re: Unusual HP 15C on TAS

*Message #7 Posted by **Peter Murphy (Livermore)** on 19 Sept 2011, 10:16 p.m.,*
in response to message #4 by Peter Murphy (Livermore)

Seller got "11" as his ON/divide result, and realizes it's an 11C. I said that if it were me I'd cancel the auction. We'll see -- my bet is seller cancels.

Re: Unusual HP 15C on TAS

*Message #8 Posted by **Jeff Kearns** on 19 Sept 2011, 10:53 p.m.,*
in response to message #7 by Peter Murphy (Livermore)

He didn't cancel... Just sold!

Re: Unusual HP 15C on TAS

*Message #9 Posted by **Paul Gaster** on 19 Sept 2011, 10:55 p.m.,*
in response to message #8 by Jeff Kearns

You beat me to it. I told him it was a 11C too. I guess he hopes that the buyer will not care and will want it anyway, which is probably not the case at all.

Re: Unusual HP 15C on TAS

*Message #10 Posted by **Dan W** on 19 Sept 2011, 11:01 p.m.,*
in response to message #9 by Paul Gaster

I also sent him a message, about an hour before closing.

Re: Unusual HP 15C on TAS

*Message #11 Posted by **Michael de Estrada** on 19 Sept 2011, 11:05 p.m.,*
in response to message #10 by Dan W

Actually, I sent the seller a message before posting this thread over 2 hours ago, stating that it was an 11c and not a 15c. I never received a reply and doubt she cares.

####### Re: Unusual HP 15C on TAS

Some pictures of anniversary 12c

*Message #1 Posted by **Jose Gonzalez Divasson** on 19 Sept 2011, 6:00 p.m.*

Waiting until my 15c sample arrives, some close-ups of my First encounter with the anniversary 12c

Has anyone considered that is a calculator that you can really give as a gift without appearing geek? (provided the receiver is finance-related)

I guess that it could appear in many jubilee, graduation, etc. parties!

Re: Some pictures of anniversary 12c

*Message #2 Posted by **DigiGal** on 19 Sept 2011, 6:46 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

I just don't get the 12C Anniversary Edition at all because they've thankfully never stopped making 12C's. This makes 3 different flavors of 12C's for sale now.

Without a 12C form factor the 15C LE's would most likely never have happened. Hopefully given the instant success they'll permanently add a non LE 15C down the line.

Edited: 19 Sept 2011, 6:48 p.m.

*Message #3 Posted by **Todd Garabedian** on 20 Sept 2011, 6:41 a.m.,*
in response to message #2 by DigiGal

Frankly, I think the case for the 30th anniversary edition is a little chintzy. I have the 12C 25th anniversary edition, and it comes with a much better leather case, much like a cell phone case you can clip on your belt. It even has an embossed 25th Anniversary logo.

Why can't these 30th anniversary models have better cases?!?!?!?

Re: Some pictures of anniversary 12c

I agree. I was hoping for something different with the 12C 30th AE. The display box is nice but you're not going to keep you calculator in there. A nice slim leather slip case would have been great. The only printed manual is a tiny quick start guide. Then there's the fact that old, buggy firmware made it into 12C 30th AE, that's the worst part.

*Message #6 Posted by **Katie Wasserman** on 20 Sept 2011, 2:41 p.m.,*
in response to message #5 by Tim Wessman

But the 12CP 25th AE case is real leather, have costs gone up that much in the past 5 years? You could use less leather than that case used and it would be nicer and less bulky. Just get ride of the cardboard and use one layer of leather.

*Message #9 Posted by **Paul Gaster** on 20 Sept 2011, 12:08 p.m.,*
in response to message #3 by Todd Garabedian

Maybe HP got some complaints about how bulky the 25th anniversary case was so this time they went

back to the classic case style.

Re: Some pictures of anniversary 12c

*Message #10 Posted by **DigiGal** on 20 Sept 2011, 12:41 p.m.,*
in response to message #9 by Paul Gaster

I picked up a surplus 25th anniversary case a few years back thinking it would be nice for my original 15c but never use it because the standard case just works much better imho.

The 25th anniversary case was pretty bulky and the sides were only elastic making it a bit awkward to slide the calculator in and out of it.

Glad they only used the standard case for the 15c LE. As Katie pointed out a leather slip case in the style of the standard case would have been nice.

Re: Some pictures of anniversary 12c

*Message #11 Posted by **Katie Wasserman** on 20 Sept 2011, 2:47 p.m.,*
in response to message #10 by DigiGal

Many years ago HP made such a thin leather case for the voyagers. It was really soft and had a tuck in flap to keep the calculator securely in the case.

Re: Some pictures of anniversary 12c

*Message #12 Posted by **Glenn Dowdy** on 20 Sept 2011, 2:51 p.m.,*
in response to message #9 by Paul Gaster

We did select the new case based on the material of the 12c PT with the style and ease of use of the 12c case. I couldn't get the puppyskin spec past the Marketing Department, though.

*Message #14 Posted by **Lincoln R.** on 20 Sept 2011, 5:08 p.m.,*
in response to message #12 by Glenn Dowdy

I for one approve of the case. I think it's a very faithful reproduction of the slipcovers that originally came with Voyagers.

Yes, I compared it to one from a circa-1993 12C. It is slightly thinner material, and the HP logo looks slightly different, but on the plus side the inside feels softer, and the case is stitched together as opposed to being heat-welded like my old 12C case.

Re: Some pictures of anniversary 12c

*Message #15 Posted by **Paul Berger (Canada)** on 20 Sept 2011, 6:17 p.m.,*

in response to message #14 by Lincoln R.

My 1982 vintage 16C SN00153 came with a plastic slip case embossed to look like leather the sides are stitched and it is lined with that lovely black material that disintegrates into black dust... I don't use it anymore and have ordered two cases from a TAS seller that are reputed to be leather one for the 16C and one for my hopefully soon to arrive 15C LE. Item number 170659088441.

Day Late, Dollar short.

*Message #1 Posted by **William L. Drylie** on 19 Sept 2011, 5:58 p.m.*

Wow!! Looked Friday at hp store, 15C LE not available yet, looked tonight and already out of stock. Probably never get one, short of watching that site every half hour.

I have waited patiently for years to see that calculator run again just to buy one to replace my demised original for work. With the calculator in production again, I was not expecting to have to scramble to buy just one.....really disappointing, probably see a load of them turn up on you know what bid site at 4 times the price.

I think at this point, if there are any left, someone can have mine. This run of the 15C is a bust as far as I can see as I am not constantly watching hp shopping, and not buying anywhere else.

Re: Day Late, Dollar short.

*Message #2 Posted by **Ethan Conner** on 19 Sept 2011, 6:29 p.m.,*
in response to message #1 by William L. Drylie

That's too bad because it appears Bach still has them at 99.99$ At least it let me add one to my shopping cart.

Re: Day Late, Dollar short.

*Message #3 Posted by **Paul Gaster** on 19 Sept 2011, 8:15 p.m.,*
in response to message #2 by Ethan Conner

I ordered from them and got a call within the hour saying that they do not have any in stock. I need to call back tomorrow to let them know if I want to wait to see if they can get more or just cancel the order.

Re: Day Late, Dollar short.

*Message #4 Posted by **DigiGal** on 19 Sept 2011, 7:00 p.m.,*
in response to message #1 by William L. Drylie

Sure is a bummer, hopefully though given the instant success they'll be permanently adding a non LE 15C to their scientific calculator lineup.

They were available to add to cart on the HP Home website over the weekend.

Re: Day Late, Dollar short.

*Message #5 Posted by **Dan M (Vermont, USA)** on 19 Sept 2011, 7:40 p.m.,*
in response to message #1 by William L. Drylie

Couple of points:

1. I don't think I've seen a "LE#" (on this site anyway) over 5000, so maybe there is still another container somewhere in the supply chain.

2. If you want to make a case, it would be very easy to talk me out of my unused one at cost (I bought 2 total), because as much as I want to, I just don't like the "landscape" layout format. And if nothing else, this dislike inspired me to bring a 42s and 32sii back into current calculator circulation (and get a WP-34s) because I like that layout style a lot more.

good luck comes to those who wait(?)

Dan M.

in response to message #1 by William L. Drylie

I have to believe that if the 15C LE really does sell out quickly, then HP will make a "not so limited edition." It would be free money.

Dave

Re: Day Late, Dollar short.

*Message #14 Posted by **Namir** on 20 Sept 2011, 2:13 p.m.,*
in response to message #13 by David Hayden

It's a supply and demand issue. If HP declares, for example, that they are making 10 million HP-15C LE units, then the frenzy to buy one will die out!!

I guess you remember what happened with the HP-32SII when we heard that HP will no longer make RPN calculators. The HP-32SII sold on TAS for $200+, up from the going price of $75. When the HP-33S came along the prices for the HP-32SII went down.

With all of 1 item for sale. I love it.

Since the production line is operational and HP proved there is a market for this calc, I'd fully expect a non 'limited edition' calc to show up in the next 6-9 months.

I wonder if a non-LE model will fix the bugs reported so far and what happens to those of us who bought the LE model. I for one don't have the special cable to attempt the fix (if firmware were ever released to do so) and am not sure I'd even try. In the past HP offered a swap for calcs/plug-ins with bugs (my 32SII was handled that way as was the Math I Pack for my dearly departed 41C).

I wonder how (or even if) HP will handle it today. My guess is it was predicted by The Beatles many moons ago: "Let It Be'....

Re: HP 15C LE selling at $349

*Message #4 Posted by **Howard Owen** on 19 Sept 2011, 6:05 p.m.,*
in response to message #3 by Tom Mathes

If a production 15C comes out with bugs fixed, I'll buy one as a beater and shelve both my 15C LEs complete with bugged firmware. Something less than 10,000 units in initial circulation, reduced by

normal attrition, would guarantee the collectable status of these machines.

If they don't follow on with a production 15C, but release fixed firmware, I'll patch my workaday unit and leave the shelved unit untouched.

I really do wonder how many they have sold so far. I'm sure Tim will be grilled over this next week. :)

*Message #5 Posted by **Namir** on 19 Sept 2011, 8:52 p.m.,*
in response to message #2 by Howard Owen

Howard,

My blind guess is that the Amazon "Lafontaine" seller is TAS's fontainebleu123, since both are in VA and share common parts of their names. He sells calculators and accessories in very good shape. Buyer have to pay for that. It's a supply and demand thing.

Namir

Re: HP 15C LE selling at $349

*Message #6 Posted by **Michael de Estrada** on 19 Sept 2011, 9:01 p.m.,*
in response to message #5 by Namir

Apples and oranges. The original vintage calcs that he / she sells are very clean and always in good working condition. This is very important with certain models like Woodstocks, which are hard to find in decent condition. There is no excuse to charge 3X as much for the new HP 15C LE, since they are all in the same NIB condition.

Re: HP 15C LE selling at $349

in response to message #10 by Dave Britten

> Quote:
>
> Have all 10,000 actually sold that fast?

The sudden unavailability could be due to something else. Let's say a bunch of retailers noticed that someone with the right coupon code could get an HP15C LE for 85 bucks. Perhaps that's not too far above the wholesale price those retailers pay. Maybe they got HP to listen when they complained.

The business site still has the 15C LE for $129, *in stock.*

Re: Maybe not sold out

*Message #13 Posted by **DigiGal** on 19 Sept 2011, 7:12 p.m.,*
in response to message #12 by Howard Owen

$129 is sure better than $349, however, when they first appeared on HP's Home site before stock even became available they were originally listed as $79.

Perhaps the unavailability has something to do with the initial reports of flaws in some of the units that people have already received.

Edited: 19 Sept 2011, 7:15 p.m.

Re: Maybe not sold out

*Message #14 Posted by **Michael de Estrada** on 19 Sept 2011, 7:21 p.m.,*
in response to message #13 by DigiGal

Actually, back in June when some retailers started taking orders before they stopped, the MSRP basis was shown as $129. I placed one of my orders with CostCentral and that's how they took my order and then applied a discount to bring the price down to a little over $80. I'd be willing to bet we're going to see more show up for under $100 before this whole circus is over.

Re: Maybe not sold out

*Message #15 Posted by **Howard Owen** on 19 Sept 2011, 7:28 p.m.,*
in response to message #13 by DigiGal

> Quote:
>
> Perhaps the unavailability has something to do with the initial reports of flaws in some of the units that people have already received.

But HP continues to sell it. "You can't buy a bugged calculator from us for $99.00, but we'll sell you one for $129.00" :)

I just had a BFO that the reason the 15C shows up at $129 on the business site is because companies negotiate discounts off MSRP with their sales critters.

Re: Maybe not sold out

*Message #16 Posted by **DigiGal** on 19 Sept 2011, 7:38 p.m.,*
in response to message #15 by Howard Owen

> Quote:
>
> But HP continues to sell it. "You can't buy a bugged calculator from us for $99.00, but we'll sell you one for $129.00" :)

I was thinking maybe the flawed units were narrowed down to a range of S/N's and pulled from the HP Home site for re-work while the good ones are still made available at HP's Business site only but at a higher price.

Re: HP 15C LE selling at $349

in response to message #10 by Dave Britten

> Quote:
>
> Have all 10,000 actually sold that fast?

Has anyone ever verified that this number floating around has any validity? I for one have not seen any "official" statement attributed to HP in any way, including Tim.

AFAIK this number came from a speculative online magazine article at the beginning of this summer's 15c madness.

The LE numbers are 5-digit, which allows 100,000 units total, if they used all available numbers.

I'm not saying I *think* they are making that many, I'm only saying that if the LE numbers were 4-digit, then we'd be pretty sure it was only 10,000. Therefore, it *could* be more.

Re: HP 15C LE selling at $349

*Message #18 Posted by **CAD_Jockey** on 19 Sept 2011, 9:39 p.m.,*
in response to message #17 by Martin Pinckney

Well, I've been having some email conversations with HP, regarding my 12c in 15c LE clothing. If I were to send my 15c to them for exchange, it would take 8-12 weeks. Reason I was told, is that some units were shipped by air to the US to vendors, and the rest are coming by cargo ship.

15c: "GSB I" bug?

*Message #1 Posted by **Dave Britten** on 19 Sept 2011, 3:28 p.m.*

The 15c supports indirect branching, by storing either a label index in I, or a line number (as a negative number) in I, then calling GTO/GSB I.

When I do this with GTO I and a negative number in I, it seems to work fine. Execution transfers to the line specified by I.

However, after I do GSB I with a negative number in I, as I'm stepping through the program, the line numbers are displayed as one higher than they actually are. Then when the program hits RTN it actually returns to line -1 * I + 1, rather than back to the instruction that called GSB I. Then the program keeps going until it hits RTN a second time, and moves up another level in the call stack. The end result is if LBL A calls GSB B, and LBL B calls GSB I, then the LBL B execution stops after the GSB I target returns (twice, mysteriously), and goes back to LBL A.

Am I missing something obvious, or is this actually a bug? This is a 15c LE, but I'm guessing this would be present in the original model.

Are there any good workarounds that won't increase the size of the program by more than 4 bytes? That's all I've got to work with at the moment. :)

Re: 15c: "GSB I" bug?

*Message #2 Posted by **Dave Britten** on 19 Sept 2011, 4:01 p.m.,*
in response to message #1 by Dave Britten

Here's a sample program that demonstrates it concisely. Note that this has to start at line 001 in order to line up properly with the GSB I target.

```
001- LBL A
002- 3
003- GSB B
004- RTN

005- LBL B
006- 1
007- 4
008- CHS
009- STO I
010- RDown
011- GSB I
012- x^2
013- RTN

014- 1
015- -
016- RTN
```

Obviously, this program should return 4. What you *actually* get is -2.

The execution sequence goes like this:

```
001- LBL A
002- 3
003- GSB B

005- LBL B
006- 1
007- 4
008- CHS
009- STO I
010- RDown
011- GSB I

014- 1 (Displays as line 015)
015- - (Displays as line 016)
016- RTN (Displays as line 017)

015- - (Should have returned to 012- x^2)
016- RTN

004- RTN
```

Weird.

*Message #5 Posted by **David Hayden** on 20 Sept 2011, 1:22 p.m.,*
in response to message #2 by Dave Britten

Does it really go to the wrong line number, or is it a byte location? What I'm getting at is whether this opens the door to a type of synthetic programming on the 15C. Is it possible to make it go to the middle of a two-byte instruction?

Re: 15c: "GSB I" bug?

*Message #6 Posted by **M. Joury** on 20 Sept 2011, 3:35 p.m.,*
in response to message #5 by David Hayden

It appears to go to the correct instruction but the line is numbered incorrectly. I have not tried GSB I to a 2 byte instruction.

Re: 15c: "GSB I" bug?

*Message #7 Posted by **Mark Hardman** on 19 Sept 2011, 4:05 p.m.,*

in response to message #1 by Dave Britten

This looks like a bug in the original HP 15C!

I enter the following:

```
001 LBL A
002 1
003 2
004 3
005 4
006 5
007 6
008 7
009 8
010 RTN
011 LBL B
012 GSB I
013 1
014 2
015 R/S
```

If I put -9 in the I register and hit GTO B, pressing SST shows:

```
011 LBL B
012 GSB I
010 8           <-- ???? SB: 009 8 !!
011 RTN
010 RTN
```

Again, this is on an original HP 15c.

Wow! After all these years, a bug in the original 15c?

> Amazing!

I guess this is what happens when you give a CS major a 29 year old computer. :)

I noticed on page 109 of the 15c LE manual, it mentions you can use GTO I and GSB I with a positive number to branch to a label, or GTO I with a negative number to branch to a specific line. Note that it makes no mention of GSB I with a negative number. Hmm. I wonder if it was never intended to work that way in the first place, or they didn't get it to work in time for release (or found a bug in late testing) and just amended the manual.

In any case, it appears to weird out *consistently*, so there may be some insane practical use for it.

Re: Wow! After all these years, a bug in the original 15c?

*Message #10 Posted by **M. Joury** on 19 Sept 2011, 4:24 p.m.,*

GTO I with a negative number works fine.

Re: Wow! After all these years, a bug in the original 15c?

*Message #11 Posted by **Michael de Estrada** on 19 Sept 2011, 4:29 p.m.,*
in response to message #9 by Dave Britten

It seems perfectly logical, because line numbers are absolute addresses, but subroutines are based on labels, which are relative addresses. So, in effect you have moved into the program area and overwritten it.

Re: Wow! After all these years, a bug in the original 15c?

*Message #12 Posted by **Dave Britten** on 19 Sept 2011, 4:34 p.m.,*
in response to message #11 by Michael de Estrada

Either way, you're just pushing the return address onto the call stack, then branching off to your subroutine, so there's no reason it couldn't work (unless the implementation happens to be broken, which appears to be the case here).

Re: Wow! After all these years, a bug in the original 15c?

*Message #13 Posted by **M. Joury** on 19 Sept 2011, 4:42 p.m.,*
in response to message #11 by Michael de Estrada

Sorry, I don't follow. Wouldn't that mean that GTO I should also not work right?

Re: Wow! After all these years, a bug in the original 15c?

*Message #14 Posted by **Michael de Estrada** on 19 Sept 2011, 4:50 p.m.,*
in response to message #13 by M. Joury

No, because a simple GTO can reference either an absolute address (line number) or a relative address (label), whereas a subroutine can only be based on a label. Otherwise, if you add or delete program lines prior to the location of the subroutine start point, then you could not call it based on a line number, since it would have moved.

Re: Wow! After all these years, a bug in the original 15c?

*Message #15 Posted by **Howard Owen** on 19 Sept 2011, 5:08 p.m.,*
in response to message #14 by Michael de Estrada

If line numbers above the one targeted by GTO change, then the GTO will go awry too. I don't see the distinction with GSB.

Re: Wow! After all these years, a bug in the original 15c?

*Message #16 Posted by **Michael de Estrada** on 19 Sept 2011, 5:16 p.m.,*
in response to message #15 by Howard Owen

The difference is that a GTO can transfer to a label or to a line number, but a subroutine is defined by a label so that a return point can be established. I'll bet you'd have the same problem if you tried to do this on an 11c or 34c or 29c. None of the manuals for those calcs show GSB calls with negative I values either.

Re: Wow! After all these years, a bug in the original 15c?

*Message #17 Posted by **Dave Britten** on 19 Sept 2011, 5:31 p.m.,*
in response to message #16 by Michael de Estrada

Programs on the 15c aren't able to modify themselves while running, so I don't see how the target could change mid-execution. You don't have to worry about your return target moving a few bytes up or down in memory during execution.

When returning from a subroutine in most languages, you only care about where you came *from*. For most HP calculators, this will always be an absolute line number (RTN can bring you anywhere, not just to a LBL instruction, in other words). The only way I could see this failing is if the original developers messed up the routine that pushes the return address onto the call stack before carrying out the branching during GSB I with a negative number.

I'd definitely be interested in finding out what happens when you try this on other models. Everything I have is newer than the 15c, though.

Re: Wow! After all these years, a bug in the original 15c?

*Message #18 Posted by **Michael de Estrada** on 19 Sept 2011, 5:59 p.m.,*
in response to message #17 by Dave Britten

I don't own an 11C, but I do have a 34C. I looked this up in the 34C manual (bottom of page 151), and you appear be correct on this, because it states that you can do a GSB I with a negative number in the I-register to transfer to a line number that is the absolute value of the number in I. It further states that the RTN instruction transfers back to the line following the GSB instruction. However, neither the 11C or 15C manuals make any mention of this capability, so it's probably not implemented in them. It's really not very useful, though, once you begin nesting subroutine calls.

"GSB I" with negative I works on the 11C

*Message #19 Posted by **Didier Lachieze** on 19 Sept 2011, 6:49 p.m.,*
in response to message #17 by Dave Britten

In my 11C French manual rev C from August 1985, GTO I and GSB I are documented as working with negative values in I, and transferring execution to the line number specified by the absolute value of I.

When I try the above program in my 11C it works fine: GSB I transfers execution to line 14 (displayed as line 14) and upon return it returns to line 12 as expected. The final result is 4.

EDIT: I've checked my 15C French manual dated September 1982 and it also says that for negative values of I, GTO I and GSB I transfer execution to the line number:
"Si le contenu de RI est négatif, GTO I et GSB I transfèrent l'exécution à la ligne identifiée par ce nombre. Le calculateur utilise la valeur absolue de la partie entière du contenu de RI."

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #29 Posted by **Thomas Chrapkiewicz** on 19 Sept 2011, 6:01 p.m.,*
in response to message #8 by gene wright

Nowhere in either the original HP15 manual nor the reprinted one does it mention that GSB I with I being negative should work.

Thus, while 'we've' stumbled into an interesting quirk in the internal architecture of the HP15, this is not a documented function working improperly, therefore NOT a bug (and it IS an interesting insight into the internal architecture of this machine).

TomC ps: One can get some crazy and unexpected results by using other well documented and used systems (such as the computer language C)by sending functions unsupported data types!

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #30 Posted by **Dave Britten** on 19 Sept 2011, 6:15 p.m.,*
in response to message #29 by Thomas Chrapkiewicz

Yup, check my 4:15 post above.

It's probably one of two things.

1. This wasn't meant to work in the first place, and they forgot/didn't bother to make GSB throw an error when you try it.

2. It was meant to work this way, but for whatever reason, wasn't working in time for manufacturing, so it was simply stricken from the manual. This feature is unimportant enough that it would be better NOT to fix it in a later revision, since you could end up with some 15c units mysteriously unable to run some programs correctly.

I think 2 is more likely, but that's just an educated guess.

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #31 Posted by **Didier Lachieze** on 19 Sept 2011, 7:10 p.m.,*
in response to message #30 by Dave Britten

I also think 2. is more likely as GSB I with a negative value in I is described as working in my 15C French manual from September 1982.
It would be interesting to check an early version of the 15C English manual to see if this was also initially included and then removed in later editions.

Feb 1983 Owner's Handbook

"To Line Numbers. If the R1 value is negative, GTO I and GSB I cause branching to that line number (using the absolute value of the interger portion of the value in R1).

For instance, if R1 contains -20.00500, then a GTO I instruction will transfer program execution to program line 020."

Third and forth paragraph - Page 109

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #34 Posted by **Gerson W. Barbosa** on 19 Sept 2011, 7:42 p.m.,*
in response to message #31 by Didier Lachieze

Translating from my Portuguese Manual from September 1982:

"**Indirect Branching to Numbered Lines.** If the content of $\mathbf{R_I}$ is *negative* then [GTO] [I] and [GSB] [I] will transfer the execution to the *line* whose *number* is the integer part of the absolute value of the content of $\mathbf{R_I}$.

For instance, if $\mathbf{R_I}$ contains -20.00500, an instruction [GTO] [I] would transfer the execution the program line 020."

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #35 Posted by **Howard Owen** on 19 Sept 2011, 8:06 p.m.,*
in response to message #34 by Gerson W. Barbosa

Interesting! That's quite different from the English text starting on p. 108 of both the newly reprinted manual and my classic manual with a print date of 1/85. Comparing your translated text with what I have, it seems plausible that yours is from an earlier draft. The later text expands the explanation quite a bit, and removes any reference to GSB I with I<0.

If that's so, it would lend credence to the idea that the feature was dropped at some point after development of the HP-15C started.

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #36 Posted by **Gerson W. Barbosa** on 19 Sept 2011, 8:45 p.m.,*
in response to message #35 by Howard Owen

Just a correction to the second paragraph:

"For instance, if $\mathbf{R_I}$ contains -20.00500, a [GTO] [I] instruction would transfer the execution to program line 020."

Your manual probably reads:

"**To Line numbers.** If the $\mathbf{R_I}$ value is *negative*, [GTO] [I] causes branching to that *line number* (using the absolute value of the integer portion of the value in $\mathbf{R_I}$).

For instance, if $\mathbf{R_I}$ contains -20.00500, then a [GTO] [I] instruction will transfer program execution to program line 020."

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #37 Posted by **Howard Owen** on 20 Sept 2011, 12:54 a.m.,*
in response to message #36 by Gerson W. Barbosa

From my original HP-15C Owner's Handbook, having "Printed in U.S.A 1/85" on the back:

Indirect Branching With [I]

The [I] key--but *not* the [(i)] key--can be used for *indirect* branching ([GTO][I]) and subroutine calls ([GSB][I]). (Only the integer portion of the number in R_I is used.) ([(i)] is *only* used for indirect *addressing* of storage registers.)

To Labels. If the R_I value is *positive*, [GTO][I] and [GSB][I] will transfer execution to the *label* which corresponds to the number in the Index register (see the above table).

For instance, if the Index register contains 20.00500, then a [GTO][I] instruction will transfer program execution to [f][LBL][A]. See the chart on page 107.

To Line Numbers. If the R_I value is *negative*, [GTO][I] causes branching to that *line number* (using the absolute value of the integer portion of the value in R_I).

For instance, if R_I contains -20.00500, then a [GTO][I] instruction will transfer program execution to program line 020.

This text is identical to that in the newly released HP-15C Owner's Handbook. Having different text in earlier versions of the Handbook seems to me to be a smoking gun indicating that [GSB][I] was intended to work as you would expect when the HP-15C was released. It also means that this bug was known to HP at least by 1985 and *they did nothing to fix it back then* but simply changed the documentation. So perhaps the HP of 1985 had clay feet, like every other human enterprise ever undertaken?

If HP knew about the bug, surely many users of the calculator must have known about it too. Is there any indication in the historical record that would confirm or deny this?

I would think a non-working minor feature like this is better left unfixed after that much time. Otherwise you'll start getting all the support calls about why newly published programs that use the feature aren't working properly on older units.

Since GSB I can be emulated using a spare label and two bytes of program memory, it seems like this would be the the most likely case.

I opt for fixing the 15c LE firmware.

If it is fixed HP might get a few calls from owner's of old units about new programs not working on them (very unlikely; those guys are all here and know why these programs wouldn't work).

BUT: If HP does not fix it, they will get many calls from new owner's of

machines under warranty who found the feature in their handbook and complain about it not working!

Unlike Tom C. I believe this **is** a bug. However, I agree it should **not** be fixed. As it is the current manual (and later original manuals) do not mention that GSB I should work for negative values in R_I anyway. It would be bad enough trying to trace it with original (possibly undocumented) source code, but having only the binary - forget it, it's not worth the effort & risk.

one could always trap it in the emulation and turn it into something 'harmless'. like, for instance, causing the sign of I to be ignored. but even that would be tricky...

Re: Wow! After all these years, a bug in the original 15c? NOT!

*Message #46 Posted by **Dave Britten** on 20 Sept 2011, 3:54 p.m.,*
in response to message #45 by robert rozee

Yeah, it really wouldn't be worth the trouble and risk. It would be much more practical to mention in the manual that GSB I with negative values does not behave as expected, and show how to code around it:

```
LBL A
GSB 9
...
LBL 9
GTO I
(end)
```

Only costs you one label and two bytes (or three bytes plus one extra byte per invocation if you have no choice but to use one of the "high" labels). You only need a single one of these two-line wrapper functions in memory to cover all use of GSB I.

> Alexander, do you really think HP has the resources to fix the old code? I doubt it.

For 100 bucks apiece I expect it to be fixed. But not having mine delivered yet, I only assumed from the OP's first post that the feature in question was actually mentioned in the LE's manual. If this is not the case, I will also opt for not fixing it.

*Message #48 Posted by **Bart (UK)** on 20 Sept 2011, 10:24 a.m.,*
in response to message #29 by Thomas Chrapkiewicz

> Quote:

> Nowhere in either the original HP15 manual nor the reprinted one does it mention that GSB I with I being negative should work.

From posts here, it was stated in the manual in 1982 & 1983:
"To Line Numbers. If the R1 value is negative, GTO I and **GSB I** cause branching to that line number (using the absolute value of the interger portion of the value in R1)."

We've all read about Dave Packard's reply about the HP-35 2.02 ln e^x bug. So, by the time this 15c bug was discovered, the man that responded "don't tell" to Dave Packard had been put in charge and decided to quietly alter the manual and pretend it wasn't supposed to work anyway ("oh, and tell customer support to reply 'misprint in the original manual' when costomers query it"). But the give-away is that it works on the 11C (as per the 1985 Rev. G manual linked by Didier Lachieze p137/138 states: "When an indirect branch or subroutine instruction is executed with a *negative* nnnnn value in R_I..."). Why would this feature work in a lower spec calc. and be deliberately dropped in the top model of the voyager line-up?

Edit: to TomC: I am just stating my feelings on the case, no intention to argue or flame. I respect your view, but just *think* that the evidence points the other way.

Re: Wow! After all these years, a bug in the original 15c? YES IT IS!

*Message #49 Posted by **Michael de Estrada** on 20 Sept 2011, 11:29 a.m.,*
in response to message #48 by Bart (UK)

I think this is a very unimportant "bug", because there are an abundance of labels available in the HP 25C to identify the start points of subroutines. This is a much more reliable way to program multiple programs / subroutines, and to edit programs with addition and deletion of lines. The HP 11C has 15 labels, whereas the HP 15C has 25 (A-E, 0-9, .0-.9), as well as more than twice the memory so conservation of memory by eliminating labels is less of an issue.

I agree that the bug is minor. I'm just fascinated with the sociology of it all.

Re: Wow! After all these years, a bug in the original 15c? YES IT IS!

*Message #52 Posted by **M. Joury** on 20 Sept 2011, 3:37 p.m.,*

in response to message #51 by Howard Owen

I don't know. GSB I to a line number is a very basic form of self-modifying code. There may be some interesting things that someone could do with that ability.

I actually tested and confirmed it on a real 11c.

Re: Wow! After all these years, a bug in the original 15c? YES IT IS!

*Message #54 Posted by **Howard Owen** on 20 Sept 2011, 1:07 p.m.,*
in response to message #48 by Bart (UK)

This aspect is what interests me from a historical perspective. From today's perspective, Dave Packard's edict that "it would be better to never make a dime of profit than to have a product out there with a problem" is nothing short of astonishing. I suspect it was unusual back in 1972. By 1985 at least* we have evidence of a more "normal" corporate outlook at HP.

It still bothers me that nobody in the user community knew about this bug back then. The fact that the manual changed is another fact that should have tipped off an observant user.

*Challenge: what is the earliest manual version that includes the altered description? Mine is dated on the back at 1/85.

Re: Wow! After all these years, a bug in the original 15c? YES IT IS!

*Message #55 Posted by **C.Ret** on 20 Sept 2011, 3:56 p.m.,*
in response to message #54 by Howard Owen

I have to admit that I share your point of view.

And considering that users have only discovered this issue after more than 26 years, let me think that the “corporate” decision to leave it uncorrected it was a good one. Why, may they have spent any time and involve any resources to fix an issue that nobody will discover before several decades?

At the time, every one receives only one manual. Who can have compare two version and discover the change? A few.

During the last 30 years, how many people use a HP-15c? Many.
How many of the many user of an Hp-15c have never program it ? A majority. But, how many of these users have program the HP-15c for something else that entering the function to be root finding, solving or integrating? A fraction.
How many people from this fraction have used HP-15c to make advance and complex program code? A bunch. Since the great advantage of the HP-15c is complex, matrix, root finding, numerical integrating, etc… It is not especially dedicated to advanced programming tool – even if it is a capable advanced unit –
From this bunch of advanced programming coders, how many have used any of the two indirect branching instruction GTO I or GSB I ? A few, since most of the problems needs conditional branching and a few algorithms need indirect branching.
From this few of indirect branching advanced program coders, how many have used branching to label (I >0) compare to line number (i<0)? A rare, since using label is far

easier to program since you to worry about exact line counts. Correct line addressing is a serious challenge.
From this rare indirect line branching advanced program coders using I<0, how many have used GTO I compare to GSB I ? A half.

Conclusion, during the last 30 years, people who have used GSB I (with i<0) on an HP-15c in program are certainly a rare half of a few bunch from a fraction of the minority of the many HP-15c users.

I am not surprise nobody discover this issue before we have many people sharing manual, documentation and experiences on Internet, own several models and collectors, compare versions and survey serial numbers, compare original material performance with new release, play and try to use modern program paradigm on vintage systems.

A last question, just to survey and infirm/confirm my statistics:

During these last 30 years, how many of you people reading this post have already used or program the GSB I instruction with I<0 on an Hp-15C ?

Please! Hand up ! Don't be scared !

That's why this bug is minor, one might even say microscopic. I think the obvious time GSB to a line number might be needed is if you have run out of labels in a program, or are trying to minimize memory when it is extremely tight. Clearly, as you state, this situation doesn't come up very often. Dave Brittan is to be congratulated not only for finding this bug, but for trying to milk the most out of the 15C's resources. :)

> Quote:
>

You nailed it.

Re: 15c: "GSB I" bug?

*Message #58 Posted by **M. Joury** on 19 Sept 2011, 4:21 p.m.,*
in response to message #7 by Mark Hardman

Yup. Unless I am miss-reading the original manual this *should* work. It doesn't. It goes to the correct *instruction* initially (but that instruction has the wrong line number) and executes correctly until the first return. At this point (in the example I am trying) it returns to the line number *after* the initial call.

e.g.

```
001  LBL 8    I have no other labels abailable
002  7
003  CHS
004  STO I
005  GSB I
006  RTN
007  1
008  ENTER
009  1
010  +
011  RTN

When run it proceeds to the GSB and then:

008  1
009  ENTER
010  1
011  _
012  RTN
008  ENTER
009  ...
```

Cheers,

-Marwan

EDIT: Just tried GTO in place of GSB. That works fine.

Edited: 19 Sept 2011, 4:25 p.m.

Re: 15c: "GSB I" bug?

*Message #59 Posted by **Dave Britten** on 19 Sept 2011, 4:31 p.m.,*
in response to message #1 by Dave Britten

Seems like the obvious solution would be to create a "wrapper function" that calls GTO I instead. This version of the sample program works perfectly. Change line 11, and add lines 17 and 18.

```
001- LBL A
002- 3
003- GSB B
004- RTN

005- LBL B
006- 1
007- 4
008- CHS
009- STO I
010- RDown
011- GSB C
```

```
012- x^2
013- RTN

014- 1
015- -
016- RTN

017- LBL C
018- GTO I
```

But the program I've got is already using all labels A-E and 0-9, so those two lines would take an extra 3 bytes, and the call to the new label will be 2 bytes. I've got 4 bytes free, so I'm going to have to clear out an extra byte or two somewhere to make this fit. :)

HP97 charger

*Message #1 Posted by **Olivier De Smet** on 19 Sept 2011, 3:20 p.m.*

I was looking at the service manual of the HP97 from the DVD set

By looking at different schematics, I have the strange feeling that the HP 82031A charger (see page 5-1) is only a 220V to 12.8V AC transformer.

See also the figure 5-10 for HP 82037A schematic diagram page 5-3/5-4

Can someone confirm this or I completly mis-read this doc ?

Thanks in advance

Re: HP97 charger

*Message #2 Posted by **Paul Berger (Canada)** on 19 Sept 2011, 4:26 p.m.,*
in response to message #1 by Olivier De Smet

Yes the charger is just a transformer see schematic figure 4-10 on page 4-15 you will see the charger input goes directly to a bridge rectifier. I use the North American 110V charger 82059 the output of it is rated for 8VAC 3VA.

Re: HP97 charger

*Message #3 Posted by **Olivier De Smet** on 19 Sept 2011, 4:50 p.m.,*
in response to message #2 by Paul Berger (Canada)

In page 2-5, and figure 2-10 it is said that

"the ac adapter/recharger is a transformer that drops the line voltage to 12.8 Vac at the input terminals of the calculator"

So is it 8 Vac or 12.8 Vac ?

Elsewhere we can find other reference for topcat adapter such as 82066B 8 Vac for 7 Watt

A 220 V to 12 Vac rated 1A is easy to get, a 8 Vac isn't ...

Re: HP97 charger

*Message #4 Posted by **Paul Berger (Canada)** on 19 Sept 2011, 9:47 p.m.,*
in response to message #3 by Olivier De Smet

Near as I can tell the chargers all have a rated output of 8VAC 3VA. The unloaded output is about 12.8VAC but drops to about 9.7 VAC when connected to a 97 with a good battery pack and drops to about 8.7VAC when the 97 is turned on.

Re: HP97 charger

*Message #5 Posted by **Olivier De Smet** on 20 Sept 2011, 5:03 a.m.,*
in response to message #4 by Paul Berger (Canada)

Thanks for the info,

I will try with a linear 9 V ac 3,5 VA adapter. The drop from the transformer at 8,7 V under load should be ok ?

It's a mascot 8310 (see http://www.mascot.no/?CatID=1179)

Re: HP97 charger

*Message #6 Posted by **Paul Berger (Canada)** on 20 Sept 2011, 6:53 a.m.,*
in response to message #5 by Olivier De Smet

I would suspect that will be ok, it is a little lower than what I observed with the HP charger. A lower input voltage would be better than higher at worst it would not be able to maintain the battery voltage and charge the batteries, but with 8.7Vac input that should not be a problem. A fully charged battery pack with good cells should be about 5.5 to 6 VDC.

I waited 25 years for this?

*Message #1 Posted by **Casey Drew** on 19 Sept 2011, 3:15 p.m.*

My order for the HP15C LE came in and I immediately fired the calculator up. After my first computation, I ran the self test for the heck of it. Display comes back immediately reading "ERROR 9"

Not happy.

Re: I waited 25 years for this?

*Message #2 Posted by **Lode** on 19 Sept 2011, 3:23 p.m.,*
in response to message #1 by Casey Drew

That's normal! It is the firmware of the original being emulated, and it's normal that the self test doesn't work because it is designed for the original hardware.

There is a different self test, I don't know from the top of my head how it works but I'm sure someone here will post it soon :)

15C LE test Re: I waited 25 years for this?

*Message #3 Posted by **troy** on 19 Sept 2011, 3:29 p.m.,*
in response to message #2 by Lode

1. turn off calculator 2. press g+ENTER together, do not release. 3. press ON then release. 4. release g+ENTER.

Re: I waited 25 years for this?

*Message #4 Posted by **Peter Murphy (Livermore)** on 19 Sept 2011, 3:32 p.m.,*
in response to message #2 by Lode

There are three 15C LE self tests, all different from those that apply to the original 15C; the manual revision process failed to reflect this.

An authoritative HP person says this about the LE tests, quote:

[url:http://h10025.www1.hp.com/ewfrf/wc/document?docname=c01788371&tmp_task=solveCategory&cc=us&dlc=en&lc=en&product=81575]

This also applies here to the 15.

Haven't a clue <g>. The only one that appears to make sense at all is "ON /" (keyboard test).

Cheers,

-Marwan

Re: I waited 25 years for this?

*Message #9 Posted by **Mike Morrow** on 19 Sept 2011, 8:22 p.m.,*
in response to message #1 by Casey Drew

You can review postings to this list since September 9 (when gamma testers first got their 15C-LE) to see all

the issues thus far identified. I identified this failure of the **original** self tests within five minutes of receiving mine that date.

More serious, however, is the other problem that I identified that date with the original self tests: Performing the **ON plus *** or the **ON plus +** self tests will corrupt program memory!

While we're at it, my other and most serious discovery on September 10 was the display irregularities that occur after two or more PSE commands are executed in a program's runstream.

The HP 15C-LE's new self tests are the same as those for the HP-12C+. Start them by turning the calculator OFF, push and hold g and ENTER keys, push ON, then release all keys.

Enjoy.

in response to message #1 by Casey Drew

Real Self Test for 15C LE linked here

No idea why this procedure was left out of the printed manual that came with the 15C LE. As others have noted it is the same as the new 12C's in fact the link actually indicates 12C.

I printed a copy and included it with the 15C LE's print manual.

Ahh, SNAFU!

Re: I waited 25 years for this?

*Message #13 Posted by **Howard Owen** on 20 Sept 2011, 5:57 p.m.,*
in response to message #11 by Michael de Estrada

The problem isn't with the printing, but the *editing.*

Re: I waited 25 years for this?

*Message #14 Posted by **Michael de Estrada** on 20 Sept 2011, 6:05 p.m.,*
in response to message #13 by Howard Owen

It is when the Chinese printer ignores the US editor.

Re: I waited 25 years for this?

*Message #15 Posted by **Mike Morrow** on 20 Sept 2011, 9:36 p.m.,*
in response to message #13 by Howard Owen

All this is putting emphasis on the wrong things. Even IF the manual had been printed as desired, which was to have NO reference to any type of self test at all:

(1) That leaves in existence a couple of keyboard actions that can corrupt program memory that should NOT corrupt anything (ON plus * and ON plus +). A properly edited manual would NOT cause those problems to go away!

(2) The real self tests would NOT be described in the manual. That is certainly a deficiency.

(3) An unnecessary deficiency and difference between the HP 12C+ and the HP 15C-LE exists. The HP 12C+ apparently tolerates performance of BOTH the old self tests AND the new self tests without any problems arising. One wonders why that doesn't also apply to its doppelgaenger, the 15C-LE.

Edited: 20 Sept 2011, 10:05 p.m.

Re: I waited 25 years for this?

*Message #16 Posted by **Ángel Martin** on 21 Sept 2011, 1:40 a.m.,*
in response to message #15 by Mike Morrow

You nailed it - the manual is the symptom, the real issue is what you describe.

Re: I waited 25 years for this?

*Message #17 Posted by **Walter B** on 20 Sept 2011, 6:38 p.m.,*
in response to message #11 by Michael de Estrada

Taking into account the Chinese talent in copying, I bet they printed *exactly* what was given to them. Textbook example for GIGO I guess.

The Volume-4 Number-5 (June 1977) issue of "65 Notes" covers it in fair detail on pages 1 and 2, with Lou Cargile's landmark article "Zen And the Art of HP-67 Maintenance" starting on page 4. This might be considered the origin of "synthetic programming" in the user community.

Jake

Re: HP 67 Black Box

*Message #4 Posted by **Jim Horn** on 19 Sept 2011, 1:40 p.m.,*
in response to message #1 by Fouad M. Kaadou

You'll find the details in the PPC Journal circa 1978/1979. It was a very simple device: a small circuit board was plugged into the power jack on the back of the '67 between the spring plate and the outer two pins. It had a section of the copper removed down its middle and a short cable attached. In the box was a potentiometer (actually, just a variable resistor) and a normally-closed pushbutton in parallel with it.

When the board was inserted, power from the 67's battery had to travel through the box to the rest of its circuitry. By pushing the button, the resistance was added to the battery. IF the resistance was close to zero,

nothing happened. If it was large, the '67 saw its power drop to where it turned off while the button was pushed. But if the resistance was just right, the '67 would stop operating *but* its power-on reset circuit wouldn't be triggered.

The result was the 67's registers, being dynamic circuits, would forget their contents but not get reinitialized. This allowed access to making all sorts of non-normalized numbers, exploring around the CPU's address space, etc. Again, check the PPC Journals for the details.

I used this trick to create arbitrary bit patterns in the '67 registers and write them to magnetic cards. By reading them into the then-brand-new HP-41C, the 41's use of memory could be explored, leading to my talk on same at the 1979 Conference in Santa Clara a month after the '41 came out. As I recall, it took about 20,000+ keystrokes that weekend to map out the data for that presentation.

Yes, I agree with others on the quality of early HP calculator keys!

Re: HP 67 Black Box

in response to message #9 by Fouad M. Kaadou

Jake Schwartz has done the herculean job of capturing all the old user journals and such on a set of disks. You'll find them at:

<http://www.pahhc.org/ppccdrom.htm>

The users groups of the past have been supplanted by the Web - something of a loss as the journals were a delight to receive and the mailing sessions at Richard Nelson's home (and later, the PPC Office) were a great gathering of enthusiasts. But we could never have imagined the real-time communications with others around the world, not just the Los Angeles area.

Good old days? Not nearly like the ones we have now!

First post & a question re:20b/30b

*Message #1 Posted by **E.Lub_EU** on 19 Sept 2011, 12:46 p.m.*

Hello all,

I've come here after reading about the WP34S project, and, well, fell for it. That will be my first own "WP" programmable!

I am French, so not an native speaker of English, so please excuse my clumsiness and mistakes. Do not hesitate to ask for clarifications, should you need any. Professionnally, I have worked as an EE, both in maintenance and design, (currently between jobs, alas). My main experience has been with hardware, my embedded software skills are limited to 8bit assembly, C being a really foreign language...

As for HP calculators, I've never owned one, though I have used several, starting with the HP35 then 45, 91, 21, ending with the HP41CV. I loved that one. I've been without a "real" calculator for a long time, but this is about to change!

Which brings me to my interrogations about the 20b/30b:

1. I intended to start with a 30b (will get one later) but have found an good deal for a 20b. I think that I would not mind is "inferior" keyboard, as long as it is working well (no missed keypresses, a decent durability). What do you think?

2. I have read that their internals were identical. But looking at a photo sent by Marcus van Cube (search for "WP34S and USB"), I noticed that it did not match the PCB shown in Richard Nelson's document named "Interfacing to the HP20b V3.pdf". Specifically, Marcus' calculator seems to miss the 10pins I/O connector (J8 on the 20b schematics). I would like to have it, just in case there is a development involving these resources (interface, memory, whatever). I can't find out whether this a difference between models, or early/late versions of the same machine. Can someone shed some light on this ?

Thanks for your assistance!

Regards, Etienne

in response to message #1 by E.Lub_EU

Bonsoir Etienne,

soyez bienvenu! This place is full of people with English as their second, third or whatever language, and some more where you think it can't be their mother tongue. So no need for excuses :-)

Referring to your questions, I can answer the first one immediately: Besides the (clearly inferior) keyboard feeling, the 20b is as suitable for repurposing as the 30b. Missed keystrokes can't happen, since you don't know when a key should register. For assessing durability, my 20b is not with me long enough yet.

Your question 2 needs an hardware guy to answer. That's my area no more.

HTH

Walter

*Message #3 Posted by **E.Lub_EU** on 19 Sept 2011, 6:37 p.m.,*
in response to message #2 by Walter B

Hi Walter,

Thanks for your welcome.

I have to say that I feel very unhappy being helpless on the code side, but hopefully, I 'll find some way to contribute. I am not familiar with the ARM family, but , for my own culture and in order to help, would like to comprehend how things work at the hardware level, i.e. uC initialisation (including the possibility of Xtal detection, if that's useful) and power usage optimisation. Don't hold your breath, though...

I have ordered a 20b right away (and am awaiting cables from Gene Wright), so I should be ready to start torturing the poor beast soon.

I don't know how to express my gratitude for your -and that of your fellow musketeers- continued involvement in this amazing project.

Bye for now Regards Etienne

*Message #6 Posted by **Neil Hamilton (Ottawa)** on 19 Sept 2011, 2:02 p.m.,*
in response to message #1 by E.Lub_EU

Hi Etienne,

Your English is better than mine!

You are correct that they are not identical inside (compare Richard's photo of the 20b to the guts of my 30b at http://web.ncf.ca/njsdham/photos/calculators/wp34s/dscn0598.jpg). However, from the WP 34S F/W point-of-view, they are sufficiently the same as to not matter.

Note that the original 30b flash image does **not** run as a 30b when installed into a 20b chassis so there is some minor difference that HP uses to differentiate the 2. Interestingly, the 30b image in a 20b chassis seems to run virtually identically to a 20b! The 30b specific functions do not work.

(I tried the above experiment of *very* temporarily loading the 30b F/W into my 20b chassis for fun one day and had the wonderfully awkward experience of looking for the 30b key meanings under my 34S overlay! I had to resort to the 30b manual to figure where the keys were. For people without a 34S overlay, the experience is most definitely reversed :-) Ten minutes later, the 20b was reset to its *natural* state as a 34S.)

Re: First post & a question re:20b/30b

*Message #7 Posted by **E.Lub_EU** on 19 Sept 2011, 6:57 p.m.,*
in response to message #6 by Neil Hamilton (Ottawa)

Hi Neil,

Great photos! Thanks a bunch, they answer some interrogations I had. The case of the missing I/O connector is solved: on the 30b, it lies alonside the JTAG pads at the bottom of the PCB, so out of the field of view of Marcus' shot.

I also noticed that the machines seem to differ in the way the PCB is assembled with the keyboard/front plate assembly. That would be a disappointment, as I had hoped that we could have somehow married the 30b nice keyboard/PCB to the 20b faceplate (I feel black is a nice match to the overlays, and it might have allowed to get past the "black S" problem in moving towards a semi-custom WP34S faceplate).

Let's wait to see the units "in the flesh"...

And indeed, thanks a lot for your work on the assembler. Much appreciated.

Regards, Etienne

in response to message #7 by E.Lub_EU

Hi Etienne,

Thanks for the note.

This photo was taken just before I installed my 32KHz crystal. I did such an ugly job soldiering the caps in place that I did not want to post the "after" photo. :-) Is it just me and my aging eyes or do things seem to be getting smaller?

BTW: As can be seen in the photo, rather than use the often suggested jeweler's screw driver to pry the case open, I used heavy gauge guitar picks. These worked marvelously!! No scratches or dings at all!

As you noted, the pitch of the connectors is coarser in the 30b than the 20b but I think they are all present and accounted for.

It never occurred to me to swap the face plates. The black 20b might look nicer but I suspect that too many things are different on the mechanical side.

Personally I have absolutely no problem with the black overlay on the silvery 30b. In fact, I have no real problems with the overlays at all. I know many have complained about the *concept* of an overlay but it certainly works well as far as I am concerned.

I think you will be very much more pleased with the snappy 30b keyboard over the mushy 20b.

Neither do I, actually. But as I had seen argued in a previous thread that the 30b faceplate, as it is now, was kind of incompatible with an evolution towards a WP34S specific design (the "black S" problem), I had hoped that starting with the 20b would be easier. Well, not so, unfortunately...

14 flash cables mail today and a moratorium please? :-)

*Message #1 Posted by **gene wright** on 19 Sept 2011, 10:13 a.m.*

I am mailing 14 additional cables just to people in the USA today. Wow.

I have 7 cables going out tomorrow to non-USA addresses.

That should cover everyone who has asked for a cable through yesterday.

Please let me have a moratorium until AFTER the HHC conference this week. Plus...I am almost out of cables! :-)

Re: 14 flash cables mail today and a moratorium please? :-)

*Message #2 Posted by **Thomas Radtke** on 19 Sept 2011, 11:19 a.m.,*
in response to message #1 by gene wright

Is this in anticipation of a revised 15C LE firmware, or still for wp34?

Re: 14 flash cables mail today and a moratorium please? :-)

*Message #3 Posted by **gene wright** on 19 Sept 2011, 11:26 a.m.,*
in response to message #2 by Thomas Radtke

Some of each. The cables work for multiple purposes, so tough to tell.

Apparently, quite a few people are unable to send email through the forum's normal channels and when I put a fairly clear indicator of my email address in the body of a post, I received a large number of "Hey, I want a cable too!".

So Gene, what is it about these cables that makes them unique from any Serial/JTAG cable? Is it just the two buttons?

If so is there a procedural workaround where the buttons would not be necessary? Or a simple mod to add switches to another cable.

I'm thinking about when you do run out. But also considering the idea Marcos posted earlier where he soldered in a small stereo audio jack (Tx, Rx, Gnd only). With this set up, a cable like those used to program the PICAXE would work (like the AXE027).

The two buttons (ERASE and RESET) are needed to get into the bootloader on the calc in order to flash the new firmware.

The HP cable is a 3v to RS232 level shifter, plus the two buttons. It uses six pogo pins to connect to the calculator (2x3 pads underneath the battery cover).

In "Interfacing to the HP20b V3.pdf" Richard Nelson shows some good close up pictures of the guts of the cable. I think there is enough detail you could wire up your own two buttons on any common level shifter. Then you just need the pogo pins or reasonable facsimile thereof.

in response to message #6 by sylvandb

> Quote:
>
> > Then you just need the pogo pins or reasonable facsimile thereof.

But this is the hard part - 6 pogo pins with 2mm spacing in a 2x3 arrangement with the asymmetric locking clips on the sides. This is incredibly difficult to make without the right molding machinery. You might be able to make a 2x3 grid of pogo pins and hold them in place but that's not reliable and you'd need a third hand to run the computer.

I've just received a query from someone in Germany and I may want to build some custom USB cable from the guts of the original programming cable, so it seems like a good idea to me if you set aside a bunch of them for me to carry home.

Re: 14 flash cables mail today and a moratorium please? :-)

*Message #12 Posted by **E.Lub_EU** on 20 Sept 2011, 2:33 p.m.,*
in response to message #11 by Marcus von Cube, Germany

Hello Marcus,

I am a newcomer to this community, with working experience as a hardware engineer (won't be a great asset for software development...), and have been thinking on the same line.

I have ordered 2 cables from Gene Wright for that exact purpose, keeping one in its original form, and hacking the second to make it a USB cable, possibly powering the calculator during these long sessions of

yours :-)

Interested in sharing ?

Regards, Etienne

Two new blog posts of interest to members of this forum

*Message #1 Posted by **Steve Leibson** on 19 Sept 2011, 10:04 a.m.*

I've just published two blog posts that might be of interest to members of this forum. The first, inspired by recent discussions on this forum is about the processor inside of the new HP 12C and 15C reissues. There's a block diagram of the Atmel processor in case you've not seen it.

The second post is a discussion of the contributions Dave Cochran made to HP calculators. If you don't know Dave, he's the HP Labs engineer who developed most of the code for the original HP 9100 Scientific Calculator and he was instrumental in making the HP 35 a reality.

Here are the two blog URLs:

EDA360 and the brand new Hewlett-Packard 15C Limited Edition RPN pocket scientific calculator

1972: When scientific calculators truly went low power

And be sure to see Dave Cochran's personal history of his career at HP:

http://www.hpmemory.org/timeline/dave_cochran/a_quarter_century_at_hp_00.htm

Re: Two new blog posts of interest to members of this forum

*Message #2 Posted by **Mike Morrow** on 19 Sept 2011, 10:42 a.m.,*
in response to message #1 by Steve Leibson

Interesting. However, none of the Voyagers (including the HP-15C) were Saturn-based as stated in the EDA360 article, and I thought the HP 15C-LE processor was the SAM7L series, not the SAM7S whose data sheet is referenced there when the link is executed.

Edited: 19 Sept 2011, 11:02 a.m.

Re: Two new blog posts of interest to members of this forum

*Message #3 Posted by **Steve Leibson** on 19 Sept 2011, 12:33 p.m.,*
in response to message #2 by Mike Morrow

Sorry, the info about being based on Saturn comes from here:

http://www.hpcc.org/calculators/hp15.html

If that's incorrect, I'm happy to change the blog. Is the processor in the Voyager series not derived from the Saturn architecture?

Also, thanks for catching the bad link to the wrong data sheet. I've fixed that in the blog.

--Steve

Re: Two new blog posts of interest to members of this forum

*Message #4 Posted by **Steve Simpkin** on 19 Sept 2011, 12:47 p.m.,*
in response to message #3 by Steve Leibson

Steve,
The CPU used in the Voyager models was based on the CPU used in the HP-41C. It included 61Kbits of ROM, 2.2Kbits of RAM, an LCD driver and a low-battery detector on-chip.
See: http://www.hpmuseum.org/tech10.htm

Re: Two new blog posts of interest to members of this forum

*Message #5 Posted by **Steve Leibson** on 19 Sept 2011, 1:56 p.m.,*
in response to message #4 by Steve Simpkin

Steve,

Thanks for the info. I have changed the blog to say that the Voyager CPU was based on the HP 41C processor architecture. However, I find the page you referenced to be somewhat confusing because it talks about the Saturn processing being developed, then is ambiguous about the processor used in the Voyager series. Perhaps that's why the page on HPCC.org is worded incorrectly.

--Steve Leibson

Re: Two new blog posts of interest to members of this forum

*Message #6 Posted by **Eric Smith** on 19 Sept 2011, 4:55 p.m.,*
in response to message #4 by Steve Simpkin

The CPU used in the original Voyager calculators did NOT include any ROM, RAM, or LCD driver on-chip. There was a second chip, "R2D2", which contained the RAM, ROM, and Display Driver. The CPU was a minor variant of the one used in the 41C.

The HP-15C had more RAM and ROM than the other Voyager models, so it contained two R2D2 chips. The second R2D2 was in a smaller, lower pin-count package, with the display driver not bonded out.

It wasn't until many years later that they did a cost reduction, putting the CPU and R2D2 functions into one chip. The 15C still needed an additional R2D2.

Re: Two new blog posts of interest to members of this forum

*Message #7 Posted by **Steve Simpkin** on 19 Sept 2011, 5:12 p.m.,*
in response to message #6 by Eric Smith

Thanks Eric for clarifying that fact. I should have noticed this from the internal picture of the original HP-15C.
http://www.hpmuseum.org/10cmbb.jpg

Re: Two new blog posts of interest to members of this forum

*Message #8 Posted by **Mike Morrow** on 19 Sept 2011, 1:58 p.m.,*
in response to message #3 by Steve Leibson

The hpcc.org page on the HP 15C-LE is incorrect stating that the LE is running an emulator of the Saturn processor. If it were, then the original firmware of the 15C would not be usable in any form, since the original 1982 15C did not use the yet-to-be-invented Saturn.

The 1984 HP-71B, 1986 HP 18C, and the 1987 HP 28C were the first Saturn machines.

Edited: 19 Sept 2011, 2:00 p.m.

Re: Two new blog posts of interest to members of this forum

*Message #9 Posted by **Mark Hardman** on 19 Sept 2011, 4:38 p.m.,*
in response to message #3 by Steve Leibson

Technically the CPU would be a 1LF5-0301 or a 1LM2-0001.

Lots of details on the CPU chips' specifics can be found on Eric's site at:

HP Voyager Calculator Variants

Integration in a program on 42s?

*Message #1 Posted by **snaggs** on 19 Sept 2011, 7:27 a.m.*

Ive nearly finished a normal distribution program for my 42s. However, I cant work out how to programatically specify the upper and lower integration limits. On the 35s you just load them in the stack.

Daniel.

Does it really have to have keys?

*Message #1 Posted by **Oliver Unter Ecker** on 19 Sept 2011, 6:36 a.m.*

Regarding the hardware base for the "ultimate RPN" calc, does it *really* have to have physical keys?

What about capacitive touchscreens?

For an RPL graphics calc with a large visible stack, I'm thinking the nook comes close to perfect hardware. One month rechargeable battery life; huge matrix display to display equations, stack, graphics, etc.

To me, having something like 30 soft-keys with labels on them and a stack I can move and interact with (pick an entry for editing by tapping it, etc.) easily beats the loss of tactile feedback.

For programming, I'm finding myself typing *a lot* faster and freer of stress on an on-screen keyboard (such as on iPhone/iPad), than on small real keys like on an 28S or an N810 (smallish keys with an QWERTY layout). I confess that, by now, I actually *like* that there's no noise or physical resistance, when I type.

The perfect dedicated calc to me would be half the size of a nook, aluminum-clad and razor thin, with shirt-pocket portability, and still sporting an Eink display. There're no EInk matrix displays smaller than 5", so I'm not holding my breath for it to come along by itself. This kind of form factor would make for a suitable base for the more classical RPN calc sought by most on this forum, with the graphics display and menus traded for lots of dedicated keys, I reckon.

Notwithstanding the question of feasibility, what do people think? Are physical keys really what the ultimate RPN calc (be it like a 42S successor, or more like a 50g successor) must have?

Re: Does it really have to have keys?

in response to message #1 by Oliver Unter Ecker

Yes. No tactile feedback without keys. YMMV

That's not a bad idea actually.

The Sharp Memory LCD's offer extremely low power consumption. There is a 3" version. I'm using a smaller one on my new uWatch Mk2 design.

The problem is the touch screen that draws considerable power compared to the display and processor.

But designing such a hardware platform would not be too hard. I'd imagine a thin machined aluminium case with a screw on front cover to hold all the guts in, an ultra thin rechargable lithium poylmer battery with micro USB connector for charging, and maybe a micro SD card slot. Or maybe standard coin cell lithium batteries depending upon the power budget, but there goes your thickness...

Such a design would slip in a shirt pocket real easily, and would not be that hard to prototype into a really usable form I suspect.

Dave.

That's an interesting aspect I hadn't known about. Any ideas how the nook can still offer two months claimed battery life? (I don't think they completely exaggerating because they'd be called out for that, as enough people compare it to the touchscreen-less Kindle, which claims a month and does 2 weeks.) Might the digitizer enter a drawing-almost-no-power mode, while not tracking?

Are there SoCs that include the necessary logic to drive/read a touchscreen? (I imagine there are.)

Yes, lovely. Your comment that it wouldn't be too hard is intriguing.

> Quote:

Could you quantify this somewhat? What do you think it would take in dollars and time to get to prototype and final HW stage for an aluminum-clad touchscreen ARM SoC-based thing, with a micro USB (and maybe micro SD) and sole power button? (Very rough estimate to give me a ballpark idea would be much appreciated.)

My question may be grossly naive, but I'm a SW guy.

Thanks.

The usual resistive touch screens take significant power all the time. Although you could shut them off under software control. Maybe some form of capacitive touch screen instead, I'd have to investigate.

> Quote:
>

Some I believe, but in any case it's fairly trivial to add capability.

> Quote:

It shouldn't be, I've gone through the motions with my calc watch projects. It's just a matter of getting a suitably thin case machined.

> Quote:

(Very rough estimate to give me a ballpark idea would be much appreciated.)

I can give you a reasonably accurate ballpark.
Rather than guess, I did a quick case design in eMachine shop, and the price comes out at $265 for 10 cases custom machined in 6063 aluminium, not including a backing panel. Includes shipping to Australia. $175 without shipping.
But that is a crude model, lets up that to say $300 for a more refined one with tapped holes for the backing panel, clear annodised etc.

The PCB would cost about $150 from pcbcart.com, cheaper from someone like iTead Studious, as little as $50.

The LCD screen would cost a bit, I don't have a price on the 3" model, but the 6" model is $200 from Mouser, so let's guess $150 that.

Other parts, let's say $50.

Battery from PowerStream.net come in thicknesses down to 0.5mm. But the 303040 model is 3mm thick 320mAh one costs $10.

Touch screen I don't know yet, haven't looked.

Time wise, a couple of days to select components and lay out the PCB, another day or two to design the case. You wait a month for the case prototype, but quicker if you knew someone with a suitable CNC machine. A day to assemble, and then another day to get a hello world running.

So really, apart from lead times, I estimate I could get a prototype working with 1 weeks worth of work, and under $700. That is fairly accurate because I've done the same thing before with the uWatch and uWatch projects, only difference is they didn't have the custom case.

The case I have shown is close to actual size of 45mm x 80mm x 5mm thick for the 3" display (not including backing plate). Actual thickness I'd need to tweak depending upon various available parts. The LCD itself is less than 1mm thick.

This isn't pie-in-the-sky stuff, those are real figures. The only unknown for me is how well someone like eMachineshop can machine such an aluminium case.

Dave.

feedback

*Message #7 Posted by **Frank Boehm (Germany)** on 19 Sept 2011, 8:15 a.m.,*
in response to message #1 by Oliver Unter Ecker

I really hate to have to type on something without feedback (like my mobile phone).
Since I have to write plenty of emails, I often have to think while typing, carelessly touching one key and having a row of ooooooooooooooooooooooooo typed would be really annoying. Same with a calculator - I need to know if a keystroke has been registered or not.

Re: feedback

Does that feedback have to be tactile? What about audible?

I have an iPad where I've installed i41CX+ from AL Software (very cool app, BTW). It offers several audible tones for keystrokes, which I find are quite acceptable for confirming data entry.

Re: Does it really have to have keys?

*Message #9 Posted by **Hugh Evans** on 19 Sept 2011, 9:50 a.m.,*
in response to message #1 by Oliver Unter Ecker

There's no getting around tactile feedback, otherwise I would be satisfied with using the emulators on my phone alone. I've considered a system based on the iPhone/iPod Touch that would fit around the devices like a case. By using traditional keys and making sure the snap domes interact with the capacitive touchscreen you get the best of both worlds. However, it's still inconvenient.

Re: Does it really have to have keys?

*Message #10 Posted by **uhmgawa** on 19 Sept 2011, 10:22 a.m.,*
in response to message #9 by Hugh Evans

That's a clever idea. And for example the elastomeric "domes" in the pioneer series are so close to voyager metal domes w/r/t tactile feedback, I didn't realize they weren't until I had need to do a repair. So carrying around a dome skin is feasible. But regrettably it fails the "grab the box and calculate" immediate gratification which likely most will find objectionable.

in response to message #1 by Oliver Unter Ecker

Real HP calculators have physical buttons, period.

Re: Does it really have to have keys?

*Message #13 Posted by **Oliver Unter Ecker** on 19 Sept 2011, 11:15 a.m.,*
in response to message #12 by hpnut

Yes, understood.

It wouldn't be an HP. ;-)

Having no keys seems to side-steps the three biggest problems with pulling such a project off the ground, if I can believe the OpenRPN thread: case, keys, legends.

There's "no one size fits all" in calculators, most likely.

Re: Does it really have to have keys?

*Message #14 Posted by **Calum Tait** on 19 Sept 2011, 4:29 p.m.,*
in response to message #12 by hpnut

I agree. In fact I still miss the mechanical keys of my old comptometer. Crunch, crunch!

Seriously though, has anyone who argues for capacitive screens ever tried to use one with gloves on or for that matter with any sort of keying reliability? Resistive screens at least work with gloves but have even worse registration reliability and of course, neither offers proper feedback.

Re: Does it really have to have keys?

*Message #15 Posted by **Garth Wilson** on 19 Sept 2011, 9:38 p.m.,*
in response to message #14 by Calum Tait

The grime and the paralax drive me away from touch screens. The grime (really just smears from skin oils) aren't bad if the display puts out its own light, but then we're back to something that consumes a lot of battery power. I want to be able to go many months without having to recharge or replace batteries.

Re: Does it really have to have keys?

*Message #16 Posted by **Oliver Unter Ecker** on 20 Sept 2011, 8:59 a.m.,*
in response to message #1 by Oliver Unter Ecker

Thanks to everyone who responded!

Twasn't enough voices to draw a decisive conclusion, but it sounds like people really want keys.

My reality distortion field lets through Walter's "YMMV" as take-away.

Re: Does it really have to have keys?

*Message #17 Posted by **DigiGal** on 20 Sept 2011, 5:54 p.m.,*
in response to message #16 by Oliver Unter Ecker

Tactile feedback of physical keys is essential for me.

I have an iPhone 15C app emulator called [SCI 15C] and it just isn't the same. It does offer sound click as feedback but that is annoying, thankfully you can turn the sound off for the emulator that I have.

Original 15C keys are better than 15C LE keys but the LE keys are very much welcome.

Re: HP 71B LE?

*Message #9 Posted by **Namir** on 19 Sept 2011, 11:29 a.m.,*
in response to message #8 by Keith Midson

Keith,

You love that emulator especially when you configure the various ports to load more memory and the ROM files. Use the **Edit | Port Configuration ...** menu commands to bring up the **Port Configuration** dialog box. You can select the port using the list box located in the upper right corner of the dialog box. The Add button allows you to add a module to the port.

Loading the JPC ROM is especially nice because it extends the BASIC dialect allowing for better looping and decision-making structures than the bare BASIC of the machine. The additional constructs reduce the reliance of the code on line numbers or labels. The resulting code is easier to read and bit more up to par with structured languages.

Namir

Needing more advice with my HP-48S

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 18 Sept 2011, 10:18 p.m.*

On 14 May I reported:

> Quote:
>
> I left the cells in my 48S longer than I should have. One of the cells leaked. The leakage got into the foam that provides the spring for the cell contacts. The leakage dissolved (if that is the correct word) the adhesive that attached the cell contacts to the foam. I have cleaned the compartment and have demonstrated that the calculator still works by simply holding the contact against the foam while inserting the cells.
>
> I think that some of the leakage is still in the foam. How can I remove the leakage safely? What adhesive should I use to attach the contact to the foam? If I replace the foam where do I find foam that does not deteriorate in a few years?

I now find that I have a new problem with my HP48S. If I press either the 2 or the 3 key the number 23 appears in the screen. Similar effects occur with the 5 and 6 keys, the 8 and 9 keys, and the . and SPC keys. Similar effects also occur with pairs of keys which are not part of the numeric keyboard. For example, if I enter 9 at level 2 and 2 at level 1 and press y^x I would expect to see 81, Instead I see 22.36159094 which indicates that the calculator took the square root of two and then raised 9 to the square root of two power. Similar effects appear with other adjacent pairs of keys such as EEX and DEL, etc.

If I place the calculator under a reading lamp for a couple of hours it will operate properly for a few minutes and then will return to the operation described above. I think this means that some of the cell leakage may have gone into the electronics compartment, perhaps under the keyboard. This is certainly possible since the cell compartment is not a bathtub as was the case with the HP-35, HP-45 and HP-80. So, my questions are:

How do I open the the device to inspect for cell leakage and to clean if necessary?

Or, am I better off simply keeping the calculator warm?

Re: Needing more advice with my HP-48S

*Message #2 Posted by **aj04062** on 18 Sept 2011, 10:42 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

You can search the internet for methods to open this or the 48G series. I have found good luck using the method HERE

However, fixing corrosion in the keyboard is a whole other thing. It requires a lot of work to take the keyboard assy apart.

Edited: 18 Sept 2011, 11:03 p.m.

Palmer, here is some information I downloaded a couple of years ago. But be advised I have not tried it myself, so you are better off listening to someone who has!

Re: Needing more advice with my HP-48S

*Message #4 Posted by **Bart (UK)** on 19 Sept 2011, 4:38 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi Palmer,

I recently opened a 48SX to the point of taking the two halves apart. That is do-able, although I still have to take the faceplate off to re-sit the big heat stakes.

However, I have noted that the keyboard is put in place with a metal backing plate that is held in with dozens of small short heat stakes, and I think it almost impossible to put back together if taken apart (about 1/3 of them are visible in TOPWORK.JPG from Martin Pinckney's reference). I don't know if maybe the keyboard can be cleaned in-situ (once the electronics is removed) as per Geoff Quickfall's Voyager method (as described in this thread, Geoff's message on 10 Dec 2010, 9:31 p.m).

15C Keyboard Issues [EMAIL ME - INFO BELOW]

*Message #1 Posted by **Tim Wessman** on 18 Sept 2011, 10:10 p.m.*

Hello,

Can anyone that feels they have a problematic keyboard you are not happy with, that has 1) keys not registering or 2) very noticeable differences in key pressure, please email me at my full name as written below connected to @hp.com? We definitely would like to get those for examination. May need to smack some heads or put a new process in place. There have not been things like this for quite a long time on the 12c units and they come off the same assembly line. There is quite a bit of puzzlement about the whole situation. . . :-(

Nobody can figure out how the 12c firmware could have slipped in there either. Should be impossible as every unit has the full tests run before it goes out. . .

A "loose" function key is not a keyboard issue. As the steel molds wear towards replacement, the tolerances for those two keys are not as tight and they become a bit looser. You have wear on the key molds, and then on the upper case. Thus two parts wear and the design of the mold takes that into account for the projected life of both molds.

This is normal. Those function keys essentially have a "barrel" at the bottom that rotates in a slot on the upper mold. All they other keys are in a keyboard tree which is why they don't have any movement.

With all due respect, I disagree with this statement. I worked as a project engineer at a contract manufacturing company for 10 years, and I was mostly working on plastic projects. Our factory was in China and I was there 3 times over the years working on project launches. Each time I was there for 2 weeks to a month.

As tools wear, typically the overall size of a part will get larger, not smaller. Of course I would like to see a tool drawing or the tool itself to know for sure, but I can't see how these keys would get smaller over time. Outside to outside measurements grow as the steel wears.

I know from experience that our factory always did everything very steel safe, which seems to be the situation with these function keys. The tool maker is either slightly out of tolerance on the key sizes now, or right at the lower limit, but the tools will wear into spec over time, and eventually the keys will get too large and out of spec. Then it's time for new tools.

Of course the housings are obviously very steel safe too, and that magnifies this issue. Let me explain. The

steel features that create the key openings in the housing are bosses or posts that stick out. They will wear smaller over time. When the tools are new, the key openings are the largest they will ever be. For the keys, as I said, they are the smallest they will be when new. This makes for loose keys when both sets of tools are new, which may be the situation here. Over time this will get better, and this strategy gives you the most tool life, but also the most complaints when your new products are launched.

could it be the issue with the f and g keys is in fact a slight warping of the PCB, such that the bottom edge curves backwards slightly allowing those two keys to sit loose?

Re: 15C Keyboard Issues [EMAIL ME - INFO BELOW]

*Message #9 Posted by **Paul Gaster** on 20 Sept 2011, 9:25 p.m.,*
in response to message #8 by robert rozee

I don't think so. The PCB could warp, yes, but I believe the board is held down by some screws. That would take any warpage out of the equation. Plus some have said those keys rotate a bit in the openings, indicating that they are just a bit on the small side.

Re: 15C Keyboard Issues [EMAIL ME - INFO BELOW]

*Message #10 Posted by **Hugh Evans** on 20 Sept 2011, 11:43 a.m.,*
in response to message #1 by Tim Wessman

I might have to get nerdy with this key pressure issue and stick my 15C LE in one of the Instrons at work, LOL. Everything looks and feels great so far on #02226.

HP-15C LE Order Page Has Gone Live

*Message #1 Posted by **Steve S** on 18 Sept 2011, 7:07 p.m.*

Just checked and the order page at HP.com has gone live.

Re: HP-15C LE Order Page Has Gone Live

*Message #2 Posted by **Daniel Greenidge** on 18 Sept 2011, 8:44 p.m.,*
in response to message #1 by Steve S

It might be worth mentioning that the HP Store has a much more generous return policy (21 days) than Samson Cables, which does not have a return policy at all on opened electronics.

Old news, Stevie. But thanks.

I got an email from HP telling me that the order I placed this morning on the HP website is shipping tomorrow by matter-energy conversion beaming (aka Fedex) and will be arriving Wednesday. Can't wait to fondle the new keys!

Re: HP-15C LE Order Page Has Gone Live

*Message #4 Posted by **Michael de Estrada** on 18 Sept 2011, 10:00 p.m.,*
in response to message #3 by Todd Garabedian

Did you use a $10 discount coupon per the original post on this ? Anyways, glad to see a few more folks are picking these up at non gouge pricing. I've already got my allotment of 2 so I'm not ordering any more from HP.

Re: HP-15C LE Order Page Has Gone Live

*Message #5 Posted by **M. Joury** on 18 Sept 2011, 10:28 p.m.,*
in response to message #4 by Michael de Estrada

There is also the OFFERS15 code that takes $15 off an order of $75 or more and supposedly good through 10/31 (31/10 for you non-US types). Don't know if it works for the HP15C as I too have my quota but thought that I would mention it.

There are also offers for $10 off a purchase of %50 or more and for those that want two an offer of $30 off %150 or more. Here is the link.

Cheers,

-Marwan

Yes, I mentioned this in my original post in another thread. The $10 discount almost covered all the state sales tax. I used one of the two codes that were mentioned.

Hp-28S Does not Turn On

*Message #1 Posted by **aj04062** on 18 Sept 2011, 6:27 p.m.*

I recently cleaned my HP-28 taking care not to get too wet (used damp cloth etc).

Now when I install the batteries, all that I get is a slightly dimmed screen when I press on. No combination of keys that I have done so far has reset it.

An suggestions?

in response to message #1 by aj04062

HP-50g?

Re: Hp-28S Does not Turn On

*Message #3 Posted by **Frank Rottgardt** on 19 Sept 2011, 6:06 a.m.,*
in response to message #2 by Namir

The 50g as well as the 48 series are IMHO overwhelming with to many functions and menues. In college many mates had the 48SX while I prefered the 28s because of a more straight forward approach. Today I have both calculators, but still I am a lot faster on my 28s. But the lack of I/O is of course a problem.

Re: Hp-28S Does not Turn On

*Message #4 Posted by **Dave Britten** on 18 Sept 2011, 8:56 p.m.,*
in response to message #1 by aj04062

If the screen appears to get power and darken just slightly, but nothing is displayed, it may be a stuck key. I have a 32s that did the same thing, and was able to fix it.

Also, you've tried adjusting the contrast already, right? (Hold On, press + or -.)

Re: Hp-28S Does not Turn On

*Message #5 Posted by **aj04062** on 18 Sept 2011, 9:38 p.m.,*
in response to message #4 by Dave Britten

Tried to find stuck keys, can't find one.

Interestingly, On - or + DOES ALTER the contrast.

Re: Hp-28S Does not Turn On

*Message #6 Posted by **Eric Smith** on 18 Sept 2011, 10:53 p.m.,*
in response to message #5 by aj04062

That means that the processor is running correctly.

Re: Hp-28S Does not Turn On

*Message #7 Posted by **Lincoln R.** on 18 Sept 2011, 10:02 p.m.,*
in response to message #1 by aj04062

This will sound obvious, but make sure you put the batteries in right. I once had my 48g doing some very weird things, turned out I had reversed one of the batteries.

Re: Hp-28S Does not Turn On

*Message #8 Posted by **aj04062** on 18 Sept 2011, 10:29 p.m.,*
in response to message #7 by Lincoln R.

I did and did not make that mistake.

Re: Hp-28S Does not Turn On

*Message #9 Posted by **Bart (UK)** on 19 Sept 2011, 4:44 a.m.,*
in response to message #8 by aj04062

Tried another set of batteries? (just because they came new out of a packet doesn't always mean they're good).

Re: Hp-28S Does not Turn On

*Message #10 Posted by **aj04062** on 19 Sept 2011, 7:02 a.m.,*
in response to message #9 by Bart (UK)

I've tried several sets that work okay in my 41. I'll buy a new set and try them out.

OpenRPN Reboot Interest?

*Message #1 Posted by **Hugh Evans** on 18 Sept 2011, 4:58 p.m.*

Since the topic has been broached: Is anyone interested in giving this concept another shot? I know it will sell when finished, so this question is directed more towards technical development people. As I see it, even if the only goal was to use existing plastic parts we can give software such as WP-34s a better environment to operate within. At least one complete machine would be fantastic, but in the short term it would be best to get a development board in production (all I need are PC boards and components because I have a good friend who owns a commercial reflow oven.)

I'm not looking for a flame war, I'm sincerely looking for expressions of interest. This would be a full reboot, making use of lessons learned and taking the original concept forward. We don't have to start from scratch, and I feel much better prepared this time around personally.

Who's up for it?

Re: OpenRPN Reboot Interest?

*Message #2 Posted by **Paul Dale** on 18 Sept 2011, 6:24 p.m.,*
in response to message #1 by Hugh Evans

I'd likely be interested again.

Re: OpenRPN Reboot Interest?

*Message #4 Posted by **DaveJ** on 19 Sept 2011, 7:00 a.m.,*
in response to message #1 by Hugh Evans

Out of curiosity as a designer of calculator hardware myself, what were the important lessons learned from all the Open RPN effort you mentioned?

Do you really only just need a PCB to move this project forward?
If this was the case then that would presumably mean that you have a housing and key solution in place?

Because as I see it, and I've probably mentioned this before, a physical calculator design is an exercise in housing, keypad, legend, and ergonomic and manufacturing design - any PCB design is a fairly trivial aspect of it all.

BTW, reflow ovens are usually not needed for prototype PCB assembly.

Dave.

Figure out the hardware and case first.

- Pauli

Re: OpenRPN Reboot Interest?

*Message #6 Posted by **Paul Dale** on 19 Sept 2011, 7:07 a.m.,*
in response to message #4 by DaveJ

I'll go one further and say that even with okay to decent hardware, the software is by no means a given. The 20b languished for quite a while with nobody (publicly) repurposing it seriously with new firmware.

the production of a new calculator will be a combined effort of hardware designers, firmware writers, application software guys and production people. I very much doubt anyone here is capable of all of these tasks and in many/most cases folks will be limited to but one.

- Pauli

> the production of a new calculator will be a combined effort of hardware designers, firmware writers, application software guys and production people. I very much doubt anyone here is capable of all of these tasks and in many/most cases folks will be limited to but one.

For sure.
But "if you build it, software will come".
With a handheld calculator, the hardware design is essentially everything. It is the thing that costs real money, commitment, and is hard to change and tweak, it "locks you in" in many ways. It is the heart and soul of the product, if it wasn't, OpenRPN would have been released years ago as a jiffy box with a bunch of tact switches and a 16x2 LCD (and failed as result of such poor hardware implementation of course).
Firmware on the other hand only takes time, and has great flexibility, it can be tweaked until the cows come home. And at a general level, firmware is fairly hardware agnostic.

The reason people like us want to design calculator hardware is because we want a physical product form factor and "look'n'feel" that is not available elsewhere. Hardware is the basis for everything. Yes, it needs software too, but I wouldn't really consider that before you have a solid physical implementation.

For example, I did not write a line of code until I had my uCalc or uWatch projects in a usable form factor, there was simply no point. The same will go for the uWatch Mk2 as well.

The reason anyone would consider a new calc design like OpenRPN, or my uWatch or uCalc, is because the current hardware platforms available are not deemed adequate. Otherwise, we'd all think the holy grail has arrived with the 20B re-purposing project.

The only reason OpenRPN has not gotten off the ground before, is solely because of a lack of actual hardware, I'm sure everyone will agree?

Also, since the last Open RPN project was floated, there has been a boon in crowd source funding via the likes of Kick Starter. So money to get projects like this off the ground is easier to get these days, which is great, but it does come with real commitments that must be met.

Dave.

Re: OpenRPN Reboot Interest?

*Message #9 Posted by **Artur-Brazil** on 19 Sept 2011, 8:35 a.m.,*
in response to message #7 by DaveJ

Well, I have to agree that the problem in creating a new calculator is very complex. See the problems a giant like HP and it's facilities at China are facing to. The software, as I could see with the great WP-34S is not the biggest problem.

I just can't understand is why people that are hooked to RPN logic or RPL just not integrate to WP-34S project and try to make a bridge to HP people, in order they incorporate this project.

HP needs to be an open organization - at least in the calculators division - and pay more attemption to what their brilliant customers are doing with HP calculators.

HP 30B is an excellent starting point hardware, as I can see: it has two line display, seems to have a decent keyboard and is reprogrammable. Just HP forgoten to make add a simple connector.

Instead of trying to make each key from scratch and so the case, membranes, steel domes, case, battery compartment, face plate and all other parts I'm probably forgoting, it's so much easier to take a 40US$ still ready hardware and improve its software?

Just for bringing more clear the difficulties: remember the keyboard problems of new HP-15C and of the 50G when it was released? How many thousand dollars were and will be invested on the solution of this very simple problem? Do a group of people have the money and time to make such

correction?

Doing a real thing, that you can press its keys is far more complicated than having it drawn on CAD software - that is what I believe in...

I have seen other dreams like this one in this forum: HP has just released our long time waiting 15C. The new hardware (and software) has some important bugs to fix, but people, instead off making pressure on HP to fix them, just dream for a release of another calculator model - like 71 or 42. It wouldn't be better fix this one we have on hands first??? Once solved, HP may bring to us the 16C model or 11C model. My apologies for my poor English .... Artur - Brazil

Re: OpenRPN Reboot Interest?

*Message #10 Posted by **robert rozee** on 19 Sept 2011, 9:27 a.m.,*
in response to message #7 by DaveJ

how about a little less ambitious starting point - a DESKTOP calculator?

i'm going to suggest (as i have before) an ATmega1284p all-in-one processor, which comes in a DIP package that most anyone can solder. it has 128k of flash, 16k ram, 4k eeprom and 32 I/O lines (including 2 serial ports).

there are several varieties of key switches that one can buy on ebay out of china for less than us$10 for a bag of 100 - some with full keytops, some with just a 1/8" stud to press on.

for an LCD, just use something standard that can be talked to down a 4-bit bus, say 24 columns x 4 lines? for batteries use 4x AA cells.

at a pinch, folks can assemble their own complete claculator on veroboard, while later on we can get some PCB kits made.

THEN, once that phase is completed, look at making it all fit inside a case the size and thickness of a credit card...

I'm not quite clear what the benefit would be as target hardware isn't the limitation and supporting the development host itself as a "target" in some form is a practical necessity. If prospective participants would benefit from having the actual target SoC handy just leverage one of the many simulators available. For example I'd used simavr for early development on both the AVR m328p and m1284p KINOMI modules, but just to validate execution performance of KEMU on these underpowered SoCs was worth continuing the effort.

> Quote:
>

May the force be with you.

But honestly you may want to consider an architecture a bit higher up the food chain. I've laid out simple eval/break_out boards for the at91sam7l and lpc1114 (both lqfp package versions)

for which I'm happy to provide the source/gerbers. These days you can find quite inexpensive board houses to build more than you're likely to need for US$10-20.

> Quote:
>

If you are intent on rejoining 1974 with a desktop calculator project, and I can fully appreciate the motivation from a novelty/retro perspective, go for broke and use one of these for a display Futaba 20x2 VFD. Doing so at least you'll have something of lasting conversation value for your effort.

Re: OpenRPN Reboot Interest?

*Message #12 Posted by **robert rozee** on 20 Sept 2011, 5:46 a.m.,*
in response to message #11 by uhmgawa

when i was working for trimble a few years back, we had a (just released) radio product that contained a 20x2 VFD matrix module, sitting right next to a bluetooth module in the front panel. the VFD was the appropriate technology for the application.

i'm keen on the 1284p because it is ACCESSIBLE to the average constructor. the average constructor has at their disposal a 40w soldering iron with a 2mm tip, veroboard, and whatever they can buy from digikey or farnell (or on ebay) in 1-off quantities.

the average constructor does **NOT** have access to PCB fabrication, SMT placement equipment, a quality soldering iron, or the money to pay for any of the above. they lack even the ability to solder 0804 SMD resistors and capacitors.

i'd like to see a project that the average constructor can build. if you can find an arm7 SoC processor in a DIP package, then i'm all ears...

Re: OpenRPN Reboot Interest?

Ah, I see -- my misunderstanding. I didn't realise you were trying to remove pcb construction entirely from the effort.

Sorry I'm not aware of arm SoCs in DIP packages, however you can find ready made eval boards which may get you to the same starting point (or further). NXP had a deal running (perhaps still do) where they were giving away LPC1114 arm eval boards to anyone and everyone with a good marketing story concerning prospective application for the board. I think it would be worth a look.

Yes that's what I was getting at. No hostility to the archaic dip format intended. I as well find smd to dip (or more generally 100mil pitch) adapter boards occasionally handy for SoC prototype usage and usually just lay out whatever I happen to need. The cost to spin a two layer PCB is amazingly cheap of late and CAD tool choices abound. Furthermore 99.9% of the real engineering has been accomplished on die and such SoC boards are little more than customized low speed interconnect and bypass. Here's a few typical examples tossed to soak up otherwise unused flat-rate space with the first round of KINOMI boards.

Re: OpenRPN Reboot Interest?

*Message #17 Posted by **robert rozee** on 20 Sept 2011, 4:04 p.m.,*
in response to message #13 by uhmgawa

the problem with eval boards is that they are invariably a short-run item, so of little use in an open-source project - a year or two down the line and the hardware is no longer available, leaving the project at a dead end.

for an open-source hardware project to be successful it needs to fulfil the following requirements:
1. people need to want the item,
2. people need to be able to construct the item with relative ease and certainty of success,
3. people need to be able to get the necessary bits both now and tomorrow.

i'm not thinking of a project where a handful of developers make a few dozen units, while other folks just look on and make comments on a feedback form saying how cool it all is. i'd like to see something where 5000 or more folks decide to have a go and use the open-source plans to make their own calculator - and learn from their experiences in a positive way. it is all about mass participation, rather than just observation.

how do others feel about a primary goal of openRPN being:
"5000 hobbyists building their own calculator"?

Whilst I don't necessarily disagree with that, #2 and #3 are not necessary for a project to be a massive success.

Take the worlds most successful OSHW product, the Arduino. Almost everyone buys the ready made version instead of buying a kit version.

I found the same thing with my uWatch project. Hardly anyone wanted a kit, they all wanted the fully assembled version. But of course they really like that it's all open source - not that most will do anything with it, but they just like the feeling that it's open source!

> "5000 hobbyists building their own calculator"?

Whilst that would be nice, and is possible in theory, I don't think it's going to work in practice. The reason is most people just don't find a calculator that interesting.

Successful kits being built by the tens of thousands by the hacker/maker communities to teach kids (and big kids) soldering and basic electronics etc are usually something more exciting than a calculator. Like a TV-B-GONE, a LED POV kit, a simple quadcopter etc.

Dave.

They would probably find it more interesting if it can act as a controller too and not just a calculator. It would be in a league different from something like a BASIC Stamp, but a lot of little controllers like that seem quite successful. This one would have the added advantage of being able to do more with data in floating-point and programming right on the device itself instead of on a host computer.

well the 1284p does have two serial ports, and i'm sure free42 could be easily extended to interact with these to become a useful [instrument] controller too.

harping on more about assembly methods (sorry all!), as engineers we do all tend to overestimate the complexity - and dexterity - of the general public / average hobbyist. personally, i have no trouble with placing the smallest leaded packages, even hand-constructing pretty complex prototype items with 0402 sized components, but i have had many years practice working at that level. i don't even need a fine soldering iron, just a suitable loupe, just the right flux, good solder, and LOTS of heat.

BUT, despite online tutorials being available, and assurances from the folks on here, i still maintain that even given a quality PCB, and a 100-pin QFP SoC, the vast majority of would-be constructors WILL end up with a mess that they will never be able to recover a working finished item from.

and as for buying a ready-built, why on earth would someone? no denying that the uWatch is impressively cool, but whipping it out and showing it to someone is pointless unless you can claim you built it

yourself! as a built-item, an HP-11 or HP-15 is far cooler (not intending any offence, Dave. and certainly not wanting to detract from what an impressive accomplishment the uWatch is). saying "hey, look at this neat calculator watch that SOMEONE ELSE built and sold to me" doesn't ring true as a good conversation starter at parties...

I suppose it is a matter of perspective. In general I find the accomplishment of getting 48 pins of a 0.5mm pitch smd package reliably tacked down to a board to be astronomically dwarfed by the feat of beaming ions at a slab of silicon, realizing a SoC design into 1e5 transistors, implementing an economical manufacturing process, and selling it to me at a profit for US$5.

Not to diminish the accomplishment of rolling your own "hardware". But as stated a conservative 99.9% of the engineering has completed before the device ever arrives in a users hands. And given the extreme simplicity of closed bus SoCs, the opportunity for design errors is generally limited to power rail bypass/sequencing and perhaps clock/pll layout.

So I'd offer the actual value add in such a prospective project begins when the reset vector is fetched. But agreed that may be too esoteric to carry the same "bragging rights" impact.

in response to message #12 by robert rozee

Skill is definitely a factor, but you don't need expensive equipment to solder SMT parts. Take an SOIC for example. A lot of flux is helpful but not imperative, and you can do it with an iron that covers three pins at once. A 1/8" chisel tip will be fine since you won't solder just one pin at a time. To start, solder just the end pins on one side, just enough to hold the IC in place. Bridges are ok for now. Then solder down the other row of pins, using lots of solder. It may be all one huge solder bridge, but that's ok to start. Then you hold the board vertically and slowly run the soldering iron from top to bottom, re-melting all the solder on that side. The excess will stay on the iron, not the IC, and there will be no bridges. Now go back and do the first side which until now was only tacked. Clean off the flux, and it looks like it was done by machine. Perfect. It really is surprisingly easy.

Soldering 1206 chip capacitors and resistors is very easy. 0805 is ok with a tiny soldering iron but still nothing special. 0402 is getting a bit ridiculous.

VFDs are quite power-hungry and won't always be sunlight-visible. They tend to make a lot of electrical noise too. LCDs don't have any of these problems.

While I definitely agree that a hardware first approach is essential, I'm not at all sure I agree that "if you build it, software will come".

The 20b platform was available to repurpose for several years before we released the 34S. The firmware only became reality because of a labour of love from two people. Believe me it was a long and arduous process. We've had some very able assistance this year but again it was predominately one extra dedicated person.

Apart from the 34S there really hasn't been a serious attempt to produce firmware for the platform. An emulator of old firmware and a four function hex calculator are the only two I am aware of.

>While I definitely agree that a hardware first approach is essential, I'm not at all sure I agree that "if you build it, software will come".

I guess the thinking is the WP34S team is around and will be around... ;-)

It's harder to find $10k in funding for a HW project than $100k in SW development. That's because people will donate time more readily than money, and with HW you have nothing to show for until it's done, whereas SW can be improved incrementally.

Of course, I agree with you. SW shouldn't be taken for granted. But it seems that there's a base to built upon out there. Not the least thanks to your (WP34S team) donations of time and effort.

It is an interesting avenue. Alternatively, why not we try to lobby the current people at HP to include more keys and a better display in their next business calculator, so it can be repurposed with an evolution of the WP-34s firmware? That would give a repurposing platform that could be used for years to come. The current HP calculator people seem to have an ear to the ground, so it is a possibility at least.

> While I definitely agree that a hardware first approach is essential, I'm not at all sure I agree that "if you build it, software will come".

I agree, there is no guarantee, unless you do it yourself. But it's infinitely more likely getting

software people involved in existing hardware, than it is to get hardware people involved in existing software. That's just the way the world works. The entire Open Source Hardware (OSWH) industry is built on this.
It's been proven over and over again, that all you need is the hardware, and some initial software drivers to make firmware development easy, and chances are the project will take off.

My idea with the uCalc and uWatch Mk2 is to build say half a dozen prototypes (it doesn't cost much more to make 6 than it takes to make 1) and give them away to interested software developers who are better at software than I am, hope\ing that they would be keen enough to develop for it if they find the hardware platform compelling enough. The fallback plan would be I simply write it myself.

Of course, I understand how important core routines are that handle things like the display and keyboard, so I would write those to help "bootstrap" 3rd party development. I thin that's vital.

One thing is for sure though, without real pre-production hardware, a calculator project does not exist.

Dave.

The biggest lesson learned hands down: Build the hardware first. It's fine to get software rolling early on, but people need something physically real to believe in it. That in turn will generate a great deal of confidence that a physical product will be the end result.

When I first started OpenRPN my resources were much more limited, and so were those of the world in general. While still far from trivial, making a few prototype enclosures is much more feasible than it was 5 years ago. Now I actually have equipment available to me for mold making/prototyping.

A little bit more will be required beyond just a PCB, it needs to be a working development kit with a display. Ideally, enough prototypes could be assembled for distribution to a few of the big contributing developers in the project. Showing them off as a finished product would be enough to drive pre-orders to fund production. Or will be helpful to convince a few investors to bankroll a sure thing. As my current connections go, I know someone who is a co-owner of a plastic and rubber molding company.

Yes, I understand that reflow may not be necessary. It will come in handy if any BGAs are used, though.

I will elaborate more on these topics when I have a few more spare minutes.

*Message #31 Posted by **Marcus von Cube, Germany** on 20 Sept 2011, 9:39 a.m.,*
in response to message #30 by Hugh Evans

The crux with WP 34S was that Pauli and Walter were busily writing software and documentation which nobody really cared about because it did not make it to the hardware until I chimed in.

The project really took off when people started to play around with it (emulator first then real hardware). You will need something to toy around with to attract more developers, testers, and, last but not least, users and customers.

if all the graphics stuff was ripped out (it wouldn't, after all, be needed), how resource-hungry would free42 actually be? the biggest hog, i'd imagine, would on the scarce onboard RAM. this could be alleviated somewhat by shifting the user program space and registers onto external storage.

Re: OpenRPN Reboot Interest?

*Message #40 Posted by **Thomas Radtke** on 21 Sept 2011, 3:23 a.m.,*
in response to message #38 by Marcus von Cube, Germany

That's what I meant, Marcus. Take a proven concept and a developer of a proven software.

The 15C LE apparently attracted several thousand customers in few weeks. With some clever

marketing, the same can be done with a 42S remake. Places where potential customers lurk are known and easily accessible.

Doing something completely new and hoping for the big success is daydreaming. Do it after you have a selling product.

Re: OpenRPN Reboot Interest?

*Message #41 Posted by **Hugh Evans** on 19 Sept 2011, 9:14 p.m.,*
in response to message #1 by Hugh Evans

Alright, I'm feeling crazy. Site backups are being pulled as we speak for reference purposes. I want to keep things as simple as possible this time around with respect to the project page. Is anyone interested in taking on webmaster responsibility? If anyone has space for hosting it would be appreciated, although otherwise I'll figure something else. I think it makes sense to keep subversion on sourceforge either way.

Within the next week I will gather the conceptual designs for review. I think ground up re-evaluation of project goals is worthwhile: for example, is the *fix system still the best approach? Hardware will need to start from scratch, and that will be a good thing.

This will not be a completely blank slate, but it won't be far from it. I firmly believe the technology needed to facilitate such a project, even at low to moderate production levels, now exists and we should pursue it.

Time to have some fun!!!

PSE bug also in Integrate and Solve

*Message #1 Posted by **Namir** on 18 Sept 2011, 4:05 p.m.*

Hi All,

The PSE bug also appears when you use the Integrate or Solve command and the targeted label has a PSE command (usually put there to trace the X values used by either command). The first time the machine encounters the PSE command it pauses and displays the value in the X register. Subsequent iterations will cause the LCD to blank out until the Integrate or Solve command has finished its task.

WP 34S : issue disassembling with latest version

*Message #1 Posted by **Miguel Toro** on 18 Sept 2011, 2:44 p.m.*

Hello,

I have issues trying to disassemble any program with three alpha characters (using wp34s_asm.exe, wp34s build 1610) :

A program like :

```
LBL 'INW'
<instructions>
RTN
```

will produce the following error message :

ERROR : Opcode 'f049' does not exist at line 2 .....

if I change for a single letter or numeric label like this :

```
LBL A
<instructions>
RTN

 or

LBL 00
<instructions>
RTN
```

No error is produced and the file is genereted.

Even the simplest :

```
LBL 'INW'
RTN
```

...causes the problem. I have yet to try with older versions.

What could be the proble here?

Regards,

Miguel

Re: WP 34S : issue disassembling with latest version

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 18 Sept 2011, 3:24 p.m.,*
in response to message #1 by Miguel Toro

Hi Miguel,

I suspect what is happening is that you are disassembling an older binary with the latest 'wp34s.op' table.

Last week(?) a bunch of op-codes moved to avoid an issue Pauli discovered.

The thing to try is to get the appropriate table for when the binary was created and disassemble using that table. Check out section 5 of the Assembler document. You will want to use the '-op the_older_wp34s.op' switch.

As for getting the table, go to http://wp34s.svn.sourceforge.net/viewvc/wp34s/trunk/tools/wp34s.op?view=log and track down the version tat most closely matches the WP 34S F/W when you wrote the program.

Let me know if: 1) that works, or 2) doesn't work. :-) We'll go from there.

Re: WP 34S : issue disassembling with latest version

*Message #3 Posted by **Miguel Toro** on 18 Sept 2011, 4:40 p.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

Thanks Neil for your answer, but here is what I did :

1. I downloaded the wp34s build 1610 on a different machine.

2. I did not use old code but simply created a new program with only :

```
LBL 'TST'
RTN
```

3. I stored in library 5 with PSTO 5. That created wp34s-5.dat

4. I tried to disassemble with :

wp34s_asm.exe -dis wp34s-5 -o prb.wp34s

and the error occurs :-(

So this is not using any old .DAT file. Could you please follow the same steps to see if you have the same result.

Thank you,

Miguel

Re: WP 34S : issue disassembling with latest version

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 18 Sept 2011, 5:24 p.m.,*
in response to message #3 by Miguel Toro

Hi Miguel,

Actually, what Franz mentioned is important -- just not in this case. There can be no space between the "LBL" and the first single quote.

I have just *down-dated* to 1610 (BTW thanks for giving that level of detail!) and entered a simple 3-line program:

```
LBL'ABC'
STO 01
RTN
```

Saved it out and disassembled on a Windows box using:

```
$ wp34s_asm.exe -dis wp34s-0.dat
```

And it worked just as expected.

Your unrecognized 'f049' is telling me that the wrong op-code table is being used. The tool is probably issuing a few commented lines before it is crapping out. These should tell you which op-code table it was using. Can you check that and let me know if it is the expected one?

Another thing to try is to *force* the tool to use the correct table (the one in the same directory as EXE is located) by using the '-op' switch.

Are you using a package that came from SVN or somewhere else (like the .zip)?

BTW: I will note that if you are the latest, bleeding edge from SVN, that the duplicate op-code warning has resurfaced :-(The first 2 messages are definitely harmless but I will have to check on the brand new 3rd one. When I get an email from the team telling me they have finalized the RLCS/STOS/?? data, we will fix this once and for all.

Re: WP 34S : issue disassembling with latest version

*Message #5 Posted by **Miguel Toro** on 18 Sept 2011, 5:46 p.m.,*
in response to message #4 by Neil Hamilton (Ottawa)

I think that the official ZIP file comes with the wrong Op table (1519). Once I updated with the files from your link, everything worked as usual.

Many thanks for your help,

Miguel

Re: WP 34S : issue disassembling with latest version

*Message #6 Posted by **Marcus von Cube, Germany** on 19 Sept 2011, 4:00 a.m.,*
in response to message #5 by Miguel Toro

My fault. I'm just uploading a new ZIP.

Re: WP 34S : issue disassembling with latest version

*Message #7 Posted by **Neil Hamilton (Ottawa)** on 18 Sept 2011, 5:30 p.m.,*
in response to message #3 by Miguel Toro

Another thing...

Are you positive that the emulator and the wp34s.op table are exactly the same SVN revision? (The wp34s.op table is located in the .\trunk\tools\ directory -- same as the wp34s_asm.exe program).

Open it in notepad (or equiv). The SVN should appear in the 1st line.

Re: WP 34S : issue disassembling with latest version

*Message #8 Posted by **Miguel Toro** on 18 Sept 2011, 5:11 p.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

Hi Neil,

This is what I get when doing the disassembling:

```
C:\Users\Miguel\Documents\wp34s-B\wp34s\tools>wp34s_asm -dis wp34s-5.dat -o tst.
wp34s
// NOTE: Detected running EXE version.
         Adjusting child preprocessor script name from 'wp34s_pp.pl' to 'wp34s_pp.exe'
// Opcode map source: wp34s.op (local directory)
// Opcode SVN version: 1519
// wp34s_asm.exe: Source file(s): wp34s-5.dat
ERROR: Opcode 'f049' does not exist at line 2 at print_disassemble_normal

C:\Users\Miguel\Documents\wp34s-B\wp34s\tools>
```

This is from the environment that comes in the wp34s.zip file. As you can notice the SVN version is 1519 (?). So I followed the link and downloaded version 1610...and that did the trick. Now my file is recognized and the text file produced.

Thanks and regards,

Miguel

A bad bad bad bug :-(

The "Opcode 'f049'" in the message is the start of one of the moved op-codes. The fact that is has been truncated is a sure indicator that the incorrect op-code table is being used.

- Pauli

Re: WP 34S : issue disassembling with latest version

HP15C LE Keyboard Survey

*Message #1 Posted by **M. Joury** on 18 Sept 2011, 1:06 p.m.*

All,

I would like to try to get some idea of how bad the keyboard quality on the 15C LE really is. If you have received one (or more) and tested it/them please indicate number received and number bad. By bad I mean keys that do not register, take more force to register, double register (repeat) etc. I am *NOT* interested in the f/g loose key/alignment/rattle condition. If the f/g keys work (register correctly) they are working for the purposes of this survey.

Cheers,

-Marwan

EDIT: Thanks to all that have responded so far. As of Tuesday morning I have data for 71 calculators (including 3 that two friends of mine that do not post to this forum purchased) of which 9 have had keyboard problems reported. That is a failure rate of just over 12.5%. At this point I still view the numbers as meaningless and they will remain so until the sample gets a lot larger.

Edited: 20 Sept 2011, 10:47 a.m. after one or more responses were posted

Don't send you HP-15C LE back to buy.com if you ever want to see one again (for reasonable $). I called them on Friday about a defective unit, and they told me all stock is gone, there are none for replacements, and they expect to get no more, which is why the unit isn't even listed as a buy.com product anymore. They would be happy to give a refund though.

Re: HP15C LE Keyboard Survey

*Message #19 Posted by **Dwight Sturrock** on 18 Sept 2011, 4:23 p.m.,*
in response to message #1 by M. Joury

The "7" key clicks before it actually registers, so it requires a little more force.

Quality is about comparable to the original 15C I purchased in 1983 (and still have).

Re: HP15C LE Keyboard Survey

*Message #20 Posted by **Seth Morabito** on 18 Sept 2011, 5:05 p.m.,*
in response to message #1 by M. Joury

I received two calculators. No keyboard issues at all on either of them.

Received: 2

Bad Keys: 0

Edited: 18 Sept 2011, 5:06 p.m.

Re: HP15C LE Keyboard Survey

*Message #21 Posted by **G Clark** on 18 Sept 2011, 6:16 p.m.,*
in response to message #20 by Seth Morabito

Received 1 calculator. 1 Bad key. (The "4" key clicks but does not register unless I press it very firmly)

Re: HP15C LE Keyboard Survey

*Message #22 Posted by **Crawl** on 18 Sept 2011, 7:06 p.m.,*
in response to message #1 by M. Joury

I bought one and haven't noticed any problems yet.

Re: HP15C LE Keyboard Survey

*Message #23 Posted by **Jesse Dodd** on 18 Sept 2011, 10:25 p.m.,*
in response to message #1 by M. Joury

I purchased two and one has a stubborn square root key. It clicks without registering unless pressed firmly. The other appears to work correctly.

Re: HP15C LE Keyboard Survey

4 units received
0 bad keyboards or other issues.

Re: HP15C LE Keyboard Survey

*Message #39 Posted by **Dan Grelinger** on 19 Sept 2011, 12:27 p.m.,*
in response to message #1 by M. Joury

1 unit purchased, from buy.com, Limited Edition Number 02368.

Two (2) bad keys: The '6' key, and the 'SST' key. Keys feel the same as the others, but do not register when the key goes down. They will only register if I press them with about twice the force necessary to make the key go down.

I got my unit on Thursday, found the issue immediatly, called buy.com Friday morning, and was told refund would be gladly made, but there were no units available for replacement, and they expected to receive no more units from HP.

I called HP support this morning. They said they sent all their stock to the retailers, and have none for replacement either, at this time. I will have to wait 8-12 weeks for a repair/replacement.

in response to message #46 by Woody Larkin

> Quote:
>
> Compare 69! with the original 12C or 15C.

You might want to compare -69.5! with the original 15C to see the difference.

Re: HP15C LE Keyboard Survey

*Message #48 Posted by **sylvandb** on 19 Sept 2011, 5:33 p.m.,*
in response to message #1 by M. Joury

1 good (0 bad)

Both old and new keyboard tests pass 1st attempt, with no tactile or observed issues.

somewhat off topic:

12c 30th AE purchased at the same time has 99% keyboard (if a key was non-functional it would be 97.5%). Once in a while, rare enough that it could be my fault, I'm pretty certain I 'clicked' a key but the calc did not register. Never able to repro on demand.

Re: HP15C LE Keyboard Survey

*Message #51 Posted by **j beede** on 20 Sept 2011, 12:28 p.m.,*
in response to message #1 by M. Joury

Just got my 15C LE yesterday. Used it for an hour+ of physics tutoring last night. I have used a 45 at home for 36 years and a 15C in my office for ~25 years. The fancy LE package had no seal and the plastic tray holding the 15C had quite a grip on the calculator. The 15C LE is heavier than my original (124g v 118g). The LE screen has same contrast but has a slight green/yellow tint. The LE battery cover is too easily opened in my opinion. The LE keys seem to have slightly more travel and are a bit noisier than the vintage unit. The LE keys have a "chalky" feel as they are pressed. No bad keys detected and I did not experience any "typos" while working at normal speed. The LE key labels are brighter or my original has faded. I paid $89 with free shipping and am pleased.

Can we make'em like Bill and David? An open RPN?

*Message #1 Posted by **snaggs** on 18 Sept 2011, 9:51 a.m.*

I had a grandeouse idea the other night. Theres at least a thousand people who would buy a calculator built like they used to. Maybe the answer is just that, like they used to.. Amongst the people here we have programmers, electrical engineers and Im sure we have some senior engineers who long ago became project managers.

Given the large catalogues of pre-produced IC's etc, is it not possible we could put together a "built like a battleship" piece of hardware, that coders like myself, and Paul etc could build on.

Start with a well thought out design which is extendable, and dont try everything all at once. First release build something with 34C feature list. It might only have trig functions etc, but each one lovelingy slaved over in 128bit precision (i learnt these algorithms in scientific computing 15 years ago, theyre in books).

Then, just grow it over time. There is still a company that bought the rights to IBM's old clickety clack keyboards, surely their are other companies that can ma,e nice buttons. There may even be an off-the-shelf generic peice of hardware thats used for remote data collection that fits the bill amd can be hijacked.

I know the wp34s software is good, but stickers on a OK keyboard dont do it justice. The hard bit is the nice package + keys, then the coders cam take over. The nut processor was reerse engineered and remade by one guy, who thought that would be possible?

Im not sure its as mad as it sounds, its how HP started, two guys in a shed, expecting only low volume.

Daniel.

Given the crazy prices on TAS, and the dema

I'll leave the explanation of failure to someone more involved than me in this project.

Hint: we now now have 34S because only two (later on three) people were developing it.

Massimo

Re: Can we make'em like Bill and David? An open RPN?

*Message #5 Posted by **Walter B** on 18 Sept 2011, 2:31 p.m.,*
in response to message #4 by Massimo Gnerucci (Italy)

Well, OpenRPN is dead for long. Great ideas, nice texts, promising drawings, little action hardware-wise, poor coordination. IIRC there were no more than some five regular project team members, but IMHO it eventually died due to suboptimal project and team management. Though the originator of OpenRPN was able to write English correctly, at least. Good luck!

"Those who don't learn from history are condemmned to experience it once more" (unknown author).

George Santayana

Re: Can we make'em like Bill and David? An open RPN?

*Message #7 Posted by **Lyuka** on 18 Sept 2011, 5:32 p.m.,*
in response to message #6 by Howard Owen

What Santayana actually said is

> Quote:
>
> Those who cannot remember the past are condemned to **fullfill** it.

It's slight difference, though, last few digits/words are important to us :-)

e.g.

```
in RADian mode,
35s : Tan(1e-4) = 1.00000000330e-4
42S : Tan(1e-4) = 1.00000000333e-4
50g : Tan(1e-4) = 1.00000000333e-4
```

It's a trigonometric bug not related to the range deduction.

Lyuka

Re: Can we make'em like Bill and David? An open RPN?

*Message #8 Posted by **Howard Owen** on 18 Sept 2011, 7:19 p.m.,*
in response to message #7 by Lyuka

There are actually multiple versions of that aphorism floating around, as I discovered today preparing the above post. The quote comes from "The Life of Reason," Volume I, chapter VII. I'm not scholar enough to know if Santayana wrote in his native Spanish or not, but English translations often give "Those who cannot remember the past are condemned to repeat it." (See, for example, The Santayana Edition's FAQ.)

Re: Can we make'em like Bill and David? An open RPN?

*Message #9 Posted by **Hugh Evans** on 18 Sept 2011, 4:08 p.m.,*
in response to message #5 by Walter B

Guilty as charged, OpenRPN was my crazy idea and there were many reasons why it never panned out. The physical manufacturing challenges are becoming much more manageable... In fact, I even have ready access to a couple of CNC machines. Team size never reached the critical mass needed to reach fruition. I also simply didn't have enough free time to manage anywhere near my potential.

In my mind, WP-34s has fulfilled many of the ideals (in a different embodiment) of the OpenRPN project. Both Walter and Pauli were instrumental to that project, and I'm not at all surprised that when opportunity presented itself they accomplished what they have.

I do have the original site fully backed up, and will talk to one of my cohorts to see if we can at least put it back up for reference.

If I ever choose to resurrect OpenRPN, it would be more hardware centered. Every time I found someone to help with electronic design, it fizzled out quickly for one reason of another. I order to avoid production and tooling costs, imagine the potential held by giving a machine such as the 30b a new set of guts. Even a modern 12C with rebuilt electronics could be a lot of fun.

One more thing: bringing back a project like OpenRPN can't come through a simple announcement. Something tangible must accompany the announcement. I think a working circuit board/development kit would be about right.

I'm at a good point in my life again to consider such an endeavor. But it would, in my eyes be more of an extension of WP-34s. There are ways existing products can be improved, and we have reasonable hardware to work with as a starting point.

This should be more than sufficient to start some flaming, but if anyone is interested in doing something crazy, let me know.

Re: Can we make'em like Bill and David? An open RPN?

*Message #10 Posted by **Marcus von Cube, Germany** on 19 Sept 2011, 3:33 a.m.,*
in response to message #9 by Hugh Evans

OpenRPN will get a mention in my WP 34S history presentation at HHC. It was a pity not to have had access to the original designs when I prepared it but Walter has helped me out with one of the proposed keyboards. In fact, WP 34S has inherited some code from OpenRPN.

I would love to see and help with another project in line with WP 34S.

Sorry, I don't see how changing the electronics in the existing already open products would be of much benefit? Don't they already have decent amounts of processing power and memory for their given user interface?

(I'm not up on the 30B repurposing project, so I'm only guessing they have plenty of resources, but it's likely I'm wrong...)

> Quote:
>
> One more thing: bringing back a project like OpenRPN can't come through a simple announcement. Something tangible must accompany the announcement. I think a working circuit board/development kit would be about right.

Sorry, but I have to disagree strongly on that one, a prototype board would not accomplish or prove anything. A PCB with a processor, a bunch of switches, and a display hacked up to work is bordering on trivial. It is in fact a common practical project in microcontroller

classes.

I really think people want/need to see attempts at actual housings and keyswitch designs.

I know that's the "hard part", but that's kinda the point...

Dave.

> I'm not up on the 30B repurposing project, so I'm only guessing they have plenty of resources, but it's likely I'm wrong...)

Yes and no.

- The CPU is fast. Very fast. Pretty much any space/time trade off is made in favour of space.
- There is a lot of flash (128kb). We've filled this several times but that is due to cramming extra functions in.
- There isn't a lot of persistent RAM (2kb). The is 100% full. One *bit* left currently.
- There isn't a lot of volatile RAM (4kb) but this seems adequate. We've only run out a few times and each time it could be coded around.
- The keyboard is adequate.
- The display is very marginal. The CPU LCD driver can only handle 400 segments. This means the dot matrix portion is tiny.

The most pressing limitation is the display. The next is the shortage of non-volatile RAM.

- Pauli

You could start a project at www.kickstarter.com - but for that you already need to formalize your project a bit and put a price-tag there.

I guess the "platform" needs to be quite open, as key-to-function mapping might change, so perhaps using exchangeable keys. Or allow to place plastic labels inside crystal-clear keys?

I also would like to see a calculator with an e-ink or other hires display (aka retina-display on the iPhone), it does not need to be large, but those low-res LCD dot-matrix displays as found on the HPs are quite outdated technology. E.g. one could then place three lines (smaller-font) or two lines (larger-font) text on them, etc.

I would buy such an calculator instantly :-)

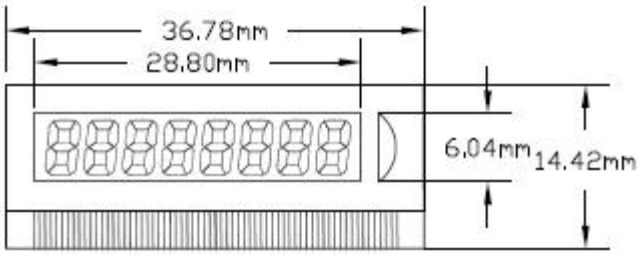
I really like this idea.

Someone mentioned E-ink displays. One can order, from E-Ink, development samples here:
http://store.nexternal.com/eink/8-x-7-p19.aspx



8x7 segmented display:

Nice thing is, power is only used when refreshing the E-Ink.

If this really gets going I'm willing to donate for development.

Which is a woefully insufficient number to merely break even given the engineering cost to "make'em like Bill and David". Don't you think if modern HP could do so given their engineering and manufacturing resources and economy of scale they might be tempted to take a stab?

> Quote:
>
> Given the large catalogues of pre-produced IC's etc, is it not possible we could put together a "built like a battleship" piece of hardware, that coders like myself, and Paul etc could build on.

You perhaps are missing the point. The issues aren't programming nor finding an SoC platform able to support it and this application. Rather the big rocks are in estimate of decreasing cost/complexity:

```
1.  Locating or manufacturing a suitable display
2.  Enclosure manufacturing
3.  Key cap manufacturing
4.  Creation of any legend plates (secondary key legends, etc..)
```

The above issues have substantial up-front tooling/engineering costs and don't lend themselves to an "eventual progress with available resources" development model as do firmware and electrical/SoC/other_mechanical tasks.

If you've found some other way to recover the above up-front expenses which don't rely on volume sales, you certainly have my ear.

1. Off-the-shelf LCDs are in the $5-$10 range even in singles. Custom LCDs, when we looked into them in the late 1980's, were a couple thousand dollars to tool up for.

2. We just this year looked into a custom enclosure requiring molds to be made, with a lot of complex curves-- not a simple design at all. The quote was $50,000.

3. Along with #1 above, we looked into a set of double-shot keys similar to the HP-71's. NRE was a few thousand-- I don't remember exactly, but it was under $5,000.

4. We made a lexan panel with dead-front annunciators in 1994 and the tool-up was $2,000.

All together, it's well under $100,000, and the custom case takes most of it. For low volumes, if you can be satisfied with an off-the-shelf case from a company like PacTec and get them custom machined, the per-piece cost will be much higher but there will be almost no up-front cost.

I've designed and brought many electronic products to market myself (but not calculators). See my post at message #10 at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=79592 to get an idea of how cheaply it can be done. If the calc is developed by a bunch of enthusiasts who don't expect to get paid, it gets even less expensive. This is not that difficult! It seemed pretty clear to me that the reason OpenRPN failed was because of all the nay-saying and discouragement that came from those who insisted that it couldn't be done and kept expecting prototypes to come out as quickly as some of the consumer-market products have to like cell phones and iPods which last only a short time and are out of date before

they're introduced if you don't do a blitzkrieg development schedule. This is different. We're hanging onto favorites that are *decades* old. What's the problem if it takes two or three years for an OpenRPN calc to go from concept to first hardware? If someone takes up the project again, let's give them our encouragement (and help if we have something to offer). Those taking up the project will probably be working on it in the evenings and when they don't have to mow the lawn. It's not their livelihood, so we can't complain.

> 1. Off-the-shelf LCDs are in the $5-$10 range even in singles.

You can certainly find lcd modules in surplus for that price -- mostly COB text modules. But they aren't typically suitable for this application due to footprint bulk, excessive current consumption, incompatible voltage rail, and being of less than preferable transreflective design. Text only modules IMHO are somewhat of an unenthusiastic compromise as, well you're limited to that rigid format.

The last point may be workable as the lower polarizer could be retrofitted. Even the current consumption could be managed if due to a brute force resistive voltage divider by removing the chain and substituting a high impedance equivalent feeding ultra-low current voltage followers. But the form factor bulk of typical modules tends to be the impasse.

In any case if substantial resources are expended on an enclosure design, the display supply needs to be reliable.

> Quote:
>
> Custom LCDs, when we looked into them in the late 1980's, were a couple thousand dollars to tool up for.

I wouldn't assume too much from that data point given the intervening time and changes in technology. Also price varies with topology, form factor, controller, etc.. so that figure by itself doesn't offer much guidance.

I sent a quote request out last week for custom/semi-custom 32x160 and 32x192 STN reflective formats in COG, COF, and bare glass. Unfortunately a bundled glass + controller unit may be a practical non-negotiable here as contemporary controllers able to support these densities are not really feasible to provide in reflowable packages.

> Quote:
>

Was the 55K up-front simply NRE or was some production volume included in this cost?

> Quote:

> 4. We made a lexan panel with dead-front annunciators in 1994 and the tool-up was $2,000.

I investigated UV resistant polyester recently and IIRC the tooling cost was around US$500. Lexan/polycarbonate besides being more expensive was actually claimed to be less durable in this service. But I do like the durable under-printed matte-upper surface design of these panels for legend use.

> Quote:
>
> All together, it's well under $100,000, and the custom case takes most of it. For low volumes, if you can be satisfied with an off-the-shelf case from a company like PacTec and get them custom machined, the per-piece cost will be much higher but there will be almost no up-front cost.

I wasn't even considering use of such utility enclosures. For an initial prototype nearly anything will do. But I doubt a pocket calculator sporting pactec aesthetics would attract much of a following. I'd even speculate a professionally 3D printed enclosure would do better in this respect.

CNC milling may also be feasible for limited production and opens up the possibility of using a cast aluminum blank.

> Quote:
>
> If someone takes up the project again, let's give them our encouragement (and help if we have something to offer).

To be clear, I'm certainly not discouraging the effort. Far from it -- I'd encourage it and would be interested to contribute assuming the direction appeals to me.

But if we're looking at a design which can compare functionally *and* aesthetically with say, a legacy HP product, there will be substantial NRE involved. Leveraging funding and patience of interested parties needs to happen in the context of some type of business model and have a realistic execution strategy and schedule.

I'm not saying it can't be done, but rather substantial engineering and logistical challenges exist on the path to getting there. No one would be happier than I for this assumption to be proven wrong.

They do, but if you are clever about the design and physical implementation, the hurdles can be quite small indeed.

My uWatch Mk2 calc watch project I'm working on looks to be do-able for under $1000 in development costs, complete with fully custom case. And for that price you get half a dozen of them as a bonus.

Dave.

None of their standard product offerings appear to be of high aspect ratio normally used for a compact calculator display. Also at horizontal graphic resolutions of interest the active area sizes run about half of that optimum for this application. So at this point it is likely a custom glass proposition. Although given the pricing for standard product thus far it certainly is promising.

Note AFAICT there appears to be a mix of reflective and transreflective product in that overview.

Feel free to contact me if you want to talk about such madness, because I've been down this road. If you are interested in resurrecting OpenRPN, I'm not opposed to it in any way.

The last crazy thought I had on the topic was to build a case that would enclose an iPhone and use physical keys with snapdomes that could interact with the touchscreen. This is one of this less crazy concepts I have. Rapid prototyping is a much more viable option than 6 or 7 years ago, and I have access to CNC equipment.

Shoot me an email and let's talk.

Some HP 97 Questions

*Message #1 Posted by **Fouad M. Kaadou** on 18 Sept 2011, 7:47 a.m.*

Hello,

I got an HP 97 from eBay and I noticed some things I want to try to fix.

1. The printing is very faint - could it be a resistor problem?

2. The card reader does not write data and I'm assuming the card reader assumes all cards as clipped because it reads properly, so is their any way to by pass the write protection?

Thanks in advance, Fouad

Re: Some HP 97 Questions

*Message #2 Posted by **Olivier De Smet** on 18 Sept 2011, 10:36 a.m.,*
in response to message #1 by Fouad M. Kaadou

I also have some questions,

I just got a working (tested with 3 AA batteries) HP97 with manuals, cards and pouch for 2 euros at a flea market (yes 2 euros)

But the deal is that there is no charger (the battery pack was re-done with sanyo battery) ...

Did someone near Paris (France) have a topcat charger ?

(I need to clean the card reader anyway)

Olivier

So the French market Topcats run on 4.5 vdc ?

Re: Some HP 97 Questions

*Message #5 Posted by **Olivier De Smet** on 18 Sept 2011, 12:17 p.m.,*
in response to message #4 by Michael de Estrada

The battery block is 4 1.2 V NiCd battery so 3 1.5 V AA works with the red led (charging needed) on.

It's enough to test the 97 and even the printer.

I dismantled the card reader and should replace the goed capstan :(But I don't have the right rubber tubing ...

Olivier

in response to message #1 by Fouad M. Kaadou

Printing "could" be old paper. Have you tried different paper to see if that helps?

There is a contact within the card reader that determines if the card is clipped or not. Perhaps it needs cleaning. If it does not make contact, logic assumes it is clipped.

Re: Some HP 97 Questions

*Message #8 Posted by **Fouad M. Kaadou** on 18 Sept 2011, 12:53 p.m.,*
in response to message #7 by aj04062

I have tried different paper and I have also tried the same paper on my HP-41CX printer and printing was great. I am pretty sure the paper is not the issue.

42s questions and 42s vs 35s

*Message #1 Posted by **snaggs** on 18 Sept 2011, 6:45 a.m.*

Had the 42s a week now, and enjoying it.

Questions ---------- 1. Cant seem to find a Normal distribution program for the 42s? 2. Once I get my head around it, will I be able to do the equivalent of the equation solver on the 35s on the 42s? I have to write an RPN program instead right? Is it fast? 3. Has anybody run out of ram?

42s vs 35s ---------- 1. The 42s manual doesn't seem as good as the 35s, not as many examples/programmes. 2. Has anybody run out of ram of the 42s? 3. Is the accuracy on solve and integration as good as 35s? 4. The keys on the 42s arnt light years better than the 35s, infact he sloped keys are nice. 5. The menu system and polish on the 42s is awesome

> 1. Cant seem to find a Normal distribution program for the 42s?

Try the software library on this site. Either the 41 or the rest, both have normal and inverse normal distributions. Conversion is straightforward.

> Quote:
>
> 2. Once I get my head around it, will I be able to do the equivalent of the equation solver on the 35s on the 42s? I have to write an RPN program instead right? Is it fast?

Yes, yes and how fast? It is fast enough for most purposes. It is as fast as a modern fast CPU -- no.

> Quote:
>
> 3. Has anybody run out of ram?

I haven't but I'm sure you could if you tried. 8kb is heaps for most purposes. If it isn't enough for you, search for the 32kb expansion and get your soldering iron out. You can also double the speed at the same time if you are keen.

> Quote:
>
> 1. The 42s manual doesn't seem as good as the 35s, not as many examples/programmes.

I'd have said it was far and away better. It covers everything, the printed manual I got with my 35s was very very thin in comparison. Do they even ship the printed manual anymore.

> Quote:
>
> 3. Is the accuracy on solve and integration as good as 35s?

Yes, if not better -- I trust the results from the 42s, I don't for the 35s.

> Quote:
>

The HP-42S is slightly more usable than the HP-41 (as a calculator), IMHO. Not only because of its menu system, but also because there is only one shift key. I'd rather have more functions directly available from the keyboard, like in the HP-15C.

Wasicki :-)

Re: 42s questions and 42s vs 35s

*Message #6 Posted by **M. Joury** on 18 Sept 2011, 1:55 p.m.,*
in response to message #5 by Gerson W. Barbosa

I never found the single shift a problem with the 41. Probably in part due to it's fully implemented user mode keyboard. The HP42S implementation is only partial (top row menu).

I don't mind menus too much as long as they are logical and relatively flat.

Cheers,

-Marwan

Please use the Enter key twice (!) to create a new paragraph. Or insert a "nl" tag in square brackets. Or, even better, use the tags for numbered lists, as stated in the advanced formatting section on this site.

> Quote:
>
> 1. Cant seem to find a Normal distribution program for the 42s?

Programs for the Gaussian CDF and its inverse (quantile) are a very weak point in HP software. The one or other program even may be used as an example for errors and pitfalls that have to be avoided in numeric software. Most even resort to the good old Hastings approximation from the Fifties which is only good for three decimals.

Of course you can do both the CDF and the quantile using the 42s' Integrate and Solve, but there are far better options here. Some of them have been discussed for the 34s project.

What precision do you need? And what range of z resp. p has to be covered?

> Quote:

> 2. Once I get my head around it, will I be able to do the equivalent of the equation solver on the 35s on the 42s?

Since there is no equation mode on the 42s you will have to use RPN. While speed may be comparable in general terms, there is something the 42s cannot do: solving your equation symbolically. The 35s (in most cases) can do that if (!) the variable to solve for appears only once. A very simple example for the Pythagorean theorem on the 35s:

```
[EQN]
A^2 + B^2 = C^2
```

You now can solve for any variable and the 35s will return the result *immediately*. No inital guesses required, no iteration, no nothing. Press SOLVE A. You are prompted for B and C, and the value for A is returned within a fraction of a second. In fact, the 35s rearranges the equation and evaluates A as the square root of C^2 - B^2.

Or, try the example in the 15C manual, a stone dropped from the Eiffel tower: $h = g/2\ t^2$

```
[EQN]
H = g / 2 * T^2
```

Yes, the 35s also knows the value for g. ;-)
Solve T, enter H and get the result instantly. Replace the constant g by a variable G and you can also solve for that. I really like that. ;-)

> Quote:
>
> Is the accuracy on solve and integration as good as 35s

I assume both use the same or at least very similar algorithms, so there should not be much difference. The nice thing on the 35s however is that you can also solve and integrate equations.

There may be a difference if the 35s uses the mentioned feature and solves an equation symbolically. Consider X^2 = 8. The iterative approach on the 42s should return two adjacent results 2,82842712475 and ...474 (the exact value is somewhere in between), while the 35s evaluates X = SQRT(8) and returs only that result (...475).

This example also shows that you will always get one single result, so in this case the negative root will not be returned. In theses cases it's easy to force an iterative calculation: simply add 0*X to the equation so that X appears twice. ;-)

> Quote:
>
> The menu system and polish on the 42s is awesome

There are several things on the 42s that are awesome. ;-) However, it does not offer any kind of mass storage or communication with something other than a printer. A 42s with a 41C-style keyboard (and alpha entry) with a simple SD(HC/XC) slot - that would be something that made (not only) my dreams come true.

Dieter

Re: 42s questions and 42s vs 35s

*Message #9 Posted by **snaggs** on 18 Sept 2011, 8:50 a.m.,*

in response to message #8 by Dieter

Well, The 35s came with a program in the manual, and its as accurate as my tables book. I dont want to have to put in Z-scores, i can just put in mean and sd (once) and then find the upper tail or inverse. Real easy.

Ive got all the 42s manuals from the DVD set from this site. Theyre ok, but have less programs in them.

Matrices is very nice on the 42s, but te equation editor on the 35s is good for quickly putting in a solution or Euler for an ODE. Im wondering if I persevere with RPN I can be fast enough to code in exams.

The most amazing thing about the 42s in comparison is the catalog for programs.

Daniel.

The 35s has some program catalog function as well:

Left Shift - MEM - 2PGM

With the up and down arrow keys you can browse the available program labels, not too much different from the 42s.

snaggs, if you're going back for a degree in applied math(s) you might consider adding an HP 50g to your toolbox. There's vast numbers of programs available and with the cable/SD card options it's easy to add programs to the libraries.

Regards,

John

No one ring to bind them all!

*Message #13 Posted by **snaggs** on 19 Sept 2011, 2:32 a.m.,*
in response to message #12 by John B. Smitherman

I had a 49g, which I dont like the look off. So I've bought three calculators in the past 2 months and are trying to decide between them;

35s : Great programs available, easy to find things (printed on buttons), no matrices!!!

42s : No fractions, which is annoying when working with Matrices with fractions in them!

48g+ : Read the manual, forget stuff, still have no idea how to do stuff on it and get lost. I got as far as the teach command, tried to store something in N, but its not lower case N so the fibon program error, and now the "left shift" Clear shows me no options and I can't delete variable "N". Press "on" button as many times as you like, and it doesnt let you run away and go back to home. 20 minutes has ellapsed and I've worked out that I created a program and deleted it. Maybe I just need to spend more time. Still can't run the FIBON example, it just beeps at me with "undefined name". Its not very encouraging!

HP 15C LE COS key

*Message #1 Posted by **troy** on 18 Sept 2011, 2:50 a.m.*

ok, so my unit does not have the wiggly f and g key, but the COS key requires more force to get it to work. i had to press it several times before it would work. quite annoying because it clicks everytime i press, even though it did not actually performed the operation; the clicking sound makes you think it worked, and if you are not looking, you might get the wrong answer in the calculation.

this also occurs when doing the g-ENTER-ON test.

all other keys work fine, though.

Re: HP 15C LE COS key

*Message #2 Posted by **Lincoln R.** on 18 Sept 2011, 3:07 a.m.,*
in response to message #1 by troy

It's a bad key. A few random 15C LEs with keys that don't work right seem to have gotten through QA. You should probably call HP tech support and try to get them to fix or exchange it unless the place you bought it from has more in stock and you can exchange it there easier.

Re: HP 15C LE COS key

*Message #3 Posted by **Paul Gaster** on 18 Sept 2011, 9:35 a.m.,*
in response to message #1 by troy

That is 5 reports now, and I am not counting the f and g key reports. Considering that there are probably less than 100 calculators bought and thoroughly tested by people on this forum that is a pretty high percentage of rejects for modern manufacturing.

Re: HP 15C LE COS key

*Message #4 Posted by **Gerardo Rincon** on 18 Sept 2011, 10:30 a.m.,*
in response to message #3 by Paul Gaster

The f and g keys on the unit I use for everyday work #1598 do have a notably left-right rocking. Much more pronounced than the rest of the keys. They work perfectly OK when pressed vertically, normal feel, good click. But I can tell they are not as solidly in place as the rest of the keys. They are not as tight.... but maybe within manufacturing acceptable tolerance???

Edited: 18 Sept 2011, 10:33 a.m.

Re: HP 15C LE COS key

*Message #5 Posted by **Lincoln R.** on 18 Sept 2011, 12:00 p.m.,*
in response to message #4 by Gerardo Rincon

The f and g keys rock more than the others because the other keys are made on one large assembly, while f and g are individual pieces of plastic. This is because they are molded out of different colors. The assembly for the other keys provides a bit more stability.

So, this isn't really a manufacturing defect unless your f and g keys honestly don't work right when pushed.

HP Home shopping site has 15c in stock now

*Message #1 Posted by **sav** on 18 Sept 2011, 12:02 a.m.*

Hurry!

http://www.shopping.hp.com/store/product/product_detail/NW250AA%2523ABA/

Use codes SVN7795 or SVN7798 to get $10 off ...

Update: it appears you must have an EPP account to be able to add the item to the cart, otherwise it shows "coming soon" for general public accounts...

Update: the item is reportedly available to general public now.

Edited: 18 Sept 2011, 8:24 a.m. after one or more responses were posted

Re: HP Home shopping site has 15c in stock now...

*Message #2 Posted by **Martin Pinckney** on 18 Sept 2011, 12:15 a.m.,*
in response to message #1 by sav

I still only see "Coming Soon" @ 99.99 on Home Office or "Add to Cart" @ 129.99 on Small Business.

Can you direct us to the site you saw?

I see you added the link while I was writing my post, but it still says "Coming Soon" for me!

33S times off in 4 seconds

*Message #1 Posted by **designnut** on 17 Sept 2011, 11:39 p.m.*

I opened a 33s I had stored, no display. I replaced the cells, still shuts off. It passes keyboard test and self running test. I tried the pinhole reset both on and off, still fails. Have I lost a calculator?

Re: 33S times off in 4 seconds

*Message #2 Posted by **Michael de Estrada** on 18 Sept 2011, 12:00 a.m.,*
in response to message #1 by designnut

I hated my 33s and sold it. Good riddance to bad rubbish. Consider this a blessing in diguise. Now that I've got a couple of HP 15C LEs to keep company with my original 15C, 32S and 32SII, maybe my junky 35s isn't too far behind.

Re: 33S times off in 4 seconds

*Message #3 Posted by **Ed Look** on 18 Sept 2011, 12:00 a.m.,*
in response to message #1 by designnut

I don't know, but I do know that I've had to change batteries at least twice on my 33S. Even medium usage seems to run them down more often than I'd like.

But are you sure the cells get run down?? Did you take the batteries afterward to a meter?

Re: 33S times off in 4 seconds

*Message #4 Posted by **designnut** on 18 Sept 2011, 12:41 a.m.,*
in response to message #3 by Ed Look

Didn't check the old cells, but no display. It's pdd it kept it's display setting. With newer cells stays running during manual kepboard and several cycles of self running teest so the cells are adequate. I recalled the pinhole reset, nothing.

Re: 33S times off in 4 seconds

*Message #5 Posted by **Frank Rottgardt** on 18 Sept 2011, 12:55 p.m.,*
in response to message #3 by Ed Look

Yes, battery drain is a problem. Use my 33s on a daily basis. Often a small program involving the solve command. Anyway, it "eats" cells.

Made in China, 50G, 35S, 33S

*Message #1 Posted by **designnut** on 17 Sept 2011, 8:53 p.m.*

Hanen't heard any critics of this build quality. 32SII made in Singapore. Hey HPNUT, isn't one made in Malaysia?

Re: Made in China, 50G, 35S, 33S

*Message #2 Posted by **Lincoln R.** on 17 Sept 2011, 10:11 p.m.,*
in response to message #1 by designnut

HPs made in Singapore are generally no worse than USA-made ones. Even some HP-35 calculators (The original, not to be confused with the 35S) were made in Singapore. I know some 12C's and possibly some 32sII models were made in Malaysia. The last-production 32sII and 48G/GX were made in Indonesia by a contract manufacturer (Rumored to be NatSteel Electronics) and had issues with paint wearing off the keys.

Re: Made in China, 50G, 35S, 33S

*Message #3 Posted by **Michael de Estrada** on 17 Sept 2011, 10:17 p.m.,*
in response to message #1 by designnut

I have a 50g and 35s, and had a 33s which I sold. The quality of the 50g IMO is excellent and light years better than the 33s and 35s. I have a 32SII made in Indonesia, which is about the same quality as the 50g, and a 32S made in Singapore that is better than all of them. The best quality ever were the original Voyagers, even better than the Classics. All of this is IMHO.

Re: Made in China, 50G, 35S, 33S

*Message #4 Posted by **bill platt** on 17 Sept 2011, 11:38 p.m.,*
in response to message #3 by Michael de Estrada

USA Voyagers were simply the best made ever. Period. No doubt about it.

HP 41 machines from the same time period are a PITA with broken posts, zebra connector issues etc. Obviously not all the time, but after 30 years, the voyagers turn out to be essentially unaffected by age and wear!

However, the pioneers aren't far behind the voyaers in robust construction. There seems to be a higher likelyhood of keyboard issues (the same issue woth the champagnes) but other htan that they seem to hold up like a voyager,

Re: Made in China, 50G, 35S, 33S

*Message #5 Posted by **Ed Look** on 18 Sept 2011, 12:03 a.m.,*
in response to message #4 by bill platt

You may be right; my 32SII is still going strong. But it's high market value and my love of it keeps me from using it much anymore.

(So I thought I'd instead beat down my 33S. But it turns out that I love that calc a whole lot too! Unfortunately, it's basically by day-to-day scientific now. But it seems to be holding up so far.)

Re: Made in China, 50G, 35S, 33S

*Message #6 Posted by **Lincoln R.** on 18 Sept 2011, 12:56 a.m.,*
in response to message #5 by Ed Look

This is why I own a very battered-looking 32S that's already been disassembled to fix the keyboard foam problem. I know USA made 32S models are worth a lot of $, but I don't think a collector would want mine, there are a lot of scratches on the metal faceplate, and the plastic case is very worn in some places, to the point that the texturing from the mold is worn off. I bought it on TAS for cheap because of the keyboard issue, it even came with an original spiral-bound manual. The 32S is pretty much the perfect calculator for most of the work I do, it has all the functions that I want and no nested menu mess.

Re: Made in China, 50G, 35S, 33S

*Message #7 Posted by **Michael de Estrada** on 18 Sept 2011, 1:20 a.m.,*
in response to message #6 by Lincoln R.

The HP 32S is a great calc for sure, although I'm not sure the USA made ones are worth that much more to collectors than the ones made in Singapore. Certainly, there's no difference in quality. But you are definitely correct that only calcs that are near mint will be worth much anyway. I picked up a mint Singapore 32S complete in its box with all packaging etc. for a bit over $100.

in response to message #9 by Lincoln R.

how do I know if it is a double shot key? appreciate to know the difference with a painted key.

Re: Made in China, 50G, 35S, 33S

*Message #11 Posted by **Lincoln R.** on 18 Sept 2011, 11:48 a.m.,*
in response to message #10 by hpnut

If you look closely at a surface-painted key, sometimes you can see that the paint is on top of the key, whereas the lettering would be at the same level as the plastic on a double-shot one. Sometimes you can tell by seeing if letters like X or a capital N aren't perfectly straight, but that seems to work better on Pioneers for some reason.

Re: Made in China, 50G, 35S, 33S

*Message #12 Posted by **hpnut** on 18 Sept 2011, 11:55 a.m.,*

Most sophisticated 15c games?

*Message #1 Posted by **Dave Britten** on 17 Sept 2011, 8:34 p.m.*

Now, I don't expect to be able to play chess against the 15c, but it seems like with its capabilities (subroutines, matrices, complex math, random numbers, lots of logical tests, indirect addressing and branching, a fair amount of memory, etc.) it ought to be able to do something more interesting than Nim, or Guess the Number.

I know it has the needed funcionality, but is there enough memory to do a simple grid-based Star Trek kind of game? Or even a very simple adventure game?

Re: Most sophisticated 15c games?

*Message #2 Posted by **Paul Dale** on 17 Sept 2011, 8:41 p.m.,*
in response to message #1 by Dave Britten

> Quote:
>

I never tried a Star Trek game but it might be possible.

I did write several simple adventure games for the 34C back in the early 80s so they are definitely possible.

I did a tic-tac-toe game (alpha-beta minimax search base) for the Casio FX602P when I had one of them and its (storage) capabilities are only a bit greater than the 15c's so this might be possible too. There are also simpler algorithms to play this game that should be smaller.

Oware/Awari might be possible -- certainly moderating the game and maybe even playing it.

- Pauli

in response to message #2 by Paul Dale

> Quote:
>
> I never tried a Star Trek game but it might be possible.

It would definitely have to be pretty simple. Maybe a 4x4 "galaxy" (or a bit bigger if there's leftover memory), and a specific amount of enemy ships - user selectable - sprinkled around the sectors. Then you would have to move around and get a reading of the number of adjacent enemies, and fire into an adjacent space to defeat them. Moving and firing would cost energy, but not as much as accidentally moving into a space with enemies. It would kind of be like Minehunt meets Star Trek.

I'll try it tomorrow if I'm bored sitting around the house. I've got a few ideas for clever use of indirect branching to handle the 8-way movement/firing.

in response to message #3 by Dave Britten

That's one thing I did not find much of when I scanned the PPC Journal issues looking for 15c material ... and that is a shame! :-)

Some of the games for the 19c/29c found a bit down on my old site here could probably be modified. I know BlackJack should work with just a few changes.

My old site lol

Re: Most sophisticated 15c games?

*Message #5 Posted by **Paul Dale** on 18 Sept 2011, 5:50 a.m.,*
in response to message #3 by Dave Britten

Pack the sectors into the registers and a 10x10 might be possible. i.e. use each digit as a cell and 10x10 takes ten registers. Using the exponent allows 12 digits per register. Using a base less than 10 allows more to be packed in.

- Pauli

Before owning a 15CLE, I found a good moon landing sim for my 12C here at the museum and entered it in. It is a turn based lander. I would like to have this on my 15CLE. I don't know yet if it needs modification - I am an RPL programmer, not RPN ;)

Moon Landing Simulator for HP-12c again

in response to message #9 by Pal G.

Pal G., I tried to type in the Moon Lander from the HP-34C. But that program uses heavily the PSE command. Of course, it didn't work.

Now, I'm going to try yours!

* * *

EDIT-

Wait a minute! This one uses a lot of PSE steps, too! How's it going work given this PSE bug in the 15C LE??

'nuther EDIT-

Oops. Sorry. You were asking, too!

Well, I guess we'll have to figure a workaround for the PSE thing.

Edited: 18 Sept 2011, 12:11 a.m.

in response to message #1 by Dave Britten

Hi

I think there is a lot of interesting games you can do on a 15C and even more on a 15C LE. Here is an example of a 'sophisticate' game that can be possible (i think it's possible for a 15 c) and some tips for this sort of calculators :

Isola game on Casio 602P and HP97

(sorry, it is in french but you can found my FX602P version and a HP97 version from C.RET page '4-5 - I have a news ideas for a far better algorithm but no time to do). The game is very easy to understand, you just have to move your 'king' like in chess and then to push a place in the game board, the first player who can't move lose

Mastermind is possible and more fun than just "guess the number"...

Easy to do is a 'one dimension 'demineur' (Minesweeper in english ?) like in windows.

here are some ideas (for a 602P and in french sorry)you can adapt on a 15C

.... http://www.ledudu.com/casio602p/programmes.htm

Edited: 18 Sept 2011, 9:34 a.m. after one or more responses were posted

in response to message #1 by Dave Britten

I apologize if this is semi-off-topic, as it doesn't deal with 15c games, but:

Back in the Woodstock and earlier LED days, when the calculator would print a scramble of random graphics while it was working on long calculations, a friend's dad had figured out that the pattern on the screen wasn't a true random scramble, but was caused by the information that was in the calculator's memory (or was passing through the CPU, or something else ... I'm sure other people on the forum know more about this than I do).

Anyway, this guy had mapped out the exact relationship between the display and its technical cause, learned how to manipulate it, and then used it to create a driving game. IIRC, obstacles would scroll from right to left, and you had a car (as a single horizontal LED segment) that you moved up and down to dodge the incoming obstacles. He was going to extend this into another type of game that involved shooting (shooting obstacles? shooting at an AI at the other side that shot back?), but I never heard about it beyond that.

Granted, I was really young, but I really hope I'm not confusing this with something else, because I still regard this as one of the most inspired accomplishments I've seen.

Re: Free42 - A Complex glitch?

*Message #1 Posted by **Thomas Okken** on 17 Sept 2011, 6:23 p.m.*

> Quote:
>
> You may be right. In fact I remember well that fix since it was me who pointed it out to Thomas. I ran into it during my 41Z testing, as I was using Free42 as a reference.

Ángel, do you remember what the test case was? I confirmed that changing the arcsin algorithm back to -i*arcsinh(i*z) fixes the branch cut bug that started the recent thread, but I forget the exact problem that I tried to fix in 1.4.67.

Thanks,

- Thomas

Re: Free42 - A Complex glitch?

*Message #2 Posted by **Namir** on 17 Sept 2011, 7:41 p.m.,*
in response to message #1 by Thomas Okken

perhaps it was arcsin(2.4)?

Re: Free42 - A Complex glitch?

*Message #3 Posted by **Thomas Okken** on 17 Sept 2011, 7:47 p.m.,*
in response to message #2 by Namir

No, that's the bug that started *this* thread. I'm asking about the older bug, that Ángel reported to me, that I tried to address in Free42 release 1.4.67. It had something to do with large arguments, but I don't remember what the problem was, exactly.

Re: Free42 - A Complex glitch?

Re: Free42 - A Complex glitch?

*Message #5 Posted by **Ángel Martin** on 18 Sept 2011, 2:44 a.m.,*
in response to message #1 by Thomas Okken

Yes, it was "large arguments" - meaning large Re and Im parts of course. I think it all started with 50+50i, and from then on up to the precision limit of the calc.

Here's one test case from our emails back then:

> Quote:
>
> z=200+200i
>
> asin(sin(z)) is not correct.
>
> Free42 returns 0-162i, whilst the correct answer is -1,62+200i (as returned by the real 42S, and double-checked on the Wolfram site http://www.wolframalpha.com/input/?i=asin%28sin%28200%2B200i%29%29

Hope this refreshes your memory. Best,'AM

Re: Free42 - A Complex glitch?

*Message #6 Posted by **Thomas Okken** on 18 Sept 2011, 11:35 a.m.,*
in response to message #5 by Ángel Martin

Ah, I got it. The problem occurs when z is large while Re(z)<0; in that case, sqrt(z^2+1) approaches -z because of the limited precision, and so ln(z+sqrt(z^2+1)) becomes noise. It seems that the fix is to simply avoid Re(z)<0 altogether, instead computing asinh(z)=-asinh(-z) whenever Re(z)<0. (I guess I should do something similar for acosh.)

Re: Free42 - A Complex glitch?

*Message #7 Posted by **Thomas Okken** on 18 Sept 2011, 2:23 p.m.,*
in response to message #6 by Thomas Okken

OK, I fixed complex ASINH and ACOSH. ASINH now calculates -arcsinh(-x) if Re(x)<0, and in the ACOSH implementation, I replaced the subexpression sqrt(z^2-1) with sqrt(z+1)*sqrt(z-1).
This fixes complex ASIN and ACOS, too, since they use ASINH and ACOSH underneath.
I uploaded 1.4.70 to my web site and to Android Market. It hasn't appeared on the Market yet; that can take a few hours. I'll update Free42 on iTunes shortly; that will probably take about a week to appear.

Many thanks for the update, Thomas! :)

Re: Free42 - A Complex glitch?

*Message #9 Posted by **Ángel Martin** on 19 Sept 2011, 2:40 a.m.,*
in response to message #6 by Thomas Okken

Hi THomas, that's basically what I also did in the 41Z code, for ACOSH. I like your method for ASINH more than what I concocted, will look into it as it'll probably save me some bytes.

Free42 Decimal now works great, however I'm still getting different results on Free42 Binary 1.4.70 for:

asin(2.404) = 1.571 - i1.524
asin(2.404+0i) = 1.571 + i1.524

Did you apply the fix to both?

Edited: 19 Sept 2011, 2:51 a.m.

Re: Free42 - A Complex glitch?

*Message #10 Posted by **Thomas Okken** on 19 Sept 2011, 10:20 a.m.,*
in response to message #9 by Ángel Martin

The fix is automatically applied to both, because it's the same code in both cases, just compiled with a different definition of the 'phloat' type depending on which version is built.

The bug in this case is in the code that calculates the complex square root in the log(x+sqrt(x^2+1)) evaluation; it returns the wrong root because the imaginary part of its argument is -0.

In a word: aargh! I'm sure there are good reasons why IEEE-754 has negative zero, but in this case it (or maybe I should say, the way atan2() treats it) is biting me in the ass. It's easy to fix, but I'll have to check all occurrences of atan2() to see if they have the same potential problem. Fortunately, there aren't all that many...

Re: Free42 - A Complex glitch?

*Message #13 Posted by **Ángel Martin** on 20 Sept 2011, 5:46 a.m.,*
in response to message #12 by Paul Dale

ok, so how about adding a check in the code for the case:

if Re(z^2+1) =~ Re(z^2) - within the precision of the CPU, that is

and if so, simply use Ln(2z) instead?

This works well for me on the 41Z, can't believe a humble 10-digit mantissa CPU handles it better ?

Cheers, ÁM.

in response to message #15 by Paul Dale

> Quote:
>
> Anyway, I think I've fixed it now. Commit coming soon.

Ok, tried it now with SVN1619 and the error has gone!

Now for something different:
After a long time I've now also downloaded wp34stest.exe again and tried it, but other than a few months ago it just gives a bunch of error messages instead of calculated values.
Here's the output (continuously running):

```
NaN     MAPM Warning: 'm_apm_set_string', Non-digit char found in parse
MAPM Warning: Text =
MAPM Warning: NaN
1.0000000000000000000000000000E+0
```

Something broken?

Edited: 20 Sept 2011, 7:45 a.m.

BTW, is there a way to interact with the Free42 from an external program and read back the LCD output? This way you could implement some kind of unit tests to assure correct calculation behavior.

Re: Free42 - A Complex glitch?

*Message #20 Posted by **Dan W** on 18 Sept 2011, 11:39 a.m.,*
in response to message #19 by Michael Kussmaul

> Quote:
>
> BTW, is there a way to interact with the Free42 from an external program and read back the LCD output? This way you could implement some kind of unit tests to assure correct calculation behavior.

The Free42s output can be sent to the emulated printer, which can be output to a text file. (the PC version)

Then one could have an external program, like Excel, read and parse the text output.

Re: Free42 - A Complex glitch?

*Message #21 Posted by **Thomas Okken** on 18 Sept 2011, 11:41 a.m.,*
in response to message #19 by Michael Kussmaul

Any regression testing tool or scripting language that is capable of sending keystrokes to an application can be used to drive Free42. Reading the display can be accomplished by sending Control-C and then reading the clipboard.
Writing all those unit tests will be a bear of a job, though. Besides, once I fix ASIN/ASINH/ACOS/ACOSH, there will be no bugs left in Free42 anyway. ;-)

Re: Free42 - A Complex glitch?

*Message #22 Posted by **Michael Kussmaul** on 18 Sept 2011, 12:45 p.m.,*
in response to message #21 by Thomas Okken

You are right, but you don't need to write all regression tests up-front, just add them over time :-)

I used to work for a telecom company and we only started using regression-tests, when it was really easy to write them. So I guess the approach of "GUI-scripting" and emulating mouse-clicks on keys could be quite cumbersome. It would be easier, if you could just supply a text-file with input-keys and the result is validated agains a certain expected output, e.g.:

SIN 3 COS 5 +
1.04853065433

(so each key-press could be separated by a space, expected result is on following line)

Of course "someone" could build a wrapper, to parse such a file, does "GUI-Scripting" and reads back the result.

BTW, I like your implementation on the iPhone, it just rocks!

Re: Free42 - A Complex glitch?

*Message #23 Posted by **Thomas Okken** on 18 Sept 2011, 2:27 p.m.,*
in response to message #22 by Michael Kussmaul

Since Free42 just happens to be programmable itself, you could write all the regression tests using plain old HP-42S user code...

Free42 complex ASIN/ASINH/ACOS/ACOSH redux

*Message #24 Posted by **Thomas Okken** on 18 Sept 2011, 9:10 p.m.,*

in response to message #1 by Thomas Okken

To summarize the whole Free42 complex ASIN saga:

Earlier this year, Ángel Martin reported to me that Free42 returned an incorrect result for arcsin(sin(200+200i)).
I thought I'd fixed that bug by changing the implementation of complex arcsin from -i*arcsinh(i*x) to conj(-i*arcsinh(conj(-i*x))).
I'm kicking myself now for ever making that change. The original algorithm and the revised one are equivalent, except for the edge case of |Re(x)|>1 and Im(x)=0, and the problem that Ángel reported had nothing to do with that edge case. The 1.4.67 change didn't fix the problem with arcsin(sin(200+200i)); it merely moved it to a different part of the complex plane: instead of returning wrong results for 200+200i and -200+200i, it now returned wrong results for 200-200i and -200-200i.

The problem with arcsin(2.404+0i) that two people reported to me via email, and that also started this thread (or, rather, the original thread that got moved to the archive a couple of days ago!), was caused by my non-fix to the arcsin(sin(200+200i)) bug. Undoing that non-fix made the arcsin(2.404+0i) bug go away, but of course it didn't do anything about the arcsin(sin(200+200i)) bug, other than moving it back to its original spot.
The problem with arcsin(sin(200+200i)) turned out to be that my naive implementation of arcsinh(x)=ln(x+sqrt(x^2+1)) fails when |x| is large while Re(x)<0. In that case, the sqrt(x^2+1) part becomes -x+epsilon, and so x+sqrt(x^2+1) becomes noise.
Changing the arcsinh algorithm to -arcsinh(-x) when Re(x)<0 causes the sqrt(x^2+1) part to approach x instead of -x for large |x|, and this avoids the loss of precision in x+sqrt(x^2+1).

So, I fixed the arcsin(2.404+0i) bug I introduced in 1.4.67 by simply reverting back to the 1.4.66 code, and I fixed the arcsin(sin(200+200i)) bug by changing the arcsinh algorithm so as to avoid the loss of precision in x+sqrt(x^2+1) for Re(x)<0.

Note that the reason that Free42 1.4.(67,68,69) did return the correct result for arcsin(2.404) but not for arcsin(2.404+0i) is that the case for real X in ASIN is handled by completely different code than the case for complex X. The "real X" code was right all along.
Also note that there was a bug in ACOS and ACOSH, caused by the same loss of precision issue, in the arccosh code, in the x+sqrt(x^2-1) subexpression for large |x| and Re(x)<0. Nobody reported that bug, and it wasn't affected by the 1.4.67 changes, but that code should be OK now, too.

Whew. :-)

Thank you to Franz Huber and Miguel Toro-Alvarez for contacting me about the arcsin(2.404+0i) bug, and to Ángel Martin for bringing the arcsin(sin(200+200i)) case to my attention, and to everyone who weighed in on the HP Forum!

It has nothing to do with China

*Message #1 Posted by **From Hong Kong** on 17 Sept 2011, 11:54 a.m.*

I see so many messages stating that China is to blame for the poor quality of HP's calculators. I think it's better to think twice before making similar statements. The products of Casio and Texas are being made in China but nearly no problems relating to the keyboard and firmware have been reported so far in local Chinese/Cantonese forums. Anyway, HP is the only one to blame!!!

Re: It has nothing to do with China

Perhaps so, but one reason I don't buy Apple products is they are mainly made by FOXCONN. Atrocious working conditions, leading to high suicide rates.

Re: It has nothing to do with China

*Message #5 Posted by **Eric Rechlin** on 17 Sept 2011, 2:31 p.m.,*
in response to message #4 by Dan W

Foxconn has a lower suicide rate than the Chinese average. Seems to me that they are doing something right, not wrong.

I'd never buy an Apple product, either, but for different reasons.

Eric

*Message #7 Posted by **Paul Gaster** on 17 Sept 2011, 12:14 p.m.,*
in response to message #1 by From Hong Kong

Casio and TI keyboards are nowhere near the quality of the typical HP keyboard. They have much cheaper designs and construction. Nobody expects them to perform perfectly, so of course you won't see complaints.

China gets blamed for a reason. Melamine in milk, ethylene glycol in toothpaste, lead paint on kids toys, the list goes on and on.

I worked for a contract manufacturing company for over 10 years. We had a factory in China. I know they lied to us and faked documents sometimes. Once a customer received a batch of brittle plastic parts for a lifesaving device. The device had to be approved by various regulatory agencies and needed the parts to be traceable. The plastic was made here in the US, and the manufacturer added some element for tracing purposes. A lab could test the parts for this tracer material to make sure we used the correct material. Our brittle parts did not have the tracer. The plastic manufacturer's retained sample of material from the lot they shipped us had the tracer. China insisted they used the right material, but clearly they were not telling the truth.

We do not know the whole story here for the calculator that had the wrong firmware, but if it was an HP mistake in telling China how to make these, then the whole batch would be wrong, not one.

Re: It has nothing to do with China

*Message #8 Posted by **Lincoln R.** on 17 Sept 2011, 12:29 p.m.,*
in response to message #7 by Paul Gaster

Also "China" is not a giant manufacturing plant. There are tons of companies in China, all delivering varying degrees of quality and making different products. HP and TI both seem to be using the same two Taiwanese manufacturing contractors who have factories in China. I would venture a guess that Casio has their own factories, they're a large Japanese manufacturer who moved into other Asian countries early on.

The fact is, HP calculators are more difficult to make than TIs, and this difficulty is largely in the keyboard. Everything else (PCBs, injection-molded cases, plastic keys, manuals, etc.) is a commodity that could easily be made alongside toilet scrubbers and plastic cups.

Quote:

> Also "China" is not a giant manufacturing plant. There are tons of companies in China, all delivering varying degrees of quality and making different products.

True enough. "From Hong Kong" you are only partially correct when you state "Quality control rests on the outsourcing company." I would say it depends on the arrangement. In most cases, the *specifications* rests with the outsourcing company, but manufacturing QC may be the responsibility of the plant.

However, there are products coming from China that originate there; they are not outsourced from USA, Europe, or Japan. There have been significant problems over the years with counterfeit bolts and hardware that were extremely substandard; I know of a man who was almost killed by a Chinese shackle that parted.

Not to mention counterfeit books, CD's, etc. that violate copyright laws.

China does get a black name sometimes, even though we get most our consumer goods there, and most of it is at least of adequate quality, some excellent.

So ultimately, yes, it does have something to do with China.

> Casio and TI keyboards are nowhere near the quality of the typical HP keyboard.

What's the typical HP keyboard today? 35s? 20b?

Usually, Casio keyboards offer nearly no tactile feedback, but I never had problems with keystrokes not registered.

This 'rotate & click' thing is great, if it works. If not, it turns into a nightmare. No feedback is better than false feedback, imo.

I see the durability of HPs and Casios on par. HPs always shined when it comes to the firmware (with the 35s the exception from the rule, but only due to the bugs). Allthough I started in life with a Casio fx-81p and got used to it, HPs are much less cumbersom.

Some folks here are talking about a 'typical' or 'classic' HP keyboard but it's gone already! We cannot deny that a modern HP keyboard isn't robust and accurate enough. It's even unusable at the outset.

Yes, you're right. Nobody care about what keyboard technology HP is using. Users just need a reliable and durable keyboard.

You know, I see all this talk about poor keyboards and inaccurate keyboard response and I simply have not experienced this. I have a 10bii, multiple 10bii+'s, multiple 12C+'s, multiple 12C Platinum's, multiple 15C LE's, multiple 33S's, multiple 35S's, multiple 30b's, multiple 17bii+ Silver's, a 49g+, and two 50g's and not one of these machines has ever had a keyboard problem. In fact the only recent HP machine that I have had a keyboard problem with has been the 20b and that seems to be (and hopefully will remain) a one-off design.

Now I may be one of the lucky ones. And maybe I no longer use my machines as frequently as I used to, but it seems to me, with the range of calculators I have and with every second or third person on this forum complaining about HP keyboard quality, I *SHOULD* have one that has problems.

And when that does happen I'll be the first to admit it. But I would also say, as others have, that no production line is perfect and that some units are going to come out with issues. The question to ask is what is the failure rate?

Cheers,

-Marwan

I have quite a number of the same machines that you list as well and generally have had good quality units. However the F and G keys on one of my 15C LE's do rattle and one key on a 12CP does not register when I feel the click.

I do think that there are production quality control issues in the current Voyager line. There are too many reports to ignore them and I think that HP should be doing something about this -- perhaps they already are.

*Message #18 Posted by **M. Joury** on 17 Sept 2011, 6:43 p.m.,*
in response to message #17 by Katie Wasserman

One of my HP15C LE's does have a very slight keyboard rattle. But so does one of my original 15C's and one of my original 12C's. I do wish that the f and g keys were better aligned and didn't rattle but I have not had a problem with them not registering.

There might be a problem with quality control. But sometimes I have to wonder if this is not a case of the squeaky wheel getting the oil, so to speak. Is it just that we hear all the complaints but none of the praise? As I have mentioned before, the only way to get a real feel for the QC of current products is to be able to calculate a failure rate and with the information on hand we are simply unable to do this.

It might actually be possible with the new HP15C LE. We have a large number purchased in a short time frame and if everyone were to report their findings we might be able to obtain some meaningful results. So far I think that I have seen 2 posters say that they have keyboard issues with many, many more stating that their machines are fine. So, what is an "acceptable" failure rate? 1/10? 1/50? 1/100? 1/1000? Obviously the optimum would be none but that is not going to happen. Even my original HP41CV bought new back in '82 had a failure soon after I purchased it and I had to send it back for repairs. It has worked great ever since but the point is that even in their heyday HP was not absolutely foolproof.

Cheers,

-Marwan

I'm sensing the same thing. There are an incredible number of problems with the 15C LE that are being reported in a very short time in every area (except the very deluxe packaging).

- non-registering keys (at least not registering coincidentally with the click) (several cases)

- key alignment/loose keys (f and g on virtually all units)

- wrong firmware loaded (only 1 case so far)

- firmware bugs (PSE, self-tests, improper display flashing)

- bad power management (20ma continuously when a key is down)

- large number of errata in the manual

This just stinks for a calculator that sells for $100 and had a development period that lasted for at least a year. Further this was based on the exsiting 12C+.

When I bought my HP-15C for about US$100 in 1985 in Hong Kong, I never thought the above problems would happen in an HP calculator. In those days, a popular Casio FX-3600P sold for less than US$20. However, the world order changed after HP-49G came out. A calculator buyer needs to risk himself in buying an HP calculator. What's going on in HP?

Re: It has nothing to do with China

*Message #28 Posted by **Howard Owen** on 18 Sept 2011, 3:16 p.m., in response to message #24 by Katie Wasserman*

I recall that, after the flashable 12C came out, an argument for bringing back the 15C was that producing it would be much cheaper because the 12C PCB could be used, and because the documentation wouldn't have to be changed. Now that the 15C LE has arrived, I notice some interesting things about price and production. It seems to me that producing 10K units of anything in consumer electronics is pretty remarkable. That's a very small stock to try to make any sort of profit on. Selling those units wholesale for something less than $80.00 (based on the early street prices) makes it even more astonishing. The total theoretical upside is something less than 800K bucks, and a realistic estimate is no doubt substantially lower. What does it cost to design and implement an emulator, redesign and implement a replica keyboard, pay setup and production costs, (hopefully reduced, but certainly not nil,) transportation costs and marketing costs? (What else? I bet I've missed a few.)

The only way I can imagine this project could have been sold inside HP would be something like this: "This machine will be cheaper to produce than a new calculator. A limited run has a chance of selling out, based on the market research. The slight profit in this proposal has to be seen in the light of creating good will with our most ardent fans. That represents marketing value of (fill in guesstimate dressed up as fact.) Oh, and it might actually take off with general users, though we aren't counting on that." OK, so maybe HP's most ardent fans are also their most severe critics, but I'm sure that wasn't a featured item in the proposal.

With a shoestring budget, problems are more likely to occur. With a

shoestring budget, fixes for those problems will be harder to sell internally. The keyboard problems don't seem to be (that) widespread. We now have a 15C body that actually isn't too bad. As to the firmware problems, the 15C LE is flashable. *We can build replacement firmware.* That won't help the average user, but the 15C LE isn't aimed at them, *it's aimed at us!* The 15C LE will never be as big a dud as the 35s, because the really unforgivable problems with that machine are firmware bugs - in a machine that can't be reflashed.

I am pleased as punch with my 2 units. Neither one is a 12C under the hood, and neither one has poorly registering keys. I think the census thread will show that a majority of units received by forum members are in that category. In any event, I'll leave it to the stat-heads to tell me whether we represent a valid sample for purposes of estimating the overall defect rate of this machine. Intuitively I'd guess we aren't, but I don't have a good head for statistics. :)

but every one of the testers **did** check that the colours of the f and g keys were a suitably faithful match to the original product. and that the LCD contrast was just right, not to forget the shine on the 15C badge.

i've worked for companies with 200+ page test manuals for products - where every new firmware release requires 6 weeks of 8-hour days spent working through those tests one by one. it requires a certain tenacity, and a determination not just to use the product, but to misuse it in every conceivable way.

it would appear that with the 15C LE, quite simply the folks doing the testing were not checking for those things that mattered. not by any fault of the testers personally, but because they were in awe of the absolute awesomeness (from their perspective) of the product...

There were reports that HP handed out 15C LE prototypes last year at the HHC to at least certain people. The key word there is prototypes. There have been posts explaining that the firmware changed since then, so what the testers could check was not the final product that we see now. Also, since they were prototypes, the tools used to mold the keys and housings may be different now. There could be some different PCBs as well and other different internal parts that could explain the key issues.

*Message #35 Posted by **Tim Wessman** on 20 Sept 2011, 10:29 a.m.,*

in response to message #34 by Paul Gaster

Everyone who had the units from last year also received an invite to a private forum to discuss any issues. They also received cables and training on how to use them. The firmware was posted in that forum and quite a few people downloaded it, installed and used for quite a while. That firmware was resolving issues people had found and identified. In the 4+ months before production we did not receive any reports of issues on the shipping firmware.

There is 0 difference between the molds of the original, and the production ones (apart from a few months of wear).

Well, if they did send me one, I would have been happy to do a teardown and a review to 10,000+ people on the release day, and generated a lot of hype (as I've done for Agilent and Tektronix under NDA). And of course would have found the battery consumption issue, as I have exposed it on a previous calculator.

Oh well.

Dave.

*Message #40 Posted by **Lincoln R.** on 17 Sept 2011, 12:23 p.m.,*
in response to message #1 by From Hong Kong

I'll agree on most counts, because most of the real problems with the 15C are software bugs. HP wrote the software. On the random other mistakes we've seen, however:

12C firmware on a 15C: This was almost certainly a factory screwup. HP would be supplying the firmware images to the manufacturer, but the manufacturer would be responsible for flashing it onto calculators. Anyhow, assuming they're made on the same production line, this is probably an easy enough mistake to make, I just hope there aren't too many of these floating around.

Random intermittent keyboards: I wouldn't assign blame to anyone here. Defective units happen. The mechanical design seems to be OK because there are a ton of 12C+'s, and even 15Cs (The ones that work so nobody ever complained about them on the internet) with keyboards that work fine. You probably don't hear about bad Casio or TI keyboards because they're not as complex to make (rubber dome sheet like a TV remote) and because the kind of person who buys a defective $5 Casio is far more likely to return the thing to the store and get another than they are to post a scathing review on casiomuseum.org or something.

All in all, I agree that we shouldn't be nailing HP's manufacturing contractor to the wall. If they made a few defective units, that happens, this is why you build extras and have a warranty. If they flashed a few with wrong firmware, this is an easy and correctable mistake, hopefully HP's contract requires them to reimburse

HP for the cost of this rework. Really, the 15C LE is not that bad. When the new firmware gets released, and the handful of defective units get exchanged, this will be a great product.

Let me give you a perspective of someone who has and still does work on an assembly line. Deisel trucks, cell phones, helicopters, biz jet wings and supersonic fighters are some of the things i have built. It does not surprise me one bit to see that a 15c le got flashed with 12c rom. Here is why. First off the people on the line in general do not have a love or devotion to the product. Second these places all have policies in place to terminate employees who do not make quota or keep up. So if you have to put in a board with 12c rom to keep up so be it.Third i have seen examples of fellow employees who were denied raises,time off etcetera deliberately screw up a product to get revenge. Many of which made it to the customer. Also assembly lines are usually dull windowless environments and the human spirit screams for some relief. It may have been done as a prank. Also employees are usually graded against each other and it may have been done to try and bring a coworker down a notch. Quite frankly even in a small run there are lots of opportunity for error and to have only heard one malfunctioning so far is pretty good.

Do you know that this will happen? I wouldn't be so sure. There are many thousands of 12C+ calculators out there (aside form the 12C 30th AE's) with older buggy firmware and HP has still not released the fixed firmware, or even acknowledged these bugs on their site. If you read this forum and ask, you can get a copy of the fixed firmware, but that's not a "release" in my view.

The difference could be that for most users, Casios and TI calcs are just that: calculators.
No one really cares about the keyboard of a TI calc, since they grew better over the decades,
and thus are "good enough" for normal use.
The opposite happened with the keyboards of HP calcs, when they changed production _and_ calc type in the late nineties.
Anyone remembers the FHB? or the 49g+ ;-)
At least those users of HP calcs which are lucky enough to have used the high quality keyboards of older HP calcs,
may be somewhat more picky regarding keyboard reliability.

In the recent years, Casio, TI and HP calculators are made in China. However, HP's calculators are far more problematic than of Casio and TI. Why? I have been using Casio calculators (nearly 10 models so far) for over 30 years but I haven't got one with missing keystrokes, defective keyboard or buggy firmware at the outset! HP sets a new era of producing defective calculators!

HP has known to make some millions of reliable calculators in the past. Their keyboards were the gold standard of reliabiltity for decades. If they should have lost this knowledge :-(they are sentenced to learn it again or they will vanish from the market >:-(
Anyway, it would have been more cost effective keeping this knowledge ... :-/

Maybe you have been as unlucky as I have been lucky (see my posting above). But I have to say that if a Casio keyboard feels and acts anything like that of a 20b I'll never own one. Because, as far as I am concerned the 20b is nearly unusable--even with WP34S firmware on-board.

I have not owned a non-HP calculator in so many years that I could not even tell you what one feels like so maybe I am wrong about the key feel. But from what I have read I would expect a Casio or TI to feel like a 20b. Sometimes I consider buying one or the other or both just to see how they feel but I can never quite get myself to do so.

After all, I wouldn't have a clue how to use one--they use something called.. darn, it's right there on the tip of my tongue... Oh, that's right! They are algebraic entry!

Cheers,

-Marwan

in response to message #50 by M. Joury

As a former TI-89 Titanium owner, I'd describe modern TI keys like this: They feel like the buttons on a television remote, except there's a piece of plastic pushing the rubber dome instead of your finger pushing the rubber dome. The keys are somewhat firm, but don't give much in the way of tactile feedback. I definitely made mistakes on my TI-89 before because I didn't push the buttons far enough for it to register, usually in digit entry.

in response to message #46 by Raymond Del Tondo

With regard to QC, it seems to me totally insane to expect quality control to occur everyplace in the chain but the factory. You have to have quality measures there. Chinese factories are no exception. Whether

given Chinese factories are better or worse at QC in a given situation is immaterial. That's because companies who outsource their manufacturing are responsible for setting QC standards, and for checking the resulting products against those standards. It is those companies, and their customers, who will decide whether the quality level is sufficient to make a successful product.

As others have noted here, this forum is populated by some rather tough customers when it comes to judging quality. Having started my computing career with an HP-41C, I more or less share those values. But I also know the impact and implication of the Walmart effect. It turns out that people have low standards for what is "good enough" quality. I find this maddening, but unfortunately true. As long as customers tolerate shoddy products, the QC in the plant that produced them will match that tolerance level.

Having said all that, I have to say that HP has usually met *my* "good enough" expectations in recent years. The newer "rotate and click" keyboards seem designed to recapture some of the classic feel of the old machines. For me, that works. I like the feel of the 15C LE keyboard, for example. The reason I got to like that feedback on my 41C was because the "click" meant the key had registered. People have reported problems with that on new machines, but even on my two 35S calculators, I've never seen it. So color me happy with my newer keyboards. The firmware on the 35S is another matter.

Fullheartedly agree. Quality-wise, it's nothing less than manufacturing in-house. BTW we're not alone with our opinion in this matter - see e.g. ISO 9001.

in response to message #1 by From Hong Kong

If HP outsource their production to an area of the world not known for its quality control then they are responsible for the results. It is HP who decide what is an acceptable quality level for their products and decide what they pay for product and where they buy from.

Confused simple accountant: TMV HP17 v HP12

*Message #1 Posted by **Paul** on 17 Sept 2011, 7:39 a.m.*

I've got myself confused with TVM results when using my HP19bii+ v my HP12CP and non-interger "n" (my wife just says, "why have two calculators" - which is a reasonable point however my secret is that I have three (also a HP10b - which gives the same results as the HP17bii+).

For instance if I run a scenario of: P/YR = 1 n = 2.5 iP/YR = 10% (those were the days!) PV = 100 PMT = 10 END MODE HP17 bii+ FV = -153.81

This seems quite reasonable as it is approximately the same as replicating the inputs for 30 months (slight compounding difference I can cope with that).

If I run the same inputs for my HP12CP I get FV = -148.05

Now, reading the manual, I thought this was because the 12CP would take the "0.5" of "n" and consider it as half a month, ie 15 days. But if I try to model a 15 day period (ie P/YR = 24 and PMT = 10/24) followed by a two year period I get FV = -142.99 (which feels about right, but is a country mile away from the 12CP).

Can anyone shed a little light on this for me.

Thanks in anticipation.

Re: Confused simple accountant: TMV HP17 v HP12

*Message #2 Posted by **MBlount** on 17 Sept 2011, 9:39 a.m.,*
in response to message #1 by Paul

When you enter a non-integer value for n in the 12c it enters odd-period mode and doesn't assume a payment until the first full period. In your example using 1 payment per year the 12c gives you 1/2 of a year interest, then one-year interest plus a payment, and finally another year's interest plus a payment.

The calculation looks like this

Beg End

Bal Int Pmt Bal

100.00 5.00 0.00 105.00

105.00 10.50 10.00 125.50

125.50 12.55 10.00 148.05

The 17bii doesn't do odd periods like that. When you key in 2.5 periods, it gives you 2.5 payments. You get an additional $5 at the end of the partial period that you don't get with the 12c.

edit: Sorry, I don't do tables well. The column headings should be Beginning Balance, Interest, Payment, and Ending Balance

HP 50g trilogy. The new HP 50g Blue (and II)

*Message #1 Posted by **Pablo P (Spain)** on 17 Sept 2011, 7:30 a.m.*

Hi all! Probably this information is interesting for some collectors. A year ago I posted the HP 50g blue here http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=173119
Now, one year later, it seems that HP has released a new blue layout. At least here in Spain. The source is from an official HP dealer in Spain: http://www.ict-iberia.com/datosftp/calculadoras/imf_1-ListaPreciosCalculadorasHP_sept2011_web.pdf

Note that the new blue has the same model number that the old one. What do you think?

*Message #3 Posted by **Chris Randle (UK)** on 17 Sept 2011, 8:50 a.m.,*
in response to message #1 by Pablo P (Spain)

Just to clarify, I think the new blue one is the one on the right, not the one that says "NUEVA". Correct?

I've got one of the old blue ones and it's rather grown on me. Based on the images above, I prefer it to the new blue one. Having said that, the old blue looks better in the flesh than in pictures, IMO, so perhaps the new ones are equally attractive.

Must resist urge to buy another bloody calculator.

If statistically significant, this looks like another victory of fashion over ergonomical design.

Re: HP 50g trilogy. The new HP 50g Blue (and II)

*Message #17 Posted by **Mike Morrow** on 18 Sept 2011, 11:28 a.m.,*
in response to message #1 by Pablo P (Spain)

Those blue models are absolutely terrible!

They seem to be motivated by the same sort of idiotic "artistic" nonsense that places no value on contrast, legibility, and usability. In other words, the same sort of U.S. West Coast decadence that produced the ugly ineffective color schemes of the Pioneers, HP-48G, and HP-38G, to name but a few. Now we can add the European HP 50g. No surprise there!

Re: HP 50g trilogy. The new HP 50g Blue (and II)

*Message #18 Posted by **Tim Wessman** on 18 Sept 2011, 12:07 p.m.,*
in response to message #17 by Mike Morrow

Have you actually held one?

The blue is actually extremely legible including for those with Protanopia and Deuteranopia - which, yes, I tested against.

Just because you don't like the color doesn't mean it does not have legibility, contrast or usability. A crappy jpg with low color calibration will not be a good stick to measure against.

Having never seen the so called "new" one on the right I can't say anything about it. You can blame me for exact color combination on the blue one, but not for the desire to do it. It was demanded that "we need an Avatar Blue calculator" and so I had to do something.

I just tried to make the best of a bad situation. :-|

Any relation between 15C LE numbers and serial numbers?

*Message #1 Posted by **Howard Owen** on 16 Sept 2011, 11:42 p.m.*

I have my second 15C LE now. Since I intend not to open the box, I can't tell what its LE number is. The serial number is printed on the outside of the package however. Is there any simple mapping between the two numbers? Perhaps we could post many examples and see if a pattern emerges?

My first one has serial# CNA1320813 and LE# 00336, My second one has serial# CNA1310KBP

Re: Any relation between 15C LE numbers and serial numbers?

*Message #2 Posted by **M. Joury** on 16 Sept 2011, 11:54 p.m.,*
in response to message #1 by Howard Owen

I would suggest that you should open the box to remove the batteries.

Cheers,

-Marwan

*Message #6 Posted by **Lincoln R.** on 17 Sept 2011, 12:35 a.m.,*
in response to message #5 by Michael de Estrada

Oh dear. Cyrille and Tim must really be wanting to smack someone in manufacturing right

now.

Re: Any relation between 15C LE numbers and serial numbers?

*Message #7 Posted by **Lincoln R.** on 17 Sept 2011, 12:04 a.m.,*
in response to message #1 by Howard Owen

I own two: CNA1310KBJ, LE#02195. CNA13208KX, LE#02922.

I'd assume the serial number breakdown goes something like this:

CNA - Some China plant code (I think CNA is Kinpo and 4CY is Inventec) 1 - Made in 2011 (normal mid-97 and up HP Datecode) 31 - Week 31 (Sounds about right for late august/early septemberish) 0KBJ - Production number. It looks like they've gone to using numbers instead of digits. Since our production numbers are close together, it'd be interesting to see what LE number you have. If they go in order, I think your CNA1310KBP would be LE#02201, but it would seem that they don't, since your unit that was built a week later has LE#00336 and mine that was built a week later has LE#02922.

If I may propose a theory, I might guess that all the metal back plates were printed, sent to the manufacturing plant, and then placed onto calculators in no particular order.

Re: Any relation between 15C LE numbers and serial numbers?

*Message #8 Posted by **Howard Owen** on 17 Sept 2011, 12:32 a.m.,*
in response to message #7 by Lincoln R.

Ah. Batteries of course. Just the excuse I needed :)

My CNA1310KBP has LE #02193. Perhaps the process for applying back labels and the process for applying serial numbers are not connected.

Re: Any relation between 15C LE numbers and serial numbers?

*Message #9 Posted by **Michael de Estrada** on 17 Sept 2011, 12:45 a.m.,*
in response to message #8 by Howard Owen

The S/N is a tacky stick-on label that often isn't even straight. I removed mine and stuck it on the first page of the manual for safekeeping. I doubt there is any relationship between it and the LE #.

Re: Any relation between 15C LE numbers and serial numbers?

*Message #10 Posted by **Mike Morrow** on 18 Sept 2011, 11:37 a.m.,*
in response to message #9 by Michael de Estrada

For all China-made HPs it appears that machinery is in use to apply the serial number strip crookedly, by design. If the strips were applied manually, at least some should occasionally be correctly applied, just by chance. Has anyone *ever* observed otherwise?

Re: Any relation between 15C LE numbers and serial numbers?

*Message #11 Posted by **Lincoln R.** on 18 Sept 2011, 11:56 a.m.,*
in response to message #10 by Mike Morrow

I've seen them at different angles on the same model, so I'd imagine the labels are either applied by humans working very fast (quite likely in the land of 25 cent/hour labor) or a very poorly

calibrated machine (also somewhat likely since serial number labels aren't really a critical part).

Although one thing I am curious about: We're pretty sure we know that HP and TI use largely the same contract manufacturers. I haven't seen a TI with a stick-on label, so the companies probably have the equipment for engraving serial numbers, unless TI does something ridiculous like engrave serial numbers when they get the calculators at their warehouse. This could be possible, the last TI I bought was in around 2005 or 2006, the calculator was made in China, but the batteries and manual were both made in the USA. I doubt TI would waste money shipping batteries and paper overseas only to be shipped back inside calculator boxes.

Classic HP LED failure diagnosis

*Message #1 Posted by **aj04062** on 16 Sept 2011, 9:51 p.m.*

I have a 65 that has a non-lighting minus sign. Upon dis-assembly, it can be observed that the Cathode 1 segment does seem to light very faintly when the CHS key is pressed. The minus sign does not light.

Upon additional testing, when the battery drains and all the decimal points light up, the Cathode 1 decimal point DOES LIGHT UP. This leads me to believe that it is likely the LED Module and not the Cathode driver.

does anyone concur with this diagnosis?

Re: Classic HP LED failure diagnosis

*Message #2 Posted by **Kees van der Sanden** on 17 Sept 2011, 3:21 p.m.,*
in response to message #1 by aj04062

Hi aj4062

I agree with your diagnosis. If the Cathode 1 digit decimal point lights up at low voltage conditions, the cathode driver does his job. A failing LED segment in the module can be the root course. The module contains only a matrix of LED diodes and no control electronics. The specifications can be found here. Desolder the module and check all segments with the diode test of a multimeter. Failing segments in classic series LED modules is a common problem.

Re: Classic HP LED failure diagnosis

*Message #3 Posted by **aj04062** on 17 Sept 2011, 5:28 p.m.,*
in response to message #2 by Kees van der Sanden

Thanks for the confirmation Kees!

Just wanted to see if anyone else comes to this conclusion before I spend the time to desolder and replace that module.

Any good way to take pictures of calculators?

*Message #1 Posted by **Eddie W. Shore** on 16 Sept 2011, 9:48 p.m.*

I am able to get decent pictures but sometimes I get flashes on top of the keyboards. Thanks.

Re: Any good way to take pictures of calculators?

*Message #2 Posted by **db (martinez, ca.)** on 16 Sept 2011, 10:04 p.m.,*
in response to message #1 by Eddie W. Shore

IIRC, Dave Hicks made a tent with white sheets in his driveway to get non-directional light with no reflections.

Re: Any good way to take pictures of calculators?

*Message #3 Posted by **Bill (Smithville, NJ)** on 16 Sept 2011, 10:21 p.m.,*
in response to message #1 by Eddie W. Shore

I've only photographed a few of my calculators, but have spent some time photographing my transistor radios.

I've used a separate flash from the camera aimed backward into a white umbrella. It diffuses the light. You have to be careful of shadows. I use a remote trigger for the camera to eliminate any shadows I might make from pressing the shutter. You can also try putting a diffuser over the flash. You can make your own out of a half sphere of white plastic. Just tape the diffuser over the flash.

Another method is to aim the camera slightly off-perpendicular, This will keep the flash from coming directly back into the camera lens. But you need to have some manual control over the camera to get the required depth of field to keep it all in focus. A camera with manual foucusing is helpful.

You can also try a polarizing filter over the lens. If the light is bouncing back at a different angle, then a polarizer can help filter some of the reflection out. But the polarizer may also filter out the display, if you are trying to show what the display looks like.

The background you use is also important. Also how you suspend the object you wish to photograph. Sometimes I'll balance the radios so they are floating above the background. It gets rid of the hard edges that can appear or hard shadows at the edges.

The nice thing about digital cameras, you can experiment with hundreds if not thousands of photo arrangements.

Bill

*Message #4 Posted by **David Ramsey** on 16 Sept 2011, 10:22 p.m.,*
in response to message #1 by Eddie W. Shore

Although generally your camera is the least important factor in making a good photograph, a DSLR helps a lot. As noted, avoiding flash is the key, but the tiny sensors in point-and-shoot cameras require more light to get decent photos. Outdoors in bright cloudy weather is your best bet...

Re: Any good way to take pictures of calculators?

*Message #5 Posted by **Peter Murphy (Livermore)** on 17 Sept 2011, 12:34 a.m.,*
in response to message #1 by Eddie W. Shore

Back in February I watched a nice 15C go for about $400 on TAS.

I asked the seller how he had made is superb photographs, which I thought had been a strong factor in his realizing such a high price. (I don't think that I saved those photographs, but perhaps they're somewhere on my hard drive. I'd have to do some learning before I could post them here, but be assured that they were very good indeed.)

Here's what he said in reply:

"On the camera, I am using a Nikon 12.1 megapixel DSLR mounted on a tripod. My lens is a manual focus Zeiss 100mm makro-planar T* f/2.0 lens. I usually shoot at f/16 or so on a 6-10 second exposure which is no problem on the tripod. I could shoot with less time, but I would need a brighter light and that might case more shadows - putting it farther away or putting a diffuser on it helps the light be more even. I have three foot wide black paper for the background from a roll that I've placed along the table and gently curved up onto the wall. The key of all of this has been manually focusing my lens, in my case a 100mm Makro-lens. Using live-view on the camera, I can get 100% of my images razor sharp. This can be done with autofocus lenses too I am sure, but to get it perfect every time, I would switch it to manual focus, then use the Live-View feature and LCD screen on the back of the camera to get the focus perfect. I hope this helps."

The black background to which he refers was the background to the 15C itself. The image was quite dramatic because of it.

*Message #6 Posted by **Dan W** on 17 Sept 2011, 1:13 a.m.,*
in response to message #1 by Eddie W. Shore

I bought one of these cube light tents. It usually comes with the tent, some base to put the item on, and a couple of lights, and a small tripod.

The tent gives very good even illumination, but the camera needs to be on a tripod, mainly because I stop it down all the way to get a good depth of field.

Also, adjust the white balance manually, and clean clean clean the calculator. Bracket the exposures.

Here's an example. Note all the specks of dust and lint. I didn't clean this one all that well. Some of this can be cleaned up in PSP or Photoshop, but its best to start as clean as possible.

I used to do quite a bit of product photography. If you have a DSLR (or even better, a proper film camera :-)) then as some other members have said, a tent type soft cube works well. These can be expensive for larger ones though useful if you want a group of items in the shot. I prefer to use continuous light with these lighting from both sides. A roll background and studio flash with a softbox is nearly as good but doesn't totally eliminate reflections. If you have a simpler camera with built-in flash then you can make a diffuser very easily by placing a paper handkerchief or similar thin white paper over the flash unit to create a diffuse light. This can work surprisingly well. A white sheet can be suspended over the subject to make a simple tent to eliminate reflections from the side while bouncing light around the subject to give fill in for the shadows. I hope this gives you some ideas.

Re: Any good way to take pictures of calculators?

*Message #9 Posted by **Dieter** on 17 Sept 2011, 7:02 a.m.,*
in response to message #1 by Eddie W. Shore

As already discussed here, the key to suceess is proper lighting. Direct, frontal light (either flash or continuous light) is not an option. The problem is not the flash - that's a great light source with many advantages, virtually every professional product photo is lit by (studio) flash. The point is: you must not use a tiny in-camera flash that points directly onto a shiny surface. ;-)

However, there is a another option that has not been mentioned yet: Want a plain vanilla picture of your calculator? Simple put it on your scanner. Most devices have sufficient depth of field to keep the whole device in focus.

Dieter

Re: Any good way to take pictures of calculators?

*Message #10 Posted by **Dave Shaffer (Arizona)** on 17 Sept 2011, 7:31 a.m.,*
in response to message #1 by Eddie W. Shore

Are you hoping to do just a few calculators, or is this likely to be an on-going project?

If the latter, then some modest effort to put together a good set up will be worth your while. You want the most diffuse light possible, mostly from the sides and top - and just a bit from the front.

The suggestions by Alexander Oestert would be a good start. There is lots of stuff on the web about how to do

this.

You can make it all yourself. I use PVC piping to make frames that hold diffusing cloth (which can be white fabric of various sorts bought at Walmart or sewing supply stores). Plain light bulbs (in a reflector from the hardware store) work fine.

As noted by somebody: white balance is very critical for the best shots. Small apertures are best for good depth of field. (but generally not the very smallest: below about f/11 or f/16 diffraction actually starts to make resolution worse - this is hardly ever mentioned in the photo magazines or elswhere!! For a given camera, this is also INDEPENDENT of lens focal length, despite occasional claims to the contary. It does depend on the actual image size in the camera - the bigger the image frame, the smaller aperture you can use before diffraction effects start to get you. An 8 by 10 view camera will do fine at f/44 or even f/64, a la Ansel Adams!!!!!)

Polarizing filters might help - but to get the best benefit, you also need polarized light sources, and diffusers wreck the polarization. I'd skip this.

(From an occasional teacher of Intro to Digital Photography, at the university level.)

Re: Any good way to take pictures of calculators?

*Message #12 Posted by **Dieter** on 17 Sept 2011, 12:35 p.m.,*
in response to message #10 by Dave Shaffer (Arizona)

I do not think white balance is crucial. All digital SLRs I know of support a raw image format. In this case the white balance can be set and fine-tuned in the raw image processor - without the slightest disadvantage compared to setting WB on the camera beforehand. It may work even better.

The more crucial point is exposure. White backgrounds may lead to underexposure if the user relies on auto exposure. However, within certain limits even this can be corrected afterwards when the camera is set to raw.

Diffraction, on the other hand, is a common subject in photography groups. ;-) As you mentioned, the critical f-stop depends from the image format, i.e. the size of the image sensor in a digital camera.

For those who are not familiar with all this: it's quite simple. As the lens is stopped down, depth of field increases. In other worde, f/16 will render a wider area in the image in sharp focus than f/8. That's fine for this kind of photography, where more sharp details of the subject mean more information.

However, there is a downside. As the lens is stopped down, another effect become more and more dominant - diffraction. In simple words: at small apertures the picture becomes more and more blurred. First you barely notice it, then some fine detail is lost, and finally the picture is evenly sharp from the front to the background, but the *level of sharpness* is so low that it can hardly be considered sharp *anywhere*.

So, there must be an optimum somewhere. Up to a certain point depth of field increases, then the whole picture gets less sharp until it's no longer acceptable. This point, the critical aperture, depends from the image size. As a general rule of thumb you can say that the maximum f-number should be roughly the (diagonal) imsage size in millimeters, or, if possible, preferably only half that.

So, if you're using a regular 35 mm camera (film or digital "full frame") where the image size 24x36 or 43,3 mm diagonally, the absolute limit is something like f/45. But if possible don't stop down further than f/22. Most digital SLRs use smaller sensors with a diagonal size of 27 or 28 mm, so it is best to keep the aperture below f/16. Typical compact (point and shott) cameras finally have extremely small sensors, usually something like 7 mm, which means that you should not stop down further than f/4. But since most of their lenses are not good enough to be limited by diffraction, f/5,6 or in some cases even f/8 do not make much difference. That's exactly the reason why virtually all compact cameras with manual aperture setting do not allow the user to stop down further than f/5,6 or f/8.

The interesting point finally is this: Yes, you should keep the aperture wider open the smaller your camera's image sensor is. But, and that's important, although the aperture now is wider, *you will not lose any depth of field*. Due to certain physical reasons, f/16 in a typical digital SLR and f/4 in a common point and shoot camera do not only show the same amount of diffraction, they also (ceteris paribus) will produce *the same depth of field*. In other words: you do not gain or lose anything, regardless which format you use. The same result (in terms of both DOF and diffraction) is only obtained at different aperture settings.

That's also the reason why 8x10" field cameras have no problem with f/64 or more. Since their image format is roughly 8x as wide and high as that of a "usual" camera, f/64 results in the same amout of diffraction (and also the same depth of field) as f/8 with the latter.

15c LE sqr and sqrt problems

*Message #1 Posted by **CAD_Jockey** on 16 Sept 2011, 9:08 p.m.*

Anyone having issues with their HP 15c LE, regarding the square and square root keys? I'm getting different (incorrect) results on the 15c, compared to my 33s, using the same key strokes.

Example on the 15c:

25 sqrt results in 25.00

25 g x^2 results in 300.00 (33s and pc emulator say 625)

Any thoughts on this? I have an email into HP support also.

Thanks, Dave

Re: 15c LE sqr and sqrt problems

*Message #2 Posted by **Michael de Estrada** on 16 Sept 2011, 9:11 p.m.,*
in response to message #1 by CAD_Jockey

I don't have a problem on my 15C LE. Sounds like a faulty chip. Did you do the checksum self test #2 ?

Re: 15c LE sqr and sqrt problems

*Message #3 Posted by **CAD_Jockey** on 16 Sept 2011, 9:53 p.m.,*
in response to message #2 by Michael de Estrada

How do you know if the check sum (test #2) works? I don't get an error message, just "ChE--A3A3h", then "2009-07-02", and "C 2008 hP". Second two screens are the copyright info...not sure what screen 1 is.

Also, is the self test (X and ON keys) almost instant? manual says 23-25 seconds of the word "running", but all I see is it flash by nearly instantly, going to all segments lit.

Thanks, Dave

Re: 15c LE sqr and sqrt problems

*Message #4 Posted by **Michael de Estrada** on 16 Sept 2011, 10:13 p.m.,*
in response to message #3 by CAD_Jockey

Wierd. Everyone else gets checksum ChE--FFFFh and the date should be something like 2011-04-15. I wonder if the chip was flashed with the wrong ROM like for the 12c+.

Re: 15c LE sqr and sqrt problems

*Message #5 Posted by **Jeff O.** on 16 Sept 2011, 10:20 p.m.,*

in response to message #3 by CAD_Jockey

That is the wrong check sum and date for the 15C LE. It sounds like the data for the 12C AE. Maybe your 15C LE got flashed with the wrong ROM. That would also explain your other odd results. I believe that the upper left key on the 12C is N, when you enter a number and press N, nothing happens to the display. I believe that g, N is "x12", multiplying the keyed in value by 12.

Don't send it back. You have a rare collectible!

Re: 15c LE sqr and sqrt problems

*Message #7 Posted by **Dave Britten** on 16 Sept 2011, 9:23 p.m.,*
in response to message #1 by CAD_Jockey

Do you have USER turned on? Pressing those 5 keys will run programs A through E if you do, and you can get some rather unexpected results if you aren't paying attention. If it's on, press USER (f RCL) again to turn it off. I'm getting correct results on my machine.

Re: 15c LE sqr and sqrt problems

*Message #8 Posted by **Michael de Estrada** on 16 Sept 2011, 9:28 p.m.,*
in response to message #7 by Dave Britten

Not if you type a shift key first. So 25 g x^2 will still result in 625. Also 25 f A will reverse and give 5.

Re: 15c LE sqr and sqrt problems

*Message #9 Posted by **Eddie W. Shore** on 16 Sept 2011, 9:46 p.m.,*
in response to message #1 by CAD_Jockey

I get the correct answers.

Re: 15c LE sqr and sqrt problems

*Message #10 Posted by **Jeff O.** on 16 Sept 2011, 10:11 p.m.,*
in response to message #1 by CAD_Jockey

Are you sure you are not in complex mode? (Is there a little "C" annunciator in the lower right corner of the display?) If so, press g, 5, 8. (g, CF, 8)

Sorry if you are well aware of complex mode, but inadvertantly being in complex mode and getting unexpected results is a common problem expressed here.

If this is not your problem, I'd try resetting your calculator via the reset hole under the battery cover, or with the calculator off, press and hold the minus key, press ON, then release both. Either action will clear memory

and reset the calculator to its default state.

Re: 15c LE sqr and sqrt problems

*Message #11 Posted by **Michael de Estrada** on 16 Sept 2011, 10:18 p.m.,*
in response to message #10 by Jeff O.

It won't matter, unless there is a non-zero value in the y stack register. See above, sounds like it's a firmware problem.

Re: 15c LE sqr and sqrt problems

*Message #12 Posted by **Jeff O.** on 16 Sept 2011, 10:29 p.m.,*
in response to message #11 by Michael de Estrada

I don't believe that is his problem, see my other post (I think he got the 12C AE firmware.) But I will point out that the stack y value value does not matter with the 15C in complex mode for sqrt or x^2, that is the 32S, 32sii, 33s and 34s paradigm. (I'm sure you knew this :-)) With a bit of calculation, I found that sqrt(25.0000 + i 1224.744872) is 25.0000 + i24.4949, which of course would just show 25.00 in the display. Pretty unlikely that he would have accidentally gotten that complex value entered.

Edited: 18 Sept 2011, 1:58 p.m.

Re: 15c LE sqr and sqrt problems * THE ANSWER *

*Message #13 Posted by **Miguel Toro** on 16 Sept 2011, 10:29 p.m.,*
in response to message #1 by CAD_Jockey

I found what the problem is!!!

You have a 12c+ with the skin of a 15c :-(

Those are the results if you make the same operation with the same key in a 12c

25 [n] = 25

25 [g] [12x] = 300

So the wrong firmware

Miguel

Looks like your cat was walking on the keyboard while you were typing this. :)

You're correct though, the 15c firmware has never been released and HP would have to make that available to anyone that wants to upgrade to a bug-fixed version -- if that ever happens. The only alternatives would be for HP to set up some place to send calculators to for the upgrade OR some group of people here decide to write their own firmware for the 15C and make that freely available.

Re: 15c LE sqr and sqrt problems * THE ANSWER *

*Message #23 Posted by **Thomas Radtke** on 17 Sept 2011, 4:08 a.m.,*
in response to message #22 by Katie Wasserman

One question: The firmware appears not to be protected (might be a wrong assumtion). So, if a 15C LE goes bad, one could take a 12C+, reflash it, and give keys and bezel of the 15C LE to it? Would that work?

Re: 15c LE sqr and sqrt problems * THE ANSWER *

*Message #24 Posted by **Katie Wasserman** on 17 Sept 2011, 8:07 a.m.,*
in response to message #23 by Thomas Radtke

I think that you're asking if there is small hardware difference in the 12C+/AE vs the 15C LE that the firmware looks at and will only run on the proper hardware. If so, I suspect not since we have one reported case where the factory appears to have sent out a 15C LE with 12C+ firmware. Probably the check would be there either way but maybe not.

Until HP releases a fixed firmware for the 15C LE this is a moot point since only beta testers would have a copy of the firmware anyway and as far as I know there is no way to extract the firmware from an existing 15C LE and save a copy of it.

-Katie

That makes sense... so could he take a 12c on the side, make calculations using the same keys of his (un)lucky 15c and see if they give the same answers...?

It could have been just one board got mixed up, but what are the odds that just one got from a tray or bin of 12C+ boards to a 15C tray or bin? I think it would be very unlikely. More likely would be that one whole bin or tray would be confused. Of course we don't know exactly how they do things, but I bet there are more like this.

in response to message #35 by Paul Gaster

given the back labels are likely shuffled semi-randomly (put on in no particular order) it is no surprise that the unit's limited edition number appears between closely numbered ok units.

my own manufacturing experience is with firmware being loaded right at the end of the production line just before units are boxed up for shipping (CB430 winCE boxes loaded with o/s and machine control software). in that way completed units can be stockpiled in the factory and the absolute latest firmware added just before they go out the door. in the case of HP calculators, this would mean final testing and loading firmware would be combined into a single step on a single jig.

so it could be a whole run of calculators have had the wrong firmware loaded. i'd certainly like to see photos of the unit in question to verify:
- back label markings (12c or 15c)
- keyboard escutcheon (12c or 15c)
- key labelling (12c or 15c)
- badge next to LCD (12c or 15c)

including two different firmwares, that gives 32 possible assembly combinations. if the unit in question has mismatched physical components (like 12c key labelling and 15c escutcheon) then it COULD be a rare collectable unit indeed.

btw, i must ask anyone at HP who is listening: how many times in the past has HP shipped a calculator with the firmware or PCBs or ROMs for a different model fitted? i'm picking this instance is probably the absolute FIRST...

in response to message #40 by CAD_Jockey

After a few emails with HP tech support, which I mentioned the suspicion of a firmware issue, I got this reply:

> Quote:
>
> Please try running the following self test for the calculator: -Turn calculator off; -Press and hold key ON; -Press and hold key [divide]; -Release ON; -Release [divide]; -Press all the keys. Starting with key [n] and one by one towards the right until [divide]. Go to the next row, staring with key [yx] until [x]. (Note: that key [Enter] must be pressed twice, when doing the third and fourth row.)
>
> If after pressing all the keys the result on the display is "12", then this is using 12C firmware. Please let us know the result you get after completing this test.

Guess what mine displays? "12"

Shall I go buy lottery tickets tonight?

*Message #45 Posted by **CAD_Jockey** on 19 Sept 2011, 9:41 a.m.,*
in response to message #44 by Eddie W. Shore

HP tech support has advised me to return the unit to my place of purchase, in this case buy.com.

I'm a bit surprised, considering the unusual issue, that they didn't want it returned directly to them.

At least buy.com provides a return label, I just hope it doesn't take forever, and that they don't run out in the mean time.

Wow, this was probably only made a few units after mine (CNA1310KBJ, LE #02195) if I'm correct about the last part of the serial number being a sequential production code. So at least maybe this means that not an entire production run got misprogrammed.

Re: 15c LE sqr and sqrt problems

*Message #53 Posted by **Paul Gaster** on 17 Sept 2011, 6:13 p.m.,*

Maybe they ran the 15C calculators first, then switched the machine over to flashing the 12C firmware before all the 15C units were through the line somehow.

Re: 15c LE sqr and sqrt problems

*Message #54 Posted by **Masaki Adachi** on 17 Sept 2011, 8:03 p.m.,*
in response to message #39 by robert rozee

I first thought its odd that factory's EOL (end of the line) test did not catch this. But further thinking, this makes sense. The line was originally set up to produce 12C only therefore all they needed to test at the final inspection was if the machine fires up. For the same reason, firmware was probably flashed at the PCB assy level, or even at the chip level.

When they brought in variable (hp-15C) they probably did not bother to update the quality process...

There is one more thing puzzles me. HP 15C LE has two (2) 2032 batteries vs HP12C+ (Platinum)has only one (1) 2032 battery. How did they get a 12C board into a 15C case with two batteries? So is it running on a single battery, and there are no contacts for the second?

Re: 15c LE sqr and sqrt problems

*Message #57 Posted by **gene wright** on 19 Sept 2011, 5:02 p.m.,*

*Message #58 Posted by **Jeff O.** on 19 Sept 2011, 8:51 p.m.,*
in response to message #56 by Kerem Kapkin (Silicon Valley, CA)

"12C+" is an informal name for the current production 12C. It is an emulation of the original 12C rom on a modern processor. The 12C Platinum is totally different hardware and software. (I am not a hardware or software expert, the preceding is based on my more or less layperson perspective regarding what I have read here over the years.)

Re: 15c LE sqr and sqrt problems

*Message #59 Posted by **Michael de Estrada** on 19 Sept 2011, 9:17 p.m.,*
in response to message #58 by Jeff O.

Correct. It's confusing, because HP never documented the changeover from 12C to 12C+. The extra large battery cover is the sign that it's a 12C+ and not an 12C. AFAIK the 12C 25th AE is the same as the original 12C and the 12C 30th AE is the same as the 12C+. The 12CP is its own animal. You are paying an extra $10 for a fancy gift box. Ironically, it appears that HP flashed the 30th AE ROM with an older buggy version of the code than the regular 12C.

Michael, it,s actually a 12c Platinum 25th Anniversary Edition, which is a dual RPN/ALG version that was a re-design of the all-silver 12c Platinum. i.e it is a little faster than the original 12c, and has the greater number of program steps, uses 1 cell.

Re: 15c LE sqr and sqrt problems

*Message #61 Posted by **M. Joury** on 19 Sept 2011, 9:42 p.m.,*
in response to message #56 by Kerem Kapkin (Silicon Valley, CA)

As noted by another poster the 12C+ is not the same beast as the 12C Platinum. All 12C+'s (AFAIK) have 2 x 2032 batteries in parallel. You change one at a time to prevent data loss. Unlike the original 12C and 15C with 3 batteries, the removal of both batteries *WILL* result in memory loss no matter how quickly you do it--at least I certainly have never managed it.

That said, the newer 12C Platinums also have 2 x 2032 batteries in parallel. Mine certainly does. These are still labeled as "New Design" on the HP web site.

Cheers,

-Marwan

That's probably because they are comparing it to the the "old" design as the all-silver Platinum without the parenthesis. I think the 2 cell Platinum adaption was a silent roll-out just to stay in-line with the 12C+ *for production purposes*, which makes sense from a production point of view (why have two different moulds if you don't need to?).

USB to Serial Cable for WP-34S

*Message #1 Posted by **Dan W** on 16 Sept 2011, 4:51 p.m.*

This comes up a lot so I searched the forums and this is a summary of specific cables people have said work. Probably any FTDI based cable will work. Avoid cheap Chinese cables. Win7 and Vista have native drivers for FTDI USB-serial devices. Samba 2.10 runs fine under Windows 7.

Examples:

Digitus (FTDI) USB-to-Serial-Adapter

ES-U-1001-R100 USB-to-RS232 (FTDI) adapter (Based on the latest FTDI "R" series chip set technology). Sold by EasySync, but this is the FTDI cable product.

USB-COM232-PLUS1 (This is an FTDI adapter from USB to RS232, no cable)

FTDI US232R-10 (Same as the EasySync product)

It had to happen sooner or later revisited

*Message #1 Posted by **Martin Pinckney** on 16 Sept 2011, 4:36 p.m.*

The TAS 15c LE we discussed yesterday now over $300. Apparently the bidders are unaware of the new model, they did not take the out offered by the seller, and they don't read this forum.

He will now be able to claim that he forewarned them that they were not getting an original.

So, unfortunately, we (who emailed him) have unwittingly aided his original fraud attempt.

Re: It had to happen sooner or later revisited

*Message #2 Posted by **Michael de Estrada** on 16 Sept 2011, 4:52 p.m.,*
in response to message #1 by Martin Pinckney

What makes you think the seller is a "he" ?

Regardless, the original HP 15C retains its value

in response to message #2 by Michael de Estrada

Hunch.

Re: It had to happen sooner or later revisited

*Message #5 Posted by **Paul Gaster** on 16 Sept 2011, 6:01 p.m.,*
in response to message #1 by Martin Pinckney

> Quote:
>
> He will now be able to claim that he forewarned them that they were not getting an original.

I understand, and he can claim that, but his claim would be BS in my opinion. The top bidder may have put in a high top bid and has not come back to check on the auction. Ebay will automatically increase the buyer's bid and let him know by email if he has been outbid. Even if the person came back to check on things, how would you catch that something changed in the auction? The main picture is the same and if you are bidding on multiple items you probably won't go into each item to read it again. You would typically just look at your list of items you are bidding on. You read the listing the first time before bidding and don't expect people to make

radical changes to their listings later. You shouldn't have to watch people like a hawk to make sure you don't get screwed.

Keep in mind my little rant here isn't directed at you. I am upset with the seller for how this has been handled.

What other retailers will get 15c LE?

*Message #1 Posted by **MBlount** on 16 Sept 2011, 3:58 p.m.*

We've heard that 10,000 would be produced. Apparently buy.com got either 1,000 or 2,000 units based on the serial numbers people have received. Samson Cables has sold out of how ever many they got.

Surely other retailers are going to get some too. The press release was featured on many of the electonic websites I frequent. I can't imagine HP limiting it to just two online stores. I would have figured that Best Buy, Office Max, Office Depot, and Amazon.com would get at least 1,000 units each. Hopefully more will show up shortly.

Re: What other retailers will get 15c LE?

*Message #2 Posted by **Jim Johnson** on 16 Sept 2011, 4:21 p.m.,*
in response to message #1 by MBlount

Also, Fry's Electronics was slated to get some of the HP-15cLE's too.

Re: What other retailers will get 15c LE?

*Message #3 Posted by **Eddie W. Shore** on 16 Sept 2011, 10:01 p.m.,*
in response to message #2 by Jim Johnson

Fry's - yes. The others (Best Buy, Target, etc) I don't expect they will sell the 15c

Re: What other retailers will get 15c LE?

*Message #4 Posted by **Adam Vaughn** on 16 Sept 2011, 6:10 p.m.,*
in response to message #1 by MBlount

I just got my HP 15C LE from buy.com, and the edition number is 02103. So I'm guessing they either got more than 2000, or I got one of the very last ones from the run they bought (which is entirely possible). -Adam

Re: What other retailers will get 15c LE?

*Message #5 Posted by **M. Joury** on 16 Sept 2011, 6:16 p.m.,*
in response to message #4 by Adam Vaughn

Or serial numbers were not sequential. For what it's worth buy.com told me that they had 1,000 in stock the very first morning they went on sale.

Cheers,

-Marwan

Re: What other retailers will get 15c LE?

*Message #6 Posted by **Eric Rechlin** on 16 Sept 2011, 10:03 p.m.,*
in response to message #5 by M. Joury

Buy.com didn't stock anything. They just use the same drop shipper that ships for a bunch of other big companies.

Re: What other retailers will get 15c LE?

*Message #7 Posted by **Michael de Estrada** on 16 Sept 2011, 10:30 p.m.,*
in response to message #6 by Eric Rechlin

Exactly. Both my Buy.com and CostCentral orders shipped from "Distribution Center, Olive Branch, MS." Even the internal packing lists have the same source.

Re: What other retailers will get 15c LE?

*Message #8 Posted by **Steve Fennell** on 16 Sept 2011, 10:42 p.m.,*
in response to message #7 by Michael de Estrada

I had a pre-order with SC and it also shipped from Olive Branch, MS. Same as the 12C and 15C I ordered from buy.com. Didn't realize they all used the same distribution center.

Re: What other retailers will get 15c LE?

*Message #9 Posted by **Michael de Estrada** on 16 Sept 2011, 10:36 p.m.,*
in response to message #6 by Eric Rechlin

See above post. Better check all your calcs before shipment to make they aren't a 12C AE ROM in a 15C LE skin.

Re: What other retailers will get 15c LE?

*Message #10 Posted by **M. Joury** on 16 Sept 2011, 11:16 p.m.,*
in response to message #6 by Eric Rechlin

If that is the case why are some out of stock and some just beginning to ship?

I know that this was discussed before but that never got explained to my satisfaction. If they are dropped shipped, as it appears, then is there stock set aside for each retailer? That would of course explain it but it would still allow individual retailers to list "stock on hand" and retain some meaning to the numbers.

What I am getting at is that buy.com knew that they had a certain amount of units to sell and that when they were done they pulled the listing. Other retailers using the same drop shipper started actually "shipping" units after buy.com was apparently all out of stock. If everyone drop ships out of the same stock why isn't it simply first come first served and whoever sells the most wins? Seems to me that retailers have stock reserved for them. If that is the case saying that they have x number of units on hand does provide some idea of how many have been sold. Since I am not in retail this is obviously all guesswork from seeing how things played out from the moment buy.com posted the 15C through when they pulled the listing and said that they were out of stock, followed by other retailers beginning to ship.

At any rate it would appear that serial number are even more meaningless as a guide to how many a retailer had available since they can be pulled off the shelf in any order by the drop shipper.

Cheers,

-Marwan

Re: What other retailers will get 15c LE?

*Message #11 Posted by **Michael de Estrada** on 16 Sept 2011, 11:49 p.m.,*
in response to message #10 by M. Joury

I think this is common practice with many online stores that do not have a physical brick and mortar store or warehouse. I recently wanted to buy a particular US branded bicycle that is made in Taiwan. It was listed at several online stores as out of stock, but this one store claimed to have it in stock. After placing the order they emailed me that they had made a mistake and did not have one available. When I inquired further they told me that they and all the other "stores" get their stock from one distributor in the USA, such that once the inventory was depleted, then it was unavailable to everyone.

It's clear, however, that some of the HP 15C LE stock has found its way to the sellers themselves like Samsom Inovations, who are proceeding to price gouge.

Re: What other retailers will get 15c LE?

*Message #12 Posted by **Dwight Sturrock** on 16 Sept 2011, 11:57 p.m.,*
in response to message #1 by MBlount

I just received serial # 2612 from Samson Cables (ordered through Amazon on 9/10/11). Price was $99, shipped USPS from Indianapolis, IN.

Process For Getting a Flashing Cable for WP 34S

*Message #1 Posted by **Dan M (Vermont, USA)** on 16 Sept 2011, 1:08 p.m.*

So the WP 34S bug has bitten me, and I want to jump on that train.

But I don't have a cable, and apparently I don't understand the process of how to get one...

I've sent Gene email 2x via this forum's email capabilities, but have not heard from him to (1) acknowledge the receipt of my request and that I am in the queue and (2) let me know his PayPal info so I can give him the reimbursement that he deserves.

So...what has happened? a. I did something really stupid or wrong, or just don't have enough patience (quite probable, even likely) b. Gene is extremely busy and will get to me eventually (very believable) c. This Forum's email capabilities are not 100% reliable (certainly possible) d. Something completely different (that could happen as well)

...and what should I do in order to obtain a cable, and know that I will get one in due time?

PS: I am unable to make it to the conference next weekend.

Thanks,

Dan M.

Re: Process For Getting a Flashing Cable for WP 34S

*Message #2 Posted by **Dan W** on 16 Sept 2011, 2:56 p.m.,*
in response to message #1 by Dan M (Vermont, USA)

Once those technical issues are resolved, the next step, probably for most of us, is a USB to RS232 converter, since the cable Gene provides is serial, and most of up probably no longer have a serial port.

Is there s known good solution for a specific converter? I read earlier the FTDI was working well. I have one such converter, the AXE027 but unfortunately it terminates in a 3.5mm audio plug (Tx, Tx, Gnd only).

*Message #3 Posted by **Gerry Schultz** on 16 Sept 2011, 5:54 p.m.,*
in response to message #2 by Dan W

The USB to RS232 adapter that I use is an ES-U-1001-R100 and SAMBA 2.10 with my Windows 7 laptop. It is an FTDI adapter and works fine with re-flashing the WP-34S. So google it and you'll find a vendor for it. I bought mine from Amazon.

in response to message #2 by Dan W

> Quote:
>
> most of us probably no longer have a serial port.

Wouldn't it be super cool if HP provided a native USB flashing cable with the fixed firmware for the HP 15c LE? Buyers that don't have the cable yet would be pleased to learn that they don't have to purchase a port adapter to obtain a flawless calculator.

Re: Native USB flashing cable for HP 15c LE and WP34s?!

*Message #6 Posted by **Namir** on 17 Sept 2011, 8:31 a.m.,*
in response to message #5 by Alexander Oestert

Getting the cable is the easy part. USING the cable with the software and various Windows version is very very difficult and frustrating!!!

> Getting the cable is the easy part.

Well, for someone not knowing this forum and the WP34s project, it's not easy at all.

I assume the normal way for a 15c LE customer would be to stumble upon the firmware bug and contacting HP service. They should have a USB flashing cable and an easy to use software readily available to send out. I think the only acceptable way for a non-geek customer would be to plug the cable in at both ends, start the software and have it take care of the rest, i.e. download the latest firmware from the Internet and install it on the calculator automatically. Ideally, even the erasing and resetting would be done by that software. Anything more complicated than syncing an iPhone to iTunes is not ok.

Re: Native USB flashing cable for HP 15c LE and WP34s?!

*Message #8 Posted by **Marcus von Cube, Germany** on 18 Sept 2011, 2:42 p.m.,*
in response to message #7 by Alexander Oestert

HP has some software replacing SAM-BA, called MySamba. It hasn't worked for WP 34S. I don't know why but it may have to do with the fact that out firmware is shorter than 128KB and

that we don't clear the flash before writing it again. But for a replacement firmware for the 15C LE, MySamba might be the best solution.

A cable which directly plugs into USB instead of a serial port would have been much easier to design and wouldn't have the power draw problems of the current offering. It's basically a single FTDI chip.

Re: Native USB flashing cable for HP 15c LE and WP34s?!

*Message #9 Posted by **Jeff O.** on 18 Sept 2011, 7:22 p.m.,*
in response to message #8 by Marcus von Cube, Germany

I almost always use MySamba for flashing wp34s. I create the full rom, back-up regions and all, according to instructions you provided (copy /b wp34s.bin+wp34s.dat+ etc.).

in response to message #12 by robert rozee

Quote:

but then hindsight is a great thing!!

Oh well, not too much hindsight needed on this one, in my opinion.

The 50G has a USB port and an SD slot that can be used for firmware upgrades. I keep reading on this forum for quite a long time how wonderful the 35s could have been if it only had a USB port. Bot no one ever asked for a weird pogo stick thingy! ;)

Re: Native USB flashing cable for HP 15c LE and WP34s?!

*Message #14 Posted by **Marcus von Cube, Germany** on 20 Sept 2011, 8:43 a.m.,*
in response to message #13 by Alexander Oestert

The trouble is that the pogo connector comes for free: no components on the board, just the pads, and just a whole in the back of the calculator. If HP had added an FTDI converter chip and a USB socket, manufacturing costs would have been seriously affected. They could have made the proper pads on the board but then the soldering and cutting of the case would be customer's homework.

Native USB inside the processor is not an option because the SAM-BA boot loader expects a serial device. The boot code is in the masked ROM part of the chip and cannot be changed.

Have you seen this plug before, or could you make one?

I can do the electronics, the plug is the real problem. I've never seen anything like it before and the best I could do would be to come up with something you'd need to hold in place while re-flashing. Given the flaky nature of SAMBA and the ARM boot loader, introducing a shaky handed person into the mix is going to be bad news.

Re: HP-15C LE Bug Reports

*Message #2 Posted by **John B. Smitherman** on 16 Sept 2011, 12:37 p.m.,*
in response to message #1 by Katie Wasserman

Thanks Katie. Have you had a chance to look at the 15cle trig functions to see if there are any improvements over the 33s and 35s?

Regards,

John

Re: HP-15C LE Bug Reports

*Message #3 Posted by **gene wright** on 16 Sept 2011, 12:57 p.m.,*
in response to message #2 by John B. Smitherman

The 15c LE trig functions are the 15c trig functions. The ONLY bugs really ought to be limited to handling the placement of an emulator running 150-175X faster than the original into the 15c LE shell.

Display updates fall into that category.

Computing sine, cosine, LN, etc. should not be affected in any way, since the code to computer those is the 15c code. Period.

Really.

Re: HP-15C LE Bug Reports

*Message #4 Posted by **John B. Smitherman** on 16 Sept 2011, 2:31 p.m.,*
in response to message #3 by gene wright

> Quote:

Re: HP-15C LE Bug Reports

*Message #7 Posted by **gene wright** on 16 Sept 2011, 3:10 p.m.,*
in response to message #6 by Tim Wessman

Verify all anyone wants. IS NOT is the proper response.

The 15c rom is inside this thing. Only the links in or out to the new hardware are different as well as the chip the code is running on.

I am not aware of ANY bug ever found in beta testing that was not somehow related to the speed differential...which is almost certainly the cause of the display craziness.

So, 99.9999999% sure all can relax. Test away! :-)

Re: HP-15C LE Bug Reports

*Message #8 Posted by **Katie Wasserman** on 16 Sept 2011, 3:29 p.m.,*
in response to message #7 by gene wright

I'll agree. It's very unlikely that any math error exists in the 15C LE that does not exist in the 15C. However it's not impossible as there could be a bug in the emulator, the compiler used to generate the object code for the emulator, or the ARM chip itself.

I would not agree with Gene's nine 9's of certainty, I'd only give it 5 nines.

-Katie

Re: HP-15C LE Bug Reports

Guess what? That's where most, if not all, of my KEMU bugs existed. Although there were some bugs in AVR gcc I needed to work around -- but admittedly I'm surprised that toolchain works as well as it does in the first place. Anyway being hosted on several platforms helped knock out such issues.

There is a deceptive amount of functionality which can perform correctly as some instructions appear infrequently, see little coverage, and may only be exposed on some rom versions. One weird problem I only found on the 16c was of the window scroll indicator (left "." in the ".b" radix indicator) not being enabled. I traced this to a bug in the NUT "C=-C-1" instruction where effectively the carry bit is always set as a result of the operation, but wasn't due to my interpretation of the HP documentation.

Many other NUT instruction semantic dark corners exist in the original HP docs. And regrettably I keep forgetting to credit Monte Dalrymple's NEWT specification as an excellent reference which helped disambiguate numerous points. Monte himself was also quite helpful and always responsive to my questions.

REmember all that conjecture about the "lost" ROM? I guess the good news is, it was never lost after all!

Re: HP-15C LE Bug Reports

*Message #11 Posted by **Martin Pinckney** on 16 Sept 2011, 4:19 p.m.,*
in response to message #10 by bill platt

If the discussion you refer to, Bill, is the same one I remember, I think Tim stated that it was the "source code" (high level, I suppose) he did not have, rather than "binaries" (ROM image, I imagine).

I am definitely out of school on this; I just remember the discussion because I had made some incorrect assumptions about what was meant by "missing" code.

Re: HP-15C LE Bug Reports

*Message #12 Posted by **Eric Smith** on 16 Sept 2011, 3:48 p.m.,*
in response to message #7 by gene wright

Actually I'm fairly certain that the display blinking problem is totally unrelated to the speed increase. In the original 15C the display blink was done in hardware using a clock completely asynchronous to the instruction execution. If the microcode told the display to blink, it didn't affect the blink phase. In the new 12C and 15C LE, it appears that the

simulation of the instruction to make the display blink effectively resets the blink phase. This would cause "display craziness" even at normal speed.

However, I haven't studied the actual code used in the new 12C and 15C LE, so I could be entirely mistaken.

Also, there definitely were other bugs found in beta testing that were unrelated to the speed differential. I provided instruction traces to Cyrille to help track down some of them.

IMNSHO, "is not" is too strong a statement. It definitely was the case during testing that there were bugs that affected computations in subtle ways. The known bugs have been resolved, but it is not impossible that there are others still lurking. I'll concede that it is somewhat unlikely that a serious computational bug remains at this point.

My concern is that a simple Cx,y was causing troubles, so, I can imagin when Complex stacks or complex matrices were created in programs or directly from keyboard. Another important point to test: the i addresser (i)...

Re: HP-15C LE Bug Reports

*Message #14 Posted by **Dave Britten** on 16 Sept 2011, 4:08 p.m.,*
in response to message #13 by Artur-Brazil

The results I was getting from Cy,x were never incorrect, numerically. Just for some reason, if my program received parameters that would cause it to loop through the Cy,x instruction exactly three times, the screen would flash as though there had been an error. The results were always correct, though. It's probably some silly race condition.

I've been doing a few little programs with matrices and indirection, and haven't found any issues with those yet.

Re: HP-15C LE Bug Reports

*Message #15 Posted by **Eric Smith** on 16 Sept 2011, 4:41 p.m.,*
in response to message #14 by Dave Britten

Actually that does sound like an outright bug in the simulation code rather than just a race condition. It sounds like something in the code is setting the internal CPU flag (not user flag 9) that tells the main microcode loop to use flash mode. While it didn't give incorrect numeric results in this case, a bug that results in an incorrect CPU flag setting could cause all manner of other problems.

I'll try your code on my own simulator, which is unrelated to HPs, and see what I get.

Re: HP-15C LE Bug Reports

*Message #16 Posted by **Gerry Schultz** on 16 Sept 2011, 5:41 p.m.,*
in response to message #12 by Eric Smith

To add to Eric's comments; the bugs reported, so far, are not in the 15C+ issued last October at HHC2010. So they are probably not related to the speed increase but induced by patches made to the firmware since last October.

in response to message #19 by Dan W

Yes

Re: HP-15C LE Bug Reports

*Message #21 Posted by **Mike Morrow** on 16 Sept 2011, 7:24 p.m.,*
in response to message #18 by Katie Wasserman

I cited this several days ago. However, rather than locking out the buggy old tests that can generate Error 9, it would be much more desirable to make them work on the 15C-LE, without always generating the Error 9 condition, *and without corrupting memory*.

The original self tests appear to actually test some things. The program memory corruption that I noted

last week when **ON plus *** or **ON plus +** tests are performed seem to occur as memory is tested. It's not obvious why the old tests should be corrupting program memory. The problem could be potentially serious and it could still lurk, if the only solution to correct the problems with the old self tests is to prevent their initiation.

The **new** tests don't appear to test anything except:
1. All LCD segments can be activated, and
2. The firmware date, checksum, and copyright texts can be read from the firmware, and
3. The keyboard contacts can be tested.

With respect to the checksum shown in new self test 2, I wonder if that is a result of the test, or just a value stored in the firmware? What is shown for the 2011-04-15 firmware is FFFFh. (How likely is that?) It seems to be a number stored in firmware that has *no real* significance as a test. Especially when the checksum is a bogus and arbitrary FFFFh!

Re: HP-15C LE Bug Reports

*Message #22 Posted by **Lincoln R.** on 16 Sept 2011, 7:49 p.m.,*
in response to message #21 by Mike Morrow

1 in 2^16, so still better than your chances of winning the lottery. Including a fake checksum display wouldn't make sense, why would someone bother coding that?

Re: HP-15C LE Bug Reports

*Message #23 Posted by **Dave Britten** on 16 Sept 2011, 8:56 p.m.,*
in response to message #22 by Lincoln R.

Maybe it isn't a checksum. Maybe the calculator is making rude noises because it's tired of running the self-tests.

Re: HP-15C LE Bug Reports

*Message #24 Posted by **Mike Morrow** on 16 Sept 2011, 10:56 p.m.,*
in response to message #22 by Lincoln R.

I don't believe that performing new self "test" 2 initiates a firmware memory scan that generates a checksum each time the self test is performed. I believe that self "test" 2 does nothing more than look at some pre-loaded text with the pre-stored checksum, the pre-stored firmware date, and the pre-stored copyright date, without actually testing **anything**. It appears that a checksum is supposed to be determined in the firmware generation process, then stored for recall whenever new self "test" 2 is performed.

It is *not* very probable that the real firmware checksum is FFFFh. That looks more like a dummy value that never got changed to reflect the real checksum of the firmware installed.

Now with respect to why there would be a fake checksum, just answer the question "What difference would it make?"

I certainly *wish* that self test 2 actually performed a checksum of the firmware image...but I doubt that's what is taking place. I will be happy to learn differently from knowledgeable people from the 15C-LE design team.

A lot! The checksum is *usually* used to determine if a bit (or bits) has changed in the ROM/Flash. So it should be calculated on what's actually there *every time* the test run. If it is not the expected value, you know that what's in the ROM/Flash is not what is supposed to be.

BUT now if it just always returns the same value, irrespective of what's actually calculated on the ROM/Flash image, you would never know if there was an error in your firmware. This is even more inportant now with Flash than with ROM.

So how do they know if the production line flashing was successful? (Not that production checks it anyway given that a 15C LE has benn shipped with 12C+ code!! - in my company there'd be hell raised, I for one would be crapping all over my MD)

There are people who read this list that know the answer to the question:

"Does new self test 2 actually calculate a checksum of the stored firmware image, or does test 2 simply report a stored checksum that was calculated when the firmware image was compiled externally?"

A second question would be:

"Is FFFFh the checksum of the existing 15C-LE firmware, or some dummy value? "

You can examine the postings to this forum since September 9, when the first 15C-LE units reached the gamma testers, to see if particular issues have already been identified.

Simple TVM Routines for HP-15C

*Message #1 Posted by **Chris Mccormack** on 16 Sept 2011, 8:55 a.m.*

I just posted an article with simple time value of money routines for the HP15C. (I've also ported these to my wife's HP11C and the HP33S.) While not as fancy as the program in the *HP-15C Advanced Functions Handbook*, they only take up 23 program steps, three labels, and two memory registers. Combine this program with the equation for compounded interest (PVF = (1+r)^N) and the adjustment to the present value annuity factor when payments are made at the **beginning** of the month ($PVAF_{beginning} = PVAF_{end}(1+r\}$) and you can handle the book examples.

After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #1 Posted by **nick lidakis** on 16 Sept 2011, 8:20 a.m.*

This is from an idiot savant who is not an expert in all that is RPN, or calculators, or math...

Now that we have the 15c LE, is there any chance of seeing a basic RPN calculator for HP? It's difficult to justify the high price of the 15C LE to someone who needs a basic scientific calculator.

For instance, I've seen the Casio fx-260 being sold (http://www.casio.com/products/Calculators_%26_Dictionaries/Scientific_%26_Financial/FX-260Solar/) on most CUNY college campuses and it does suffice for things like general chemistry. Though, it was a lot easier working out calculations after getting a used RPN (hp 48g) that with an algebraic.

But teaching and expounding on the benefits of RPN to a calc or math newbie and then having to recommend a $89 HP calc for them to use is a major fail on HP's part.

Why isn't there a simple RPN scientific from HP as a gateway drug to other RPN calcs in HP's line?

P.S. The fx-260 fits nicely in my paramedic work shirt pocket with room to spare for my protocol notes. The HP 15c, alas, does not. A small, basic RPN scientific shirt pocket calc sure would be nice...

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #2 Posted by **Chris McCormack** on 16 Sept 2011, 8:59 a.m.,*
in response to message #1 by nick lidakis

A simple calculator would be nice. My high school sophomore was told he couldn't have a programmable calculator for the exams. That disqualifies the HP11C, HP15C, HP33S, HP35S, HP49G, HP49G+, and HP50G he could have used!
(Of course, I suspect if the teacher was pressed the non-graphical models would be allowed.)

> Of course, I suspect if the teacher was pressed the non-graphical models would be allowed.

In my introductory calculus class, I explicitly allow programmable, non-graphing calculators. Only a very small minority of students ever bother.

I regularly impress students by showing them how their calculator can convert fractional hours to hours:min:sec, or even how to store a number in memory instead of writing it down on paper and typing it in again later. No kidding, a lot of them really do that, and they fight you tooth and nail when you try to teach them about "STO" and "RCL".

I believe they thought the 35s would fill that role. Unfortunately, it has not gone over well (for various reasons) with long time HP users.

The best/easiest bet appears to be if HP were to put a 32sII or 42s (functionality wise) in the current 30b form factor. This is the calculator that is the basis for the wp34s. A somewhat nicer, expanded, display and a few more buttons would be nice... but the 30b hardware is there today which just leaves some programming and a new faceplate/buttons.

What I'm trying to say is that there is no *basic* RPN scientific calc from HP. More basic than the 35s, 32s or 42s. Basic and inexpensive. Inexpensive for the high school kids and college kids on a budget. Inexpensive enough for them to give RPN a try.

See, now when I explain to someone (which I occasionally do) in detail why RPN exists, why it matters even for basic algebra and why it's the better way to go, the person that might want to try RPN only has 2 options. A 50 dollar HP 35s or a ~90 dollar HP 15c LE.

Also, for people I truly care about, I would spend the 12 to 20 bucks if a basic RPN was available at that price and give it to them. Give it to them and spend a couple of minutes showing them the elegance of RPN.

My frustration mirrors this gentleman's angst if you replaced the iPhone with any TI/Casio/Sharp and the Nokia with a RPN HP:
http://www.thebestpageintheuniverse.net/c.cgi?u=iphone

Some profanity in the above link.

*Message #8 Posted by **nick lidakis** on 16 Sept 2011, 9:51 a.m.,*
in response to message #6 by Miguel Toro

Isn't this (HP 20b) a financial calculator? I see, from the photo on HP's site, that the basic functions on the keys are financial related.

And, at $40 (even at Amazon) can you say that it competes with a Casio fx-260 ($11) or fx-300 ($12-$15)?

Casio fx-260:

Slide cover. Dimensions: 5.25" L x 3" W x 3/4" D

It's small, lightweight, inexpensive and designed as a basic scientific.

Like this. But RPN.

I just was answering to your question about a simpler, less costly HP RPN calculator with scientific capabilities. I gave you a suggestion that covers all those "requirements". there is even a better version (30b) that cost even less in amazon.

Well, I was just trying to help. I think there is no need to mock.

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #12 Posted by **nick lidakis** on 16 Sept 2011, 1:12 p.m.,*
in response to message #11 by Miguel Toro

I apologize. My intent was not to mock. Honestly, I was just making a joke, and not at your expense.

I was trying to highlight, with some (maybe not so funny) humor what I fantasized would happen in trying to introduce someone to RPN via the financial calc route.

The point is, HP doesn't have a basic, inexpensive, introductory RPN calc for the uninitiated. The student/person who hears about RPN and then checks HP's website will probably not check the Financial Calc section for a Scientific Calculator. Or scout through forums when they should be doing homework. Or looking through the PDF manuals of the 20b to figure out the scientific functions.

Again, I'm sorry if you misunderstood my humor. But you seemed to have misunderstood what I was getting at: Getting more RPN calculators in the hands of people who start using calculators would probably make them more long term users of RPN calcs in general. You can do that by offering the uninitiated a decently priced basic scientific calc that is *labeled* as such and *advertised* as such and put under the URL link called Scientific Calculator. Something like the HP 10s (as someone else noted) available in RPN to help whet the appetite. Get them while they're young.

P.S. I came across RPN by accident when I took my first chemistry class at a CUNY college. The professor said (to save us money)

that the fx-260 was all the calc that we needed; no fancy TI graphing calcs need apply. So I got one for $12. But I hated the mushy keys and that fact that I had to right down intermediate results or use memory. When I got my hands on a used 48g for $20 via craigslist, I realized just how much easier it was to do messy, multi-stepped chem problems with RPN and a stack in about 10 minutes flat.

So, I find it strange that HP has no RPN calc in the same vein as the casio fx-260 or the like.

One wonders why they would even be interested...

Remember, this group is not typical. I believe most of the world these days would expect calculators to use an algebraic model.

Words like that are kinda like a self fulfilling prophecy, no? The group that uses RPN will never get bigger if there isn't a low barrier to entry to bring in new blood.

My soon to be wife has this crazy idea that our soon to be son will be some kinda physicist. My soon to be nephew in law of 7 years has already asked that I bring back my Icom 730 HF transceiver so that he can hear morse code and SSB transmissions, in addition to being excited about the model rocket he's expecting. So, 2 of the 4 HP 15C LE I purchased are going into the safe deposit box (sans batteries) for future use by future evil geniuses.

I am 1/10th the geek of most people here, in regards to the math that is discussed here. Does that make me even more atypical? Is my logic skewed for not understanding why HP doesn't offer a basic scientific calc as an upgrade path to more profitable RPN models?

You're just about 10-20 years late, that's all. After HP curtailed, then dropped the Pioneers, original 48 series, things started going downhill rapidly.

Pal,

The HP 15c LE fits in the work pocket of my current shirt without the pen sleeve stitching. I can't even jam it in the other pocket. But this is all really a small pet peeve.

I'd still like to see a *basic* RPN calc offered for under $30 bucks. Thinking about this more after the release of the 15c LE, it just doesn't make sense that an introductory RPN calc isn't offered.It makes less sense that HP doesn't tout/advertise the benefits of their RPN calcs more that the 2 web pages offered on their website.

Perhaps the RPN groupies can come with a slogan that can be put on t-shirts or stickers? Something like this:

"Let *me* tell you about RPN because HP is too busy _____"

But I would need help filling in the blank.

HEWLETT hp PACKARD

HP Key Notes

And The Walls Came Tumbling Down ...

Yes, that *is* the Great Wall of China in the accompanying photograph! And the person in the photo is **Gary M. Tenzer,** of Pacific Palisades, California. Mr. Tenzer recently visited China on his vacation and took with him his HP-67. Here's a letter from him about this unusual experience.

Dear Henry:

With all of the attention given to the Peoples Republic of China in the past few months, I thought that it might be interesting to share with your readers some of my experiences on a recent trip to China with my trusty traveling companion, my HP-67.

My tour of China was limited to 16 days and three cities: Canton (Kwangchow), Shanghai, and Peking (Beijing). The Chinese people are very solicitous and warm but the language barrier forclosed much verbal communication.

As you know, China's technological progress has been minimal over the last 30 years. It is indeed odd to walk into a department store in Canton (yes, they do have department stores!) and see the electronic equipment for sale. The TV sets and radios are all the vacuum tube variety, the type sold in this country 25 years ago. It is of little wonder that, when the Chinese people interact with Americans, a cultural shock takes place.

It is impossible for an American to walk the streets of a Chinese city or through a store without being mobbed by literally hundreds of people curious about visitors from the West and their sophisticated American gadgets. Often, I was approached by people anxious to examine my camera equipment and my digital watch. They were particularly excited when I showed them my HP-67 in order to share an example of superior American technology. They were awed! I would then do some arithmetic calculations, communicating in the universal language of mathematics. Several of the young people around were familiar with algebra, as it is required in the secondary schools. They were most excited about the machine's potential for use in their studies.

The Chinese interpreter for out group had some knowledge of engineering and math. Because he spoke English, I was able to demonstrate some of the programmable features of my HP-67 by programming some simple arithmetic functions and some branching routines. He was especially impressed by the "Polynomial Evaluation" and the "Matrix Operations" programs as well as some mathematical games such as "Bagels."

The experience of visiting a country on the verge of a technological revolution was like a trip back in time. The Chinese people are fascinated with American technology and are eager to grasp its wonders. I look forward to visiting China again to view the effects of further Westernization and technological progress.

I have enclosed a photograph that was taken of me standing on the "Great Wall of China," proudly wearing my Hewlett-Packard, *ENTER GREATER THAN EQUALS T-shirt.*

Kindest regards,
Gary M. Tenzer

(Mr. Tenzer holds an AB degree in Economics from the University of California (Berkeley) and two Masters degrees (MBA and MSBA) in Finance and Real Estate Finance from the University of Southern California. He also holds a California Real Estate Broker's license. Currently he is entering a career in the Real Estate Development industry. Gary spends much of his spare time putting his HP-67 and HP-97 to work for him in investment analysis as well as in consulting with businesses to help them get the most beneficial use from their HP programmables. it's a 10C with the programmability removed - count the keys across and you'll see one column has been deleted. the non-programming

functions on that column have been distributed onto other keys (->R and ->P placed above divide and multiply, square root moved to below e^x). the display hasn't been moved across because the space to the right is still needed for the 2x 2032 batteries.

at the same time i also re-engineered the key frame so the f key is co-moulded in with the rest of the keys to prevent wobble. and there is space above the % and R-down keys for two more functions if anyone wishes.

in response to message #30 by Eric Smith

> Quote:
>
> How did you accomplish that?

[chuckles] i wondered if anyone would notice that... using the same virtual factory that manufactured the calculator pictured - of course!

btw, i have seen keyframes with different coloured plastics for some keys in real life. takes a little ingenuity, but certainly far from impossible. i'd have thought HP would be able to do it with ease.

The battery compartment on the 15C LE overlaps (underlaps?) the display.

in response to message #27 by robert rozee

Do any of you guys remember or have heard of or have seen the old (Spice series) HP-31E or 32E?

They were basic scientific NONprogrammable calculators, the latter with statistical functions. I think these would make excellent calculators for late middle/junior high, most of high school students, and many college students that have to deal with science courses. (Unfortunately for hard science majors) They had no continuous memory, but that would make them good for many exams, including stuff like SATs, engineering licensing exams, etc.

They are like the (Voyager series) HP-10C and HP-11C, but portrait layout instead of landscape and nonprogrammable.

If HP could come up with inexpensive RPN calcs that did what any of these did, say, one with and one without continuous memory, it may begin to eat into TI's, Casio's student markets.

Basic RPN calculators

Chip in the Casio FX is probably a dedicated calculator chip that is used in bulk. Most of the newer HP calclator is run by Arm processor. Economy of scale will also affect the cost of LCD and keypads. so as long as HP sticks to current way of designing RPN calculators, I dont see anyway of making the RPN machine with sub $10 price range. HP-10s to me looks like re-badged Sharp or Casio.

So here is my proposal to HP if they are interested in striking back into mass calculator business. Take 33S, redo the keyboard graphics so there is no hint of programmability on the front face, remove manual and case from the package and add a folded sheet of paper that only describe the basics of RPN, repackage and sell them for less than $20 each. I blieve the tool and development cost for the 33s is already paid for. its probably a doable pricing.

OK, then, just issue a 10c LE. You should have the ROM image. We'll even pay a little more than $20!

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #38 Posted by **gene wright** on 16 Sept 2011, 5:04 p.m.,*
in response to message #37 by Martin Pinckney

Ah, but keys would have to be redone. Production line time would have to be scheduled. Line switchovers would have to be paid for. Approvals sought..."Why should we do this? How many will we sell? What will you not work on while this is being debugged? What will not be worked on while suppliers will be worked into this picture...etc."

If the $$ is not high enough (no idea what $$ that is), then management will likely not put resources on it because they have higher absolute $$ projects to put people to work on.

Not to mention... the time this takes is time not spent on the 67CXi model.

Besides, there is no need at all for the 10C if the 15c is out.

(But I for one really would like a cheap RPN calculator...in addition to the 20b/30b which are the cheapest RPN models out).

That.

Furthermore: it will be impossible for HP to make any profit from a 10C that would sell around $20. Even assuming that the production/marketing costs are less than that, you would need to sell a staggering amount of these calcs to make any profit.

Also: if your objective is promoting RPN among youngsters, you really should be promoting free RPN calc apps for smartphones (and quite a few good ones already exist, like Free42). THAT is the way to showcase RPN to youngsters.

Yes (emphatically), I agree about the economics of reintroducing a 10c.

No. (politely) Smart-phones can't be used during exams. Phones can be a distraction to some. The downsides of smart-phones (battery life, back light annoyance, etc.) have been mentioned here before (I lurk). Also, don't assume every "young" person even wants or expects smart-phone.

One would hope that a scientific version of the 20b/30b would be possible.

Of course, a 30s would be competing with the 35s which is probably not feasible from a product placement standpoint. Oh well.

Generating a simpler version of the wp34s would be fine, but that doesn't help the desire of some here to see such a product readily available in stores. Then again, enlightening those around us is better than nothing at all.

We're all just guessing here. I'm sure it's a tough market when such a product competes with $10-$15 (nearly) disposables. We don't know how many would sell at a $25-$35 price point. Some (many?) here are just frustrated that there isn't such an option. Even the 35s could be OK if they were done "right".

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #43 Posted by **Bart (UK)** on 16 Sept 2011, 9:51 a.m.,*

Yes, I want the HP-10C back

*Message #47 Posted by **Håkan Thörngren** on 16 Sept 2011, 2:25 p.m.,*

in response to message #1 by nick lidakis

Please bring the HP-10C back, it is a wonderful small simple RPN instrument that will fit my daily hand calculation needs nicely.

Re: Yes, I want the HP-10C back

*Message #48 Posted by **Michael de Estrada** on 16 Sept 2011, 2:42 p.m.,*
in response to message #47 by Håkan Thörngren

It would cost the same amount to replicate it as the HP 15C LE, and gain you nothing in ease of use. Same primary key functions and same shifted key functions. I see no advantage in this at all.

Re: Yes, I want the HP-10C back

*Message #49 Posted by **Håkan Thörngren** on 16 Sept 2011, 4:40 p.m.,*
in response to message #48 by Michael de Estrada

Less cluttered keyboard and half the rattle? :)

I am hoping it could sell for a lower price, and for basic daily calculations it should be fine enough.

The 10C is less intimidating than a 15C, and for doing more advanced things I would pick up a 41 or a 48.

Re: Yes, I want the HP-10C back

*Message #50 Posted by **Michael de Estrada** on 16 Sept 2011, 5:06 p.m.,*
in response to message #49 by Håkan Thörngren

What rattle ? Mine doesn't. As to clutter, since the shifted functions are above and below, there really is no added clutter. I really don't agree with you that it would somehow be "less intimidating." And I don't see how it could be much cheaper either. When HP brought out the original HP 10C it was an attempt to capture market that was lost by the very expensive HP 15C, and I'm certain it cost them in profits to do so.

The only resource difference between the 10c and 15c is the 10c has half of the ROM footprint and half the RWM requirement of the 15c. In round numbers that's a difference of under 8KB ROM and 256B RWM -- essentially in the noise cost wise by today's standards. And if for some reason that somehow was a concern I'd opt for the 11c instead which can live within the same budget.

Disclaimer: I don't own a 10c nor have examined a rom image so the portion of ROM actually used in the 10c r2d2 may be considerably less than its actual capacity.

It is a wild guess but I don't think I'd be too far off to suspect the manufacturing cost difference of a legacy 15c vs. any other voyager model to have been about US$1-2.

About the only way I could see some savings would be to eliminate the printed manual and fancy gift box as they now do with the HP 35s. Also, it would take less time to do the initial programming and manual preparation for the CD.

This.

Eco cardboard? Simple one page compostable instruction sheet and packaging?

Re: Yes, I want the HP-10C back

*Message #54 Posted by **Jeroen Van Nieuwenhove** on 16 Sept 2011, 7:02 p.m.,*
in response to message #51 by uhmgawa

That is true, but sometimes it pays to simply "dumb down" an existing model and sell it at a lower price, even if the manufacturing costs are the same. Everything depends on your profit margin. But, of course, in the case of the 10C, this strategy did not work. There's a reason why these calcs are so rare ;-)

Re: Yes, I want the HP-10C back

*Message #55 Posted by **Michael de Estrada** on 16 Sept 2011, 7:27 p.m.,*
in response to message #54 by Jeroen Van Nieuwenhove

Same could be said for the HP 31E, 37E and 70. In any case today's maket would not support a "dumbed down" Voyager at any price, and the 15C market is largely legacy. The basic features of the HP 15C LE are just as easy to access and use as the 10C.

A scientific 4-banger using RPN was tossed around as an idea here a few years back. If something like this were available, I'd buy plenty.

By adding a single shift key, amazing amounts of functionality can be put into a twenty key device. There were designs with lots of scientific functions and others that were programmable...

Here's the proposed model (The 4 Banger+, aka 4sII) that was most heavily discussed:

There were comments about it having too many shifted combinations. It would be good to see that level of functionality running on 20b/30b hardware. The hardware has more keys than the proposed model so one would hope for fewer awkward shifted key combinations.

Imagine if HP were to produce a 30b with replaceable keycaps (these would snap on over a smaller base key mechanism). You could get dummy caps and print/paint them, or use clear caps with printed inserts. Although not possible with the current design, if the bezel included slots at the top & bottom to facilitate overlays you'd have a truly "re-purposable" calculator.

in response to message #59 by Jurrie Lulofs

absolutely beautiful - lets build it!!

and can we make the case just 2" wide?

btw, you can put pi onto the EEX key (like casio do): if EEX is pressed while entering a number it performs as expected, if pressed prior to starting number entry it produces pi.

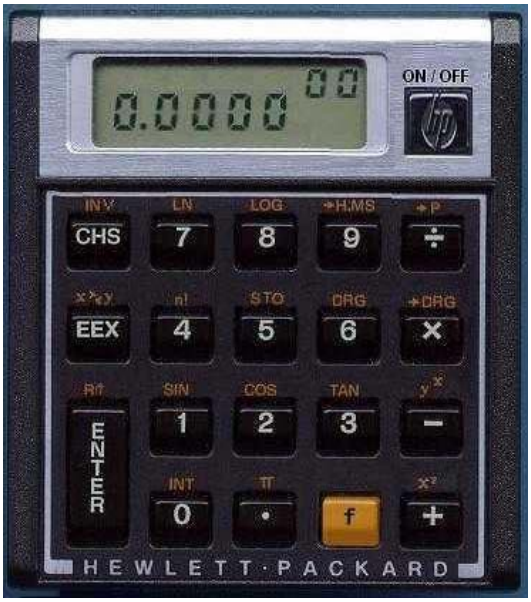
in response to message #59 by Jurrie Lulofs

Here is another propostion à la HP-10c :



Note that : - The HP logo is the ON/OFF switch, auto power OFF still exist, - The Shift+CHS produce an INV fonction which invert next fonction. This make possible $\sin^{-1}$, $\cos^{-1}$ and $\tan^{-1}$ function, as well as R_{down} or RCL operations, etc.

Despite classic HP-10c or 15c, which are limited to only fit one calculator per pocket, this half-size landscape model allow you to store **two** calculators per shirt pocket.

This is the greatest advantage of this new concept.

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #62 Posted by **Howard Owen** on 18 Sept 2011, 11:41 a.m.,*
in response to message #61 by C.Ret

Some of my reactions:

- This thing looks too small and crowded for comfortable operation in my clumsy hands
- I'd switch INV to primary and CHS to shifted. Given the importance of the INV key, it's likely it would be used much more frequently.
- I would make X<>Y primary and EEX shifted, just because X<>Y is primary on every classic RPN HP calculator, and my brain refuses to accept any other arrangement, :)
- Along the same lines, I would make the shifted R^ a shifted Rv. On the classic calcs, Rv was on a primary key and R^ was a shifted function.
- Did I mention this layout looks hopelessly cluttered and non-ergonomic?

I'd have to agree. Also I think if that display became reality it would have potential users screaming into their pillow.

If what you really want is a scientific voyager with that in-pocket footprint, why not size the display to the full 10.5 digits and use the original 15c key layout & pitch but in a clamshell format? Downgrading functionality to a 10c or even 11c doesn't really buy you anything significant.

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #64 Posted by **C.Ret** on 19 Sept 2011, 4:53 a.m.,*
in response to message #63 by uhmgawa

Agree, to avoid any cluter display and keyboard, I propose a larger display and removing shift and INV key.

Following the first HP 4 banger which two fit in one shirt pocket: having two calc in one pocket double power for computation. With a litte training, one can use both hands, each on one of these HP 4-bangers:

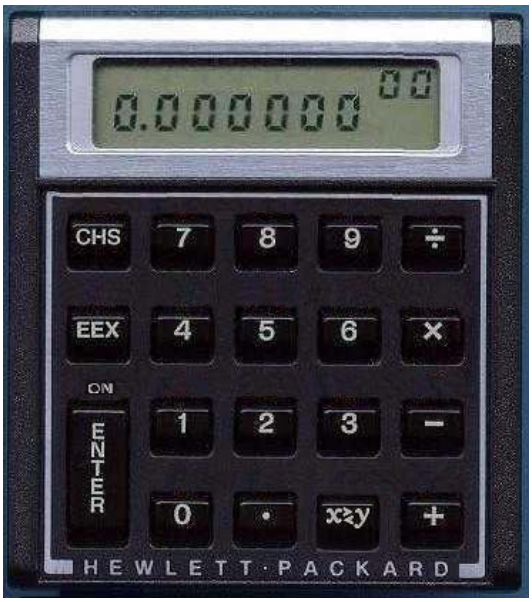
*Message #66 Posted by **C.Ret** on 19 Sept 2011, 9:10 a.m.,*
in response to message #65 by Paul Dale

That's true, I have to add the [x><y] exchange key, since as any HP calculator this compact version have at least 4 levels of stack.



But no LAST register. This is perhaps a problem because if one user misskey a value, he have to start his computation from start.

Perhaps, is this design not optimal. I may have better to add one colum of keys for ON/OFF and stack manipulations.

Yes :-)

It's the HP's dual-core system. And no stack will be stack due to cascading process or services !

The true dual HP-calculator cores;
- one HP-15c LE at right hand (faster at right),
- one HP-15c original at left hand (I am not as fast on left hand).

(Note that gooffy peoples may surf on the true dual-core HP calculator system the opposite way whith no loss of power, if for any reason they prefer speed at left hand.

<fantasy> It would be cool if HP just sold just 1 or 2 calculators - say a 20b (cheap and mass produced) and 30b (better physical design for a premium) - with the a USB cable, sticky overlays and a CD-ROM with different firmwares that you can burn it with: - basic scientific/statistics - business/finance - programmable scientific - do everything calculator or perhaps with all 4 FW already in flash and you just pick which one from a mode menu and put the appropriate overlay on it. </fantasy>

I've been using a wp-34S emulator while I wait for my HP-20B to arrive in the mail and already I'm thinking about how I'd like to re-do some of it. Probably push more stuff to menus (stats) to eliminate 1 or 2 shift keys and get sin/cos/tan back as un-shifted keys.

Feel free to modify the sources and submit patches ;-)

Have fun getting sin/cos/tan at the top level and in a row. We dropped that idea quite early. If the hot-keys disappear, it would be possible. There really isn't much on the un-shifted plane that doesn't demand to be there.

Removing a shift key or even two wouldn't be too difficult, the catalogues are quite functional now -- they were less so when originally devised.

Regardless, have fun.

What tool-chain are you using? I see reference in the source to Sorcery G++ (free "Lite" version) and MinGW, but I also see references to Eclipse and MS Visual C++, which I assume is needed to build the emulator?

Sorry if there is an article already describing this - I find the forum search a little flaky (date constraint only goes up to 2010!)

I know, to make volume, a calculator these days has to be tailored to education/school - as they probably buy plenty...

But I'm wondering, what about all those engineers out there? Is there no market for those professionals? My dream calculator would be like this:

Tailored for engineering professionals, who like to have a quality calculator

small and thin (aka 15c but thinner, or 42s)
- alway with me in shirt or pocket
- two line dot-matrix display
- should be programmable, it would be sufficient to program on computer and store programs over to calculator, so I could use them for my daily work - e.g. To calculate basic values in a meeting
- no graphics capability (if I need that, I can use my computer)
- no symbolic calculation (same here: if needed I use Mathematica or such)
- it does not need to be cheap, I'm happy to pay $200/$300 if quality is right.

*Message #79 Posted by **Michael Kussmaul** on 17 Sept 2011, 8:56 a.m.,*
in response to message #78 by Michael de Estrada

I like the 42s too (I don't have one) - but it's 20 years old... there should be a more modern one, one which can connect to my computer to transfer programs (or "Apps" as you would probably called it nowadays :-)

And it's still too thick&heavy, half of it would be nice.

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

in response to message #79 by Michael Kussmaul

there should be a more modern one, one which can connect to my computer to transfer programs

Indeed. MicroSD would be cool, actually, and please tell "them" to make the programming language a simple script-like deal that any goof with a text editor can hack.

In the meantime, I really like my 35S. It's dedicated to some astronomy programs I wrote, and it fills that role far better than a smartphone ever could: no backlight to kill dark adaptation and it works great with gloves. If it had a reasonably accurate clock and the means to push the time and date into the stack I'd be overjoyed.

Re: After the 15c LE, better chance of a basic RPN calc from HP now?

*Message #81 Posted by **snaggs** on 18 Sept 2011, 8:15 a.m.,*
in response to message #77 by Michael Kussmaul

The 35s really is good, only using the 42s makes you realise theres that last level of polish missing.. However, the 42s was the peak of the Pioneer line.

Given the 35s is approved for surveyor exams, it will get updated, and version 2 has little to fix.

Also, whats good for engineers is good for maths students, as most applied maths is engineering.

Daniel.

Ps. Theres also lots of 35s programs on the net.

No complaints about the HP-12C AE?

*Message #1 Posted by **From Hong Kong** on 16 Sept 2011, 1:55 a.m.*

Many problems of the HP-15C LE have been reported so far. However, I don't see any complaints about the HP-12C AE. I wonder if the HP-12C AE is nearly perfect.

Re: No complaints about the HP-12C AE?

*Message #2 Posted by **Katie Wasserman** on 16 Sept 2011, 2:07 a.m.,*
in response to message #1 by From Hong Kong

It got released with old firmware. See this thread.

Somehow this thread got lost in the Forum archives. The essential fact is that the 12C 30th AE got released with firmware dated 2009-07-02 and has bugs in it that were fixed in later releases back in 2009.

Re: No complaints about the HP-12C AE?

*Message #3 Posted by **From Hong Kong** on 16 Sept 2011, 2:31 a.m.,*
in response to message #2 by Katie Wasserman

Thanks, Katie! :)

It seems that the HP-12C AE users are 'luckier' than the HP-15C LE users. The HP-15C LE's key and current draw problems are not fixed easily!

Re: No complaints about the HP-12C AE?

*Message #4 Posted by **Katie Wasserman** on 16 Sept 2011, 3:33 a.m.,*
in response to message #3 by From Hong Kong

I don't understand the key problems on the 15C LE, I would have thought that they were made on the same production line as the 12C+ machines are, perhaps not.

However, the current draw, PSE and self-test problems on the 15C LE should be relatively easy to fix using the same patching techniques that were used to create the 12C+.

I think the hardest part of fixing the 12C AE and the 15C LE will be getting new firmware to the existing and future owners. Will HP recall these, make cables and new firmware easily available to all who want them (and don't read this forum), something else, or just ignore the problem?

I sure hope it's not that last option.

-Katie

The chance of recalling the defective units is very slim. I think they may fix the not-yet-shipped units and probably ignore the shipped ones. As Gene has been making cables for power users, they may not bother to provide cables in the short term. In the long term, they may consider including a cable to every unit just like the HP-50G package.

*Message #6 Posted by **gene wright** on 16 Sept 2011, 7:47 a.m.,*
in response to message #5 by From Hong Kong

And if I need to send out cables to 10,000 people, I'm sorry to say but my price will have to go up! lol

I believe the $3 / $5 I charge comes within $0.25 of covering my costs. Paypal takes 10% off the top. Then postage. Then the envelopes, then gas to get to the post office (which is no longer trivial). Then since I'm now doing this roughly 3 times a week, I value my time at the remaining $0.25 per 1/2 hour. :-) That time is time putting all this stuff into the envelopes, getting the addresses right, filling out the customs forms (wow, a lot of you guys live overseas from me!), etc. :-)

But, if the volume continues to go up (I have sent 15 in the last week), I might have to adjust...just a little bit. I can still promise that doing this is not contributing to my retirement fund.

Cable for update firmware

Well there's your problem! ;)

I'd gladly pay $10 for one of these cables, plus shipping, and I'd still feel like I was getting a bargain. Heck, compared to the prices I've paid SOME vendors in the past (*cough*Cisco and DEC*cough*) for proprietary cables, $10 feels like a rounding error.

By the way, I really would like to buy one of these cables, but unfortunately I will not be making it to HHC this year. I'm extraordinarily bummed out about that, too. This seems like a year not to miss, but there's just no way I can do the trip this time. Sigh.

*Message #11 Posted by **gene wright** on 16 Sept 2011, 3:12 p.m.,*
in response to message #10 by Seth Morabito

Ah, but HP did not give me these cables to get rich. They gave them to me to take a load off their day-to-day activities.

A big corporation might not have to worry about allocating postage to individual mailings, but I think it better if the HP calculator team is not sending out cables one at a time. So, I offered to help.

HP would not be happy if I started selling these on ebay, of course. :-)

That's a shame. When the 35 and 11C were discovered to have bugs they were recalled and users given a new calculator. Bill apparently thought that customers should have confidence in the HP name. What an old fashioned way of thinking that now seems!

*Message #13 Posted by **Seth Morabito** on 16 Sept 2011, 2:01 p.m.,*
in response to message #12 by Calum Tait

Though to be fair, adjusted for inflation the HP-35 cost US $2,000.00 when it was introduced, and the HP-11C cost US $317.00. I'm not at all happy with reports of poor quality, but I wouldn't expect a recall for a $90.00 product, either.

*Message #14 Posted by **Calum Tait** on 17 Sept 2011, 6:44 a.m.,*
in response to message #13 by Seth Morabito

I don't think the price should be the main issue. At $90 it is still quite an expensive calculator anyway but it is more a matter of the company showing that it offers quality products and has good customer service. In other words, that it cares about its customers. The fact that everything nowadays seems to boil down to cost without thinking about the lost future sales from a bad service experience encapsulates everything that has gone wrong with companies like HP. A faulty $90 calculator could tarnish someone's confidence in a company enough to affect a much bigger purchase in the future.

*Message #19 Posted by **Crawl** on 16 Sept 2011, 7:53 a.m.,*
in response to message #4 by Katie Wasserman

Yes, I just hope they do something. Sending it back or patching it myself (assuming I can do it; I don't have a cable yet) would both be palatable to me.

Re: No complaints about the HP-12C AE?

*Message #20 Posted by **gene wright** on 16 Sept 2011, 3:14 p.m.,*
in response to message #19 by Crawl

You can do it. Cable is available for cost of postage and the procedure really is simple enough that all can do it. You DO need a serial port or a usb to serial adapter of a special type.

I found a $50 laptop on ebay with a serial port that I use for this stuff.

If I can flash a unit...

Re: No complaints about the HP-12C AE?

*Message #22 Posted by **Lincoln R.** on 16 Sept 2011, 2:07 a.m.,*
in response to message #1 by From Hong Kong

Probably. My impression of the 12C AE is that it's most likely just a regular-production 12C with a "30th Anniversary" script and a limited edition number printed on it. There was 1 report of a 12C AE coming with out-of-date firmware on it, but that's probably just an assembly plant screwup that should be easy to fix.

HP has been building 12Cs continuously since 1981, while this is the first time they've tried to make a 15C since 1989, so it's perfectly reasonable for a few minor, correctable software bugs to turn up. Also, at least some of the making fun of the build quality is probably coming from people who have no use for a financial calculator and never owned a modern 12C.

15c finally available from HP for $129.00 US

*Message #1 Posted by **Quan** on 16 Sept 2011, 1:21 a.m.*

Here is the link:

http://h10010.www1.hp.com/wwpc/us/en/sm/WF05a/215348-215348-64232-20037-215351-33532.html

I wonder if the online stores will raise the price to match.

Re: 15c finally available from HP for $129.00 US

*Message #2 Posted by **Howard Owen** on 16 Sept 2011, 1:30 a.m.,*
in response to message #1 by Quan

HP usually charges full price in order not to undercut their retailers. Of course, at $200.00+ on eBay, they may undercut them anyway!

Actually, I think this will put a stop to the gouging - for now.

*Message #3 Posted by **Lincoln R.** on 16 Sept 2011, 1:59 a.m.,*
in response to message #2 by Howard Owen

That's the business store, where prices seem to be higher. It's still listed as $99.99, but 'coming soon' on the home/home office one. Although I imagine this means that HP has them in stock, and whoever's responsible for managing the home user store just needs to update the site.

Re: 15c finally available from HP for $129.00 US

I beg to differ. Back in the early-to-mid 1990s timeframe, Jim Lawson, a member of our local Philadelphia Area HP Handheld Club (founded in 1978 as the Philly chapter of the PPC club) had a one-man HP dealership called "Handi-Calc". He was an avid HP fan and put out his own 2-to-8-page newsletter periodically over several years, explaining how to use HP machines and announcing new ones. When HP began undercutting his prices by discounting below their own MSRP, Jim couldn't compete and had to fold up shop. We complained to the new head of HP's ACO (Chris Wallin) and only got useless answers. This

told us that despite his plea at the 1997 British HPCC Club's 15th-Anniversary conference in London (which I attended and videotaped) that he was interested in our concerns, this was merely "lip service".

Moving to the present day, Eric Rechlin (from hpcalc.org) mentioned recently that the prices of the HP machines from the distributors which he would resell, are not as low as the price that he can purchase them RETAIL from Amazon.com, and thus he can't really compete domestically with the large Internet retailers in the U.S. I'm not sure what HP can do, but they didn't consider their small dealers 15 years ago and I don't think they are taking care of them now either.

Jake

Re: 15c finally available from HP for $129.00 US

*Message #5 Posted by **Howard Owen** on 16 Sept 2011, 5:49 p.m.,*
in response to message #4 by Jake Schwartz

Past is prologue, I suppose. But as of now, HP is not undercutting their channel with the 15C LE.

Companies that have a retail channel often try to ensure their partners have a crack at selling their wares at a profit, however slight. That is, if they want to retain the channel. Sometimes companies decide to forego, or deemphasize a retail channel for various reasons. HP clearly hasn't gone that route with calculators. The 12C, for example, sells in lots of brick and mortar stores, and on the web. Taking a look at one giant discount retailer, Amazon currently has the 12C for $61.19, whereas HP is charging $69.99.

Here's a table of price comparisons between HP and Amazon. These do not take shipping or tax into account. All prices are below MSRP.

Calculator	HP Price	Amazon Price
HP-12C 12C#ABA	$69.99	$61.19
HP-12C Platinum	$79.99	$67.39
HP-12C 30th Anniversary	$79.99	$68.66
HP-17BII+	$99.99	$78.99
HP-30B	$49.99	$23.95
HP-35S	$59.99	$51.15
HP-50G	$149.99	$99.99

I took the prices from HP's Home/Home Office site and from Amazon search. Some of the calculators are from Amazon stock and some are from retail partners. In either case, the third column figures should represent valid street prices. As far as MSRP goes, obviously the *real* benchmark is what HP charges customers directly. The higher MSRPs don't count for much, except they give retailers a large number to claim large discounts against.

So it appears HP isn't systematically undercutting its retailers. The 15C LE is interesting in that regard. The business site still lists it at $129.99 in stock, while the Home/Home Office site has it at $99.99 "coming soon." The latter price might undercut some retailers, except HP isn't actually selling it for that price.

I'm not saying that HP never undercuts their retailers. I'm just saying that they seem to be happy having a retail channel, and aren't currently going out of their way to destroy it, at least with calculators.

HP-15C LE - Two bad keys

*Message #1 Posted by **Dan Grelinger** on 16 Sept 2011, 12:04 a.m.*

I received my HP-15C LE from buy.com today ($89.99 + free shipping), Limited Edition Number 02368, and low and behold it has two bad keys. The SST key requires much more effort than a normal keypress to register, and the '6' key will go down and click with a light touch and not register the press. Is this common? Since buy.com seems to be out, I guess I will have to go the route of warranty service through HP.

Re: HP-15C LE - Two bad keys

*Message #2 Posted by **Howard Owen** on 16 Sept 2011, 12:17 a.m.,*
in response to message #1 by Dan Grelinger

It's not the case with my unit, and I haven't heard anyone else complain of keys registering poorly like that. That's definitely grounds for returning it. Why not ask buy.com id they can exchange it? If not, then HP would be the right way to go.

Re: HP-15C LE - Two bad keys

*Message #3 Posted by **Jesse Dodd** on 16 Sept 2011, 12:58 a.m.,*
in response to message #1 by Dan Grelinger

Mine also was from buy.com #00549 and the square root key will click without registering unless pressed with additional force.

Re: HP-15C LE - Two bad keys

*Message #4 Posted by **Howard Owen** on 16 Sept 2011, 1:40 a.m.,*
in response to message #3 by Jesse Dodd

Wow. That's two reports now. :(

*Message #5 Posted by **Thomas Radtke** on 16 Sept 2011, 2:52 a.m.,*
in response to message #4 by Howard Owen

And that's not an acceptable problem :-(. At least I wouldn't want to live with that.

Re: HP-15C LE - Two bad keys

*Message #6 Posted by **Dan Grelinger** on 16 Sept 2011, 11:25 a.m.,*
in response to message #5 by Thomas Radtke

Yes, this condition is unacceptable. I normally press keys consistently with just the force necessary to depress them, and the '6' key is a pretty important key. To use the calculator in this state, one must watch the display carefully to ensure that each keypress of the affected keys has registered.

Very inconvenient, and unacceptable. I bought a used HP-41C advertised as 'works perfectly' a few years ago on TAS with this same problem (most likely developed over time with much use) and returned it for a refund.

I called buy.com this morning and found that they are completely sold out of HP-15C LEs, and will not be getting anymore. They informed me that they would be happy to take the return and refund my purchase. But I will not accept that offer as I want to end up with a unit, and it appears likely these are close to selling out. I wonder if HP will have any for sale on their own web site. I certainly hope that they have enough replacements for defective units that they must warranty.

Re: HP-15C LE - Two bad keys

*Message #7 Posted by **Thomas Radtke** on 16 Sept 2011, 12:09 p.m.,*
in response to message #6 by Dan Grelinger

> Quote:
>
> [...] and it appears likely these are close to selling out.

It's probably of not much help, but there's still a batch of european calculators to be sold.

I wonder if the problem is dirt from the production process or a problem with the contact itself. The former might by resolved by just cleaning using Randys procedure. I very much hope for it.

Edited: 16 Sept 2011, 12:13 p.m.

Re: HP-15C LE - Two bad keys

*Message #8 Posted by **Miguel Valenzuela** on 16 Sept 2011, 2:07 a.m.,*
in response to message #1 by Dan Grelinger

I received by unit from buy.com with a LE #00506.

The "g" function button must be pressed with much more force than any other key in order to register. If I slide the key a bit toward the screen (upward) and press down, it is much more likely to register. If I slide it the opposite direction (downward) and press, it rarely ever registers.

This makes things difficult, since the "g" key is used very often... When I am calculating quickly, I find I forget to press the key with greater force than the rest. The result is incorrect calculations.

Re: HP-15C LE - Two bad keys

*Message #9 Posted by **John Pierce** on 16 Sept 2011, 8:24 a.m.,*
in response to message #1 by Dan Grelinger

My HP-15C LE serial # 02364 has an identical problem with the '6' key. The '6' key takes about twice as much force to produce a result. I havn't noticed any other key problems. Since the serial numbers are only four apart this might be a manufacturing defect that affects many calculators.

Re: HP-15C LE - Two bad keys

*Message #10 Posted by **Seth Morabito** on 16 Sept 2011, 1:51 p.m.,*
in response to message #9 by John Pierce

Very strange indeed.

Mine is #02391 (CNA1310K9L), and I have encountered no keyboard problems at all. I wonder if I should feel lucky?

I intend to post a full review of my unit some time over the weekend.

Re: HP-15C LE - Two bad keys

*Message #11 Posted by **Lincoln R.** on 16 Sept 2011, 2:31 p.m.,*
in response to message #10 by Seth Morabito

I got 2 with perfectly good keyboards. You're pretty much only going to see the complaints on the internet. It is inevitable that you get a few defective units when doing volume manufacturing, and it simply isn't possible to catch all of them. I would imagine the manufacturing tests are largely automated, and would be very surprised if I discovered that somebody at the factory had to run the keyboard test on every single calculator. It is far more likely that some get randomly spot-checked.

Even in the "good old days" when HPs were made in the USA and cost many times more than they do today, defective units found their way into the hands of consumers. I have a totally mint HP-80 with a faulty LED array in a digit, that undoubtedly left the factory that way. It looks like it is unused, so perhaps that is why it was never returned to the factory for warranty repair / replacement.

The rest are still in the possession of FedEx and UPS. But these will be gone before those arrive, so there will be no reunion. I also am expecting ten of the 12c 30th Anniversary units to arrive on Monday.

*Message #6 Posted by **Eric Rechlin** on 15 Sept 2011, 10:49 p.m.,*
in response to message #2 by Michael de Estrada

These 16 (plus two more not pictured) I bought on the secondary market, since the second-tier distributors didn't have them yet. My next shipment will be from a second-tier distributor.

I opened up one of them to photograph it, and I was lucky enough to get unit # 00888!

Eric

Re: Such a beautiful sight

*Message #12 Posted by **Lincoln R.** on 16 Sept 2011, 10:19 a.m.,*
in response to message #11 by robertoataulfo

The HP that many people here seem to believe in would have never even *made* a 15C reissue. The fact is, they did it. Whether engineers convinced management it would be a cool idea, someone had a revelation in a dream, or whatever, it is once again possible to buy an HP 15C.

The PSE function is a *software* bug which can be fixed. The 12C+ had some bugs when it first came out too, and those have been fixed. I'm certain that once HP fixes the bugs, even if they don't offer to reflash calculators for people, they will at least provide the new firmware image to people like us.

As for the "bad keys," the wobbly f and g keys simply aren't a big deal. As far as keys that actually don't work or have to be pushed excessively hard are concerned, manufacturing defects happen. Even when HPs were made exclusively in the US and Singapore, defective calculators slipped past QA. I have an almost perfect-looking USA made 32s 50th Anniversary with a top row of keys that feel mushier than the rubber keys on my Casio FX-7000g. If you have a legitimately bad keyboard, exchange the calculator, HP put a warranty on these things for a reason.

Re: Such a beautiful sight

*Message #13 Posted by **Thomas Radtke** on 16 Sept 2011, 11:34 a.m.,*
in response to message #12 by Lincoln R.

I fear all 15C LE keyboards will develop this problem sooner or later. My 35s was at first ok in this respect, but last time I tried one key had a tactile feedback from *not* registering the keystroke ;-(. It's just not possible to have a durable keyboard and save 25ct/unit at the same time. Sharholder value always win, of course.

I'm so sorry for Tim et al. for doing a great job messed up by HP. Time for them to build some startup company ;^).

Anyway, my sample-if it arrives-is a good investment, and certainly will sell on TAS. But that was not what I was hoping for :-(.

Re: Such a beautiful sight

*Message #14 Posted by **Michael de Estrada** on 16 Sept 2011, 12:20 p.m.,*
in response to message #13 by Thomas Radtke

Fortunately, the one that I bought doesn't have any keyboard issues. Still, even if it does develop them down the road, it will serve its main purpose of saving wear and tear on my original HP 15C, which works perfectly although it's a bit scuffed up from heavy use from when I was still working. I have a second unit arriving today, which I will store away as backup in case this one fails. Hopefully, additional units at normal prices will reappear for those of you that have had problems.

Re: Such a beautiful sight

*Message #15 Posted by **Lincoln R.** on 16 Sept 2011, 1:24 p.m.,*
in response to message #13 by Thomas Radtke

To me, 35s keyboards felt noticeably bad. I can push a 35s key hard and get a lot of flex. Not true with the 15c LE. See also: The hardware (keyboard included) of the 15c LE has been used in 12cs since 2009 and at least I haven't read too many reports of keyboard failures on those. The fact is, keyboard construction materials aren't that expensive, so it *is* possible to produce a quality keyboard at a reasonable manufacturing cost.

Ok, but there are quite some reports about 15C LE failures. I don't know the exact bad/good ratio, but it seems larger than 1% (from observations about delivery reports). They may have changed something for the LE/AE calculators.

15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #1 Posted by **Dave Britten** on 15 Sept 2011, 8:57 p.m.*

My 15c LE arrived today. (Whee!) Part of putting it through the initial paces has involved converting my typical binomial probability distribution program. It's nothing fancy - it just takes a few input parameters, and returns a probability:

t: Number of trials
z: Probability of individual success
y: Min number of successes desired
x: Max number of successes desired

If I run it with inputs 3, 1/3, 1, 3, I get the correct result, but the display flashes like there was an overflow somewhere. If I step through the program, using the same inputs, this doesn't happen, and I still get the same correct result..

I'm not quick to shout "BUG!" so what dumb thing am I likely doing wrong?

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #4 Posted by **From Hong Kong** on 15 Sept 2011, 11:42 p.m.,*
in response to message #3 by Dave Britten

Is 0.7037 the correct result?

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #5 Posted by **Dave Britten** on 16 Sept 2011, 6:55 a.m.,*
in response to message #4 by From Hong Kong

Yes, I'm pretty sure that's correct. I get that result whether I run the program, or step through it, but the display only flashes if you run it normally.

And this is even weirder. If you run it with these inputs, the display doesn't flash: 3, 1/3, 0, 3

Try as I might, I can't find any overflow happening in the program.

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #6 Posted by **From Hong Kong** on 16 Sept 2011, 7:40 a.m.,*
in response to message #5 by Dave Britten

I used my classic HP-15C to run your program. No flashing display!

This may be another known bug.

Anyway, I got 1 from your input.

Edited: 16 Sept 2011, 7:46 a.m.

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #7 Posted by **Dave Britten** on 16 Sept 2011, 8:26 a.m.,*
in response to message #6 by From Hong Kong

Just to clarify my tests a bit...

3, 1/3, 1, 3: Result: .703, flashing display
3, 1/3, 0, 3: Result: 1, no flashing display

The flashing display "error" will only happen if I run the program with "f B" (or just "B" in USER mode), or "GSB B". If I run it by pressing "GTO B R/S", the display does NOT flash after executing. Nor does the display flash if I step through the entire program with SST.

So, am I screwing something up, or is it a calculator bug? I tried this with the included 15c emulator for Windows, and the results appear the same.

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #8 Posted by **Jeff O.** on 16 Sept 2011, 8:27 a.m.,*
in response to message #5 by Dave Britten

I also confirm the behavior, and also do not get it on my 15C Classic. I note that if I set the program pointer to Label B with GTO B, then press R/S, the flashing display does not occur (with the 3, 1/3, 1, 3 inputs). I do not believe there is any overflow in your program. For a true overflow, say tan(90), you get a 9.999999 e99 flashing display. Pressing the back-arrow key stops the flashing but does not clear the display. With your program, pressing the back-arrow key stops the flashing and clears the display. Perhaps this is related to the flashing display behavior reported by Katie a day or two ago, i.e., if that problem is found and fixed maybe this one will also go away.

Edited: 16 Sept 2011, 8:27 a.m.

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #9 Posted by **Dave Britten** on 16 Sept 2011, 8:38 a.m.,*
in response to message #8 by Jeff O.

Here's a much simpler test case that exhibits the same behavior.

```
LBL A
STO 0
LBL 9
8
ENTER
3
Cy,x
DSE 0
GTO 9
RTN
```

If you put 3 on the stack and run it with "f A" or "GSB A", the screen will flash. Other integer inputs don't seem to cause this. Something about running Cy,x or Py,x exactly 3 times in a loop that's started with GSB seems to cause it.

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #10 Posted by **Katie Wasserman** on 16 Sept 2011, 10:53 a.m.,*
in response to message #9 by Dave Britten

This is definitely a new bug you've found.

I think we need to start a bug report list for the 15C LE and put it somewhere that's accessible. Are these all of them so far:

1) PSE run more than once in a program blanks display and run even once causes display flashing issues.

2) When Cx,y/Px,y are run in a program multiple times with certain values (e.g., 8 ,3) it

causes display flashing issues.

3) Executing the self tests documented in the manual can corrupt program memory.

-Katie

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #11 Posted by **Bart (UK)** on 16 Sept 2011, 11:06 a.m.,*
in response to message #10 by Katie Wasserman

Also the current draw you found:

4) High current draw during key press/hold

-B

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #13 Posted by **Dave Britten** on 16 Sept 2011, 11:06 a.m.,*
in response to message #10 by Katie Wasserman

Fortunately, the known bugs mostly seem to be minor cosmetic issues so far, with the exception of the self-test hosing memory (and with only a few hundred bytes of RAM, even the impact of that one is limited).

The PSE bug is annoying, but I personally don't use that instruction much when programming. I prefer to have a flag switch the program between "run as fast as possible until completion", and "stop and show intermediate results until R/S is pressed to continue".

So, how can I get a cable to flash the firmware when an update is inevitably released? :)

(Just found another one: Do 90!, ENTER. The display will keep flashing even if you start entering other numbers.)

Edited: 16 Sept 2011, 11:07 a.m.

Re: 15c(LE): Will the display flash for reasons besides overflow,

SF9?

This is normal.

Re: 15c(LE): Will the display flash for reasons besides overflow, SF9?

*Message #15 Posted by **Dave Britten** on 16 Sept 2011, 11:20 a.m.,*
in response to message #14 by Katie Wasserman

Okay. Then not a bug - just odd. :)

Katie movement

*Message #16 Posted by **Artur-Brazil** on 16 Sept 2011, 11:27 a.m.,*
in response to message #14 by Katie Wasserman

I believe Katie is right!

HP should be advised about the bugs on HP 15C AE.

I ordered one from Samson Cables, but, sincerely, I almost removed my order yesterday, when I saw the bug concerning Cx,y and factorial functions and even the printing of these functions on calculator's face plate. I only did not remove my order because my name was also in that list of buyers for Bring HP15C Back movement.

I live in Brazil and if I have to send the calculator back to HP, it will be very expensive and a dangerous operation.

After all, I believe that a calculator on which you can't trust the results doesn't worth one little penny - I apologize the effort spent on it, but it is useless. Very hard and heavy words, sorry...

I was very inclined to buy one 30B and rewrite it with WP34S and wait or help (as I can) on developing matrices routines for it.

Edited: 16 Sept 2011, 11:47 a.m.

Re: Katie movement

Yes, then we can get a firmware update.

> Quote:
>
> After all, I believe that a calculator on which you can't trust the results doesn't worth one little penny - I apologize the effort spent on it, but it is useless. Very hard and heavy words, sorry...

Not by a long shot. The known bugs so far are largely just goofy cosmetic issues. So far I don't believe anybody has found a way to make the 15c LE produce wrong results. Cy,x and Py,x appear to work perfectly fine - it's just that for some reason, calling them three times within a loop can make the display flash as though there had been an overflow error (even though the results are still correct).

The memory loss from running the self test should be addressed, but it's not nearly as bad as it sounds. For one, you only stand to lose a few hundred bytes of memory, and secondly, what are the chances of running the self test *accidentally*? Compare this to the freeze/memory loss problem in the 35s, which could rear its head as the result of a poorly coded loop. And in that case, you stand to lose up to 32 KB of programs and data. Not fun! (I speak from experience there.)

Re: Katie movement

> Quote:
>
> Just to complicate the issue, I don't get a flashing display no matter how I run this program on my HHC2010 15C+.

I'm not surprised and there may be other beta-test versions around as well. That's why I put the firmware date at the top of bug list article, it's very important to cite the firmware version when claiming a bug. (I just hope that there is never more than one version released per day.)

in response to message #1 by Gerardo Rincon

Hi Gerardo,

I don't see any printed manual. Is that a thin quick start guide?

Re: Updated my Calculator Collection Website

*Message #3 Posted by **Lincoln R.** on 15 Sept 2011, 10:19 p.m.,*
in response to message #2 by hpnut

There is a printed manual with the 15c. It's a real full manual. It's not spiral bound, but the printing and binding is at least as good as the 48g manual is. I bought 2 15cs, each box contained the following:

1 HP 15c Limited Edition calculator
1 Vinyl slip case that looks quite similar but not exactly like the original Voyager cases
1 CD containing a PDF manual and the emulator software, with a printed license key sticker stuck to the disc
1 folded piece of paper with warranty info for random countries that require printed warranties (not the USA).
1 genuine paper HP 15c owner's handbook containing 283 pages of actual content plus some assorted FCC and RoHS info.

Edited: 15 Sept 2011, 10:21 p.m.

Re: Updated my Calculator Collection Website

*Message #4 Posted by **hpnut** on 15 Sept 2011, 10:33 p.m.,*
in response to message #3 by Lincoln R.

thanks. is the printed manual in color?

Re: Updated my Calculator Collection Website

*Message #5 Posted by **Gerardo Rincon** on 15 Sept 2011, 10:41 p.m.,*
in response to message #4 by hpnut

The manual is in Black & White. Print quality could be better, but it's a nice full manual. It has some updated pages which refer specifically to the HP 15C LE. I wish the advanced functions handbook would be re-issued.

Re: Updated my Calculator Collection Website

*Message #6 Posted by **Lincoln R.** on 15 Sept 2011, 11:50 p.m.,*
in response to message #5 by Gerardo Rincon

As others have said, there's a scan of the original on the emulator CD. Also, I believe Tim Wessman said there'd be an updated AFH released online at some point.

Re: Updated my Calculator Collection Website

Sampson Cable HP-15C Arrived Today

*Message #1 Posted by **Dan W** on 15 Sept 2011, 7:47 p.m.*

My wife called me at work and said some package had arrived, saying something about a calculator.

So I say, yea, it's a new calculator.

"Do you really need a new calculator?" she says.

"Um, well, actually, no, not really. But it's a really great calculator..."

At any rate, the one I pre-ordered from SC arrived. I have to say, the box really is quite nice. The manual is nice, but not color.

And the calculator looks very good. No rattling. ;) #02631 The orange/blue keys even look better than I expected.

Thanks HP.

When can I get a HP-42S LE?

Re: Sampson Cable HP-15C Arrived Today

*Message #2 Posted by **hpnut** on 15 Sept 2011, 7:57 p.m.,*
in response to message #1 by Dan W

ummm, I was wondering if it is the same situation with Katie:

KW: yea, it's a new calculator.

Spouse: "Do you really need a new calculator?"

KW: "Um, well, actually, no, not really. But it's a really great calculator..."

LOL!

in response to message #2 by hpnut

My wife will just say, "Marcus, you need a new shelf!".

Re: Sampson Cable HP-15C Arrived Today

*Message #4 Posted by **Mike Maiorana** on 16 Sept 2011, 6:52 a.m.,*
in response to message #1 by Dan W

I've been talking about this for the last month since I pre-ordered from SC. When it arrived yesterday (number 2627) I showed it off to my 17 year old daughter. She said "Is this like some old-person calculator? It's lame". I told her that she just didn't understand :)

I want to say thank you to HP and to those that made this happen. It is beautiful, solid and feels like an HP. I was tempted to put it back in the box and never touch it. Maybe I should buy another?

Regards, Mike M.

Battery-less 128K ram card for HP 48GX

*Message #1 Posted by **mr-scorpio** on 15 Sept 2011, 7:02 p.m.*

Hi there, I recently purchased a 128K memory card at a reasonable price. After installing it, I've managed to merge it with the 48GX internal ram, so I now have a lovely 256KB.

The intriguing thing about the card is that it DOESN'T use any kind of replacement battery. There is certainly no way to open the card, & no removable opening to insert a battery. It only has a write protect switch. The card is made by: Microcards ?

Does anyone have an idea how this card functions power-wise? Does it draw a tiny amount of juice from the calculator batteries to run it? - Even when the 48GX is OFF? Does it contain a rechargeable 'battery' of some kind? OR does it have some sort of persistent memory, that once written to remains resident until it is written to again, even if the card is removed? - OR if i were to remove the card, would anything stored on it would be lost?

It seems to be a professionally made card with a metal chassis.

Look forward to your insights.

Re: Battery-less 128K ram card for HP 48GX

*Message #2 Posted by **Dave Britten** on 15 Sept 2011, 9:26 p.m.,*
in response to message #1 by mr-scorpio

I think most of them have some kind of rechargeable battery inside the casing that trickle charges using power from the 48 while it's turned on. The 48 only supplies power to cards while it's turned on, so if you can power it off without losing data, the card battery at least isn't totally shot.

Re: Battery-less 128K ram card for HP 48GX

*Message #3 Posted by **Howard Owen** on 15 Sept 2011, 9:29 p.m.,*
in response to message #1 by mr-scorpio

The battery "door"is often hard to see on those things. If you press along the top edge of the card, you should find a inset drawer that contains the backup battery.

*Message #4 Posted by **Martin Pinckney** on 15 Sept 2011, 9:33 p.m.,*
in response to message #3 by Howard Owen

Well, if there truly is no battery, then probably the card can only be used to augment system RAM while it is plugged in.

Reminders: If you're coming to HHC 2011...

*Message #1 Posted by **gene wright** on 15 Sept 2011, 3:24 p.m.*

1) You need to be registered. You will have to sign in at HP security and we need a list in advance. Those who show up at the last minute without registering will simply cause a delay for yourself. We WANT you to come :-) but we need you to register.

2) Registration affects the food budget. Please register if you are going to attend and do so before 9/21/2011 (next Wednesday).

3) You will probably need to sign a Non-disclosure agreement.

4) DOOR PRIZES. There is a long history and tradition of attendees bringing some exciting item (or items!) to go on the door prize table. At the end of the day Sunday, we start drawing for the door prize giveaway. Most years, people get 2, 3, or more items. One year, an attendee got an HP 70 (yes, the red LED HP 70) as a door prize! But, this means if you are attending, we ask that you dig through your closet, drawers and find interesting items for the door prize table. I usually bring 4-5 items at least. :-)

5) This year, we will be more time crunched than usual. We are thinking of enforcing stricter time limits on presentations. If you are given 30 minutes to present, we will limit you to 30 minutes. Really.

6) Please be patient with the committee members. Something may not go as we planned but we all try to arrange things to be informative, interesting and fun!

So, if you are anywhere near San Diego or can come, see item one above and join us!

There is a shuttle from the hotel to the event.

If you need to get from the airport to the hotel there is info on the HHC site. Or you can just start walking, but hold up a calc with a big ENTER key instead of your thumb and I am sure one of us will pick you up.

:-)

Hi, Egan! I don't have a big ENTER^ key but I do have other things for you that are *long* past due delivery! I hope to make it there so you can get them in person.

Will have to dig through storage to find other old HP stuff to bring as door prizes or trivia for other certified nerds like me.

Hi Jim! In all likelihood I will be renting a car. My flight arrives at 8:53am on Friday, and my flight home takes off at 12:30pm on Monday. So if either or both of your flights are within say an hour or so of those times, I'll be happy to give you a lift. I should have room for one or two more, first come first served.

in response to message #2 by Jim Horn

Sorry to have to clarify: Is there a way to arrange ride sharing from *far away*? For instance, I may be driving from Portland, Oregon by way of US Interstate 5 with side trips possible to the San Francisco Bay area. My van has eight seats. Or, conversely, I may like to ride with someone else from up here (or Seattle, Washington, Boise, Idaho (Hi, Vern!), etc.). (By the way, just 'cause I love RPN doesn't mean I can't use parentheses (see!)).

There must be others who could benefit by combining their trips as well...

in response to message #1 by gene wright

Hi,

I would suggest everyone bring their 15Cs in all their "incarnations" so we can hold them up in the group photo...

And DEFINITELY bring 20bs and 30bs for flashing into the 34S units, or perhaps existing 34S units to get re-flashed with the most updated firmware.

Jake

Re: Reminders: If you're coming to HHC 2011...

*Message #18 Posted by **Marcus von Cube, Germany** on 15 Sept 2011, 4:50 p.m.,*
in response to message #17 by Jake Schwartz

I just made sure that I'm able to compile the 34S software on my MacBook which I will bring to the conference. So we may even create new versions there. I don't have an FTDI equipped single port USB/RS232 adapter, so one of you should bring one. I'll bring my special FTDI cable (USB to 2.5mm stereo) for my modified 30b.

My main development unit is broken: The serial port no longer works and thus SAM-BA won't work any longer :-(. I've just won another 20b for less then 30€ which will be modified to replace the broken one when I'm back.

Re: Reminders: If you're coming to HHC 2011...

*Message #19 Posted by **Namir** on 15 Sept 2011, 7:41 p.m.,*
in response to message #17 by Jake Schwartz

I am bringing two 30b and two 20b. Only one of the 30b models has a version of the wp34s. But I will need to flash them all!!! I also want to see the process up close. I recently got an old laptop with a serial port and Windows XP. I installed SAM-BA 2.10 and used Gene's cable and followed the process. Still no success. I played withe cable took the batteries out and then put them back in ... nothing going! So I will need to get my learning cap on!

Cost Central shipping HP15C LE?

*Message #1 Posted by **M. Joury** on 15 Sept 2011, 12:33 p.m.*

Hi,

When the info that buy.com had sold out showed up I called Cost Central to see what they had to say. I was one of those that had an order with them originally until buy.com beat them to it. I was told that they had them in stock (they are not showing up on their web page yet).

So those of you that have an order in with them may be getting your units soon.

Cheers,

-Marwan

Re: Cost Central shipping HP15C LE?

*Message #2 Posted by **Howard Owen** on 15 Sept 2011, 12:41 p.m.,*
in response to message #1 by M. Joury

Did you ask how many units they have?

Re: Cost Central shipping HP15C LE?

*Message #3 Posted by **M. Joury** on 15 Sept 2011, 12:55 p.m.,*
in response to message #2 by Howard Owen

Oops. No I did not. Sorry. I will say that they did not seem very sure of any of the answers they gave me so I would not hold my breath just yet.

Cheers,

-Marwan

Re: Cost Central shipping HP15C LE?

*Message #4 Posted by **Michael de Estrada** on 15 Sept 2011, 2:56 p.m.,*
in response to message #3 by M. Joury

I checked my account, and apparently a unit has shipped to me via FEDEX, and it is due to arrive tomorrow. The interesting thing is that it has shipped from the same Olive Branch, Miss. location as the one I received from Buy.com. So this begs the question as to whether this is actually a true distribution center for HP products and CostCentral and Buy.com are simply soft sellers with no actual warehouses of their own. Essentially, the calcs are being drop shipped from the common warehouse. I sure hope this one is properly shipped in an outer box and not simply a padded bag.

Re: Cost Central shipping HP15C LE?

*Message #5 Posted by **Eric Smith** on 15 Sept 2011, 5:02 p.m.,*
in response to message #4 by Michael de Estrada

CostCentral, Buy.com, and MANY other online merchants use drop shipping from the same wholesale distribution centers. I often find that if I search for computer products, a bunch of these online merchants claim to have exactly the same number of the items in stock, because they're querying the wholesaler's database.

Re: Cost Central shipping HP15C LE?

*Message #6 Posted by **M. Joury** on 15 Sept 2011, 5:06 p.m.,*
in response to message #5 by Eric Smith

Ok, makes sense, but that begs the question: Why does buy.com no longer have any units available and Cost Central has just started shipping?

If the above were the case, and it does make sense to me, why are both not taking orders? Did cost central reserve a number of units based on orders or request a certain inventory that is held in reserve for it? And if the same warehouse is shipping for both retailers why didn't cost central start shipping a week ago? Just wondering.

Cheers,

-Marwan

Re: Cost Central shipping HP15C LE?

*Message #7 Posted by **Eric Smith** on 15 Sept 2011, 5:50 p.m.,*
in response to message #6 by M. Joury

Possibly Cost Central has a business relationship with another wholesale distribution center that Buy.com does not.

Re: Cost Central shipping HP15C LE?

*Message #8 Posted by **Lincoln R.** on 15 Sept 2011, 5:46 p.m.,*
in response to message #5 by Eric Smith

SYNNEX Corporation is apparently the actual owner of that warehouse. They list HP as one of their suppliers, which is probably how Buy.com got 15cs so fast.

Re: Cost Central shipping HP15C LE?

*Message #9 Posted by **Namir** on 15 Sept 2011, 8:21 p.m.,*
in response to message #1 by M. Joury

I just got an email from CostCentral. It says that they have shipped my order. SO that is good news. the email offers a tracking number.

When I track the order on Fedex's web site it says that the package was dropped off at OLIVE BRANCH, MS ... same place where the orders of BUY.COM were dropped off. Very interesting!

15C LE: Will 10K units get sold quickly?

*Message #1 Posted by **Howard Owen** on 15 Sept 2011, 11:41 a.m.*

I think that there are people who are passionate about calculators at HP and that we can thank them for the impetus to deliver the 15C LE into our eager though ungrateful hands. On the other hand, I don't believe HP as a corporation would have built the machine without a solid expectation of profit. I believe they have done market research that told them an initial run of 10K units would probably sell out. If they did that, It appears to me they were correct. Buy.com has sold northward of 2K units, and has reportedly jacked the price up to $199.95. I'm betting they are looking at the end of their allocation. How many did they get? I'm guessing it's around 3K. Other dealers in the US received units too, and we haven't accounted for EMEA or Asia. Surely there are units earmarked for those regions as well.

The great question in my mind is whether this apparently brisk sales volume is due mainly to enthusiasts like us, or if ordinary calculator users are snapping it up, perhaps due to the cachet and reputation earned by HP in the 1980s, but kept alive by enthusiasts over the years. If a more general customer base remains interested in the 15C, then we could see it reenter normal production. This would be great news for us, since engineering costs for things like bug fixes could be spread out over a wider base.

I also think that enthusiasts like us are a great guerrilla marketing resource for HP. In my wish fulfilling imagination, I see the 15C LE as a scheme to fire us up in preparation for the launch a new high end calculator. *sigh*

*Message #6 Posted by **M. Joury** on 15 Sept 2011, 12:04 p.m.,*
in response to message #1 by Howard Owen

A question and a statement:

1. Where did you get your numbers from for units that buy.com had? When I asked them early the very first morning their listing went up they told me they had 1,000 in stock.

2. Buy.com is apparently sold out. They did not boost their price. It is another seller, Sampson Innovations selling through their store that is selling the 15C LE for 199.99.

Cheers,

-Marwan

Re: 15C LE: Will 10K units get sold quickly?

> 1. Where did you get your numbers from for units that buy.com had? When I asked them early the very first morning their listing went up they told me they had 1,000 in stock.

I noticed that my first unit from buy.com had a LE number of 336, and that later units sold by them were in the 2200's. While it's true they could have received two or more lots with discontinuous numbers, there's at least a chance that the difference in numbers could represent actual units sold.

> Quote:
>
> 2. Buy.com is apparently sold out. They did not boost their price. It is another seller, Sampson Innovations selling through their store that is selling the 15C LE for 199.99.

I didn't know that. I guess it remains to be seen if the new street price will hold up.

If they started with 1000 units, as you were told, it would still represent 10% of the total production run. Selling that many units quickly is remarkable enough.

Re: 15C LE: Will 10K units get sold quickly?

*Message #8 Posted by **M. Joury** on 15 Sept 2011, 12:27 p.m.,*
in response to message #7 by Howard Owen

> Quote:
>
> If they started with 1000 units, as you were told, it would still represent 10% of the total production run. Selling that many units quickly is remarkable enough.

No argument there.

If they really did sell 1,000 units in under a week and Sampson Cables has already sold out their first shipment wouldn't this be a reason for HP to consider turning this into a regular item in their lineup?

I can't quite decide if the very quick sellout is good news or bad--are we just going to see a new round of price gouging or is HP going to come through for us and make it a standard item?

Cheers,

-Marwan

Re: 15C LE: Will 10K units get sold quickly?

*Message #9 Posted by **Neil Gruending** on 15 Sept 2011, 12:46 p.m.,*
in response to message #8 by M. Joury

Th 15C has a lot of competition from current models. I personally would not choose it based on features/dollar. Instead I want one because I think it's neat, but once everyone like me has one I can't see many more selling.

Re: 15C LE: Will 10K units get sold quickly?

*Message #10 Posted by **M. Joury** on 15 Sept 2011, 12:54 p.m.,*
in response to message #9 by Neil Gruending

I really don't see that the 15C has any current competition. The 35S is not terribly well regarded, most people here don't particularly like the 33S, and all other options are large graphing calculators.

That is not to say that the 15C is the best calculator HP has ever built. I would have to choose the 41 (for it's I/O) or the 42 (power and convenience) for that distinction. But the 15C has no current competition.

What would you buy instead?

Cheers,

-Marwan

Re: 15C LE: Will 10K units get sold quickly?

*Message #11 Posted by **Thomas Radtke** on 15 Sept 2011, 2:05 p.m.,*
in response to message #10 by M. Joury

The 35s could have been something great, and the first reactions were very positive. I still think that the 3*S (\30S) series is easy to use but powerful, and the concept of the 35s brought it to a new level. But the bugs and the problematic keyboard killed it for professional use. Very sad story since it seems to sell well.

To me, the 15C appears to have all the features I need and more, while having a good form factor. A 42S would be overkill for me, in terms of power and cost. I bet I'm not alone with this opinion.

Re: 15C LE: Will 10K units get sold quickly?

*Message #12 Posted by **Howard Owen** on 15 Sept 2011, 1:29 p.m.,*

> Quote:
>
> I personally would not choose it based on features/dollar.

Reading this forum, you can tell that opinions vary on this. I lean toward your view, but then I wonder if the advantages the modern RPN machines have over the 15C are maybe not a concern for the largest number of potential customers. A two line display and alphanumerics might be not much help to some users. With regard to programming, I recall some discussion here about how many 12C users actually program their machines. I think the consensus was that probably few users did that. The 30B comes with an overlay for programming functions precisely because most users don't want those functions. Those are business calculators, and the technical market probably has a larger percentage of users who could program their calculators. But maybe those folks save their programming for their computers, and instead use their calculators to um.. calculate? All of is preamble to say that the advantages the 35s, say, has in programming may not actually matter to a modern 15C buyer.

This is all speculation though. I honestly don't know what's true one way or the other. However I think the interesting thing is letting the marketplace figure out which opinion matches the buying public's requirements.

The $199.95 and $6.67 for shipping at buy.com (actually Samson Cables):

http://www.buy.com/prod/hp-15c-scientific-calculator/223173356.html

And to think I ordered mine last week for $73.99 last week. Free market at work. Must be a lot of demand for the supply.

*Message #15 Posted by **Martin Pinckney** on 15 Sept 2011, 12:06 p.m.,*
in response to message #1 by Howard Owen

I think all this talk about "enthusiasts" misses a large point. There are many thousands of engineers, scientists,

even draftsmen, for crying out loud, of a certain age range, who used Voyagers (not to mention other types) in their careers, and who will want a 15c LE, if they find out about it.

Re: 15C LE: Will 10K units get sold quickly?

*Message #16 Posted by **Howard Owen** on 15 Sept 2011, 12:13 p.m.,*
in response to message #15 by Martin Pinckney

Good point. I sort of lumped them together under "ordinary calculator users," but I can see that segment deserves consideration on its own.

edit: On further reflection, for many purposes, an engineer who used Voyagers in school and still wants a 15C could be thought of as an "enthusiast." People like that might or might not read this forum or go to HHC, but they could still be influential in spreading the idea that the 15C was something special.

Re: 15C LE: Will 10K units get sold quickly?

*Message #17 Posted by **Jim Horn** on 15 Sept 2011, 1:01 p.m.,*
in response to message #15 by Martin Pinckney

I agree. When the engineer next to me at work saw my WP-34S he was intrigued but mentioned what he really wanted was the HP calculator he had used years ago. After some head scratching, we realized it was the HP-15C. When the 15CLE came out, he ordered one in minutes and is eagerly awaiting its arrival.

He's never been on any HP group sites. He just wanted a tool that served him very well again. I suspect there are many in that catagory...

in response to message #1 by Howard Owen

although made in Asia (China), i don't trust that the 15C LE will ever reach Malaysia. Hence my early decision to buy from Samson. still waiting for the consignment to arrive.

Re: 15C LE: Will 10K units get sold quickly?

*Message #19 Posted by **LMMT** on 15 Sept 2011, 3:14 p.m.,*
in response to message #1 by Howard Owen

Maybe, but just for us, collectors, aficionados and sort of. I have two children (17 and 14) and they want an Ipad, a Blackberry and, if at all they ask me for a pocket calculator, a Casio fx 991 ES will do absolutely well. If I give then an HP 15C they will ask me for the tactile screen. Do you really think that an LCD screen from the 80s can compare to the dot matrix one of the Casio or let alone the retina screen of the Iphone? For me, I would love to own an HP 15C to turn it on for a while and then back to my drawer!. Using it for programming, solving engineering problems and so on is impossible when you compare with other HP calcs like, lets say, the HP 48 GII. That's my point of view. HP will no sell ten of thousands of this machine like the HP 12C.

I think all this talk about "enthusiasts, collectors, aficionados" misses a large point. There are many thousands of engineers, scientists, even draftsmen, for crying out loud, of a certain age range, who used Voyagers (not to mention other types) in their careers. They probably don't know anything about this forum, or the ups and downs of HP's calculator division in recent years, but they will want a 15c LE, if they find out about it.

Think Baby Boomers (US). They're buying all sorts of stuff these days for nostalgic or similar reasons.

Besides, the 15c is a well-implemented, compact, good-looking, useful calculator.

... but featuring an outdated display for a programmable scientific of 2011. Given the costs to get the 15C LE in/to this part of the planet and the bugs reported so far, I'll probably refrain from buying one here. It's a very nice calc, but the antecessor of the 42S only :-/

Just my 20m€ as usual. Ceterum censeo: HP, launch an up-to-date 43S!

Walter

Agreed. It is not state of the art, but my point is, that's beside the point. Because even though it is *not* state of the art, it *is* a useful calculator in its own right, and it will have wider appeal than just a few "enthusiasts."

in response to message #19 by LMMT

Don't be so quick to judge. I'm 22 and keep an HP 32s in my bag. I don't own an iPhone, I have an iPod touch, and I honestly don't like trying to use the touchscreen for a calculator. Calculators with real buttons

are honestly more efficient for quick back-of-the envelope math (especially if they're tactile buttons like HP instead of mushy Casio or TI ones). Even at work, I found my 32s more convenient for doing a quick decimal to hex conversion than clicking buttons on my computer, which probably has more compute power in the microcontroller for the battery pack than my calculator.

Re: 15C LE: Will 10K units get sold quickly?

*Message #25 Posted by **Patrick Rendulic** on 16 Sept 2011, 4:56 a.m.,*
in response to message #1 by Howard Owen

I informed 2 european friends who don't collect HPs, but who still use a 11C and a 32S because they like RPN and there is no decent replacement.

They ordered 4. I hope they will not get disappointed by the bugs and the bad keys which some of us reported.

Re: HP 15C LE at buy.com price skyrockets!

*Message #1 Posted by **Jim Johnson** on 15 Sept 2011, 10:37 a.m.*

WOW! The $89.99 that I paid for my two HP-15cLE's from Buy.com now looks pretty good! Hmmmmm, if list one on TAS today and sell it for +$200, then when HP finally opens up their inventory, I can buy two more!

Re: HP 15C LE at buy.com price skyrockets!

*Message #2 Posted by **Jim Johnson** on 15 Sept 2011, 11:57 a.m.,*
in response to message #1 by Jim Johnson

My ethics prevent me from price gouging and the $199.99 price is neither fair or reasonable. I'm hopeful that HP will flood the market with new HP-15cLE's and that everyone can enjoy this wonderful tool at a fair price.

Re: HP 15C LE at buy.com price skyrockets!

*Message #3 Posted by **Masaki Adachi** on 15 Sept 2011, 11:24 p.m.,*
in response to message #2 by Jim Johnson

If I recall correctly, there were two sources listed on that page. One was from Buy.com and another by Samson Enterprise. The listing from Samson was $199 as of last Sunday, when I picked Buy.com listing and placed an order for $89. Now the link to buy.com is gone. It appears they sold out their allocation of the units.

15c: Need good programs for Mod, nCr, nPr

*Message #1 Posted by **Dave Britten** on 15 Sept 2011, 11:15 a.m.*

From the look of the tracking info, my 15c LE will be showing up this afternoon. I noticed from staring at photos of a 15c keyboard, that it's lacking Mod, nCr, and nPr functions, which I do use on a fair basis on my 48SX. Are there any good implementations of these functions for a 15c? I'd like something that will produce results without overflowing during an intermediate step if one of the inputs is relatively large (the 48SX will compute COMB(3000, 4) with ease, for example, and that won't fly with a naive implementation). Speed won't be an issue with the LE model, I presume. :)

*Message #3 Posted by **Dave Britten** on 15 Sept 2011, 11:44 a.m.,*
in response to message #2 by Martin Pinckney

Ah, excellent. Can't believe I missed that.

It appears I'm still in need of a Mod function, however.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #4 Posted by **Don Asmus** on 15 Sept 2011, 1:22 p.m.,*
in response to message #3 by Dave Britten

Here is a small 15C MOD routine that works if both arguments have the same sign.

/ LSTx x<>y FRAC *

It was verified against 48GX results. If the signs of both arguments do not match, it does not return the correct result. If you are like me, and only use arguments of the sign sign, it will be fine. I suspect that a proper algorithm uses the Floor function, or something similar that is also not natively available on the 15C.

Re: 15c: Need good programs for Mod, nCr, nPr

> Quote:

> I suspect that a proper algorithm uses the Floor function, or something similar that is also not natively available on the 15C.

You are right. Some Floor function implementations for the HP-32SII here. They might work on the HP-15C as well.

*Message #6 Posted by **x34** on 15 Sept 2011, 1:23 p.m.,*
in response to message #3 by Dave Britten

HP-15C has INT(IP) and FRAC(FP). So, X MOD Y could be X-Y*IP(X/Y) (depending on modulo function definition).

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #7 Posted by **Dave Britten** on 15 Sept 2011, 1:58 p.m.,*
in response to message #3 by Dave Britten

Just found the Mod routine I made for the 32s/32sii (and had forgotten about). It's got the interesting quality that it preserves stack contents, and only needs one storage register. It's also a little more impervious to precision issues than the implementations that use FRAC *. This ought to work with only minimal conversion effort.

```
M01     LBL M
M02     x<>y
M03     STO T
M04     x<>y
M05     /
M06     LASTx
M07     x<>y
M08     IP
M09     *
M10     RCL- T
M11     +/-
M12     RTN
```

Anybody want to take a stab at making it better?

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #8 Posted by **Egan Ford** on 15 Sept 2011, 2:47 p.m.,*
in response to message #7 by Dave Britten

```
LBL 0
-
LSTx
x<=y
GTO 0
Rv
RTN
```

This will just subtract off until it cannot. Slow, but short, no registers, probably very fast on 15LE. y > x.

in response to message #8 by Egan Ford

> Quote:
>
> This will just subtract off until it cannot. Slow, but short, no registers, probably very fast on 15LE. y > x.

Really nice, thank you, much better thant the one I proposed ! Of course, this way may be a bit slow on original HP-15c , especially with large intergers.

```
# ------------------------------------------
   000 {              }
   001 {    42 21 11 } f LBL A
   002 {          30 } -
   003 {       43 36 } g LSTx
   004 {       43 10 } g x<=y?
   005 {       22 11 } GTO A
   006 {          33 } R_dwn
   007 {       43 32 } g RTN
# ------------------------------------------
```

But, don't try *789456123 MOD 9* on an original HP-15c, it's so looooooong for a really expected result !

Edited: 15 Sept 2011, 4:06 p.m.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #11 Posted by **Katie Wasserman** on 15 Sept 2011, 3:29 p.m.,*
in response to message #7 by Dave Britten

I came up with this one on the 32sii a long while back, it's not so obvious but is short and sweet and doesn't need more than the stack.

for y mod x:

```
0
enter
CMPLX+
/
IP
*
-
```

-Katie

Edited: 15 Sept 2011, 3:30 p.m.

This is even a bit shorter:

```
RCL Y
RCL/ Y
INT
*
-
```

I hope the 32s has RCL Y and RCL/ Y, I don't know this calculator. ;-)

That's strange, because in message #6 Dave has used STO T and RCL- T in a 32s program, so I couldn't imagine that such commands won't exist for register Y !?

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #15 Posted by **Don Shepherd** on 15 Sept 2011, 4:52 p.m.,*
in response to message #14 by fhub

But your Y is stack Y. Dave's T is regular register T (of A-Z).

Ahhh, now I got it: then this 32s doesn't have the usual 4 register stack XYZT !?

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #17 Posted by **Katie Wasserman** on 15 Sept 2011, 5:06 p.m.,*
in response to message #16 by fhub

Wow this is an unnecessarily confusing discussion.

Let's call x,y,z,t the stack and the non-stack registers A, B, C, ... X, Y, Z.

The routine I wrote uses the x,y,z,t stack registers only. The routine that Dave wrote uses the stack resisters plus register T. Although it preserves the stack registers, while mine does not.

On the 32s/ii there are no STO/RCL functions that allow you directly address x,y,z,t like there are in the 42s, for example.

Does that clear things up?

Re: 15c: Need good programs for Mod, nCr, nPr

Katie, can you be king enough to just explain a bit more your code. I only know a few about HP-32sii and I am unable to understand your trick with CMPLX+. As the HP-15c also have complex calculation capability,perhaps may your way lead to a feasible solution on HP-15c ?

Re: 15c: Need good programs for Mod, nCr, nPr

Well, maybe "queen" enough would be more appropriate!

Sorry: could not resist. :)
Massimo

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #20 Posted by **Marcus von Cube, Germany** on 15 Sept 2011, 6:03 p.m.,*
in response to message #18 by C.Ret

If I understand it correctly, 0 ENTER pushes a complex zero to X,Y and the arguments for mod to Z,T. The COMPLX+ just adds 0 to Z and 0 to T, placing the "sum" in X, Y without dropping Z and T. So the result of the operation is that you have the arguments twice on the stack. In RPL you would do DUP2 instead.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #21 Posted by **Katie Wasserman** on 15 Sept 2011, 6:12 p.m.,*
in response to message #20 by Marcus von Cube, Germany

Exactly how I think of it: 0, ENTER, CMPLX+ is the DUP2 operation, a function in RPL and often defined in Forth. I wish it would have been an RPN function too, I'd certainly use it more than roll-up.

> Quote:
>
> I really needed this for the past 39 years, every since I had my HP-35.

No problem! Set up a loop with the 34S AT (alter time) function. Decrement

the current date until you reach the desired time, leave off a 34S (not the one you are using!) for your former self, and execute BTF (back to future.)

There's very little RPN isn't capable of. :)

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #26 Posted by **Walter B** on 16 Sept 2011, 2:15 a.m.,*
in response to message #25 by Howard Owen

No need for loops - the counterpart of BTF is ATP (Advance To Past, please see page -17 of the well known manual) :-)

Edit: Almost forgot - there's also a command Stay At Present time ;-)

*Message #30 Posted by **C.Ret** on 16 Sept 2011, 4:47 a.m.,*
in response to message #21 by Katie Wasserman

Thank you Katie and Marcus.

It’s now clear for me, and I realize that there is no chance that complex-calculus capabilities of the HP-15c will help there.

Katie’s code translate to RPL will be same sort of :

```
« DUP2 / IP * -»
```

Here follow illustration of the various clever stack moves induce by RPN and RPL code:

At first consider the clever stack manipulation from Katie's contribution:

```
[ 0 ][ Enter ][Cmplx][ + ][ / ][ IP ][ * ][ - ]
```

Suppose we have $y = x.q + r$,
where integer q is the multiplicand and integer r the modulus of interest.
We have $r = y\ MOD\ x$. And I also need posing $f = (y/x) – INT(y/x) = FRAC(y/x)$.

I like the clever way of managing the RPN stack:

```
t:    ~   |   ~   |   y   |   y   |   y   |   y   |   y   |   y   |
z:    ~   |   y   |   x   |   x   |   y   |   y   |   y   |   y   |
y:    y   |   x   |   0   |  y+0  |   x   |   x   |   y   |   y   |
x:    x   |   0   |   0   |  x+0  |  y/x  |   q   |  x.q  | y MOD x |
        [0]   [ENTER] [Cplx+]   [/]    [IP]    [*]    [-]
```

It's really close to what may be done in RPL (without the built-in MOD function.

```
4:        |   y   |       |       |       |       |       |
3:        |   x   |   y   |   y   |       |       |       |
2:    y   |   y   |   x   |   x   |   y   |       |       |
1:    x   |   x   |  y/x  |   q   |  x.q  | y MOD x |
«       [DUP2]   [/]    [IP]    [*]    [-]       »
```

The version proposed by **flsh**, which look really close to a HP-41C style with stack register manipulation.It spare one step through memory recall and operation combine in one [RCL/ IND Y] instruction.

```
t:    ~~~   |    ~    |    ~    |    ~    |    ~    |    ~    |
z:     ~    |    y    |    y    |    y    |    ~    |    ~    |
y:     y    |    x    |    x    |    x    |    y    |    ~    |
x:     x    |    y    |   y/x   |    q    |  x.q    | y MOD x |
  [RCl ST Y][RCL/ ST Y]       [IP]      [*]       [-]
```

But as RPL devices, the HP-41C (and HP-42S) calculator has built-in MOD function.

Here a version for the great WP-34S which have no built-in MOD function (or I am missing something?):

```
t:     ~    |    y    |    y    |    y    |    y    |    y    |
z:     ~    |    x    |    y    |    y    |    y    |    y    |
y:     y    |    y    |    x    |    x    |    y    |    y    |
x:     x    |    x    |   y/x   |    q    |  x.q    | y MOD x |
     [CENTER]     [ / ]   [FLOOR]       [*]       [-]
```

How to produce with short code the same stack manipulations on the HP-15C is another storie.

Here is for comparison the way proposed by **Gerson**:

```
l:  ~  |  ~  |  ~  |  ~  |  ~  |  x  |  x  |  x  |  x  |  x  | y/x |
y/x | y/x |

t:  ~  |  ~  |  ~  |  y  |  y  |  y  |  y  |  ~  |  y  |  y  |  y  |
y  |  y  |
z:  ~  |  ~  |  x  |  ~  |  ~  |  y  |  y  |  y  |  y  |  y  |  y  |
y  |  y  |
y:  y  |  x  |  y  |  x  |  y  |  ~  | y/x |  y  | y/x |  x  |  x  |
y  |  y  |
x:  x  |  y  |  y  |  y  |  x  | y/x |  ~  | y/x |  x  | y/x |  q  |
```

```
q.x |  r  |
    x<>y ENTER  Rdwn  x<>y     /  x<>y  Rdwn LASTx  x<>y   INT     *
-
```

Obviously HP-15C lacks same stack manipulation command. But that's what makes the charm of this old-style true RPN calculator. In daily use of it, did this lack of complex stack manipulations miss any users?

A way to mimic the DUP2 stack manipulation style will be to use statistic function. But, even if this is short, this solution will clear (and use) registers R2 to R7. Perhaps it is not a convenient way ?

```
R2:    ~   |    0    |    0   |    0   |    1   |   1    |  1  |  1
|  1  |  1  |  1  |
R3:    ~   |    0    |    0   |    0   |    x   |   x    |  x  |  x
|  x  |  x  |  x  |
R4:    ~   |    0    |    0   |    0   |   x.x  |  x.x   | x.x | x.x
| x.x | x.x | x.x |
R5:    ~   |    0    |    0   |    0   |    y   |   y    |  y  |  y
|  y  |  y  |  y  |
R6:    ~   |    0    |    0   |    0   |   y.y  |  y.y   | y.y | y.y
| y.y | y.y | y.y |
R7:    ~   |    0    |    0   |    0   |   x.y  |  x.y   | x.y | x.y
| x.y | x.y | x.y |

t :    ~   |    0    |    0   |    0   |    0   |    0   |  y  |  y
|  y  |  y  |  y  |
z :    ~   |    0    |    0   |    0   |    0   |    y   |  x  |  y
|  y  |  y  |  y  |
y :    ~   |    0    |    y   |    y   |    y   |    y   |  y  |  x
|  x  |  y  |  y  |
x :    ~   |    0    |    y   |    x   |    1   |    x   |  x  | y/x
|  g  | g.x |  r  |
[CLEAR Sig]  y [ENTER]        x   [Sig+][RCL Sig][RCL Sig]   [/]
[IP]   [*]   [-]
```

Since this last solution use so much memory register and clearing statistic also clear the stack, it is not a valid code. I would prefer a simple one normaly using only one register and making the job straighforward.

I greatly prefer not to try to manipulate stack on an HP-15c, and using an approximative MOD function, only valid for *y* and *x* both positive :

```
l:      ~   |   x   |   x   |   x   | y/x | y/x |

t:      ~   |   ~   |   ~   |   ~   |  ~  |  ~  |
z:      ~   |   ~   |   ~   |   ~   |  ~  |  ~  |
y:      y   |   ~   |  y/x  |   x   |  x  |  ~  |
x:      x   |  y/x  |   x   |  y/x  |  f  |  r  |
[FIX 0] [ ÷ ] [LASTx]  [x<>y]  [FRAC] [ × ]
```

*Message #31 Posted by **Paul Dale** on 16 Sept 2011, 4:59 a.m.,*
in response to message #30 by C.Ret

For the 34S:

```
cmplx ENTER
/
FLOOR
*
-
```

Which is a direct copy of the 32sii version changing IP for FLOOR (the 34S having both).

The 34S has a remainder function that is the same as MOD for positive arguments but slightly different for negative.

Thank you.

I just revised my previous post incorporating the WP34S version. After I have re-read manual, since I still not fill confortable with this new calculator.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #34 Posted by **Paul Dale** on 16 Sept 2011, 6:10 a.m.,*
in response to message #33 by C.Ret

The 34S RMDR operation (h-shift divide) behaves the same as C's MOD operator (for both integer and real modes). For example:

```
 7  3 RMDR =  1
 7 -3 RMDR =  1
-7  3 RMDR = -1
-7 -3 RMDR = -1
```

There was mention a while ago of this not being the correct behaviour for *MOD*. I don't remember the exact details though. What should the values be here?

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #35 Posted by **C.Ret** on 16 Sept 2011, 6:57 a.m.,*
in response to message #34 by Paul Dale

Quote:

```
 7  3 RMDR =  1
 7 -3 RMDR =  1
-7  3 RMDR = -1
```

```
     -7 -3 RMDR = -1
```

Hepp! That what I missed; the "remainder" fonction of 34S, 42S and 16C tools !

```
 7  3 RMDR =  1     RMDR is MOD correct since   7 =  2 × 3  +  1   and  0 < 1 < 3                                  7 3 MOD =  1

 7 -3 RMDR =  1     RMDR isn't MOD despite of   7 =(-2)×(-3) +  1 due to 1 being greater than (-3).
                    In this case we have to consider   7 =(-3)×(-3) +(-2) where remainder (-2) is between (-3) and 0.
So  7 -3 MOD = -2

-7  3 RMDR = -1     RMDR isn't MOD despite of (-7)=(-2)×3  +(-1) due to (-2) being out of range.
                    In this cas we have to consider  (-7)=(-3)×3  +  2 so that 2 is between 0 and 3 :  0 < 2 < 3    So -7  3 MOD =  2

-7 -3 RMDR = -1    RMDR is MOD correct since  (-7)=  2 ×(-3) +(-1) where -3 < -1 < 0
-7 -3 MOD = -1
```

Sametime I wonder myself, why and how simple idea became so complicated in the mathematic world ?

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #36 Posted by **Paul Dale** on 16 Sept 2011, 7:48 a.m.,*
in response to message #35 by C.Ret

Isn't the code above doing the remainder instead of MOD then?

-7 mod 3 is -1 according to the code above:

```
[RCl ST Y][RCL/ ST Y]  [IP]      [*]       [-]
(changing the INT  to IP and the IND to ST).
```

You need FLOOR instead of IP or INT to get a MOD don't you?

- Pauli

*Message #37 Posted by **Dieter** on 16 Sept 2011, 2:27 p.m.,*
in response to message #36 by Paul Dale

Well...

> Quote:
>
> You need FLOOR instead of IP or INT to get a MOD don't you?

...the 35s has them both: IP and INTG. And RMDR, of course. ;-)

```
REGY-REGX*IP(REGY/REGX)
```

resp.

```
REGY-REGX*INTG(REGY/REGX)
```

will return the one or the other result.
The second version is equivalent to the 35s RMDR function.

>
> ...the 35s has them both: IP and INTG. And RMDR, of course. ;-)

FLOOR (or INTG on the 35s) really is a very useful function. However, most devices only offer INT or IP which simply cuts off the decimals.

But there is a way - for instance on the '41:

```
ENTER^
ENTER^
 1
MOD
 -
```

You can also try this with -1 and see what you get.

Dieter

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #39 Posted by **C.Ret** on 16 Sept 2011, 5:03 p.m., in response to message #37 by Dieter*

Let make a table to check which fonction for which result :

```
  y  x : y MOD x   y RMDR x : y-x.INT(y/x)   y-
x.FLOOR(y/x)   y-x.CEIL(y/x)
                                 y-x.IP(y/x)
  7  3 :       1          1 :             1
1              -2
  7 -3 :      -2          1 :             1
-2                1
 -7  3 :       2         -1 :            -1
2              -1
 -7 -3 :      -1         -1 :            -1
-1                2
```

Obviously, MOD is obtained from FLOOR and RMDR from IP or INT. CEIL lead to a third type of modulus.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #40 Posted by **Dieter** on 18 Sept 2011, 6:53 a.m.,*
in response to message #39 by C.Ret

I think it's important to say *which* MOD or RMDR you refer to. For instance, the results of MOD on the 41 and RMDR on the 35s are exactly the same.

Regarding CEIL: usually this is an easy one as CEIL(x) = -FLOOR(-x).
On a '41 this can be accomplished by

```
ENTER^
ENTER^
-1
MOD
 -
```

On a 35s, use RDMR instead. ;-) Or simply CHS INTG CHS. That's one of the things I like on the 35s.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #41 Posted by **Gerson W. Barbosa** on 16 Sept 2011, 7:34 a.m.,*
in response to message #34 by Paul Dale

My (outdated) wp34s manual says:

RMDR Equals MOD on *HP-42S* and RMD on *HP-16C*.

However, on the HP-42S we have:

```
 7  3 MOD =  1
 7 -3 MOD = -2
-7  3 MOD =  2
-7 -3 MOD = -1
```

Gerson.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #42 Posted by **Paul Dale** on 16 Sept 2011, 7:52 a.m.,*
in response to message #41 by Gerson W. Barbosa

The manual is incorrect. It is the same as RMD on the 16C. It honours the sign of the numerator. To get MOD, add the denominator to the result if the signs of the two numbers are different.

Maybe I should just implement MOD as well although it will eat up a bit of space to do so. RMDR works with integers, reals and complex numbers and double precision integers -- MOD should also.

- Pauli

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #43 Posted by **Dieter** on 16 Sept 2011, 2:13 p.m.,*
in response to message #30 by C.Ret

Of course there must be no RCL IND Y commands in any of these routines. This would recall the register whose *address* is in y.
The correct sequence, as stated by Franz "fhub", actually is

```
RCL Y
RCL/ Y
INT
 *
 -
```

Although not required on a **HP-41** (MOD is available), a double RCL Y will match the DUP2 of RPL:

```
RCL Y
RCL Y
 /
INT
 *
 -
```

Of course you can also do it on a **classic HP machine**. The following code is two steps shorter than Gerson's and uses the t-duplication on stack drop:

```
ENTER^
ENTER^
CLX
 +
RDN
 /
INT
R^
 *
 -
```

The **HP35s** finally has a RMDR function and can also access the stack registers directly. It features both IP as well as INTG. It even offers a command for integer division, similar to DIV in some programming languages. Very handy in many cases. Using equation mode one could do it this way:

```
REGY-REGX*IDIV(REGY,REGX)
```

*Message #44 Posted by **C.Ret** on 16 Sept 2011, 4:04 p.m.,*
in response to message #43 by Dieter

Thank you for your attentive reading and pointing out the “IND” error.

Of course, there’s no indirect access there. My intention was to make HP-41C "STO Y - where Y is in stack " notation not confused with HP-32 alphabetic name f register (where "STO Y" means store in register named Y). Using reserved keyword IND is my own mistake.

I have to correct this in my post.

I like your code using a dump zero addition " Clx + " to realize the DUP2 style algorithm on classic. It is a triky way.

```
t:    ~   |   ~   |   y   |   y   |   y   |   x   |   x   |   x
|   x   |   x   |   x   |
z:    ~   |   y   |   x   |   x   |   y   |   y   |   x   |   x
|   y   |   x   |   x   |
y:    y   |   x   |   x   |   x   |   x   |   y   |   y   |   y
|   q   |   y   |   x   |
x:    x   |   x   |   x   |   0   |   x   |   x   |  y/x  |   q
|   x   |  x.q  |   r   |
   [ENTER^][ENTER^]   [Clx]   [ + ] [R dwn]   [ ÷ ]   [INT]  [R
up]   [ × ]   [ - ]
```

Nice shot ! Achievable on all the classic !

There indeed is a special keyword on those calculators that feature both lettered registers and stack access, e.g. the 42s. Here, a simple "ST" distinguishes between stack and variables:

Recall variable (data register) "Y":

```
RCL Y
```

Recall stack register y:

```
RCL ST Y
```

On other calculators RCL Y is unambiguous since it can have only one meaning: There are no lettered data registers or variables on the 41, so RCL Y refers to the stack. On the 32s, there is no direct stack access, so it's clear that RCL Y refers to the variable (data register) with that name.

BTW, the 34s does it in a very special way: the content of the stack registers is stored in registers with the same letter. So RCL Y means both "recall variable Y" *and* "recall stack register Y". ;-)

*Message #47 Posted by **Gerson W. Barbosa** on 16 Sept 2011, 9:21 a.m.,*
in response to message #46 by Alexander Oestert

This is the remainder of the integer division, however, not the modulus function. MOD can be defined as

```
MOD(x,y) = x - y * Floor(x/y)
```

where

```
Floor(x) = INT(x) + INT(FRAC(x) + 1) - 1

IP, FP: same as INT and FRAC, on the HP-15C
```

*Message #48 Posted by **Alexander Oestert** on 16 Sept 2011, 9:28 a.m.,*
in response to message #47 by Gerson W. Barbosa

As I wrote, my code was just an implementation of Katie's very elegant 32s-idea ported to the 15c, whether it yields modulo or remainder - I didn't investigate. After I read the modulo article on wikipedia I'm not sure if I still know the difference between modulo and remainder... ;) .

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #49 Posted by **Gerson W. Barbosa** on 16 Sept 2011, 9:36 a.m.,*
in response to message #48 by Alexander Oestert

Yes, there is some confusion. On the HP-33s, for instance, they have implemented the modulus function, and yet they name it Rmdr. When the signs of the arguments are the same, they are equivalent:

```
 7  3 RMDR =  1
 7 -3 RMDR =  1
-7  3 RMDR = -1
-7 -3 RMDR = -1

 7  3 MOD =  1
 7 -3 MOD = -2
-7  3 MOD =  2
-7 -3 MOD = -1
```

You'll need to FIX 0 first, e.g. 10 3 MOD is not 1, its .9999999999.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #52 Posted by **C.Ret** on 15 Sept 2011, 3:21 p.m.,*
in response to message #51 by Egan Ford

> Quote:
>
> You'll need to FIX 0 first, e.g. 10 3 MOD is not 1, its .9999999999.

You are right, but FIX 4 may give in most cases the right integer result. Only FIX 9 may encounter a wrong result in rare occasions (like the one you give in your exemple).

Since there is no STD display format, most FIX *n* may be OK with n less than 9.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #53 Posted by **Gerson W. Barbosa** on 15 Sept 2011, 2:44 p.m.,*

```
001 LBL B
002 x<>y
003 ENTER
004 Rv
005 x<>y
006 /
007 g LSTx
008 x<>y
009 g INT
010 *
011 x<>y
```

```
012 Rv
013 CHS
014 g x<=y
015 +
016 g TEST 7
017 +
018 g RTN
```

This needs some simplification and stack preserving, but you've got the idea.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #54 Posted by **C.Ret** on 15 Sept 2011, 3:39 p.m.,*
in response to message #53 by Gerson W. Barbosa

Hi,

Yes, you are right, the first version of my code return an approximate *y MOD x* since it is not (or in rare situation) an integer, as expected.

So, I propose a second version which returns the correct integer result as long as both arguments are both positives. My new version use one register to store a the small value $eps = 5\times 10^{-7}$ used to correctly round-up results. This *eps* constant have to be adjusted for larger result than 10000.

```
# ------------------------------------------
   000 {              }
   001 {    42 21 11  } f LBL A
   002 {           10 } ÷
   003 {       43 36  } g LSTx
   004 {           34 } x<->y
   005 {       42 44  } f FRAC
   006 {           20 } ×
   007 {    45 40  0  } RCL + 0
   008 {       43 44  } g INT
   009 {       43 32  } g RTN
# ------------------------------------------
```

USAGE :
Initiate register R0 with a small positive value (i.e. 5×10^{-7}),
Enter integer *y* and *x* into the HP-15 LE stack,
Press [f][A] to run the code. The integer result *y MOD x* is return and displayed.

Re: 15c: Need good programs for Mod, nCr, nPr

*Message #55 Posted by **x34** on 15 Sept 2011, 5:01 p.m.,*
in response to message #54 by C.Ret

Better use INT instead of FRAC, no need to round.

MOD(y,x) as equivalent to MOD on the HP-41/42S and Rmdr on the HP-33s

*Message #56 Posted by **Gerson W. Barbosa** on 15 Sept 2011, 8:48 p.m.,*
in response to message #54 by C.Ret

```
001 LBL A
002 x<>y
003 ENTER
004 Rv
005 x<>y
006 /
```

```
007 x<>y
008 Rv
009 g LSTx
010 x<>y
011 g INT
012 g LSTx
013 f FRAC
014 g TEST 2
015 f HYP COS
016 g INT
017 -
018 *
019 -
020 g RTN
```

MOD(y,x) = x - y * Floor(x/y)

Perhaps someone might want to do some optimization.

15c LE in europe?

*Message #1 Posted by **Bart K.** on 15 Sept 2011, 6:13 a.m.*

Hi all,

anybody already found a reliable shop to order a 15c LE in Europe? Or an American store that ships to Europe?

Kind regards,

Bart

Re: 15c LE in europe?

*Message #2 Posted by **Marcus von Cube, Germany** on 15 Sept 2011, 10:58 a.m.,*
in response to message #1 by Bart K.

I've ordeed one at Samson Cables (hpcalculators.com). Shipping is $40.

in response to message #5 by Marcus von Cube, Germany

Ok, I guess they mislabeled my parcel. There was a thread about it, so now I wonder if it will arrive :-(. Yours likely will.

Re: 15c LE in europe?

*Message #7 Posted by **Bart (UK)** on 15 Sept 2011, 3:41 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Samson Cables seems to have wildly varying postage prices.
When it first came up it was $16 to UK, later it was $24.
On 1st September I ordered both the 15C LE and 12C 30th Ann., and paid $35 for both to UK. (Got an email yesterday saying it was shipped).
Now I looked and indeed they quote $40 postage for 1 unit!! That another 40% of the calculator price!

Edit:
However, at the time the 12C 30th was listed at $99.99, which is what I was charged. Thus I paid $234.98 for both with postage. (Of course taxes and Royal Mail charges will come on top of that when it arrives in the UK).

in response to message #9 by Bart K.

I don't think they have stock yet though. However, in an email the owner of TheCalculatorStore mentioned that there was a separate batch destined for Europe with their own product number different from the US product no.

Re: 15c LE in europe?

*Message #11 Posted by **Jose Gonzalez Divasson** on 15 Sept 2011, 3:53 p.m.,*
in response to message #9 by Bart K.

Hi,

Both units (15c LE and 12c AE) will be presented to European distributors on Friday next week in a meeting in France. Latest news are that the 12c will be in October, 15c even later, in European version (not within the US batch, and we might have the known bugs sorted out by then)

Please consider that the number of calculators involved are extremely small compared with other more mainstream models. We are not important in the HP scheme of things. We do not know how much we have to thank Tim and Co. who spent their time for calcs of such low volume. Think that the revenues for HP for this model migh be around 250-300 k€ in total - contribution much lower than that. Compare that with the fact that China has decided that their students shall have graphical calcs as standard tool in school, starting next year!

Re: 15c LE in europe?

*Message #12 Posted by **Jose Gonzalez Divasson** on 15 Sept 2011, 3:56 p.m.,*
in response to message #11 by Jose Gonzalez Divasson

By the way, while no European distributor has been given info on these calcs, the latest price list show 3 other calcs as "obsolete". One of them surprises me...

It's a shame. But if people are paying those prices, it's a strong indication HP has a hit. On the other hand, it's also possible speculators bought large numbers from buy.com or other retailers. In either case, I've got that item on my watch list. Whether it sells or not should be enlightening.

Re: 15c LE Now listed at $199.99 on Buy.com

*Message #12 Posted by **Hugh Evans** on 15 Sept 2011, 6:33 p.m.,*
in response to message #2 by Paul Gaster

Hpcalc.org has them in stock, I just ordered two today (one for my dad's birthday.) I may get a spare, but I'm in decent shape for work calculators. At the moment I'm using my 48gx and 42s. I scored a mint

condition 42s through craigslist a few months ago with case and manual. The owner hadn't used it since college, was shocked that I knew how it worked, and sold it to me for $20! It's the only calculator I have a true backup for.

In the final (Aug, 1983) issue of HP Key Notes (Vol. 8 No. 2) on the cover is a photo of Key Notes editor Henry Horn with part of his HP collection and front and center is his clear HP-97. Back in 1981 after the HP Calc conference in Corvallis had wrapped up, Richard Nelson and I visited Henry at his house there, and one of the things he did was pull out all his clear machines to show off. That was impressive.

Jake

Re: HP-65 clear body!!

*Message #5 Posted by **Brian Walsh** on 15 Sept 2011, 12:12 p.m.,*
in response to message #1 by robertoataulfo

It would be more desirable if the top half of the case were clear, too.

I have a one of a kind blue (think blue shift key) HP-41 case. The entire case. I've never used it but am

considering transplanting my 41CX into it when the 41CL arrives.

WP 34S: New Release on SF

*Message #1 Posted by **Marcus von Cube, Germany** on 15 Sept 2011, 8:29 a.m.*

I've put up version 2.1 of the software on SourceForge.

Remarks:

1. Before you update: Use the wp34s_asm tool to transform your programs to text form. We've made changes that force a memory clear on the update. Flash libraries need to be recreated, too.

2. The number of flash regions is now 10 (0-9), including the backup. This will most probably change in later versions when we add more functions.

Please report back any findings. I'll be off to San Diego from Monday on till end of September with limited opportunities to fix bugs.

Re: WP 34S: New Release on SF

Marcus, why is the matrix stuff not included yet?
Is it still not ready?
There's a matrix.wp34s in the SVN/library folder, but without the matrix stuff compiled in it's of course useless. :-(

Franz

> There's a matrix.wp34s in the SVN/library folder, but without the matrix stuff compiled in it's of course useless. :-(

You got it. The matrix stuff is for version 2.2. It's not yet ready for a release because Pauli is still working on it. There will eventually be versions in SVN with the routines built in. One major drawback is space: They cost us several K which reduces the number of user flash regions so it doesn't make sense to include them before they are finished.

Re: WP 34S: New Release on SF

*Message #5 Posted by **gene wright** on 15 Sept 2011, 10:08 a.m.,*
in response to message #3 by fhub

From what I believe, it is not ready yet.

At HHC next week, I hope to show the PPC ROM translated matrix routines for the 34s, but I know the 34s native changes that will eventually be unveiled will be better.

So... Patience! It isn't quite ready yet. :-)

Re: WP 34S: New Release on SF

*Message #6 Posted by **Paul Dale** on 15 Sept 2011, 5:42 p.m.,*
in response to message #5 by gene wright

The native matrix code isn't necessarily better. It is different.

To start with, the space cost for them will be (much) larger than the keystroke programs. For the space of the internal versions you can easily have keystroke equivalents plus lots of other stuff in the lost flash pages. The keystroke versions would be less flexible but sufficiently functional.

The PPC ROM routines (M1 - M3) are utilities that allow easy row operations on matrices. We've not decided if the internal versions of these are worthwhile space wise or not -- the PPC code is very compact and quite usable. The internal code for these three routines is equivalent to many more steps than the PPC code requires. The internal code for M3 will be more accurate than a straight translation -- it is a vector multiply add -- but the keystroke program could be updated to match. On the plus side, the internal equivalents to these, if included, won't change the stack when run.

The PPC ROM routines M4 and M5 will likely exist as internals. I'm using a different format for matrix descriptors and having stack friendly ways to manage these makes any keystroke programs using them much simpler. Again, the keystroke code would be smaller but in this case flexibility is definitely more important. There will be a couple of other routines to manipulate matrix descriptors easily -- to build ISG or DSE loops for rows and columns e.g.

The internal code will also support matrix addition and multiplication. Both of these are missing from the PPC ROM. Multiplication in particular will benefit from the extended internal precision (although cases that exceed even this are possible). I've also done an in place transpose which might be better suited as a keystroke program.

I've not implemented a matrix inverse or determinant routine yet but I suspect the PPC example RRM code will be the way to go here.

Then there will need to be a pile of utility routines (matrix norms, min and max elements etc). These will best be done as keystroke code I suspect.

Anyway, lots of balancing to go.

- Pauli

Re: WP 34S: New Release on SF

*Message #7 Posted by **Ángel Martin** on 16 Sept 2011, 6:19 a.m.,*
in response to message #6 by Paul Dale

I understand the real life constrains and practical reasons to consider using the M1-M5 routines - yet it's a pity that the 42 code couldn't be leveraged.

Sure being MCODE doesn't make it an easy (suitable?) candidate for direct translation, and I suppose the same issue exists with the CCD/Advantage matrix implementation. However I for one would not touch the M1-M5 with a 12-ft pole after having used the "real" stuff.

I'm not trying to create controversy here, just my individual opinion.

ÁM

Edited: 16 Sept 2011, 6:20 a.m.

Re: WP 34S: New Release on SF

*Message #8 Posted by **Paul Dale** on 16 Sept 2011, 7:38 a.m.,*
in response to message #7 by Ángel Martin

Don't worry, I'm still thinking about how best to do the matrix code. We can't do it exactly like the 42. We don't have a matrix type for starters. Leave that for the WP 43S :-) I'm quite happy to take suggestions for matrix operations and the primitives needed to support them. We're pretty much working with a blank slate here.

The M1-M3 routines are very useful when you're doing a row operations and no matter how many matrix decompositions I code, there will be more and many of these are done using such operations. So having these in some form kind of makes sense -- they really are basic low level routines. Think of them as the BLAS support code for the features in LAPACK or similar.

M4 and M5 are useful by themselves to convert x, y coordinates to register location and back. Again handy as a building block rather than a high level function. Even though I do like the 42's matrix/matrix an matrix/vector operations, I don't much like the 42's I and J access into matrices.

I've also supplied routines to create loop counters for row/column/entire matrix access. Again useful low level commands. Want an iterator to go down the third column of a matrix -- done.

These basic commands could be put into a keystroke library but then higher level routines that call them will become more complicated and need more temporaries.

I'd like to provide lots of higher level functions as well. Matrix inverse, determinant, eigen decomposition, Cholesky decomposition, LU decomposition, SVD, least squares, Jordan normal form, ... There are lots of possibilities here and a case could be made for any or all of them. Given that flash is quite tight, what subset makes most sense? Given that they will be smaller as keystroke code, what is the best suite of support routines to implement them with? Despite this which should be internal?

Although the low level functions might be annoying to use, XEQ'M^-1' which inverts the matrix from a descriptor on the stack won't be. Some of the above matrix operation might also merit coding in C where there are more resources available for temporary storage. e.g. an in-situ inverse or an eigen decomposition that doesn't require extra registers for temporary storage.

I've coded a matrix multiply internally for precision reasons. This will stay in C since doing it as a keystroke would be very hard without losing accuracy. Calling this is easy: matrix descriptors in Y and Z and a base register for the result in X. Mt* gives a matrix descriptor in X. Almost as good as the 42 and likely the best we can do on the 34S.

I've done a scalar multiply / matrix add operation. This could be coded via keystroke programming and would be smaller done that way. I might yet change it over. The in-situ transpose is another one that might change to key stroke for space reasons. the point is everything here is a space/usability tradeoff. Matrix support is not going to be a core 34S feature so I'm willing to lose a bit on the usability side.

Things are very much in a state of flux at the moment -- these functions are not in the firmware we're putting in the release archive and aren't documented. That will only change when we're happy with the basic suite of operations, if there ever even occurs.

Now if people want to volunteer to code the missing matrix commands as keystroke programs (or even doing them in C), please let us know. If, while doing so, a need appears for more basic operations, they will be implemented. This isn't going to be a trivial effort. I have several thick and heavy books dedicated to the numerical evaluation of matrix functions.

Still people have asked for matrix support and we're trying.

- Pauli

Re: WP 34S: New Release on SF

*Message #9 Posted by **Ángel Martin** on 16 Sept 2011, 11:05 a.m.,*
in response to message #8 by Paul Dale

Pauli, I just read your post - got no time at this moment for a more elaborate answer but if FOCAL routines are a possible avenue, I'd suggest taking a detailed look at JM-Baillard's matrix libary:

http://hp41programs.yolasite.com/eigen.php
http://hp41programs.yolasite.com/matrixop.php
http://hp41programs.yolasite.com/determinant.php

Obviously all my Matrix modules are not useful, since it's all based on the CCD/Advantage foundation.

Cheers, ÁM

Re: WP 34S: New Release on SF

*Message #10 Posted by **Paul Dale** on 16 Sept 2011, 7:30 p.m.,*
in response to message #9 by Ángel Martin

I've looked at JM-Baillard's matrix code in some detail. I've been basing some of the decisions involved on his implementations -- he seems to have done the most key stroke matrix operations of anyone and has a rich suite available already.

I did change the matrix descriptor format to better match the 34S's memory layout and to improve the easy of use a little. There are utility routines to create and disassemble these currently, there will likely be a few more.

FOCAL is definitely the path to matrix functionality -- we don't have enough spare flash for a full implementation in C. We might have enough flash for key stroke programs even though they won't be as easy to use.

- Pauli

*Message #13 Posted by **fhub** on 16 Sept 2011, 9:35 a.m.,*
in response to message #1 by Marcus von Cube, Germany

> Quote:
>
> Please report back any findings.

Hi Marcus, not sure if this is a new issue:

IIRC then after opening any catalog (e.g. [h][P.FCN]) you were able to quickly jump to the functions by pressing their initial letters, and this even worked if you pressed another letter (e.g. if you've used a wrong one first) - at least I can remember that it has been so in previous versions.
But now only the first pressed/clicked letter is accepted, after this you can't access any other letter anymore!?
Is this a new bug introduced in the last few versions?

Franz

> you can't access any other letter anymore!?

Just tested build 1610 on the emulator: AFAICS it works as advertised. Please see page 70 of the manual and make sure you read the footnote, too. This page didn't change for many months.

Walter

*Message #16 Posted by **Marcus von Cube, Germany** on 16 Sept 2011, 6:33 p.m.,*
in response to message #15 by fhub

It's just a way to navigate to the second or third letter of the name if you type fast enough. The arrow keys reset the search as does the 3 seconds delay.

15C LE Wobbly F/G Keys

*Message #1 Posted by **DaveJ** on 15 Sept 2011, 3:46 a.m.*

I don't know if this has been mentioned before, but someone posted this video on my forum:
http://www.youtube.com/watch?v=rF5-e-ZY1Rw

Dave.

Re: 15C LE Wobbly F/G Keys

*Message #2 Posted by **hpnut** on 15 Sept 2011, 8:09 a.m.,*
in response to message #1 by DaveJ

that is one (no, two) wonky key, totally unacceptable to me. this is not the HP quality that i know.

Re: 15C LE Wobbly F/G Keys

*Message #3 Posted by **db (martinez, ca.)** on 15 Sept 2011, 9:21 a.m.,*
in response to message #2 by hpnut

Some of you people would complain if you got hung with a new rope.

Sam, Cyrille, Tim and every one involved in the new 15c deserve a medal for finding a way to make this improbable and unprofitable pipe dream into a reality, as does anyone that finds a fixable problem in the firmware.
I bought 3 because i said i would on that online petition and i'm in the bad habit of keeping my word. However: what i'd really like to see and use is that 42 clone-on-the-17b platform that people have been talking about. But that will never happen if all we do is bitch them out for unimportant or correctable flaws in this one.

in response to message #4 by hpnut

The shift keys work fine. Sure, the pieces of plastic feel a little bit loose, but the actual key action is fine.

Just waiting for someone to say its for fools and so real engineer could use it.

I mean, you could be building a skyscraper, and at the critical task of ensuring the steel is straight and orthogonal, using your 'f' and 'g' keys as a set square could destroy the project as one of them was a few degrees out.

Daniel

If you read the several posts on this subject over the last day or two, you will find that several have said their original 15c's also have keys that are a little loose.

In any event, this is really a non-problem, IMO. There just isn't that much movement.

I gave both my original and the new one the good old shake test and there was more rattle from the original--none from 2/3 new ones, the third had a very slight rattle.

Admittedly my original is many years old but it has led a pretty sheltered life. I certainly don't have any complaints about the quality of the LE.

Cheers,

-Marwan

Re: 15C LE Wobbly F/G Keys

*Message #14 Posted by **robert rozee** on 15 Sept 2011, 10:18 a.m.,*
in response to message #2 by hpnut

the solution to this would have been incredibly easy - make the f and g keys the same colour (brown) as the rest, then print them with a gold/blue block with the f/g in reverse (ie, the brown of the underlying plastic).

this would have the added advantage of providing the LE calculators with a very clear discerning feature to differentiate it from the originals, as well as producing an overall simpler product to assemble.

If this were done, I wonder how long before the paint rubbed off.

Re: 15C LE Wobbly F/G Keys

*Message #16 Posted by **Bart (UK)** on 15 Sept 2011, 11:05 a.m.,*
in response to message #15 by Quan

It's that way on the 35s. Also, the white numbering/lettering is printed on anyway, so the numbers are likely to wear off before the function keys (assuming the same "toughness" paint is used).

Re: 15C LE Wobbly F/G Keys

*Message #17 Posted by **Martin Pinckney** on 15 Sept 2011, 11:32 a.m.,*
in response to message #14 by robert rozee

No, I like the solid color keys as implemented. More true to the original.

Re: 15C LE Wobbly F/G Keys

*Message #18 Posted by **Mike Morrow** on 15 Sept 2011, 11:44 a.m.,*
in response to message #14 by robert rozee

Horrible idea! Painted shift keys *would definitely* have kept me from purchasing the 15C-LE units I have. It looks very cheap, and very ugly. Did I mention cheap?

This "wobbly keys" issue is bullshit. Some could instead find better better use of their time looking for *real* issues in need of improvement.

As a *gamma-tester, :-)* I found several substantial *but fixable* problems (self-tests, memory corruption, PSE bugs) that I documented here last week. Still, I am quite happy with product value after spending five hours using it since Friday.

Is it an original 15C? No. Is it a 42S? Not even close. It is just a very servicable and attractive machine the likes of which HP will doubtless not be eager to waste time on in the future. I could easily have lived without a HP 15C re-issue. The 15C was far from being my favorite HP from 34 years of HP usage, so the 15C-LE won't replace my 42S or 50g.

But I'm damned happy to own two.

Re: 15C LE Wobbly F/G Keys

*Message #19 Posted by **bill platt** on 15 Sept 2011, 12:07 p.m.,*
in response to message #14 by robert rozee

Yuk.

Give me a wobbly key any day, over that.

Re: 15C LE Wobbly F/G Keys

*Message #20 Posted by **Lincoln R.** on 16 Sept 2011, 2:27 a.m.,*
in response to message #14 by robert rozee

We already have a good way to tell them apart from the front: the "Limited Edition" script. If a seller is dishonest enough to photoshop that out, what's to stop them from copy/pasting keys from another picture onto a TAS auction or something?

Re: 15C LE Wobbly F/G Keys

*Message #21 Posted by **Quan** on 15 Sept 2011, 10:55 a.m.,*
in response to message #1 by DaveJ

Despite the small imperfection, I am happy with the new 15c that many have worked hard to bring it back, even in a small production run.

I now have 2 in my hand. No more wishing and hoping that HP would bring it back.

I also like the advantage of the new 15c over the old one: the firmware is upgradable which I would like to see happen soon to correct some of the issues reported here.

Not a problem for me.

Re: 15C LE Wobbly F/G Keys

*Message #22 Posted by **Seth Morabito** on 15 Sept 2011, 1:33 p.m.,*
in response to message #1 by DaveJ

I got my two 15C calculators last night. My first impressions are quite good, actually. The f and g keys are nowhere near that wobbly on the two I received.

Message concerning shipment from Samson Cables

*Message #1 Posted by **kc** on 15 Sept 2011, 1:17 a.m.*

I just got a message from Samson Cables concerning the shipment of my ordered HP 15C LE (I am from Hong Kong):

Your order is ready to ship but I need a clarification on shipping.

When we originally listed the 15C we estimated the 15C as 1 lb but it is actually 2 lbs shipping weight which limits our shipping options. With the $24 you paid we can send the calculator in a USPS Priority Flat Rate Padded Mailer. If you would like it shipped in a box, which is safer, the rate is higher. To complicate matters, due to the popularity of the 15C, we have temporarily run out of USPS Priority Flat Rate Padded Mailers.

Please choose from one of these options:

1) Pay an additional $8 and have it shipped in a box USPS Priority Mail (no tracking). 2) Pay an additional $16 and have it shipped in a box USPS Express Mail (with tracking, 3-5 business day delivery) 3) No extra charge, ship in USPS Priority Flat Rate Padded Mailer (no tracking, 1 week wait for shipment of padded mailers)

We can charge the extra payment to your order credit card or you may PayPal the difference to orders@samsoncables.com.

I apologize for the delay and thank you for your understanding. We will wait for your direction before shipping.

Chris

Anyone else also got the above message?

Re: Message concerning shipment from Samson Cables

*Message #2 Posted by **Neil Gruending** on 15 Sept 2011, 1:45 a.m.,*
in response to message #1 by kc

I got the same message, even though I was charged $16 for shipping not $24. I would've been upset if the calculator showed up in a padded mailer and I told them so.

Re: Message concerning shipment from Samson Cables

*Message #3 Posted by **Howard Owen** on 15 Sept 2011, 2:23 a.m.,*
in response to message #2 by Neil Gruending

Nice they asked, then. It's still you paying for their mistake, however.

Re: Message concerning shipment from Samson Cables

*Message #4 Posted by **Frank Rottgardt** on 15 Sept 2011, 6:12 a.m.,*
in response to message #1 by kc

Same here. Paid additional 8 bugs for a box. So shipment costs are up to 1/3 of the calculators price. Initinally I was charged 24 USD for transport. Now it is 32 making the final price being 132 USD.

So all guys "over there" should be happy with 79-85 USD from buy.com :-) In Europe it has always been a bit more expensive being a HP-enthusiast...

Re: Message concerning shipment from Samson Cables

*Message #5 Posted by **Neil Gruending** on 15 Sept 2011, 11:12 a.m.,*
in response to message #1 by kc

Yes, it is nice that they asked first and I did authorize them to charge the extra $8. $24 to ship from the US to Canada is about right. I remember thinking that the original $16 was too cheap.

Re: Message concerning shipment from Samson Cables

*Message #6 Posted by **Paul Berger (Canada)** on 15 Sept 2011, 11:51 a.m.,*
in response to message #5 by Neil Gruending

hmmm they never asked me, charged me $16 for shipping claim it went out Tuesday.

Re: Message concerning shipment from Samson Cables

*Message #7 Posted by **Neil Gruending** on 15 Sept 2011, 12:15 p.m.,*
in response to message #6 by Paul Berger (Canada)

Their web page said it was shipped on Tuesday for me too, but it didn't actually leave until today. I bet yours has shipped in a padded envelope instead of a box because I think part of the problem was that they ran out of envelopes.

15C package

*Message #1 Posted by **Quan** on 14 Sept 2011, 6:19 p.m.*

I ordered a 15c on the 9/8/2011 and it arrived in a thin plastic bubble bag. No damage.

I ordered another 15c on the 9/9/2011, but this time it arrived in a box. No damage either.

LE number 915 and 2152.

Did yours come in a bag or a box? Any damage if it arrived in a bag?

Just curious.

Re: 15C package

*Message #2 Posted by **gene wright** on 14 Sept 2011, 6:22 p.m.,*
in response to message #1 by Quan

They are all supposed to be in a box.

Who did you order from? call them and complain. Loudly.

Re: 15C package

in response to message #2 by gene wright

> Quote:
>
> They are all supposed to be in a box.
>
> Who did you order from? call them and complain. Loudly.

Couldn't agree more.

Many moons ago I ordered a 35s (don't ask) from buy.com only to have it shipped in a thin plastic bag which appeared it was used to mop the floor, and resulting in the blister pack being crushed. As it only cost me US$15 I didn't make a fuss over it. Reading some here state they were shipping the 15c as such made me cringe. Fortunately mine arrived in a substantial box sealed curiously enough with "tamper evident" tape.

I suppose it is fair to say buy.com's shipping procedure is inconsistent.

Re: 15C package

*Message #4 Posted by **Quan** on 14 Sept 2011, 6:51 p.m.,*

in response to message #2 by gene wright

I suspect someone already complained, hence the change from bag to box.

BTW, thank you very much for the cable.

Re: 15C package

*Message #5 Posted by **Martin Pinckney** on 14 Sept 2011, 7:05 p.m.,*
in response to message #2 by gene wright

> Quote:

I got mine from Buy.com. It came in the "lizard skin" presentation box, but the box was shipped in a bubble bag. I think that was what Quan meant.

Re: 15C package

*Message #6 Posted by **Quan** on 14 Sept 2011, 7:10 p.m.,*
in response to message #5 by Martin Pinckney

Exactly!

One box in a bag and one box in a bigger box.

:)

Re: 15C package

*Message #7 Posted by **BruceH** on 15 Sept 2011, 4:40 p.m.,*
in response to message #6 by Quan

Good thing it was only Buy.com doing the packaging and not HP.
http://www.theregister.co.uk/2008/07/18/hp_packaging/

:-)

Re: 15C package

*Message #8 Posted by **Katie Wasserman** on 15 Sept 2011, 5:13 p.m.,*
in response to message #7 by BruceH

I used to run a a few HP3000 systems and the documentation was routinely delivered to us in a series of nested boxed, although not quite as many levels deep as this. Does HP own a paper company, if not they should it would help with their ink sales too.

Re: 15C package

*Message #9 Posted by **Tim Wessman** on 15 Sept 2011, 5:54 p.m.,*
in response to message #7 by BruceH

I have an even better one.

Ordered a large, flexible cutting mat from Amazon to aid with kite construction. I think it is about 1m by 1.5m. It came in a box the size of a 3/4 sized refrigerator and was completely empty except for the flexible mat loose at the bottom. The delivery person asked me if I'd open it up so he could see what was in it. He throught it was an empty box!

I guess they didn't want to roll it up. . . :-|

Re: 15C package

*Message #10 Posted by **Dave Shaffer (Arizona)** on 15 Sept 2011, 10:42 p.m.,*
in response to message #9 by Tim Wessman

I think I have seen the real world record - at least for packaging volume to product volume: an FET chip (not a complete transistor in its three-lead housing, but just the naked silicon chip itself) certainly less than a mm square and a few hundred microns thick, delivered in a shoe-box size package.

This was for a specialized radio astronomy receiver.

The outside box did help keep the product from getting lost along the way!

Re: 15C package

*Message #11 Posted by **M. Joury** on 14 Sept 2011, 6:27 p.m.,*
in response to message #1 by Quan

My first one arrived in a bag and the outer box was damaged. The next two arrived in a box in perfect condition. I actually mentioned it to buy.com as an aside in my back and forth about availability (which at that stage was a moot point since I already had mine) and they immediately (without my asking) offered either:

1. An exchange or 2. A $15 credit

Since I had 2 perfect ones I took the credit. Got that $5 off per unit after all!

I was actually pleasantly surprised by their immediate response and offer to correct the problem. Specially after all the negative feedback flying around on this forum when we were still unsure if buy.com actually had the units at all.

Cheers,

-Marwan

in response to message #1 by Keith Midson

Keith,

Would you compare the build quality of the 12c 30th with the 12c Platinum (the newest black one).

Thanks.

Re: HP12C 30th Anniversary

*Message #3 Posted by **Keith Midson** on 15 Sept 2011, 7:33 p.m.,*
in response to message #2 by Martin Pinckney

Hi Martin, the build quality is very similar. I prefer the keys in the 30th anniversary model - they have a similar feel, but the Platinum keys seem a little more 'plastic' - very hard to distinguish (maybe it's just the colour). The 12C 30th should be the faster ARM processor. I also prefer the 'traditional' 12C logo on the 30th model. I still prefer the more rounded edges of the original 80's 12C.
Just added a couple of extra photos of comparison in the set HERE
Cheers, Keith

15C re-release may be a good time to remind..

*Message #1 Posted by **Pal G.** on 14 Sept 2011, 2:43 p.m.*

.. folks about this great paper, written by W Kahan:

Mathemtics Written in Sand.

```
"ABSTRACT:  Simplicity  is a  Virtue;  yet we
continue to cram ever more complicated circuits
ever more densely into silicon chips,  hoping all
the while that their internal  complexity  will
promote  simplicity  of use.  This paper exhibits
how well that hope has been fulfilled by several
inexpensive devices widely used nowadays for
numerical computation.  One of them is the
Hewlett-Packard  hp-15C  programmable shirtpocket calculator ..."
```

http://www.cs.berkeley.edu/~wkahan/MathSand.pdf

Re: 15C re-release may be a good time to remind..

*Message #2 Posted by **Howard Owen** on 14 Sept 2011, 3:25 p.m.,*
in response to message #1 by Pal G.

Simplicity! LOL

```
[The paper] had been typeset on an  IBM PC  and printed on an  EPSON FX-80  at
draft speed with an unreadable type-font of the author's devising,
and then photo-reduced.
```

Re: 15C re-release may be a good time to remind..

*Message #3 Posted by **Mike Morrow** on 14 Sept 2011, 3:44 p.m.,*
in response to message #1 by Pal G.

The advanced features of the HP 15C are not very simple to use, but in 1983 (the date of the cited paper) the 15C was the best thing out there for complex domain, matrix, integrate, and solve functions. Not even the HP-41 series with Advantage Module matched it.

But...having spent more time since Friday with the 15C/15C-LE than I have since a HP 42S replaced my 15C 15 years ago, I can say honestly that I'd forgotten *how terribly awkward and convoluted* it is to use those features. But...it is pretty, and isn't that the *most* important thing? :-)

Simplicity of use had to wait for the HP 42S, a monumental and stunning advancement over the 15C. It is bizarre that some fall head-over-heels for 30 year old *yet oddly immature* technology, as opposed to 20 year old mature technology.

> Quote:
>
> It's bizarre that we're still falling head-over-heels for 30 year old technology.

I believe it's not as much a matter of the head than of the heart. Fans of the 15C's power as a calculator might disagree.

Re: 15C re-release may be a good time to remind..

*Message #5 Posted by **bill platt** on 14 Sept 2011, 4:18 p.m.,*
in response to message #4 by Howard Owen

If you go back over Valentins's excellent stuff, even he minced no words in the superior nature of the 42s over the 15c.

But to me, neither is worth much programming effort: no I/O = No Start.

Re: 15C re-release may be a good time to remind..

Especially the box -- don't forget the box. I mean can you recall when you've seen before (if ever) so much thought and design go into a cardboard box for a consumer electronic device? I'm afraid to touch the thing with an ungloved human hand for fear I may affect its perceived value. Plastic overwrap designer cover too for that matter.

in response to message #7 by Howard Owen

One could argue that people like us (and probably RPN users in general) have the same sort of fanaticism for HP calculators that Apple fans do for the latest iPhone. Admittedly, my first reaction when I found out the 15C reissue was real was "where can I get one?" shortly followed by "will it be priced such that I can afford one?"

And I'm quite thankful that I didn't have to stand in line at an HP store (which I know does not actually exist) for hours to get one either :-P

15C re-release may be a good time to remind..

15C LE -- fun with the PSE

*Message #1 Posted by **Katie Wasserman** on 14 Sept 2011, 1:01 p.m.*

The PSE bug results in some interesting displays, try this little program:

```
LBL A
PSE
SF 9
RTN
```

and run it.

or this:

```
LBL A
PSE
PSE
SF 9
RTN
```

and run the with a number greater than 1000.

-Katie

The display driver in the original r2d2 disables the annunciators when it is in blink mode. So that needs to be explicitly addressed in an emulation scenario.

Re: 15C LE -- fun with the PSE

*Message #4 Posted by **Thomas Chrapkiewicz** on 14 Sept 2011, 2:12 p.m.,*
in response to message #1 by Katie Wasserman

Curious!

Running on the HP15CLE, the display alternates between 'running' and the number in X. With the double-pause code only the 'USER' or GRAD or RAD annunciators blink.

Single Pause code: Running on an original 15C, the display is blinking. Of course, clearing flag 9 stops this blinking - returning to a normal display.

Running on the 15C2010HHC (with code received there), the display totally blanks; but briefly reappears when a key is hit. Again, clearing flag 9 returns the display to normal.

*Message #3 Posted by **gene wright** on 14 Sept 2011, 3:35 p.m.,*
in response to message #2 by Eddie W. Shore

Well, very little of the 15c reference file is original!

I simply went through as much of the PPC Journal and Datafile as possible and pulled out articles, programs, etc. related to the 15c.

The quick reference guide was very nice and came from an online source.

I did get a laugh with my example integral in the second file, which was entirely original. :-)

Annunciators on the 15c LE

*Message #1 Posted by **troy** on 14 Sept 2011, 11:55 a.m.*

Hi:

This is my first 15c, ever. I never even heard of it until ~15 years ago when I saw one of my professors using it. I was so intrigued that I bought the 32sii, got hooked on RPN, and got the 33s, 35s, 2 49g+ (one given to a friend), 50g, 28s, and a couple of slide rules. Back in college, all I know of calculators are casios and tis. But ever since that fateful day with my prof, I've always wanted a 15c. And it's finally here!

So, pardon my ignorance for asking this question. I haven't finished going through the manual yet, but the old timers here might know.

On the 15c, the f and g show an indication that you've pressed it. but the fix, sci, eng does not? is this right? So how do you know that you've pressed it (the FIX, SCI, ENG)? or perhaps accidentally pressed it? Perhaps it only takes getting used to. I'm just so used to my 32sii.

Thanks all!

Re: Annunciators on the 15c LE

*Message #2 Posted by **gene wright** on 14 Sept 2011, 12:04 p.m.,*
in response to message #1 by troy

Yes, that is correct. The annunciators show up on about page 60 of the manual.

HP 15C-LE Pause (PSE) Command Bug

*Message #1 Posted by **Mike Morrow** on 10 Sept 2011, 12:44 p.m.*

I tried out the PSE command on the 15C-LE to see if there were timing problems with it. I found a surprising and unhappy result.

The following simple loop counts down from 10 to 1, pausing to display before each decrement. That's what happens in the original 15C, but not the 15C-LE.

001 LBL E
002 1
003 0
004 STO 0
005 LBL 9
006 RCL 0
007 PSE
008 DSE 0
009 GTO 9
010 RTN

On the 15C-LE, the program pauses for the first time and displays 10.0000. For the remainder of the program, the display blanks completely, the program pauses each time the PSE is executed (determined by long program run time), **but nothing is shown in the display until execution terminates.**

This is a firmware bug that could be very inconvenient. Essentially the PSE command is non-functional on the 15C-LE.

Edited with some additional observations below.

I added a 1000-iteration sub-loop to see what the display looks like when a great number of other steps are taking place between PSE commands:

001 LBL E
002 1
003 0
004 STO 0
005 LBL 9
006 RCL 0
007 PSE
008 1
009 0
010 0
011 0
012 STO 8
013 LBL 8
014 DSE 8

015 GTO 8
016 DSE 0
017 GTO 9
018 RTN

In FIX 4 display, after starting the program with f E, I see 10.0000 paused in display, then a couple of seconds of blinking "running" displays, then simply a "runn" in mid-LCD that blinks every few seconds, presumably when the next PSE command is encountered, until program terminates and normal display appears.

In FIX 9 display, the same occurs, except that "runn00000" instead of "runn" appears in the display until the program terminates and normal display appears.

*Message #4 Posted by **bill platt** on 10 Sept 2011, 1:18 p.m.,*
in response to message #3 by Mike Morrow

Isn't that more an un-wrong-documented feature rather than a bug?

Quibbling ...

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #5 Posted by **Mike Morrow** on 10 Sept 2011, 1:59 p.m.,*
in response to message #4 by bill platt

I think the old self test issue fully qualifies as a bug because:
1. It is a feature that is described in the manual that does not work.
2. If the "ON plus *" or the "ON plus +" tests are attempted by an unwary user following the

manual instructions, program memory will likely be corrupted (something the self tests should never do).

If the issue is addressed only by a change to manual appendix F, and firmware remains unaltered, program corruption can take place through indavertent initiation of the old self tests.

Since firmware changes are required to correct this, it more than qualifies as a bug and not a documentation issue.

You've got to be kidding. I assure you that there was lots of testing on this machine. Just because something got missed doesn't mean that testing was not done. In addition, just because one hasn't been found yet does not guarantee that any HP calculator model is completely bug free.

Jake

> I assure you that there was lots of testing on this machine.

Did none of the 2010 conference recipients of the HP 15C LE ever try a program with PSE in it? Or does PSE work in some cases and just doesn't in this one?

I'm seriously thinking about canceling my order of two units. Or is it likely that a fixed firmware will be released and also be flashable with the HP 30b cable (that I already have!)?

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #9 Posted by **Kiyoshi Akima** on 10 Sept 2011, 4:27 p.m.,*
in response to message #8 by Alexander Oestert

> Quote:

> Did none of the 2010 conference recipients of the HP 15C LE ever try a program with PSE in it? Or does PSE work in some cases and just doesn't in this one?

The PAUSE worked fine in my Towers of Hanoi program on my HHC2010 15C+, so I had no cause to report a bug.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #10 Posted by **Mike Morrow** on 10 Sept 2011, 1:48 p.m.,*
in response to message #7 by Jake Schwartz

I agree. Even old firmware technology is complex and nothing is ever perfect (except the Apollo Lunar Modules!). I'm happy with my two 15C-LE units...though this PSE problem does need correction.

I think it's worth repeating that the 15C-LE is only about one-quarter the cost of the original in terms of real dollars. I believe it offers a very good value.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #11 Posted by **Thomas Radtke** on 10 Sept 2011, 2:16 p.m.,*
in response to message #7 by Jake Schwartz

Well, I also find it odd that this hasn't been tested. If anything can fail in an emulation that seems to work otherwise, it is likely based on timing. Guess that's what Mike was looking for when testing PSE.

@Alexander, I'm sure there will be an update. I wouldn't cancel my order now. Even if this bug remains, I bet the 15C LE can be sold on TAS anytime for more than the 100 Euros we'll likely have to pay for it.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #12 Posted by **MK-52** on 10 Sept 2011, 2:46 p.m.,*
in response to message #7 by Jake Schwartz

You're right. I really spoke too harshly and it was offensive to the testers and developers. I've ordered three units and had unrealistic expectations.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #13 Posted by **bill platt** on 10 Sept 2011, 1:19 p.m.,*
in response to message #1 by Mike Morrow

what happens if you insert more than one pse at each pause? Will this slow it down enough to work?

What happens if you insert R/S instead of pse? Does it work correctly?

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #14 Posted by **Mike Morrow** on 10 Sept 2011, 1:37 p.m.,*
in response to message #13 by bill platt

Adding a second PSE only increases the execution time in which a blank display appears. The program above takes 11 second to end with one PSE, and 22 seconds with two PSE. The PSE is in fact pausing execution. But the LCD is completely blanked...there isn't even a "running" display after the first PSE.

Of course, R/S will stop everything.

Re: HP 15C-LE Pause (PSE) Command Bug

>
> This is a firmware bug that could be very inconvenient. Essentially the PSE command is non-functional on the 15C-LE.

Sounds like there may be a problem with the logic used to simulate the display blink mode (which in NUT voyagers is a hardware function) along with normal rendering to the sam7l display.

I'm unsure what approach would cause that to occur unless the emulator is attempting to factor out the spurious/partial display updates emitted by the voyager firmware. KEMU rendering to a graphic display when running on the AVR needed to factor out these updates which although themselves are generally imperceptible to the user, also occur when a user is entering key strokes and cause an objectionable lag in interactivity.

The display rendering correctly at the termination of the program would seem to support this theory as when coalescing display updates a push out of pending data needs to happen when the firmware pauses with a POWOFF instruction.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #16 Posted by **Lincoln R.** on 10 Sept 2011, 1:59 p.m.,*
in response to message #15 by uhmgawa

It should be fixable. I imagine 15C LEs are reflashable, because as Tim Wessman has repeatedly told us, they're the same hardware as the 12C+. HP may have to do something like have people send their calculators back to be reflashed (for dealing with folks who don't have access to reprogramming cables), but I can't imagine they would leave this unfixed, especially since it sounds like the 12C/15C code was developed in-house unlike the 35S.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #17 Posted by **Katie Wasserman** on 10 Sept 2011, 2:24 p.m.,*
in response to message #16 by Lincoln R.

I don't understand why this has any bugs at all, there's no reason for them. The 2009-11-19 version of the emulator in the 12C+ has PSE working fine as well as the self tests. I helped debug this with Cyrille, publicly on this forum after it's release. Didn't HP learn from developing that how to get these things right?

-Katie

Re: HP 15C-LE Pause (PSE) Command Bug

Again the 15c firmware has additional emulation requirements to successfully pass the native firmware self test. And in general HP is either patching the firmware, or adapting emulator behavior on a firmware specific basis. So none of this seems surprising except for the fact it hadn't been caught in alpha/beta testing.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #19 Posted by **Katie Wasserman** on 11 Sept 2011, 5:54 a.m.,*
in response to message #18 by uhmgawa

I understand that the specific patches to the firmware might be different for the 12c and the 15c while the emulator changes should be pretty similar if not identical. I was more questioning not learning from past mistakes of having the same self test issues on the 12C+.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #20 Posted by **Thomas Klemm** on 10 Sept 2011, 2:34 p.m.,*
in response to message #1 by Mike Morrow

Simple solution, don't use it. :-)

Exactly. What about those who read this forum but *do not have* cables or SAMBA (whatever *that* is) because we don't do 34s.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #27 Posted by **Reth** on 11 Sept 2011, 12:21 p.m.,*
in response to message #25 by Katie Wasserman

Excellent point. Still whoever bought the LE would be HP calc fanatic and they would know. That explains the "LE" in a way, after they are sold, a fixed non-LE edition will be emitted.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #28 Posted by **Norman Dziedzic** on 10 Sept 2011, 11:41 p.m.,*
in response to message #1 by Mike Morrow

Just curious, does this bug also occur in the windows emulator that comes with the 15C LE?

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #29 Posted by **From Hong Kong** on 11 Sept 2011, 12:20 a.m.,*
in response to message #1 by Mike Morrow

Compared with Casio's FX-502P, FX-602P and FX-603P, the classic HP-15C's implementation of the pause command is quite limited. The pause command of Casio's calculators can display something and accept keyboard input temporarily. Some games were developed using this feature. However, HP-15C only allows values to be displayed.

Edited: 11 Sept 2011, 12:21 a.m.

Unfortunately, there's no such workaround for HP-15C! :(

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #33 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Sept 2011, 8:53 a.m.,*
in response to message #31 by Ángel Martin

Just to add that "input during PAUSE" started with the 67/97 and certainly was most useful on the 41. Note that the 42S PAUSE works differently, IIRC.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #34 Posted by **Dieter** on 11 Sept 2011, 9:21 a.m.,*
in response to message #31 by Ángel Martin

No, it hasn't, just as it predecessor, the 34C. The 15C cannot be compared to top-of-the-line devices like the 67/97, let alone the 41. These not only allowed keyboard data entry during the PSE

instruction, even magnetic cards could be read. In either case the calculator could check whether data had been entered or not.

The 34C, as well as its successor 15C, and even the current 35s cannot do that. Like some other things that are/were possible on the higher-end models. I think it's fine that way.

Dieter

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #35 Posted by **From Hong Kong** on 11 Sept 2011, 2:31 a.m.,*
in response to message #1 by Mike Morrow

Mike:

In your first program, could you replace 10 with 10.00001 and run it again?

I would like to see whether the PSE command works after specifying explicitly the yy value to 01.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #36 Posted by **HrastProgrammer** on 11 Sept 2011, 3:33 a.m.,*
in response to message #1 by Mike Morrow

To be honest, it surprises me that such obvious bug hasn't been noticed during beta testing because PSE isn't some obscure used-once-in-a-year feature. Something like LBL 01 1 + PSE GTO 01 is the first thing I was checking while developing all my emulators ...

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #37 Posted by **Patrick Rendulic** on 11 Sept 2011, 4:54 a.m.,*
in response to message #36 by HrastProgrammer

Pfffffffffff.

I ordered an HP15C-LE, because I want a new and working RPN calculator. My HP-35s is unusable because of too many bugs. So HP it seems that you have spoiled it again.

How does that firmware update work? Do you have to take the calculator apart? Will HP provide free cables?

I have noticed that many people must have known about this new calculator for more than a year. Wouldn't it have been wiser to imply more people from the community for serious debugging? That keep it top secret stuff is pure nonsense. What's the use op HHC when the final product is C*R*A*P?

No longer want that calculator.

in response to message #37 by Patrick Rendulic

Connector is accessible from within the battery compartement, if I identified it correctly in Katies pictures. Gene Wright offers appropriate cables for shipping costs only. You'll need a serial port and

some patience for the new firmware to be written ;-).

Can I make the cable easily?

*Message #39 Posted by **MK-52** on 11 Sept 2011, 11:19 a.m.,*
in response to message #38 by Thomas Radtke

Can I make the reprogramming cable easily? In Japan, Nihon-Hewlett-Packard decided to stop selling their calculators and outsource their customer service to Sykes Co, Ltd(China) several years ago. I don't think they provide firmware flashing service. So I may have to fix the problem myself.

Re: Can I make the cable easily?

*Message #40 Posted by **Thomas Radtke** on 11 Sept 2011, 11:38 a.m.,*
in response to message #39 by MK-52

Sorry, I don't know the internals of this cable. Thus far, people got them for free, some just paying shipping costs (it isn't much, even for oversea shipment). Wait some time for HP to present a solution, a new firmware won't be out tomorrow anyway ;-).

Might it be possible to extract said firmware from these machines, make it available for download and flash it to the ones that are now sold?

*Message #44 Posted by **Thomas Radtke** on 11 Sept 2011, 8:20 a.m.,*
in response to message #43 by Alexander Oestert

What if it was replaced for a reason? It might contain different bugs :-(. The calculator folks

should sort it out and offer one _working_ firmware when it's ready and tested.

@Gene, BTW., do the stock of cables last for a few thousand customers? I imagine also it is asked a little too much to have them send out by just one person.

*Message #46 Posted by **Jeff Fontaine (Canada)** on 11 Sept 2011, 9:37 a.m.,*
in response to message #44 by Thomas Radtke

I would like to get a cable from Gene, hoping I will be able to flash my 15CLE when I get it (should be sent next Tuesday).

But, IMHO, HP has to manage that bug, and maybe some others that will appear, crossing my fingers the number is limited.

First, as said, Gene has probably not enough cables for thousands of people, and sending them would be a huge job.

Second, HP has to fix that and it is pretty easy to work with resellers who have lists of buyers and the organisation for managing large shippings of cable + CD with software and image. This is also probably cheaper for HP rather than to have users sending their calcs somewhere, flashing them and returning them to their owners, especially in case of bugs appearing later...

Are the reprogramming cables manufactured in China, or are they homemade by Gene and / or a group of volunteers?

If they are made in China, why not let ER sell them on his site? If they are free to those who ask (by HP?), I will gladly pay USPS cost to have one.

If they are homemade can we get a diagram or schematic so we can make our own??

If they are homemade and the cable diagram is already on the internet, could someone provide a link. I will go searching in the meantime..

Thanks!

in response to message #47 by Pal G.

Here are the details needed to make your own cable. I'm pretty sure that these cables are made in China but are not available for purchase, only free from Gene.

I think that the main problem is making them more available is that they are really quite difficult to use. I've reprogrammed of all the ARM-based machines many times and still have a hard time using them. The cables themselves are not at fault, the SAMBA software and the ARM chip are -- they're very temperamental.

> Here are the details needed to make your own cable.

I sketched a configuration for a flat profile connector before Tim was kind enough to send a full cable my way.

I've built a similar configuration (left hand board) to reflash a KINOMI module although the pitch here was 0.8mm rather than the sam7l's 2.0mm grid. So the task is relaxed considerably.

But unless you are doing quite a bit of reflashing such a jig is likely overkill. A more simple approach would be to scrounge phosphor bronze music wire (0.4~0.5mm should be fine) which has both suitable spring temper and is solderable.

I've even used paper clips, hot glue and popsicle sticks in a pinch as the steel has enough temper to maintain sufficient tension and can be soldered directly with a little ambition. In any case be sure to grind/sand/wire_brush the tips of the probes to a smooth convex surface so they don't excessively scuff up the gold plating on the sam7l PCB.

My thoughts

*Message #50 Posted by **gene wright** on 11 Sept 2011, 1:43 p.m.,*
in response to message #46 by Jeff Fontaine (Canada)

Well, I don't have thousands of cables now, but I'm sure HP will be taking a look at this and talking about it this next week. Remember, this wasn't found until after close of business on Friday. :-)

The firmware from HHC contained a few bugs related to timing of the display flashing (errors, etc) and these were fixed in an update. I don't believe the PSE error was present then, but another update was done that appears to have re-introduced them.

Patience, please. I'm not happy that the 15c LE has these minor issues, and it shouldn't have had any. However, I'm confident a fix will be forthcoming and something will be done to fix it.

Remember, HP did not have to redo this machine *at all*. It was done as a bow to those who really wanted this machine brought back. It won't budge HP's bottom line at all. It is and was a labor of love of many people. Those same people are *also* not happy with these two issues either, I'm sure.

Just my thoughts. Patience. :-)

Like how the 35s was fixed? I would like to have such confidence...

Quite different...

*Message #52 Posted by **gene wright** on 11 Sept 2011, 5:20 p.m.,*
in response to message #51 by Martin Pinckney

The 15c LE can be flashed through a firmware update.

The 35s cannot.

Several orders of a magnitude difference between correcting one and not the other. One requires creating firmware and distributing it over the internet with no change to production lines, manufacturing processes, inventory, blah blah blah. The other requires a great deal more.

Your statement also shows a lack of awareness of firmware updates already created for the 49g, 49g+, 50g, 12c+, etc.

So, please give us all a break. No one will force you to buy a 15c LE...until they are all sold and you can buy one off ebay at > original cost. :-)

Re: Quite different...

*Message #53 Posted by **Howard Owen** on 11 Sept 2011, 5:25 p.m.,*
in response to message #52 by gene wright

Not to mention the numbers. Despite the real and perceived flaws celebrated here, the 35s has stayed in HP's catalog for years. I'd guess there are high six figures in circulation, at least.

You guys are a tough audience. :)

I have read some references to firmware updates on this forum. I should point out that the four you listed above are regular production calculators, not "Limited Edition" offerings.

> Quote:
>
> So, please give us all a break.

Who are you including in "all"?

> Quote:
>
> No one will force you to buy a 15c LE...

What does that have to do with this discussion?

Re: Quite different...

*Message #55 Posted by **gene wright** on 11 Sept 2011, 10:22 p.m.,*
in response to message #54 by Martin Pinckney

Yes, they were regular production calculators that could take a firmware update.

You seem to have missed that point for the second time now.

Say this out loud...

The HP 35s is not firmware upgradable, but every calculator HP has made that CAN be firmware upgradable has had a bug fix.

Sigh.

And, now to your questions:

2) All includes me, myself and I. Three.

3) If you feel that HP will never fix anything ala your view of the HP 35s, then don't ever buy a 15c LE and you won't have to worry about it. Just a suggestion.

This isn't intended as any sort of excuse, but the 35S cannot be re-flashed, and thus had a ROM revision been made available, you'd have to obtain a new unit one way or another. I can only imagine the cost to the company if they offered a no-cost swap of an old one for a new one....that would have to be at least an order of magnitude more than simply putting a firmware revision on their web site for downloading. But I agree that there should have appeared a ROM revision in the sales pipeline at some point in the past four years.

*Message #59 Posted by **Lincoln R.** on 11 Sept 2011, 12:27 p.m.,*
in response to message #37 by Patrick Rendulic

Patrick,

Apparently the prototypes that got handed out at HHC last year didn't contain this bug. I'm not sure if any members of the community got to test the firmware version that shipped on the production 15C LEs. I do think that HP will fix this though, for the simple reason that this firmware was in-house as opposed to the 35S that was developed entirely by a 3rd party.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #60 Posted by **Namir** on 11 Sept 2011, 1:16 p.m.,*
in response to message #36 by HrastProgrammer

As a programmer I have, on a few occasions, created unforeseen new bugs by doing last minute tweaks to my code. And yes it was embarrassing if the code went to someone else. My guess is that this is what happened with the HP-15C LE. From what I read the beta version given at HHC2010 had the PSE command working properly. So, drawing from my own experience, a last minute tweak of the 15C LE code is the culprit.

Namir

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #61 Posted by **Tim Wessman** on 11 Sept 2011, 2:18 p.m.,*
in response to message #60 by Namir

It was probably the fix that was put in to speed up integration. The HHC version from last year had serious speed issues during integration due to the display updating so frequently. It was around 15x the speed of the original instead of the current speed.

Cyrille fixed this in the last version that was given to beta testers in April. Nobody reported any issues with it so. . . :-(

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #62 Posted by **uhmgawa** on 11 Sept 2011, 11:01 a.m.,*
in response to message #1 by Mike Morrow

> Quote:
>
> In FIX 4 display, after starting the program with f E, I see 10.0000 paused in display, then a couple of seconds of blinking "running" displays, then simply a "runn" in mid-LCD that blinks every few seconds, presumably when the next PSE command is encountered, until program terminates and normal display appears.
>
> In FIX 9 display, the same occurs, except that "runn00000" instead of "runn" appears in the display until the program terminates and normal display appears.

That sounds quite familiar. Communication with the LCD controller residing in the r2d2 is via two 56-bit registers located in the address map. The voyager firmware can only modify these registers serially but in the case of an r2d2 sniffing the ISA bus, modifications are realized immediately which masks the gratuitous updates made by the firmware. Under emulation it is possible (and potentially necessary) to factor out these excessive updates. But in doing so you'd need to synchronize the display register state to the display device after the firmware has set fully coherent display data in the corresponding registers.

From the above description it is possible the emulator isn't getting this quite right as it appears to be rendering at a transition point before the firmware has coherently modified both display registers. At least that is one explanation for the half-updated half-stale LCD display cited above and admittedly a scenario I needed to address in KEMU when driving a display other than the ISA r2d2.

*Message #63 Posted by **Geoff Quickfall** on 11 Sept 2011, 2:23 p.m.,*
in response to message #62 by uhmgawa

I use the same cable and Samba for the 34S as I do for the 15C.

My pause display was tested with the latest firmware but not in an interative loop. Only for pause between two separate answers.

As far as firmware updates go, I have flashed through 3 of them so far with Samba and the cable with no problems at all.

I ordered one 15C+ from SC and have one 15C+ Beta unit. Nice thing is the Beta has a different bezel and harser colours diffentiating it from the 15C+ sales unit. Thus it will always be a stand alone 'collectable' unit.

I currently have 10 programs loaded for aviation and have not found any bugs on the latest version of software. The calc is unbelievably fast, compared especially to the 15C of course, but favourably to the 42S and 41CL for the same routine using similar code.

Fits in the pocket and is used as backup to the 41CL which I carry with me to work.

I think you will all enjoy it, and with cable, Samba and updates hopefully available, it will make a great package.

Cheers, Geoff

Thanks for stating this with such clarity! This might have been obvious for you beta testers, but I needed this assurance to calmly go to sleep tonight and happily await the delivery, hopefully in a week or two!

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #65 Posted by **Mike Morrow** on 11 Sept 2011, 3:05 p.m.,*
in response to message #62 by uhmgawa

> Quote:
>
> That sounds quite familiar...
>
> From the above description it is possible the emulator isn't getting this quite right as it appears to be rendering at a transition point before the firmware has coherently modified both display registers.

Not to beat this to death, but here's another short program for the 15C-LE that demonstrates display oddities following PSE:

```
001 LBL E
002 5
003 0
004 0
005 0
006 STO 0
007 PSE
008 R/S
009 PSE
010 LBL 9
011 DSE 0
012 GTO 9
013 RTN
```

With a FIX 9 display, when this is executed (f E), the 15C-LE can be seen pausing (step 7) with 5000.000000 in display, then halting (step 8) with 5000.000000 in display. So far, so good.

When R/S then is pushed to restart execution at step 9, within a fraction of a second the display shows *alternating* 5000.000000 followed by runn00000 images (with less than 1 second period), until execution

ends about ten seconds later and the display returns to normal.

If the R/S (step 8) and second PSE (step 9) are deleted, then all appears normal...5000.000000 is shown in display by the PSE (step 7), followed by blinking "running" in display until execution ends.

It appears that **two** or more PSE commands must be executed during a program's runtime for problems to be observed afterwards. The PSE commands do not have to be consecutive.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #66 Posted by **Graham D. Wilson** on 11 Sept 2011, 4:34 a.m.,*
in response to message #1 by Mike Morrow

Oh dear!

I fear what other more obscure but more harmful bugs may have escaped detection given that PSE is itself such a common programming instruction for debugging programs.

Reports like this make me mistrust the accuracy and reliability of the LE, and I hate that feeling.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #67 Posted by **Marcus von Cube, Germany** on 12 Sept 2011, 2:33 a.m.,*
in response to message #66 by Graham D. Wilson

All the algorithms are exactly the same as in the original 15C. What you see here (the PSE bug) is in the emulation layer that mimics the original hardware. It's just a display glitch and does not affect the accuracy of the results in any way.

Nonetheless, the bug needs to be fixed. I assume Cyrille and Tim had some bad nights recently.

It had to happen sooner or later

*Message #1 Posted by **Michael de Estrada** on 14 Sept 2011, 10:54 a.m.*

Well, I guess the HP 15C fraud had to begin sooner or later, so here it is:

HP 15C LE on TAS misrepresented as an HP 15C

Edited: 14 Sept 2011, 11:00 a.m.

Re: It had to happen sooner or later

*Message #2 Posted by **bill platt** on 14 Sept 2011, 11:00 a.m.,*
in response to message #1 by Michael de Estrada

Man, I am such a sucker. If I thought like a businessman instead of an engineer, instead of questioning my need for a new 15c LE, I would have bought a bunch and turned them for a handsome 100% profit!

Re: It had to happen sooner or later

*Message #3 Posted by **M. Joury** on 14 Sept 2011, 11:01 a.m.,*
in response to message #1 by Michael de Estrada

LOL...

Michael,

How many times have you come across products you are familiar with on eBay and said to yourself: "What idiot would pay that much when they can get the same product brand new from a regular retailer with free shipping for X% less"?

The other day I saw a listing for an HP-12C Plat for some ridiculous amount. He had 4 for sale each at that price. I sent him a message asking him to confirm that the quoted BIN price was for all 4 because why else would I spend that much. Never got an answer of course.

Cheers,

-Marwan

Re: It had to happen sooner or later

*Message #4 Posted by **Michael de Estrada** on 14 Sept 2011, 11:05 a.m.,*
in response to message #3 by M. Joury

Yeah, but in this case the seller is misrepresenting a HP 15C LE as an original HP 15C. I think this is intentional fraud. Note that the main listing photo shows a HP 15C, not a HP 15C LE. Only one photo shows the correct model.

Re: It had to happen sooner or later

*Message #5 Posted by **M. Joury** on 14 Sept 2011, 11:12 a.m.,*
in response to message #4 by Michael de Estrada

Ohhhhh.... I glanced at it real quick and missed that. One of us should report the listing to eBay as fraudulent!

Re: It had to happen sooner or later

*Message #6 Posted by **bill platt** on 14 Sept 2011, 11:06 a.m.,*
in response to message #1 by Michael de Estrada

It is actually a fraudulent listing. Some of the photos show a 15C, while others show a 15C LE in LE packaging.

But there is *no category* in the Ebay reporting system to capture this and report it properly!

Re: It had to happen sooner or later

*Message #7 Posted by **M. Joury** on 14 Sept 2011, 11:17 a.m.,*
in response to message #6 by bill platt

I reported it anyway under "Fraudulent Listing".

Re: It had to happen sooner or later

*Message #8 Posted by **bill platt** on 14 Sept 2011, 12:39 p.m.,*
in response to message #1 by Michael de Estrada

I can't find anything in Ebay rules making it illicit to make a false claim as to what the product is. Apparently it is simply "caveat emptor" which makes sense, as ebay doesn't want to have anything to do with the truth of a listing. That would open them up to liability.

So chalk it up to "there is a sucker born every minute"

and "honest folk are suckers"

Re: It had to happen sooner or later

*Message #9 Posted by **Jim Johnson** on 14 Sept 2011, 12:48 p.m.,*
in response to message #8 by bill platt

```
I did send the HP-15cLE seller a message yesterday indicating that he was
misrepresenting the HP-15cLE and that he needed to CLEARLY state that it was a "Limited
Edition" version.
Of course, no answer from this seller.
I noticed that the high bidder, for the misrepresented calculator, had bid on other
German items.  Does that mean that someone in Germany can't buy the HP-15cLE yet?
```

in response to message #9 by Jim Johnson

I sent him a direct email (I think), by inferring from his eB** I.D. what his email address is.

We shall see.

Re: It had to happen sooner or later

*Message #11 Posted by **Michael de Estrada** on 14 Sept 2011, 12:51 p.m.,*
in response to message #8 by bill platt

Actually, they do worry when they can be sued by manufacturers for fake brand name items. Like fake Gucci bags etc. This isn't a fake HP, just one that has been grossly misrepresented. The buyer can still go after the seller if they figure it out. Before TAS made aliases of the bidder user names, a good samaritan could send a warning message to the bidder before the auction ended. The current high bidder appears to be outside the USA, and probably has no idea that this is a total fraud.

Re: It had to happen sooner or later

*Message #12 Posted by **bill platt** on 14 Sept 2011, 1:08 p.m.,*
in response to message #11 by Michael de Estrada

Ebay is all geared towards big sellers now. I hate ebay. I have lost about $10 even trying to sell stuff the last 2 years. I haven't bought anything on ebay since a beat up 27s about 2 or 3 years ago. I just think it is the pits now.

Re: It had to happen sooner or later

*Message #13 Posted by **Michael de Estrada** on 14 Sept 2011, 1:20 p.m.,*
in response to message #12 by bill platt

I stopped selling anything with them, since they changed their selling fee to include the shipping cost as part of the sale amount. I sold some calcs privately to overseas addresses, and the shipping costs were over $50, which would have meant an additional $4.50 fee in a TAS listing.

Re: It had to happen sooner or later

*Message #14 Posted by **Howard Owen** on 14 Sept 2011, 5:16 p.m.,*
in response to message #12 by bill platt

The balance of power has shifted toward sellers in recent years. Hiding identities of bidders has prevented buyers from banding together in various ways. Some of those strategies could be described as abusive, but many just give buyers the advantage of the wisdom of the crowd. What eBay has come up with is the opposite of social networking. eBay's customers are the sellers. eBay's products are the buyers. You don't let your products conspire against your customers. That's no doubt how they see it.

I still find it worthwhile to bid on eBay occasionally. I keep strict discipline, bidding only what I am willing to pay, and disregarding other bidders. I no longer go to the effort to make last second bids for items, although that remains a viable strategy in the face of buyers who compulsively outbid anyone that comes along. I simply don't care as much about most things I see on eBay now, so I make many fewer bids. I find I'm much happier with the results if I follow those rules.

Re: It had to happen sooner or later

*Message #15 Posted by **Paul Gaster** on 14 Sept 2011, 9:39 p.m.,*
in response to message #14 by Howard Owen

I somewhat disagree with you. Ebay for several years now does not allow sellers to leave

negative or neutral feedback for a buyer, no matter what. I have sold several non-calculator items to just clean up my place, and several people have bid, won, and never paid. It was a shock to find out that I could not leave any negative feedback, and not even neutral either. And after you go through the unpaid item process and that is closed, you can't even leave any feedback. You can't even leave a positive with a warning to others that this guy never paid. Also, others have mentioned this, but now ebay takes a cut from even your shipping dollars. Yes, they take their percentage off that too. They keep squeezing sellers more and more all the time.

in response to message #15 by Paul Gaster

It is really a bad deal all around. They used to be the most amazing bargain. Now they are marginal at best.

If you are selling, you have to sell big ticket items to make it worthwhile. They expenses on $20 to$50 items runs close to $30% of sale price in the end.

Back in the 1999 period, it was less than 10%--gee, it might have been 5%!

in response to message #15 by Paul Gaster

I thought that non-payment was the only case in which a seller could leave negative feedback these days. Has that changed as well?

The logic behind this was to prevent sellers from posting retaliatory feedback (that was the theory in any case) but the whole feedback system is worthless if it does not work both ways.

Re: It had to happen sooner or later

Yes, it changed, and it was way back in 2008.

http://contact.ebay.com/ws/eBayISAPI.dll?CustomerSupport

Search Results:Here's what we found for "cannot leave negative feedback"[Previous] While sellers can leave a positive Feedback rating and a comment for buyers, they can't leave negative or neutral Feedback.

-------- http://cybernetnews.com/sellers-cant-leave-negative-feedback-on-ebay/

"eBay has really got their work cutout for themselves this time. They have decided, as expected, that it's time to block sellers from leaving neutral or negative feedback for buyers. Oh, and to make matters even worse they are now counting neutral feedback left by buyers as a negative when calculating the feedback score, which is sure to drop the score of many sellers. A lot of sellers have turned the other cheek when eBay has jacked up their fees, but I think this move could very well be the tipping point."

---

edit: one more thing I should mention... I have had about a dozen people in the last year not pay for items they won and it's a major pain to deal with. Ebay's policy for these situations is frustrating to say the least. You have to wait 4 full days before you can open a case for non-payment. Then you have to wait 4 more full days before you can close the case. The math is simple, but I want to stress that this is 8 full days. And that is if you open the case promptly after the 4 days, then close the case quickly 4 days later. Then you have to relist your item again, typically for a week, and wait. So in summary, you list an item and you wait a week for it to sell, then 8 days because someone doesn't pay, then another week for it to sell again. Now we are over 3 weeks for what should take 1. Major pain.

Re: It had to happen sooner or later

*Message #20 Posted by **M. Joury** on 15 Sept 2011, 7:14 a.m.,*
in response to message #19 by Paul Gaster

I found the passage which states: Note: Buyers can leave sellers negative, neutral, or positive Feedback. Sellers can leave buyers positive Feedback or choose not to leave Feedback.

So what the heck is the point of the buyers even having a feedback rating. It is meaningless.

Re: It had to happen sooner or later

*Message #21 Posted by **Bart (UK)** on 15 Sept 2011, 8:02 a.m.,*
in response to message #20 by M. Joury

Hmmm, recently I was going through someone's feedback and saw a positive, but the comments were in capitals and in the line of "buyer doesn't pay...". I wondered why someone would leave a positive with negative comment, this

explains it.

Re: It had to happen sooner or later

*Message #22 Posted by **bill platt** on 15 Sept 2011, 9:46 a.m.,*
in response to message #21 by Bart (UK)

That is actually quite clever. It is the only way to actually leave negative feedback!

Re: It had to happen sooner or later

*Message #23 Posted by **Namir** on 15 Sept 2011, 8:19 a.m.,*
in response to message #20 by M. Joury

The TAS rules about feedback in either case (old and new rules) allow abuse. A two-way positive-neutral-negative allows buyers and sellers to blackmail each other! The current feedback rule allows buyers to abuse sellers and blackmail them.

I agree the current system that allows sellers only positive feedback or no feedback is not much. TAS wants to encourage people to buy, since there are plenty of sellers. So they are biased towards buyers.

Of course buyers are even more craftier in sham descriptions that seem encouraging about the item, but include "sold as is" and "no return or refund" behind which the seller hides when you get a dud.

Namir

Re: It had to happen sooner or later

*Message #24 Posted by **Martin Pinckney** on 15 Sept 2011, 10:02 a.m.,*
in response to message #15 by Paul Gaster

You guys must trade in product areas with a lot of shifty customers. I have about 650 transactions, and I only experienced one non-paying buyer and one non-shipping seller (a minor item).

But most of my dealing has been in only two product areas: collectible Nikon film camera stuff and Unimat miniature machining stuff. Perhaps a higher class of traders?

> HP 15C LE on TAS misrepresented as an HP 15C

And the seller has a 100% positive feedback rating! This stunt should put a dent in that assuming the eventual

buyer realises they've been scammed.

Re: It had to happen sooner or later

*Message #26 Posted by **Eddie W. Shore** on 14 Sept 2011, 3:17 p.m.,*
in response to message #25 by uhmgawa

Agree. The seller is banking on that the buyer does not know the difference. Apparently the seller missed that episode on Judge Judy where a scammer tried to pass pictures of cell phones as actual cell phones.

Re: It had to happen sooner or later

*Message #27 Posted by **Paul Berger (Canada)** on 14 Sept 2011, 7:24 p.m.,*
in response to message #25 by uhmgawa

Seller has added a further note saying that first picture is a stock picture and not the actual item, that was obvious to me as that picture is in focus and on a white background unlike the other 3 pictures, seller goes on to make it clear item is the limited edition version.

Re: It had to happen sooner or later

*Message #28 Posted by **Martin Pinckney** on 14 Sept 2011, 8:49 p.m.,*
in response to message #27 by Paul Berger (Canada)

But notice he states:

> Quote:
>
> Any bids prior to 9/14/2011 at 7:00 pm EST are welcome to be retracted. Bids after this time are expected to be fulfilled.

So he still hopes to rip someone off.

Re: It had to happen sooner or later

*Message #29 Posted by **Martin Pinckney** on 14 Sept 2011, 7:13 p.m.,*
in response to message #1 by Michael de Estrada

I Too sent a message through eB**, and actually got a reply:

Me: You have listed a 15c LE as if it were an original 15c. Please change your description.

Answer: The pictures accurately show the product.

However, he has since revised his description. I wonder how long before he gets bid retractions?

Re: It had to happen sooner or later

*Message #30 Posted by **Nick R** on 14 Sept 2011, 7:47 p.m.,*
in response to message #29 by Martin Pinckney

It's probably worth checking the serial numbers, as sooner or later one of these bottom-feeders might figure out a way to carefully erase the "Limited Edition"

Re: It had to happen sooner or later

*Message #31 Posted by **Michael de Estrada** on 14 Sept 2011, 8:52 p.m.,*
in response to message #30 by Nick R

The back of the calc looks completely different, anyways, and says "Product of China". So it won't make any difference unless the buyer is totally clueless.

Re: It had to happen sooner or later

*Message #32 Posted by **Michael de Estrada** on 14 Sept 2011, 8:35 p.m.,*
in response to message #29 by Martin Pinckney

Not only have there been no bid retractions so far, but the price has been pushed up by the second bidder, and the top bidder still has two bids placed, so it could go a lot higher.

Re: It had to happen sooner or later

*Message #33 Posted by **Martin Pinckney** on 14 Sept 2011, 8:53 p.m.,*
in response to message #32 by Michael de Estrada

Yes, notice he states:

> Quote:
>
> Any bids prior to 9/14/2011 at 7:00 pm EST are welcome to be retracted. Bids after this time are expected to be fulfilled.

So he will still rip someone off unless they wise up and file a complaint with eB**. Or just refuse to pay.

In the old eB** days one could email the bidders and warn them.

Re: It had to happen sooner or later

*Message #34 Posted by **Paul Gaster** on 14 Sept 2011, 9:29 p.m.,*
in response to message #29 by Martin Pinckney

I sent him a message too. Here is a cut and paste of what he told me:

"You are rude for your statement. I have no intent to deceive. Look at the pictures. I have revised the listing however."

On the other hand ...

*Message #35 Posted by **Howard Owen** on 14 Sept 2011, 8:29 p.m.,*
in response to message #1 by Michael de Estrada

Here's an auction of a vintage 15C by a seller who is aware of the LE.

edit: I want to point out that this guy is being honest. What was interesting to me is evidence of the impact the LE is having on auctions.

Edited: 14 Sept 2011, 8:46 p.m.

Re: On the other hand ...

*Message #36 Posted by **Michael de Estrada** on 14 Sept 2011, 8:56 p.m.,*
in response to message #35 by Howard Owen

I agree. The originals should still command a higher price, because of the quality difference and where they were made. Even where the quality is the same, I've seen made in USA calcs command a premium over made in Singapore calcs.

Re: On the other hand ...

*Message #37 Posted by **Peter Murphy (Livermore)** on 14 Sept 2011, 9:11 p.m.,*
in response to message #35 by Howard Owen

The seller must have been jolted into action by severe words from Forum members, but his response is still well short of ideal. His listing title still reads, "HP 15C HP-15C Scientific Calculator New In Box," for example, with the words "Limited Edition" conspicuous by their absence. Starting over from scratch would have been the right thing to do.

Bidders who do not retract their bids (as might be the case if they do not revisit the listing and discover the seller's revision of it) may end up paying well more than they should: bids before the retraction deadline were over $224, well more than the $89.99 at which Buy.com had sold 43 LEs on TAS as of a few minutes ago.

Edited: 14 Sept 2011, 9:17 p.m.

Re: On the other hand ...

*Message #38 Posted by **Michael de Estrada** on 14 Sept 2011, 10:24 p.m.,*
in response to message #37 by Peter Murphy (Livermore)

In fairness to the seller, IIRC you can't change the title of a listing once bidding has begun. You would have to end the listing, which cancels the bids, and start an all new listing.

Re: On the other hand ...

*Message #39 Posted by **Paul Gaster** on 14 Sept 2011, 10:29 p.m.,*
in response to message #38 by Michael de Estrada

How about the stock picture? That should be removed if possible. I still think he could do better.

Re: On the other hand ...

*Message #40 Posted by **Cristian Arezzini** on 15 Sept 2011, 3:50 a.m.,*
in response to message #39 by Paul Gaster

I agree about removing the picture, but I think that the description is pretty honest now... He states very clearly that the first picture is to be disregarded, and that he sells the Limited Edition. Of course we can't expect him to say "I'm selling a lower quality, made in China copy", but the listing, as it is now, couldn't "fool" anyone... I hope! :)

Cristian

I know, I wasn't implying anything negative. I myself bought two of them. It's that the "purists" here wouldn't consider the LE on par with the original 15c, and I believe someone here called it a "copy" a few days ago...

Re: On the other hand ...

*Message #43 Posted by **Gerson W. Barbosa** on 15 Sept 2011, 1:26 p.m.,*
in response to message #42 by Cristian Arezzini

Ciao Cristian,

Well, the word "copy" sounds somewhat belittling to me, considering the effort HP has put into the project to bring it back at a competitive price. In a sense, however, every unit except the first working prototype is a copy.

Gerson.

Hp-67 Power life

*Message #1 Posted by **Fouad M. Kaadou** on 14 Sept 2011, 9:53 a.m.*

Hello Hp Museum,

I am new here and this is my first post. I read that their is nothing you guys can't answer. My question is how long is the ON life of an Hp-67 with a fully charged battery pack (around 4.2V).

Thanks in advance, Fouad

Re: Hp-67 Power life

*Message #2 Posted by **M. Joury** on 14 Sept 2011, 10:38 a.m.,*
in response to message #1 by Fouad M. Kaadou

These days that would depend very heavily on the capacity of the cells you are using. I would hazard to say that everyone running an HP67 is using a rebuilt pack and it probably has much higher capacity than the original.

Re: Hp-67 Power life

*Message #3 Posted by **Jim Horn** on 14 Sept 2011, 11:12 a.m.,*
in response to message #1 by Fouad M. Kaadou

Indeed - it also depends on what you're doing with it. Sitting and siplaying "0" takes far less power than continuous program operation with lots of card use.

Back when I used mine heavily, it would typically give me about 2 - 2.5 hours of use on a charge (1976 - 1979). Today's cells have a much larger capacity (over 3X) so it should be good for a lot more than that if using a modern battery pack.

Re: Hp-67 Power life

*Message #4 Posted by **Fouad M. Kaadou** on 14 Sept 2011, 11:44 a.m.,*
in response to message #3 by Jim Horn

The cells are 1.2V NiCd Tenergy 1000mAh. I have charged it for about 3 hours to 4.2V and I left it on with the "0.00" display and it lasted less than 1 hour. You should know that when I first received it the charger was set to 110V and I plugged the calculator into 220V, but the charger still works find. Any thoughts?

Re: Hp-67 Power life

*Message #5 Posted by **M. Joury** on 14 Sept 2011, 11:49 a.m.,*
in response to message #4 by Fouad M. Kaadou

The charger is a trickle charger and I suspect that you are not getting a full charge from 3 hours. Are

you testing the cell voltage under load? I would suggest charging overnight and trying again.

Re: Hp-67 Power life

*Message #6 Posted by **Fouad M. Kaadou** on 14 Sept 2011, 11:55 a.m.,*
in response to message #5 by M. Joury

Thanks. I will try it tonight and get back to you tomorrow.

Re: Hp-67 Power life

*Message #7 Posted by **Jim Horn** on 14 Sept 2011, 1:04 p.m.,*
in response to message #6 by Fouad M. Kaadou

I know that when I used my '67 for a final exam in an Air Force orbital mechanics and perturbations class around 1978, I expected it to last for the two hour exam. Just for humor I took along my 15cm Post slide rule as well. To my dismay, I had forgotten to recharge the '67 that night so it died halfway through the exam and I had to resort to using the slide rule after all. Once I finished the exam, another student loaned me his TI calculator and I re-ran my numbers, getting more than 2 or 3 digits of accuracy for the answers.

That's my personal reference for '67 operating life...

Re: Hp-67 Power life

*Message #8 Posted by **Fouad M. Kaadou** on 15 Sept 2011, 3:01 p.m.,*
in response to message #7 by Jim Horn

Hello again. I took your suggestion and charged it over night - around 10 hours - I did not use the calculator till the afternoon but before I did I charged it for another 2 hours. I left it on idle at "0.00" display and it lasted around 2 hours and 15 minutes. I measured the voltage when it turned off and it was at 3.7V, that does not look good . I noticed the longer I charge it the longer it stays on but when I measured both voltages after 3 and 10 hours of charging they were the same - 4.2V.

HELP!

FOUAD

Re: Hp-67 Power life

*Message #9 Posted by **M. Joury** on 15 Sept 2011, 5:03 p.m.,*
in response to message #8 by Fouad M. Kaadou

You have to measure the voltage under load otherwise the reading is probably off.

Also, note that a NiCd or NiMH battery has a VERY flat discharge curve. That means that it will display high voltage until just before it dies. An example of such is the old HP-41 battery pack. With regular Alkaline batteries the calculator could run for hours, days, even weeks, with a low battery indication on. But with a NiCd pack you were lucky if you got 30 minutes, or even less, after the low batt lit up.

The point here is that the voltage difference will be very small between a fully charged battery and one the is at 50% charge. This is particularly true of the battery is tested with no load on it.

Cheers,

-Marwan

Re: Hp-67 Power life

*Message #10 Posted by **M. Joury** on 15 Sept 2011, 5:20 p.m.,*
in response to message #8 by Fouad M. Kaadou

One more thing: If this is a new battery pack it can take as many as 10 charge/discharge cycles for it to reach full capacity.

Re: Hp-67 Power life

*Message #11 Posted by **Dave Shaffer (Arizona)** on 15 Sept 2011, 10:31 p.m.,*
in response to message #10 by M. Joury

Similar for a battery that has just been sitting around for a while - you may need several charge/discharge cycles to get it back to "normal". Check the various battery manufacturer pages for more info.

Re: Hp-67 Power life

*Message #12 Posted by **M. Joury** on 15 Sept 2011, 10:44 p.m.,*
in response to message #11 by Dave Shaffer (Arizona)

Good point. I forgot to mention that.

Re: Hp-67 Power life

*Message #13 Posted by **Fouad M. Kaadou** on 17 Sept 2011, 1:00 a.m.,*
in response to message #12 by M. Joury

I have measured the voltage at the end of the calculators battery life - a little after the low power LED turned on. The voltage started at 3.8V and was quickly decreasing and in around 25 seconds it stopped at 2.29V. I am now working on charging the calculator for 3 hours and then discharging it. Is 3 hours of charging enough?

Thanks for all the help, Fouad

Re: Hp-67 Power life

*Message #14 Posted by **M. Joury** on 17 Sept 2011, 9:00 a.m.,*
in response to message #13 by Fouad M. Kaadou

> Quote:
>
> I am now working on charging the calculator for 3 hours and then discharging it. Is 3 hours of charging enough?

If you mean to cycle the batteries through 10 charges? Probably not. This takes several *full* charge discharge cycles. What I would do is simply to charge it overnight, use it until it turns off and then repeat. After 10 cycles or so I would run your test again.

Also, I was more interested in how you measured the voltage after a charge than at the end of the charge. What you are seeing at the end of a charge is typical NiCd/NiMH behavior but at the beginning of a charge testing under load gives you more information than without.

Cheers,

-Marwan

Re: Hp-67 Power life

*Message #15 Posted by **Fouad M. Kaadou** on 17 Sept 2011, 10:26 a.m.,*
in response to message #14 by M. Joury

I don't recall checking the voltage after charging the battery pack. I will measure it under and without load after fully charging it and come back to you.

Regards,

Fouad

> What I would do is simply to charge it overnight

The 67's charger was a slow charger for the original NiCds. A full charge of those took overnight. I believe the original cells were about 400mAh. 350mAh were common then, and the best was about 600mAh.

If the new cells have 4x the capacity, it will take at least 4x the charge time.

The NiMH in my 67 take about 30 hours to full charge (from flat) using the 67's slow charger. I think I used 1600mAh but they might be only 1400's.

hp 15C LE

*Message #1 Posted by **William L. Drylie** on 14 Sept 2011, 8:33 a.m.*

I don't know about others on this forum, but I am just really happy to have the 15C back again, loose keys, bugs and all.

I lost my original about 5 years ago to a strong EMP. A tech tried to fix it, too much damage. That series was a true shirt pocket calculator. While I occasionally use my 12C for financial matters, it's really useless for my work. I really do not see why hp stopped manufacturing the 15C, along with the 12C, they have such a great form factor. One Science, One Business.

If hp is going to continue manufacturing calculators, I think the 15C should be a Standard edition and not a Limited one. They could ditch the 35S, and that other one that looks like an automobile grill. Those two don't even fit in your pocket well. If the new 15C is hard on batteries, so be it, I'll buy extra. The old one was all I needed at work, and the new one will be too! Well done hp, well done.

Re: hp 15C LE

*Message #2 Posted by **Mark Storkamp** on 14 Sept 2011, 9:43 a.m.,*
in response to message #1 by William L. Drylie

I'll second everything you said. Even though I noticed the f and g keys slightly askew, I think the keyboard feels better than on my 16C. Finally I have something decent to use at work.

Re: hp 15C LE

*Message #3 Posted by **Dave Britten** on 14 Sept 2011, 10:26 a.m.,*

You may want to get in your car and start driving, because the NCEE folks will be upon you with their pitchforks shortly. :)

Re: hp 15C LE

*Message #4 Posted by **M. Joury** on 14 Sept 2011, 10:46 a.m.,*
in response to message #1 by William L. Drylie

I am very happy with the HP15C LE and if we get updates (which should be possible since it is flashable) it would be near perfect for an everyday carry machine.

Actually I like the 35S if they would only fix it. Better yet change the LCD and re-implement it as a 42Sii or 43S (IMHO the 42S was the best RPN calculator HP ever made barring the lack of I/O). I would not miss the "automobile grill" model one little bit though.

Cheers,

-Marwan

That's the hp 33s or the Ford Edsel of calculators for the uninitiated :-)

Re: hp 15C LE

*Message #6 Posted by **Martin Pinckney** on 14 Sept 2011, 1:33 p.m.,*
in response to message #5 by hpnut

If that's the case you'd better hang on to your 33s. Priced an Edsel lately?

Re: hp 15C LE

*Message #7 Posted by **Ed Look** on 14 Sept 2011, 11:41 p.m.,*
in response to message #4 by M. Joury

I have both the 35s and the 33s. Admittedly, I got the 35s because I really thought it superior to the 33s. But after using both, I much prefer using the 33s on an everyday basis. It may not look nearly as nice as the 35s, and I myself was fairly vocal in panning the appearance of the 33s, but in terms of ease of use and feeling good in the hand during use, to me, the 33s wins hands down.

Hp 33s not that bad

*Message #8 Posted by **Frank Rottgardt** on 15 Sept 2011, 6:27 a.m.,*
in response to message #7 by Ed Look

Same here. I bashed the 33s a lot when the calculator was new on the market. I bought it anyway cause it was the only available non graphic RPN at that time. And I must confess the 33s grew on me. I like the unshifted x2, SQRT. I also got used to the "weird" key alignment and the small ENTER is not an issue anymore. Only downgrade is that the "0" key sometimes doesn´t register and the very poor contrast of the green and purple key legend.

35S vs 30b Stack

*Message #1 Posted by **Alex Mark (Greece)** on 14 Sept 2011, 2:21 a.m.*

Hi all!

I have a question regarding 35S vs 30b stack operation.

If I am not totally confused, these two calcs do not have the same stack. 35S just has X, Y, Z and T levels, while 30b also has a "hidden" command line. For example:

In 35S, to add 1+2 you press: 1 [enter] 2 +

In 30b, you have two options: 1 [input] 2 + OR 1 [input] 2 [input] +

So, 30b is like a 50g with just 4 levels??? Am I correct? This is confusing me a bit, any clarification would be most welcome.

Regards,

Alex

*Message #2 Posted by **Thomas Radtke** on 14 Sept 2011, 2:28 a.m.,*
in response to message #1 by Alex Mark (Greece)

Yes, the 20b and 30b calculators don't let you edit the x-register directly, i.e., there's an additional register.

Re: 35S vs 30b Stack

*Message #3 Posted by **Marcus von Cube, Germany** on 14 Sept 2011, 2:35 a.m.,*
in response to message #2 by Thomas Radtke

We had the discussion on the 34S recently. Internally it would have been easier for us to get rid of the whole stack lift business and do it the 30b way (which I actually prefer) but the community decided against this. 34S behaves like the old RPN calculators do. Maybe this is the reason why we spell it 34S and not 34s.

*Message #4 Posted by **Walter B** on 14 Sept 2011, 2:46 a.m.,*
in response to message #3 by Marcus von Cube, Germany

We print **WP 34S RPN** SCIENTIFIC on it. So it simply must be 100% pure RPN :-)

> So it simply must be 100% pure RPN :-)

It's got nothing to do with that.

It's simply because old peole want it the way they are used to it. Old habits die hard etc. etc.

It was implemented like that in the first 35 where the X-register is used as the input register as well, maybe because memory was expensive or because it fitted the CPU construction better. The 28/48/20/30 approach is actually a more sensible approach and easily implemented in modern technology. But because many had learned RPN the original 35 way, they are set in their ways and do not like change, so they feel they have the right to call it "true" RPN.

And this is my 2p worth ;-)

Re: 35S vs 30b Stack

*Message #6 Posted by **M. Joury** on 14 Sept 2011, 10:36 a.m.,*
in response to message #5 by Bart (UK)

I think that part of the issue here is the multi-line display of the RPL calculators. I can see what is on the stack and am not surprised by the resulting operation. This is not true for the 20b and the 30b and maybe it is just habit but I do make mistakes with those calculators. For example one of the operations I am very used to is something like 2 ENTER + to double a number or 2 ENTER * to square a number. These won't work on the 20b/30b or the 48 machines. As far as I am concerned that is ok for the 48 machines because I can see what is happening and I am not going to perform an ADD or MULTIPLY with one item on the stack. RPN is utterly different--the stack is always there and if not specifically set to a value will have all values set to 0. You can operate on an "empty" stack in RPN but not RPL. These differences mean that for (IMHO anyway) each type of calculator (multi-line vs. single-line display) the chosen paradigm works best.

I agree that stagnation does not benefit anyone and the 48 series are a great example of that. They moved to a new stack paradigm because they had a much more powerful unlimited stack available to them.

To each there own, but the way I see it is that a multi-line display makes better use of RPL while a single-line display makes better use of RPN. What the 20b and 30b appear to implement is a 4-level RPN stack with an RPL entry paradigm. I would also argue that an unlimited RPL stack with an RPN entry paradigm would also be "wrong".

Again, just my 2 cents.

Cheers,

-Marwan

Re: 35S vs 30b Stack

*Message #7 Posted by **Paul Dale** on 14 Sept 2011, 5:23 a.m.,*
in response to message #4 by Walter B

Interestingly, the 34S's input isn't true to the RPN ideal. The 34S has a command line buffer for input and keystrokes go there first and can be backspaced or deleted entirely with no impact on the X register. Once ENTER is press all the stack magic happens.

As Marcus noted, supporting stack lift/suppression of stack lift is a right pain to get just right.

> Quote:
>
> The 34S has a command line buffer for input and keystrokes go there first [...]

Wouldn't it be easier to keep a copy of x (if really needed) and edit x directly? This would remove all inconsistencies. You're programming as if you would implement RPL but mimick RPN :-/.

Re: 35S vs 30b Stack

*Message #9 Posted by **Paul Dale** on 14 Sept 2011, 6:04 a.m.,*
in response to message #8 by Thomas Radtke

I don't think this is a harder path. In many ways it is simpler than editing values in X directly. The stack lift issues are mostly separate from the entry of data into X. Other things than ENTER (like Sigma+ e.g.) disable stack lift. Also, there are zero free states in our registers to store extra information like the second decimal for fraction entry.

The 34S maintains a text buffer of what the user has typed and only parses it at the end. This makes handling most anything pretty easy. Of course we've paid a RAM cost for this but that is in the LCD buffer memory and isn't cutting into the 2kb of persistent RAM.

If there are any inconsistencies apart from preserving X when the entry line is deleted, please let me know.

*Message #10 Posted by **Paul Gaster** on 14 Sept 2011, 9:39 a.m.,*
in response to message #7 by Paul Dale

Maybe this is asking too much, but is it possible to develop and release RPN and RPL firmwares for the 34S? Then people can pick what they want.

Re: 35S vs 30b Stack

*Message #11 Posted by **Jurrie Lulofs** on 14 Sept 2011, 10:50 a.m.,*
in response to message #10 by Paul Gaster

Even better would be a user selectable RPN/RPL mode. Then the RPN annunciator would actually have meaning. :-)

I'm fine with things as they are, but clearly there are those that would prefer the RPL method. Given the limited available memory I doubt we'll see such a user selection appear.

I don't know if the code is such that the evaluation and stack lift logic is centralized thereby making a conditional compile even feasible, or if the RPN/RPL impact is more scattered. Only the WP-34S developers can tell us that.

Something tells me that if this had been easy that it would probably already be there.

Second that! I'd like if I could just disable the whole "stack lift disabling" thing... I really make many mistakes with "pure RPN" because I'm used to RPL...

Cristian

Re: 35S vs 30b Stack

*Message #13 Posted by **Marcus von Cube, Germany** on 14 Sept 2011, 4:38 p.m.,*
in response to message #11 by Jurrie Lulofs

It would be possible if we had another state bit left in memory for the purpose. I'd prefer to get rid of all the stack lift business altogether which would save some code space.

The RPN annunciator has recently acquired a new use: It goes off for any temporary display.

How is this different from any HP that has the <= (backspace) key?

Re: 35S vs 30b Stack

*Message #15 Posted by **M. Joury** on 14 Sept 2011, 10:51 a.m.,*
in response to message #14 by Martin Pinckney

One difference: Take an HP-41 or your new HP-15C LE and enter a number onto the stack. Then start entering a second number. Change your mind and back-space all the way. On the 41, 42, 15, you get '0' on the stack. On the WP34S you get the number you entered first.

Cheers,

> Quote:

> And unwillingness to change has been the downfall of many a great company too.

Hi Bart,

the problem with PRL is you don't know *how* things are implemented. 1 ENTER 2 + gives the same result as 1 ENTER 2 ENTER +. This is very confusing, since you would assume from the first action that x is edited, and thus the latter should give 4, which is not the case on RPL machines.

Sometimes a secret stack lifting has to happen in RPL, such as when an operator is used while editing a number. *That's* inconsistent.

I see no disadvantage with RPN, but one huge advantage: Transparency of operation.

Thomas

Re: 35S vs 30b Stack

*Message #21 Posted by **Håkan Thörngren** on 14 Sept 2011, 7:02 a.m.,*
in response to message #20 by Thomas Radtke

I am no big fan of RPL, but come on! The RPL stack is not strange at all, it is just different to a 4-level RPN stack.

ENTER ends input (and checks that it is correct). If you perform a operation, it terminates entry (performs an implicit ENTER) before performing the operation. I cannot see how that is strange. What else should it do, throw the value just entered away?

In addition to this, you have visual feedback of the top levels of the stack and can see what is going on, something you seldom have on an RPN machine.

I have seen more than one newbie to RPN typing 1 ENTER 2 ENTER + only to get 4 (wrong result). You ENTER the first number, why should you not ENTER the second? Instead, ENTER makes an extra transient copy of the number, now that is confusing to a newcomer.

Re: 35S vs 30b Stack

*Message #22 Posted by **Cristian Arezzini** on 14 Sept 2011, 11:21 a.m.,*
in response to message #21 by Håkan Thörngren

> Quote:

That happened to me many times! :) Unluckily many times it wasn't obvious what had happened, and it took me some time to track back the error in my calculation...

Cristian

Re: 35S vs 30b Stack

*Message #23 Posted by **Bart (UK)** on 14 Sept 2011, 8:51 a.m.,*
in response to message #20 by Thomas Radtke

I started HP life with the 28S, and there's nothing inconsistent in the RPL stack operation. Actually it is more consistent.

Sorry Thomas, you don't seem to understand the fundamental difference. As I said in my reply to Walter's post, the old RPN stack used the X-regiter as an input register as well. Therefore, when you hit Enter, the value is copied into the Y-register, why?, because for the next entry, *the X-register is overwritten because it is the input register*. The so-called RPL stack has a separate input register, *that is why the need to copy the input value to the Y-register is **not** necessary when hitting Enter*. The input register only exists *during* input (for obvious reasons), so hitting '+' operator with an input active, operates on the *input* and *first stack item*. When there is no active input, hitting '+' operator operates on the *first stack item* and *second stack item*.

> Quote:
>
> This is very confusing, **since you would assume from the first action that x is edited**, and thus the latter should give 4, which is not the case on RPL machines.

I hope my explanation makes it clear that X is not edited, why it's not necessary & what it is doing.

> Quote:
>
> Sometimes a secret stack lifting has to happen in RPL, such as when an operator is used while editing a number.

How so? As I explained, when input is active, the input register is used as the first argument (or the only argument in a 1 argument operation).
Unless you are actually referring to editing the first stack line after it was entered - then you have effectively removed the item from the stack and it will only be put back when you finish editing. SO, if you use an operator while edit is active, it will work on whatever was above the item being edited, because that item was removed from the stack while editing. You can't complain about this behaviour, because such a mode did not exist on RPN calculators anyway.

> Quote:
>
> I see no disadvantage with RPN, but one huge advantage: Transparency of operation.

You ENTER two numbers that you want to operate on, but end up operating on the last number AND a copy of the last number. That's transparent? I want numbers A and B, whether I hit ENTER or not. BEFORE hitting ENTER, a number is not on the stack. Now I to put both A and B on the stack, then operate. So after actually putting B on the stack (by hitting ENTER - it is not officially ON the stack until then), I now have a COPY of B in Y??? Now THAT's inconsistent, but because

people have learnt to live with it, they call it consistent? or "the way"?

As you rightly commented, Pauli has to mimic the "RPN" behaviour using "RPL" type stack because people don't want to change, are unwilling to adapt, not moving with modern technology, etc. etc.

Again, as always, just my 2p worth.

Re: 35S vs 30b Stack

*Message #24 Posted by **Alex Mark (Greece)** on 14 Sept 2011, 9:29 a.m.,*
in response to message #23 by Bart (UK)

I never thought that I would start a holly war with this question, nevertheless, if you care about a beginner's point of view, and after having read all your thoughts, RPL now seems a bit more "logic" to me, since it can also work as RPN (by omitting the 2nd Enter, so no extra keystrokes are necessary). I find Bart's explanation quite reasonable, but I guess that since this has not been resolved in this forum for so many years, it will not be resolved now.

Wow. Now I think I finally understand this "stack lift" business. And I have to agree with Alex: the RPL method does make more sense. Thanks, Bart!

Re: 35S vs 30b Stack

*Message #27 Posted by **bill platt** on 14 Sept 2011, 12:43 p.m.,*
in response to message #26 by Martin Pinckney

RPL causes a waste of keystrokes. 2 ENT 2 X required to square a number (versus 2 ENT X). But it is also confusing, because the command line in RPL also functions just as it does in RPN for most things--in other words you don't have to do 2 ENT 2 ENT X.

I think really, they both are good. Nothing can be all things to all situations.

I think x^2 is present on RPL calcs? It's usually a shifted function, so 2 SHIFT x^2 is also 3 keypresses. :-)

Well I think you're giving a biased selection of reasons why people won't embrace the RPL stack style. I can also come up with some good reasons to STAY with the RPN stack.

BTW I faced many of these considerations implementing the 41Z Complex Stack - didn't have an easy life from the developper's standpoint either but I'm very happy with the result.

Of course, I am always biased to my own liking ;-). And I just like to give the "oldies" a hard time ;-))

Each to his own actually, and though the WP-34S has the "older" style implementation, I still play with it.

It should be clear what that means. You just need to read what I wrote, Bart. It's not really kind to ignore or invert my contributions to come to your conclusions about my knowledge :-(.

To the point, and please w/o any rants:

RPN is competely consistent about ENTER where RPL is not. If, in my example above, a second ENTER is a NOP in the RPL world, something's wrong. It indicates special treatment where the internals of RPN are quite straight forward.

I think I'm done here in this thread. To discuss something isn't worth it if I'm (maybe deliberately) mistaken.

*Message #33 Posted by **Marcus von Cube, Germany** on 14 Sept 2011, 5:07 p.m.,*
in response to message #32 by Thomas Radtke

RPL has a command DUP. RPN has not. Instead it has ENTER which makes a DUP and then causes the next entry to replace the lower stack level. This is kind of strange, isn't it?

Thank you all for your answers.

I am not ready to form a definitive opinion about this, I am not sure which approach I actually prefer. The 30b approach subsumes the 35S way of operating (in all cases, I wonder?), therefore one would say: why not have both and choose? On the other hand the 30b approach sometimes is confusing; do I press input for a second time or not? While in 35S you know you do NOT have to press Enter again.

Thank you again...

*Message #46 Posted by **M. Joury** on 14 Sept 2011, 6:23 p.m.,*
in response to message #45 by Steve Simpkin

How utterly unreasonable :)!

As do I actually, per an earlier post, I just don't like the RPN/RPL mix of the 20b/30b it is nether fish nor fowl.

To reiterate my earlier posting: A multi-line display using RPL entry syntax works fine for me. A 4-element stack machine (dare I say an RPN stack machine?) using RPN entry syntax also works fine for me. A 4-element (RPN?) stack using RPL syntax--not so much.

Again, as always, my 2c...

Cheers,

-Marwan

15C LE current draw issue

*Message #1 Posted by **Katie Wasserman** on 13 Sept 2011, 11:40 p.m.*

At Lyuka's suggestion I tested the current draw on the 15C LE and found a problem.

The current draw is identical to the 12C+ in the following states:

```
OFF - 0.004 ma
ON, idle no keys presses - 0.047 ma
ON, running tight loop - 21 ma
```

so far so good, but there is a critical difference.

On the 12C+ the current draw when pressing and holding a key averages about 0.4 ma, while on the 15C LE it's a full 21 ma! This is going to substantially shorten the battery life on the 15C LE compared to the 12C+ if you use the calculator a lot.

If you assume that the linger time on a key is 1/10 of a second this roughly means that every 10 key presses is equal to running a program for 1 second and I've guesstimated that you have around 5 hours of long program run time on a set of batteries. That's only 18,000 key presses. A lot less if your fingers are not so nimble.

(Before DaveJ jumps on me for this, I realize that short pulses like keystrokes are not as damaging to the cells as a continuous current draw. However, in the best case I can't imagine cells will last for more than twice my guess.)

I have no idea how hard this is to fix, but it was done in the 12C+ so it should be doable on the 15C LE too. I'm hopeful that this fix will get rolled into a new firmware version that addresses the PSE issue and the self test problem too.

in response to message #1 by Katie Wasserman

Hi Katie,

Thank you for your quick response.

It's interesting, but such amount of current draw is not acceptable for just a calculator.
However, performance / mA is about five times better than that of original 15C.

80x / 21mA : 1x / 1.2mA = 4.6

On the other hand, the current draw while key pressed is more than eight times worse,
so, you must type eight times faster than ever :-)

Regards,
Lyuka

*Message #4 Posted by **Lyuka** on 14 Sept 2011, 12:49 a.m.,*
in response to message #3 by Michael de Estrada

Hi Michael,

If you never pressed the key of the 15C LE, it will last 10 years or so :-)

200mAH * 2 / 0.004mA = 100kH = 4167days = 11.4years

That's impossible, I'm afraid. Lithium cells tend to expire in some years. So even with a ridiculously low current draw, the useful life of the cells would be limited.

I've heard opposite claims for shelf life due to the naturally occurring insulating oxide layer which forms during periods of light/no use. This reduces cell self-discharge rate and [reportedly] extends their usable life considerably. But the only practical issue is whether you can reasonably expect to *find* whatever cell you need in the next 5-10-15-20 years.

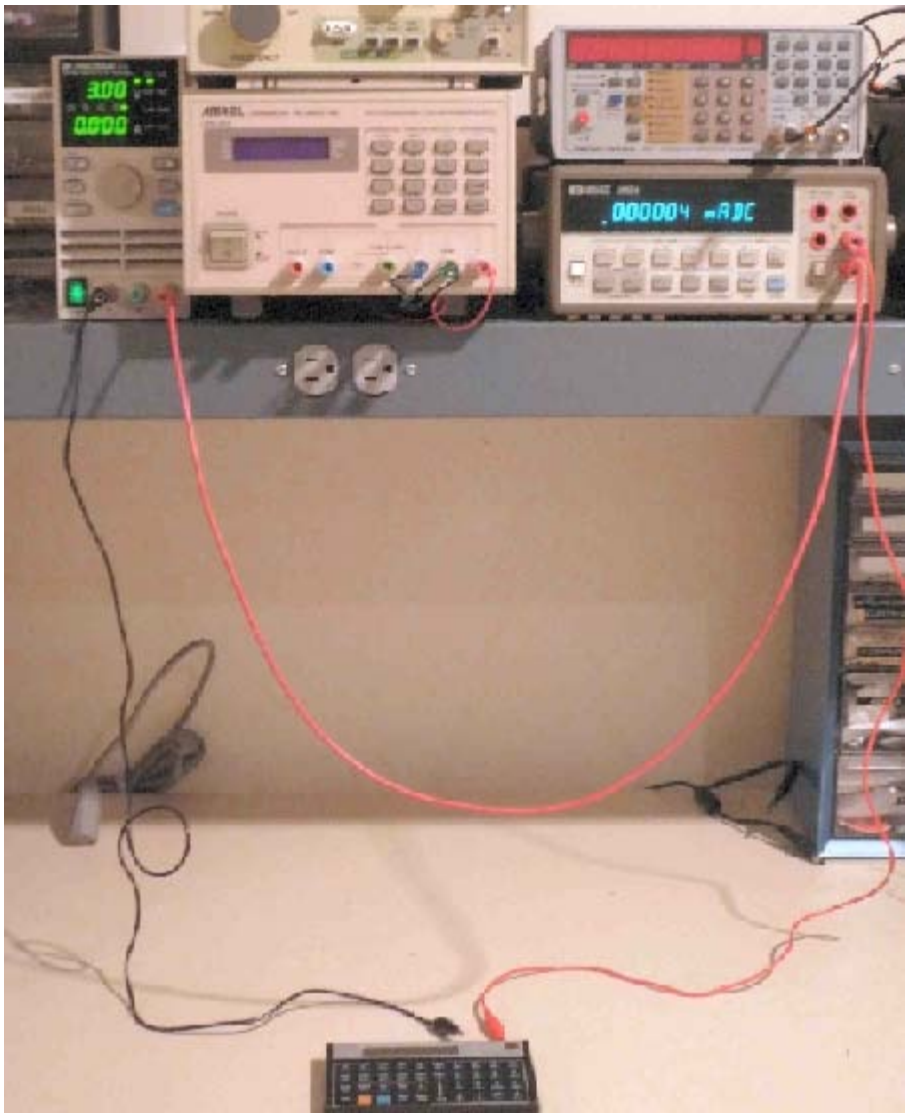
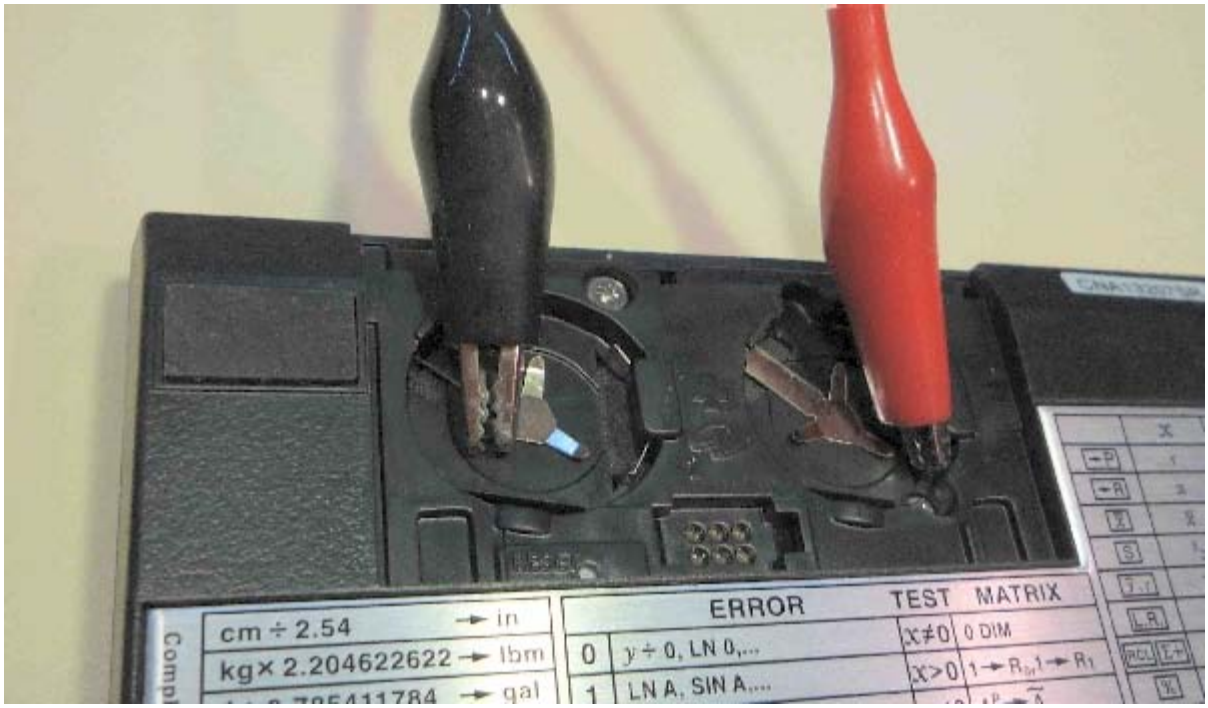
in response to message #10 by hpnut

It's very simple. Just put a power supply in series with a current meter in series with the battery contacts in the calculator. like this:





The only important thing is to use a current meter with a low voltage voltage burden -- the voltage that drops across its internal current sense resistor.

Re: 15C LE current draw issue

*Message #15 Posted by **Marcus von Cube, Germany** on 14 Sept 2011, 8:36 a.m.,*
in response to message #14 by Katie Wasserman

Katie, with my limited equipment it's just not the most fun and accuracy could be better. So I kindly ask you to help me in this regard. Be aware that 34S has an "active idle" mode where interrupts are enabled. This mode is entered with a PSE statement or after the control has returned to the user for half a second before going to deep sleep.

> The only important thing is to use a current meter with a low voltage voltage burden

Yes, that is VERY IMPORTANT. If you use a typical cheap multimeter, the burden voltage of the meter will result in the voltage to the calculator being too low, and either the calculator won't work at all, or you'll get a possibly inaccurate measurement. The inaccuracy of the measurement is caused by running the calculator at less than the expected voltage. If the calculator does not use a switching regulator, it will probably draw less current at lower voltage (almost proportionate). If the calculator uses a switching regulator in boost configuration, it will draw more current at lower voltage. Either way you're not getting a representative sample for the intended supply voltage.

Note that the burden voltage depends on the current range used on the meter, even with autoranging meters. Rich and I have run into that problem with our calculator prototypes on a handheld DMM. On some ranges the burden is low enough for everything to work OK, but at the lowest current range, necessary for accurate measurements of sleep current (i.e., under 20 uA), the calculator will not work *except* in sleep mode.

I'm now using an Agilent 34410A. The burden voltage on the 100uA and 10mA scales is <0.03V, which is great, but on the 1mA and 100mA scales it is <0.3V, which is barely acceptable.

That looks like an HP 34401A on Katie's bench. It has a burden voltage of <0.1V for the 10mA range, which is reasonably decent, but <0.6V on the 100mA range, which I would consider unacceptable. I use the 34410A rather than a 34401A partly because I wanted lower current ranges than 10mA, and partly for the lower burden voltage.

Inexpensive multimeters often don't even provide specifications for burden voltage.

To really do a good job of measuring very low currents, you need something like DaveJ's µCurrent.

Re: 15C LE current draw issue

*Message #17 Posted by **Bart (UK)** on 14 Sept 2011, 5:39 a.m.,*
in response to message #16 by Eric Smith

I usually use a calibrated shunt (with max 100mV drop @ full scale of wahtever range I'm interested in) with a storage scope for short pulses (a DMM cannot be trusted for this either). I have never used a DMM for current measurement, as I ususally remove the fuse (having worked with battery installations of 50V to 500V & up to 1000Ah an accidental connection to the current inputs of a DMM can be disastrous).

Re: 15C LE current draw issue

*Message #18 Posted by **Lyuka** on 14 Sept 2011, 6:10 a.m.,*

I often use a 25 years old I-V converter that is made of AD515A to measure leakage current of 100nA-10uA full-scale range.

The most important things to do is a thorough cleaning of the feedback resistors and the summing point terminal.

Lyuka

That's the right way to do it. Although I noticed you weren't using the offset null. I'm guessing that measurement error was buried in the noise given the target resolution/gain? Can't quite make out the voltage divider.

> Quote:
>
> The most important things to do is a thorough cleaning of the feedback resistors and the summing point terminal.

True. :) But even less esoteric is the fact you can easily swamp a 100nA measurement through a misplaced finger tip on a probe. For those of us guilty of the occasional hasty measurement..

*Message #20 Posted by **Joel Setton (France)** on 14 Sept 2011, 6:56 a.m.,*
in response to message #16 by Eric Smith

You could also work around the ammeter voltage burden by measuring voltage with a DVM "after" the ammeter, and adjust the power supply so that the calculator gets 3.3V. In this configuration the error term is equal to the current running through the voltmeter, which can be neglected in this case.

FWIW!
Joel

Re: 15C LE current draw issue

*Message #21 Posted by **Marcus von Cube, Germany** on 14 Sept 2011, 8:43 a.m.,*
in response to message #20 by Joel Setton (France)

Joel, there is a problem with the varying load having an impact on the actual voltage. An amp meter typically measures the voltage drop over a shunt. With varying current draw this drop varies and you may end up with too high a voltage at the input of your device.

Re: 15C LE current draw issue

*Message #22 Posted by **Joel Setton (France)** on 14 Sept 2011, 9:40 a.m.,*
in response to message #21 by Marcus von Cube, Germany

That's quite true if you have a *really* poor ammeter... But if the power supply is set to a constant 3.3V, then the voltage will never be higher than that and the calculator will be safe. All you have to do is switch down the range on the ammeter when calculator

consumption is low.

Good eyes, it is a 34401A. I also have a Fluke 867B and get similar readings on it. The 867B has burden voltage of 0.3V on the 30ma range (the manual says 0.03 volts, I think it's wrong).

I've been guilty of this namely leaving a DUT connected to a meter set to a 100uA scale, long forgetting about it, and then wondering why the supply rail is dipping wildly at unpredictable times. As a bandaid stopgap, a low forward voltage diode across the meter may clamp the voltage drop to an acceptable level. You won't get a meaningful measurement when it does but the meter will be overscale at that point anyway and have your attention.

The better solution as pointed out is a precision shunt and offset nulled instrumentation amp. I might toss a uC with A/D in there such that I can collect continuous data synchronized with events of interest. With a bit of finesse the gain of the opamp could be adjustable during acquisition to keep the sample within digitization range. Most SoCs have suitable precision & range A/Ds available but self-sampling above/below its own vdd/gnd is involved.

Another back burner project to join all of the others..

> Quote:
>
> If I recall, CR2032 cells have an internal series resistance of about 15 ohms.

Herein lies the problem with running these cells at high current. The initial internal resistance is around 15 ohms or lower and you can easily pull 20ma out of them two of them parallel without a voltage drop. But at this current level the internal resistance skyrockets so that at 20ma you start seeing a large voltage drop in short order.

The are no specs for this because these cells are being run so far beyond the manufacturers stated nominal current draw of 0.2ma. They are a terrible choice for a power source in these ARM-based calculators, especially the programmable ones.

It should be a relatively easy fix for most cases where the firmware is fixated on keyscan by just dropping the cpu clock rate during an approximate window containing key i/o instructions. As the firmware assumes a 4KHz ballpark NUT instruction execution rate, doing so also helps preserve the original timing in loop scenarios containing key access instructions. While a nit to be cleaned up I'm not sure how serious of a issue it is in practice given the pressumed key-down duty cycle.

However one interesting related scenario to test would be the current draw of the unit in OFF mode when a key other than ON is depressed. Eg, the unit is closed in a drawer or briefcase in OFF mode but someting depresses a non-ON key over a long time interval. This is similar to the "remote control falls between the couch cushions" battery preservation logic.

No problem with this. When the calculator is off the current draw when any key(s) are pressed (other then ON) is just the off state current of 0.004ma.

Re: 15C LE current draw issue

*Message #35 Posted by **DaveJ** on 15 Sept 2011, 4:14 a.m.,*

> That's just massively disappointing, and bad engineering.

I think that's a bit harsh of an external assessment on the developers. Yes there are bugs to be stomped out as those here have found. And there appears to be some regression in power management optimization. But I suspect the developers may as well be victim in part of a less than comprehensive beta program, given the series of issues quickly surfacing in this forum.

I'm unsure what HP's business aspirations are for this product. Perhaps it is diabolically strategic and they are out to reseed the remaining voyager crony market with 10K units of the 15C LE, after which a cosmetically modified 15C+ LE pops up and they continue to sell that until the market is saturated. Or perhaps this was a largely altruistic effort where they decided to give something back to their loyal fan base who have been forever banging on the table for the 15c to be reintroduced.

If the latter, I believe we risk teaching HP the lesson that no good deed goes unpunished and assuring they don't forget the payback received for the 15C LE.

Re: 15C LE current draw issue

*Message #37 Posted by **bill platt** on 15 Sept 2011, 9:53 a.m.,*

in response to message #36 by uhmgawa

I get the feeling that your last point will ring true.

Unlike the "faceless nameless" period when HP shut down all calculator operations, this project, the 15C LE, involves people whom we actually know--and even in many cases know personally, face to face!

I'd say this is an *enormous* turnaround for such a huge corporation. Really, really have to be pleased.

Take your mind back to early 2000s when they pulled the plug. Remember what you were thinking then? Remember scrambling to find and NOS you could? (I bought 4 20s machines from Samson cables for $20 a piece--just to have pioneer keyboard quality backup!)

This is, really, a Dream Come True. Really.

Rather extraordinary.

A New Prototype at the HHC?

*Message #1 Posted by **Dan W** on 13 Sept 2011, 9:21 p.m.*

Recently in posts regarding HHC2011 I've seen statements like this:

I can tell this HHC meeting is going to be out of this world!!!

This looks to be one of the best years yet.

Last year I understand the HP-15C LE prototype was introduced, and everyone kept quiet. I'm just wondering, fantasizing probably, if another similar calculator could be introduced this year.

That would be of course, the HP-42S LE.

Why? Well if the HP-15C is successful, can a 42S be far behind? After all, the 42S still exists today, disguised as a financial calculator, the HP-17BII. Same form factor, same display. The engineering work to convert it to a modern HP-42S would be relatively simple.

I still use the 42S I purchased in 1989. I could really make use of a new one.

At any rate, I wish everyone a great conference.

Cheers

Re: A New Prototype at the HHC?

*Message #2 Posted by **bill platt** on 13 Sept 2011, 9:46 p.m.,*
in response to message #1 by Dan W

The entire Pioneer production has ceased as of early this century.

The 17bii is no longer in production. Its replacement, the 17bii+ is of no value to building a 42s.

Because it uses a low-performance masked-ROM microcontroller. If the 42S code was completely rewritten in C to run on that chip, it might be about as fast as the 42S was, but I doubt that HP wants to invest the engineering resources to rewrite it.

And that is a critical difference. The 15c LE was, by comparison, much easier to do than the 42s would be.

Sadly, I don't see a 42sII in my future.

But, the 34S is here!

Hi Gene,

I'm resurrecting my 42S after a long convalescence. But the 34S is of great interest. I have tried to contact you regarding the cable but I'm not sure I am getting thru via the forum email. Can you try to contact me?

they don't need to - it's already been done in the form of free42. just compile the code for an ATmega1284p (that has 128k of flash and 16k RAM), attach a keyboard, LCD, serial port, and it's all done. the 1284p is in a 40-pin dip package (ideal for hobbyists), if more flash is required one has to go to a QFP version.

the amount of engineering required would be quite minimal.

The licensing issues might be more difficult to resolve than the technical ones.

Re: A New Prototype at the HHC?

*Message #11 Posted by **Eric Smith** on 14 Sept 2011, 1:43 p.m.,*
in response to message #9 by robert rozee

The "attach [...] LCD" part is problematic from a cost perspective. All HP calculators other than the 38/39/40/48/49/50 series use a microcontroller with built-in LCD drive, to save cost. This hypothetical new 42S is going to need hardware that is far more expensive than the 17BII+ hardware, and the only way they can do that is if they can sell it for a lot more.

I've actually worked on fitting Free42 into a microcontroller, and it is nowhere near as easy as you make it out to be. The Free42 code is designed to manage its memory using methods appropriate for running under an OS with plenty of memory, so it takes a lot of hacking to make it work with 16K of RAM.

I don't think you'll ever see a 40-pin dip in any new consumer electronic product, much less a pocket calculator.

> Quote:

AFAIK the m1284p is the end of that family in terms of flash size irrespective of package. There are also architectural issues once the flash grows beyond 128KB. Yet 128KB should be sufficient for the task.

Still the Harvard architecture can be maddening to deal with in terms of needing different primitives to accommodate data depending whether it resides in flash vs. RWM. And it after all ***is*** an 8-bit processor which tops out at 20MHz if supplied at 4.5V <= vdd Otherwise the upper frequency limit is 10Mhz @ 2.7V <= vdd which realistically falls to 8MHz if the internal RC oscillator (vs. external resonator) is used. The redeeming graces of this uC are large, zero wait state flash, fairly comfortable RWM size, and a power OFF quiescent current consumption *with SRAM data retained* that would make even old HP proud.

If you want to hack on something, use an ARM <whatever>. Paradoxically I haven't found anything much better than the ageing atmel at91sam7l128 for this application area. The energymicro EFM32 M3 series looks like interesting middle ground but the flash speed only supports zero wait states up to 16MHz IIRC. Still it is a 32-bit arch and doesn't have the usage issues of the 8-bit AVRs. I looked at the NXP LPC1114 but outside powering a single model voyager-class emulation at a brisk 50Mhz, there isn't much else to recommend it except for price -- which frankly is quite impressive @ US$1.50 in single unit quantities. If they could tame the RWM data retained power draw and increase flash size they'd steal the show.

But just wait a bit. I expect we've only seen the tip of the iceberg thus far in terms of SoCs marketed for this application space.

There would be a few immediate objections to free42 on a calculator. Two that come to mind immediately are:

- Free42 is too memory hungry, it wouldn't fit on a deeply embedded device like a calculator.
- Free42 doesn't use HP's maths library.

Neither of these matter to us when we use Free42. I know the second matters to HP and the first is quite observable when running it.

Better still, It would be nice if a new debugged firmware was ready so the lucky ones attending the HHC could flash their HP 15C LE.

What a better way for HP to show they care. Until now, we do not know if something is, at least, in the work to correct the issues that have been found so far.

HP 15C LE - review wanted

*Message #1 Posted by **Jeroen Van Nieuwenhove** on 13 Sept 2011, 6:18 p.m.*

While all these messages about serial numbers, fedex packages and key rattle are very interesting, I really would like to see a decent writeup, preferably with pictures, describing the new calc in comparison with the 15C classic. All of you lucky guys/gals are undoubtedly absorbed by this new toy for weeks to come, but inquiring minds that haven't yet received or ordered their units, would like to know what they can expect.

Thanks in advance!

*Message #5 Posted by **From Hong Kong** on 14 Sept 2011, 11:42 a.m.,*
in response to message #4 by Jeff O.

Thanks a lot for your test! :)

A classic HP-15C gave 1:19:10 or 4,750s. Your HP-15C LE gave 28s, i.e. an HP-15C LE is 170x faster than a classic HP-15C.

*Message #6 Posted by **Jeff O.** on 14 Sept 2011, 12:56 p.m.,*
in response to message #5 by From Hong Kong

Yes, that is what I calculated for the speed increase factor. That is the highest speed increase that I have seen for any test. Most reports and my tests of other routines seem to indicate a speed increase factor of 100 to 150. I don't know if the N-queens routine lends itself to higher speeds for some reason, or if the results for the HP-15C were from a slow example of the original unit. I may test it on my old 15C, but for such a long running program it is difficult to make sure you catch it when it finishes.

Perhaps HP should issue an alternative firmware with enough delay loops to match the original speed, to emulate that typical 1-second delay for trig functions or the eternal "running"-message, just in case you really want to have that Voyager experience ;-)

*Message #8 Posted by **Jeff O.** on 14 Sept 2011, 12:48 p.m.,*
in response to message #1 by Jeroen Van Nieuwenhove

Not sure exactly what you want, but here are a few random comparisons:

Appearance
The biggest difference in appearance between the 15c LE and a classic 15C is that of the keys themselves. The 15c LE keys have a matte finish to them and are (very slightly) rough to the touch, while the 15C Classic's keys are glossy in appearance and quite smooth to the touch. The blue and yellow (or gold, if you prefer) colors for the legends appear to be essentially identical between my 15c LE and my 15C Classic. (Much closer than the 15c+ units given to HHC2010 attendees, which used the orange and blue font colors from the 12C Platinum, I believe.) The display on the 15c LE is very slightly yellow as compared to the 15C Classic unit. The silver "15C" logo badge appears to be identical to the old, expect of course it is shiny and pristine on my 15c LE and beat up and worn on my 15C Classic. The silver line that surrounds the keyboard may be ever-so-slightly wider on the 15c LE, but that is really splitting hairs. The back label is of course much different due to the need to rearrange everything because of the much larger battery compartment door. It is also black print on a silver background instead of the silver on black of the original. All of the same information is included, except for a diagram of the battery insertion orientation. The silver bezel surrounding the display is very close in appearance. I cannot tell if the 15c LE is actually a brushed aluminum or a painted finish that mimics brushed aluminum.

Key-press feel
The key press feel is slightly different between new and old. The new is very good in my opinion, the difference is difficult to describe in words. The old is perhaps a slightly softer feel, not mushy soft, of course. I believe the old keys have slightly less travel, but again it is a very subtle difference.

As for pictures, Gene posted a link to a very large photo of the 15C LE here, and there are photos of the 15C Classic here at the museum.

Don’t know if the above is the type of information you were after, if you have any specific questions, just ask.

Re: HP 15C LE - review wanted

*Message #9 Posted by **Jeroen Van Nieuwenhove** on 14 Sept 2011, 4:14 p.m.,*
in response to message #8 by Jeff O.

Thank you, Jeff, for this clarifications. I am glad that they got the blue/gold colors for the legends right. On the FlickR picture that Gene linked to, the gold color was definitly not identical to the original Voyager color scheme.

Most important thing for me is the feeling of the keys, but your description gives me a pretty good idea, thanks. I hope that the legends on the keys do not wear off too soon... I guess that will be the only long-term cosmetic disadvantage, compared to the injection molded keys of the original model.

I still have this question: is the 15C LE level on a flat surface? No instances of slightly warped cases?

Comparing the two side by side, I can confirm that the gold on the LE is more yellow, and therefore brighter. It is indeed more readable IMO.

Some of the original Voyager models had painted keys near the end of their production run. Also I believe many of the more recent HP-12C models have painted keys so there should be some history of how long they last out there somewhere.

*Message #13 Posted by **megarat** on 15 Sept 2011, 11:19 p.m.,*
in response to message #1 by Jeroen Van Nieuwenhove

I'll add some additional observations. Mine arrived today and so far I like it a lot. Key press is much better than I anticipated, and I think Jeff O. described it pretty well: firmer keypress than original, but not as nice/smooth, yet still very respectable.

I get no key rattle at all, and while the colored function keys do drift a little, they're not bad, and I probably only noticed this because it was mentioned here. The display is great, basically identical to the vintage 15c display, with maybe a slightly (as in very slightly) yellowish tinge.

Cosmetically it's an almost-perfect reproduction. I'll concur some of the other points: the yellow labels are a bit brighter, making them easier to read. If one really scrutinizes, you'll find that the border around the edge of the keyboard is slightly thicker, and that the "HEWLETT-PACKARD" branding on the bottom is bold Helvetica instead of plain. (And now the label runs to the near-end of the RCL key instead of to the middle.) And comparatively, the LE's plastic case is more black than then vintage 15c's brown.

If you stand them on a desk side by side, the LE stands a tiny bit higher (1mm, maybe 1.5mm), and I can see that the LE is more uniform in thickness (in that the original 15c has more of a taper toward the front/bottom edge). I first attributed this to the fact that the LE has thicker feet pads, but upon inspection it actually is thicker, especially on the front/bottom edge.

(I suspect that this is the same physical form factor as the modern 12c calculators, but I don't have one to compare.)

The back side of the calculator, of course, looks totally different. The big metal label (with error codes, &c.) is silver instead of black. I personally find this contrast jarring, but nothing substantial to complain about. Also, the brushed aluminum bezel on the front is different ... it doesn't actually feel like brushed aluminum in that it's totally smooth.

All in all, I think it's great. HP, this totally made my month. Many thanks.

For full disclosure, I do have one complaint thus far, which is regarding the slipcase. It's fractionally too small for my calculator (both in width and length) and irregularly sewn. Even when I fight the calculator all the way in there, it sticks out of the case by about 3mm. Just by trying to force the calculator into the case, one of the seams at the opening has already started to come undone. Annoying, but not a big deal, especially since I think I have a spare kicking around in the office.

15C LE & 12C AE, somewhat disappointing

*Message #1 Posted by **Katie Wasserman** on 13 Sept 2011, 3:10 p.m.*

My 2 15C LE's (#01604 + #01576) and one 12C AE (#02519)arrived from buy.com today and I'm somewhat disappointed with the build quality, here's why:

One of the 15C's has a slight key rattle (just the F and G keys). All 3 calculator have poorly aligned F and G keys (as has been noted before) -- my earlier 12C+ calculators has somewhat better alignment of these keys. The plastic used in the keys is noticeable rougher to the touch than that used in my 2 early model 12C+ calculators. The firmware in the 12c AE is dated 2009-07-02 and has bugs in it that my 12C+ firmware dated 2009-11-19 does not have. Finally, the 12C AE does not come with a printed manual, just a short getting started guide and a CD. I think that there's room in that box for a manual, does the regular 12C come with a full manual?

While you could say that I'm being unreasonably picky about the aesthetic issues, I see no reason why the firmware has to be the older, buggy version. I can upgrade this to the latest version myself, but what about all those people that don't have cables and don't read this forum?

-Katie

Re: 15C LE & 12C AE, somewhat disappointing

*Message #4 Posted by **Martin Pinckney** on 13 Sept 2011, 4:18 p.m.,*
in response to message #1 by Katie Wasserman

Katie, my reaction was the opposite - excellent build quality on the 15c LE (I don't have the 12c).

On mine, the blue and yellow keys don't rattle, but they can be twisted very slightly to appear a little

misaligned - but they can also be moved back into alignment just as easily, so I don't consider that an issue.

I think someone opined earlier that the blue and yellow keys behave differently because they are different colors from the rest of the keys, and therefore they are separate moldings, while the others are all part of a linked array.

Is someone here the author of this video? Some rattling has been reported.

Re: 15C LE & 12C AE, somewhat disappointing

*Message #6 Posted by **Ethan Conner** on 13 Sept 2011, 9:11 p.m.,*
in response to message #5 by Gerson W. Barbosa

My shift keys don't rattle although they are slightly more loose than the rest. They are not even near as bad as the you tube video. I'm usually easy to disappoint in the quality area(aviation background) but so far happy with the unit that was sent to me. :)

Re: 15C LE & 12C AE, somewhat disappointing

*Message #7 Posted by **Lincoln R.** on 13 Sept 2011, 4:32 p.m.,*
in response to message #4 by Martin Pinckney

That would make sense. The keys on my vintage-ish (Singapore, 1993) 12C *all* rattle, and none of the keys on my 12C+ do. I know that the old HP double-shot keys were not all made on one assembly. I can live with the rattle, I'm glad they decided to actually make orange and blue keys instead of just painting black keys with something that will wear off.

Re: 15C LE & 12C AE, somewhat disappointing

*Message #8 Posted by **Les Bell** on 13 Sept 2011, 8:33 p.m.,*
in response to message #7 by Lincoln R.

Agree; the bottom row of keys on my USA-made 16C also rattle; if I hold the calc upside-down and run my finger along each row it's clear that it's the f, g and STO keys that are loosest - the others don't move up and down, but only slightly sideways.

I think 'twas ever thus.

Best,

--- Les
[http://www.lesbell.com.au]

Re: 15C LE & 12C AE, somewhat disappointing

*Message #9 Posted by **Steve Fennell** on 13 Sept 2011, 5:30 p.m.,*
in response to message #4 by Martin Pinckney

I received my 15C and 12C today from buy.com. Generally I am happy with the purchase and the shift keys don't rattle although they move slightly more than the other keys. I would have liked a manual for the

12C but that's not a big issue. Overall I'm happy with the quality of the calculators.

The keys rattle when shaken on my HP-45, HP-55, and HP-34c...

Re: 15C LE & 12C AE, somewhat disappointing

*Message #12 Posted by **sylvandb** on 13 Sept 2011, 7:05 p.m.,*
in response to message #1 by Katie Wasserman

My 15c LE and 12c 30th both came this afternoon, so I've had less than an hour with each of them. I'm happen with them so far. Who knows what 10 years will bring.

I did notice a bit of an oddity...

When switching the decimal point/comma, when does the calculator turn on? Key sequence, calc off: 1) Decimal down, 2) ON down, 3) ON up, 4) Decimal up.

The 12c 30th (and 25th, and the oldest 12c I have) turn on after releasing the ON before releasing Decimal. (After step 3.)

The 15c LE (no older one at hand to compare) will turn on only after releasing both keys. (After step 4.) Is that normal?

No rattle when shaken. A couple of times with each of them I wondered if there was a rattle so shook more then harder and then different directions. Nothing reproducible. My old Brazil 3-cell 12c rattles noticably but the keys still feel solid. (I think the rattle is wear and tear and I expect the new ones will develop rattles with usage.)

Yes, the color keys move a bit.

Overall I'm quite pleased with the build quality compared to the brand new TI 84 plus SE I bought earlier this year.

The TI seems OK. Kind of like my TI-30 did back in 1975-6. Neither the current TI nor the current 15c LE and 12c 30th have the "wow, this is incredible" quality feeling that my original 15c inspired in 1982. However the HP's are much closer than the TI.

The TI does seem a far better value in specs and capability tho. And my oldest's 6 year old TI 84 plus has held up with no functional or even notable issues. Now with 3 of those TI's purchased, I expect I would have seen something if any of the serious quality problems I saw develop with the TI-30 were endemic in the current 84 plus.

Just got my first 15C-LE, serial #CNA1320813, LE number 00336. Mine does not rattle when shaken. People at the coffee shop looked at me kind of funny when I did that, however. Moral: only shake your 15C in private, if you don't want to be thought odder than you obviously are. :)

Re: 15C LE & 12C AE, somewhat disappointing

in response to message #1 by Katie Wasserman

I hope not, my 12C and 15C LE (two of them?) are coming in a few business days, hopefully in time for the HHPC conference.

Re: 15C LE & 12C AE, somewhat disappointing

*Message #18 Posted by **Erturk Kocalar** on 14 Sept 2011, 12:42 a.m.,*
in response to message #17 by Eddie W. Shore

My 12C platinum had rattling keys. i opened the back and put one or two strips of paper behind the F/G keys. Now it works great. Don't put too much though :)

So I'm not worried about the keys rattling. Hopefully the production line will adjust as we give feedback.

I'm not either. Many of the original voyagers had (or now have) rattling keys, but it is a quality control issue that should have attention paid to it.

> Quote:
>

*Message #20 Posted by **From Hong Kong** on 14 Sept 2011, 4:05 a.m.,*
in response to message #1 by Katie Wasserman

I don't want to rub salt into one's wound but I think you guys have become the 'martyrs' of the early batches of the HP-15C LE! After receiving your responses, hopefully I think the problems will be fixed when I get my own calculator several months later in Hong Kong.

Edited: 14 Sept 2011, 4:07 a.m.

Question about Storage

*Message #21 Posted by **Gerardo Rincon** on 14 Sept 2011, 7:05 p.m.,*
in response to message #1 by Katie Wasserman

I received my three HP 15C LE. Very exciting! Many years waiting for what I consider the best Pocket Scientific calculator!

I have LE numbers 1081, 1200, and 1598. They are all solid, well made, top quality! All keys are excellent.

QUESTION: I plan to use one of the three and keep two "boxed" . Should I remove the batteries on these units? Any concern about leave them with or without batteries?

My HP 15C is here! IT DOES EXIST!!!!!

*Message #1 Posted by **jonathan G harris** on 13 Sept 2011, 2:51 p.m.*

I oredered 3 of the HP15C LE from Buy.com last Thursday and they arrived today!!! I bought 2 for myself (primary calc and spare)and 1 for my friend who is a SRO (senior reactor operator) at the dreaded University of Florida (We had physics/calcs together). I am a Relay Engineer (protection & control) and I use a calculator almost daily for both work and trivial calculations. All 3 came in one box and I absolutely love the packaging. Looks very professional and everthing so far looks good. I am gonna take (the one I opened...) home and play with it tonight along with one of my original 15Cs that I bought off of Ebay 2-3 years ago. The keys don't feel as good as the original but so far I am very happy and pleased with my purchase. I am a little suprised at the cost of the new models. They could have charged a hundred apeice and I (along with probably everyone that has bought the new 15C..) would still have bought three.

I am happy that the HP calculator community fought the good fight. I have been an engineer for 4 years and even though I own a TI-86, TI-92+, HP 50G, 33S, 35S (for the EIT/PE) the only calculator that will ever be (or fits...) in my shirt pocket will be a HP15C!!!

Screenshots of the HP-15C LE emulator?

*Message #1 Posted by **Torsten** on 13 Sept 2011, 1:41 p.m.*

I would like to see screenshots of the HP-15C LE Emulator. Can someone upload photos?

Torsten

Re: Screenshots of the HP-15C LE emulator?

*Message #2 Posted by **Dave** on 13 Sept 2011, 2:03 p.m.,*
in response to message #1 by Torsten

There's nothing to see. It looks exactly like the 15C. Find a picture of the 15C, and you'll have a screen shot of the emulator. In fact, you can just R-click the logo and hide the title bar so all you see is the calculator.

Edited: 13 Sept 2011, 2:04 p.m.

*Message #5 Posted by **Gerson W. Barbosa** on 13 Sept 2011, 2:43 p.m.,*
in response to message #4 by M. Joury

Does it run at fastest possible speed? TIA.

Re: Screenshots of the HP-15C LE emulator?

*Message #6 Posted by **Michael de Estrada** on 13 Sept 2011, 2:51 p.m.,*
in response to message #5 by Gerson W. Barbosa

As far as I can tell it runs at the processor speed, effectively instantaneous.

Re: Screenshots of the HP-15C LE emulator?

*Message #7 Posted by **M. Joury** on 13 Sept 2011, 3:04 p.m.,*
in response to message #6 by Michael de Estrada

Hmmmmm..... Interesting. Your results seem utterly different from mine.

Re: Screenshots of the HP-15C LE emulator?

*Message #8 Posted by **M. Joury** on 13 Sept 2011, 3:03 p.m.,*
in response to message #5 by Gerson W. Barbosa

I would say not. I compared it against the WP34S emulator and programmed both to do a 100,000 DSE loop. I wrote the programs the same way on both machines not using any of the tricks of the WP34S. The 15C took approx. 5 seconds to complete while the WP34S took under a second.

I don't know how the emulator is implemented but a 100,000 count on a 1.6GHz Intel processor should be nearly instantaneous.

There are also a couple of bugs in the emulator itself. Not the HP-15C if you get my drift. Refreshing the window is broken in some situations and I saw screen artifacts while keying in my short test program. For example, those that have it installed can try this: Go into program mode and press the f key. You will see an image of the top row of keys on the emulator screen (at least I did).

Cheers,

-Marwan

Re: Screenshots of the HP-15C LE emulator?

*Message #9 Posted by **Gerson W. Barbosa** on 13 Sept 2011, 3:26 p.m.,*
in response to message #8 by M. Joury

WP34s is expected to run faster because it runs native C++ code. Emulators are noticeably slower. Compare, for instance, Free42 with Emu42.

Cheers,

Gerson.

Re: Screenshots of the HP-15C LE emulator? -- edited

*Message #10 Posted by **M. Joury** on 13 Sept 2011, 3:54 p.m.,*
in response to message #9 by Gerson W. Barbosa

I agree. Which is why I commented on the emulator implementation. As another benchmark I just tried the same sort of loop on EMU48 running a 48SX and, for what it's worth, the timing was very close to that of the HP15C LE emulator.

Still, keep in mind that the WP34S is still being emulated. What you have with the 15C is an emulator running an emulator running your code while with the WP34S it is an emulator running your code. So an extra layer of emulation which, again, is why the emulator layer becomes so important.

I am not sure that your example of Free42 vs. Emu42 is valid since Free42 is presumably running native code on whatever hardware platform it is running on while WP34S is still being emulated.

However, the extra layer of emulation could indeed be the culprit here.

Cheers,

-Marwan

Re: Screenshots of the HP-15C LE emulator? -- edited

*Message #11 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 4:18 p.m.,*
in response to message #10 by M. Joury

On Windows, there is no emulation layer in WP 34S and only one in the 15C LE. Both run native code compiled for the x86 architecture. In the case of the 15C, this native code runs a NUT CPU which executes the original 15 C firmware. In the case of WP 34S there is no such layer. It's just an ordinary Windows program.

We call it "emulator" because it pretends to be the real calculator without being it but not in the sense of trying to mimic the internals of the ARM processor.

Re: Screenshots of the HP-15C LE emulator? -- edited

*Message #12 Posted by **M. Joury** on 13 Sept 2011, 4:32 p.m.,*
in response to message #11 by Marcus von Cube, Germany

Hi Marcus,

Thanks for that clarification. I assumed that the WP34S running under Windows was emulating the ARM processor and I made the same assumption for the HP12C. So one layer of emulation removed from each and I assume that this would place the WP34S at the same "emulation" level as Free42.

I guess that I would call both WP34S and Free42 simulators per some of the posters in this thread. Obviously this is not universally accepted.

Thanks again,

-Marwan

Re: Screenshots of the HP-15C LE emulator? -- edited

*Message #13 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 5:03 p.m.,*
in response to message #12 by M. Joury

We had this discussion already. We emulate (simulate?, pretend?) the outer appearance of the calculator on the screen (which is a software totally separate from the code that runs inside the hardware). The calculator guts themselves are compiled from the very same sources that are used to build

the ROM image. It's just a different target.

Re: Screenshots of the HP-15C LE emulator? -- edited

*Message #14 Posted by **M. Joury** on 13 Sept 2011, 5:30 p.m.,*
in response to message #13 by Marcus von Cube, Germany

Makes sense. Like I said. Peoples opinions differ. I just made an assumption, based on the term "emulator", that was wrong.

Re: Screenshots of the HP-15C LE emulator?

*Message #15 Posted by **Torsten** on 13 Sept 2011, 3:08 p.m.,*
in response to message #4 by M. Joury

Then there's still room for other simulators/emulators which offer these functions. I doubted whether it is worthwhile to continue with my HP-15C simulator.

ADV HEPAX goes for $1,000 at TAS !!!

*Message #1 Posted by **Ángel Martin** on 13 Sept 2011, 12:33 p.m.*

seeing is believing! auction here

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #2 Posted by **Dan Grelinger** on 13 Sept 2011, 12:54 p.m.,*
in response to message #1 by Ángel Martin

The buyer got snagged by the reserve for $177 more than the second highest bidder wanted to pay. That is why I never bid on reserve price auctions. Does anyone recall when the last one sold, and at what price?

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #3 Posted by **Martin Pinckney** on 13 Sept 2011, 1:53 p.m.,*
in response to message #1 by Ángel Martin

Out of curiosity, I went to the webpage referenced in the auction. Since it is in French, I clicked the translate button. This yielded these gems:

> Quote:
>
> belongs...in the category of modules most wanted mythical lovers HP-41.

and

> Quote:
>
> "I can honestly say that this module is a module for general use the most useful that a user could buy. "

With those kinds of endorsements, it' no wonder it went so high [;-)

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #4 Posted by **Ángel Martin** on 13 Sept 2011, 3:11 p.m.,*
in response to message #3 by Martin Pinckney

sure but remember: the NoVRAM does all the HEPAX did plus more... (permanent RAM) - at a tenth of that price!

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #5 Posted by **Juergen Keller** on 13 Sept 2011, 4:47 p.m.,*
in response to message #4 by Ángel Martin

From the practical viewpoint you're right. But be aware that a collector's mind behaves differently, he wants the original one. It's not a rational decision, it's an emotional one. However, $1000 is a lot of money, particularly with regard to the missing box. There is another auction for a clear case HP-65, with a BIN price of more than $2000! I suppose I have to play EuroMillions ;-)

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #6 Posted by **Gerson W. Barbosa** on 13 Sept 2011, 3:16 p.m.,*
in response to message #3 by Martin Pinckney

From what I can remember from Elementary School French:

"The HEPAX module... belongs to... the category of mythical modules that are most looked after by HP-41 enthousiasts."

"I can honestly say this module is one of the most useful general use modules a user could buy"

Despite they are not perfect (yet), online translators are useful sometimes.

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #7 Posted by **Walter B** on 13 Sept 2011, 5:17 p.m.,*
in response to message #6 by Gerson W. Barbosa

> Quote:
>
> Despite they are not perfect (yet), online translators are useful sometimes

... if used on a solid foundation of e.g. some Elementary School French. Else the result may be way off. There are lots of examples :-)

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #8 Posted by **Gerson W. Barbosa** on 13 Sept 2011, 6:05 p.m.,*
in response to message #7 by Walter B

French was well taught here back then. Teachers could actually speak the language. In 1976, when I entered high-school, English replaced French as the only foreign language taught at public schools. Most students hated it. If they had a choice they would rather study Spanish instead :-)

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #9 Posted by **Thomas FR69** on 13 Sept 2011, 6:32 p.m.,*
in response to message #8 by Gerson W. Barbosa

In fact, as it is written on the page ("*Simon Bradshaw wrote in HPCC Magazine (V6N7, October 1987)...*"), you try to translate sentences that are extracted from the HPCC Magazine (Index of Datafile, the HPCC club magazine), and were thus in english originally.

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #10 Posted by **Gerson W. Barbosa** on 13 Sept 2011, 9:10 p.m.,*
in response to message #9 by Thomas FR69

His exact words, per your reference:

"I can honestly say that this looks like one of the most useful general purpose extension modules that a User could buy."

Yours are very close:

"Je peux honnêtement dire que ce module est un des modules d'utilisation générale les plus utiles qu'un utilisateur pourrait acheter".

Perhaps "...ce module semble être un des modules..." would be slightly more faithful, but I'm not sure that's the proper way to say that in French. My French doesn't go much further than *le livre est sur la table*. It sure needs a brush-up :-)

Regards,

Gerson.

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #11 Posted by **Thomas FR69** on 14 Sept 2011, 3:08 p.m.,*
in response to message #10 by Gerson W. Barbosa

Gerson, I think your translation is the best. I put your proposition "...ce module semble être un des modules..." on the page.

Regards, Thomas

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #12 Posted by **Gerson W. Barbosa** on 14 Sept 2011, 7:15 p.m.,*
in response to message #11 by Thomas FR69

Hello Thomas,

Please notice there was no criticism intended. Anyway "it appears to be" is different from "it is" and this change might please Ángel Martin and others :-)

I don't have an opinion about HEPAX myself as I was never an HP-41 user. I skipped it (and all those interesting modules) back then. I remember I saw a 41C in 1983 in a local Carrefour store, but the price tag looked astronomical. I ended up buying a 15C instead). I have now one of those London new old stock HP-41CX and some accessories, but I seldom use it. At that time, once I was amused when a French engineer who was working with us said "Juliette Packard". I don't remember this referred to his HP-41C or HP calculators in general.

Regards,

Gerson.

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #13 Posted by **Howard Owen** on 13 Sept 2011, 10:28 p.m.,*
in response to message #6 by Gerson W. Barbosa

Google Translate keeps getting better though. If you run this page through Google Translate, you will

get a machine translation of Baudelair's "Enivrez-Vous" ("Get Drunk") on the left, and a translation by a human being on the right. It's remarkable how well Google does with the translation, though there's still no question the human translated version is better.

Re: ADV HEPAX goes for $1,000 at TAS !!!

*Message #14 Posted by **Gerson W. Barbosa** on 13 Sept 2011, 11:20 p.m.,*
in response to message #13 by Howard Owen

Isn't the Google translation another human translation? It appears Google Translate is able to find lots of this kind of Rosetta Stone through the internet, then it presents the translation as it were its own. Plagiarism? :-)

OT: Translation

*Message #15 Posted by **Howard Owen** on 13 Sept 2011, 11:31 p.m.,*
in response to message #14 by Gerson W. Barbosa

It's less sinister than that. Google tries to "crowd source" its translations, offering you alternate translations or your own preferred translation. It aggregates those results in some way, so that their translations improve based on those inputs.

I went looking for that particular poem because, once upon a time, I ran that text through Google Translate and got an obviously human produced result. That translation took account of the poetic elements in the source text, translating those ideas instead of the words themselves. This time I came up with that side-by-side translation, which I thought was interesting. But I don't think the machine translation in this example was taken from a human. It disregards the poetry, and translates the words. The human produced English on the right does better, but it still isn't as good as it could be in that regard.

edit: correct bonehead "it's" for "its."

Edited: 14 Sept 2011, 3:47 p.m.

Re: OT: Translation

*Message #16 Posted by **Gerson W. Barbosa** on 14 Sept 2011, 8:09 p.m.,*
in response to message #15 by Howard Owen

I can see it now! Somehow I had overlooked your important recommendation "run this page through Google Translate". Sorry!

Re: OT: Translation

*Message #17 Posted by **Howard Owen** on 14 Sept 2011, 8:56 p.m.,*
in response to message #16 by Gerson W. Barbosa

I could have made that clearer. I am using Chrome for my web browser. If you view a page with a language that doesn't match your locale, Chrome will give you a "translate" option that does the work in place. It's very convenient, but it's not the way most people do it.

Re: OT: Translation

*Message #18 Posted by **Gerson W. Barbosa** on 14 Sept 2011, 9:38 p.m.,*

in response to message #17 by Howard Owen

I am using Chrome as well, but I have disabled the automatic translation from French offer.

Found in a rubbish bin.

*Message #1 Posted by **Stuart Sprott** on 13 Sept 2011, 7:58 a.m.*

The company that I work for have just moved to another office. They had been in the last office for over 30 years. In that time a hell of a lot of useless files equipment had accumulated.

The move was a good time to get rid of the useless stuff.

During the move I just happened to look in one of the rubbish bins and spotted HP 32Sii. Naturally I picked it and tried to use it. The keys felt good but nothing happened. Perhaps the batteries were flat; but I felt that would be too good to be true. Anyway I brought some batteries today and it fired up straight away. As far as I can see everything works just fine.

In the past I have never had a 32Sii. The calculator appeals to me and seems easy to program. I do not have a manual, but so far I have been able to work out most of the functions.

My guess is that who ever owned it was just to lazy to get new batteries. I wonder how many good calculators have ended up in a rubbish tip.

Just one question. The face of the calculator is fairly grotty. What is the best fluid and method to clean the face without damaging the original markings?

Re: Found in a rubbish bin.

*Message #2 Posted by **db (martinez, ca.)** on 13 Sept 2011, 8:23 a.m.,*
in response to message #1 by Stuart Sprott

Whatever you use, be gentle on the first couple of passes or the grit you are cleaning off will buff thousands of microscopic lines into the painted faceplate.

I don't know this because i'm a *good* calculator cleaner.

Re: Found in a rubbish bin.

*Message #3 Posted by **Bart (UK)** on 13 Sept 2011, 8:41 a.m.,*
in response to message #2 by db (martinez, ca.)

> Quote:

Somewhere in my head I can't help hearing "Good judgement comes from experience, experience comes from..." :-)

Re: Found in a rubbish bin.

*Message #4 Posted by **robert rozee** on 13 Sept 2011, 8:42 a.m.,*
in response to message #1 by Stuart Sprott

i use a little De-Solv-It, a citrus based glue solvent and stain remover. a similar (though not quite effective) option is eucalyptus oil. a very light spray, then brush away the dirt with a 1" paintbrush, periodically wiping the brush clean with a rag.

De-Solv-It has the extra advantage of leaving an orangey fresh smell behind!!

Re: Found in a rubbish bin.

*Message #5 Posted by **Namir** on 13 Sept 2011, 9:01 a.m.,*
in response to message #4 by robert rozee

Be careful! De-Solv-It may alter the Solve algorithm in the calculator. Make sure that you test that feature and that it gives good results!

:-)

Namir

PS: Sorry ... hehehehe .. I could not help myself but to respond to De-Solv-It. It was too good to just let it slide by!

Edited: 13 Sept 2011, 9:03 a.m.

Re: Found in a rubbish bin.

*Message #6 Posted by **Lyuka** on 13 Sept 2011, 9:17 a.m.,*
in response to message #5 by Namir

Then, I'd recommend Super Solver instead :-)

Lyuka

P.S.
Actually, I'll use isopropanol / methanol mixture at first. If it won't work, I'll use CRC-6-66 then.

Edited: 13 Sept 2011, 9:24 a.m.

Auctions Vintage HP-15C

*Message #1 Posted by **Jim Johnson** on 13 Sept 2011, 7:48 a.m.*

HP-15C (vintage) auction stats from that "famous" auction site, with data collected starting 9/8/2011:

```
No Reserve:  6 of 11 HP-15C's have sold. Avg. price: $156.40
Start Price: 0 of 5 HP-15C's have sold.  Avg. start price: $132.00
Buy It Now:  0 of 11 HP-15C's have sold. Avg. BIN price: $338.63
```

All calculators sold were in working condition. Various cosmetic conditions from average to near mint. Higher priced models sold with a manual included. Several auctions have lowered the "starting price" from what was first listed. No BIN sellers have lowered their prices (yet).

Edited: 13 Sept 2011, 8:15 a.m.

Re: Auctions Vintage HP-15C

*Message #2 Posted by **megarat** on 13 Sept 2011, 3:40 p.m.,*
in response to message #1 by Jim Johnson

I might be the outlier on this forum, but I don't believe that the introduction of the 15C LE is going to have much of an effect on the market price of the vintage 15c calculators.

There's enough of a difference between the original 15c and the LE (build quality, double injection-moulded keys, &c.) that I think the original will still be sought after enough by collectors to keep the prices up. This will especially be the case if the 15c LE is truly LE.

After all, it only takes two people wanting to win an auction to get the closing price high.

That said, I'm hoping that the prices *do* go down, so I can pick up an extra or two ...

Re: Auctions Vintage HP-15C

*Message #3 Posted by **Lincoln R.** on 13 Sept 2011, 3:50 p.m.,*
in response to message #2 by megarat

Collectors will always be interested in the vintage 15Cs, I agree. However, a lot of 15C demand is probably coming from people who want one to use it (as evidenced by scratched up models, ones missing battery doors, covers, or original manuals, ones with engraved names, etc.) still selling for above the price of a new 15C LE. Also, I'm really not sure how many people there are stuffing calculators in display cases and never touching them...

Re: Auctions Vintage HP-15C

*Message #4 Posted by **Michael de Estrada** on 13 Sept 2011, 4:01 p.m.,*
in response to message #1 by Jim Johnson

This was a very low price IMO, especially considering that the auction was worldwide.

Haven't been following Evilbay 15c follies lately. But back when I convinced myself I needed a reference unit or two for my emulator work, I believe I paid about US$105-110 each. One with a manual which had never been loved, one without, and both regrettably badge-less. So not too much different from the auction above.

I thought too as others have voiced, the introduction of the 15c le will create a divide in price of the legacy 15cs. Anything less than in justifiable collector's condition should plummet price-wise as there now exists another option for folks who just "want one".

SOS- Did Not Succeed in Flashing 30b!

*Message #1 Posted by **Ed Look** on 13 Sept 2011, 12:13 a.m.*

I was able to get as far as the steps on the cable with the ERASE and RESET buttons.

Then I opened the SAM-BA software and I'm told there is a fatal error- No Valid Processor ID Found. I chose the board type recommended in the "Upgrading a 20b HP Calculator - Version 9-16-2009" instructions.

And now the 30b is blank.

Um... also, where do I get the "20b Flash Kit"? There appears to be some more files in that which I may not have.

I would appreciate ANY assistance!

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #2 Posted by **gene wright** on 13 Sept 2011, 12:19 a.m.,*
in response to message #1 by Ed Look

Try again. Many times simply starting over fixes this No Processor ID found.

Also, make sure you do not start SAMBA at all until AFTER you have done all the RESET or ERASE stuff.

Try it again. have **never** had a 20b / 30b become bricked.

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #3 Posted by **Walter B** on 13 Sept 2011, 1:24 a.m.,*
in response to message #1 by Ed Look

Hi Ed,

Please take the newest version of the manual (from here). Go to page 88. Do what you read there. It should work - else tell me.

Personally, I've thought I bricked my 20b twice - but it resurrected even after many days as soon as the procedure was done properly.

HTH

Walter

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #4 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 2:08 a.m.,*
in response to message #3 by Walter B

Don't let the batteries for any length of time in a calculator running the SAM-BA boot software, they will

almost certainly be flat when you try again!

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #5 Posted by **Alexander Oestert** on 13 Sept 2011, 3:46 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Can I simply take the batteries out during flashing to prevent drainage or does this mean one has to keep the procedure as short as possible?

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #6 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 5:55 a.m.,*
in response to message #5 by Alexander Oestert

Full batteries are needed for flashing. It's just a bad idea to let the calculator sit there in SAM-BA mode while you are shopping for a USB/serial adapter.

Keep the procedure as short as possible!

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #7 Posted by **Alexander Oestert** on 13 Sept 2011, 6:42 a.m.,*
in response to message #6 by Marcus von Cube, Germany

Thanks for the info.

*Message #8 Posted by **robert rozee** on 13 Sept 2011, 8:47 a.m.,*
in response to message #6 by Marcus von Cube, Germany

if one clips the wire carrying the 3v from the calculator to the level converter, and powers the level converter from an external pair of AA cells, does this improve the power drain situation for the calculator's internal batteries?

alternatively, pop out the internal batteries and wire said AA cells to the level converter without cutting the feed going back into the calculator.

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #9 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 10:00 a.m.,*
in response to message #8 by robert rozee

This will work and is a good idea if you are flashing on a regular basis. During the flash process, RAM will be cleared anyway so removing the coin cells doesn't lose any information.

If you want to use the cable for the transfer of data between the calc and the PC, you most probably do not want to lose memory contents. One option is to remove the batteries attached to the cable. Another way is to make a backup (ON+STO) on the calc before you remove the coin cells and connect the powered cable. The restore on power on is automatic.

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #10 Posted by **Ed Look** on 13 Sept 2011, 10:17 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Thank you Gene, Walter, and Marcus; thank you very much.

At least now my sense of panic is gone! ;)

Now, I did try again last night, but I will give it another shot tonight. And, yes, I'll download the updated manual. Of course, I won't give up and will keep you guys here posted.

in response to message #10 by Ed Look

And you tried with new batteries (or a reliable supply as per suggestions)? (Sorry, just checking, sometimes the most obvious is overlooked ;-)

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #12 Posted by **Ed Look** on 13 Sept 2011, 10:44 a.m.,*
in response to message #11 by Bart (UK)

I don't believe the SAM-BA software was running very long, but I did try to run it a few times. After many seconds each time, an error message appeared and when I clicked "OK", it appeared that the program shut down each time. But it's a trivial matter to take a meter to the batteries, although paying for new ones in another matter... ;P

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #13 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 11:21 a.m.,*
in response to message #12 by Ed Look

SAM-BA on the PC does not find the SAM-BA boot loader in your calc. Most probably the batteries are already flat. Once erased, there is no way to turn the calculator off except by removing the batteries. If you did not do that, they are drained because the boot loader in your device eats them quickly and you don't see it. :-(

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #14 Posted by **Walter B** on 13 Sept 2011, 1:44 p.m.,*
in response to message #13 by Marcus von Cube, Germany

That's a very annoying (and expensive) feature of said boot loader :-(

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #15 Posted by **Ed Look** on 13 Sept 2011, 3:51 p.m.,*
in response to message #13 by Marcus von Cube, Germany

Oh-oh...

... it sounds like new battery time...

Re: SOS- Did Not Succeed in Flashing 30b!

*Message #16 Posted by **Bart (UK)** on 13 Sept 2011, 11:30 a.m.,*
in response to message #12 by Ed Look

Also, do not be fooled by un-loaded (open circuit) voltage of the batteries. Even for half full coin cells the voltage can drop quickly at high current drains. See this thread for a discussion on the problem.

To buy or not to buy..that is the conundrum

*Message #1 Posted by **bill platt** on 12 Sept 2011, 9:20 p.m.*

Am I alone with this?

I don't want to spoil the fun. And I am really jaw-droppingly impressed that HP came around to the 15C LE!

But I own two 15c, one beat up, the other near perfect. I have the manual, the box, the funny pink wrapper...

And I have an 11C complete with both manuals...

So do I really need a 15C LE? I always thought I'd buy a now production in a jiffy. And now, having become a 17bii fan, I'm not even sure I really need it. And I already have 2 originals.

Am I alone? How many of "us" are sitting on our hands? Is this 10,000 unit business going to back-fire because we sit on our hands?

Re: To buy or not to buy..that is the conundrum

*Message #2 Posted by **Michael de Estrada** on 12 Sept 2011, 9:31 p.m.,*
in response to message #1 by bill platt

It's much much much much faster. Try it, you'll like it.

Re: To buy or not to buy..that is the conundrum

*Message #3 Posted by **Namir** on 12 Sept 2011, 9:35 p.m.,*
in response to message #1 by bill platt

Bill, buying the new machine comes from an inner conviction. If you don't have it, then stay with the machines you have.

Namir

Re: To buy or not to buy..that is the conundrum

*Message #4 Posted by **Egan Ford** on 12 Sept 2011, 9:37 p.m.,*
in response to message #1 by bill platt

No, you are not alone. I also have 2 15C's, one new and one used. Both work great. I've been reading the reviews here and so far I've determined that there are bugs (that can be fixed) and that the keys may be loose or perhaps not as solid as a "classic" 15C. For me I'd probably prefer to continue using my existing 15Cs. That is why I have them; to use.

Now that is not going to stop me from giving the 15C LE (Limited Experience :-) as gifts. It is the 2nd best calculator ever made (after the original 15C of course).

Re: To buy or not to buy..that is the conundrum

I felt that way, too, but at $79 w/free shipping I succumbed to the fever. I can say it is very nicely made, bugs aside. Looks nicer than the 12cp 25thA, my only other Voyager experience. I am trying to decide what I really would use it for, since I use Pioneers at home & work every day.

> Quote:
>
> @Egan ...Now that is not going to stop me from giving the 15C LE (Limited Experience :-) as gifts.

That may be what I end up doing with it.

Re: To buy or not to buy..that is the conundrum

*Message #6 Posted by **Don Shepherd** on 12 Sept 2011, 10:40 p.m.,*
in response to message #1 by bill platt

Bill, you're not alone. I'm not a scientist, so I have neither the need nor the desire for a 15c--old or new. Like you, I have become a 17bii fan, due to its programmable solver. I am challenged to see if a solution to a problem can be programmed on the 17bii solver, given its limitations. Not the 17bii+, that solver is a huge disappointment.

And I'm also a fan of the 32sii since Katie turned me on to that machine. A programmer's delight.

While others order their 15c's, I'm collecting the old iron--17bii and 32sii--on Ebay. I just got a NIB 17bii for $12.50.

And I never have to worry if my self-test or PSE will work.

Re: To buy or not to buy..that is the conundrum

*Message #7 Posted by **Michael de Estrada** on 12 Sept 2011, 11:09 p.m.,*
in response to message #6 by Don Shepherd

I'm just the opposite, an engineer with little interest in business models. I have an original HP 12c, and have no interest in the modern ones, including the 12c+. I also have a 32sii, which my last company gave me when I worked for them and they graciously let me keep it when I retired. I also have a mint 32s that I picked up recently. Now that I've also got both an original and new 15c's, I may just donate my 35s to a friend, since I really don't care for it very much. Frankly, the only modern scientific HP calc that I like is the 50g.

> I'm just the opposite, an engineer with little interest in business models.

My favorite is the 27s, for the combination of common scientific functions plus that wonderful alphanumeric Solver.

Although also an engineer, I, like Bill and Don, find the 17b/17bii's useful, because:

1) They share the same solver as the 27s (albeit with a somewhat different feature set),

2) They add some useful 'business' (as opposed to 'financial') functions that the 27s lacks, and,

3) They generally come a lot cheaper than the 27s.

> Quote:
>
> I'm collecting the old iron--17bii and 32sii

Old plastic, maybe. Old iron would be the 9100, 9825, no?

I'm a big fan of both of these calculators of course. But I use my 12C+ every day as well.

As a collector a have to buy anything that's LE, so that was an easy decision. I'm sure I'll play with the 15c LE a lot if for no other reason than to enjoy the speed that I always wished for during the many years that my 11C and 16C kept me going.

I can't wait to calculate pi to 400+ digits in no time at all.

*Message #10 Posted by **Lincoln R.** on 13 Sept 2011, 12:20 a.m.,*
in response to message #7 by Michael de Estrada

I own a 12C and 12C+ but may sell them because I really don't need financial calculators. The only real reason I bought the 12C+ was to try to get a feel for what the 15C LE keyboard would be like...

Re: To buy or not to buy..that is the conundrum

*Message #11 Posted by **Geoff Quickfall** on 13 Sept 2011, 12:58 a.m.,*
in response to message #1 by bill platt

Well, I have the beta unit and it is used every day at the moment. So it should be parked as it is different

looking from the 15LE.

Of course I now have to get two LE's, one to replace the beta version and one to save in pristine condition in the box for the heck of it.

Gee, if I had only kept the original 15C or 15C or 41C in its box when I purchased them. Here's my chance.

So 4 restored originals. One beta, and two production models.

OCD or what!

Geoff

Re: To buy or not to buy..that is the conundrum

*Message #12 Posted by **Nick R** on 13 Sept 2011, 2:09 a.m.,*
in response to message #1 by bill platt

I'll buy one if they eventually become available here in Canada. I'm not particularly taken with the Limited Edition status, as I don't believe any currently produced calculators are manufactured to a high enough standard to take their place in a collection alongside their illustrious predecessors such as the original 15C.
I appreciate the effort that's gone into resurrecting this Voyager model. I just find it sad that there are no longer any calculators being made on this continent, and what does arrive from overseas sources is generally more recyclable than collectible.

Re: To buy or not to buy..that is the conundrum

*Message #13 Posted by **Lincoln R.** on 13 Sept 2011, 10:10 a.m.,*
in response to message #12 by Nick R

It's unfortunate, but I believe that the last American-made calculator (of any kind that i've encountered, not just HP) was the 48sx (and even those had a Japanese LCD display if you really want to split hairs). By the time it came out, TI had already outsourced most of their manufacturing to Taiwan, and most of the other North American calculator manufacturers had failed in the early 80s.

Singapore-made HPs seemed to be as good as the American ones, once things started moving to Indonesia and China quality did take a drop, but honestly the later models (12c+, 30b, etc.) seem to be better built than things like the 49g, later production Pioneers with the key labels that wear off, etc. Do they match the quality of the 80s HPs? Probably not, but if anyone could even make a calculator like that it would cost so much that only people like us would buy one, and there aren't enough of us to keep a few hundred people employed for 40 hours a week making calculators.

*Message #15 Posted by **Manatee** on 13 Sept 2011, 8:07 a.m.,*
in response to message #1 by bill platt

I have an original 15C, in very good condition, and I really have no need for a calc with its feature set anymore. Still, I was so amazed that the new 15C actually made it to production that I bought two. One will be carried in my daypack, and I'll play with it as time allows. The other will remain unopened, becoming part of my personal time capsule, along with my never-opened pets.com sock puppet.

Re: To buy or not to buy..that is the conundrum

*Message #16 Posted by **Manolo Sobrino** on 13 Sept 2011, 8:31 a.m.,*
in response to message #1 by bill platt

If the 15c is your main calculator, and you are sure it is because you have tried many others, then you should get one if you can afford it (two spare calculators should be enough). Otherwise, there's no real need... but we all love new toys, don't we?

Re: To buy or not to buy..that is the conundrum

*Message #17 Posted by **megarat** on 13 Sept 2011, 3:43 p.m.,*
in response to message #16 by Manolo Sobrino

As an original 15c owner (and having also acquired a second one for the office) I waffled with the same dilemma, but settled on buying one, for the following reasons:

-- Provide my support to HP for resurrecting this great vintage calc, and creating new scientific calculators in general.

-- In case anyone creates a new firmware for this calculator, I'll be able to play along.

(The calculator may actually get some use, for instance as a travel candidate, but I doubt it will actually supplant any of the vintage 15c units that I have.)

I had thought about picking up a second one as a gift, but decided against it for now.

Thank you HP!!!

*Message #1 Posted by **Namir** on 12 Sept 2011, 8:03 p.m.*

I want to take the opportunity to say thank you to HP and folks like Cyrille and Tim (and others that I have not mentioned) for doing a very good job. I am looking at the boxes of the HP-15C LE and the HP-12C 20th Anniversary and I must say that there was a lot of care in putting the calculators in these very nice packages!

I also want to thank the forum folks who campaigned to bring the HP-15C back. I never believed that I will see this day and often thought that they were wasting their time. This is your moment to celebrate and I applaud your perseverance and patience. HP heard you, responded, and now we are all enjoying the new toys and at very reasonable prices!!!

This is a day where the community of HP calculator users can celebrate. We hope whatever the future brings to the PSG division, that they will continue to serve us with their fine products (PC, calculators, and other accessories). Yes technology evolves and makes certain items obsolete. It is part of our civilization. We have always enjoyed HP products and will continue to do so whether these products are under the HP logo or some other logo.

Namir

How to keep up regarding WP-34S?

*Message #1 Posted by **Michael O. Tjebben** on 12 Sept 2011, 7:11 p.m.*

Wow! It has been years since I've posted to this forum, I got so busy with a new job, and the birth of two wonderful girls (5 years ago, twins) that I just barely keep up with everything. In fact, my account with the hpmuseum had expired.

Recently, however, my father (nearly an octogenarian) and I were revisiting our HP calculator collections, and we got to talking about our interest in the WP-34S.

I did some digging through the hpmuseum archives and the wiki4hp, and we decided we'd each like to buy an hp-30b and convert them to wp-34s'.

However (and please correct me if I'm wrong), it appears that the overlays that make the hp-30b "look" like a wp-34s are currently not available. Are more coming? I could not find anything that lets me know if such is true.

And the cable seems difficult to obtain (dependent on poor Gene Wright who is probably SWAMPED!). Is there another source? We don't want to burden him further (especially since I prefaced this with my own acknowledgement that life can get BUSY!). I'm gathering that *maybe* one can buy some other calculator (hp12c?, others?) that has the cable and that can be used for the 30b? Is such true?

I guess, in addition to asking about the overlay and cable, I'm asking for assistance that might help any newby who wishes to help-him/herself: Is there some place that the status of overlays and cable could be posted so that those of us that are interested in such could keep checking and not keep asking?

My best wishes to the group! Though many of us get distracted by other things for a time in life, there remains a latent interest in HP calculators that can be rekindled with little effort... And, as most of you know, that can become a sort-of obsession...

-Mike

Re: How to keep up regarding WP-34S?

*Message #2 Posted by **M. Joury** on 12 Sept 2011, 8:26 p.m.,*
in response to message #1 by Michael O. Tjebben

Hi Michael,

I recently returned to this forum after a hiatus of some years. Just in time to see all the info about the WP-34S. I now have an HP-20b and an HP-30b both converted over. It isn't hard but you do need the cable.

The cable is only available from Gene at this time. It can be used on the HP-12C+, the new HP-12C 30th Anniversary Edition, the new HP-15C LE, the HP-20b, HP-30b, and the HP-10bii+ (did I miss any?). However, it does not come with any of these machines.

The overlays are not available at the moment and Eric is apparently waiting for a back-ordered blade to the cutter he uses to produce these overlays. I vaguely remember that the blade may be available sometime this

month (or was it October?). Anyway, they should be available in the future, just not right now.

As for flashing the HP-30b to a WP-34S, once you have the cable get hold of Tim Wessman's instructions on flashing the 20b.

I hope this provides you with some of the answers to your questions.

Cheers,

-Marwan

*Message #3 Posted by **gene wright** on 12 Sept 2011, 8:51 p.m.,*
in response to message #2 by M. Joury

Well, I mailed 6 cables today and have 3 more to go out tomorrow.

If you want a cable, just let me know.

Now... if it continues to grow, don't worry. I will be suggesting alternatives to HP directly! :-)

Meanwhile, here is the link for flashing a 20b/30b/etc:

Flash!

*Message #5 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 1:55 a.m.,*
in response to message #3 by gene wright

Just to add to the confusion. We are in the process of creating an updated (bug fixed) release which will render any stored code or data invalid, so use the wp34s_asm tool to salvage what you have created. The release will hopefully be available before I go to SD next week.

Re: How to keep up regarding WP-34S?

*Message #6 Posted by **Michael O. Tjebben** on 13 Sept 2011, 7:32 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Gentlemen: Thank you all!

I had, in fact, previously found the links -to the EXCELLENT information- you have included, but nonetheless appreciate them again. My biggest difficulty was ascertaining whether there was more

than one source each for the labels and cables. It had appeared that there was only one source for the labels and that source had run out (Eric). It seems I understood correctly (from my multiple searches) on that discovery. I had also thought the cable might be available for one of the other calculators and could be used for the 30b, but Marwan helped correct me about that.

We will happily wait on the labels. In the meantime we would like to obtain the cables, and dare I say two? One for me and one for my father? (I hesitate in asking for two, based on my previous acknowledgement that Gene must be SWAMPED. If that is the case, even one cable would be fine - we'll just share that when we visit each other on a reasonably regular basis. I am just thinking that two would be most useful, especially in light of Marcus comment that periodic flashing may be necessary to keep up with feature enhancements and bug-fixes.)

I will send a check or paypal to Gene. I can contact him directly offline...

Again, thank you!

-Mike

*Message #7 Posted by **Marcus von Cube, Germany** on 13 Sept 2011, 9:53 a.m.,*
in response to message #6 by Michael O. Tjebben

Even after flashing the cable is useful as a means to transfer programs and data between the emulator on the PC and the device. All the stuff we are putting in libraries needs the cable to get into the calculator.

*Message #8 Posted by **Michael O. Tjebben** on 14 Sept 2011, 7:51 p.m.,*
in response to message #7 by Marcus von Cube, Germany

Do you know if one MUST have Windows-XP to run the Atmel SAM-BA program (to program, specifically, the hp30b)?

I realize that there are discussions that one probably has to use an RS-232 port under XP, though a USB-to-Serial converter might work under XP if that converter happens to have the FTDI chipset.

But none of these variations work under anything but XP? (like Vista, Windows-7?)

What about SAM-BA for linux?

Or XP-running in a VMware or Vitual Box Virtual machine?

Re: How to keep up regarding WP-34S?

*Message #9 Posted by **Gerry Schultz** on 14 Sept 2011, 8:59 p.m.,*
in response to message #8 by Michael O. Tjebben

No, Samba 2.10 runs fine under Windows 7 and I used an ES-U-1001-R100 USB-to-RS232 adapter. I've updated my WP-34S twice now with no problems.

in response to message #8 by Michael O. Tjebben

Running XP in a virtual machine that grants direct access to the USB bus is working fine. I'm using Parallels on a Mac for this.

Re: How to keep up regarding WP-34S?

*Message #12 Posted by **Michael O. Tjebben** on 15 Sept 2011, 7:38 p.m.,*
in response to message #11 by Marcus von Cube, Germany

Thank you all!

Though I don't have the cables yet, I was able to test the usb-to-serial adapter and even got it working with Vista. (I searched the forum for more information from Gerry Schultz, which pointed to a post he did regarding Bart (from the UK) getting it working under Vista, I found Bart's instructions, and that worked for me too...)

I'll bet it will all work well.

If not, I'll use the Windows-7 Virtual machine on my MacBook Pro.

Thanks to HP folks in this group

*Message #1 Posted by **Don Davis** on 12 Sept 2011, 6:52 p.m.*

This may have already been said elsewhere, so I apologize if I missed it. I just wanted to say thank you to the HP calculator guys who are a part of this group. I used to read the petitions about bringing back the 15C with interest, but I never really thought it would happen. It did not make sense to me that a company the size of HP would make such a business decision for a relatively small return. I don't know, but I suspect that those who are involved in the business for HP must have made a case internally to support the remaining enthusiasts in this way. Just guessing, but however you did it, I appreciate it. I hope that it is rewarding to you to be involved with a product that garners this sort of attention.

Thanks and best wishes, Don

HP-9825

*Message #1 Posted by **Paolo Cipollone** on 12 Sept 2011, 4:44 p.m.*

I was offered a 9825 in excellent cosmetic shape. The seller (a collector himself) says it was refurbished less than a year ago and that it works fine, but he's away from me, and I can't do the testing myself. The price would be about 150 euro. I don't know much about this machine, so what should I have him check, and do you think the price is right? Are there known age issues and are they easily managed?

Thanks in advance

Re: HP-9825

*Message #2 Posted by **David Ramsey** on 12 Sept 2011, 8:10 p.m.,*
in response to message #1 by Paolo Cipollone

In general the old HP desktop calculators are very reliable. With the 9825, the main issue is the tape drive: the rubber drive wheel will have turned "gummy" over the years and must be replaced before you can successfully use tapes. This is easy to check: just look in the tape slot and inspect the wheel; feel it with your finger if necessary. It should feel dry and you shouldn't be able to deform it with your finger.

Repairing a gummy wheel is fairly easy if you're mechanically handy. Your problem will then be finding DC-100 tapes, which haven't been made for many years. There is one company that sells refurbished DC-100 tapes, Athana.com, but they're rather expensive.

The printer's paper advance mechanism can fail, but this is less common.

Other than that, simply have him turn it on and verify that the display works.

The price you're getting is a very good price for a fully functioning 9825.

Re: HP-9825

*Message #5 Posted by **fhub** on 12 Sept 2011, 5:57 p.m.,*
in response to message #4 by Tim Wessman

Will this 15C emulator also be available separately, i.e. without having to buy the real calculator?

There's a "HP Calculator Emulator program" where almost every HP calc is emulated (I have a few of them), but I don't see the HP15C on these sites. :-(

> Will this 15C emulator also be available separately, i.e. without having to buy the real calculator?

Good Question.

I'm not interested in actually owning the 15C - I've had several over the years and really didn't use them.

But I would be interested in the emulator. I could then participate in any of the discussions that come up and try the programs out. I don't really see where making the emulator available would impact the sales of actual units.

That is cool!

Re: Tim, Help! 15C LE emulator activation not working

*Message #17 Posted by **M. Joury** on 12 Sept 2011, 11:42 p.m.,*
in response to message #15 by Michael de Estrada

Hi Michael,

I eventually went the "offline" activation route. Use the same serial number but copy a text field that is provided, drop the text field in the web page accessed by the link also provided, and finally take the response provided by the web page and drop it back in the response pane of the calculator's validation screen.

The fact that worked shows that the serial is correct and that the problem lies somewhere in the way my Win 7 box is trying to activate over the net. It appeared to

be going out to the server and then returned with the message that the serial number data was invalid. I never received any UAC prompts, it just quietly failed.

Thanks for the suggestions though.

Cheers,

-Marwan

HP-15C LE box specs for SC please!

*Message #1 Posted by **Juergen Rodenkirchen** on 12 Sept 2011, 4:07 p.m.*

Hi! I had contact with SC lately. SC wants to generate labes for international orders in advance in order to accelerate shipping. For this, SC needs the box specs. Who can help Chris of SC (support@samsoncables.com)?

Here is Chris' original message:

> Quote:
>
> [...] I have been waiting on generating labels for international orders to verify the actual length, width, height, and weight of the calculator box. If you have those specs it will help me out. I don't trust the ones that were given to me b/c they were wrong on the 12C 30th and I don't want to generate all the labels incorrectly.

Regards, Jürgen

Re: HP-15C LE box specs for SC please!

*Message #2 Posted by **allen** on 12 Sept 2011, 10:14 p.m.,*
in response to message #1 by Juergen Rodenkirchen

Tell Carl, it's 8.75 by 6.5 by 2.75 inches, 1 lb 11.2 ozs. Too large for anything smaller than a USPS medium flat rate box.

Re: HP-15C LE box specs for SC please!

*Message #3 Posted by **M. Joury** on 12 Sept 2011, 10:42 p.m.,*
in response to message #2 by allen

Just don't do what buy.com did and throw it in a plastic envelope.

Re: HP-15C LE box specs for SC please!

*Message #4 Posted by **Ethan Conner** on 12 Sept 2011, 11:11 p.m.,*
in response to message #3 by M. Joury

I'm surprised to hear people got theirs in an envelope. Mine came i a cardboard box. Must have been shift change and next person got told to quit wasting cardboard and use a padded envelope.

Re: HP-15C LE box specs for SC please!

*Message #5 Posted by **M. Joury** on 12 Sept 2011, 11:45 p.m.,*
in response to message #4 by Ethan Conner

I actually had two orders with them. The single unit arrived today in a plastic envelop. The second

order gets here tomorrow. Since there are two units in the second order I am hoping for a box.

-Marwan

Re: HP-15C LE box specs for SC please!

*Message #6 Posted by **Michael de Estrada** on 12 Sept 2011, 11:16 p.m.,*
in response to message #3 by M. Joury

Yeah, I hate it when people ship things that way. I always use an oversize box with bubble wrap. I once got a Sinclair calc from the UK and the idiot shipped it in its original box, which got badly crushed in transit. It was in mint condition per the photos in the auction, and for the cost of shipping it could have been packaged properly. I gave the seller negative feedback.

15C LE expanded a bit on SOLVE & INTEGRATE?

*Message #1 Posted by **Namir** on 12 Sept 2011, 3:43 p.m.*

If I am not mistaken, the HP-15C LE has expanded on the labels you can use with SOLVE and INTEGRATE. If I remember correctly, these commands worked with code appearing only after LBL 0 and LBL 1. I have used code after LBL A with both SOLVE and INTEGRATE in the HP-15C LE and it works!!!

The HP-15C LE manuals speaks of needing to take a break while the Integrate command is working. Not anymore with the speed of the LE version. Manual needs to edit that part and any other part that hints at the slow speed of the original 15C.

Namir

Edited: 12 Sept 2011, 3:46 p.m.

Firmware updates for the 49g, 12C+ etc

*Message #1 Posted by **Tommy** on 12 Sept 2011, 1:20 p.m.*

I read that there were updates for some calcs. How did you do the update? Did everyone use this cable?

/Tommy

Re: Firmware updates for the 49g, 12C+ etc

*Message #2 Posted by **Marcus von Cube, Germany** on 12 Sept 2011, 2:28 p.m.,*
in response to message #1 by Tommy

The USB equipped calcs download the update via USB. If an SD card is available this can be used as well.

The cable is for the 10bii+, 12C+, 15C LE, 20b and 30b.

Re: Firmware updates for the 49g, 12C+ etc

*Message #3 Posted by **Eddie W. Shore** on 12 Sept 2011, 3:35 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I didn't realize there was a cable for the 10bII+.

Re: Firmware updates for the 49g, 12C+ etc

*Message #4 Posted by **gene wright** on 12 Sept 2011, 4:31 p.m.,*
in response to message #3 by Eddie W. Shore

Same cable as the 20b/30b/34S/12c+/15cLE.

Re: Firmware updates for the 49g, 12C+ etc

*Message #5 Posted by **Mark Harman** on 12 Sept 2011, 10:29 p.m.,*
in response to message #2 by Marcus von Cube, Germany

The cable isn't USB. It is serial, just like the 6 pin connector on the back.

The calculators you mention all have the same connection and can use the same cable. My biggest word of warning is to not leave the cable in any longer than needed. It really drains the batteries very quickly.

Regards,

Mark

HP-15C LE Emulator Problem

*Message #1 Posted by **Namir** on 12 Sept 2011, 11:27 a.m.*

Hi All,

I just got my HP-15C LE. I installed the emulator. When I run it, it asks for a key code and says if the key code fails to click an Offline button. When can I find the key code? Also, clicking the Offline button does NOT resolve anything!!

:-(

Namir

Re: HP-15C LE Emulator Problem

*Message #2 Posted by **jweisskohl** on 12 Sept 2011, 11:32 a.m.,*
in response to message #1 by Namir

There is a code on the CD. Try that.

I just received mine too. Really nice that HP included the printed manual!

Does the fact that we have to activate it mean that we can only install it on one computer?

Cheers,

-Marwan

Re: HP-15C LE Emulator Problem

*Message #5 Posted by **Tim Wessman** on 12 Sept 2011, 12:12 p.m.,*
in response to message #4 by M. Joury

No, it allows a few. It collects a tiny bit of info about the system, turns it into a hash, sends the hash, and then if you use the same computer in the future it will not use up another activation if the hash matches once already in use.

Re: HP-15C LE Emulator Problem

*Message #6 Posted by **M. Joury** on 12 Sept 2011, 12:32 p.m.,*
in response to message #5 by Tim Wessman

Thanks for the info Tim. One more question: Can you uninstall it so that you recover the "use" (increment your available installs) or is it decrement only so that when I get rid of a computer I have lost one usable copy of the emulator?

I ask because the machine I have sitting in from of me is an older laptop that has problems and will eventually (relatively soon) be replaced.

Thanks,

-Marwan

Re: HP-15C LE Emulator Problem

*Message #7 Posted by **Tim Wessman** on 12 Sept 2011, 12:44 p.m.,*
in response to message #6 by M. Joury

It doesn't "recover".

However, I beleive you have 5 installs, so it shouldn't be an issue.

And I can reset specific keys, or add allowable installs if needed.

in response to message #12 by robert rozee

It does once, and you can do it over a web browser instead. It never will check again.

It will send a version code every 30 days and prompt you to download a new version if one is available, but only if you don't check to turn that off.

But to each their own.

*Message #16 Posted by **M. Joury** on 13 Sept 2011, 8:02 a.m.,*
in response to message #15 by bill platt

Hi Bill,

Are you asking for an explanation of DRM? Or why someone would not use a DRM (or DRM-like) enabled product?

DRM: Digital Rights Management-controlling the installation and use of software or distributed media.

As for the reason why one wouldn't use a DRM enabled product... I am sure those of us that don't each have our own reasons but I for one will not buy any software that is DRM enabled if I can possibly help it.

I always thought that Borland had the right idea with it's software (the book analogy)--install and use on multiple machines as long as you could guarantee that the same license would never be used on two different machines at the same time.

I have around a dozen computers at home and all my installed software is purchased but I generally choose to go with companies that provide a home license option of some sort--one license for all machines in the house--as some companies are beginning to do now. Otherwise it will get ridiculously expensive for me to maintain my software.

Just my 2 cents worth...

Cheers,

-Marwan

Re: HP-15C LE Emulator Problem

*Message #17 Posted by **Bart (UK)** on 13 Sept 2011, 9:17 a.m.,*
in response to message #15 by bill platt

In the stricktest application, it limits the use to one computer, e.g. SAE documnets:

From their site (SAE DRM Overview):
What are the restrictions on how I can use my purchased PDF document?
Once you complete your purchase and open the secure document, your PDF will be permanently locked to that computer. You may view it as many times as you like and print it twice. You will not be able to use the document on another computer, or network it to other computers.

This restricts my right to use it as I wish, where wish. Yes, I can print it, but

what's the use of a printed version. These documents can be several 100's of pages (even > 1000 pages) big. I want to take it (actually usually several) with me when visiting customers or contractors - which are often overseas. Yes, I can use a laptop for travel, but have a desktop on my desk at work. Now I must contact SAE to transfer the licence to the laptop & back again every time? Or buy multiple licences? I prefer the old Borland approach that Marwan quoted. I respect that and I for one do not pass on copies ("I paid for it, so can you"). However, my ideal world has been broken by piracy, and providers feel that that they should use DRM to protect their products. They have a right to implement it, I have a right not to buy it.

How does this affect my use of the 15C emulator? I would want to use it at work and at home. Between them I have been through 6 PC's in 5 years. It would be OK if the counter decremented with an un-install (I remember there used to be software that had a token tranferred back to a floppy upon uninstall). But now after a few years I'd be left not being able to use the emulator, unlike the physical calculator that we all know is used for decades. So my use of the emulator is restricted, thus I'd rather not use it at all.

OT: DRM

*Message #18 Posted by **Howard Owen** on 13 Sept 2011, 9:48 a.m.,*
in response to message #15 by bill platt

In addition to immediate practical concerns about DRM, there are theoretical issues too. For instance, GNU and FSF founder Richard Stallman has philosophical problems with DRM.

What about a touch-screen emulation? :-)

Re: HP-15C LE Emulator Problem

*Message #24 Posted by **Marcus von Cube, Germany** on 12 Sept 2011, 2:32 p.m.,*
in response to message #21 by Michael de Estrada

If the emulator is based on the same code base as the 20b SDK, pressing two keys at the same time is not possible. I modified the code in the 34S to support shift hold sequences. Maybe HP has done a similar work on the (internal) 30b emulator which uses shift hold sequences.

Re: HP-15C LE Emulator Problem

*Message #25 Posted by **Gerson W. Barbosa** on 12 Sept 2011, 2:55 p.m.,*
in response to message #24 by Marcus von Cube, Germany

> Quote:
>
> Maybe HP has done a similar work on the (internal) 30b emulator which uses shift hold sequences.

This might be necessary to change the radix mark (ON/.), unless there is another way to do so.

Re: HP-15C LE Emulator Problem

*Message #26 Posted by **Jeroen Van Nieuwenhove** on 12 Sept 2011, 4:37 p.m.,*
in response to message #25 by Gerson W. Barbosa

I remember having been able to do exactly that in the (no longer available) Nonpareil emulation of the 15C by using the shortcut keys and the mouse simultaneously. Since I do not have the HP emulation program for the 15C LE (yet), I don't know whether this might be a solution.

Re: HP-15C LE Emulator Problem

*Message #27 Posted by **Marcus von Cube, Germany** on 12 Sept 2011, 5:12 p.m.,*
in response to message #26 by Jeroen Van Nieuwenhove

I've implemented two versions in WP 34S: Press and hold a keyboard key (f) and click the key on the virtual keyboard or right-click the virtual shift key to lock it down, click or press the key, unlock the virtual shift with another right-click.

Sort of OT: Dice odds

*Message #1 Posted by **Dave Britten** on 12 Sept 2011, 10:08 a.m.*

I'm already familiar with calculating the odds of getting a certain number of *specific individual results* when rolling an arbitrary number of dice (simple binomial distribution). But a fair amount of Google searching and working out numbers by hand hasn't led me to a general formula for calculating the odds of getting a certain *total* when rolling an arbitrary number of dice. (e.g. What are the odds of rolling a total of 17 or greater using four standard 6-sided dice?) This looks like some form of binomial expansion, but I'm drawing a blank putting it all together.

And I can always post a 15c implementation of the calculation, since that's the hot topic at the moment. ;)

Re: Sort of OT: Dice odds

*Message #2 Posted by **M. Joury** on 12 Sept 2011, 10:24 a.m.,*
in response to message #1 by Dave Britten

Try this page: Chance of total with 'x' dice

From the above page:

This section endeavors to answer the frequently asked question on the probability for any given total over the throw of multiple dice. ... My method was a recursive computer program. No, I don't know of an easy non-recursive formula.

Hope this helps.

Cheers,

-Marwan

Re: Sort of OT: Dice odds

*Message #3 Posted by **Dave Britten** on 12 Sept 2011, 11:34 a.m.,*
in response to message #2 by M. Joury

I was afraid I might have to resort to that. Now, to really complicate things, I also want to be able to do this with non-standard dice. For example, a 6-sided die with faces reading 0, 0, 0, 1, 1, 2, or something like that, and maybe even mixtures of different dice. I'll have to see how far I can take this on the 15c LE when it shows up, though honestly I think this would be easiest to implement with SQL and liberal use of cross joins.

Re: Sort of OT: Dice odds

*Message #4 Posted by **M. Joury** on 12 Sept 2011, 11:48 a.m.,*
in response to message #3 by Dave Britten

SQL? If you end up going that route I would love to see how you do it. Although I would not consider

myself a SQL programmer (C, C++, C#) I do program SQL on a regular basis for my job and solving this using SQL would never (never did) even occur to me!

Cheers,

-Marwan

Re: Sort of OT: Dice odds

*Message #5 Posted by **Dave Britten** on 12 Sept 2011, 12:44 p.m.,*
in response to message #4 by M. Joury

Sure, here's what I slopped together for SQL Server (I'm assuming you have access to that, with C# background). The memory/CPU usage gets really out of hand with a large number of dice. Doing 7 six-sided dice takes about 10 seconds on an 8-core server with 32 GB RAM. But you can mix and match types of dice, and do non-standard dice.

http://dave.brittens.org/Dice.sql

You'll also need to have my string split function in the current database.

http://dave.brittens.org/fn_split.sql

Re: Sort of OT: Dice odds

*Message #6 Posted by **M. Joury** on 12 Sept 2011, 12:46 p.m.,*

Re: Sort of OT: Dice odds

*Message #7 Posted by **Egan Ford** on 12 Sept 2011, 12:22 p.m.,*
in response to message #1 by Dave Britten

This smells of Project Euler. I'm afraid you are going to have to tough it out like the rest of us have. :-)

Re: Sort of OT: Dice odds

*Message #8 Posted by **Dave Britten** on 12 Sept 2011, 12:32 p.m.,*
in response to message #7 by Egan Ford

Ha ha, I was wondering if there might have been one on there like that. I should check my Project Euler source code and see if I solved it and forgot about it.

Actually, I'm more interested in game play and/or design at the moment, and figuring these things out mathematically could come in handy.

Re: Sort of OT: Dice odds

*Message #9 Posted by **Thomas Klemm** on 12 Sept 2011, 3:34 p.m.,*
in response to message #1 by Dave Britten

Quote:

What are the odds of rolling a total of 17 or greater using four standard 6-sided dice?

There's a function *glob* in Perl that does the cross joins. For example, this produces nine strings, one for each pairing of fruits and colors:

@many = glob "{apple,tomato,cherry}={green,yellow,red}";

That's the program I came up with:

```
#!/usr/bin/perl

use strict;
use warnings;

my $dice = '+{1,2,3,4,5,6}';
my $n = 4;

my %seen;
for my $roll (glob $dice x $n) {
    my $sum = eval $roll;
    $seen{$sum}++;
};

my $total = 0;
for my $value (sort { $a <=> $b } keys %seen) {
    printf <<EOF, $value, $seen{$value};
%4d %6d
EOF
    $total += $seen{$value} if 17 <= $value;
}

printf <<EOF, $total, $total/6**$n;

Total = %d   (%.5f)
EOF
```

And that's the result it produces when the script is started with *time*:

```
   4      1
   5      4
   6     10
   7     20
   8     35
   9     56
  10     80
  11    104
  12    125
  13    140
  14    146
  15    140
  16    125
  17    104
  18     80
  19     56
  20     35
  21     20
  22     10
  23      4
  24      1

Total = 310   (0.23920)

real    0m0.032s
user    0m0.029s
sys     0m0.002s
```

I hope it is useful and you can modify it to your needs. It's not optimized for speed (the function *eval* is used

often), but for small n it might be fast enough.

Kind regards
Thomas

Edited: 12 Sept 2011, 5:14 p.m.

Re: Sort of OT: Dice odds

*Message #10 Posted by **Kiyoshi Akima** on 13 Sept 2011, 1:29 p.m.,*
in response to message #1 by Dave Britten

Here's an unoptimized, brute-force implementation on the 15C:

```
001 .             012 LBL 3         023 ISG 0
002 9             013 6             024 DSE 4
003 STO 0         014 STO 4         025 GTO 4
004 6             015 LBL 4         026 DSE 3
005 STO 1         016 RCL 1         027 GTO 3
006 LBL 1         017 RCL + 2       028 DSE 2
007 6             018 RCL + 3       029 GTO 2
008 STO 2         019 RCL + 4       030 DSE 1
009 LBL 2         020 1             031 GTO 1
010 6             021 7             032 RCL 0
011 STO 3         022 x<=y?         033 INT
```

It runs in just under ten seconds on my HHC2010 15C+. It did take a little longer to key it in on the fly...

All sorts of time optimizations are possible. For example, if you total up the first three dice, you can immediately calculate the number of ways the fourth die would push the total to 17 or above, eliminating the fourth loop.

WP 34S : Numeric integration * EDITED*

*Message #1 Posted by **Miguel Toro** on 12 Sept 2011, 9:57 a.m.*

Hello,

I was doing some tests with the numeric integration and noticed that it was not as accurate as other calculators. Then, I found this discussion about the subject, so after reading it, I have some questions:

For Team 34s:

- Is there any plan to improve the built in integrator?

- Pauli talks about a wrapper that would use the built in integrator. Do you have any example of that, or, is there any basic way to do it so one can adapt it easily to any function?

For Gene:

- In the same thread, you talk about a “matrix series modeled after the M1 - M5 routines from the PPC ROM”. Is this already available somewhere?

Please excuse me for these evidently badly informed questions

Thanks,

Miguel

Miguel

Re: WP 34S : Numeric integration * EDITED*

*Message #4 Posted by **Marcus von Cube, Germany** on 12 Sept 2011, 2:37 p.m.,*
in response to message #1 by Miguel Toro

The idea is to subdivide the interval in several subintervals and integrate with the built in function in each subinterval. Repeat the step with an increased number of subintervals and compare the results. If they are close enough together, you're done.

Re: WP 34S : Numeric integration * EDITED*

*Message #5 Posted by **Miguel Toro** on 12 Sept 2011, 2:47 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Ok. Understood.

Thank you very much Marcus,

Miguel

in response to message #1 by Miguel Toro

Here is a newer post about the matrix math:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=190327

Re: Talking about the WP 34s at the internal HP calculator forum Message #3 Posted by gene wright on 11 Aug 2011, 4:03 p.m., in response to message #2 by Walter B

Good! Did not know you could read it without registration.

Yes, it has quieted down, but I wanted to again point people in the direction to find out more info.

On another note...I have the first draft of the matrix programs for the 34s keyed in. Debugging now. 197 lines is all it takes. Could do a 6x6 system or inverse, 8x8 determinant. That's a limit based on 100 registers available.

It looks like things are moving forward.

Re: WP 34S : Numeric integration * EDITED*

*Message #7 Posted by **gene wright** on 12 Sept 2011, 4:32 p.m.,*
in response to message #6 by Paul Gaster

I hope to present the RRM routines at HHC in a couple of weeks, after which they will be public.

Re: WP 34S : Numeric integration * EDITED*

*Message #8 Posted by **Walter B** on 12 Sept 2011, 4:49 p.m.,*
in response to message #7 by gene wright

Looking forward to. Will have to use, however, the global edition of extendable ears.

Re: WP 34S : Numeric integration * EDITED*

*Message #9 Posted by **gene wright** on 12 Sept 2011, 5:23 p.m.,*
in response to message #8 by Walter B

I'll be watching for those extendable ears under the door.

For any non-NDA sessions, I would expect video to be up fairly shortly thereafter.

No.

> Quote:
>
> - Pauli talks about a wrapper that would use the built in integrator. Do you have any example of that, or, is there any basic way to do it so one can adapt it easily to any function?

I'm not aware of any example code to do this.

To do much better then integrator needs to be adaptive. The current integrator calculates two different estimates of the integral. With a bit of programming it should be possible to integrate over an interval and if the two estimates disagree by too much, to subdivide the interval and try again.

> Quote:
>
> In the same thread, you talk about a “matrix series modeled after the M1 - M5 routines from the PPC ROM”. Is this already available somewhere?

I've also done a bit of work on some matrix code.

The M1 - M5 routines are the basics commands necessary to row reduce a matrix, they are not a full matrix package by themselves.

These do not include enough functionality to do a matrix multiplication or transpose e.g. They can, however, be used to calculate an inverse or a determinant very easily.

They are a great basis for further work & definitely worthwhile having.

- Pauli

hp 67, battery

*Message #1 Posted by **Sok-khieng Chum Hun** on 12 Sept 2011, 4:05 a.m.*

Hi,

When I connect the calculator to the charger(with the battery), it is working correctly, but when not connected to the charger, I can't turn it on, even if the battery is charged.

Anyone know what might be the problem?

Thank you :)

Re: hp 67, battery

*Message #2 Posted by **Vladan Dugaric** on 12 Sept 2011, 4:24 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

The battery pack needs rebuilding with new cells.

WARNING: DO NOT CONNECT CALCULATOR TO CHARGER WITH DEAD BATTERY OR WITHOUT BATTERY!

If you do, you will fry the calculator. The battery is part of the voltage regulator in all HP LED calculators apart from the original 35/45/55/65/70/80 models. 19/25/29/67/31/32/33/34/37/38 are all easily killed when connected to power supply with a dead or dying battery or without battery, since the charger is not voltage regulated and relies on the battery to limit the maximum voltage supplied to the calculator. The calculator is exposed to overvoltage and circuits are damaged if the battery is not good.

Vladan

Re: hp 67, battery

*Message #3 Posted by **Tony Duell** on 12 Sept 2011, 4:50 a.m.,*
in response to message #2 by Vladan Dugaric

The 3 pin charger used with the classic series has 2 outputs, a constant current output for charging the NiCd battery and a constant voltage output to run the calculator. When you plug this charger into a 35,45,55,70 or 80, the battery is electrically disconnected from the rest of the calculator. The calculator logic is run from the constant voltage output of the charger and this does not depend on having a good battery fitted. It is safe to run those models from the charger without having a good (or any) battery installed.

The 65 and 67 as similar except for one important difference. The card reader sense amplifier/motor driver IC is connected directly to the battery back. So in those models, the votlage across this IC when the charger is connected is determined by the battery pack acting as a shunt regualtor. If there is no battery, or a defective battery, fitted, then that voltage will be much higher than normal. The HP65 manual acutally warns that this can do damage. The HP67 card reader IC was redesigned, hopefully to prevent such

damage, but I certainly don't risk it!

The later models with 2-pin charagers all use the battery as a shunt regulator to limit the voltage. In the case of the non-contiuous-memory models, there is no danger in trying to charge the battery in the calculator with the calculator turned off (the logic is then entirely disconnected from the battery by the on/off switch). Turning such a non-continuous-memory model on while connected to the charger without a good battery is unlikely to do any damage, the calcualtor draws enough current to reduce the voltage at the output of the charger circuit to a safe level. However the calculator will not work correctly.

The continuous memory models (19C, 25C, 29C, 33C, 34C, 38C at least) use the battery to power the RAM chip even when the machine is turned off. This is how the memory is maintained. If you connect such a machine to the charger without a good battery fitted, a higher-than-normal votlage is applied across the RAM chip -- the RAM chip on its own does not draw enough current to pull the voltage down. This is very likely to do damage. With the machine turned on, it shouldn't do any damage to connect the charger without a good battery, but the machine can't work correctly. I don't risk it.

The Topcat (91, 92, 97) machines have a circuit in them designed to apply a load to the charger to keep the voltage down if it rises too high (that is, if the battery is defective or missing). As with the non-continuous-memory models above, it should be safe to connect the charger without a good battery fitted, but the machine won't work correctly. Now, this circuit only works with the machine turned on, and the (very rare) 95C uses the battery to maintain the continuous memory as you might expect. In the case of the 95C, therefore, connecting the charger without a good battery installed may well do damage (and on a machine where spares are next-to-impossible to find).

So to sum up, connecting a charger to a machine without a good battery :

35, 45, 55, 70, 80 -- Works fine

65, 67 -- May damage the card reader sense amplifier IC

Non-continous-memory Woodstocks, Spices, etc -- Won't work, may do damage, but it's unlikely

Continuous memory Woodstocks, Spices, etc -- Is very likely to damage ICs

Non-continuous-memory Topcats -- Won't work, but there is a protection circuit that should prevent damage

95C -- Is very likely to damage ICs.

*Message #4 Posted by **db (martinez, ca.)** on 12 Sept 2011, 9:16 a.m.,*
in response to message #3 by Tony Duell

Note to the original poster: Adding anything to instructions by Tony is like correcting Newton's math, but there is one more thing. When you get that new battery, remember that a bit of dust or corrosion on the contacts can completely take the battery out of the system. Make sure you have a good connection when charging. I charge my woodstock and spice batteries in a cradle and the bats for the 65/67 in a 35 for that reason.

Tony; While you are on the subject of battery charging:
Is the 75c protected or should i charge it's battery in the 35 too?
Would it be safest to charge the batteries for the Topcat series in a 41 printer or IL device, or do those have potential weaknesses too? I sometimes really use my 41's peripherals and would hate to fry one just to charge the 92's battery

Re: hp 67, battery

*Message #5 Posted by **Marc Ferrer (France)** on 12 Sept 2011, 1:19 p.m.,*
in response to message #4 by db (martinez, ca.)

Hello,

First, thank you all for these instructions, they're worth a printing. That leads me to a question for which I didn't get an answer by now :

Has anyone already designed an electronic shunt regulator that can be connected instead of the battery ? It could be a convenient way to power a (non continuous memory) calculator with its charger, when you haven't any good battery at hand -and when you're too lazy to build a custom power supply :-)

Ideally, that device would be small enough to fit in the battery compartment ; the challenge is, not to dissipate too much heat due to the voltage drop.

Any ideas ? Thanks in advance !

Best regards from France, Marc

Re: hp 67, battery

*Message #6 Posted by **Steve Simpkin** on 12 Sept 2011, 3:05 p.m.,*
in response to message #5 by Marc Ferrer (France)

In theory, a 2.5V or 2.7V Zener diode rated for at least 500mW connected across the battery terminals should suffice. I would also recommend adding a 1000 uF capacitor across the battery terminal as well to filter the half-wave rectified power from the charging power supply. Assuming the maximum charging current is 125mA, the Zener will dissipate less than 400mW. In fact, HP could have just added a 3V, 500mW Zener across the battery side to eliminate the possibility of damaging these calculators when the battery was missing or had gone open. Oh well.....

Re: hp 67, battery

*Message #7 Posted by **Marc Ferrer (France)** on 13 Sept 2011, 1:20 p.m.,*
in response to message #6 by Steve Simpkin

Hello Steve,

Thank you for your answer ; to say the least it's quite simple a solution... I'll soon give it a try.

That simplicity makes me think that HP really fought to save even the smallest fraction of a cent in their BOM.... years before the Chinese era !

Troll mode ON : was it already a strategy to easily get more calculators serviced ? Argh :-)

Marc

Re: hp 67, battery

*Message #8 Posted by **Steve Simpkin** on 14 Sept 2011, 5:34 p.m.,*

in response to message #7 by Marc Ferrer (France)

Please be very careful....
I would not want my "theory" to be proven wrong and result in a damaged calculator. I was very lucky. When the batteries started to go bad in my HP-25 around 1985, I replaced them with alkaline batteries and inserted a diode in series with the battery holder springs. If the original rechargeable batteries had gone open, I might have lost my first HP.

Re: hp 67, battery

*Message #9 Posted by **Marc Ferrer (France)** on 15 Sept 2011, 1:08 p.m.,*
in response to message #8 by Steve Simpkin

Hi Steve,

Please do not worry, I don't want to "brick" my 21 and my 25. I got some schematics from Jacques Laporte's web pages ; so when I have enough time, I'll give this trick a try by building some kind of a test environment : charger + load + Zener, and so on...

Thanks again,

Regards, Marc

Re: hp 67, battery

*Message #12 Posted by **Tony Duell** on 13 Sept 2011, 4:00 a.m.,*
in response to message #4 by db (martinez, ca.)

Yes, indeed. A battery that's not electrically connected to the machine (e.g. because of corroded contacts) is the same as no battery at all .

AFAIK the HP75 is protected. I think the service manual says that the machine will even operate correctly from the AC adapter with no battery fitted.

With non-continuous-memory machines (like the 92), it is quite safe to charge the battery with the machine turned off. With the switch off, there is no power to any of the logic. In fact with the topcats, there's the protection circuit I mentioned, so turning them on shouldn't be a problem either. But this doesn't apply to the HP95C.

I suppose the safest way is to use the 'reserve power packs' -- the external chargers. They exist for the classic series, woodstocks, topcats and spices. But they are not easy to find.

Long term storage question on 15C LE

*Message #1 Posted by **nick lidakis** on 11 Sept 2011, 10:53 p.m.*

I purchased 2 units with the expectation that one would be put away for a future user and I was wondering: Are the batteries pre-installed? I assume if yes, I should open the packaging and remove them if the unit will be in storage for, say, over 7 years?

Re: Long term storage question on 15C LE

*Message #2 Posted by **Mike Morrow** on 11 Sept 2011, 10:58 p.m.,*
in response to message #1 by nick lidakis

The CR 2032 cells are installed. But none of the packaging of the 15C-LE is sealed (there's no shrink wrap), so it's a simple matter to open, remove the cells, then put everything back just like you got it.

There's going to be firmware upgrading needed for both machines, so keep those batteries handy.

Edited: 11 Sept 2011, 11:58 p.m.

Re: Long term storage question on 15C LE

*Message #3 Posted by **Lincoln R.** on 11 Sept 2011, 11:45 p.m.,*

That depends on where you are. My father told me that one of the biggest non-cultural adjustments he had to make when we moved in the 60s was that while back in Japan the computer center was dehumidified to prevent decks of punched cards from turning to mush, here in Colorado the computer center was humidified to prevent decks of punched cards from turning to dust.

Re: Long term storage question on 15C LE

*Message #5 Posted by **Peter Murphy (Livermore)** on 12 Sept 2011, 1:35 a.m.,*

OT:Yes! We have our Corbulin!

*Message #1 Posted by **robertoataulfo** on 11 Sept 2011, 10:19 p.m.*

```
Hp 15c 1984 New In Box Made In U. S. A.
Value BRA R$2500 -> U.S. $1480 !!!!!.

HP-15C US$ 1480

Gerson you know this person highly informed? :-)

"HP 15c Made in USA made in 1984.
A machine was a family heritage, is only used to check the self test and battery status.
Is equal to 100% of a new store.
The quality of a Made in the USA is far superior to any other HP.
It has leather cover elite, Owner's Manual, Manual of advanced features, HP original box and
documentation, all 100% original.
For those who do not know the HP 15c visit the hpmuseum.
There should be little machine in the world in this condition New in Box with 27 years of age.
Totally recommended for collectors and enthusiasts from HP.
I've had more than 50 HP's in my collection, and this is the last price will not decrease.
There is no question that I ask the value, it is the passion of the buyer happy.
I know there are other collectors in Brazil and abroad that would charge more than $ 3500.00
per one like this,
but hardly anyone wants to sell,
so this is a rare opportunity for investment even as the value of 15c in the world market only
increases since it stopped being made.
*** NO EXCHANGES OR COUNTER OFFERS oNLY ***
BUY AND CAN bE SURE tO PAY tO AVOID FUTURE JUDICIAL PROCESS ***
The value of $ 2500.00 and the business is only for deposit into an account by mail FREE
SHIPPING *** ***"

If the buyer discover 15LE he'll have a heart attack!!!

Re: Dr Bills Quadratic solver for 35S

*Message #4 Posted by **Paul Gaster** on 11 Sept 2011, 9:16 p.m.,*
in response to message #3 by snaggs

Which one did you enter? There is one for the 33S and one for the 35S. You have to scroll down to see the 35S version.

Re: Dr Bills Quadratic solver for 35S

*Message #5 Posted by **snaggs** on 11 Sept 2011, 9:31 p.m.,*

in response to message #4 by Paul Gaster

I did the 35S version, but it doesn't use the "i" feature of the 35S. Youll notice Dr Bills version uses the "i" key.

The "Cadillac" Quadratic solver talks about how it can find roots in situations when others can't . Does anyone know one of these so I can test it vs Dr Bills?

Daniel.

Re: Dr Bills Quadratic solver for 35S

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 11 Sept 2011, 9:54 p.m.,*
in response to message #5 by snaggs

> Quote:
>
> The "Cadillac" Quadratic solver talks about how it can find roots in situations when others can't . Does anyone know one of these so I can test it vs Dr Bills?

The documentation for the Cadillac Quadratic Solver in Article 881 includes eight test cases. Some are similar to those in the HP-15C Advanced Functions Handbook where the differences are due to the use of a different quadratic equation there. Others were added to provide more difficult problems for 12 digit machines.

SC ships 15C LE on 9/13

*Message #1 Posted by **Thomas Radtke** on 11 Sept 2011, 1:07 p.m.*

Just checked the status page for my order at Samson Cables: "HP15C Orders ship Tuesday 9/13/2011." Still the old price is given.

I'm curious: Who's waiting, too? :-)

Re: SC ships 15C LE on 9/13

*Message #2 Posted by **Ángel Martin** on 11 Sept 2011, 1:17 p.m.,*
in response to message #1 by Thomas Radtke

That makes two of us - I ordered ONE, my token to the cause.

Me, too. Same shipping date.

Re: SC ships 15C LE on 9/13

*Message #4 Posted by **Lincoln R.** on 11 Sept 2011, 1:48 p.m.,*
in response to message #1 by Thomas Radtke

Same here. I was rather amused by the "A package was shipped to you on 09/13/2011 via U.S. Postal Service Priority Mail" at 4 AM on 09/11. I've never gotten e-mail from the future before :-P

Re: SC ships 15C LE on 9/13

*Message #5 Posted by **Thomas Radtke** on 11 Sept 2011, 2:04 p.m.,*
in response to message #4 by Lincoln R.

Well, a calculator sold in '82 and shipping in the future must have some strange effects on timespace. E.g., PSE is actually working properly. It's just that you don't see the display content since light follows some paths around the user, which, in its normality, is an impurity in 15C-space ;^).

Re: SC ships 15C LE on 9/13

*Message #6 Posted by **Howard Owen** on 11 Sept 2011, 3:50 p.m.,*
in response to message #4 by Lincoln R.

There used to be an old joke about IBM, back in the days when they were ***IBM***. It was said that they had invented a supply channel that could see the future. You could find a million dollar computer on your loading dock before you knew you needed it!

I imagine lots of companies would like to have that, even today. Or they might prefer if customers would go along with that song and dance regardless. LOL

Re: SC ships 15C LE on 9/13

*Message #7 Posted by **M. Joury** on 11 Sept 2011, 8:29 p.m.,*
in response to message #4 by Lincoln R.

I've had that happen to me frequently with USPS. I spoke to a delivery man once about it and was told it had something to do with the way they showed and reported scheduling on items.

In my case they have generally reported items delivered before the fact.

Cheers,

-Marwan

in response to message #1 by Thomas Radtke

Me too! Can't wait to Get my hands on it... So far my only experience with the 15c is on my iPhone 15c emulator :-)

Re: SC ships 15C LE on 9/13

*Message #14 Posted by **Thomas Radtke** on 11 Sept 2011, 3:06 p.m.,*
in response to message #13 by Michael Kussmaul

I tried the Lygea simulator on Win Mobile as a first 15C experience. With its alphanumeric program editor, it really adds some value. But then, my first HP was the 20S, and so I'm quite used to keycodes ;-).

Re: SC ships 15C LE on 9/13

*Message #15 Posted by **MK-52** on 11 Sept 2011, 3:35 p.m.,*
in response to message #14 by Thomas Radtke

My first RPN is real 15C. It was powerful and reliable pocket calculator. Owner's Handbook and Advanced Functions Handbook were top notch. Unfortunately, my 15C died almost 6 years ago. Now I use 42S.

Edited: 11 Sept 2011, 3:36 p.m.

Re: SC ships 15C LE on 9/13

*Message #16 Posted by **Thomas Radtke** on 11 Sept 2011, 3:56 p.m.,*
in response to message #15 by MK-52

BTW, does your display name indicate you have one of those? I was owning an MK-52, too, but apparently the EEPROM was dead, so half the value of this beautiful machine was gone. Gifted it a few years ago to someone and since then looking for a white sample :-).

Re: SC ships 15C LE on 9/13

*Message #17 Posted by **MK-52** on 11 Sept 2011, 4:55 p.m.,*
in response to message #16 by Thomas Radtke

The origin of my display name is Elektronika MK-52. Vacuum Fluorescent Display, Cyrillic alphabet keypad and the story of Soyuz TM-7 mission attract me. However, I don't have it. I'm looking for it, but Soviet calculators are very rare in Japan. :(

Re: SC ships 15C LE on 9/13

*Message #18 Posted by **Gerson W. Barbosa** on 11 Sept 2011, 3:15 p.m.,*
in response to message #1 by Thomas Radtke

Waiting for three units. I guess I am the first in line (ordered mine on 07/25) but probably not the first to receive them, even though I chose USPS Express. No problem, what are a few days more after a 20-year wait? :-)

Re: SC ships 15C LE on 9/13

*Message #19 Posted by **Art Litka** on 11 Sept 2011, 3:24 p.m.,*
in response to message #18 by Gerson W. Barbosa

My SC order for the HP15LE is also confirmed as having been shipped two days from now. Looking forward (or backward?) to comparing it with my original model. BTW, the confirmation ID is 30 digits long which is many orders of magnitude greater than the estimated number of stars in the observable universe!

Re: SC ships 15C LE on 9/13

*Message #20 Posted by **Thomas Radtke** on 11 Sept 2011, 3:25 p.m.,*
in response to message #18 by Gerson W. Barbosa

You beat me by just one day :-).

I'll probably have to wait for 2 or 3 weeks. It arrives somewhere in Europe in less than a week, rest of the time is spent for customs. Over here, we're cited to the office by mail to bill taxes.

Re: SC ships 15C LE on 9/13

*Message #21 Posted by **Gerson W. Barbosa** on 11 Sept 2011, 3:35 p.m.,*
in response to message #20 by Thomas Radtke

> Quote:

Same here, except the taxes are a bit higher (outraging 60% :-(

Re: SC ships 15C LE on 9/13

*Message #22 Posted by **Wanderley Navarro** on 11 Sept 2011, 11:57 p.m.,*
in response to message #21 by Gerson W. Barbosa

> Quote:
>
> ..except the taxes are a bit higher (outraging 60% :-(

Gerson. Our states are side by side and our cities are distant only 230 km, but here the total tax for imported goods is 93% due to the ICMS (state sales tax) that is computed over the federal tax of 60%.

Since you do not have this "bonus" in your state, you are happy without knowing my friend... :-)

Cheers.

Re: SC ships 15C LE on 9/13

*Message #23 Posted by **Gerson W. Barbosa** on 12 Sept 2011, 12:25 a.m.,*
in response to message #22 by Wanderley Navarro

Olá Wanderley,

I don't remember ever being charged ICMS on these here. I hope they don't read your post :-) However, there's a 6.38% tax over credit card expenditures abroad I forgot to mention which will turn my purchase into a take 3 pay 5 deal...

Até,

Gerson.

Re: SC ships 15C LE on 9/13

*Message #24 Posted by **Manatee** on 11 Sept 2011, 4:35 p.m.,*
in response to message #1 by Thomas Radtke

I have a couple on order with them.

Re: SC ships 15C LE on 9/13

*Message #25 Posted by **Dan W** on 11 Sept 2011, 4:48 p.m.,*
in response to message #1 by Thomas Radtke

Yep I got the same message. I ordered one, mainly because I have coveted the 15C ever since the mid 80's when I decided I could only afford the 11C. The 11C served me well a few years until I got a 42S. But then I sold the 11C to my later regret.

I'm plenty patient though. It isn't as if the world's economy is awaiting this great new engineering tool.

I haven't decided if I'll really use it that much. Time will tell.

Re: SC ships 15C LE on 9/13

*Message #26 Posted by **Les Wright** on 11 Sept 2011, 5:27 p.m.,*
in response to message #1 by Thomas Radtke

Mine shows just "Payment received, order being prepared for shipping."

I got a personal reply from Chris Edmunds acknowledging PayPal payment within hours of me paying.

Looking forward to this. I overpaid for my near-mint original, and am afraid to use it, like Nigel Tuffnell's guitar that's never been played...

Re: SC ships 15C LE on 9/13

*Message #27 Posted by **Matt Fegenbush** on 11 Sept 2011, 5:53 p.m.,*
in response to message #26 by Les Wright

It's got wonderful sustain.

Re: SC ships 15C LE on 9/13

*Message #28 Posted by **Thomas Radtke** on 13 Sept 2011, 5:21 a.m.,*
in response to message #1 by Thomas Radtke

Shipping Status: SHIPPED 13-Sep-11

That was at about 3 a.m. (MST)

Edited: 13 Sept 2011, 5:23 a.m.

Re: SC ships 15C LE on 9/13

*Message #29 Posted by **Michael Kussmaul** on 13 Sept 2011, 6:03 a.m.,*
in response to message #28 by Thomas Radtke

Mine shipped as well :-) let's see how long it takes to arrive here in Switzerland...

I'm always wondering on which side of the globe my goods I order from the U.S. are traveling, when they origin in China :-) Is it: China->Europe->U.S.->Switzerland or China->Japan->U.S.->Switzerland

:-)

Re: SC ships 15C LE on 9/13

*Message #30 Posted by **Thomas Radtke** on 13 Sept 2011, 6:15 a.m.,*
in response to message #29 by Michael Kussmaul

I suppose the Pacific route would be the most reasonable to take.

However, I'm not sure if it really shipped or just an automatism entered that text into the system. We'll see ... hopefully ;-).

Re: SC ships 15C LE on 9/13

*Message #31 Posted by **Lincoln R.** on 13 Sept 2011, 11:03 a.m.,*
in response to message #30 by Thomas Radtke

I kind of doubt that Chris at Samson would be up at 3 AM stuffing calculators into USPS boxes :-P

Re: SC ships 15C LE on 9/13

*Message #32 Posted by **Thomas Radtke** on 13 Sept 2011, 12:01 p.m.,*
in response to message #31 by Lincoln R.

Yes, very strange. I hope he gets the labelling right and manages to get all packages out soon.

Re: SC ships 15C LE on 9/13

*Message #33 Posted by **Alexander Oestert** on 13 Sept 2011, 7:37 a.m.,*
in response to message #29 by Michael Kussmaul

> Quote:
>
> Is it: China->Europe->U.S.->Switzerland or China->Japan->U.S.->Switzerland

From China directly to Europe via one of the poles would be another option... ;)

oops....

Re: 15c manuals

*Message #4 Posted by **Namir** on 11 Sept 2011, 8:56 a.m.,*
in response to message #1 by Paul Dale

I am **assuming** that the seller is actually violating copyright law?? Am I right or wrong Tim?

Namir

Re: 15c manuals

*Message #5 Posted by **allen** on 11 Sept 2011, 9:03 a.m.,*
in response to message #4 by Namir

My guess is the seller bought the MOHP DVD and is just printing color copies. Regardless of the source, I agree with Namir's suggestion, the manuals likely represent illegal copies.

Ebay has not responded to any of my reports to that effect.

Allen (ebay:hudendai)

On a side note, except for the discussion, the original posting should probably be in the Classifieds section, not in the Forum.

(edit) Another interesting side note: a quick survey of the seller's other auctions shows he's netted north of $2500 selling (illegal) HP manual copies.

Edited: 11 Sept 2011, 9:08 a.m.

Re: 15c manuals

*Message #6 Posted by **Gerardo Rincon** on 11 Sept 2011, 9:06 a.m.,*
in response to message #1 by Paul Dale

I found HP 15C manuals here HP Manual

Edited: 11 Sept 2011, 9:09 a.m.

Re: 15c manuals

*Message #7 Posted by **Eric Smith** on 11 Sept 2011, 2:04 p.m.,*
in response to message #6 by Gerardo Rincon

Also a reprint, most likely in violation of copyright.

Re: 15c manuals

*Message #8 Posted by **Lincoln R.** on 11 Sept 2011, 2:08 p.m.,*
in response to message #7 by Eric Smith

And in violation of country of origin labeling since I doubt the reprints are actually being printed in Canada :-P

Re: 15c manuals

*Message #9 Posted by **uhmgawa** on 11 Sept 2011, 4:32 p.m.,*
in response to message #1 by Paul Dale

> Quote:
>
> Hp-15c manuals, if you don't have them yet:

I have one here received as an eval copy, but I can't say I'm all that impressed. It is a reasonable reprint and appears to be of mohpc origin as AFAICT it has the same digitization artifacts. It is printed two pages to a physical US letter size page and subsequently cut in half which yields the footprint. But it would have been better IMHO if either the manual image was scaled to fit the full half page area or (preferably) each half page was cut down to actual printed area. The spiral binding though is a welcome feature.

Although admittedly I'm quite impressed with HP's decision to reauthor the Owner's and Advanced Functions

Handbook. I hope the latter is forthcoming and doesn't get lost in the shuffle.

New Interface for HP-28S ?

*Message #1 Posted by **robertoataulfo** on 10 Sept 2011, 2:30 p.m.*

Interface for HP28S

Re: New Interface for HP-28S ?

*Message #2 Posted by **Howard Owen** on 10 Sept 2011, 2:53 p.m.,*
in response to message #1 by robertoataulfo

Looks like it might have an IR receiver. There's no way this could be bidirectional, so the statement that you can "send the data from the computer" has to be wrong. But a print to text algorithm might be possible to save HP-28S data, including programs. But since you can't reload them without keying them in again, the statement that this device will prevent you from "loosing [*sic*]" them is also misleading.

Re: New Interface for HP-28S ?

*Message #3 Posted by **Eric Smith** on 10 Sept 2011, 7:24 p.m.,*
in response to message #2 by Howard Owen

I owned one of these years ago. It is an IR receiver for the HP 82440A/B printer infrared protocol. It does NOT do IRDA or any other infrared protocol.

It will NOT work with a USB-serial adapter, and it needs specific DOS software which will NOT work correctly under any version of Windows.

Re: New Interface for HP-28S ?

*Message #4 Posted by **Christoph Giesselink** on 12 Sept 2011, 1:50 p.m.,*
in response to message #3 by Eric Smith

> Quote:

>
> It will NOT work with a USB-serial adapter, and it needs specific DOS software which will NOT work correctly under any version of Windows.

Hi Eric,

do you know if this product has an own CPU?

There was a similar product end of the 80'ies in Germany called **PrintHP**. This product consists of a dumb IR receiver sending the decoded 32KHz bursts to the PC CPU over the RS-232 CTS input line.

Therefore you needed also pure DOS, the special receiver software and a PC not faster than 80386 or an early slow 80486.

Christoph

Re: New Interface for HP-28S ?

*Message #5 Posted by **Eric Smith** on 13 Sept 2011, 10:53 a.m.,*
in response to message #4 by Christoph Giesselink

It does not. It just has an IR receiver driving one of the EIA-232 handshake lines. That is why it won't work with Windows.

Re: New Interface for HP-28S ?

*Message #6 Posted by **Raymond Del Tondo** on 10 Sept 2011, 7:36 p.m.,*
in response to message #2 by Howard Owen

Slightly OT, but actually you can perform serial I/O on the HP-28S ;-)

A few years ago Christoph Giesselink demonstrated serial I/O using an HP-28S (which I donated to him for exactly these tests) .
He used the pins of the IR transmitter to send _and_ receive data. The whole proof of concept is documented. If interested please ask Christoph for more details.
IIRC the driving idea behind this was to elaborate whether serial I/O could be implemented on the HP-42S. I think it would work, but then there were other projects...

Ray

Re: New Interface for HP-28S ?

*Message #7 Posted by **Bart (UK)** on 13 Sept 2011, 5:28 a.m.,*
in response to message #1 by robertoataulfo

Looks indeed like a *receiver* for the 28C/S. If you manage to get it working you can indeed prevent losing the listing of programs, but in case of calculator "memory loss" you'd have to re-type it into the calculator.

If you really want to try bi-deractional I/O, here's a project on HPCalc: HP-28 I/O

Re: New Interface for HP-28S ?

*Message #8 Posted by **Christoph Giesselink** on 13 Sept 2011, 1:41 p.m.,*
in response to message #7 by Bart (UK)

> Quote:
>
> If you really want to try bi-deractional I/O, here's a project on HPCalc: HP-28 I/O

I read this file some years ago. I still find it silly to use one contact of the keyboard matrix for input. ;-)

My solution use the '+' pin from the anode side of the IR-transmitter LED, the signal pin from the cathode side of the IR-transmitter LED and GND from battery minus. The "trick" is using the IR-transmitter signal pin for both directions; quite nobody knows that the LED driver is a bidirectional pin.

Christoph

Cleaning HP41C keys

*Message #1 Posted by **Rob Willett** on 10 Sept 2011, 1:31 p.m.*

Hi,

This is my first post to this esteemed forum. I've been lurking for a while just trying to get a feel for the place.

I have been a fan of HP calcs since I got an HP16C, I needed to develop a large chunk of C code to handle 18 bit signed arithmetic. I could not have done the work without that calculator and still have it.

Since then I've got an HP17BII, an HP20S, an HP12C, an HP15C an HP48GX, an HP41CV and a rather grubby HP41C. I may have missed one or two out now I think back on this.

Anyway, most of them are in excellent condition but I've just got my hands on an HP41C and need to clean it up. It's physically in great shape but the keys seem to have a thin layer of grease and dirt on them. It means when you use the keys, you fingers stick ever so slightly to them.

Does anybody have any suggestions they have actively used and can recommend? I could use pure alcohol and cotton buds but am wary of doing any damage to such an old gem.

My intention is to use the HP41C for work, we have close to £10M of comp hardware in my dept but a good calculator is hard to come by :)

Re: Cleaning HP41C keys

*Message #2 Posted by **Alexander Oestert** on 10 Sept 2011, 3:06 p.m.,*
in response to message #1 by Rob Willett

I've had good results with

a) isopropyl alcohol and a Q-Tipp

b) immersing the whole keyboard in an ultra sonic cleanser at an optician's shop

c) tissues to clean plastic car dashboards

Re: Cleaning HP41C keys

*Message #3 Posted by **Nick R** on 10 Sept 2011, 3:54 p.m.,*
in response to message #1 by Rob Willett

I use Windex on a Q tip to clean dirt off keys and keyboard, followed by another Q tip moistened slightly with water. I never like using alcohol when I'm cleaning plastics (unless I'm drinking it)

Re: Cleaning HP41C keys

*Message #4 Posted by **Rob willett** on 11 Sept 2011, 9:13 a.m.,*

in response to message #3 by Nick R

Thanks for the advice. Would never have thought of Windex.

Re: Cleaning HP41C keys

*Message #5 Posted by **Randy** on 11 Sept 2011, 10:09 a.m.,*
in response to message #4 by Rob willett

Forget the cotton swabs, takes all day!

Windex, soft toothbrush. Wet lightly, scrub. Wipe with soft towel, blast with canned air to remove liquid that accumulates around keys, wipe again, blast again. Repeat if needed. If it is really dirty, allow the windex to soak while holding calculator upside down so it does not run willy-nilly into the keys.

This method is okay on the 41 *only*. Classics and others may not hold up to brushing. The construction of the 41 is quite different and is the most tolerant of aggressive cleaning.

HP 15C-LE Pause (PSE) Command Bug

*Message #1 Posted by **Mike Morrow** on 10 Sept 2011, 12:44 p.m.*

I tried out the PSE command on the 15C-LE to see if there were timing problems with it. I found a surprising and unhappy result.

The following simple loop counts down from 10 to 1, pausing to display before each decrement. That's what happens in the original 15C, but not the 15C-LE.

001 LBL E
002 1
003 0
004 STO 0
005 LBL 9
006 RCL 0
007 PSE
008 DSE 0
009 GTO 9
010 RTN

On the 15C-LE, the program pauses for the first time and displays 10.0000. For the remainder of the program, the display blanks completely, the program pauses each time the PSE is executed (determined by long program run time), **but nothing is shown in the display until execution terminates.**

This is a firmware bug that could be very inconvenient. Essentially the PSE command is non-functional on the 15C-LE.

Edited with some additional observations below.

I added a 1000-iteration sub-loop to see what the display looks like when a great number of other steps are taking place between PSE commands:

001 LBL E
002 1
003 0
004 STO 0
005 LBL 9
006 RCL 0
007 PSE
008 1
009 0
010 0
011 0
012 STO 8
013 LBL 8
014 DSE 8

015 GTO 8
016 DSE 0
017 GTO 9
018 RTN

In FIX 4 display, after starting the program with f E, I see 10.0000 paused in display, then a couple of seconds of blinking "running" displays, then simply a "runn" in mid-LCD that blinks every few seconds, presumably when the next PSE command is encountered, until program terminates and normal display appears.

In FIX 9 display, the same occurs, except that "runn00000" instead of "runn" appears in the display until the program terminates and normal display appears.

in response to message #1 by Mike Morrow

I guess you found bug ONE!!! Kinda reminds me of the "bug one" on the HP-41C (of course it was of a different nature).

A pause command that does not work right is very irritating!

Let's hope that HP can provide us with an updated firmware at HHC2011.

*Message #3 Posted by **Mike Morrow** on 10 Sept 2011, 12:58 p.m.,*
in response to message #2 by Namir

Bug 2.

Bug 1 was the self-tests that don't work, and that also corrupt program memory.

Isn't that more an un-wrong-documented feature rather than a bug?

Quibbling ...

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #5 Posted by **Mike Morrow** on 10 Sept 2011, 1:59 p.m.,*
in response to message #4 by bill platt

I think the old self test issue fully qualifies as a bug because:
1. It is a feature that is described in the manual that does not work.
2. If the "ON plus *" or the "ON plus +" tests are attempted by an unwary user following the

manual instructions, program memory will likely be corrupted (something the self tests should never do).

If the issue is addressed only by a change to manual appendix F, and firmware remains unaltered, program corruption can take place through indavertent initiation of the old self tests.

Since firmware changes are required to correct this, it more than qualifies as a bug and not a documentation issue.

You've got to be kidding. I assure you that there was lots of testing on this machine. Just because something got missed doesn't mean that testing was not done. In addition, just because one hasn't been found yet does not guarantee that any HP calculator model is completely bug free.

Jake

Did none of the 2010 conference recipients of the HP 15C LE ever try a program with PSE in it? Or does PSE work in some cases and just doesn't in this one?

I'm seriously thinking about canceling my order of two units. Or is it likely that a fixed firmware will be released and also be flashable with the HP 30b cable (that I already have!)?

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #9 Posted by **Kiyoshi Akima** on 10 Sept 2011, 4:27 p.m.,*

> Quote:

> Did none of the 2010 conference recipients of the HP 15C LE ever try a program with PSE in it? Or does PSE work in some cases and just doesn't in this one?

The PAUSE worked fine in my Towers of Hanoi program on my HHC2010 15C+, so I had no cause to report a bug.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #10 Posted by **Mike Morrow** on 10 Sept 2011, 1:48 p.m.,*
in response to message #7 by Jake Schwartz

I agree. Even old firmware technology is complex and nothing is ever perfect (except the Apollo Lunar Modules!). I'm happy with my two 15C-LE units...though this PSE problem does need correction.

I think it's worth repeating that the 15C-LE is only about one-quarter the cost of the original in terms of real dollars. I believe it offers a very good value.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #11 Posted by **Thomas Radtke** on 10 Sept 2011, 2:16 p.m.,*
in response to message #7 by Jake Schwartz

Well, I also find it odd that this hasn't been tested. If anything can fail in an emulation that seems to work otherwise, it is likely based on timing. Guess that's what Mike was looking for when testing PSE.

@Alexander, I'm sure there will be an update. I wouldn't cancel my order now. Even if this bug remains, I bet the 15C LE can be sold on TAS anytime for more than the 100 Euros we'll likely have to pay for it.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #12 Posted by **MK-52** on 10 Sept 2011, 2:46 p.m.,*
in response to message #7 by Jake Schwartz

You're right. I really spoke too harshly and it was offensive to the testers and developers. I've ordered three units and had unrealistic expectations.

*Message #13 Posted by **bill platt** on 10 Sept 2011, 1:19 p.m.,*
in response to message #1 by Mike Morrow

what happens if you insert more than one pse at each pause? Will this slow it down enough to work?

What happens if you insert R/S instead of pse? Does it work correctly?

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #14 Posted by **Mike Morrow** on 10 Sept 2011, 1:37 p.m.,*
in response to message #13 by bill platt

Adding a second PSE only increases the execution time in which a blank display appears. The program above takes 11 second to end with one PSE, and 22 seconds with two PSE. The PSE is in fact pausing execution. But the LCD is completely blanked...there isn't even a "running" display after the first PSE.

Of course, R/S will stop everything.

Sounds like there may be a problem with the logic used to simulate the display blink mode (which in NUT voyagers is a hardware function) along with normal rendering to the sam7l display.

I'm unsure what approach would cause that to occur unless the emulator is attempting to factor out the spurious/partial display updates emitted by the voyager firmware. KEMU rendering to a graphic display when running on the AVR needed to factor out these updates which although themselves are generally imperceptible to the user, also occur when a user is entering key strokes and cause an objectionable lag in interactivity.

The display rendering correctly at the termination of the program would seem to support this theory as when coalescing display updates a push out of pending data needs to happen when the firmware pauses with a POWOFF instruction.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #16 Posted by **Lincoln R.** on 10 Sept 2011, 1:59 p.m.,*
in response to message #15 by uhmgawa

It should be fixable. I imagine 15C LEs are reflashable, because as Tim Wessman has repeatedly told us, they're the same hardware as the 12C+. HP may have to do something like have people send their calculators back to be reflashed (for dealing with folks who don't have access to reprogramming cables), but I can't imagine they would leave this unfixed, especially since it sounds like the 12C/15C code was developed in-house unlike the 35S.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #17 Posted by **Katie Wasserman** on 10 Sept 2011, 2:24 p.m.,*
in response to message #16 by Lincoln R.

I don't understand why this has any bugs at all, there's no reason for them. The 2009-11-19 version of the emulator in the 12C+ has PSE working fine as well as the self tests. I helped debug this with Cyrille, publicly on this forum after it's release. Didn't HP learn from developing that how to get these things right?

Again the 15c firmware has additional emulation requirements to successfully pass the native firmware self test. And in general HP is either patching the firmware, or adapting emulator behavior on a firmware specific basis. So none of this seems surprising except for the fact it hadn't been caught in alpha/beta testing.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #19 Posted by **Katie Wasserman** on 11 Sept 2011, 5:54 a.m.,*
in response to message #18 by uhmgawa

I understand that the specific patches to the firmware might be different for the 12c and the 15c while the emulator changes should be pretty similar if not identical. I was more questioning not learning from past mistakes of having the same self test issues on the 12C+.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #20 Posted by **Thomas Klemm** on 10 Sept 2011, 2:34 p.m.,*

*Message #29 Posted by **From Hong Kong** on 11 Sept 2011, 12:20 a.m.,*
in response to message #1 by Mike Morrow

Compared with Casio's FX-502P, FX-602P and FX-603P, the classic HP-15C's implementation of the pause command is quite limited. The pause command of Casio's calculators can display something and accept keyboard input temporarily. Some games were developed using this feature. However, HP-15C only allows values to be displayed.

*Message #33 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Sept 2011, 8:53 a.m.,*
in response to message #31 by Ángel Martin

Just to add that "input during PAUSE" started with the 67/97 and certainly was most useful on the 41. Note that the 42S PAUSE works differently, IIRC.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #34 Posted by **Dieter** on 11 Sept 2011, 9:21 a.m.,*
in response to message #31 by Ángel Martin

No, it hasn't, just as it predecessor, the 34C. The 15C cannot be compared to top-of-the-line devices like the 67/97, let alone the 41. These not only allowed keyboard data entry during the PSE

instruction, even magnetic cards could be read. In either case the calculator could check whether data had been entered or not.

The 34C, as well as its successor 15C, and even the current 35s cannot do that. Like some other things that are/were possible on the higher-end models. I think it's fine that way.

Dieter

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #35 Posted by **From Hong Kong** on 11 Sept 2011, 2:31 a.m.,*
in response to message #1 by Mike Morrow

Mike:

In your first program, could you replace 10 with 10.00001 and run it again?

I would like to see whether the PSE command works after specifying explicitly the yy value to 01.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #36 Posted by **HrastProgrammer** on 11 Sept 2011, 3:33 a.m.,*
in response to message #1 by Mike Morrow

To be honest, it surprises me that such obvious bug hasn't been noticed during beta testing because PSE isn't some obscure used-once-in-a-year feature. Something like LBL 01 1 + PSE GTO 01 is the first thing I was checking while developing all my emulators ...

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #37 Posted by **Patrick Rendulic** on 11 Sept 2011, 4:54 a.m.,*
in response to message #36 by HrastProgrammer

Pfffffffffff.

I ordered an HP15C-LE, because I want a new and working RPN calculator. My HP-35s is unusable because of too many bugs. So HP it seems that you have spoiled it again.

How does that firmware update work? Do you have to take the calculator apart? Will HP provide free cables?

I have noticed that many people must have known about this new calculator for more than a year. Wouldn't it have been wiser to imply more people from the community for serious debugging? That keep it top secret stuff is pure nonsense. What's the use op HHC when the final product is C*R*A*P?

No longer want that calculator.

I would like to get a cable from Gene, hoping I will be able to flash my 15CLE when I get it (should be sent next Tuesday).

But, IMHO, HP has to manage that bug, and maybe some others that will appear, crossing my fingers the number is limited.

First, as said, Gene has probably not enough cables for thousands of people, and sending them would be a huge job.

Second, HP has to fix that and it is pretty easy to work with resellers who have lists of buyers and the organisation for managing large shippings of cable + CD with software and image. This is also probably cheaper for HP rather than to have users sending their calcs somewhere, flashing them and returning them to their owners, especially in case of bugs appearing later...

Jeff

Re: Extract firmware from HHC 15c LE?

*Message #47 Posted by **Pal G.** on 11 Sept 2011, 9:53 a.m.,*
in response to message #46 by Jeff Fontaine (Canada)

Are the reprogramming cables manufactured in China, or are they homemade by Gene and / or a group of volunteers?

If they are made in China, why not let ER sell them on his site? If they are free to those who ask (by HP?), I will gladly pay USPS cost to have one.

If they are homemade can we get a diagram or schematic so we can make our own??

If they are homemade and the cable diagram is already on the internet, could someone provide a link. I will go searching in the meantime..

Thanks!

Here are the details needed to make your own cable. I'm pretty sure that these cables are made in China but are not available for purchase, only free from Gene.

I think that the main problem is making them more available is that they are really quite difficult to use. I've reprogrammed of all the ARM-based machines many times and still have a hard time using them. The cables themselves are not at fault, the SAMBA software and the ARM chip are -- they're very temperamental.

> Here are the details needed to make your own cable.

I sketched a configuration for a flat profile connector before Tim was kind enough to send a full cable my way.

I've built a similar configuration (left hand board) to reflash a KINOMI module although the pitch here was 0.8mm rather than the sam7l's 2.0mm grid. So the task is relaxed considerably.

But unless you are doing quite a bit of reflashing such a jig is likely overkill. A more simple approach would be to scrounge phosphor bronze music wire (0.4~0.5mm should be fine) which has both suitable spring temper and is solderable.

I've even used paper clips, hot glue and popsicle sticks in a pinch as the steel has enough temper to maintain sufficient tension and can be soldered directly with a little ambition. In any case be sure to grind/sand/wire_brush the tips of the probes to a smooth convex surface so they don't excessively scuff up the gold plating on the sam7l PCB.

My thoughts

*Message #50 Posted by **gene wright** on 11 Sept 2011, 1:43 p.m.,*
in response to message #46 by Jeff Fontaine (Canada)

Well, I don't have thousands of cables now, but I'm sure HP will be taking a look at this and talking about it this next week. Remember, this wasn't found until after close of business on Friday. :-)

The firmware from HHC contained a few bugs related to timing of the display flashing (errors, etc) and these were fixed in an update. I don't believe the PSE error was present then, but another update was done that appears to have re-introduced them.

Patience, please. I'm not happy that the 15c LE has these minor issues, and it shouldn't have had any. However, I'm confident a fix will be forthcoming and something will be done to fix it.

Remember, HP did not have to redo this machine *at all*. It was done as a bow to those who really wanted this machine brought back. It won't budge HP's bottom line at all. It is and was a labor of love of many people. Those same people are *also* not happy with these two issues either, I'm sure.

Just my thoughts. Patience. :-)

in response to message #51 by Martin Pinckney

The 15c LE can be flashed through a firmware update.

The 35s cannot.

Several orders of a magnitude difference between correcting one and not the other. One requires creating firmware and distributing it over the internet with no change to production lines, manufacturing processes, inventory, blah blah blah. The other requires a great deal more.

Your statement also shows a lack of awareness of firmware updates already created for the 49g, 49g+, 50g, 12c+, etc.

So, please give us all a break. No one will force you to buy a 15c LE...until they are all sold and you can buy one off ebay at > original cost. :-)

Re: Quite different...

*Message #53 Posted by **Howard Owen** on 11 Sept 2011, 5:25 p.m.,*
in response to message #52 by gene wright

Not to mention the numbers. Despite the real and perceived flaws celebrated here, the 35s has stayed in HP's catalog for years. I'd guess there are high six figures in circulation, at least.

You guys are a tough audience. :)

I have read some references to firmware updates on this forum. I should point out that the four you listed above are regular production calculators, not "Limited Edition" offerings.

> Quote:
>

Who are you including in "all"?

> Quote:
>
> No one will force you to buy a 15c LE...

What does that have to do with this discussion?

Re: Quite different...

*Message #55 Posted by **gene wright** on 11 Sept 2011, 10:22 p.m.,*
in response to message #54 by Martin Pinckney

Yes, they were regular production calculators that could take a firmware update.

You seem to have missed that point for the second time now.

Say this out loud...

The HP 35s is not firmware upgradable, but every calculator HP has made that CAN be firmware upgradable has had a bug fix.

Sigh.

And, now to your questions:

2) All includes me, myself and I. Three.

3) If you feel that HP will never fix anything ala your view of the HP 35s, then don't ever buy a 15c LE and you won't have to worry about it. Just a suggestion.

Rather, I *made* that point (that the others were regular production, and the 15cLE presumably isn't).

> Quote:
>

I never said anything contrary to that. You're missing my point, which was, that HP has not shown much interest in fixing one-off models with problems.

> Quote:
>
> 3) If you feel that HP will never fix anything ala your view of the HP 35s, then don't ever buy a 15c LE and you won't have to worry about it. Just a suggestion.

I never made that statement, you have assumed that. See above.

This isn't intended as any sort of excuse, but the 35S cannot be re-flashed, and thus had a ROM revision been made available, you'd have to obtain a new unit one way or another. I can only imagine the cost to the company if they offered a no-cost swap of an old one for a new one....that would have to be at least an order of magnitude more than simply putting a firmware revision on their web site for downloading. But I agree that there should have appeared a ROM revision in the sales pipeline at some point in the past four years.

*Message #59 Posted by **Lincoln R.** on 11 Sept 2011, 12:27 p.m.,*
in response to message #37 by Patrick Rendulic

Patrick,

Apparently the prototypes that got handed out at HHC last year didn't contain this bug. I'm not sure if any members of the community got to test the firmware version that shipped on the production 15C LEs. I do think that HP will fix this though, for the simple reason that this firmware was in-house as opposed to the 35S that was developed entirely by a 3rd party.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #60 Posted by **Namir** on 11 Sept 2011, 1:16 p.m.,*
in response to message #36 by HrastProgrammer

As a programmer I have, on a few occasions, created unforeseen new bugs by doing last minute tweaks to my code. And yes it was embarrassing if the code went to someone else. My guess is that this is what happened with the HP-15C LE. From what I read the beta version given at HHC2010 had the PSE command working properly. So, drawing from my own experience, a last minute tweak of the 15C LE code is the culprit.

Namir

*Message #61 Posted by **Tim Wessman** on 11 Sept 2011, 2:18 p.m.,*
in response to message #60 by Namir

It was probably the fix that was put in to speed up integration. The HHC version from last year had serious speed issues during integration due to the display updating so frequently. It was around 15x the speed of the original instead of the current speed.

Cyrille fixed this in the last version that was given to beta testers in April. Nobody reported any issues with it so. . . :-(

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #62 Posted by **uhmgawa** on 11 Sept 2011, 11:01 a.m.,*
in response to message #1 by Mike Morrow

> Quote:
>
> In FIX 4 display, after starting the program with f E, I see 10.0000 paused in display, then a couple of seconds of blinking "running" displays, then simply a "runn" in mid-LCD that blinks every few seconds, presumably when the next PSE command is encountered, until program terminates and normal display appears.
>
> In FIX 9 display, the same occurs, except that "runn00000" instead of "runn" appears in the display until the program terminates and normal display appears.

That sounds quite familiar. Communication with the LCD controller residing in the r2d2 is via two 56-bit registers located in the address map. The voyager firmware can only modify these registers serially but in the case of an r2d2 sniffing the ISA bus, modifications are realized immediately which masks the gratuitous updates made by the firmware. Under emulation it is possible (and potentially necessary) to factor out these excessive updates. But in doing so you'd need to synchronize the display register state to the display device after the firmware has set fully coherent display data in the corresponding registers.

From the above description it is possible the emulator isn't getting this quite right as it appears to be rendering at a transition point before the firmware has coherently modified both display registers. At least that is one explanation for the half-updated half-stale LCD display cited above and admittedly a scenario I needed to address in KEMU when driving a display other than the ISA r2d2.

*Message #63 Posted by **Geoff Quickfall** on 11 Sept 2011, 2:23 p.m.,*
in response to message #62 by uhmgawa

I use the same cable and Samba for the 34S as I do for the 15C.

My pause display was tested with the latest firmware but not in an interative loop. Only for pause between two separate answers.

As far as firmware updates go, I have flashed through 3 of them so far with Samba and the cable with no problems at all.

I ordered one 15C+ from SC and have one 15C+ Beta unit. Nice thing is the Beta has a different bezel and harser colours diffentiating it from the 15C+ sales unit. Thus it will always be a stand alone 'collectable' unit.

I currently have 10 programs loaded for aviation and have not found any bugs on the latest version of software. The calc is unbelievably fast, compared especially to the 15C of course, but favourably to the 42S and 41CL for the same routine using similar code.

Fits in the pocket and is used as backup to the 41CL which I carry with me to work.

I think you will all enjoy it, and with cable, Samba and updates hopefully available, it will make a great package.

Cheers, Geoff

Thanks for stating this with such clarity! This might have been obvious for you beta testers, but I needed this assurance to calmly go to sleep tonight and happily await the delivery, hopefully in a week or two!

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #65 Posted by **Mike Morrow** on 11 Sept 2011, 3:05 p.m.,*
in response to message #62 by uhmgawa

> Quote:
>
> That sounds quite familiar...
>
> From the above description it is possible the emulator isn't getting this quite right as it appears to be rendering at a transition point before the firmware has coherently modified both display registers.

Not to beat this to death, but here's another short program for the 15C-LE that demonstrates display oddities following PSE:

```
001 LBL E
002 5
003 0
004 0
005 0
006 STO 0
007 PSE
008 R/S
009 PSE
010 LBL 9
011 DSE 0
012 GTO 9
013 RTN
```

With a FIX 9 display, when this is executed (f E), the 15C-LE can be seen pausing (step 7) with 5000.000000 in display, then halting (step 8) with 5000.000000 in display. So far, so good.

When R/S then is pushed to restart execution at step 9, within a fraction of a second the display shows *alternating* 5000.000000 followed by runn00000 images (with less than 1 second period), until execution

ends about ten seconds later and the display returns to normal.

If the R/S (step 8) and second PSE (step 9) are deleted, then all appears normal...5000.000000 is shown in display by the PSE (step 7), followed by blinking "running" in display until execution ends.

It appears that **two** or more PSE commands must be executed during a program's runtime for problems to be observed afterwards. The PSE commands do not have to be consecutive.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #66 Posted by **Graham D. Wilson** on 11 Sept 2011, 4:34 a.m.,*
in response to message #1 by Mike Morrow

Oh dear!

I fear what other more obscure but more harmful bugs may have escaped detection given that PSE is itself such a common programming instruction for debugging programs.

Reports like this make me mistrust the accuracy and reliability of the LE, and I hate that feeling.

Re: HP 15C-LE Pause (PSE) Command Bug

*Message #67 Posted by **Marcus von Cube, Germany** on 12 Sept 2011, 2:33 a.m.,*
in response to message #66 by Graham D. Wilson

All the algorithms are exactly the same as in the original 15C. What you see here (the PSE bug) is in the emulation layer that mimics the original hardware. It's just a display glitch and does not affect the accuracy of the results in any way.

Nonetheless, the bug needs to be fixed. I assume Cyrille and Tim had some bad nights recently.

HP-15C LE calculator forensics?

*Message #1 Posted by **Joel Setton (France)** on 10 Sept 2011, 11:43 a.m.*

Folks,
Has anyone run the Calculator Forensics formula on the HP-15C LE?
Just being curious, mine is still awaiting shipment in some distant warehouse...
Joel Setton

Re: HP-15C LE calculator forensics?

*Message #2 Posted by **Katie Wasserman** on 10 Sept 2011, 12:21 p.m.,*
in response to message #1 by Joel Setton (France)

It has to be the same as the original 15c, it's just an emulator running the 15c ROM image.

Re: HP-15C LE calculator forensics?

*Message #3 Posted by **Mike Morrow** on 10 Sept 2011, 12:51 p.m.,*
in response to message #2 by Katie Wasserman

Yes, the numerical results are always identical between the 15C and 15C-LE. Even the sequence of random numbers generated after reset with the RAN# command is identical.

Re: HP-15C LE calculator forensics?

*Message #4 Posted by **Gerson W. Barbosa** on 10 Sept 2011, 3:01 p.m.,*
in response to message #3 by Mike Morrow

BTW, even the 12C Platinum can be programmed to replicate the original 15C forensic results. From article #654:

```
1) asin(acos(atan(tan(cos(sin(9))))):

Keystrokes                Display

9                         9.
R/S                       0.156434465
g GTO 090 R/S             0.999996273
g GTO 100 R/S             0.017455000
g GTO 178 R/S             0.999996272
g GTO 157 R/S             0.156441660
g GTO 137 R/S             9.000417403
```

> Quote:
>
> Even the sequence of random numbers generated after reset with the RAN# command is identical.

I will run the program in message #19 of this thread. The result should be

```
534,912,768.0
```

That's a solution to Karl Schneider's interesting challenge, that is,

```
5/34 + 9/12 + 7/68 = 1
```

No one should try this on his/her new HP-15C LE as it will take about 7 hours to run. I hope the batteries last that long :-) (Valentin Albillo presented later a faster 15C program, about 850 times as fast).

*Message #6 Posted by **Thomas Klemm** on 10 Sept 2011, 5:33 p.m.,*
in response to message #5 by John B. Smitherman

I don't quite agree with the results for the HP-15C.

round #1: accuracy of tan(355/226)

> Quote:
>
> correct answer, tan(355/226) = -7497258.18532

But there's no way to enter 355/226 into this calculator. The best you can do is to calculate that number which is 1.570796460. That's why we have to compare the result of tan(1.570796460).

- HP-15C: -7,507,225.705
- Correct answer: -7,507,219.878
- Relative error: 7.7619×10^{-7} instead of 1.33×10^{-3}

round #2: cube root of -27

After setting complex mode (SF 8) I get the correct answer: 1.5000 + 2.5981i instead of *Error 0*.

round #3: definite integration

3.5: integrate(sqrt(abs(x-1)), 0, 2)

The HP-15C has an issue with this integral. However it's interesting that the correct answer is given rather fast when using 1 as the lower limit. I was astonished that this calculator has a problem with this function while both HP-32Sii and HP-48G don't have it since I assumed all use the same algorithm.

Thanks for pointing out this *torture test*.

Thomas

Re: HP-15C LE calculator forensics?

*Message #7 Posted by **Dieter** on 10 Sept 2011, 6:57 p.m.,*
in response to message #6 by Thomas Klemm

Since we had this discussion on how the new 15C compares to the 35s, here are the results for the latter:

- **Tan 355/226** = tan 1,57079646018 = -7497089,06507601...
  The 35s result is -7497089,2551 => rel. error is just 2,5 E-8.
  If 10 digits are used (like in the 15C LE example, i.e. tan 1,570796460) the error in the 35s result still is only 2,5 E-8.

- **Cuberoot of -27**: simply enter -27 [ENTER] 3 [XROOT] => -3. No error message, no complex mode required.
  This also is another example that shows how useful an XROOT function is. It returns results where the usual approach -27 [ENTER] 3 [1/x] [y^x] will not work and throw an error - simply because 0,3333.... is not the same als 1/3.

  Want a complex result? -27 i 0 [ENTER] 3 [1/x] [y^x] => 1,5000 i 2,5981.

- **Integrate sqrt(abs(x-1)) from 0 to 2**: In FIX 4 it takes a moment, but finally the 35s comes back with the correct result 1,3333.

That's why I still think the 35s is a nice calculator. Yes, it has its bugs, but these are known and I can work around them. ;-)

How long is *a moment*? Because I stopped the integration on my HP-35s after a minute or so. I've tried both ways: using a program and an equation.

Does anybody have an idea what's going wrong here? To me this function doesn't apear to be wild. Ok, there's a singularity of the first derivative at x = 1. But why isn't it a problem when it is used as lower limit?

This is another function most HP calculators seem to have a problem with: $f(x) = Sqrt[|x| (2 - |x|)]$. It describes a circle with radius $r = 1$ and center at $(1, 0)$ or $(-1, 0)$.

Integrating this function from 0 to 2 is not a problem. But when the interval $[-1, 1]$ is used it takes much longer or seems to never end.

While I knew that Romberg-integration has a problem with these kind of singularities I wasn't aware that this happens only when they are located inside the interval.

Re: HP-15C LE calculator forensics?

*Message #11 Posted by **Dieter** on 11 Sept 2011, 7:44 a.m.,*
in response to message #10 by Thomas Klemm

The 35s took 40 - 45 seconds for the integral in FIX 4 mode. The function had been entered as an equation. Since this elegant feature is available: use it. ;-)

Edit: I also tried the function you mentioned over [-1; 1] on the 35s. For a first look at the result I set FIX 2 and the result was returned immediately as 1,52 (last digit is off). FIX 3 returns 1,570 (correct within 1 ULP) after 16 seconds. Finally, FIX 4 requires two minutes, but comes back with the correct result 1,5708 as well. :-)

I kind of hope you weren't using the 34S as the 16 digit benchmark for this.

In this case, the 34S is correct but please nobody assume it is everywhere, I've done no theoretic error analysis and the number of values actually validated is tiny.

That all said, definitely let me know when it isn't correct within +/- 1 in the last digit :-)

Re: HP-15C LE calculator forensics?

*Message #18 Posted by **Ángel Martin** on 11 Sept 2011, 1:13 p.m.,*
in response to message #17 by Paul Dale

I think that's called "programmer's remorse" (akin to the buyer's but more lonely :-)

I know, it also happens to me...

Re: HP-15C LE calculator forensics?

*Message #19 Posted by **Gerson W. Barbosa** on 11 Sept 2011, 12:38 p.m.,*
in response to message #15 by Paul Dale

> Quote:
>
> I kind of hope you weren't using the 34S as the 16 digit benchmark for this.

.

I used WolframAlpha's result truncated at the second zero:

```
-7.5072198783666710922545119574391592156309211475564175... × 10^6
```

This, of course, would sure match the wp34s's result :-)

Gerson.

in response to message #14 by Gerson W. Barbosa

> Quote:
>
> You are right. It would not be fair to compare the calculators results with the exact result of tan(355/226).
> correct 16-digit answer, tan(1.570796460) = -7507219.878366671

As already mentioned in a previous message, this tangent evaluation is extremely prone to errors. Since the argument may always be off by plus or minus 5 E-10, the tangent may vary by ~28000 (!) or a relative error of 3,7 E-3.

Yes, the tangent of 1,57079646000000000000000000000.... has the mentioned value, but in real life we are dealing with irrational numbers (i.e. #digits is infinite), so we cannot expect correct results for tan(x_close_to_pi/2) at all.

Dieter

HP 28S saw 36V versus 4.5V, damage and repair?

*Message #1 Posted by **Joshua Keena** on 10 Sept 2011, 10:10 a.m.*

I have an HP 28S that due to a battery mixup (human error) saw 36V versus 4.5V. Any insight into damage done and possible repair recommendations? The calculator is now non-functional. I was able to non-destructively take the case apart to isolate the CPU (logic) board.

Re: HP 28S saw 36V versus 4.5V, damage and repair?

*Message #2 Posted by **Lincoln R.** on 10 Sept 2011, 11:50 a.m.,*
in response to message #1 by Joshua Keena

Ouch. I'd think the best that you can hope for is that the excessive voltage burned up one of the traces that goes from the batteries to the CPU. I'd try checking for continuity between each battery terminal and whatever pin they go to. Beyond that, you could try looking for damaged passive components (caps, resistors, etc.) but in all likelihood that much of an overvoltage probably killed some ICs.

Re: HP 28S saw 36V versus 4.5V, damage and repair?

*Message #3 Posted by **Joshua Keena** on 10 Sept 2011, 1:15 p.m.,*
in response to message #2 by Lincoln R.

Thanks, I'll try that.

Re: HP 28S saw 36V versus 4.5V, damage and repair?

*Message #4 Posted by **Alexander Oestert** on 10 Sept 2011, 2:01 p.m.,*
in response to message #1 by Joshua Keena

Recently I also got an HP 28S off of ebay and the seller had unknowingly included three 12V batteries from his garage door opener which really look surprisingly similar to the correct 1.5 V batteries. Not checking I inserted them right after opening the box and the calculator emitted some very strange sounds but doing nothing else. I guess I tried and tried for at least two minutes before even suspecting something wrong with the voltage. After inserting some of the spare 1.5 V cells I always keep for my 41's the 28S works flawlessly! I hope yours will do, too, after only some minor surgery!!!

P.S. Have you checked the battery door to be correctly closed? That thing is a bit wobbly and might cause connection problems.

Re: HP 28S saw 36V versus 4.5V, damage and repair?

*Message #5 Posted by **Joshua Keena** on 10 Sept 2011, 10:58 p.m.,*
in response to message #4 by Alexander Oestert

Well that is a terrific outcome. I am very glad yours suffered no apparent damage, and your story gives me some hope. I'm actually without a battery door. I was working on fabricating a replacement when the unfortunate incident occurred. I sincerely appreciate you sharing, and here's hoping mine fares as well as

yours.

Hp15c LE on TAS

*Message #1 Posted by **Ethan Conner** on 10 Sept 2011, 5:05 a.m.*

Looks like it's the same place that has been delivering.

Re: Hp15c LE on TAS

*Message #2 Posted by **M. Joury** on 10 Sept 2011, 10:42 a.m.,*
in response to message #1 by Ethan Conner

Now that is interesting. Should put a stop to the stupid high prices. Hopefully they are not all purchased by Co* and hoarded for future sale! 6 sold to date.

Edited: 10 Sept 2011, 10:43 a.m.

Re: Hp15c LE on TAS

*Message #3 Posted by **Michael de Estrada** on 10 Sept 2011, 10:59 a.m.,*
in response to message #2 by M. Joury

Mr. C doesn't pay BIN prices, and his bids on regular auctions are never more than a tiny fraction of his sale prices.

Re: Hp15c LE on TAS

*Message #4 Posted by **M. Joury** on 10 Sept 2011, 11:47 a.m.,*
in response to message #3 by Michael de Estrada

Excellent. And now we can keep track, to some extent, of how fast these things are selling.

Cheers,

-Marwan

Re: Hp15c LE on TAS

*Message #5 Posted by **Lincoln R.** on 10 Sept 2011, 11:53 a.m.,*
in response to message #2 by M. Joury

I wonder... would it be dishonest to list a 15C LE as "HP 15C with original box and manuals" as long as the pictures clearly show that it's a 15C LE and not a NOS 80s 15C? I've noticed that lots of the people wanting $Insane for HPs have a box, manual, and cover (Although I honestly wouldn't be surprised if at least some of them have pieced together that stuff, I've seen plenty of TAS auctions with ridiculous things like a Pioneer in a Voyager case, or worse yet a Spice or Woodstock one, and the seller is still trying to claim it's original)

Re: Hp15c LE on TAS

*Message #6 Posted by **M. Joury** on 10 Sept 2011, 12:06 p.m.,*
in response to message #5 by Lincoln R.

Hmmmmm.... I would say yes. I think that one should specify "LE".

Just my 2 cents.

I wonder what my brand-new-all-original-in-box-with-manuals HP41CX is worth?

Cheers,

-Marwan

Re: Hp15c LE on TAS

*Message #7 Posted by **bill platt** on 10 Sept 2011, 6:26 p.m.,*
in response to message #6 by M. Joury

In hte beginning of this century, a 41CX went over #500 and we were all "oh my gosh!"

Now I think that would be cheap...

Re: Hp15c LE on TAS

*Message #8 Posted by **Howard Owen** on 10 Sept 2011, 12:42 p.m.,*
in response to message #5 by Lincoln R.

I think it would be misleading. I expect to see many such auctions. Caveat collector.

Re: Hp15c LE on TAS

*Message #9 Posted by **Namir** on 10 Sept 2011, 12:43 p.m.,*
in response to message #5 by Lincoln R.

Definitely specify that it is a Limited Edition!!!

Re: Hp15c LE on TAS

*Message #10 Posted by **Lincoln R.** on 10 Sept 2011, 1:54 p.m.,*
in response to message #9 by Namir

Yeah, I'm not trying to defraud anyone and probably won't even be selling any 15Cs on TAS, I was just thinking that one would want to ensure that their 15C LE appeared with the rest of the 15Cs. I definitely wouldn't try to convince someone that a new 15C was actually one of the 80s ones.

Re: Hp15c LE on TAS

*Message #11 Posted by **Michael de Estrada** on 10 Sept 2011, 3:23 p.m.,*

Show a clear photo of the back that let's one see the "Product of China" on it. Anyone dumb enough to pay an inflated price deserves to get screwed.

Re: Hp15c LE on TAS

*Message #12 Posted by **Michael de Estrada** on 10 Sept 2011, 5:12 p.m.,*
in response to message #2 by M. Joury

An original HP 15c in good working and cosmetic condition with slip case but no manual just sold on TAS for about $155 shipped. It was a worldwide auction, but only got one bid. Hard to say if the listing of the HP 15c LE had any effect, or if it was simply missed by this bidder. The listing by Buy.com has no photos at all, which is pretty stupid IMO. Anyway, as I post this, Buy.com has sold 10 units so far.

Re: Hp15c LE on TAS

*Message #13 Posted by **Brandon Poindexter** on 10 Sept 2011, 5:51 p.m.,*
in response to message #12 by Michael de Estrada

You called them and they just told you that they sold 10 units over the phone? I guess i would have never thought they would give out this info so willy-nilly.

Edited: 10 Sept 2011, 6:01 p.m.

Re: Hp15c LE on TAS

*Message #14 Posted by **Michael de Estrada** on 10 Sept 2011, 6:12 p.m.,*
in response to message #13 by Brandon Poindexter

Nope. The number of sold units is showed on the TAS listing. Currently it's 11.

Edited: 10 Sept 2011, 6:13 p.m.

Re: Hp15c LE on TAS

*Message #16 Posted by **Paul Gaster** on 11 Sept 2011, 6:40 p.m.,*
in response to message #12 by Michael de Estrada

I saw that auction too. The reason it only had one bid is that it was Buy It Now, not a regular auction. I would bet the seller was in a hurry to get some money quick, or did not know how much it could sell for in a regular auction. Or maybe it had some scuffs, scratches, or a small flaw, etc and they thought it would never sell for a higher price.

Re: Hp15c LE on TAS

*Message #17 Posted by **Michael de Estrada** on 11 Sept 2011, 7:08 p.m.,*
in response to message #16 by Paul Gaster

Actually, it was a regular auction with a start price of $149.99. Nobody bid on it until time had almost expired. Regardless, since there was only one bid, it did not sell for more. There are other auctions going on right now that have been bid up higher, so the HP 35c LE auction does not appear to be having an effect so far.

The *REAL* Self Tests For the 15C LE

*Message #1 Posted by **Mike Morrow** on 9 Sept 2011, 11:05 p.m.*

In the midst of the discussion about invalid self tests for the HP 15C LE that are described in its manual, it is worth pointing out that **new** self tests are available in the 15C LE firmware. But, AFAIK there's nothing in the 15C LE manual that says how to perform them. They are the same tests that are used for the two-cell HP 12C. This HP website describes access and use of the new self tests for the 12C+ (and 15C LE).

Edited: 9 Sept 2011, 11:18 p.m.

Re: The *REAL* Self Tests For the 15C LE

*Message #2 Posted by **Gerson W. Barbosa** on 10 Sept 2011, 12:00 a.m.,*
in response to message #1 by Mike Morrow

So, it appears it's just a matter of updating the manual. Has the battery changing section been modified accordingly? I still haven't found the online version of the new manual.

Edited: 10 Sept 2011, 12:02 a.m.

Re: The *REAL* Self Tests For the 15C LE

*Message #3 Posted by **Mike Morrow** on 10 Sept 2011, 12:57 a.m.,*
in response to message #2 by Gerson W. Barbosa

Yes, Appendix F was updated for the new 2032 cells. That's also the section that describes the old original 15C self tests. It should be altered to describe the new self tests. More importantly, the firmware should disable the old tests to prevent inadvertent program memory corruption which the 'ON plus *' and 'ON plus +' tests can cause.

Now that I've played around with the 15C-LE for a few hours, I'm quite satisfied with the value presented for the cost. I was unfair in having an initial negative outlook after the self tests failed. In truth, the 15C-LE is not at all a bad effort. I'd buy it again, but I'd still much much rather see a 42S-LE.

There was some talk that the famous HP-15C *Advanced Functions Handbook* was to be included on the CD-ROM that is included with the 15C-LE. Alas...it's not there. It's still referenced in the manual included with the 15C-LE. (I've got my old hard copy, but a pdf of the original would be great to have on the CD-ROM.)

BTW, buy.com shipped my two 15C-LE units from Olive Branch, Mississippi, only about 180 miles west of me. Without expedited shipping, they still arrived 23 hours after ordering! But...how did a shipment of 15C-LE units get to Mississippi ahead of every other place in the USA?

One question arises when I look at the HP web page I cited above. It's actually for the HP 12C+, and it tells the user to use the new self test procedure if an Error 9 is received (after performing the traditional Voyager self tests).

That implies that the HP 12C+ retains the old self tests, which fail and generate Error 9. Has memory corruption been noted on the 12C+ following the 'ON plus *' or the 'ON plus +" tests? That's what occurs in the 15C-LE.

The 15C-LE firmware should be modified to prevent inadvertent performance of the destructive old self tests. If the tests are not "locked out", then those old self tests should be modified to not disrupt memory.

The new tests are described as generating an error message if an error is detected, but the web page does not say what that message contains. I'm assuming the message is not Error 9. Then disabling the old self tests completely would result in nothing that generates Error 9. In addition to references in the manual, the calculator back plate should be modified to eliminate the Error 9 entry.

Edited: 11 Sept 2011, 11:06 p.m.

Re: The *REAL* Self Tests For the 15C LE

*Message #11 Posted by **Jeff O.** on 12 Sept 2011, 8:51 a.m.,*
in response to message #10 by Mike Morrow

The latest 12C+ firmware, or at least what I believe to be the latest firmware, dated 2009-11-19, does indeed retain the original self tests. Behavior is as follows:

'ON plus /' : Works fine if you start pressing keys quickly enough. If you press the keys out of order or wait too long, Error 9 is displayed.

'ON plus x' : Display flashes "running" once, then lights all segments except low-battery.

'ON plus +' : Display flashes "running" somewhat erratically. I got various results after pressing "any" key to stop the test, including Error 2, Error 6, and all segments lit, most often the latter.

To test for memory corruption with the latter two tests, I entered the following program:

```
1
2
3
4
5
6
7
8
9
ENTER
9
8
7
```

```
6
5
4
3
2
1
+
GTO 00
```

This simple program was not corrupted by the self tests, I don't know if that proves that other programs would not be corrupted.

By the way, 'ON plus -' clears memory and resets the calculator as it has always done.

Re: The *REAL* Self Tests For the 15C LE

*Message #12 Posted by **Mike Morrow** on 12 Sept 2011, 11:57 a.m.,*
in response to message #11 by Jeff O.

Interesting. The 15C-LE behaves differently from the 12C+ when the old 'ON plus *' and 'ON plus +" tests are attempted. They terminate immediately with Error 9, and alter program memory as I described Friday.

Does the HP 12C+ Owner's Handbook describe the old tests or the new tests?

Edited: 12 Sept 2011, 12:27 p.m.

Re: The *REAL* Self Tests For the 15C LE

*Message #13 Posted by **Gene Wright** on 12 Sept 2011, 10:36 a.m.,*
in response to message #10 by Mike Morrow

"In addition to references in the manual, the calculator back plate should be modified to eliminate the Error 9 entry."

Gene: THAT I can probably safely say will not happen. To do so would require re-doing the assembly line and production, and my guess is that HP would throw everything away rather than go through the trouble to re-do any production of this limited edition / limited run of machines.

If they are making only 10K of these, firmware updates...sure. Changes to a manual made available as a PDF...sure. Reprinting of a physical manual...less likely. Change to the physical unit requiring a new production run...not likely at all.

It is what it is.

Re: The *REAL* Self Tests For the 15C LE

*Message #14 Posted by **Mike Morrow** on 12 Sept 2011, 11:44 a.m.,*
in response to message #13 by Gene Wright

I know it would not happen with current LE production. But if the 15C-LE became a standard product, the back plate design would need to be modified to eliminate the limited edition serial. One might then wish to correct the Error 9 information. Obviously, such a change to the back plate could only happen if 15C-LE production became a recurring event. I doubt that general consumer demand will cause that to happen.

I suspect that the writer of Appendix F in the Owner's Handbook "Verifying Proper Operation" never tried *any* self test (old or new) on a real 15C-LE. The text is copied from an old HP-*12C* manual,

because it says a "12" will appear at the end of the old keyboard test.

Re: The *REAL* Self Tests For the 15C LE

*Message #15 Posted by **Tim Wessman** on 12 Sept 2011, 12:19 p.m.,*
in response to message #14 by Mike Morrow

Yes. The communication was "Take the new 12c battery info and put it into the manual. Remove the information regarding the self tests."

1 out of 2 isn't that bad I guess. . . :~|

TW

Re: The *REAL* Self Tests For the 15C LE

*Message #16 Posted by **Mike Morrow** on 12 Sept 2011, 2:14 p.m.,*
in response to message #15 by Tim Wessman

Nothing is ever perfect. One can only catalog the issues identified by us gamma-testers for possible implementation in future production (if any).

It would be very appropriate, given the typical characteristics of a 15C-LE purchaser compared to the general customer-base, to describe in Appendix F the *new* **'ON plus g plus ENTER'** tests, including a description of what is actually being tested and what error messages can be generated under what conditions. Even though no customer has any *real* need to know this, the typical 15C-LE purchaser would doubtless appreciate the information.

I'm pretty happy with my LE units. I have no regrets. Let's hope there's such a large demand that subsequent production runs (with bugs removed from manual and machine) become irresistible for HP. It's a lot more exciting than yet another HP-12C reincarnation. (I hate financial calculators, except the 30b.)

Now that I've given my 15C-LE a workout, it's time to get back to the personal computer I was using when I bought my first 15C. I just hope that 180 kB floppy drive in the expansion box of my 48 kB RAM TI-99/4A will still work! :-)

Does the 15C LE have a 6-pin JTAG connector?
*Message #1 Posted by **Pal G.** on 9 Sept 2011, 10:15 p.m.*

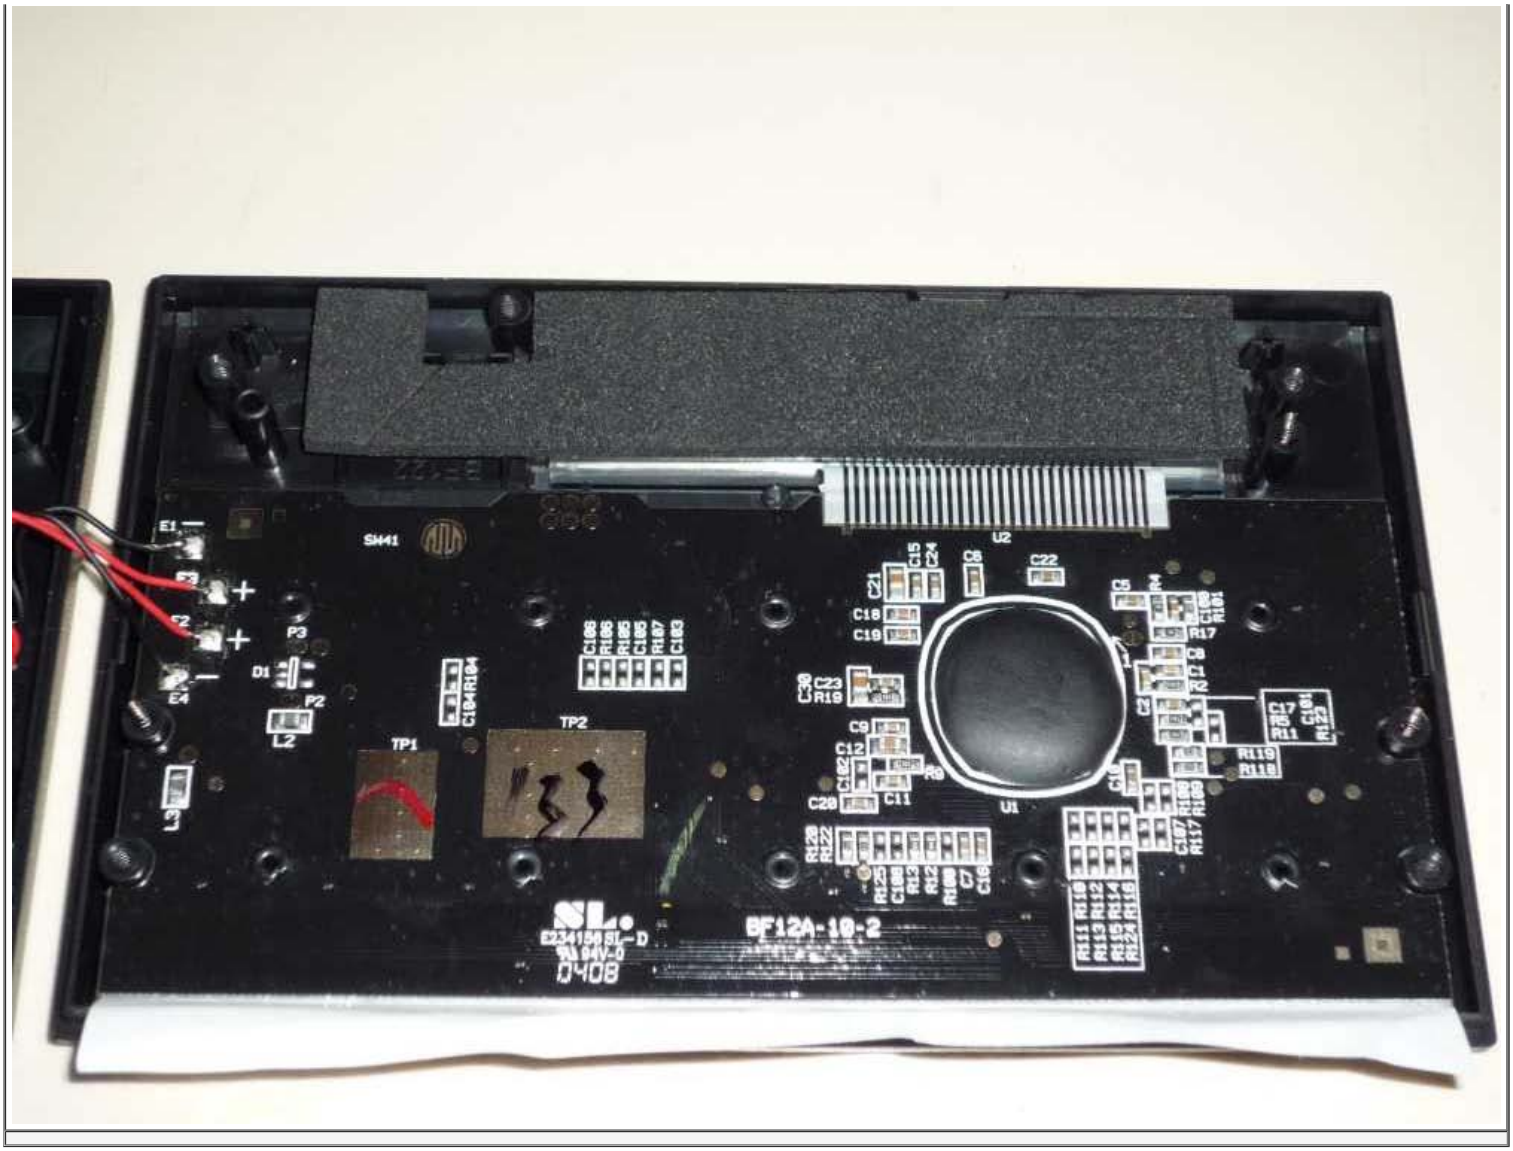
Has anyone looked inside their battery compartment for the programming interface? I didn't really see anything in those pictures TW posted a few days ago.

Will we be able to flash the 15C LE if we need too?

Thanks.

Re: Does the 15C LE have a 6-pin JTAG connector?
*Message #2 Posted by **Katie Wasserman** on 9 Sept 2011, 10:22 p.m.,*
in response to message #1 by Pal G.

I'm sure that it uses the same PCB as the 12C+ and there is no JTAG connector.



Re: Does the 15C LE have a 6-pin JTAG connector?
*Message #3 Posted by **Pal G.** on 10 Sept 2011, 12:26 a.m.,*
in response to message #2 by Katie Wasserman

Thank you, Katie.

In this thread:

"http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv018.cgi?read=143521

Cyrille states:

"Unfortunately, the HP 12C+ does NOT have the Jtag interface (sorry) due to ESD reasons... BUt it still has the serial interface, so you can still reprogram it! I will be probably releasing data on the HP 12C+ soon including schematics and an example application."

Maybe I did not ask my first question properly. Is the 15C LE re-programmable?

Re: Does the 15C LE have a 6-pin JTAG connector?
*Message #4 Posted by **Katie Wasserman** on 10 Sept 2011, 12:51 a.m.,*
in response to message #3 by Pal G.

Yes. You can reprogram/re-purpose it like the 12C+, 10bii, 20b and 30b. They all require the same cable (from Gene) and the SAMBA software.

Re: Does the 15C LE have a 6-pin JTAG connector?

No. Like all the other recent HP calculators, this uses a single ARM chip that contains all the RAM and ROM. This is a closed system limited to the 2K battery backed RAM.

Re: is memory upgrade possible?
*Message #8 Posted by **Katie Wasserman** on 10 Sept 2011, 12:36 p.m.,*
in response to message #7 by Katie Wasserman

Just to qualify my "No" reply....

Eirc's proposal was to expand the memory in the 15c by adding a memory chip to the existing one to double the address space. In the current ARM-based designed that's not possible from a hardware perspective. Now, it's being suggested that HP might not have used up all the available 2K battery backed RAM. By modifying the ROM image (and maybe the emulator) it might be possible to make use of whatever RAM is not being used.

While I think there's a good chance of their being some unused RAM in the 15C LE, this course of action would require a copy of the original ROM image that HP has claimed copyright over. On the other hand if you bought a 15C LE you implicitly bought a copy of the ROM image and should not be in violation of a copyright. Yet the ROM image that needs to be modified is not the copy you bought. I think there's an interesting legal issue here.

I imagine whoever manages to modify the firmware accordingly may offer a diff file to apply to the original firmware. I assume the firmware can either be read directly from the 15C LE or taken from the emulation on CD. If my assumption is wrong, this is a lost case unless HP brings out firmware updates to expand the memory.

I can wholeheartedly relate to the fascination of reusing 30 year old firmware, and there are well known arguments for doing so. But I think the madness at some point must end. It ***is*** largely a 30 year old black box, and effort arguably could be better spent creating a minimum footprint functional reimplementation which would be far more maintainable and straightforward to enhance. The existence of the 15C LE on the planet now gives anyone interested in doing so a customized development platform for less than $100.

In this respect the WP34s folks have IMHO taken the correct engineering approach. I expect an open GPL'ed, portable firmware implementation to eclipse the 30 year validation soak of legacy firmware in a small fraction of that time.

Re: is memory upgrade possible?

*Message #12 Posted by **Thomas Radtke** on 10 Sept 2011, 3:39 p.m.,*
in response to message #11 by uhmgawa

I was just pointing out a way to *hopefully* legally offer something leading to a firmware 'update'.

I don't know what to think of it really. It would be nice to have a native reimplementation on one hand, on the other a proven software is more or less given to satisfy the needs of many.

But then, a project like you described seems inevitable given the enthusiasm of experts like you and all the others in this forum :-).

Yes, I hope. Like the 12c vs 20b/30b. Now we have the 15c and the community WP34s. Perhaps HP will come up with their own scientific as much advanced over the 15c as the 30b is over the 12c.

That's certainly achievable by emulating an ISA bus memory device. In practical terms that would manifest as a uC camped on the ISA bus responding to requests. The point I'd reached was if I'm going to add a uC in the box to serve up memory it would be faster running an emulator directly as RWM and ROM can become significantly more efficient internal access.

> Quote:
>
> In the current ARM-based designed that's not possible from a hardware perspective.

Do we know conclusively no unused (or resuable) gpio lines exist which can be leveraged? Oh for lack of the sam7l lqfp package..

> Quote:
>
> Now, it's being suggested that HP might not have used up all the available 2K battery backed RAM.

I'd be surprised if there wasn't considerable unused battery backed RWM. A single instance of 15c RWM consumes well under 650 bytes such that doubling it should be quite feasible.

The much greater concern I have would be taking a poke at the firmware to increase the size of the r2d2 memory windows, in terms of compromising that 30 years of real-world soak the 15c firmware has seen thus far. But admittedly I haven't yet looked at the firmware specifically with this in mind.

> Quote:

> By modifying the ROM image (and maybe the emulator) it might be possible to make use of whatever RAM is not being used.

It will most probably need a change to the emulator ram mapping as the memory areas as seen by the firmware are not contiguous.

*Message #15 Posted by **Howard Owen** on 10 Sept 2011, 3:10 p.m.,*
in response to message #8 by Katie Wasserman

Beyond legal theories of fair use or whatnot, there's the point that any "pirated" ROM image that a hobbyist want would only ever run on HP hardware. I can't see HP going after enthusiasts for that sort of activity. They aren't Sony or the MPAA.

If a clone maker wanted to use it on their own hardware, that would be a different matter.

Re: is memory upgrade possible?

*Message #16 Posted by **Paul Dale** on 10 Sept 2011, 7:59 p.m.,*
in response to message #8 by Katie Wasserman

If HP release new firmware fixing the bugs being found then the question of accessing an image becomes moot. Once people have an image available, patching it becomes possible. Like I said, I'm hopeful but by no means sure it is possible.

Re: is memory upgrade possible?

*Message #17 Posted by **Marcus von Cube, Germany** on 11 Sept 2011, 3:24 a.m.,*
in response to message #16 by Paul Dale

Even if you can patch the original firmware (the NUT part of it) to access more registers, the emulation layer must have provisions for it, too. If the emulation dimensions memory for 64 registers and the firmware expects 128, trouble is certainly to arise.

However Eric Smith states in HP Calculator Microcode Copyright Status:

> Quote:
>
> In the United States, for works created before March 1, 1989, a copyright notice must be present to secure a copyright, except in very limited circumstances as defined in 17 U.S.C. 405(a), quoted below.
>
> I have verified the absence of both printed and machine-readable copyright notices on the following HP calculator models:
>
> Voyager HP-11C, HP-12C, HP-15C, HP-16C

Is this information just outdated? This page was last updated May 25, 2005. In the news on the front page is a note from 23-AUG-2008 that Voyager calculator models have been removed in release 0.79 due to licensing issues.

Can anybody shed light on this issue?

Thanks in advance
Thomas

Re: is memory upgrade possible?

*Message #20 Posted by **sylvandb** on 13 Sept 2011, 9:00 p.m.,*
in response to message #19 by Thomas Klemm

I see no discrepancy or need for correction/update in that information as presented. Copyright and license are two distinct and different entities. They are often confused because copyright is one of the rights frequently controlled by license.

The lack of copyright means that there is no copyright which means that the publication does not enjoy that protection and so might be copied if that was all there was. However it might still have patents or trademarks or contract (license) or hit men or maybe even no protection at all.

As for license, license issues could occur involuntarily with anything where permission was granted under license or contract, or voluntarily relinquished via the same.

That anything might have been something prior to voyager support being added and notification of violation or permission being revoked resulted in the removal.

Or it might have been something that happened at the same time as the removal and those current negotiations required the removal.

Or the removal might have been proactive for something that was to happen in the future, perhaps an expiration or a new contract.

To bring the abstract concrete in a possible but quite unlikely example, perhaps Eric was buying a new house and the loan contract included a clause that he not distribute an emulator of Voyager calculators because the lender was financing a competitor.

I think if you google enough, you might find some information or rumors regarding this particular license situation.

Re: is memory upgrade possible?

*Message #21 Posted by **Paul Dale** on 10 Sept 2011, 3:29 a.m.,*
in response to message #6 by x34

It is going to depend on how the internal 2kb of RAM is arranged and if the emulator can handle the extra address space.

If the 15c's RAM is followed by enough unused space and if the emulator doesn't get confused or block things, then in theory the ROM modifications would work.

We'll have to wait for someone to try it I suspect....

Re: HP15c LE -- Where Are Canadians Ordering?

*Message #7 Posted by **Les Wright** on 11 Sept 2011, 9:45 a.m.,*
in response to message #1 by Les Wright

I do stand corrected. I went at Samson's via Buy.com and by that path shipping to Canada not accepted via PayPal. Going straight to Samson Cables and it all went well. Only downside is shipping cost and the likelihood that a parcel of this declared value will be stopped by customs and assessed the 13% harmonized sales tax plus the admin fee of 5 to 8 bucks. But it looks like these things are actually real, and Samson's seems to be standing behind these preorders and sales.

HP 15C LE Memory Corruption After Self Test Performance

*Message #1 Posted by **Mike Morrow** on 9 Sept 2011, 8:55 p.m.*

In other threads today I reported failure of the self tests normal to the 15C and described on page 261 of the 15C LE manual.

But now, I can report that attempting to perform the "ON plus *" self test not only results in immediate "Error 9", but also corrupts any program that is in memory.

I had a Savage benchmark in memory consisting of the following steps:
001-42,21,12
002-44 0
003-43 8
004-42,7,9
005-0
006-42,21,0
007-1
008-40
009-11
010-43 11
011-43 12
012-12
013-43 25
014-25
015-42,5,0
016-22 0
017-43 7
018-43 32
(FWIW, putting a number in the X register, followed by "f" and "B" executes the Savage Benchmark for the number of iterations in X. If X holds the traditional 2500, the results will show in about 48 seconds.)

After turning the 15C LE off, then executing "ON plus *", I get "Error 9".

Then, when I go to program mode, here's what's I find there now:
001-42,21,11
002-44 1
003-43 8
004-42,7,9
005-0
006-42,21,0
007-44,20,12
008-11
009-43 11
010-43 12
011-12
012-43 25

013-26
014-42,5,24
015-22 0
016-43 7
017-43 32

Really really strange!

I did a reset with "ON plus -", got the expected and proper "Pr Error", then reprogrammed the 15C LE. I was able to get this conditionn to repeat.

I conclude that one won't want to try any self tests if there is something in program memory!

What else lurks out there? I've only spent a couple of hours with my new 15C LE.

I'm not all that happy with this, but it seems to have some, er, possibilities. :-)

True. But demountable SPI EEPROM in the new HP Voyager Flash Card format would have worked quite well from all concerns.

Looks like a missed opportunity to seed a proprietary media design into a captive market.

Huh, sounds like something is getting stomped on elsewhere as a result of the test. The system self test does cycle through memory alternately writing "55555555555555" and "aaaaaaaaaaaaa" patterns but takes care not to permanently alter data.

I do not understand :-)

*Message #1 Posted by **robertoataulfo** on 9 Sept 2011, 8:25 p.m.*

I do not understand this excitement by an HP-15C.

reasons:

Has no I / O
The display is not alpha
It is limited in terms of programming.
etc.

Here is a competitor in size and weight

Sharp PC-1262

- Scientific, 10 BCD digits, exponent ±99, Algebraic
- 10.4 kByte permanent RAM
- BASIC interpreter
- 2 lines each 24 digits 5x7 black&white LCD with separate contrast adjustment knob on the right side of the unit.
- Thermal printer and output to tape

Now walk with a limited HP-15C if I can walk with a true pocket in my pocket?
And besides having to copy the programs and results using a pen and paper?
You are correct that the printer is not very portable, but do what, not everything is perfect. :-)
I'm waiting for 41CL is really something from another world.
Long Live HP-41CL

Olá Roberto,

Actually the HP-15C was my first HP calculator and I used it a lot in college until it was eventually replaced by an HP-28S (later replaced by a 48GX). The HP-15C was purchased in 1983 after my two-month old TI-59 was stolen. At first I thought of buying an HP-41C, but it was too expensive. Now I realize the HP-15C was the best option for me then (because of the features Namir mentions).

Take the chance and buy another one for your uncle's nephew while they are still available :-)

Até,

Gerson.

in response to message #1 by robertoataulfo

The HP-15C has Solve, Integrate, and built-in matrix commands. The Sharp PC-1262 does not!! So you have to program these features in BASIC. When it comes to matrix commands ... good luck! It's a lot of coding!

Edited: 9 Sept 2011, 8:48 p.m.

in response to message #1 by robertoataulfo

The HP-41CL really is wonderful, but it requires already owning a real 41-C that you can take apart. That's too tall of an order for me!

Now, if someone were to create a new case for the HP-41CL that looked like the old 41C, I'd be quite interested in it!

Interesting idea, why don't you guys going to the conference talk HP into producing empty 41 shells? (well not quite empty, there's the little details like display and keyboards, of course :).

Really doing the CL "brain transplant" is a no brainer (pun intended), assuming you have a suitable donor. The issue is finding a C/CV which screw posts don't decompose beyond repair when you open it, and then you're home free.

in response to message #11 by Ángel Martin

I would not mind seeing an ARM based hp-41. Sort of a real halfnut with AAA batteries (rechargeable ones should work too). Skip the hp-41 bus port and go for a couple of USB ports instead.

My tracking shows Dallas and my door(fort worth) monday before 4:30. I got a paycheck on saturday from the Fed people but i'm sure there was a premium paid to make that happen.

Re: How many HP 15c do you plan to order?

*Message #10 Posted by **gene wright** on 9 Sept 2011, 8:44 p.m.,*
in response to message #6 by Howard Owen

I keep seeing hopes that the 15c LE will be floating down from the sky at the upcoming HHC meeting. :-)

This is a very limited run and I do not expect to see a lot of these given away - at all. While I have no internal information one way or the other, I really REALLY do not expect a cart containing 100 of these guys to roll in at the conference.

HP has been kind enough to give some freebies the last several years, but again they are gifts and while gifts can be hoped for, they might or might not happen again.

Perhaps everyone should hope instead for a nice new HP 10bII+ instead? :-)

Bottom line ... IMO ... if you want a 15c LE, then BUY ONE. :-)

Or 2, or 10, etc.

Yeah, and I got mine for only $73.99 with the $5 coupon and free economy shipping. :)

Re: The longer you wait, the more it will cost

*Message #18 Posted by **Howard Owen** on 9 Sept 2011, 11:43 p.m.,*
in response to message #15 by Michael de Estrada

Yup. I paid $89.99 for my second unit.

Re: The longer you wait, the more it will cost

*Message #19 Posted by **Jim Johnson** on 10 Sept 2011, 6:16 a.m.,*
in response to message #18 by Howard Owen

I just ordered two HP-15C Limited Edition calculator's from Buy.com. As I was online ordering the first one at 5:30am (EDT) on 9/10/2011, the price jumped from $89.99 to $99.99. I was able to get a second one ordered by using the back button on my browser to find the $89.99 price again and create a 2nd order. It appears that Buy.com is increasing the price, yet again. I noticed that they list the seller as "Samson Innovations". If you Google this company, they are a Chinese(Hong Kong) exporter. Hope I'm not ordering some knock-off that isn't HP sanctioned.

Re: The longer you wait, the more it will cost

*Message #20 Posted by **Michael de Estrada** on 12 Sept 2011, 2:49 a.m.,*
in response to message #19 by Jim Johnson

No, Buy.com is still $89.99. Samson is a different seller, and you don't need to buy from them for $99.99.

Re: The longer you wait, the more it will cost

in response to message #20 by Michael de Estrada

I can't even find the Samson Innovation price that the OP mentioned.

Re: How many HP 15c do you plan to order?

*Message #22 Posted by **Thomas Radtke** on 10 Sept 2011, 6:27 a.m.,*
in response to message #1 by Gerardo Rincon

Ordered one, but will buy one from the 2nd production run. Rumors are, the chinese are already busy scratching Us and Ns into the bezel.

Re: How many HP 15c do you plan to order?

*Message #23 Posted by **Glenn Dowdy** on 11 Sept 2011, 2:31 p.m.,*
in response to message #22 by Thomas Radtke

More than 10,000. ;)

Re: How many HP 15c do you plan to order?

*Message #24 Posted by **Patrick Rendulic** on 12 Sept 2011, 3:43 a.m.,*

in response to message #1 by Gerardo Rincon

I ordered one. Not more. I just want to check the quality. A year ago I bought a dozen 12c platinums, because I got them for $20 a piece, but you won't believe me, 8 had scratches on the bezel in the brand new sealed package. So I want to make sure that I don't buy a scratched china toy.

Other question. What does limited mean? Some say 10.000 units. Then after that? What? All thyt hype for some calculators?

Why not offering them all over the world in the next decade? Won't there be any more engineers in a year or 2? I still don't get it.

Re: How many HP 15c do you plan to order?

*Message #25 Posted by **Howard Owen** on 12 Sept 2011, 4:20 a.m.,*
in response to message #24 by Patrick Rendulic

My assumptions about this are:

1. The idea for the machine was sold inside HP by someone who cared about this community. In other words, bringing back the 15C was mostly about thrilling people who had clamored for it for years.
2. The reason it was sellable inside HP, is that they had a pretty good idea they wouldn't lose money making it. I think they used the popularity of 15C emulators as one way to judge the actual market for these things.
3. Whether or not they make more than 10,000 is going to depend on whether the current batch sells out. That's obvious, but it's still an open question in my mind if they will or won't. It sure seems like Buy.com wouldn't be raising the price in the face of soft demand, however.

Re: How many HP 15c do you plan to order?

*Message #26 Posted by **Paul Dale** on 12 Sept 2011, 4:25 a.m.,*
in response to message #25 by Howard Owen

> Quote:
>
> Whether or not they make more than 10,000 is going to depend on whether the current batch sells out

I honestly don't think the question is if the current production run sells out (because it will), but far more about how quickly it sells out.

10k units in a month is justification for another run. 10k units in a year isn't.

WP 34S : Reopening last catalog called - Revisited

*Message #1 Posted by **Miguel Toro** on 9 Sept 2011, 12:44 p.m.*

Hello team 34s,

I flashed the new firmware and tested the "last catalog called" feature, and it worked...beyond expectation: now, even if you turn off the calculator, the last position is kept. That is really nice...a little à la 42s. What is needed is a small change on the manual, page 66, so to delete "This position is lost when the WP 34s is turned off." :-)

Thanks and regards,

Miguel

Re: WP 34S : Reopening last catalog called - Revisited

*Message #2 Posted by **Marcus von Cube, Germany** on 9 Sept 2011, 1:01 p.m.,*
in response to message #1 by Miguel Toro

That the position used to be lost across a power cycle was actually a bug in an internal routine. But if Walter insists I can make the software behave the way the manual describes. ;-)

*Message #6 Posted by **Steve Fennell** on 9 Sept 2011, 5:31 p.m.,*
in response to message #4 by Mike Morrow

Could you post a little more detail about the quality and differences between the two generations of the 15C?

Re: OT: Limited Ed.

*Message #7 Posted by **Tim Wessman** on 9 Sept 2011, 5:48 p.m.,*
in response to message #6 by Steve Fennell

Looks like cyrille forgot to patch the old self tests away, or at least slow them down.

The old self tests are there. The keyboard one works but times out quickly. If you start pressing keys immediately and don't wait more then about 2 seconds between each, you pass it fine. The second one runs too quickly and thus fails.

The real menus used now are the 12c+ ones that have the checksum and LCD test.

If you think the quality on a 12c+ is crap, you will think the 15c+ is crap too. They are the same except for firmware and cosmetics.

Report: 15C LE Self Tests and Benchmark Run Times

*Message #8 Posted by **Mike Morrow** on 9 Sept 2011, 6:25 p.m.,*
in response to message #7 by Tim Wessman

I was **unfair** stating that the 15C LE quality was far below that of the original 15C. I would say it is perceptibly less than, but not far below, the original. It is certainly serviceable. I was initially influenced negatively by the self test performance failures.

In that area:
"ON with /" tries to work for a fraction of second, then ends with "Error 9".
"ON with *" immediately results in "Error 9".
"ON with -" immediately results in "Pr Error" and clears the memory and programs, ALL as expected.
"ON with +" immediately results in "Error 9".
The manual, page 261, describes the self tests as functioning in the manner of the original 15C, but they do not.

In other areas:
The 15C LE produces identical numerical results as the 15C, including the sequence of RAN# outputs.

Performance of a 2500-iteration Savage benchmark takes 48 seconds on the 15C LE, and 5840 seconds on the 15C. That shows a runtime improvement by a factor of 122.

It's worth the money, IMHO. Still, I'd prefer a 42S LE...greatly. :-)

Edited: 9 Sept 2011, 8:02 p.m.

Unless the tests are stumbling on an incorrect checksum due to rom patching, it likely isn't a question of speed, but rather quirks in the r2d2 which cause the "on" + "x" and "on" + "+" tests to fail in your emulation. I puzzled on that early when writing KEMU on the unfulfilled belief those tests (well they're essentially the same) would ferret out implementation bugs in KEMU. Unfortunately for as much as they try to be, they aren't able to exhaustively functional test all instruction semantics.

Rather what I'd done as a more definitive benchmark was to take one of the NUT cpus left over from a KINOMI conversion and place it in a test jig PCB such that I could instrument it via feeding it instructions and examining the results. Some of the internal NUT state needs to be inferred, but IIRC it should provide complete coverage. Regrettably that project has fallen derelict due to available time (what's that?), but I should have extra break-out NUT PCBs if anyone would be interested to complete the effort.

Concerning rom patching, I'd sidestepped the issue as while KEMU running on a atmega1284p realizes a 5-6x speed increase over the stock NUT, it wasn't as drastic as you'd find on a 32bit SoC running at a substantially higher clock rate. And while keyscan debounce timing was made independent of emulation speed, other scenarios exist such as <f> + "prefix" which you can see here, timeout the delay at the actual emulation speed.

> Quote:
>
> If you think the quality on a 12c+ is crap, you will think the 15c+ is crap too. They are the same except for firmware and cosmetics.

Please don't say that in earshot of the Evilbay sellers now stuck with $400 NUT Voyagers lest they start marketing them as "Classic Voyagers" and we'll never be rid of them.

*Message #12 Posted by **Katie Wasserman** on 9 Sept 2011, 10:18 p.m.,*
in response to message #11 by uhmgawa

On My 12C+ (not LE) the "+" and "x" self tests work just fine. This is version 2009-11-19. The "/" self test does time out if your wait more than 2 seconds between key presses but this is because it's running 150 times faster then the original 12c. The "/" self test on the original 12c (10c, 11c, 16c and 15c) also times out but you need to wait for around 5 minutes.

I don't understand why these self tests didn't make it into the 15C LE firmware.

-Katie

>
> I don't understand why these self tests didn't make it into the 15C LE firmware.

I'm sure it's in there, but apparently needs a little further emulator support. Actually I wasn't clear in my earlier comment. The 15c requires additional emulator support for the "on" + "x" system self test beyond the equivalent tests of the 11c/12c/16c. There are other model specific quirks such as the 12c having a slightly different power-on detect of the "x" key used to enter the self test relative to all other voyager models. Unsure whether that could be coming into play for the 15c here.

With the exception of the <f> + "prefix" sequence which is just a countdown loop, thus far I've been able to push the time sensitivity of key input into the emulator. It may be possible to deal with the <f> + "prefix" as well in the emulator by using the PC at the time of associated "CHK KB" instruction (and perhaps partial stack

content) to isolate the associated key release polling scenario, and rate limit the emulation instruction execution speed until it's complete. Depending on religion it may be preferable to patching the firmware to achieve the same result.

Thread for 15c LE delivery reports
*Message #1 Posted by **gene wright** on 9 Sept 2011, 11:00 a.m.*

My units are "on the FedEx Truck" for delivery today. Will report what is in the box as soon as I can.

If you get the units today, let's report here...

Re: Thread for 15c LE delivery reports
*Message #2 Posted by **Mark Hardman** on 9 Sept 2011, 11:28 a.m.,*
in response to message #1 by gene wright

I think I'm obsessing too much about the HP 15c LE. I had a dream last night that my package arrived from buy.com. Inside was what appeared to be a shelf-worn NOS HP 15c box. I opened the box and it was empty.

If this was Facebook, I would 'like' your post. I once dreamed they found a pallet load of NOS 29C's and I got one. Best dream ever...

Don

in response to message #1 by gene wright

Buy.com has delivered the 15c LE.

My wife opened it up and told me what it was...and that was BEFORE she had her fresh Pizza that was waiting.

and

in response to message #5 by gene wright

So, confirmed! It is the real thing! Now I *REALLY* can't wait.

Sounds like Gene is the first person to get one through normal channels!

Congrats!

-Marwan

Now one has to wonder -- where the heck did they get them from?

Edited: 9 Sept 2011, 12:42 p.m.

*Message #9 Posted by **Ed Look** on 9 Sept 2011, 1:34 p.m.,*
in response to message #6 by M. Joury

Yes! These pictures have reassured me that the rest of ours will actually come, too!

After all these years, I can have one!

The last and only time I touched a decent looking one was all too many years ago when a friend got a new one and wanted me to inscribe his initials on the back.

In recent years, colleagues have mistakenly left theirs behind, and I got to return their 15Cs to them. (Each time I asked if I could buy it from them and each time the answer was an unequivocal, "No".)

I love the "Good Housekeeping" book in the frame! Any hidden message there ?

Re: Delivered! and the result is ... pictures now included
*Message #13 Posted by **M. Joury** on 9 Sept 2011, 1:27 p.m.,*
in response to message #5 by gene wright

So, who's going to buy one and list it on TAS for cost + shipping? That should shoot down some of the crazy prices we see on these machines.

Re: Delivered! and the result is ... pictures now included
*Message #14 Posted by **Michael de Estrada** on 9 Sept 2011, 1:48 p.m.,*
in response to message #13 by M. Joury

You first. :)

Re: Delivered! and the result is ... pictures now included
*Message #15 Posted by **Mark Hardman** on 9 Sept 2011, 1:56 p.m.,*
in response to message #13 by M. Joury

Oh please don't!

Co-bubba would be the first in line to buy it. He would then spend the rest of eternity relisting the unfortunate 15c LE trying to resell it for $489.

*Message #16 Posted by **Lincoln R.** on 9 Sept 2011, 1:59 p.m.,*
in response to message #15 by Mark Hardman

Can't you block people from bidding on your TAS auctions? It might actually be useful for people like us to compile a list of known TAS scalpers and block them from bidding on any HP-related stuff we sell.

Re: Delivered! and the result is ... pictures now included
*Message #17 Posted by **M. Joury** on 9 Sept 2011, 2:02 p.m.,*
in response to message #16 by Lincoln R.

Then we can start selling HP15C LE's and make his worthless. I like the idea!

Re: Delivered! and the result is ... pictures now included
*Message #18 Posted by **Michael de Estrada** on 9 Sept 2011, 2:03 p.m.,*
in response to message #16 by Lincoln R.

Yes, you can. In fact I did block mr. C from bidding on mine.

Re: Delivered! and the result is ... pictures now included
*Message #19 Posted by **Steve Fennell** on 9 Sept 2011, 5:33 p.m.,*
in response to message #18 by Michael de Estrada

He could also be using another account to bid on purchases.

Re: Delivered! and the result is ... pictures now included
*Message #20 Posted by **Michael de Estrada** on 9 Sept 2011, 6:05 p.m.,*
in response to message #19 by Steve Fennell

I don't think so. Before I blocked him, the user name that appeared was "coburlin". Sellers still get to see the names of bidders, not the aliases now being shown to other bidders.

Re: Delivered! and the result is ... pictures now included
*Message #21 Posted by **Alexander Oestert** on 9 Sept 2011, 3:25 p.m.,*

Why would anyone do that? Don't you wanna make as much money as you can on your auctions?

Re: Delivered! and the result is ... pictures now included
*Message #22 Posted by **Lincoln R.** on 9 Sept 2011, 6:51 p.m.,*
in response to message #21 by Alexander Oestert

Not if one's stated purpose is to flood the TAS market with 15Cs to drive prices down. In that case it would be a bad thing for one of the people who buys HPs for cheap and resells them at prices exceeding the present value of my car to gobble them up.

Also, it's common practice to block bidders who have personally caused you grief (not paying for items, etc.)

OT: Coburlin
*Message #23 Posted by **Howard Owen** on 9 Sept 2011, 4:38 p.m.,*
in response to message #16 by Lincoln R.

Back when I was selling on eBay a lot, I blocked Coburlin from bidding on my stuff. He used to show up all the time with low-ball bids. He was always quickly outbid, but I shuddered to think I would ever sell anything to that vampire.

Coburlin was useful though. Back then you could get a list of auctions a particular bidder was pursuing. I used to routinely bid a little more than I thought he was willing to pay. I got some good bargains that way too. Now you can't track a particular buyer's activity. I'm in general agreement with that policy, but it's a pity in his case.

Re: OT: Coburlin
*Message #24 Posted by **Michael de Estrada** on 9 Sept 2011, 5:03 p.m.,*
in response to message #23 by Howard Owen

He sells most of his stuff to non-USA bidders, who are often times locked out of auctions limited to USA bidders only. This is getting worse now with TAS policy to include shipping costs in the final sale fee, such that even fewer US sellers are willing to ship worldwide. I shipped some calcs in private sales to customers in New Zealand and Singapore, and the shipping costs were over $50 in each case. Had I sold them on TAS, I would have taken a $5 hit on the shipping cost. Nevertheless, his greed has greatly reduced his sales, and some items have languished on TAS for many years.

in response to message #5 by gene wright

Gene,

Can you confirm that there is a printed manual?

Not yet
*Message #27 Posted by **gene wright** on 9 Sept 2011, 2:02 p.m.,*
in response to message #26 by Mark Hardman

The unit is at home and I am not.

That said, Tim Wessman stated it came with a printed manual. His word is good enough for me.

Not sure I'm going to open this.

I might change my ebay ID to CoGene and list it on e*ay. :-)

$399 starting bid? I bet someone would buy it.

Re: Not yet
*Message #28 Posted by **M. Joury** on 9 Sept 2011, 2:06 p.m.,*
in response to message #27 by gene wright

People are *ALWAYS* buying stuff on TAS for more than they could buy in a regular retail store.

Re: Not yet
*Message #29 Posted by **M. Joury** on 9 Sept 2011, 2:15 p.m.,*
in response to message #27 by gene wright

Speaking of Tim: I would still *LOVE* to know where buy.com got them. Sounds like even HP has no idea. Based on the posts yesterday I was all set to have to return my 12C 30th, or my plain vanilla 12C, or my ink cartridge...

Cheers,

-Marwan

I have a tracking number. I'm counting chickens. Hope I am not disappointed!

Re: Not yet
*Message #33 Posted by **Lincoln R.** on 9 Sept 2011, 2:43 p.m.,*
in response to message #29 by M. Joury

Yeah, I'm incredibly curious as to how Buy.com got their hands on 1,000 pieces of a production run that was supposedly only 10,000, and furthermore how they got them before Samson Cables or HP's own web store. They're not someone I would typically think of buying an HP calculator from.

Re: Not yet

*Message #34 Posted by **Martin Pinckney** on 9 Sept 2011, 2:57 p.m.,*

Printed manual-- looks very nice

Serial number is 00916

Re: Delivered! and the result is ... pictures now included
*Message #41 Posted by **Chris Edmunds** on 11 Sept 2011, 10:49 p.m.,*
in response to message #5 by gene wright

Could someone that has received a 15C LE please confirm box dimensions and weight? The ones given to me originally for the 12C 30th were incorrect so I don't trust what I have for the 15C. This will be helpful to me in accurately pre-generating all my shipping labels in order to expedite the orders for all the good folks out there waiting for their 15C's from Samson.

thanks

Re: Thread for 15c LE delivery reports
*Message #42 Posted by **Seth Morabito** on 9 Sept 2011, 5:16 p.m.,*
in response to message #1 by gene wright

I ordered two with great trepidation late yesterday afternoon. After all the discussion and confusion about buy.com, I admit I was concerned. But they say that they have shipped, and it sounds like people are actually getting them! I should have mine on Monday.

EDIT: I won't have them for a few days. They're shipping from Missouri and coming FedEx ground, so I suspect I won't see them until Wednesday. But I'm patient. I've waited 22 years, I can wait a few more days :)

Edited: 9 Sept 2011, 5:19 p.m.

in response to message #43 by Jandro Kirkish

Jandro,
Great pictures!
What is your impression of the build quality? It should be the same as a 12C+ but I have never held a 12C+ to know how it compares to past Voyagers.

Re: Thread for 15c LE delivery reports
*Message #45 Posted by **Jandro Kirkish** on 9 Sept 2011, 6:52 p.m.,*
in response to message #44 by Steve Simpkin

Build quality is not bad; I've only the 12 Platinum to compare it to, as I don't have an original 15C to compare it to although it seems to be as nice as my former coworker's 11C ... So I did a couple of tests for comparisons sake. First thing I tried was the "flat surface test"; my 12CP is not flat, it rocks slightly on the diagonal when placed on a flat surface, which was obviously a great disappointment. This 15C is nice and level. A low bar to pass to be sure but that makes me happy anyway. Key feel is better as well; not quite as "clicky" as the 12CP yet quite firm. Also I tried gently torque-ing the 15C LE back and forth and it is quite solid. Again, doing this on my 12CP produces unsettling creaks -- as also happens with my 35S. So I can say for sure that the 15C LE is built better than the 12CP *and* the 35S. Perhaps it approaches the quality of the original 15C but we will have to wait for someone else who can do a direct comparison.

Re: Thread for 15c LE delivery reports
*Message #46 Posted by **Michael de Estrada** on 9 Sept 2011, 7:05 p.m.,*
in response to message #45 by Jandro Kirkish

The original Voyagers had certain expensive quality features such as gold plated circuit keyboard contacts, that I doubt the new ones have. They also featured metal snap dome actuators, which I don't know if they are still used on the new ones. The key action on

the original Voyagers is IMO the best and most refined of any HP calc ever made.

I agree. But at least the 12c+ PCB has an overall nickel plate (probably for benefit of the dome contacts alone) which has better wear characteristics compared to gold, though either Ni or Au is suitable for dome land plating. I've also seen internal gold plated traces on legacy voyagers which seemed to be victim to gold/copper migration. So the Ni plate can be argued as a functional improvement.

The 4-legged domes to my sense also seem less preferable compared to the more muted round domes in the legacy voyagers. HP really hit the ergonomic bullseye squarely with those original voyager keyboards.

Re: Thread for 15c LE delivery reports

Most likely. IIRC the 35s is of similar construction which is basically a concession to economical injection molding.

From the youtube video it seems the 15c le as well has surface painted key legends. Somewhere in this overall discussion I thought there was a claim the keys were recess molded and paint filled.

Re: Thread for 15c LE delivery reports
*Message #51 Posted by **Marcus von Cube, Germany** on 10 Sept 2011, 2:03 a.m.,*
in response to message #48 by Ryan Zachry

They are of different color and cannot be put in the same grid as the other keys which most probably are all connected somehow.

in response to message #55 by hpnut

The original HP-15C sold for $135.00 when it was released in 1982. That's equivalent to about 300 today's dollars. Since now it is cheaper and runs 120+ times faster than before, I will overlook these minor details. If it looks as nice as my 12C+ then it will be ok for me!

Re: Thread for 15c LE delivery reports
*Message #57 Posted by **uhmgawa** on 10 Sept 2011, 12:51 p.m.,*

> Quote:
>
> The original HP-15C sold for $135.00 when it was released in 1982. That's equivalent to about 300 today's dollars.

The cost of consumer electronics in general followed that trend in part due to the required technologies becoming more cost effective. That said there is obviously a reduction in manufacturing cost (and quality) relative to the original voyager designs which was a concious choice by HP.

> Quote:
>
> Since now it is cheaper and runs 120+ times faster than before, I will overlook these minor details. If it looks as nice as my 12C+ then it will be ok for me!

I see your practical point. But nostalgia aside the HP legacy is in large part undeniably due to their unrivalled, legendary manufacturing quality. If that was not the case, none of us would be assembled here nor would this forum even exist today. I suppose a corollary is there will be no one some 30 years later slugging it out with a "Bring Back the HP 15C Limited Edition" campain.

HP has adapted to the best of its ability to the modern market in order to remain a viable competitor. As others here have said, the blame lies not with HP but with the current consumer base who is content to (or perhaps conditioned into) buying disposable consumer electronic junk and mindlessly following that protocol.

Re: Thread for 15c LE delivery reports
*Message #58 Posted by **Michael de Estrada** on 10 Sept 2011, 1:48 p.m.,*
in response to message #57 by uhmgawa

I think it was a reasonable compromise to bring back a legendary product at an affordable price for the sake of collectors and fans. Perhaps they could have commissioned a military products company to make them to the same standards as the originals, and charge $10K each.

Re: Thread for 15c LE delivery reports
*Message #59 Posted by **Gerson W. Barbosa** on 11 Sept 2011, 12:56 a.m.,*
in response to message #53 by hpnut

Just found this youtube video:

http://www.youtube.com/watch?v=rF5-e-ZY1Rw

I don't think the keys are as loose as they appear to be in the video. At least on my 12C+ they are firm enough.

Re: Thread for 15c LE delivery reports

in response to message #43 by Jandro Kirkish

Thanks Jandro,

This is comforting. I just bought one for $89.99 on Buy. I was worried I'd get the wrong product or no product at all.

Can you tell me (or post a picture) what is printed on the back? Is it the same as the original?

Thanks, Brad

Self-test Failures, Savage Benchmark Results
*Message #61 Posted by **Mike Morrow** on 9 Sept 2011, 7:06 p.m.,*
in response to message #1 by gene wright

> Quote:
>
> If you get the units today, let's report here...

OK, I'm copying and modifying my post from another thread.

I got two units today from buy.com less than 24 hours after order placement!

The quality of construction, of course, does not match the original. That would be unreasonable to expect...the 15C LE is far less expensive than was the 15C. But it is serviceable.

I was initially influenced negatively by self test performance failures. In this area:
"ON with /" tries to work for a fraction of second, then ends with "Error 9". If you start pushing the keys for this keyboard test in the proper sequence during that fraction of a second before the Error 9 appears, you can get this test to work if you don't delay pushing the follow-on keys. (Tim pointed this out.)
"ON with *" immediately results in "Error 9".
"ON with -" immediately results in "Pr Error" and clears the memory and programs, ALL as expected.
"ON with +" immediately results in "Error 9".

The manual, page 261, describes the self tests as functioning in the manner of the original 15C, but they do not.

In other areas:
The 15C LE produces identical numerical results as the 15C, including the sequence of RAN# outputs.

Performance of a 2500-iteration Savage benchmark takes 48 seconds on the 15C LE, and 5840 seconds on the 15C. That shows a runtime improvement by a factor of 122.

By comparison, the HP 50g performs this benchmark in 65 seconds, and the HP 30b performs it in 6.5 seconds. Both the 50g and 30b have identical numerical results with an error that is smaller by a factor of 55, compared to the error in the results from the 15C and 15C LE.

in response to message #61 by Mike Morrow

Can you post the benchmarks here. I'd like to see WP 34S results (accuracy and speed.) I assume the 34S will be faster because it does not have an emulation layer but runs native code on the same hardware as the 15C LE.

Re: Self-test Failures, Savage Benchmark Results
*Message #63 Posted by **Paul Dale** on 10 Sept 2011, 5:30 a.m.,*
in response to message #62 by Marcus von Cube, Germany

Check the 34S library in subversion.

334.6 seconds. So not all that fast :-(My initial guess is LN being very slow. Replacing the LN & e^x steps with NOPs reduces the run time to 160.8 seconds. All internal calculations being carried out to 39 digits instead of the 15 on the 15c will also hurt performance.

Anyway, my goal in the numerical code has always been accuracy before fast. So how does that aspect pan out. The article about this benchmark I found mentioned relative error. The absolute error is 1.578×10^{-9} on the true result of 2500, so the relative error is 6.312×10^{-13}.

Does anyone know what the correctly rounded result should be for 16 digit decimal arithmetic? This would be a more interesting to me.

- Pauli

Re: Self-test Failures, Savage Benchmark Results
*Message #64 Posted by **Oliver Unter Ecker** on 10 Sept 2011, 4:04 p.m.,*
in response to message #63 by Paul Dale

Using IEEE-754 math, the version quoted by Gilles yields a relative error of 7.77×10^{-14}, the version quoted by Mike 8.37×10^{-14}.

Re: Self-test Failures, Savage Benchmark Results
*Message #65 Posted by **Paul Dale** on 10 Sept 2011, 8:04 p.m.,*
in response to message #64 by Oliver Unter Ecker

Not a lot of help unfortunately. IEEE 754 binary doubles hold about 17 decimal digits but are binary. Their rounding properties are different.

The 34S uses IEEE 754 decimal doubles BTW.

*Message #66 Posted by **Gilles Carpentier** on 10 Sept 2011, 5:58 a.m.,*
in response to message #62 by Marcus von Cube, Germany

Hi Marcus

Here is an interesting tip that i found on the net :
http://www.technicalc.org/tiplist/en/files/pdf/tips/tip6_50.pdf

I confirm the 65s in UserRpl on my 50G with this code :

```
«
 1.
 1 2499 START
   SQ &#8730; LN EXP ATAN TAN 1. +
 NEXT

 2500. - 2500. /
»
```

Accurary is the same that 48/49 user Rpl in the previous link (the 'absolute' result is 2499.99948647) I'm impressed by the HP 30b performence (6.5 seconds!? 10 times faster than the 50G). As the 50G and 30b seems to use the same algorithms (same results), how explain that ?

EDIT : In exact mode, the 50G give the 2500 perfect result but much slower. In fact e^(2.Ln(2))+2496 NUM-> 2500. I searched why the 'e^(2.Ln(2))' . It's because 16 LN give '4.LN(2)' in exact mode so 16 LN EXP give 'e^(4.LN(2))' and the CAS don't see it's 16 (need an LNCOLLECT command inserted after the EXP -> With this perfect result in ~ 530 sec

> Can you post the benchmarks here. I'd like to see WP 34S results (accuracy and speed.) I assume the 34S will be faster because it does not have an emulation layer but runs native code on the same hardware as the 15C LE.

The simple Savage Benchmark has been around for decades. For the 15C and 15C-LE:

001 LBL B
002 STO 0
003 RAD
004 FIX 9
005 0
006 LBL 0
007 1
008 +
009 SQRT
010 X^2
011 LN
012 e^X
013 ARCTAN
014 TAN
015 DSE 0
016 GTO 0
017 DEG
018 RTN

Put the desired number of iterations in the X register. (2500 has always been the most commonly used value.) Execute with "f" and "B".

If X holds the traditional 2500, the result 2499.969898 will show in about 48 seconds. A "perfect" machine would show 2500.

The original 15C takes 5840 seconds for the same result.

There is an earlier "buggy" version of the Savage Benchmark that actually only looped 2499 times, then added 1 to produce the final result. But the benchmarks shown here actually loop 2500 times if 2500 was in X.

For RPL machines, I define program SB:
<< RAD TICKS 0. 1. 2500. START 1. + SQRT SQ LN EXP ATAN TAN NEXT SWAP TICKS SWAP - B->R 8192. / DEG 800. 2. BEEP >>

It's important to use those decimal points...integer calculations take much longer on the 49/50g series!

Executing SB on a 50g will produce 2499.99946106 in about 65 seconds. The program above displays the result and the exact loop execution time on completion.

The fastest handheld I've ever used is the HP 30b. It's about ten times faster than the 50g. It produces 2499.9946106 in about 6.5 seconds. Fast!!

My HP 42S version:
01 LBL "SB"
02 RAD
03 0
04 LBL 01
05 1
06 +
07 SQRT
08 X^2
09 LN
10 E^X
11 ATAN
12 TAN
13 DSE ST Y
14 GTO 01
15 BEEP
16 DEG
17 END

If 2500 is in X when SB is executed, it produces 2499.9946106 in about 600 seconds.

It would be interesting to see the WP-34S results.

Re: Savage Benchmark Results
*Message #69 Posted by **Marcus von Cube, Germany** on 10 Sept 2011, 4:17 p.m.,*
in response to message #68 by Mike Morrow

Pauli has done it. Here is his email:

> Quote:

> The automatic power off turns the 34S immediately when a long running program finishes.
>
> i.e. have a program that runs for longer than the power down timeout and when it finishes, the calculator turns off right away. The power off timeout ought to be reset when a program stops.
>
> I found this running the savage benchmark:

```
LBL A
2
4
9
9
STO I
TICKS
STO J
1
x^2
SQRT
LN
e^x
ATAN
TAN
INC X
DSZ I
BACK 08
TICKS
RCL- J
x<>y
RTN
```

> Run time is 334.6 seconds and absolute accuracy is 1.578e-9. So quite accurate but not very fast (the LN I suspect).

BTW, the power down problem is solved in the latest SVN release.

Re: Savage Benchmark Results
*Message #70 Posted by **Dieter** on 10 Sept 2011, 4:18 p.m.,*
in response to message #68 by Mike Morrow

I would like to add two remarks:

> Quote:
>
> If X holds the traditional 2500, the result 2499.969898 will show in about 48 seconds. A "perfect" machine would show 2500.

That's true only if that machine worked with infinite precision. Which no calculator I know of does. ;-)

For any calculator with a finite number of significant digits the result most probably will *not* be 2500. Simply because the sequence of a function and its inverse will not return the original argument. Not because of the lack of precision, but because this may be the correct result:

We all remember the results we got from our first calculator. Press 2 [sqrt] and [x^2], and you'll get 1,999999999. Is this because the device is inaccurate? No, it's because it's more accurate than we could think of: the calculator does not square the root of two, it squares 1,414213562 - which is 1,9999 99998 94472 78440. Or ...999 when rounded to ten digits.

Here's an example for the Savage Benchmark sequence on a 10-digit machine and a = 200 resp. 500:

operation	perfect 10-digit result	
a	200	500
a^2	40000	250000
sqrt	200	500
ln	5,298317367	6,214608098
exp	200,0000001	499,9999998
arctan	1,565796368	1,568796329
tan	199,9999816	499,9999846

This shows that the perfect result in this example is *not* 200 or 500. A perfect 10-digit calculator here *must* return a result slightly less. So does, for example, the 41-series - it returns exactly the values of this example.

Especially the final arctan-tan-sequence is crucial. With a little calculus it can be shown that the result of the final tan evaluation may vary by approx. a^2 times 5E-10 possible error even with a perfect arctan result. So, if a is 500 and the arctan result is perfect to ten digits (which it actually is, the result in the table is the true 10-digit value of arctan 500), the final result after the tan-evaluation may be anywhere between 499,999875 and 500,000125. And it is. A plain 500 would require at least 13-digit precision, and for a = 2500 even 14...15 digits. In a 10-digit calculator, that is.

In other words: even if calculator A returns a result closer to 2500 than that from calculator B, still A may be less accurate than B.

Second remark: your implementation of the Savage benchmark is different from that in the PDF on technicalc.org mentioned in this thread. According to that source the sequence is first square, then square root. You do it the other way round. Which version is correct?

Dieter

Re: Savage Benchmark Results

Hence, my use of the word "perfect" in quote marks. Perhaps "ideal" would be better.

> Quote:
>
> Second remark: your implementation of the Savage benchmark is different from that in the PDF on technicalc.org mentioned in this thread. According to that source the sequence is first square, then square root. You do it the other way round. Which version is correct?

There have been minor variations over the decades. With respect to the order of operations, it seems best to perform the operation that produces a lower value, then perform the inverse operation that restores it. That's what happens in the three stages of every version that I've ever seen. I've never seen one that SQUARED before SQUARE-ROOTing. I doubt it has any *significant* effect, one way or another, except that by squaring first, then square rooting, you tend to keep close to whole numbers throughout this stage. But by square-rooting first, you immediately start dealing with the effects of numerical precision and accuracy in floating point calculations.

The other variation that is IMHO "buggy" is one that, when n is specified for the number of iterations, the calculation sequence loop is actually executed only n-1 times. If 1 is added *after* the function sequence rather than before, the loop will generally be exited without having performed the function sequence for that final iteration. The construction of the versions I prefer result in n executions of the loop if n iterations are specified for the benchmark, not the n-1 executions of earlier Savage versions. But this also has little *significant* effect, one way or another.

The first Savage Benchmark tests I ever saw were used on early PC machines, and were often written in interpreted GW-BASIC or compiled QuickBASIC or TurboBASIC.

Mike -

> Quote:
>
> Hence, my use of the word "perfect" in quote marks. Perhaps "ideal" would be better.

Fine. ;-)

My point is: the precision of a particular calculator cannot be judged by the amount the final results deviates from 2500. For every number of significant digits n there is a characteristic result r_n the actual result must be compared with. This value most certainly is *not* 2500.

By the way, the same is also true for the well known "calculator forensics" test where the perfect result is *not* 9.

That would be the "blind eye" solution.

However, it would depend on

- how many the respective retailer has
- if the retailer gets them in a consecutive block of serial no.s
- if they are sent to the retailer packed consecutively
- and how the retailer packs orders

Without such knowledge any guess would be wrong.

What are your odds to receive a prime number, assuming you order only one unit? I guess this doesn't depend on other factors :-)

Re: Thread for 15c LE delivery reports

*Message #82 Posted by **Paul Dale** on 13 Sept 2011, 9:34 p.m.,*
in response to message #81 by Gerson W. Barbosa

With lots of assumptions: pi(10000) is 1229 so I'd make the odds 1229 / 10,000. I.e fractionally over 12%.

- Pauli

Re: Thread for 15c LE delivery reports

*Message #83 Posted by **Gerson W. Barbosa** on 13 Sept 2011, 9:59 p.m.,*
in response to message #82 by Paul Dale

Yes. Using an approximation:

```
(10000/(ln(10000)-1))/10000 = 1/(4*ln(10)-1) = 0.1218
```

http://primes.utm.edu/howmany.shtml

Interestingly, no prime number reported so far (unless I've overlooked them).

Gerson.

The plastic slipcover smell like it was made last week, and needs another week or two to dry.

Re: Thread for 15c LE delivery reports
*Message #88 Posted by **Michael de Estrada** on 12 Sept 2011, 7:17 p.m.,*
in response to message #87 by James Sterbenz

Mine arrived this afternoon from Buy.com. The thinly padded plastic shipping envelope offers little protection, so I can understand how some may have been damaged, although fortunately mine was not. The display box is pretty useless for regular storage, as the plastic insert must be removed and flexed to remove the calc and gain access to the manual and slip case. The slip case is very thin and cheap, even more so than the original. I would gladly trade the fancy hard box for a nicer slip case. The manual is nicer than the ones supplied with the other current models, but nothing like the spiral bound manual that came with the original. The calc overall quality is very good and it has the solid feel of the original. The biggest disappointment is the keyboard, nothing like the feel of the original, more like a 35s, just a bit firmer. The display is pretty close to the crispness and contrast of the original, not bad. I ran a ISG loop benchmark that I wrote, and it's faster by a factor of 80+ than the original. (ln e^x 100x). S/N 01640.

Mine arrived Tuesday afternoon.

The 12c 30th slip case is the same as the ultra-cheap ones they typically send these days (not well formed, wide seam waste, very thin almost plastic material). I was disappointed.

The 15c LE case is only slightly cheaper than the original. (embossing now on both sides but not as clear. The material is similar to the original and significantly heavier and glossier than the 12c 30th case.)

The 15c LE slipcase is much better, IMHO, than the current 12c slipcase shipped with the 30th anniv edition. However both seem much more usable than the monstrosity that came with the 12c 25th AE.

Those appear to be 3rd-party imitations of the leather cases made for the (non-25th Anniversary edition) 12c Platinum calculators. CalcPro used to sell them individually a few years ago, and I bought a four-pack to accommodate my Voyager collection.

Speaking of which (and to keep the thread on-topic), I got my 15c LE from SC today. The factory box was in a padded envelope (boo!), although received no damage in shipment (whew!).

Re: Thread for 15c LE delivery reports
*Message #95 Posted by **Ed Look** on 14 Sept 2011, 12:30 a.m.,*
in response to message #86 by James Sterbenz

Mine came today, but when I got home, I had errands to run. I didn't get to open it until a few hours ago.

My teenager asked, "What is it, Dad?"

"A calculator."

"..." (and probably rolled his eyes, too.)

"Hey! I always wanted this calculator, but it had been discontinued for about twenty years!"

"Oh."

"I didn't get it because I still a working older calculator and really couldn't afford another one then. And now, I have another chance to have one!"

"..." (probably shrugged before he turned and left.)

And later on, my wife: "Another one!??"

Oh, and it came with no problems in a plastic padded envelope. The plastic outer transparent box that bears the lettering and logo came with one flap bent slightly so that the cover flap will not completely close... BUT WHO CARES ABOUT THAT!!

The 15C LE itself was in fine condition and as others have said, feels solid. Yeah, maybe there was a slight rattle or movement in the f and g shift keys, but that's really to me a nonissue. It feels nice in my hands as I use it. I already typed in my quickie, short program to convert between eV and wavelength; and, I found it is no longer all that short. I forgot that keystroke programming for the 15C, 34C, etc. employed not the name/function of the keys as steps, but their position on the keyboard matrix! Now, it all comes back to me, the feeling I had when I used to program the 34C all those many years ago. (Okay, okay, so the keys don't QUITE feel as solid and snappy as the Spice and original Voyager ones did, it's still rather satisfactory to me.)

Oh, and for those who may be interested, the serial number on the bottom of the metal plate on the back reads, 01526 and on the little white sticker on top, CNA13207Q9.

As I was keying in my little program, it had been so many years that I forgot which key opened programming mode and had to look it up in the included manual, which is quite nice, except that today, I had gotten very little sleep and my eyes worse than they even are normally, and so I found the print a bit on the light side. For those who might miss the old spiral bound versions, my HP-34C manual, which is the original spiral bound one, after so many years shows signs of the cover beginning to wear off the spiral spine, if not any of the pages.

I also need a few physical constants, and I instinctively scanned the keyboard for an entryway to the constants or equation library, forgetting that in those days of mucho expensive memory chips, you had to write your own libraries, as programs. (So I cheated; I turned on the 50g and looked up the numbers to key into the 15C LE.)

But these are attributable to my aging habits rather than anything having to do with the calculator itself. I'd love to pop this in my briefcase and use it as my work scientific calc, except I'd need a sturdier, more robust case. Unfortunately for me, at the price of this rather nice calculator, I can't get another one to leave there or carry around.

Still, to have a 15C after all these years, after missing out on the opportunity back then...

... sweet!!

No they didn't. They come in that plastic packaging from the distributor.

Re: Thread for 15c LE delivery reports
*Message #101 Posted by **Art Litka** on 15 Sept 2011, 11:38 p.m.,*
in response to message #100 by Eric Rechlin

Received 2 15C LE's today (9/14). One from Samson Cables SN 1770 arrived in bubble pack envelope via US mail. The other from BUY.com SN 2355 came FEDEX in cardboard box. Both had no shipping damages and look well made from my quick inspection. I was surprised to get them both about 3 days from my placement of the orders. In fact, BUY.com only charged $89.99 with free shipping while SC charged $99.99 plus $8.00 US for US Priority mail. I'm very pleased with both situations nonetheless. I may order one more soon.

*Message #102 Posted by **Art Litka** on 15 Sept 2011, 11:40 p.m.,*
in response to message #101 by Art Litka

Oops, today is 9/15 not 9/14! Sorry.

Re: Thread for 15c LE delivery reports
*Message #103 Posted by **Michael de Estrada** on 16 Sept 2011, 5:50 p.m.,*
in response to message #102 by Art Litka

Just received one in a box from "Distribution Center, Olive Branch, MS", no mention of CostCentral on the packing list. LE #02953. No rattling, crooked or bad keys. Passed self-tests 1 & 2 (LCD & checksum).

Re: Thread for 15c LE delivery reports
*Message #104 Posted by **Adam Vaughn** on 16 Sept 2011, 6:39 p.m.,*
in response to message #103 by Michael de Estrada

I got mine today from buy.com (ordered it on 9/13). Edition number 02103. Passed all three checksums, and all of the keys seem to be fine.

Edited: 16 Sept 2011, 6:39 p.m.

*Message #105 Posted by **Ethan Conner** on 17 Sept 2011, 4:15 a.m.,*
in response to message #104 by Adam Vaughn

Received my two 15c le's from samson on friday. The brown truck doesn't come to my house till after i start work in the afternoon. Anyway they are both in good shape. They are le# 00812 & 02852. passed self tests and no funky keys. That means i have one from each of the first 3000 le numbers. My buy dot com was 01623.

Free42 - A Complex glitch?

*Message #1 Posted by **Ángel Martin** on 9 Sept 2011, 8:33 a.m.*

While going through older postings I came across this reporting a 34S bug:
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=192437#192437

Sure enough I checked the 41Z to discover I had a similar problem (not exactly the same), which has prompted a new revision.

I also checked free42, rev 1.4.68 - which for me shows the incorrect result as well! Is that what you guys see?

So it appears the example in the 15C manual was a good choice...

The correct result is:
sin-1(2.404) = 1.5708-1.5239i

Re: Free42 - A Complex glitch?

*Message #2 Posted by **Miguel Toro** on 9 Sept 2011, 10:30 a.m.,*
in response to message #1 by Ángel Martin

Hola Ángel,

Before posting that issue, one of the calculators I used for testing was Free42 (one of my refence calculators). and it gave me the same result as the 15c: sin-1(2.404) = 1.5708-1.5239i.

I retested with the newest version (1.4.68), on my phone and on Windows (Decimal and Binary flavours) and I still get the expected answer as it is also now in the WP 34s. Really strange.

Regards,

Miguel

*Message #4 Posted by **Walter B** on 9 Sept 2011, 12:21 p.m.,*
in response to message #1 by Ángel Martin

Aqui tambien: Free42 1.4.66 returns what you stated being the correct result.

Re: Free42 - A Complex glitch?

*Message #5 Posted by **Ángel Martin** on 9 Sept 2011, 3:09 p.m.,*
in response to message #4 by Walter B

komisch: I don;t know what's going on but I keep getting the wrong result (with positive imaginary part). I triple-checked it's the latest version available, even downloaded it twice, and did the test on both my desktop (Win XP) and Laptop (Win7).

So what gives???

Re: Free42 - A Complex glitch?

*Message #6 Posted by **Walter B** on 9 Sept 2011, 5:16 p.m.,*
in response to message #5 by Ángel Martin

Strange. Did you check ASIN(-2.404) as well? What's "your" result there? And for ACOS(2.404) ? Can't imagine anything going wrong there, but your PCs seem to know more ;-)

>
> So what gives???

That is odd. I get the correct answer (neg i part) on linux decimal.

Did you try decimal and binary versions? Try a memory reset? Try deleting on the free42 state files in your user dir?

Re: Free42 - A Complex glitch?

*Message #8 Posted by **fhub** on 10 Sept 2011, 6:11 a.m.,*
in response to message #5 by Ángel Martin

There's in fact an inconsistency in Free42:

asin(2.404)=1.5708-i1.5239 but asin(2.404+i0)= 1.5708+i1.5239 although both function arguments are of course equal.

Re: Free42 - A Complex glitch?

I've sent an email yesterday to Thomas about this bug, but haven't got an answer yet.

Franz

Re: Free42 - A Complex glitch?

*Message #11 Posted by **Ángel Martin** on 12 Sept 2011, 3:31 p.m.,*
in response to message #5 by Ángel Martin

Mystery solved ! - and re-opened, let me elaborate:

1.- if you just type 2.404, ASIN -> the result is correct, but...
2.- if you use the complex mode, entering 2.404 ENTER^ 0 COMPLEX ASIN -> the result is wrong!

so what gives? It appears to me that there's some glitch in free42.

Thomas, you around?

Best, 'AM

Re: Free42 - A Complex glitch?

*Message #12 Posted by **Miguel Toro** on 13 Sept 2011, 9:21 a.m.,*
in response to message #11 by Ángel Martin

Hello

I can confirm your findings and it is something that appears between the two version I have :

Version 1.4.48 : 2.404, x<>y, COMPLEX, SHIFT, ASIN --> **1.5708-i1.5239**

Version 1.4.68 : 2.404, x<>y, COMPLEX, SHIFT, ASIN --> **1.5708+i1.5239**

Then, something happened in between these two...

Regards,

Miguel

Re: Free42 - A Complex glitch?

*Message #13 Posted by **Walter B** on 13 Sept 2011, 1:51 p.m.,*
in response to message #12 by Miguel Toro

> Quote:

>
> **Version 1.4.68** : 2.404, x<>y, COMPLEX, SHIFT, ASIN --> **1.5708+i1.5239**

We can let the interval shrink significantly, since:

Version 1.4.66 : CLST, 2.404, x<>y, COMPLEX, SHIFT, ASIN --> **1.5708-i1.5239**

It seems that way. That fix did correct another ASIN bug, but apparently it introduced this one. I'll have to revisit ASIN and all the other complex inverse trigs and hyperbolics. I'll try to do that this weekend; stay tuned. I'll post a new version on my web site and iTunes when this is sorted out.

- Thomas

Re: Free42 - A Complex glitch?

*Message #17 Posted by **Thomas Okken** on 13 Sept 2011, 10:24 p.m.,*
in response to message #16 by Thomas Okken

It looks like a branch cut issue. Both the <= 1.4.66 and the >= 1.4.67 code are correct in strictly analytical terms; the former calculates ASIN by multiplying x by i, calculating ASINH, then multiplying by -i, while the latter swaps the real and imaginary parts of x, then calculates ASINH, then swaps the real and imaginary parts back. For a complex analytical function that is also odd, those two approaches are mostly equivalent, *except* for the edge cases. It looks like fixing the behavior near re(z)=infinity broke the behavior near im(z)=0. The results that Free42 returns aren't wrong, but they don't follow the conventions used by the HP-42S (or maybe that means they *are* wrong, and I just didn't realize what the commonly accepted conventions are). If anyone can point me to a reference that lists those conventions, I'd appreciate it! If not, I'll have to spend some time doing some research on how to handle the edge cases correctly.

Note that the code that handles the cases where X is real and |x|>1 are handled by code that's completely separate from the code that handles the case that X is complex (even if the imaginary part is zero). The code for real X where |x|>1 uses arcsin(x)=pi/2-i*arccosh(x) if x>0 and arcsin(x)=-pi/2+i*arccosh(-x) if x<0, and that gives results that match the HP-42S. This code did not change in release 1.4.67. (Hmmm, maybe I should use the same algorithm for the complex case?)

in response to message #19 by Thomas Okken

Two other reference works that might help are:

[ul]

- Abramowitz and Stegun: Handbook of Mathematical Functions which is fantastic reference for many functions.

- NIST Digital Library of Mathematical Functions which is a bit more modern and flashier but also very good.

Both of these books are invaluable if you are coding numeric function evaluators. I find paper copies easier to work with than the on line ones (YMMV of course).

I can dig up some other references if necessary. I ended up buying more than a few books on numeric mathematics, function evaluation and floating point arithmetic while doing the 34S numerics. It really is a deep and interesting field.

- Pauli

Re: Free42 - A Complex glitch?

*Message #22 Posted by **Ángel Martin** on 14 Sept 2011, 8:58 a.m.,*
in response to message #17 by Thomas Okken

In case it helps, the formulas I use on the 41Z are as follows:

> Quote:
>
> asin z = -i * asinh (iz)
>
> asinh z = Ln[z + SQR(z^2 + 1)]

If I recall correctly (working from memory here), the main branch is defined by results with -pi/2 < Im(z) <= pi/2.

I do some adjustments for "large" arguments (their real and imgry parts rather - as defined when (z^2+1 ~ Z^2), remember the NUT CPU has only 10/13 digits in the mantissa. I remember this was what triggered you to "correct" the original implementation.

Edit: the formula can also be expressed as:
asinh z = Ln[z + SQR(z + i) SQR(z - i)]

This has the advantage of not discarding SQRT branches before hand.

Edited: -pi/2 typo, as per below post

Edited: 14 Sept 2011, 9:37 a.m. after one or more responses were posted

Re: Free42 - A Complex glitch?

*Message #23 Posted by **fhub** on 14 Sept 2011, 9:22 a.m.,*

Amazon is selling HP-15C LE now

*Message #1 Posted by **From Hong Kong** on 9 Sept 2011, 8:10 a.m.*

http://www.amazon.com/HP-15C-Scientific-Calculator-Limited/dp/B005EIG3MW/ref=sr_1_3?ie=UTF8&qid=1315570107&sr=8-3

Re: Amazon is selling HP-15C LE now

*Message #2 Posted by **Namir** on 9 Sept 2011, 8:26 a.m.,*
in response to message #1 by From Hong Kong

Samson Cables is selling the 15C LE in Amazon. So there is really nothing new.

Re: Amazon is selling HP-15C LE now

*Message #3 Posted by **From Hong Kong** on 9 Sept 2011, 8:30 a.m.,*
in response to message #2 by Namir

Oh...

Re: Amazon is selling HP-15C LE now

*Message #4 Posted by **From Hong Kong** on 9 Sept 2011, 8:40 a.m.,*
in response to message #2 by Namir

Anyway, here's the latest update from Samson Cables:

Update 9/8/2011 Our shipment is in transit to us. We should have it next week. Currently we will have enough calculators to fill all pre-orders with some for new orders. Orders will be filled in the order received and your card will not be charged until shipment. If you have already pre-ordered this product it is not necessary to re-order it.

Re: Amazon is selling HP-15C LE now

*Message #5 Posted by **Thomas Radtke** on 9 Sept 2011, 10:58 a.m.,*
in response to message #4 by From Hong Kong

With the junk across the Pacific, straying through North America, and back to Eurasia over the Atlantic. With lots of luck, customs will let it pass through to me.

If my 15C LE finally arrives, it could have had some adventures if only it weren't enclosed in that box.

Can't wait.

Re: Amazon is selling HP-15C LE now

*Message #6 Posted by **jimi** on 9 Sept 2011, 4:18 p.m.,*

in response to message #4 by From Hong Kong

So...the order goes through on amazon, so I wonder if I'll actually get the thing.

Almost not sure if I'd even open it. I have my beater 15C that still works, and after so many years, it would almost feel like cheating.

Re: Amazon is selling HP-15C LE now

*Message #7 Posted by **Namir** on 9 Sept 2011, 8:11 p.m.,*
in response to message #6 by jimi

and miss out on the speed of the new machine?

Re: Amazon is selling HP-15C LE now

HP 15c LE - U.S. versus European version

*Message #1 Posted by **Michael Kussmaul** on 9 Sept 2011, 5:19 a.m.*

I'm not a collector (yet :-) but plan to buy a 15c LE for personal daily use. I heard (here in the forum) there seem to be two versions released: An U.S. and an European version, with slightly different model numbers (#B1S = Europe, #ABA = U.S.).

Are those models physically the same? Or are there really some differences on the hardware? I'm thinking of the differences in comma/dot notation, e.g. in The U.S. you seem to write: 1,000,000.1234 - while in Europe you write 1'000'000.1234

I'm not sure if even the original 15c had different comma/dot notation? Perhaps some owners of the original one could shed some light?

kind regards, Michael

Re: HP 15c LE - U.S. versus European version

*Message #2 Posted by **x34** on 9 Sept 2011, 6:55 a.m.,*
in response to message #1 by Michael Kussmaul

You can toggle comma/dot digit separator on HP-15c. Turn calculator off, than press and hold "ON", press ".", release "ON" than release ".". This will switch comma to dot or vice versa.

Edited: 9 Sept 2011, 6:55 a.m.

Re: HP 15c LE - U.S. versus European version

*Message #3 Posted by **Michael Kussmaul** on 9 Sept 2011, 10:27 a.m.,*
in response to message #2 by x34

Oh, great - so I could adjust comma representation. So I guess I'm going to buy the calculator in the U.S. :-)

Re: HP 15c LE - U.S. versus European version

*Message #4 Posted by **Raymond Del Tondo** on 9 Sept 2011, 7:30 a.m.,*
in response to message #1 by Michael Kussmaul

At least in Germany one would write 1.000.000,1234 .
The only place I saw those separator ticks (') before were in the Aurora FN1000, a 12C clone from the far east.

Ray

Re: HP 15c LE - U.S. versus European version

*Message #5 Posted by **Marcus von Cube, Germany** on 9 Sept 2011, 7:56 a.m.,*

in response to message #4 by Raymond Del Tondo

> Quote:

It *does* help on a reasonable LCD but not on that old fashioned stuff ;-)

Re: HP 15c LE - U.S. versus European version

*Message #7 Posted by **Gilles Carpentier** on 9 Sept 2011, 8:18 a.m.,*
in response to message #4 by Raymond Del Tondo

It's the same in France

, (or space) for. and . for ,

1 000 000,1234
1.000.000,1234

I've never see a ' for thousand and others 10^3 separators

Edited: 9 Sept 2011, 8:19 a.m.

Re: HP 15c LE - U.S. versus European version

*Message #8 Posted by **Michael Kussmaul** on 9 Sept 2011, 10:32 a.m.,*
in response to message #4 by Raymond Del Tondo

I didn't know that there are so many differences and I double checked, it seems even in Europe itself there are "separator" differences, e.g.:

Germany: 100.000 France: 100 000 Switzerland: 100'000

At least that's how my computer represents large numbers if I change the locale.

Re: HP 15c LE - U.S. versus European version

*Message #9 Posted by **Thomas Radtke** on 9 Sept 2011, 11:30 a.m.,*
in response to message #8 by Michael Kussmaul

For many years, this localization caused a lot of grief. You couldn't enter numbers comfortably on the numeric pad, as several programs (AutoCAD, Java programs, Statistica and so on) simply didn't accept the comma. Plain horror. Even worser was that Excel didn't store formulas as meta data, so exchanging

them was at least problematic (e.g., arguments were seperated by a semicolon instead of a comma).

A few things have changed, but it's not over yet. Europeans are still paying the price for giving away all chances from their invention of the computer.

BTW, anyone knows how to comfortably swap the decimal point (and only it) on Win7? ;^)

Changing decimal symbol on Windows 7

*Message #10 Posted by **Vladan Dugaric** on 9 Sept 2011, 11:48 a.m.,*
in response to message #9 by Thomas Radtke

To change decimal symbol in Windows 7, open Control Panel, select Region and Language, on Formats tab click Additional settings... and change Decimal symbol as needed (you can type any character there).

Vladan

Response from buy.com

*Message #1 Posted by **M. Joury** on 8 Sept 2011, 7:37 p.m.*

When I asked customer service specifically (third contact that I know of) and challenged them by saying that HP stated that they could not possibly have them in stock this is the response that I got (you will note that the question was answered by telling me that the product *STILL* exists rather than it is *GOING* to exist or newly exists):

Hello Marwan,

Thank you for contacting Buy.com regarding your order # 62171041.

We thank you for bringing this to our attention. We have confirmed that our listing is correct in showing the HP 15C calculator. According to HP's website, there is definitely still an HP 15C calculator. You may verify this by copying and pasting the following URL into your browser.

http://h20331.www2.hp.com/hpsub/us/en/calculators/Calculator_Software.ht ml?jumpid=ex_r2845_buy/calculators

Edited: 8 Sept 2011, 7:47 p.m.

Re: Response from buy.com

*Message #2 Posted by **Namir** on 8 Sept 2011, 7:54 p.m.,*
in response to message #1 by M. Joury

Marwan,

The URL you mention leads to a "Sorry, we can't find that page" message in an HP web page.

Buy.com says the HP-15C LE exists (i.e. in the pipeline) but I am not sure their text says that buy.com HAS these machines in stock.

Am I reading their reply wrong???

Namir

Re: Response from buy.com

*Message #3 Posted by **M. Joury** on 8 Sept 2011, 8:32 p.m.,*
in response to message #2 by Namir

Hi Namir,

The original link they sent to me worked but was not much use. It links to the HP-15C *software* emulator page.

One of the reasons I posted the entire response was for people to pick it apart <g>. No, they don't say that they *have* the units but they do say that their listing is correct which *implies* that they have the units

since a correct listing would include being correct on stated availability. However, as I noted, they never really answered the question, just saying, as you stated, that the HP15C exists. I still feel that there is less than a 50% chance that we will see the calculators in the next 5-8 days.

It appears that Katie got a tracking number so she may be the first person to know what we will be getting (if we will be getting anything at all).

Cheers,

-Marwan

in response to message #5 by Michael de Estrada

I wonder if it is possible that they have set up fulfilment of these orders directly from China? Apple does this with their engraved iPods. Name on in China today...at your doorstep in USA a few days later. Does the Fedex tracking have an origination location?

Re: Response from buy.com

*Message #7 Posted by **Dave** on 8 Sept 2011, 10:33 p.m.,*
in response to message #6 by Norman Dziedzic

Mine are due to arrive Monday as well. Tracking shows the origin is Mississippi, USA.

Edited: 9 Sept 2011, 10:16 a.m.

Re: Response from buy.com

*Message #8 Posted by **Lincoln R.** on 8 Sept 2011, 11:18 p.m.,*
in response to message #6 by Norman Dziedzic

Doubtful. They would have to arrange that with HP, and in that case Tim and Glenn probably would have known about it. While a 3rd party (most likely Kinpo or Inventec) may be making these calculators for HP, they're making them *for HP*. If they sold a few pallets to someone

else on the sly, and HP found out about it), this would be a very good way for them to lose a valuable production contract.

Re: Response from buy.com

*Message #9 Posted by **Katie Wasserman** on 9 Sept 2011, 12:40 a.m.,*
in response to message #6 by Norman Dziedzic

I'll bet that what buy.com is sending out are the 12C LE calculators when you order a 15C. The product ID for the 12C LE is: NW258AA#ABA and for the 15C it's: NW250AA#ABA. It's pretty easy for someone to mistype or misread an 8 for a 0 in that string of characters.

Re: Response from buy.com

*Message #10 Posted by **Howard Owen** on 9 Sept 2011, 12:50 a.m.,*
in response to message #9 by Katie Wasserman

We shall see. I'm going to buy a 12C LE too, or may have already done so. :)

*Message #11 Posted by **From Hong Kong** on 9 Sept 2011, 2:01 a.m.,*
in response to message #9 by Katie Wasserman

It doesn't seem that they made a mistake on that because they're selling HP-12C 30th anniversary with a correct product ID:

http://www.buy.com/prod/hp-12c-30th-anniv-calculator/223173354.html

Edited: 9 Sept 2011, 2:03 a.m.

Re: Response from buy.com

*Message #12 Posted by **Katie Wasserman** on 9 Sept 2011, 4:08 a.m.,*
in response to message #11 by From Hong Kong

Yes indeed, they sell both. However according to Tim, they can't possibly be sending out the 15C, yet they've already sent something to me and others who ordered the 15C and I'm guessing that it's a calculator of some sort.

We'll know early next week how badly they screwed up (or if Tim was wrong).

Re: Response from buy.com

*Message #13 Posted by **Namir** on 9 Sept 2011, 5:19 a.m.,*
in response to message #12 by Katie Wasserman

Agreed ... when we receive our orders on Monday, this forum will light up again with messages about either how buy.com messed up or how on earth did they get their hands on HP-15 LE units!!!

"HP" covers a lot of territory. Since "HP" variously has listed the calculator, taken it off, stated "out of stock", "coming soon", "algebraic", has/doesn't have a printed manual, changed the price several times, etc. etc., I doubt there is any one person at HP, even Tim, that really "knows" what's up with the 15c LE.

Edited: 9 Sept 2011, 10:55 a.m.

HHC2011 Conference Presenters: Please Prepare Your Papers

*Message #1 Posted by **Jake Schwartz** on 8 Sept 2011, 3:35 p.m.*

Hi,

Richard Nelson is in the process of aggregating presentation materials for the HHC2011 conference proceedings. There probably will be a printed version for attendees, as well as the possibility of an electronic version. If you plan to have a paper, or if not to present slides, please get an electronic copy to Richard as soon as possible. His email is rjnelsoncf <at> cox <dot> net. If your paper is not ready until very close to the conference weekend, then we would respectfully ask that you do your best to bring 75-80 hard copies (as well as an electronic copy) to distribute to the attendees, if at all possible. We'd like your material to reach the widest possible audience, including HP.

Thanks,

Jake (conf. presenter and attendee since 1979, when the '41 was "king")

Re: HHC2011 Conference Presenters: Please Prepare Your Papers

Of course, any speaker can make his/her own materials available anywhere. I should ask the conference committee what they think regarding posting the entire set of papers on line.

Jake

I'll post mine as a PDF after the conference, most probably on our SourceForge pages. I've sent the status quo to Richard but there may well be some last minute changes until the presentation is really held.

Caveat: A set of slides is more of a table of contents of what the actual presentation on HHC will be. Don't expect the full info and don't expect me to just read it down in sequence. ;-)

USPS

*Message #1 Posted by **hpnut** on 8 Sept 2011, 2:00 p.m.*

Hi all

Samson advised that my order has been received, credit card charged and HP12C 30 AE shipped by USPS Priority Mail International.

Is USPS traceable shipping method?

hpnut in Malaysia

Edited: 8 Sept 2011, 2:17 p.m. after one or more responses were posted

Re: USPS

*Message #2 Posted by **gene wright** on 8 Sept 2011, 2:00 p.m.,*
in response to message #1 by hpnut

Priority Mail can have delivery confirmation -- to a USA address.

Really no way to cheaply get tracking by US Mail for anything outside the USA.

Re: USPS

*Message #3 Posted by **hpnut** on 8 Sept 2011, 2:32 p.m.,*
in response to message #2 by gene wright

Chris at Samson just confirmed USPS Priority is not trackable. Only USPS Express Mail is trackable.

Re: USPS

*Message #4 Posted by **Michael de Estrada** on 8 Sept 2011, 2:32 p.m.,*
in response to message #2 by gene wright

You can't track int'l via priority mail. I know, I've tried it.

Re: USPS

*Message #5 Posted by **Lincoln R.** on 8 Sept 2011, 3:50 p.m.,*
in response to message #4 by Michael de Estrada

I shipped a calculator to Italy using USPS Priority once, and was able to track it until it left the US, and IIRC the tracking eventually updated to show that it had arrived in Italy, but no delivery confirmation for when the receiver actually got it.

Re: USPS

*Message #6 Posted by **Michael de Estrada** on 8 Sept 2011, 4:04 p.m.,*
in response to message #5 by Lincoln R.

How did you track it ? The times I went to the post office, I was told that a tracking # was not available for priority mail international, only express mail. I paid for a return receipt post card, but that was it. There is a # on the customs form, but that is not a tracking #. All my packages were insured, and reached their destinations undamaged, so I really was not concerned.

Re: USPS

*Message #7 Posted by **Paul Gaster** on 8 Sept 2011, 9:47 p.m.,*
in response to message #6 by Michael de Estrada

Late last year or early this year I shipped two different items out of the US using USPS. They were sold through TAS and I printed the labels from Paypal, and when you do that you automatically a tracking number is generated. These were shipped Priority and with small flat rate boxes. The problem was that the tracking number was useless. One scan each showed, which was from the post office I dropped them off at. There were no further updates. They both made it OK, but it took a while and made me pretty nervous.

Another scary thing about USPS is that unless you get insurance it's almost like throwing your item and your money in a black hole. I had a package lost once and I sent it without insurance. I knew I could not get reimbursed for the item since I didn't get insurance, but assumed I would at least get a refund on the shipping. Nope. I was told that USPS was not a guaranteed service, and that was about it. So if you have something even remotely valuable to ship put insurance on it or use another service. At least with UPS they have an automatic $100 insurance. Of course they are rougher on your items and may run it over, drop kick it, or stab it with the fork on a forklift.

Re: USPS

*Message #8 Posted by **Paul Berger (Canada)** on 9 Sept 2011, 6:37 p.m.,*
in response to message #7 by Paul Gaster

My experience with having packages shipped to me from the US via USPS has always been very good, I have never had a package lost and a number of items shipped to me that where purchased on TAS where trackable, I could even track their progress through Canadian Customs and the tracking would get updated by Canada Post as well between the point of entry into Canada and my home. I could not tell you right now what postal class they where shipped by as I don't have any of the box labels anymore, but I do know that all the trackable packages had to be signed for. While UPS may be quicker, I usually avoid bringing item across the border via UPS and they are in the habit of charging very exorbitant fees for customs brokerage, where as the post office charges none, and for most items I do not even pay any taxes or duty when they are shipped via parcel post.

Re: USPS

*Message #9 Posted by **bill platt** on 10 Sept 2011, 1:23 p.m.,*
in response to message #8 by Paul Berger (Canada)

I think you can thank the postal agreements for this.

HP 15C Available at buy.com?

*Message #1 Posted by **M. Joury** on 8 Sept 2011, 10:17 a.m.*

Hi,

I saw that the 15C LE was available for purchase at buy.com and showing in stock. I actually called them and they swear they have 1,000 on hand. Does anyone actually believe this?

Cheers,

-Marwan

HP15C at buy.com

Edited: 8 Sept 2011, 10:19 a.m.

Re: HP 15C Available at buy.com?

*Message #4 Posted by **Quan** on 8 Sept 2011, 10:36 a.m.,*
in response to message #3 by M. Joury

I predict by this time tomorrow, it will be sold out!

:)

Re: HP 15C Available at buy.com?

*Message #5 Posted by **gene wright** on 8 Sept 2011, 10:38 a.m.,*
in response to message #4 by Quan

Which to me would be a fabulous thing.

I truly think that if HP sees this stuff sell out quickly, they might have their eyes opened.

Re: HP 15C Available at buy.com?

*Message #6 Posted by **M. Joury** on 8 Sept 2011, 10:40 a.m.,*
in response to message #5 by gene wright

I am with you there as long as they don't all go to eBay sellers that will hoard them and try to piece them out at $400 each!

Re: HP 15C Available at buy.com?

*Message #7 Posted by **Quan** on 8 Sept 2011, 10:51 a.m.,*
in response to message #6 by M. Joury

If this production run quickly sold out, HP would be wise to produce more, so long as it continues to sell.

Then these hoarders will be left with warehouse full of 15c but no where to go.

Then the older 15c can go for much, much less on the TAS.

It's a win/win.

Re: HP 15C Available at buy.com?

*Message #8 Posted by **M. Joury** on 8 Sept 2011, 10:58 a.m.,*
in response to message #7 by Quan

IF HP produces more...

Re: HP 15C Available at buy.com?

*Message #9 Posted by **Namir** on 8 Sept 2011, 11:07 a.m.,*
in response to message #8 by M. Joury

IF they do not, then someone higher up in HP (Apotheker or someone else) should see a shrink ... preferably Freud!!!

:-)

> *IF* HP produces more...

The only reason they wouldn't continue to turn the crank on the manufacturing process already in place would be if the projected sales volume at some point dips below revenue required to keep the pipe open. That *will* happen eventually when the pent up market for the 15c is saturated, and sales volume drops to the level resources are best spent elsewhere.

Even after reaching that state I expect the scarcity of the original NUT voyagers will only be a footnote in the head of an extreme few. It will certainly exist up there in connoisseur space but most in this forum I'd expect are looking for a tool vs. an exhibition piece for the bell jar. So I'd expect the EvilBay legacy 15c market to nearly dry up but not vanish, and no justification for a 15c le analog until such point as HP obsoletes the product again.

I think that the original 15C and the upcoming 15C LE are both items which appeal mainly to the collector and calculator hobbyist market. It's obvious from recent postings that even in the community of this forum there are many who attach **no** significance to the sophistication of the 15C. For those users there have long been HP machines available at significantly lower cost that serve their needs completely...even much more completely if alphanumeric capability in program mode is desired. There is no reason for them to buy a 15C of any sort.

Re: HP 15C Available at buy.com?

*Message #12 Posted by **Tom Mathes** on 8 Sept 2011, 11:02 a.m.,*
in response to message #1 by M. Joury

This thing showed for less $$ earlier today, then was shown sold out, now back at a higher price. Bizarre to say the least.

I have to question if this listing is for real with all of the rapid changes. And they have them in stock but HP doesn't? Smells real fishy. I never see an item that buy.com has and Amazon doesn't. Amazon has no listing for the 15C LE

And where do you see the number in-stock? I see nothing in the web page to indicate that.

Re: HP 15C Available at buy.com?

*Message #13 Posted by **M. Joury** on 8 Sept 2011, 11:14 a.m.,*
in response to message #12 by Tom Mathes

Actually I would not be at all surprised. For example Sampson Cables has, and is selling, the HP12C 30th Anniversary Edition and *NO ONE* else including HP Home and Home Office Store is listing it as available. I realize that the Small Business store has them but for approx $25 more!

Not that you are mistaken, mind you, I, like Namir, will (to use the phrase he didn't) believe it when I see it!

Cheers,

-Marwan

Re: HP 15C Available at buy.com?

*Message #14 Posted by **Namir** on 8 Sept 2011, 11:03 a.m.,*
in response to message #1 by M. Joury

I ordered one machine from them. I will "accept" it as true (the hypothesis that buy.com HAS machines at hand) when the little monster arrives at my doorstep. Notice I did not say "I will believe it when I see it" because that is an oxymoron!

:-)

Re: HP 15C Available at buy.com?

*Message #15 Posted by **Ed Look** on 8 Sept 2011, 11:34 a.m.,*
in response to message #14 by Namir

Namir,

I ordered one, too, from Buy.com. I sincerely hope it's true!

I remember I passed on buying the original because I still had my then still totally functional HP-34C. When it stopped working (gradually), I really regretted not getting the 15C. Now, here's my chance again!

Re: HP 15C Available at buy.com?

Re: HP 15C Available at buy.com?

*Message #18 Posted by **Tim Wessman** on 8 Sept 2011, 12:43 p.m.,*
in response to message #17 by Namir

Probably because as far as we know there is no air-lifting going on, and there is no way a boat could have arrived since we don't even think any palates have shipped yet.

If anyone does have any 15c units marked "shipped" it wouldn't surprise me if someone at the warehouse messed up and you get a 12c or something. . .

in response to message #18 by Tim Wessman

Oops

Re: HP 15C Available at buy.com?

*Message #21 Posted by **M. Joury** on 8 Sept 2011, 1:54 p.m.,*
in response to message #18 by Tim Wessman

So I called customer service and told them HP said that they could not possibly have them. The lady said that she will check with their merchandising department to see if there is an error on the web page and get back to me within 1 business day.

As noted elsewhere I was suspicious from the very beginning but when forum members said that they had received notification that the order had gone to the warehouse I saw a glimmer of hope.

Oh well...

Re: HP 15C Available at buy.com?

*Message #22 Posted by **Michael de Estrada** on 8 Sept 2011, 2:22 p.m.,*
in response to message #21 by M. Joury

So, has your credit card been charged yet ?

Re: HP 15C Available at buy.com?

*Message #23 Posted by **M. Joury** on 8 Sept 2011, 2:26 p.m.,*
in response to message #22 by Michael de Estrada

Yes. But I don't know buy.com's policy on charging before shipping and I don't know if it is just a "hold".

I specifically told them that HP said they could not have them yet and that I was worried that they would send me a 12C instead. She promised to have my concerns looked into.

Cheers,

-Marwan

Re: HP 15C Available at buy.com?

*Message #24 Posted by **Katie Wasserman** on 8 Sept 2011, 6:50 p.m.,*
in response to message #18 by Tim Wessman

It's going to be interesting to see what I get from Buy.com. I've got a tracking number from them on 2 15C's that I ordered earlier today.

Maybe they've got a mole in China that's sneaking them out the back door of the factory. Or maybe, they've sent me some overpriced HP ink cartridges by mistake. Whatever it is I won't know until next week.

I also ordered a 12C LE on a separate order from them, but that hasn't shipped yet, curiously.

Re: HP 15C Available at buy.com?

*Message #25 Posted by **James Sterbenz** on 8 Sept 2011, 6:58 p.m.,*
in response to message #24 by Katie Wasserman

Or maybe "in the shipping process" means on the boat from China.

Re: HP 15C Available at buy.com?

*Message #26 Posted by **M. Joury** on 8 Sept 2011, 7:35 p.m.,*
in response to message #25 by James Sterbenz

Response from buy.com. I will also post in it's own thread:

Hello Marwan,

Thank you for contacting Buy.com regarding your order # 62171041.

We thank you for bringing this to our attention. We have confirmed that our listing is correct in showing the HP 15C calculator. According to HP's website, there is definitely still an HP 15C calculator. You may verify this by copying and pasting the following URL into your browser.

http://h20331.www2.hp.com/hpsub/us/en/calculators/Calculator_Software.ht ml?jumpid=ex_r2845_buy/calculators

Re: HP 15C Available at buy.com?

*Message #27 Posted by **Tom Mathes** on 8 Sept 2011, 8:48 p.m.,*
in response to message #26 by M. Joury

I guess we'll find out soon enough Marwan since many of us (myself included) placed an order.

If it doesn't show up, oh well. That'll make 0 for 2 in getting HP gear in the last month (lost out on the Touchpad firesale). At least I have 2 35S units, a 33S and my trusty HP48G and 32SII to fall back on (not to mention a few HP emulators on my ifruit phone). No way I'm using an equals key! :-)

Tom

Re: HP 15C Available at buy.com?

*Message #28 Posted by **Michael de Estrada** on 8 Sept 2011, 8:53 p.m.,*
in response to message #26 by M. Joury

Haha. That page has already been removed anyway. Well, I guess we'll all find out soon. And I like her saying that there "still" is an HP 15C. I just got a FEDEX notification with an ETA of 9/12.

Re: HP 15C Available at buy.com?

Which page? The HP one? The buy.com order page is still up.

Re: HP 15C Available at buy.com?

*Message #30 Posted by **Michael de Estrada** on 8 Sept 2011, 9:06 p.m.,*
in response to message #29 by Tom Mathes

Yes, the HP one that's now replaced with the regular HP store. I just meant that the lady that Marwan was talking to really didn't have a clue as to whether the calcs were actually here in the US yet. Just have to cross our fingers.

Re: HP 15C Available at buy.com?

*Message #31 Posted by **Paul Gaster** on 8 Sept 2011, 9:59 p.m.,*
in response to message #30 by Michael de Estrada

For more than a decade I have sometimes lurked on deal sites like Slickdeals, Fatwallet, and Anandtech Hot Deals. There are tons of other similar sites too.

Anyway, the point is that Buy.com is well known for getting things screwed up. I can't tell you how many times people have thought they were going to get a great deal from them only

to either get the wrong item shipped to them, or they get the order cancelled because it was a pricing mistake. Don't get your hopes up too much just yet.

Re: HP 15C Available at buy.com?

*Message #32 Posted by **Michael de Estrada** on 8 Sept 2011, 10:10 p.m.,*
in response to message #31 by Paul Gaster

Not to worry. I've still got another order pending at CostCentral, which I won't cancel until this one arrives. Bird in hand, ya know.

Point well taken. I've had them screw up a few shipments years ago but they made good. My fallback I guess is the Hp web site when they put it up for order (my employer is a supplier so I get a slight discount though employee purchasing).

*Message #39 Posted by **Namir** on 8 Sept 2011, 11:11 a.m.,*
in response to message #1 by M. Joury

Marwan,

I say who cares if HP's web site still has "Coming Soon"?? If these merchants have actually received the 15C LE and are fulfilling orders, then we are in good shape. I know Samson Cables are good for it. They are not going to be left out with no LE stock. They are very reliable and I never had any problem with them. And I feel that HP has a good relationship with them.

Re: HP 15C Available at buy.com?

*Message #45 Posted by **Cristian Arezzini** on 8 Sept 2011, 11:32 a.m.,*
in response to message #40 by M. Joury

Hmmm... buy.com sells them at 78.99, free shipping... Samson sells them at 99.99 PLUS shipping. If buy.com is "for real" I might cancel my order at Samson... Thoughts?

Re: HP 15C Available at buy.com?

*Message #46 Posted by **Cristian Arezzini** on 8 Sept 2011, 3:05 p.m.,*
in response to message #45 by Cristian Arezzini

Update: I contacted Samson, telling them about buy.com's offer, asking if they would consider matching their price. Here's what they replied:

"Our shipment is in transit so we will be shipping next week when it arrives.

The Buy.com pricing is lower than our cost so I cannot match. I am told it is a mistake."

This makes me wonder, and sort of confirms Tim's message. And for now I'm not canceling my order with Samson! :)

*Message #53 Posted by **Tom Mathes** on 8 Sept 2011, 11:36 a.m.,*
in response to message #52 by M. Joury

The order likely hasn't been processed and can be cancelled and re-ordered. Give it a shot and see if you can do that; I do it often at other web sites and never run into problems.

Tom

Re: HP 15C Available at buy.com?

*Message #54 Posted by **Quan** on 8 Sept 2011, 11:44 a.m.,*
in response to message #53 by Tom Mathes

I took a look at my order status. It has the following note: "In the Shipping Process"

According to Buy.com's Questions about Order Status page, it means that "An item cannot be cancelled because it is being picked from the shelves, packaged, and stacked on the loading dock."

Plus I can no longer cancel the order.

So, it's on the way to my house... shortly!

Woohoo!!!

UPDATE: I just refresh the status page and got this "Sent to Warehouse" which means "We have verified your payment and your order/item has been sent to our warehouse to be fulfilled."

Look like a real deal!

*Message #62 Posted by **M. Joury** on 8 Sept 2011, 11:59 a.m.,*
in response to message #53 by Tom Mathes

Interesting. Tells me I am not eligible for this coupon. Oh well.

Re: HP 15C Available at buy.com?

*Message #63 Posted by **Ed Look** on 8 Sept 2011, 11:39 a.m.,*
in response to message #52 by M. Joury

I feel as you, except I am not good at looking for coupons. I have to remember these things!!

The only consolation I have on this matter is that I did not buy all my HP calculators at full price, maybe half of them.

Re: HP 15C Available at buy.com?

*Message #64 Posted by **Cristian Arezzini** on 8 Sept 2011, 12:09 p.m.,*
in response to message #63 by Ed Look

I'm trying to place an order with them. I want the calculator shipped to my wife's address in the US (she is an American citizen), so it's not an international shipment. They won't accept my credit card though, because I'm Italian and it's an Italian credit card; they won't even accept my paypal or google accounts for the same reason. My wife isn't here now so I can't ask her credit card number. Is there any other way that you know of, to order from them? I don't get why all these limitations... I mean, do they *want* my money or not? :(

Cristian

in response to message #65 by hpnut

you can set up a US Virtual VISA card at entropay.com - this has worked for me before.

EDIT - I just used this virtual visa card to order 3 units with the $5 coupon - I live in Canada, so it is being shipped to a brokerage in Niagara, NY for me to pick up !

*Message #67 Posted by **Ethan Conner** on 8 Sept 2011, 1:39 p.m.,*
in response to message #66 by svisvanatha

Buy.com accepted my order however in their terms use they state that if they can't ship the item they will refund your credit card so them and samson will probably take as many orders as they can.

Re: HP 15C Available at buy.com?

*Message #68 Posted by **Ethan Conner** on 8 Sept 2011, 1:28 p.m.,*
in response to message #64 by Cristian Arezzini

If you read their terms of use it's spelled out clearly concerning international orders. (buy.com) I'm pretty sure their software detects isp's. Anyway i got a confirmation e-mail saying it was in stock so we will see. Also their terms of use states that if the item is unable to ship if they run out or whatever they will automatically refund your credit card. Which is probably why buy.com and samson seem to be willing to take orders. They don't care if they have the item or not they will hold your payment for a few months collect some interest and then pay you back.

Re: HP 15C Available at buy.com?

*Message #69 Posted by **Cristian Arezzini** on 8 Sept 2011, 3:28 p.m.,*
in response to message #68 by Ethan Conner

My point was that this is not really an international sale - I want it shipped to an address in the US, and the order was placed with my wife's name - and she's an US citizen...

And by the way, Samson hasn't charged my card, they will only charge it when they're ready to ship, so they're not getting any of my interest! :)

Cristian

*Message #72 Posted by **Ethan Conner** on 8 Sept 2011, 2:12 p.m.,*
in response to message #71 by M. Joury

I imagine they will do like samson and take as many orders as possible quantity on hand or not. They have a refund policy/ disclaimer that let's them off the hook so i won't hold my breath but i do have a confirmation number.

Re: HP 15C Available at buy.com?

*Message #73 Posted by **Tom Mathes** on 8 Sept 2011, 7:41 p.m.,*
in response to message #70 by Howard Owen

I just ordered one with the $5 coupon even though I'm a buy.com previous customer. I figured out that if I order through Amazon's checkout it takes the $5 coupon.

Extra bonus: Amazon now backs me if buy.com sends me the wrong item, so I've got some 'heft' in my corner if there's a problem.

Edit: I checked buyer feedback for buy.com on Amazon. YIKES. Glad I ordered it through Amazon.

Edited: 8 Sept 2011, 7:43 p.m.

I used PayPal, which also has buyer protection.

Re: HP 15C Available at buy.com?

*Message #75 Posted by **Katie Wasserman** on 8 Sept 2011, 11:43 p.m.,*
in response to message #74 by Michael de Estrada

Ditto. I've found that using AmEx via Paypal is the best buying protection. While it's almost never necessary to make a claim for merchandise from normal retail outlets, I've been defrauded on TAS and on each occasion all it took was a quick phone call to AmEx to get a refund. No need to even fill out a Paypal claim.

Received HP 12C 30th Anniv.

*Message #1 Posted by **Gerardo Rincon** on 7 Sept 2011, 8:52 p.m.*

I just received the HP-12C 30th Anniversary - Added to my collection website: rinconcentral.com.

The 25th Anniversary was a Platinum model - much nicer than the HP 12C 30th Anniversary which is a Standard (non-platinum) calculator. This one does have the two batteries with the faster processor.

Edited: 7 Sept 2011, 11:14 p.m.

I'll take the non-platinum color one any day for its use of traditional blue and gold shift keys and matching key and overlay labeling which are far more legible than the platinum version, especially that horrid orange and low contrast orange overlay lettering.

*Message #12 Posted by **Glenn Shields** on 8 Sept 2011, 9:03 p.m.,*
in response to message #1 by Gerardo Rincon

Please answer one burning question: does SST work now? Meaning, when holding down the SST button, do you see the program step? TIA, Glenn

Re: Received HP 12C 30th Anniv.

*Message #13 Posted by **Katie Wasserman** on 9 Sept 2011, 4:14 a.m.,*
in response to message #12 by Glenn Shields

Yes, this was fixed a couple of years ago in a later version of the firmware. The first batch of 12C+ calculators went out with an early version of the firmware that had several problems. Read this thread for all the details.

Re: Received HP 12C 30th Anniv.

*Message #14 Posted by **Glenn Shields** on 9 Sept 2011, 12:04 p.m.,*
in response to message #13 by Katie Wasserman

I appreciate that info, but the new 12C I got from Amazon (two months ago) doesn't work right, so my question is how do I get one now with a working SST (in any version)? Do none of the "plain" 12Cs have it fixed? BTW, loved your sorting program, which sorts "top-down", I was able to write one which sorts up, and uses a financial register as a "flag" to check for any mis-ordered pairs, so the running time varies depending on the data set. But it is longer and not as elegant. But so much pencil and paper is necessary without having that SST! Thanks again, Glenn in West LA

Re: Received HP 12C 30th Anniv.

*Message #15 Posted by **gene wright** on 9 Sept 2011, 12:19 p.m.,*
in response to message #14 by Glenn Shields

You can flash this yourself with the proper cable and firmware update.

I have both. Cable will cost you postage, firmware is free. :-) Send me a note through the forum email option.

Re: Received HP 12C 30th Anniv.

*Message #16 Posted by **Katie Wasserman** on 9 Sept 2011, 3:18 p.m.,*
in response to message #14 by Glenn Shields

Glenn,

Post your sorting program, I'd love to see it. Debugging on the 12C can indeed be very hard.

I wrote linked-list sort some time ago for the 12CP, it uses the Nj registers for the link, it's here. It took forever with pencil and paper to debug it even with SST and BST working.

-Katie

Re: Received HP 12C 30th Anniv.

*Message #17 Posted by **Glenn Shields** on 10 Sept 2011, 12:03 a.m.,*
in response to message #16 by Katie Wasserman

Thanks for sharing that, Katie- I didn't realize how far back that goes. I have learned so much from this forum, and hoped that I could share a little along the way (but I get a little hasty in composing posts and don't edit with separate lines the way most of you do).

Anyway, here is something I sort of adapted from working with the 35S (which has flags and indirect addressing, of course) but is more fun on the extremely fast 12C, using up to 16 items stored in registers 0 -> .5 :

1 5 STO n 0 STO i RCL gCFj RCL gCFj x<y? GTO 20 x<>y gCFj x<>y gCFj STO i RCL n 1 - STO n GTO 24 RCL n 1 + STO n x=0? GTO 27 GTO 06 RCL i x=0? GTO 00 GTO 01

When register i has any value besides 0 it means a switch is necessary. Again, what an honor to hear from you, Katie - thanks, Glenn :-)

*Message #18 Posted by **Marcus von Cube, Germany** on 10 Sept 2011, 1:58 a.m.,*
in response to message #17 by Glenn Shields

Here it is on separate lines with step numbers using the "preformatted" button:

```
01 1
02 5
03 STO n
04 0
05 STO i
06 RCL g CFj
07 RCL g CFj
08 x<y?
09 GTO 20
10 x<>y
11 g CFj
12 x<>y
13 g CFj
14 STO i
15 RCL n
16 1
17 -
18 STO n
19 GTO 24
20 RCL n
21 1
22 +
23 STO n
24 x=0?
```

```
25 GTO 27
26 GTO 06
27 RCL i
28 x=0?
29 GTO 00
30 GTO 01
```

*Message #19 Posted by **Katie Wasserman** on 10 Sept 2011, 3:07 a.m.,*
in response to message #18 by Marcus von Cube, Germany

Glen,

Very nice! Way, way back when I was teaching myself how to program I started with a bubble sort and worked on incrementally improving it with stopping conditions (like you have) and bi-directional bubbling, etc.. This is a real challenge on a 12C, but I was using PL/C. Fortunately I got smart before too long and stopped wasting valuable IBM/360 time with O(n^2) sorts.

-Katie

*Message #20 Posted by **Glenn Shields** on 10 Sept 2011, 11:15 a.m.,*
in response to message #19 by Katie Wasserman

Wow, that brings back memories (can we re-trace our lives via computing power?) of being in school in a Fortran class, waiting for my program to run in a room full of terminals (1986). I had a 15C then, and a classmate had a 41CV (it was always beeping with his reminders) and another had the Sharp mini-computer. Before that (in 1975) I got an HP35 (thanks to Dad), and my classmate then was threatening us with the power of his soon-to-be-acquired HP45 (in slide rule class!). Just torturing myself over the fact that I have none of these items today. Also had a Sharp 12-digit Elsi-mate with two separate memories to use for series computations of trigs and logs, just for the challenge. The fun of that is still here, like Valentin's 99-step trig program (still haven't tried to parse that out to see how it works). Thanks to all for your wonderful input. The forum helped me keep this hobby alive. ;-)

Guessing game - non-HP RPN calculator "Made in Germany"

*Message #1 Posted by **Joerg Woerner** on 7 Sept 2011, 8:21 p.m.*

Collectors,

I received today a box from Gemany with some interesting calculators sold in Germany. One of them might interest you:

1) It uses RPN

2) It is Scientific

3) It has a wonderful RED LED display

4) It was made in Germany

Who is the first one to identify this cutie?

Cheers, Joerg

TOS Confusion for newbies

*Message #1 Posted by **Dave Hicks** on 7 Sept 2011, 8:09 p.m.*

There have been some references to TOS and confusion by newbies, so here's what I posted 5 years ago:

> Quote:
>
> A brief chronology as I know it.
>
> Long ago there was a site with an interesting simulator. I linked to it. It became more popular and was occasionally linked to in this forum.
>
> Sometime later HP told me that the site was hosting ROMs without permission and that I should prevent links to it in the forums. I complied. (I took a look at the site at that time and it said something like: These ROMs are NOMAS so I can place them here, which was surely well-intentioned but legally nonsense I believe.)
>
> Sometime later the site owner told me that he had later received permission so it was OK now. That sounded great, but since it was HP who asked me not to link, I checked with my contacts. They hadn't heard anything about this. I tried more contacts. I tried several people in person. I even tried after beer. I asked other people who were and, still are, trying to get permission to copy ROMs for simulators. No one else I know has heard anything about it. Comments from two HP employees: (quotes from memory) "You would be wise to stay away from this" and "There are many sites with inappropriate HP content but I don't report them to legal for fear that they would take them all out, including the good ones."
>
> Everyone points to Fred Valdez (the GM of the calculator division) as the person who can provide the definitive answer. I asked some time ago and didn't get an answer. I planned to corner him in person at HHC late last year but he had a last minute conflict. At HHC Eric Smith asked if there was any chance of getting some ROMs released for his simulator and Cyrille de Brebisson (Calculator R&D manager) said "I believe that will never happen". (Which tends to imply that he also thinks it never has.)
>
> Later I emailed Fred again and this time I thought I was pretty clever: Instead of asking for confirmation that the site was now operating with HP's blessing, I only asked for permission to remove the link block and for HP to agree to hold me blameless for links to some site I don't control which are added by other people in this forum. That seemed like a simple request that didn't limit HP in any way. I even said I would reinstate the block on their request at any time. An assistant to Fred told me that they were looking into it and it would take some time. That's the last I've heard.
>
> Perhaps the other site owner can ask his contacts to contact Fred. I have no idea whether Fred doesn't know, doesn't agree, or this just gets lost in the shuffle.

After that was posted, the TOS site owner told me that his contact at HP was non-responsive and that's the last I have ever heard on this. I've heard legalistic comments from all sides that encouraged and continue to encourage me to stay away.

I have a theory as to how this may have unfolded. You might be able to get me to reveal it over a beer but I'm not going to write it up because it's only a guess. In any event, even if my guess is true, I am still doing as they ask since I am redistributing HP content by (continuing) permission.

Coincidentally, I received another content removal request (totally unrelated content) from HP yesterday from someone I don't know. I forwarded this to someone I do know for clarification/verification along with a reference to TOS and all the flak I get for censoring it. I got a response that I don't have to remove the new unrelated content, but he didn't take the bait on the TOS sub-topic. (Not too surprising - I always thought he was smart. ;-))

This was really quite a coincidence because content removal requests like this only happen about once every few years and only about three of those have been from HP.

No one has ever told me I should censor the text "TOS" so I don't.

Edited: 7 Sept 2011, 8:10 p.m.

Re: TOS Confusion for newbies

*Message #2 Posted by **Martin Pinckney** on 7 Sept 2011, 9:47 p.m.,*
in response to message #1 by Dave Hicks

Thanks, Dave, for elucidating.

I can understand the prohibition from *linking* to TOS. Does the definition of "linking" extend to mentioning the site by name?

Re: TOS Confusion for newbies

Same here; any clues as to what that site is? I assumed "TOS" was another way of staying "TAS" but obviously I was wrong.

My First HP Calc to Fail

*Message #1 Posted by **Jandro Kirkish** on 7 Sept 2011, 2:34 p.m.*

Hi all, from a frequent reader and rare post-er. I have many RPL machines; my first was my trusty 28S, 23 years old and still going strong (I guess I got the kind without the failing battery door :). Because I loved it so much I bought a 49G back in 2002 or thereabouts. I wanted to love it too but in all honesty I didn't like anything about it; the rubbery keys the misplaced ENTER key, the horrible screen and all the other issues that I am sure make this calculator a singularly unloved object in this forum. Over the years I tried to "correct" my decision to by this piece by buying a 49G+ (better screen) and a 50G (EQN library yay!). Well, in the process of consolidating my collection I dug the 49G out of my garage and put new batteries in it and -- you guessed it -- it failed to turn on. (The ON/C/CONT/OFF button had for years been getting harder to register a key press so I pretty sure this is the problem.) I was very slightly sad. But here is what I have to say: this 9 year old calc, used sparingly, failed where a heavily used 23 year old one has not. Say what you will about the 28S (and I know what many of you might say), it still works after all this time. Does anyone else have a similar story to tell?

Re: My First HP Calc to Fail

*Message #2 Posted by **BruceH** on 7 Sept 2011, 3:12 p.m.,*
in response to message #1 by Jandro Kirkish

The moral of the story is clearly "use all your calculators regularly"!

Re: My First HP Calc to Fail

*Message #3 Posted by **Gilles Carpentier** on 7 Sept 2011, 3:25 p.m.,*
in response to message #1 by Jandro Kirkish

Hi,

All my HP48SX / 49G / 49G+ and 50G works fine :D

And also my 30 years old Casio FX-602P , the best ever Casio calculator and precursor : Casio FX-602P
Nota : you can find an interesting HP41C program and its 602P version here (clic on "regle du jeu") : KIBUR

About the 49G, I removed the plastic protection of the screen long ago and the screen is perfect now. I don't like at all the keyboard feeling of the 49G.

When I use sometime my HP48SX I love the so sweet keyboard feeling. My prefered calculators are now the 50G and my so old Casio 602P. The 50G is near perfect for me (but I would love a better screen resolution and 48SX keyboard feeling)

About the 48/50 series keyboard, perhaps I'm alone but i have no problem with the small Enter key and prefer the keyboard disposition and readibility of the 50G far better that the 48. The keyboard feeling is not so sweet that the 48SX but remain correct.

Edited: 7 Sept 2011, 3:31 p.m.

in response to message #3 by Gilles Carpentier

> Quote:
>
> About the 48/50 series keyboard, perhaps I'm alone but i have no problem with the small Enter key

Me too.

I think what some people don't realize is that the Space key, which is right next to the Enter key, often acts like an Enter key in RPL.

Like, if you wanted to enter X+Y, you could type

X Enter Y +

but you could also type

X Space Y +

So, often, the two together act like a pseudo-double wide Enter key.

The advantage of keeping them separate is you need to use the Space approach when entering expressions in situations where you don't have access to the stack (eg., in the Matrix writer)

Re: My First HP Calc to Fail

*Message #5 Posted by **Chris Randle (UK)** on 7 Sept 2011, 6:19 p.m.,*
in response to message #3 by Gilles Carpentier

Like you Gilles, I have a Casio FX-602P (progressed from a 501P) and I agree that it's a beautiful machine.

But, since the topic is failing HPs, my 602P failed 20 years ago after passing through an airport scanner. I'm not convinced the scanner was to blame, but it was working one side and not the other. And it didn't just stop working, it went bonkers. Typing 2 + 2 = would come back with 37 and other weird nonsense. I still have it though because I'm too fond of it to part company, and I've since come to realise that it's not a bug, it's just a less accurate algorithm than some other calculators use ;-)

So, almost back on topic, twenty years ago I replaced it with a new HP 48SX, my first ever HP. And I don't need to tell anyone here what happened after that. If anyone had told me then that twenty years later I'd have dozens of HP calculators I'd have said they were mad. But I now know that it is I who am mad. Happy, but mad.

need the reprogramming cable for the 30b...

*Message #1 Posted by **stacy_k** on 7 Sept 2011, 10:07 a.m.*

hello,

are the cables to reprogram the HP30b, still being distributed? (I need one...)

Is mr. gene wright still the source for them?

please help

thank you

(ps is there any description or schematic for what this cable is exactly, and how it works?)

Re: need the reprogramming cable for the 30b...

*Message #2 Posted by **M. Joury** on 7 Sept 2011, 10:11 a.m.,*
in response to message #1 by stacy_k

Try sending Gene an email through the forum.

Re: need the reprogramming cable for the 30b...

*Message #3 Posted by **stacy_k** on 7 Sept 2011, 10:19 a.m.,*
in response to message #2 by M. Joury

I tried to send him a mail but didn't get a response yet. Guess I'll wait a little bit more & maybe try again. thx

Re: need the reprogramming cable for the 30b...

*Message #4 Posted by **gene wright** on 7 Sept 2011, 10:59 a.m.,*
in response to message #3 by stacy_k

Hi. Don't think I ever got an email. Try again. :-)

Re: need the reprogramming cable for the 30b...

*Message #5 Posted by **stacy_k** on 7 Sept 2011, 11:27 a.m.,*
in response to message #4 by gene wright

Hi there (sorry for being a n00b) I tried again just now, did the mail make it to you? thanks again - stacy

Re: need the reprogramming cable for the 30b...

*Message #6 Posted by **gene wright** on 7 Sept 2011, 11:55 a.m.,*
in response to message #5 by stacy_k

Nope. Perhaps you have to associate an email with your user-name here for it to work?

I have had no problems getting emails from many other cable-seekers here, so something else must be happening.

Associate an email and let ME send an email your direction. Let's see if that will work.

Re: need the reprogramming cable for the 30b...

*Message #7 Posted by **stacy_k** on 7 Sept 2011, 1:06 p.m.,*
in response to message #6 by gene wright

Hello,

I had entered an email & marked it for public, but I guess that didn't work (? ?)

Anyhow I now entered my original email, that I used to register for the forum, and it should be public.

Did it work? It's srkmz[@]sentex.net

-stacy

in response to message #1 by stacy_k

> Quote:
>
> ps is there any description or schematic for what this cable is exactly, and how it works?

I don't have a schematic bu I know what the cable does. :-)

It's a level shifter to adapt the 3V TTL level serial pins on the connector to valid RS232 levels suitable for a PC serial port. In addition it provides two buttons: a RESET button to reset the processor and an ERASE button which will erase the flash memory contents of the processor: Turn the calculator on, press and hold erase, press any key on the calculator.) Erasing the flash will make the SAM-BA boot loader active which will connect to the SAM-BA flashing utility.

With the WP 34S firmware installed, the cable can be used to exchange data between the calculator and an emulator on the PC.

Re: need the reprogramming cable for the 30b...

*Message #11 Posted by **stacy_k** on 7 Sept 2011, 10:41 a.m.,*
in response to message #10 by Marcus von Cube, Germany

OK but there's no description anywhere, of what the guts of the cable actually are?

Re: need the reprogramming cable for the 30b...

*Message #12 Posted by **Katie Wasserman** on 7 Sept 2011, 10:55 a.m.,*
in response to message #11 by stacy_k

Here are all the details.

*Message #13 Posted by **stacy_k** on 7 Sept 2011, 11:07 a.m.,*
in response to message #12 by Katie Wasserman

thank you

Re: need the reprogramming cable for the 30b...

*Message #14 Posted by **Dominic Richens** on 7 Sept 2011, 1:28 p.m.,*
in response to message #12 by Katie Wasserman

thanks! I've been looking for that.

Re: need the reprogramming cable for the 30b...

*Message #15 Posted by **Gerry Schultz** on 7 Sept 2011, 1:10 p.m.,*
in response to message #10 by Marcus von Cube, Germany

I assume that since there is an increased drain on the 30b's batteries when connected through the programming cable, that you would want to keep the connection time to a minimum?

Re: need the reprogramming cable for the 30b...

*Message #16 Posted by **Marcus von Cube, Germany** on 7 Sept 2011, 6:07 p.m.,*
in response to message #15 by Gerry Schultz

Since the cable contains a level shifter which is fed by the 3V pads on the calculator sockets, it draws power from the coin cells. This is true even with the calculator turned off. I measured a current draw around 4 mA.

WP 34S : Reopening last catalog called

*Message #1 Posted by **Miguel Toro** on 7 Sept 2011, 9:06 a.m.*

Hello,

I noticed that the last command in the last catalog called feature is reset when one leaves Program Mode with the [EXIT] key but still works if one leaves with the [h][p/r] combination. For example:

```
[h],[mode],24h,[enter],[h],[p/r],[h],[p/r],[h],[mode] -> 24h

But

[h],[mode],24h,[enter],[h],[p/r],[exit],[h],[mode] -> 12h,
```

Is this the intended behaviour? Maybe it could be explained somewhere in the manual.

Thanks and regards,

Miguel

Re: WP 34S : Reopening last catalog called

*Message #2 Posted by **Marcus von Cube, Germany** on 7 Sept 2011, 10:25 a.m.,*
in response to message #1 by Miguel Toro

This looks more like an oversight to me. EXIT resets some fields which need not be cleared and should be kept.

Updated SandMath-II and 41Z modules

*Message #1 Posted by **Ángel Martin** on 7 Sept 2011, 4:47 a.m.*

With summer gone I thought it'd be a good time to post updated versions of the classics, so here they are.

Updated 41Z - Revision 9F.
Includes minor code enhancements and a bug fixing for corner cases in ZSQRT. Also corrects issues involving the inverse hyperbolic functions used from a ROM, like in the ZMTV program.

Updated SandMath-II
I removed two functions redundant with other modules, which freed up some vital space for enhancements. Added the following:

- A new Statistics function menu
- Improvements to the special functions launcher, adding Carlson Integrals and Hankel functions sub-sections.
- JM Baillard's excellent Borwein implementation to calculate Riemann's Zeta.
- A new V41 overlay reflecting the changes: [SandMath-II Overlay]

All available at TOS for download.

Enjoy, ÁM

Edited: 7 Sept 2011, 11:23 a.m. after one or more responses were posted

Re: Updated SandMath-II and 41Z modules

Poor Mr Riemann, an often misspelled person. ;-)

Re: Updated SandMath-II and 41Z modules

*Message #3 Posted by **Ángel Martin** on 7 Sept 2011, 11:23 a.m.,*
in response to message #2 by Marcus von Cube, Germany

ok, hardly the most relevant part of the post but I got it :-)

Re: Updated SandMath-II and 41Z modules

*Message #4 Posted by **Gerson W. Barbosa** on 7 Sept 2011, 1:56 p.m.,*

in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> Re*i*mann's Zeta.

Sounds just a typo to me, rather than mispelling, like s*ie*ze intead of s*ei*ze. In typing, these vowels are assigned to the medium fingers, hence some occasional confusions. *Ryemann* or *Rainman* would have been mispelling :-)

Re: Updated SandMath-II and 41Z modules

*Message #5 Posted by **Ángel Martin** on 7 Sept 2011, 3:50 p.m.,*
in response to message #4 by Gerson W. Barbosa

I think you're right Gerson, more and more my fingers go their own way independent from the eyes on the keyborad...

It's actually a relatively frequent typo amongst native english speakers - which I'm not, but that's another story. Since I live in germany I'm very aware of the "ie" vs. "ei" diphthongs, so shame on me I also fell into the same trap.

Re: Updated SandMath-II and 41Z modules

*Message #6 Posted by **Marcus von Cube, Germany** on 7 Sept 2011, 5:58 p.m.,*
in response to message #4 by Gerson W. Barbosa

I came across the same error in the WP 34S sources in more than one place. I'll never understand why the same vowel [i:] is spelled differently in "receive" and "believe". But this makes me understand why native English speakers tend to confound the two.

Ángel, where are you located in Germany?

Re: Updated SandMath-II and 41Z modules

*Message #7 Posted by **Gerson W. Barbosa** on 7 Sept 2011, 7:20 p.m.,*
in response to message #6 by Marcus von Cube, Germany

> Quote:
>
> I'll never understand why the same vowel [i:] is spelled differently in "receive" and "believe".

Etymology (Anglo-French receivre > receive) and the Great Vowel Shift might offer some explanation.

Programming RPN on the 48?
*Message #1 Posted by **snaggs** on 7 Sept 2011, 1:36 a.m.*

Ive been reading more aboutthe HP 48. I had one for a week before it got stolen in ~1992, so I never had time to get comfortable with it. Being a geek I then went on specs and replaced it with a 49g+ which has sat in a drawer ever since.

Looking back at the HP 48G, it seems to have more functions on the keyboard, and a lovely design.

Im not ready to evaluate RPL vs RPN, but I am enjoying RPN on my 35s. Can the 48's RPL be ignored and programmed RPN? If thats the case, why would you use a 42s?

Daniel.

Re: Programming RPN on the 48?
*Message #2 Posted by **BruceH** on 7 Sept 2011, 2:14 a.m.,*
in response to message #1 by snaggs

> Quote:
>
> Can the 48's RPL be ignored and programmed RPN?

No. The 48 is RPL only.

Re: Programming RPN on the 48?
*Message #3 Posted by **Namir** on 7 Sept 2011, 2:16 a.m.,*
in response to message #1 by snaggs

Daniel,

The 48 machines (and successors) do not support RPN. They offer RPL.

RPN and RPL while similar in certain aspects are different in many others. Both use stacks. RPN machines have had 4-level stacks as designed by HP. RPL uses a dynamic stack (in both the number of levels and the contents of each level) and uses its more intensely than RPN. For example in RPN you can use the command STO 0 to store the contents of the X-register to memory register 0. In RPL you have a value at level 1 that you want to store. You push the name of the recipient variable, say 'X', into the stack and then execute the STO command. That command takes its destination from level 1 and the value to store in level 2. After you execute the STO command in RPL, the original values in levels 1 and 2 are consumed by the STO command and the stack drops by 2 levels. In other words the value you wanted to store no longer appears in the stack. This is quite different from a STO in RPN which leaves the value to be stored on the stack. To mimic RPN's behavior in RPL, you need to first issue a DUP command to duplicate the value in level 1, push the name of the target variable into the stack, and then execute STO. The result is that level 1 now has the value that you stored, and variable 'X' also stores that value.

This is a simple example on how RPN and RPL differ. One noteworthy difference to mention is that RPL can declare local variables in the blocks of code contained in pairs of << and >> characters. RPN lacks the feature of local variables, making the creation of reusable program objects more difficult.

Namir

Edited: 7 Sept 2011, 2:37 a.m.

Re: Programming RPN on the 48?
*Message #4 Posted by **Gilles Carpentier** on 7 Sept 2011, 7:39 a.m.,*
in response to message #3 by Namir

I think that a major difficulty for those who came from RPN and then uses RPL is the lack of GOTO function. RPL is a strongly structured language and RPN not. RPL is far more powerfull but more complex to learn (not sure of that for simple RPL programs). Imho there is no possible comparaisons between them. But the best tools (language) are those wich permit to solve easily your problems.

It would probably be impossible (and heretic !) to have GOTO / LBL instructuctions in RPL, but this could help people who have problems with structured language. I'm quite sure that people who like RPN and not RPL would have another views if they could use some GOTOs and LBLs in RPL.

Edited: 7 Sept 2011, 7:53 a.m.

Re: Programming RPN on the 48?
*Message #5 Posted by **Marcus von Cube, Germany** on 7 Sept 2011, 10:09 a.m.,*
in response to message #4 by Gilles Carpentier

The RPN to RPL relationship is roughly the same as is BASIC to PASCAL. In RPN, as in BASIC, its easy to start writing simple programs but creating more involved code quickly gets unhandy.

RPL is well structured, has powerful control statements and lacks GOTO, very similar to PASCAL. It is a bit of a hurdle to begin writing software with it but the results have more potential of being cleanly structured, easily expandable and correct.

Maybe RPL is more like FORTH for some. You can do everything on the stack which makes some RPL programs look "write only". It's possible to do so and it's efficient (code and speed wise). If you have the need to look after your programs some time later, a more defensive approach at compactness may be the better approach.

Re: Programming RPN on the 48?
*Message #6 Posted by **Crawl** on 7 Sept 2011, 10:52 a.m.,*

in response to message #5 by Marcus von Cube, Germany

The lack of Goto becomes quite annoying when you need to break out of a loop. You can always do it, of course, by adding more structures, but that seems like overkill for the problem.

I've seen some people recommend loop breaking with error trapping, but I wish there was a more "normal" way of doing it.

I agree at 110% ;). But no needs of GOTO for that : It just miss something like a BREAK or EXIT command in RPL (this exists in many language, like Pascal ...). The use of "error trapping" is not natural and very slow. This lack is very annoying in some cases..

Re: Programming RPN on the 48?
*Message #8 Posted by **Crawl** on 7 Sept 2011, 12:15 p.m.,*
in response to message #7 by Gilles Carpentier

Yeah. It has KILL, which works if you only want to break out of one level of program. But if another program CALLS a program that has KILL in it, KILL will kill even the parent program.

Pascal has GOTO.

It was in every Pascal I used (last was over 10 years ago) and is defined in ISO 7185 from 1982 and even in the 1973 language summary which Wirth referred to several times as standard Pascal.

in response to message #9 by sylvandb

I worked a lot in Pascal UCSD then Turbo Pascal then Delphi in the past and don't remember at all any GOTO ... Perhaps Tubo/Delphi are not ISO compatible but even if it is possible, I never imagined use a GOTO in Pascal. Seems like an horror for me ;)

Searching for "Goto in Pascal" I found this:

"Software is getting slower more rapidly than hardware becomes faster." Niklaus Wirth's law

While it's true that Pascal has goto, if I remember correctly (it's been a few years) the target of the goto has to be a numeric label. So you have to write things like

```
goto 100;
```

rather than

```
goto lastditcherrorhandler;
```

which would be more meaningful. I always got the impression Wirth was a bit mean-spirited over that; he would let you write non-structured code, but if you did, he would punish you for it and make it as painful as possible so you'd learn your lesson.

Best,

The use of the goto statement per se does not imply non-structured codes. Actually the first PASCAL programs I wrote in 1984 used labels at the beginning of every structure (010, 020, 030...) as per teacher's recommendation. Our textbook was Jean-Dominique Warnier's Logical Construction of Programs (LCP). We learned all other PASCAL statements later and goto was never needed again. Our professor's intention was making his students able to write structured code, no matter the programming language they used.

Gerson.

Exactly.

Once you have conditional's and goto you have the beginnings of structure and you can fake the rest.

It can be quite helpful if you have at least one level of subroutine, and having many levels helps a bit more.

But even more useful than a subroutine is to have local variables.

For a time I had to maintain and enhance a large program written in an "advanced" BASIC. It's only advanced feature for the time was optional line numbers but it did have goto {variable}. No gosub/return, no local variables, and only 6 char variable names. The "main" and all subroutines had to use defined variable names to avoid clobbering each other's variables. And each subroutine had a "goto RVAR00" at the end. The caller would save the previous contents of RVAR00 and set RVAR00 to the proper line number for the ending 'goto' to return from the subroutine. But our code was structured and that made it much more maintainable.

In that era, and still today, it certainly does. Edsger Dijkstra's paper, "Go To Statement Considered Harmful" (see [url:http://www.google.com/url?sa=t&source=web&cd=2&ved=0CCcQFjAB&url=http%3A%2F%2Fciteseerx.ist.psu.edu%2Fviewdoc%2Fdownload%3Fdoi%3D10.1.1.92.4846%26rep%3Drep1%26type%3Dpdf&ei=UshoTu3QMsmpiAeMqKnHCw&usg=AFQjCNEjry3w6PN-Lb9yWUlwZHC6prLPGg&sig2=J7wb2OmxsCkmjqB3ZL7_iQ]) had led to the Structured Programming movement, which was intended to stamp out the goto. That's what Structured Programming is: programming with a somewhat restricted set of control flow statements, especially no goto's [1].

I tried it out for myself, implementing a large subset of the dBASE language in approximately 70 modules (of PL/I code) without a single goto, and realised that it pretty much worked - only one bug was ever found in my code, although it only

took three days to write. On the other hand, there are times when you find yourself many levels deep in subroutines with no exception handling, and goto is the ideal tool for the job, so I favour its retention.

These days, the purists restrict themselves even more, with functional programming. Who needs while loops, when you've got recursion and the lambda calculus? ;)

Best,

my 2 (euro)cents

The major problem of RPL, IMHO, is lack of orthogonality and presence of many functions, which are not needed. Many high level languages, especially designed by Niklaus Wirth, have very concise and elegant syntax, while RPL has very cumbersome and complicated one.

Compared to RPL, RPN could be assumed to be assembler-like, but good assembler/instruction set (like DEC's PDP-11) is much more easier to program than overloaded, unsymmetrical, non-orthogonal high-level language. When high-level control structures are combined with giant set of assembler-level primitives, we get DUP2, DROP2 and other weird beauties. It seems as if RPL designers put everything of a kind in the box, trying to adhere to the latest programming technology trends.

Personally, I think RPL is very awkward and unelegant language. Learning curve is so steep not because RPL is powerful, but because it is ill-designed. However, it IS the most powerful calculator language available now, so there is no choice yet.

Maybe, there is a fundamental problem of designing programming language with stack structure. Stack languages are rather rare, but some of them (e.g. Forth), are simpler.

I think this makes RPN calculators so popular now. And yes, RPN firmware for HP-50g (a-la WP-34s) could be very popular.

Everything here reflects my very subjective point of view.

I started programming RPL with the HP28S and never really had a problem with RPL based machines. I program for a living, primarily in C derivative languages (I programmed C itself for a decade) as well as Pascal derivatives such as Delphi and this may be partially why I have never seen RPL as particularly hard to learn.

Many of the large function set you refer to were, I suspect, added for performance reasons. Take for example your own examples of DUP2 and DROP2. One could easily do DUP DUP or DROP DROP however, either of these would require additional parameter checking as performed by each User RPL command. Having DUP2 and DROP2 available eliminates half the parameter checking of using DUP DUP or DROP DROP it also eliminates a call/return and in the case of DROP DROP, where it might very well be implemented as a stack pointer adjustment, it could eliminate half the code. This may not matter so much in the current HP50g and would matter even less if the command set were implemented natively instead of via an emulator, however, it did make a difference for the considerably slower HP48SX. Once implemented HP saw fit (and IMHO this was a good decision) to maintain the same functionality in newer machines. If you think of RPL in terms of processor architecture it would very definitely be considered a CISC machine. Throw in everything including the kitchen sink, cabinets, and any other odds and ends you can think of. While this might make it hard to remember the entire command set and it certainly makes it possible to do things multiple ways it also offers power and lots of opportunities for performance tweaking.

While RPN is definitely simpler for "quick and dirty" solutions it has neither the power nor the maintainability of a well written RPL program which, due to enforced structure and named variables and subroutines can be self-documenting if the programmer makes just a little effort. Give me both in the same machine (without use of an additional emulator layer) and I would be delighted. Even better would be to provide a built-in C compiler or interpreter as would be possible with the newer processor architecture alongside the existing tools (and an RPN layer) and in my opinion the machine would be darn near perfect from a programmability point of view. Of course one can use a cross compiler but I like the ability of being able to develop code wherever and whenever I so choose.

This, of course, is just my 2 cents worth after using RPL based machines since the 28S. Note that I have also used RPN since the 41C and before that with borrowed HP67's so my experience includes both paradigms.

Cheers,

-Marwan

I agree with you, it is not because a command is available that you have to use it. I have often found myself writing some complicated code only to find that one command does it for me. I would consider that as an advantage rather than a nuisance. As for the argument that you can't do keystroke programming in RPL, I don't follow it. You just start with << do your keystroke sequence and end with >> I can't see anything complicated there...

Re: Programming RPN on the 48?
*Message #21 Posted by **M. Joury** on 8 Sept 2011, 9:44 a.m.,*
in response to message #20 by Arnaud Amiel

And I agree with you--we can start a mutual agreement society here <g>. Keystroke programming IS available on the HP48 and above. What I think some users are bothered by are the control structures. It is much easier for non-programmers and even some programmers, even if less neat, to use simple tests and a goto rather than the more powerful and more complex control structures offered by the RPL machines. At least that is the only conclusion that I can come to when I hear the complaint that the HP48 machines are not keystroke programmable.

I still think that for quick and dirty programs with a couple of very simple loops providing an RPN emulation mode would not hurt sales one bit.

Cheers,

-Marwan

I worked with and programmed RPN calculators (1977:HP-25, 1986:HP-11C) for eleven years before buying an HP-28C in 1988. I remember that learning PRL was a major paradigm shift for me and it took a fair amount of effort to become proficient at it. I do admire its purity (I did not mean that line to sound creepy like it did in the movie "Alien"!). On RPN machines some operations such as STO, FIX, ENG, SCI, etc were post-fix operations requiring numeric data to be entered after the command key was pressed. RPL is strictly post-fix. When you execute a command in PRL you had better already have whatever data that operation requires on the stack.

Structured programming was a major change as well. Luckily, most programs I wrote were simple formula conversions so RPL was very much like RPN for those types of problems.

As I moved on to the HP-28S and finally to the HP-48SX as my daily engineering calculator, I found myself almost never using my HP-11C. I finally sold it around 2000 for about twice what I paid for it with the original set of batteries still going strong! Although I did not really use it anymore, I really miss that calculator and hope to pick up a HP-15C LE if I can convince my wife that I need yet another calculator :)

P.S. I am really looking forward to attending HHC this year! I have been wanting to go for years but either it was too far away or something else always came up. I can hardly wait to be there!!!

in response to message #24 by Thomas Klemm

True. Sorry. I was thinking of DUPDUP.

However, it does not change the point I was trying to make which is that DUP2 is faster than separate calls such as OVER OVER and DUPDUP is faster than DUP DUP.

Cheers,

-Marwan

Perl is also cursed for its inelegance. A major philosophy of the language is "There's more than one way to do it," (TMTWWTDI). Not only are there multiple ways to do things, but there are zillions of things one can do with Perl. Programmers can write Perl in highly idiosyncratic ways, and often do. Reading someone else's code can be difficult sometimes. Much Perl code is criticized for looking like "line noise" (That's partly due to extensive reliance on regular expressions, without using the facilities the language provides for making them more readable.) But Perl is an extremely powerful language that adapts to the way *you* think. People with orderly thought processes tend to favor languages like Python, which successfully tries to fill the niches Perl occupies, but does so with elegant, though rigid object oriented syntax. On the other hand, if your mind is chaotic and messy like mine, you might feel more comfortable with Perl. (Actually, I impose order and structure in my Perl, as an exercise in taming my mental chaos to a degree. That underlines the fact that you don't *have* to write cryptic unmaintainable code with Perl, even if you *can*.)

RPL is a lot like Perl in that way. TMTWWTDI certainly applies to the 50g and others. Like Perl, RPL has a steep learning curve. (My opinion is that Perl is easier to get started with however.) I hated RPL until I broke through with understanding it. That took a long time, but once I got over that barrier, I found that I loved RPL for the freedom it offers to be insanely twisted and clever above and beyond my capability in those things. No doubt there are other reasons to admire RPL, but since I don't have many real problems I need to solve with my calculators, "geek fun" is all I need to enjoy the language.

The acronym looks like phonetic writing to me. The WW should be OW in my eyes. ;-)

Back to topic: Many programming languages allow convoluted code. Unstructured spaghetti code in BASIC is one extreme, tightly optimized RPL stack manipulation code without any named variables the other. I have a coding style which makes my programs look similar independent of language, within the bounds set by the syntax.

First of all I don't necessarily agree with everything you quoted. But the main issue is you would *completely* give up any semblance of keystroke programming. Comments posted on this site not withstanding, RPL *is* keystroke programmable. Not in the way that RPN was, but taking out the added complexity of control statements you can key in a simple program to reproduce a series of keystrokes (my ultimate definition of keystroke programming) with a few seconds effort. If you want a *real* programming language in addition to RPL (and/or RPN) that's fine and I would be all for it but don't remove the ability to write quick and dirty programs. And make the language 'C', not Pascal.

Just MHO.

Cheers,

-Marwan

Re: Why disnt they just do pascal then?

*Message #33 Posted by **Oliver Unter Ecker** on 10 Sept 2011, 4:30 p.m.,*
in response to message #32 by M. Joury

Excellent point.

In my mind, RPL is about the simplest way to add a handful of common control structures to an otherwise RPN model of operation.

The "steep" learning curve isn't really in the language (which is minimal; and the only odd thing I can think of is the clumsiness of having to bind local vars to "defining procedures"), but the command set. And here, you choose/use what you need. It's good that the kitchen sink is thrown in, as it gives you a nice set of commands/math abilities you would otherwise have to implement yourself (depending on your needs).

The "power" of RPL comes from the fact that it knows about objects, and has polymorphism (in the OO language sense). "+" works with Reals, Complex numbers, Vectors, Matrices, etc. That aspect is cool and respectable, even in 2011.

(And since RPL machines support more objects/types, that makes them arguably superior to earlier RPN machines--if you need those types and/or functions, that is.)

I think, being stack-oriented is a strength and weakness, and a detail not to be ignored when comparing RPL (or RPN) to other languages. It sometimes makes for terse code for simpler jobs, but it makes reading RPL quite hard. You have to actually parse the code to "get" what is being accomplished (and what constitutes the 'lvalue' in an assignment).

I don't think RPL is very suitable for longer programs. But for small jobs, it's quite sweet. Starting with the fact that you only need one char to start a program and no syntax for inputs and outputs (as they come from, and go to, the stack).

HP Pascal studio

*Message #35 Posted by **x34** on 11 Sept 2011, 3:44 p.m.,*
in response to message #34 by Gilles Carpentier

Gilles, the site is in French only. Is there any free version of Pascal Studio (if so, how could it be obtained)? Does it work with HP-50G?

Re: HP Pascal studio

*Message #36 Posted by **Gilles Carpentier** on 11 Sept 2011, 4:50 p.m.,*
in response to message #35 by x34

Yes It works on HP50G. It also works with Emu48

Note that it's not a perfect tool and there is some bugs. It's a subset of Pascal langage (no records and type for example, and of course no Objects).

The project seems dead few years ago.

It's open source so i think you can find some download area. All the docs are in french.

What is interesting is :

- The graphics commands are very fast ! - Fine keyboard management - HP48/49/50 compatibility - Easy Saturn integration (ASM command like in Turbo Pascal) ex: http://hppascal.free.fr/pages/library_show.php3?file=graphhp.unt - Bin not too big for simple program

The minus : - some bugs - a subset of Pascal - The project is dead - It seems not possible to exchange parameters with RPL stack (the documentation is very unclear on this point) - You need a PC to generate the binary

Imo, it's more a proof of concept that an ultimate tool, but it's usable (for exemple the PAC MAN or TERTRIS exemples are very impressive - and it works on 50g with a new compilation and some change to slow down the programs). You would not use it for a 'serious' project but you can have fun with. Note there is also sprites and bitmap management

If there is some interest note that I have partialy adapted the Math UNIT to work on HP49G+/50

Re: HP Pascal studio
*Message #37 Posted by **x34** on 12 Sept 2011, 7:46 a.m.,*
in response to message #36 by Gilles Carpentier

I could not find any way to download it. Payment does not work, and there are no sources/binaries I can find. It's a pity.

Re: HP Pascal studio
*Message #38 Posted by **Gilles Carpentier** on 12 Sept 2011, 2:04 p.m.,*
in response to message #37 by x34

The website and documentation says HP-Pascal is a freeware and opensource. I sent you an email. The zip installation file is only 1 MB

Just to compare speed of RPL and HP Pascal, a solution for the problem 1 of Euler project http://projecteuler.net/index.php?section=problems&id=1

HP PASCAL :

```
Uses CrtHP_49;
Var i,t : Integer;
Begin
 For i:=1 to 999 Do
  If i mod 3=0 Or i mod 5=0 Then t:=t+i;
 Write(t); Repeat Until Keypressed;
End.
```

s : 0.5057 sec Code size : 406 Bytes

User RPL

```
«
 0.
 1. 999. FOR i
   i 3. MOD i 5. MOD AND NOT { i + } IFT
 NEXT
»
```

s: 13.29 sec Code Size : 73,5 Bytes

Pascal is 26 times faster

Re: Programming RPN on the 48?
*Message #42 Posted by **Reth** on 7 Sept 2011, 2:27 a.m.,*
in response to message #1 by snaggs

I see no reason to use RPN on the 48 but if one have to, there are 41 emulators. To use RPN on RPL machine is like breaking walnuts with a microscope. ;)

Re: Programming RPN on the 48?
*Message #43 Posted by **Thomas Chrapkiewicz** on 7 Sept 2011, 8:01 a.m.,*
in response to message #1 by snaggs

(and this echoes others sentiments).

I've been using RPN since the days of the 35/45/65 (~40 years), use a 42s/35s/15c/48 regularily and have found that this highly discussed 'transition' to RPL to be highly over-rated. It is really very similar and I find that it requires very little attention that the machine is not RPN.

> If thats the case, why would you use a 42s?

1. RPN Native.
2. Pocketability.
3. Just short of a zillion years of battery life.

There is no such thing as a universal solution that works for all people in all cases.

in response to message #44 by Egan Ford

I love Hrast's emulators. He has them for many of my favorite machines. In addition to HP-41X, there are HP-42X, HP-71X, and HP-1xE for the Voyagers, except the 10C. Until Cristoph Giesselink came out with EMU71 for Windows, HP-71X was the only emulator that could run my YATZ71 game. (It is still the only one that can run it with sound. :) They are well worth a look.

> Quote:
>
> Looking back at the HP 48G, it seems to have more functions on the keyboard, and a lovely design.

More functions on the keyboard, compared to what? The total functionality of the HP 48G is a much dimished subset of the later HP 49g+ and HP 50g. But the functions explicitly shown on the keyboard of each of these is very similar. There are menus after menus after menus on all of these machines due to the tremendous number of functions they support.

I purchased an HP 48SX in 1991, and a HP 48GX in 1996. They have great keyboards, but typically some of the fuzziest low-contrast LCDs that anyone ever put on a calculator. Only very late in HP 48GX history did decent sharp high-contrast LCDs show up. They are painfully slow, and have no way of receiving AC power during long program execution times.

Essentially all the capability of the HP 48GX is contained in the HP 49g+, plus CAS, USB, much greater speed, LCD quality, and memory capacity (with SD cards). (Unfortunately, the keyboard of most HP 49g+ units suck.) Also very importantly, 49g+/50g firmware can easily be upgraded by downloading the image on a PC to an SD card, then upgrading from that SD card in the calculator. The HP 48S and G series have no firmware upgrade capability. IIRC, the last HP firmware in the 48S and 48G series is Version

R, but if you have something earlier on your machine then you're stuck with it forever. The 49g+/50g also have an extensive developer's application built in that allows access to the internals at either the ARM or the emulated-Saturn levels.

The 2006 HP 50g corrected the 49g+ keyboard problems, improved the appearance, and added the capability for operation from external power through the USB port. If one can stand the large size and attendant weight, and if one is willing to learn User RPL, the HP 50g is the finest hand-held calculator made by anyone anywhere anytime. Not perfect, just all things considered the best that happens to be in existence since 2006...and a giant advance over the HP 48G series by any measure. (I haven't used my 48SX and two 48GX units at all since getting my 49g+ and 50g.)

Re: Programming RPN on the 48?
*Message #49 Posted by **David Hayden** on 7 Sept 2011, 3:42 p.m.,*
in response to message #1 by snaggs

If you'd like to play with RPL a little, you can use one of the excellent PC-based development environments.

For User RPL, I like HPUserEdit 5. Note that the program defaults to Spanish, but you can change it to one of several others (including English) as described here

The Advanced Users Reference contains a detailed tutorial on RPL programming at the beginning, as well as descriptions of all the commands. I believe the link given has the version with bookmarks to make it easy to navigate.

There are several mini-challenges on hpcalc.org that make nice programs to attempt.

Good luck! Dave

*Message #50 Posted by **Gilles Carpentier** on 7 Sept 2011, 4:53 p.m.,*
in response to message #49 by David Hayden

I agree... HPUserEdit is a great tool with a perfect integration with emu48. Well done INFORM INPUT and CHOOSE wizard are present and much more

There is also a french version A screen shot :

http://imagik.fr/uploads/412269

I uses this to solve Euler project problem and i'm near 100 solved problems (it's my objective, still 7) , most of them in RPL I learned UserRPL with this book : "La Maitrise De La Hp-48 - Tome 1 - Programmation Et Exercices Jean-Michel Ferrard" wich is very interesting. I think you need a book or on-line documentation because HP doc are very very poor about User RPL programming.(not the description of each command in the AUR but how to combine all this;))

Edited: 7 Sept 2011, 4:59 p.m.

Project Euler looks like a great way to learn programming!
*Message #51 Posted by **snaggs** on 7 Sept 2011, 6:55 p.m.,*

Re: Project Euler looks like a great way to learn programming!
*Message #52 Posted by **Pal G.** on 7 Sept 2011, 11:03 p.m.,*
in response to message #51 by snaggs

Besides using HPUser edit, try coding on the 49g+ itself. The large screen (and the optional choice of the size 6 font) makes writing and editing code quite comfortable. I hardly ever plot anything on my 50g, but I find the large LCD is great for editing multi-lined RPL code (anywhere you happen to be - bus, train, plane, automobile).

After several hours of coding on the device you'll get good and look Elton John in "Tommy". People will wonder what the @#$% you are doing..

RPN alongside RPL in one calc
*Message #53 Posted by **Oliver Unter Ecker** on 8 Sept 2011, 3:10 p.m.,*
in response to message #1 by snaggs

If someone is interested in implementing a RPN interpreter within an existing framework for calculators running on modern mobile devices (iOS/Android), please contact me.

I could provide skeleton code for a class that would permit an RPN model of programming (and possibly calc operation) alongside and within an existing RPL model of programming (and calc operation).

To be written in JavaScript, with an existing framework of math functions, I swear this cannot be done much more easily/comfortably.

*Message #54 Posted by **Mark Hardman** on 8 Sept 2011, 3:43 p.m.,*

in response to message #53 by Oliver Unter Ecker

A single plug for your iOS product gets a pass by me. But, since this is the second mention of your ND0/ND1 app in this thread, this should perhaps be moved to the "Classifieds" section of the MoHPC.

Re: RPN alongside RPL in one calc
*Message #55 Posted by **Oliver Unter Ecker** on 8 Sept 2011, 4:30 p.m.,*
in response to message #54 by Mark Hardman

Sorry if this post offended you. I explicitly didn't name the product, trying to minimize any "plug" suspicions.

The post is simply an invite for cooperation.

Is the Classifieds section the right place to suggest collaborations? What would be the harm, if a project were started as a result of this discussion?

Re: RPN alongside RPL in one calc
*Message #56 Posted by **Howard Owen** on 8 Sept 2011, 4:38 p.m.,*
in response to message #55 by Oliver Unter Ecker

We know that development discussions are **cough** strictly off limits here. :)

(Since irony is infamous for not surviving cultural translation, please note the "smiley" above. :)

Re: RPN alongside RPL in one calc
*Message #57 Posted by **Mark Hardman** on 8 Sept 2011, 4:57 p.m.,*
in response to message #55 by Oliver Unter Ecker

My apologies Oliver. I assumed that ND1 was just another iOS calculator app being added on the growing dung heap that is the Apple App Store (tm).

After taking a look, I like what I see and have actually purchased a copy.

Re: RPN alongside RPL in one calc
*Message #58 Posted by **Oliver Unter Ecker** on 8 Sept 2011, 7:09 p.m.,*
in response to message #57 by Mark Hardman

No problem, Mark. Thank you, and I hope you'll enjoy the calc.

If now you sign up for the RPN module, you'll make my day. ;-)

Re: RPN alongside RPL in one calc
*Message #59 Posted by **Howard Owen** on 8 Sept 2011, 4:35 p.m.,*
in response to message #54 by Mark Hardman

That is obviously not a commercial pitch in the sense that he is not asking you to buy anything.

Re: Test post

*Message #2 Posted by **Michael de Estrada** on 6 Sept 2011, 9:38 p.m.,*
in response to message #1 by Martin Pinckney

Really ? IIRC I've seen it used previously w/o being deleted.

Re: Test post

*Message #3 Posted by **Martin Pinckney** on 6 Sept 2011, 10:54 p.m.,*
in response to message #2 by Michael de Estrada

Michael,

See posts 13,14,& 25 of this thread (at least those were the correct numbers as of the time of this posting).

After I figured out what site TOS referred to, I tried responding with the actual name, and was greeted with a "your post will be reviewed by the moderator when he has time" sort of message. The first and another unrelated post have not yet appeared.

Re: Test post

*Message #4 Posted by **Walter B** on 7 Sept 2011, 7:11 a.m.,*
in response to message #3 by Martin Pinckney

Experienced the same this morning. This blocked all subsequent posts for a while, though there was nothing critical in them.

Re: Test post

*Message #5 Posted by **db (martinez, ca.)** on 7 Sept 2011, 9:12 a.m.,*
in response to message #1 by Martin Pinckney

Moderator: please feel free to erase this if it shouldn't be here.

I know a small bit about the problem you guys are worrying on. Originally, it involved a corporation we all know and love and someone i still do believe is better than this throwing rocks (mostly) over Dave's head, and Dave wondering what all this vaguely threating legalese tied to the rocks that accidentally hit him means.

Our curator acted in good faith, and (i think) so did the other guy, at least at first. That large corporation probably would have, and sent the same message to everyone concerned, but the employees don't all know each other - or all agree either (maybe).

My guess is that Dave would prefer that this subject had resolved or disappeared ten years ago. It should have too, since everyone is on the same side.

My least favorite words: "Coming soon"

*Message #1 Posted by **Allen** on 6 Sept 2011, 6:54 p.m.*

For almost a week after the official HP press release of the 15C LE we have been plagued by these dreaded words on the 15C LE page:

```
"Coming soon"
```

Certainly the customer outreach by the Calculator Division is above expectations. Even their sponsorship at HHC events is feels so intimate, validating and enriching, you can't help BUT to be an HP fan after attending HHC.

For all the creative, rational, intelligent, responsive folks in the Calculator Division, it's quite sad that HP's public face (e.g. the Web Division) is the exact opposite.

Re: My least favorite words: "Coming soon"

*Message #2 Posted by **Lincoln R.** on 6 Sept 2011, 8:19 p.m.,*
in response to message #1 by Allen

I'd take a wild guess that this is simply because the people working in the calculator division are people who truly want to be doing this, as opposed to web designers who might even be a subcontractor that also does websites for dog food and umbrellas. I don't know how many people the calculator division employs, but at least 3 of them post fairly regularly here, which they almost certainly wouldn't bother doing if HP calculators weren't something they were actually interested in.

Re: My least favorite words: "Coming soon"

*Message #3 Posted by **Mike T.** on 6 Sept 2011, 9:04 p.m.,*
in response to message #1 by Allen

I'd rather see comming soon than nothing at all!!!

Hope the new 15C goes on sale in the UK (and that I can aford it).

Mike T.

Re: My least favorite words: "Coming soon"

*Message #4 Posted by **Howard Owen** on 6 Sept 2011, 9:49 p.m.,*
in response to message #1 by Allen

The "Coming Soon" is a decision taken by marketing, not the web server content people.

1. This calculator was "outed" by dealers much earlier than planned.
2. Drumming up unsatisfied interest is a time honored technique for boosting sales
3. If you are annoyed by that in this case, you are unlikely to go buy a TI calculator instead. :)
4. Patience, Grasshopper! :)

Re: My least favorite words: "Coming soon"

*Message #5 Posted by **Namir** on 6 Sept 2011, 10:00 p.m.,*
in response to message #1 by Allen

I think the probability of buying the HP-15C LE from the HP web site follows (in my humble statistical opinion) a Poisson curve. The initial part of the waiting time increases the probability of the LE being sold on the web. As the days go buy, that probability reaches a maximum value and then drops towards zero. You can interpret the drop as based on one of the following reasons:

```
1. HP has decided to sell all the LE units ONLY through the dealers.
2. HP has decided to kill the LE (to which we shout ... boo hiss).
3. HP has JUST sold the calculator division. The buyer now has the right to all the
supplies of HP calculators.
4. Was a miscommunication with the HP web master in the first place, giving way to points 1
or 2 above.
5. Another reason that has escaped me.
```

Namir

Re: My least favorite words: "Coming soon"

*Message #6 Posted by **Lincoln R.** on 6 Sept 2011, 10:10 p.m.,*
in response to message #5 by Namir

I sincerely doubt it's been killed off. Glenn Dowdy posted pictures of a 15C package on a factory conveyor as well as a bin full of newly manufactured production model 15Cs. They built them, even if they decided not to make any *more* who knows how many have been built since Glenn posted those pictures.

Last week Tim said they were still being built. I imagine they're being built in China, which means they will have to be shipped to HP before they can sell them. Air freight is expensive, so I imagine the calculators will be shipped on a boat along with the current run of 12Cs and what have you.

Re: My least favorite words: "Coming soon"

*Message #7 Posted by **hpnut** on 6 Sept 2011, 11:52 p.m.,*
in response to message #6 by Lincoln R.

ah, the slow boat from China, that's why we are waiting!

Re: My least favorite words: "Coming soon"

*Message #8 Posted by **David Hayden** on 7 Sept 2011, 3:59 p.m.,*
in response to message #6 by Lincoln R.

I just heard that the boat carrying the 15C's has arrived at port, but they said something about "drying out" that I didn't quite understand:

Webcam of the ship docking.

:) Dave

Re: My least favorite words: "Coming soon"

*Message #9 Posted by **M. Joury** on 7 Sept 2011, 4:06 p.m.,*

in response to message #8 by David Hayden

LOL! Lets hope not!

Re: My least favorite words: "Coming soon"

*Message #10 Posted by **Nick R** on 7 Sept 2011, 4:38 p.m.,*
in response to message #8 by David Hayden

Could be the lead-based paint used in imported goods caused the ship to list dangerously while unloading.

Re: My least favorite words: "Coming soon"

*Message #11 Posted by **Namir** on 7 Sept 2011, 2:34 a.m.,*
in response to message #1 by Allen

I think the message on the HP web site for the new calculators is incomplete. It should read:

"Coming soon in the slow boats from China!"

:-)

Re: My least favorite words: "Coming soon"

*Message #12 Posted by **M. Joury** on 7 Sept 2011, 8:50 a.m.,*
in response to message #1 by Allen

It seemed quite clear to me that the 15C LE was not quite ready to sell. No stock, planned for a future date (10/01?), whatever the reasons I was pretty sure that we would not see a "Buy Now" button for a while.

What I don't understand is the lack of availability on the Home Store site of the 12C 30th Anniversary. It was supposed to be available 9/01 and it appears to be available at Sampson Cables and on the Small Business site for $20 and $25 more respectively. Why can't we get one from the home store at what I understand to be the advertised price?

Cheers,

-Marwan

Re: My least favorite words: "Coming soon"

*Message #13 Posted by **Miguel Toro** on 7 Sept 2011, 9:34 a.m.,*
in response to message #1 by Allen

From the page of Samson Cables:

"This item is not in stock yet but we are making it available to pre-order due to expected high demand and limited availability. Orders will be filled in the order received and your card will not be charged until shipment. We were told to expect shipment in **Oct - Dec 2011** but I heard today (9/1/2011) **it may be as soon as next week**. Check this page for updates. If you have already pre-ordered this product it is not necessary to re-order it."

So the expected delivery is...whenever in 2011, perhaps, maybe :-)

Miguel

Help with 41CV - memory problem ?

*Message #1 Posted by **timw** on 6 Sept 2011, 8:28 a.m.*

Hi, I am repairing a 41CV (fullnut, s/n 2202S40037) for a workmate and would appreciate some help. I refurbished the card reader, fixed the battery contacts and repaired the screw posts - cosmetically it is excellent. I put it back together and it appears to work ok performing simple calculations. STO and RCL work and the values are preserved when powered off.

I then entered a 4 line program and when executed the 41CV locks up and has to be powered off to regain control. Executing GTO .. results in a lockup with 'PACKING' showing on the display. I can read pre-programmed cards but they also lock up the 41CV. I am guessing this is indicating a problem with the memory IC's.

The IC's are as follows :

ILB738, ILB739, ILB740 - ROMS ?

ILA701

ILE701, ILE702, ILE703, ILE704, ILE705 - memory ?

I have removed the abovementioned chips but do not have another 41CV to test them in.

Any advice on how to proceed will be appreciated as I would like to surprise my friend by returning his 41CV to full health.

Regards, tim.

Re: Help with 41CV - memory problem ?

*Message #2 Posted by **Raymond Del Tondo** on 6 Sept 2011, 12:22 p.m.,*
in response to message #1 by timw

Hi Tim,

On 1st look it sounds like there are no program Registers assigned. Just XEQ SIZE , and fill the prompt with a Value, like 050 . The above number tells the HP-41 to assign 50 of the available registers as Data Storage Registers, and to use the remaining memory as program storage. Please also consult the Manual for more details.

HTH

Ray

Re: Help with 41CV - memory problem ?

*Message #3 Posted by **Geoff Quickfall** on 6 Sept 2011, 3:29 p.m.,*
in response to message #2 by Raymond Del Tondo

The CV from a memory lost state should assign program registers automatically.

XEQ SIZE 000 switch to prgm mode

and record the number of program registers available and let us know if you see 319.

that would indicate that all RAMs are functional.

Let us know what you see.

Geoff

Re: Help with 41CV - memory problem ?

*Message #4 Posted by **timw** on 7 Sept 2011, 9:10 a.m.,*
in response to message #3 by Geoff Quickfall

Hi, thanks for the tips Raymond and Geoff.

As I have already desoldered and removed ILA701, ILE701, ILE702, ILE703, ILE704, ILE705 I am wondering whether I can solder them back in a specific sequence to help diagose the problem ?

For example if ILE701 is the first set of memory registers (64 ?) and there are no other memory chips present, would XEQ SIZE 000 show 64 if ILE701 is ok ? With a faulty memory chip in-circuit would the XEQ SIZE 000 command then fail, indicating that the last chip fitted is faulty ?

Here I am assuming the ILA701 is memory registers 1-64, ILA702 is registers 65-128, etc, however this is just a guess.

Or should I put them all back in-circuit and proceed with fault finding ?

Thanks, Tim.

Re: Help with 41CV - memory problem ?

*Message #5 Posted by **Eric Smith** on 7 Sept 2011, 1:53 p.m.,*
in response to message #4 by timw

1LA701 is the "status registers". The calculator needs that and 1LE701 at a minimum (along with all the ROMs) to work at all.

Re: Help with 41CV - memory problem ?

*Message #6 Posted by **timw** on 7 Sept 2011, 8:25 p.m.,*
in response to message #5 by Eric Smith

Hi Eric, when I said "....Here I am assuming the ILA701 is memory registers 1-64, ILA702 is registers 65-128, etc, however this is just a guess...." I should have said ILE701, ILE702, etc.

Anyway, I soldered the ILA701 and ILE701 back in (ILE702 to ILE705 are not in-circuit) and when I switch to program mode the display shows '000 REG 46'. GTO .. initiates 'PACKING' and a lockup. Does this mean the 41CV is only seeing the first 46 registers of the ILE701 and that it is a faulty chip ? If so, any tips on finding an ILE701 as I am not keen on buying another 41CV just for 1 chip.

I think the display also showed '000 REG 46' before I removed ILE701 to ILE705.

Thanks for you help. Timw.

Re: Help with 41CV - memory problem ?

*Message #7 Posted by **Eric Smith** on 7 Sept 2011, 8:55 p.m.,*
in response to message #6 by timw

You are correct that 1LE701 contains the first 64 "user" memory registers. The "000 REG 46" is the correct display after entry to PRGM mode from MEMORY LOST, because the partition between registers registers and program space is fixed somewhere in the middle of the 1LE701 chip.

With all RAM chips installed, you should be able to access (STO and RCL) registers 00 though 272, but you have to use indirect addressing to get at registers above 99. For instance, you could do something like:

```
272 STO 00
1.23456789E41 STO IND 00
CLx
RCL IND 00
```

and you should bet the stored number back. (Press the gold shift key for IND.)

The other ways to look at the memory size are:

```
XEQ alpha SIZE alpha 000 -- configures for NO user data registers
PRGM - tells you how many program registers are available, e.g.,
00 REG 63, 00 REG 127, 00 REG 191, 00 REG 255, or 00 REG 319
```

Or, with the Extended Function/Memory module:

```
XEQ alpha SIZE? alpha
```

Failing during PACKING suggests that there is another failure. Most likely this would be either a ROM, the 1LA701 RAM, or the processor chip (1LA5-0001, 1LE3-0002, or 1LF5-0002). It is obvious that the ROMs, 1LA701, and processor are at least partially working, which makes this difficult to pin down.

The official service procedures would tell you to replace a series of chips until the calculator works correctly. This is obviously not practical for you, since there is no source of replacement parts aside from other calculators. At this point it sounds to me like your 41CV is only useful as a possible parts donor.

has 16C memory increased?

*Message #1 Posted by **designnut** on 5 Sept 2011, 8:09 p.m.*

As I recall iot was a little short of programmable memory space. I am unable to find if that has changed, anyone know? Sam

Re: has 16C memory increased?

*Message #2 Posted by **Eric Smith** on 5 Sept 2011, 8:39 p.m.,*
in response to message #1 by designnut

The 16C has been discontinued since 1988, so none of its specifications have changed since then.

If you are referring to the new 15c limited edition, AFAIK the only specifications that are changed are the speed (much faster) and the batteries (two CR2032, vs. three 357 button cells). The available memory is unchanged: up to 65 registers or 448 program steps.

Re: has 15C memory increased?

*Message #3 Posted by **kc** on 6 Sept 2011, 5:54 a.m.,*
in response to message #2 by Eric Smith

So that's the question: Isn't it much easier nowadays to have say, 32k RAM than to have less than 2k?

Re: has 15C memory increased?

*Message #4 Posted by **Paul Dale** on 6 Sept 2011, 6:01 a.m.,*
in response to message #3 by kc

The CPU in the modern 12c and almost certainly the 15c has exactly 2kb of battery backed RAM. So, no it isn't always easier to have more RAM.

The 15c firmware uses less than this BTW.

- Pauli

> So that's the question: Isn't it much easier nowadays to have say, 32k RAM than to have less than 2k?

It depends on the SoC and whatever other functionality is competing for finite silicon real estate. Most

notably the current ARM SoCs have rather limited RWM capacities. Also the lowest achievable system power reduction in which RWM data is retained differs considerably between designs. The power-down-data-retained leakage current varying in proportion to the RWM size is another motivation to limit its size.

Unfortunately with present SoCs applicable to this application area you are limited to on-die ROM/RWM in practical terms for direct access/execute memory. However for firmware emulator applications, serial interconnect (eg: SPI) RWM can be acceptable for firmware (vs. emulator) sourced access without much of a performance penalty. To a lesser extent this can be true for ROM (flash) as well but in my experiments I've found some internal caching was needed to avoid getting bogged down in SPI addressing overhead as well leverage repetitive localized instruction fetching. To frustrate matters caching itself consumes internal SRAM so an application specific balance needs to be struck.

Connecting the HP-41 to the HP-71... Why? How?

*Message #1 Posted by **Geir Isene** on 5 Sept 2011, 1:24 p.m.*

Is it possible to connect the HP-41 to the HP-71 in any useful way? If so, why? And how?

Re: Connecting the HP-41 to the HP-71... Why? How?

*Message #2 Posted by **Raymond Del Tondo** on 5 Sept 2011, 1:58 p.m.,*
in response to message #1 by Geir Isene

Yes it's possible through HP-IL, of course.
On the HP-71 perform CONTROL OFF, then connect the HP-IL module of the HP-41 to the HP-IL interface of the HP-71, then do stuff.
Actually, you may want to let the HP-71 participate in some way, so you could write a loop in BASIC, which reads and evaluates things coming over the loop using ENTER.
Data sharing on mass media and data transfer from one machine to the other are possible applications, as well as using the HP-71 as slave for the HP-41.
The HP-41 Translator Pac for the HP-71B nicely shows a practical application, too: The HP-71 acts as a printer for HP-41 programs.

HTH

Re: Connecting the HP-41 to the HP-71... Why? How?

*Message #3 Posted by **Geir Isene** on 5 Sept 2011, 4:37 p.m.,*
in response to message #2 by Raymond Del Tondo

Any example of programs/usages?

Re: Connecting the HP-41 to the HP-71... Why? How?

*Message #4 Posted by **Etienne Victoria** on 5 Sept 2011, 7:17 p.m.,*
in response to message #3 by Geir Isene

Yes,

With Raymond's example above:

- I PRP the 41 program I want to use up to the Hp-71.

- The resulting text file is then post-processed by the 41 emulator.

- From there, the program can be stored and expanded beyond the original Hp-41 capabilities (memory size, display...).

It will then be executed through the Forth engine and with the HP-71B great display.

Etienne

Edit: Any synthetic programming will not work through this process, just plain FOCAL.

Edited: 5 Sept 2011, 7:18 p.m.

*Message #5 Posted by **Howard Owen** on 5 Sept 2011, 2:33 p.m.,*
in response to message #1 by Geir Isene

The 41C can't yield control of the loop, which is why you need CONTROL OFF on the 71B.

Why connect any two machines? If you were actually using them in the lab or the field, I supposed uploading data captured by the 41 to the 71 for processing might make sense, but I don't pay attention to practicality. I do stuff like that because I'm crazy ... for the old calculators. :)

Re: Connecting the HP-41 to the HP-71... Why? How?

What do you like most about the HP-15C?

*Message #1 Posted by **Gerardo Rincon** on 4 Sept 2011, 9:58 p.m.*

Size (truly pocket size Scientific calculator), No Menus, RPN

Edited: 4 Sept 2011, 10:25 p.m.

Re: What do you like most about the HP-15C?

*Message #2 Posted by **Lincoln R.** on 4 Sept 2011, 10:31 p.m.,*
in response to message #1 by Gerardo Rincon

The fact that HP actually did it. People have been wanting a 15C reissue for so long, and they finally made one. I obviously haven't gotten one yet, and never owned an original production 15C to compare it to (although if the reissue has the desired effect on TAS prices I may buy one), so I won't be able to speak as to whether it's better or worse than the original.

Re: What do you like most about the HP-15C?

*Message #3 Posted by **hpnut** on 5 Sept 2011, 12:23 a.m.,*
in response to message #2 by Lincoln R.

I don't understand the rationale of HP making limited production run of the HP 15C.

I don't think the 10,000 unit production run will satisfy the pent up demand of 84,000+ projected by the hp15c.org if their stats can be believed. there's too much room for speculators to cash in at e**y.

Re: What do you like most about the HP-15C?

*Message #4 Posted by **Lincoln R.** on 5 Sept 2011, 12:28 a.m.,*
in response to message #3 by hpnut

I don't know how accurate that petition is. There were 15,192 people saying they would buy 84,148 calculators. That's approximately 5.5 calculators per signatory. And if the limited production run flies off shelves that quickly, it would be trivial for HP to make more since it's based on the 12C hardware.

Re: What do you like most about the HP-15C?

*Message #5 Posted by **Marcus von Cube, Germany** on 5 Sept 2011, 2:11 a.m.,*
in response to message #4 by Lincoln R.

Maybe the LE signature gets dropped and the packaging approaches that of a standard 12C with future production runs. So the LE will stay a collectors' item primarily.

Re: What do you like most about the HP-15C?

*Message #6 Posted by **Katie Wasserman** on 5 Sept 2011, 2:15 a.m.,*

in response to message #3 by hpnut

Where did this limited edition count of 10,000 come from? I don't recall reading anything from HP about how many will be created. The picture that Tim posted of the 12C LE shows a 5-digit serial number leading one to suspect that 100,000 will be made of that. Perhaps a similar number of 15C LE calculators will be made.

Edited: 5 Sept 2011, 2:22 a.m.

As I'd speculated earlier I can't see any way 10K units will cover development NRE alone.

It seems logical to assume if the 10K volume limit for the limited edition flavor is held, a non-designer version will follow (perhaps at a price adjustment) in order to attempt meeting revenue requirement for the product.

How likely are either one of these scenarios in a manufacturing environment? ;)

Re: What do you like most about the HP-15C?

*Message #14 Posted by **Howard Owen** on 5 Sept 2011, 10:54 p.m.,*
in response to message #12 by gene wright

Base 16 would imply up to 1,048,575 units, if you started with 1. :)

Edited: 5 Sept 2011, 10:55 p.m.

Re: What do you like most about the HP-15C?

*Message #15 Posted by **Dwight Sturrock** on 7 Sept 2011, 12:54 a.m.,*
in response to message #14 by Howard Owen

More likely binary, limiting it to 64 units.

Re: What do you like most about the HP-15C?

*Message #16 Posted by **Howard Owen** on 7 Sept 2011, 4:41 p.m.,*
in response to message #15 by Dwight Sturrock

Which would be terrible news! But what about base 64?

$64^5 - 1 = 1\ 073\ 741\ 823$!

Now we are talking a significant fraction of the world population, and eBay 15C prices are in serious trouble! :)

Re: What do you like most about the HP-15C?

*Message #17 Posted by **Katie Wasserman** on 8 Sept 2011, 12:07 a.m.,*
in response to message #16 by Howard Owen

Yes ebay prices would head to zero, but could you imagine if 10% of the world had an HP-15C and knew how to use it? This would be one smart planet.

Re: What do you like most about the HP-15C?

*Message #18 Posted by **Les Bell** on 5 Sept 2011, 2:09 a.m.,*
in response to message #1 by Gerardo Rincon

I think many (most) of the people here are "hackers" - in the traditional sense, of people who enjoy exploring programmable machinery to make it do the most that it can. That involves learning, exploring, researching - not just the device, but in this case, the mathematical principles on which it is bounded.

From that perspective, the 15C offers probably the most hack-power per cm^3 of all the HP line. It's small enough to be slipped in a shirt pocket and used for daily back-of-an-envelope work, but it also has enough memory and a rich enough feature set to be used to solve very complex problems, if it's the only tool to hand.

Yes, the 41C and later are easier to program, with their alpha displays - but then, a computer is easier still. And probably not as satisfying, as a result.

So:

- Small size
- Rich feature set: matrices, complex, SOLVE, numerical integration, etc.
- Excellent documentation
- Attention paid to accuracy of algorithms
- Darn good looking!

Best

--- Les

*Message #19 Posted by **Egan Ford** on 5 Sept 2011, 12:18 p.m.,*
in response to message #1 by Gerardo Rincon

The 15C was *my* first RPN calculator. And there was nothing I could not do with it, except plot graphs (I had an Apple II+ for that, and pen and paper of course).

I still have my original 15C, and it's still on my desk. (Regrettably) it's the only tech I kept from the '80s.

I guess what I am saying, is that you always have a thing for your first. My 15C got me through most of the '80s and early '90s. So what do I like the most? The memories. Cheesy, I know.

Re: What do you like most about the HP-15C?

*Message #20 Posted by **Lyuka** on 5 Sept 2011, 1:51 p.m.,*
in response to message #19 by Egan Ford

The memories, so am I.

Re: What do you like most about the HP-15C?

*Message #21 Posted by **Howard Owen** on 5 Sept 2011, 10:59 p.m.,*
in response to message #19 by Egan Ford

My first programmable device of any description was an HP41C. That machine will always remain at the top of my list of favorites. I admire the 15C as a sort of aesthetic and practical triumph, but It wouldn't be the first machine I'd reach for if I needed one.

HP 12c Prestige

*Message #1 Posted by **Brandon Poindexter** on 4 Sept 2011, 8:14 p.m.*

HP must really like dishing variants of their calculators left and right right now. Their calculator page shows something called the HP 12c Prestige. I haven't really followed the HP 12c in the past. But is it a new derivative or an older model?

Re: HP 12c Prestige

*Message #2 Posted by **Martin Pinckney** on 4 Sept 2011, 8:48 p.m.,*
in response to message #1 by Brandon Poindexter

For me most of these supposed HP web pages linked today appear to be dummies. I mean there is limited information on them. The expandable menus don't work.

Anyone else have the same experience?

Edited: 4 Sept 2011, 8:51 p.m.

Finding prime factors on a "non-programmable" calculator

*Message #1 Posted by **Don Shepherd** on 4 Sept 2011, 7:13 p.m.*

Article describing a new approach to finding prime factors on the "non-programmable" HP-17bii.

Re: Finding prime factors on a "non-programmable" calculator

*Message #2 Posted by **M. Joury** on 4 Sept 2011, 7:38 p.m.,*
in response to message #1 by Don Shepherd

Thanks Don!

I am continuously learning more about the power of the 17b solver!

Cheers,

-Marwan

Re: Finding prime factors on a "non-programmable" calculator

*Message #3 Posted by **Lode** on 4 Sept 2011, 8:04 p.m.,*
in response to message #1 by Don Shepherd

Hey, how long does it take to do the same example (6,469,693,230) for each of the factors for which the time in minutes was given for the non optimized version?

Re: Finding prime factors on a "non-programmable" calculator

*Message #4 Posted by **Don Shepherd** on 4 Sept 2011, 8:18 p.m.,*
in response to message #3 by Lode

Here are the timings, in seconds, for the old version from the Tech. Applications manual, and my version:

factor	old version	new version
2	2	2
3	2	2
5	2	2
7	2	2
11	105	2
13	33	2
17	10	2
19	4	2
23	2	2
29	2	2

Re: Finding prime factors on a "non-programmable" calculator

*Message #5 Posted by **Don Shepherd** on 4 Sept 2011, 10:08 p.m.,*
in response to message #1 by Don Shepherd

After posting the article, I had to make a change. I thought I could adjust variable TF (beginning trial factor) to the current factor and avoid going back to trial factor 3 each time, but I forgot that the Technical Applications manual states on page 25:

> Quote:
>
> Any attempt to alter the values of the (loop control variables) using the LET function causes the solver to create separate variables of the same name.

Therefore, the loop to find factors must always start at 3, the beginning value of the loop control value cannot be adjusted when a factor is found.

Re: Finding prime factors on a "non-programmable" calculator

*Message #6 Posted by **Don Shepherd** on 5 Sept 2011, 8:25 a.m.,*
in response to message #5 by Don Shepherd

Actually, the original version does work because what you can't do is modify any of the loop control variables from within the loop in an attempt to end the loop early, because the real loop control values are inaccessible to the user while within the loop. But the modified version of the program is preferable because (a) you don't have to press INIT before each execution, and (b) starting the loop for trial factors at 3 each time does not significantly increase the run time since n (and, therefore, √(n)) is adjusted whenever a factor is found.

Re: Finding prime factors on a "non-programmable" calculator

*Message #7 Posted by **Allen** on 5 Sept 2011, 10:11 a.m.,*
in response to message #1 by Don Shepherd

Thanks for the cool article.. You're amazing with the 17b solver!

Removing 9810 printer snap rings (circlips)

*Message #1 Posted by **David Ramsey** on 4 Sept 2011, 6:13 p.m.*

Suggestions on how to remove these things? These are very sturdy pieces. I cannot apply enough pressure to spread them open sufficiently to slip them off using standard snap ring pliers.

Edited: 4 Sept 2011, 6:13 p.m.

Re: Removing 9810 printer snap rings (circlips)

*Message #2 Posted by **Ethan Conner** on 5 Sept 2011, 3:25 a.m.,*
in response to message #1 by David Ramsey

Here are a couple of things i have done in the past. Both are gross misuse of tools but anyway be careful. Try a straight slot screwdriver tip that will just fit in the opening and twist, this might generate enough torque to open up the snap ring. If you have enough room you can use two hook scribes to try and pull apart the snap ring. Hope this helps.

Re: Removing 9810 printer snap rings (circlips)

*Message #3 Posted by **David Ramsey** on 5 Sept 2011, 1:06 p.m.,*
in response to message #2 by Ethan Conner

Sadly, no. Either I don't have the right tools, or there's something special about this clip.

The tips of snap ring pliers deflect under load until they slip out of the holes. Likewise, I cannot apply enough force with the blade of a screwdriver to spread the ends of the clip without the screwdriver slipping out (and gouging the plastic gear this clip retains). Using a hammer to tap a flat blade screwdriver against the open end of the clip has no results (at least and the forces I'm willing to apply).

So far the only results of my efforts have been scratches and gouges in the clip and the plastic gear it secures.

Edited: 5 Sept 2011, 1:13 p.m.

in response to message #3 by David Ramsey

If you were local to me this is the part where i would say "let me try". :)

Re: Removing 9810 printer snap rings (circlips)

*Message #5 Posted by **Tony Duell** on 6 Sept 2011, 4:41 a.m.,*
in response to message #1 by David Ramsey

Somewhat unusually, the circlips in this printer do not fit into grooves in the shafts. They just fit over the shafts and rely on friction to keep them in place.

That means you don't have to open them up very much to get them off. If you put your circlip pliers in the circlip and try to open it, and then put a screwdrver under the circlip (say between the circlip and one of the gears) and lever it towards the end of the shaft, it'll probably come off with no problem.

In the case of the spindles for the loading belts, I've found it easiest to open the circlip with the pliers as normal, then push the spindle into the printer.

Re: Removing 9810 printer snap rings (circlips)

*Message #6 Posted by **David Ramsey** on 6 Sept 2011, 1:32 p.m.,*
in response to message #5 by Tony Duell

Thanks, Tony! The clips come off pretty easily when you know The Secret!

In other news, you can find 100% alcohol in the paint section of your local hardware store.

41CX with bad row of keys....

*Message #1 Posted by **Jimi** on 4 Sept 2011, 2:27 p.m.*

Frustrated. I just can't get a fully working 41CX anywhere. I continue to purchase "fully working" units, only to discover they are completely dead, or in this case, has a dead row of keys (the trig row).

Do you think a dead row is a loose interconnect problem? I hate opening these up, because it seems like they never go back together tight again. The seller might take it back, but unfortunately it came with a printer, working card reader, and other goodies and I'd kind of like to keep those.

Re: 41CX with bad row of keys....

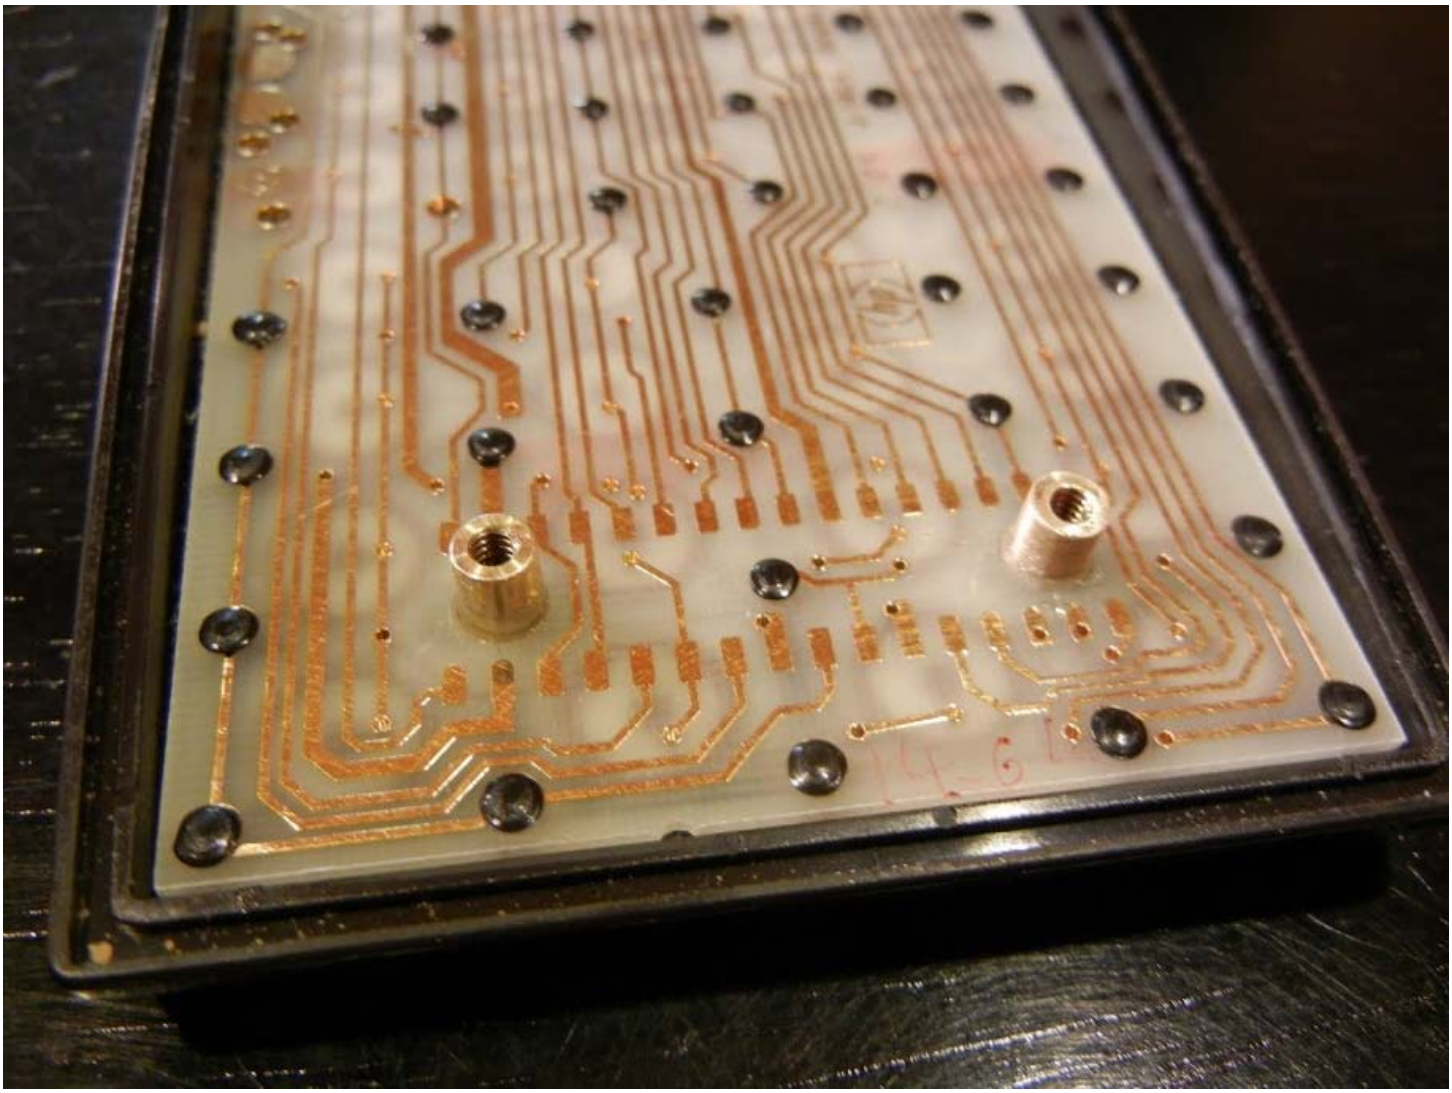
*Message #2 Posted by **Paul Berger (Canada)** on 4 Sept 2011, 7:36 p.m.,*
in response to message #1 by Jimi

Yes it could be a connection problem between the keyboard PCB and the CPU PCB in fact since you lost an entire row that would be my first suspect. This could be a problem with a cracked or broken post, if you put the calculator on a table top and press down firmly on the sides next to X and 3 does it help? If you have a damaged post you may even see the top half move slightly when you press down on it.

Re: 41CX with bad row of keys....

*Message #3 Posted by **aj04062** on 4 Sept 2011, 10:20 p.m.,*
in response to message #2 by Paul Berger (Canada)

I've come up with a very reliable solution to the cracked post problem. Replace them with a standoff.



I first tried a 4-40 standoff. The typical OD(.187) fits nicely into the hole vacated by the post, but the 4-40 screw is too big. The heads of most screws require you to modify the back case. I am going to try a 2-56 standoff next. It has a .156 OD, but I should be able to use a standard screw and not mess with the case.

Re: 41CX with bad row of keys....

*Message #4 Posted by **jimi** on 4 Sept 2011, 10:22 p.m.,*
in response to message #2 by Paul Berger (Canada)

No, pressing down doesn't help any. Everything feels very solid.

Re: 41CX with bad row of keys....

*Message #5 Posted by **aj04062** on 5 Sept 2011, 12:04 p.m.,*
in response to message #4 by jimi

Most of the strange behavior I have encountered can be blamed on this contact. I'm not saying yours is to blame, but all takes is one of the gold contacts shown in the picture to loose contact for this to occur.

Re: 41CX with bad row of keys....

*Message #6 Posted by **Randy** on 5 Sept 2011, 1:56 p.m.,*
in response to message #1 by Jimi

Halfnut or Fullnut model? Big difference internally.

Re: 41CX with bad row of keys....

*Message #7 Posted by **jimi** on 5 Sept 2011, 9:56 p.m.,*
in response to message #6 by Randy

I should have specified in the original post. This is a fullnut model.

Re: 41CX with bad row of keys....

*Message #8 Posted by **Randy** on 7 Sept 2011, 12:07 a.m.,*
in response to message #7 by jimi

The logical problem would be a loss of connection between the keyboard and logic board for that keyboard column/row. Corrosion/loss of connection/etc. Disassemble and have a look, the only way to know for sure.

Searching for a modern solution

*Message #1 Posted by **Mark Storkamp** on 4 Sept 2011, 1:54 p.m.*

Lately I've been prototyping some molded polyurethane items. I've programmed my trusty 41CX to prompt me for various dimensions and mixture information, then using the I/R printer it prints out the amount of prepolymer and curative I need to weigh out.

I've now handed the process on to others, but I'm still making the printouts for them. I'm not about to let them take my 41. That's lead me to thinking about what is currently available in the market place to do the same task.

Where they are set up it is not convenient to put a computer, and even then, there's a lot more effort involved in making a program for them to run. I can't think of anything that comes natively with Windows anymore that allows for programming. At least QBASIC or GWBASIC allowed for quick and dirty custom apps. For the printout, most every printer is sheet fed, so you need to print an entire page just for a couple of numbers. Not very efficient.

I think I've decided on the 30b, since it has has alpha prompts and messages. It's just that awkward <shift>-hold-<(> sequence for the R/S function that is a bit off-putting. They'll have to write the number down themselves too I guess. - What I would really like to do is have the calculator connect directly to the scale and set the amount that needs to be poured, something that may have been possible with the right accessories on the 41.

With the predicted demise of the desktop in favor of tablets and iDevices, it's only going to get worse for folks doing something other than email and browsing. Can you even connect a 50g to an iPad? Consider what special versions of software and hardware ports are required to flash a 34s.

The 41 is over 30 years old, and who would have thought at the time that in 30 years nothing else would have come along to expand on its concepts. Enough ranting, but if anyone has any other suggestions I'd like to hear them.

Re: Searching for a modern solution

*Message #2 Posted by **Thomas Chrapkiewicz** on 4 Sept 2011, 2:21 p.m.,*
in response to message #1 by Mark Storkamp

A few (not fully formed) ideas:

1. Excel with VBA.

2. PowerBASIC

A couple thoughts/questions:

a. The cost/'green-ness' of a single 8x10 sheet of paper is not likely much worse than a small strip of thermal paper.

b. Does the scale have an RS232 port?

TomC

Re: Searching for a modern solution

*Message #3 Posted by **Garth Wilson** on 4 Sept 2011, 3:51 p.m.,*

> Quote:
>
> a. The cost/'green-ness' of a single 8x10 sheet of paper is not likely much worse than a small strip of thermal paper.

This is partly why I still use a dot-matrix impact printer with pin feed and fanfold paper, even with my HP41 and 71 (going through an interface converter for the Centronics parallel). You can print out just a line or two and cut off a fraction of a sheet if you like. 20 years later it will look a lot better than the thermal paper too. If you need compactness, you can get tiny dot-matrix impact printers intended for printing things like receipts on non-thermal adding-machine paper. (I do use the laser printer if I want to print something like a data sheet though.)

This application is one of the reasons I say the newer calcs fall short. Unlike the 41, they are unable to interface to the printer and the scales and other lab instruments all at the same time, acting as the controller to replace laptops and other computers that are big and not nearly as quick to program.

Edited: 4 Sept 2011, 3:52 p.m.

This is not a bad way to go. A 50g (modern) has a serial port and should be able to print to any serial printer. Serial dot-matrix printers are still available and office supply stores still sell the paper.

Almost any off-the-shelf calculator by Ti, Casio or Sharp I would say. Very easy to use, very easy to program. You can find a Ti85 that's perfectly adequate for the job for 1 Euro/$ on eBay any day. I have one of those on

"my" aeroplane for routine calculations. If someone breaks it or it gets lost, I couldn't care less. I have three more at home that I got for 1 Euro each...

Regards, max

Re: Searching for a modern solution

*Message #7 Posted by **Manolo Sobrino** on 4 Sept 2011, 2:48 p.m.,*
in response to message #6 by Maximilian Hohmann

Fully agree, any ti 85/86, albeit slow, would do. If you need a better basic, bbc has been ported to 83/84 plus. Casio is not that bad either, 4500p is a keystroke one easy to program, and 5800p or any of the graphing cheap ones have a rudimentary basic to get things done.

Microsoft made Visual Studio Express 2010 available last year. It is free (with registration) and can be used for commercial purposes. There are Visual Basic, C# and C++ versions.

Visual Studio Express 2010

Re: Searching for a modern solution

*Message #9 Posted by **Marcus von Cube, Germany** on 4 Sept 2011, 2:47 p.m.,*
in response to message #1 by Mark Storkamp

Instead of the 30b, the 34S could be an alternative. Just write a program that can be put in flash so it won't get lost on a battery change or power loss. Create a custom overlay for the four top left keys (A to D) and R/S (right to the decimal point). For this application there is no need for the full keyboard overlay.

With a modified version of the programming cable, you can even connect a serial printer (those used for cash registers)(*) and at the same time feed external power to the calculator. Mount the modified device to a fixed stand and you have the custom device you need. We can add the user mode serial commands back in so that you can print arbitrary information via the serial interface.

(*) Edit: Or a serially controlled industrial scale.

Edited: 4 Sept 2011, 3:49 p.m.

When you talk about connecting to a scale you are now in the realm of industrial controls. While most of these are probably more pricey than you are willing to go, but there are some lower cost options.

```

Re: Searching for a modern solution

*Message #13 Posted by **Egan Ford** on 5 Sept 2011, 12:39 p.m.,*
in response to message #1 by Mark Storkamp

You could rewrite your programs in Javascript at no cost. This way they would run on any device with a browser.

Then get your staff iPods, setup Wifi to get access to the app that you now control centrally. You can also record a video of how to use the new system that they can watch--just in case.

Lastly use Airprint to print it out.

OR

Put the i41CX (emulator) on the iPod, print to it's virtual printer, then email the output to an email to print service (that you have to setup). With i41CX you can automate that in your program, i.e. create output, email output as text to a fixed address.

Used 8MB iPod touches are cheap. Just get a hardened case for them.

OR

Use the 50g with it's large screen (to avoid printing) and it's serial port to use with a serial printer or anything else with a serial port (e.g. your scales).

*Message #3 Posted by **aj04062** on 4 Sept 2011, 10:54 a.m.,*
in response to message #2 by Raymond Del Tondo

nothing shows up in USA...

Re: HP-41C SKWIDBC Barcode Generation ROM

*Message #4 Posted by **Raymond Del Tondo** on 4 Sept 2011, 12:59 p.m.,*
in response to message #3 by aj04062

Not TAS, but TOS instead. It's an HP41 related ORG website;-)

I just looked, it's there, although as single pages download.

Edited: 4 Sept 2011, 12:59 p.m.

Re: HP-41C SKWIDBC Barcode Generation ROM

*Message #5 Posted by **Lode** on 4 Sept 2011, 1:56 p.m.,*
in response to message #4 by Raymond Del Tondo

Hey, what's the URL of TAS? I think I saw someone once post it means "That auction site". Googling for "That auction site" brings up no link to such site however. And searching for "TAS" brings up a lot of results related to Tasmania.

Thanks.

Edited: 4 Sept 2011, 1:57 p.m.

Re: HP-41C SKWIDBC Barcode Generation ROM

*Message #6 Posted by **Marcus von Cube, Germany** on 4 Sept 2011, 2:29 p.m.,*
in response to message #5 by Lode

There is the well known auction site but there is also The Other Site, a web site dealing with HP calculators (especially the HP41) which should not be directly linked to because there are issues with copyrighted material from HP. You'll find it. :-)

Not quite, Marcus...

*Message #7 Posted by **gene wright** on 4 Sept 2011, 3:36 p.m.,*
in response to message #6 by Marcus von Cube, Germany

There is a disagreement between the museum curator and the TOS site creator about whether there is a problem with materials on the TOS site.

The TOS creator has stated on multiple times that he has written permission to host the materials on his site. The museum curator here does not believe that is possible or correct.

So, what to do? :-)

Re: Not quite, Marcus...
*Message #8 Posted by **Marcus von Cube, Germany** on 4 Sept 2011, 3:52 p.m.,*
in response to message #7 by gene wright

It's an issue nonetheless, even if it's "only" between the two curators. We are guests here and thus have to adhere to the rules set-up by our host.

Re: Not quite, Marcus...
*Message #9 Posted by **gene wright** on 4 Sept 2011, 4:43 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Agreed, not disputing that.

I was just making sure that someone reading that did not automatically assume that there WAS an issue with copyright with the materials at TOS.

The TOS site curator has paperwork from someone at HP that he claims authorizes the distribution of the materials.

The Museum curator seems to have been told by someone else at HP that that is hogwash.

Hence, the dispute. That's all I was trying to clarify. :-)

Edited: 5 Sept 2011, 9:26 a.m.

Re: Not quite, Marcus...
*Message #10 Posted by **Frido Bohn** on 5 Sept 2011, 4:31 a.m.,*
in response to message #7 by gene wright

Well, it is indeed somewhat confusing for the newcomer to figure out what "TOS" means. For myself, it took some time to get behind it.
I have to admit that my first contact over the internet to HP41-related material led me to TOS. The site really offers a whole cornucopia of documents related to that calculator and its peripherals. I was astounded of the collection and wondered why HP did not sue against TOS. May be there is a secret standstill agreement between TOS and HP. However, I can not imagine that the offering of so much HP41 material is the base of the dispute between HP-Museum and TOS. It would be HP's part to undertake something against the practice of TOS. But why should the Museum curator bother? Does no other than the curator have the right to disseminate material of discontinued HP calculators?

Re: Not quite, Marcus...
*Message #11 Posted by **Ángel Martin** on 5 Sept 2011, 2:19 p.m.,*
in response to message #10 by Frido Bohn

my thoughts exactly...

Re: Not quite, Marcus...
*Message #12 Posted by **Howard Owen** on 5 Sept 2011, 2:45 p.m.,*
in response to message #10 by Frido Bohn

For me, it's not a question of whether TOS violates copyrights or not. It's not a question of whether the curator has acted appropriately or not. What stands out for me is the notice that appears on this posting form:

Posting indicates your agreement with the Museum of HP Calculators Terms of Use

It's right above the buttons for previewing or posting. That trumps the discussion, in my mind.

Re: Not quite, Marcus...
*Message #13 Posted by **Martin Pinckney** on 5 Sept 2011, 10:52 p.m.,*
in response to message #12 by Howard Owen

Well, I confess I still am in the dark. I suppose the unmentionable site is either HPCC.org or HPCalc.org - whoops!

What part of the TOU applies to this discussion about either of these sites?

Re: Not quite, Marcus...

Those are both OK. If you can post them to the forum without their text being filtered out, and you receiving a stern warning, then they aren't TOS.

Its in the org domain. with .org on the end. It's concerned with the hp-41c, but the webmaster doesn't like hyphens.

:)

in response to message #13 by Martin Pinckney

Hmm, I see what you mean. There's no specific exclusion for TOS, but there is a section that I believe relates to it:

> Quote:
>
> You agree not to post any copyrighted material unless the copyright is owned by you or by this forum. You also agree not to use this forum to request or trade copies of copyrighted material. For example, most ROMs are copyrighted. Therefore, it is OK to buy and sell original ROM chips or calculators containing original ROM chips but in most cases it is not OK to buy and sell copies of those ROMs or ROM image files..

I believe I remember the curator worrying about contributory infringement if he allowed links to copyrighted materials, ROMS in particular, at another site. Turns out he may be correct about that, given the Pirate Bay and others recently. (I'm sure we could have a long discussion over that, but let's not. :)

I do think HP could clear things up by simply cutting those ROMS loose, but notice that they have just retrieved one of those from the past and issued it as the HP-15C LE. I remember several years ago when Eric removed the Voyager ROMs from Nonpareil saying that HP had asked him to do so. Seeing the 15C come out now connects the dots for me on that one.

There are several 15C software clones out there and my guess is that many are using the original ROM. HP has never gone after any of them. They haven't tried to stop Victor from selling that laughably trashy hardware 12C clone either. They haven't moved legally against anyone distributing old ROMs, so far as I know. But they clearly demure from giving their old IP away wholesale. As long as that's the case, I can understand the curator's point of view.

I don't think either Victor or Aurora used the actual HP firmware. On the other hand, it does appear that the manual for the Aurora infringed the copyright of HP's manual.

Re: OT: Copyright

*Message #19 Posted by **Eric Smith** on 6 Sept 2011, 11:35 a.m.,*
in response to message #17 by Tim Wessman

Clear that the Aurora copied the manual, the firmware, or both?

I haven't compared the manual myself, but others have said that it was a blatant copy.

There are enough differences in the calculator's behavior that it seems unlikely to me that they copied the firmware. However, I have not tried to extract firmware from it.

*Message #21 Posted by **Katie Wasserman** on 6 Sept 2011, 1:53 p.m.,*
in response to message #19 by Eric Smith

I have 3 12C-like calculators, here's my take on them.

Victor V-12: Is likely a modified copy of the first version of the 12CP source code. It doesn't allow for CF(0) to be changed -- this was only in the early 12CP and it doens't implement the self tests.

Compucessory CCS28956: Is also a modified version of the an early version of the 12CP source code. However, it implements the undo functions, has the same self tests (but they make no sense since the key mappings are all wrong) and adds in some new code for cost/sell/margin.

Aurora FN1000: This appears to be a re-implementation of the original 12C. The self tests are similar but not identical and it adds a COM key that (I think) performs the same mode setting as <STO> <EEX> in the original 12C.

In short: I don't think any of these are ROM image clones, but likely the Victor and definitely the Compucessory are based on copied source code.

The 12CP source being used in the V-12 is entirely possible since that code was apparently

developed by Kinpo from HP docs. Depending on what kind of contract HP signed with Kinpo when they had the 12CP design done, this may or may not be legal. Also, HP may or may not be interested in going to court in Taiwan over a few poor imitations of the 12CP.

*Message #24 Posted by **Raymond Del Tondo** on 4 Sept 2011, 2:33 p.m.,*
in response to message #5 by Lode

There were many related threads here in the hpmuseum forum years ago.
TAS means That Auction Site aka *Bay, TOS means the HP41 site with the ORG domain.
Note there is no "-" in the name, so just add the domain, and you're there...

Why all this obfuscation? Ask the museum curator and the maintainer of TOS
Maybe they finally have solved their issues, so that the one can spell out the full web site name w/o getting filtered.

Re: HP-41C SKWIDBC Barcode Generation ROM

*Message #25 Posted by **Howard Owen** on 4 Sept 2011, 6:24 p.m.,*

There's actually no filter in the forum software for "eBay," as there is for TOS. People were complaining about all the auctions a few years back, and TAS was coined as a joke on TOS.

HP 71b soft case decomposing...

*Message #1 Posted by **Giancarlo** on 4 Sept 2011, 8:36 a.m.*

Hello, i have a problem with my hp71b soft case. The internal side of the soft case produce a lot of (rubber?) powder. Do you know if there is a way to restore or just stop this phenomena?

I was trying to show you a couple of pictures but no way to do it (for me).

Thanks

Giancarlo

Re: HP 71b soft case decomposing...

in response to message #1 by Giancarlo

I had the same problem with several HP-71B cases. I just put them in the clothes washer with detergent and then air dried them. It was a great success.

Re: HP 71b soft case decomposing...

*Message #3 Posted by **Raymond Del Tondo** on 4 Sept 2011, 9:44 a.m.,*
in response to message #1 by Giancarlo

Hello,

this is normal for certain production runs of these cases.

Just put the case into hand warm water in which you dissolved some washing powder before.
Let the case stay the one or other hour, and then rinse out the dark water:-)

You'll se most of the granulate is one.

HTH

Has this ever happened to you ? :)

*Message #1 Posted by **Michael de Estrada** on 4 Sept 2011, 12:05 a.m.*

Have you ever been just randomly searching on TAS, and suddenly you find a rare calc that normally sells in a regular auction for a princely sum for much much less in a BIN auction? Anyway, tonight I found a clean working APF Mark 55, a very rare non-HP RPN calc that included its charger and slip case for $19.99 + $4.99 shipping. Normally, this calc would sell for well over $100 in a regular auction. It had apparently just been listed, because there were over 29 days to go, so not many other bidders if any had seen it yet. The listing title omitted "RPN", so I only found it by searching for "APF calculator". Also, the seller specifically stated that shipping would only be to the USA, limiting the number of potential buyers. I wonder how many great deals like this have quietly slipped away shortly after they were listed, and I was never aware of them because they were gone so quickly.

Re: Has this ever happened to you ? :)

*Message #2 Posted by **Lincoln R.** on 4 Sept 2011, 12:27 a.m.,*
in response to message #1 by Michael de Estrada

I think I once found a 16C that sold for an $9.99 buy it now in the TAS completed listings section. IIRC the seller was a pawn shop or estate sale guy or some other entity likely to think "oh, it's a worthless old 80s calculator with dead batteries, can't possibly be worth more than a pack of smokes."

Re: Has this ever happened to you ? :)

*Message #3 Posted by **Paul Dale** on 4 Sept 2011, 12:40 a.m.,*
in response to message #2 by Lincoln R.

I missed an 11C for about A$25 once. Did a search and by the time I got it (maybe 5 minutes), it was sold. At the time the exchange rate with the US$ would have been A$3 = US$2 roughly.

- Pauli

Re: Has this ever happened to you ? :)

*Message #4 Posted by **Lincoln R.** on 4 Sept 2011, 12:45 a.m.,*
in response to message #3 by Paul Dale

I did get lucky with a buy it now for calculator-related stuff once: Some tool listed an 82240B infrared printer as a cash register receipt printer, $15 buy it now with free shipping, even came in the original box.

Re: Has this ever happened to you ? :)

*Message #5 Posted by **Michael de Estrada** on 4 Sept 2011, 12:55 a.m.,*
in response to message #4 by Lincoln R.

That is a great deal. I paid $47.90 for mine in a regular auction nearly 4 years ago.

Re: Has this ever happened to you ? :)

*Message #6 Posted by **Michael de Estrada** on 4 Sept 2011, 12:44 a.m.,*
in response to message #2 by Lincoln R.

That would definitely be quite the find. Actually I once found a lot of 5 non-working calcs for $25, which included a Novus Scientist PR (4525) RPN calc, made by National Semiconductor in the 1970s. I was able to get 4 of them working, including the Novus.

Re: Has this ever happened to you ? :)

*Message #7 Posted by **Cristian Arezzini** on 4 Sept 2011, 1:22 a.m.,*
in response to message #1 by Michael de Estrada

There is a "certain seller" in TAS... the one who sells lots of HP stuff at outrageous BIN prices... try looking at his past auctions; not the things he sold, but the things he *bought*... I found some big surprises there. I suppose he developed a way to find stuff with not-so-clear titles... *and* he spends all of his time looking on TAS for deals...

Cristian

Re: Has this ever happened to you ? :)

*Message #8 Posted by **Bart (UK)** on 4 Sept 2011, 9:44 a.m.,*
in response to message #7 by Cristian Arezzini

That seller bid on one of my auctions, his highest bid was 1/10th of his list price for the same models (he didn't get it though). So that's the strategy, making 10x the purchase price, so no wonder that having only occasional sales still pays off.

Re: Has this ever happened to you ? :)

*Message #9 Posted by **Michael de Estrada** on 4 Sept 2011, 10:50 a.m.,*
in response to message #8 by Bart (UK)

IDK. Many if not most of his items have been listed on TAS for many years, so it seems more like sheer greed than anything else to me. He's put in bottom feeder bids on my auctions too, which were a tiny fraction of the final sale price and has never come even close to winning one of my auctions. He also seems to have a personal performance problem as well, to put it delicately.

Re: Has this ever happened to you ? :)

*Message #10 Posted by **Maximilian Hohmann** on 4 Sept 2011, 7:38 a.m.,*
in response to message #1 by Michael de Estrada

Hello!

> Quote:
>
> Have you ever been just randomly searching on TAS, and suddenly you find a rare calc that normally sells in a regular auction for a princely sum for much much less in a BIN auction?

Occasionally, yes. Like my near-mint HP-15C with leather pouch for 25 Euros. It was even listed in the correct category, I just happened to be there at the right time and press the mouse button fast enough. Or the 41CX with card-reader and other accessories that was contained in a large box of PC remains (ethernet hubs,

cables, power supplies, sound cards, books, ...) listed under "household goods". I can't remember the BIN price, but it was low compared to the shipping cost. I tried to persuade the seller to send me only the calculator and keep the rest, but he insisted on "all or nothing" as he wanted to get rid of his junk. In the description it said "HP calculator" but the type could only be guessed from the photos.

But generally I think, as has been said in another thread a few days ago, that the prices for old calculators are steadily coming down anyway. The market seems to be saturated and there are not many new collectors/enthusiasts emerging. I do not know what young collectors collect today, but obviuosly not calculators.

Yesterday I received a nicely working stainless steel HP-01 in the mail, complete with all accessories except the box (even the battery changing tool full of spare batteries is there) for three-hundred-and something Euros. The times when these would fetch in excess of 1000 Euros are over, really.

Regards, max

or the economic downturn is starting to affect the calculator collector market too.

Re: Has this ever happened to you ? :)

*Message #12 Posted by **Michael de Estrada** on 4 Sept 2011, 10:56 a.m.,*
in response to message #11 by Bart (UK)

IDK. Seems like prices are all over the place for some items. In the last year or so I've seen an HP-70 sell for between a little shy of $1000, to a little over $100. It takes at least two aggressive bidders to drive the price up, but if there is only one, the sale price can be very low.

Re: Has this ever happened to you ? :)

*Message #13 Posted by **Maximilian Hohmann** on 4 Sept 2011, 12:33 p.m.,*
in response to message #11 by Bart (UK)

Hello!

> Quote:
>
> or the economic downturn is starting to affect the calculator collector market too.

There is no economic downturn here (in Germany). A few days ago, newspapers reported that never before in history germans have put so much money aside than in the first half of 2011. With a lot of money around and with unstable stock markets and currencies, I would expect it to be natural that people invest more money in hardware like gold and collectibles and drive the prices up. As the gold price clearly shows.

Regards, max

Re: Has this ever happened to you ? :)

*Message #14 Posted by **Mike Morrow** on 5 Sept 2011, 1:12 p.m.,*
in response to message #1 by Michael de Estrada

Two years ago I found my most recently acquired HP-15C in its box with manual and slip cover at an amateur radio "hamfest" fleamarket. Even the rubber feet were in good condition. It cost me $10.

Fifteen years ago I got a non-working but complete in almost mint condition HP-9820A at a hamfest. It cost me $20.

I've found other vintage HP and TI machines (several TI-59s for $5) at similar prices at such hamfests, including an HP-19C (with dead battery, and no accessories).

Amateur radio fleamarkets are often good places to search for old electronics.

New Version of the HP-39GII

*Message #1 Posted by **Mark Hardman** on 3 Sept 2011, 11:01 p.m.*

I was looking in the usual places on www.hp.com where I might find an entry for the HP-15C LE with an active "Add To Cart" button. Scrolling through the entries at http://www8.hp.com/us/en/products/calculators/index.html I stumbled across the following:

Link to HP 39GII Product Page

If you look closely, you'll notice that the soft menus in the image are in Chinese characters. These could not possibly be rendered unless the display has a higher resolution that the current HP 39GS.

Maybe those luck few going to HHC2011 will get a look.

Re: New Version of the HP-39GII

*Message #2 Posted by **Brandon Poindexter** on 3 Sept 2011, 11:32 p.m.,*
in response to message #1 by Mark Hardman

Well, at least its something new. The colors are "meh", and the keys look like Casio rubber keys. Although i like that they put all the labels onto the keys so it looks less cluttering. But that probably will mean they will wear off sooner. Also the cursor key (SINGULAR) is a disappointment.

I do like the overall shape and the border though. Its not all swoopy curves and other laughable styles from 1999 (Ford Taurus anyone?).

If they could take this, color it black, and style the keys similar to the hp 35s. I would look into it.

Re: New Version of the HP-39GII

in response to message #3 by Michael de Estrada

> Quote:
>
> I'm waiting for a HP-50gii with a large ENTER key in the correct location...

And that correct location is above the * / + - keys. The ENTER key and the basic math operation keys

should always be on the same side of the keyboard, the way they were for the first ten years of HP calculator history. I don't care which side of the keyboard the basic math ops keys are on, but the ENTER needs to be there too, above them.

At least the HP high-end scientific models for the past decade have the ENTER on the correct side, but not at the correct elevation.

Looks nice

*Message #5 Posted by **snaggs** on 3 Sept 2011, 11:54 p.m.,*
in response to message #1 by Mark Hardman

Gone are the horrible curvy stuff, and instead a nice geometric design. Looks very classy. Traditional colours too!

Where does this sit in the range?

320x200 and monochrome would give it almost 2/3 the pixels of a Palm Tungsten T (320x320), which was released about 10 years ago. Be still, my heart.

Re: New Version of the HP-39GII

*Message #14 Posted by **Paul Guertin** on 4 Sept 2011, 1:57 p.m.,*
in response to message #12 by Gilles Carpentier

As the above message does not show, I **am** glad to see a new graphing calculator from HP. The case looks better than its predecessors (are we finally getting away from the "gratuitous curves at all costs" era in electronic device designs?) and it could be a good alternative to TI calculators.

Keyboard quality remains to be seen, as is repurposability. If the processor and memory permit it, one

might see an enterprising hacker port Linux to it.

Re: New Version of the HP-39GII

*Message #15 Posted by **bluesun08** on 4 Sept 2011, 2:23 p.m.,*
in response to message #14 by Paul Guertin

"Waoooo !!! What a screen !" ??? "It could be a good alternative to TI calculators" ???

Hard to believe. Sorry, but where you live? The life is colored and the newest TI too !!!

What about HP?

Re: New Version of the HP-39GII

*Message #16 Posted by **Eric Smith** on 4 Sept 2011, 3:37 p.m.,*
in response to message #15 by bluesun08

The TI Nspire CX color display is very pretty, but my HP 49g, 49g+, and 50g with their monochrome displays have very long battery life with a few inexpensive AAA cells. The TI needs to be recharged quite frequently.

I guess if you are accustomed to charging your other devices frequently, then charging your calculator too might not be such a bother.

On the other hand, if the batteries in my 50g run low during an exam, I have a spare set in my backpack. With the TI, I'd be SOL.

If HP has put a higher-resolution monochrome display in the 39gII, the reason they chose that over color is almost certainly battery life.

Someone speculated that the 39gII display might have 16-level grayscale. I haven't seen a 39gII in person, and am not privy to any details about it, but I suspect that it will turn out to have hardware with no grayscale support, only high-resolution monochrome. That would mean no antialiasing on fonts, but since the resolution is probably around 173 dpi, it should look pretty good despite that.

Based on comments heard at past HHC conferences, I suspect that this is probably not running RPL-based software derived from the 38/48 series, but rather an entirely new code base in C and/or C++.

It seems pretty straightforward to re-implement the function set of a 39G in C but this way, a 40gII will be a really big effort to do. The same will hold for a new 50G.

Is there some big difference between the 39g and 40g other than CAS? There's plenty of C/C++ CAS software out there.

However, I expect that a ground-up rewrite of the 39g, if that is what happened, probably took a lot of man-hours of development time. I'm not sure what you have in mind when you say "pretty straightforward", but it's not a small project.

Re: New Version of the HP-39GII

*Message #19 Posted by **Marcus von Cube, Germany** on 5 Sept 2011, 1:47 a.m.,*
in response to message #18 by Eric Smith

I was talking about the CAS. If you replace it by something completely different, there are chances but a rewrite from scratch with the same functionality seems to be a very big task.

OTH, the basic functionality of a 39G is limited (which is not a bad thing given the audience) and it may be the easier path to re-implement it then to do another Saturn emulation and try to fix an old firmware for the new screen layout. Maybe a combined approach (Saturn virtual machine for CAS) is possible.

*Message #22 Posted by **bluesun08** on 4 Sept 2011, 4:29 p.m.,*
in response to message #16 by Eric Smith

Would you buy a new handy with monochrome display to have a longer battery life? Would you buy a monochrome television instead a colored flat-tv due to price? I think no!

Nearly everybody have a handy and is accustomed to charging it frequently (every 2-3 days). Why do not put the calculator frequently in docking station?

With a colored display you can distinguish several graphs easier (for example function, derivation and anti-derivation).

My suggestion: HP should build two mode in the calculator: a monochrome and a colored mode. So the user could affect the battery (respectively accu-) life himself.

Re: New Version of the HP-39GII

*Message #23 Posted by **Cristian Arezzini** on 4 Sept 2011, 4:56 p.m.,*
in response to message #22 by bluesun08

I would definitely buy a new graphing calc with a monochrome display. The 50g's screen has a great contrast, and is perfectly legible. And its grayscale is very good. If they could double (at least) the resolution (4x no. of pixels) it would be great. And yes, I would very much prefer a long battery life with common batteries. I keep my calc on my work bag at all times, ready for when I might need it. I don't want to (and I would forget to) recharge it often. Plus, standard replaceable batteries are the best when they run flat "on the road"... AAA batteries can be found everywhere. A socket and charger, no. Same goes for my trekking-handheld GPS: I only buy units with standard AA batteries, and I've often had to replace batteries during day-trips.

And as far as I know, monochrome and color displays use totally different technologies; sending a monochrome image to a color screen, it would still use the same amount of power. Now, if they want to experiment with color e-paper screens... :)

Cristian

*Message #24 Posted by **Eric Smith** on 4 Sept 2011, 5:43 p.m.,*
in response to message #23 by Cristian Arezzini

Monochrome e-ink displays have terrible contrast ratio, about 15:1 at best. The color e-ink displays I've seen were even worse. I'm not interested in color e-ink until they improve the contrast a lot.

Re: New Version of the HP-39GII

*Message #25 Posted by **bluesun08** on 4 Sept 2011, 6:03 p.m.,*
in response to message #23 by Cristian Arezzini

A monochrome display is adequate for common (algebraic) calculations. But if you use your calculator extensive for GRAPHIC applications then a colored display is IMHO better because of the distinguishability of (many) curves and lines. And remember: This post discuss a GRAPHIC calculator.

Yes, and therefore i sell my pc and iphone and go back to the HP 200 LX. It have all the things i need: A file manager, Lotus 1-2-3, Pocket Quicken, a scientific calculator, a simple word processor, a very powerful database application, a note taker, a few games, Laplink Remote Access, a terminal emulation.... AND: All this run on a full MS-DOS 5.0 three weeks with only two inexpensive AAA cells. Because i don't often reading the screen in dim or dark environment or in total darkness furthermore i don't need a backlight upgrade. And to phone someone on the way i reactivate my good old (monochrome) Nokia:

Life can be so easy ....

Maybe I'm starting to "get old" but I find the new design to be mostly ... UGLY. Ugly colors, ugly key layout, ugly material (is that rubber in the keys?1)... you get the idea. Mind you, I started with HP calculators with the introduction of the HP48G series and then later started to collect the older Pioneer models. Though some of the even older HP fanatics consider the HP48G series "ugly." I guess it may be that I am biased and prefer the design that I am most familiar with (the Pioneer models and the HP48 series; they all share a similar keyboard and case design).

The newer calculators with slanted sides (who idea was that?!) ... I will never understand why. I just don't understand how these new designs would ever be considered "cool."

It's hard to tell what sort of keys those are from a single photograph. Rubber keys would be a bummer, I agree. I can see at least two features that I like, in addition to the higher resolution display. First, the color contrast of the shifted key label is excellent, in my opinion. Second, the case design is rectilinear, which appeals to my techno-geek sensibilities. (The curves on the 50g et al appeal to my artsy/fartsy sensibility, but I have my geek on today. :)

Fixing the bezel on a 10C

*Message #1 Posted by **Keith Midson** on 3 Sept 2011, 11:12 a.m.*

Hi all, I have a 10C that is in perfect condition except for the bezel. It is not scratched, but has imperfections in the form of wavy lines - you can see in this photo: HP10C
Does anyone know if this is fixable? I am nervous to try to 'polish' the bezel in case it wrecks it. Is there a resin layer over the bezel? Thanks in advance, Keith

Re: Fixing the bezel on a 10C

*Message #2 Posted by **Gerson W. Barbosa** on 3 Sept 2011, 12:07 p.m.,*
in response to message #1 by Keith Midson

It looks like this has been caused by gluish material from the inner part of the vinyl case. Perhaps the calculator was kept inside the case for too long. I have an HP-11C with this kind of imperfection near the logo, to a lesser extent however.

http://www.geocities.ws/gwbarbosa/calc_1.html

Yes, the bezel is coated with kind of a varnish. Polishing the bezel is not a good idea, unless you have a technique to restore it to its original appearance. I think Geoff Quickfall might help on this. The bezel of the HP-15C in the picture has been polished, but no resin layer has been applied.

Cheers,

Gerson.

Re: Fixing the bezel on a 10C

*Message #3 Posted by **Keith Midson** on 4 Sept 2011, 12:22 a.m.,*
in response to message #2 by Gerson W. Barbosa

Thanks everyone. I suspect it is mild corrosion under the top coat. I purchased it for a nice price on TAS earlier this year in this condition, so it was already there. It hasn't got any worse since i've had it (I keep all my collection in a cool, dry place). I will take a closer photo and post it in the next day or so. Cheers, Keith

Re: Fixing the bezel on a 10C

*Message #4 Posted by **robert rozee** on 3 Sept 2011, 12:23 p.m.,*
in response to message #1 by Keith Midson

as Gerson says, it could be a glue residue. however, do you feel it is like an etching down into the surface of the aluminium?

i have seen aluminium escutcheons that are coated with varnish, where moisture has got below the varnish and corroded lines in the aluminium that look very much like what is on your 10C.

if it is just glue, one good 'universal' solvent that can be used is eucalyptus oil, or better still a product called "de-solv-it" (based on oil extracted from orange peel). with either: apply to glue (or to surface of a label to be removed), leave for 10-15 minutes, and then peel off label or wipe away remains of the glue.

any chance you could post a much closer-up photo?

Re: Fixing the bezel on a 10C

*Message #5 Posted by **Gerson W. Barbosa** on 3 Sept 2011, 1:03 p.m.,*
in response to message #4 by robert rozee

There are imperfections in the opposite side as well:

Re: Fixing the bezel on a 10C

*Message #6 Posted by **robert rozee** on 3 Sept 2011, 1:24 p.m.,*
in response to message #5 by Gerson W. Barbosa

i'm afraid that does look like corrosion to me. i have no good solution that is simple apart from keeping the calculator is a very dry place to slow down any progress as much as possible. a complex solution would be to remove the escutcheon, clean back to bare metal, then re-varnish, but that is quite a bit of work and very hard to obtain the original finish.

or get a nice HP employee to send you a spare one (assuming the modern 10 series calculators are exactly the same dimensions, with badge in exactly the same place).

Re: Fixing the bezel on a 10C

*Message #7 Posted by **Ethan Conner** on 3 Sept 2011, 1:27 p.m.,*
in response to message #5 by Gerson W. Barbosa

Thought i would offer a tip i learned from another collecting hobby. In knife collecting you never long term store a knife in a leather sheath. A sock or just storing in dry place uncovered seems to work best. Leather products and their treatments are notorious for causing damage.

Re: Fixing the bezel on a 10C

*Message #8 Posted by **Gerson W. Barbosa** on 3 Sept 2011, 2:51 p.m.,*
in response to message #7 by Ethan Conner

Thanks for your tip, Ethan. I fear Robert is right about corrosion caused by moisture. Though I haven't noticed the stains haven't increased since I purchased that 11C four years ago, I have noticed a tiny speck on the bezel of my old 3-battery 12C which was not there before. The calculators have been kept in a clothes closet facing a north-oriented wall. Time to look for another place to keep them...

Edited: 3 Sept 2011, 10:08 p.m.

The calculator is dead - viva la HP 15C Limited Edition

*Message #1 Posted by **Joerg Woerner** on 3 Sept 2011, 9:14 a.m.*

I'm really surprised about the buzz created here in the forum with the re-release of a 29 years old calculator - limited in production and overpriced. A clear sign that the calculator is dead and you use your pocket shirts for a smart phone and do your calculations with Excel.

*** STOP THE PRESS ***

The next generation Ford Fusion will be developed in Europe, Michigan is preparing in its Detroit based skunk works a re-release of the Tin Lizzy to celebrate the 100th anniversary. They started to plant the first trees to harvest the raw material for authentic rubber tires.

Shortage on the transistor market. A major US company bought back thousands of Transistors on several eBay auctions. Rumors are a re-release of the Regency TR-1.

Motorola sells mobile phone group to Google. We know more! The development costs of the Motorola DynaTAC 8000X re-release (30th anniv in 2013) went off.

Cheers, Joerg

*Message #3 Posted by **Joerg Woerner** on 3 Sept 2011, 2:23 p.m.,*
in response to message #2 by hpnut

Dear hpnut,

I'm not really jealous - TI missed indeed the opportunity to celebrate the introduction of the Datamath (TI-2500) Calculator.

But I received a week ago a box from TI Dallas, Texas with some exciting new calculators. One of them, please check the German website of TI, is ready to be released to celebrate the 35th anniversary of an unrivaled product. Introduced in 1976, last modification in 1997 and discontinued early in the 21th century.

No - it is NOT the TI-30...

It will be available in a few weeks - my sample was manufactured in June 2011.

Enjoy: Link to the box of the new TI product. Fresh from Kinpo.

Cheers, Joerg

Dennis, I bet you knew it all the time!!!

Re: There will be a commemorative product from TI, too! 35th years - no kidding!

*Message #4 Posted by **Howard Owen** on 3 Sept 2011, 4:31 p.m.,*
in response to message #3 by Joerg Woerner

The TI-30 sucked, but it was followed up with the somewhat less sucky TI-35. I managed to keep one of those going through the time I finally bought a 41C.

Re: There will be a commemorative product from TI, too! 35th years - no kidding!

*Message #5 Posted by **Jeroen Van Nieuwenhove** on 4 Sept 2011, 7:02 p.m.,*
in response to message #3 by Joerg Woerner

Well, a reintroduction of the TI-58/59 would be really awesome. Even if Kinpo would be producing it, a better keyboard should not be too difficult to manufacture.

*Message #14 Posted by **Manolo Sobrino** on 3 Sept 2011, 12:03 p.m.,*
in response to message #1 by Joerg Woerner

I think you have a point, but the re-release of the 15c is good news. As much as it'd be great having truly useful new calculators, a classic is a classic and should always be available. I can't understand for instance why ti discontinued the superb 85/86 line and instead upgraded the less capable 83, or casio ditched the fx 880p, much in use with site engineers over here (and even why hp withdrew the 42s).

Re: The calculator is dead - viva la HP 15C Limited Edition

*Message #15 Posted by **Steve Fennell** on 3 Sept 2011, 12:06 p.m.,*
in response to message #1 by Joerg Woerner

Tube amplifiers still sell. So do Vinyl LP records. I know several people who still drive cars with carbureted engines. Some of them cost a lot and all were developed long before the 15C. There's always an enthusiast market.

Tube audio and vinyl

*Message #16 Posted by **Jose Gonzalez Divasson** on 3 Sept 2011, 1:23 p.m.,*
in response to message #15 by Steve Fennell

Tube audio equipment can compete with the best solid state amps and preamps. It is easier to set up a satisfying tube-

based system than a solid state one.

Many audiophile releases are recorded with tubed equipment.

Vinyl can compete (and some people say win) with 96/24 and 192/24 digital audio. It trounces CD quality (44/16). Never mind MP3.

Among connoisseurs, the last sentence is not even under discussion (Stereophile, The absolute sound, Hi-fi News,...)

Re: Tube audio and vinyl

*Message #17 Posted by **Dave Shaffer (Arizona)** on 3 Sept 2011, 4:43 p.m.,*
in response to message #16 by Jose Gonzalez Divasson

> Quote:

Yeah, but only the first few times you play that LP (unless you can afford one of these).

And, they are hard to listen to in your car!

You are right about MP3 audio being junk. (But most of what the kids listen to on MP3 is junk, anyway, so maybe not much loss there!)

Re: Tube audio and vinyl

*Message #18 Posted by **Daniel Oliva** on 3 Sept 2011, 9:40 p.m.,*
in response to message #17 by Dave Shaffer (Arizona)

In most cases, you wouldn't be able to tell the difference between a correctly encoded MP3 audio track (high quality VBR profile with a fine encoder like LAME) and the original source (be it vinyl, CD, or whatever). MP3 files are junk when encoding is done by uneducated people.

Re: Tube audio and vinyl

*Message #19 Posted by **Cristian Arezzini** on 4 Sept 2011, 1:38 a.m.,*
in response to message #18 by Daniel Oliva

I for one have to admit I usually can't tell the difference between a fine, high-BR MP3 and the original... but to be on the safe side, I re-encoded all my CDs to lossless flac codec, as my player (a Cowon) can play that...

Cristian

Re: Tube audio and vinyl

*Message #20 Posted by **Ken Shaw** on 6 Sept 2011, 10:39 a.m.,*
in response to message #19 by Cristian Arezzini

Same here. I can't tell the difference except in a rare situation. But I've also switched to FLAC (and freed my iPod from iTunes).

Re: Tube audio and vinyl

in response to message #20 by Ken Shaw

You mean you can read FLAC on the iPod? My wife has an iPod, and she doesn't use iTunes (she

uses Banshee on Linux) but the iPod still only reads mp3...

Cristian

Re: Tube audio and vinyl

*Message #22 Posted by **Paul Dale** on 4 Sept 2011, 1:57 a.m.,*
in response to message #16 by Jose Gonzalez Divasson

I kind of lost respect for the *connoisseurs* when they claimed to be able to distinguish between these and normal (cheap) wire. In this case the signal is digital, there will never be enough signal loss to degrade it to the point that a *1* is mistaken for a *0*. Even in the analogue case, the difference is insignificant.

Okay, I lost all respect for *connoisseurs* way before this, but this is the best of the best in regards to stupidity :-)

I've a friend who used to make *connoisseur* quality audio equipment and he laughs at the folks who buy this kind of thing. His amplifiers and speakers are superb however.

*Message #23 Posted by **Jose Gonzalez Divasson** on 4 Sept 2011, 10:29 a.m.,*
in response to message #22 by Paul Dale

Digital audio problems (and cable differences) do not stem from loss of information, but due to jitter (timing differences) of the data stream.

While you might think that a well designed PLL should be able to reduce it to non-audible levels, the sad fact is that the best current approaches are based on writing data received in ROM memory and play from that memory, properly clocked with a premium quartz clock (with strategies to lower the clock jitter to less than 5ppm).

With a properly set-up system, differences can be very audible. But this is not the object of this forum!!

And I will be the first to agree that there are huge amounts of snake oil in specialist audio!

So, are you saying that there are cables that introduce timing discrepancies in digital audio data streams that subsequently have an audible effect?

> Quote:
>
> ... the sad fact is that the best current approaches are based on writing data received in ROM memory...

Since, by definition, ROM is not writable, this statement makes no sense to me.

Does '5ppm' mean 'within 1/200,000th of where it should be'? At what level would it create an audible effect?

Indeed, although it seems to have a matching amount of delusional thinking and comical physics among hi-fi reviewers and proponents of things like conditioned mains cables.

There's a good talk and demonstration on the golden-ears baloney at http://www.youtube.com/watch?v=BYTlN6wjcvQ . There are a few funny parts, like at 3:15 to 4:45 where he says he compared a McIntosh tube amp to a cheap solid-state amp for a room full of enthusiasts. All the audiophiles said the tube amp sounded better, while the engineers said the solid-state amp sounded better; but the reality was that the A-B switch did nothing to the signal routing, and the cord going to the tube amp was only stapled to the back, and the tube amp itself was dead. There are various demonstrations of bit rate, number of bits, phase changes, etc.. For the things that rely on non-compressed audio data (as opposed to what YouTube does to it), the link is given to the full data. Enjoy.

If the cable is not properly terminated with the characteristic impedance required by the network (either S/PDIF, AES/EBU or I2S), yes, it will introduce signal reflections that will impact on jitter

I meant RAM, obviously - my fault.

Regarding jitter:

jitter in wikipedia

Regarding jitter in audio:

Jitter, Bits and Sound quality

BTW - no one in the industry would consider Monster cable "expensive" or "cutting edge". Again, cable industry is the realm of snake oil (while I can readily differentiate among the three speaker cables that I have - all very different in electrical measures (R,L,C))

Jitter is an inconsistency in the clock timing from one period to the next. I am very familiar with it. An improperly terminated cable will *not* cause *inconsistencies* in timing. (Proper termination is easy anyway. There's no excuse not to get it right.) Neither will refelections that will be the same from one sample to the next. In fact if the reflection is not strong enough to change the state of the receiver out of the 0 or 1 that is should be, it will introduce absolutely no error. And as your second article stated, the clock is generally stabilized by PLL at the DAC anyway. The first digital recording I heard was at an Audio Engineering Society convention probably over 30 years ago. Its only problem seemed to be from inadequate anti-alias filtering.

>
> (while I can readily differentiate among the three speaker cables that I have - all very different in electrical measures (R,L,C))

Take a look at a 3-dimensional graph of the complex impedance of your speakers versus frequency. The reactance can go plus and minus j a few ohms across frequency, and the resistance varries a few ohms too. And these will change with temperature.

Re: Tube audio and vinyl

*Message #28 Posted by **Frank Wales** on 6 Sept 2011, 6:53 p.m.,*
in response to message #27 by Garth Wilson

It's amusing that the second quoted article is citing artifacts that are between 83dB and 98dB below the signal level; good luck hearing those, even if you're a bat.

Whereas, the other cited attempt at simulating artificial jitter lifts the noise floor to, shock! horror! 110dB below the signal. Which is about a millionth of the power of the noise floor on vinyl, if memory serves.

I can't even be bothered to calculate how many miles long digital cables would have to be for internal reflections to be a potential source of timing errors, assuming delayed reflections could somehow introduce or suppress bits in a way that got around link-level integrity checks.

> I kind of lost respect for the *connoisseurs* when they claimed to be able to distinguish between these and normal (cheap) wire. In this case the signal is digital, there will never be enough signal loss to degrade it to the point that a *1* is mistaken for a *0*. Even in the analogue case, the difference is insignificant.

Proof by assertion. If you perceive a difference yet can't measure it, you're most likely not measuring the right thing.

> Quote:
>
> Okay, I lost all respect for *connoisseurs* way before this, but this is the best of the best in regards to stupidity :-)

So in your book anyone who claims to perceive a difference is stupid. Maybe you need a Q-Tip and some manners.

Now you're talking

My longtime reference source is vinyl. I don't own an ELP laser turntable (nor do I want to--its performance is mediocre), but I do own a Loricraft record cleaning machine.

I also like tube electronics. Not exclusively, but it tends to be easier to get good sound with them. I also happen to like output transformerless amplifiers and full range electrostatic loudspeakers.

And yeah, I'm one of those "loonies" who claim to hear differences in cables. But that's a whole separate discussion for which there is no final agreement.

A kindred soul!

It happens that the best sound I have ever heard was from an OTL amp - Transcendent's T16 - driving Gallo (crosoverless) speakers. While I am electronic engineer, by no means I think that every amp sounds the same.

As the amp was a loaner, I intend to build another OTL when funds and significant other allow. Hopefully with a couple of Quad 2805's (which are yours? Acoustats? Atma Sphere amps?

I think Leica camera wins the prize for oldest re-release:

In 2002 the Leica 0 series was re-released : a clone on the 1923 original.

There was a modern formulation of the 50mm Anastigmat lens and a small modification to take 135 film cassettes, which had not been invented in 1923, but that was it.

I have one - it's a fun camera.

To keep the post on topic; I also have an original HP-15C and have every intention of getting a HP-15C-LE as a day to day replacement.

I don't have an original Leica 0 series : but they do come up at auction occasionally - one sold last year for $1.9 million

It might be eight years younger than the Leica but the Bolex H16 has been in continuous production since 1935 with little change -Bolex H16. With the 12C, it shows that when you get the basics right first time, there's no reason to change for the sake of fashion. The prices have remained high too but so has the quality -Bolex H16 Spring Driven Price List.

HP-15C Software - Part II

*Message #1 Posted by **Gerry Schultz** on 2 Sept 2011, 8:53 p.m.*

Last October I asked about locating 15C software on the web and Karl Schneider responded:

> Quote:
>
> There is a meager assortment of Software Library programs for the HP-15C at the Forum's main page:
>
> http://www.hpmuseum.org/software/software.htm
>
> I have intended to add several of my own programs that might be practical:
>
> HP-15C Library of complex-number utilities
>
> HP-15C program to compute 3x3 complex matrix determinant
>
> Valentin Albillo's clever program, found halfway through the following thread, solves a numerical puzzle posed by me:
>
> A modest arithmetical challenge

With the new HP-15C announced, is there any update to Karl's list? This will help everyone get a fast, fresh start on the new calculator.

Thanks, Gerry

in response to message #1 by Gerry Schultz

I have mostly written for the HP42S, but here is a program that I adapted for my 15c:

/*Program to convert decimal fraction to a fraction readable on a tape measure.

Registers:

STO 0- ORIGINAL NUMBER

STO 1- NUMERATOR

STO 2- DENOMINATOR

*/

```
01 LBL A
02 STO 0
03 FRAC //Creates numerator x as a fraction with 16 as denominator: x/16
04 1 //Use 32 ON steps 04-05 if you want 32nds
05 6
06 STO 2
07 *
08 FIX 0
09 RND
10 FIX 3
11 INT
12 STO 1
13 LBL 7 //Can fraction be reduced?
14 2
15 /
16 FRAC
17 TEST 0 //Same as X#0
18 GTO 8 //If fraction can't be reduced, go to formatting subroutine
19 RCL 2 //Reduce fraction
20 2
21 /
22 STO 2
23 RCL 1
24 2
25 /
26 STO 1
27 GTO 7 //Try again
28 LBL 8 //Formatting subroutine
29 RCL 0 //Original number will be left in y register
```

30 RCL 1 //The next 7 steps put the fraction into the format Num.Deno:

31 RCL 2 //For Example, 1/16 will display as 1.16, 5/8 as 5.08

32 .

33 0

34 1

35 *

36 +

37 RTN

Comments are C++ style, obviously leave those out. Not sure of my use of the word "reduced" in the comments. This program can to take 5-10 sec to run- interesting to see how fast on the 15cLE.

Dwight

*Message #3 Posted by **Jeff O.** on 6 Sept 2011, 4:32 p.m.,*
in response to message #1 by Gerry Schultz

Gerry,
Not a very "heavyweight" program, but here is "CodeBreaker" for the 15C. Play is as described here. It runs painfully slow on a 15c classic. (I officially claim priority for first referring to the original 15c as the "15c classic".) It is quite fast on the 15c LE.

I have tried everything I can think of to make the program shorter. I had one idea that saved one step but would likely run slower, not that it matters on the 15c LE. Suggested improvments would be welcome!

```
Step    Function        Keycode         Comment
001     LBL C           42,21,13        Label C for "Code Breaker"
002     Cl REG          42 34           clears all registers, mostly to get zeroes in 1 -
4, .0
003     FIX 1           42, 7, 1        set display mode Fix 1 so scores are presented as
x.x

Has something happened to the forum?

*Message #1 Posted by **BruceH** on 2 Sept 2011, 6:57 p.m.*

On a new device, I was reading the forum as a guest just fine. A couple of days later I logged on in order to post a message and find that some threads have been truncated. e.g.

> Re: Focus more on Texas Instruments' calculators ;-)), uhmgawa - 30 Aug 2011, 10:12 p.m.

which is clearly part of a thread but now appears on its own - at least it does to me. Anyone else seeing this?

(Edited for typos)

Edited: 2 Sept 2011, 6:58 p.m.

Re: Has something happened to the forum?

*Message #2 Posted by **Howard Owen** on 2 Sept 2011, 7:33 p.m.,*
in response to message #1 by BruceH

Postings a few days old regularly get moved off into an archive. The current year's archive is number 20.

Re: Has something happened to the forum?

*Message #3 Posted by **Bart (UK)** on 2 Sept 2011, 8:13 p.m.,*
in response to message #2 by Howard Owen

Yup, threads get "cut" between archive and active :-)

How many of you bought HP's 15C app for iOS?

*Message #1 Posted by **Howard Owen** on 2 Sept 2011, 4:49 p.m.*

I did. I also bought a couple of others. But I'm an enthusiast. I wonder how many other people bought HP's app? I thought at the time that it might have been a vehicle to gauge demand among the iPhone toting set for a real 15C.

edit:fix typo

Edited: 2 Sept 2011, 4:50 p.m.

Re: How many of you bought HP's 15C app for iOS?

*Message #2 Posted by **Norman Dziedzic** on 2 Sept 2011, 5:12 p.m.,*
in response to message #1 by Howard Owen

I bought it. My only wish is that they would update it to allow you to change the volume of the key clicks. It is just annoyingly loud.

Re: How many of you bought HP's 15C app for iOS?

*Message #3 Posted by **Tim Wessman** on 6 Sept 2011, 10:25 a.m.,*
in response to message #2 by Norman Dziedzic

Unfortunately, Apple decided that we couldn't update it.

When the application was developed, it was submitted under the 3rd party developer but using HP's digital certificate. We had several fixes in place and went to submit it less than a month later but could no longer do so. In the meantime, Apple updated the submission process so that it would specifically check for this situation and only allow applcations to be submitted under the same name as the certificate.

However, they would not fix the old applications that were done that way and this effectively orphaned them.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #4 Posted by **Egan Ford** on 2 Sept 2011, 5:34 p.m.,*
in response to message #1 by Gene Wright

I would have thought 'e' would have been a better constant to use on the 12C.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #5 Posted by **Gene Wright** on 2 Sept 2011, 5:42 p.m.,*
in response to message #4 by Egan Ford

Eh, it was tough. Sure, e shows up in continuous compounding, but 99% of business users would not recognize that.

So what to show? 360 perhaps. Just not really a good choice.

So, someone at HP chose PI. Better than 0.7734, imo. :-)

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #6 Posted by **Gerson W. Barbosa** on 2 Sept 2011, 6:39 p.m.,*
in response to message #5 by Gene Wright

> Quote:
>
> Sure, e shows up in continuous compounding,

I just read about it on the book *e: The Story of a Number*, by Eli Maor:

```
f CLEARFIN 1 0 0 ENTER EEX 1 0 n / i 1 CHS PV FV   -->  2.718281828
```

Sure *e* would have been very appropriate.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #7 Posted by **Lode** on 2 Sept 2011, 6:01 p.m.,*
in response to message #1 by Gene Wright

If you place both images on top of each other (or align them exactly the same in two browser tabs and switch the tabs) you can see that the leathery pattern on the sides is exactly the same on both. Is that leathery pattern made in such a way that it has the same pattern on every calculator?

What I mean is, in the top left, top right and bottom left of the calculators especially, the bumps and lower spots, the black and white spots, are the same.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #8 Posted by **Lincoln R.** on 2 Sept 2011, 6:26 p.m.,*
in response to message #7 by Lode

Are you talking about the texturing of the plastic case? They'd almost certainly all be identical, or there would only be a handful of variations. Plastic injection molds are expensive, and that texture gets there by sand blasting the mold used to make the case.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #9 Posted by **Jean-Michel** on 3 Sept 2011, 2:46 a.m.,*
in response to message #8 by Lincoln R.

Hello,

If texturing are strictly identical from one part to another, then there is only one cavity in the mold of this part. This is consistent with the fact that only few units are planned to be molded. (When I say "few", I means regarding usual volumes of plastic injection molding, which are commonly hundreds of thousands or even millions, and not only a small batch of 10,000 15C-LE plus the 12C.) Kind regards.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #10 Posted by **Lyuka** on 3 Sept 2011, 12:06 p.m.,*
in response to message #9 by Jean-Michel

Hi,

It's interesting.

I compared the texture of two hp 15C that I have.

"hp 15C texture comparison "

One is made in 1986, and the other is in 1988. (serial number 2612Axxxxx and 2813Axxxxx)
The textures are identical but the later one (2813Axxxxx) seems dull.

Lyuka

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #11 Posted by **robert rozee** on 3 Sept 2011, 12:30 p.m.,*
in response to message #10 by Lyuka

it is quite possible that there was only ever ONE mould/die that was used to make EVERY original 10-series calculator case. making a die can cost $100,000 so not cheap, yet a single one can be good for making a million or more items - with (as you observe) a slight loss of fine detail over time.

Edited: 3 Sept 2011, 12:32 p.m.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #12 Posted by **Lincoln R.** on 3 Sept 2011, 2:10 p.m.,*
in response to message #11 by robert rozee

There were probably multiple molds as I doubt HP really wanted to ship pieces of molded plastic from Corvallis to Singapore and Brazil (Maybe someone who worked in HP manufacturing back then knows this). It's entirely possible that each plant only had 1 mold though. I know there were multiple molds for the Pioneers, I've opened a Singapore-made 32sII and a USA 32s, the insides of the cases were marked "MOLDED IN SGP" and "MOLDED IN USA" respectively.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #13 Posted by **Jean-Michel** on 3 Sept 2011, 4:30 p.m.,*
in response to message #12 by Lincoln R.

I'm not sure that a single mould could be used over that much years to produce that many parts without having to change it, due to wearness and loss of precision of the dimensions getting out of tolerances. Even if moulds are made of hardened steel they are subject to wearness and have a limited lifetime. That being said, only experts like you all could notice such tiny differences. Kind regards.

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #14 Posted by **Dan W** on 2 Sept 2011, 9:32 p.m.,*
in response to message #1 by Gene Wright

Really nice image.

I discovered that if one wants really big images, just put the calculator on a flat-bed scanner. The depth of field is sufficient for a sharp image. The real trick is getting rid of all the microscopic bits of dust and lint. At 1200 DPI a speck of dust looks like a boulder. No matter how well I clean it I end up tweaking out the debris in photoshop.

Could you post a shot of the back as well?

I don't own any Voyager, so I have to ask: Were/are there usually no clearance within the hinge of the Voyager calculators?

Re: Large pic of 15c LE and 30th anniversary - you can download these too

*Message #18 Posted by **Jeff O.** on 3 Sept 2011, 1:09 p.m.,*
in response to message #15 by hpnut

The yellow (f) and blue (g) shift keys of the new 12c+/15c LE hardware platform are somewhat "wobbly" compared to all other keys. This allows them to look a little mis-aligned. My guess is that they are individual keys, not a part of some overall grid that connects and stabilizes all the other keys. I do not intend to dis-assemble a unit to find out. They work fine, feel fine, just a little wobbly as compared to the other keys, and subject to slight mis-alignment. Been this way since the 12c+ came out.

*Message #20 Posted by **Namir** on 2 Sept 2011, 2:10 p.m.,*
in response to message #18 by Michael de Estrada

I followed what you did and yes it show my order. I was doing it the long way and that was not working.

Thanks!

Re: Updated HP Web Page for the HP-15C LE

*Message #21 Posted by **M. Joury** on 2 Sept 2011, 11:49 a.m.,*
in response to message #12 by Michael de Estrada

Ah, got it. Excellent memory. I did. I am just not sure I am willing to bet the farm on that order. It all depends on how fast it looks like the things are selling. I also would like to get a 12C 30th and I did not pre-order those.

I was one of those that tried to get hold of an HP Touchpad and though I did get one it was a very close thing. One thing that has happened is that lots of people bought the TP at the much reduced price and are now selling it on TAS for 2-3 times what I paid. Seeing what happened there I really don't want to miss out on a 15C and will order extra if I think that might happen.

Cheers,

-Marwan

It was **part** of a *whimsical* explanation for the currently published price of the 15C LE. (See the smiley face at the end? Some of you are taking this 15C stuff way too seriously.)

The 50g sells on HP's web site for $128. The simple and grossly less capable 15C LE now quoted at $100 appears to have a price that is completely arbitrary...one that even HP can't seem to pin down. What's it going to be a hour from now?

Re: Updated HP Web Page for the HP-15C LE

*Message #34 Posted by **Michael de Estrada** on 2 Sept 2011, 1:45 p.m.,*
in response to message #33 by Mike Morrow

Apples and oranges. The HP-50g has a large sales volume and unlimited supply. The HP-15C is a limited edition of an otherwise vintage product with a relatively small fixed supply. There are quality features in the HP-15C that are not present in the HP-50g, such as better keyboard and printed documentation.

*Message #35 Posted by **Calum Tait** on 2 Sept 2011, 2:30 p.m.,*
in response to message #34 by Michael de Estrada

Considering it is essentially a 12C+ with slightly modified software and modified screen printing the premium seems a little high. Especially considering that the "limited edition" is 10K. We should probably be grateful that HP have listened for once and made it at all though.

*Message #36 Posted by **Michael de Estrada** on 2 Sept 2011, 2:41 p.m.,*
in response to message #35 by Calum Tait

They still had to make all new key buttons for a relatively limited run. I'll let Tim or others more knowledgeable chime in on this, but I suspect that there were significant costs involved above those of the 12C+.

It's just a common **non-vintage, current-production** HP-12C+ running some 30-year-old firmware other than the 30-year-old firmware that the HP-12C+ normally runs. What a great

technical triumph!

I can get people some "limited edition" Dale Earnhart NASCAR trinkets, if a manufacturer's declaration of "limited edition" is accepted as **the** signature of desirability.

How many could agree with characterization of a product that has yet to be seen, except by HP and some insiders. I recall similar pre-release speculation about the HP 35S joke.

I can't speak for HP but in my experience the 15c firmware requires chasing a few dark corners in terms of emulator support beyond that needed for the 11/12/16c. Also execution time aware code exists specific to a firmware model and at the advertised 100x speed differential, emulator support ideally will be required to normalize some sequences to legacy execution timing.

*Message #43 Posted by **Nick R** on 2 Sept 2011, 2:54 p.m.,*
in response to message #33 by Mike Morrow

I'd certainly like to own a 15C once again so I can run some of the programs I wrote for this machine in 1985. I just can't understand all the reticence about price and availablity.
To me, a calculator is a simply a tool to work with, and the fact that this model is being presented as a Limited (collector's) Edition is unfortunate, as it lessens the chance that they'll be available to people outside the US who want one for daily use. I can forsee many of them being hoarded or bought up in large number by resellers who will release them in small quantities at inflated prices.

Re: Updated HP Web Page for the HP-15C LE

*Message #44 Posted by **Michael de Estrada** on 2 Sept 2011, 3:16 p.m.,*
in response to message #43 by Nick R

I don't think the market for this calc is people who think "a calculator is a simply a tool to work with". Most people would pay far less to get something with the same featureset, or

expect a lot more modern features at that price. I use my HP-50g a lot more for problems involving matrices than my HP-15C. It does have a compact size, but if I'm going to the supermarket and want to figure product pricing, I'll just take a cheap solar calc. So, again, I think this is mainly an appeal to collectors and nostalgia buffs. I do agree that 10K seems low, especially if you belief the numbers on the petition. If you live in BC, Canada, then perhaps you can befriend someone stateside to get you one.

Tim gave an optimistic answer that one. If demand is significant, they might run a few more through the factory. If the 10,000 units don't jump off the shelves, then the supply issue won't be there for current buyers.

Between those two extremes there's a chance that your fear might be realized. But there are alternatives, at least three 15C clones on the App Store, and even one on Android now. Current owners of 15Cs might or might not be pleased to see the prices for their old machines stay stable in the face of a new supply.

The best outcome I could hope for would be a quick sellout of the LE model, prompting HP to bring back the 15C as a normal product. Without the LE badge. those machines would be less collectable, but would amply serve those who wanted a 15C for real workflows.

While I'm able to smile about the opportunity to eventually buy a 15C at a moderate price, it isn't exactly a joke ;-).

I understand (hopefully right) you do not consider this 'relaunch' to be something special, and I got your reasons. I also like the 42S after using free42 for some month now, but I take it this way: Besides the 50g, it will be the only serious scientific calculator on sale from HP, and it is sufficient for my needs. So yes, I'm serious and happy about it. And I have quite some fun following the threads and participate in them :-).

PPC DVD HP-Calc Archive Disk "Slightly" Updated

*Message #1 Posted by **Jake Schwartz** on 1 Sept 2011, 8:55 p.m.*

Hi,

Now that the 15C LE is announced, I did a slight update to the PPC HP-calc archive DVD disk to include the 53 HP15C-related pages distributed at the HHC2010 conference last year. Each attendee received an "HP15C+" prototype under NDA and they even based the annual programming contest on the 15C. (Can you imagine everyone keeping quiet for a year? It somehow worked out...) More info on the disk may be obtained by checking http://www.pahhc.org/ppccdrom on the web.

Thanks, Jake

P.S. - HHC2011 is going to be amazing.....check http://hhuc.us/2011/index.htm for info

15c LE programming contest entry

*Message #3 Posted by **gene wright** on 1 Sept 2011, 9:16 p.m.,*
in response to message #1 by Jake Schwartz

The contest for the 15c LE was to sort numbers in 0 through 9 in ascending order.

Winning program was published here and was something like this:

```
LBL A
8
STO I
RCL 9
LBL 0
RCL (i)
TEST 7
GTO 1
DSE I
GTO 0
RTN

LBL 1
X<>Y
X<> (i)
ISG I
```

```
LBL 1
STO (i)
GTO A
```

That at least, was my program. :-) Richard Schwartz won the contest by replacing the NOP LBL 1 I used with MATRIX 9, certainly a more ingenious NOP.

However, the contest for RPL machines was to sort a list of numbers in ascending order but to sort the odd numbers first, then the even numbers. So, given 1, 2, 3, 4, the result would have been 1, 3 then 2, 4 but for 10 values.

After the conference, I wrote the program on the PDF attached so the 15c LE could sort numbers in 0 through 9 with the odd numbers sorted first and the even numbers sorted afterward.

This took a LONG time with the 15c, but runs FAST on the 15c LE.

Program Listing

I expect a great deal of additional information will be presented at HHC 2011 in a few weeks.

Why would this make the difference between winning and not?

- Pauli

Re: 15c LE programming contest entry

*Message #5 Posted by **Gene Wright** on 2 Sept 2011, 7:36 a.m.,*
in response to message #4 by Paul Dale

Because it was considered more elegant. :-)

It was funny...Richard and I *independently* came up with the exact same solution otherwise. Richard turned his in several hours before I did, which also properly figured into it, since the solutions were the same otherwise.

So, having lost the HHC contest, I programmed the RPL challenge on the 15c LE, which has now been shared in the PDF.

Re: 15c LE programming contest entry

*Message #6 Posted by **Paul Dale** on 2 Sept 2011, 7:44 a.m.,*
in response to message #5 by Gene Wright

More elegant? No way. MATRIX 9 is a *two* byte command whilst LBL 1 is a *one* byte command. You lost unfairly ;-)

Not being first is a good reason however.

- Pauli

Re: 15c LE programming contest entry - for the 34s?

*Message #7 Posted by **Gene Wright** on 2 Sept 2011, 8:02 a.m.,*
in response to message #6 by Paul Dale

Oh, I wasn't sad at all. Richard Schwartz is an amazing person and merely coming up with the same code as he did, even if a bit later, :-) made me feel very nice.

Hey Pauli... how about a 34s program that does the same thing?

Random positive integers stored in 0 through 9. Sort the odd numbers first, then the even numbers. Examples of input and output:

Input stored in 0 through 9: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10

Output stored in 0 through 9: 1, 3, 5, 7, 9, 2, 4, 6, 8, 10.

Input stored in 0 through 9: 2, 2, 5, 1, 9, 4, 8, 8, 6, 3

Output stored in 0 through 9: 1, 3, 5, 9, 2, 2, 4, 6, 8, 8.

etc. Be good to see just how small and fast a 34s version would be.

Re: 15c LE programming contest entry - for the 34s?

in response to message #7 by Gene Wright

> Quote:
>
> Hey Pauli... how about a 34s program that does the same thing?

The base challenge for the 15c is kind of a non-event:

```
001: LBL A
002: .
003: 1
004: R-SORT
005: RTN
```

The odd/even version might be a fun challenge to pose.

Maybe I should modify R-SORT to take a label argument that defines an ordering function.

- Pauli

Edited: 2 Sept 2011, 8:11 a.m.

Re: 15c LE programming contest entry - for the 34s?

*Message #9 Posted by **Gene Wright** on 2 Sept 2011, 9:48 a.m.,*
in response to message #8 by Paul Dale

Agreed on the plain "sort 1 through 9" or "sort 0 through 9" part. :-)

It is the odd / even distinction that makes it interesting! :-)

Is redefining how a function works considered cheating? :-)

Re: 15c LE programming contest entry - for the 34s?

*Message #10 Posted by **Paul Dale** on 2 Sept 2011, 6:41 p.m.,*
in response to message #9 by Gene Wright

> Quote:
>
> It is the odd / even distinction that makes it interesting! :-)

Had a neat idea about this one last night while suffering a bit of insomnia. If we run the 34S in integer sign and mantissa mode and assume that the supplied integers are positive then we can apply this bit of code:

```
9
STO I
LBL 00
RCL->I
ODD?
NOT
STO->I
DSZ I
GTO 00
```

Then sort registers 1 - 9 however you want. R-SORT isn't viable here unfortunately here since we're in integer mode. Finally:

```
9
STO I
LBL 01
RCL->I
x<0?
NOT
STO->I
DSZ I
GTO 01
```

And you have you result. The clever trick I'm relying on here is that in sign and mantissa mode, NOT negates the number without reversing the apparent ordering of the numbers. For example, in 4 bit integer mode:

```
#   NOT #
1    -6
3    -4
5    -2
```

This relies on having positive numbers in the registers. If negatives are permitted as well, the problem is a bit more interesting. RR 01 might be a viable transform.

> Quote:
>
> Is redefining how a function works considered cheating? :-)

Only if I can't justify the change as useful more globally :-)

- Pauli

I agree with that! I will key this in and play.

Re: 15c LE programming contest entry - for the 34s?

*Message #12 Posted by **Howard Owen** on 2 Sept 2011, 7:27 p.m.,*
in response to message #10 by Paul Dale

Since we assume all were positive, we can do

```
RCL->I
ABS
STO->I
```

in the second code block. I'm assuming we have "ABS" on the 35s. Mine is out of batteries too.

Re: 15c LE programming contest entry - for the 34s?

>
> in the second code block. I'm assuming we have "ABS" on the 35s. Mine is out of batteries too.

Yes, the *34S* has ABS.

ABS isn't sufficient in this case. The NOT used initially isn't just negating the number. It is making the number negative in a way such that the relative ordering of the (positive) numbers doesn't change.

- Pauli

Re: 15c LE programming contest entry - for the 34s?

*Message #14 Posted by **Paul Dale** on 2 Sept 2011, 8:52 p.m.,*
in response to message #7 by Gene Wright

> Quote:

> Hey Pauli... how about a 34s program that does the same thing?

How about this:

```
001: LBL A
002: 8
003: STO I
004: RCL 09
005: LBL 00
006: ODD?
007: GTO 90
008: RCL->I
009: ODD?
010: GTO 80
011: x>? Y
012: GTO 01
013: GTO 80
014: LBL 90
015: RCL->I
016: EVEN?
017: GTO 01
018: x>? Y
019: GTO 01
020: LBL 80
021: DSE I
022: GTO 00
023: RTN
024: LBL 01
025: X<>Y
026: X<>->I
027: INC I
028: STO->I
029: GTO A
```

If I could be bothered counting steps and using SKIP and BACk, the total would reduce by four steps to 25. The final RTN could also be omitted by moving the LBL 01 block above LBL 90 to bring the total to 24.

- Pauli

Re: 15c LE programming contest entry - for the 34s?

*Message #15 Posted by **Paul Dale** on 2 Sept 2011, 9:04 p.m.,*
in response to message #14 by Paul Dale

A bit of rearrangement and it is down to 24 steps without omitting the final RTN. 23 if it is omitted.

```
001:  LBL A
002:  8
003:  STO I
004:  RCL 09
005:  ODD?
006:  SKIP 10
007:  RCL[->]I
008:  ODD?
009:  SKIP 12
010:  x[<=]? Y
011:  SKIP 10
012:  x[<->]y
013:  x[<->][->]I
014:  INC I
015:  STO[->]I
016:  GTO A
017:  RCL[->]I
018:  EVEN?
019:  BACK 07
020:  x>? Y
021:  BACK 09
022:  DSE I
```

```
023:  BACK 18
024:  RTN
```

Any advances?

- Pauli

Actually, if you search for "HHC2010" on YouTube, you will find many session videos up there, placed there by Eric Rechlin. It is still my goal to have the DVDs complete by conference time, and to have multiple sets on the door-prize table.

Jake

in response to message #17 by Jake Schwartz

That reference document is priceless. The reprintings of Valantin Abillio's "Long Live the HP-15C!" and his polynomial fitting article lay out the case for the HP-15Cs worthiness better than any other documents I'm aware of. Then we find, later on in the appendices, John Dearing's 15C review in the PPC journal. Some of his complaints about the machine, coming from the perspective of a 41C user, echo many that I've seen here lately. His list of pros include many of Mr Abillio's points and few more. The rest of the material is extremely useful and interesting too. Kudos!

WP34S : is this result "zero" enough ?

*Message #1 Posted by **Miguel Toro** on 1 Sept 2011, 8:38 p.m.*

Hola,

I am still playing with the 15c examples and this time it is from the advanced functions handbook, page 78, calculating the nth roots of a complex number. I tried my best to translate the program, so here is my WP34s version:

```
001 LBL A
002 [cmplx]x[<->]y
003 [cmplx]1/x
004 [cmplx]RCL L
005 [cmplx]R[v]
006 [cmplx]y[^x]
007 [cmplx]STO 02
008 0
009 ENTER[^]
010 3
011 6
012 0
013 [cmplx]R[^]
014 [cmplx]/
015 [cmplx]STO 04
016 0
017 STO K
018 LBL 00
019 [cmplx]RCL 04
020 RCL[times] K
021 1
022 DEG
023 [->]REC
024 [cmplx]RCL[times] 02
025 1
026 STO+ K
027 R[v]
028 STOP
029 GTO 00
```

to run it, I first set the ssize8, then 0 FILL and then follow the example in the book, using 1^1/100 as the value. Here are the results:

```
k = 0,  z0  = 1 (check!)
k = 1,  z1  = 0.9980+0.0628i (check!)
k = 50, z50 = -1+(1.2815^-38)i (check? 15C result is -1)
```

So, is this because the different precision between both machines and this is the good result? ... or am I that bad as a programer :-)

Saludos,

Miguel

Edited: 1 Sept 2011, 8:41 p.m.

Re: WP34S : is this result "zero" enough ?

*Message #2 Posted by **Marcus von Cube, Germany** on 2 Sept 2011, 2:24 a.m.,*
in response to message #1 by Miguel Toro

Miguel, you could try the various rounding modes (RM) which affect how the internal high precision numbers are rounded. The e-38 looks very much like a rounding artifact because the internal precision is in this range.

Looking more closely at your code I see you do calculate the inverse of the exponent and later multiply it by k. This may lead to different results then computing k/n.

Edited: 2 Sept 2011, 2:27 a.m.

Re: WP34S : is this result "zero" enough ?

in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> you could try the various rounding modes (RM) which affect how the internal high precision numbers are rounded.

The RM modes only change how an internal high precision number is rounded to a sixteen digit register, not how rounding takes place during internal high precision calculations.

- Pauli

Re: WP34S : is this result "zero" enough ?

*Message #4 Posted by **Paul Dale** on 2 Sept 2011, 2:49 a.m.,*
in response to message #1 by Miguel Toro

Without having investigated specifically, the 10^{-38} result you are seeing is around the internal precision used for calculations.

My guess would be a slight rounding issue is present here. Probably in the polar to rectangular conversion.

Still, I'm not really concerned here, the result is close enough to zero for my liking.

- Pauli

Re: WP34S : is this result "zero" enough ?

*Message #5 Posted by **Miguel Toro** on 2 Sept 2011, 8:51 a.m.,*
in response to message #4 by Paul Dale

I think the rounding issue may come from the y^x. I tried this simple example with (1+i)^2:

```
1, ENTER, 1, 0, ENTER, 2, CPX, Y^X = (-7,5998)^-39 + 2i
1, ENTER, 1, CPX, X^2 = 2i
```

In both cases the 15c and 42s give 2i as the result, either with y^x or x^2.

I tried the RM command (thanks for calling me geek :-))and it did not make any difference.

As you say, it is close enough to zero.

Thanks,

Migue

Is there anything the 15c can't do compared to the 35s?

*Message #1 Posted by **snaggs** on 1 Sept 2011, 6:39 p.m.*

I know people here heap scorn on the 35s, but its been a good calculator for me doing maths. Would the 15c replace it for daily usage?

Daniel

Re: Is there anything the 15c can't do compared to the 35s?

*Message #2 Posted by **Michael de Estrada** on 1 Sept 2011, 8:02 p.m.,*
in response to message #1 by snaggs

AFAIK, the only significant item is matrix math. Otherwise the 35s beats it on memory, two line display and alpha characters. The new 15C LE is probably faster as well. The main difference is keyboard quality IMO. Also the 35s is very buggy, whereas the 15C is totally solid in this regard.

Edited: 1 Sept 2011, 8:04 p.m.

Re: Is there anything the 15c can't do compared to the 35s?

*Message #3 Posted by **snaggs** on 1 Sept 2011, 11:19 p.m.,*
in response to message #2 by Michael de Estrada

I havnt started doing linear algebra on the 35s yet. What is it missing that the 15C has?

The reason Im asking all this is it takes a while to learn where things are on a new calculator!

Re: Is there anything the 15c can't do compared to the 35s?

*Message #4 Posted by **Michael de Estrada** on 1 Sept 2011, 11:43 p.m.,*
in response to message #3 by snaggs

Like I said, about the only significant item is matrix math, which includes vectors. The 35s has far more features, and is an extension of the 32s, 32sii line. If you are happy with the 35s, then there is no reason to get a 15c. Most of us are getting it for nostalgia and because it has a unique form factor. Fact is, my 15c spends most of its time in its slip case, while I use my 32sii far more, and just got a nice 32s which I plan to use a lot as well. I don't use my 35s much because of all its annoying issues and lower quality keyboard and display.

*Message #13 Posted by **M. Joury** on 1 Sept 2011, 8:14 p.m.,*
in response to message #1 by snaggs

IMHO the short answer is "yes".

The 35S does have some features (such as binary arithmetic--even if badly implemented) that the 15C does not have. There was a voyager (16C) designed just for this purpose and it would run rings around the 35S's binary math capabilities. The 35S has more memory and possibly a slightly more powerful programming control set and it has replaced key codes with mnemonics (which is very nice). The 35S can be used as an algebraic calculator though most here (myself included) would not consider this an advantage. But in general the 15C can do everything that the 35S can do and with the updated processor it can do it faster.

Just my 2 cents and I am sure others will chime in <g>.

Cheers,

-Marwan

*Message #14 Posted by **Palmer O. Hanson, Jr.** on 1 Sept 2011, 9:08 p.m.,*
in response to message #1 by snaggs

Can the 15C be used in the test environments for which the 35s was specifically designed?

Re: Is there anything the 15c can't do compared to the 35s?

*Message #15 Posted by **Jeff O.** on 1 Sept 2011, 10:05 p.m.,*
in response to message #14 by Palmer O. Hanson, Jr.

Certainly not on the FE/PE/PS tests. I suppose it is possible that NCEES could add the 15c to their "approved calculator list", but they have not been too responsive to concerns about their policy and seriously doubt that they will care to add another approved calculator. I think they would prefer to get it down to one approved model, to make it super easy on their proctors.

Re: Is there anything the 15c can't do compared to the 35s?

*Message #16 Posted by **Jeff O.** on 1 Sept 2011, 10:14 p.m.,*
in response to message #1 by snaggs

In my opinion, the programming capabilities of the 35s are superior to the 15c. Lots of labels, two index registers, alpha dislay of functions instead of key codes, ability to display alpha prompts, etc. But the 15c will make a fine daily use calculator. Other than entry and display, and ability to directly store and recall complex values, the 15c has better complex number support.

edit - remembered that the 15c cannot directly store and recall complex values.

I think snaggs is referring to a thread a few weeks ago in which he "debunked" some of the reported bugs.

Re: Is there anything the 15c can't do compared to the 35s?

*Message #21 Posted by **snaggs** on 2 Sept 2011, 8:01 a.m.,*
in response to message #20 by Martin Pinckney

Yes, bugs has been used to describe "doesn't do it like my old calclator". There are clearly some thing on that list which could have been done better, but theyre not bugs, just mildly inconvenient.

I dont find the arrow keys a "bug", I like them. The keybord is not as good as a Pioneer keyboard, and keys require some more pressure, this is not a "bug", its just not as good.

Re: Is there anything the 15c can't do compared to the 35s?

*Message #22 Posted by **Paul Dale** on 2 Sept 2011, 8:13 a.m.,*
in response to message #21 by snaggs

Are we talking about the same list here? The 35s bug list doesn't mention arrow keys, let alone calling them a problem or a bug. It also doesn't mention keyboard quality.

I will freely admit that there are seven items down the bottom (in a separate list) which are classified as a bit weird or cumbersome rather than as bugs. This is made pretty clear.

The list of nineteen items at the top are definitely bugs however. Unless some of these have been fixed in the meantime.

No, they have great memories of using a 15c!

> Quote:
>
> I must have very different needs from some people here as I can't see how for me a 15c could replace a 35s.

Yes, whether 15c could replace 35s depends on the user's needs. Two different feature sets:

15c - Ease of use for everyday keyboard calculations, classic RPN programing paradigm for true HP aficionados, bug-free.

35s - Also ease of use for everyday keyboard calculations (with a few quirks), more advanced/capable programing paradigm, lots of bugs.

It is more a case of the 15c not having a huge amount of memory.

I don't leave programs on my 15c long. Well I do but I never remember what I last left on it. Then I clear program memory and write another quick and dirty.

- Pauli

Anyone with qualification in a scientific or engineering discipline would immediately recognize that the 35S has no competent or coherent capability in the complex domain. It's a fool's toy.

That alone disqualifies the 35S as an acceptable calculator for any but the most trivial uses.

The 15C is second (though a distant second) only to the 42S as a complex domain RPN calculator.

Evidence is that there are few knowledgeable people who would choose a 35S over a 15C.

When I saw that 34s does LambertW and Gamma on complex numbers in the same consistent way as it does them for every function, I was blown away! :)

Re: Holy cow!

*Message #34 Posted by **snaggs** on 2 Sept 2011, 2:02 a.m.,*
in response to message #31 by Mike Morrow

Can you give me an example of a problem that can be solved on the 15C (or 42s) that can't on the 35s?

I have a 42s emulator until my in-the-flesh 42s arrives. So I can give it a go on both and finally understand what the problem is..

Sorry, but Im not just being contrary, its just that every day I have a good experience with what I can do with the 35s! For example, from a worded problem I was working through for revision 10 minuteds ago I came up with an equation for mortage payments;

P=(1+U/12)^n*A-((1-(1+U/12)^n)/(1-(1+U/12)))*D

where U is the annual interest rate, A the inirial amount, D the payment, and P is the remaining mortage after n months.

I could just pop this into EQN, and solve for N when with P=0.

Im not sure how long that would take on a 15c, could you do it during a exam?

Re: Holy cow!

*Message #35 Posted by **Gene Wright** on 2 Sept 2011, 7:41 a.m.,*
in response to message #34 by snaggs

I guess if you want to spend the time programming the 35s, you could do an 8x8 determinant, but you can do that out of the box on the 15c.

Not possible unless you write a long, complicated program on the 35s.

This is probably unfair, but you can't find the cosine of 89.99999 on the 35s in degrees mode, but you can on the 15c. (I know, that's below the belt).

Re: Holy cow!

*Message #36 Posted by **snaggs** on 2 Sept 2011, 8:10 a.m.,*
in response to message #35 by Gene Wright

You can, its just not as accurate. Add another 9 or remove one and its fine. It is however more accurate except for those specific values.

I do agree however, that given 30 years have passed in computer science since the 15c, we do have better algorithms out

there. We could have had our cake and et it to!

As for the 8x8 determinant, thanks for the example. Ill have a play with that and can now see for myself whats missing.

Daniel

Re: Holy cow!
*Message #37 Posted by **Gene Wright** on 2 Sept 2011, 8:12 a.m.,*
in response to message #36 by snaggs

No problem. I do agree that specifically choosing an example where the 35s has a bug is highly unfair, but there are a good number of places where you can run into problems with the 35s, per the list.

Complex number support is better and "more native" on the 15c LE than the 35s.

Matrix work is much better on the 15c LE than the 35s.

Speed is much better on the 15c LE than the 35s.

Re: Holy cow!
*Message #38 Posted by **snaggs** on 2 Sept 2011, 12:40 p.m.,*
in response to message #37 by Gene Wright

Thanks for some specific examples. It really seems that alost every model has something to offer that others dont.

It would be nice if HP would make one calculator that is includes all these small advamces in the one machine.

PS? Wjilst googling Arcsin on the HP35s I stumbled across this awesome site! Chocker block full of some very complicated problems.

http://homepage.mac.com/nwjh/HP-35S/index.html

The program has aleady been written. See Stefan's HP-35s Matrix Multitool thread of November 2, 2007, near the top of Archive 17, or go directly to it at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=127861. You will also find some material in that thread which compares the results from Stefan's program and those from the HP-15C and the HP-41 Advantage module.

You can also look at Article 886 where I wrote some additional programming to do other matrix tasks using Stefan's program for input.

And with that comment you have recognized the real deficiency of the 35s for many users -- the absence of an input/output capability. The other major deficiency with respect to entering programs is the unreliability of the check sum.

But wasn't the absence of an input/output capability recognized as a requirement for use on NCEES tests? I suggest that trying to combine the development of an NCEES calculator with the release of a device commemorating the original HP-35 led to some compromises that left all users somewhat unhappy. I also suggest that the push to release the HP-35s at the HP-35 anniversary may have led to an earlier release than was justified by the development status at the time.

Yes, lack of I/O was an absolute requirement for NCEES approval. Lack of alpha capability was also a requirement, they either overlook or are unaware of the limited alpha capability that the 35s has via its equations.

*Message #45 Posted by **Jeff O.** on 2 Sept 2011, 2:24 p.m.,*
in response to message #44 by Mike Morrow

The 35s can evaluate several of the examples on your list:

```
 1.  cannot do
 2.  can do.  You must enter -2 as -2+i0, but you must do the
     same on wp34s for example.
 3.  cannot do
 4.  cannot do
 5.  can do directly, i.e., key in 1, i, 1, press COS, see answer.
 6.  cannot do
 7.  can do directly, i.e., key in 1, i, 1, press LN, see answer.
 8.  same as 7 above, does it just fine
 9.  can do directly, press i, enter, y^x
10.  cannot do
```

I agree that it *should* handle all of the above directly, but the functions it has are quite useful.

edit - also can do no. 5 (Thanks Dieter, I missed that one.)

in response to message #44 by Mike Morrow

Well, the 35s cannot do hyperbolic and inverse trig in the complex domain. Which accounts for half of your examples. You could have chosen all ten examples that way to show what a completely unuseable device the 35s is. ;-)

In fact, with the mentioned exceptions, the 35s handles all other examples easily. Even easier than the 15C since you don't have to remember things like the use of flag 8 or the meaning of a small c in the display. ;-) The 35s has a more direct approach: enter a real number and the result will be real (or an error). Enter a complex number (maybe with a zero imaginary part) and the result will be complex.

Your examples:

```
-2i0 ln   => 0,6931 i 3,1416
 1i1 ln   => 0,3466 i 0,7854
 1i1 e^x  => 1,4687 i 2,2874
 1i1 cos  => 0,8337 i-0,9889
```

And finally, ultimately elegant:

```
 i ENTER y^x => 0,2079 i 0
```

Yes, I like it. :-)

in response to message #46 by Dieter

Thanks Dieter, they really should edit the "bugs" listed which is bandied around so authoritively.

As you have demonstrated, many so called bugs are just "doesnt do it like my old calculator". I like you think the 35s complex mode makes sense and is easy.

Of course it would be nice to have it switch automatically into complex mode for root -1. The 32sII couldnt do complex hyperbolics either, yet these are sold for big $$ on ebay and not bandied as unusable.

Re: Holy cow!

*Message #48 Posted by **Paul Dale** on 2 Sept 2011, 6:56 p.m.,*

> Quote:
>
> Thanks Dieter, they really should edit the "bugs" listed which is bandied around so authoritively

There is ***nothing*** in the 35s bugs list article involving any of these computations or anything even close to them.

In fact no complex operations are even mentioned in the bug list.

There is *one* mention of a complex number and this is in bug #19 where the presence of a complex number in a register prevents the linear solver from working. Definitely a bug but not one in the complex function set.

That all said, I'd be surprised if there weren't numeric issues in the complex functions.

Maybe you should read the bugs list article before denigrating it. As for editing it, as I've already pointed out, I'm quite happy and willing to do so. My criteria is that more than one person reproduces a bug not being present anymore.

- Pauli

A closer look at the 35s bug list

*Message #49 Posted by **Dieter** on 4 Sept 2011, 12:34 p.m.,*
in response to message #48 by Paul Dale

A few remarks regarding the 35s bug list.

First, I would not consider the fact that ALL mode often requires scrolling a bug. It's intended this way, simply because ALL does what it says: it displays *all* digits of the mantissa. Due to the limited space (14 displayable digits) this cannot be done including the exponent. Yes, that's certainly not nice (and I really appreciate the 34s ALL nn mode), but it's the way the 35s is supposed to work. This feature should be moved to the section of *"items that cannot be classified as bugs since they are documented or work correctly"*, which is where it belongs.

Then there is the cos/tan issue (bugs 2 and 3) for angles close to 90 degrees.
Let's take a closer look at this.

	correct mantissa	HP35s	error
cos(89,9)	1,74 532 836 590	1,74 532 836 590	0
cos(89,99)	1,74 532 924 313	1,74 532 924 306	-7D 12
cos(89,999)	1,74 532 925 191	1,74 532 925 091	-1D 10
cos(89,9999)	1,74 532 925 199	1,74 532 925	-2D 10
cos(89,99999)	1,74 532 925 199	1,74 532 92	-5D 9
cos(89,999999)	1,74 532 925 199	1,74 532 9	-3D 8
cos(89,9999999)	1,74 532 925 199	1,74 532	-9D 7
cos(89,99999999)	1,74 532 925 199	1,74 532 925 199	0
cos(89,999999999)	1,74 532 925 199	1,74 532 925 199	0
cos(89,9999999999)	1,74 532 925 199	1,74 532 925 199	0

The problem seems to be the loss of digits as the argument moves closer to 90 degrees.

So, instead of full 12 digit precision the result may carry only 11 to 6 valid digits. The remaining digits are simply missing. Yes, precision is lost. But are these results completety "dud", as the bug list calls it? All results are correct within -1 ULP of the displayed result.

By the way, I now remember a discussion on the 34s quantile functions, proposing to return a result with less than the full 16 digits, say: 10 or 8, if a full precision result would take too much time or effort. ;-)

The loss of precision in the cosine routine also affects the tan-results that are obviously evaluated by dividing sine by cosine:

	correct mantissa	HP35s	error
tan(89,9)	5,72 957 213 354	5,72 957 213 355	+1D 12
tan(89,99)	5,72 957 789 313	5,72 957 789 338	+2D 11
tan(89,999)	5,72 957 795 072	5,72 957 795 401	+3D 10
tan(89,9999)	5,72 957 795 130	5,72 957 795 785	+6D 10
tan(89,99999)	5,72 957 795 131	5,72 957 812 200	+2D 8
tan(89,999999)	5,72 957 795 131	5,72 957 877 856	+8D 7
tan(89,9999999)	5,72 957 795 131	5,72 960 832 397	+3D 6
tan(89,99999999)	5,72 957 795 131	5,72 957 795 131	0
tan(89,999999999)	5,72 957 795 131	5,72 957 795 131	0
tan(89,9999999999)	5,72 957 795 131	5,72 957 795 131	0

These tan-results returned by the 35s can easily be obtained by manually dividing the sine values by the cosine as shown above.

Example:

```
tan(89,999)
    = sin(89,999) / cos(89,999)
    = 0,999999999848 / 1,74532925091 E-5
    = 5,72 957 795 400 E+4

tan(89,99999)
    = sin(89,99999) / cos(89,99999)
    = 1,00000000000 / 1,745329 E-7
    = 5,72 957 877 856 E+6

tan(89,9999999)
    = sin(89,9999999) / cos(89,9999999)
    = 1,00000000000 / 1,74532 E-9
    = 5,72 960 832 397 E+8
```

As you see, we get exactly the same results as returned by the 35s. In fact, the 35s may even be slightly better

due to the internal 15-digit arithmetics.

So, the loss of precision in the tangent calculation simply is a result of the digit loss in the cosine routine.

There are other examples of earlier HP calculators showing loss of precision in their trig functions. Take a look at the HP-41 (and most probably the HP-67/97 and 15C as well) in radians mode and see how the results of the good old times compare to today's:

```
                 mantissa as returned by             correct result
                 "good old HP"    HP-35s
-----------------------------------------------------------------------
sin(3,1415)      9,26 535 898 7   9,26 535 896 582    9,26 535 896 607
sin(3,14159)     2,65 359         2,65 358 979        2,65 358 979 324
sin(3,1415926)   5,35 9           5,35 897 9          5,35 897 932 385
sin(3,14159265)  3,59             3,58 979            3,58 979 323 846
sin(3,141592653)  5,9             5,89 793 238 463    5,89 793 238 463
sin(3,141592654) -4,1            -4,10 206 761 537   -4,10 206 761 537
```

Should we also consider the 41/67/97/15C result in the left column to be "dud"? Is this also known as a bug in these calculators, returning "dud" sine results for arguments close to Pi? It's the same as with the 35s: in sin(3,1415) the last two digits are wrong, and as the argument gets closer to Pi, precision drops to merely two valid digits. As opposed to the 35s who returns at least six. ;-)

So, let's be fair.

Dieter

You will find the answer in the first message of that thread: The 33s simply does *not* display all digits when in ALL mode. In the example given, it displays just 4,2631597346E-7 (eleven out of twelve digits), while the 35s displays all of them and adds the missing 3 at the end - which is the reason why the final 7 of the exponent moves out of the display.

There are two ways to implement a display mode like this: first, the calculator can do what the mode says: display all digits. Since the display has 14 places while the device uses a 12-digit mantissa, it is clear that this can require scrolling. On the other hand, the calculator may display less than all 12 digits to make the value fit in the display. Since up to six display digits can be occupied by signs, an E and a three-digit exponent, in the worst case only 8 out of 12 digits can be shown. So that's an ALL command that doesn't show all digits. Maybe it should better be named STD or FLOAT or something like that. ;-)

In both cases it's a tradeoff. Actually I prefer the second approach since the full mantissa can be displayed by using MANT or SHOW, but the 35s method is another valid option.

> Quote:
>
> Still consider it not a bug?

It's the way HP chose the 35s to work. No, I don't like it, but it still is not a bug. ;-)

The bug list just says "dud" and this they are, they are both incorrect and they could easily be better. I wouldn't say these results are "completely dud" however.

Yes. The difference being that this would have been documented as a known defect if it came to pass. Besides, with your able assistance, we fixed these ;-)

That was also my opinion when I first noticed the tan bug on the HP-33S five years ago. However, according to an analysis by Karl Schneider the HP-33S uses the CORDIC algorithm to compute the trigonometric functions, which would imply tangent is computed first.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103989

Gerson.

You are correct

*Message #54 Posted by **snaggs** on 5 Sept 2011, 8:40 a.m.,*
in response to message #49 by Dieter

There are double standards and a witch hunt by some re: the 35s. Outisde of 89.99999 the 35s is more accurate than the 42s for other trig values.

Its just a different algorithm. The "buglist" as published is somewhere between propoganda and hysteria, and only 50% accurate.

Daniel.

You keep saying this. Put your money where your mouth is and tell us which nine items on the bug list

aren't bugs.

I'm happy to accept that the COS and TAN items are manifestations of the same bug. The list is eighteen bugs if we accept this.

I'm willing to accept Dieter's suggestion that the ALL display problem isn't strictly a bug but an annoyance.

Eight more please.

Since when can we class incorrect checksums as *not* a bug? That re-classification of yours would turn the whole computing world upside-down!

> Quote:
>
> 4. What does meaningless mean?

OK, so perhaps "inconsistent" or "incorrect" would have been more appropriate. However, the intended meaning is quite clear from the context - one synonym for "meaningless" is "useless", and that is exactly what an inconsistent program checksum & length is.

For the implication of these 2 bugs, see the italics in the 'remarks' section of my post below on complex arcsin & arccos.

in response to message #56 by snaggs

> Quote:
>
> 3. Not a bug

You are kidding right? Enter a program. Take the checksum. Clear the program. Enter the program anew. Take the checksum. This time the checksum is different. How can that possibly not be a bug??? You have a very "interesting" definition of bug if so.

The program needs to have numbers and/or expressions in it and as far as I'm aware nobody has isolated the cause of the problem.

This is relevant when you want to share a program with someone else. I'll use this program as an example. After all that typing you'd like to know that you've entered it correctly. The checksum should help here only it doesn't. My records list the checksum I got for this program as EB55. You won't get the same.

The sharing of programs and pieces of code is one of the great strengths of this community. Open source well before that term was coined.

> Quote:
>
> 4. What does meaningless mean?

The size returned for programs can be incorrect. Similar conditions to #3 above. Taking that same program, the reported length was 3331 bytes. Enter it and the free memory drops by close to 8kb. One (or both) of these two sizes is incorrect. The program size certainly is wrong.

Again this is useful when sharing programs as a validity check. Also useful if you want to add another routine to your calculator and you'd like to see if it will fit -- not such a big issue for the 35S with its loads of RAM.

> Quote:
>
> 6 dont get it, works either way

Can someone else please confirm this and I'll add a note saying bug fixed in recent versions. It definitely was a bug but might not be anymore.

> Quote:
>
> 7 is just a limit

But still a bug I think. Why can't I enter a new label here? I can delete an earlier step, enter the label and then add the step back in and things are happy. Still, I'm will to concede this one as weird and unusual behaviour rather than a bug.

> Quote:
>
> 9, shows correct value

Only the value scrolls sometimes and you can no longer see the first digit. As Dieter pointed out and as I mentioned earlier, I'm willing to say this isn't strictly a bug and I'd already given you this one.

> Quote:
>
> 15. Just did it and pressed run 20 times, always same answer
>
> -466.9270

#15 one doesn't return a result. I assume you mean #14 :-) Again, can someone confirm this and I'll note it as fixed in recent firmware.

Quote:

Then I just got bored

I'm not surprised, the next one #15 is an infinite loop hang :-)

I manually confirmed all the bugs except the first one when the list was compiled and amended soon after the release of the 35S. They all definitely exist in my 35S. Some might have been addressed in the meantime.

However, I'm not about to go out and buy a recent model 35S just to validate that these bugs do or do not still exist.

Quote:

Well, the 35s cannot do hyperbolic and inverse trig in the complex domain...You could have chosen all ten examples that way to show what a completely unuseable device the 35s is. ;-)

The vast complex domain capability of the HP 35S is only "half-vast". :-)

It is sufficient to discredit HP 35S firmware design if these many examples of inconsistent or incomplete complex domain competency can be cited. They aren't bugs...they simply indicate HP's deliberately indifferent and less than mediocre HP 35S firmware design.

HP 35S firmware design, entirely new 20 years after HP 42S introduction, is grossly inferior in general function and capability. Almost all of the functionality of an *improved* HP 42S could easily have been designed into the HP 35S *for only the cost of developing the firmware!*

The HP 35S is from the start an abandoned one-shot project. **Not one** of the well-documented bugs has been corrected, almost five years since introduction. Most Pioneer (and other) series had firmware imperfections quickly addressed. The HP 42S had firmware versions A, B, and C in its first four years.

Quote:

> ...the 35s handles all other examples easily. Even easier than the 15C since you don't have to remember things like the use of flag 8 or the meaning of a small c in the display. ;-)

That's very true. I **never** cite the HP 15C as a **good** example of a generalized complex domain machine. It is the first HP that had this capability in firmware, but it is **more than a little awkward** to use. The HP 42S corrected this with its alphanumeric display capability and many other improvements.

Complex ArcSin & ArcCos On the HP35S

To make life easier, I decided to implement a few common functions that allow for inputs resulting in complex answers, namely:
Sqrt(x), $x < 0$
Arcsin(x), $|x| > 1$
Arccos(x), $|x| > 1$
Log10(x), $x < 0$
The following formulae were used:
$\text{Arcsin}(x) = -i\ \text{Ln}(ix+\text{Sqrt}(1-x^2))$
$\text{Arccos}(x) = -i\ \text{Ln}(x+\text{Sqrt}(x^2-1))$
$\text{Log}_{10}(x)=\text{Ln}(x)/\text{Ln}(10)$
where
$\text{Ln}(x)=\text{Log}_e(x)$

This calculator has a more intuitive a***i***b complex number representation, and the answers are presented as such. However, during my use with complex numbers on the HP35S, I found that it was a pain to separate the real and imaginary parts and thus also added a routine to easily separate a complex number (usually an answer of a previous calculation) into the real part (X-register) and complex part (Y-register).
Using the labels as per the listing the routines are called as follows: (x can be real or complex)
Sqrt of negative numbers: x XEQ I002
arcsin of numbers $|x| > 1$: x XEQ I007
arccos of numbers $|x| > 1$: x XEQ I025
Log10 of negative numbers: x XEQ I039
Separate the complex number in RE and IM parts: a***i***b XEQ I046

Remarks

Program length and checksum are not provided as they make no sense on this calculator.
(Note to snaggs: here we sharing programmers usually put the length & checksum so that others have some confidencen that they have typed it in correctly - bummer, doesn't work on the 35s)
The two-tiered complex number system of the 32S means that in effect you are left with a two-level stack when doing complex maths. This means some added manipulation and use of storage registers.
In contrast, the 35s implementation of complex numbers means a full four-level stack is available for complex maths. With the added feature of the keytop i, I find complex number entry easier than the 42S. Some functions on the 35s can be made to do complex calculations by adding 0i0 to the arguments (e.g. y^x and Ln(x)).

Please note that:

- I have not extensively tested these functions, just a few random points
- Accuracy of the tested points was 9 digits or better compared to results on a real 42S.

I'm sure there are ways to optimise this. Any suggestions/comments welcome.

Mike,
So now you can do some complex stuff on the 35s :-), and you should still have plenty space of other programmes (the same functions were similarly programmed on the 32S and used 112.5 bytes)

I'm sure it shouldn't take too much more to do arctan and the hyp functions ;-)

-B

I've found the following expression to be more accurate to calculate arc cos in the complex domain:

acosh z = Ln[z + sqrt(z-1) sqrt(z+1)]

Reason being the branch selection for SQRT does make a difference, and that gets lost if you pre-select it by compacting the formula before hand.

Cheers, 'AM.

in response to message #34 by snaggs

If you are seriously interested in writing programs on/for a calculator, I strongly recommend that you skip past the 35s and get a 50G. There is no I/O on the 35S, nor the 15C, nor the 42. In our modern world, why the hell would anyone want to start out new

with something like that?!! Remember, many of us "experts" are old-timers who learned to use (and appreciate) these old non-I/O machines back when there weren't any other low-cost alternatives. (Excepting the Sharp programmables. but that is another story).

I know you like the 35S. It is somewhat cool. But it is also such a damn shame that it wasn't properly finished.

You will do yourself a big favor if you cut and run at this point. Heck, skip the calculators entirely and go right to Wolfram etc....

*Message #68 Posted by **snaggs** on 2 Sept 2011, 6:21 p.m.,*
in response to message #67 by bill platt

Well, we cant take Matlab or Wplfram into exams, we can take any calculator we like.

As for the 35s vs 50g. I bought a 49g+ years ago when it came out. I couldnt even figure out how to do basic things like nPr on it. It has remained in my drawer unused.

I like the fact that so many functions on the 35s are on the keys. I will have a crack at the 48 programming again over the Christmas holidays, direction fields would be nice. But for routine calculating I find he 35s so easy!

Ive already put 250 hours through my 35s.

That's not at all true for the HP 42S. It has I/R printer output, and it has audio beep output. These are great advantages. The audio beep in particular I've found to be very useful to prompt for user input during a long-running program.

I suspect you refer actually to memory I/0. The only time I've ever lost anything on any of my HP 42S units is when I was fooling around with that remarkable built-in memory scanner/debugger. I've had several 400-step programs stored in my daily-use HP 42S that have been there for 14 years.

But...memory I/O would be nice.

With all due respect, your dismissal of the 35S as a "fool's toy" and acceptable only for trivial uses is way off base. While the 35S is certainly far from the best that HP has produced, it is still very usable.

Anyone with qualification in a scientific or engineering discipline should also know that not everyone in science or engineering needs complex number support. I'm a civil engineer with more than 30 years experience and, except for fooling around with them on my 42S, I haven't used complex numbers since college.

Well said, Fred.

Don't want to speak for snaggs, but I think I understand his points. For the most part, as I see it, the posters on this Forum tend to be super critical. Not only of calculator design, but as to technical nomenclature, even to the point of sometimes parsing each others sentence structure. And snaggs and you are right about some of the bugs being meaningless in the real world of everyday engineering calculations. The criticisms from this group have to be taken in context. The 35s is a useful calculator, just disappointing compared to the quality expected from HP. And the biggest disappointment is, no fixes being made.

*Message #73 Posted by **Michael de Estrada** on 2 Sept 2011, 2:35 p.m.,*
in response to message #72 by Martin Pinckney

The problem is that we oldsters have long memories of the great past products that set HP apart from all the other calc manufacturers. I remember engineers cursing the crummy keyboards on their cheap but affordable calcs, while I was in calc heaven with my HP-35 that cost me 2 weeks takehome pay. Today's market is intolerant of such high pricing, and the result is something like the HP-35s. It's not that the HP-35s is so terrible, but that the older stuff was really good. I recently added an HP-32S to my stable, and it's general quality is massively better than the HP-35s. I had no problem paying $100+ for it, but I can't see any college student doing it. BTW, I still have my original HP-35 and it still works great.

in response to message #73 by Michael de Estrada

What you say Michael makes perfect sense. One good thing, is HP seem to have learnt from the backlash, look how tne 15c relaunch has been handled. Give the hardcore users a free calc and find the ellusive bugs.

Maybe there is hope that a 35sII could be successfully executed to its full potential,

As for cursing crummy keyboards, the 35s is still a bastion of quality compared to the casio FX 82 AU plus recommended for my course.

Does this count as double shot keys? Help me!!

Martin....

I agree. I can't understand why anyone would imply that complex number support is the key (only?) criteria for the usefulness of a scientific calculator. Obviously, many scientists and engineers need complex number support. On the other hand, it should be equally obvious that many do not. To make it the key criteria is unrealistic and frankly self-centered.

That being said, I do agree that there is no excuse for not providing something like the HP-42S level of complex number support on a modern high-end scientific calculator. But the HP-35S is NOT high-end but mid-level. For me, root solving and linear regression are far more important than complex numbers, but that's just me.

As great as HP calculators have been over the years, none have been perfect and none have had exactly the mix of features I would have specified. Since the market is not homogeneous, this makes perfect sense. That's why I like progammability: I can add the capabilities that HP "left out."

BTW, my experience with HP calcs started with an HP-35 that my dad (a high school chemistry teacher) bought right after it was announced. I was in 9th grade. I bought it from him when he upgraded to the HP-45. I then bought an HP-55 as a senior in high school, followed by a 34C in college and a 41CV and a 41CX early in my engineering career. My everyday calculator is a 42S I bought in 1989. I also have a 48G+, a 32Sii, a 35S, and several others. I have done a lot of programming on the 41CV/CX and 42S and a little on the 48G+. (What I wouldn't give for a 41/42 hybrid, but that will never happen.)

The 35S sits on the desk in my home office as a convenience calculator. I keep a couple of simple programs and a couple of equations in it. While I know there are bugs, and the keyboard sometimes misses keystrokes, the 35S does a good job fulfilling its role as a mid-level calculator. It will never be a 41CX or a 42S and we shouldn't expect it to be.

I never could get into the 15C, as good as it is. First, after years of handholding to do calculations, I prefer the vertical format. Second, I didn't see it as that big of a jump up from the 34C like the 41 was, and it can't hold a candle to the subsequent 42S.

Having followed the speculation and hoopla for a couple of years, I find myself being tempted to get one of the new ones, but when I really think about it, I can't imagine why I would want one.

Re: Holy cow!

*Message #79 Posted by **Fred Lusk** on 3 Sept 2011, 12:07 a.m.,*
in response to message #78 by Martin Pinckney

The last time I did complex number calcs for real was in the one electrical engineering course I had to take, which was in my 3rd year of college. I had the HP-55 at the time and probably used a few of the complex number programs in the Mathematics Programs book that I bought from HP. I'm certain we hit complex numbers in Calculus a time or two and definitely in that part of Physics that deals with electricity and magnetism, but beyond that I really don't remember.

The only reason I would buy an anniversary edition of either the 12C or 15C would be for the nostalgia. Most of the calcs in my modest collection are ones I use/have used for school and work and I don't collect for profit.

You call the 35S a mid-level calculator, not high end, but HP calls the 35S the ultimate scientific calculator right on the packaging. They are advertising it as a high end scientific.

Re: Holy cow!

*Message #81 Posted by **Fred Lusk** on 3 Sept 2011, 12:25 a.m.,*
in response to message #80 by Paul Gaster

True, but advertising hyperbole doesn't make it so.

By comparison with other HP offerings, both historically and contemporaneously, the only time the HP-35S would have been considered high-end would be if it had been available back in the 1970s. The HP-41C and its system, released in 1979, would have immediately relegated the 35S to mid-level status. Susequent high-end HPs (42S, 28 and 48 series) would have kept it there. In today's world, the presence of the HP-50G keeps the 35S at a mid-level. The 10S looks like the low end.

I have a hunch that one of the main reasons HP has a mid-level calculator is that the 35S and the earlier 33S are approved for use on the NCEES exams for professional licensure for engineers and surveyors...but it's only a hunch.

I used to think that the 41 was as close as possible to that ideal, but now I know it for sure: the 41 CL is such an ideal, as it removes the only possible objection one could have held against the original 41: speed.

Add to that the ROM library built in, and you have perfection in your hands.

Just my opinion, of course :-)

Even better than a 42s?

*Message #84 Posted by **snaggs** on 6 Sept 2011, 7:01 p.m.,*

in response to message #82 by Ángel Martin

Does the 41CL have multi-character labels? Alpha entry looks easy with the letters printed on the keys.

What does it have to replace the EQN button? Im usig that to store a bunch of simple equations like the binomial dsitribution and some preditor prey models.

Id miss the 2 line LCD though.

Daniel.

If that's on your CL it's probably be due to the TURBO settings. Try it with the original speed.- The unit change is supposed to kick in only if you hold the ON key longer than what's needed for the turning-off action. It works for me.

Good lateral thinking Mark, but I did no changes at all to the ON-key interrupt, nor to the invoked code (believe me, I know better than that :-)

While it's "possible" that something happened during the changes, the ON functionallity works very well on my CL, even at higher turbo speeds BTW.

in response to message #84 by snaggs

If the HP-42S had I/O like the 41C had, it would be THE next to perfect calculator, running circles around the 41C-whatsoever. But unfortunately HP had the 48SX in the make at that time already, and they feared internal competition most probably - who would buy a sledgehammer featuring a RePeLlent programming language as long as (s)he can get a pocket sized user friendly multitool? So in this case the good was the enemy of the better, reverting a popular saying for the worse :-/

FWIW,

Walter

P.S. Exactly this I tried to post this morning, but received "Your message has been sent to the moderators for review. Acceptable messages will be posted as soon as a moderator is available. *Message #98 Posted by **Howard Owen** on 8 Sept 2011, 4:47 p.m.,*
in response to message #96 by Jake Schwartz

I know the 41C alpha keyboard like the back of my hand, but I don't mind the 42S "pick board" alpha scheme. The greatly expanded character set demanded menus. You could have filled the keyboard with fixed alpha assignments without accounting for all the characters the 42S is capable of manipulating. Yes it's annoying, but XTOA for all of those characters would *really* have been a pain.

Nowadays I use Free42, and enjoy the freedom of keyboard alpha entry. I only have to deal with the 42S alpha scheme if and when I transfer programs to my real machine.

That would be the ultimate: a calculator featuring a slide-out QWERT keyboard. Would reduce clutter ;-) For sure that will be banned from NCEES etc. but who cares ...

Re: Even better than a 42s?

*Message #100 Posted by **Marcus von Cube, Germany** on 9 Sept 2011, 2:46 a.m.,*
in response to message #99 by Walter B

The querty keyboard makes the TI 92(+) and Voyage 200 more appealing to me then the functionally identical TI-89. To make a calculator with such a keyboard pocketable, a folding or sliding mechanism would be needed. I have a Ben NanoNote on my shelf which would come close if it only had a more calculator friendly keyboard. It has enough power for a calculator application

but the key labels (and key feeling) are totally inappropriate.

Well...you could fill the keyboard with the HP41 alpha characters, and also the top row "alternately" gets the soft-key menu with the remaining "special" characters. That way, regular letters take one keystroke each, and only the others would require two each. Check out http://h20331.www2.hp.com/hpsub/downloads/Newsletters_HP_Calculator_eNL_02_April_2011_v2.pdf and click on the "Tweaking the HP42S" article link. Also, you could go to http://www.pahhc.org/keyboards.htm#The_HP42S_versus_a_proposed_HP42S+:_ and scroll to the bottom and click on the link marked "The HP42S+ ALPHA Keyboard"....Just one person's ideas.

I'd forgotten how thoroughly you studied this, Jake. At the risk of being treading a deeply furrowed path here, I'd like to give my 2^{-2} dollars worth of feedback. First, I like the layout very much. I love it that more programming functions are accessible without menus. I also like how you implemented the alpha characters. The old pick boards are still there but more accessible. And like you say, the most common characters are directly accessible. (Where have I seen that particular arrangement of alpha keys before? :) I also have to say that, although you have tried to minimize clutter, (successfully I think,) the density of available functions on that keyboard just warm the cockles of my gadget-geek heart. :) The excellent color contrast is a big help here.

But the display needs work :). I want higher resolution for selfish reasons. My Yatz42 game has to omit soft menu labels because the minimum vertical size I could squeeze a die image into was 9 pixels high. Using binary coding per the 42S manual, a column containing three vertical dots and the borders has to be 101010101. That means I have to take one row of the bottom line for the die border. I'm going to place my own caret marks below each die to indicate they can be toggled with the soft keys.

If there was a guarantee that they'd sell a bazillion of 'em, I bet they'd consider doing it. Instead of a campaign like "Bring Back the HP15C" (which apparently worked after over 5 years of trying), perhaps we need something like "Bring FORTH the 42S!"

:-)

There is no 15C source either--that didn't stop'em. If EMU42 can run from the 42S ROM, then new HW can too.

These old calcs were programmed in assembly language or machine code. We've got the source--you just need to disassemble them.

But attempting a simple mechanical translation back to the originally intended character is a context sensitive mapping, eg: "runnin9": '9 -> {'9', 'g'}, "5EL": '5' -> {'5', 'S'}, etc.. Certainly feasible but it adds another layer of clunk to the UI.

So I find myself warming up to your plea for at least a circa 1985 native graphic matrix display support in a year 2011 calculator. I still applaud the Voyager firmware design to take living within 7-segments as far as it did. But nostalgia aside, bottom line cost just isn't a reasonable argument to avoid a matrix display as it was in 1980. And the legacy technical limitations have largely become non-issues.

How about something akin to the 14-segment display of the HP-41? Would the current 12C+/15C LE processor be able to drive that? And is such a beast even available anymore?

Admittedly a fully addressable dot matrix display would be better but if the current processor is capable of driving a 14-segment LCD might that be the optimal solution as no other hardware changes would be needed (or would there need to be other changes?

I still say: Give me a 17bii+ with 42S firmware and I/O! Old tech, I know, but I *LOVE* my HP-42S! Maybe one day HP will update the 17bii+ with a new processor and make it flashable and then our local heroes can come up with the ultimate HP-41 replacement.

Cheers,

-Marwan

I believe I've still seen that display topology kicking around but it is extremely rare. Even straight reflective (vs. transreflective, eg: backlight-able) graphic/character displays are rare these days -- you can find them but the footprint and resolution selection are quite limited.

> Quote:
>

If the firmware supports only rendering to a numeric display you end up (best case) with a better looking numeric display but confined to the original UI.

The argument which exists for a graphic display in a voyager application running under emulation is that code external to the legacy firmware can take advantage of the improved display format.

Yes, the CPU would be capable of driving such a display. The internal LCD driver can handle up to 400 segments.

Out of reach is a full dot matrix display, at least without external hardware which makes using an integrated CPU with LCD controller somewhat pointless.

display of letters & Holy Cow Memory

*Message #132 Posted by **db (martinez, ca.)** on 2 Sept 2011, 11:34 p.m.,*
in response to message #125 by uhmgawa

UG; I'm guessing that the new 15 is flashable. So maybe someday there will or can be a "WP 15s" that adds those characters as alpha, with arcl and prompt. As someone once told me: "I'm a surveyor. I can't spell for shit but i can abbreviate the hell out of anything"

n, E, EL, Pt, no, Hd, U(V)d, AnGL, In, OUt, GrAdE..... it's all there.

Snags; It's like someone else said. The 15 only had a half a K of memory. A surveyor for example could put two programs into a 15, which would do a couple of things each, depending on how the solve function was implemented. You could have a traverse/inverse/sideshot program and a really nice vertical curve routine that would do asymmetrical VCs if that's how you entered it. That's it for room, and it's easily remember-able if you use it regularly. Still though; I'd like that abbreviated prompt and alpha recall feature.

Honestly I think that is unlikely. IMHO the 15c takes the industry award for the most successful attempt to pack as much functionality into a 7-segment UI as the world will ever see. It may be possible to best that effort as you describe above but I expect doing so would be well beyond the point of diminishing returns.

Moreover functional extension would require a firmware re-write. The attraction of the 15c at this point in time is the corresponding firmware can be leveraged via running it unaltered (+/-) under emulation on low power off-the-shelf SoCs. It is essentially an opportune coincidence of technologies which hasn't before economically existed.

That said, about the only scenario I could envision for a legacy firmware re-write would be something akin to a "labor of love" open source collaborative effort. Even for the 15C which as evidenced here has about the most passionate following you will ever find for a pocket calculator, I don't think a rewrite will ever materialize. And given the presumed successful productization of the 15c+ I'd imagine HP has concluded its low-hanging-fruit leverage of that technology.

Not sure I understand here. If I were to do a scientific repurposing of the Voyager hardware, starting with the 15LE makes more sense than starting with the 12C. The keyboard labels can be reused for a start. The 15C's layout is very good and covers most things.

There are plenty of enhancements possible:

- More program steps.
- More registers.
- Fill out the complex functions (e.g. gamma, Py,x and Cy,x).
- Extra matrix operations.
- More conditional tests.
- Integer bases.

There is plenty of flash left for sure and I suspect quite a bit of RAM too. The limit will always be the display and a deal of creativity would be necessary to make everything fit the seven segment format. That or tell everyone you have to carry a thick quick reference guide around.

I wonder how long it will be before the 15LE gets the memory expansion. If we're lucky, it might even be as simple as patching the ROM image -- 11 x 11 determinants :-)

Re: display of letters & Holy Cow Memory

*Message #137 Posted by **db (martinez, ca.)** on 4 Sept 2011, 12:06 a.m.,*
in response to message #136 by Paul Dale

Paul; I should type fuller sentences or none. I meant that i agree with you that it would not be a good return on your time to do a "WPXX" Voyager because of the screen limitations. But if someone ever does that (and if the 12c ARM architecture is the same as the 15, or at least big enough) it would pay off to use the 12 because there will probably be a bunch of them and they'll be cheaper. After all; it's not a **limited edition**. Eric makes fine overlays so the original keys' functions isn't important.

Me personally, i hope you three keep using your time on the 34s. There must be **something** it doesn't do yet.

I'd agree, if the plan was to live within the functionality defined by the 15c and there is certainly an argument to be made for doing so. Particularly as it likely would gently shepherd something approximating a 15c firmware rewrite which is goodness by any measure.

But the existing 12c+ econo keycaps are more agreeable to engraving should we have other ideas. There is also something less sacrilegious about bandsawing a 12c+ for experimentation. Maybe that stigma will minimize once 15c+ are more prevalent.

One pie-in-the-sky thought for the surplus flash within a KINOMI module was to some extent help a 16c and 15c interoperate. But the more I thought about it the more it seemed like a unjustifiable dead-end effort without any reusable code as a by product of the development. I suppose I've found myself increasingly questioning to what extent the real-world practical benefits of running decades old black-box firmware in emulation overshadow the limitations of customization and maintenance.

> Quote:
>
> The limit will always be the display and a deal of creativity would be necessary to make everything fit the seven segment format. That or tell everyone you have to carry a thick quick reference guide around.

I think a replacement for the segment display needs to happen unless we're content to keep emulating enhanced voyager firmware. Semi-standard 32x144 and 32x160 graphic formats exist and would fit the segment display aperture quite well. The problem is the controller and/or interconnect such that we're dealing with a COG extension or interconnect flange which will cause the resulting footprint to outgrow the available area. But this seems such a promising and enabling upgrade that considerable effort is well justified to ferret out a solution.

> Quote:
>
> I wonder how long it will be before the 15LE gets the memory expansion. If we're lucky, it might even be as simple as patching the ROM image -- 11 x 11 determinants :-)

I admittedly haven poked at the 12C+ pcb in sufficient detail to determine if/where the SPI lines are brought out, but that's about the only expansion route of reasonable throughput. Doubly so as the SPI controller IIRC has DMA support. nvSRAM looks like single solution which would address several needs. But even if the stock PCB doesn't furnish access to the needed sam7l lines a replacement board wouldn't be too difficult to justify.

Copying the stack between the two would be enough for interoperation. Even better if that bit of memory in both emulators was the same locations. Still, I think you are correct about the reward vs effort involved.

> Quote:
>
> I admittedly haven poked at the 12C+ pcb in sufficient detail to determine if/where the SPI lines are brought out...

That wasn't the point of what I wrote. The existing ARM cpu has sufficient RAM for the memory expansion I linked to. It doubles the number of bank registers in the 15c -- 64*7 = 448 bytes. The CPU has 2kb of non-volatile RAM and a lot of this is likely empty.

Copy the stack? While the 15C and 16C stack are the same depth (four levels plus LastX), they aren't even always the same width: 56 bits on 15C, 1 to 64 bits on 16C. What does a 15C Matrix A turn into on a 16C? What does the number 123456788abcdef0h turn into on a 15C?

Re: display of letters & Holy Cow Memory

*Message #142 Posted by **Paul Dale** on 5 Sept 2011, 2:10 a.m.,*
in response to message #141 by Eric Smith

The only thing that makes sense copying is reals. At least copying without some manner of conversion.

Does the 16c really maintain the five stack registers separately resizing them as required? I've seen the synthetic information for the 15c but I don't remember seeing similar for the 16c.

The stack in the 16C is stored as 64 bits per level. 56 out of 64 are stored in one register, and the extra 8 bits from all four levels and LastX are combined and stored in another register. However, when using WSIZE < 64, not all bits are used.

There isn't much published information on synthetics on the 16C because (unlike the original 15C) there is no known technique for gaining access to memory the user wasn't intended to access.

*Message #144 Posted by **Jose Gonzalez Divasson** on 5 Sept 2011, 3:24 p.m.,*
in response to message #136 by Paul Dale

A good idea would be to have switchable register sets. In one you can have several programs. In another set, other group of programs; and another, mostly free for heavy matrix work.

But the most logical first mod would be to move the upper register limit to 128.

in response to message #1 by snaggs

A built-in constants library, I guess? But I'd probably use the HP50g for things like that (constants AND units)

Schooling has probably permanently frozen (at least approximations for) a lot of the ones I'd be likely to use into my brain, anyway (c~3x10^8 m/s, h-bar-c ~197 ev-nm, kT ~ 1/40eV, etc., etc.)

Re: Is there anything the 15c can't do compared to the 35s?

in response to message #1 by snaggs

For me the thing the 15c can't do that I like on the 35s is the equation solver. I have many such equations that I need to solve one way or the other on a regular basis and the 35s makes that a breeze. They are only very simple linear equations but having them preloaded in the calculator and tested speeds up things quite a bit for me. However, in truthfulness, I have now moved on to mostly using the multiple equation solver in the 50g because of the capability of multiple equations and the use of units.

Re: Is there anything the 15c can't do compared to the 35s?

*Message #147 Posted by **snaggs** on 1 Sept 2011, 11:30 p.m.,*
in response to message #146 by Norman Dziedzic

Same here, Ive been loading lots of eqn's in for pop models, prey etc whilst doing questions and are able to reuse them in other questions and tests.

Its great for discrete equations, and doesnt use up any labels! It would be cumbersome to write programs to solve all these! Im not sure what the downside is?

Daniel.

Quote:

> It would be cumbersome to write programs to solve all these! I'm not sure what the downside is?

There's no downside when comparing equation writing on the 35s to programming on the 15c.

However, one of the reasons the 35s got slammed was, compared to equation writing on the 27s and 17b series, the 35s stinks. HP just evolved the 32s series Solver a little bit, instead of incorporating the Solver from the aforementioned models, which is greatly superior.

Re: Is there anything the 15c can't do compared to the 35s?

*Message #150 Posted by **M. Joury** on 2 Sept 2011, 6:28 p.m.,*
in response to message #149 by Martin Pinckney

Yes! That solver (the one from the 17b/19b/27S) should be made available on every calc in HP's lineup. There are many cases where it is an easier and more intuitive solution than programming. I like using the solver for conversions where you can solve either way from a single equation rather than have to write 2 routines in RPN.

Lots of other uses too and lots of power when you really dig into it. Having both the solver and RPN programming in the same machine would be great. The 35S had a chance to get that right and didn't. Of course you have that capability with the 48 series calcs (solver but with RPL) but now we are talking larger graphing calculators.

Cheers,

-Marwan

*Message #151 Posted by **bill platt** on 3 Sept 2011, 9:04 a.m.,*
in response to message #150 by M. Joury

I gave up using the RPN models for daily use (though there is usually a 15c in the drawer if I can't find anything).

"Daily use" is now the 17b series and the 27s, along with the trusty 48gx.

Bill, we are a lot alike. I, too use the last three you mentioned (except 48sx instead of gx) most of time. But instead of a 15c, I keep a 32sii around, mostly for the fraction math.

Re: Is there anything the 15c can't do compared to the 35s?

*Message #153 Posted by **Walter B** on 2 Sept 2011, 2:16 a.m.,*
in response to message #1 by snaggs

The two line dot matrix LCD of the 35s allows for some important features the 15C will never have:

- listing function names in programs
- catalog of constants
- readable complex numbers

But that's it IMHO. OTOH, the 35s has the bugs listed while the old 15C does not have any known bugs at all. That's it as well :-/

So it depends on your personal preferences to some extent.

> while the old 15C does not have any known bugs at all. That's it as well :-/

Actually, there is one known bug in the 15c firmware. That's pretty good after 30+ years of searching -- it was only identified in the past year or three. I forget the details but it is rather esoteric and even if you encountered it you most likely wouldn't notice anyway. It certainly isn't a numeric issue or a hard lock crash.

There is a second almost bug. The ability to create weird matrix descriptors using the ON-D shift the X register combination, this allows access to system memory and program space via the registers. Technically not a bug since, according to the documentation, this key combination should always be followed by CLx.

To me, the effort and attention to detail put into making the 15c the best possible calculator is summed up by the comment on page 179 of the *Advanced Functions Handbook*:

> Quote:
>
> A function that grows to infinity or decays to 0 exponentially fast as its argument approaches +/- infinity may suffer an error larger than one unit in its 10th significant digit, but only if its magnitude is smaller than 10^{-20} or larger than 10^{20}; and though the relative error gets worse as the result gets more extreme (small or large), the error stays below three units in the last (10th) significant digit. The reason for this error is explained later. Functions so affected are e^x, y^x, x! (for noninteger x), SINH, and COSH for real arguments. The worst case known is 3^{201}, which is calculated as 7.968419664 x 10^{95}. The last digit 4 should be 6 instead, as is the case for $7.29^{33.5}$, calculated as 7.968419666 x 10^{28}.

Not only concerned about getting the answer correct, but identifying the (most likely) worst case where it is out by 2 ULP!

If you haven't already get a copy of this volume (it is on the MoHPC DVD) and read pages 172 onwards. You will be enlightened.

- Pauli

I wouldn't even consider that an "almost bug". As you point out, the manual says that ON-D should be followed by CLx. If you fail to follow the instructions, you get undefined results, and it's your own fault, not HP's.

However, whether you call it a bug or not, I am 99.9999% certain that it will be "fixed" in the 15c Limited Edition.

> Quote:
>
> Is there anything the 15c can't do compared to the 35s?

1. Fit in your pocket, with case.
2. Not miss keystrokes. (Dunno about the LE). IIRC, I had a few issues with the bottom row of my 35s. I put it in storage after that. BTW, having same problem with '+' on my 30b (or more accurately my 29.5b).
3. More complete complex number support. Once in complex mode I do not have to do anything special to do complex operations. I do however need to do something special to view the results.
4. STO a number with one less keystroke.
5. Decade magnitude battery life. I just took out my 35s from storage to test a few things and I couldn't. Dead batteries. I must admit however, it's very good looking.

> Quote:
>
> Would the 15c replace it for daily usage?

For me, yes. I guess it really depends on what you do daily. The 15C was my only daily calculator in the '80s. I had to learn to do everything on it. To this day, its operations are etched in my brain. With the 35s I have to relearn a few things about programming and how to work around the complexities of its complex number support.

HP 12c Video and HP 15c questions

*Message #1 Posted by **Brandon Poindexter** on 1 Sept 2011, 6:13 p.m.*

HP 12c 30th AE Video

An interesting video I found if anybody hasn't seen it. I'm mostly interested in the HP 15c but in any case:

Some question pop up from this. 1) She talks briefly about how you can etch one's name onto the back. Has this always been the case? if not will the HP allow one to order an HP 15c with their names etched on?

2)She also says that the price "starts" at $79.99. But the HP shop website lists as $84.99 for the HP 12c. I don't want to sound like a cheapstake but if the HP 15c can be had for $5 less as well that would be great. Buying books and paying the billing statement for my sophomore year has took a huge toll on my banking account. . .

Anyway I'm probably going to get the HP 15c regardless if i cant do those two above. Can't wait! Thanks HP!

Edited: 1 Sept 2011, 6:15 p.m.

Re: HP 12c Video and HP 15c questions

*Message #2 Posted by **Laura (San Diego)** on 1 Sept 2011, 6:32 p.m.,*
in response to message #1 by Brandon Poindexter

Hello, These calcs have not always had a place where you can etch your name in the back, but I don't think that feature is unique to the anniversary version.

Pricing on the HP Store is problematic and should be revised soon. The MSRP for the 12c 30th Annviersary is $79.99, and it's $99.99 for the 15c.

Re: HP 12c Video and HP 15c questions

*Message #3 Posted by **M. Joury** on 1 Sept 2011, 8:20 p.m.,*
in response to message #2 by Laura (San Diego)

They are both currently posted at $99.99. It is $84.99 with the %15 discount that is currently being offered for all calcs. So the 15C is posted correctly and the 12C will drop considerably in price if it becomes available before the sale expires.

Cheers,

-Marwan

You can certainly order any of our calculators with a request for you name to be etched on the back, but alas, we don't have the capability to fulfill that part of the order. You'll need to source that service locally.

Besides, you can't etch on vapor anyway, can you?

Hi,

In that video, she says that RPN became the "standard" in financial calculators as a result of the 12C, but I wonder if the 1973 release of (probably) the world's first financial handheld calc, the HP80 (also an RPN machine) didn't have a good deal to do with it as well. The HP80 got an 8-page cover story in the May, 1973 Hewlett-Packard Journal. And, of course, there were an assortment of other HP financial machines between the HP80 and the 12C, namely the HP70, HP22, HP37E, HP92 and the HP38E/C, all sporting RPN and all which probably helped popularize the financial RPN paradigm.

Jake

*Message #6 Posted by **Katie Wasserman** on 1 Sept 2011, 9:42 p.m.,*
in response to message #5 by Jake Schwartz

I don't know about the HP-80 having much effect on the use of RPN in finance it wasn't very affordable even by wall street types back in the day. While I only started working on "the street" in early 1981, the only HP calculator I recall seeing at a few places before the 12C was the the HP-41.

In this video Greta says that "a few components are different" between the 12C and the 12C+, someone needs to get her up to speed on this. The 150x speed up should be a big selling point and she doens't even mention that.

There aren't more *than* a few components in either version, but that presentation did seem rather informal.

> Quote:

> The 150x speed up should be a big selling point and she doens't even mention that.

That number seems to be actively groomed by the marketing department and AFAICT keeps getting bigger. Anyone know what benchmark is being used to derive that figure of merit?

Re: HP 12c Video and HP 15c questions

*Message #8 Posted by **Katie Wasserman** on 2 Sept 2011, 3:20 a.m.,*
in response to message #7 by uhmgawa

I don't have a 15C+ to run tests on but I do have an original 12C and a 12C+ and have run many tests. Assuming the latest version of the firmware (it has some emulator enhancements) I have found that all programs and long amortizations run roughly 150 times faster on the 12C+.

I'm pretty sure that the 12C+ and the 15C+ are running exactly the same emulator so the 15C+ should run 150x faster than the 15C.

I caught that too. And from the related comment made yesterday by Tim Wessman, it could be interpreted as the injected key legends have returned. If so that could leave only the lower contrast LCD of the arm7 voyagers as the last design tradeoff in favor of the legacy models.

12c and 15c LE key structure?

*Message #13 Posted by **Gene Wright** on 2 Sept 2011, 7:45 a.m.,*
in response to message #12 by uhmgawa

Tim can correct me here, but the keys are NOT double-injection moulded.

I believe it is something more like there is a depression on the top of the key in the shape of the key legend (?) and the spray color function goes into this depression. This means as the key wears down, the function label wears down a bit with it.

This explanation was given to me by someone at HP, and I was skeptical. :-)

Tim?

> >
> > This explanation was given to me by someone at HP, and I was skeptical. :-)

Interesting. Actually that's essentially what I'd been proposing as a means to repurpose key caps of existing devices. Engraving the surface via CNC and filling with a non-shrinking medium such as epoxy paint would approximate the service life of conventional double shot molded keys without the astronomical tooling costs. CNC isn't strictly needed and even a pantograph with suitable fixturing can easily get one through the basement prototype.

Ironically for repurposing (vs. original manufacturing) surface painted key caps are preferable as the thin legend can be polished off yielding a flat surface for the engraving operation. Double shot or previously engraved blanks aren't really suitable as-is since the former legend by design can't be obscured by superficial abrasion and substantial material must be removed from the blank to allow a "retread" operation. But that becomes complex in terms of maintaining the original profile and color matching. Probably easier to just manufacture suitable key blanks in the first place. Or possibly one could approach whatever subcontractor in China is injection molding the current key blanks to buy unprinted prototype stock.

15c LE quantities?

*Message #1 Posted by **Rav Walia** on 1 Sept 2011, 4:54 p.m.*

Hello All,

A while back one of the distributors that had information about new calculators said that it would be a limited run of 10k pieces.

Can anyone confirm that the 15c LE will be limited to 10k units?

Just wondering if I'll actually be able to get one if they are going to be this rare.

> Just wondering if I'll actually be able to get one if they are going to be this rare.

I suppose I'm a little skeptical of that number as the best case gross sales would be US$1M given such a quantity limit. But I'll take a stab here.. I'd be surprised if the BOM cost for the unit itself exceeds US$30 and I'd expect considerably less given the 12C+ production volumes can be leveraged. Add to that manufacturing, packaging and distribution costs, let's lowball HP's cost of putting it in a reseller's hands at US$40/unit. Assuming the suggested street price of $100 and a typical retail markup of 40%, the retailer's cost would be $71.43 and HPs profit $31.43 x 10k units weighing in at under US$320K. I can't believe this is enough to begin covering the up front engineering costs even if we push that number around considerably. And in the ideal case shopping.hp.com is doing all of the "retailing" that profit gets bean-counted elsewhere.

So I'd expect an advertised 10K unit limited run might if anything be that of a given cosmetic version of the 15c+, after which further volumes would be needed to derive realistic revenue from the effort.

Just my two cents.

Correct 15C information

*Message #1 Posted by **Tim Wessman** on 1 Sept 2011, 3:32 p.m.*

Exact same as 12c+ internally.

Comes in a "gift box" that shows the calculator through the front. User's Handbook was recreated from scratch. Printed and in box. Searchable copy on CD. Manual took forever to get it nearly perfect.

Windows emulator on CD.

AFH was not ready in time to put on CD - will be available for download.

There are units slated for Europe.

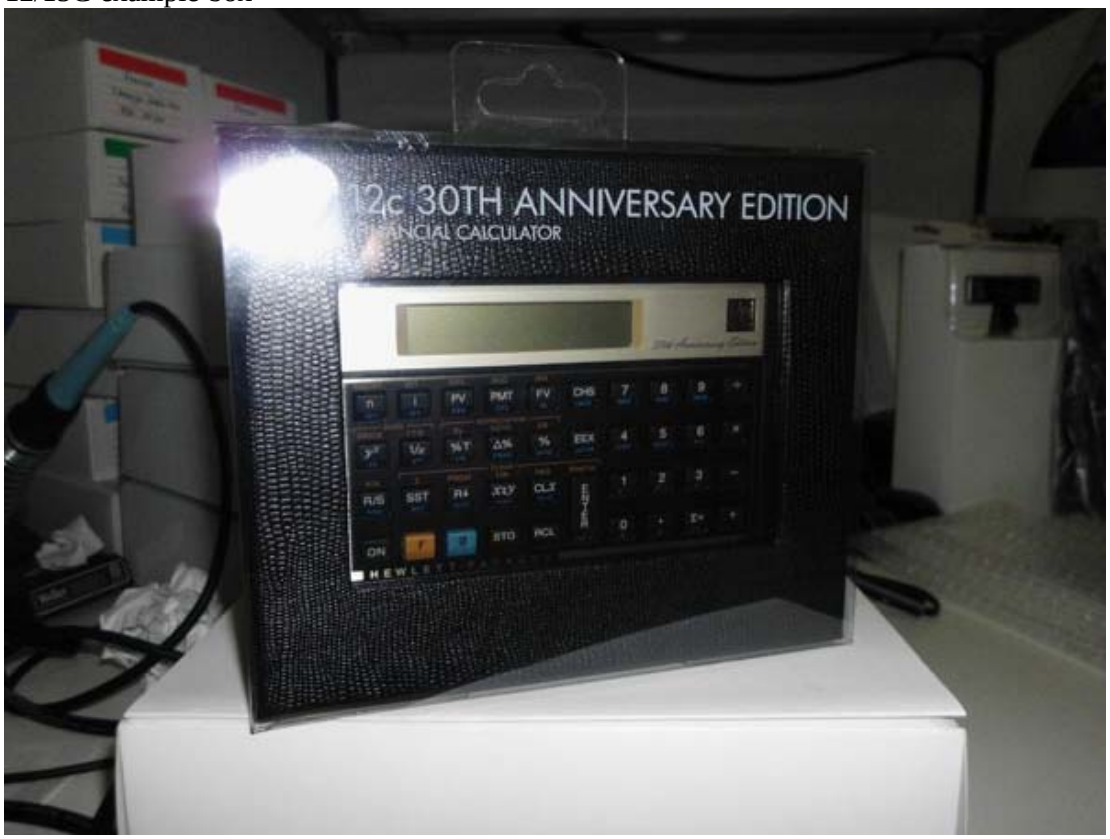
Is still being produced (mainly due to delay getting the manual "perfect" causing delay).

There is the normal "sticker" serial on the back, and an individual enumeration number at the bottom.

HHC last year everyone received one of these (at least a non-final version that had printed key colors ala 12cp). Thanks be to them for doing final bug checking to find any remaining issues. A large public thank you to everyone who respected the CDAs and did not discuss it prematurely. . .unlike our distributors and internal web pages. :-(

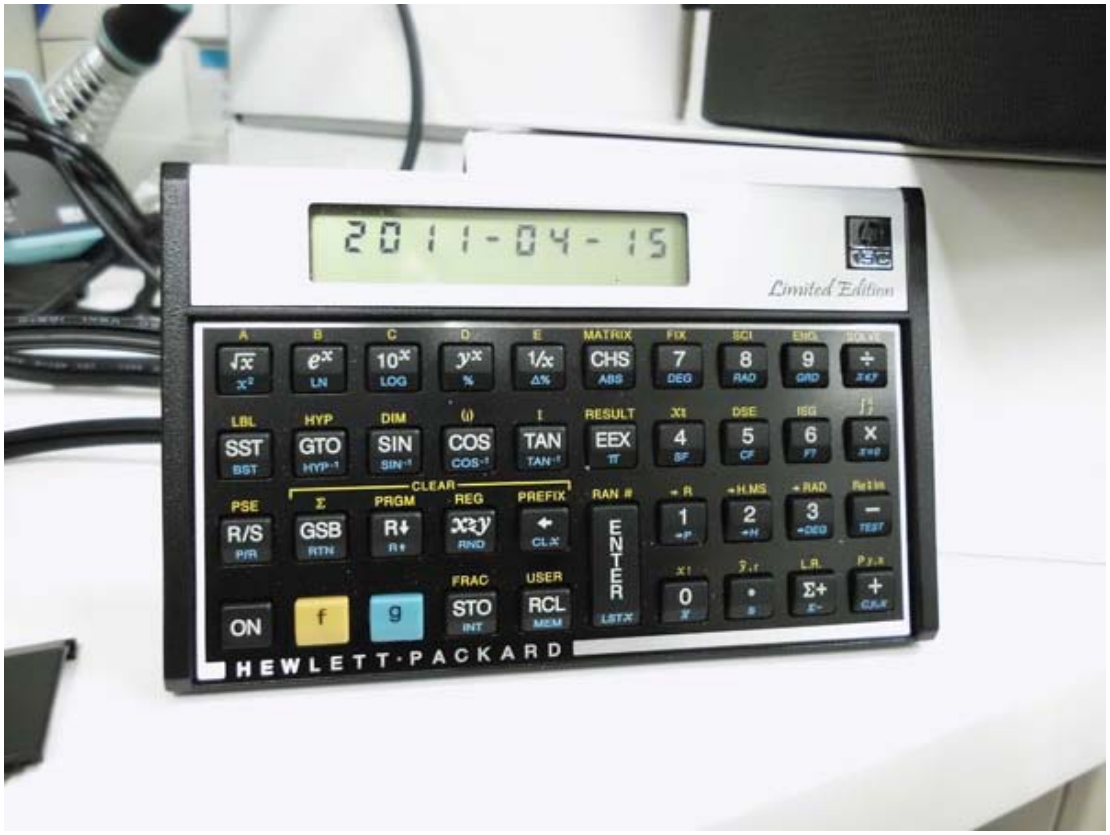
TW

12/15C example box



Example of enumeration. Is that...??? Yes, it is! :-)

Unit



Back of unit (not final, missing enumeration number at bottom right).

Walter, just set up a gathering near you, get at least 50 people to commit to attending and voila' :-)

Actually, the British club has mini-gatherings all the time, so ping someone in HPCC to get one going.

*Message #18 Posted by **Bill Carter** on 1 Sept 2011, 5:36 p.m.,*
in response to message #1 by Tim Wessman

Wow, just... wow. After years of lurking, I just have to say thank you to Tim and everybody at HP's calculator group. I've been Voyager-less for years (too stubborn to pony up on TAS), and I don't do nearly the calculations that I did when I was younger. Still, I look forward to getting my hands on one of these and using it as my "daily driver". It may be old tech, but the Voyagers just feel right. Thank you!

Excellent. Not to at all diminish the balance of the engineering effort but I'd imagine recreating both documents was no trivial task.

> Quote:
>

I'm a bit curious of that statement above. Are the key cap legends of the 15c+ double shot molded or surface printed?

I personally find myself drowning in Voyagers. But seeing the candy on the table may make it difficult to pass up the honor of adding this specimen to the collection. Nice job!

Is there a PDF brochure?

in response to message #23 by Glenn Dowdy

Hi Tim,

i am keen to know what part of "production" does US HP Calculator Division (or Personal Systems Group) do? the 15C is made in China, does that relegate US HP to packaging it nicely for customers?

sorry I meant this question in a nice way, I have been an HP calculator user since 1978 :-)

hpnut in Malaysia

oh, btw the 12C was once made in Penang, Malaysia. i believe that unit is now an Agilent T&M facility. You really should come work here if Carly's successors decide to close the calculator division :-(

Everybody keeps thanking me, but I didn't really do anything on this other then be around when it came out. :-)

It existed in one form or another for a couple of years now. Sam Kim, former R&D manager, was the one who pushed to get the first batch made when the first set of 12c+ units was made. Cyrille did the excellent work on the emulator and original 12c+ code.

A large public thank you to everyone who respected the CDAs and did not discuss it prematurely. . .unlike our distributors and internal web pages. :-(

It is commendable that HP was bold enough to distribute early 15C LE's in this manner! And also commendable that those with units for a year now (!!!!) respected their CDA's. (although I did suspect that certain people had them in their possession). Nice job all around!.

Question for Tim or Anyone else at HP: Will any online or brick-and-mortar stores be selling them in Canada? Staples Canada has the new 12C in store, can we expect the same for the 15C LE?

Many thanks.

Re: Correct 15C information

*Message #34 Posted by **Steve Cote** on 5 Sept 2011, 12:10 a.m.,*
in response to message #1 by Tim Wessman

It's great to read here that a printed manual is included with the 15c. However, at the HP website, it says the HP-15c is packaged in a keepsake gift box & for 'What's in the Box' it mentions a Manual on CD is included but says nothing about a printed manual.

Re: Correct 15C information

*Message #35 Posted by **Lincoln R.** on 6 Sept 2011, 3:37 p.m.,*
in response to message #34 by Steve Cote

Tim Wessman's initial post of 15C info said that there would be a print manual. I'm inclined to believe him over whatever's floating around hp.com these days since assorted misinformation has already been found there (15C listed in printer division, listed as having algebraic mode, etc.)

*Message #3 Posted by **Tim Wessman** on 1 Sept 2011, 3:34 p.m.,*
in response to message #2 by Gerson W. Barbosa

Just love those photographers. Typing in the value of "pi" is why that image came out with a 3 on the end. Took a while to fix that. . .

Nobody could come up with something more meaningful, so they just had pi on both.

e would have been a better choice for a financial calculator. It comes up in certain calculations (continuous compounding, for example) and is available on the keyboard of the 12c.

*Message #3 Posted by **Lincoln R.** on 1 Sept 2011, 10:47 a.m.,*
in response to message #2 by Ethan Conner

Hm. Expected price $99.99. I wonder when samson will be dropping their preorder price ;-)

Re: HP Press Release about the 30th Anniversary 12c and 15c LE

*Message #4 Posted by **M. Joury** on 1 Sept 2011, 11:06 a.m.,*
in response to message #3 by Lincoln R.

Note the price discrepancy on the 12C. It is listed for $99.99 but the announcement says:

> Quote:
>
> Pricing and availability(2)
>
> The HP 12c Financial Calculator is available now at HP Home & Home Office for $79.99. The HP 15c Scientific Calculator is expected to be available at HP Home & Home Office this month for $99.99.

Cheers,

-Marwan

But what about Europe...

*Message #5 Posted by **Lode** on 1 Sept 2011, 11:17 a.m.,*
in response to message #4 by M. Joury

They don't say anything about Europe! Near the price it says:

"(2) Estimated U.S. street prices. Actual prices may vary."

Will this be available in Europe for a reasonable price?

Re: But what about Europe...

*Message #6 Posted by **gene wright** on 1 Sept 2011, 11:27 a.m.,*
in response to message #5 by Lode

No idea, but I'm sure some here in the US would be able to "help out" if needed.

Re: But what about Europe...

*Message #7 Posted by **Thomas Radtke** on 1 Sept 2011, 12:01 p.m.,*
in response to message #5 by Lode

> Quote:
>
> Will this be available in Europe for a reasonable price?

No.

Calculate (US price plus shipping) * 1.2 (E-USt.), no customs. That's common practice, but you can file an objection to get the E-USt. back for the shipping costs within Europe. It will be granted. BTW, no tax exempt from SC.

That will be for sure cheaper than buying from a european reseller.

Re: But what about Europe...

*Message #8 Posted by **Gerson W. Barbosa** on 1 Sept 2011, 1:20 p.m.,*
in response to message #7 by Thomas Radtke

> Quote:
>
> Calculate (US price plus shipping) * 1.2 (E-USt.), no customs.

You are lucky! Down here:

(US price plus shipping) * [1 + 0.60 (customs taxes) + 0.068 (tax on expenses abroad)]

So far I've been charged $224.98 + $15.29. I will be charged another $135 when the calculators arrive. The final price will be $187.63 per item.

Re: But what about Europe...

*Message #9 Posted by **Thomas Radtke** on 1 Sept 2011, 1:37 p.m.,*
in response to message #8 by Gerson W. Barbosa

Hi Gerson!

I guess we're both lucky to still have dealers shipping worldwide ;-).

in response to message #9 by Thomas Radtke

You're right, Thomas! Thinking of ordering yet another one, but will wait until the price drops a bit.

Cheers,

Gerson.

Re: But what about Europe...

*Message #11 Posted by **Jose Gonzalez Divasson** on 1 Sept 2011, 3:46 p.m.,*
in response to message #5 by Lode

It will take a little more than in the US, but they are guaranteed to come. The new calculators are presented to distributors on Sept.22. Prices have not been communicated yet to the network, and there are some points to decide yet.

The models will be in English only, but they will be a different part number than the US ones (#B1S instead of #ABA). I will not be able to tell the differences -if any- until I receive the samples.

There has been a change in the head of the EAME calculator business - this does not speed up the process. but, eventually, you will have a "local" calculator supported by the local network.

in response to message #5 by Lode

> Quote:
>
> Will this be available in Europe for a reasonable price?

Speaking about HP and saying "Europe" and "Reasonable price" in the same sentence, I love your humour.

Lets guess
HP12C in USA is $80, in Europe is 95 Euros which is about $133.
HP15C in USA is $100, my guess in Europe is 115 Euros which is about $1160.

What a wonderful gesture toward this community! Despite the merits or demerits of the 15C as a calculator, there can be no doubt that its return has been a dream close to many hearts around here. **Thank you** to the wonderful folks in the calculator group for this triumph. You have my fondest wishes that this is not a coda, but an intro to a whole new movement!

Gratefully,
Howard

Re: HP Press Release about the 30th Anniversary 12c and 15c LE

*Message #22 Posted by **Gerry Schultz** on 1 Sept 2011, 6:07 p.m.,*
in response to message #21 by Howard Owen

Here's an email I just got from Samson Cables on my original order for two HP-15C calculators:

"Pricing has been finalized on the 15C and 12C 30th Anniversary models at $99.99 so I have reduced the pricing on your order which was higher. The 12C 30th Anniversary is shipping now. We expect to receive the 15C very soon. You may check your order status at anytime online."

Original price for a 15C was $109.99.

I wonder if they will arrive in time for HHC2011?

Gerry

Re: HP Press Release about the 30th Anniversary 12c and 15c LE

*Message #23 Posted by **Michael de Estrada** on 1 Sept 2011, 6:17 p.m.,*
in response to message #22 by Gerry Schultz

So SC will sell it to you for MSRP + shipping and HP will sell it to you with a 15% discount and free shipping. Unless you're afraid HP will run out before you can get your order placed, why buy from SC ? If you lived outside the USA I might understand, but this makes no sense to me.

Re: HP Press Release about the 30th Anniversary 12c and 15c LE

*Message #24 Posted by **Gerry Schultz** on 1 Sept 2011, 6:38 p.m.,*
in response to message #23 by Michael de Estrada

Good question. I originally placed the order back in July as I didn't know about availability back then. I think my best course of action would be to try and order from HP and if successful, then cancel my Samson order.

Thanks,

Gerry

*Message #25 Posted by **Ethan Conner** on 1 Sept 2011, 7:07 p.m.,*
in response to message #23 by Michael de Estrada

Let me try and help you understand. The last time i saw one and held it in my hands was 1982. I let some well meaning people talk me out of the purchase. Now that i am older and have a desire to own a 15c i am taking NO chances on being able to acquire one this time around. I have placed orders with whoever i could and if HP puts an "add to cart" button i will order from them also. Almost 30 years waiting who cares about a measley 12 to 15 dollars shipping. :)

Whoops! I re-read your post and realized that I took it out of context, thinking that the reference was for the 1982 price, not the original LE posted price. Sorry about that....I'll read more carefully next time :-)

Jake

You guys have no idea how much fun Tim and I have had reading all the comments and theories here over the last few months, and now I can stop sitting on my hands. It's been a fun product development, with a few surprises tossed in here and there that I can't talk about.

We hope you enjoy this new version and that everyone that wants one, gets one. Or the dozen that you signed up for on the 15c website. ;)

Calling on the Spirit of Comedian Sam Kinison

*Message #1 Posted by **Namir** on 1 Sept 2011, 9:59 a.m.*

If you remember the late comedian Sam Kinison with his long hair and the way he'd bend forward and yell at the top of his voice "SAY IT!! SAY IT!! SAY IT!!"

Well I hope Sam Kinison is listening and could put a good word with the folks at the HP web site that is offering the HP-15C LE ... and yell:

"SELL IT!!! SELL IT!!! SELL IT!!!"

:-)

Say what? HP restarts tablet production

*Message #1 Posted by **Brian Walsh** on 1 Sept 2011, 8:55 a.m.*

http://www.businessweek.com/ap/financialnews/D9PF2SVO0.htm

Unbelievable.

Re: Say what? HP restarts tablet production

*Message #2 Posted by **Namir** on 1 Sept 2011, 9:15 a.m.,*
in response to message #1 by Brian Walsh

Good indication how HP's earlier "insight" about the market is WRONG!!! They have been listening to the wrong bean counters who have no patience at all.

I am glad to see the HP Tablet get a second chance.

ill they call it the HP Tablet Limited Edition??????? Might as well!!

Edited: 1 Sept 2011, 9:16 a.m.

Re: Say what? HP restarts tablet production

*Message #3 Posted by **M. Joury** on 1 Sept 2011, 9:42 a.m.,*
in response to message #2 by Namir

Not sure that this qualifies as a second chance. Reports at the moment only mention a single additional production run. Yeah, Slap LE on it and sell it on TAS for $700...

Just think about this though, the less expensive unit was selling (during the fire sale) for the same price as a 15C LE!

Cheers,

-Marwan

Edited: 1 Sept 2011, 9:43 a.m.

Don't count on it doing any better the second time around. Once the decision to kill it was made, they should have stood by their decision. This looks even more boneheaded than their preannouncement of spinning off the PC business.

I won't be surprised to see another fire sale.

Very believable.

*Message #6 Posted by **Frank Boehm (Germany)** on 1 Sept 2011, 10:03 a.m.,*
in response to message #1 by Brian Walsh

Considering most chinese/taiwanese production partners had already pre-produced bunches of parts, this doesn't come as a surprise. The only surprise is, that they obviously had not received any warning before. Speaking of "warning", I remember the HP phone dropping significantly in price one or two days before the official funeral - so at least someone somewhere was in the knowing.

I got the impression that the 15LE will be available at the end of this month??? Yes? No? Anyone?

Re: HP 15c Limited Edition Calculator on shopping.hp.com now

*Message #8 Posted by **M. Joury** on 1 Sept 2011, 8:20 a.m.,*
in response to message #1 by gene wright

There appear to be eight 15C's listed on TAS at the moment prices running from $61 (with active bidding) to $500. Wonder what this will do to those prices.

Hopefully HP will make enough that this will pull the rug out from under these sellers.

Mind you, I often see buyers paying MORE on eBay than they would direct from the manufacturer, so who knows.

Cheers,

-Marwan

look carefully at the HP calculator page link given by Gene.

it says

• Limited collector's edition

• Perfect gift for scientists and engineers on the go

• Up to 100x faster than original edition

• 120+ built-in functions with RPN and algebraic entry

but Gene says not to worry, it;s pure RPN

No paper manual! No mention of the emulator!

From a different page:

> Quote:
>
> Gift box, calculator, batteries, Owner's Handbook, protective sleeve, CD with virtual calculator

I wonder which is correct?

Cheers,

-Marwan

Re: Specific link

*Message #22 Posted by **Namir** on 1 Sept 2011, 9:30 a.m.,*
in response to message #21 by M. Joury

Marwan,

What really matters is the unit itself. If what I read is correct and the LE is just a much faster implementation of the original, then the old manual is still good and accurate. The new manual is of secondary importance. As for the emulator, there are already several emulators for Windows, and for the iPod/iPhone/iPad.

Namir

It sort of begs the question from where would this new "15c Owner's Handbook" originate, eg: is this a reproduction of the original or did HP actually produce a new version in a contemporary electronic format? Beyond that looms the question of the availability for the "Advance Functions Handbook" and in what format that may exist.

Re: Specific link

*Message #27 Posted by **gene wright** on 1 Sept 2011, 2:03 p.m.,*
in response to message #26 by uhmgawa

My understanding is:

A new, very nicely prepared paper Owners manual and a new nicely prepared PDF of the advanced functions book on CD.

98% sure that's what it is. Don't know. Don't have one of these yet.

There are only going to be 10,000 of these made. Each one is individually numbered and comes in a very nice, different box/package.

Re: Specific link

*Message #28 Posted by **uhmgawa** on 1 Sept 2011, 2:37 p.m.,*

That seems to be consistent with the suspicion this was primarily an effort to cultivate a market for a collectable item. But whatever it takes to get a better version of the Owner's and Advance Function Handbook to us all. ;)

Re: Specific link (web site text aspects)

*Message #29 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Sept 2011, 7:54 a.m.,*
in response to message #20 by Brian Walsh

In the Product Description on the web site, the "own a classic" sentence is (almost) duplicated.

```
Own a classic: each calculator is stamped with a unique limited-edition production
number.
.....
Own a classic: each limited-edition model of this cool calculator is stamped with its
own production number
```

The first line is the best one, in my opinion.

Also, the reference to "complex calculations" may be more specific; it's not a "complexity" issue, but the ability to work with "complex numbers".

Re: Specific link (web site text aspects)

*Message #30 Posted by **Andrés C. Rodríguez (Argentina)** on 3 Sept 2011, 11:03 a.m.,*
in response to message #29 by Andrés C. Rodríguez (Argentina)

Duplicate "own a classic" line is gone.

WP 34S : Operation with complex numbers

*Message #1 Posted by **Miguel Toro** on 31 Aug 2011, 2:21 p.m.*

Hola,

I was trying some examples from the 15c handbook and I got a little strange result from the one in page 133:

```
 - 15c in complex mode: sin-1(2.404) = 1.5708-1.5239i
 - 42s: same result = 1.5708-1.5239i.
But
 - 34s: sin-1(2.404) = 1.5708+1.5239i (so imaginary part is positif!)
```

I am doing the following sequence:

```
0, [ENTER], 2.404, [CPX], [g][SIN-1] = 1.5708+1.5239i
```

I think this is the proper way to enter it...or maybe not.

Saludos,

Miguel

Edited: 31 Aug 2011, 2:24 p.m.

Re: WP 34S : Operation with complex numbers

*Message #2 Posted by **Walter B** on 31 Aug 2011, 3:52 p.m.,*
in response to message #1 by Miguel Toro

Olá Miguel,

si, it's the right way to enter this little problem. And it looks like you've found a pretty old bug, since build 1108 returns the same result as build 1551 does :-/ Thank you for reporting :-)

Walter

Re: WP 34S : Operation with complex numbers

*Message #3 Posted by **Jeff O.** on 31 Aug 2011, 4:27 p.m.,*
in response to message #1 by Miguel Toro

As Walter reports, you are entering it correctly. Prior to Walter's repsonse I prepared the following. Not sure if it is pertinent, but I will let it stand.

I note the following: if you take sin(1.5708+i1.5239) on all three calculators, you get 2.4040 (plus a small imaginary component that would be zero with infinite precision.) If you take sin(1.5708-i1.5239) on all three calculators, you get 2.4040. So apparently both answers are valid. Being mostly a math dummy, I googled “complex arcsin” (actually I use startpage, but “startpaged” is not a common term for “entered into an internet search engine”) and found the following at wolfram.com:

> Quote:
>
> The inverse sine is a multivalued function and hence requires a branch cut in the complex plane… This follows from the definition of $\sin^{-1} z$ as:
>
> $\sin^{-1} z = -i \ln (-i z + (1 - z^2)^{1/2})$

If I use the above formula, and use the positive value of the square root, I get the answer that the 15C and 42s provide. If I use the negative value of the square root, I get the value that wp34s provides. I do not know if that is how wp34s (prior to the next revision if it is to be changed) calculates the inverse sine of a complex value.

edit: Per Pauli's correction, the above formula should be:

$\sin^{-1} z = -i \ln (i z + (1 - z^2)^{1/2})$

I'll leave the mistake for posterity.

Edited: 31 Aug 2011, 9:10 p.m.

Re: WP 34S : Operation with complex numbers

*Message #4 Posted by **Paul Dale** on 31 Aug 2011, 5:57 p.m.,*
in response to message #1 by Miguel Toro

The complex inverse trigonometric function on the 34S are defined by these formulas:

```
arcsin(z) = k PI + (-1)^k . asin(beta) + i (-1)^k ln(alpha+sqrt(alpha^2-1))
arccos(z) = 2k PI +- (acos(beta) - i ln(alpha+sqrt(alpha^2-1)))
where
        alpha = 1/2 sqrt((x+1)^2+y^2) + 1/2 sqrt((x-1)^2+y^2)
        beta  = 1/2 sqrt((x+1)^2+y^2) - 1/2 sqrt((x-1)^2+y^2)

arctan(z) = k PI + 0.5 atan(2a / (1-a^2-b^2) + i/4 ln((a^2+(b+1)^2)/(a^2+(b-1)^2))
```

(in the doc/formulas file).

It looks like the branch cut here is different :-(

- Pauli

Re: WP 34S : Operation with complex numbers

*Message #5 Posted by **hugh steers** on 31 Aug 2011, 7:49 p.m.,*
in response to message #4 by Paul Dale

when i put complex numbers into my library, i specially arranged the branch cuts to be the same as on HP calcs. specifically, i checked everything against the 15c.

i know they're arbitrary, but i found this gave me a level of sanity and comparability.

in response to message #5 by hugh steers

Probably a good idea. I trust the 15c's complex handling :)

I've updated the 34S to use the log based formula (there is a typo above BTW). Saved a bit of space too.

Crap. Something I mention gets implemented and I screwed it up. Wish I could take credit for suggesting it, but I

was just trying to figure out what was going on. (If I had suggested it, maybe I could have asked for a favor, like using the saved space to display the imaginary component or angle in the dot-matrix display area after ->REC and->POL commands. Sorry, I could not resist.)

I have added the correct formula to my message above. I left the error so that your comment makes sense.

The great dot matrix allows for displaying something like -2.3E-4i up there. Is this what you want, what you really, really want?

*Message #9 Posted by **Paul Dale** on 1 Sept 2011, 2:36 a.m.,*
in response to message #8 by Walter B

Ignore Walter, this isn't going to happen ;-)

I saved tens of bytes maximum.

- Pauli

Re: WP 34S : Operation with complex numbers

*Message #10 Posted by **Marcus von Cube, Germany** on 1 Sept 2011, 3:48 a.m.,*
in response to message #9 by Paul Dale

Actually the save is in the 100 bytes arena. We still have some headroom. Not enough for another user flash region but hopefully enough for further bug fixing.

Walter is good at insisting on bugs getting fixed. :-)

Re: WP 34S : Operation with complex numbers

*Message #11 Posted by **Paul Dale** on 1 Sept 2011, 4:01 a.m.,*
in response to message #10 by Marcus von Cube, Germany

Walter, is very very good at this.

The reason the 34S is so good is mostly down to Walter's tenaciousness. Otherwise it would be more like the Elektronikas with lots of *hidden* features and surprises (but still numerically sound).

> The great dot matrix allows for displaying something like -2.3E-4i up there. Is this what you want, what you really, really want?

As near as I can tell, the dot matrix area could support up to a 9 character display (plus radix, plus the "i" or "<") in small font, 7 characters in the large font. So at worst you have is something like "i-8.89e-333" in the small font. I hardly ever deal with numbers requiring 3-digit powers of 10. Much of time, I believe the number could be formatted to look decent. I guess what I really, really want is to display the imaginary or angle, honoring the display setting if possible, changing the display setting for the number as needed to display it as best as possible. But I can see that that might be a lot of work. I'd be happy with just appending the number to the "i" or "<", cutting off what does not fit and alpha-displaying it. I'll accept that to do that, I have to learn C programming and all the other steps necessary to change the code myself.

Just to be clear, my "helpful" suggestions are not intended to indicate disappointment or dissatisfaction with wp34s. Far from that. But, if I conceive something that sounds good to me (as most things that I conceive do, curiously), I figure it cannot hurt to suggest it. At best, maybe one day I'll suggest something that resonates with the developers and it will happen. At worst, you say "can't do" or "won't do", but at least I asked.

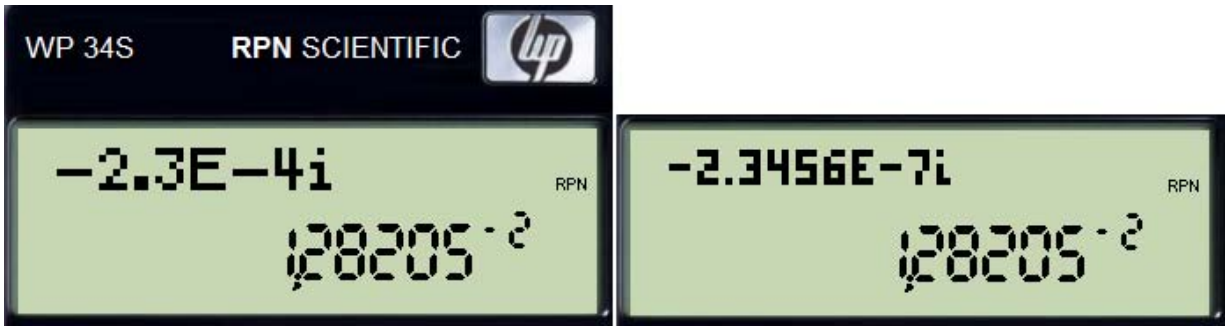
No need for excuses :-) Please continue your helpful suggestions (did I tell about the different meanings of quotation marks in different languages? ;-)). Anyway, here's what's feasible spacewise:



No more. So you know what can be done before you start programming ;-)

Walter

Re: WP 34S : Operation with complex numbers

*Message #17 Posted by **Jeff O.** on 1 Sept 2011, 9:45 p.m.,*
in response to message #16 by Walter B

Hmmmm...I can get -2.34e-5i (or i-2.34e-5 as I would probably implement it) to display in large font on my 30b running rev. 1551. I get the same results as you show in small font. It also uses a small letter e in both large and small font. But no matter, you are correct, it is not ideal. But I would probably give it try if I had the power.

I'm not sure if you have told about the different meanings of quotation marks in different languages. I used them above in a casual English manner meaning "perhaps not really." Do people do the so called "air quotes" in other parts of the world? (If they do not, that term probably won't make any sense at all.)

Communication (OT, was Re: WP 34S : Operation with complex numbers)

*Message #18 Posted by **Walter B** on 2 Sept 2011, 1:55 a.m.,*
in response to message #17 by Jeff O.

> Quote:
>
> I used them above in a casual English manner meaning "perhaps not really." Do people do the so called "air quotes" in other parts of the world?

That are two ways I use them as well. Additionally we use them for quoting (surprise! :-) . But I know many people here employ them for emphasizing (being too lazy for underlining), and I thought so far that custom came from the US of A. IIRC we had this topic here some years (?) ago with the example of a German butcher advertising

Heute "frische" Wurst!

- an ad I wouldn't call an ad in my understanding ;-)

Walter

Re: Communication (OT, was Re: WP 34S : Operation with complex numbers)

*Message #19 Posted by **Andrés C. Rodríguez (Argentina)** on 3 Sept 2011, 10:27 a.m.,*
in response to message #18 by Walter B

Quite a number of people here use quotation marks for emphasis. I do share Walter's concern, and pointed the issue to friends, coworkers, students, etc. many times, but it seems there are strong (and unknown) reasons for this to happen so frequently.

[Please disregard any idiomatic mistake]

Re: Communication (OT, was Re: WP 34S : Operation with complex numbers)

*Message #20 Posted by **Jeff O.** on 3 Sept 2011, 1:26 p.m.,*
in response to message #19 by Andrés C. Rodríguez (Argentina)

I had not noticed, now it will probably annoy me. Emphasis should be denoted by **bold**, *italic*, underline, or maybe _this_, whatever it is called. Or ***_all four methods_*** for super emphasis.

HP-35: once working, now only one dim segment on display

*Message #1 Posted by **elmwood** on 31 Aug 2011, 2:08 p.m.*

Greetings all!

I rescued a old HP-35 calculator not too long ago. ($1!) It worked perfectly, but I still disassembled and carefully cleaned the internals, with no problems.

Today, I got a new aftermarket 2000mAh rechargeable battery pack, to replace the original leaked and dead battery pack. I installed the battery, plugged in the HP-35, and all was well. I then turned off the calculator.

A few minutes later, I turned the calculator back on. There's no familiar "0" in the first LED; instead, there will be one lone, very dim segment displayed in the fourth LED from the left. The displayed segment changes when I turn the calculator on and off. Occasionally, it will display two very dim decimal points in the fourth and fifth LED. It doesn't matter whether I use only the battery, the power supply without the battery, or both together - the result is the same.

Any thoughts?

Re: HP-35: once working, now only one dim segment on display

*Message #2 Posted by **elmwood** on 31 Aug 2011, 10:16 p.m.,*
in response to message #1 by elmwood

Bump. Anyone? Or are you all just waiting for it to come up for sale on eBay for parts ...

Re: HP-35: once working, now only one dim segment on display

*Message #3 Posted by **Michael de Estrada** on 31 Aug 2011, 10:55 p.m.,*
in response to message #2 by elmwood

Maybe one of the truly expert members here will chime in. We're not ignoring you, just don't have a good idea what specifically it could be. Normally when displays stop working properly, some electronic component has gone bad in which case you won't be able to repair it unless you are able to get your hands on a donor calculator. Since you only paid $1 for it, just put it in a closet or toss it.

Re: HP-35: once working, now only one dim segment on display

*Message #4 Posted by **Peter Murphy (Livermore)** on 1 Sept 2011, 1:52 a.m.,*
in response to message #3 by Michael de Estrada

An idea: ask Randy Sloyer at FixThatCalc.com if he could use your 35 for spare parts. He's done good work for me, at fair prices, so I've been happy to have found some old, inoperative calcs to send him.

Re: HP-35: once working, now only one dim segment on display

*Message #5 Posted by **Joel Setton (France)** on 1 Sept 2011, 2:34 a.m.,*

in response to message #1 by elmwood

I know this may sound trivial, but are you sure the new battery pack has any charge in it?And did you try running the calculator on a charger?
Joel Setton

Re: HP-35: once working, now only one dim segment on display

*Message #6 Posted by **Randy** on 1 Sept 2011, 11:17 a.m.,*
in response to message #1 by elmwood

Perhaps you received a bad battery? Low voltage can cause the symptom you see. Anything is possible, I've seen both bad cells and reversed cells in after-market packs.

As the 35 will work safely from the charger alone, remove the battery and try with just the ac adapter. If no joy, check the output of the charger. The center pin is common, one side is regulated ~4.5 volts dc and the other side is a 55 ma constant current source that charges the battery that when open circuit, should measure approximately 16 volts dc. A schematic is available in the archives:

Classic charger schematic

Darn! 15C preorder relisted at Samson. $129

*Message #1 Posted by **Borja** on 31 Aug 2011, 3:19 a.m.*

I've just checked the Samson Cables page. They list the HP-15C special edition, this time at $129.

The photo they show is a photoshopped image of a 15C, but with "special edition" written below the HP logo.

Re: Darn! 15C preorder relisted at Samson. $129

*Message #2 Posted by **Ethan Conner** on 31 Aug 2011, 4:50 a.m.,*
in response to message #1 by Borja

It's still cheaper than what's on TAS. Decided to place another order anyway. Need a backup. :)

Re: Darn! 15C preorder relisted at Samson. $129

*Message #3 Posted by **hpnut** on 31 Aug 2011, 7:24 a.m.,*
in response to message #1 by Borja

I pre-ordered in July, as these details:

(1) HP 15C Scientific Calculator PreOrder $94.99

---------- Sub Total: $94.99 Shipping & Handling (USPS Priority Mail): $18.00 UT State Sales Tax: $0.00 Total: $112.99 (Pay Via: CreditCard)

I wonder if they will honor that price.

hpnut in Malaysia

*Message #10 Posted by **Michael de Estrada** on 31 Aug 2011, 1:15 p.m.,*
in response to message #9 by Namir

I think they're just trying to sell it for the expected MSRP, instead of a discount, because they figure their competition will do the same, since the supply will be too limited to meet demand. If and when this happens, I do expect massive price gouging on the secondary market, such as TAS. I realize those of you not residing in the USA have limited options, but please don't let someone like SC insert a phallus up your derrieres.

Re: Darn! 15C preorder relisted at Samson. $129

*Message #11 Posted by **Thomas Radtke** on 31 Aug 2011, 1:21 p.m.,*
in response to message #9 by Namir

That was the suggested retail price, iirc. Due to the limited stock, it wouldn't make sense to give any discount. The 15C LE will soon be sold out and reappear on TAS at 200% afterwards.

Re: Darn! 15C preorder relisted at Samson. $129

*Message #12 Posted by **gene wright** on 31 Aug 2011, 1:27 p.m.,*
in response to message #11 by Thomas Radtke

that sounds like a great idea to me! ;-)

Re: Darn! 15C preorder relisted at Samson. $129

*Message #13 Posted by **Thomas Radtke** on 31 Aug 2011, 1:38 p.m.,*
in response to message #12 by gene wright

Sorry Gene - already ordered 10,000 units ;-).

but the single line display is restrictive.

Agreed 100%. The form factor is great, but imagine if they kept the physical case and keys but inserted a two-line full dot-matrix display. With the Atmel CPU/platform of the "12C+", it could handle 12-digit mantissa/3-digit exponent numerics, it would have the capability to support soft-key menus and Walter, Pauli and Marcus would have a field day :-)

The sam7 can't natively drive an LCD matrix of such density so an external controller would be required. This may detract from utility of the sam7 but even dismissing that I haven't found much to compete with it in this application space.

> Quote:
>

I believe the attraction of the 15c in part follows from the unmodified firmware proven over 30 years in the field.

However I hazard what you're really after is one of these HP-42C.

Yes I'm looking for one too.

I can't understand the bizarre enthusiasm either. It is without any logical basis. Assuming a new HP-15C becomes available, speed would be the **only** advantage over the original. What good is that?

The original HP-15C is slow, but who ever did work on an HP-15C that would be enhanced by doing it faster? It has no output device (not even a BEEP) except the very limited display. It has no input device except the keyboard. Faster speed is not likely to have substantive value at all to any HP-15C application.

I'd rather have an original HP-15C. At least the battery life and the quality of construction will be vastly superior to any Chinese re-incarnation. The good old HP traditional quality is still there in 30-year-old originals.

The appearance of the HP 42S in 1988 showed that HP once could produce a small RPN calculator that is an order of magnitude better than the HP-15C. The HP 15C LE is a sign of failure in innovation at even 1988 levels!

And yet the 12C still sells well after 30 years. Perhaps that machine is just good enough to do the jobs demanded of it. Maybe it fits into pockets and workflows that include far more powerful and sophisticated computing devices.

The 15C is a lot more powerful than the 12C for mathematics. It's also more

complicated. So I wonder if it will find a similar niche out there. I consider that an open question, though.

Speed counts for something to some folks, and the original NUTs are quite slow for anything beyond on-the-fly interactive calculations and limited programming. So a sam7 ARM version does offer value relative to the original.

I would however expect an encore 15c to add bidirectional i/o of some sort. The sam7 can certainly support it and running the firmware in emulation makes it quite straightforward. But AFAIK no one has seen the new 15c yet so it may best to hold off on that evaluation.

> I'd rather have an original HP-15C. At least the battery life and the quality of construction will be vastly superior to any Chinese re-incarnation. The good old HP traditional quality is still there in 30-year-old originals.

From the perspective of mechanical construction, LCD contrast, and quiescent current draw I'd have to agree with you there.

> Quote:
>
> The appearance of the HP 42S in 1988 showed that HP once could produce a small RPN calculator that is an order of magnitude better than the HP-15C. The HP 15C LE is a sign of failure in innovation at even 1988 levels!

Wow, tough audience. But the 42s has detractions as well considering the carbon pill key switch construction and the "service hostile" enclosure design. The LCD contrast is far inferior to the low multiplex rate segment display of the 15C (but admittedly may have been average for graphic LCDs of that era). Paradoxically we get a piezo beeper but no IR receiver in the 42s such that a user could have a means to get code into the box which doesn't involve human digits.

But quite honestly either machine offers an interesting platform to build upon.

The 15C is a gorgeous and capable work of art! Granted the 42S is far more capable, but it's also butt-ugly. :-)

I hope HP makes a zillion 15Cs since it is the only gift I am going to give anymore--wedding presents, baby showers, get-well-soon, sorry-for-your-loss, etc...

Retro is in!

(Whatever Walter says), the 16C! Please?

I can't disagree with any part of that. The HP-15C is visually far more attractive than **any** later HP. I also think it's much better looking than the HP-41 series.

I don't know what happened to HP in 1986, after which all those left-coast "artsy" low contrast goober-head ugly color schemes were adopted. The HP 28, 48S and G, 38G, and **all** Pioneers have absolutely terrible color schemes. Even my dear HP 42S...ugly orange on even uglier brown...what drugs were those HP folks on?

At least today's 50g and 30b, and...even the unfortunate 35S, show a lot of practical "visual" sense has returned to HP since the demise of the Pioneers and the 48G series.

What's wrong with the 20S' cyan/gold legends?

For those who do not have a 15c, the Limited Edition release is an opportunity to purchase a new unit for considerably less than the price of a used 15c.

For those that have a 15c (and use it), the Limited Edition release is an opportunity to be able to purchase a new backup with printed manual and emulator for considerably less than the price of a used 15c.

For those who collect, the Limited Edition release is another shiny object to hoard.

I don't consider myself a "collector" per se. Collector makes me think of some guy with his display case stuffed full of red dot HP35s and a pallet of NIB 16cs that never actually get used. I own several HPs, but use almost all of them (including my non red dot, version 3 HP-35 that I actually used on my last exam as an undergrad at college... in May, 2011). It started when I bought a 48g after my TI-89 Titanium got stolen... I picked up a few other models, decided I wanted a 32S because the 48G was bulky and I really didn't use the graphing feature that often, so I managed to buy one that had the keyboard contact problem on TAS for $15 and fixed it. I'll probably buy one of the new 15Cs, but I intend to use it, not flip it on TAS or hide it in the bottom drawer of my desk for the next 50 years.

It's nice to see a young person show interest in these old designs and appreciate them. I too have an HP-35, V3, except that I bought mine new in 1973 when I got my first engineering job. It replaced my trusty K&E slide rule, and speeded up my work to the degree that I would annoy my boss by asking for more work because I would finish long before quitting time. I still have the HP-35, and it still works great. I'm sure you will enjoy the HP-15C.

Voyagers in general and the 15c in particular certainly have a strong legacy, and honestly that was one motivation for my time sink developing the KINOMI project.

But Voyagers are a point product which limits the design to their current feature set, in terms of having practically unmodifiable firmware along with limitations of the existing user interface.

That said I suppose I personally draw a similar analogy between open source and proprietary software. I don't really get excited by software for which source isn't available, in part due to the practical, potential need to adapt such software to my needs and part psychological in that I **can** modify said software. So in the case of Voyagers and others, having usable firmware (legal restrictions aside) and a documented programming model allow a platform beyond the original product -- a night to day transformation IMHO.

Speaking of which, is there any more news on this front? I for one would love to see more of this. I have a few old chassis that I would love repurpose.

Fair question and I haven't forgotten about the folks asking for this.

Yes I'd like to release it as an open project, but am still undecided how best to do so. The procedure to actually get a KINOMI module functional in a Voyager is fairly involved such that in its current form I suspect it would have limited appeal. Issues such as nondestructively removing the NUT cpu, building a KINOMI module itself with 0201 footprint and 0.5mm surface mount components, adding the bottom floating conductor standoffs to the module, and manually soldering it to the prepared PCB takes some skill and tooling ideally including a low power microscope.

It would be considerably easier if the Voyager PCB were to be un-staked for the above assembly operation but doing so has its own complications. Still it may be inevitable and this option removes the need for a prospective modification to live within the 14x14.6mm KINOMI footprint. Eg, a complete board replacement is possible which opens up considerably more

real estate allowing use of a more powerful SoC, and perhaps within reason additional RWM/svRAM/FLASH, and I/O. I think it is also far more feasible for an end experimenter to replace/restake an upgrade board than spending hours hunched over the family stereo microscope and hot-air rework station constructing a module less than the size of a US dime.

That said the existing KINOMI modules versions are certainly viable and I have several running here. For those interested in reviewing the design I'll try to get at least the schematics and PCB gerbers available for download within the next week +/-. Apologies this is taking so long but despite it being some of the most enjoyable leisurely hacking I can recall, no one seems interested to fund my preoccupation with 30 year old calculators. ;)

why not just design it as a refit into a modern 12C+ casing? the user could then, at the same time, repaint/silkscreen the keyboard buttons and escutcheon too.
