Program Title REVERSI

Contributor's Name Valentin Albillo

Address Padre Rubio, 61 - 2°C

City Madrid, 29   **State/Country** Spain   **Zip Code**

Program Description, Equations, Variables This program allows the user to play a game of Reversi against an HP-41C. The present program includes all features required: plays quite well and will easily defeat a beginner, so it provides a challenging level for everyone. The program itself runs the same with or without a printer, but if one is present, it will print the board.

```
YOU PLAY 57
FLIP 2 PCES

   1 2 3 4 5 6 7 8
1  - - - - - - - -
2  - - - - - - - -
3  O O O - - - - -
4  - - O O O - - -
5  - - O ▓ ▓ ▓ ▓ -
6  - - O O O ▓ ▓ O
7  - - - - O ▓ ▓ -
8  - - - - - O ▓ O
```

The program is also autonomous: no data cards required, no card reader required.

It is also quite fast for such a complex game: the HP-41C performs some 30 moves (whole game) in 25 minutes. Besides, the running speed increases as the game goes on.

You can select who makes the first move, and the type of opening either diagonal or parallel. Also, you may select to print the board after every new position, or only after HP moves (so saving paper and time). The machine recognizes and rejects illegal moves. Can play a single move for you against itself. Even a whole game against itself if you want (imagine, the HP-41C playing both black and white at the same time!)

Though you are supposed to know the rules of the game, a brief explanation will be given, for the sake of completeness. Here is a brief outline of the rules:

Necessary Accessories 3 single-density memory modules (or a quad module).

Operating Limits and Warnings Your move must be of the form xy, with both x and y ranging from 1 to 8, limits included, and the two exceptions to this rule being 0 (no move) and -1 (HP plays for you). Any negative number may be used instead of -1, if desired. The game generally ends when the board is full of pieces, but it may also end if no player can make a legal move. In that unlikely case, the counting of the pieces is not automatically performed. You must do it by yourself.

Reference(s) New Mathematical Diversions, by Martin Gardner. Includes the rules of Reversi, and some other curiosities. You can also have a look at the Games Pac for the HP-85 computer, which includes a program to play Reversi (not related to this program in any way, to be sure!!!)

Reversi is played on an 8x8 board. There are two standard openings (see illustrations):

-diagonal opening (left)
-parallel opening (right)

```
  1 2 3 4 5 6 7 8
1 - - - - - - - -
2 - - - - - - - -
3 - - - - - - - -
4 - - - ▓ O - - -
5 - - - O ▓ - - -
6 - - - - - - - -
7 - - - - - - - -
8 - - - - - - - -
```
```
  1 2 3 4 5 6 7 8
1 - - - - - - - -
2 - - - - - - - -
3 - - - - - - - -
4 - - - O O - - -
5 - - - ▓ ▓ - - -
6 - - - - - - - -
7 - - - - - - - -
8 - - - - - - - -
```

One of the players plays the white pieces (represented by the 0), the other the black ones (represented by the checkerboard character).

To make a move, the player places one of his pieces in an empty location (represented by a dash) taking into account that:

-it must be adjacent to a piece of the other player.
-at least one enemy piece must be enclosed between the just placed piece and another piece of the same color.

This is, any number of pieces enclosed between the played piece and any other of the same color are flipped: they become of the capturer's color. No empty locations can be enclosed, only full rows of enemy pieces can be flipped. The row can be placed in any direction: horizontal, vertical or diagonal. If more than one row is enclosed at the same time, all are flipped. You can capture only when putting a piece on the board: enemy pieces which are left enclosed by yours because of other factors are not captured, of course.

```
  1 2 3 4 5 6 7 8
1 O ▓ ▓ - ▓ ▓ ▓ O
2 O O O O O O O O
3 O O O ▓ O O O O
4 ▓ ▓ O ▓ O O ▓ O
5 ▓ ▓ O O ▓ O ▓ O
6 ▓ O - O O O O ▓
7 ▓ O O O O O O O
8 O O O O O O O O
```

Some example should make it clear. Look at the diagonal opening. If black plays to 64 (6 vertical, 4 horizontal), then the white piece at 54 is between the 2 black pieces at 44 and 64 (just played), so it's flipped: the white piece at 54 becomes black. (By the way, you play black, HP plays white).

Now, look at the illustration at the left of these lines: if white plays at 14, the black pieces at 12 and 13 are enclosed between the just played piece at 14 and the white piece at 11, so they would be flipped. Simultaneously, the black pieces at 15, 16 and 17 are between the just played piece at 14 and the white piece at 18, so they would be flipped, too.

On the other hand, in the same board position, if black plays at 63, it would flip the white pieces at 62, 53, 43, 33, 23, 64, 65, 66, and 67, because there is another black piece at the end of each row of white pieces, and none of the rows contain empty locations between pieces.

PROGRAM CHARACTERISTICS

The program is exactly 672 bytes (96 registers) long, so it exactly fits onto 3 magnetic cards. The program is optimized for running speed: each location on the board is stored into a single data register, so a minimum SIZE 117 is required. This makes it necessary to have at least 3 single-density memory modules attached, in order to run the program, leaving a port free to plug in the card reader or the printer.

Registers are used as follows: R00 through R07 are scratch. R08 through R15 contain the directions array, necessary to scan each row. R16 through R27 store an array of constants used by the strategic part of the program to compute each move. R17 through R116 store the 8x8 board, including edges (thus being actually a 10x10 board). As you may see, the constants array and the board overlap, so saving 11 registers. This is possible because the edges may be any number except +1 or -1, and none of the constants have those values. White (HP's) pieces are stored as +1, black (yours) ones as -1, and empty locations are 0. The edges are typically 0, but can be any number except +1 or -1.

The program uses flags 1, 2, 3, 4, and 5. If flag 3 is set, your move is being tested for legality, or HP is playing your pieces against its own. If flag 4 is set, a given number is not yet considered legal. If flag 1 is set, HP plays your pieces for you. If flag 2 is set and the printer is present, the board will not be printed after your moves (except, of course, if you make the last move). If flag 2 is clear, the board is printed after every move. All flags are controlled by the program, except flag 2, which is user-dependent: you may set or clear it from the keyboard as often as you like. Flag 5 is set before a sequence of board positions is tested. If the flag is set at the end of the sequence, none of the positions tested are valid.

Remember that the program is printer-compatible: if you do not use a printer, it runs the same, except that the board is not printed, of course.

TIPS AND REMARKS

Here are a few typical running times. These times are just the time needed to compute HP moves. They do include time required to print the board, but, of course they do not include the time required for you to think out your own move.

-an average game : 30 HP moves

-without printer : 25 minutes
-printer, SF 02 (1 board) : 60 minutes
-printer, CF 02 (2 id.) : 75 minutes

As you may see from these figures, the printer slows down significantly the execution speed, but the convenience of the automatic handling of the board, and the fact that an actual board is not needed at all, together with the game being recorded on the paper tape, make it worth the price.

Remember also that execution gets faster as the program progresses, from some 70 seconds for a move near the beginning of the game, to a few seconds for a move near the end of the game. This is possible because HP keeps track of already occupied locations, and once a group of 5 locations is tested to be occupied, they are not tested any more, speeding up the search algorithm quite a lot when the game is close to its termination.

No moves are random, so the same game is played if you make exactly the same moves. This feature is useful: if you made a mistake that allowed HP to win, you can repeat that game once more, this time avoiding the error, to see who wins now. As you'll see, the level of play is quite good for such a tiny program running under the speed limitations of the HP-41C. Any improvements to the playing logic are welcome, however.

There are several ways of making room for improvements, or to fit the program into 2 RAMs (instead of 3). Possible shortcuts are:

1) Delete lines 68, 69, change LBL "REVERSI" to LBL "R", line 260 to "OK", and shorten other alpha comments. This saves 27 to 30 bytes at almost no cost.

2) If you have no printer, or do not want printing of the board, you can delete lines 6, 62, 195 through 251, 254 through 258 (limits always included) and change line 49 to 60 instead of 61. This modification saves 116 bytes.

3) You may use a data card: delete lines 7 through 30 (both included) and insert in their place: 07 16.027
08 RDTAX

This saves another 148 bytes, but a card reader is needed, and you must load a data card when the program asks for one. The data card contains the constants that the program stores (in lines 7 through 30) in their respective registers. See program listings.

Remember that, although the game normally ends when the board is full of pieces, it may end if no player can make a legal move (or if a player loses all his/its pieces). In these cases, the automatic counting of the pieces to decide the winner is not performed: you'll have to do it manually.

SF 02   <u>SAMPLE GAME:</u> Load the program, SIZE 117, and press the following:
XEQ "REVERSI"   SF 02 (selects one board only)

DIAG ?
        RUN   XEQ "REVERSI" : see printout at the left.

               - the display asks you whether you want to play DIAGonal opening: you
  1 2 3 4 5 6 7 8   agree by pressing R/S
1 — — — — — — — —
2 — — — — — — — —   - the board is printed now reflecting the diagonal opening that you
3 — — — — — — — —   have selected. This is the initial position. You are playing
4 — — — ※ O — — —   black (checkerboard characters) and HP plays white (the O's).
5 — — — O ※ — — —
6 — — — — — — — —   (if you are not using a printer, you need an actual 8x8 board, and
7 — — — — — — — —   a set of 64 reversible pieces, one side white, the other black.
8 — — — — — — — —   Dispose them as in the printout, and always actualize the board
                       after your moves and after HP moves).

HP 1ST ?   - the machine prompts you whether it makes the first move
N   RUN   - enter an N and press R/S (N stands for NO): you move first
MOVE ?   - the machine then prompts for your move
        64   RUN   - enter 64, then R/S (you put a piece at 6 vertical, 4 horizontal)
YOU PLAY 64   - the machine tests your move, finds it legal, and acknowledges the
FLIP 1 PCES   move, displaying also the number of flipped pieces
I PLAY 63   - then computes its move, displays it, the number of pieces it flips,
FLIP 1 PCES   and prints the board

  2 3 4 5 6 7 8   (the board was not printed after your move because we set flag 02)
1 — — — — — — — —
2 — — — — — — — —   the board reflects the position after the moves. Your move at 64
3 — — — — — — — —   flipped the white piece at 54, which became black, but then the
4 — — — ※ O — — —   machine moved to 63 flipping that same piece once more to white.
5 — — — O ※ — — —   This is so because by playing at 63 the piece at 54 is enclosed
6 — — O ※ — — — —   between both white pieces at 63 and 45   MOVE ?
7 — — — — — — — —   CF 02
8 — — — — — — — —   ... the game continues ... (You:53, HP:65) then,   76   RUN
                   we decide to have a printing of both boards, so we   YOU PLAY 76
                   clear flag 02, and enter 76, R/S as our move: (the   FLIP 1 PCES
                   flag is cleared using the keyboard sequence CF 02).
                   The machine acknowledges your move, and, since flag
                   02 is cleared, prints the board reflecting your move.   1 2 3 4 5 6 7 8
                                                                          1 — — — — — — — —
The board is printed. Your move at 76 just flipped the white piece   2 — — — — — — — —
at 65, which became black. You must be aware that this printout is   3 — — — — — — — —
not a direct continuation of the previous one, since we took the   4 — — — ※ O — — —
game up two moves later.   5 — — ※ ※ O — — —
                                                                          6 — — O O ※ — — —
                                                                          7 — — — — — ※ — —
                                                                          8 — — — — — — — —
The machine plays to 66, so flipping once more the piece at 65. As
you may see, unlike other games, such as chess or checkers, pieces   I PLAY 66
never move from where they are left, but merely change sides any   FLIP 1 PCES
number of times. Of course, the object of the game is to have the
maximum number of pieces on the board when the game ends.   1 2 3 4 5 6 7 8
                                                                          1 — — — — — — — —
The board is printed now, showing the effects of the machine move   2 — — — — — — — —
on the position.   3 — — — — — — — —
                                                                          4 — — — ※ O — — —
                                                                          5 — — ※ ※ O — — —
                                                                          6 — — O O O O — —
                                                                          7 — — — — — ※ — —
                                                                          8 — — — — — — — —

```
GAME IS OVER

HP: 49, YOU: 15

I WON
```

SAMPLE GAME CONTINUED: In the printout at the left, a typical game ends.

HP has just moved. Then you are prompted for your move. In the position shown, there is just one empty location left. But you cannot place a piece there, because no white pieces would result enclosed between your piece and another of your pieces. So you have no legal move. However, if you are a beginner, you may be unsure about it, so you decide to have the machine select your move (if any) for you:

Enter -1, R/S. HP begins to search for a suitable move for you. But as expected, finds none, displays (and beeps; you may have noticed by now that most messages are beeped as well as displayed and printed) NO MOVE, then proceeds to search for its move. Finally, after a few seconds, it moves to 28 (where else?!) and, while doing so, flips no less than 8 of your pieces: those located at 22, 23, 24, 25, 26, 27, 37, and 46.

The board is printed for the last time. Then the machine realizes that the game has ended, displays GAME IS OVER, and counts both black and white pieces on the board, to decide the winner. This time, it displays HP: 49, YOU: 15, meaning there are 49 white pieces on the board, while you have only 15 of your pieces remaining. Obviously, HP has won, so it displays a final I WON message. Once this message is on the display, there is only one possibility left for you: TRY AGAIN.

TEST GAME: If desired, test that your program is correctly loaded by executing the following game.

Diagonal opening, HP first. Only the moves are shown (no flip pieces)

YOU	HP		YOU	HP		YOU	HP		YOU	HP		YOU	HP
--	65		42	68		57	85		25	16		38	48
46	33		75	36		83	58		26	52		78	82
64	63		35	84		76	41		32	47		71	87
43	66		86	51		61	34		23	14		12	11
72	53		31	56		62	74		15	73		0	21
67	81		27	18		24	13		17	37		77	88
												22	28

FINAL SCORE: 17 47, so HP WON

NOTE: If you play with a printer (and set it to NORM, as recommended), you'll have each machine move printed, as well as displayed. However, if you play without a printer, and you happen to miss the I PLAY xy display, do not worry. Simply use backarrow to clear the MOVE ? display, and the last HP's move will be in the display, in the form xy. (Use backarrow just once. Using it twice or more consecutively would also clear the xy move! You can also simply turn alpha on and off to clear the MOVE ? prompt from the display.)

USER INSTRUCTIONS

SIZE:
(HP-41C) 117

STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
1	Load the program. You play black. HP white.			
2	If you want to use the printer, plug it in now and set NORM position.			
3	If a printer is used and you want to suppress board printing after your moves, press: the board will now be printed just after HP moves. This can be done at any time.		SF 02	Flag 2 annunc. on
or 3	To print the board each time, press:		CF 02	Flag 2 annunc. off
4	Make sure you have at least SIZE 117.			
5	Begin the game, press:		XEQ "REVERSI"	DIAG?
6	If you want to play diagonal opening:		R/S	HP 1ST?
or 6	If you want to play parallel opening:	N	R/S	HP 1ST?
7	If you want HP to make the first move:		R/S	I MOVE
or 7	If you want to make the first move:	N	R/S	MOVE?
8	IF IT IS YOUR TURN (MOVE? on the display)			
	Enter your move: (x=vertical, y=horizontal) (Your move is tested for legality. If it is found to be illegal, you'll be prompted once more for your move with MOVE?. Go to Step 9, then)	xy	R/S	YOU PLAY xy FLIP p PCES or ILLEGAL MOVE?
or 9	You have no legal move: enter: and HP proceeds to compute its move.	Ø	R/S	
or 9	You want the machine to play your pieces against its own in this turn: enter: and HP computes your move, displays: and then automatically computes its own move. NO MOVE is displayed if the machine finds no legal move for your pieces. If you want a whole machine/machine game, always enter -1 as your move.	-1	R/S	YOU PLAY xy FLIP p PCES or NO MOVE
10	IF HP MOVES it will think about its move for a while, then display: xy is the location where HP puts its piece and p is the number of your pieces flipped. NO MOVE is displayed if no legal move is possible for HP. You then have the turn once more: Go to Step 8			I PLAY xy FLIP p PCES or NO MOVE MOVE?
	(If you play without a printer, remember to actualize the board after HP moves: put a white piece where indicated, then flip your captured pieces.)			

STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY

11   Once the last player makes the last move,
     you should see:

      where nn = number of white (HP)
                pieces on the board

        mm = number of black (you)
                pieces on the board

Of course, the player with the most pieces
at the end of the game wins the game. So,
if HP has 24 pieces on the board and you
have 40, you won. If HP has 40 and you 24,
HP wins. But if both have 32 pieces, it is
a tie and no winning message is displayed.

Display column:

```
GAME IS OVER
HP: nn,   YOU: mm
I WON or YOU WON
```

NOTES: If the printer is plugged in, everything that appears in the display is printed
        as well, and the resulting board position is printed after every legal move if
        Flag 02 is clear, and only after HP moves if it is set. After the last move, the
        board is printed also, regardless of the status of Flag 02.

        You may set or clear Flag 02 using SF 02 and CF 02 respectively from the keyboard
        as often as you like. You may do it at any time during program execution, when-
        ever the machine is at a halt.

        If no player can make a legal move, or if one player loses all his pieces, the
        game is ended, but this is not recognized by the program, and the automatic
        counting of the pieces is not performed. Do it yourself, to determine the winner.
        The board, if not already printed, may be forced to be printed by the following
        series of keystrokes:
                        GTO .202
                        R/S

and halt the program just after the 8th row is printed, by pressing R/S. Once
the board is printed, you can perform the counting.

        The machine-plays-for-you feature is very useful. You can use it freely whenever
        you don't know what to play: let the machine play (honestly) your pieces, hoping
        its selection is a good one. Or, if you are unsure whether you have any legal
        move or not, let the machine play your pieces:

                - if there is a legal move for you it will be found

                - if no legal move at all, NO MOVE is displayed, and
                  the machine now computes its own move.

        This capability is especially useful for beginners; also, if you want the machine
        to play a whole game against itself, always enter -1 as your move, and you'll see
        HP in action as never before!
